The term ''regular inspection'' means that the employer has some type of schedule, formal or informal, for inspecting walking-working surfaces that is adequate enough to identify hazards and address them in a timely manner. The final rule uses a performance-based approach instead of mandating a specific frequency for regular inspections. OSHA believes that employers need to consider variables unique to each workplace that may affect the appropriate frequency for workplace inspections. Therefore, OSHA believes that employers are in the best position to evaluate those variables and determine what inspection frequency is adequate to identify and address hazards associated with walking-working surfaces. Once employers make that determination, the final rule requires that they conduct inspections of walking-working surface according to that frequency.

Adding a general requirement in the final rule for regular inspections of walking-working surfaces makes the rule consistent with OSHA's construction standards. Section 1926.20(b)(2) requires employers to have a program that ''provides for frequent and regular inspections of job sites, materials, and equipment.''

In addition to regular inspections, final paragraph (d)(1) also requires employers to conduct inspections ''as necessary.'' For purposes of final paragraph (d)(1), inspecting workplaces ''as necessary'' means that employers must conduct inspections when particular workplace conditions, circumstances, or events occur that warrant an additional check of walking-working surfaces to ensure that they are safe for workers to use (*i.e.,* that the walking-working surface does not increase the risk of a slip, trip, or fall). For example, an additional inspection may be necessary to ensure that a significant leak or spill did not create a slip, trip, or fall hazard on walking-working surfaces. Similarly, employers may need to inspect outdoor workplaces after a major storm to ensure that walking-working surfaces are free from storm debris, downed power lines, and other related hazards.

The proposed rule specified that employers conduct ''periodic'' inspections, in addition to regular inspections. The purpose of the proposed requirement to conduct periodic inspections was to address specific workplace events, conditions, or situations that trigger slip, trip, or fall hazards not addressed by regular inspections, which are conducted at fixed times. However, OSHA believes that the language ''as necessary'' more accurately describes the purpose of the proposed requirement. Moreover, OSHA believes that the revised language clarifies when employers need to check walking-working surfaces and, thus, will enable employers to use their resources efficiently. Therefore, OSHA specified in final paragraph (d)(1) that employers must conduct inspections as necessary, in addition to regular inspections. Accordingly, employers must check the workplace when events, conditions, or situations arise that could put workers at risk of harm due to slips, trips, or falls, regardless of whether the workplace is due for a regular inspection. Thus, the final rule, as revised, fulfills the interpretation given to paragraph (d) in the proposal, that the employer ''ensure that inspections are conducted frequently enough so that hazards are corrected in a timely manner'' (75 FR 28862, 28875).

AFSCME recommended that § 1910.22 also require that employers perform a hazard assessment (Ex. 226). OSHA believes that requiring employers to inspect walking-working surfaces regularly and as necessary enables employers to determine the hazards that are present in those areas; therefore, additional language is not necessary.

NCSG objected to paragraph (d)(1)'s requirement that walking-working surfaces be maintained in a ''safe'' condition as again incorporating the General Duty Clause (Ex. 150). That is not OSHA's intent, and the Agency incorporates its response to the that objection, discussed in final paragraph (a)(3), here. The same hazards are addressed by final paragraphs (a)(3) and (d)(1); (a)(3) requires that the surface be maintained free of those hazards, while (d)(1) requires inspection for and correction of those hazards when found.

Final paragraph (d)(2) requires that employers correct or repair hazardous conditions on walking-working surfaces before allowing workers to use those surfaces again. The final rule also requires that if employers cannot fix the hazard immediately, they must guard the hazard to prevent workers from using the walking-working surface until they correct or repair it. Taking immediate corrective action or guarding the hazard is important for the safety of workers; delaying either action can put workers at risk of injury or death. OSHA notes that corrective action may include removal of the hazard.

When employers cannot fix the hazard immediately and need to guard the hazard area, the final rule gives employers flexibility in selecting the type of guarding to use (*e.g.,* erecting barricades, demarcating no-entry zones). However, whatever method employers use, they must ensure it is effective in preventing workers from accessing or using the surface.

NCSG contended that proposed paragraph (d)(2) is a redundant provision, since proposed paragraph (a)(3) would already contain language requiring that walking-working surfaces be free of hazards (Ex. 150).

OSHA disagrees. First, as discussed, OSHA revised final paragraph (a)(3) so it more clearly identifies examples of walking-working surface hazards that could cause slips, trips, and falls. For example, if employers do not maintain walking-working surfaces free of leaks and spills, workers could slip and fall and be seriously injured. Corrosion can weaken walking-working surfaces and render them unable to support loads placed on them. In addition, examples of walking-working surface hazards incorporated in final paragraph (a)(3), stress that final § 1910.22, like the existing rule, covers more than slip, trip, or fall hazards.

Second, OSHA does not believe final paragraphs (a)(3) and (d)(2) are redundant because they serve different purposes and objectives. The purpose of final paragraph (a)(3) is to ensure employers have procedures or programs in place to maintain walking-working surfaces so workers are not exposed to hazards that may cause injuries such as slips, trips, and falls. OSHA believes that if employers establish good housekeeping and maintenance procedures and programs they can prevent worker exposure to such hazards. However, even when employers establish rigorous housekeeping and maintenance programs, hazardous conditions may still arise. When they occur, final paragraph (d)(2) specifies what employers must do to correct or repair those hazards before they allow workers to use the surface.

Final paragraph (d)(3) requires that when any correction or repair involves the structural integrity of the walking-working surface, a qualified person must perform or supervise that correction or repair. For purposes of the final rule, OSHA defines a qualified person as ''a person who, by possession of a recognized degree, certificate, or professional standing, or who by extensive knowledge, training, and experience has successfully demonstrated the ability to solve or resolve problems relating to the subject matter, the work, or the project'' (see § 1910.21(b)). The definition in the final rule is the same as other OSHA standards (*e.g.,* §§ 1910.66, appendix C, Section I; 1910.269; 1915.35; 1926.32(l)).

Structural integrity generally addresses a structure's uncompromised ability to safely resist the loads placed on it. Deficiencies in the structural integrity of a walking-working surface can be extremely hazardous. OSHA believes corrections and repairs involving the structural integrity of a walking-working surface require the skill of a qualified person to ensure that affected surfaces are safe during and after repair or correction.

OSHA received three comments that raised concerns about the requirement in proposed paragraph (d)(3). Steven Smith of Verallia stated:

> The duty to inspect, to guard, or take out of use certain areas, and to require 'qualified persons' be present for all repairs is duplicative of other OSHA requirements and adds additional layers of procedure and cost to employers that are unduly burdensome and unnecessary (Ex. 171).

Robert Miller of Ameren Corporation said:

> Oft times repairs to facility equipment is performed by contractors and their employees or supervisors would be considered qualified. As [paragraph (d)(3)] reads, this may be interpreted to mean that the employer is responsible to staff qualified employees for all structural repairs to walking and working surfaces. Clarity of expectations needs to be taken into consideration in the final version (Ex. 189).

Charles Lankford commented:

> I believe it is excessive to ask of someone assigned to sand or scrape excessive rust off the metal treads of stairways and then paint them, to possess a degree or demonstrated 'extensive knowledge training, and experience' . . . . The more appropriate option here would be to require a qualified person for those applications where he/she is specifically required, and allow for a 'competent' person to apply his/her competency for the broad scope of tasks which he/she is well-suited to perform (Ex. 368).

OSHA believes the commenters have misinterpreted proposed paragraph (d)(3) as requiring qualified persons to conduct all correction and repair tasks. To the contrary, final paragraph (d)(3) is narrowly drawn. The final rule only requires that a qualified person perform or supervise the correction or repair of a walking-working surface if the correction or repair affects the structural integrity of the walking-working surface. If the correction or repair task does not rise to that level, the final rule does not require the employer to have a qualified person perform or supervise the task. Thus, using Mr. Lankford's example, final paragraph (d)(3) does not require employers to have a qualified person, as defined in this rule, perform or supervise sanding or scraping rust off of stairway treads. However, for example, a qualified person may have to perform or supervise welding a broken rung on a metal ladder.

To ensure that employers clearly understand the limited scope of final paragraph (d)(3), OSHA revised and reorganized the provision. For example, OSHA revised the language in the final rule to clarify that it only applies to repairs and corrections that affect the structural integrity of a walking-working surface, and not to the general maintenance of walking-working surfaces.

Mr. Smith generally commented that the requirements in proposed paragraph (d) were subjective and vague; however, he did not provide any explanation or examples to substantiate these comments (Ex. 171). OSHA disagrees with these comments. Pursuant to the OSH Act (29 U.S.C. 655(b)(5)), OSHA used performance-oriented language in paragraph (d) to provide employers with greater flexibility in complying with the requirements. As discussed above, OSHA also revised the language in paragraph (d) to provide greater clarity. In addition, this preamble explains in detail what employers must do to comply with the inspection, maintenance, and repair requirements in final paragraph (d).

Section 1910.23—Ladders

Final § 1910.23 revises and consolidates into one section the existing ladder requirements in §§ 1910.25 (Portable wooden ladders), 1910.26 (Portable metal ladders), 1910.27 (Fixed ladders), and 1910.29 (Mobile ladder stands and scaffolds (tower)). The final rule retains many of the existing requirements because OSHA believes they continue to provide an appropriate level of worker safety.

The final rule also updates and revises the existing OSHA general industry ladder rules to increase safety, clarity, consistency, and flexibility. To illustrate, the final rule revises the existing ladder requirements to make them consistent with OSHA's construction ladder standard (29 CFR 1926.1053). This action will make compliance easier for employers engaged in both general industry and construction operations.

Similarly, the final rule updates existing ladder requirements to make them consistent with current national consensus standards addressing ladders, including:

- American National Standards Institute (ANSI) A14.1–2007, American National Standard for Ladders—Wooden—Safety Requirements (A14.1–2007) (Ex. 376);
- ANSI A14.2–2007, American National Standard for Ladders—Portable Metal—Safety Requirements (A14.2–2007) (Ex. 377);
- ANSI A14.3–2008, American National Standard for Ladders—Fixed—Safety Requirements (A14.3–2008) (Ex. 378);
- ANSI A14.5–2007, American National Standard for Ladders—Portable Reinforced Plastic—Safety Requirements (A14.5–2007) (Ex. 391); and
- ANSI A14.7–2011, American National Standard for Mobile Ladder Stands and Mobile Ladder Stand Platforms (A14.7–2011) (Ex. 379).

Throughout the summary and explanation of final § 1910.23, OSHA identifies which provisions are consistent with these national consensus standards. OSHA believes this is important because national consensus standards represent accepted industry practices, and thus are technologically and economically feasible. Moreover, since most of those national consensus standards have been in place for years, OSHA believes that virtually all ladders this section covers that are manufactured today meet the requirements in those standards. As such, employers should not have problems complying with the requirements in the final rule that OSHA drew from those standards.

OSHA notes that final § 1910.23 incorporates a number of revisions to make the final rule easier for employers and workers to understand and follow. First, as mentioned, OSHA has consolidated all of the general industry ladder provisions into this section. Second, within this section, OSHA has consolidated into a single paragraph the general requirements that are common to, and apply to, all types of ladders. These revisions eliminate unnecessary repetition, and make the section easier to follow. The organization of the consolidated final ladder requirements is:

- Paragraph (a) Application—This paragraph specifies the types of ladders the final rule covers or exempts;
- Paragraph (b) General requirements for all ladders—This paragraph specifies the requirements that are common to, and apply to, all types of ladders the final rule covers;
- Paragraph (c) Portable ladders—This paragraph specifies the requirements that apply to portable ladders, including wood, metal, and fiberglass or composite material portable ladders;
- Paragraph (d) Fixed ladders—This paragraph covers the provisions that apply to fixed ladders, including individual-rung ladders; and
- Paragraph (e) Mobile ladder stands and mobile ladder stand platforms—This paragraph updates existing OSHA requirements for mobile ladder stands, and adds requirements for mobile ladder stand platforms.

Third, in the final rule OSHA revises existing provisions to make them performance-based, whenever appropriate. Performance-based language gives employers maximum flexibility to comply with the requirements in the final rule by using the measures that best fit the individual workplace.

Finally, when possible, OSHA drafted final § 1910.23 in plain language, which also makes the final rule easier to understand than the existing rules. For example, the final rule uses the term ''access'' instead of ''access and egress,'' which OSHA used in the existing and proposed rules. OSHA believes this revision makes the final rule easier to understand than the existing and proposed rules. Moreover, using ''access'' alone eliminates potential confusion since the term ''egress'' is often linked, and used interchangeably with, the term ''means of egress,'' or ''exit routes,'' which 29 CFR part 1910, subpart E (Exit Routes and Emergency Planning), addresses. The purpose of that subpart is to establish requirements that provide workers with safe means of exit from workplaces, particularly in emergencies. That subpart does not address access to, and egress from, walking-working surfaces to perform normal and regular work operations. OSHA notes this rulemaking on walking-working surfaces does not affect subpart E.

OSHA believes the need for the vast majority of the provisions in final § 1910.23 is well settled. Pursuant to section 6(a) of the OSH Act (29 U.S.C. 655(a)), OSHA adopted most of them in 1971 from existing national consensus standards. Furthermore, all of the ANSI ladder standards, with the exception of A14.7–2011, Mobile Ladder Stands, derive from the original A14, American National Standard Safety Code for Construction, Care, and Use of Ladders, which ANSI first adopted in 1923. ANSI also revised and updated those standards regularly since then to incorporate generally accepted industry best practices.

With the revision of OSHA's ladder requirements for general industry, OSHA also revised the ladder requirements in other general industry standards. For example, OSHA replaced the ladder requirements in 29 CFR 1910.268 (Telecommunications) with the requirement that ladders used in telecommunications meet the requirements in 29 CFR part 1910, subpart D, including § 1910.23.

Paragraph (a)—Application

Final paragraph (a), similar to the proposal, requires that employers ensure that each ladder used in general industry, except those ladders the final rule specifically excepts, meets the requirements in final § 1910.23. Final paragraph (a) consolidates and replaces the application requirements in each of the existing OSHA ladder rules with a uniform application provision applicable to all ladders; § 1910.21(b) defines ''ladder'' as ''a device with rungs, steps, or cleats used to gain access to a different elevation.''

Final paragraph (a) includes two exceptions. First, final paragraph (a)(1) specifies that § 1910.23 excepts ladders used in emergency operations such as firefighting, rescue, and tactical law enforcement operations or training for these operations. The proposed rule limited the exception to firefighting and rescue operations, but the final rule expanded that exception to cover all emergency operations and training, including tactical law enforcement operations. OSHA believes this exception is appropriate because of the exigent conditions under which emergency responders perform those operations and training.

OSHA based the expansion of the exception for all emergency operations in part on comments from David Parker, manager of the risk-management section for the Pima County (Tucson, AZ) Sheriff's Office and Public Risk Management Association (PRIMA) board member, which represents 1,500 public-sector members, including the following comment:

> [The impact of the proposed rulemaking on public entities] is particularly important in view of the fact that some of the requirements within the proposed [rule] may well be reasonable, necessary, cost effective and [technologically] feasible in common industrial environments. But they can create significant challenges and greater hazard when extended to certain public entity activities such as police tactical operations and training (Ex. 329, 01/20/2011, p. 7).

Mr. Parker also said that applying the ladder requirements to emergency operations, specifically law enforcement tactical situations, and their training exercises, was impractical because those operations require ladders designed for fast placement and access.

Second, final paragraph (a)(2), like the proposed rule, exempts ladders that are designed into or are an integral part of machines or equipment. OSHA notes this exemption applies to vehicles that the Department of Transportation (DOT) regulates (*e.g.,* commercial motor vehicles). In particular, the Federal Motor Carrier Safety Administration (FMCSA) regulates the design of ladders on commercial motor vehicles. Section 4(b)(1) of the Occupational Safety and Health Act of 1970 (OSH Act) (29 U.S.C. 653(b)(1)) specifies that OSHA regulations do not apply where another Federal Agency ''exercise[s] statutory authority to prescribe or enforce standards or regulations affecting occupational safety or health.''

Final paragraph (a)(2) is consistent with OSHA's ladder requirements for marine terminals (29 CFR 1917.118(a)(1)), which excepts ladders that are an integral part of transportation-carrier equipment (*e.g.,* cargo containers, highway carriers, railway cars).

The exceptions in final paragraph (a) differ from the exceptions in the existing OSHA ladder rules (*i.e.,* §§ 1910.25 (Portable wood ladders) and 1910.29 (Manually propelled mobile ladder stands and scaffold (towers))). Existing § 1910.25 notes that it does not specifically cover the following ladders: Other specialty ladders, fruitpicker's ladders, combination step and extension ladders, stockroom step ladders, aisle-way step ladders, shelf ladders, and library ladders. This final rule does not carry forward those exceptions. Thus, if an orchard ladder (formerly a fruitpicker's ladder) meets the definition of ladder in this final rule (*i.e.,* ''a device with rungs, steps, or cleats used to gain access to a different elevation'') and is used in general industry, the employer must ensure that it meets the requirements in the final rule. However, OSHA notes that the final rule does not apply to an orchard ladder used solely in agricultural activities covered by 29 CFR part 1928.

Existing § 1910.29(a) specifies that it does not cover ''aerial ladders;'' however, the existing rule does not define this term. Section 1910.67 (Vehicle-mounted elevating and rotating work platforms) defines ''aerial ladder'' as a ''device consisting of a single- or multiple-section extension ladder'' mounted on a vehicle (§ 1910.67(a)(2)). Although the final rule does not specifically except aerial ladders, OSHA believes that aerial ladders come within the exception for ladders designed into, or that are an integral part of, a machine or equipment, which includes vehicles.

OSHA did not receive any comments on paragraph (a) of the proposed rule and, therefore, adopted it as revised.

Paragraph (b)—General Requirements for All Ladders

Final paragraph (b), like the proposed rule, establishes general requirements that apply to all ladders this section covers, including wood, metal, and fiberglass or composite ladders, portable and fixed ladders, stepladders and stepstools, mobile ladder stands and mobile ladder stand platforms, and other ladders such as job-made ones. The final rule draws most of the provisions in this paragraph from the existing OSHA ladder standards for general industry and construction with the goal of making these standards consistent. OSHA also draws a number of provisions from the national consensus standards listed above.

Final paragraph (b)(1), like the proposed rule, requires that employers ensure ladder rungs, steps, and cleats are parallel, level, and uniformly spaced when the ladder is in position for use. The final provision is consistent with OSHA's other ladder requirements in general industry, marine terminals, longshoring, and construction (see §§ 1910.25(c)(2)(i)(B), 1910.27(b)(1)(ii), 1910.268(h)(2) and (6), 1917.118(d)(2)(i), 1917.119(b)(2), 1918.24(f)(2), 1926.1053(a)(2)). Final paragraph (b)(1) also is consistent with the ANSI ladder standards (A14.1–2007, Sections 6.2.1.2, 6.3.1.2, 6.4, and 6.5.4; A14.2–2007, Section 5.3; A14.3–2008, Sections 5.1.1, and 5.1.3(e); and A14.7–2011, Section 4.3.3). As mentioned, OSHA believes the need for this ladder requirement is well settled. Most of OSHA's existing ladder requirements include this provision, as do all of the ANSI ladder standards.

Final paragraph (b)(1) adds the word ''cleats,'' which is common terminology for a type of ladder cross-piece. OSHA added the term, which is interchangeable with ''rungs'' and ''steps,'' to make final paragraph (b)(1) consistent with other Agency ladder standards and national consensus standards. OSHA did not receive any comments on the proposed provision.

Final paragraphs (b)(2) and (3) establish requirements for spacing between rungs, steps, and cleats on different types of ladders. With the exception of ladders in elevator shafts, the final rule requires that employers measure spacing between the centerlines (midpoint) of the rungs, steps, or cleats. Measuring the spacing at the centerline of the rung, step, or cleat ensures that measurements are done consistently throughout the length of the ladder and variations between different steps are minimal.

Like the proposed rule, final paragraph (b)(2) requires that, except for ladders in elevator shafts and telecommunication towers, employers ensure ladder rungs, steps, and cleats are spaced not less than 10 inches and not more than 14 inches apart. OSHA drew the proposed and final requirement from its construction ladder standard (§ 1926.1053(a)(3)(i)), which OSHA updated in 1990 (55 FR 47660 (11/14/1990)). Final paragraph (b)(2) is consistent with OSHA standards that have flexible vertical-spacing requirements. For example, OSHA's Telecommunications standard at 29 CFR 1910.268 specifies that vertical spacing on fixed ladders on communication towers not exceed 18 inches (§ 1910.268(h)(2)), and vertical spacing of rungs on climbing devices be not less than 12 inches and not more than 16 inches apart (§ 1910.268(h)(6)). In addition, three maritime standards specify that rungs be spaced between 9 to 16.5 inches apart (§§ 1917.118(d)(2)(1); 1917.119(b)(2); 1918.24(f)(2)).

Final paragraph (b)(2) provides greater flexibility than ANSI's ladder standards, most of which require that vertical spacing be 12 inches (A14.1–2007, Sections 6.2.1.2 and 6.3.1.2; A14.2–2007, Section 5.3; and A14.3–2008, Section 5.1.1), but the A14.7–2011 standard incorporates flexible vertical spacing on mobile ladder stands by specifying that vertical spacing not exceed 10 inches (Section 4.3.3).

Although OSHA believes that both the final rule and existing OSHA and national consensus ladder standards provide adequate protection, the Agency also believes it is important that the final rule be consistent with the construction ladder requirements (§ 1926.1053). OSHA recognizes that some employers and workers perform both general industry and construction work. Increasing consistency between OSHA's general industry and construction standards will assist those employers and workers in complying with the OSHA requirements, and also will minimize the potential for confusion. In addition, providing greater flexibility will give employers more options to tailor ladders to specific work operations. There were no comments on the proposed provision.

The final rule, like the proposal, adds two exceptions to paragraph (b)(2). Final paragraph (b)(2)(i) specifies that employers must ensure rungs and steps on ladders in elevator shafts are spaced not less than 6 inches and not more than 16.5 inches apart, as measured along the ladder side rails.

Final paragraph (b)(2)(ii) specifies that employers ensure that vertical spacing on fixed ladder rungs and steps on telecommunication towers not exceed 18 inches, which is consistent with the existing requirement in OSHA's Telecommunications standard in § 1910.268(h)(2). Final paragraph (b)(2)(ii) also adds the phrase ''measured between the centerlines of the rungs or steps.'' This addition clarifies the provision, and makes it consistent with final paragraphs (b)(2) and (3), which also requires vertical spacing to be measured between rung or step centerlines. OSHA did not receive any comments on the proposed exceptions.

Final paragraph (b)(3), like the proposed rule, addresses vertical spacing for stepstool steps. The final rule requires that employers ensure stepstool steps are spaced not less than 8 inches, and not more than 12 inches, apart, as measured between centerlines of the steps. The final paragraph (b)(3) deleted the terms ''rungs'' and ''cleats'' from the proposal because stepstools do not have them.

OSHA proposed requirements for stepstools in recognition that employers use stepstools routinely in general industry. However, stepstools differ from stepladders and other portable ladders, and OSHA does not believe that some of the requirements applicable to stepladders are appropriate for stepstools. The final rule defines a stepstool as a self-supporting, portable ladder with flat steps and side rails that is designed so an employee can climb on all of the steps and the top cap. A stepstool is limited to those ladders that are not height adjustable, do not have a pail shelf, and do not exceed 32 inches (81 cm) in overall height to the top cap, except that side rails may continue above the top cap (§ 1910.21(b)).

Stepladders and other portable ladders, by contrast, do not have height limits, and the final rule requires that employers ensure workers do not stand on the top step or cap of those ladders.

OSHA drew final paragraph (b)(3) from its construction ladder standards (§ 1926.1053(a)(3)(ii)), and the final rule is consistent with the ANSI ladder standards that address stepstools (A14.1–2007, Section 6.5.4; and A14.2–2007, Section 6.6.4). These standards also address stepstools differently from step ladders and other portable ladders.

OSHA believes that employers should not have any difficulty complying with final paragraph (b)(3). The A14.1–2007 and A14.2–2007 standards have been available for years, so OSHA believes that almost all stepstools currently in use already meet the requirements in the final rule. OSHA did not receive any comments on proposed paragraph (b)(3).

Final paragraph (b)(4) consolidates OSHA's existing requirements on the minimum clear width for rungs, steps, and cleats on portable and fixed ladders (§§ 1910.25, 1910.26, 1910.27). The final rule requires employers to ensure that ladder rungs, steps, and cleats on portable and fixed ladders have a minimum ''clear width'' of 11.5 inches and 16 inches, respectively. ''Clear width'' is the space between ladder side rails, but does not include the width of the side rail. OSHA also incorporates as paragraph (b)(4) the proposed note informing employers that the clear width measurement on fixed ladders is done before installation of any ladder safety system.

Generally, the final rule is consistent with OSHA's existing ladder standards, notably OSHA's standards for portable wood ladders, fixed ladders, mobile ladder stands and platforms, and construction ladders (existing §§ 1910.25(c)(2)(i)(*c*)); 1910.27(b)(1)(iii); 1910.29; and current § 1926.1053(a)(4)). The final rule differs slightly from the existing rule for portable metal ladders, which required a minimum clear width of 12 inches (§ 1910.26(a)(2)(i)). However, the final rule will not require employers to take any action since the existing portable metal ladder rules already meet the minimum 11.5-inch clear-width requirement of the final rule. In addition, OSHA removed the term ''individual-rung ladder'' from final paragraph (b)(4) because these ladders are a type of fixed ladder and, therefore, do not need a separate listing.

The final rule also is consistent with the ANSI ladder standards (A14.1–2007, Sections 6.2.1.3, 6.3.2.4, 6.3.3.8, 6.3.4.3, 6.3.5.4, and 6.4.1.3; A14.2–2007, Sections 6.1.3, 6.2.1, and 6.2.2; and A14.3–2008, Section 5.1.2). Although the minimum clear widths in the ANSI standards differ depending on the type of portable or fixed ladder used, virtually all of these standards require the minimum clear width specified by the final rule.

Final paragraph (b)(4) contains four exceptions to the minimum clear-width requirement. First, final paragraph (b)(4)(i), like the proposal, includes an exception for ladders with narrow rungs that are not designed to be stepped on, such as those located on the tapered end of orchard ladders and similar ladders. This exception recognizes that manufacturers did not design the narrow rungs at the tapered end of the ladder to be foot holds, but rather designed them to allow the worker to establish the best work position. For example, tapered ladders allow workers to safely position the ladder for activities such as pruning tree branches. Since workers will not use the narrow rungs on the tapered end of orchard and other similar ladders for stepping, OSHA believes that it is not necessary to apply the clear width requirements in the final rule to the narrow rungs on these ladders. However, OSHA stresses that the exception only applies to the narrow rungs on the tapered end; the remainder of the ladder rungs where workers may step must meet the requirements in the final rule. Moreover, employers are responsible for ensuring that workers do not step on the narrow rungs.

Second, final paragraph (b)(4)(ii) retains the proposed rule's exception for portable manhole entry ladders supported by manhole openings. The final rule only requires that the rungs and steps of those ladders have a minimum clear width of 9 inches. Southern New England Telephone Co. said the revision was necessary because the ladder supported at the manhole opening reduces clearance for workers climbing through the manhole opening (Ex. OSHA–S041–2006–0666–0785). The commenter also said that using a narrower ladder provides more space for workers to negotiate the manhole opening, which makes it less likely that space restrictions could cause the worker to fall.

Third, final paragraph (b)(4)(iii), like the proposal, incorporates the exception in OSHA's Telecommunications rule (§ 1910.268(h)(5)) for rolling ladders used in telecommunications centers. That standard only requires that rungs and steps on rolling ladders used in telecommunication centers have a minimum clear width of 8 inches. OSHA notes that the final rule deletes the existing requirements in § 1910.268(h), and specifies that ladders used in telecommunications must meet the requirements in revised subpart D.

Final paragraph (b)(4)(iv) is a new requirement that addresses the minimum clear width for stepstools, which OSHA defines as a type of portable ladder (§ 1910.21(b)). The final rule specifies that stepstools must have a minimum clear width of at least 10.5 inches instead of the 11.5-inch minimum clear width that the final rule requires for other portable ladders. Although OSHA did not receive any comments on this issue, in accordance with section 6(b)(8) of the OSH Act (29 U.S.C. 655(b)(8)), the Agency added this provision to make the rule consistent with ANSI/ALI national consensus standards for wood and metal portable ladders (A14.1–2007 and A14.2–2007).

As mentioned above, final paragraph (b)(4) incorporates into this provision the language from a note in the proposal specifying the minimum clear width on fixed ladders is to be measured before installing ladder safety systems. OSHA included the information to help employers understand how OSHA measures clear width on fixed ladders for compliance purposes and has determined that the information may better serve employers in the actual provision, instead of in a note. OSHA did not receive any comments on the proposed provision.

Final paragraph (b)(5), like the proposal, adds a new requirement that employers ensure wooden ladders are not coated with any material that may obscure structural defects. Such defects, if hidden by coating or paint, could injure or kill workers if the defected ladder they step on breaks or collapses. OSHA drew the final rule from its construction ladder standard, which prohibits coating wood ladders with any ''opaque covering'' (§ 1926.1053(a)(12)), but adds language identifying the hazard that the provision will prevent (*i.e.,* workers using defective ladders with obscured ''structural defects''). The final rule is consistent with A14.1–2007, which specifies that wood ladders may have transparent, non-conductive finishes (*e.g.,* shellac, varnish, clear preservative) but not with opaque finishes (see A14.1–2007, Section 8.4.6.3). The A14.3–2008 standard includes the same requirement for fixed wood ladders (Section 9.3.8). OSHA believes that A14.1–2007 and A14.3–2008 provide helpful examples of the types of coatings that the final rule prohibits. OSHA did not receive any comments on the proposed provision.

Final paragraph (b)(5) does not carry forward the language in the construction and ANSI ladder standards that allows identification or warning labels to be placed on one face of the side rails. OSHA does not believe the language is necessary for two reasons. First, for purposes of final paragraph (b)(5), OSHA does not consider manufacturer-applied warning and information labels to be ''coatings,'' therefore, final paragraph (b)(5) does not prohibit placing labels on one side of side rails. Second, OSHA believes that the requirements in final paragraph (b)(9) to inspect ladders before initial use each workshift to identify defects, and the requirement in final paragraph (b)(10) to remove defective ladders from service, will ensure that employers do not use ladders with structural defects, even structural defects covered up by labels placed on the face of side rails. OSHA did not receive any comments on the proposed provision.

Final paragraph (b)(6) requires that employers ensure metal ladders are made with corrosion-resistant material or are protected against corrosion. For example, metal ladders coated or treated with material that resists corrosion will meet this requirement. Alternatively, employers may use metal ladders made with material that is inherently corrosion-resistant, such as aluminum. OSHA believes this provision is necessary to protect workers because rusty metal ladders can become weak or fragile, and can break when a worker steps on them. To illustrate, untreated metal ladders exposed to certain acids may experience chemical corrosion that could reduce the strength of the metal.

Final paragraph (b)(6) carries forward the language in OSHA's existing portable metal ladders standard (§ 1910.26(a)(1)), and is consistent with a similar provision in the existing fixed ladder standard (§ 1910.27(b)(7)(i)). The final rule also retains the language in the existing rule that employers do not have to protect metal ladders that are inherently corrosion resistant. In the proposed rule, OSHA preliminarily determined that this language was not necessary because ladders ''protected against corrosion'' included ladders made of inherently corrosion-resistant material. However, upon further analysis, OSHA believes that retaining the existing language (§ 1910.26(a)(i)) makes the final rule clearer and better reflects the purpose of this provision.

OSHA did not receive any comments on the proposed provision.

Final paragraph (b)(7), like the proposed rule, specifies that employers must ensure ladder surfaces are free of puncture and laceration hazards. Workers can suffer cuts and puncture wounds if a ladder has sharp edges or projections, splinters, or burrs. The final rule consolidates and simplifies OSHA's existing ladder requirements addressing puncture and laceration hazards (see §§ 1910.25(b)(1)(i) and (c)(2)(i)(f); 1910.26(a)(1) and (a)(3)(viii); and 1910.27(b)(1)(iv) and (b)(2)). Although final § 1910.22(a)(3) contains a similar general requirement, OSHA believes it is important to include language in final paragraph (b)(7) to emphasize the need to keep ladders free of such hazards to prevent injuries and falls. For example, a worker's instantaneous reaction to getting cut on a sharp projection could be to release his or her grip on the ladder, which could cause the worker to fall. OSHA did not receive any comments on the proposed provision.

Final paragraph (b)(8), like the proposed rule, requires that employers ensure ladders are used only for the purposes for which they were designed. OSHA believes, as the ANSI standards states, that ''[p]roper use of [ladders] will contribute significantly to safety'' (A14.1–2007, Section 8.1.5; A14.2–2007, Section 8.1.5; and A14.3–2008, Section 9.1.2). Improper use of a ladder can cause workers to fall.

Final paragraph (b)(8) revises the existing general industry ladder rules. Using performance-based language, final paragraph (b)(8) consolidates the existing general industry requirements on permitted and prohibited uses of ladders (§§ 1910.25(d)(2) and 1910.26(c)(3)(vii)). Those standards specify a number of uses that are clearly unsafe and, thus, prohibited, such as using ladders for scaffold planks, platforms, gangways, material hoists, braces, or gin poles. However, the existing rules do not, and could not, provide an exhaustive list of all unsafe uses. For example, the existing rules do not specifically prohibit self-supporting portable metal ladders to be used as a scaffold plank support system, yet such practices are clearly dangerous and an improper use of ladders. Therefore, final paragraph (b)(8) revises the existing rules to specify how employers must use ladders, instead of specifying a longer, but still incomplete, list of prohibitions. OSHA's approach to final paragraph (b)(8) is consistent with A14.3–2008, which states, ''The guidelines discussed in this section do not constitute every proper or improper procedure for the maintenance and use of ladders (Section 9.1.1.).'' Accordingly, the prohibited uses listed in the existing rules continue to be improper procedures for the use of ladders, which this final rule continues to prohibit.

Final paragraph (b)(8) is virtually identical to OSHA's construction ladder standard (§ 1926.1053(b)(4)), and is consistent with the ANSI ladder standards (A14.1–2007, Section 8.3; A14.2–2007, Section 8.3; and A14.3–2008, Section 9.1.2). Final paragraph (b)(8) does not carry forward the language in existing § 1910.26(c)(3)(vii), which prohibits employers from using ladders for certain purposes ''unless specifically recommended for use by the manufacturer.'' OSHA believes that requiring employers to use ladders ''only for the purposes for which they were *designed* [emphasis added]'' achieves the same purpose. In addition, the revised language in the final rule ensures that the revised requirement also covers job-made ladders the employer designs. OSHA did not receive any comments on the proposed provision.

Final paragraph (b)(9) requires that employers ensure ladders are inspected before initial use in each work shift, as well as more frequently as necessary. The purpose of this inspection is to identify visible defects that could affect the safe use and condition of the ladder and remove unsafe and damaged ladders from service before a worker is hurt. Employers may accomplish the visual inspection as part of the worker's regular procedures at the start of the work shift. The final rule differs in two respects from the existing and proposed standards. First, the final rule states more explicitly than the existing and proposed rules when the inspection of each ladder must be done: before using the ladder for the first time in a work shift. Two of OSHA's existing general industry rules require that employers inspect ladders ''frequently'' and ''regularly'' (§§ 1910.25(d)(1)(x) and 1910.27(f)). OSHA's construction ladder standard requires employers to inspect ladders ''on a periodic basis'' (§ 1926.1053(b)(15)).

In the proposed rule, OSHA sought to clarify the frequency of ladder inspections. OSHA drew on the language in its longshoring ladder standard (§ 1918.24(i)(2)) and A14.1–2007 and A14.2–2007. OSHA's longshoring standard requires that employers inspect ladders ''before each day's use'' (§ 1918.24(i)(2)), and the ANSI standards require that employers inspect ladders periodically, ''preferably before each use'' (A14.1–2007, Section 8.4.1.; and A14.2–2007, Section 8.4.1). Based on those standards, OSHA proposed that employers inspect ladders ''before use.'' OSHA intended the proposed language to mean that employers must ensure ladders are inspected before workers use them for the first time during a work shift. OSHA believes the language in final paragraph (b)(9) more clearly and directly states the Agency's intention.

Second, final paragraph (b)(9) adds language specifying that, in addition to inspecting ladders before they are used for the first time during the work shift, employers also must inspect ladders ''as necessary'' to identify defects or damage that may occur during a work shift after the initial check. OSHA believes that situations may arise or occur during a work shift that necessitate employers conducting additional inspections of ladders to ensure that they continue to remain safe for workers to use. For example, if a ladder tips over, falls off a structure (*e.g.,* roof) or vehicle, is struck by an object (*e.g.,* vehicle or machine), or used in a corrosive environment, it needs to be inspected to ensure damage has not occurred and the ladder is still safe to use. The final rule is consistent with the existing requirement for portable metal ladders § 1910.26(c)(2)(vi), which specifies that employers must inspect ladders ''immediately'' if they tip over or are exposed to oil or grease. Similarly, OSHA's marine terminal and longshoring standards require that employers inspect ladders ''after any occurrence, such as a fall, which could damage the ladder'' (29 CFR 1917.119(e)(2) and 1918.24(i)(2)). OSHA believes the addition to final paragraph (b)(9) will help employers implement a proactive approach that ensures ladders are safe at the start of, and throughout, each work shift. The final rule better articulates OSHA's intent in the proposal for the frequency of inspections. (See 75 FR 28876, noting that workers need not inspect ladders multiple times per shift ''unless there is a reason to believe the ladder has been damaged due to an event such as being dropped.'')

Final paragraph (b)(9) provides employers with flexibility to tailor ladder inspections to the situations requiring them. For example, inspections conducted at the start of the work shift may include checking the ladder to ensure the footing is firm and stable, engaging spreader or locking devices to see if they work, and identifying whether there are missing or damaged components. If a ladder tips over, the employer may focus the inspection on identifying whether footing problems may have caused the tip-over or examining whether rungs are still firmly attached. On the other hand, the existing rule does not provide this flexibility and requires that all inspections conducted after a tip over must include the following:

- Side rails for dents or bends;
- Rungs for excessive dents;
- All rung-to-side-rail connections;
- Hardware connections; and
- Rivets for shear (existing § 1910.26(c)(2)(vi)(a)).

OSHA believes this list of inspection procedures may be both over-inclusive and under-inclusive. For example, the existing rule does not specify that the inspection cover the ladder footing. OSHA believes that using performance-based language will allow employers to determine the scope of the inspection that may be necessary.

Finally, OSHA notes that the revisions simplifying final paragraphs (b)(8) and (9) are consistent with the goals of the Plain Language Act of 2010. OSHA did not receive any comments on these proposed provisions.

Final paragraph (b)(10), which is almost identical to the proposed rule, requires that employers immediately tag ladders with structural or other defects ''Dangerous: Do Not Use'' or similar language that is in accordance with § 1910.145. In addition, final paragraph (b)(10) requires that employers remove defective ladders from service until the employer repairs them in accordance with § 1910.22(d) or replaces them. Final § 1910.22(d)(2) contains a general requirement that employers correct, repair, or guard against ''hazardous conditions on walking-working surface surfaces,'' including ladders. However, OSHA believes it is important to also include a specific requirement in this section because falling from a defective ladder could seriously injure or kill workers. Final paragraph (b)(10) clearly instructs employers of the minimum procedures (*i.e.,* tagging, removing, and repairing or replacing) that they must take when an inspection reveals a ladder to be defective. Final paragraph (b)(10), like final § 1910.22(d)(2), is a companion, and logical extension, to the requirements that employers maintain walking-working surfaces, including ladders, in a safe and serviceable condition, and inspect them as required (§§ 1910.22(d)(1); 1910.23(b)(9)).

Final paragraph (b)(10) is a performance-based consolidation of the existing general industry, maritime, and construction requirements (§§ 1910.25(d)(1)(iii), (d)(1)(x), and (d)(2)(viii); 1910.26(c)(2)(vii); 1915.72(a)(1); 1917.119(e)(1); 1918.24(i)(1); and 1926.1053(b)(16)). Some of these standards are similar to the final rule, while other standards specify particular ladder defects that necessitate removing the ladder from service. For example, the construction ladder standard requires removal of ladders that have defects such as broken or missing rungs, cleats, or steps; broken rails; or corroded ladder components (§ 1926.1053(b)(16)), and the existing general industry portable wood ladders standard requires employers to replace frayed rope (§ 1910.25(d)(i)(iii)). The final rule simplifies the existing requirements by specifying that employers remove ladders that have ''structural or other defects.'' OSHA believes this approach will make the final rule easier to understand. As noted above, the defects listed in the existing rules in §§ 1910.25(d)(2)(viii) and 1910.26(c)(2)(vii)) continue to warrant removal of the ladder from service.

Final paragraph (b)(10) retains the key signal warning word ''Dangerous'' in existing § 1910.25(d)(1)(x). OSHA proposed to remove the word from the regulatory text and include it in guidance material. After further analysis, OSHA believes that retaining the signal word is necessary to get workers' attention to provide them with basic information that a hazard exists and they must not use the ladder. OSHA did not receive any comments on proposed paragraph (b)(10).

Final paragraphs (b)(11), (12), and (13), like the proposed rule, are companion provisions that establish safe work practices for climbing ladders. The final paragraphs are almost identical to OSHA's construction ladder standard (*see* § 1926.1053(b)(20), (21), and (22)). OSHA notes that final paragraphs (b)(11), (12), and (13) apply to all ladders this section covers, including mobile ladder stands and mobile ladder stand platforms.

Final paragraph (b)(11), like the existing (§ 1910.26(c)(3)(v)) and proposed rules, requires that employers ensure workers face the ladder when climbing up and down it. The final rule also is almost identical to OSHA's construction ladder standard (§ 1926.1053(b)(20)) and the ANSI ladder standards (A14.1–2007, Section 8.3.7; A14.2–2007, Section 8.3.7; and A14.3–2008, Section 9.2.1). Facing the ladder while climbing ensures that workers are able to maintain a firm grip on the ladder and also identify possible defects before climbing any higher. Accordingly, workers are to face the steps, not away from them, when climbing up and down mobile units.

To make final paragraph (b)(11) easier to understand, OSHA replaced the existing and proposed language ''ascending or descending'' with plain language: Climbing up and down. This revision is consistent with general comments recommending that OSHA make the final rule easier to read and understand (Exs. 53; 175). OSHA did not receive any comments on the proposed provision.

Final paragraph (b)(12), like the proposed rule, adds a new provision requiring that employers ensure workers use ''at least one hand to grasp the ladder at all times when climbing up and down it.'' [19] As stated in the proposal, the intent of this provision is for employers to ensure their workers maintain ''three-point contact'' (*i.e.,* three points of control) with the ladder at all times while climbing. The A14.3–2008 standard requires three-point contact and defines the term as consisting of ''two feet and one hand or two hands and one foot which is safely supporting users weight when ascending/descending a ladder'' (Section 9.2.1). OSHA drew final paragraph (b)(12) from its construction ladder standard (§ 1926.1053(b)(21)). The final provision also is consistent with ANSI ladder standards.

The final rule requires that employees ''grasp'' the ladder with at least one hand when climbing, which is equivalent to the requirement in A14.1–2007 and A14.2–2007 to ''maintain a firm hold on the ladder'' (A14.1–2007, Section 8.3.7.; A14.2–2007, Section 8.3.7). At the hearing, Ellis explained the importance of maintaining a firm grasp on the ladder at all times, ''[F]alls happen very suddenly and unless you have your hand on something or your foot on something that's horizontal and flat or round * * * you're going to be surprised. And once you get to a few inches away the speed of the fall is such you can't reach—you can't grab, that's why you can't stop a fall'' (Ex. 329 (1/21/2011), p.277). Many stakeholders said employers already train workers to use three-point contact when climbing ladders (*e.g.,* Exs. 148; 158; 181).

NCSG contended that an employer can comply with this requirement if its employees slide one hand along the rail of the ladder while climbing so that the other hand is free to carry an object (Ex. 150). It claimed that merely maintaining ''contact'' between the hand and the ladder at all times was sufficient (see Ex. 329 (1/18/2011), p. 289). OSHA does not agree that this technique is grasping the ladder within the meaning of paragraph (b)(12). It is important that a climber have a firm hold on the ladder

[19] OSHA notes paragraph (b)(12) pertains only to the process of climbing up and down the ladder, not working on the ladder once the worker reaches the correct level.

with at least one hand to help ensure that the climber maintains his or her balance. Moreover, as Ellis noted, when a climber starts to lose balance, the climber needs ''the grip available to stabilize the body'' (Ex. 329 (1/21/2011), p. 275–76). OSHA notes that it rejected NCSG's ''sliding hand'' technique as unsafe when it adopted the construction standard; in fact, the construction standard uses the term ''grasp'' precisely because OSHA intended to forbid the practice (55 FR 47682).

OSHA notes that the requirement that a worker maintain a firm grasp of the ladder with at least one hand at all times while climbing does not prohibit workers from carrying certain objects while they climb. However, any object a worker does carry must be of a size and shape that still allows the worker to firmly grasp the ladder with that hand while climbing.

OSHA received one comment on proposed paragraph (b)(12). Ellis Fall Safety Solutions (Ex. 344) recommended OSHA require that workers hold onto horizontal rungs and not side rails or ladder extensions. Ellis submitted a study showing that climbers cannot hold onto side rails or ladder extensions effectively if they begin to fall off the ladder. OSHA agrees with Ellis that grasping the ladder on horizontal rungs is preferable and encourages employers to follow this practice. However, OSHA also recognizes there may be times when it is necessary for employees to hold the side rails. OSHA is not aware of any reports that holding the side rails of ladders creates a problem when workers maintain three points of contact while climbing. In addition, OSHA notes that neither the construction ladder standard (§ 1926.1053(b)(21)) nor the ANSI/ALI consensus standards (A14.1–2007 and A14.2–2007) prohibit workers from holding onto ladder side rails while climbing.

Final paragraph (b)(13), like the proposed and construction ladder rules (§ 1926.1053(b)(22)), requires that employers ensure workers climbing ladders do not carry any objects or loads that could cause them to lose their balance and fall. As OSHA stated in the preamble to the construction ladder standard, the purpose of this provision is to emphasize the importance of proper and careful use of ladders when workers need to carry items to and from work spaces:

> It is OSHA's belief that the employee's focus and attention while climbing up and/or down a ladder should be on making a safe ascent or descent and not on transporting items up and down the ladder (55 FR 47682).

As explained above, neither the final rule nor the construction ladder standard prohibit workers from carrying an object while climbing a ladder. The final rule allows workers to carry an object, provided they:

- Face the ladder while climbing (final paragraph (b)(11));
- Grasp the ladder with at least one hand at all times when climbing up and down the ladder, which will ensure workers maintain at least three points of contact (final paragraph (b)(12)); and
- Do not carry an object(s) that could cause them to lose their balance and fall (final paragraph (b)(13)).

Similarly, in the preamble to the construction ladder standard, OSHA said:

> Although OSHA believes that small items such as hammers, pliers, measuring tapes, nails, paint brushes, and similar items should be carried in pouches, holsters, or belt loops, the language in the final rule would not preclude an employee from carrying such items while climbing a ladder so long as the items don't impede the employee's ability to maintain full control while climbing or descending the ladder (55 FR 47682).

Under both the final and construction rules, employers are responsible for ensuring that workers are able to maintain full control and balance while they are climbing. Employers also must ensure that carrying an object does not impede workers' control and balance, such as struggling to maintain their control or balance on the ladder. To that end, employers need to evaluate whether the weight and size of tools and other items workers use for jobs are such that workers can maintain their balance and grasp on the ladder while carrying the item in that hand or whether workers need to use other methods to get the items to the roof safely, such as using backpacks, making multiple climbs, or lifting items attached to ropes. NCSG said their members conduct evaluations (*i.e.,* hazard assessments) at each job site, which include whether workers ''can . . . safely access the roof with ladders'' (Ex. 329 (1/18/2011), p. 276).

Employers also need to ensure workers know what items they can and cannot carry while climbing ladders. NCSG agreed, saying they train workers so they ''understand what items they are permitted to carry and how they should be carried so that they maintain a stable position while ascending and descending the ladder(s)'' (Ex. 150). For example, OSHA does not believe workers can maintain the required balance and control if they must carry a heavy or bulky object in one hand while climbing.

NCSG raised several objections to proposed paragraphs (b)(12) and (13). NCSG said the requirements ''would make it technically and economically infeasible for [chimney] sweeps to perform their work'' because it would be impossible for workers to get items up to the roof if they cannot carry them in one hand and slide their other hand up the ladder rail while climbing (Ex. 150). OSHA does not believe the record supports NCSG's infeasibility contentions.

First, as stated above, final paragraphs (b)(12) and (13) do not prohibit workers from carrying an item when they climb a ladder. Workers can carry an object while climbing a ladder, provided they also can grasp the ladder with that hand during the climb. Some of the objects NCSG said their members carry are small enough that it would be possible for workers to hold them and grasp the ladder with the same hand.

Second, even if a worker cannot carry a particular object and still maintain a firm grasp on the ladder with that hand, there are a variety of other methods they can use to transport the object(s) to the roof and still allow the worker to firmly grasp the ladder with their hands. According to NCSG, member companies already use them. For example, NCSG said workers get tools and equipment, such as flashlights, mirrors, screwdrivers, wrenches, cameras, tape measures, and cleaning rods and brushes, up to the roof using backpacks, tool belts, and quivers (Ex. 150). For one story homes, NCSG said workers lean roof hook ladders against the eaves and pull the ladder up once they have climbed up on the roof (Ex. 329 (1/18/2011), p. 342).

If the job is a major repair (*e.g.,* relining or rebuilding chimneys), which according to NCSG accounts for 20 to 25 percent of chimney sweep work, employers use scaffolds or aerial lifts (Ex. 329 (1/18/2011), p. 327). According to NCSG, not only do scaffolds allow employers to get materials to the roof without carrying them on a portable ladder, they provide workers with ''a nice flat platform to stand on'' (Ex. 329 (1/18/2011), p. 325).

OSHA believes that chimney sweep companies also can use handlines and ropes to pull heavy or bulky items up on the roof. OSHA believes this method will work particularly well for getting chimney caps and roof hook ladders to the roof, both of which NCSG said do not fit into backpacks. Pulling up materials to the roof is a common practice in the construction industry. In the preamble to the construction ladder standard, OSHA said workers take ''large or heavy'' items to the roof by ''pull[ing] the object up or lower[ing] it with a handline'' (55 FR 47682). NCSG, however, said that ''it is unlikely [lifting items to the roof with a handline] can be done without risking damage to the home or [item].'' NCSG did not explain or provide any evidence to support their claim. In addition, NCSG did not provide any evidence that it is not possible to prevent damage by using appropriate techniques or padding. OSHA has not received any reports and is not aware of any problems in the construction industry using handlines to pull up items to residential or commercial roofs.

NCSG claimed that using handlines to lift items to roofs would be ''economically infeasible'' because it could not be done without the assistance of a second person, which they claim would increase job costs by about 30 percent. OSHA finds this claim unsupported by the record. NCSG did not explain or provide evidence about why a second worker would be necessary in such instances. In addition, NCSG did not provide any support for its claim that costs would increase by 30 percent.

Finally, NCSG contended that complying with final paragraphs (b)(12) and (13) would create a greater hazard for workers than allowing them to carrying objects up ladders with one hand while sliding the other hand up the ladder rails (Ex. 150). In particular, they said that attaching work tools and other items to a rope and lifting them to the roof would create a greater fall hazard because workers must be ''right at the roof's edge to keep the item in view and lift it onto the roof'' (Ex. 150). To establish that an OSHA standard creates a greater hazard an employer must prove, among other things, that the hazards of complying with the standard are greater than those of not complying, and alternative means of employee protection are not available (*Bancker Construction Corp.,* v. *Reich,* 31 F.2d 32, 34 (2d Cir. 1994); *Dole* v. *Williams Enterprises, Inc.,* 876 F.2d 186, 188 (D.C. Cir. 1989)).

NCSG has not provided any evidence to establish that complying with final paragraphs (b)(12) and (13) or using other methods to get objects up to the roof is more dangerous than allowing employees to carry objects, regardless of their weight and size, in one hand while sliding the other hand up ladder rails while they climb the ladders. In fact, an NCSG witness testified that the greatest fall hazard is the ''ladder-to-roof transition'' (Ex. 329 (1/18/2011), p. 333). The transition is made even more hazardous if workers are carrying heavy or bulky objects in one hand and trying to get onto the roof by sliding the other hand along the ladder rail.

NCSG also maintained that pulling items up to the roof with handlines would require workers to be at the roof's edge, where they will be at risk of falling. NCSG did not provide any evidence to support that claim. OSHA notes that the final rule requires workers to use fall protection while working at the edge of a roof.

Finally, although NCSG said they were ''not aware of any feasible alternatives to carrying items in one hand and sliding the other hand up the ladder rail, NCSG identified several alternatives that they currently are using. NCSG said workers put tools and other items in backpacks, tool belts, and quivers so they can climb ladders with both hands free, instead of carrying the objects in their hands (Ex. 150). With the exception of roof hook ladders and chimney caps, NCSG said they are able to get all items up to the roof in backpacks, tool belts, and quivers. OSHA also believes that handlines and ropes are feasible to safely lift chimney caps and roof hook ladders.

Paragraph (c)—Portable Ladders

Final paragraph (c), like the proposed rule, sets forth requirements for portable ladders. The requirements in final paragraph (c) are in addition to the requirements in final paragraph (b) that apply to all ladders this section covers. The final rule defines ''portable ladder'' as a ladder that can be readily moved or carried, and usually consists of side rails joined at intervals by steps, rungs, or cleats (§ 1910.21(b)).

To further OSHA's goal of making the final rule clearer and easier to read, final paragraph (c) replaces existing detailed design and construction specifications with more flexible performance-based language. By doing so, OSHA was able to make other revisions that will increase employers' and workers' understanding of the final rule. First, using performance-based language allowed OSHA to combine the existing requirements for portable wood (existing § 1910.25) and portable metal ladders (existing § 1910.26), thereby eliminating unnecessary repetition. Second, it allowed OSHA to remove the exceptions in existing § 1910.25(a) for ''special'' types of ladders, including orchard ladders, stock room step ladders, and library ladders. Final paragraph (c) covers all of those ladders to the extent that employers use them in general industry operations. Finally, it also allows OSHA to remove the separate requirements for certain types of portable ladders such as painter's stepladders, mason's ladders, and trolley and side-rolling ladders.

Final paragraph (c)(1), like the existing and proposed rules, requires that employers minimize slipping hazards on portable metal ladders. Accordingly, the final rule specifies that employers must ensure rungs and steps of portable metal ladders are corrugated, knurled, dimpled, coated with skid-resistant material, or otherwise treated to minimize the possibility of slipping. Final paragraph (c)(1) is the same as OSHA's construction ladder standard (§ 1926.1053(a)(6)(ii)), and is consistent with A14.2–2007 (Section 5.5). Ellis (Ex. 155) supported skid-resistance on ladder steps. There were no opposing comments on the provision.

Final paragraph (c)(2), like the proposal, retains existing requirements (§§ 1910.25(c)(2)(i)(*f*) and 1910.26(a)(3)(viii)) that employers ensure each stepladder, or combination ladder used in a stepladder mode, is equipped with a metal spreader or locking device. The final rule also requires that the spreader or locking device securely holds the front and back sections of the ladder in an open position while the ladder is in use. The term ''stepladder mode'' as used in final paragraph (c)(2) means that the configuration of the combination ladder is such that the ladder is self-supporting and functions as stepladder.

The OSHA construction ladder standard also requires that stepladders have spreaders or locking devices (§ 1926.1053(a)(8)). In addition, the A14.1–2007 and A14.2–2007 standards require spreaders or locking devices for stepladders, and A14.2–2007 requires that combination ladders and trestle ladders also have those devices (A14.1–2007, Section 6.2.1.6; and A14.2–2007, Sections 6.1.9, 6.5.8, 6.6.8). The proposed rule would have required that stepladders be ''designed'' with spreaders or locking devices; the final rule clarifies that the stepladder must be ''equipped'' with those devices when used by an employee.

Final paragraph (c)(2) does not retain language in the existing rules requiring that employers remove or cover sharp points or edges on spreaders (§§ 1910.25(c)(2)(i)(*f*) and 1910.26(a)(3)(viii)). OSHA believes that final § 1910.23(b)(7), which requires employers to ensure ladder surfaces are free of puncture and laceration hazards adequately addresses that issue. Thus, OSHA believes that it is not necessary to repeat that requirement in final paragraph (c)(2). OSHA did not receive any comments on the proposed deletion.

Final paragraph (c)(3) requires that employers not load portable ladders beyond their maximum intended load. A note to final paragraph (c)(3) reminds employers that maximum intended load includes the weight and force of workers and the tools, equipment, and materials workers are carrying, which is consistent with the definition of ''maximum intended load'' in final § 1910.21(b).

The final rule differs from both the existing and proposed rules. The existing rule requires that portable ladders be capable of withstanding a 200-pound load. In the proposed rule, OSHA required that employers ensure that the weight on portable ladders not exceed the weight ''for which they were designed and tested, or beyond the manufacturer's rated capacity.''

After further analysis, OSHA removed the proposed language from final paragraph (c)(3) for the following reasons. First, OSHA believes that requiring employers to ensure each ladder supports its maximum intended load is comprehensive, and the additional language in the proposed rule is not necessary. OSHA believes that the language in the ''maximum intended load'' definition (*i.e.,* ''loads reasonably anticipated to be applied to a walking-working surface'') will ensure that the load on a ladder will not exceed the weight for which the ladder was designed or tested, or the manufacturer's rated capacity.

Second, removing the additional language in the proposal makes final paragraph (c)(3) consistent with final § 1910.22(b), and easier to understand. Third, OSHA believes that including the proposed language ''manufacturer's rated capacity'' in the final rule may cause confusion about whether the provision applies to both job-made ladders and manufactured ones. The language in the final standard clearly reads that the requirement applies to all types of portable ladders.

OSHA notes that, unlike the performance-based language in final paragraph (c)(3), the construction ladder standard requires that portable ladders meet specific load requirements (§ 1926.1053(a)(1)). As discussed above, one of the goals of this rulemaking is to make the final rule consistent with the construction standard. Accordingly, OSHA will consider employers who ensure their portable ladders meet the load requirements in § 1926.1053(a)(1) as being in compliance with final paragraph (c)(3). OSHA did not receive any comments on the proposed provision and finalizes the provision as discussed.

Final paragraph (c)(4), like the proposed rule, requires that employers ensure portable ladders are used only on stable and level surfaces unless they are secured or stabilized to prevent accidental displacement. When the footing of ladders is not stable or level and the ladder is not secure, the ladder can slip out of place or tip over because of workplace activities, traffic, and weather conditions (*e.g.,* high winds). According to the A14.1–2007 standard, lack of stability and sliding of the ladder are the major causes of falls from self-supporting ladders, while lateral sliding at the top of the ladder and outward sliding of the ladder at the lower base support are major causes of falls from non-self-supporting portable ladders (A14.1–2007, Section 8.1.3).

The final rule consolidates and revises the existing portable ladder rules, which requires placing portable ladders so they have ''secure footing'' (§§ 1910.25(d)(2)(iii) and 1910.26(c)(3)(iii)). The final rule further clarifies that employers can ensure secure footing for portable ladders either by (1) placing them on a stable and level surface, or (2) securing or stabilizing them.

Depending on the type of ladder and the conditions of use, securing or stabilizing portable ladders may be as simple as using swivel or rubber ladder feet, or may involve more complex procedures such as using ladder levelers to equalize side rail support. The A14.1–2007 and A14.2–2007 standards provide useful guidance about methods employers can use to secure portable ladders, including foot ladder boards and similar devices.

Final paragraph (c)(4) does not carry forward language in existing § 1910.25(d)(2)(iii) requiring that the top rest for portable ladders be reasonably rigid and have ample strength to support the supplied load. OSHA believes final paragraph (c)(10) adequately addresses the hazard, so the language in the existing rule is no longer needed. The final rule requires placing the bottom and top of ladder side rails on a stable and level surface, or securing and stabilizing the ladder. Unless the employer addresses the stability of both ends of the ladder, the ladder is not safe for workers to use.

Final paragraph (c)(4) is almost identical to OSHA's construction ladder standard (§ 1926.1053(b)(6)), and is consistent with OSHA's maritime ladder standards (§§ 1915.72(a)(3); 1917.119(f)(8); and 1918.24(j)(1) and (2)). The final rule also is consistent the A14 portable ladder standards (A14.1–2007, Section 8.3.4; and A14.2–2007, Section 8.3.4). OSHA did not receive any comments on the proposed provision.

Final paragraph (c)(5), like the existing and proposed rules, requires that employers ensure workers do not use portable single-rail ladders. OSHA's construction ladder standard (§ 1926.1053(b)(19)), which also prohibits using single-rail ladders, defines them as ''a portable ladder with rungs, cleats, or steps mounted on a single rail instead of the normal two rails used on most other ladders'' (§ 1926.1050(b)). In the preamble to the final construction ladder rule, OSHA said, ''Single-rail ladders are inherently difficult to use because of their instability'' (55 FR 47681). OSHA believes that use of single-rail ladders in general industry also poses the same hazards. OSHA notes the prohibition in the existing rule has been in place since OSHA adopted it in 1971 from national consensus standards available at the time.

Although the A14.1–2007 standard does not contain the prohibition on single-rail ladders that was in A14.1–1968, OSHA believes it is clear that A14.1–2007 and A14.2–2007 do not cover or endorse their use. The definition of portable ladder in both of these standards indicates that they consist of ''side rails, joined at intervals by rungs, steps, cleats or rear braces'' (A14.1–2007, Section 4; and A14.2–2007, Section 4). OSHA notes that A14.1–2007 and A14.2–2007 do not address single-rail ladders, which indicates that their use is not generally accepted industry practice.

Mr. Robert Miller, a senior safety supervisor with Ameren, opposed the prohibition on single-rail ladders, arguing:

> I don't feel it is necessary to eliminate what for an employer may be the safest most feasible method of accessing another level of the work area if that employer can show by training, performance and history that the single rail ladder poses no greater hazard than another method (Ex. 189).

Mr. Miller recommended that OSHA allow employers to demonstrate by training, performance, and history that the single-rail ladder poses no greater hazard than any other method (Ex. 189). However, Mr. Miller did not provide a single example of when using a single-rail ladder would be as safe, or safer, than using portable ladders with two side rails. Accordingly, Mr. Miller did not convince OSHA to remove from the final standard the prohibition on using single-rail ladders.

OSHA notes that, in an enforcement action, employers may raise the affirmative defense of greater hazard. Employers raising this defense have the burden of proving that complying with the OSHA standard poses a greater hazard to employees than complying with the standard and no alternative means of employee protection are available. OSHA observes that Ameren did not present any information or evidence that would meet this burden.

Final paragraph (c)(6), like the proposal, adds a new requirement that employers ensure a ladder is not moved, shifted, or extended while a worker is on it. Moving, shifting, or extending an occupied ladder is dangerous to workers, whether it is the worker on the ladder who moves (''hops'') it or a worker on the ground who moves the ladder while a worker is on the ladder. Moving, shifting, or extending an occupied ladder could cause the worker to fall off the ladder or cause the ladder to tip over. According to the A14.1–2007 standard, a leading factor contributing to falls from portable ladders is movement of the ladder (A14.1–2007, Section 8.1.5).

OSHA drew this provision from the construction ladder standard (§ 1926.1053(b)(11)). The A14.1–2007 and A14.2–2007 standards also prohibit ''relocating'' a ladder while a worker is on it (A14.1–2007, Section 8.3.15; and A14.2–2007, Section 8.3.15). OSHA did not receive any comments on the proposed provision.

Final paragraph (c)(7), consistent with the proposed rule, requires that employers ensure ladders placed in locations where other activities or traffic can displace them (*e.g.,* passageways, doorways, and driveways) are:

- Secured to prevent accidental displacement (final paragraph (c)(7)(i)); or
- Guarded by a temporary barricade, such as a row of traffic cones or caution tape, to keep activities or traffic away from the ladder (final paragraph (c)(7)(ii)).

Final paragraph (c)(7) is consistent with the existing rule, which requires that employers must not place ladders in front of doors unless the door is blocked, locked, or guarded (§ 1910.25(d)(2)(iv)). OSHA believes the final rule retains the flexibility of the existing rule and identifies additional measures employers can use to prevent activities and traffic from striking ladders that are near passageways, doorways, or driveways, which may cause workers located on the ladders in those areas to fall. For example, to prevent injury to workers while they work on ladders by a doorway, employers can ''secure'' the area by simply locking the door so no one can open it and strike the ladder, or ''guard'' the door using a temporary barricade of traffic cones or caution tape. If the doorway is a required exit route (see 29 CFR part 1910, subpart E) that cannot be locked or blocked, the final rule allows employers the flexibility to ''guard'' the doorway by posting a monitor to control passage through the door.

Final paragraph (c)(7) is almost identical to OSHA's construction ladder standard (§ 1926.1053(b)(8)). It also is consistent with A14.1–2007 (Section 8.3.12) and A14.2–2007 (Section 8.3.12).

Final paragraph (c)(8) requires that employers ensure that employees do not use the cap, if equipped, and the top step of a stepladder as steps. The purpose of final paragraph (c)(8) is to clarify that the existing and proposed rules, which state that employers must not use the ''top of a stepladder,'' includes both the top step of the stepladder and top cap of the stepladder. Using either surface as a step may decrease the ladder's stability and cause it to fall over, injuring the worker.

Final paragraph (c)(8) is almost identical to OSHA's construction ladder standard (§ 1926.1053(b)(13)), and is consistent with both A14.1–2007 (Section 8.3.2(1)) and A14.2–2007 (Section 8.3.2(1)). OSHA did not receive any comments on the proposed provision.

Final paragraph (c)(9) requires that employers ensure portable ladders used on slippery surfaces are secured and stabilized. For the purposes of this paragraph, slippery surfaces include, but are not limited to, environmental (*e.g.,* rain, snow, ice) and workplace conditions (*e.g.,* oil, grease, solvents). When any of these conditions make walking-working surfaces slippery, it is important that employers secure and stabilize ladders to prevent displacement, which could cause workers to fall. Final paragraph (c)(9) is a companion provision to final paragraph (c)(4), which requires that employers ensure portable ladders are used only on stable and level surfaces unless they are secured or stabilized to prevent displacement.

The final rule gives employers flexibility in selecting measures to secure or stabilize ladders that they use. Consistent with OSHA's construction ladder standard (§ 1926.1053(b)(7)), in appropriate situations employers may use ladders equipped with slip-resistant feet to secure and stabilize them on slippery surfaces. However, employers may not be able to rely on the use of ladders with slip-resistant feet in all cases where surfaces are slippery. In some conditions it may be necessary for employers to take additional or other measures, such as lashing, to secure and stabilize portable ladders. For example, the construction ladder standard specifies that slip-resistant feet shall not be used as a substitute for holding a ladder that is used upon slippery surfaces including, but not limited to, flat metal or concrete surfaces that are constructed so they cannot be prevented from becoming slippery (§ 1926.1053(b)(7)).

OSHA notes the final rule covers all portable ladders while the proposed rule only would have applied the requirement to portable ladders that are not self-supporting. OSHA revised the final rule for two reasons. First, although under final paragraph (c)(4) OSHA considers slippery surfaces to be unstable for all types of portable ladders, the Agency is expressly applying final paragraph (c)(9) to all portable ladders to make sure the hazard is clearly addressed. For example, self-supporting ladders that are not equipped with slip-resistant feet can move or slide in slippery conditions, which can cause the worker to fall off the ladder. The revision ensures that the final rule protects workers from this hazard.

Second, the revision of final paragraph (c)(9) makes the provision consistent with the construction ladder standard, which applies to all ladders (§ 1926.1053(b)(7)). Applying final paragraph (c)(9) to all portable ladders also makes the final rule consistent with A14.1–2007 (Section 8.3.4) and A14.2–2007 (Section 8.3.4), which address all wood and metal portable ladders, as well as Section 6(b)(8) of the OSH Act (29 U.S.C. 655(b)(8)). Section 6(b)(8) specifies that whenever an OSHA standard differs substantially from an existing national consensus standard, the Agency must explain why the adopted rule better effectuates the purposes of the OSH Act. OSHA believes the revised provision will protect all workers using any type of portable ladder, and therefore best effectuates the OSH Act. OSHA did not receive any comments on the proposed provision.

Final paragraph (c)(10), like both the existing and proposed rules, requires that employers ensure that employees place the top of non-self-supporting ladders so that both side rails are supported, unless the ladders are equipped with single support attachments. Final paragraph (c)(10) revises the existing rule (§ 1910.26(c)(3)(iv)) by adding the term ''non-self-supporting'' to clarify that it is non-self-supporting ladders that need to be supported before workers attempt to use them. Self-supporting ladders must not be used as non-self-supporting ladders (see final paragraph (b)(8); *see also,* A14.1–2007, Section 8.3.5)). The final rule is identical to OSHA's construction ladder standard (§ 1926.1053(b)(10)), and is consistent with both A14.1–2007 (Section 8.3.5) and A14.2–2007 (Section 8.3.5). OSHA did not receive any comments on the proposed provision.

Final paragraph (c)(11), like the existing and proposed rules, requires that employers ensure portable ladders used to gain access to an upper landing surface have side rails that extend at least 3 feet above the upper landing surface. OSHA believes that retaining the existing requirement is important because transitioning from ladders to upper landing surfaces is hazardous to workers. Requiring the ladder side rails to extend 3 feet above the upper landing surface ensures that workers have adequate support and hand holds so they can access the upper landing surface safely. OSHA's construction ladder standard (§ 1926.1053(b)(1)), A14.1–2007 (Section 8.3.10), and A14.2–2007 (Section 8.3.10) also require that portable ladders extend 3 feet above the upper landing surface.

OSHA received one comment on the proposal. Ellis Fall Safety Solutions (Ex. 329 (1/21/2011, p. 260)) said OSHA should recognize attaching extensions onto the end of side rails as an acceptable means to comply with the 3-foot extension requirement. In the proposal, OSHA noted that employers may use after-market ladder extensions to increase the length of a ladder to meet proposed paragraph (c)(11), provided:

- The after-market rail extensions ''are securely attached (that is, secured to the extent necessary to stabilize the extension and not expose the employee to a falling hazard from the extension's displacement)''; and
- The ladder to which the after-market rail extensions is attached is ''specifically designed for the application'' in accordance with proposed paragraph (c)(14).

OSHA said that side-rail extensions that meet these requirements ''would be considered part of the ladder itself'' (75 FR 28877). In 2005, OSHA permitted use of after-market rail extensions under the construction ladder standard if the ladders meet the requirements above (see letter to Mr. Bruce Clark, president of American Innovations Corporation, December 22, 2005).[20] Based on the record as a whole, OSHA concludes that employers may use after-market rail extensions to meet the requirement of final paragraph (c)(11), provided that the ladders meet these requirements.

Final paragraph (c)(12), like proposed paragraph (c)(13), requires that employers not use ladders and ladder sections tied or fastened together to provide added length unless the ladder design specifically permits such use. The purpose of the final paragraph is to prevent the use of unsafe rigging methods and to use ladders only as they were intended. Ladders gerry-rigged to provide longer lengths are not likely to be as strong and stable as ladders designed to reach such heights.

Limiting fastening together ladders and ladder sections to those ''specifically designed for such use'' means that the designer developed both the ladders and any mechanism used to connect them specifically to achieve greater length. The final rule revises existing § 1910.26(c)(3)(v), which specifies that the manufacturer must equip the ladders and ladder sections with necessary hardware fittings, if the manufacturer endorses allowing such ladder extensions, to ensure that the requirement covers both manufactured and job-made ladders and ladder sections. Therefore, under the final rule the ladder designer, regardless of whether employed by the employer, a manufacturer, or other company, must develop the ladder or ladder section specifically for the purpose of fastening them together to extend the length of the ladder or the employer must not fasten the ladder or ladder sections together. Final paragraph (c)(12) is consistent with existing § 1910.25(d)(2)(ix), A14.1–2007 (Section 8.3.11), and A14.2–2007 (Section 8.3.11).

Final paragraph (c)(13) retains the language in existing § 1910.25(d)(2)(v), which prohibits placing ladders on boxes, barrels, or other unstable bases to obtain additional height. The proposed rule (proposed paragraph (c)(14)) prohibited employers from increasing the reach of ladders and ladder sections by any means not permitted specifically by the design of the ladders. After further analysis, OSHA believes the language in the existing rule is clearer and easier to understand than the proposed language. The language also is the same as A14.1–2007 (Section 8.3.4) and A14.2–2007 (Section 8.3.4).

For the purposes of final paragraph (c)(13), unstable bases include surfaces such as vehicles, truck flatbeds, scaffolds, and stairs. OSHA received one comment on the proposed provision. Southern Company (Ex. 192) asked whether paragraph (c)(13) prohibited the use of ladder-leveling devices that extend the reach of the ladder. Final paragraph (c)(12) addresses fastening together ladders and ladders sections. However, OSHA does not consider ladder-leveling devices to be ladders or ladder sections. Rather they are devices attached to ladder side rails and allow for independent adjustment of the rails to ensure the ladder is level. Like the A14 standards, OSHA considers ladder-leveling devices to be ''ladder accessories . . . that may be installed on or used in conjunction with ladders'' (A14.1–2007, Section 1.1; and A14.2–2007, Section 1.1). Although ladder-leveling devices may be temporary or permanent attachments to the ladder, OSHA does not consider ladder-leveling devices to be ''part of the ladder itself'' (75 FR 28877). Therefore, final paragraph (c)(13) does not apply to ladder-leveling devices, even if they increase the length of the ladder.

That said, other provisions in §§ 1910.22 and 1910.23 (*e.g.,* final paragraphs (b)(8) and (c)(4)) are applicable when employers use ladder-leveling devices. For example, paragraph (b)(8) mandates that employers use ladders only for their intended purpose. OSHA believes that employers are using ladders for their intended purpose only when the design of the accessories attached to, or used in conjunction with, the ladders permit such use. OSHA notes that there are many after-market ladder devices that employers may attach to, or use in conjunction with, ladders. Many of these devices, including ladder-leveling devices, can help to make ladders safer for workers to use. OSHA is not prohibiting the use of ladder accessories that can make ladders safer for workers to use. However, after-market add-ons must meet the standard's requirements. That is, when in use, the additional device must not reduce the ladder's strength or stability, and employers must use them only for their designed purpose. Although allowed, OSHA cautions employers against using job-made devices unless a professional engineer designed and certified them. OSHA notes that the Agency does not approve or endorse specific products.

Paragraph (d)—Fixed Ladders

Final paragraph (d) establishes requirements that apply to fixed ladders, in addition to the requirements in final paragraph (b). The final rule defines ''fixed ladder'' as a ladder, with side rails or individual rungs, that is permanently attached to a structure, building or equipment (§ 1910.21(b)). Fixed ladders do not include ship stairs, stepbolts, or manhole steps.

Final paragraph (d)(1), like the proposed rule, establishes a

[20] OSHA letter to Mr. Bruce Clark available at: *http://www.osha.gov/pls/oshaweb/owadisp.show_document?p_table=INTERPRETATIONS&p_id=25177.*

performance-based provision requiring that employers ensure any fixed ladder a worker uses is capable of supporting the maximum intended load. As discussed in § 1910.22, and above in this section, ''maximum intended load'' means ''the total load (weight and force) of all employees, equipment, vehicles, tools, materials, and loads the employer reasonably anticipates to be applied to a walking-working surface'' (§ 1910.21(b)).

The performance-based language in final (d)(1) replaces the detailed specification requirements in the existing rules (§ 1910.27(a)(1)(i) through (iv) and (a)(2)). OSHA requested comment on whether the Agency should retain the specification requirements in existing § 1910.27(a)(1), but did not receive any comments.

OSHA did not adopt proposed paragraph (d)(2) as a companion to proposed paragraph (d)(1). Proposed paragraph (d)(2) required that employers ensure fixed ladders installed on or after 150 days after issuing the final rule meet specific design, construction, and maintenance requirements, including supporting two 250-pound live loads. The existing rule requires that fixed ladders support a single concentrated 200-pound load (§ 1910.27(a)(1)). After additional analysis, OSHA decided to adopt proposed paragraph (d)(1), and not retain existing § 1910.27(a) or adopt proposed paragraph (d)(2). First, OSHA believes the maximum load requirement in final paragraph (d)(1) is as safe as, or more protective than, the existing and proposed rules. Final paragraph (d)(1) requires that employers ensure that a fixed ladder meets the maximum load that the designer specifically established for that particular fixed ladder. OSHA believes that following the load requirement established for a particular ladder is at least as safe as a general specification (200 or 250 pounds) applied to all fixed ladders.

Second, OSHA believes the performance-based approach in final paragraph (d)(1) is easier to understand and follow than the minimum weight specifications in the existing and proposed rules. In addition, the final rule gives employers greater flexibility in selecting and using fixed ladders. OSHA notes that Ameren (Ex. 189), among other commenters, supported the use of performance-based language for this and other provisions in the final rule.

Third and finally, not adopting the proposed rule, which had an effective date 150 days after publication of the final rule, addresses commenters' concerns that that OSHA failed to give adequate lead-in time to come into compliance with the new requirement (Exs. 189; 192).

Final paragraph (d)(2), like proposed paragraph (d)(3), requires that employers ensure the minimum perpendicular distance from the ladder to the nearest permanent object in back of the ladder is 7 inches. The final rule requires that this distance be measured from the centerline of the fixed ladder steps and rungs or grab bars, or both, to the object in back of the ladder (*e.g.* wall). OSHA believes the 7-inch minimum will ensure that workers have adequate space to get a safe foothold on fixed ladders. Final paragraph (d)(2) also includes an exception for elevator pit ladders. For these ladders, the employer must ensure that the minimum perpendicular distance is 4.5 inches.

Final paragraph (d)(2), like the proposal, revises the existing rule (§ 1910.27(c)(4) and (5)) in several ways. First, the final rule replaces the existing 4-inch minimum perpendicular distance for grab bars with a 7-inch minimum clearance. To ensure worker safety while they climb fixed ladders and transition to upper landing surfaces, OSHA believes that the minimum perpendicular distance for grab bars needs to be the same as the minimum perpendicular distance specified for ladder rungs and steps.

Second, final paragraph (d)(2) eliminates an exception from the 7-inch clearance requirement for ''unavoidable obstructions'' (§ 1910.27). OSHA stated in the preamble to the final construction ladder standard that ''the minimum clearance requirement is necessary, regardless of any obstructions, so that employees can get safe footholds on ladders'' (55 FR 47675).

Third, final paragraph (d)(2) adds a new exception that reduces the minimum perpendicular clearance in elevator pits to 4.5 inches. OSHA drew this exception from the construction ladder standard (§ 1926.1053(a)(13)). The exception is consistent with the ANSI/ASME A17.1–2010, Safety Code for Elevators and Escalators (Section 2.2.4.2.4) (Ex. 380). Generally, space in elevator pits is restricted, and it may not be possible to have a 7-inch clearance. In the preamble to the construction ladder standard, OSHA said the exception for elevator pit ladders was appropriate because elevator shafts generally are secure from unauthorized access (55 FR 47675). As such, only workers who have the required equipment and fall protection training would be accessing the elevator pit (55 FR 47675). Under the final rule, employers must train each worker in the proper use of equipment, including fixed ladders, before permitting any worker to use the equipment (§ 1910.30(b)(1)).

One of OSHA's goals in revising the existing rule (§ 1910.27(c)(4)) was to make the final rule consistent with OSHA's construction ladder standard, and final paragraph (d)(2) is almost the same as that rule (§ 1926.1053(a)(13)). The construction standard also contains language specifically indicating that the required 7-inch clearance also applies to obstructions. In addition, the final rule is consistent with the 7-inch minimum perpendicular distance in existing § 1910.27(c)(4) and A14.3–2008 (Section 5.4.2.1).

OSHA received one comment from Southern Company (Ex. 192). They asked to grandfather in the existing requirement because they have many fixed ladders and ''[r]edesigning or moving any of these ladders to avoid these obstructions could be expensive or in some cases infeasible.'' OSHA does not believe that grandfathering is necessary. The Agency believes the vast majority of fixed ladders currently in use comply with the final requirement because the final rule reflects requirements in place under ANSI A14.3 since 1974. In addition, OSHA's construction standard has required the same clearance since the Agency adopted it in 1994.

Final paragraphs (d)(3) through (8) establish requirements for ladder extension areas to ensure that workers are able to transition safely from the fixed ladder to the landing surface. In particular, several of the provisions apply to through and side-step ladders. The A14.3–2008 standard defines through ladders as rail ladders that require a worker getting off to step through the ladder to reach the landing (A14.3–2008, Section 3). That standard also defines side-step ladders as rail ladders that require workers getting off at the top to step sideways from the ladder to reach the landing (A14.3–2008, Section 3).

Final paragraph (d)(3), like the existing (§ 1910.27(c)(5)) and proposed rules, requires that employers ensure grab bars on the climbing side do not protrude beyond the rungs of the ladder they serve. The final rule defines grab bars as individual vertical or horizontal handholds that provide access above the ladder height (§ 1910.21(b)). Grab bars that protrude beyond the rungs of the ladder can be hazardous because they make it more difficult to climb and transition to landing surfaces. To illustrate, having the grab bars protrude further than the ladder would put the worker at an angle greater than 90 degrees and make climbing and holding on more difficult, which makes a fall more likely. OSHA did not receive any comments on the proposed provision.

Final paragraph (d)(4), like the proposed rule, establishes requirements for through and side-step ladders, including those ladders used on buildings with parapets. The final rule requires that employers ensure the side rails of through or side-step ladders extend 42 inches above the top of the access level or platform served by the ladder.

Final paragraph (d)(4) also adds language specifying what constitutes the ''access level'' for through and side-step ladders on buildings that have parapets. When a parapet has an opening that permits passage through it (*i.e.,* through ladder), the final rule specifies that the access level is the roof (final paragraph (d)(4)(i)). For parapets without such an opening (*i.e.,* side-step ladders), the final rule specifies the access level is the top of the parapet (final paragraph (d)(4)(ii)). OSHA added this language to clarify the Agency's intent that workers must have sufficient handholds at least 42 inches above the highest level on which they will step when reaching the access level, regardless of the location of the access level (*i.e.,* roof or top of parapet). The language also makes the final rule consistent with § 1926.1053(a)(24) and A14.3–2008 (Section 5.3.2.1). OSHA did not receive any comments on the proposed provision.

Final paragraph (d)(5), like the existing (§ 1910.27(d)(3)) and proposed rules, specifies that employers ensure that there are no steps or rungs on the portion of the through ladder extending above the access level. It is obvious that this requirement is necessary to allow workers to pass the ladder and step onto the upper landing surface. The final rule is the same as OSHA's construction ladder standard (§ 1926.1053(a)(25)) and A14.3–2008 (Section 5.3.2.2).

In addition, final paragraph (d)(5), like the proposed rule, also requires flared extensions of the side rails above the access level to provide clearance of not less than 24 inches and not more than 30 inches. The final rule increases the existing clearance width (from 18 to 24 inches) between the side rails. OSHA believes the additional clearance will help to ensure that workers equipped with personal fall protection systems, tools, and other items have adequate space to negotiate the pass-through area and reach the upper landing safely. The increased clearance width makes the final rule consistent with OSHA's construction standard (§ 1926.1053(a)(25)) and A14.3–2008 (Section 5.3.2.2).

Final paragraph (d)(5) adds a new clearance width requirement for through ladders equipped with ladder safety systems. In those cases, the final rule requires that employers ensure the clearance between side rails of the extensions does not exceed 36 inches. The new provision makes the final rule consistent with OSHA's construction ladder standard (§ 1926.1053(a)(25)). OSHA did not receive any comments on the proposed provision.

Final paragraph (d)(6), like the proposed rule, adopts a performance-based revision of the existing rule for side-step ladders (§ 1910.27(d)(3)). Accordingly, the final rule requires that employers ensure the side rails, rungs, and steps of side-step ladders be continuous in the extension. The existing rule, by contrast, specifies that the landings of side-step or off-set fixed ladder sections have side rails and rungs that extend to the next regular rung above or beyond the 42-inch minimum extension. OSHA believes the performance-based revision makes the final rule easier to understand and follow. The final rule is consistent with OSHA's construction standard (§ 1926.1053(a)(24)) and A14.3–2008 (Section 5.3.2.3).

Final paragraphs (d)(7) and (8) specify criteria for grab bars. Final paragraph (d)(7), like the proposed rule, requires that employers ensure grab bars extend 42 inches above the access level or landing platforms of the ladder, which is the same height required for side rails in the extension area of through and side-step ladders (see final paragraph (d)(4)). Final paragraph (d)(7) revises and clarifies the existing rule (§ 1910.27(d)(4)), which states that grab bars ''be spaced by a continuation of the rung spacing when they are located in the horizontal position,'' and have the same spacing as ladder side rails when located in the vertical position. The final rule identifies, more clearly and exactly, the required location (*i.e.,* above the access level or platform) and height (*i.e.,* 42 inches) of the grab bars. OSHA believes that employers will find the final rule easier to understand and follow.

OSHA drew the language in final paragraph (d)(7), in part, from its construction ladder standard (§ 1926.1053(a)(27)) and A14.3–2008 (Sections 5.3.3.1 and 5.3.3.2). The final rule expands application to grab bars on all fixed ladders; OSHA's construction ladder standard and A14.3–2008 only apply to individual-rung ladders. Also, the final rule does not include the exception in OSHA's construction standard and A14.3–2008 for manhole steps, covers, and hatches because manhole steps are not considered ladders in this rule and are covered in a separate section (final § 1910.24). OSHA did not receive any comments on the proposed provision.

Final paragraph (d)(8), like the existing (§ 1910.27(d)(4)) and proposed rules, requires that employers ensure the minimum size (*i.e.,* cross-section or diameter) of the grab bars are the same size as the rungs on that ladder. The final rule clarifies the existing rule by specifying that the grab bars and rungs of fixed ladders be the same size (diameter). The final rule is consistent with A14.3–2008 (Section 5.3.3.3).

OSHA received one comment about grab bars. Nigel Ellis, Ellis Safety Solutions, LLC (Ex. 155), recommended that the final rule require horizontal grab bars, especially if the length of vertical grab bar exceeds 6 inches. He pointed to a study (Young et al., ''Hand-hold Coupling: Effect of Handle Shape, Orientation, and Friction on Breakaway Strength,'' 51 Human Factors 705, October 2009) showing that breakaway strength (*i.e.,* the maximum force that can be exerted on an object before it pulls away or slips from the grasp of the hand) was greatest for fixed horizontal cylindrical-shaped bars (Ex. 344). Based on that study, Mr. Ellis said that it would be more likely that workers could arrest a fall by grabbing a horizontal, rather than a vertical, grab bar. He also said, ''It has been shown that vertical grab bars are a sliding element that prevents an adequate grip to stop a fall,'' and concluded that ''if a vertical grab bar exceeds 6 inches vertically then the hand-sliding fall is unstoppable'' (Ex. 344).

OSHA agrees that horizontal bars provide the possibility of stronger grips than vertical ones in the event of a fall from a ladder when a ladder safety system or a personal fall protection system is not taken into account. However, horizontal grab bars do not provide the level of protection from falls that ladder safety systems and personal fall protection systems provide. Given that ladder safety systems and personal fall protection systems will increasingly protect workers who climb ladders from falling, OSHA does not believe is it necessary at this point to require installation of horizontal grab bars when any vertical grab bar exceeds 6 inches.

Final paragraph (d)(9), like the proposed rule, establishes two requirements for ladders that terminate at hatch covers. First, the final rule requires that employers ensure that the hatch cover opens with sufficient clearance to provide easy access to or from the ladder (see final paragraph (d)(9)(i)). Second, the final rule requires that employers ensure counterbalanced hatch covers open at least 70 degrees from the horizontal (see final paragraph (d)(9)(ii)). In essence, this provision defines in objective terms (70 degrees) what constitutes ''sufficient clearance,'' as used in the existing rule (§ 1910.27(c)(7)).

Final paragraph (d)(9), like the proposal, revises the existing rule in two ways. First, the final rule increases to 70 degrees the angle to which counterbalanced hatch covers must open. The existing rule only requires that hatch covers open a minimum of 60 degrees, but also specifies that the minimum distance from the centerline of the top rung be at least 24 inches for ladders with ''offset wells,'' and at least 30 inches for ''straight wells.'' OSHA believes that increasing the opening to 70 degrees will ensure that the space between the top rung and hatch provides adequate clearance regardless of what type of fixed ladder is used.

Second, the final rule replaces the specification requirement in the existing rule with performance-based language. The performance-based language ensures that the final rule provides a level of worker safety that is as great as or greater than the existing rule, but gives employers the flexibility to determine how counterbalanced hatch covers will open to 70 degrees. The performance-based language also makes final paragraph (d)(9) clearer and easier to follow than the existing rule. The final rule is consistent with A14.3–2008 (Section 5.3.4.2). OSHA notes that A14.3–2008 also includes language similar to the specification language in the existing rule, but the language is only advisory. OSHA did not receive any comments on the proposed provision.

Final paragraph (d)(10), like the existing (§ 1910.27(b)(1)(v)) and proposed rules, requires that employers ensure that the construction of individual-rung ladders will prevent the worker's feet from sliding off the ends of the rungs (Figure D–4 in regulatory text illustrates). OSHA believes this requirement is essential because individual-rung ladders do not have side rails to block the worker's feet from sliding off the rung. Final paragraph (d)(10) is the same as OSHA's construction industry standard (§ 1926.1053(a)(5)). OSHA did not receive any comments on the proposed provision.

Final paragraph (d)(11), like the proposed rule, requires that employers ensure workers do not use fixed ladders that have a pitch greater than 90 degrees from the horizontal. A ladder that exceeds a pitch of 90 degrees makes the ladder dangerous to climb because pitch greater than 90 degrees would require climbers to exert considerable extra force to maintain their grip on the ladder against the gravitational force. The final rule revised the specification approach in the existing requirements (§ 1910.27(e)(1) through (4)), and replaces it with performance-based language. OSHA believes much of the language in the existing rule continues to provide useful information best included in compliance-assistance documents. OSHA did not receive any comments on the proposed paragraph.

Final paragraph (d)(12), like the proposed rule, addresses step-across distances for through and side-step ladders. Specifically, final paragraph (d)(12)(i) requires that employers ensure the step-across distance for through ladders is not less than 7 inches, and not more than 12 inches, to the nearest edge of the structure, building, or equipment accessed from the ladders, measured from the centerline of the ladder. Final paragraph (d)(12)(ii) requires that employers ensure the step-across for side-step ladders is at least 15 inches, but not more than 20 inches, measured from the centerline of the ladder to the nearest point of access on the platform edge.

The final rule, like the proposal, revises the existing rule in § 1910.27(c)(6) in several ways. First, the final rule establishes specific step-across distances for each through and side-step ladder (§ 1910.27(c)(6)). The existing rule establishes a single step-across distance applicable to all fixed ladders. Compared to the existing rule, OSHA believes the final rule more appropriately tailors the step-across distances to the type of ladder used, which improves worker safety.

Second, final paragraph (d)(12) revises the existing step-across distance (*i.e.,* not less than 2.5 inches and not more than 12 inches) to make transitioning from the ladder to the upper landing surface safer and consistent with other provisions in the final rule. OSHA believes that a 2.5-inch step-across distance could conflict with the 7-inch minimum perpendicular clearance requirement in final paragraph (d)(2). The 7-inch clearance requirement is necessary to ensure that workers will have a safe foothold on the ladder. If the existing rule inadvertently results in workers having an inadequate foothold on the top of the ladder, it could increase the worker's chance of falling.

Third, the final rule does not retain the companion provision in the existing rule (§ 1910.27(d)(1)) that requires employers to provide a landing platform if the step-across distance is greater than 12 inches. OSHA believes that the final rule already addresses this issue; therefore, it is not necessary to retain the requirement.

Final paragraph (d)(12) requires that employers measure step-across distance from the centerline of the ladder to the ''nearest edge of the structure, building, or equipment.'' Thus, in the final rule, the nearest edge of a structure may be a landing platform. Final paragraph (d)(12) is consistent with OSHA's construction ladder standard (§ 1926.1053(a)(16)) and A14.3–2008 (Section 5.4.2.2). OSHA did not receive any comments on the proposed provision.

Final paragraph (d)(13) addresses fixed ladders that do not have cages or wells. Final paragraph (d)(13)(i), like the existing (§ 1910.27(c)(2)) and proposed rules, requires that employers ensure ladders without cages or wells have a clear width of at least 15 inches on each side of the ladder centerline to the nearest object. Having at least a 15-inch minimum clearance on the ladder is necessary to provide adequate clearance to climb the ladder and prevent damage to the ladder. Figure D–2 illustrates this requirement, which is consistent with OSHA's construction ladder standard (§ 1926.1053(a)(17)) and A14.3–2008 (Section 5.4.3.1).

Final paragraph (d)(13)(ii), like the proposed rule, requires that employers ensure there is a minimum perpendicular distance of 30 inches from the centerline of the steps or rungs to the nearest object on the climbing side of the ladder. The final rule, like the proposal, revises the existing requirement in § 1910.27(c)(1) in three ways. First, the final rule replaces the existing requirement that the pitch of the ladder be the basis of the minimum perpendicular distance (*i.e.,* 36 inches for 75-degree pitch ladder and 30 inches for 90-degree pitch ladders) with a single, minimum clearance, regardless of the ladder pitch. OSHA believes that the revised rule will not pose problems for employers because the pitch of virtually all fixed ladders is 90 degrees. As such, the final rule is consistent with the existing rule. The revision in the minimum perpendicular clearance makes the final rule consistent with OSHA's construction ladder standard (§ 1926.1053(a)(14)) and A14.3–2008 (Section 5.4.1.1).

Second, the final rule provides an exception to the minimum perpendicular clearance requirement ''[w]hen unavoidable obstructions are encountered.'' The final rule allows a reduction of the minimum clearance to 24 inches in those cases, provided that employers install deflector plates. The deflectors will protect workers on fixed ladders by guiding them around unavoidable obstructions. Adding this exception makes the final rule consistent with OSHA's construction ladder standard (§ 1926.1053(a)(15)) and A14.3–2008 (Section 5.4.1.3).

Third, final paragraph (d)(13) recasts the existing rule so it is more performance-based. OSHA believes this change makes the final rule easier to understand and follow than the existing rule.

OSHA received one comment on the proposed provision. Ameren Corporation stated:

> As long as the fixed ladders in any facility comply with the current ''inches clearance per pitch'' requirements, they should be grandfathered in due to the potential financial impact and minimum difference in clearance as well as any history of no apparent difficulties with head clearance by way of reviewing incident reporting trends (Ex. 189).

OSHA does not agree with Ameren that the revisions to the minimum perpendicular clearance on the climbing side of fixed ladders will have any significant financial impact on employers who are in compliance with the existing rule. As mentioned earlier, almost all fixed ladders have a 90-degree pitch, which means that they must already meet the 30-inch clearance requirement of the existing rule. Therefore, the vast majority of employers would not have to replace their ladders since they are in compliance with the existing provision.

Final paragraph (d) includes an informational note stating that §§ 1910.28 and 1910.29 establish, respectively, the duty to provide fall protection for workers using fixed ladders and the mandatory criteria for that fall protection.

Paragraph (e)—Mobile Ladder Stands and Mobile Ladder Stand Platforms

Final paragraph (e) establishes requirements that apply to mobile ladder stands and mobile ladder stand platforms (mobile ladder stands and platforms). These requirements apply to mobile ladder stands and platforms in addition to the requirements specified by paragraph (b) of this section that cover all ladders.

Final paragraph (e) is a performance-based revision of the design and use requirements in the existing rule (§ 1910.29(a) and (f)), and consistent with the design requirements in the ANSI standard (A14.7–2011). Therefore, consistent with the requirement in the OSH Act that OSHA express standards ''in terms of objective criteria and of the performance desired,'' final paragraph (e) does not incorporate the testing requirements in either the existing OSHA rule or ANSI standard (*e.g.,* § 1910.29(f)(5); A14.7–2011 (Section 5)).

For purposes of the final rule, final § 1910.21(b) defines a ''mobile ladder stand'' as a ladder that:

- Is mobile;
- Has a fixed height;
- Is self-supporting; and
- Is designed for use by one worker at a time.

This paragraph of the final rule also specifies that mobile ladder stands generally consist of:

- Wheels or casters on a rigid base;
- Steps (treads); and
- A top step.

Mobile ladder stands also may have handrails. This definition is consistent with both the existing OSHA rule and ANSI standard (§ 1910.21(g); A14.7–2011, Section 3). Although the final rule does not identify what constitutes a ''top step,'' the ANSI standard defines the term ''top step'' as ''[t]he uppermost flat surface of a ladder stand upon which a person may stand and that has a front to back dimension of not less than 9.5 inches or more than 32 inches and does not exceed 6.7 square feet in area'' (A14.7–2011, Section 3).

A ''mobile ladder stand platform,'' as defined in the final rule (§ 1910.21(b)), is a mobile ladder stand with treads leading to one or more platforms. Unlike the definition of mobile ladder stands, some mobile ladder stand platforms may be designed for use by more than one worker at a time.

Although the existing OSHA ladder rules for general industry do not define or specifically address mobile ladder stand platforms, the final definition is consistent with the ANSI standard (A14.7–2011, Section 3). The ANSI standard also defines a ''platform'' as ''[a]n elevated surface for standing or working that is more than 6.7 square feet in area, or more than 32 inches in depth and may be occupied by more than one person'' (A14.7–2011, Section 3).

While the existing OSHA rule does not specifically address mobile ladder stand platforms, many of the provisions in the existing rule provide effective worker protection regardless of whether employees are working on mobile ladder stands or mobile ladder stand platforms. Thus, when appropriate, in the final rule OSHA applied provisions in the existing rules to mobile ladder stand platforms as well as mobile ladder stands.

One commenter raised general concerns about the design requirements for mobile ladder stands and platforms:

> Nearly all requirements are design and construction requirements over which an employer would have minimal or no control.
>
> Again, an employer would be relying primarily on third party certification without any assurance that such reliance would be recognized as a legitimate defense against OSHA citations (Ex. 368).

The commenter is correct that most of the general provisions in proposed and final paragraph (e)(1) are equipment-design requirements. This also applies to the existing OSHA rules, which have been in place since 1973. Many other OSHA standards also require that employers provide equipment designed, constructed, and maintained so it is safe for their workers to use. In the years since OSHA adopted the existing rules, no employers have raised concerns about being able to comply with the design requirements. OSHA also believes that today, more than 40 years after it adopted the existing rules, virtually all mobile ladder stands and platforms manufactured meet the design requirements of the existing rules, as well as the ANSI standard.

OSHA, however, does not agree that employers have minimal or no control over whether mobile ladder stands and platforms meet the design requirements in the final rule. Employers are free to design and construct their own equipment to the design requirements in OSHA standards, and some employers do. For example, employers may build their own mobile ladder stands and platforms if they need the units for special purposes, or if the ladders must fit into unusual locations.

Employers also have control over the equipment they purchase. They can evaluate, investigate, and even test potential equipment to ensure that it meets OSHA requirements. They also can select equipment that a recognized third party (*e.g.,* Underwriters Laboratories) tests and certifies as meeting the OSHA requirements. In addition, employers can obtain the third-party testing information or reports to reassure themselves that the equipment meets the requirements in the final rule.

Final paragraph (e)(1) establishes general design and use requirements that apply to both mobile ladder stands and mobile ladder stand platforms. OSHA drew these general requirements from two sources: (1) The existing rule (§ 1910.29); and (2) A14.7–2011.

Final paragraph (e)(1)(i), like the existing (§ 1910.29(a)(3)(ii)) and proposed rules, requires that employers ensure that the minimum width of steps on mobile ladder stands and platforms is 16 inches. This minimum-width requirement applies regardless of the length (depth) of the top step of mobile ladder stands, which, pursuant to A14.7–2011, may be up to 32 inches in depth or 6.7 square feet in area. OSHA believes that this approach is generally consistent with the ANSI standard, which requires that steps, including the top step, on mobile ladder stands have a minimum width of 16 inches (A14.7–2011, Section 4.3.1); for mobile ladder stand platforms, section 4.4.1 of A–14.7–2011 requires a minimum step width of 16 inches.

OSHA believes that employers should not have any problem complying with final paragraph (e)(1)(i). The existing OSHA and ANSI standards have been in place for many years and OSHA believes the width of steps on virtually all mobile ladder stands and platforms meet the ANSI requirements, and, therefore, are in compliance with the final rule. OSHA did not receive any comments on the proposal, and adopts the provision as discussed.

Final paragraph (e)(1)(ii), like the existing (§ 1910.29(a)(3)(iv)) and proposed rules, requires that employers ensure that steps and platforms of mobile ladder stands and platforms be slip resistant. The final rule includes language, drawn from A14.7–2011, that gives employers greater flexibility in complying with the slip-resistance requirement. Final paragraph (e)(1)(ii) provides that employers may meet the slip-resistance requirement by providing mobile ladder stands and platforms where the slip-resistant surfaces either are (1) an integral part of the design and construction of the mobile ladder stand and platform, or (2) provided by a secondary process or operation. For the purposes of this final rule, secondary processes include things such as dimpling, knurling, shotblasting, coating, spraying the walking-working surfaces, or adding durable slip-resistant tape to steps and platforms.

In addition to providing more flexibility than the existing OSHA requirements for meeting the slip-resistance requirement, OSHA believes the final paragraph will help to ensure a level of protection that is equivalent to or greater than the existing requirements. First, it allows employers to select the types of slip resistance that will provide the most effective protection for workers in the particular workplace conditions in which employers use the unit. For example, in outdoor, icy conditions, grated steps and platforms may provide better slip resistance than steps and platforms with a sprayed-on finish.

Second, the new language also indicates that employers have both an initial and continuing obligation to ensure that steps and platforms on mobile ladder stands and platforms remain slip resistant (*i.e.,* ''[t]he steps . . . are slip resistant''). Accordingly, while the manufacturer may apply the secondary slip resistance process initially, if the slip resistance on steps of stands or platforms wears down or is in need of repair, the final rule requires that employers treat those surfaces with additional processes to restore their slip resistance. For example, if slip-resistant tape comes off, the employer must replace it. OSHA believes that employers should not have problems complying with the final provision since slip-resistance processes and materials are readily available in the marketplace. OSHA did not receive any comments on the proposed provision, and adopts it as proposed.

Final paragraphs (e)(1)(iii) and (iv) establish strength and stability requirements for mobile ladder stands and platforms to ensure units are safe for workers to use. Final paragraph (e)(1)(iii), which is almost identical to proposed paragraph (e)(1)(vi), requires that employers ensure mobile ladder stands and platforms are capable of supporting at least four times their maximum intended load. The existing OSHA rule and ANSI standard also require that mobile ladder stands be capable of supporting at least four times the ''design working load'' or ''rated load,'' respectively (§ 1910.29(a)(2)(ii)(*b*); A14.7–2011, Section 4.2.1). Both standards have been in place for many years, so OSHA believes that virtually all mobile ladder stands and platforms manufactured and currently in use already comply with the final rule.

Final paragraph (e)(1)(iv), which also is almost identical to proposed paragraph (e)(1)(iii), requires that employers ensure wheels and casters of mobile ladder stands and platforms under load are capable of supporting: (1) their proportional share of four times the maximum intended load, plus (2) their proportional share of the unit's weight. OSHA believes this requirement is necessary to ensure that mobile ladder stands and platforms are safe for workers to use. Unless the wheels and casters can support both the proportional weight of the mobile ladder stand or platform and the weight of the maximum intended load placed on that unit, failure of the wheel(s) or caster(s) may occur. If that happens, the stand or platform could become unstable and the worker could fall off the unit and be injured or killed.

Final paragraph (e)(1)(iv) provides greater protection than the existing OSHA rule in § 1910.29(a)(4). The existing rule does not require that wheels or casters be capable of supporting the weight of the mobile ladder stand or mobile ladder stand platform, as well as the weight of the load (*e.g.,* worker, tools, equipment, and materials) placed on it (§ 1910.29(a)(4)(i)). However, OSHA notes that the final rule is almost identical to the ANSI standard (A14.7–2011, Sections 4.3.7 and 4.4.8). As discussed above, the ANSI standard has been in place for many years, so OSHA believes that virtually all mobile ladder stand and platform wheels and casters manufactured and currently in use already comply with the final rule.

In final paragraphs (e)(1)(iii) and (iv), OSHA replaced the term ''design working load'' in the existing OSHA rule with ''maximum intended load'' (*i.e.,* the total load of all employees, equipment, tools, materials, and other loads the employer reasonably anticipates to be applied to the mobile ladder stand or platform). While the definition of ''maximum intended load'' in this final rule (see § 1910.21(b)) is similar to the definition of ''design working load'' in the existing rule (see § 1910.21(g)(5)), using the term ''maximum intended load'' in final paragraphs (e)(1)(iii) and (iv) makes these paragraphs consistent with other provisions in the final rule that use the term.

Finally, consistent with OSHA's goal to make the final rule performance based, final paragraphs (e)(1)(iii) and (iv) do not incorporate the testing requirements in either the existing OSHA rule (§ 1910.29(f)(5)) or A14.7–2011 (Section 5). OSHA did not receive any comments on either of the proposed requirements, and adopts final paragraphs (e)(1)(iii) and (iv) as discussed above.

Final paragraph (e)(1)(v) establishes general requirements for handrails on mobile ladder stand and platform steps (except for handrails on top steps when paragraph (e)(2)(ii) applies). Final paragraph (e)(1)(v) requires that employers ensure mobile ladder stands and platforms have handrails when the height of the top step or platform is 4 feet or higher above lower levels. Where handrails are required, employers must ensure that the handrails have a vertical height of at least 29.5 inches but not more than 37 inches, as measured from the front edge of the step, unless specified elsewhere in the section.

The purpose of the final paragraph (e)(1)(v) is to protect workers from falling when they are climbing or standing on mobile ladder stands and platforms. OSHA believes handrails are necessary to assist workers as they are climbing mobile ladder stands and platforms, and also provide a handhold they can grab to steady themselves if they slip or start to fall off the unit. In addition, handrails provide a necessary barrier to prevent workers from falling off the side of steps and off the top step or platform. To ensure that the barrier provides adequate protection, OSHA notes that stands and platforms must have handrails on both sides of the steps, including the top step and platform. On mobile ladder stands, the handrail also must extend across the open back of the top step.

The existing OSHA rule requires that mobile ladder stand steps have handrails (a minimum of 29 inches high, measured vertically from the center of the step) if the height of the top step was more than 5 feet or 5 steps (§ 1910.29(f)(4)). However, the existing rule does not specify the maximum height allowed for the handrails. In addition, the existing rule does not contain a specific provision covering handrails on mobile ladder stand platforms. The proposed rule, on the other hand, included specific and separate handrails provisions for mobile ladder stands and mobile ladder stand platforms (proposed paragraphs (e)(2)(ii) and (e)(3)(ii)). In the final rule, OSHA consolidated those proposed provisions into the general requirement in paragraph (e)(1)(v) to reduce repetition and simplify the final rule.

The final rule provides greater protection than the existing OSHA rule. The final rule requires that mobile ladder stands and platforms have handrails where the top step height is at least 4 feet compared to more than 5 feet or 5 steps in the existing rule. OSHA notes that the ANSI standard (A14.7–2011, Sections 4.3.5 and 4.4.5) also requires that handrails provide the same level of protection as the final rule.

Final paragraph (e)(1)(v), like the proposal (a note to proposed paragraphs (e)(2)(ii) and (e)(3)(ii)), also allows alternatives to the handrails requirement for ''special-use applications.'' In such situations, the final rule permits employers to use removable gates or non-rigid members (such as chains) instead of handrails on the top step of mobile ladder stands and platforms. The alternative means of compliance allows employers to remove the gates or chains when a work task involves special-use application; however, employers must replace the gates or chains (*i.e.,* comply with the handrail requirement) when they complete the special-use task. In a special use application, it is important that the mobile ladder stand or platform is placed to minimize the risk of falls. For example, when a gate needs to be removed to place or remove objects from a shelf, the employer needs to ensure that the unit is placed so there is no gap between the unit and shelf that could result in a worker falling while performing the task. OSHA believes this alternative method provides flexibility for employers while reducing the exposure of workers to fall hazards under these conditions. For the purposes of this provision, a special-use application may include a situation in which permanent handrails block or impede the movement of boxes, products, or materials from the ladder stand or platform to shelves or other storage areas. The ANSI standard also includes this alternative method (A14.7–2011, Sections 4.3.5, 4.3.6, 4.4.5, and 4.4.6). OSHA did not receive any comments on the proposed provisions, and adopts them as consolidated and revised.

Final paragraph (e)(1)(vi), like the existing OSHA and proposed rules (§ 1910.29(a)(3)(i) and (f)(2); proposed paragraph (e)(1)(v)), requires that employers ensure the maximum work-surface height of mobile ladder stands and platforms does not exceed four times the shortest dimension of the base, without additional support. OSHA believes this requirement is necessary to prevent units from tipping over and injuring workers. Also consistent with the existing and proposed rules, the final rule specifies that when mobile ladder stands and platforms need to reach greater heights, the employer must provide additional support such as outriggers, counterweights, or comparable means to stabilize the base and prevent the unit from overturning. The ANSI standard includes the same requirement (A14.7–2011, Section 5.2).

Final paragraph (e)(1)(vi) differs from the existing OSHA rule in one respect: it does not incorporate the testing requirement in existing § 1910.29(f)(2) for calculating the maximum base length, opting instead to adopt a performance-based requirement. Similarly, it does not incorporate the A14.7–2011 testing provisions. OSHA did not receive any comments on the proposal, and adopts it with minor editorial clarifications.

Final paragraph (e)(1)(vii), like proposed paragraph (e)(1)(iv), requires that employers ensure wheels and casters on mobile ladder stands and platforms are equipped with a system that will impede horizontal movement when a worker is on the unit. OSHA drew the final requirement from the ANSI standard (A14.7–2011, Sections 4.3.8 and 4.4.9); the existing OSHA rule does not contain a similar provision. OSHA believes the requirement in final paragraph (e)(1)(vii) is necessary to prevent accidental or inadvertent movement of a mobile ladder stand or platform. If the stand or platform suddenly moves, it may cause the worker to fall off the unit. Sudden movement also can cause materials, equipment, and tools to fall off a mobile ladder stand or platform and hit employees working in the immediate area. The phrase ''rigid and swivel'' has been removed from the proposed language because it is unnecessary. In addition, OSHA added the phrase ''when an employee is on a stand or platform'' to the proposed text to clarify that it is acceptable that mobile ladder stands move at other times. OSHA did not receive any comments on the proposed rule, and adopts it as discussed.

Final paragraph (e)(1)(viii), like proposed paragraph (e)(1)(vii), requires that employers ensure mobile ladder stands and platforms do not move while workers are on them. The final rule will prevent workers from falling from mobile ladder stands and platforms. Working on a unit, particularly on the top step or platform, raises the unit's center of gravity, causing the unit to become less stable. If somebody moves the unit, intentionally or not, a worker on the unit could lose his or her balance and experience a serious fall. The same consequences could occur if a worker rides on a mobile ladder stand or platform when somebody moves the unit to a new location in the workplace.

OSHA also drew this requirement from A14.7–2011 (Section 6.4) because the existing rule does not contain a similar requirement. OSHA did not receive any comments on the proposed rule, and adopted it as proposed with minor editorial changes for clarity.

Final paragraph (e)(2) establishes design requirements for mobile ladder stands that apply to mobile ladder stands in addition to the general mobile ladder stand and platform requirements in final paragraph (e)(1). As with the general requirements in final paragraph (e)(1), OSHA carried forward most of the provisions in final paragraph (e)(2) from its existing rule (§ 1910.29) or from A14.7–2011.

Final paragraph (e)(2)(i), like proposed paragraph (e)(2)(i), establishes requirements for mobile ladder stand steps. The employer must ensure that these steps:

- Are uniformly spaced and arranged;
- Have a maximum rise of 10 inches; and
- Have a minimum depth of 7 inches.

The final rule also requires that the employer ensure the slope (angle) of the ''step stringer'' to which the steps are attached is not more than 60 degrees from horizontal. A step stringer (also called a ''stile'' or ''siderail'') is the inclined structural member that supports the steps (treads).

The requirements in final paragraph (e)(2)(i) are consistent with the general requirements for ladders in final paragraph (b) of this section. Final paragraph (b) also requires that ladder steps be ''parallel, level, and uniformly spaced'' (final paragraph (b)(1)) and have steps spaced ''not less than 10 inches and not more than 14 inches apart'' (final paragraph (b)(2))(see discussion of final paragraph (b) above).

Final paragraph (e)(2)(i) differs from the existing OSHA rule (§ 1910.29(f)(3)) in two respects. The final rule does not carry forward the existing requirements to have (1) a 9-inch minimum rise for mobile ladder stand steps, and (2) a minimum 55-degree slope for step stringers. OSHA believes final paragraph (e)(2)(i) simplifies the rule and provides greater compliance flexibility. Since the final rule is virtually identical to the ANSI standard (A14.7–2011, Section 4.3.3), OSHA also believes the revisions to the final rule do not compromise worker protection. OSHA did not receive any comments on the proposed rule, and adopted it with minor editorial revisions.

Final paragraph (e)(2)(ii), like proposed paragraph (e)(2)(iii) and the ANSI standard (A14.7–2011, Section 4.3.6), establishes requirements for mobile ladder stands with a top step height more than 10 feet above lower levels. Final paragraph (e)(2)(ii) requires that employers ensure these mobile ladder stands have handrails on three sides of the top step. The employer must ensure that the handrail has a vertical height of at least 36 inches. Also, top steps with a length (depth) of at least 20 inches, front to back, must have midrails and toeboards.

The requirements in final paragraph (e)(2)(ii) provide additional protection from falls and falling objects that are particularly important when employees work on taller mobile ladder stands. To protect workers from falls, final paragraph (e)(2)(ii) ensures that workers have a handhold to grab onto while they are climbing or located on the top step. In addition, final paragraph (e)(2)(ii) requires top steps that are at least 20 inches in depth to be provided with a midrail and toeboard. This protects adjacent workers from falling objects when the top step becomes large enough for the possibility of materials, tools, equipment, or other objects to be placed on the top step. OSHA drew the requirements in final paragraph (e)(2)(ii) from the ANSI standard (A14.7–2011, Section 4.3.6). The existing OSHA rule (§ 1910.29(f)(4)) does not include any of these protections.

Although final paragraph (e)(2)(ii) is similar to proposed paragraph (e)(2)(iii), it also differs in some respects. OSHA reorganized the final paragraph so it is a plain-language provision. OSHA believes that the reorganized provision in the final rule is easier for employers to understand than the proposed provision.

Also, final paragraph (e)(2)(ii) contains two clarifications of the proposed provision. First, final (e)(2)(ii) clarifies the handrail, midrail, and toeboard requirements, stating that employers must provide these protective structures on three sides of the top step. Although OSHA believes that most employers understand that locating handrails, midrails, and toeboards on three sides is necessary to provide adequate protection to their workers, the final rule expressly clarifies this requirement.

Second, a note to final paragraph (e)(2)(ii), like final paragraph (e)(1)(v), incorporates an alternative method from the handrail and midrail requirement for special-use applications. (See the explanation of the exception for special-use applications in paragraph (e)(i)(v) above.) OSHA did not receive any comments on the proposed provision, and adopts it as revised.

Final paragraph (e)(2)(iii), like proposed paragraph (e)(2)(iv), requires that employers ensure the standing areas of mobile ladder stands are within the base frame. OSHA believes this requirement is necessary to ensure the stability of mobile ladder stands. Keeping the center of gravity within the base frame increases the stability of the mobile ladder stand. This requirement reduces the potential for the mobile ladder stand to tip when a worker is using it.

OSHA drew final paragraph (e)(2)(iii) from the ANSI standard (A14.7–2011, Section 4.3.9) since the existing OSHA rule does not include this requirement. Consistent with the goal of making the final rule more performance based, OSHA did not adopt the stability-testing requirements in the ANSI rule (A14.7–2011, Section 5). OSHA did not receive any comments on the proposed provision, and adopts it as proposed.

Employers must comply with the design requirements for mobile ladder stand platforms specified by final paragraph (e)(3), as well as the general requirements for mobile ladder stands and platforms in final paragraph (e)(1). OSHA drew most of these requirements from A14.7–2011. In addition, OSHA expanded the existing requirements on mobile ladder stands in § 1910.29 that apply to mobile ladder stand platforms.

Final paragraph (e)(3)(i), like the proposed paragraph and final paragraph (e)(2)(i), requires that employers ensure the steps of mobile ladder stand platforms:

- Are uniformly spaced and arranged;
- Have a maximum rise of 10 inches; and
- Have a minimum depth of 7 inches.

The final rule also requires that the employer ensure the slope (angle) of the ''step stringer'' to which the steps are attached is not more than 60 degrees from horizontal.

Final paragraph (e)(3)(i) differs from final paragraph (e)(2)(i) in one respect. It includes an exception when the employer demonstrates that the final requirement is not feasible. In that circumstance, the employer may use mobile ladder stand platforms that have steeper slopes or vertical rung ladders, provided the employer stabilizes the alternative unit to prevent it from overturning. The final rule includes this exception because OSHA recognizes that there may be situations or locations where, for example, the slope of the step stringer on a mobile ladder stand platform may need to be greater than the 60-degree limit. To illustrate, there may be a workplace space where the employer needs to use a mobile ladder stand platform, but the unit does not fit. In that situation, OSHA believes it would be appropriate to use an alternative unit with a steeper stringer slope or a vertical rung ladder that takes up less space.

The ANSI standard also includes a similar exception for mobile ladder stand platforms (A14.7–2011, Section 4.4.3). The exception in the ANSI standard specifically permits employers to use alternative mobile ladder stand platforms that have steps with a slope of 60 to 70 degrees. OSHA notes that some alternative units consist of retractable ship's stairs which, consistent with final § 1910.25(e)(1), have a slope of 60 to 70 degrees. When employers demonstrate the final rule is not feasible, OSHA notes that employers will be in compliance with final paragraph (e)(3)(i) if they use mobile ladder stand platforms with a slope of up to 70 degrees, the limit permitted by A14.7–2011, Section 4.4.3. The exception also requires that employers properly stabilize the alternative unit to reduce the risk of workers falling off the steeper steps. OSHA did not receive any comments on the proposed provision, and adopts it as discussed above.

Final paragraphs (e)(3)(ii) and (iii) establish requirements addressing the platform area of mobile ladder stand platforms. When the height of the platform is 4 feet to 10 feet, final paragraph (e)(3)(ii) requires that employers ensure the platform areas have handrails and midrails. Employers also must ensure the handrails on the platforms in this height range have a vertical height of at least 36 inches. As discussed in final paragraph (e)(2)(ii), these requirements are necessary to protect workers from falling off walking-working surfaces that are 4 feet or more above a lower level.

Although the existing OSHA rule contains a requirement for handrails on mobile ladder stands (§ 1910.29(f)(4)), it only requires that the vertical of height of the handrails be at least 29 inches, which is not as protective as the ANSI standard. Therefore, OSHA adopted final paragraph (e)(3)(ii) from the ANSI standard (A14.7–2011, Section 4.4.4).

Final paragraph (e)(3)(ii) differs from the proposed rule in that OSHA removed the proposed requirement that mobile ladder stand platforms have handrails on the steps if the top step height is 4 feet to 10 feet. The final rule consolidated that requirement in final paragraph (e)(1)(v), which preserves the step-handrail requirement for both mobile ladder stands and platforms. (See discussion of handrails in the summary of final paragraph (e)(1)(v) above.) OSHA did not receive any comments on the proposed requirement, and adopts it as revised.

Final paragraph (e)(3)(iii), like the proposal (proposed paragraph (e)(3)(iii)), establishes requirements for mobile ladder stand platforms that are more than 10 feet above a lower level. For these units, the final rule requires that employers must ensure that the exposed sides and ends of the platforms have both guardrails and toeboards. OSHA notes that all fall protection and falling object protection requirements must meet the systems criteria in final § 1910.29.

OSHA believes it is essential that guardrails on platforms that are more than 10 feet in height comply with the criteria in final § 1910.29(b) to ensure that employers adequately protect workers from falling off the platforms. OSHA also believes that toeboards must meet the criteria in final § 1910.29(k)(1) to ensure workers on the ground are not hit by falling objects. The toeboards must, consistent with the requirements of § 1910.29:

- Have a vertical height of at least 3.5 inches;
- Not have more than a 0.25-inch clearance above the platform surface;
- Be solid or have openings that do not exceed 1-inch at the greatest dimension; and
- Be capable of withstanding a force of at least 50 pounds applied at any downward or outward direction at any point along the toeboard (see final § 1910.29(k)(1)(ii)).

Lastly, like final paragraphs (e)(1)(v) and (e)(2)(ii), final paragraph (e)(3)(iv) includes language, proposed as a note to this provision, that permits the use of removable gates or non-rigid members instead of handrails and guardrails in special-use applications (see further discussion of special-use applications in final paragraph (e)(1)(v) above). OSHA did not receive any comments on the proposed provisions, and adopts them as revised.

Section 1910.24—Step Bolts and Manhole Steps

Final § 1910.24, like the proposed rule, establishes new design, strength, and use requirements for step bolts and manhole steps. The final rule defines a step bolt as ''a bolt or rung attached at intervals along a structural member used for foot placement and as a handhold when climbing or standing'' (§ 1910.21(b)). Step bolts, often are used on metal poles or towers, and include pole-steps, commonly used on wooden poles such as utility poles.

The final rule, like the proposed rule, defines manhole steps as ''steps individually attached to, or set into, the wall of a manhole structure'' (§ 1910.21(b)). Manhole steps are cast, mortared, or attached by mechanical means into the walls of the base, riser, and conical top sections of a manhole.

Telecommunications, gas, and electric utility industries are the industries that most often use step bolts and manhole steps. Manufacturing establishments also use them instead of conventional ladders and stairs, especially in locations where it is infeasible to use ladders and stairs.

OSHA drew the step bolt and manhole step requirements in the final rule from the following six sources:

- The step bolt, pole step, and manhole ladder requirements in OSHA's Telecommunications standard (29 CFR 1910.268);
- The step bolt and manhole step provisions in OSHA's 1990 proposed Walking and Working Surfaces and Personal Protective Equipment (Fall Protection Systems) standard (55 FR 13360), which drew its requirements from proposed Electric Power Generation, Transmission, and Distribution standard (29 CFR 1910.269) (54 FR 4974 (1/31/1989));
- American National Standards Institute/Telecommunications Industry Association (ANSI/TIA) 222–G–1996, Structural Standard for Antenna Supporting Structures and Antennas (ANSI/TIA 222–G–1996) (Ex. 33);
- American National Standards Institute/Telecommunications Industry Association (ANSI/TIA) 222–G–2005, Structural Standard for Antenna Supporting Structures and Antennas (ANSI/TIA 222–G–2005) (Ex. 27);
- American Society for Testing and Materials (ASTM) C 478–13, Standard Specification for Precast Reinforced Concrete Manhole Sections (ASTM C 478–13) (Ex. 381); and
- American Society for Testing and Materials (ASTM) A 394–08, Standard Specification for Steel Transmission Tower Bolts, Zinc-Coated and Bare (ASTM A 394–08).

The requirements in final § 1910.24 replace the step bolt, pole step, and manhole step provisions in the existing Telecommunications standard (§ 1910.268(h)), and final § 1910.23 replaces the ladder requirements in § 1910.268(h). Thus, the final rule deletes those requirements from § 1910.268(h). Therefore, the telecommunications industry, as well as all other users of ladders, step bolts, and manhole steps in general industry must comply with the ladder, step bolt, and manhole step requirements in revised subpart D.

Consistent with section 6(b)(5) of the OSH Act (29 U.S.C. 655(b)(5)), the final rule is performance based to the extent possible. For example, final paragraph (a)(2) of this section requires that the employer ensure that step bolts are designed, constructed, and maintained to prevent the worker's foot from slipping off the ends, instead of mandating specific requirements on the size and shape that the step bolt heads must meet.

OSHA notes that two of the step bolt provisions (final paragraphs (a)(1) and (7)), and all but two of the manhole step requirements (final paragraph (b)(2)), apply only to those steps installed after the effective date of the final rule. OSHA recognizes that many step bolts and manhole steps already in workplaces currently comply with the requirements in final § 1910.24. This high rate of compliance, OSHA believes, is the result of the Agency issuing its Telecommunications standard in 1975 (40 FR 13341 (3/26/1975)), and because the national consensus standards addressing step bolts and manhole steps have been in place for a number of years. That said, OSHA believes the most efficient and least disruptive way to implement the final rule is to require employers to comply with the final rule when they install new step bolts and manhole steps. Employers may install new step bolts and manhole steps when they install new structures (*e.g.,* telecommunications and utility towers), or when they replace damaged step bolts and manhole steps (*e.g.,* broken, missing) that are hazardous for workers to use. Because final paragraphs (a)(8) and (b)(3) of this section require that employers inspect step bolts and manhole steps, respectively, at the start of each work shift, OSHA believes that employers will quickly and readily identify whether hazardous conditions, including damage, are present. If such conditions are present, final § 1910.22(d)(2) and (3) require that employers repair, correct, or replace the step bolts or manhole steps.

For example, if an inspection of an electric utility tower finds a corroded step bolt that cannot support the required load (final paragraphs (a)(6) and (7)), the final rule requires that the employer replace it with one made of corrosion-resistant materials or with corrosion-resistant coatings (final paragraph (a)(1)). However, if the inspection shows existing step bolts still have useful life, *i.e.,* they can support the required load and meet the other requirements in final paragraph (a), the employer can continue to use the step bolt even if it is not made with corrosion-resistant materials or coatings. OSHA believes that following this type of implementation strategy and schedule, rather than requiring employers to retrofit all existing step bolts not made with corrosion-resistant materials or coatings, will ensure that the final rule does not impose an undue burden on employers, while ensuring that the existing step bolts are safe for workers to use.

Paragraph (a)—Step Bolts

Paragraph (a) of the final rule, like the proposal, establishes requirements addressing the design, dimensions, strength, and installation of step bolts. OSHA received a comment recommending that the final rule prohibit the use of step bolts unless it requires that employers provide fall protection, such as ladder safety systems, when workers use step bolts (Ex. 155). Dr. J. Nigel Ellis, of Ellis Fall Safety Solutions, referenced a 1990 Duke Power study he said demonstrated step bolts had a high breaking frequency, and therefore, that fall protection was necessary for workers using step bolts. Dr. Ellis also said fall protection needed to be continuous, and not require the worker to manipulate or handle objects when climbing.

OSHA addressed in final § 1910.28 Dr. Ellis' concerns about protecting workers using step bolts that break unexpectedly. That section requires that employers provide fall protection for workers on any walking-working surface with an unprotected side or edge that is four feet or more above a lower level (§ 1910.28(b)). The final rule is more protective than ANSI/TIA 222–G–2005, which requires that antenna-supporting structures designed for climbing to heights greater than 10 feet must have at least one climbing facility (*e.g.,* step bolts) and a ''safety climb device'' (Section 12.3). The ANSI/TIA 222–G–2005 standard defines a ''safety climb device'' as ''a support system that may be a cable or solid rail attached to the structure'' (Section 12.2), and specifies that the device meet the requirements in the A14.3 standard (Section 12.4).

Final paragraph (a)(1), 1ike the proposed rule, requires that employers ensure step bolts installed in an environment where corrosion may occur are constructed of, or coated with, material that protects against corrosion. The final rule is consistent with 1990 proposed § 1910.24(b)(6) (55 FR 13399). The ANSI/TIA 222–G–2005 standard requires that structural steel members and components must have zinc coating (Section 5.6.1). Although the national consensus standard specifies that hot-dip galvanizing is the preferred method, employers may use other equivalent methods (Section 5.6.1).

Corrosive environments can cause damage to unprotected metals. For example, corrosion can lead to deterioration and weakening that may cause step bolts to break or fail to support the total required load. OSHA believes that corrosion-resistant materials and coatings will protect step bolts and ensure they are capable of supporting at least four times the maximum intended load.

Final paragraph (a)(1), like the proposed rule, applies the requirement prospectively to step bolts installed on or after the effective date of the final rule. As noted above, OSHA believes this is the most efficient way to implement this provision while, at the same time, ensuring worker protection. Mr. Robert Miller, of Ameren Corporation, supported OSHA's decision to make the paragraph (a)(1) prospective (Ex. 189). Accordingly, OSHA is adopting paragraph (a)(1) as discussed.

Final paragraph (a)(2), similar to the proposed rule, requires that employers ensure step bolts are designed, constructed, and maintained to prevent the worker's foot from slipping off the end of it. If a worker's foot slips off the end of the step bolt, the worker could fall or sustain an injury from slipping. Designing the head of the step bolt to prevent the worker's foot from slipping off will provide the requisite protection. Final paragraph (a)(2) also is consistent with the ANSI/TIA 222–G–2005 standard (Section 12.5(f)), as well as 1990 proposed § 1910.24(b)(5).

The proposed rule specified that step bolts be ''designed to prevent slipping or sliding off the end of the bolt,'' but the proposal also required step bolts to be ''designed, constructed, and maintained'' free of recognized hazards (proposed § 1910.22(a)(3)). Only properly designed, constructed, and maintained step bolts will be effective in preventing the worker's foot from slipping off the end, therefore the Agency added ''constructed and maintained'' to final paragraph (a)(2) to emphasize that step bolts must meet these requirements as well. OSHA did not receive any comments on the proposed provision and has adopted paragraph (a)(2) with the revisions discussed.

Final paragraph (a)(3), like the proposed rule, requires that employers ensure step bolts are uniformly spaced at a vertical distance of not less than 12 inches and not more than 18 inches apart, measured center to center. The final paragraph also notes that the spacing from the entry and exit surface to the first step bolt may differ from the spacing between other step bolts. This requirement means that the maximum uniform spacing between alternating step bolts is 18 inches, resulting in a maximum spacing between step bolts on the same side of 36 inches. OSHA believes that uniform spacing helps to ensure safe climbing when using step bolts. (Figure D–6 illustrates the vertical spacing requirements in the final rule.)

The final rule generally is consistent with the proposed rule and the existing Telecommunications standard (§ 1910.268(h)(2)), which limit the maximum vertical spacing between step bolts (alternating) to 18 inches. OSHA adopted the Telecommunications standard in 1975 based on recommendations of a voluntary committee of representatives from telephone companies and communication unions (40 FR 13341 (3/26/1975)). The 1990 proposal specified that the spacing between step bolts be between 6 and 18 inches (§ 1910.24(b)(1)). The ANSI/TIA 222–G–2005 standard requires that the spacing between step bolts be between 10 to 16 inches, with a tolerance of ± 1 inch (Section 12.5).

In the proposed rule, OSHA requested, but did not receive, comments on whether the Agency should adopt the proposed requirement or the spacing that the ANSI/TIA 222–G–2005 standard specifies. OSHA believes that adopting the maximum 18-inch uniform vertical spacing requirement in final paragraph (a)(3) is appropriate for two reasons. First, as mentioned earlier, the step bolt requirement in the Telecommunications standard has been in place for more than 35 years. During that period, the telecommunications industry constructed many towers that have step bolts spaced no more than 18 inches apart. OSHA has no data showing that the maximum 18-inch vertical step bolt spacing requirement in the Telecommunications standard poses any safety problems or resulted in any injury in that industry. Moreover, OSHA believes that most of the telecommunications industry already is in compliance with § 1910.268, and that final paragraph (a)(3) would not impose a financial burden on employers.

Second, if the ±1-inch tolerance allowed in the ANSI/TIA 222–G–2005 standard is taken into account, there is, at most, only a 1-inch difference in the maximum vertical spacing in final paragraph (a)(3) and the ANSI/TIA 222–G–2005 standard. OSHA does not consider this difference to be significant in this provision. Therefore, OSHA is adopting in the final provision, the step bolt spacing requirement (between 12 and 18 inches) that is consistent with OSHA's Telecommunications standard.

Final paragraph (a)(3), like the proposed rule, allows the spacing of step bolts at the entry and exit surface to the first step bolt to differ from the uniform spacing between the other step bolts. For example, the first step bolt on a monopole may be 10 feet above the ground. Having a higher first step bolt on a structure is not unusual; in many cases, this configuration limits unauthorized access to the structure's hazardous heights, communication devices, or electrical wiring.

OSHA's Telecommunications standard also allows the spacing of the initial step bolt to differ from the other steps, ''except where working, standing, or access steps are required'' (existing § 1910.268(h)(2)). The 1990 proposal did not specifically address spacing of the initial step bolt. Section 12.5(a) of ANSI/TIA 222–G–2005 requires that ''spacing shall remain uniform over a continuous length of climb,'' but does not address entry and exit spacing. OSHA believes that allowing a variation in spacing from the entry surface to the first step bolt or from the last step bolt to the exit surface will make it easier and safer for workers to establish their foothold. Once again, since the Telecommunication standard allows the spacing on the first and exit step bolt to differ and OSHA is not aware of any injuries or problems occurring as a result, the Agency is adopting paragraph (a)(3) as proposed, with minor editorial revisions.

Final paragraph (a)(4), like the proposed rule, requires that employers ensure step bolts have a minimum clear width of 4.5 inches. The final rule is the same as OSHA's Telecommunications standard (§ 1910.268(h)(2)); 1990 proposed § 1910.24(b)(2); and the ANSI/TIA 222–G (2005) standard (Section 12.5(f)).

OSHA believes it is necessary that workers have an adequate space on which to step and secure their foothold while climbing or they could slip and fall. OSHA believes the telecommunications industry supports the 4.5-inch minimum clear-step width in the Telecommunications and ANSI/TIA 222–G–2005 standards. In addition, since both standards have been in place for many years, OSHA believes the industry already is in compliance with the minimum clear width requirement.

Mr. Larry Halprin, of Keller and Heckman, said that OSHA should only apply the vertical spacing distance (final paragraph (a)(3)) and minimum clear width (final paragraph (a)(4)) requirements prospectively (Ex. OSHA–S029–2006–0662–0381). He stated that, in the OSHA notice reopening the rulemaking docket on subpart D, the Agency said that the 1990 proposal specified prospective application of the revised provisions, and ''would allow workplaces and equipment meeting existing subpart D requirements to be 'grandfathered in''' (68 FR 23529 (5/2/2003)). However, neither the 2010 nor the 1990 proposed rules stated that OSHA would apply the vertical spacing or minimum clear width requirements prospectively. In addition, as mentioned, the Telecommunications and ANSI/TIA 222–G–2005 standards, which have been in place more than 35 years, include both requirements. Moreover, OSHA received no comments from affected industries indicating that they could not meet the existing vertical spacing and minimum clear width requirements. Therefore, OSHA believes that most employers already are in compliance with final paragraphs (a)(3) and (4). Accordingly, OSHA does not believe it is necessary to limit the vertical spacing and minimum clear width requirements to prospective application and adopts the provisions as proposed, with minor editorial revisions.

Final paragraph (a)(5), like the 2010 and 1990 proposed rules, requires that employers ensure the minimum perpendicular distance between the centerline of each step bolt to the nearest permanent object in back of the step bolt is at least 7 inches. When employers can demonstrate that they cannot avoid an obstruction, the final rule permits them to reduce the minimum perpendicular clearance space to 4.5 inches.

The required 7-inch minimum perpendicular clearance space in final paragraph (a)(5) is consistent with the minimum perpendicular clearance for fixed ladders in final § 1910.23(d)(2), the construction ladders standard (§ 1926.1053(a)(13)), and ANSI/TIA 222–G–2005 standard (Section 12.5). However, final paragraph (a)(5), like the 2010 and 1990 proposals, provides more flexibility than those standards. When the employer demonstrates that an obstruction is not avoidable, final paragraph (a)(5) allows employers to reduce the minimum perpendicular clearance to 4.5 inches for any step bolt.

OSHA believes that a 7-inch minimum perpendicular clearance for step bolts, like fixed ladders, is necessary to ensure workers are able to maintain a secure foothold and negotiate the step bolts while they are climbing or working. Because the final rule gives employers the flexibility to reduce the minimum perpendicular clearance space for any step bolt if an obstruction cannot be avoided, the Agency believes that employers need to be able to demonstrate that they made a case-by-case evaluation and determination that the obstruction was not avoidable in the specific instance. For example, where an employer uses step bolts in an industrial setting because it is not feasible to use fixed ladders or stairs (*e.g.,* space limits), employers need to show they evaluated the specific situation and considered potential options in determining whether they could avoid or remove the obstruction. The language in the final rule clarifies the Agency's intent about the situations in which employers may reduce the minimum perpendicular clearance space on a step bolt. The Agency did not receive comments on proposed paragraph (a)(5) and adopts the requirement as discussed.

Final paragraphs (a)(6) and (7) address strength requirements for existing step bolts and for step bolts installed on or after the effective date of the final rule. The final rule establishes different strength requirements for existing and new step bolts to reduce the need for retrofitting step bolts that currently meet the maximum intended load requirements in final § 1910.22(b) and still have useful life.

Final paragraph (a)(6), like the proposed rule, requires that employers ensure each step bolt installed before the effective date of the final rule is capable of supporting the maximum intended load. The final rule defines maximum intended load as ''the total load (weight and force) of all workers, equipment, vehicles, tools, materials, and loads the employer reasonably anticipates to be applied to a walking-working surface at any one time'' (§ 1910.21(b)).

The final provision is based on the Telecommunications standard requirement that employers shall ensure that no employee nor any material or equipment may be supported or permitted to be supported on any portion of a ladder unless it is first determined, by inspections and checks conducted by a competent person that such ladder is adequately strong, and in good condition (§ 1910.268(h)(1)), and is consistent with 1990 proposed § 1910.24(c)(2). The ANSI/TIA 222–G–2005 standard establishes strength specifications:

A load factor, α_L = 1.5, shall be applied to the nominal loads specified herein:

The minimum nominal load on individual rungs or steps shall be equal to a normal concentrated load of 250 lbs [1.1 kN] applied at the worst-case location and direction.

The minimum nominal load on ladders shall be 500 lbs [2.2 kN] vertical and 100 lbs [445 N] horizontal applied simultaneously, concentrated at the worst-case location between consecutive attachment points to the structure (Section 12.4).

The general requirements in the final rule specify that employers ensure all walking-working surfaces are capable of supporting the total weight and force employers reasonably anticipate placing on that surface (§ 1910.22(b)). Final paragraph (a)(6) reinforces that this requirement applies as well to existing step bolts. OSHA believes step bolts that cannot support their maximum intended load are not safe to use, regardless of when the employer installed them.

The ANSI/TIA 222–G standard has been in place since 2005, and OSHA believes most step bolts manufactured today meet the requirements of that standard. In addition, OSHA's experience is step bolt manufacturers generally specify maximum loads that step bolts can withstand without failure. As such, OSHA believes that most existing step bolts are in compliance with final paragraph (a)(6) and § 1910.22(b). That said, employers must continue to inspect step bolts to ensure that the loads placed on the step bolts covered by this provision do not exceed the maximum intended loads and manufacturer specifications. This is because failure or deflection of step bolts can occur during use, particularly since the weight on step bolts is not static and varies as a worker climbs. OSHA did not receive any comments on proposed paragraph (a)(6), and is adopting it as discussed.

Final paragraph (a)(7), like the proposed rule, requires that employers ensure each step bolt installed on or after the effective date of the final rule is capable of supporting at least four times its maximum intended load. As discussed in the proposed rule, OSHA believes that requiring step bolts be capable of supporting four times the maximum intended load is necessary to provide a safety factor that is adequate to ensure that step bolts do not fail during use. The required safety factor (*i.e.,* 4 times the maximum intended load) will provide an additional level of assurance that step bolt are safe for workers to use. OSHA believes that common engineering practice requires manufacturers to include a safety factor in any product design to account for any unanticipated conditions that may stress the product beyond its designed capabilities.

Final paragraph (a)(7) is consistent with 1990 proposed § 1910.24(c)(1), which specified that ''[e]ach step bolt shall be capable of withstanding, without failure, at least four times the intended load calculated to be applied to the [step] bolt.'' In addition, as mentioned above, the Telecommunications standard requires any portion of a ladder to be ''adequately strong,'' while the ANSI/TIA 222–G–2005 standard establishes specification requirements.

The ASTM A 394–08 standard establishes specification for step bolts with nominal thread diameters of ½, ⅝, ¾, ⅞ and 1-inch (Ex. 383). OSHA believes that ⅝-inch diameter steel step bolts normally comply with the strength requirement in final paragraph (a)(7), and are the most commonly used step bolts in general industry. Manufacturers also produce step bolts smaller than ⅝-inch diameter, but OSHA notes that ½-inch step bolts may not comply with final paragraph (a)(7).

Final paragraph (a)(7), unlike the ANSI/TIA and ASTM standards, is a performance-based requirement. OSHA believes that giving employers flexibility in determining the maximum load they anticipate applying to any step bolt will ensure that the maximum intended load accurately reflects the particular work and workplace conditions present. By contrast, OSHA believes that the ANSI/TIA 222–G–2005 test procedures are for manufacturers, not employers, because manufacturers are in the best position to test whether step bolts meet the strength requirements. Employers are free to use the specifications and test procedures in the ANSI/TIA national consensus standard to determine whether their step bolts meet the maximum intended load requirements in final paragraph (a)(7).

OSHA received two comments on the proposed requirement. As discussed in final paragraph (a)(1), Mr. Miller, of Ameren, supported the Agency's decision to apply the new strength requirement in final paragraph (a)(7) prospectively (Ex. 189). In the second comment, Mr. Richard Willis, of Southern Company, questioned how employers would calculate the performance-based maximum intended load for step bolts in final paragraph (a)(7) (Ex. 192). He recommended:

We suggest that the methodology of National Electric Safety Code (NESC) 2007 Rule 261N be adopted. We also feel that OSHA needs to state a failure criteria for 1910.24(a)(7). . . .

Instead of using the four times the maximum intended load, OSHA should consider using the criteria of the NESC or IEEE 1307 (Ex. 192).

OSHA recognizes the methodologies in the national consensus standards that Mr. Willis recommended are methodologies employers can use to determine and ensure that step bolts are capable of supporting four times the maximum intended load. Employers are free to use the NESC and IEEE 1307 standards, which OSHA referenced in the proposed rule (75 FR 28901) in determining whether their step bolts are capable of supporting four times the total load they reasonably anticipate placing on the step bolt. In a 2003 letter of interpretation, OSHA wrote, ''We believe in most situations an employer's compliance with IEEE 1307–1996 will usually prevent or eliminate serious hazards'' (OSHA letter to Mr. Brian Lacoursiere, May 5, 2003).[21]

Under the performance based final rule, employers may use other methods to ensure step bolts comply with the strength requirement in final paragraph (a)(7). For example, employers may select step bolts that manufacturers test according to the strength requirements specified by the ANSI/TIA 222–G

[21] Available from OSHA's website at: *http://www.osha.gov/pls/oshaweb/owadisp.show_document?p_table=INTERPRETATIONS&p_id=24564.*

standard (Section 12.4), and then ensure that workers do not place a total load on the step bolts that exceeds the specified strength limits.

Mr. Willis also said that OSHA should state the failure criteria for final paragraph (a)(7) as: ''If the intent is a 15 degree deflection as referenced by the NESC and in 1910.24(a)(9), then this should be stated'' (Ex. 192). OSHA does not believe it is necessary to put additional language in final paragraph (a)(7) specifying a ''failure criteria'' for step bolt strength. First, the Agency believes that final paragraph (a)(9) makes clear that step bolts bent more than 15 degrees do not meet the requirement in paragraph (a)(7). Final paragraph (a)(9) states that employers must remove and replace those step bolts. Second, the language Mr. Willis recommended is not performance based as it does not include other failure criteria manufacturers and employers may use. Therefore, OSHA finalizes the provision as discussed.

Final paragraph (a)(8) requires that employers ensure step bolts are inspected at the start of each work shift and maintained in accordance with § 1910.22. By including the reference to § 1910.22, OSHA is emphasizing that step bolts, like all walking-working surfaces, must meet the general requirements in the final rule.

OSHA believes a visual inspection often can reveal structural and other problems with step bolts that may make them unsafe for workers to use. Employers must correct, repair, or replace step bolts with structural problems (*e.g.,* broken, fractured, loose, bent, or corroded step bolts) that indicate that the step bolts cannot support the maximum intended load (final § 1910.22(b) and (d)(2)). A visual inspection also can identify whether step bolts are dry, or likely to be slippery because of snow, ice, or rain (final § 1910.22(a)(2)). Final paragraph (a)(8) requires that employers address these conditions to maintain step bolts in accordance with § 1910.22.

As with the inspection requirements in final § 1910.22, the inspection of step bolts most often will consist of a short, visual observation of the condition of the step bolts. Final paragraph (a)(7) permits workers to perform this visual inspection as they begin to climb the structure, so long as the workers inspect the step bolts before stepping on, or grasping them, and know not to proceed if the step bolts do not pass the visual inspection. Where a worker or supervisor identifies a problem during a visual inspection, a more thorough examination may be necessary. The employer must repair, correct, or replace the damaged or hazardous step bolt before allowing workers to continue climbing the structure.

OSHA notes the proposed rule, like 1990 proposed § 1910.24(c)(4), specified that employers inspect step bolts visually ''before each use.'' The phrase ''before each use'' means before the worker climbs the step bolts for the first time at the start of the work shift. It does not mean that employers must, throughout a work shift, have workers inspect the step bolts each time they climb them. OSHA understands that workers may climb step bolts multiple times during a work shift, and believes that inspecting step bolts at the initial climb is sufficient. OSHA did not receive any comments on the inspection requirement and adopts the requirement as discussed.

Final paragraph (a)(9), like the proposed rule, requires that employers ensure any step bolt that is bent more than 15 degrees from the perpendicular, in any direction, is removed and replaced with a bolt that meets the requirements of the section, before a worker uses it. OSHA believes this provision is necessary because step bolts bent to such a degree are not safe for workers to use. Regardless of the direction of the bend, it could cause the worker to slip or fall off the step bolt. If the bend in a step bolt is more than 15 degrees below horizontal, a worker's feet may slip or slide off the end of the step bolt. If the bend in a step bolt extends upwards more than 15 degrees, it is likely to reduce the minimum clear step width (4.5 inches) necessary to ensure the worker has a secure and safe foothold (final paragraph (a)(4)).

The final rule also requires that employers ensure that step bolts used for replacement meet the all of the requirements of final paragraph (a). This requirement will ensure that replacement step bolts provide workers with the maximum level of protection afforded by paragraph (a).

OSHA drew final paragraph (a)(9) from 1990 proposed § 1910.24(c)(5). OSHA did not receive any comments on paragraph (a)(9), and adopts it as discussed.

Paragraph (b)—Manhole Steps

Final paragraph (b) addresses the design, capacity, and use of manhole steps. There are no requirements specifically addressing manhole steps in existing subpart D, although OSHA's Telecommunications standard establishes requirements to protect workers who use metal ladders in manholes (§ 1910.268(h)(8)). OSHA drew most of the manhole step requirements from the 1990 proposed Walking and Working Surfaces and Personal Protective Equipment (Fall Protection Systems) standard (55 FR 13360), which drew its requirements from a 1989 proposed rule on Electric Power Generation, Transmission, and Distribution. OSHA did not believe that it was necessary to include the manhole step requirements in the Electric Power Generation, Transmission, and Distribution final rule because the 1990 proposed rule to revise subpart D included provisions on manhole steps.

Final paragraph (b)(1), like the proposed rule, requires that employers ensure manhole steps are capable of supporting their maximum intended load, as defined in § 1910.21(b). As mentioned in the discussion of final paragraph (a)(6), final § 1910.22(b) requires that employers ensure all walking-working surfaces are able to support the maximum intended load that employers reasonably anticipate placing on them. Final paragraph (b)(1) emphasizes that the maximum intended load requirement in the final rule applies to existing manhole steps, regardless of when the employer installed them. Manhole steps that cannot support the maximum intended load without failure are not safe to use.

OSHA based the provision on 1990 proposed § 1910.24(c)(2), which also specified that existing manhole steps be capable of supporting their maximum intended load. The ASTM C 478 standard requires vertical and horizontal load testing of manhole steps in accordance with ASTM Test Methods C 497 (Section 16.6.1.3) (Ex. 382).

Final paragraph (b)(1), like final paragraph (a)(6) of this section and final § 1910.22(b), is performance based. However, employers are free to use the test procedures in ASTM C 478 and C 497 in determining whether their manhole steps can support the maximum intended load the employer anticipates placing on them. OSHA did not receive any comments on this provision, and adopted it as proposed wit minor editorial revisions.

Final paragraph (b)(2), like the proposal, establishes requirements for manhole steps installed on or after the effective date of the final rule. OSHA based most of these requirements on 1990 proposed § 1910.24, and ASTM C 478–13, with many of the manhole step requirements in 1990 proposed § 1910.24 applying only prospectively (*e.g.,* 1990 proposed § 1910.24(b)(6), (b)(7), and (c)(3)(i)–(iv))). As mentioned earlier, OSHA believes that applying the manhole step requirements when employers install new or replacement steps is the most efficient and least disruptive way to implement the requirements in final paragraph (b)(2). Manhole steps, compared to step bolts, are generally more expensive to replace, and such replacement may not be necessary when the manhole steps can support the maximum intended load, and the employer inspects them at the start of each work shift, and repairs or replaces them immediately after identifying damage or hazardous conditions.

Final paragraph (b)(2)(i), like the proposed rule, requires that employers ensure manhole steps have a corrugated, knurled, dimpled, or other surface that minimizes the possibility of a worker slipping. The final rule is consistent with the requirements for metal manhole ladders in OSHA's Telecommunications standard (§ 1910.268(h)(8)(v)). The 1990 proposed rule (proposed § 1910.24(b)(7)) specified the same requirement as final paragraph (b)(2)(i) for manhole steps.

OSHA believes this final rule is necessary to reduce workers' risk of slipping and falling. Underground manholes often have moisture and other slippery substances (*e.g.,* mud, grease) that can pose slip hazards for workers. Ensuring that workers have, and can maintain, a secure foothold when entering the manhole and climbing the manhole steps is important to protect them from injury. OSHA notes final paragraph (b)(2)(i) is performance based. Thus employers are free to use any type of surface preparation that effectively minimizes the risk of slipping. OSHA received no comments on the proposed provision and adopts the requirement as discussed.

Final paragraph (b)(2)(ii), like the proposal and final paragraph (a)(1) of this section for step bolts, requires that employers ensure manhole steps are constructed of, or coated with, material that protects against corrosion if the manhole steps are in an environment where corrosion may occur. The final rule is consistent with the Telecommunications standard (§ 1910.268(h)(8) introductory text and (h)(8)(vi)) and 1990 proposed § 1910.24(b)(6)). The Telecommunications standard also requires that employers, when selecting metal ladders, ensure that the ladder hardware must be constructed of a material that is protected against corrosion and that the metals used shall be selected as to avoid excessive galvanic action (§ 1910.268(h)(8)(vi)). The ASTM C 478 standard, however, addresses corrosion hazards using a different approach. The national consensus standard does not require that manhole steps consist of corrosion-resistant materials or have corrosion-resistant coatings. Instead, it requires that ferrous metal steps not painted or treated to resist corrosion must have a minimum cross-sectional dimension of one inch. OSHA believes that requiring all manhole steps to consist of corrosion-resistant material or have corrosion-resistant coatings is more protective, and better effectuates the purposes of the OSH Act, than ASTM C 478. OSHA's final rule protects manhole steps from becoming corroded, while the ASTM C 478 standard requires that employers make ferrous metal steps with large cross-sectional dimensions so they will hold up against corrosion longer.

Furthermore, as discussed in final paragraph (a)(1) of this section for step bolts, OSHA believes that corrosive environments can weaken and cause damage to unprotected metals, including manhole steps. Corrosion resistance will help to prevent deterioration that can lead to failure of manhole steps. OSHA did not receive any comments on the provision and adopts it as proposed with minor editorial clarifications.

Final paragraph (b)(2)(iii), like the proposed rule, requires that employers ensure manhole steps have a minimum clear step width of 10 inches. The final rule is consistent with the ASTM C 478 standard (Section 16.5.2), as well as 1990 proposed § 1910.24(b)(2). The ASTM C 478 standard has been in place for many years, so OSHA believes that most manhole steps have a step width of at least 10 inches. OSHA did not receive any comments on paragraph (b)(2)(iii) and adopts it as proposed.

Final paragraph (b)(2)(iv), like the proposal, requires that employers ensure manhole steps are uniformly spaced at a vertical distance of not more than 16 inches apart, measured center to center between steps. As mentioned above, OSHA believes that uniform spacing helps to make climbing safe. The ASTM C 478 standard specifies a maximum vertical spacing of 16 inches. The 1990 proposed provision (proposed § 1910.24(b)(1) specifies a uniform spacing of not less than six inches nor more than 18 inches apart.

Final paragraph (b)(2)(iv), like final paragraph (a)(3) of this section for step bolts, also allows spacing from the entry and exit surface to the first manhole step to be different from the spacing between the other steps. Additionally, OSHA added a standard method for measuring the distance—from center to center between steps. This measurement method and the allowance for different spacing of the first manhole step are common practices, and will provide the consistency needed to help protect workers, who will be entering, exiting, and working in different manholes. OSHA did not receive any comments on this provision and adopts it as discussed.

Final paragraph (b)(2)(v), like the proposed rule, requires that employers ensure manhole steps have a minimum perpendicular distance of at least 4.5 inches measured between the centerline of the manhole step and the nearest permanent object in back of it. The minimum clear-distance requirement is consistent with 1990 proposed § 1910.24(b)(3) and ASTM C 478, indicating that 4.5 inches is the common, accepted clearance for manhole steps. This requirement will provide adequate foot and hand holds, which are necessary for workers to safely climb manhole steps. OSHA did not receive any comments on this provision and adopts it as proposed.

Final paragraph (b)(2)(vi), like the proposal and final paragraph (a)(2) of this section for step bolts, requires that employers ensure that manhole steps are designed, constructed, and maintained to prevent the worker's foot from slipping or sliding off the end of the manhole step, which can result in a fall or slip. The final rule is the same as 1990 proposed § 1910.24(b)(5).

The proposed rule specified that manhole steps be designed to prevent workers' feet from slipping off the end of the step. For the same reasons discussed above in final paragraph (a)(2) for step bolts, OSHA added ''constructed and maintained'' to the final rule. OSHA did not receive any comments on this provision and adopted it as revised.

Final paragraph (b)(3), like the proposed rule and final paragraph (a)(8) of this section for step bolts, requires that employers ensure manhole steps are inspected at the start of the work shift, and maintained in accordance with § 1910.22. 1990 proposed § 1910.24(c)(4) specified that manhole steps be maintained in a safe condition and visually inspected prior to each use. OSHA's reasons for requiring manhole step inspections at the start of each work shift are the same reasons as those discussed above in final paragraph (a)(8) and, therefore, are not repeated here.

The proposed rule specified that manhole steps be visually inspected before each use. Mr. Miller, of Ameren, objected to the proposed language, saying: ''Manhole steps are inspected when entered. There should be no need for additional inspection which would only increase the time and have little to no impact on safety. This seems only to be a paperwork requirement and would do little to protect workers from hazards'' (Ex. 189).

OSHA is unclear what Mr. Miller means by ''additional inspection,'' specifically whether he is referring to the ''before each use'' language in the proposed rule or the requirement that employers also maintain manhole steps in accordance with final § 1910.22, which requires inspection of walking-working surfaces regularly and as necessary. The ''before each use'' language means that employers must ensure inspection of manhole steps before the first use in a work shift, and not every time a worker climbs on manhole steps. OSHA recognizes that workers may climb manhole steps multiple times during a work shift, and believes that inspecting the manhole steps when workers first use them during a work shift is sufficient. The final rule clarifies this point.

If Mr. Miller is referring to the inspections of walking-working surfaces employers must conduct in accordance with § 1910.22(d)(1), OSHA disagrees with Mr. Miller that such inspections are simply a paperwork burden that have no impact on safety. Conducting regular inspections ensures that hazards are identified and corrected in a timely manner, thereby preventing worker injury or death. Regular inspections also are important if workers do not use manhole steps daily or frequently. Inspections provide the assurances that walking-working surfaces such as manhole steps will be in a safe and useable condition when workers use them.

By contrast, the American Federation of State, County and Municipal Employees (AFSCME) recommended that OSHA strengthen the visual inspection requirement for existing manhole steps: ''Our members report that many of these steps degrade due to exposure to the elements and are difficult to inspect visually. Often manholes are not entered regularly. We suggest the Agency require inventory of manholes that use permanent step ladders and that they be inspected annually'' (Ex. 226). OSHA believes that the level of inspection the final rule requires provides far more protection than AFSCME recommends for existing manhole steps. Final paragraph (b)(3) requires that employers ensure each manhole step is inspected at the start of each work shift, which could amount to multiple inspections each workday, depending on the number of work shifts in a workday. OSHA believes that requiring inspection before initially using manhole steps in a work shift is more protective than using manhole steps that were last inspected almost a year ago.

Final paragraph (b)(3) also requires that employers maintain manhole steps in accordance with final § 1910.22. That section requires employers to inspect walking-working surfaces regularly and as necessary, and to maintain them in safe condition. ''Regular inspection'' means that the employer has some type of schedule, formal or informal, for inspecting walking-working surfaces that is adequate to identify hazards and address them in a timely manner. For purposes of the final rule, ''as necessary'' means that employers must conduct inspections when particular workplace conditions, circumstances, or events occur that warrant an additional check of walking-working surfaces to ensure that they are safe for workers to use. For example, an additional inspection may be necessary to ensure that a significant leak or spill does not create a slip, trip, or fall hazard on a walking-working surface.

OSHA believes this combination of inspection requirements will ensure that employers identify and correct hazardous conditions, such as degradation due to corrosion, on a timely basis, even if workers do not use manhole steps regularly. In addition, the requirement that manhole steps must be capable of supporting the maximum intended load (§ 1910.22(b)) will supplement visual inspections to ensure that manhole steps are safe to use.

Section 1910.25—Stairways

Section 1910.25 of the final rule establishes requirements for the design and installation of stairways. OSHA carried forward the majority of these requirements from the existing rule (§ 1910.24, Fixed industrial stairs), and also drew a number of provisions from the following national consensus standards:

- American Society of Safety Engineers/American National Standard Institute (ASSE/ANSI) A1264.1–2007, Safety Requirements for Workplace Walking/Working Surfaces and Their Access; Workplace, Floor, Wall and Roof Openings; Stairs and Guardrail Systems (A1264.1–2007) (Ex. 13);
- National Fire Protection Association (NFPA) 101–2012, Life Safety Code (NFPA 101–2012) (Ex. 385); and
- International Code Council (ICC) International Building Code-2012 (IBC–2012) (Ex. 386).

Final § 1910.25 is titled ''Stairways,'' which replaces the ''Fixed Industrial Stairs'' title in the existing rule (see discussion of ''fixed industrial stairs'' below). The final rule (§ 1910.21(b)) defines a stairway as ''risers and treads that connect one level with another, and includes any landings and platforms in between those levels.'' Final § 1910.25, like the proposed rule, covers all stairways, including standard, ship, spiral, and alternating-tread type stairs, used in general industry (§ 1910.25(a)). OSHA organized final § 1910.25 by the types of stairways that the final rule covers, and revised the format to add a separate paragraph identifying the scope and application of the section, as follows:

- Paragraph (a), Application, which specifies the stairs the final rule covers and excepts;
- Paragraph (b), now titled General Requirements, which establishes the requirements that apply to *all* covered stairways;
- Paragraph (c), Standard Stairs; and
- Paragraphs (d) through (f), which specify requirements when employers use spiral stairs, ship stairs, and alternating tread-type stairs.

OSHA believes this revised format makes final § 1910.25 easier to understand and follow.

Final § 1910.25, like the proposal, replaces the term ''fixed industrial stair'' in the existing rule with the plain-language term ''stairways.'' In addition, in final § 1910.25, OSHA uses the term, ''standard stairs,'' that § 1910.21(b) defines as ''a fixed or permanently installed stairway.'' In the proposed rule, the Agency explained that ''fixed industrial stairs'' was the term in use when OSHA adopted the existing rule in 1971 from ANSI A64.1–1968 (now A1264.1–2007). The Agency said ''standard stairs'' was easier to understand and consistent with revised and updated national consensus standards (A1264.1–2007, NFPA 101–2006) and industry codes (IBC–2003) (75 FR 28881–82). Those standards and codes used ''standard stairs,'' ''stairways,'' and ''fixed stairs'' interchangeably, and none used or defined ''fixed industrial stairs.''

OSHA requested comment about replacing the term ''fixed industrial stairs,'' particularly whether it would cause confusion or leave a gap in coverage. OSHA only received one comment from the National Fire Protection Association (NFPA), which supported the proposed change (Ex. 97). NPFA said standard stairs was consistent with NFPA 101–2009 (Sections 3.1 and 7.2.2.2.1). OSHA believes it is important to update terminology so standards are easy to understand and reflect current industry practice.

Paragraph (a)—Application

As mentioned, OSHA changed the title of final paragraph (a) to ''Application.'' OSHA believes that ''Application'' better describes the content of paragraph (a), which identifies what stairways the final rule covers and excludes. Final paragraph (a) is broad and comprehensive. The scope of the existing rule, § 1910.24(a), which covers ''interior and exteriors stairs around machinery, tanks, and other equipment, and stairs leading to or from floors, platforms, or pits,'' also is comprehensive. However, OSHA believes the language in the final rule more clearly and fully explains the Agency's objective, and ensures that the final rule does not inadvertently exclude any type of stairway used in general industry.

Final paragraph (a) also lists certain stairways that § 1910.25 does not cover, specifically:

- Stairs serving floating roof tanks;
- Stairs on scaffolds;
- Stairs designed into machines or equipment; and
- Stairs on self-propelled motorized equipment (*e.g.,* motor vehicles, powered industrial trucks).

Stairs serving floating roof tanks. As discussed in the proposed rule, these types of stairs are not covered by recognized industry standards and the Agency does not have any information or sufficient evidence on how to regulate these stairs. OSHA requested information on these types of stairs in the proposed rule and did not receive comment. Therefore, OSHA has not included stairs serving floating roof tanks in the scope of this section.

Stairs on scaffolds. Final paragraph (a) retains the proposed exemption for stairs on scaffolds. Requirements for stairs on scaffolds are provided in the construction industry standards in § 1926.451. In the preamble to the proposed rule, the Agency explained that the purpose of the proposed exemption was to have employers comply with the requirements for stairs on scaffolds contained in § 1926.451. OSHA said the proposed approach would increase consistency among its standards, assist employers who perform both general industry and construction work, and minimize potential for confusion. This exemption is consistent with OSHA's approach in final § 1910.27(a) for scaffolds used in general industry. OSHA believes that having employers who use scaffolding follow a single standard will reduce confusion and help ensure worker safety.

Stairs designed into machines or equipment and stairs on self-propelled motorized equipment. Final paragraph (a) retains the proposed exemption from final § 1910.25 for stairs designed into machines or equipment and stairs on self-propelled motorized equipment, such as motor vehicles and powered industrial trucks. However, OSHA does not intend this exemption to apply to equipment that the existing standard (§ 1910.24) currently covers. For example, the exemption does not apply to equipment such as mobile well-servicing rigs [22] that are transported to various oil and gas wells (*Delta Drilling Co.* v. *OSHC*, 91 F.3d 139 (5th Cir. 1996) (unpublished); Basic Energy Services, 25 BNA OSHC 1811 (No. 14–0542, 2015); Poole Co., Texas Ltd., 19 BNA OSHC 1317 (No. 99–0815, 2000)).

The exemption for stairs designed into machines or equipment and stairs on self-propelled motorized equipment is consistent with the scope of A1264.1–2007 and other national consensus standards, none of which address those stairs either. In the proposed rule, the Agency explained that it did not have sufficient information about such stairs, and there were no national consensus standards or industry codes to turn to for guidance or best industry practices. Although OSHA requested comment and information, only the Society of Professional Rope Access Technicians (SPRAT) responded:

> It is the recommendation of this commenter that any stairs not covered by recognized industry standards, and about which the Agency does not have sufficient information or evidence to regulate, simply be acknowledged as a potentially hazardous situation with provision for protection against falls required (Ex. 205).

SPRAT pointed out that IBC–2009 and A1264.1–2007 only cover stairs associated with buildings, and the scope and requirements of those standards do not include stairs on machines or equipment. Given that, SPRAT said it would be inappropriate for OSHA to use those standards to justify covering stairs on, or designed into, machines and equipment. SPRAT also argued that the rulemaking record did not have adequate information to support regulating such stairs. OSHA agrees with SPRAT and retains the exemption for those reasons.

Although final § 1910.25 does not apply to stairs designed into machines or equipment or stairs on self-propelled motorized equipment, OSHA notes that the OSH Act's requirement that employers provide their workers with a place of employment that is free from recognized hazards that are causing, or are likely to cause, death or serious physical harm continues to apply (see 29 U.S.C. 654(a)(1)).

Final paragraph (a) eliminates the following existing exceptions:

Stairs to construction operations at private residences, articulated stairs installed on dock facilities and stairs used for fire exit purposes. Final § 1910.25 does not include the existing exemption for stairs to construction operations in private residences, and the exemption for articulated stairs installed on dock facilities. OSHA believes that, by specifying that final § 1910.25 only applies to stairs used in general industry it is no longer necessary to retain exemptions for stairs in construction operations in private residences or articulated stairs installed on dock facilities since general industry does not use such stairs. OSHA's construction (29 CFR part 1926) and maritime (29 CFR parts 1915, 1917, and 1918) standards regulate these two types of stairs as stairs used for fire-exit purposes.

OSHA also did not include the existing exemption for stairs used for fire exit purposes in either the proposed or final rules for two reasons. First, OSHA recognizes that employers could use virtually all stairways for fire and emergency exits, which makes a special provision for fire-exit stairs unnecessary. Second, when workers use stairways to exit an area in the event of a fire, it is important that the stairways meet the safety requirements in § 1910.25 so workers are able to safely escape. The Agency notes that its Means of Egress standards (29 CFR part 1910, subpart E) supplement walking-working surfaces requirements, including those in § 1910.25, for those portions of exit routes, including stairways, that are ''generally separated from other areas to provide a protected way of travel to the exit discharge'' (29 CFR 1910.43(c)).

Paragraph (b)—General Requirements

Paragraph (b) of the final rule sets forth general requirements for all stairways covered by this section, while other provisions of § 1910.25 specify

[22] A mobile well-servicing rig, also referred to as a ''workover rig,'' consists of ''a telescoping derrick; . . . articulating platforms to allow for differences in the respective well sites to which the rig travels; as well as many other implements that aid in the maintenance and upkeep of an existing well'' (Basic Energy Services, 25 BNA OSHC 1811 (No, 14–0442, 2015)). Once the rig is placed on ''stable ground'' over the well head, the ''rig-up'' process begins (Id.). ''[T]he platforms of the mobile well servicing rig are attached to the base of a derrick, which is a part of the drilling rig itself . . . The servicing units, though mobile, are placed on stands while in use . . . [T]he sole purpose of the [well-servicing rig] is to serve as a work platform'' (Poole Co., Texas Ltd., 19 BNA OSHA 1317 (No. 99–0815, 2000)). The rigging-up process also includes installation of guardrails, stairs and other implements related to ingress/egress and safety'' (Id.).

requirements for specific types of stairways. The general requirements in the existing rule (29 CFR 1910.23 and 1910.24) only apply to fixed industrial stairs. However, OSHA believes it is necessary to apply these general requirements to all stairways used in workplaces to ensure that workers have adequate protection from fall hazards.

Final paragraph (b)(1), like proposed paragraph (a)(2), requires that employers ensure handrails, stair rail systems, and guardrail systems are provided in accordance with final § 1910.28. This provision is intended to protect workers from falling off stairways. The final rule revises the proposal in two ways. First, OSHA added ''guardrail systems'' to final paragraph (b)(1). There are places on stairways, such as a platform between two flights of stairs, where guardrails, not stair rail systems are used. This was OSHA's intent in the proposed rule and is clarified for the final rule. There is no additional burden imposed on employers because they already must provide protection on unprotected sides and edges 4 feet or more above a lower level in accordance with final § 1910.28. Section 1910.29 of the final rule details the criteria these guardrail systems must meet.

Second, the Agency did not include the note from proposed paragraph (a)(2) in final paragraph (b)(1). The note was moved to § 1910.29(f)(1)(iii) in the final rule. The proposed note specified that the top rail of a stair rail system may also serve as a handrail when installed in accordance with § 1910.29(f). The Agency determined that the note primarily addresses criteria for stair rail systems and is more appropriately placed with the criteria requirements in § 1910.29. OSHA did not receive any comments on the proposed provision and adopted the provision with the clarifications discussed above.

Final paragraph (b)(2), like proposed paragraph (a)(3), requires employers to ensure that the vertical clearance above any stair tread to any overhead obstruction is at least 6 feet, 8 inches, as measured from the leading edge of the tread. Like the proposal, spiral stairs must meet the vertical clearance requirement specified by final paragraph (d)(3), which is 6 feet, 6 inches.

The required vertical clearance in the final rule is lower than the 7-foot minimum clearance in the existing requirement (§ 1910.24(i)). However, the 6-foot, 8-inch clearance is consistent with A1264.1–2007 (Section 6.12) and NFPA 101–2012. OSHA notes that Section 6(b)(8) of the Occupational Safety and Health Act of 1970 (OSH Act) (29 U.S.C. 655(b)(8)) requires OSHA to promulgate rules that are consistent with existing national consensus standards or explain why differences better effectuate the purpose of the OSH Act. The Agency believes that the requirements in A1264.1–2007 and NFPA 101–2012 provide adequate protection and reflect accepted industry practice. OSHA also points out that stairways built in compliance with the existing clearance requirements already meet the final rule. OSHA did not receive any comments on the proposed provision.

Final paragraphs (b)(3) through (5) establish requirements for riser heights, tread depths, and stairway landing platform dimensions. The final paragraphs, which are consistent with existing subpart D, are the minimum criteria necessary to ensure worker safety when using stairs. The final provisions also contain minor non-substantive changes to increase clarity.

Final paragraph (b)(3), like proposed paragraph (a)(4), incorporates the requirement in existing § 1910.24(f) that employers ensure that stairs have uniform riser heights and tread depths between landings. OSHA believes that retaining this requirement is necessary because, in the Agency's experience, even small variations in riser height can cause trips.

OSHA, however, is not carrying forward other language in existing § 1910.24(f). For example, the existing rule requires that employers ensure stair treads and nosings are slip-resistant. OSHA does not believe this provision is necessary because final § 1910.22 already addresses this hazard. To illustrate, § 1910.22(a)(3) requires employers to maintain walking-working surfaces free of hazards such as spills, and § 1910.22(d)(1) requires employers to maintain walking-working surfaces in a safe condition. Therefore, OSHA is not repeating this requirement in final § 1910.25.

Similarly, OSHA believes it is not necessary to include in final § 1910.25(b)(3) the existing language allowing employers to use ''welded bar grating treads without nosings.'' The final rule is performance-based so employers are free to use stairways constructed of any type of material that will meet the requirements of the final rule.

OSHA received comments on the proposed provision. In particular, NFPA argued that the uniform tread and riser dimensions in final paragraph (b)(3) are not achievable because the provision does not include construction tolerances. NFPA stated, ''It is not technically possible to build stairs with consistent riser height and consistent tread depth as construction tolerances creep into the process'' (Ex. 97). To address this issue, NFPA recommended that OSHA incorporate the tolerances allowed in NFPA 101–2009, which permits an allowance of no more than 3⁄16 inches in adjacent tread depth or riser height, and a tolerance of no more than 3⁄8 inches between the largest and smallest tread or riser in any flight of stairs. NFPA stated that the recommendation would provide a ''safety net for compliance'' and would protect employers from an interpretation of ''uniform'' that does not permit any allowance for construction tolerances, or that permits tolerances that are less than the tolerances established in NFPA 101–2009 (Ex. 97).

OSHA believes that minor variations in tread depth and riser height, such as those allowed in NFPA 101–2012 and A1264.1–2007, are acceptable. OSHA understands that minor variations in tread depth and riser height due to construction tolerances are likely to occur when building stairs and these minor variations are acceptable under the final rule.

Final paragraph (b)(4), like proposed paragraph (a)(5) and existing § 1910.24(g), requires that employers ensure the size of stairway landings and platforms is not less than the stair width and not less than 30 inches in depth, as measured in the direction of travel. The final rule is consistent with A1264.1–2007 (Section 6.10). OSHA did not receive any comments on the proposed provision adopts the proposed language with only minor clarifications.

Final (b)(5), like proposed paragraph (a)(6), requires that, when a door or a gate opens directly onto a stairway, employers must provide a platform and ensure the swing of the door or gate does not reduce the effective usable depth of the platform to less than:

- 20 inches for platforms installed before the effective date of the final rule; and
- 22 inches for platforms installed on or after the effective date of the final rule.

The final and proposed rules revise the language of the existing rule (§ 1910.23(a)(10)), which requires employers to ensure that doors or gates do not reduce the effective usable depth to less than 20 inches, by increasing the effective usable platform depth by 2 inches for newly installed platforms. The final rule grandfathers in the 20-inch platform depth requirement for existing stairways. Increasing the platform depth requirement to a minimum 22 inches is consistent with the current and earlier versions of A1264.1 (1995, 2002, and 2007).

The final and proposed rules use the term ''effective usable depth.'' The term means the portion of the platform that is beyond the swing of the door or gate where a worker can stand when opening the door or gate. As Figure D–7 in the regulatory text illustrates, the effective useable depth is that portion of the platform that extends beyond the swing radius of the door or gate when it is open fully to the leading edge of the stair. OSHA believes this term expressly clarifies that the minimum platform depth must consider the portion of the platform used to accommodate the swing of the door or gate.

The Agency requested comment on the proposed provision and the amount of unobstructed space necessary for landing platforms when doors or gates open directly onto them. Ameren Corporation commented:

> The necessary landing outside the swing radius of any door is directly dependent upon the direction of the door's swing in relation to the direction of travel. If the door opens in the direction of travel, much less clearance is needed for the employee. Since no objective evidence is available for one distance for all paths of travel, the clearance of door swing should remain as is and allow the employer to determine whether or not two more inches of clearance is necessary for the safety of their personnel (Ex. 189).

OSHA believes that adopting the 22-inch effective useable platform depth for newly installed stair platforms is appropriate. As mentioned earlier, OSHA drew the requirement from the A1264.1–2007 standard. The standard reflects the considered views of employers, employees, safety professionals, and others. The 22-inch requirement also was in the 1995 and 2002 editions of the A1264.1 standard. With the requirement in A1264.1–2007 being in effect since 1995, OSHA believes it clearly represents accepted industry practice. OSHA notes the 22-inch effective-depth requirement applies to platforms installed on or after the effective date of the final rule, which is January 17, 2017. OSHA believes that the phase-in time the final rule allows is more than adequate for employers who install platforms, gates, and doors on stairways.

Ameren Corporation also raised an issue about the compliance deadline for paragraph (b)(5):

> Lead time for material orders are often quite longer than three months[,] often up to years to order material for large capital projects. Small projects with possibly only a small amount of material being required shouldn't have much of an issue of complying depending on the manufacturer capabilities and their imposed deadlines. Stipulations of ''ordered'' material should be imposed in regard to the date of the final rule because the time between ordering and placing into service is often greater than 90 days (Ex. 189).

The 22-inch platform depth requirement in the final rule is prospective: it only applies to stairways, platforms, doors, and gates installed on or after the effective date of the final rule, which is January 17, 2017. This provision gives employers a 60-day lead time after publication of the final rule to come into compliance with the requirement when they install new stairway platforms. OSHA does not believe that it is necessary to extend the compliance deadline any further, even though the Agency proposed 150 days. The Agency believes a 60-day compliance lead time is more than adequate given that the 22-inch requirement in the A1264.1 standard has been in place for more than 18 years. During this 18-year period, OSHA believes the vast majority of employers, as well as manufacturers, construction companies, and building owners, came into compliance with the 22-inch requirement. Therefore, OSHA requires employers to comply with the 22-inch effective useable platform depth requirement by the standard's effective date.

Final paragraph (b)(6), like proposed paragraph (a)(7), requires that employers ensure stairs can support at least five times the normal anticipated live load, and never less than a concentrated load of 1,000 pounds, applied at any point on the stairway. This requirement is consistent with A1264.1–2007 and earlier versions, which have been in place for many years. OSHA believes that most existing stairs have been installed in accordance with the ANSI requirements, and, therefore, already are in compliance.

OSHA requires employers to apply this safe-load requirement to spiral stairs, ship stairs, and alternating tread-type stairs, as well as standard stairs. OSHA believes the safe-load requirement is necessary to protect workers from stair collapse due to overloading, regardless of the type of stairs they are using. OSHA notes that final paragraph (b)(6), like the ANSI standard, applies to all stairs that § 1910.25 covers.

For the purposes of final paragraph (b)(6), a ''normal anticipated live load'' means a dynamic load (*e.g.,* temporary, of short duration, or moving) that an employer reasonably anticipates will or could be applied to the stairs (see letter to Mr. M. Podlovsky, May 8, 2000).[23] A ''concentrated load,'' for the purposes of final paragraph (b)(6), is the load-application point where the structure would experience maximum stress. Thus, a normal live load is spread over the whole stair tread area, while a concentrated load refers to a load applied at one point on the stair tread.

Final paragraph (b)(6) includes revisions that OSHA believes will provide an equal or greater level of protection to workers than the existing and proposed rules. For example, final paragraph (b)(6) requires that employers ensure stairways ''can support'' the required load, while the existing (at § 1910.24(c)) and proposed rules specify that stairways must ''be designed and constructed'' to support the required load. The revision ensures that, in addition to the design and construction of the stairways, the employer has an ongoing duty to maintain the stairways to ensure they can continue to support the load applied to them without collapse.

The final rule also revises the default strength language to require that stairways be capable of supporting a concentrated load of not less than 1,000 pounds ''applied at any point.'' The existing rule requires that stairways be capable of carrying not less than a ''moving'' concentrated load of 1,000 pounds. OSHA believes the final provision provides equal or greater level of safety by making the final rule applicable to any single point on the stairs, particularly the point that experiences maximum stress. These revisions are consistent with A1264.1–2007. OSHA did not receive any comments on the proposed provision and adopts paragraph (b)(6) with the changes discussed.

Final paragraphs (b)(7) through (9) specify when and where employers must provide standard stairs, and under what conditions employers may use spiral, ship, or alternating tread-type stairs. In final paragraphs (b)(7) and (8), OSHA simplified and reorganized the existing rule (§ 1910.24(b)) to make the requirements clearer and easier to understand than the existing and proposed rules.

Final paragraph (b)(7), like proposed paragraph (a)(8) and existing § 1910.24(b), requires employers to provide standard stairs to allow workers to travel from one walking-working surface to another. The existing and final rules both recognize that standard

[23] OSHA letter to Mr. Podlovsky available at: *http://www.osha.gov/pls/oshaweb/owadisp.show_document?p_table=INTERPRETATIONS&p_id=23731.*

stairs are the principal means of providing safe access in workplaces and employers must provide them when operations necessitate ''regular and routine travel between levels,'' including accessing operating platforms to use or operate equipment. The final provision is consistent with A1264.1–2007 (Section 6.1).

For purposes of the final rule, OSHA describes ''regular and routine travel'' in much the same way as the existing rule in § 1910.24(b). The term includes, but is not limited to, access to different levels of the workplace daily or during each shift so workers can conduct regular work operations, as well as operations ''for such purposes as gauging, inspection, regular maintenance, etc.'' (existing § 1910.24(b)). ''Regular and routine'' also includes access necessary to perform routine activities or tasks performed on a scheduled or periodic, albeit not daily, basis, particularly if the tasks may expose employees to acids, caustics, gases, or other harmful substances, or require workers to manually carry heavy or bulky materials, tools, or equipment (existing § 1910.24(b)).

Final paragraph (b)(7) retains the existing provision allowing the use of winding stairways on tanks and similar round structures when the diameter of the tank or structure is at least 5 feet. OSHA notes that winding stairs on such tanks and structures still must meet the other general requirements for stairways specified in the final rule. This provision does not preclude the use of fixed ladders to access elevated tanks, towers, and similar structures, or to access overhead traveling cranes, etc., when the use of such ladders is standard or common industry practice. OSHA received no comments on the proposed requirement and adopted the provision with only minor editorial change.

Final paragraph (b)(8) allows employers to use spiral stairs, ship stairs, and alternating tread-type stairs (collectively referred to as ''non-standard stairs''), but only when employers can demonstrate that it is not feasible to provide standard stairs.

The existing rule (existing § 1910.24(b)), which OSHA adopted in 1972 from ANSI A64.1–1968 pursuant to section 6(a) of the OSH Act (29 U.S.C. 655(a)), allows employers to use spiral stairs for ''special limited usage'' or as a secondary means of access but only where it is ''not practical'' for employers to provide standard stairs. The existing rule, however does not address either ship or alternating tread-type stairs.

The 1973 proposed rule would have allowed the use of ship stairs ''in restricted spaces in which a fixed industrial stairway cannot be fitted'' (38 FR 24300, 24304 (9/6/1973)), however, OSHA withdrew that proposal (41 FR 17227 (4/23/1976)). In a 1982 letter of interpretation, though, OSHA said if employers use ship stairs in accordance with the 1973 proposal, the Agency would consider it to be a *de minimis* violation of existing § 1910.24(e) (Letter to Edward Feege, August 20, 1982 [24]).

That year OSHA issued Instruction STD 01–01–011 (April 26, 1982) allowing the use of and establishing guidelines for ''a newly developed alternating tread-type stair'' [25] (*See also,* Letter to Mr. Dale Ordoyne, December 2, 1981 [26]). To ensure worker safety, the instruction stated that alternating tread-type stairs must be designed, installed, used, and maintained in accordance with manufacturer's recommendations. In addition, OSHA said alternating tread-type stairs must meet the following requirements:

- The stairs are installed at a 70 degree angle or less;
- The stairs are capable of withstanding a minimum uniform load of 100 pounds per square foot with a design factor of 1.7 and the treads are capable of carrying a minimum concentrated load of 300 pounds at the center of any treadspan or exterior arc with a design factor of 1.7. If the alternating tread-type stairs are intended for greater loading, the employer must ensure the stairs are constructed to allow for additional loading; and
- The stairs are equipped with a handrail on each side to assist employees climbing or descending the stairs.

OSHA announced in both STD 01–01–011 and the 1982 letter of interpretation that it would include provisions on ship stairs and alternating tread-type stairs in the subpart D rulemaking. The 1990 proposal included provisions allowing employers to use spiral, ship, and alternating tread-type stairs and establishing design specifications for each type of stair (55 FR 13360, 13400 (4/10/1990)). No final rule came from that proposal either.

In 2002, in response to an Office of Management and Budget (OMB) request for comment on its Draft Report to Congress on the Costs and Benefits of Federal Regulations, the Copper and Brass Fabricators Council (CBFC) urged OSHA to revise the existing rule (§ 1910.24(b)) to allow the use of ship and spiral stairs in a broader range of situations:

> OSHA regulations under some circumstance require the use of fixed ladders when spiral stairways or ship stairs would be safer . . . [S]ection 1910.24(e) prohibits any stairs with an angle of rise greater than 50 degrees. Unfortunately, it is very common to have a tight location in industry where there is insufficient space for stairs with an angle of 50 degrees or less. Traditionally, these areas would use ship stairs that have separate handles from the stair rail but steps that are less deep than the traditional 8 inch to 12 inch step. Otherwise, a spiral stair was used which allowed a deeper tread. Under the present regulation, industries are required to use rung ladders in these locations which is less safe than spiral stairs or ship stairs (Ex. 4).

The 2010 proposed rule expanded the existing standard to allow employers to use spiral, ship, and alternating tread-type stairs. Similar to the existing rule, the proposal allowed employers to use non-standard stairs for ''special limited usage'' and ''secondary access,'' but only when the employer can demonstrate it is ''not practical'' to provide standard stairs in either situation (proposed paragraph (b)(9)). The proposed rule did not define any of these terms. Also, A1264.1–2007 did not define ''special limited use,'' but OSHA explained in the preamble to the proposed rule that the International Building Code (IBC)–2009 identified ''special limited usage'' area as a space that is no more than 250 square feet (23 m^2) and serves no more than five occupants'' (75 FR 28882). The IBC–2009 also identifies ''galleries, catwalks and gridirons'' as examples of special limited usage areas (75 FR 28882).

Final paragraph (b)(8) differs from the proposed rule in several ways. First, final paragraph (b)(8) deletes the language in the proposed rule limiting the use of non-standard stairs to ''special limited usage'' areas and as a secondary means of access. Although the existing, proposed, and A1264.1–2007 standards permit employers to use non-standard stairs in special limited usage areas and for secondary access, none of these standards defines either term. OSHA believes eliminating those undefined terms makes the final rule easier to understand.

Second, the final rule replaces the proposed language (*i.e.,* ''special limited usage and secondary access situations

[24] Letter to Mr. Feege available from OSHA's Web site at: *http://www.osha.gov/pls/oshaweb/owadisp.show_document?p_table=INTERPRETATIONS&p_id=19042.*

when the employer can demonstrate it is not practical to provide a standard stairway'') with long-standing and familiar performance-based language (*i.e.,* ''can demonstrate that it is not feasible to use standard stairs''). The language in the final rule is consistent with the legal requirements of the OSH Act. In addition, OSHA believes that the language in the final rule gives employers greater flexibility. For example, there may be places other than special limited use areas and secondary access situations where an employer can demonstrate that standard stairs are infeasible. The final rule allows employers to use non-standard stairs in those situations.

Third, the Agency believes the performance-based language in the final rule does a better job of targeting the areas where it is not possible to use standard stairs and, thus, provides more protection for workers than the existing and proposed rules. The final rule limits the use of non-standard stairs to those situations in which it is not possible to use standard stairs. For example, under the final rule, employers must use standard stairs in special limited usage areas if it is possible to install them.

OSHA requested comment on proposed rule, including whether the final rule also should identify additional or specific limited usage areas where employers can use non-standard stairs (75 FR 28882). Two stakeholders said OSHA should narrow the situations in which employers may use non-standard stairs (Exs. 97; 159). For example, NFPA stated:

> [I]t appears that OSHA is proposing to allow other than Standard Stairs to be used as long as the employer shows a Standard Stair cannot be used. However, no criterion as to why a standard stair could not be used is provided. Section 1910.25(a)(9) seems to allow spiral stairs, ship stairs or alternating tread devices without any limits. NFPA suggests OSHA establish a bracket of circumstances when such devices can be used (Ex. 97).

In particular, NFPA recommended that OSHA limit the circumstances in which employers may use non-standard stairs to the following list, which are the circumstances where NFPA 101 Life Safety Code allows the use of non-standard stairs, such as alternating tread-type stairs:

- As a means to access unoccupied roof spaces;
- As a second means of egress from storage elevators;
- As a means of egress from towers and elevated platforms around machinery or similar spaces, and occupied by no more than three persons at the same time; and
- As a secondary means of egress from boiler rooms or similar spaces, and occupied by no more than three persons at the same time (NFPA 101–2009, Section 7.2.11.1).

NFPA added that incorporating the NFPA 101–2009 list would ''close the gap created by the proposed language and greatly limit the circumstances by which 'non-standard' stairs are acceptable for use'' (Ex. 97).

Similarly, Jacqueline Nowell, of the United Food and Commercial Workers Union (UFCW), recommended that OSHA adopt a definition of special limited usage that is narrower than the IBC–2009 definition:

> The Agency refers to the ICC Building Code definition [of special limited usage] as ''a space not more than 250 square feet (23m\2\) in area and serving not more than five occupants.'' Work platforms in many packaging houses would meet this definition of ''special limited usage.'' By allowing the use of spiral stairs or other non-standard stairs, OSHA would be introducing a new and unnecessary hazard to the workers who must climb up and down from these platforms multiple times a day, wearing heavy and bulky layers of personal protective equipment. I urge OSHA to develop a more restricted definition of ''special limited usage'' in order to prevent falls and other injuries to these workers (Ex. 159).

On the other hand, Southern Company (Ex. 192) said the definition of ''special limited usage'' in IBC–2009 (*i.e.,* ''a space not more than 250 square feet'') was too restrictive and urged OSHA to adopt a more flexible approach (Ex. 192). They pointed out that mezzanine storage space generally is a special limited use area, even though in many cases the space may exceed 250 square feet (Ex. 192). They recommended that OSHA follow the approach in STD 01–01–011 and its letters of interpretation and allow the use of non-standard stairs when space limitations make the use of standard stairs infeasible, regardless of whether the space is greater than 250 square feet (Ex. 192) (See Letter to Edward Feege (August 20, 1982) and Erin Flory (February 10, 2006) [27]).

OSHA believes the performance-based language in final paragraph (b)(8) addresses many of the concerns the stakeholders raised. The language in the final rule provides the increased flexibility that Southern Company supports. At the same time, the final rule limits the use of non-standard stairs to those circumstances where, based on specific case-by-case evaluations and demonstrations, it is not possible to use standard stairs. Thus, for example, if it is possible to use standard stairs in a space that is less than 250 square feet, the employer is not permitted to use non-standard stairs under the final rule. In conclusion, OSHA adopts final paragraph (b)(8) as discussed.

Final paragraph (b)(9), which is a new provision, requires employers to ensure that non-standard stairs are installed, used, and maintained in accordance with manufacturer's instructions. Since 1982, OSHA Instruction STD 01–01–011 has applied this requirement to alternating tread-type stairs. Although final § 1910.22(d) already requires that employers inspect and maintain walking-working surfaces in a safe condition, OSHA believes that specifically requiring that non-standard stairs comply with the instructions or provisions the manufacturer has issued for the installation, use, and maintenance is critical to ensure that unique aspects of these stairs are identified and addressed. OSHA also believes this requirement is necessary to minimize potential risks inherent in spiral, ship, and alternating tread-type stairs (*e.g.,* reduced tread depth, increased stair angle, improper climbing techniques) and to ensure those stairs are safe for workers to use. OSHA notes that final paragraph (b)(9), like final § 1910.22(d), applies to existing spiral, ship, and alternating tread-type stairs as well as non-standard stairs installed after the final rule is effective.

Finally, the Agency notes the requirements for spiral, ship, and alternating tread-type stairs in final paragraphs (b)(8) and (9) that employers must follow are in addition to the other general requirements in final paragraph (b) and specific requirements in final paragraphs (d), (e), and (f), which also apply to non-standard stairs.

Paragraph (c)—Standard Stairs

Paragraph (c) of the final rule, like proposed paragraph (b), establishes specific requirements for standard stairs that apply in addition to the general requirements in final paragraph (b). OSHA believes these specific requirements are the minimum criteria necessary to ensure workers can negotiate standard stairs safely. The requirements in final paragraph (c) generally are consistent with the A1264.1–2007 standard and most of the requirements are in the existing rule.

Final paragraph (c)(1), like proposed paragraph (b)(1) and existing § 1910.24(e), requires employers to install standard stairs at angles between 30 and 50 degrees from the horizontal. The final rule is consistent with

---

[27] Available from OSHA's Web site at: *https://www.osha.gov/pls/oshaweb/owadisp.show_document?p_table=INTERPRETATIONS&p_id=25301.*

A1264.1–2007, which permits employers to install standard stairways at angles between 30 and 70 degrees from the horizontal, depending on the type of stairs. The final standard includes a diagram explaining that the slope for standard stairs is 30 to 50 degrees (see Figure D–10). OSHA received no comments on the proposal and adopted the provision as proposed.

Final paragraphs (c)(2) and (3), like proposed paragraphs (b)(2) and (3), require that employers ensure standard stairs have a maximum riser height and minimum tread depth of 9.5 inches.[28] The final rule also includes an exception (final paragraph (c)(5)) on riser heights and tread depths for standard stairs installed prior to the effective date of the final rule, which is January 17, 2017. The exception specifies that employers will be in compliance with the riser height/tread depth requirements if they meet the dimensions specified in the note to final § 1910.25(c)(2) and (3), or if they use a combination that achieves the required angle range of 30 to 50 degrees.

The existing rule (§ 1910.24(e)) does not specify a maximum riser height or minimum tread depth for fixed stairs. Instead, it requires that fixed stairs be installed at an angle of 30 to 50 degrees from horizontal and allows employers to use any combination of uniform riser and tread dimensions that achieves a stairway angle within the required range. To assist employers, the existing rule (§ 1910.24(e), Table D–1) provides examples of riser height and tread depth combinations that will achieve the required angle range. The existing rule also specifies that employers may use riser and tread combinations other than those listed in Table D–1, provided they achieve a stairway angle that is within the required slope of 30 to 50 degrees.

Like the final rule, A1264.1–2007 (Section 6.5) requires a 9.5-inch maximum riser height and minimum tread depth. And like the existing rule, A1264.1–2007 also allows employers to use any combination of riser and tread dimensions that achieve a stair angle within the permissible range. OSHA notes that A1264.1–2007 (Section E6.4) specifies that the permissible angle range for ''typical fixed stair'' is 30 to 50 degrees, which is consistent with the existing and final rules.

OSHA believes that the riser height and tread depth requirements in final paragraphs (c)(2) and (3), respectively, are simpler, clearer, and easier to understand and follow than the existing rule. The final rule also makes it easier for employers to achieve the required stair angle range of 30 to 50 degrees in final paragraph (c)(1).

OSHA received several comments on the proposed riser height and tread depth requirements. For example, Ellis Fall Safety Solutions (Ex. 155) advocated that OSHA follow the maximum riser heights and minimum tread depths of 7 and 11 inches, respectively, in IBC–2009, stating, ''If other locations in commerce are 7/11 why should we not find that at work too? Also it is less tiring for workers to climb a 7/11 stair . . . . OSHA should not be different than the IBC Building Code in this instance'' (Ex. 155).

To reduce employer burdens, Ellis also suggested that the final rule include a provision grandfathering in the riser and tread dimensions of existing stairways until employers do ''major renovation'' of the stairs (Ex. 155). Southern Company agreed that OSHA should grandfather in existing stairways that have a tread depth of less than 9.5 inches, ''[W]e have not seen data that an existing stairway with an 8 inch tread depth produces an increase in the fall exposure that would justify replacing these stairs. Absent data . . . we feel these stairs should be grandfathered'' (Ex. 192).

NFPA, on the other hand, said there was ''no technical justification'' for allowing a tread depth of less than 9.5 inches, especially since it was more lenient than the 11-inch tread depth requirement in new IBC codes (Ex. 97).

OSHA agrees with NFPA that the 9.5-inch minimum tread requirement in the proposed, final, and A1264.1–2007 standards provides stepping space that is adequate to protect workers from falling. Although A1264.1–2007 (Section 6.5) requires a 9.5 maximum riser height and minimum tread depth, an explanatory note also suggests that employers consider the riser and tread requirements in IBC codes. OSHA notes that employers who have or install standard stairs with an 11-inch tread depth, which IBC–2009 requires, are in compliance with the final rule. Moreover, as mentioned above, OSHA grandfathers in the riser heights and tread depths of existing stairs even if they are less than 9.5 inches, which addresses the concerns of Southern Company.

OSHA removed from final paragraph (c)(3) the proposed exception from the minimum tread-depth requirement for stairs with open risers. OSHA adopted the proposed exception from the 9.5-inch tread-depth requirement for open risers from A1264.1–2007. A note to that standard explained: ''Open risers are needed on certain narrow tread and steep angled stair systems and exterior structures'' (Section E6.13.).

NFPA opposed the proposed exception, saying that allowing a tread depth of less than 9.5 inches for open risers is problematic in two ways:

> (1) Where open risers are present, not only does the specific 9.5-inch not apply, but no minimum tread depth is specified. The tread depth could be as little as 3–4 inches. (2) Stairs are used for travel in the downward direction at least as much as they are used for travel in the upward direction. An open riser might help to provide some extra ''effective'' tread depth for persons using the stair for upward travel. . . . [However,] [a]n open riser does not create greater effective tread depth for persons using the stair for downward travel (Ex. 97).

In addition, NFPA maintained that there is no technical justification for permitting a tread depth of less than 9.5 inches when the riser is open, stating, ''The 9.5-inch minimum tread depth specified [in paragraph (c)(3)] is already lenient as compared to the minimum 11-inch tread depth required in new construction model codes. The exemption for open risers should be deleted'' (Ex. 97). OSHA agrees with NFPA and, therefore, removed the proposed exception for standard stairways with open risers from the final rule.

Final paragraph (c)(4), like proposed paragraph (b)(4), requires that employers ensure standard stairs have a minimum width of 22 inches between vertical barriers. Examples of vertical barriers include stair rails, guardrails, and walls. The added language makes the final provision more protective than the existing rule (§ 1910.24(d)), which also requires a tread width of 22 inches but does not specify how to measure the width. The additional language makes the final rule consistent with A1264.1–2007, which requires a minimum clear width of 22 inches. OSHA did not receive any comments on the proposed provisions and adopts the provision as proposed.

The requirements for non-standard stairs in final paragraphs (d) (spiral stairs), (e) (ship stairs), and (f) (alternating tread-type stairs) parallel most of the provisions established for standard stairs in paragraph (c). Like the requirements for standard stairs, the requirements for spiral, ship, and alternating tread-type stairs represent the minimum requirements OSHA believes are necessary to ensure that

[28] Riser height is a vertical distance that is measured from the tread (horizontal surface) of one step to the top of the leading edge of the tread above it. Tread depth is a horizontal distance that is measured from the leading edge of a tread to the point where that tread meets the riser (See § 1910.25, Figure D–8). This method of measuring riser height and tread depth is consistent with NFPA 101–2009 (Section 7.2.2.3.5) and IBC (Section 1009.7.2).

employees are able to move safely from one walking-working surface to another. OSHA adopted the requirements for non-standard stairs from A1264.1–2007, NFPA 101–2012, and IBC–2012.

Paragraph (d)—Spiral Stairs

Final paragraph (d), like proposed paragraph (c), establishes specific requirements for spiral stairs. As mentioned earlier, these requirements apply in addition to the general requirements in paragraph (a). OSHA adopted most of the requirements in final paragraph (d) from NFPA 101–2012. OSHA believes that the vast majority of spiral stairs currently in use already meet the requirements in final paragraph (d) because these spiral stairs conform to the current industry practice expressed in this NFPA standard. Therefore, OSHA believes employers will not have difficulty complying with the final rule.

Final paragraph (d)(1), like paragraph (c)(1) of the proposed rule, requires that employers ensure spiral stairs have a minimum clear width of 26 inches. The ''clear'' width requirement in final paragraph (d)(1) is similar to the approach in final paragraph (c)(4) and A1264.1–2007 (Section 6.3). That is, the width is measured from the vertical barrier on the outside of the stairway to the inner pole onto which the treads are attached. Spiral stairs need a greater width than standard stairs because only the outside portion of the stairs can be stepped on since the inner part of treads are too short in depth. OSHA did not receive any comments on the proposed provision and adopts the provision as proposed.

Final paragraph (d)(2), like proposed paragraph (c)(2) and final paragraph (c)(3), requires that employers ensure that spiral stairs have risers with a maximum height of 9.5 inches. OSHA did not receive any comments on the proposed provision, and the final rule adopts the provision as proposed.

Final paragraph (d)(3) requires that employers ensure spiral stairs have a minimum headroom above the spiral stair treads of at least 6 feet, 6 inches. The final rule also requires that employers measure the vertical clearance from the leading edge of the tread. This requirement means that, at any and every point along the leading edge, the minimum headroom must be at least 6 feet, 6 inches. The proposed rule (paragraph (c)(3)) specifies that same minimum headroom, but proposed to measure it at the center of the leading edge of the tread. OSHA believes it is necessary to revise the method for measuring the vertical clearance to prevent injury to workers when using spiral stairs. The minimum headroom the final rule requires for spiral stairs is two inches less than the headroom final paragraph (b)(2) requires for all other stairways. Because the required headroom is less, OSHA believes it is important that employers measure the required minimum headroom at all points along the leading edge. OSHA did not receive any comments on the provision and adopts the proposed provision with the change discussed.

To ensure that workers are able to maintain safe footing while using spiral stairs, final paragraph (d)(4), like proposed paragraph (c)(4), requires that employers ensure spiral stairs have a minimum tread depth of 7.5 inches. Because the tread depth on a spiral stair is not the same across the width of the tread, the final rule also requires that employers measure the minimum tread depth at a point 12 inches from the narrower edge. This requirement ensures that workers will have adequate space at the point on the tread where they are most likely to step.

Although the minimum tread depth final paragraph (d)(4) requires is less than that for standard stairs, OSHA has several reasons for concluding that the minimum 7.5-inch tread depth is adequate to provide safe footing for workers. First, spiral stairs usually have open risers that provide additional space for the foot. Second, employers use spiral stairs where space restrictions make the use of standard stairs infeasible. In restricted-space situations, there may be insufficient room for stairways with 9.5-inch tread depths. Third, final paragraph (d)(4) is consistent with NFPA 101–2012. OSHA did not receive any comments on the proposal and adopts the provision as proposed.

Final paragraph (d)(5), like proposed paragraph (c)(5), requires that employers ensure spiral stairs have a uniform tread size. As OSHA mentioned in the discussion of paragraph (b)(3), this requirement is necessary because, in the Agency's experience, even small variations in tread size and shape may cause trips and falls. OSHA did not receive any comments on the proposed rule and adopts it as proposed.

Paragraph (e)—Ship Stairs

Final paragraph (e), like proposed paragraph (d), provides specific requirements employers must follow in situations where they may use a type of stair commonly referred to as a ''ship stair'' or ''ship ladder.'' Employers often use ship stairs as a means to bypass large equipment, machinery, or barriers in tight spaces. OSHA drew some of the provisions in final paragraph (e) from the A1264.1–2007 standard.

The requirements in final paragraph (e) apply in addition to the general requirements specified in paragraph (a) above. In addition, OSHA is reorganizing some of the provisions in final paragraph (e) to make the paragraph easier to follow and understand. For example, OSHA is grouping the riser requirements into one provision (final paragraph (e)(2)).

OSHA notes that the requirements in final paragraph (e) apply only to ship stairs used in general industry. Some commenters raised concerns about whether OSHA was applying the requirements in paragraph (e) to ship stairs used on vessels. For example, Northrop Grumman Shipbuilding (NGS) said:

> OSHA has included a definition (§ 1910.21(b)) and design requirements for ship stairs. . . . [W]e wish to clarify that despite the inclusion of the term ''ship stairs'' in the standard, OSHA is not attempting to extend application of the design criteria for ladders, stairs or other walking-working surfaces to vessels, which we believe are under the regulatory authority of the United States Coast Guard (Ex. 180).

Mercer ORC Networks raised similar concerns:

> Mercer believes that OSHA intends to apply this definition to a particular stair or ladder configuration wherever it is found, whether on a ship or in a land-based facility. However, if one reads the definition literally (which should be possible with regulations), one might easily conclude that unless the stairs or ladder are actually aboard a ship, they do not fit the regulation (Ex. 254).

Using the longstanding industrial term ''ship stairs'' does not mean that this final rule applies to any industry sectors or workplaces beyond general industry, or working conditions regulated by other agencies. As mentioned in § 1910.21, OSHA considers ''ship stairs'' to be a term of art for a type of stairway used when standard stairs are not feasible. OSHA recognizes that, historically, vessels used ship stairs to access different levels in restricted spaces. Today, however, employers use these stairs in other situations, including general industry workplaces. OSHA continues to use the term in the final rule to refer to a particular stair design, and not to designate where employers install or use them (see discussion of ship stairs in § 1910.21(b)).

Final paragraph (e)(1), like paragraph (d)(1) of the proposed rule, requires that employers ensure ship stairs are installed at a slope of 50 to 70 degrees from the horizontal. As A1264.1–2007 indicates, this slope range is standard for ship stairs (see Figure 6.4 of A1264.1). OSHA did not receive any comments on the proposed provision and adopts it as proposed.

Final paragraph (e)(2), like paragraph (d)(2) of the proposed rule, addresses risers on ship stairs. First, the provision requires that employers ensure ship stairs have open risers. The final rule is consistent with A1264.1–2007 (Section 6.13), which requires that ship, spiral, and alternating tread-type stairs having a tread depth of less than 9.5 inches must have open risers. The A1264.1–2007 standard explains that open risers are necessary for stairs with narrow tread depth, such as stairs used in restricted space (Sections E6.5 and E6.13). An open riser gives workers additional space to ensure they are able to maintain safe footing on treads that have a narrow tread depth due to the limited space.

Second, final paragraph (e)(2), like proposed paragraph (d)(3), requires that employers ensure ship stairs have a vertical rise between tread surfaces of at least 6.5 inches and not more than 12 inches. For clarity, OSHA moved the proposed requirement to paragraph (e)(2) because it also addresses stair risers. OSHA did not receive any comments on the proposed ship stair requirements for open risers and acceptable riser height and adopts the provision as proposed.

Final paragraph (e)(3), like proposed paragraph (d)(3), requires that employers ensure ship stairs have a minimum tread depth of 4 inches. Employers must apply final paragraph (e)(3) in combination with paragraph (e)(2). Although the required 4-inch minimum tread depth for ship stairs is less than the 9.5-inch minimum tread depth required for standard stairs (final paragraph (c)(3)), nevertheless, OSHA believes the tread depth is adequate to ensure that workers have a safe stepping area because final paragraph (e)(2) requires that ship stairs have open risers. As discussed, open risers give workers additional space to maintain safe footing on ship stairs. Also, together the riser and tread requirements in final paragraphs (e)(2) and (3), respectively, set the necessary framework for employers to achieve the required 50- to 70-degree angle range for ship stairs. OSHA did not receive any comments on the proposed provision and adopts the provision as discussed.

Final paragraph (e)(4), like proposed paragraph (d)(3), requires that employers ensure ship stairs have a minimum tread width of 18 inches. Although the required tread width for ship stairs is 4 inches less than that specified in final paragraph (c)(4), OSHA believes this width is adequate for stairs that employers may use only in certain limited situations, such as in restricted spaces where it is not feasible to use standard stairs. OSHA notes that the final rule makes the tread-width requirement a stand-alone provision, which makes paragraph (e)(4) consistent with the other tread-width provisions in § 1910.25. The Agency did not receive any comments on the proposed tread width provision and adopted it as proposed.

Paragraph (f)—Alternating Tread-Type Stairs

Final paragraph (f), like proposed paragraph (e), establishes specific requirements for those situations in which employers may use alternating tread-type stairs. The requirements in final paragraph (f) apply in addition to the general requirements in final paragraph (b). The Agency based the requirements on OSHA Instruction STD 01–01–011 and three national consensus standards (A1264.1–2007, NFPA 101–2012, and IBC–2012).

Final paragraph (f)(1), like proposed paragraph (e)(1), requires that employers ensure the series of treads installed in alternating tread-type stairs have a slope of 50 and 70 degrees from the horizontal. As A1264.1–2007 indicates, this slope range is standard for alternating tread-type stairs (see Figure 6.4). Final (f)(1) also is consistent with OSHA Instruction STD 01–01–011, which specifies that alternating tread-type stairs must have a slope angle of 70 degrees or less. OSHA did not receive any comments on the proposed requirement and adopts the provision as proposed.

Final paragraph (f)(2), like proposed paragraph (e)(2) and proposed § 1910.28(b)(11)(iii), specifies the required horizontal distance between handrails. It requires that employers ensure the distance between the handrails on alternating tread-type stairs is not less than 17 inches and not more than 24 inches.

OSHA Instruction STD 01–01–011, which allows employers to use alternating tread-type stairs, does not specify a minimum width between handrails. The existing (§ 1910.24(d)), proposed (proposed paragraph (b)(4)), and final rules (final paragraph (c)(4)) require that employers ensure standards stairs have a minimum 22-inch tread width between vertical barriers (*i.e.,* handrails). Similarly, A1264.1–2007 (Section 6.3) requires that all fixed stairs have a minimum ''clear width'' of 22 inches, which, in other words, means that the distance between handrails must be at least 22 inches.

OSHA believes the handrail distance requirement in the final rule better effectuates the purposes of the OSH Act than A1264.1–2007. First, alternating tread-type stairs can pose unique issues. OSHA believes the 17- to 24-inch handrail distance is appropriate and provides needed flexibility to address those issues. For example, as A1264.1–2007 (Section E6.1.1) points out, some alternating tread-type stairs are built so that workers need to descend facing away from the stairs, which makes three-point contact ''a necessity.'' For those stairs, OSHA believes that the distance between handrails may need to be adjusted so workers are able to maintain critical three-point contact while they are descending the stairs.

Second, the final 17- to 24-inch handrail distance requirement is established specifically for the alternating tread-type stairs. By contrast, the 22-inch width requirement in A1264.1–2007 applies to all fixed stairs and does not take into consideration the issues and limitations involved with alternating tread-type stairs. Therefore, OSHA believes the flexibility that final paragraph (f)(2) provides, combined with its specific consideration of the issues involving alternating tread-type stairs, ensures that the final rule will provide appropriate protection.

Finally, adopting a 17- to 24-inch handrail distance is consistent with the NFPA 101–2012 requirement for alternating tread-type stairs (Section 7.2.11.2). Unlike A1264.1–2007, the NFPA 101 standard establishes handrail width requirements specific to alternating tread-type stairs and the unique issues and limitations those stairs involve. OSHA is therefore following the NFPA 101–2012 standard in accordance with section 6(b)(8) of the OSH Act (29 U.S.C. 655(b)(8)).

OSHA notes that since 1986, OSHA Instruction STD 01–01–011 has required that alternating tread-type stairs ''be equipped with a handrail on each side'' to assist workers using the stairs. Final paragraph (f)(2) (*i.e.,* ''between handrails'') is consistent with that instruction. OSHA did not receive any comments on proposed paragraph (f)(2) and adopts as discussed.

Final paragraphs (f)(3) and (f)(4) address tread depth for alternating tread-type stairs. Final paragraph (f)(3), like proposed paragraph (e)(3), requires that employers ensure alternating tread-type stairs have a tread depth of at least 8.5 inches. However, if the tread depth is less than 9.5 inches, final paragraph (f)(4), like proposed paragraph (e)(4), requires that employers ensure alternating tread-type stairs have open risers. The A1264.1–2007 standard contains the same requirement (Section 6.13), explaining that open risers are necessary on stairs with narrow treads (Section E6.13). OSHA did not receive any comments on the proposed provisions, which the final rule adopts with only minor editorial changes.

Final paragraph (f)(5), like proposed paragraph (e)(5), requires that employers ensure that each tread has a minimum width of 7 inches measured at the leading edge (nosing) of the tread. The measurement is taken at the leading edge of the tread because treads on many of these types of stairs narrow at the back of the tread. This requirement is based on a requirement in the IBC–2012 (§ 1009.13.2). OSHA did not receive any comments on the proposed requirements and adopts the provisions as proposed.

Section 1910.26—Dockboards

Section 1910.26 of the final rule establishes requirements for the design, performance, and use of dockboards. The final rule updates the existing requirements for dockboards (existing § 1910.30(a)).[29] For example, the final rule deletes the existing requirement that the design and construction of powered dockboards conform to the 1961 Department of Commerce (DOC) Industrial Lifts and Hinged Loading Ramps Commercial Standard (CS202–56). ANSI/ITSDF B56.1 (2012) and other recently updated national consensus standards supersede the DOC standard. These standards include:

- American National Standards Institute (ANSI)/Industrial Truck Standards Development Foundation (ITSDF) B56.1–2012, Trucks, Low and High Lift, Safety Standard (B56.1–2012) (Ex. 384);
- ASME/ANSI MH14.1–1987, Loading Dock Levelers and Dockboards (MH14.1–1987) (Ex. 371);
- ANSI MH30.1–2007, National Standard for the Safety Performance, and Testing of Dock Loading Devices (MH30.1–2007) (Ex. 372); and
- ANSI MH30.2–2005, Portable Dock Loading Devices: Standards, Performance, and Testing (MH30.2–2005) (Ex. 20).

Both the proposed and final rules adopted provisions that generally are consistent with these national consensus standards. Final § 1910.26 applies to all dockboards unless a provision states otherwise.

The final rule (final § 1910.12(b)) defines a dockboard as a portable or fixed device used to span a gap or compensate for a difference in height between a loading platform and a transport vehicle. Dockboards may be powered or manual, and include, but are not limited to, bridge plates, dock levelers, and dock plates.

''Loading platforms,'' as used in the definition of dockboards, include loading docks, interior floors, driveways or other walking or working surfaces. ''Transport vehicles,'' as used in the definition and in the final rule, are cargo-carrying vehicles that workers may enter or walk onto to load or unload cargo and materials. Transport vehicles include, but are not limited to, trucks, trailers, semi-trailers and rail cars. Employers primarily use transfer vehicles on dockboards in order to move cargo and materials on and off transport vehicles. ''Transfer vehicles,'' which are mechanical powered or non-powered devices to move a payload, include, but are not limited to, powered industrial trucks, powered pallet movers, manual forklifts, hand carts, hand trucks, and other types of material-handling equipment. Transfer vehicles include all mechanical handling equipment that 29 CFR part 1910, subpart N, covers.

These descriptions of transport vehicles and transfer vehicles are consistent with the definitions of those terms in the MH30.1–2007 and MH 30.2–2005 consensus standards. In proposed § 1910.26(d), OSHA used the term ''equipment'' to reference all types of transfer vehicles. OSHA believes the term ''transport vehicle'' more accurately describes the types of equipment OSHA intends to cover in final § 1910.26.

Paragraph (a) of the final rule, like proposed paragraph (a), requires that employers ensure that the dockboards are capable of supporting their maximum intended load. Section 1910.21(b) of the final rule defines ''maximum intended load'' as the total load (weight and force) of all workers, equipment, vehicles, tools, materials, and other loads that the employer ''reasonably anticipates'' to be applied to a walking-working surface at any one time. OSHA recognizes that not all dockboards are equal, and some employers may have multiple dockboards with different capacities. Some dockboards are made of lightweight materials, such as aluminum, designed to support lighter loads such as those that typically occur with manual material handling methods. Other dockboards, such as those made of steel, are typically designed to accommodate a heavier load, such as a laden powered industrial truck. Additionally, portable dockboards may be carried on transport vehicles for use at various loading platforms and subjected to a wide range of anticipated loads.

The final rule differs from existing § 1910.30(a)(1) in that the existing rule requires dockboards to be strong enough to carry the load imposed on them. As OSHA explains in the discussion of final § 1910.21(b), the term ''maximum intended load'' applies not only to total loads currently applied to a walking-working surface, such as a dockboard, but also to total loads that the employer has a reasonable anticipation will be placed on the walking-working surface.

The provision for loads in final § 1910.22(b) requires that employers ensure all walking-working surfaces are capable of supporting the maximum intended load that will be applied to that surface. OSHA believes it is important for clarity to include this performance-based requirement in § 1910.26. OSHA included the provision in final § 1910.26(a) to emphasize that the final rule revised the load criteria in the existing rule from ''load imposed'' to ''maximum intended load.'' Also, OSHA included the load requirement in this section to emphasize that it applies to all dockboards that workers use, regardless of whether the employer or some other entity owns or provides the dockboard; whether the dockboard is portable, fixed, powered, or manual; or whether the employer uses the dockboard as a bridge to a transport vehicle. Finally, OSHA included the requirement in this section to stress that, consistent with MH14.1–1987 (Section 2), the design and construction of all load-supporting parts of the dockboard must ensure that the dockboard unit as a whole, when under load, is capable of supporting the maximum intended load.

The national consensus standards also provide guidance to help employers comply with final paragraph (a). For example, MH14.1–1987 and MH30.2–2005 identify factors and circumstances employers should consider when ensuring their dockboards meet the load requirement in final paragraph (a): ''In selecting dock leveling devices, it is important [for employers/owners] to consider not only present requirements but also future plans or adverse environments'' (MH14.1–1987 (Section 3.1(j) and MH30.2–2005 (Section 6.2.9))).

The MH14.1–1987 standard requires that load-supporting parts of dockboards, including structural steels

[29] The final rule also deletes the existing requirements for forging machine areas and veneer machinery in existing § 1910.30(b) and (c), respectively. OSHA believes these requirements are not necessary because § 1910.22(b) of the final rule, as well as other general industry standards (*e.g.,* 29 CFR part 1910, subpart O (Machinery and Machine Guarding)) already address those hazards. For example, subpart O includes standards on forging machines (§ 1910.218).

and other materials, when under load, conform to American Society for Testing and Materials (ASTM) standards, and that all welded connections on dockboards comply with American Institute of Steel Construction standards (Sections 2(a) and (b)). Similarly, the MH30.1–2007 standard recommends that owners and employers never use dockboards outside the manufacturer's rated capacity (Section 5.4.10). OSHA believes the guidance these national consensus standards provide will help employers ensure that dockboards are able to carry, and do not exceed, the maximum intended load. OSHA did not receive any comments on the proposed provision and adopts it with editorial revisions.

Final paragraph (b)(1), like the proposed rule, requires employers to ensure that dockboards put into initial service on or after the effective date of the final rule, January 17, 2017, are designed, constructed, and maintained to prevent transfer vehicles from running off the dockboard edge. In other words, dockboards put into service for the first time starting on the effective date of the final rule must have run-off protection, guards, or curbs. A ''run-off guard,'' as defined in the MH14.1–1987 standard, is ''a vertical projection running parallel with the normal traffic flow at each side extremity of the dockboard. Its intent is to avoid accidental side exit'' (Section 1.3; *see also* MH30.1–2007 (Section 1.2.16) and MH30.2–2005 (Section 2.9))). For example, run-off protection on many dockboards is simply a lip on the side of the dockboard that is bent 90 degrees from the horizontal portion of the dockboard. The existing rule does not include a similar requirement.

OSHA believes this provision is necessary to protect workers. A transfer vehicle that runs off the side of a dockboard could kill or injure employees working on or near it. For example, forklifts used to load items onto a transport vehicle could seriously injure or kill the operator and nearby workers if the forklift runs off the side of the dockboard. In addition, workers using hand trucks to load and unload materials from a truck could lose their balance and fall if there is no run-off guard to prevent the hand truck from running off the side of the dockboard.

Final paragraph (b)(1) is a performance-based version of the run-off protection requirements in national consensus standards. To illustrate, the MH14.1–1987 standard specifies:

> Run-off guards shall be used for units that bridge an opening in excess of 36 in. (910 mm) from the face of the dock. The minimum run-off guard height shall be 2¾ in (70 mm) above the plate surface. Ends of run-off guards shall be contoured both horizontally and vertically to permit a smooth transition to minimize damage to the tires of handling equipment. (Section 3.2(a); *see also* Sections 3.4(c), 3.5, 3.6.)

The MH30.1–2007 and MH30.2–2005 standards also contain similar specifications (MH30.1–2007 (Sections 5.3.2, 5.3.3) and MH30.2–2005 (Section 6.1.4)) to prevent transfer equipment from accidentally running off the side of the dockboard. OSHA will deem employers that comply with the run-off protection specifications in MH14.1–1987, MH30.1–2007, or MH30.2–2005 as being in compliance with final paragraph (b)(1). OSHA also will consider employers that follow a different approach, or use dockboards with run-off guards of a different height, to be in compliance with the final rule, provided the run-off guards they use are effective in preventing transfer vehicle from running off the dockboard side.

OSHA made several revisions to proposed paragraph (b) in the final rule. First, final paragraph (b)(1) clarifies that this provision is prospective only, that is, it only applies to dockboards put into ''initial service'' on or after the effective date of the final rule. The final rule grandfathers existing dockboards (75 FR 29009–10), meaning employers do not have to replace or retrofit dockboards currently in use.

Second, OSHA revised the compliance deadline for this provision. The effective date specified by the proposed rule was 90 days after the effective date of the final rule. After reviewing the record, OSHA does not believe that the longer proposed compliance phase-in period is necessary because the national consensus standards on which OSHA based final paragraph (b) have been in place for many years. As such, OSHA believes many dockboards currently in use, and virtually all dockboards manufactured today, already have run-off guards. Therefore, OSHA does not believe the compliance date in final paragraph (b) will impose an undue burden on employers.

Third, OSHA added an exception (final paragraph (b)(2)) in response to a comment the Agency received on the proposed provision. The American Trucking Associations, Inc., (ATA) (Ex. 187) said the proposed rule was ''very broad'' and opposed the requirement that all dockboards have run-off protection:

> To load or to unload, the driver of the commercial motor vehicle backs up to the dock slowly and does not stop until contacting the dock or the installed dock bumper blocks. In most cases, the gap between the vehicle and the loading dock is no more than a few inches. Either a dock leveler or portable dockboard is used to reduce even this minimal amount of space. There is insufficient space between the terminal and the truck to permit a powered industrial truck loading or unloading freight to fall to the ground.
>
> OSHA's proposed requirement that portable dockboards and dock plates be provided with edging and curbing is ill-conceived. Moreover, there is no space between the side of the truck and the edge of dock bay opening to allow for a forklift truck to run off of the edge to cause death or injury to the employee.
>
> Further, this requirement actually would reduce safety for employees in the trucking industry, as providing curbing on dock plates would create a tripping hazard for employees walking on the plates (Ex. 187).

Accordingly, ATA recommended that OSHA revise paragraph (b) to specify:

> [C]urbing on dockplates to prevent a vehicle from running off the edge of a ramp or bridging device is not required where there is insufficient space for a vehicle using the device to run off the edge and drop to the ground. Any requirement for curbing on the edges of ramps and bridging devices should be limited to those working environments where a true fall-off hazard exists (Ex. 187).

The Agency agrees with ATA that run-off protection is not necessary when there is insufficient space for equipment to run off the side of the dockboard. Accordingly, OSHA added an exception to final paragraph (b)(1) specifying that employers do not have to use dockboards equipped with run-off guards if there is no fall hazard to guard against. This exception is consistent with MH14.1–1987, MH30.1–2007, and MH30.2–2005, which only require run-off guards when the opening the dockboard bridges exceeds 36 inches (MH14.1–1987 (Sections 3.2(a), 3.4(c), 3.5, 3.6) and MH30.2–2005 (Section 6.1.4)). Unlike the national consensus standards, final paragraph (b)(1) does not specify what size of opening on the dockboard constitutes a run-off hazard. In some circumstances, an opening of less than 36 inches may pose a fall hazard. As such, OSHA believes the most effective way to determine whether a hazard exists is for employers to evaluate whether a particular opening poses a hazard, including considering factors such as the type and size of transfer vehicle the worker is using.

Paragraph (c) of the final rule, like existing § 1910.30(a) and the proposed rule, requires employers to secure portable dockboards by anchoring them in place or using equipment or devices to prevent the dockboard from moving out of a safe position. The final rule also specifies that, when the employer can demonstrate that it is not feasible to secure the dockboard, the employer must ensure that there is sufficient contact between the dockboard and the surface to prevent the dockboard from moving out of a safe position.

OSHA believes this provision is necessary to protect workers from injury or death. If the employer does not securely anchor the dockboard or equip it with a device that prevents movement, it could slide or drop off of the loading platform or transport vehicle, and the worker could fall. Workers also could fall if the dockboard moves or slides while they are on it. In addition, failure to secure a dockboard could expose workers to crush or caught-in hazards if the dockboard moves, and pins or strikes the worker, or causes the load the worker is moving to shift or fall against the worker.

Final paragraph (c) is consistent with B56.1–2012. That standard also requires anchoring or equipping portable dockboards with devices that prevent the dockboards from slipping (Section 4.13.2). B56.1–2012 does not include any requirements for employers to follow when anchoring or equipping portable dockboards from slipping is not feasible. It does require, like final paragraph (c), dockboards of all types be designed and maintained so the ends have ''substantial contact'' with the dock and transport vehicle to prevent the dockboard from ''rocking or sliding'' (Section 4.13.5). Similarly, MH14.1–1987 (Section 3.7(b)), MH30.1–2007 (Section 5.1.7), and MH30.2–2005 (Section 6.2.2) require at least 4-inch overlap between the edge of a dockboard and the edge of the supporting surface (*e.g.,* dock, platform, trailer track bed). OSHA did not incorporate a specific minimum overlap in the final rule because it believes that what constitutes an adequate overlap may involve a number of factors that employers need to determine on a case-by-case basis. OSHA did not receive any comments on proposed paragraph (c) and finalized the paragraph as discussed.

Final paragraph (d), like the proposed rule, requires that employers provide and use measures (*e.g.,* wheel chocks, sand shoes) to prevent transport vehicles from moving while dockboards are in place and workers are using them. OSHA believes it is necessary to prevent transport vehicles from moving in order to protect workers from falling when they work on dockboards. If a transport vehicle moves when a worker is on the dockboard, the sudden movement may cause the worker to fall off the dockboard or the dockboard may be displaced and fall to the ground along with the worker.

The proposed and final rules expand the existing rule (§ 1910.30(a)(5)), which only requires that employers prevent ''rail cars'' from moving when workers are using dockboards to load/unload cargo. However, workers also are exposed to fall hazards when they use dockboards to load/unload other types of transport vehicles. As a result, OSHA expanded the existing rule to ensure that workers are protected whenever they use dockboards, regardless of the type of transport vehicle workers are loading/unloading.

The final rule gives employers flexibility in selecting measures to prevent the transport vehicle from moving. Employers must ensure whatever measures they use are effective in preventing movement, regardless of the type of transport vehicle the employer is loading/unloading. For example, for wheel chocks, which are one of the most frequently used measures to prevent transport vehicles from moving, the size of the transport vehicle wheel determines the size of the wheel chock that will be effective to prevent the vehicle from moving.

OSHA received one comment on the proposed rule. ATA said the requirement is both unnecessary and conflicts with section (4)(b)(1) of the OSH Act (29 U.S.C. 653(b)(1)):

> FMCSA's [Federal Motor Carrier Safety Administration] brake regulations address this condition and preclude OSHA's wheel chocking requirements. Jurisdiction in this matter was asserted in a 2001 letter from then FMCSA Acting Deputy Administrator Julie Cirillo to OSHA officials. The letter clearly asserts FMCSA's exclusive jurisdiction over the immobilization of parked vehicles in stating that FMCSA's parking brake regulations were ''written specifically to protect truck drivers and anyone else who might be injured by inadvertent movement of a parked commercial motor vehicle.'' . . . We believe [FMCSA] brake regulations constitute an 'exercise of statutory authority' to prescribe or enforce standards or regulations affecting occupational safety or health (Ex. 187).

Department of Transportation (DOT) regulates interstate transportation of ''commercial motor vehicles'' (CMV) traveling on public roads, thus, pursuant to section 4(b)(1) of the OSH Act, OSHA is preempted. DOT regulations define a CMV, in part, as a self-propelled or towed vehicle used on the highways in interstate commerce, if the vehicle:

- Has a gross vehicle weight rating or gross vehicle weight of at least 10,001 pounds, whichever is greater; or
- Is used in transporting materials found by the Secretary of Transportation to be hazardous as defined by DOT regulations and transported in a quantity requiring placarding under DOT regulations (49 U.S.C. 31132).

DOT regulations do not apply to transport vehicles that do not meet the definition of CMV, do not operate in interstate transportation, or are not used on public roads. OSHA continues to have authority over:

- Transport vehicles that do not meet the definition of CMV; and
- CMVs not operated in interstate commerce, which includes CMVs that transport materials on private roads or within a work establishment.

OSHA has the authority to enforce chocking requirements in these situations, which the Agency outlined in two letters of interpretation (Letter to Mr. Turner, November 8, 2005 [30] and letter to Mr. Cole, March 7, 2011 [31]). Thus, to the extent that FMCSA covers the specific vehicle, final paragraph (d) does not apply. That said, OSHA believes final paragraph (d) is necessary because not all transport vehicles are CMVs or used on public roads. Employers use transport vehicles to move material and equipment within their facilities. In addition, most transport vehicles are loaded and unloaded off public roads. Therefore, OSHA adopted proposed paragraph (d) with editorial revisions.

Final paragraph (e), like existing § 1910.30(a)(4) and the proposed rule, requires that employers equip portable dockboards with handholds or other means that permit workers to safely handle the dockboard. Handholds and other means of gripping are necessary so workers are able to move and place dockboards without injuring themselves or others. If workers cannot handle or grip a dockboard safely, they could drop it on their feet, crush their fingers while putting the dockboard into place, or fall. Handholds also make it possible to place dockboards into the proper position (*e.g.,* adequate overlap, secure position) so the dockboards will be safe for workers to use.

Final paragraph (e) is essentially the same as existing § 1910.30(a)(4) and is consistent with B56.1–2012 (Section 4.13.3), MH14.1–1987 (Section 3.2.(b)), MH30.1–2007 (Section 5.2.1), and MH30.2–2005 (Section 6.1.6). OSHA notes that these national consensus standards also specify that, when handling a portable dockboard

[30] OSHA letter to Mr. Turner available at: *http://www.osha.gov/pls/oshaweb/owadisp.show_document?p_table=INTERPRETATIONS&p_id=25161.*

[31] OSHA letter to Mr. Cole available at: *http://www.osha.gov/pls/oshaweb/owadisp.show_document?p_table=INTERPRETATIONS&p_id=28121.*

mechanically, employers must provide forklift loops, lugs, or other effective means to move or place the dockboard. There were no comments on the provision and OSHA adopted the provision with minor editorial revisions.

Section 1910.27—Scaffolds and Rope Descent Systems

Final § 1910.27, like the proposed rule, addresses scaffolds and rope descent systems (RDS) used in general industry. The purpose of § 1910.27 is to protect workers whose duties require them to work at elevation, whether on scaffolds or RDS. The existing standards (§§ 1910.28 and 1910.29) address scaffolds, but not RDS. Prior to the final rule, OSHA regulated the use of RDS under the general duty clause (29 U.S.C. 654(a)(1)) and through written policy statements that established minimum expectations for employers who use RDS.

For two reasons, OSHA divided the final rule into separate paragraphs for scaffolds and RDS. First, the record shows that the hazards involved in working on scaffolds are different from the hazards associated with using an RDS (Exs. 66; 122; 221). Second, based on comments received in the record, OSHA believes that the final rule should not regulate RDS as a type of suspended scaffold. Uniformly, commenters said RDS are not suspended scaffolds (Exs. 122; 163; 205). For example, Mr. Matt Adams, with Rescue Response Gear, stated: ''Rope descent systems are described in this document as representing a variation of the single-point adjustable suspension scaffold. This is a terribly antiquated view of what rope work really is, and does not adequately acknowledge the extreme versatility and safety record of rope access'' (Ex. 122). The Society of Professional Access Technicians (SPRAT) had similar concerns, noting:

> Permitting rope descent systems to be regulated as suspended scaffolds is potentially hazardous in that this does not adequately address the versatility, safety, and training required to achieve safety while working suspended on rope. The hazards associated with suspended scaffolds do not in any way emulate the hazards associated with roped access work, and as a result the mitigation measures, training, and equipment requirements also differ (Ex. 205).

For the reasons discussed above, OSHA also revised the title of this section of the final rule to ''Scaffolds and Rope Descent Systems'' from the proposed ''Scaffolds (including rope descent systems).'' OSHA agrees with commenters that the proposed title may mistakenly imply that RDS are a type of scaffold (Exs. 122; 221). The only purpose of the proposed title was to indicate that RDS, like scaffolds, involve working at elevated work locations.

OSHA notes that a number of stakeholders who commented on various provisions of proposed § 1910.27 submitted almost identical comments. OSHA does not cite to all of these comments when discussing each provision of the final rule. Instead, OSHA cites to samplings of those comments when addressing an issue.

OSHA drew the rope descent system requirements in the final rule from the following sources:

- 1991 OSHA memorandum to regional administrators allowing the use of RDS when employers follow all of the provisions outlined therein (Ex. OSHA–S029–2006–0062–0019);
- American National Standards Institute/American Society of Safety Engineers ANSI/ASSE Z359.4–2012 Safety Requirements for Assisted-Rescue and Self-Rescue Systems, Subsystems and Components (ANSI/ASSE Z359.4–2012) (Ex. 387); and
- American National Standards Institute/International Window Cleaning Association I–14.1–2001—Window Cleaning Safety (I–14.1–2001) (Ex. 14).[32]

Paragraph (a)—Scaffolds

Final paragraph (a), like the proposed rule, requires that employers ensure scaffolds used in general industry meet the requirements in the construction scaffold standards (29 CFR 1926, subpart L (Scaffolds)), and, as a result, the final rule deletes the existing general industry scaffold requirements (existing §§ 1910.28 and 1910.29). The construction scaffold standards, which OSHA updated on August 30, 1996 (61 FR 46104; 61 FR 46107; 61 FR 46116)), are more current than the general industry standards, which OSHA first adopted in 1974 (39 FR 23502), and last updated in 1988 (53 FR 12121 (4/12/1988)).

The final rule, similar to the proposed and construction scaffold rules, defines scaffold as a ''temporary elevated or suspended platform and its supporting structure, including anchorage points, used to support employees, equipment, materials, and other items'' (§ 1910.21(b)). For the purposes of final subpart D, scaffolds do not include crane-suspended or derrick-suspended personnel platforms or RDS. OSHA's standard on powered platforms for building maintenance (§ 1910.66) addresses personnel platforms used in general industry.

Commenters supported making OSHA's general industry and construction standards consistent. For example, Mr. Bill Kojola with the AFL–CIO, said: ''We believe that it is important to have consistent standards that address scaffolds so that all workers, regardless of the industry in which they work, have equal or equivalent protection from the hazards that are associated with scaffolds'' (Ex. 172). At the hearing on the proposed rule, Mr. Kojola added:

> OSHA is proposing that general industry comply with the construction industry's scaffold standards in 29 CFR 1926(L). . . . By requiring employers in general industry to comply with the construction scaffold standards, consistency will be achieved as well as a decrease in any confusion that . . . would likely arise if the standards were different between these two industries (Ex. 329 (1/20/2011, p. 222)).

Mr. Mark Damon, president of Damon, Inc., observed: ''My experience is that people in general industry are sometimes involved in the erection of scaffolds. I believe . . . similar protection should be afforded to workers in general industry'' (Ex. 251).

OSHA believes that the final rule will ensure consistent application of the general industry and construction standards, and increase understanding of, and compliance with, the final rule by employers who perform both general industry and construction work. The record indicates that many general industry employers who use scaffolds also perform construction work on scaffolds; therefore, they already are familiar with the construction scaffolds standards. OSHA believes that having those employers comply with a single set of requirements will facilitate

[32] After the rulemaking record was closed and certified on June 13, 2011, ANSI administratively withdrew ANSI/IWCA I–14.1–2001, Window Cleaning Safety, on October 23, 2011, because the standard had not been revised or reaffirmed by the deadline required. ANSI Essential Requirements (*www.ansi.org/essentialrequirements*) specify all that ANSI national consensus standard must be revised or reaffirmed within 10 years from their approval as an American National Standard or the standard is automatically withdrawn (Section 4.7 Maintenance of American National Standards).

SEIU Local 32BJ objected to OSHA's reliance on I–14.1–2001, arguing that the ANSI/IWCA I–14 committee did not operate by consensus and misrepresented votes (Ex. 316, 324, Ex. 329 (1/19/2011), pgs. 5–8). The Local submitted a number of documents purportedly substantiating this claim (see Ex. 316–320). However, ANSI has due process requirements that standards developers must follow. Because the I–14 committee was accredited by ANSI and the I–14.1–2001 standard was approved by ANSI, OSHA presumes those requirements were followed. ANSI's requirements include procedures for dealing with the sort of objections Local 32BJ has made, and nothing in these documents show that Local 32BJ presented its claims to ANSI, through an appeal or otherwise. OSHA is unable to ascertain from the Local's documents that the I–14 committee did not follow the ANSI rules.

compliance and, thus, provide greater worker protection. In addition, these employers will not have to change their current practices to meet the requirements of the final rule. OSHA also believes that other general industry employers should not have difficulty complying with the final rule. The construction scaffold standards include all 21 types of scaffolds the existing general industry standards regulate. Therefore, OSHA finalizes paragraph (a) as discussed.

Paragraph (b)—Rope Descent Systems

Final paragraph (b), similar to the proposed rule, establishes requirements for rope descent systems (RDS) when employers use them. The final rule defines an RDS as a ''suspension system that supports an employee in a chair (seat board) and allows the employee to descend in a controlled manner and, as needed, stop at any point during the descent'' (§ 1910.21(b)). An RDS, sometimes referred to as controlled descent equipment or apparatus, usually consists of a roof anchorage, support rope, descent device, carabiner(s) or shackle(s), and a chair (seat board) (§ 1910.21(b)). The final rule definition also expressly states that an RDS does not include industrial rope access systems.

The use of RDS is prevalent in the United States today. Employers frequently use RDS in building cleaning (including window cleaning), maintenance, and inspection operations. As far back as 1990, OSHA noted that, according to some estimates, 60 percent of all window cleaning operations used RDS (55 FR 92226). In 2010, Valcourt Building Services (Valcourt) stated that about 70 percent of all window cleaning operations in high-rise buildings in the United States used RDS (Ex. 147).

OSHA's existing general industry and construction standards do not address the use of RDS.[33] In the 1990 proposed rule, OSHA requested comments on whether OSHA should allow or prohibit the use of RDS (55 FR 29224, 29226 (7/18/1990)). Although OSHA did not finalize the 1990 proposal, in 1991 the Agency issued a memorandum allowing the use of RDS when employers follow all of the provisions outlined in that memorandum (hereafter, ''1991 RDS memorandum'') (Ex. OSHA–S029–0662–0019).[34]

The 1991 RDS memorandum specified that employers must use RDS in accordance with the instruction, warnings, and design limitations that the manufacturer or distributor sets. In addition, the 1991 RDS memorandum specified that employers must implement procedures and precautions including employee training; equipment inspection; proper rigging; separate fall arrest systems; equipment strength requirements; prompt employee rescue; padding of ropes; and stabilization. OSHA based the proposed rule on the provisions in the 1991 RDS memorandum. OSHA notes that the International Window Cleaning Association (IWCA) also based its standard, ANSI/IWCA I–14.1–2001—Window Cleaning Safety (I–14.1–2001), on the 1991 RDS memorandum. Commenters overwhelmingly supported, and already comply with, the requirements in that memorandum and I–14.1–2001 (Exs. 138; 147; 163; 184; 221; 242).

OSHA received many comments on RDS, most of which supported allowing employers to use those systems (Exs. 138; 151; 153; 205; 219; 221; 222; 227; 241; 243). First, many commenters said RDS are safe and, as a number of commenters claimed, safer than using suspended scaffolding (Exs. 163; 184; 221; 227; 242; 243; 329 (1/19/2011, pgs. 326–329)). Mr. Stephan Bright, with IWCA and chair of the I–14.1 committee, said that RDS are safe, particularly when used in accordance with the I–14.1–2001 standard, which has established ''accepted safe practices'' for using RDS (Ex. 329 (1/19/2011, p. 466)). He also indicated that OSHA must believe RDS are safe to use because the Agency ''has been referencing this standard since its publication and has used this standard as a guideline to enforce rope descent system safety in over 100 citations against window cleaning contractors in the last 10 years'' (Ex. 329 (1/19/2011, p. 466)). Mr. Bright said that the decreases in injuries and fatalities associated with RDS use since the IWCA issued the I–14.1–2001 standard ''clearly reveal that RDS is a safe and viable means to use when the eight provisions of OSHA's memorandum and the I–14 Standard are met. Enforcement of the same by OSHA only increases the level of safety'' (Ex. 329 (1/19/2011, p. 467)).

Mr. Sam Terry, owner and president of Sparkling Clean Window Company (Sparkling Clean), said his analysis of more than 350 incidents (125 involving window cleaning) showed that RDS are safer than suspended scaffolding (Exs. 163; 329 (1/19/2011, pgs. 326–329)). In particular, he said the analysis indicated that the RDS provisions of the proposed rule would prevent almost every RDS incident, while more than 80 percent of the suspended scaffolding incidents resulted from equipment failure that was ''beyond the control'' of the employer or workers using the equipment (Exs. 163; 329 (1/19/2011, pgs. 326–329)).

Commenters also said RDS are safer than suspended scaffolds because they said RDS do not involve the ''ergonomic consequences'' that suspended scaffolding does (Exs. 163; 184; 221; 242). These commenters pointed out that, in many cases, moving and assembling suspended scaffolding components requires lifting heavy weights, such as davit masts (weighing up to 160 pounds), davit bases (weighing up to 145 pounds), and davit booms (weighing up to 98 pounds).

Second, some commenters supported allowing RDS because RDS give employers greater control over the safety of workers and the public than suspended scaffolding (Exs. 163; 227; 243). With regard to worker safety, Mr. Terry said workers using RDS are able to descend to the ground or ''get themselves and their equipment out of harm's way'' more quickly than workers using suspended scaffolding (Exs. 163). Commenters said this advantage is particularly important if sudden or unexpected dangerous weather hazards appear (Exs. 138; 163; 184; 221; 242). Sparkling Clean said:

> [A] worker can stop and be on the ground in a matter of minutes . . . . [O]f the 65 incidents and 31 fatalities which occurred by users of RDS in the window cleaning industry since 1995, not one occurred as a result of . . . using the equipment during wind gusts, micro bursts or tunneling wind currents (Ex. 163).

Moreover, Sparkling Clean maintained that the adverse weather does not affect using RDS any more than using suspended scaffolding (Ex. 163).

With regard to protecting the safety of the public and other workers on the ground, commenters indicated that RDS are safer because suspended scaffolding requires assembling components, often done on narrow ledges without fall protection, and these components could fall and strike individuals below (Exs. 163; 184; 221; 242).

Third, commenters supported allowing employers to use RDS because acceptance of RDS increased over the last 20 years since OSHA issued the 1991 RDS memorandum and the IWCA adopted its I–14.1 standard, which addresses RDS (Ex. 147). As noted earlier, Mr. Bruce Lapham, of Valcourt, mentioned that, nationally, about 70 percent of all window cleaning operations in high-rise buildings use

[33] The existing general industry rule only covers boatswain's chairs (29 CFR 1910.28(j).

[34] 1991 RDS Memorandum is available from OSHA's Web site at: *http://www.osha.gov/pls/oshaweb/owadisp.show_document?p_table=INTERPRETATIONS&p_id=22722*.

RDS (Ex. 147). IWCA also said that the use of RDS by their member companies has grown since it issued the I–14.1–2001 standard (Ex. 329 (1/19/2011, p. 483)). Mr. Lapham said that, although the IWCA standard made window cleaning safer, he had concerns that without ''clear cut regulations'' on RDS, misuse of that equipment could occur (Ex. 147).

Finally, several commenters urged OSHA to allow employers to use RDS because they are less expensive than suspended scaffolding (Exs. 163; 184; 221; 242). Some commenters said that using suspended scaffolding can cost as much as 30 percent more than using RDS (Ex. 329 (1/19/2011, pgs. 209, 314)). Other commenters said using RDS was less costly even if the building has an existing suspended scaffold system (Exs. 163; 184; 221; 242). Mr. Terry explained:

> The time involved in setting up a powered platform system and riding the scaffold up and down at 30 feet per minute is typically much slower than using [RDS]. The largest cost we incur in providing our services is labor by a significant percentage. Therefore, in many cases, it is actually less expensive to access the side of the building using [RDS] . . . (Ex. 163).

Commenters also said OSHA should allow employers to use RDS even if the design of the building or structure permits the use of other means and methods to perform window cleaning or other maintenance activities (Exs. 163; 184; 221; 242).

OSHA notes that many commenters provided support for the use of RDS, saying that OSHA should allow employers to use RDS, but only if employers follow all of the provisions in OSHA's 1991 RDS memorandum, as well as those in I–14.1–2001, including the 300-foot RDS height limit (Exs. 138; 147; 215; 245; 331).

A number of commenters, primarily workers and worker organizations, opposed allowing employers to use RDS (Exs. 311; 313; 316; 329 (1/19/2011, pgs. 5–8, 17–19)); 329 (1/20/2011, p. 222)). For example, the Service Employees International Union (SEIU) Local 32BJ members opposed allowing RDS because they said RDS were not safe (Exs. 224; 311; 313; 316; Ex. 329 (1/19/2011, pgs. 5–8)). At the hearing, Mr. John Stager, former SEIU Local 32BJ president, said:

> I wonder whether OSHA has seriously studied the hazards and evaluated the history of this rulemaking; and if so, I do not understand how OSHA could have decided that unrestricted use of RDS is compatible with OSHA's mission of adopting fully protective safety standards. I understand that OSHA's [1991 RDS memorandum] was much less than a fully protective standard; rather, it was the way that OSHA deals with hazards for which no standards exist. We disagreed with the terms of the [1991 RDS memorandum] then, and still do today . . . . But, to incorporate the terms of [the 1991 RDS memorandum], or terms like them, in a permanent standard is completely inadequate and flawed. In fact, it flies in the face of the Supreme Court's decision that OSHA must place pre-eminent value on assuring employees a safe and healthful working environment limited only by the feasibility of achieving such an environment (Ex. 329 (1/19/2011, pgs. 5–6)).

Mr. McEneaney, another SEIU Local 32BJ member, added:

> My comparisons and recommendations will ultimately show that even if these proposed safety standards are adopted, controlled descent devices cannot adequately ensure worker safety to the same extent as scaffolding. A major difference between scaffolding and rope descent systems is the type of rope used. The wire rope utilized in scaffolds is never subject to failure due to abrasions; unlike RDS ropes that are constantly at risk of abrasion once it goes past the entry point. There was also no reliable mechanism for protecting RDS rope from abrasion points between the point of entry and the ground; for example, cornices and signs, et cetera (Ex. 329 (1/19/2011, pgs. 17–19)).

Mr. Jesus Rosario, a SEIU Local 32BJ member, and window cleaner since 1989, called RDS ''a very dangerous system'' (Ex. 311). He explained his personal experience with RDS as a way to substantiate his contention:

> The protection gap [for RDS] increases with the length of the rope. The more rope, the more movement. The wind can push you around much more [when using an RDS rather than suspended scaffolding]. When I was about 10 stories, I have swayed as much as 3 windows apart from sudden wind. And I have been pushed by the wind when I was as little as 5 or 6 stories down.
>
> Once, I was working by myself, and the rope below me got caught in a fan. I had to climb down the lifeline rope to get out of the [RDS]—about three stories. . . . Entry over the side [of the roof] is very dangerous. Sometimes, I have even had to jump with my chair to the edge of the building, and then over the side, which could crack the chair (Ex. 311).

Mr. Rosario summed up:

> Please do not allow the contractors and the building owners to use RDS. Sure, sometimes there will be places where you just cannot hang a scaffold. But if there is any way to safely hang a scaffold, it is so much safer that there is no good reason to allow [RDS]. I know it's cheaper for the building owner. But so what—isn't my life worth something too (Ex. 311)?

Mr. Hector Figueroa, SEIU Local 32BJ secretary-treasurer, mentioned the New York regulation prohibiting RDS use on buildings above 75 feet as the best proof that RDS are dangerous, and that OSHA should not allow their use (Ex. 224). SEIU also urged that federal OSHA allow the New York regulation to continue without federal preemption, because they believed it is far more protective than the proposed standard. (See the discussion of the preemption issue in the Federalism section.)

OSHA disagrees with Local 32BJ, and has decided against banning all RDS use. The record shows that RDS is a useful method of accessing the sides of building and necessary, at least in certain circumstances. Further, the record shows that RDS use can be conducted safely if proper precautions are followed.

For more than 20 years OSHA has permitted employers to use RDS, provided that employers follow all of the requirements in the 1991 RDS memorandum. Stefan Bright, with IWCA, provided evidence supporting the inference that the 1991 RDS memorandum protects workers:

> A survey of IWCA membership was conducted in 1996 and it revealed the following facts: . . . that approximately 800 systems were being used on a day to day basis with an average of 8,000 descents a day and over the course of that nine-month season, which fluctuates because [in] the warmer states, it's 12 months, the states like here in the North are about nine, 800 workers performed 1,584,000 descents in 1996. In 1996, there was one fatality by a window cleaner using a rope descent system.
>
> In 1991, OSHA published the infamous eight-step RDS memorandum. In the six years prior to this publication, 1985 to 1991, there were 19 fatalities by window cleaners using RDS to perform an estimated nine million descents using the previous information. In the six years after the memorandum was published, 1991 to 1996, only 11 fatalities occurred when window cleaners were using RDS to perform the same number of descents. So that was a significant drop, almost 50 percent reduction (Ex. 329 (1/19/2011, pgs. 463–465)).

Further, as discussed in the FEA, OSHA conducted an analysis of 36 incidents in which one or more deaths were caused by a fall from an RDS between 1995 and 2001. It found that all of the 21 of these incidents caused by the mishandling or malfunction of RDS system or lifelines would be prevented by compliance with one or more provisions of the final rule. OSHA is not aware of any fatalities involving RDS that have occurred when all of the requirements of the final rule were followed.

The final rule incorporates all of the requirements in the 1991 RDS memorandum. In addition, the final rule adopts additional requirements, including anchorage requirements, a 300-foot RDS height limit, prohibition on RDS use in hazardous weather, securing equipment, and protecting ropes from hazardous exposures. OSHA believes these requirements enhance the protection of workers provided by the 1991 RDS memorandum. Moreover, OSHA believes that the additional protections address a number of the safety concerns SEIU Local 32BJ raised. Accordingly, the final rule continues to allow the use of RDS for suspended work that is not greater than 300 feet above grade.

In the final rule, OSHA added language to the definition of RDS expressly specifying that RDS do not include industrial rope access systems (IRAS) (§ 1910.21(b)). As such, final § 1910.27 does not cover or apply to IRAS. However, other sections of the final rule, including § 1910.28, do cover IRAS.

OSHA agrees with commenters who said IRAS and RDS are different (Exs. 69; 129; 205). For example, Ms. Loui McCurley, of SPRAT, said:

> I would like to point out that rope access is not the same thing as controlled descent, rope descent systems, any other big bucket that you might want to put it in. Rope access systems and rope access technicians vary greatly from just a controlled descent or a rope descent system (Ex. 329 (1/19/2011, pgs. 135–138)).

Commenters also pointed out other differences between the two systems. Global Ascent said that IRAS use a two-rope system (Ex. 129). They stated the two-rope system consists of a working line and a safety line, whereas RDS use only a working line (Ex. 129). Accordingly, Global Ascent noted that IRAS have built-in fall arrest by virtue of the dual-ropes (Ex. 129). Several commenters also said that the training requirements necessary for IRAS use and RDS use are much different (Exs. 78; 129; 205). They also said IRAS users need more training than RDS users. Based on these comments, OSHA concluded that IRAS differ significantly from RDS and did not include them in the RDS requirements in final § 1910.27(b).

Final paragraph (b)(1) adds new requirements for anchorages to secure RDS. The final rule defines anchorage as a secure point of attachment for equipment such as lifelines, lanyards, deceleration devices, and rope descent systems (final § 1910.21(b)). The proposal would have required that employers use ''sound anchorages,'' and OSHA noted that they are ''essential to the safety of RDS'' (proposed § 1910.27(b)(2)(iv); 75 FR 28886). OSHA also noted that the 1991 RDS memorandum required that employers rig RDS properly, including having ''sound anchorages'' (75 FR 28869). Although the proposed rule did not include specific requirements on anchorages for RDS, proposed § 1910.140(c)(12) contained a requirement for a separate anchorage for personal fall arrest systems. The Agency requested comment on whether its proposed approach was sufficient to ensure the safety of anchorages.

OSHA also noted in the proposed rule that the Agency raised the issue of anchorages, and also requested comments in the 1990 proposal (55 FR 29224 (7/18/1990)). At that time, IWCA and window cleaning companies told OSHA that there often were no anchorages on building rooftops (75 FR 28869; OSHA–S041–2006–0666–0543; OSHA–S041–2006–0666–1252; OSHA–S041–2006–0666–1253). Since the companies did not own or have control over the building, they had no control over whether or where building owners would place anchorages. Therefore, they urged OSHA to require building owners to install anchorages and test, inspect, maintain, and certify that the anchorages are capable of holding the RDS, worker, and all equipment. As noted, OSHA did not finalize the 1990 proposed rule.

Today, OSHA continues to believe anchorage requirements are necessary because, as the Final Economic Analysis indicates, anchorage failure is one of the primary causes of window cleaning accidents involving RDS. Data that Mr. Terry, president of Sparkling Clean, compiled and analyzed also showed that lack of sound anchorages accounted for 65 (more than 50 percent) of the 125 window cleaning incidents involving RDS (Ex. 163). Mr. Stefan Bright, with the IWCA, said their analysis of window cleaning fatalities revealed that 95 percent were due to lack of sound anchorages (Ex. 329 (1/19/2011, p. 465)). In addition, commenters uniformly supported adding specific requirements on anchorages to the final rule (Exs. 163; 184; 221; 242).

Final paragraph (b)(1)(i) requires that, before the employer uses any rope descent system, the building owner informs the employer in writing that the building owner has identified, tested, certified, and maintained each anchorage so it is capable of supporting at least 5,000 pounds in any direction, for each worker attached. The final rule also requires that the building owner base the information provided to the employer on:

- An annual inspection; and
- A certification of each anchorage, as necessary, and at least every 10 years.

The building owner must ensure that a ''qualified'' person conducts both the inspection and certification. The final rule defines qualified as a person who, by possession of a recognized degree, certificate, or professional standing, or who by extensive knowledge, training, and experience has successfully demonstrated the ability to solve or resolve problems relating to the subject matter, the work, or the project (§ 1910.21(b)).

For the purposes of final paragraph (b)(1)(i), the term ''as necessary'' means when the building owner knows or has reason to believe that recertification of the anchorage is needed. The final rule gives building owners flexibility in determining when anchorage recertification is necessary. Factors or conditions indicating that recertification may be necessary include, but are not limited to, an accident involving a worker using an RDS, a report of damage to the anchorage, major alteration to the building, exposure of the anchorage to destructive industrial substances, and location of the building in an area of high rainfall or exposure to sea air and humidity that might accelerate corrosion.

OSHA requested comment on adding more provisions ensuring the safety of anchorages in the final rule. In particular, the Agency asked whether it should adopt the information disclosure requirements of § 1910.66.

- Paragraph (c)(1) of § 1910.66 requires that building owners of new installations inform employers in writing that installations meet the requirements of paragraphs (e)(1) and (f)(1) of that section and additional design criteria contained in the other provisions of paragraphs (e) and (f).
- Paragraph (c)(2) of § 1910.66 requires that building owners base the information required in paragraph (c)(1) on the results of a field test of the installation before being placed into service and following any major alteration to an existing installation, and on all other relevant available information, including, but not limited to, test data, equipment specification, and verification by a registered professional engineer.
- Paragraph (c)(3) of § 1910.66 requires that building owners of all installations, new and existing, inform employers in writing that the installation has been inspected, tested, and maintained in compliance with the requirements of paragraphs (g) (inspection, tests, and certification) and (h) (maintenance) of the section and that all protection anchorages meet the requirements of paragraph (I)(c)(10) of appendix C (fall protection anchorages must be capable of supporting 5,000 pounds).

Paragraph (e) of that rule specifies that structural supports, tie-downs, tie-in guides and affected parts of the building included in the installation shall be designed by or under the direction of a registered professional engineer experienced in such design (§ 1910.66(e)(1)(i)).

In addition, the I–14.1–2001 standard requires that building owners provide window cleaning contractors with the following written information:

- The installation or structure has been inspected, tested and maintained in compliance with the requirements of I–14.1–2001;
- All equipment dedicated to the building meets the requirements in Part B (*i.e.,* equipment and building design requirements, such as the requirement that anchorages support a 5,000 pound load in any direction (9.1.11) and that certifications and re-certifications of anchorages be conducted under the supervision of a registered professional engineer (Section 9.1.10);
- Specified load ratings, intended use and limitations to fixtures permanently dedicated to buildings; and
- Manufacturer's instructions for installations, anchorages and fixtures permanently dedicated to the building (Section 1.6.2 (a)–(d)).

Overwhelmingly, commenters supported requiring that building owners identify, test, and maintain anchorages, and certify that those anchorages are capable of supporting 5,000 pounds in each direction for each attached worker.

Many commenters said the anchorage provision is necessary because the lack of ''sound anchorages'' was the leading cause of fatalities and incidents involving RDS (Exs. 138; 163; 184; 221; 222; 243). Valcourt said:

> [W]orkers that use Rope Descent Systems deserve a safe place to work. . . . There is no greater contributing factor to having a safe workplace in which to use an [RDS] than having identified and certified anchorage points in which to tie to. In its 26-year existence, Valcourt has seen both building owners and window cleaners come to a greater understanding of this fact, leading to much safer working conditions (Ex. 147).

Another commenter, 20/20 Window Cleaning of NC, said the new anchorage requirement would prevent accidents and save lives (Ex. 153). IWCA noted that, without the new provision, workers using RDS would not have an equivalent level of protection than do workers who use permanent powered platforms (Ex. 138).

Commenters also said the anchorage requirement is necessary because many building owners do not provide certified anchorages, even though IWCA issued the I–14.1–2001 standard more than 10 years ago (Exs. 147; 163; 245; 329 (1/19/2011, pgs. 218–219)). Valcourt said about 75 percent of the buildings they service do not have certified anchorages, while LWC Services said less than 5 percent of the buildings they service have them (Exs. 147; 245). LWC Services also estimated that seven percent of mid- and high-rise buildings have certified anchorages (Ex. 245). Finally, LWC Services said their most significant problem is finding anchorage points to allow suspension of equipment, and they questioned how they could install anchorages when they only work at a particular location for a couple of days per year, inferring infeasibility (Ex. 245).

Most commenters said they think permanent anchorages are the responsibility of building owners, and they urged OSHA to require that building owners provide anchorages, and to inspect, test, certify, and maintain them (Exs. 138; 147; 163; 184; 193; 221; 242; 329 (1/19/2011; pgs. 378–388)). Valcourt said OSHA needed to mandate that building owners provide anchorages because building owners will not provide and certify anchorages if it is voluntary:

> If OSHA . . . [omits] the requirement of building owners to have their roof anchorage systems initially certified . . . and inspected by a qualified person annually, many building owners will simply state that it is not a requirement of OSHA and not [do it]. This would make the marketplace more dangerous and be a regression of 20 years in window cleaning safety for both the window cleaning and building owner industries (Ex. 147; 329 (1/19/2011, pgs. 378–388)).

Commenters uniformly agreed that OSHA should require that anchorages be capable of supporting 5,000 pounds in all directions for each worker attached, which is consistent with I–14.1–2001 (Section 9.1.1) (Exs. 163; 184; 221; 242; 243). Clean & Polish suggested that OSHA require that anchorages sustain a 5,000 pound load or at least have a 4-to-1 safety factor when using an RDS (Ex. 242). They also supported applying this requirement to tie-backs (Ex. 242).

Commenters were about evenly divided on whether OSHA should codify the language in § 1910.66(c) or the I–14.1–2001 standard. Regarding his support for following the approach in § 1910.66, Mr. Terry, of Sparkling Clean, said:

> I agree that building owners should provide employers with the same information required by 1910.66; a certificate of inspection, testing, and maintenance of anchorages for rope access and suspended scaffolding used in building maintenance, and that an existing certificate for powered platform anchorages would suffice for the same anchorages to be used for rope access. This would allow for rope access to be utilized on buildings with systems or anchorages originally designed for suspended scaffold use without any new requirements or expenses on the building owner (Ex. 329 (1/19/2011, pgs. 224–226)).

Commenters provided recommendations for specific language and items the final requirement on anchorages should contain. For example, Penta Engineering said OSHA should require load testing of all anchorages and davits (Ex. 193). Martin's Window Cleaning (Martin's) said OSHA should require that employers ask for and obtain verification of anchorage certification (Ex. 65).

Several commenters recommended specific timelines for anchorage inspection and certification. Martin's recommended inspections every year, and certifications every 10 years (Ex. 65). Penta Engineering Group agreed, and recommended that OSHA also require anchorage recertification after building owners install new roof systems (Ex. 193).

One commenter urged OSHA to require that building owners ensure qualified persons conduct the annual inspections and certifications (Ex. 204). Other commenters said that professional engineers should perform those tasks (Exs. 65; 193; 329 (1/19/2011, pgs. 378–388)). LJB Inc., noted that it may be a violation of local and state building codes to have anyone other than a professional engineer certify anchorages (Ex. 204). OSHA notes that, under the final provision and the final definition of qualified, building owners are free to use professional engineers to inspect and certify anchorages.

OSHA did not receive any comments opposing an anchorage requirement. OSHA notes that the Building Owners and Managers Association (BOMA) did not submit any comments on the proposed rule or testify at the rulemaking hearing, but they did oppose the requirement in the 1990 proposed rule that building owners provide anchorages. OSHA also notes BOMA was a member of the I–14.1–2001 committee that approved the national consensus standard, which includes anchorage requirements building owners must meet. OSHA agrees with many of the comments and recommendations submitted to the record, and incorporated many of them into the final rule. For example, given that outside contractors generally perform building maintenance (such as window cleaning), and that these outside contractors usually have no control over the building anchorages and are at particular buildings for only a few days, OSHA determined that inspecting, testing, certifying, and maintaining anchorages and providing information about the anchorages must be the responsibility of building owners. Only when building owners take responsibility for anchorages and provide written information to employers and contractors, can there be adequate assurance that workers will be safe when they use RDS.

Final paragraph (b)(1)(ii) establishes a new provision that requires employers to ensure that no employee uses any anchorage before the employer obtains written information from the building owner that the anchorage meets the requirements of final paragraph (b)(1)(i). In other words, the final rule requires that employers ensure no employee uses an RDS until the employer obtains written information that the building owner identified, tested, certified, and maintained each anchorage so it is capable of supporting at least 5,000 pounds in any direction for each worker attached. The final rule also requires that the employer keep the written information from the building owner for the duration of the job.

OSHA's powered platforms standard contains a requirement similar to the final rule (§ 1910.66(c)(4)). Also, the I–14.1–2001 standard requires that employers (*i.e.,* window cleaning contractors) and building owners not allow suspended work to occur unless the building owner provides, identifies, and certifies anchorages (Section 3.9).

OSHA believes the final rule will ensure that each anchorage to which workers attach an RDS meets the inspection, testing, certification, and maintenance requirements of the final rule before workers attach to it. Under the final rule, employers are not to allow workers to attach to an anchorage and begin work if the employer did not receive written certification that the anchorage is capable of supporting 5,000 pounds. Specifically, final paragraph (b)(1)(ii) prohibits employers, when there are no certified anchorages, from ''making do'' or attaching RDS to alternative structures, making the assumption that these structures are capable of supporting 5,000 pounds.

OSHA acknowledges that employers currently attach RDS to other structures if there are no certified anchorages available. For example, Mr. Charles Adkins, of Corporate Cleaning Services (Corporate Cleaning), explained what his company does at the 30 to 40 percent of the buildings they service that don't have certified anchorages:

> They go up and they select it with the assistance of the foreman who is—we have—we've heard some mention of supervision here and we totally agree that that's a very important fact and that's why we have four salaried foremen, plus an operations manager, who focus exclusively on supervision.
>
> They go up and select them. There are a number of alternatives. They can attach them to the permanent part of the building. They can use parapet clamps if they have a way to properly attach the tieback and the safety line to it and just about every building is different. Sometimes we can use weights to keep them from—to help hold the ropes (Ex. 329 (1/19/2011, pgs. 218–219)).

Finally, OSHA believes that the written information on anchorages that building owners must provide to employers will be helpful for employers throughout the job. Employers can use the information to keep workers continuously informed about which anchorages have proper certification. The information also will be helpful if there are work shift-related changes in personnel, if the employer brings new workers to the job, or if there is a change in site supervisors. Therefore, the final rule is requiring employers to retain the written information on anchorages they obtained from building owners for the duration of the job at that building.

In final paragraph (b)(1)(iii), OSHA provides employers and building owners with additional time to implement the requirements in final paragraphs (b)(1)(i) and (ii). The final rule gives employers and building owners one year from November 18, 2016 to meet the new requirements in final paragraphs (b)(1)(i) and (ii). This means that building owners must identify, inspect, test, certify, and maintain each anchorage by the compliance date.

OSHA believes the additional compliance time is necessary because a number of commenters said most buildings where they use RDS do not have certified anchorages (Exs. 147). For example, Mr. Lapham, of Valcourt, said that their company services 3,850 buildings in 14 states (Ex. 147). Of the buildings Valcourt cleans, Mr. Lapham said almost 75 percent did not have certified anchorages, more than 20 years after OSHA issued the final Powered Platforms standard (§ 1910.66) (Ex. 147).

Mr. Charles Adkins, of Corporate Cleaning Services, the largest window cleaning company in the Chicago area, said that they perform window cleaning services on more than 1,200 buildings (Ex. 329 (1/19/2011, p. 201)). He estimates that about 60 to 70 percent of those buildings already have certified anchorages (Ex. 329 (1/19/2011, pgs. 218–219)).

In the 1990 rulemaking, BOMA objected to requiring building owners to provide anchorages, but agreed that new buildings completed two to five years after the effective date of the final rule should have anchorages (75 FR 28862, 28879; Ex. OSHA–S041–2006–0666–1212).

It is now 24 years since OSHA first proposed a rule addressing RDS, and 23 years since OSHA's 1991 RDS memorandum allowed the use of RDS provided they have ''sound anchorages.'' OSHA does not believe building owners, at this late date, need another two to five years to identify, inspect, test, certify, and maintain anchorages in new or existing buildings. OSHA believes that giving building owners an additional year to meet the requirements of final paragraph (b)(1)(i) is adequate.

Final paragraph (b)(2) establishes RDS design and work-practice requirements that employers must follow to ensure their workers' safety when using an RDS. OSHA drew most of the requirements from the 1991 RDS memorandum and the I–14.1–2001 national consensus standard. Many commenters who supported allowing the use of RDS also supported requiring employers to comply with all of the provisions in the 1991 RDS memorandum and I–14.1–2001 (Exs. 138; 151; 219).

Final paragraph (b)(2)(i), like proposed paragraph (b)(1) and the I–14.1 standard (Section 5.7.12), requires that employers ensure no RDS is used at heights greater than 300 feet (91 m) above grade. The final rule includes two exceptions to the 300-foot height limit, discussed extensively below.

Many stakeholders supported the proposed 300-foot height limit (Exs. 138; 147; 168; 206; 215; 300; 329 (1/19/2011, pgs. 253–254, 401); 329 (1/21/2011, pgs. 98, 474, 477); 331). They said using an RDS at heights above 300 feet was dangerous for workers, and establishing a height limit was an important ''safety issue'' (Exs. 147; 215). Mr. John Capon, of Valcourt, said, ''I think anything above 300 feet is preposterous, to be honest with you. The risks associated with it, just the height, all the conditions, are just overly-dramatic at that height'' (Ex. 329 (1/19/2011, p. 401)). Mr. LaRue Coleman, of JOBS Building Services (JOBS), also said worker safety mandated that employers not use RDS over 300 feet, noting: ''Contractors will always use the excuse that an area cannot be accessed in any other manner [than RDS] to save the building money. This is a safety issue and should not be left up to an individual employer or employee to make an onsite decision of this nature'' (Ex. 215). Mr. Coleman also suggested that OSHA adopt a height limit of 130 feet, which California OSHA [35] uses (Ex. 215). Not only would a 130-foot height limit significantly reduce the dangers to workers who use RDS, but Mr. Coleman said it also would eliminate stabilization issues and requirements (Ex. 215). OSHA notes that the State of California also requires all buildings over 130 feet to be equipped with a powered platform.

Mr. Lapham, of Valcourt, said their experience indicated that the following factors necessitated limiting RDS use to a maximum of 300 feet:

- The significant increased effect of wind at heights above 300 feet;
- The significant increased length and weight of ropes required for using RDS above 300 feet; and
- The increased potential that moving the weightier ropes will ''literally pull a window cleaner over the edge of the building'' roof (Ex. 147).

Other commenters agreed with Valcourt's analysis. Ms. Kelley Streeter, of Vertical Access, said ropes longer than 300 feet are heavy and moving or working with such lengths can be hazardous and strenuous for workers (Ex. 329 (1/21/2011, p. 98)). Mr. Brian Gartner, of Weatherguard Service, Inc. (Weatherguard), agreed, and identified additional factors that contributed to the danger of using RDS above 300 feet:

> In my opinion, based on testing and evaluation and basic engineering concepts, 300 feet is at the high end of the safe use range. Suspensions over 225 feet start responding to the effects of wind on the ropes and the worker. The longer the rope, the more surface area is exposed to the wind. The wind effect is variable. The lower the worker is from the roof, there is more rope above him or her that can be subjected to the wind, thus the higher the suspension, the more the worker is free to move.
>
> The longer the suspension the greater the ''spring'' in the suspension and safety ropes. This springiness is in all synthetic ropes that are in the diameter ranges that are used for this purpose whether they are static type ropes or other rope types. There are many other factors that contribute to the dangers of rope descents above 300 feet. For every foot of increased suspension, the dynamics and conditions change and become more problematic (Exs. 329 (1/19/2011, pgs. 253–254); 331).

Mr. Gartner added that there is a marked difference in handling RDS ropes (support and fall arrest) on buildings less than 300 feet compared to buildings above 300 feet: ''[T]he differences of how the winds affect [the ropes] and you, on the roof, and the trouble discerning what is happening with the ropes will speak volumes regarding the safety issues of building height and rope descent'' (Ex. 331; *see also* Ex. 300). For example, he said moving heavier ropes has the potential of pulling workers over the edge of the building (Ex. 147). In conclusion, he stated: ''Those that minimize, overlook, or disregard all of these factors, as they are all safety concerns, are not responsibly or realistically addressing the height issue and manifesting a disregard to worker and the public's safety'' (Exs. 329 (1/19/2011, pgs. 253–254); 331).

Some commenters said the 300-foot height limit would not be a burden on most employers. Mr. Gartner said, ''The [number] of buildings in the United States taller than 300-feet is miniscule when compared to the [number] of buildings under 300 feet in height'' (Ex. 331). Mr. Coleman said that the 300-foot limit would affect only six percent of office buildings in the 19 largest national markets:

> If you were to take the study out to additional markets the effect would be even less since smaller/shorter buildings are typically built in these markets. If you were to add schools, hospitals and hotels to a study the effect would be even less since again these types of structures are typically shorter except when located in a major metropolitan area. Of the 6% of buildings over 11 floors the vast majority of them will have either permanent rigging or building owned davits and tie-backs thereby reducing the cost effect of lowering the height (Ex. 215).

Finally, commenters said OSHA should adopt the 300-foot height limit because the I–14.1–2001 national consensus standard requires it. Mr. Lapham, of Valcourt, who was one of the members of I–14.1–2001 committee, said it took ''multiple decades'' for the industry to agree to the 300-foot limit in the I–14.1–2001 standard, so OSHA should not eliminate it ''under any circumstance'' (Ex. 147). Mr. Gartner, of Weatherguard, and also a member of the I–14.1–2001 committee, said that Ontario, Canada, also adopted the I–14.1–2001 standard's 300-foot limit for RDS:

> Canada spent much time and money in the establishment of their Code with respect to the height limit of 300 feet.[36] They did studies, hired consultants and deliberated at length. Their Code was promulgated due to the high death toll of their window cleaners; they had one fatality a month before the code was enacted (Ex. 331).

Many commenters opposed the proposed 300-foot RDS height limit for various reasons (Exs. 126; 151; 163; 178; 184; 205; 218; 219; 221; 222; 242). Most of those commenters said there was no safety-related reason to impose the height restriction, claiming that using RDS at heights above 300 feet is safe (Exs. 151; 163; 184; 218; 242). Mr. Terry, of Sparkling Clean, said using RDS ''at all heights is routinely performed safely [and] successfully . . . in many parts of the country'' (Ex. 163). He considered using RDS at any height to be so safe that ''I believe the proposed 1910.27(b) should actually read [that using RDS] is encouraged at any height'' (Exs. 163; 329 (1/19/2011, p. 330)). He added that OSHA's final rule also should allow employers to use RDS as a substitute to the means and methods originally designed into the building or structure when the design of the building or structure will safely support the use of the RDS (Ex. 163).

A number of commenters said their injury data also demonstrated that RDS are safe to use at any height. These commenters said that they had no recordable incidents related to using RDS on taller buildings (Exs. 163; 184; 242). Mr. Terry said his analysis of nine RDS incidents that involved RDS use over 300-feet indicated that none of the cases involved the height of the work as the cause of the incident (Ex. 163).

Many commenters said they considered RDS to be safer than powered platforms at any height, including above 300 feet, and, thus, there was no reason for OSHA to impose the 300-foot height limit on their use. For example, Corporate Cleaning said RDS are safer than powered platforms at all heights below 700 feet because they are more maneuverable, and allow workers to descend more quickly in an emergency (Ex. 126).

Other commenters disputed the argument that the effects of wind on RDS used above 300 feet are greater than for suspended scaffolding/powered platforms. Some commenters said there was no difference in the effects of wind on RDS use than on powered platforms at any height (Exs. 163; 205). For instance, Ms. McCurley, of SPRAT, said:

> We . . . find that the height restrictions and the wind exposure to be. . . unfounded. In practical living and in practical working, we find that all of these things are a matter of skills, knowledge and good decision-making. If the wind is too high that day, if there is ice out there that day, you just don't go. And that's true of whether you are using a scaffold or a powered platform or a ground-based system or whatever. You just have to

[35] California Code of Regulations, Title 8 Chapter 4, Subchapter 7 Article 5, § 3286.

[36] The Ontario window cleaning regulation specifies that employers must not use controlled descent devices above 90 meters, which equals 295.276 feet (R.R.O. 1990, Regulation 859 § 28(c)).

make the right decision based on the gear that you are using (Ex. 329 (1/19/2011, p. 154)).

Some commenters who opposed the proposed 300-foot RDS height limit claimed it was ''arbitrary.'' For instance, Mr. Ken Diebolt, of Vertical Access, said:

My primary objection is to the 300-foot limit . . . [is] it seems to us completely arbitrary. I mean, once you're X number of feet off the ground, once you're 10 feet off the ground, 50 feet, 100 feet, it doesn't really—you're no safer at 300—at 100 feet than you are at 300 feet or 500 feet if you're doing the work well. And I wonder where this came from. It comes from the window washing industry but I have no history of that and I don't know (Ex. 329 (1/21/2011, p. 138)).

Mr. Adkins, of Corporate Cleaning, agreed:

We urge you not to adopt that limitation, especially as it is written in your proposals. . . . It appears to be an arbitrary limit and does not, is not based on any kind of empirical research to determine that there is a problem in fact with the use of ropes in excess of 300 feet. In fact, I haven't been able to find any evidence of any accidents or any serious incidents where the length of the rope had anything to do with it (Ex. 329 (1/19/2011, p. 204)).

In addition, several commenters disputed there was consensus supporting the RDS height limit. For example, Mr. Adkins said:

[T]here is an implication there's a consensus in this industry supporting the 300-foot rule. I think a lot of testimony we've had here today makes it clear that that is not the case. Not only do I not believe it, not only will you hear from other individuals in the window washing industry who do not support that, you also heard from people on the other side, Mr. Stager from the Union who doesn't believe there's been an effective consensus developed on it (Ex. 329 (1/19/2011, pgs. 203–212)).

However, Mr. Bright, chair of the I–14.1–2001 committee, said there was ''broad agreement'' among the committee to include a 300-foot RDS height limit, which is ANSI's definition of ''consensus'' (Ex. 329 (1/19/2011), pgs. 244–46).

Commenters opposing the RDS height restriction also said the IWAC based the I–14.1–2001 requirement more on emotions and economics than on safety (Ex. 163; 184; 221; 222; 241). The comment of Mr. Sam Terry, of Sparkling Clean, was representative of those stakeholders:

It is my contention that the 300' limitation is based more on the following two issues:

- The emotions of the untrained observer who thinks [RDS] looks scary
- The financial benefit to the manufacturer, designer, installer or equipment associated with suspended scaffolding and the large window cleaning companies who can limit their competition by restricting the use of the less expensive option of [RDS] (Ex. 163).

Mr. Adkins agreed:

Now like I said, those people worked very hard on it, I don't dispute that, but the I–14 Committee or 50 percent of them were not window washers. They are from other industries and they are very honest, hard-working people of integrity but they have legitimate business interests to look at enforcing a 300-foot limitation or eliminating it all together and that has to be considered, I am sure (Ex. 329 (1/19/2011, pgs. 203–212)).

Mr. Adkins also said that restricting RDS use would lead to economic hardship for some window cleaning companies and to higher unemployment (Ex. 329 (1/19/2011, p. 220), but he did not have knowledge of any companies that experienced economic hardship by following the I–14.1–2001 height restriction on RDS use. However, Diamond Window Cleaning said the RDS height limit would give unfair competitive advantage to larger companies that have, and only use, powered platforms or systems installed on buildings (Ex. 219). Some commenters said using RDS is less costly than using powered platforms, and requiring companies to use powered platforms would be costly (Ex. 219). Mr. Terry explained:

Of the buildings in my marketplace, the buildings taller than 300 feet typically do not have permanently-installed powered platforms for access to the exterior of the building. Most of those buildings were designed and built in the last five years and do not have permanently installed powered platforms for access to the exterior of the building (Ex. 163).

After reviewing the rulemaking record, OSHA has decided to retain the proposed requirement that employers not use RDS at heights above 300 feet above grade. OSHA continues to believe that using RDS above 300 feet is hazardous, and that adopting the height limit in the final rule will help protect workers from injury and death.

OSHA agrees with commenters who said that there are many factors that contribute to the dangers of operating RDS above 300 feet. First, as the proposed preamble and commenters discussed, OSHA believes that using RDS at greater heights increases the potential effects of wind (*e.g.,* wind gusts, microbursts, tunneling wind currents) on workers. OSHA believes that, when working at heights over 300 feet, the effects of wind on the RDS and the worker are greater in general, and greater than the effects imposed on heavier powered platforms. OSHA notes that commenters identified incidents in which workers used RDS in windy weather, and the wind blew the workers around the side of a building and 30 feet away from a building (Exs. 163; 168). Moreover, while OSHA agrees that workers can descend more quickly on RDS if severe weather suddenly occurs, excessively windy weather can buffet workers descending from above 300 feet, causing them to swing great distances during the long descent. Most likely in these situations, workers using RDS will have only intermittent stabilization (*i.e.,* suction cups) so they can swing by the ropes and hit the building or other structures and get seriously injured before they reach the ground.

Second, using RDS above 300 feet requires the use of longer ropes. OSHA said in the proposed rule, and IWCA (Ex. 138) agreed, that the greater the length of rope used for descent, the greater the effect of winds (*e.g.,* wind gusts, microbursts, tunneling wind currents) (*see also* Ex. 300). Longer ropes have a greater possibility of getting tangled or caught on objects, especially in windy (or gusty) weather, leaving the worker unable to descend or self-rescue. The compilation of RDS incidents Mr. Terry submitted included cases in which the ropes got entangled in equipment lines, an antenna, and other workers' RDS lines, leaving the worker stuck and unable to descend (Ex. 163). These cases arise because, as Mr. Bright testified, employers often have a number of workers (*e.g.,* 5 to 6) descending on the same side of a building at the same time (Ex. 329 (1/19/2011, pgs. 477, 489–490)).

Third, OSHA agrees with Mr. Lapham, of Valcourt, and Ms. Streeter, of Vertical Access, who said that longer ropes needed for RDS use above 300 feet are heavier, and moving them can be hazardous (Ex. 147; 329 (1/21/2011, p. 98)). Taken together, OSHA finds convincing the arguments that workers are at an increased risk of harm when using RDS over 300 feet, and that the RDS height limit in the final rule is necessary to protect them.

OSHA also retained the RDS height limit in the final rule because the I–14.1–2001 national consensus standard included the same limit. The American National Standards Institute (ANSI) approved the I–14.1–2001 standard, and industry widely uses it. OSHA believes the national consensus standard reflects industry best practices. Commenters, including some who were members of the I–14.1 committee, said there was broad agreement to include the 300-foot RDS height limit in the I–14.1 standard (Ex. 147; 329 (1/19/2011, pgs. 210–211, 253, 267–268)).

Since IWCA issued the I–14.1–2001 standard, several jurisdictions have adopted the 300-foot RDS height limit. Minnesota (5205.0730, Subpart 6(A)) and Washington (WAC–296–878–20005) issued regulations limiting RDS use to 300 feet, while California now limits RDS use to 130 feet (Cal. Code Regs., Tit. 8, § 3286 (2012)). Additionally, OSHA believes the experience of Canada (Ontario province) deserves consideration (R.R.O. 1990, Regulation 859). According to Mr. Brian Gartner, of Weatherguard Service, who was a member of the I–14.1 committee:

> Canada invested much time and money in the establishment of their code with respect to the height limit of 300 feet. They did studies, hired consultants, and deliberated at length. Their code was promulgated due to the high death toll of their window cleaners. They had one fatality a month before the code was enacted (Ex. 331).

With regard to commenters' claims that economics was the basis for supporting or opposing the RDS height limit in I–14.1–2001 (as well as OSHA's proposed rule), OSHA notes that commenters on both sides of the issue claimed that the other side was seeking an economic advantage. Those commenters who supported the RDS height limit said employers were using RDS above 300 feet to win bids for window cleaning and save money (Ex. 215). For example, Mr. Gartner noted: ''RDS is the least expensive method to service a building, saving the building owner money while allowing for the largest profit margin for a window cleaning contractor'' (Ex. 331).

Commenters who opposed the 300-foot RDS height limit said large window cleaning companies that use powered platforms instead of RDS were pushing for the height restriction to gain an ''unfair competitive advantage.'' Those commenters also said that prohibiting the use of RDS above 300 feet would result in loss of jobs, higher unemployment, and loss of income because it costs more to use powered platforms.

During the rulemaking hearing, OSHA asked Mr. Coleman, of JOBS, whose company only uses powered platforms, why the company did not support prohibiting the use of RDS since such a prohibition would be in his company's best economic interests. He replied: ''Because . . . I understand the reality that it's here. It's going to be used and so I understand the importance of some regulation that's definite. Nothing that leaves a loophole, that leaves it up to the people in the field'' (Ex. 329 (1/19/2011, pgs. 315–316)). Moreover, Mr. Coleman said the company did not lay off any employees or lose business when they decided in 1985 to only use suspended scaffolding for suspended work (Ex. 329 (1/19/2011, p. 313)). Mr. Coleman testified that the company initially lost income because they did not change their prices even though using suspended scaffolding cost as much as 30 percent more than RDS use. He further noted that, the company eventually passed the cost to customers, ''the building owners did not really flinch when they understood that we were not going to use a device that there was no OSHA regulation for. They saw their liability rise. So . . . window cleaning on a building, if you put it on a chart, probably won't even measure as a measurable cost for most buildings'' (Ex. 329 (1/19/2011, p. 314)).

In conclusion, based on analysis of comments and the record as a whole, OSHA believes there is substantial evidence to support retaining the 300-foot height limit for RDS use.

Mr. Adkins, of Corporate Cleaning Services, recommended that OSHA, instead of prohibiting the use of RDS for heights greater than 300 feet, limit their use based on wind speeds [37] (Exs. 297; 360). Mr. Adkins' model assumes that a 25 mph wind speed and 300-foot rope length ''yields a 'safe' horizontal displacement,'' which he calculated to be 5 feet (Ex. 297). According to his model, as the RDS rope length increases, the permissible wind speed decreases. Thus, for example, under Mr. Adkins' model when the rope length is 700 feet the permissible wind speed for RDS use would be 15 mph [38] (Ex. 297).

The rulemaking record, however, does not support Mr. Adkins' model or recommendation to replace the 300-foot RDS height limit with wind speed limits. First, according to a study, ''Wind Effects on a Window Washer Suspended on a Rope,'' a 250-pound window cleaner hanging 75 feet down from a 300 foot building in a steady 25 mph wind would be displaced/deflected as much as 40 feet, which is far greater than the 5 feet Mr. Adkins' model predicts (Exs. 300; 352). Moreover, changes in wind speed (*i.e.,* gusts, stops) when window cleaners are deflected significantly more than 5 feet could cause them to swing back into the building resulting in death or serious injury. In fact, the study found that window cleaners can be knocked over by ''moderate wind speeds'' (*i.e.,* approximately 7 mph at 300 feet) and injured hitting buildings at a speed of 4 mph, both of which are significantly less than wind speeds Mr. Adkins says would be safe at 300 feet.

Second, many stakeholders did not support limiting RDS based on wind gusts instead of height (*e.g.,* Exs. 138; 147; 168; 206; 215; 300), or that the wind speeds limits Mr. Adkins recommends for RDS use above 300 feet would be safe (Exs. 153; 163; 184; 298; 317; 329 (1/19/2010, p. 411); 331; 352). Mr. Craig Schoch, of Tractel, Inc., said OSHA should reject Mr. Adkins' recommendation because his ''safe'' wind speeds are based on incorrect deflection assumptions (Ex. 352). Other stakeholders, including window cleaning contractors and members of the IWCA I–14.1–2001 committee, said wind speeds of 20—25 mph ''are excessive'' or ''very dangerous,'' regardless of height (Exs. 317; 329 (1/19/2010, p. 411); 331). Several employers said they discontinue using RDS when wind speeds are between 15—20 mph and stop cleaning windows before winds reach 15 mph (Exs. 153; 163; 184; 298). Mr. Terry said 15 mph is a ''reasonable'' speed limit, but added that his company stops window cleaning before winds reach that speed (Ex. 163). And although Mr. Adkins recommended the wind speed alternative, he said:

> Now, in actual fact, I've never had anybody work at 15 mph and never will because that, in my opinion, is too high for . . . a boatswain's chair, a swingstage, [and] a scaffold (Ex. 329 (1/19/2010, p. 213)).

Thus, OSHA does not believe there is sufficient evidence that Mr. Adkins' wind speed/rope length alternative would adequately protect of workers using RDS, and the final rule does not adopt that approach.

Final paragraph (b)(2)(i) includes two exceptions to the 300-foot height limit for using RDS. Employers may use RDS above 300 feet when they demonstrate (1) it is not feasible to access heights above 300 feet by any other means; or (2) other means pose a greater hazard than using RDS. The proposed rule would have allowed employers to use RDS at any height when the employer can demonstrate that ''access cannot otherwise be attained safely and practicably,'' which is consistent with I–14.1–2001.

OSHA received a number of comments on the proposed exceptions. Some commenters opposed the proposed exceptions (Exs. 147; 215; 331). For example, Valcourt said:

> In no case should a window cleaning contractor be allowed to determine when RDS is acceptable over 300 feet. . . . The determination that RDS can be utilized on a per case basis on descents over 300 feet

---

[37] Mr. Adkins said the term ''wind speed'' refers to wind gusts (''[W]hen I talk about wind speed, I talk about a gust'' Ex. 329 (1/19/2010, p. 234)).

[38] Mr. Adkins said 9 mph would be a safe wind speed when the rope is 700 feet if the maximum speed allowed at 300 feet is 15 mph (Ex. 297).

should be made by a third party qualified person and/or, likely, a registered professional engineer experienced in facade access equipment (Ex. 147).

Mr. Coleman, of JOBS, agreed with Valcourt, stating, ''This is a safety issue and should not be left up to an individual employer or employee to make an onsite decision of this nature'' (Ex. 215).

Mr. Gartner, of Weatherguard, said OSHA's proposed exception allowing RDS use above 300 feet when employers cannot attain access ''safely and practicably'' was subjective and difficult to enforce (Ex. 329 (1/19/2011, pgs. 255–256)). He said, ''What is practical for me may not be practical for you and what I deem to be safely is not necessarily what you consider safely'' (Ex. 331).

OSHA agrees with the commenters and revised the language in the final rule to make it consistent with established legal tests and defenses under the OSH Act.

Final paragraph (b)(2)(ii) requires employers to ensure RDS use is:

• In accordance with manufacturer instructions, warnings, and design limitations (hereafter collectively referred to as ''instructions''), or

• Under the direction of a qualified person.

The final rule (§ 1910.21(b)) defines qualified as someone who, by possession of a recognized degree, certificate, or professional standing, or who by extensive knowledge, training, and experience has successfully demonstrated the ability to solve or resolve problems relating to the subject matter, the work, or the project.

The I–14.1–2001 standard also requires that employers use RDS in accordance with manufacturer's instructions. In addition, the standard specifies that employers follow design requirements in I–14.1–2001 (Section 5.7.1).

OSHA believes that following manufacturer's instructions is critical to ensure the safety of workers who use RDS. To illustrate, manufacturers may design and sell ropes and equipment rated appropriately for recreational, but not industrial, use. The final rule requires that employers ensure they use only equipment that the manufacturer rated for industrial use. Similarly, under the final rule, employers must ensure that, if they replace elements of one manufacturer's RDS with the components of another manufacturer's system, the instructions specify that the components are compatible. Using incompatible systems or components could endanger the safety of workers and result in fatal accidents.

Proposed paragraph (b)(2)(i)), like the 1991 RDS memorandum, would have required that employers use RDS in accordance with manufacturer or distributor instructions, and did not include the qualified person option. In the preamble to the proposed rule, OSHA requested comment about whether to allow employers to act in accordance with the instructions of either the manufacturer or a qualified person, as defined in § 1910.21(b) (75 FR 28886).

Commenters overwhelmingly supported adding the qualified person option and removing distributors (Exs. 138; 150; 153; 163; 184; 221; 220; 241; 242; 243; 245). For instance, Martin's said it was appropriate to allow employers to rely on qualified persons because they are ''able to solve relevant problems'' (Ex. 222). Mr. Gene Donaldson, of Sunlight Building Services (Sunlight), also preferred qualified persons because they ''must have a recognized degree, certificate, etc., or extensive experience and ability to solve subject problems, at the worksite'' (Ex. 227). Mr. Lawrence Green, president of Clean & Polish, said he supported replacing distributors with qualified persons ''because distributors primarily sell the product to the end user and are not responsible for the safety, design and training of the personnel using them'' (Ex. 242).

OSHA agrees with the commenters and revised final paragraph (b)(2)(ii) by adding qualified person and deleting distributor. The Agency believes the revised language in the final rule provides greater flexibility for employers, while ensuring that RDS use is at the direction of a person who is qualified.

Final paragraph (b)(2)(iii), like proposed paragraph (b)(2)(ii) and the 1991 RDS memorandum, requires employers to ensure that each worker who uses an RDS receives training in accordance with § 1910.30. This requirement means that the employer must train each worker who uses an RDS in the proper rigging, use, inspection, and storage of an RDS before the worker uses the RDS. In addition, since the final rule requires that each worker who uses an RDS also uses an independent personal fall arrest system (§ 1910.27(b)(2)(vi)), the employer must ensure that each worker receives fall hazard training before that worker uses an RDS in an area where the worker may be exposed to fall hazards (§ 1910.30(a)(1)). As final § 1910.30 specifies, the fall hazard training must include the nature and recognition of the fall hazards in the work area; the procedures to follow to minimize the hazards; the correct procedures for installing, inspecting, maintaining, disassembling, and operating the fall protection systems workers will use, such as proper hook-up, anchoring, and tie-off techniques; and methods of inspection and storage of the equipment the manufacturer specifies (§ 1910.30(a)(1) and (3)). Moreover, to ensure that the RDS training meets the requirements of § 1910.30, employers also must provide retraining when they have reason to believe the workers do not have the understanding and skill needed to use RDS safely.

OSHA notes that the final provision is similar to the I–14.1–2001 standard, which requires that employers train workers who use RDS so they understand the manufacturer's instructions, inspection of components, accepted rigging practices, identifying anchorages, descending, fall arrest requirements, rescue considerations, and safe working conditions (Section 5.7.2).

OSHA believes that the final provision is necessary. Evidence in the record indicates that some employers do not train their workers who use RDS (Ex. 329 (1/19/2011, pgs. 86, 100)). OSHA believes, and commenters agreed, that workers are able to safely use RDS only if they are thoroughly knowledgeable in the equipment and its proper use (Exs. 66; 138; 151; 163; 153; 184; 216; 221; 222; 242; 243; 245; 329 (1/19/2011, pgs. 22–24, 433)). A number of commenters said proper training is the most important aspect of using RDS safely (Exs. 163; 184; 221; 242; 329 (1/19/2011, p. 252)). Those commenters also said that proper training would prevent most, if not all, of RDS incidents they identified (Exs. 163; 184; 221; 242). Similarly, Mr. Capon, of Valcourt, credited their training program as the reason their company did not have a fatality during its 25 years of operation (Ex. 329 (1/19/2011, pgs. 419–420)). Some commenters recommended that OSHA also require that employers use professional organizations to train and certify their workers (Exs. 123; 205). The performance-based approach in the final rule clearly allows employers to use professional organizations to provide training, and to require that workers receive certification to operate RDS. However, the performance-based approach of the final rule gives employers flexibility to determine how to train their workers, provided the training and the training contents meet the requirements of § 1910.30. Accordingly, OSHA does not believe it is necessary to adopt the commenters' recommendation, and finalizes the provision as discussed.

Final paragraph (b)(2)(iv), like proposed paragraph (b)(2)(iii), requires that employers ensure inspection of each RDS at the start of each workshift in which their workers will use it. Additionally, the employer must ensure damaged or defective equipment is removed from service immediately and replaced. The equipment inspection must include every component of the RDS, including safety devices, ropes, rope grabs, lanyards, descent devices, harnesses, seat boards, carabiners and other hardware. When replacing damaged or defective equipment, the replacement component or system must be compatible, undamaged and not defective. Overwhelmingly, commenters supported the requirement to inspect RDS equipment (Exs. 138; 151; 153; 163; 184; 221; 222; 242; 243; 245).

The final rule revises the proposed paragraph to clarify the regulatory language. First, OSHA drafted the final provision to specify that employers must inspect each RDS ''at the start of each workshift that it is to be used'' rather than ''each day before use'' as in the proposed rule. Therefore, the final rule specifies that employers must inspect each RDS before a worker uses it in their workday. Thus, to the extent that there is more than one workshift in a work day, the RDS needs to be inspected to ensure it is safe for each worker to use during their workshift. The inspection of RDS equipment at the start of each workshift ensures that any damage (such as abrasions and cracks) that may have occurred when using the RDS during the last workshift is identified, and appropriate action is taken before another worker uses the RDS. In addition, employers need only inspect an RDS if a worker will use it during a workshift, rather than each day. The language in the final rule clarifies this requirement.

Second, the final rule requires that employers remove both damaged and ''defective'' equipment from service, while the proposed rule only specified removal of damaged equipment. OSHA added ''defective'' because, regardless of whether an inspection reveals that equipment was damaged during use or defectively manufactured, OSHA considers such equipment to be unsuitable for continued use.

Third, OSHA added language to the final rule specifying that employers remove damaged or defective equipment from service ''immediately.'' This addition is consistent with the I–14.1–2001 standard (Section 5.7.3).

Finally, the final rule revises the proposed rule to specify that employers must replace damaged or defective equipment removed from service. OSHA believes this language clarifies that improvised repairs are not allowed, consistent with I–14.1–2001 (Section 5.7.3). Replacing damaged or defective components is necessary to ensure that RDS are restored to their original condition and capacity. For these reasons, OSHA adopts the final provision as discussed.

Final paragraph (b)(2)(v), like proposed paragraph (b)(2)(iv) and the 1991 RDS memorandum, requires that employers ensure the RDS has proper rigging, including proper anchorages and tiebacks. The final rule also requires that employers ensure that RDS rigging emphasizes providing tiebacks when using counterweights, cornice hooks, or similar non-permanent anchorage. The I–14.1 standard addresses proper rigging by requiring that employers train workers in ''correct'' and ''accepted'' rigging practices (Section 5.7.2).

Proper rigging of RDS equipment is essential to ensure that the system is safe for workers to use. To ensure proper RDS rigging and safe use, OSHA believes that employers also must take into consideration and emphasize the specific conditions present. For example, OSHA believes that giving particular emphasis to providing tiebacks when using counterweights, cornice hooks, or similar non-permanent anchorages is an essential aspect of proper rigging and necessary to ensure safe work. To illustrate, when tiebacks and anchorages are not perpendicular to the building face, it may be necessary for worker safety for employers to install opposing tiebacks to support and firmly secure the RDS, have at least a 30-degree sag angle for opposing tiebacks, or ensure that no angle exists on single tiebacks. In addition, as the final rule specifies, OSHA believes that employers also must place emphasis on non-permanent anchorages because of the possibility of damage during transport and installation.

Finally, some commenters recommended that OSHA include additional rigging requirements in the final rule. For example, Vannoy & Associates recommended that OSHA include a requirement for angle of attachment (Ex. 213). OSHA believes that the term ''proper rigging'' includes the angle of attachment and, therefore, needs no further elaboration. For the reasons discussed above, OSHA adopts the provision as discussed.

Final paragraph (b)(2)(vi), like proposed paragraph (b)(2)(v) and the 1991 RDS memorandum, requires that each worker uses a separate, independent personal fall arrest system, when using an RDS. Final § 1910.140(b) defines personal fall arrest system as ''a system used to arrest an employee in a fall from a walking-working surface.'' A personal fall arrest system consists of at least an anchorage, connector, and a body harness, but also may include a lanyard, deceleration device, lifeline, or suitable combination of these devices (§ 1910.140(b)). The final rule requires that the personal fall arrest system meets the requirements in 29 CFR part 1910, subpart I, particularly final § 1910.140. This final rule is consistent with other existing OSHA standards (*e.g.,* § 1910.66(j), Powered Platforms for Building Maintenance, Personal Fall Protection; § 1926.451(g), Scaffolds, Fall Protection), as well as the I–14.1 consensus standard (Section 5.7.6).

OSHA believes the provision is essential to protect workers from injury or death if a fall occurs. As the 1991 RDS memorandum mentions, requiring workers to use personal fall arrest systems that are completely independent of RDS ensures that any failure of the RDS (*e.g.,* main friction device, seat board, support line, anchorage) does not affect the ability of the fall arrest system to quickly stop the worker from falling to a lower level.

Commenters uniformly supported the proposed provision (Exs. 138; 151; 153; 184; 221; 222; 242; 243). Also, Surface Solutions pointed out that 91 of 125 RDS incidents they reviewed as far back at 1977 resulted from the lack of an independent personal fall arrest system (Ex. 184). OSHA finds the comments and data persuasive and, therefore, adopts the requirement as proposed with only minor editorial change, for clarity.

Final paragraph (b)(2)(vii) requires that employers ensure all components of each RDS, except seat boards, are capable of supporting a minimum rated load of 5,000 pounds. For seat boards, the final rule requires that they be capable of sustaining a live load of 300 pounds. In accordance with section 6(b)(8) of the OSH Act (29 U.S.C. 655(b)(8)), OSHA revised the final provision in three ways to make it consistent with the I–14.1–2001 national consensus standard.

First, the final rule revised the proposal (proposed paragraph (b)(2)(vi)) to require that employers ensure ''all components'' of each RDS, except seat boards, are capable of supporting a 5,000-pound minimum rated load. As the final definition of RDS specifies, these systems usually consist of the following components: Roof anchorage, support rope, descent device, carabiner(s) or shackle(s), and chair (seat board) (final § 1910.21(b)).[39] I–14.1–2001 (Section 14.1.2) also requires that each RDS must include the same list of components. The proposed rule (proposed paragraph (b)(2)(vi)) and 1991 RDS Memorandum, by contrast, only required that ''all lines'' be capable of sustaining the required load, but was silent on the minimum load requirements for other RDS components.

However, like I–14.1–2001, OSHA believes that requiring all RDS components, except seat boards, be capable of supporting the required minimum rated load is essential to ensure that these systems are safe for workers to use. It makes no difference if RDS lines and ropes are capable of supporting the minimum 5,000-pound required load if RDS connectors, anchorages, and other components cannot sustain such a load. In other words, all components must be able to support the required load because RDS are only as strong as their weakest component. Thus, applying the final load requirement to all RDS components will ensure that none of the critical components will break or fail when supporting a significant load. OSHA notes that commenters overwhelmingly support the minimum 5,000 load requirement as essential to ensure RDS are safe to use (Exs. 138; 151; 153; 184; 221; 222; 242; 243).

Second, in final paragraph (b)(2)(vii), consistent with I–14.1–2001 (Section 14.1.4), OSHA does not apply the 5,000-pound rated load requirement to seat boards. Instead, OSHA incorporates language from I–14.1–2001 (Section 14.3.1(c)) specifying that seat boards must be capable of supporting a live load of at least 300 pounds. I–14.1–2001 (Section 14.3.1(a)) specifies that seat boards must be made of ''wood or other suitable material,'' which cannot and does not need to support a rated load of 5,000 pounds. OSHA notes that final paragraph (b)(2)(vi), as mentioned, requires that employers ensure each employee who uses an RDS also uses a ''separate, independent personal fall arrest system'' that meets the requirements in final § 1910.140.

Third, the final rule, consistent with I–14.1–2001 (Section 14.1.4), revises the proposed rule to require that RDS components be capable of sustaining a minimum ''rated load'' of 5,000 pounds. The proposed rule specified that RDS lines be able to sustain a minimum ''tensile load'' of 5,000 pounds. OSHA believes that ''rated load'' or ''rated strength'' is the appropriate term to specify the ability of all RDS components to support a load and is consistent with the I–14.1–2001 standard. I–14.1–2001 (Section 2) broadly defines ''rated load'' as ''the combined weight of the [workers], tools, equipment, and other materials which the device is designed and installed to lift.'' Tensile load, on the other hand, is the maximum stress that material can withstand while being stretched before breaking or failing. While the term is appropriate to use for identifying the required strength of ropes or lines, it is not a standard measure for components that do not stretch.

OSHA notes that the final rule does not preclude the use of lines or ropes that have a knot, swage, or eye splice, which could reduce the tensile strength of a rope or line. However, under final paragraph (b)(2)(vii), even if an employer uses a line or rope that has a knot, swage, or eye split, the rope or line still must be capable of supporting a minimum rated load of 5,000 pounds. Several commenters supported this interpretation of the final paragraph (b)(2)(vii).

In conclusion, OSHA believes that employers should not have difficulty complying with the final paragraph (b)(2)(vii) as revised. Virtually all RDS manufactured today meet the design requirements in I–14.1–2001 (Section 14) (See *e.g.,* Ex. 242). In addition, I–14.1–2001 represents standard industry practice, thus, OSHA believes that the revisions to final paragraph (b)(2)(vii) will make the final rule easier to understand and reduce potential for confusion.

Final paragraph (b)(2)(viii), like proposed paragraph (b)(2)(vii), requires that employers provide for prompt rescue of each worker in the event of a fall. The final rule is almost the same as the 1991 RDS memorandum and § 1910.140(c)(21), and generally consistent with the I–14.1 standard (Section 5.7.11).

Like § 1910.140(c)(21), final paragraph (b)(2)(viii) establishes two fundamental points—(1) employers must provide for the rescue of workers when a fall occurs, and (2) the rescue must be prompt. First, providing for rescue means employers need to develop and put in place a plan or procedures for effective rescue. The plan needs to include making rescue resources available (*i.e.,* rescue equipment, personnel) and ensuring that workers understand the plan.

Appendix C to § 1910.140 provides guidance to employers on developing a rescue plan (appendix C, Section (h)). For example, appendix C recommends that employers evaluate the availability of rescue personnel, ladders, and other rescue equipment, such as mechanical devices with descent capability that allow for self-rescue and devices that allow suspended workers to maintain circulation in their legs while they are awaiting rescue. OSHA's Safety and Health Information Bulletin on Suspension Trauma/Orthostatic Intolerance identifies factors that employers should consider in developing and implementing a rescue plan, including being aware of signs and symptoms of suspension trauma and factors that can increase the risk of such trauma, rescuing unconscious workers, monitoring suspended and rescued workers, and providing first aid for workers showing signs and symptoms of orthostatic intolerance (SHIB 03–24–2004).[40]

Although an increasing number of employers train workers and provide devices that allow workers to rescue themselves (Exs. 227; 242), the employer's rescue plan still needs to make provisions for appropriate rescue personnel and equipment because self-rescue may not be possible in some situations. For example, unconscious workers will not be able to move and, therefore, cannot pump their legs to maintain circulation or relieve pressure on the leg muscles. The same may be true for seriously injured workers or workers who are in shock. When RDS ropes get caught on structures or entangled, workers may not be able to self-rescue (see analysis of RDS and suspended scaffolding incidents in Ex. 163).

Second, the final rule requires that employers provide ''prompt'' rescue of workers suspended after a fall. Sunlight Building Services commented that ''prompt'' is ambiguous, and asked whether OSHA defines it to mean ''immediately'' or ''quickly'' (Ex. 227). The International Safety Equipment Association (ISEA) and Capital Safety Group (CSG) urged OSHA to require that rescue of suspended workers occur ''quickly,'' pointing out the life-threatening dangers of suspension trauma/orthostatic intolerance (Exs. 185; 198).

OSHA agrees with ISEA and CSG. OSHA's definition of ''quick'' or ''prompt'' is performance-based. Prompt means that employers must act quickly enough to ensure that the rescue is effective; that is, to ensure that the worker is not seriously injured. If the worker is injured in the fall, the employer must act quickly enough to

[39] OSHA notes that RDS often include tiebacks, but they are not a required component of RDS.

[40] SHIB 03–24–2006 is available from OSHA's Web site at: *http://www.osha.gov/dts/shib/shib032404.html.*

mitigate the severity of the injury and increase the survivability of the worker. OSHA's performance-based definition has consistently recognized, and taken into account, life-threatening injuries and dangers (Ex. 22; *see also* 76 FR 24576 (5/2/2011); Letter to Charles Brogan, January 16, 2007; Letter to Brian F. Bisland (March 23, 2007)). For example, OSHA's Safety and Health Information Bulletin (SHIB) on orthostatic intolerance explains:

> Orthostatic intolerance may be experienced by workers using fall arrest systems. Following a fall, a worker may remain suspended in a harness. The sustained immobility may lead to a state of unconsciousness. Depending on the length of time the suspended worker is unconscious/immobile and the level of venous pooling, the resulting orthostatic intolerance may lead to death. . . . Unless the worker is rescued promptly using established safe procedures, venous pooling and orthostatic intolerance could result in serious or fatal injury, as the brain, kidneys, and other organs are deprived of oxygen.
>
> Prolonged suspension from fall arrest systems can cause orthostatic intolerance, which, in turn, can result in serious physical injury, or potentially, death. Research indicates that suspension in a fall arrest device can result in unconsciousness, followed by death, in less than 30 minutes (SHIB 03–24–2004).

In sum, prompt rescue means employers must be able to rescue suspended workers quickly enough to ensure the rescue is successful, *i.e.,* quickly enough to ensure that the employee does not suffer physical injury (such as injury or unconsciousness from orthostatic intolerance) or death. Many employers provide self-rescue equipment so workers can rescue themselves quickly after a fall, ensuring that the rescue is prompt and risks associated with prolonged suspension are minimal. OSHA believes the performance-based approach in the final rule will ensure prompt rescue of workers after a fall, while also giving employers flexibility to determine how best to provide prompt and effective rescue in the particular circumstance.

Commenters uniformly supported the proposed provision (Exs. 138; 153; 184; 221; 222; 242; 243). Clean & Polish said, ''It is a documented fact that there is a great risk of suspension trauma when hanging from a harness.'' Accordingly, they recommended that a team of at least two workers should perform every job assignment and that workers receive training in self-rescue (Ex. 242). Sunlight also supported self-rescue, saying it is the quickest form of rescue, followed by assistance from a coworker trained in rescue. Sunlight added that, in a medical emergency, they recommend calling the local fire department (Ex. 227). A number of commenters said they train their own workers in rescue and require them to practice/demonstrate their rescue capabilities at least twice a year (Exs. 184; 221; 227; 243).

The final rule is performance-based and gives employers flexibility to select the rescue methods that work best for their workers and worksite. However, OSHA emphasizes that, whatever rescue methods employers use, they are responsible for ensuring that it provides prompt rescue. Some commenters said they rely on calling local emergency responders, which may or may not be adequate. If employers rely on this method of rescue, they need to ensure that the responders have the appropriate equipment to perform a high angle rescue and are trained and qualified to do so. (Also see the discussion of prompt rescue in final § 1910.140 below.)

Final paragraph (b)(2)(ix), consistent with proposed paragraph (b)(2)(viii), the 1991 RDS memorandum, and I–14.1 (Section 5.7.5), requires that employers ensure the ropes of each RDS are effectively padded or otherwise protected where they contact edges of the building, anchorage, obstructions, or other surfaces to prevent them from being cut or weakened. Padding protects RDS ropes from abrasion that can weaken the strength of the rope. If employers do not protect RDS ropes, the ropes can wear against the sharp edges of buildings (*e.g.,* parapets, window frames, cornices, overhangs), damaging their structural integrity and possibly causing them to break.

The final rule requires that employers ensure the rope padding is ''effective.'' To be effective, padding needs to be, for example, firmly secured in place and strong and thick enough to prevent abrasion. To ensure the padding remains effective, employers also need to inspect it ''regularly and as necessary'' (final § 1910.22(d)(1)).

OSHA added language to the final rule specifying that employers may ensure that ropes are padded or ''otherwise protected.'' OSHA believes the added language gives employers greater flexibility in complying with final (b)(2)(ix). OSHA recognizes that padding may not be the only effective measure available to employers. For example, several commenters said that parapet carpets and rope-wrapper protection are effective rope protection devices (Exs. 138; 153; 184; 221; 242). Other available measures include rubber hoses and polyvinyl chloride (PVC) piping. OSHA believes that various materials are readily available and used in common industry practice; thus, employers should not have significant problems complying with the final rule.

Overwhelmingly, commenters supported the provision (Exs. 138; 153; 184; 221; 222; 242; 243), and OSHA did not receive any comments opposing the requirement. Therefore, OSHA adopts the provision as discussed.

Final paragraph (b)(2)(x), like proposed paragraph (b)(2)(ix), requires that employers provide stabilization at the worker's specific work location whenever descents are greater than 130 feet. The purpose of the stabilization requirement is to reduce the risks of worker injury when longer descents are made using a RDS.

For purposes of final paragraph (b)(2)(x), the worker's ''specific work location'' refers to the location in the descent where the worker is performing the work tasks that necessitate the use of an RDS. For example, a window cleaner's specific work location is the window the worker is cleaning. While using an RDS, workers may have many specific work locations during a descent, and they must be stabilized at each of those locations when the descent is greater than 130 feet.

OSHA uses a performance-based approach in final paragraph (b)(2)(x). It gives employers the flexibility to use intermittent or continuous stabilization. In addition, the final rule allows employers to use any method of stabilization (*e.g.,* suction cups, rail and track system) that is effective to protect workers from adverse environmental effects, such as gusty or excessive wind.

OSHA notes that the 1991 RDS memorandum included a requirement for ''intermittent'' stabilization on descents in excess of 130 feet.[41] Similarly, the I–14.1 standard, which also requires stabilization on descents greater than 130 feet, specifies that stabilization may include continuous, intermittent, or work station stabilization (Section 5.7.12). The I–14.1–2001 standard identifies suction cups as an example of work station stabilization.

In the proposed rule, OSHA requested information on commonly used methods of stabilization and on other methods that may increase worker safety. The vast majority of commenters

[41] Shortly after OSHA issued the 1991 RDS memorandum, the Agency confirmed that employers could use suction cups to meet the stabilization requirement in the memorandum (Letter to Mr. Michael Bell, July 31, 1991, available on OSHA's website at: *http://www.osha.gov/portable_ladders/oshaweb/owadisp.show_document?p_table=INTERPRETATIONS&p_id=22722*).

said suction cups are the method they most use for stabilization (Exs. 138; 163; 184; 221; 222; 241; 242). Some commenters said they use different methods for stabilization, but only mentioned suction cups, and said suction cups is their ''primary'' method (Exs. 163; 184; 221; 242; 329 (1/19/2011, p. 436)).

Sunlight said that some buildings have permanent rail or track systems to provide stabilization (Ex. 227). TRACTEL North America (TRACTEL) also said they use ''mulling and track,'' designed for use by powered platforms for stabilization, to stabilize RDS (Ex. 329 (1/19/2011, p. 436)). TRACTEL added that mulling and track stabilization systems provide greater protection because the stabilization is continuous, while suction cups only provide intermittent protection (Ex. 329 (1/19/2011, p. 436)).

Many commenters supported the RDS stabilization requirement for work operations involving descents greater than 130 feet (Exs. 138; 147; 151; 215; 222; 241; 227; 356), and a number of commenters supported the use of suction cups as an effective stabilization method (Exs. 138; 151; 152; 222; 241).

However, a number of commenters said stabilization is not necessary. They indicated there was no need for a stabilization requirement because the prohibition against using RDS in adverse or hazardous weather is adequate and a more protective approach (Exs. 163; 184; 221; 227; 241; 242; 243). Mr. Terry, of Sparkling Clean, explained:

Every incident that can be partially abated by stabilization can be totally abated by substituting a restriction from working in adverse weather restrictions. Suspended workers using [RDS] only need stabilization during adverse weather conditions. . . .

[Suction cups] can certainly be used for stabilization, if a worker chooses to work in adverse conditions that should have been avoided in the first place . . . (Ex. 163).

Ms. McCurley, of SPRAT, also said the proposed requirement was not necessary:

Sometimes stabilization is required, and when stabilization is required, the stabilization needs to be adequate to the situation. But, stabilization is not necessarily required just as a matter of course. . . . [T]hat requirement tends to come from the scaffold industry, which does require stabilization all the time, because that's what scaffolds do. They have to have stabilization. But, because of the individual not having nearly the wind load—a wind load on this table, because it looks a lot like an airplane wing, is going to have a much different effect than the same wind load on your body standing there (Ex. 329 (1/19/2011, pgs. 167–168)).

Nevertheless, Mr. Terry and other commenters said they provide stabilization devices (primarily suction cups) and use them on descents as short as 10 feet (Exs. 163; 184; 221; 242; 329 (1/19/2011, p. 62)). Mr. Terry pointed out that his company uses the suction cups ''for positioning to keep us in front of the glass, not for stabilization against the effects of the wind'' (Ex. 329 (1/19/2011, p. 337)).

Mr. Diebolt, of Vertical Access, did not oppose the concept of stabilization, but opposed OSHA's 130-foot trigger:

Now, the 130-foot tie-offs, I have essentially the same objections. It seems arbitrary for the kind of work at least that we do, it's unnecessary. . . . Granted we're doing light work, making observations and notes and that sort of thing. Occasionally, we have done some work like take core samples out of a concrete structure using a coring rig drill rig hung from a separate line. And under those conditions, you do actually have to put in a bolt or something to hold you to the building . . . when you're on a long pendulum, when you're on a long tether.

But making it mandatory seems arbitrary and sort of eliminates the possibility of the flexibility of doing the work (Ex. 329 (1/21/2011, pgs. 139–140)).

However, the major objection to the proposed rule was not to the proposed regulatory text, but rather with the use of suction cups as a stabilization method. The Glass Association of North America (GANA), a trade association representing the architectural and glazing industry, recommended that OSHA not to allow the use of suction cups for worker stabilization:

Glass is a brittle material and, as such, can break without warning and vacate the window framing system. Glass installed in commercial and residential buildings is designed to withstand external loads, primarily wind events, with a certain safety factor. . . . In other words, breakage cannot be eliminated in brittle materials like glass. There is no way to guarantee a specific lite of glass will not break under the loads exerted by workers as they move vertically and horizontally back and forth across the glass lites. . . . The use of suction cups may be sufficient in certain conditions to cause the glass to break and vacate the opening, particularly in the event the RDS fails and the worker is left to rely upon the suction cups used for stabilization . . . to support his/her weight.

GANA urges OSHA, in its final rule, to reject the use of suction cups as an approved employee work location stabilization device for RDS. . . . Their use does not satisfy the safety criteria OSHA has established for this rulemaking proceeding: ''to be effective, fall protection systems must be both strong enough to provide the necessary fall protection and capable of absorbing fall impact so that the forces imposed on employees when stopping falls do not result in injury or death'' (Ex. 252).

Mr. Gartner, of Weatherguard, and Mr. Coleman, of JOBS, opposed the use of suction cups for the same reasons as GANA (Ex. 215; 329 (1/19/2011, pgs. 259–260)). Mr. Gartner said:

The use of suction devices for stabilization is problematic. The glass industry strongly discourages them and the window wall people are robustly against them. They are devices used at whim. The loads that they apply to a surface are totally unknown as there are numerous barrier bowls that influence them and they're applied to surfaces that have never been rated for these pinpoint concentrated loads.

Applying a device to glass seems reckless when we're all aware of glass's characteristics and lack of strength. Furthermore, as glass ages, it becomes more brittle and it loses strength, just another variable to make their use totally uncontrolled (Ex. 329 (1/19/2011, pgs. 259–260)).

Mr. Coleman also stated:

In order for Work Station Stabilization to be safe, the worker must attach to a component of the building curtain wall that is designed for and capable of providing the stabilization required. Presently most Work Station Stabilization is done by using suction cups attached to the glass pane. The glass is typically not designed for such point loading; it is designed for a wind load spread out over the entire surface of the glass (Ex. 215).

Therefore, Mr. Coleman concluded that the final rule should not allow suction cups, which provide only intermittent stabilization, as the primary stabilization device (Ex. 356). Rather, he said OSHA should define ''Work Station Stabilization'' as: ''a means to stabilize suspended access equipment by securing the worker or suspended access equipment to an approved anchor point on the exterior of the building surface,'' thus ensuring continuous stabilization (Ex. 215). Mr. Schoch, of TRACTEL, agreed with Mr. Coleman's recommendation (Ex. 329 (1/19/2011, p. 439)).

Several workers, based on personal experience, also opposed the use of suction cups, calling the devices ''unsafe'' (Exs. 311; 316; 329 (1/19/2011, pgs. 5, 8, 15, 18, 19, 61, 62); 329 (1/20/2011, p. 222)). For instance, Mr. Rosario, of SEIU Local 32BJ, stated:

I believe the use of suction cups fails to provide adequate protection. Suction cups are unreliable because they get dirty and fail to maintain suction. I remember having to clean 20-story buildings, sometimes with multiple stops per floor. At least half the time I applied the [suction] cup, it released during the cleaning and I had to apply it again (Ex. 311).

Mr. Rosario also said the support offered by suction cups ''usually only lasts for a few seconds'' (Ex. 329 (1/19/2011, p. 19)). Mr. Rosario added that usually he had to clean suction cups four or five times per descent (Ex. 329 (1/19/2011, p. 86)). Mr. McEneaney, with SEIU Local 32BJ, said suction cups were not reliable stabilization devices because they leave the worker ''de-stabilized during the movement from one floor to another'' (Ex. 329 (1/19/2011, p. 15)). However, most commenters said they primarily use suction cups for stabilization, and did not indicate they were not effective (Exs. 138; 163; 184; 222; 227; 241; 242).

After reviewing the rulemaking record, OSHA decided, for several reasons, to adopt the stabilization requirement as proposed. First, OSHA believes, and many commenters agreed, that stabilization of RDS is necessary to protect workers on descents greater than 130 feet. The effects of wind gusts, microbursts, and tunneling wind currents on longer RDS ropes is particularly severe and likely to increase the risk of injury to workers. For instance, increases or changes in the wind can cause a significant pendulum effect on the long RDS ropes, and will cause workers not stabilized to swing a great distance away from or into the building, possibly causing injury or death. For example, the RDS accident data analysis Mr. Terry submitted indicated that strong wind gusts (more than 35 mph) swung two workers using RDS 30 feet away from a building (Ex. 163).

In addition, even a single wind gust or a sudden drop in the wind speed can initiate this pendulum effect on RDS ropes and destabilize the workers using them. Moreover, when RDS ropes are long, the slightest wind movement also can cause the ropes to sway (*i.e.,* pendulum effect) and swing or propel workers into the building. OSHA believes that requiring stabilization in these situations will prevent RDS ropes from swaying and buffeting workers against the building.

Mr. Terry's accident analysis demonstrates what can happen when workers are not using stabilization, and how using stabilization could prevent such cases. Three RDS accidents in that analysis involved wind:

- Window cleaner cleaning 50-story building became stranded in descent equipment line as a result of a wind gust;
- Window cleaner was stuck between 12th and 13th floor and managed to rest on narrow window ledge. Winds that were gusting 35 mph caught his ropes and wrapped them around an antenna on the west side of the building so worker was unable free to himself; and
- Two window cleaners were left dangling from a building when their lines became tangled during a windy rain shower. Wind was gusting about 36 mph. The workers were stuck between the 11th and 14th floors and blown 30 feet away from the building (Ex. 163).

OSHA believes that stabilization, as required by this final standard, could prevent many such incidents.

Second, while OSHA agrees that employers must not allow workers to perform suspended work in hazardous weather and gusty or excessive winds, the Agency also recognizes that adverse conditions can suddenly occur without warning. When such conditions occur, employers must ensure that workers using RDS have stabilization methods immediately available so they can protect themselves from the effects of the wind, even if all they are doing is descending to stop work due to hazardous weather conditions. OSHA notes that even those commenters who asserted that stabilization is not necessary because weather restrictions can totally abate the hazard, also noted that they regularly use and rely on stabilization devices, even on descents as short as 10 feet (Exs. 163; 184; 221; 242).

Third, the final rule is consistent with the I–14.1–2001 national consensus standard. The I–14.1–2001 standard also requires that employers ensure workers using RDS have stabilization at their work station on all descents greater than 130 feet (Section 5.7.12). The I–14.1–2001 standard reflects best industry practices.

With regard to suction cups, for the following reasons OSHA decided not to prohibit their use under the final rule. First, OSHA believes that suction cups provide effective stabilization for workers using RDS, particularly in long descents. The record shows that suction cups are an effective and easy-to-use device that helps keep workers positioned or stabilized at their specific work location (Exs. 137; 138; 147; 153; 163; 184; 298).

OSHA received a comment from GANA stating that suction cups are not safe or effective to use for stabilization (Ex. 252). GANA's comment appears to indicate that they believe suction cups are a type of personal fall protection system, and concludes suction cups are not effective because the cups are not ''strong enough to provide the necessary fall protection and capable of absorbing fall impact so that the forces imposed on employees when stopping falls do not result in injury or death'' (Ex. 252). GANA also says suction cups are not effective because they cannot support the worker's weight if the RDS and personal fall arrest system both fail (Ex. 252). However, OSHA agrees with IWCA's post-hearing comments that GANA's description of the purpose and use of suction cups is not accurate (Ex. 346). As IWCA points out, and OSHA agrees, ''Suction cups are not intended to be part of the fall protection system and they are not part of the fall protection system'' (Ex. 346).

The second reason for allowing suction cups is that OSHA believes suction cups can provide stabilization and protection when sudden weather conditions occur while the worker is using an RDS, even if workers use the suction cups only to safely descend due to excessive wind. As Mr. Terry said, ''In the event of a sudden unforeseen weather hazard, the [RDS user] . . . can very easily . . . utilize the suction cup. . . . This method of stability can even be performed while descending out of harm's way'' (Ex. 329 (1/19/2011, p. 329)).

Third, OSHA believes that suction cups are widely used and accepted by employers and workers who use RDS, even by those employers who doubt the need for stabilization, because the devices have a track record of being effective, and economical. As far back as July 31, 1991, OSHA allowed employers to use suction cups to meet the stabilization requirement in the 1991 RDS memorandum. IWCA said that, since 1991, the use of suction cups in conjunction with RDS is widespread among window cleaning companies and workers in the United States and other countries (Ex. 346). Over that period, neither OSHA nor IWCA are aware of any data or evidence indicating that a significant problem exists with using suction cups. Although GANA said it is not safe to use suction cups on glass, they did not provide any data indicating that suction cups are causing glass windows to break (Ex. 252). Moreover, according to IWCA, a 2010 GANA press release said their members did not have any record of windows breaking when window cleaners were using suction cups (Ex. 346). OSHA notes that a review of the rulemaking record failed to show that suction cups cause anything more than a few isolated cases of window breakage. For example, Mr. John Capon, of Valcourt, reported that each year his company only had to replace 15 to 20 windows on the approximately 4,000 buildings they clean 2–3 times each year because of suction cup-related damage (Ex. 329 (1/19/2011, p. 372, 399)).

Finally, the performance-based final rule allows, but does not require, the use of suction cups for stabilization. Employers are free to use other devices, and some commenters said they use other stabilization methods, such as rail and track systems, that provide continuous stabilization (Exs. 163; 184; 221; 242; 329 (1/19/2011, p. 436)). Based on the above discussion, OSHA concludes that stabilization is essential at specific workplaces where descents are greater than 130 feet and is finalizing the provision as proposed.

Final paragraph (b)(2)(xi) is a new provision added to the final rule that requires employers to ensure no worker uses an RDS when ''hazardous weather conditions'' are present. The final provision also identifies some examples of weather conditions that OSHA considers hazardous for workers using RDS: Storms and gusty or excessive wind.

OSHA's general industry standard on powered platforms (§ 1910.66) and construction standard on scaffolds (§ 1926.451) also prohibit elevated work when certain weather conditions are present. Specifically, the powered platforms standard prohibits using powered platforms in winds in excess of 25 mph, and requires that employers determine wind speed based on ''the best available information, which includes on-site anemometer readings and local weather forecasts, which predict wind velocities for the area'' (§ 1910.66(i)(2)(v)). The construction standard prohibits work on scaffolds during storms or high winds ''unless a competent person has determined that it is safe for employees to be on the scaffold and those employees are protected by personal fall arrest systems or wind screens'' (§ 1926.451(f)(12)).

The I–14.1 standard also prohibits window cleaning operations and RDS use when the ''work area is exposed to excessive winds,'' which the standard defines as ''any wind which constitutes a hazard to the worker, public or property'' (Sections 3.7 and 5.7.12). The I–14.1 also requires that employers train workers in the effects of wind on RDS operations, and make workers aware of ''the potential of sudden climatic changes such as wind gusts, micro bursts or tunneling wind currents'' when they perform descents over 130 feet (Section 5.7.11(a)).

In the preamble to the proposed rule, OSHA requested comment on a number of issues regarding hazardous weather conditions including the following (75 FR 28886):

- Should the final rule prohibit RDS use in certain weather conditions? If so, what conditions?
- How should employers determine whether weather conditions are hazardous?
- How should OSHA define excessive wind?
- Should the final rule prohibit RDS use if winds reach a specific speed? If so, what speed?
- Should the final rule require that employers monitor winds speeds? If so, how?

Overwhelmingly, commenters supported prohibiting the use of RDS, as well as suspended scaffolding, in inclement or hazardous weather (Exs. 151; 163; 184; 221; 222; 227; 241; 242; 243; 329 (1/19/2011, p. 329)). They also agreed that conditions such as ''thunderstorms, lightning; hail, high winds, hurricane, snow and ice storms'' were hazardous. Sunlight added that heavy rain and extreme cold also make RDS use hazardous: ''Rain can affect the operation of the working line but the use of rope that is essentially waterproof can negate this problem. Very cold weather stiffens the rope and especially wet rope can be a hazard'' (Ex. 227).

In addition, some commenters said that as the length of rope during a drop increases, the effects of wind on RDS can increase (Exs. 147; 329 (1/19/2011, pgs. 253, 291–292)). As mentioned in the proposed rule, the greater the length of rope used for a descent, the greater the adverse effects of environmental factors such as wind gusts, microbursts, or tunneling wind currents, and the greater the risk of injury to workers (75 FR 28886). OSHA notes that some window cleaning companies disagreed that greater heights pose greater wind effects on RDS (Exs. 222; 247; 329 (1/19/2011, p. 329)). Dana Taylor, of Martin's, said their accident analysis files did not show any RDS accidents occurring due to excessive wind (*i.e.,* ''wind gusts, microbursts or tunneling wind currents'') (Ex. 222). Sam Terry of Sparkling Clean said:

> The adverse effects of environmental factors do not affect rope access any more than they affect suspended scaffolding. In actuality, users of rope access have the ability to get themselves and their equipment out of harm's way should unexpected weather hazards suddenly appear much quicker than users of suspended scaffolding.
>
> In the event of a sudden unforeseen weather hazard, the user of rope access can very easily use their hands, arms, legs, and feet to hold on to parts of the building or structure or to utilize the suction cup as long as a smooth surface is available. This method of stability can even be performed while descending out of harm's way. (Ex. 329, 1/19/2011, p. 329)).

Commenters also had different viewpoints about defining ''excessive'' wind. Some commenters said winds were excessive and dangerous when they reached 25 mph (Exs. 227; 329 (1/19/2011, p. 411)), while others said winds in excess of 15 mph were too high to use RDS (Exs. 138; 151; 152; 222; 329 (1/19/2011, p. 329)). For instance, John Capon of Valcourt said: ''I don't work . . . in more than 10 or 15 miles per hour [wind] and I almost look at that as normal. That seems a little awkward to me because that's not very windy at all. When it gets to 20 and 25 miles per hour, to me it gets very dangerous'' (Ex. 329 (1/19/2011, p. 411)).

Several stakeholders in the window cleaning industry indicated that including a 15-mph or 25-mph wind speed limit in the final rule was not necessary. Texas Window Cleaning Company said: ''Not many window cleaners are going to risk their health on wind, storm or other increments of bad weather. They know and are trained when, where and how to postpone the cleaning'' (Ex. 218).

Other window cleaning companies indicated that water ''blowback'' stops window cleaning operations long before winds reach 15 mph to 25 mph (Exs. 151; 163; 329 (1/19/2011, pgs. 213–214)). Mr. Adkins, of Corporate Cleaning, explained:

> I've never had anybody work at 15 miles an hour and never will because that, in my opinion, is too high, both for a boatswain's chair, a swingstage, a scaffold. Also, I might add there's something else that happens with window washing and that's the blowback effect. Window washers don't like to do their work over, and at a certain level of wind, you wind up with dirty water blowing on clean windows . . . which, of course, the customer doesn't like. They want us to come back, do it over. So, consequently, that's a lower level normally than anything where you have to worry about safety. Most normal window washers will shut down and we support this, we fully support this because I don't want the phone call from the property manager. Most window washers will shut down before they reach an unsafe level, before they come anywhere near it. The most I think I've ever seen our company working is in 15-mph winds (Ex. 329 (1/19/2011, pgs. 213–214)).

For companies that use RDS to perform operations that do not have the ''built-in monitoring'' capability for blowback of water, several commenters said, ''[I]t would seem to me that a 15 mph limit is reasonable'' (Exs. 163; 221).

The American Wind Energy Association (AWEA), however, opposed adding any wind-speed restriction to the final rule because it would be ''detrimental'' to the wind energy industry, which works in windy areas (Ex. 178). AWEA said that OSHA should allow employers to establish their own ''detailed policies and [job hazard analyses] for work in inclement weather'' (Ex. 178). Mr. Diebolt, of Vertical Access, also agreed that employers should be able to set their own weather policies:

Just a word about weather and changing site conditions. Wind has been a concern and understandably. But you can understand after AWEA's testimony this morning that a wind effect of somebody hanging on the outside of a turbine or working on top of a nacelle is entirely different from somebody working on a bridge, pier, abutment or the side of a building (Ex. 329 (1/21/2011, pgs. 139–140)).

With regard to monitoring wind speed, several window cleaning companies indicated that it was not necessary because ''blowback'' of water is an adequate measure (Exs. 138; 163; 222). That said, some of these companies recommended that employers monitor weather reports in their area and notify workers of changes that would prohibit the use of RDS (Exs. 151; 163; 222). Sunlight noted that ''the use of [B]lackberry, PDAs, internet and cell phones give the employer the tools to monitor weather conditions in real time'' (Ex. 227).

OSHA agrees with commenters who said the final standard must prohibit the use of RDS when weather conditions are hazardous for workers and the equipment. As the record and OSHA standards indicate, workers using RDS are vulnerable to sudden weather changes such as wind gusts, microbursts, and wind tunneling. Gusty and excessive winds can cause workers using RDS to swing into buildings, resulting in possible injury or death.

OSHA believes that employers' support of a mandatory prohibition on RDS during windy weather indicates that they are aware of the hazards posed by inclement weather. That said, the record indicates that what constitutes ''hazardous'' weather and ''excessive'' wind is dependent on the type of work performed when using RDS. For window cleaning, the record shows that water blowback acts as a reliable sign that winds have become excessive, even if they are well below 15 mph. However, for other jobs it may be safe to use RDS at higher wind speeds, depending on the type of job performed. For instance, the record indicates that using an RDS below 130 feet may be safe when winds approach 25 mph, but hazardous when using RDS at heights approaching 300 feet, or when the length of the descent rope is long.

In light of the many variables of RDS use, OSHA decided that using a performance-based approach in the final rule is the most effective way to cover varying worksite and job conditions. Under the performance-based final rule, employers must evaluate or analyze the worksite and job variables in light of existing weather conditions. If that analysis indicates that weather conditions are hazardous and winds are excessive, the employer must ensure that no employee uses an RDS. OSHA believes this approach will best ensure that employers provide an adequate level of safety, and take appropriate measures to protect workers in each specific work operation. Moreover, OSHA believes the performance-based final rule will not impose significant burdens on employers. The record shows that employers said they already monitor on-site weather conditions to determine whether to proceed with or postpone the job.

OSHA also believes the performance-based approach obviates the need to require in the final rule that employers conduct on-site weather monitoring or use specific weather-monitoring systems. The record shows that many employers currently use various electronic tools to monitor local weather forecasts.

Final paragraph (b)(2)(xii), like proposed paragraph (b)(2)(x), requires that employers ensure equipment is secured by a tool lanyard or similar method to prevent it from falling. Examples of equipment include tools, squeegees, and buckets. The purpose of this provision is to protect workers and the public below from being struck by falling equipment. The final rule is consistent with the I–14.1–2001 standard (Sections 3.10 and 5.7.15), and supplements the falling object requirements in final § 1910.28(c) (Protection from falling objects).

Several commenters, including IWCA, supported the requirement (Exs. 138; 151; 153). However, Mr. Donaldson, of Sunlight, said the provision was not practical or needed (Ex. 227). In particular, he stated that tool bungees are imperative to the window cleaning business, but a serious impediment to the use of squeegees or other tools. Therefore, he suggested the following alternative to the final rule:

The danger of workers below being struck by falling equipment is minimal. Workers rarely work directly below other workers. The tools themselves are light and blunt and could not cause serious injury unless dropped from a great height. . . . Requiring window cleaners to wear hard hats would be a more practical solution than tool bungees (Ex. 227).

AWEA also suggested additional alternatives:

[T]here are various ways to protect workers from falling objects in the wind industry. Workers are prohibited to work below other workers when using items that can fall. In addition, workers often use tool tethers for equipment. Typically, tools are hoisted in tool buckets versus being carried by workers. This practice allows the trained employee free use of his hands and mitigates the potential for tools falling out of workers' pockets (Ex. 329 (1/21/2011, p. 12)).

OSHA does not agree with Sunlight's comment for several reasons. First, OSHA believes the performance-based approach in the final rule assures that employers have maximum flexibility in meeting the requirement to secure equipment (*e.g.,* tools, squeegees, buckets) that workers use. Many different types of tool lanyards and similar methods are currently available to secure equipment. Tool lanyards and other securing equipment are available in many types, lengths, and load capacities, and a worker can secure the equipment at various points, including the worker's wrist, tool belt, harness, and seat board.

Second, Mr. Donaldson did not provide any explanation about how or why tool bungees are a ''serious impediment'' to using squeegees and other tools. OSHA did not receive any other comments supporting Mr. Donaldson's claim.

Third, OSHA disagrees with Mr. Donaldson's assertion that falling tools will not cause serious injury if they hit workers below. Many of the tools employees use in suspended work can be heavy and sharp (*e.g.,* a bucket of cleaning water or the corner at the end of a squeegee). Tools can cause injury to various parts of the body, especially if dropped from significant heights. In any event, Mr. Donaldson's recommendation that employees wear head protection when they work below elevated workers, such as window cleaners, will not protect other persons who also may be below.

With regard to the controls AWEA identified, OSHA believes that tethering controls is one way employers can comply with the final rule. As to the other controls AWEA suggested, OSHA believes that securing equipment is the most protective option because it removes the hazard of equipment falling and hurting workers. Putting tools in buckets and prohibiting employees from working below other workers, as AWEA suggests, does not prevent equipment from dropping and, in the case of prohibiting work below the worker, requires ongoing monitoring by the employer to be effective. Thus, OSHA believes that the final rule establishes the most protective control, and likely the most efficient one. Accordingly, OSHA adopts the requirement that employers ensure that equipment used in RDS work is secure to prevent it from falling and injuring workers and the public.

Final paragraph (b)(2)(xiii), like proposed paragraph (b)(2)(xi), requires that employers protect RDS ropes from exposure to open flames, hot work, corrosive chemicals, and other destructive conditions that could damage or weaken the ropes. This requirement will prevent damage to ropes that could lead to failure. Failure of a suspension or fall arrest line could seriously injure or kill a worker.

The performance-based approach in final paragraph (b)(2)(xiii) gives employers flexibility in determining how to protect RDS ropes from damage. OSHA believes that this approach is appropriate for the final rule because there are various controls available to protect RDS ropes from damage. This approach also is consistent with the I–14.1–2001 standard, which prohibits the use of hazardous or corrosive materials that could ''endanger the . . . safety of the worker or may affect the safe operation of equipment'' (Section 3.5).

A number of commenters supported the provision (Exs. 138; 151; 153; 184; 221; 222; 243), and OSHA did not receive any comments opposing the provision, and finalizes the provision as proposed.

Section 1910.28—Duty To Have Fall Protection and Falling Object Protection

Final § 1910.28 is the first of three new sections in subpart D that consolidate requirements pertinent to fall protection and falling object protection. The new sections are:

- § 1910.28—Duty to have fall protection and falling object protection;
- § 1910.29—Fall protection systems and falling object protection—criteria and practices; and
- § 1910.30—Training.

Final § 1910.28 specifies the areas and operations where employers must ensure that workers have fall and falling object protection and what type(s) of protection employers may use. The criteria for fall and falling object protection that employers use to comply the duties imposed by § 1910.28, and the training workers who use those systems must receive are in §§ 1910.29 and 1910.30, respectively. OSHA notes that § 1910.140 specifies criteria for personal fall protection systems that employers must meet when their workers use these systems.

OSHA believes these sections along with the general requirements in § 1910.22, taken together, establish a comprehensive approach to fall and falling object protection. OSHA believes this approach will ensure a better understanding of the final rule, fall hazards, and fall protection systems; provide flexibility for employers when choosing a fall protection system and falling object protection; ensure the systems they choose will be effective; and most importantly, will reduce significantly the number of fall injuries and fatalities in general industry.

Final § 1910.28, like the proposed rule, consolidates most of the general industry fall and falling object protection requirements throughout subpart D. OSHA patterned this section after the construction fall protection standard (29 CFR 1926.501, Duty to have fall protection). OSHA draws the range of fall protection options in the final rule, for the most part, from the construction standard. These options include engineering controls (*e.g.,* guardrails, safety net systems), personal fall protection systems (*e.g.,* personal fall arrest systems, travel restraint systems, positioning systems), and administrative measures (*e.g.,* designated areas). OSHA strived to make the final rule consistent with the construction standard, when appropriate. The record shows a number of employers have workers who perform both general industry and construction activities.

There are several ways in which OSHA made the final rule consistent with the construction fall protection standard. For example, the final rule provides for control flexibility. This rule, like the construction fall protection standard, allows general industry employers, similar to construction employers, to protect workers from fall hazards by choosing from a range of accepted conventional fall protection options. The existing general industry standard does not allow this flexibility and mandated the use of guardrail systems as the primary fall protection method (*e.g.,* see existing § 1910.23(c)).

The 1990 proposed revision of subpart D continued to require the use of guardrail systems. However, in the 2003 notice reopening the record, OSHA acknowledged that it may not be feasible to use guardrails in all workplace situations (68 FR 23528, 23533 (5/2/2003)) and requested comment on whether the Agency should allow employers to use other fall protection systems instead of guardrails. Commenters overwhelmingly favored this approach, which the construction fall protection standard adopted in 1994. In response to comments and OSHA's history and experience with the construction fall protection standard, the Agency proposed in 2010 to allow employers to select from a range of fall protection options instead of requiring employers to comply with the existing mandate to use guardrail systems.

OSHA is adopting the proposed approach for several reasons. First, the final rule's control flexibility reflects longstanding OSHA policy first incorporated in the 1994 construction fall protection standard. OSHA's history and experience with the construction standard indicates that its control flexibility approach has been effective. In addition, stakeholders responding to the proposed rule overwhelmingly supported this approach and there was little opposition to providing greater flexibility in controlling fall hazards.

Second, the fall protection systems that the final rule allows employers to use (guardrail systems, safety net system, personal fall protection systems) are accepted conventional fall protection systems that OSHA has determined provide an appropriate and equal level of safety. Moreover, allowing employers to select the least costly fall protection system from those controls that provide equal protection also ensures the final rule meets OSH Act requirements that a standard be cost effective (*Cotton Dust,* 452 U.S. at 514 n. 32; *Lockout/Tagout II,* 37 F.3d at 668).

Third, OSHA believes giving employers greater control flexibility in selecting fall protection systems allows them to select the system or method that they determine will work best in the particular work operation and location and draw upon their experience successfully protecting workers from fall hazards. OSHA believes that the process of determining the best fall protection system for the specific work activity will improve safety because employers will need to evaluate the conditions present in each specific workplace and consider factors such as exposure time, availability of appropriate attachment points, and feasibility. Similarly, it also will allow employers to consider and select the fall protection system that enables workers to perform the job most efficiently, thereby reducing workers' exposure to fall hazards.

Fourth, providing control flexibility allows general industry employers to take advantage of advances in fall protection technology developed since OSHA adopted the existing rule. For example, neither safety net systems nor personal fall protection systems were developed until after OSHA adopted the existing rule.

Fifth, greater control flexibility makes the final rule consistent with the construction fall protection standard, which makes it easier for employers to comply with the final rule and thereby should increase compliance. To illustrate, making the final rule consistent with the construction standard ensures that employers who have workers engaged in both general industry and construction activities are able to use the same fall and falling object protection while performing both types of activities. It eliminates the need to purchase different fall protection systems when their workers switch from performing general industry operations to construction activities, which ensures that the final rule is a cost-effective approach for eliminating or reducing fall hazards.

Finally, as mentioned, providing greater control flexibility is part the final rule's comprehensive approach to fall protection that also includes new requirements on system criteria and use; regular inspection, maintenance and repair; and fall hazard and equipment training. OSHA believes this comprehensive approach will provide equivalent or greater protection than the existing rule. As a result, OSHA believes that the additional flexibility and consistency achieved by this final rule in providing fall protection will reduce worker deaths and injuries. OSHA's history and experience with the construction standard confirms that its comprehensive approach to fall protection has been effective.

As mentioned, stakeholders supported incorporating control flexibility in the final rule (*e.g.,* Exs. OSHA–S029–2006–0662–0224; OSHA–S029–2006–0662–0252; OSHA–S029–2006–0662–0306; OSHA–S029–2006–0662–0365). For example, Northrop Grumman Shipbuilding (NGS) commented:

> We applaud the agency's work to recognize modern methods and technologies that are now available to ensure adequate fall protection for employees. Our experience is that no single method is effective in all potential fall situations and that a menu of proven methods and techniques . . . works best (Ex. 180).

Uniseal, Inc. said:

> OSHA should allow employers to responsibly choose any type of fall protection in proposed Sec. 1910.28 that the employer can demonstrate will be appropriate for the specific work location and activities being performed (Ex. OSHA–S029–2006–0662–0345).

Clear Channel Outdoor agreed, saying:

Clear Channel Outdoor and employers in the outdoor advertising industry should be permitted to choose appropriate fall protection, depending upon the location and type of structure. (Ex. OSHA–S029–2006–0662–0308)

The National Grain and Feed Association (NGFA) said:

> OSHA should not require guardrails as the primary means of fall protection but allow employers the flexibility to choose the most appropriate fall protection system that is appropriate to the specific work situation and activities being performed.
>
> [E]mployers evaluate each work situation to determine which option (*e.g.,* guardrails, cages, fall arrest systems, etc.) is the most appropriate and effective (Ex. OSHA–S029–2006–0662–0223).

Duke Energy said OSHA should allow general industry employers to ''select from the list of options'' like the construction fall protection standard:

> The construction industry standard allows employers to select fall protection from a list of options. All of the options provide equivalent protection. Employers should be allowed to use the option that fits the specific situation. The factors that employers use when selecting fall protection options include (1) duration of the job; (2) experience of the workers involved; (3) installation costs; (4) availability of fall protection at the location. There are times when the installation of guardrails is technically ''feasible'' but adds costs that are unnecessary, since other systems (such as a personal fall arrest system) provide equivalent protection (Ex. OSHA–S029–2006–0662–0310).

Some stakeholders, however, raised concerns about providing greater control flexibility. The American Federation of State, County and Municipal Employees (AFSCME) commented, ''Although we understand the need for flexibility, we believe employers should use guardrail systems and other engineering controls whenever possible, as is stated in the existing standard'' (Ex. 226). Thomas Kramer of LJB, Inc., expressed concerns that the proposed control flexibility would not be as protective as the existing rule's requirement to use guardrail systems to protect workers from fall hazards, stating:

> The hierarchy of control is something that is essential in the area of safety, and OSHA's failure to include something on this . . . is a significant omission. While there are a number of effective abatement options in the proposed regulation—and I understand that many considerations are involved in the cost/benefit analysis for hazard abatement—I still believe that it is a material oversight to remove the hierarchy and state that the options outlined provide ''equivalent protection.''
>
> The hierarchy of control clearly compares the effectiveness and ''defeatability'' of a protective system. Employing the hierarchy of control to evaluate abatement options is fundamental, and eliminating its application will lead to more use of a harness and lanyard than ever before. Although this can be an effective way to protect someone from a fall hazard, personal protective equipment is definitely not the safest and is not equal to engineering controls or passive fall protection (Ex. 204).

As discussed above, OSHA believes the comprehensive approach to fall protection that the final rule, like the construction fall protection standard, incorporates will provide equivalent or greater protection than the existing rule. OSHA is only permitting employers to use those accepted conventional fall protection systems that the Agency has determined to provide an appropriate and equal level of protection. The greater flexibility the final rule affords employers will allow them to select from those fall protection systems that provide equal protection the option that works best in the specific situation and is the most cost-effective protective measure capable of reducing or eliminating fall hazards. Moreover, the comprehensive approach in the final rule, like the construction fall protection standard, recognizes that, in some instances, it may not be possible to use guardrail systems or safety net systems to protect workers from falls. For example, some commenters said employers may not be able to install permanent systems such as guardrails when they do not own the building or structure on which their workers are working. OSHA believes the final rule addresses the concerns of these commenters without limiting employer flexibility or compromising worker safety.

OSHA notes that the final rule also limits fall protection choices in some situations where the Agency determined that guardrail systems are necessary to protect workers from falling. For example, in final paragraphs (b)(4) and (5) of this section, OSHA specifically requires the use of guardrails on dockboards and runways and similar walkways, respectively.

In addition to control flexibility, there are other ways in which OSHA made the final rule consistent with the construction fall protection standard. OSHA increased the consistency between the general industry and construction fall protection standards by including a provision similar to the construction standard addressing work on low-slope roofs (final paragraph (b)(13)). Workers on these walking-working surfaces perform both construction and general industry activities and OSHA believes that uniform requirements should apply to both activities. Final paragraph (b)(13), like the construction fall protection standard, allows employers to use designated areas instead of conventional fall protection systems when workers are performing work that is both infrequent and temporary at least six feet from the edge of a low-slope roof, while also ensuring that employers protect workers working closer to the edge using conventional systems (*e.g.,* guardrail, personal fall arrest, or travel restraint systems). As mentioned, OSHA believes that an important key to protecting workers is allowing employers the flexibility to select the fall protection system or method that will work best for their particular work activities or operations, thereby allowing employers to consider factors such as exposure time, availability of appropriate attachment points, and feasibility of compliance.

Consistent with the construction standard, the final rule requires that employers also must train their workers working in designated areas in the use of warning lines (see final §§ 1910.29(d) and 1910.30(a)).

Finally, OSHA increased the consistency of the general industry standard with the construction fall protection standard by organizing this final rule in a format that is similar to the construction standard. OSHA believes that the reorganized format will increase employer understanding of, and compliance with, the final rule.

Many commenters supported making the general industry and construction industry fall protection rules consistent (Exs. 111; 157; 165; 176; 212; 225; 236). For example, American Airlines (AA) supported making the general industry and construction standards uniform because they said it is ''nonsensical to have different fall protection requirements for similar—and sometimes identical—hazards across construction and general industries'' (Ex. 194).

However, Mr. Kramer, of LJB, Inc., expressed doubts about whether making the final rule similar to the construction fall protection standard will produce a significant decrease in fatalities. He claimed that fatality data in the years following adoption of the construction fall protection standard showed an increase in fall fatalities. OSHA does not find his argument convincing. Mr. Kramer does not clearly identify the source or scope of the data. At one point he suggests the data are from BLS, and at another point he indicates the data are from another source. In addition, it is unclear whether the data to which he refers are for construction or for all private industry fatalities. He did not provide any of the data itself. In any event, as explained in more detail in the Analysis of Risk and FEA (Sections II and V), there are a significant number of fall fatalities in general industry, and OSHA believes the final rule will be effective in reducing those numbers.

The final rule also establishes criteria and work practices addressing personal fall protection systems (§ 1910.140). These criteria include minimum strength and load, locking, and compatibility requirements for components of personal fall protection systems, such as lines (vertical lifelines, self-retracting lines, and travel restraint lines), snaphooks, and anchorages. The work practices include requiring employers to ensure inspection of personal fall protection systems before each use, and to ensure that a competent or qualified person inspects each knot in a lanyard or vertical lifeline. OSHA believes these criteria and work practices, in conjunction with the training and retraining requirements in the final rule, provide a combination of controls and redundancies that will help to ensure that personal fall protection systems are effective in protecting workers from falls hazards.

Paragraph (a)—General

Final paragraph (a)(1), like the proposed provision, requires employers to provide protection for workers exposed to fall and falling object hazards. It also specifies that, unless stated otherwise, the protection employers provide must comply with the criteria and work practices set forth in § 1910.29, Fall protection systems and falling object protection—criteria and practices. In addition, final paragraph (a)(1) clarifies that personal fall protection systems must comply with the criteria and work practices in § 1910.140, Personal fall protection systems.

Fall hazard identification is particularly important when workers work in a ''designated area'' or under other work situations where employers do not provide conventional fall protection systems. Additionally, when general industry employers contract with other employers to perform jobs and tasks at the worksite, OSHA also requires that the host employer and contract employer work together to identify and address fall hazards. One method of accomplishing this requirement is to follow the guidance specified by appendix B of 29 CFR part 1910, subpart I, Non-Mandatory Compliance Guidelines for Hazard Assessment and Personal Protective Equipment Selection. National consensus standards provide another resource for identifying and controlling fall hazards. For example, ANSI/ASSE Z359.2–2007, Minimum Requirements for a Comprehensive Managed Fall Protection Program, provides procedures for eliminating and controlling fall hazards (Ex. 29).

OSHA notes that the requirements in proposed paragraph (a)(2), which address the strength of walking-working surfaces, have been moved to final § 1910.22(b), which establishes requirements for maximum intended loads applied to walking-working surfaces. OSHA believes this change more clearly emphasizes that all walking-working surfaces must have the strength and structural integrity to support workers safely, not just those surfaces and work conditions requiring fall protection.

Final paragraph (a)(2) lists seven situations in which the requirements in § 1910.28 do not apply:

- Portable ladders (final paragraph (a)(2)(i));
- When the employer is inspecting, investigating, or assessing workplace conditions or the location at which work is to be performed prior to the start of work or after all work has been completed. However, this exception does not apply when fall protection systems or equipment meeting the requirements of § 1910.29 have been installed and are available for workers to use. If fall protection systems are present, workers must use them while conducting pre-work and post-work inspections, investigations, or assessments of workplace conditions (final paragraph (a)(2)(ii));
- Fall hazards presented by the exposed perimeters of entertainment stages and the exposed perimeters of rail-station platforms (final paragraph (a)(2)(iii));
- Powered platforms covered by § 1910.66(j) (final paragraph (a)(2)(iv));
- Aerial lifts covered by § 1910.67(c)(2)(v) (final paragraph (a)(2)(v));
- Telecommunications work covered by § 1910.268(n)(7) and (n)(8) (final paragraph (a)(2)(vi)); and
- Electric power generation, transmission, and distribution work covered by § 1910.269(g)(2)(i) (final paragraph (a)(2)(vii)).

The first two exceptions, specified in final paragraphs (a)(2)(i) and (ii), are new additions to the final rule. OSHA added language specifically excepting portable ladders to clarify that employers only have to provide fall protection on fixed ladders. The National Chimney Sweep Guild (NCSG) (Exs. 150; 240; 268; 269; 329 (1/18/2011, pgs. 254–348); 365) pointed out that in the proposed rule OSHA did not exclude portable ladders from the duty to have fall protection, and expressed concern that, by default, the rule would cover portable ladders under the ''catch-all'' provision (final paragraph (b)(15), Walking-working surfaces not otherwise addressed). The fall protection requirements in the proposal were to apply only to fixed ladders, not portable ladders. Therefore, OSHA agrees with NCSG that adding a specific exception to the final rule clarifies this requirement.

The final rule also adds an exception when workers are inspecting, investigating, or assessing (collectively referred to as ''inspecting'') workplace conditions prior to the start of any work or after completing all work. However, once any work begins, employers must provide workers performing inspections (inspectors) with, and ensure that they use, fall protection where required by this section. Moreover, this exception does not apply when properly installed fall protection systems or equipment meeting the requirements of § 1910.29 are available for use. The existing rule does not exclude pre-work or post-work inspections from fall protection requirements. OSHA drew the exception from the construction fall protection standard (§ 1926.500(a)(1)).

Several commenters urged OSHA to add this exception to the final rule (Exs. 111; 150; 157; 176; 177; 212; 225; 240; 268; 269; 329 (1/18/2011, pgs. 254–348); 365). First, some commenters said it was not necessary for workers conducting pre-work or post-work inspections to use fall protection. For example, American Insurance Association (AIA) said the final rule should recognize that certain tasks that workers (*e.g.,* claims adjustors and loss-control personnel) perform on roofs have ''lower risks'' because ''these tasks are usually conducted in good weather and normally expose employees to a fall hazard only for a short time, if at all'' (Ex. 157). Allstate Insurance Company (Allstate) agreed, adding that insurance inspectors (and adjustors) only access roofs infrequently to inspect damage (Ex. 212).

Littler Mendelson, P.C., said, ''Employees who inspect, investigate or assess workplace conditions and perform no physical work should be exempt from the requirements of fall protection, provided the employee has received the training specified in Section 1910.30'' (Ex. 111). AIA added that all of their workers who perform inspections receive training in safe roof access, and are well aware of the proximity of unprotected sides (Ex. 157). Allstate also said that workers performing inspections are more aware of their location than other workers (Ex. 212).

A number of commenters said OSHA should add an exception because requiring inspectors to use fall protection would expose them to greater, and additional, hazards (Exs. 111; 150; 157; 177; 212; 225; 240; 268; 365). For instance, Littler Mendelson said, ''By allowing such employees to perform their inspection duties without fall protection, OSHA would avoid the greater fall hazards incurred by employees who must access elevations carrying the tools and materials required to install fall protection for the inspectors'' (Ex. 111). Commenters also said that requiring inspectors to use fall protection would pose greater hazards because it would expose them to fall hazards for greater periods of time. Littler Mendelson said requiring inspectors to use fall protection would expose them to fall hazards for longer than it takes to perform the inspection (Ex. 111). NCSG agreed, explaining that it would take longer to get to, install, and remove anchors than the time it takes to conduct the inspection (Exs. 150; 240; 268; 269; 329 (1/18/2011, pgs. 254–348); 365). NCSG said the vast majority of their work is chimney cleaning and inspection in which chimneys are cleaned from the ground and workers only access the roof for a few minutes to inspect the chimney at the conclusion of the job to verify the cleaning operation is complete (Ex. 150). NCSG also said that chimney sweeps perform pre-inspections on roofs to identify whether repairs or other maintenance work may be needed. The fall protection exception in final paragraph (a)(2)(ii) would cover both of these inspections.

Similarly, Roofing Consultants Institute, Inc. (RCI) said that complying with the proposed rule would require spending increased time on roofs to anchor and position fall protection systems, therefore increasing worker exposure to falls (Ex. 225). AIA, Allstate, Confrere Strategies on behalf of the National Association of Mutual Insurance Companies (Confrere Strategies), and Farmers Insurance Group of Companies (Farmers) also voiced the same argument (Exs. 157; 176; 177; 212).

Several commenters complained that requiring inspectors to use fall protection would be infeasible and ''unduly burdensome'' (Exs. 150; 157; 176; 177; 212; 235). Allstate said the proposed requirement was infeasible because the insurance company does not own or control the properties that its adjusters inspect and does not have permission to install fall protection systems (Ex. 212). AIA indicated that the proposed requirement was infeasible, and that an exception was necessary for the insurance industry to continue its work. However, AIA did not provide any explanation regarding why the proposed requirement was infeasible (Ex. 157). RCI said the proposed rule was unreasonably burdensome because it did not provide any discernible benefits (Ex. 225).

Two commenters, Allstate and Farmers, indicated that inconsistency between the proposed rule and the construction fall protection standard, and lack of clarity about which standard would apply to inspectors, would cause confusion and pose an unreasonable burden on employers (Exs. 157; 176). Specifically, Allstate believed that the construction exception covered the activities of insurance adjusters, but was unsure whether inspecting damaged property is subject to the general industry rule or the construction rule. Farmers pointed out:

> Currently, neither the Proposed Rule nor the construction fall protection requirements make clear whether a claims adjuster's inspection and assessment of damaged property before and after construction is considered ''construction work'' covered by 29 CFR § 1926.500(a) or whether such inspection activities would be subject to the General Industry Standards under the Proposed Rule (Ex. 176).

Finally, some commenters said OSHA's rationale for allowing the exception for the construction industry also should apply to general industry inspectors (Exs. 157; 177; 212; 225). For example, RCI said, ''[W]ork practices used by RCI members performing site visits . . . such as [on] roofs would most likely be identical for both general and the construction industry'' (Ex. 225). Confrere Strategies said:

> The 1994 rationale for the insurance and inspection exception remains today. Subjecting inspectors and adjusters to fall protection standards would be overly burdensome and infeasible and would subject employees to fall hazard for greater periods of time. Incorporation of specific exemption language in Subpart D is consistent with prior regulations, reflects the realities of insurance inspection and claims adjustment operations and would eliminate any potential confusion related to the definition of ''construction activities'' (Ex. 177).

AIA added, ''AIA supports harmonization of the fall protection requirements in the Construction and General Industry Standards. In furtherance of that goal, we recommend incorporating into the proposed rule the exception to fall protection requirements for inspection, investigation and assessment activities contained in the Construction Industry Standard'' (Ex. 157).

OSHA recognizes that requiring workers to use fall protection when conducting inspections prior to, and after completion of, work may not be feasible in some isolated or limited situations. For example, as Allstate said, the insurance companies are unlikely to own the structures the inspectors are inspecting, and it may not be possible to obtain permission to install fall protection equipment, such as anchors (Ex. 212). Therefore, OSHA added a limited exception to the final rule for pre-work and post-work inspections activities.

However, as mentioned earlier, unlike the exception in the construction fall protection standard, final paragraph (a)(2)(ii) does not apply when fall protection systems or equipment already are installed on the structure where an inspector will conduct a pre-work or post-work inspection, that is, when fall protection systems are installed, workers performing pre-work and post-work inspections, like all other workers, must use them.

OSHA believes that limiting the application of the exception to pre-work and post-work is appropriate. The Agency believes that, where fall protection equipment already is installed, there is no reason why inspectors should not use it like all other workers working on the same walking-working surface must. To illustrate, where anchors and self-retracting lifelines meeting the requirements of § 1910.29 already are installed on a roof, OSHA believes that attaching a harness should not increase inspectors' exposure to the fall hazard in any appreciable way, while taking this action ensures that they can safely conduct the inspection. When inspectors have to climb fixed ladders equipped with ladder safety systems or self-retracting lifelines for personal fall arrest systems to inspect damage or assess maintenance needs, OSHA believes it is feasible for these workers to attach their harnesses to the existing equipment without difficulty or increasing exposure time.

OSHA notes that evidence in the record indicates that an increasing number of buildings and fixed ladders are equipped with anchorages and ladder safety or personal fall arrest systems, respectively. Unlike pre-work and post-work inspections in the construction industry, in general industry, buildings and structures already exist and already may have fall protection equipment installed. Therefore, OSHA believes that a number of situations currently exist in which it may be feasible to use fall protection when conducting pre-work and post-work inspections, and that these situations are likely to continue increasing.

The third exception to the requirement to provide fall protection, specified in final paragraph (a)(2)(iii), applies to fall hazards presented by exposed perimeters of entertainment stages and rail station platforms; OSHA carried this exception over from the proposed rule. The use of guardrails or other fall protection systems could interfere with performances on stage, or create a greater hazard to the performers than would otherwise be present. OSHA recognizes that there may be circumstances when fall protection may be feasible in these occupational settings, and encourages employers in these settings to use fall protection when possible, such as during rehearsals. OSHA did not receive any comments opposing this exception, and adopted it as proposed.

Paragraphs (a)(2)(iv) through (vii), like the proposed rule, specify that the final rule does not apply to powered platforms (§ 1910.66), aerial lifts (§ 1910.67), telecommunications (§ 1910.268), or electric power generation, transmission, and distribution (§ 1910.269). Other general industry standards address those operations and equipment, and include provisions requiring employers to provide and ensure workers have and use fall protection. OSHA received one comment on these exceptions. Ameren Corporation agreed that final § 1910.28 should not apply to work that § 1910.269 covers (Ex. 189). OSHA adopted the proposed exceptions with only minor editorial changes, for clarity.

Paragraph (b)—Protection From Fall Hazards

Final paragraph (b), like the proposed rule, sets forth the requirements on the types of fall protection systems that employers must select and use to protect workers from fall hazards while working in specific workplace areas, situations, and activities (final paragraph (b)(1) through (15)). The final rule allows employers to use any one or more of the fall protection systems listed for the particular area, situation, or activity, including:

- *Guardrail systems*—barriers erected to prevent workers from falling to a lower level (final § 1910.21(b));
- *Safety net systems*—passive fall protection systems that arrest a worker from falling to a lower level when a fall occurs. Employers must install safety net systems as close as practicable below the surface where workers are working, and extend the systems beyond the outermost projection of the workstation;
- *Personal fall protection systems*—a type of conventional fall protection system that protects a worker from falling, or safely arrests a worker's fall if one occurs. They include personal fall arrest, and travel restraint and positioning systems, but not rest lanyards (final § 1910.140(b));
- *Personal fall arrest systems*—a type of personal fall protection system used to arrest workers from falling to a lower level when a fall occurs. These systems consist of an anchorage, connector, and body harness. A personal fall arrest system also may include a lanyard, deceleration device, lifeline, or combination of these items (final § 1910.140(b));
- *Travel restraint systems*—a type of personal fall protection system used to limit a worker's travel to prevent exposure to a fall hazard. Travel restraint systems consist of a combination of an anchorage, connector, lanyard, and body support. Unlike personal fall arrest systems, travel restraint systems do not support the worker's weight. Rather, the purpose of these systems is to prevent workers from reaching the fall hazard, such as an unprotected side or edge (final § 1910.140(b)).
- *Ladder safety systems*—a system designed to eliminate or reduce the possibility of falling from a fixed ladder. A ladder safety system usually consists of a carrier (*i.e.,* a flexible cable or rigid rail track), a safety sleeve (*i.e.,* a moving component that travels up and down on the carrier), lanyard, connectors, and body harness (final § 1910.21(b));
- *Positioning systems (work-positioning systems)*—a type of personal fall protection system designed to support a worker in a fixed location, on an elevated vertical surface (*e.g.,* fixed ladders), so the worker can work with both hands free (final § 1910.140(b));
- *Handrails*—rails used to provide workers a handhold for support (final § 1910.21(b)); and
- *Designated areas*—a distinct portion of a walking-working surface delineated by a perimeter warning line in which workers may perform work in certain situations without using additional fall protection (final § 1910.21(b)).

OSHA believes each of the fall protection systems listed for a particular situation are effective and appropriate in those situations. In this regard, OSHA notes that the final rule only permits employers to use designated areas on low-slope roofs (final paragraph (b)(13)). The proposed rule permitted employers to use designated areas for unprotected sides and edges (proposed paragraph (b)(1)(ii)), wall openings (proposed paragraph (b)(7)(ii)), and walking-working surfaces not otherwise addressed (proposed paragraph (b)(13)(ii)).

After reviewing the rulemaking record, as well as OSHA's letters of interpretation addressing the use of controlled access zones and warning line systems under the construction fall protection standard, OSHA believes that designated areas must be limited to only ''a few, very specific situations'' (see, *e.g.,* letter to Mr. Keith Harkins (11/15/2002)[42]). To illustrate, the construction standard only permits the use of a warning line system for roofing work on low-slope roofs (§ 1926.501(b)(10)), and the use of controlled access zones for overhand bricklaying and related work (§ 1926.501(b)(9)). The construction standard also allows the use of controlled access zones for some leading edge work, for precast concrete erection, and in residential construction, rather than the broad category of unprotected sides and edges (§ 1926.502(k)), and then only when employers can demonstrate that it is infeasible or creates a greater hazard to use conventional fall protection equipment.

Applying the rationale in the construction standard to general industry, the final rule limits the use of designated areas to work on low-slope roofs (final paragraph (b)(13)). OSHA believes that the use of designated areas is appropriate on flat or gently sloping surfaces or when workers and work are located a safe distance from a fall hazard, such as a roof edge. However, OSHA does not believe that designated areas provide adequate protection from fall hazards on steep or vertical surfaces or for work performed near an unprotected edge or side, such as narrow walking-working surfaces. (See further discussion of designated areas in final paragraph (b)(13), below.)

OSHA received several comments on the use of designated areas. David Hoberg, with DBM Consultants, supported limiting the use of designated areas because ''it is a huge opening for abuse'' (Ex. 206). He suggested limiting the use of designated areas to those situations that existed prior to publication of this final rule, are unique to the work such that the same work is not done at other locations using standard methods, and when a certified safety professional or professional engineer with experience in the work and conditions approves use of a designated area (Ex. 206). As discussed in more detail below (final § 1910.28(b)(13)), OSHA is limiting the use of designated areas to low-slope roofs and to work more than 6 feet from the edge. Employers may use designated areas for work that is more than 6 feet and less than 15 feet from the edge if it is both infrequent and temporary. If the work is not temporary or infrequent, the employer may use a designated area if the work is more than 15 feet from the roof edge. The Agency believes this clarification addresses Mr. Hoberg's concerns.

Several commenters objected to the designated area approach because it was too different from the construction standard's requirements for residential roofs, and instead asked that OSHA synchronize the general industry requirements with the construction standard for those roofs (See, *e.g.,* 124, 149, 150.). OSHA agrees in general, and the final rule includes a new paragraph (final § 1910.28(b)(1)(ii)) addressing these concerns. Under this provision, employers may implement a fall protection plan meeting the requirements of the construction standard if they can demonstrate that it is not feasible or creates a greater hazard to use guardrail, safety net, or personal fall protection systems on a residential roof.

In addition to establishing fall protection options for specific workplace areas and situations, final paragraph (b) also establishes the height that triggers the employer's obligation to provide fall protection. The final rule, like the existing and proposed rules, generally requires that employers provide fall protection when workers work at levels that are four feet or more above a lower level. The final rule, like the proposal, defines ''lower level'' as an area to which a worker could fall (§ 1910.21(b)). The definition also includes examples of lower levels, including ground levels, floors, excavations, pits, tanks, materials, water, equipment, and similar surfaces and structures, or portions thereof.

Employers' duty to provide fall protection when workers can fall four feet or more to a lower level is not new. As mentioned earlier, the existing rule, which OSHA adopted in 1971, has a four-foot trigger height (*e.g.,* existing § 1910.23(b)(1)(i), (b)(2), (b)(3), (c)(1), (c)(2); § 1910.268(g)). Pursuant to section 6(a) of the OSH Act, OSHA adopted the 4-foot trigger from ANSI A12.1–1967, Safety Requirements on Floor and Wall Openings, Railings and Toe Boards. As far back as 1932, ANSI A12.1 prescribed a 4-foot trigger height. ANSI/ASSE A1264.1–2007, Safety Requirements for Workplace Floor and Wall Openings, Stairs and Railing Systems, also requires the use of fall protection where there is an unprotected side or edge 4 feet or more above a lower level (Ex. 13). Like ANSI A12.1, the ANSI/ASSE A1264.1 standard has specified the 4-foot fall protection height requirement since its inception.

Since OSHA adopted the general industry four-foot trigger, the Agency consistently reinforced the requirement in numerous public statements and Agency interpretations (*e.g.,* letters to Mr. Paul Osborne (May 13, 1980);[43] Mr. Anil Desai (September 14, 1990);[44] M.O. Brown, Jr. (October 22, 1992)[45]). Moreover, as far back as 1932, the ANSI A12.1 standard included the four-foot trigger. Thus, OSHA believes the general industry four-foot trigger is a well-recognized requirement.

In 1994, the construction fall protection standard, with some exceptions, set a six-foot trigger height for construction work (59 FR 40672 (8/19/1994)). In 2003, when OSHA reopened the record for comment on subpart D, comments received by the Agency indicated that some stakeholders mistakenly believed that the general industry fall protection trigger height is the same as the construction fall protection standard. To address this confusion, OSHA clearly pointed out in the 2010 proposed rule that the four-foot trigger height for general industry ''has been standard industry practice for more than 75 years'' (75 FR 28887).

OSHA did not propose to revise the four-foot trigger height, noting that the existing rule is a long-standing requirement and standard industry practice. OSHA also said the results of a 1978 University of Michigan study supported the four-foot fall protection trigger height (Ex. OSHA–S041–2006–0666–0004). OSHA requested comment on the four-foot trigger height, including information on any recent studies and information that ''support or contradict'' the four-foot trigger height (75 FR 28887).

A number of commenters supported retaining the existing four-foot trigger height (Exs. 65; 172; 226). In particular, the American Federation of Labor and Congress of Industrial Organizations (AFL–CIO) stated, ''The 4-foot rule maintains a long-standing OSHA requirement and industry practice that we believe is important for protecting workers against fall hazards to a lower

[42] OSHA letter to Mr. Keith Harkins available at: *https://www.osha.gov/pls/oshaweb/owadisp.show_document?p_table=INTERPRETATIONS&p_id=24552.*

level'' (Ex. 172). Martin's Window Cleaning said that ''[s]ince it has always been OSHA's stand that [potential] falls be limited to less than 4 [feet in general industry], then it is imperative that OSHA include requirements for . . . lifeline tie backs . . . in locations that would limit falls to this distance'' (Ex. 65). In addition, they said, ''OSHA should require that all fall protection systems and suspension systems limit falls to 4 [feet]'' (Ex. 65).

The American Society of Safety Engineers (ASSE) urged OSHA to conduct research that would support a single trigger height for fall protection in general industry and construction, noting:

As OSHA ably recognizes in its discussion [in the proposed rule], research supports the conclusion to maintain its current 4-foot trigger height for general industry. In the same discussion, however, OSHA also recognizes that a 6-foot trigger height is the standard for construction. Despite the long-established traditions behind these different trigger heights, we would encourage OSHA to work with NIOSH to determine if appropriate research can be conducted that would help lead the occupational safety and health community to a single trigger height. If a single trigger height could become widely accepted, ASSE believes there would be significant gains in understanding the importance of fall protections and ways to protect employers. Given the continued high incidence of injuries from heights, it would be prudent to at least examine whether a single trigger height would be helpful (Ex. 127).

ORC Mercer also supported a single fall protection trigger height for general industry and construction, although it was ''not arguing that OSHA should set the trigger for fall protection to six feet for all general industry work'' (Ex. 254). However, they said OSHA needed to provide a ''better explanation/ justification for the disparity in the trigger for fall protection in General Industry maintenance work versus Construction work,'' stating:

The proposed rule retains the historic disparity of a 4-foot trigger for fall protection in General Industry and a 6-foot trigger for fall protection in Construction. Although the proposal makes a number of arguments regarding the history of its adoption of the four-foot trigger for General Industry work and states that the four-foot rule has been used in consensus standards for more than 75 years, OSHA has not addressed the difficulties for employers who may have General Industry maintenance work going on within only a few feet of activities that meet the definition of Construction work. The definition of what constitutes construction work versus work that falls under the General Industry [standard] continues to confuse employers seeking to set a consistent standard in their workplaces. Simply telling a construction contractor (who is performing work at a manufacturing site) that he must protect his employees whenever they may fall more than four feet above a lower level (because the host employer wishes that all workers on the site to adhere to a uniform standard) is likely to be met with resistance as the construction contractor's employees will have been trained and equipped to work with the 6-foot trigger. Hence many employers have simply adopted the six-foot trigger for all non-routine or maintenance work (Ex. 254).

ORC Mercer added that ''language and guidance for determining the feasibility of fall protection for work that is done between four and six feet above the next lower lever is needed in both the final rule and in any compliance documents that follow the promulgation of this rule'' (Ex. 254).

Others stakeholders also supported a single trigger height, but argued that the single height should be six feet instead of four feet (Exs. 165; 202; 236). The Mechanical Contractors Association of America (MCAA) said, ''Construction workers performing work at existing facilities often have to comply with both standards, which creates confusion, and therefore, opportunity for unintentional noncompliance'' (Ex. 236). MCAA added that making the general industry trigger height consistent with the construction standard ''would eliminate the confusion and simplify compliance requirements without compromising worker safety,'' noting:

This section proposes to keep the previously established four foot fall protection/prevention rule in place for general industry. However, employers are often unclear about what OSHA considers to be maintenance and repair, which falls under the agency's general industry standards (29 CFR 1910), vs. construction work, which falls under the construction standards (29 CFR 1926). In addition, inconsistencies between the two sets of standards often require employers to comply with both sets of standards for the same application (Ex. 236).

Mr. Kramer, of LJB, Inc., raised concerns about the availability and effectiveness of personal fall arrest systems in situations where the fall hazard is only four feet, stating:

It is clear from the proposed regulation that a personal fall arrest system can be used in situations where the fall hazard is 4 feet. I acknowledge that it is possible to rig a fall arrest system to protect a worker from a fall where the allowable fall distance is 4 feet. However, without a direct and in-depth discussion on fall clearance requirements, the statement by OSHA can be very misleading. Falls occurring while attached to a horizontal lifeline can result in total fall distances as large as 15 feet. OSHA risks having employers simply provide their employees with a harness, lanyard and anchorage when they are four feet above a lower level. In this case, the employee is not protected. The stated goal of reducing fatalities and injuries due to a fall has not been achieved and it is clear in these circumstances that a personal fall arrest system does not provide equivalent protection to a guarded platform (Ex. 204).

However, other commenters said there is personal fall protection equipment available that can limit falls to four feet. In this regard, Capital Safety Group (CSG) and the International Safety Equipment Association (ISEA) said:

ASSE is currently working on a standard for self-retracting lanyards that includes a class of [self-retracting line] that when anchored overhead is designed to protect workers in situations where fall clearance is very limited such as the case when exposed to a 4-foot fall. OSHA should include a reference to this standard when it becomes available (Exs. 185; 198).

Comments and testimony submitted in this rulemaking record have not persuaded OSHA that adopting a fall protection trigger height greater than four feet would provide equivalent or greater protection than the current trigger. As mentioned, existing national consensus standards require that employers provide fall protection where unprotected sides or edges are more than four feet above a lower level. Section 6(b)(8) of the OSH Act specifies that OSHA follow the requirements in national consensus standards unless the Agency can show why a rule that differs substantially from consensus standard ''will better effectuate the purposes'' of the OSH Act than the national consensus standard. None of the stakeholders arguing that OSHA should change its longstanding general industry four-foot trigger height provided any recent studies, data, or other information to support changing the trigger height to six feet. OSHA believes increasing the height at which employers must provide fall protection may expose workers to additional risk of injury, reduce worker safety, and decrease the protection afforded to workers by OSHA's general industry fall protection standards (75 FR 28887).

With regard to comments arguing that different fall protection trigger heights for general industry and construction would cause confusion and non-compliance, OSHA's experience and the rulemaking record do not bear that out. The general industry and construction fall protection trigger heights have been in place for years. OSHA's enforcement experience with both standards does not indicate that employers are confused about or not been able to comply with applicable fall protection height requirements. In addition, stakeholders did not submit comments in this rulemaking indicating that they currently are experiencing confusion. Given that, OSHA does not believe that reaffirming the current general industry four-foot fall protection height trigger will cause confusion in the future. In any event, OSHA points out that employers will be in compliance with both the general industry and construction fall protection standards if they provide fall protection when workers are working four feet or more above a lower level.

Final paragraph (b), like the proposal, includes the following four exceptions[46] from the four-foot trigger height:

- When using motorized equipment on dockboards (final paragraph (b)(4)(ii));
- Over dangerous equipment (final paragraph (b)(6));
- Around repair, service, and assembly pits (final paragraph (b)(8)); and
- On fixed ladders (final paragraph (b)(9)).

More specifically, for work performed on dockboards, the final rule establishes a trigger height of greater than 10 feet for guardrails or handrails when dockboards are used solely for materials-handling operations using motorized equipment. For work performed over dangerous equipment, the final rule, like the proposal, requires that employers protect workers from falling onto or into dangerous equipment regardless of the height at which the workers are working above the dangerous equipment. For work around repair, service, and assembly pits, the use of fall protection is not required for pits that are less than 10 feet deep, provided the employer limits access to the edge of the pit to trained, authorized employees, marks the floor around the edge of the pit in contrasting colors (or places a warning line at least 6 feet from the pit edge), and posts readily visible caution signs around the pit that warn workers of the fall hazard. For fixed ladders, the final rule adopts the proposed requirement that employers must provide fall protection when the ladder extends more than 24 feet above a lower level. (See the detailed discussion of these exceptions below.)

As mentioned earlier, final paragraph (b) also adds a new provision for work on low-slope roofs (final paragraph (b)(13)). In addition, the final rule moves work on platforms used in slaughtering facilities into a separate provision (final paragraph (b)(14)). The proposed rule addressed these platforms as part of proposed paragraph (b)(1), Unprotected sides and edges.

Unprotected sides and edges. Final paragraph (b)(1), like the proposed rule, establishes fall protection requirements employers must follow to protect workers from falling off unprotected sides and edges of walking-working surfaces that are four feet or more above a lower level. The final rule defines ''unprotected sides and edges'' as any side or edge of a walking-working surface (except at entrances and other points of access) where there is no wall, guardrail system, or stair rail system to protect an employee from falling to a lower level (final § 1910.21(b)).

Final paragraph (b)(1)(i), similar to the construction fall protection standard (§ 1926.501(b)(1)), specifies that employers may use one or more of the following fall protection options to protect workers from fall hazards at unprotected sides and edges:

- Guardrail systems (final paragraph (b)(1)(i)(A));
- Safety net systems (final paragraph (b)(1)(i)(B));
- Personal fall protection systems, such as positioning, travel restraint, and personal fall arrest systems (final paragraph (b)(1)(i)(C)).

Final paragraph (b)(1)(i) differs from the proposed rule in two ways. First, the final rule allows employers to use positioning systems, in addition to using personal fall arrest and travel restraint systems. Neither the proposed rule nor the construction fall protection rule (§ 1926.501(b)(1)) included positioning systems in the list of personal fall protection systems that employers may use. However, OSHA believes positioning systems are effective to protect workers from falling when they are working in a fixed location above a lower level. OSHA notes that some employers equip their workers with both systems, especially when the workers climb and work on fixed ladders. That is, employers provide personal fall arrest systems to protect workers during climbing and positioning systems to protect workers when they work while standing on the ladder.

Second, as discussed, final paragraph (b)(1)(i) eliminates the use of ''designated areas'' to protect workers from fall hazards on any unprotected side or edge, which proposed paragraph (b)(1)(ii) would have allowed. As discussed, the use of designated areas is intended for a very few specific and limited situations rather than all unprotected sides or edges.

General industry work on residential roofs. In final paragraph (b)(1)(ii), which was not in the proposed rule, OSHA adds a provision from the construction fall protection standard (§ 1926.501(b)(13)) that applies to construction on residential roofs. Final paragraph (b)(1)(ii) specifies that when employers can demonstrate it is infeasible or creates a greater hazard to use any type of conventional fall protection system (*i.e.,* guardrail, safety net, or personal fall protection system) when working on a residential roof they must take specific alternative measures to eliminate or reduce fall hazards. Specifically, employers must develop and implement a written ''fall protection plan,'' including other control measures, and training that meet the requirements in the construction standard (29 CFR 1926.502(k) and § 1926.503(a) and (c); STD 03–11–002 Compliance Guidance for Residential Construction (6/6/2011)).

At the outset, and discussed in detail below, OSHA notes that many stakeholders, including NCSG, urged OSHA to add the construction fall protection plan requirements to the final rule (Exs. 149; 150; 240). These stakeholders, many of whom perform both general industry and construction activities, said making the final rule consistent with the construction standard would make it easier for them to protect workers performing both types of activities. In addition, stakeholders indicated the specific requirements of the fall protection plans give employers a clear blueprint for protecting their workers and achieving compliance when conventional fall protection is infeasible or creates a greater hazard.

OSHA limits final paragraph (b)(1)(ii) to work employers perform on ''residential roofs.'' OSHA's definition of ''residential roof'' incorporates the principles established in its Compliance Guidance for Residential Construction (STD 03–11–002 (6/6/2011)):

> The Agency's interpretation of ''residential construction'' for purposes of 1926.501(b)(13) combines two elements—both of which must be satisfied for a project to fall under that provision: (1) the end-use of the structure being built must be as a home, *i.e.,* a dwelling; and (2) the structure being built must be constructed using traditional wood frame construction materials and methods (although the limited use of structural steel in a predominantly wood-framed home, such as a steel I-beam to help support wood framing, does not disqualify a structure from being considered residential construction). . . .

[46] For work on scaffolds, the final rule specifies that employers must protect workers from falls in accordance with the construction scaffold standards (29 CFR part 1926, subpart L). The construction scaffold standards (§ 1926.451(g)(1)) require that employers provide fall protection for workers working on a scaffold more than 10 feet above a lower level.

Recently it has become more common to use metal studs for framing in residential construction rather than wood. . . . OSHA will consider it within the bounds of ''traditional wood frame construction materials and methods'' to use cold-formed sheet metal studs in framing.

And finally, OSHA is aware that many homes and townhouses, especially in the southern and southwestern regions of the country, have usually been built using traditional wood frame construction throughout the structure except for the exterior walls, which are often built with masonry brick or block. . . . Because the same fall protection methods are likely to be used in the construction of homes built with wood framed and masonry brick or block exterior walls, the Agency has decided that it is consistent with the original purpose of 1926.501(b)(13) to treat the construction of residences with masonry brick or block in the exterior walls as residential construction.

In accord with the discussion above, and for purposes of the interpretation of ''residential construction'' adopted herein, ''traditional wood frame construction materials and methods'' will be characterized by:

Framing materials: Wood (or equivalent cold-formed sheet metal stud) framing, not steel or concrete; wooden floor joists and roof structures.

Exterior wall structure: Wood (or equivalent cold-formed sheet metal stud) framing or masonry brick or block.

Methods: Traditional wood frame construction techniques.

Consistent with the construction standard, final paragraph (b)(1)(ii) does not apply to nursing homes, hotels, and similar facilities, even though they are homes or dwellings. As OSHA explained in Compliance Guidance for Residential Construction:

Construction of nursing homes, hotels, and similar facilities typically involves the use of the following materials in the framework of the structure: precast concrete, steel I-beams (beyond the limited use of steel I-beams in conjunction with wood framing, described above), rebar, and/or poured concrete. These materials are not used in traditional wood frame construction, and buildings constructed using these materials will not be considered ''residential construction'' for purposes of § 1926.501(b)(13) (STD 03–11–002 (6/6/2011).

OSHA does not intend for final paragraph (b)(1)(ii) to apply to low-slope residential roofs. Employers performing work on low-slope residential roofs must comply with final § 1910.28(b)(13), which requires the use of conventional fall protection in certain locations (within 6 feet of the roof edge) and allows employers to use designated areas further from the roof edge. OSHA does not believe these residential roofs pose the same types of hazards and potential feasibility issues as work performed on residential roofs that have a greater slope. OSHA notes that final paragraph (b)(1)(ii) applies to the vast majority of residential roofs because they do not meet the final rule's definition of low-slope roof: ''a roof having a slope less than or equal to 4 in 12 (vertical to horizontal)'' (§ 1910.21(b)).

As mentioned, final paragraph (b)(1)(ii), like the construction standard, requires that employers use a fall protection plan but only where they demonstrate that all of the fall protection systems specified in final paragraph (b)(1)(i) are infeasible or present a greater hazard in a specific location on a residential roof. The final rule adopts the definition of ''infeasible'' in the construction fall protection standard, which states that ''infeasible'' means that it is impossible to perform the construction work using a conventional fall protection system (*i.e.,* guardrails, safety net system, or personal fall arrest system) or that it is technologically impossible to use any one of those systems to provide fall protection (§ 1926.500(b)).

To establish that an OSHA standard creates a greater hazard, an employer must prove, among other things, that the hazards of complying with the standard are greater than those of not complying, and no alternative means of employee protection are available (*Bancker Construction Corp.,* v. *Reich,* 31 F.2d 32, 34 (2d Cir. 1994); *Dole* v. *Williams Enterprises, Inc.,* 876 F.2d 186, 188 (D.C. Cir. 1989)). It is not enough for the employer to show that complying with a standard will create a new hazard. The Occupational Safety and Health Review Commission (the Commission) has held that the employer must establish that complying with a standard would be more dangerous than allowing employees to work without compliance (*Secretary of Labor* v. *Spancrete Northeast, Inc.,* 16 O.S.H. Cas. (BNA) 1616, *aff.* 40 F.3d 1237 (2d Cir. 1994)) (See further discussion of greater hazard vis-à-vis rolling stock and motor vehicles in the explanation of final § 1910.21). OSHA notes that employers must document in the fall protection plan the reasons for their determination of infeasibility or greater hazard (§ 1926.502(k)(5)).

Final paragraph (b)(1)(ii), like the construction standard, includes a note specifying there is a presumption that using at least one of the fall protection systems final paragraph (b)(1)(i) specifies is feasible and will not create a greater hazard. The record includes information and examples of conventional fall protection controls that employers currently are using or are available for work on residential roofs (Exs. 150; 240; 347). For example, the NCSG acknowledged there are personal fall protection anchorages available that work on residential roofs (Ex. 150). Some of these systems have been available and in use since OSHA issued the construction fall protection standard in 1994 (59 FR 40694–95). Based on the rulemaking record, OSHA believes there is substantial evidence that employers can protect workers from falling with conventional fall protection systems in virtually all work operations performed on residential roofs. For example, NCSG indicates that it is feasible to use conventional fall protection in substantial and major installation and repair jobs. Thus, OSHA believes it is appropriate to include the note to underscore that employers have the burden to prove in the particular roof operation all of the controls in final paragraph (b)(1)(i) are infeasible or pose a greater hazard.[47] If those criteria are satisfied, employers must implement:

- A written fall protection plan that meets the requirements of § 1926.502(k), including implementing other control measures (§ 1926.502(k)(6) and (8)); and
- Training that meets the requirements of § 1926.503(a) and (c).

Section 1926.502(k) specifies that the employer's fall protection plan must:

- Be prepared by and have any changes approved by a ''qualified'' person (§ 1926.502(k)(1) and (2)). The final rule defines qualified as a person who, by possession of a recognized degree, certificate, or professional standing, or who, by extensive knowledge, training, and experience has successfully demonstrated the ability to solve or resolve problems relating to the subject matter, the work, or the product (final § 1910.21(b));
- Be developed specifically for the site where the employer will perform work on residential roofs (§ 1926.502(k)(1));
- Be maintained up to date (§ 1926.502(k)(1)), which OSHA said in the construction fall protection standard ''provides clear notice to employers that they have an ongoing responsibility'' to monitor conditions and address any changes or deficiencies (59 FR 40718);
- Be maintained at the job site (§ 1926.502(k)(1) and (3)), which gives workers the opportunity to inspect the fall protection plan and provides them with needed reassurance that the employer is taking appropriate measures to reduce or eliminate exposure to fall hazards when conventional fall

[47] Employer claims that standards are infeasible or create a greater hazard are affirmative defenses that employers have the burden of proving in citation cases (OSHA Field Operation Manual, Chapter 5, Section VI).

protection cannot be used (59 FR 40719);

- Be implemented under the supervision of a ''competent person'' (§ 1926.502(k)(4)). The construction standard defines competent person as a person who is capable of identifying existing and predictable hazards in the surrounding or working conditions which are unsanitary, hazardous, or dangerous to employees, and who has authorization to take prompt corrective measures to eliminate them (§ 1926.32(f));
- Identify each location where conventional fall protection cannot be used and document the reasons why the use of conventional fall protection systems is infeasible or would create a greater hazard (§ 1926.502(k)(5) and (7)).[48] OSHA explained in the preamble to the construction fall protection standard that requiring employers to make a close examination helps to ensure their decision is justified and has an objective basis (59 FR 40719). A closer examination also ensures that employers have not overlooked locations or operations where conventional fall protection can be used (59 FR 40719);
- Discuss other measures that the employer will take to eliminate or reduce the fall hazard for workers where conventional fall protection is infeasible or creates a greater hazard (§ 1926.502(k)(6));
- Implement control measures to reduce or eliminate hazards or implement a safety monitoring system that complies with § 1926.502(h) (§ 1926.502(k)(8));
- State the name or other method of identification for each worker who works in a location where a fall protection plan is implemented (§ 1926.502(k)(9)); and
- Investigate the circumstances of any fall or other serious incident that occurs to determine whether the employer needs to change the fall protection plan and implement those changes (§ 1926.502(k)(10)).

In the preamble to the construction fall protection standard, OSHA said the fall protection plan requirements gives employers a ''clear direction'' about what they must do and how they must proceed if conventional fall protection cannot be used (59 FR 40718). Requiring employers to comply with all of the requirements of the fall protection plan, including implementing other control measures, reflects the Agency's position that any deviation from the general requirements for fall protection must be construed as narrowly as possible'' (59 FR 40720). OSHA believes that requiring employers to strictly comply with all of the requirements in § 1926.502(k) when conventional fall protection is not feasible or creates a greater hazard ''will provide the best opportunity to avert employee injury and death'' (59 FR 40718).

The construction fall protection standard requires that employers develop and implement a fall protection plan for the specific site where they are performing work on a residential roof (§ 1926.502(k)(1)). OSHA notes that a fall protection plan an employer develops for repetitive use for a particular style or model of a residential structure will be considered site-specific for other sites, but only if the plan ''fully addresses all issues related to fall protection at that particular site'' (STD 02–11–002). For example, chimney sweep companies may use a fall protection plan they develop for a particular type of residential roof (*e.g.,* tile, metal) for other roofs of that type rather than developing a new plan for each residence. Additionally, where a roof is similar to others for which the employer has a fall protection plan, the employer may modify an existing plan instead of developing a new one. However, where the roofs are not the same type or involve different specifications or working conditions, employers must develop and implement a fall protection plan that is specific to the site.

OSHA stresses that after employers have identified where and why conventional fall protection cannot be used (§ 1926.502(k)(5)), it will not be acceptable for employers' fall protection plans to simply state that they will not be implementing any measures to reduce or eliminate the fall hazard in those locations. Employers must implement other measures to reduce or eliminate fall hazards for workers in those locations (§ 1926.502(k)(6)). The construction fall protection standard identifies a number of measures employers can use to reduce fall hazards when conventional fall protection cannot be used, such as scaffolds, ladders, bucket trucks, and vehicle mounted platforms (§ 1926.502(k)(6)). To reduce the risk of falls in ''ladder to roof transitions,'' which NCSG said was ''one of the highest hazards,'' employers can use equipment (*e.g.,* quivers, backpacks, rope pull) to lift materials and tools instead of carrying them up on ladders. Other measures include safe work practices (*e.g.,* workers positioning themselves so their backs are not to the fall hazard, not working in adverse weather), safety screens (59 FR 40720), scaffold platforms (Ex. 150), and fall hazard training specific to residential roofs.

Stakeholders who recommended adding the fall protection plan provision to the final rule, indicate that they are using the measures identified above (Exs. 150; 342). NCSG, for example, said they use scaffolds and bucket trucks for some chimney sweep operations, particularly significant and major repairs and installations that may takes days to a week to complete (Ex. 329 (1/18/2011), pgs. 268–69, 278–80). Chimney sweep companies also work from ladders where possible because, according to NCSG, doing so reduces the fall hazards associated with transitioning from the ladder to the roof (Ex. 150).

Where no other measures can be implemented, the construction fall protection standard requires that employers implement a safety monitoring system that complies with § 1926.502(h). In the preamble to the construction fall protection standard, OSHA indicated that using safety monitoring system is a last resort ''when no other, more protective measures can be implemented'' (59 FR 40719–20 (''OSHA has determined that the employer must do what it can to minimize exposure to fall hazards before turning to the use of safety monitoring systems'')).

Section 1926.502(h)(1) requires that safety monitoring systems must designate a competent person to be the safety monitor for employees working in areas where no other fall protection measures are used. Section 1926.502(h)(1) also specifies, among other things, that safety monitors must be on the same walking-working surface be within visual sight of workers, close enough to orally communicate with the workers they are monitoring, and not have any other responsibilities that could take their attention away from the workers they are monitoring. In addition, safety monitors must warn workers when it appears that the workers are not aware of fall hazard or are acting in an unsafe manner.

OSHA believes that many employers will not use safety monitoring systems as alternate control measures because

[48] OSHA notes that the construction fall protection standard requires employers to classify each location in which conventional fall protection cannot be used as a ''controlled access zone'' and follow the requirements for controlled access zones in § 1926.502(g) (§ 1926.502(k)(7)). Unlike the construction fall protection standard, the general industry final rule does not permit the use of controlled access zones. Therefore, the final rule does not require employers to comply with the controlled access zones requirements in § 1926.502(k)(7), such as erecting a flagged control line around the entire length of the unprotected edge, in locations where the employer has demonstrated that conventional fall protection cannot be used.

they assign one-worker jobs and a safety monitoring system requires at least two workers at each work location. NCSG said, for instance, that one-person jobs constitute the majority of their work (Ex. 150).

In addition to implementing other measures to eliminate or reduce worker exposure to fall hazards, final paragraph (b)(1)(ii) also requires that employers using fall protection plans must develop and implement a training program and retraining for each employee who works in a location where conventional fall protection cannot be used. The training must meet the requirements in § 1926.503(a) and (c). Section 1926.503(a) requires that employers ensure, among other things, their fall protection plan training program ''enables each employee to recognize the hazards of falling and . . . train each employee in the procedures to be followed in order to minimize the hazards'' (§ 1926.503(a)(1)). The retraining requirements in § 1926.503(c) are essentially the same at those in final § 1910.30(c).

As stated above, OSHA believes, based on the rulemaking record and the Agency's experience with the construction fall protection standard, that in most, if not virtually all, jobs performed on residential roofs employers can protect workers from falls by using conventional fall protection systems (*i.e.,* guardrail systems, safety net systems, personal fall protection systems). That said, OSHA has decided to add paragraph (b)(1)(ii) to the final rule for two reasons: (1) To make the final rule consistent with the construction fall protection standard, which is one of the stated goals of this rulemaking, and (2) to address stakeholder concerns about the feasibility of conventional fall protection in certain residential roof operations.

Allowing employers who perform both general industry and construction activities to follow the same standard makes it easier and more efficient for employers to safely perform both types of activities, and thereby, facilitates compliance and reduces potential for confusion about which standards apply to a particular operation.

Throughout this rulemaking, stakeholders have repeatedly urged OSHA to harmonize the general industry and construction fall protection standards, particularly with respect to the fall protection plan requirements in the construction standard (Exs. 124; 149; 150; 240; 329 (1/18/2011, p. 279); 342; 365). For example, SBA Office of Advocacy said small business representatives (SERs) who attended a roundtable discussion on the proposed rule, recommended that ''OSHA should further synchronize the proposed general industry rule with the existing construction standard'' (Ex. 124). According to SBA Office of Advocacy, SERs expressed concern that ''[t]wo employees could be working side by side on similar tasks, but one could be covered by the general industry standard and the other by the construction standard'' (Ex. 124). SBA Office of Advocacy added that SERs were confused about ''the difference between maintenance and repair (general industry) and construction activities'' and ''which standards applied under what circumstances'' (Ex. 124). To illustrate, NCSG said it can be difficult to figure out whether certain chimney sweeps operations (*e.g.,* replacing chimney caps, repairing roof flashing) are maintenance (general industry) or construction activities. OSHA believes that making the general industry and construction fall protection standards consistent resolves those concerns.

OSHA notes the construction fall protection plan requirements have been in place since 1994, therefore, general industry employers who perform construction activities (*e.g.,* chimney sweep companies) have significant experience developing and implementing fall protection plans, other control measures, and training in jobs where conventional fall protection cannot be used. OSHA has not received any reports that these employers have experienced difficulty complying with the fall protection plans requirements in the construction standard. Rather, these stakeholders repeatedly urged OSHA to allow them to implement fall protection plans when they satisfy the criteria in final paragraph (b)(1)(ii) regardless of whether the activity is general industry or construction.

OSHA also is adopting final paragraph (b)(1)(ii) to address the concerns stakeholders raised (*e.g.,* Exs. 149; 150; 240). NCSG, for instance, commented that using conventional fall protection systems on residential roofs is ''technologically and/or economically infeasible'' ''for the great majority of tasks performed by [chimney] sweeps'' and ''threatens both the continuing viability of the industry and the availability of chimney inspection, sweeping, and repair services at affordable prices'' (Ex. 150).

NCSG and the National Association of Home Builders (NAHB) both argued that it is not possible to use conventional fall protection systems on residential roofs because there are not suitable attachment or anchorage points and it is not possible to install them (Exs. 149; 150; 342). For instance, NAHB said it is not possible to penetrate tile or metal roofs to secure an anchor (Ex. 149). In addition, NAHB and NCSG said homeowners would not permit contractors to nail anchorages into the roof or install guardrails because of concern that such installation would cause damage.

OSHA notes that NCSG's own materials suggest some flexibility in the use of nails in particular. In their ''successful chimney sweep training'' booklet, NCSG recommends securing ladders by ''driv[ing] a nail into the roof and secur[ing] the ladder with rope. If you choose this method, remember to remove the nail and to seal the hole before leaving the rooftop'' (Ex. 342). NCSG offers no explanation as to why homeowners would allow ladders to be secured to the roof with nails but not roof anchorages. In addition, CSG and ISEA said temporary roof anchors can be mounted to common roof structural materials by clamps or screws, which would not damage the roof (Exs. 185; 198).

OSHA recognizes that, where homeowners will not allow employers to install temporary or permanent anchors or other fall protection (*e.g.,* guardrails) and all other conventional fall protection systems are infeasible, implementing a fall protection plan, other measures to eliminate or reduce fall hazards, and training ''will provide the best opportunity to avert employee injury and death'' (59 FR 40718). That said, OSHA notes that attaching personal fall protection systems to a roof anchorage may not be the only available method of anchoring those systems. However, to the extent other types of anchors or attachment devices are or become available, employers would have to demonstrate that those devices are infeasible in order to satisfy the criteria in final paragraph (b)(1)(ii).

As mentioned, stakeholders, including NCSG, have argued they should be allowed to use fall protection plans and other control measures where they demonstrate conventional fall protection would create a greater hazard. NCSG said requiring the use of conventional fall protection would result in extended exposure to fall hazards, and thereby create a greater hazard, because it may take longer to install and remove fall protection (*e.g.,* roof anchors for personal fall protection) than to perform the work. NCSG said chimney cleaning and inspection involves accessing the roof for only 5 to 20 minutes and minor repairs (*e.g.,* replacing a chimney cap, minor flashing repair) typically requires the chimney sweep to work on the roof for 20 minutes to 2 hours (Ex. 150). By contrast, they said installing anchors would take 45 to 90 minutes (Ex. 150). However, Tom Wolner, of CSG, said that employers can install temporary nail-on roof anchors in ''probably less than 10 minutes'' (Ex. 329 (1/18/2011, p. 107)).

Stakeholders also said requiring the use of conventional fall protection in residential rooftop operations would create a greater hazard because workers would have to carry extra equipment to the roof, which they said would ''increase the number of ground to roof trips'' (Ex. 150). NCSG pointed out that chimney cleaning and inspection typically is done in one climb; however, they also acknowledged that fall protection can be brought to the roof during the initial climb and even minor repairs and installations can involve multiple climbs (Ex. 150). As the examples above illustrate, rooftop work varies widely in the duration and climbs. Employers will have to demonstrate that using conventional fall protection in the specific operation makes it more dangerous for workers than working without that protection.

Some commenters opposed allowing any exemptions from using conventional fall protection systems (Exs. 185; 198; 329 (1/18/2001), pgs. 82–83, 107). For example, Tom Wolner, of CSG, said:

> Certain segments within general industry have requested that OSHA provide broad exemptions from proposed fall protection regulations, by citing things such as hardships that the use of fall protection would create, safe work histories or feasibility concerns. Capital Safety is opposed to granting such general exemptions within the regulation. It is our opinion that it is feasible and practical to provide workers with active or passive means of fall protection in nearly every work situation. A variety of all fall protection equipment available today, combined with our ability and the ability of others like us within the fall protection industry to customize or tailor fall protection equipment to specific needs often eliminates the need for exemptions (Ex. 329 (1/18/2011, pgs. 82–83)).

OSHA agrees with Mr. Wolner that it is feasible for employers to provide workers with conventional fall protection systems in ''nearly every work situation.'' However, OSHA does not agree with Mr. Wolner that final paragraph (b)(1)(ii) is an overly broad exemption or unprecedented. In enforcement action, employers always are permitted to raise affirmative defenses, such as a claim that the required controls are not feasible or pose a greater hazard.

Final paragraph (b)(1)(iii), similar to proposed paragraph (b)(1)(vi), excepts employers from providing the fall protection specified in final paragraph (b)(1)(i) when employers can demonstrate that it is not feasible for workers to use fall protection on the working side of platforms used at loading racks, loading docks, and teeming platforms. The ''working side'' is the side of the platform where workers are in the process of performing a work operation. The final rule, similar to the proposed rule, specifies that the working side exception to providing fall protection only applies when the employer demonstrates infeasibility and:

- The work operation for which fall protection is infeasible is in process (final paragraph (b)(1)(iii)(A));
- The employer limits access to the platform to ''authorized'' workers (final paragraph (b)(1)(iii)(B)), which the final rule defines as a worker who the employer assigns to perform a specific type of duty, or allows to be in a specific location or area (final § 1910.21(b)); and
- The employer trains authorized workers in accordance with final § 1910.30 (final paragraph (b)(1)(iii)(C)).

Section 1910.30 requires, among other things, that employers train workers, including authorized workers, to recognize fall hazards and the procedures to follow to minimize them.

OSHA notes that, in limited cases, it may not be possible for workers to perform work operations if fall protection, such as guardrails, interferes with access to the work operation. However, as the final rule specifies, the issue of blocking access to the work operation is a concern only when workers are in the process of performing the work operation. As a result, fall protection, such as guardrails, must be in place or used when workers are not performing a work operation on the working side of a platform. OSHA believes that fall protection does not interfere with performing tasks such as maintenance, cleaning, and similar tasks; therefore, when workers are performing these tasks, employers must provide fall protection.

Final paragraph (b)(1)(iii) differs from the proposal in two respects. First, the final rule deletes the proposed exception for the ''working side'' of slaughtering facility platforms (proposed paragraph (b)(1)(iv)). Based on evidence in the record, OSHA decided to regulate those platforms separately in final paragraph (b)(14).

Second, the exception in the final rule only applies when the employer demonstrates that no fall protection system is feasible. The proposed rule applied the exception when the employer demonstrates guardrail systems are not feasible (proposed paragraph (b)(1)(vi)). Therefore, to the extent fall protection systems other than guardrails are feasible, such as travel restraint or personal fall arrest systems, the employer would have to provide those systems and the exception would not apply.

Stacked materials. In the proposed rule, OSHA raised an issue about whether there is a need to promulgate specific requirements to address the use of fall protection when employees work and climb four feet or more above a lower level on stacked materials, such as stacks of steel and precast concrete products that are being stored or loaded onto motor vehicles and rail cars for transport (75 FR 28868). OSHA noted in the proposed rule that the Agency uses § 1910.23, § 1910.132 and the general duty clause (29 U.S.C. 654(a)(1)) to protect workers who climb and stand on stacked materials from falling (75 FR 28868).

By 2004, the American Iron and Steel Institute (AISI) and Precast/Prestressed Concrete Institute (PCI) had raised the issue of fall protection on stacked materials (75 FR 28868; Exs. 5; 41). In general, they both said using fall protection, such as ''guardrails or tie-off protection,'' on stacked materials was infeasible or creates a greater hazard (75 FR 28868). AISI said workers at steel and steel product companies ''need to stand on 'stacks' of product that have a large surface area in order to rig bundles for crane lifts and similar activities'' or ''[load] products onto truck trailers and railcars'' (Ex. 5, AISI's comments on the Office of Management and Budget ''Draft Report to Congress on the Costs and Benefits of Federal Regulations''). They characterized the solutions OSHA recommended to protect those workers (*i.e.,* guardrails around stacked materials, magnet cranes, and safety lines around vehicle trailers and rail cars) as ''not feasible'' and ones that could ''create its own serious safety hazard.'' For example, AISI said safety lines would interfere with movement of the product and magnet cranes cannot connect to single bundles.

PCI, in a January 3, 2000, letter requesting an exception from existing fall protection requirements for loading/unloading precast concrete products on motor vehicles and for stacking, storing, and loading/unloading precast concrete products in the plant, said workers need to access the top of concrete products for only ''very short periods of time'' to connect/disconnect lifting devices or rigging (Ex. 41). They said installing a fall protection system, by contrast, would expose employees to fall hazards for ''an extended period of time'' and, therefore, poses a greater hazard (Ex. 41). PCI also pointed out that the OSHA construction fall protection standard does not require that workers use fall protection when unloading precast concrete at construction sites (Ex. 41).[49]

AISI and PCI recommended that OSHA allow employers to use alternative measures, such as safe work practices and training, including a ''mentor system hands-on process for training'' (Exs. 5; 41). AISI said OSHA should require guardrails or tie-off protection only ''where practical'' and be permitted to use an ''alternative practice'' and provide training where it is not (Ex. 5). However, AISI did not identify any alternative practices that would provide adequate protection for employees working on stacked materials. PCI said employers should be allowed to provide ''individual instruction as well as have a mentor system hands on training process'' instead using fall protection systems on stacked materials (Ex. 41). PCI also recommended that employees perform ''corrective and detail work'' at the ground level or from a ladder or mobile-elevating work platform instead of on the stacked materials.

OSHA received a number of comments in response to the proposed rule, most of which supported requiring the use of fall protection on stacked materials (Exs. 127; 155; 161; 185; 198; 205; 238). For example, ASSE stated:

> ASSE cannot agree with ''some commentators (who) have recommended that OSHA allow the use of safe work practices by trained employees in lieu of conventional fall protection for certain activities,'' . . . . If employers are going to ask employees to climb on stacked materials where there are fall hazards and, typically, exposure to falls off the sides to lower levels, employers have the duty to warn, train and protect workers from falls. In our members' experience, this is not infeasible or unreasonable to ask (Ex. 127).

The Society of Professional Rope Access Technicians (SPRAT) said ''the prevalence of incidents that have occurred in these situations'' warrants a requirement to use ''fall protection of some sort'' on stacked materials (Ex. 205). SPRAT recommended allowing employers to use industrial rope access systems (IRAS) to protect employees because they said it would mitigate any difficulty or impossibility of using ''measures previously recognized by OSHA as being 'conventional' '' (Ex. 205). SPRAT further recommended:

> [I]f OSHA's language toward protection against falls were less method-specific and more results-oriented, competent and qualified persons would have greater latitude in creating protective systems that would be very protective without having to use a proscribed method. OSHA would be well-advised to permit use of such systems so long as they are approved by a Qualified Person, created by a Competent Person, and appropriate training [is] provided to the Authorized Person (Ex. 205).

OSHA did not propose to cover IRAS and the final rule clarifies that IRAS are not rope descent systems (§ 1910.21(b)). Given that, OSHA is not adopting SPRAT's recommendations.

Several commenters said fall protection systems to protect employees working on stacked materials are feasible and currently in use in general industry (Exs. 155; 185; 198). For instance, ISEA and CSG said fall protection manufacturers have developed and are supplying employers with such systems, including ''trailer-mounted systems, A-frames, rope grab systems, and ropes at tie-off points'' (Exs. 185; 198). They added that manufacturers also create custom fall protection systems (Exs. 185; 198). Ellis Fall Safety Solutions (Ellis) said that temporary and permanent wheeled and fork-lifted devices with railed personal fall protection anchorages are available for loading/unloading operations and should be required for stacked materials (Ex. 155; *see also* 148; 158; 198; 355–2). Ellis also pointed out that these systems can provide fall protection over a large surface area (*i.e.,* ''up to 30 ft.'') (Ex. 155).

PCI and the International Sign Association (ISA), in response to the proposed rule, submitted comments opposing any requirement for fall protection on stacked materials (Exs. 161; 238). PCI said in the 14 years since their request for an exception from the existing fall protection requirements they had ''not learned of any system or device'' that would change their position that requiring the use of fall protection on stacked materials is infeasible and would create a greater hazard (Ex. 238).

ISA, like PCI and AISI, argued that it is infeasible to require the use of fall protection on stacked cargo and motor vehicles (Ex. 161). In particular, ISA said permanent attachment of fall protection equipment to motor vehicles is not feasible because the area of the truck bed normally available for walking or working is usually quite small and such equipment would interfere with the utility of trucks as cargo-carrying vehicles. Like PCI and AISI, ISA also recommended that OSHA ''should provide flexibility for employers in terms of implementing alternative practices, appropriate training, or both'' (Ex. 161).

ISA also appeared to suggest that installing fall protection for employees working on stacked materials would create a greater hazard. ISA said employees stand or work on stacked materials only ''occasionally'' and ''temporarily'' to perform operations that ''are strictly associated with rigging of cargo items for hoisting,'' implying that rigging stacked cargo only exposes employees to fall hazards for a very brief period of time compared to the time necessary to install fall protection systems (Ex. 161).

After reviewing the rulemaking record, OSHA does not agree that requiring fall protection on stacked materials is infeasible or could create a greater hazard. OSHA finds there is substantial evidence showing that a number of fall protection systems for stacked materials are available and already are in use in general industry (Exs. 155; 185; 198). For example, commenters said wheeled, trailer-mounted and fork-lifted overhead anchor and retractable line systems are available and in use to protect employees working on stacked materials (Exs. 155; 185; 198. *See also, e.g.,* Exs. 148; 158; 355–2; OSHA–S029–2006–0662–0373). These stand-alone systems can be used for stacking, storing, and loading/unloading stacked materials in open yards and plants as well as for loading/unloading stacked materials on rolling stock and motor vehicles (*e.g.,* Ex. 355–2). In addition, the record shows that other fall protection systems employers use for loading/unloading stacked cargo on rolling stock and motor vehicles also work for materials that are stacked or stored in yards or plants. These systems include mobile work platforms, scissor lifts and stairs equipped with railings/guardrails that allow workers to access stacked materials without standing on them (*e.g.,* Exs. 63; 124; 169; 181; 335; OSHA–S029–2006–0662–0208; OSHA–S029–2006–0662–0227; OSHA–S029–2006–0662–0350; OSHA–S029–2006–0662–0373).

Finally, OSHA also concludes that the final rule does not need to include specific or separate requirements addressing stacked materials. OSHA believe that final § 1910.28(b)(1) (Unprotected sides and edges) and (b)(15) (Walking-working surfaces not otherwise addressed) adequately address fall protection on stacked materials.

Hoist areas. Final paragraph (b)(2), like the proposed rule, establishes fall

[49] OSHA notes that the definition of ''walking-working surface'' in the construction fall protection standard does not include rolling stock and motor vehicles (29 CFR 1926.500(b)).

protection requirements for workers who work in hoist areas that are four feet or more above a lower level. The final rule defines a ''hoist area'' as an elevated access opening to a walking-working surface through which equipment or materials are loaded or received (final § 1910.21(b)).

Final paragraph (b)(2)(i) requires employers to protect workers in hoist areas from falls by:

- Guardrail systems (final paragraph (b)(2)(i)(A));
- Personal fall arrest systems (final paragraph (b)(2)(i)(B)); or
- Travel restraint systems (final paragraph (b)(2)(i)(C)).

The construction fall protection standard includes a similar provision requiring that employers provide guardrail or personal fall arrest systems to protect workers in hoist areas that are six feet or more above a lower level (§ 1926.501(b)(3)). This final rule provides greater control flexibility than the construction standard because it also allows employers to provide travel restraint systems to protect workers. OSHA received no comments on the proposed provision and it is finalized as discussed.

Final paragraph (b)(2)(ii), like the proposed and construction rules (§ 1926.501(b)(3)), requires that, if removing any portion of a guardrail system, gate, or chains and if the worker leans through or over the edge of the access opening to facilitate hoisting, the employer must protect the worker from falling by a personal fall arrest system. The proposed rule required that employers provide ''grab handles'' on each side of a hoist area opening, in addition to a personal fall arrest system, if removing the guardrail, gate, or chains and if the worker leans out the access opening. The existing rule does not have a specific provision addressing hoist areas. However, the existing provisions on wall openings and holes requires that both sides of openings and holes have grab handles if the rail, half door, or other equivalent barrier is removed (existing § 1910.23(b)(1)). In addition, where the structure has extension platforms onto which employers may place hoisted materials, the existing rule requires that employers provide side rails or equivalent guards to protect workers (existing § 1910.23(b)(ii)). OSHA notes that it adopted the existing rule in 1971, before personal fall arrest systems were widely available.

OSHA only received one comment on the proposed provision. Ameren recommended that OSHA define what would qualify as a grab handle to ensure the final rule does not result in confusion or misinterpretation (Ex. 189). After further consideration, OSHA believes it is not necessary for employers to provide grab handles in addition to personal fall arrest systems if removing guardrails, gates, or chains and if workers look through or over the edge of an access opening to facilitate hoisting. OSHA believes that personal fall arrest systems provide adequate worker protection, and better protection than grab handles, therefore, OSHA does not carry forward the proposed requirement on grab handles. Of course, employers are free to provide grab handles or other handholds in addition to personal fall arrest systems in those situations. OSHA believes that the revisions in the final rule address Ameren's concern and the provision is finalized as discussed.

Final paragraph (b)(2)(iii), specifies that if grab handles are installed at hoist areas, they must meet the requirements of § 1910.29(l). Employers are not required to install grab handles at hoist areas; however, if they do install grab handles, the handles must meet the criteria specified in § 1910.29(l). Although OSHA believes it is not necessary to install grab handles at hoist areas when workers use a personal fall arrest system, the Agency recognizes grab handles can provide some security when workers must lean out from a hoist area. In those cases, OSHA believes it is important for grab handles to be of a certain size, have sufficient clearance, and be capable of withstanding the forces placed on them.

Holes. Final paragraph (b)(3) consolidates the proposed requirements to protect workers from falls associated with holes (proposed paragraph (b)(3)) and floor holes (proposed paragraph (b)(14)), and requires that employers protect workers from falling into or through any hole, including skylights, stairway floor holes, ladderway floor holes, hatchway and chute-floor holes, and other holes on roofs. The final rule defines a ''hole'' as a gap or open space in a floor, roof, horizontal walking-working surface, or other similar surface that is at least 2 inches in its least dimension (final § 1910.21(b)). Although skylights may be covered by screens or other material, for the purposes of this definition and the final rule, OSHA classifies skylights as holes. Falling into a hole or tripping and possibly falling due to a hole in a walking-working surface may injure or kill a worker.

OSHA believes that consolidating the requirements for protecting workers from falling into or tripping on a hole is appropriate because the hazards generally associated with these conditions, and the methods to address these hazards, are the same. Moreover, consolidating the provisions makes the final rule easier to understand and follow, which will enhance employer compliance.

In the final rule, OSHA moved the proposed requirement (proposed paragraph (b)(3)(iii)) to protect workers on walking-working surfaces from being hit by objects falling through overhead holes to final paragraph (c), Protection from falling objects. The final rule consolidates all requirements addressing falling object hazards in final paragraph (c).

OSHA received one general comment on the proposed requirements to protect workers from falling or stepping into, or tripping on, holes. Ellis Fall Safety Solutions (Ellis) said the final rule should require that employers not leave holes exposed or uncovered for more than two minutes and assign a ''standby person'' to be present to warn workers about the hole until employers cover or barricade the hole (Ex. 155). Ellis also said the final rule should require that employers use two means to protect employers from falling into holes as a way ''to safeguard the next trade or planned work'' (Ex. 155). For example, Ellis suggested that employers cover the hole with a plywood board as the primary means of protection and, as the secondary protection, attach a net to a bar joist underneath the hole using a scissor lift. OSHA believes the final rule provides a reasonable and appropriate level of protection. Any of the fall protection systems specified by the final rule will protect workers from falling, tripping, or stepping into holes. OSHA believes the final rule already ensures the ''next trade'' is safeguarded from holes. The final rule requires that all employers in any trade must conduct inspections of walking-working surfaces and maintain those surfaces in a safe condition before allowing workers to work there (final § 1910.22(d)(1)). OSHA notes that employers are free to use more than one measure to protect workers from hazards associated with holes.

Final paragraph (b)(3)(i) requires that employers ensure workers are protected from falling through any hole (including skylights) that is four feet or more above a lower level using one or more of the following:

- A cover over the hole (paragraph (b)(3)(i)(A));
- A guardrail system around the hole (paragraph (b)(3)(i)(B));
- A travel restraint system (paragraph (b)(3)(i)(C)); or
- A personal fall arrest system (paragraph (b)(3)(i)(D)).

Final paragraph (b)(3)(i) is the same as the proposed rule, and provides greater control flexibility than the existing general industry and construction fall protection rules (existing § 1910.23(a)(4), (8), and (9), and § 1926.501(b)(4)). The existing general industry rule only allows employers to guard holes using standard railings (guardrails) or, in some situations, a cover. The construction rule does not include travel restraint systems as a fall protection option to protect workers from falling into holes (§ 1926.501(b)(4)(i)).

Final paragraph (b)(3)(ii) requires that employers ensure workers are protected from tripping into or stepping into or through any hole that is less than four feet above a lower level by covers or guardrail systems. The final rule differs from the proposal in two ways. First, final paragraph (b)(3)(ii) clarifies that OSHA intended that the proposed requirement only applied to holes that are less than four feet above a lower level. Where a hole is four feet or more above a lower level, the requirements in final paragraph (b)(3)(i) apply and ensure that workers do not step or trip into the hole or fall into it. Second, final paragraph (b)(3)(ii) provides greater control flexibility than the proposal and the construction fall protection standard because it adds guardrail systems as an alternative option employers may use to protect workers from tripping or stepping into holes. Proposed paragraph (b)(3)(ii) and the construction standard (§ 1926.501(b)(4)(ii)) only permit employers to use covers to prevent stepping or tripping into holes.

Final paragraph (b)(3)(iii), like the existing standard (§ 1910.23(a)(1)) and the proposed rule (proposed paragraph (b)(14)(i)), requires that employers ensure workers are protected from falling into stairway floor holes by a fixed guardrail system erected on all exposed sides, except at the stairway entrance. The final rule also carries forward, with revisions, the existing and proposed exception for stairways when (1) used less than once a day and (2) traffic across the opening prevents the use of a fixed guardrail system (*e.g.,* stairway floor hole located in store aisle). In that situation, employers may protect workers from falling using a hinged floor-hole cover that meets the criteria in § 1910.29 plus a removable guardrail system on all exposed sides except the stairway entrance. The exception in the final rule is consistent with ANSI/ASSE A1264.1–2007, Safety Requirements for Workplace Walking/Working Surfaces and Their Access; Workplace, Floor, Wall and Roof Openings; Stairs and Guardrails Systems (ANSI/ASSE A1264.1–2007).

OSHA also clarifies the ''infrequently used'' language in the existing exception by incorporating the language in a note in the proposed rule stating that ''infrequently used'' means using the stairways ''on less than a daily basis.'' The exception in the final rule also clarifies the language in the existing and proposed rules requiring that the hinged floor-hole cover be of ''standard strength and construction'' by specifying that the cover must meet the criteria in final § 1910.29, specifically § 1910.29(e). OSHA believes the language in the final rule will make the rule easier for employers to understand and follow. For example, requiring that the hinged floor-hole cover meet the requirements in § 1910.29 ensures that they will support, without failure, at least twice the maximum intended load that may be imposed on the cover (final § 1910.29(e)(1)). This is important because a hinged floor-hole cover, like all covers, need an adequate margin of safety to ensure they are capable of supporting intended loads, and to account for the possibility of unforeseen traffic across the cover.

In addressing stairways used less than once a day, OSHA requested information and comment in the proposed rule on using automatically rising railings that come into position when a load-bearing hinged floor-hole cover opens (75 FR 28892). Explanatory paragraph E3.1 in ANSI/ASSE A1264.1–2007 states that the removable guardrail system required for infrequently used stairways should be ''hinged or otherwise mounted so as to come into position automatically with the opening of the [hinged floor-hole] cover.'' Ameren commented, ''As long as the automatic rising railings are an option and not the only method of protection this provision would be feasible'' (Ex. 189). OSHA did not receive any comments supporting making automatically rising guardrails mandatory, and the final rule does not include such a requirement.

Final paragraph (b)(3)(iv), similar to the existing (§ 1910.23(a)) and proposed (proposed paragraph (b)(14)(ii)) rules, requires that employers ensure they protect workers from falling into ladderway floor holes or ladderway platform holes by providing a guardrail system and toeboards on all exposed sides, except at the hole entrance. In addition, the final rule requires that employers protect the access opening in the guardrail system by using a ''self-closing'' gate or an offset so workers cannot walk or step into the hole.

Final paragraph (b)(3)(iv) substitutes ''self-closing'' gate for ''swinging'' gate language in the existing and proposed rules. The purpose of these gates, when open, is to provide a means of access to ladderway floor holes and, when closed, to provide guardrail protection that meets of all the criteria in final paragraph (b). The term ''swinging'' gate, as used in the existing and proposed rules, refers to gates that automatically swing back into a closed position when the opening is not being used for access to prevent workers from falling into the ladderway hole. These are sometimes called ''safety gates'' (Ex. 68). If gates do not swing automatically into a closed position, they do not provide the required guardrail protection.

OSHA is aware that, in addition to swinging gates, there are automatically closing sliding gates that are currently manufactured, readily available, and in use to protect workers from falling into ladderway floor and platform holes. OSHA believes these sliding gates provide protection that is as effective as the protection swinging gates provide. Therefore, to give employers the flexibility to use the type of automatically closing gate that works best for them, OSHA uses the term ''self-closing'' gates in final paragraph (b)(3)(iv).

OSHA received one comment on the proposed requirement. Edison Electric Institute (EEI) recommended that OSHA allow employers to use double chains ''around holes used as points of access (such as ladderways)'' (Ex. 207). ''Many industrial facilities use double chains instead of swinging gates or guardrails at the top of fixed ladders,'' EEI said. ''These have been effective for a number of decades'' (Ex. 207). EEI also pointed out that the 1990 proposed rule would have allowed the use of chains, in addition to swinging gates and offsets, at the access openings in the guardrail systems.[50]

OSHA has not adopted EEI's recommendation. In the preamble to the 2010 proposed rule, OSHA said the new proposed rule replaces the 1990 proposal (75 FR 28863). Unlike the 1990 proposal, proposed paragraph (b)(14)(ii)

[50] *See also* Letter to Mr. Stephen Hazelton (5/23/2005) that states:

[T]he [1990] proposed paragraph at 1910.28(b)(6) permits the use of movable guardrail sections such as gates, chains, and other means, which, when open, provide a means of access and, when closed, provide the guardrail protection that meets the proposed paragraphs 1910.28(b)(1) through (b)(5). An employer's compliance with the proposed rule, in lieu of compliance with an existing rule [1910.23(a)(2)], is considered as a de minimis violation.

This letter available on OSHA's website at: *https://www.osha.gov/pls/oshaweb/owadisp.show_document?p_table=INTERPRETATIONS&p_id=25100.*

did not permit employers to use double chains in place of self-closing gates or offsets. As mentioned, OSHA believes that chains less protective than self-closing gates or off sets. Self-closing gates and offsets are passive fall protection methods that automatically restore guardrail protection as soon as the worker passes through the opening or offset area. Neither method requires the worker to take any action to restore that protection. However, if employers provide double chains at entrances to ladderway floor or platform holes, their employees would have to remove the chains and reattach them once they pass through the opening. If workers forget or fail to reattach the chains, they and others in the area could fall through the hole. Workers also are at increased risk of falling through the hole once they enter the area inside the guardrails to climb down the ladder because they have to turn around and away from the hole to reattach the chains and risk falling backward into the hole. If workers avoid this risk by not reattaching the chains, it exposes other workers to the risk of a fall when they approach the opening in the guardrail system. OSHA believes that double chains do not fully protect workers from falls at hole entrances, and therefore, is adopting the existing and proposed requirements that entrances to ladderway floor and platform holes have a self-closing gate or be offset to prevent workers from falling.

Final paragraph (b)(3)(v), like proposed paragraph (b)(14)(iii), requires that employers ensure workers are protected from falling through hatchway and chute-floor holes by one of the following:

- A hinged floor-hole cover and a fixed guardrail system that leaves only one exposed side.[51] When the hole is not in use, the employer must ensure the cover is closed or a removable guardrail system provided on all exposed sides (final paragraph (b)(3)(v)(A));
- A removable guardrail system and toeboards on not more than two sides of the hole and a fixed guardrail system on all other exposed sides. The employer must ensure the removable guardrail system remains in place when the hole is not in use (final paragraph (b)(3)(v)(B)); or
- A guardrail system or travel restraint system when the work operation necessitates passing material through a hatchway or chute floor hole (final paragraph (b)(3)(v)(C)).

With one exception (final paragraph (b)(3)(v)(C)), the final rule generally is consistent with existing § 1910.23(a)(3) and A1264.1–2007 (Section 3.1). Final paragraph (b)(3)(v)(C) adds a requirement that employers provide a guardrail system or travel restraint system when workers need to pass materials through a hatchway or chute-floor hole. The existing and ANSI rules only state that ''protection shall be provided to prevent a person from falling through the opening,'' but do not specify what protection is needed. OSHA believes the final rule is more protective and clearer than these rules because it specifies how employers must protect workers. OSHA adopts final paragraph (b)(3) as discussed.

Dockboards. Final paragraph (b)(4) adds fall protection requirements to protect workers on dockboards. The final rule defines a ''dockboard'' as a portable or fixed device for spanning a gap or compensating for the elevation difference between a loading platform and a transport vehicle. Dockboards include, but are not limited to bridge plates, dock plates, and dock levelers. (final § 1910.21(b)).

Final paragraph (b)(4)(i), like the proposal, requires that employers ensure each worker on a dockboard is protected from falling four feet or more to a lower level by a guardrail system or handrails. The final rule limits the fall protection options that employers may use. OSHA believes guardrails and handrails will provide adequate protection for workers. In addition, employers can use them on dockboards while other options may not work. For example, it may not be possible to install anchorages on dockboards that would support the use of personal fall arrest systems.

OSHA notes that in some situations there may be insufficient space between the dock and the transport vehicle for a worker to fall and, therefore, no fall hazard would exist. In that situation, final paragraph (b)(4)(i) would not apply.

Final paragraph (b)(4)(ii), like the proposal, includes an exception specifying that employers do not have to provide a guardrail system or handrails when:

- Using the dockboard solely for materials-handling operations using motorized equipment (final paragraph (b)(4)(ii)(A));
- Workers engaged in motorized material-handling operations are not exposed to fall hazards greater than 10 feet (final paragraph (b)(4)(ii)(B)); and
- Employers train those workers in accordance with § 1910.30 (final paragraph (b)(4)(ii)(C)).

Final paragraph (b)(4)(ii)(C) does not include the proposed language identifying the subjects that training must address. The requirements in final § 1910.30 cover all of the topics OSHA proposed, thus, OSHA does not believe it is necessary to repeat them in this provision.

OSHA believes the exception in final paragraph (b)(4)(ii) is appropriate. Employers often use motorized equipment to move large and heavy material across dockboards. However, such equipment may not fit on a dockboard that has guardrails or handrails. Preventing workers from using motorized equipment to move the material may expose them to other hazards, such as risk of injury associated with lifting and carrying heavy materials. OSHA did not receive any comments on the proposed dockboard requirements, and finalizes the provisions as discussed.

Runways and similar walkways. Final paragraph (b)(5) specifies the fall protection systems that employers must provide to protect workers from falling off runways and similar walkways. The proposed and final rules define a ''runway'' as an elevated walking-working surface (§ 1910.21(b)). For purposes of the final rule, runways include catwalks, foot walks along shafting, and elevated walkways between buildings.

Final paragraph (b)(5)(i), like the proposed rule, retains the existing requirement (§ 1910.23(c)(2)) that employers must protect workers on runways or similar walkways from falling four feet or more to a lower level by a guardrail system. The final rule generally is consistent with the construction fall protection standard (§ 1926.501(b)(6)). Like dockboards, the final rule limits the fall protection options employers may use. OSHA believes that guardrails will provide adequate protection from falls, and that other options may not work on runways. For example, it may not be possible for employers to install anchorages and other components of personal fall protection systems that would protect workers from falling off runways while still allowing them to walk on the runway.

Final paragraph (b)(5)(i) no longer includes the existing and proposed requirement that employers provide toeboards on both sides of runways if workers are likely to use tools, machine parts, or other objects on the runway. The primary purpose of requiring toeboards is to prevent objects from

[51] OSHA used the term ''permanently attached'' guardrail system in the proposal. In the final rule, OSHA uses the term ''fixed'' guardrail systems, which OSHA considers to be equivalent to, but clearer than, the proposed term.

falling onto workers on a lower level. As mentioned earlier, OSHA consolidated all requirements addressing falling object hazards in final paragraph (c), and, therefore, does not repeat them here.

Final paragraph (b)(5)(ii), which is similar to the proposed rule, addresses runways used exclusively for special purposes, such as filling tank cars. The final paragraph requires that when the employer can demonstrate that it is not feasible to have guardrails on both sides of special purpose runways, the employer may omit the guardrail on one side, provided the employer:

- Ensures that the runway is at least 18 inches wide (final paragraph (b)(5)(ii)(A)); and
- Provides each worker with, and ensures that each worker uses, a personal fall arrest system or travel restraint system (final paragraph (b)(5)(ii)(B)).

The final rule clarifies two points in the proposed rule. First, the final rule clarifies that guardrails may be omitted from a special purpose runway only when the employer can demonstrate that it is not feasible to have guardrails on both sides of the runway. Feasibility is the standard test of whether employer action is possible, and OSHA believes employers are familiar with, and understand, it.

Second, final paragraph (b)(5)(ii)(B) clarifies the language in the proposed rule requiring that employers ensure ''the proper use of personal fall arrest systems or travel restraint systems.'' This provision means that employers may omit a guardrail on one side of a special purpose runway only when the employer both provides and ensures that each worker properly uses a personal fall arrest system or travel restraint system.

OSHA notes that the final rule provides greater protection for workers than both the existing rule (§ 1910.23(c)(2)) and A1264.1–2007 (Section 5.2). Although these standards specify that employers may omit a guardrail on one side of a special use runway only if they use a runway that is at least 18 inches wide (consistent with final paragraph (b)(5)(ii)(A)), the standards do not require that employers provide, and ensure that workers use, personal fall arrest or travel restraint systems while on those runways.

OSHA received no comments on the proposed runway requirements, and adopts them with the revisions discussed above.

Dangerous equipment. Final paragraph (b)(6) addresses the hazards associated with working above dangerous equipment. Final § 1910.21(b) adopts the definition of ''dangerous equipment'' in the construction fall protection standard (§ 1926.500(b)). The definition also specifies that such equipment includes vats, tanks, electrical equipment, machinery, machinery with protruding parts, or similar units that, because of their function or form, may harm a worker who falls into or onto the equipment. The existing rule in § 1910.23(c)(3) also provides examples of equipment OSHA considers to be dangerous, including pickling or galvanizing tanks and degreasing units. The definition of dangerous equipment in this final rule includes similar equipment. OSHA added a definition of dangerous equipment to the final rule in response to Northrup Grumman Shipbuilding's (NGS) recommendation that OSHA define the term so that employers understand what equipment the final rule covers (Ex. 180).

This final rule, like the proposed rule, includes requirements for protecting workers who are working less than four feet above dangerous equipment. OSHA believes it is necessary to protect workers from falling onto or into dangerous equipment regardless of how far above the equipment they are working. Falling less than four feet into or onto equipment that has sharp, protruding, or moving parts could kill or seriously injure a worker.

When workers are less than four feet above dangerous equipment, final paragraph (b)(6)(i), like the proposed rule, requires that employers protect workers from falling into or onto the dangerous equipment using a guardrail system or a travel restraint system, unless the equipment is covered or guarded to eliminate the hazard. The existing rule in § 1910.23(c)(3) requires that, regardless of height, employers must protect workers who are working above dangerous equipment using guardrails and toeboards. The construction fall protection standard contains a provision requiring guardrails or equipment guards when workers are working less than six feet above dangerous equipment (§ 1926.501(b)(8)).

OSHA believes final paragraph (b)(6)(i), which allows employers to protect their workers by providing either guardrails or travel restraint systems, but does not require toeboards, provides greater control flexibility than the existing rule without compromising worker safety. OSHA believes that either guardrails or travel restraint systems provide sufficient protection for workers above dangerous equipment. Therefore, OSHA does not believe that toeboards, which primarily protect workers from falling objects from higher levels, are necessary. Accordingly, OSHA deleted the existing toeboard requirement, but notes that final paragraph (c)(1) of this section requires that employers provide toeboards to protect workers from objects falling from higher levels and hitting them.

OSHA notes that the final rule does not permit employers to use safety nets or personal fall arrest systems when workers are less than four feet above dangerous equipment. At these heights, safety nets and personal fall arrest systems may not be safe to use because there may not be sufficient stopping distance to prevent a falling worker from making contact with the dangerous equipment.

Final paragraph (b)(6)(i), like the proposal, does not require employers to use guardrails or travel restraint systems if the employer covers or guards dangerous equipment and the worker is less than four feet above the equipment. OSHA believes that covering or guarding dangerous equipment that is less than four feet below workers adequately eliminates the hazard.

When workers are four feet or more above dangerous equipment, final paragraph (b)(6)(ii), like the proposed rule, requires that employers protect workers from falling by providing:

- Guardrail systems (final paragraph (b)(6)(ii)(A));
- Safety net systems (final paragraph (b)(6)(ii)(B));
- Travel restraint systems (final paragraph (b)(6)(ii)(C)); or
- Personal fall arrest systems (final paragraph (b)(6)(ii)(D)).

Final paragraph (b)(6)(ii) provides more control flexibility for employers than the existing rule, which requires that employers protect workers from falling onto or into dangerous equipment by providing a guardrail system. OSHA believes that allowing employers to use a range of fall protection options ensures that employers will be able to select the fall protection option that best fits the particular workplace situation and conditions.

OSHA received two comments on the proposed provision. Verallia recommended that OSHA delete the requirement because they said the proposal was ''too subjective and vague'' and ''could be interpreted differently'' (Ex. 171). However, Verallia did not provide examples or further explain its recommendation. As mentioned earlier, this final rule adds a definition of dangerous equipment, which also includes examples of specific equipment OSHA considers to be dangerous. The final rule specifically and clearly identifies what constitutes dangerous equipment, what protections employers must provide at specific heights, and when and at what height employers can protect workers from falling using fall protection options other than guardrails or travel restraint systems. Moreover, OSHA believes the examples of equipment OSHA defines as being dangerous specifically clarifies, in objective terms, under what conditions employers must comply with the final rule and, therefore, reduces the possibility of conflicting interpretations.

The second commenter, NGS, said the proposed rule was not as protective as the existing rule and would not provide an equivalent level of protection from ''open pits, vats, etc.'' as existing § 1910.22(c) (Ex. 180). NGS recommended that ''standard guardrails be required around open tanks'' and ''vats that contain hazardous substances that pose an immediate threat to life'' (Ex. 180). OSHA does not believe including NGS's recommendations are necessary in this final rule. First, although final paragraph (b)(6) does not retain existing § 1910.22(c) as a separate provision, OSHA incorporated into the final definition of dangerous equipment all of the equipment § 1910.22(c) covers, including the equipment NGS mentioned. The final rule does not leave any dangerous equipment unaddressed, and, therefore, the Agency believes the final rule provides protection equivalent to that in existing § 1910.22(c).

Second, the final rule allows employers to use controls that provide equivalent or greater protection than the controls specified in existing § 1910.22(c). OSHA believes that giving employers flexibility in choosing what protection to use will enable them to select the measure that works best, and is the most effective, in the particular work situation. Third, the final rule recognizes that it may not be possible to use guardrails in a particular situation and provides employers with alternatives that will protect their workers in those cases.

Fourth, where dangerous equipment is not covered or guarded, final paragraph (b)(6)(i) requires that employers use guardrails or travel restraint systems to protect workers from falling onto the dangerous equipment, when the height of the fall is less than four feet. OSHA notes that employers are free to use guardrails when an employee works at any height above dangerous equipment.

Openings. Final paragraph (b)(7), similar to the proposed rule, requires that employers protect workers from falling through openings. Final § 1910.21(b), like both the proposed and construction (§ 1926.500(b)) rules, defines an ''opening'' as a gap or open space in a wall, partition, vertical walking-working surface, or similar surface that is at least 30 inches high and at least 18 inches wide through which a worker can fall to a lower level.

The final rule requires that employers protect workers on walking-working surfaces near openings (including openings with a chute attached) if the inside bottom edge of the opening is less than 39 inches above the walking-working surface and the outside bottom edge of the opening is four feet or more above a lower level. The employer must protect workers from falling through those openings by providing:

- Guardrail systems (final paragraph (b)(7)(i));
- Safety net systems (final paragraph (b)(7)(ii));
- Travel restraint systems (final paragraph (b)(7)(iii)); or
- Personal fall arrest systems (final paragraph (b)(7)(iv)).

The final rule, unlike the proposal (proposed paragraph (b)(7)(ii)), does not allow employers to use designated areas instead of providing conventional fall protection to protect workers from falling through openings. As discussed above, the final rule limits the use of designated areas to the limited and specific situation of work on low-slope roofs. Deleting the option of designated areas from final paragraph (b)(7) makes the provision consistent with the construction standard, which also does not allow the use of designated areas to protect workers from falling through openings (§ 1926.501(b)(14)).

The final rule simplifies, updates, and increases the control flexibility of the existing rule. For example, the final rule establishes one set of requirements that apply to all openings, while the existing rule, in § 1910.23(b), contains different provisions for different types of wall openings (*e.g.,* chute-wall, window-wall, and temporary wall openings). The final rule also incorporates new fall protection technology (*e.g.,* personal fall arrest systems, travel restraint systems, safety net systems) in place of some of the measures listed in the existing rule (*e.g.,* rail, roller, picket fence, half door, standard slats, standard grill work). OSHA believes that allowing employers to use new technology will enhance worker protection.

Finally, in several ways the final rule provides more flexibility than the existing rule. First, the final rule only requires employers to provide fall protection when the inside bottom edge of the opening is less than 39 inches above the floor or other type of walking-working surface, while the existing rule, with one exception, generally requires employers to protect wall openings regardless of the height of the bottom inside edge of the opening.[52] OSHA does not believe that it is necessary to provide fall protection when the bottom inside edge of openings are 39 inches or higher than the walking-working surface on which the worker is standing; in such cases, OSHA believes the wall or partition itself usually provides adequate protection against falling though the opening. Second, the final rule allows employers to use a wider range of fall protection options than the existing rule to protect workers near wall openings. OSHA believes the increased flexibility will ensure that workers have the most effective protection because employers will be able to select the fall protection option they determine works best in the particular situation. Finally, paragraph (b)(7) of the final rule, unlike the existing rule in § 1910.23(b)(1)) and (e)(10), does not require that employers install grab handles on each side of wall openings. OSHA believes that the fall protection options specified by final paragraph (b)(7) provide adequate protection from falls through wall openings, and therefore, grab handles are not necessary.

As discussed in the preamble to the proposed rule, when work operations require that workers reach through wall openings to facilitate hoisting materials, OSHA considers the opening to be a ''hoist area'' covered by final paragraph (b)(2), and not a wall opening. OSHA believes this distinction is important. Final paragraph (b)(7) allows employers to use guardrail, personal fall arrest, travel restraint, or safety net systems to protect workers from falling through wall openings. However, it is not always possible to use a safety net system to protect workers from falling when they are hoisting materials through an opening because a safety net system may interfere with materials being hoisted or may not provide a sufficient stopping distance to prevent a falling worker from making contact with the lower level. Accordingly, final paragraph (b)(2) specifies that employers must protect workers using only a guardrail, personal fall arrest, or travel restraint systems. Moreover, when workers need to lean out or over the edge of the hoist area, final paragraph (b)(2) requires that employers protect workers with personal fall arrest

[52] OSHA notes the existing provision (§ 1910.23(b)(3)) for window wall openings at stair landings, floors, platforms, or balconies did not require fall protection if the bottom edge of the opening is three feet or more above the landing, floor, platform, or balcony.

systems. Final paragraph (b)(7) does not contain the protective limitations specified by final paragraph (b)(2). OSHA did not receive any comments on proposed paragraph (b)(7), and adopts it as discussed.

Repair, service and assembly pits (pits) less than 10 feet deep. Final paragraph (b)(8), like the proposed rule, adds a new provision addressing fall hazards associated with repair, service, and assembly pits that are less than 10 feet deep. Employers use these pits primarily to provide access to the underside of vehicles to perform work, such as vehicle maintenance. Typically, a worker drives a vehicle over the pit and uses stairs to get into the pit. The final rule specifies that employers do not have to provide fall protection systems for service, repair, or assembly pits that are less than 10 feet deep, provided the employer:

• Limits access within six feet of the pit edge to authorized workers trained in accordance with final § 1910.30 (final paragraph (b)(8)(i));

• Applies floor markings or warning lines and stanchions, or a combination thereof, at least six feet from the pit edge. Floor markings must be a color that contrasts with the surrounding area and warning lines and stanchions must be capable of resisting, without tipping over, a force of at least 16 pounds that is applied horizontally against the stanchion at a height of 30 inches (final paragraph (b)(8)(ii)); and

• Posts readily visible caution signs that state ''Caution—Open Pit'' and meet the requirements of § 1910.145, Specifications for Accident Prevention Signs (final paragraph (b)(8)(iii)).

Final paragraph (b)(8) only applies to service, repair, and assembly pits that are less than 10 feet deep. For deeper pits, employers must provide a conventional fall protection system specified in final paragraph (b)(1), Unprotected sides and edges.

Neither the existing nor construction fall protection rules contain a similar provision on service, repair, and assembly pits. Historically, OSHA addressed these hazards through Section 5(a)(1) (General Duty Clause) of the OSH Act (29 U.S.C. 654).

The final rule recognizes that protecting workers from falling into service, repair, and assembly pits can present some unique issues. For example, for vehicle service and repair pits, the fall hazard is present only when a vehicle is not over the pit. Driving a vehicle over the pit normally eliminates the fall hazard. In addition, conventional fall protection systems may not work at service, repair, and assembly pits. For instance, using guardrails can interfere with driving vehicles over or away from a pit, and personal fall arrest and travel restraint systems may prevent workers from reaching the area where they need to perform work. Finally, it is OSHA's understanding that workers are unlikely to be near service, repair, and assembly pits when they are not working on vehicles.

OSHA believes the final rule strikes an appropriate balance between protecting workers and ensuring that they can repair, service, or assemble vehicles. The Agency believes that establishing well-marked areas (that is, floor markings or warning lines and stanchions, or both), along with posting caution signs, will be effective in warning authorized workers that they are about to enter a hazardous area, and other workers that they need to keep out of the area. In addition, limiting access within six feet of pits to those workers who the employer specifically assigns or allows to be in the area, and who, as a result of training, recognize the applicable fall hazards, will keep worker exposure to these hazards to a minimum.

OSHA received comments on the proposed provision from the American Trucking Associations, Inc. (ATA) and the American Truck Dealers Division of the National Automobile Dealers Association (NADA). Both organizations supported the proposed rule (Exs. 181; 187). NADA said, ''These proposed requirements should serve to adequately address the potential for fall hazards related to motor vehicle service pits'' (Ex. 181).

OSHA added a sentence to the final rule addressing the situation where two or more pits are in a common area and are not more than 15 feet apart. It specifies that OSHA employers may comply with final paragraph (b)(8)(ii) if they place contrasting floor markings at least six feet from the pit edge around the entire area of the pits. OSHA added the sentence to respond to a comment from ATA, which stated:

> OSHA should include a provision stating that when two or more pits are in a common area, a perimeter marking and the posting of appropriate warnings around the entire area will meet the requirements of this section. In addition, when the distance from a building entrance to the pit is less than 6 feet, a floor marking and warning sign at the entrance will satisfy the requirements (Ex. 187).

ATA also noted, ''In some large motor carrier facilities, there may be two or more adjacent pits in one area of the shop,'' that ''[t]he distance between pits can vary from 12 to 15 feet,'' and that ''the distance from the doorway to the closest portion of the pit . . . is less than six feet'' (Ex. 187). OSHA believes the added sentence in the final rule addresses ATA's concerns and finalizes the provision as discussed.

Fixed ladders (that extend more than 24 feet above a lower level). Final paragraph (b)(9) establishes fall protection requirements for fixed ladders that extend more than 24 feet above a lower level. Final § 1910.21(b), like the proposed rule, defines ''fixed ladder'' as a ladder with rails or individual rungs that is permanently attached to a structure, building, or equipment. Fixed ladders include individual rung ladders, but not ship stairs, step bolts, or manhole steps.

Final paragraph (b)(9), like the proposal, only requires that employers provide fall protection to those fixed ladders that extend more than 24 feet above a lower level. The existing rule (§ 1910.27(d)(1)(ii)) requires that fixed ladders more than 20 feet above a lower level be equipped with cages or wells. Changing the fall protection trigger height to 24 feet makes the final rule consistent with ANSI/ASC A14.3–2008 and OSHA's construction ladder standard (§ 1926.1053(a)(18) and (19)), which is one of the Agency's goals in this rulemaking. This change allows workers who perform both general industry and construction activities to use fixed ladders with the same fall protection trigger height.

Siebe North, Inc., a manufacturer of ladder safety systems and personal fall arrest systems, supported the proposed change in the fall protection trigger height for fixed ladders (Ex. OSHA–S041–2006–0666–0198). CSG and ISEA, on the other hand, argued that OSHA should require fall protection on fixed ladders from the ground up (Exs. 185; 198). As discussed above, limiting fall protection to fixed ladders that extend more than 24 feet above a lower level makes the final rule consistent with both OSHA's construction rule and the long-standing ANSI standard (A14.3). In any event, OSHA does not believe the change from the existing rule will affect worker safety substantially because fixed ladders that extend more than 24 feet must have fall protection systems that protect workers from the ground up even if workers climb the ladder less than 24 feet above the lower level.

In final paragraph (b)(9)(i), OSHA revises the existing fall protection requirements for fixed ladders. The final rule requires that employers equip fixed ladders with ladder safety systems or personal fall arrest systems to protect workers from falling to a lower level, which could result in death or serious injury. Final paragraph (b)(9)(i) establishes a new framework to protect workers from fall hazards on fixed ladders that allows employers to gradually, over 20 years, phases in ladder safety systems/personal fall arrest systems and phase out the use of cages and wells as a means of fall protection. After this 20-year period ends, the final rule requires that employers must ensure all fixed ladders are equipped with either ladder safety or personal fall arrest systems to protect workers from fall hazards. The final rule establishes the following phase-in/phase-out schedule:

- For existing fixed ladders (that is, for ladders erected before November 19, 2018)—employers have up to 20 years to install ladder safety or personal fall arrest systems (final paragraph (b)(9)(i)(A));
- For new fixed ladders (that is, for new ladders erected on or after November 19, 2018)—the employer must equip the new ladder with a ladder safety or personal fall arrest system (final paragraph (b)(9)(i)(B));
- For ladder repairs and replacements—when an employer replaces any portion of a fixed ladder the replacement must be equipped with a ladder safety or personal fall arrest system (final paragraph (b)(9)(i)(C)); and
- The final deadline for all fixed ladders—on and after November 18, 2036 all fixed ladders must be equipped with a ladder safety or personal fall arrest system (final paragraph (b)(9)(i)(D)). (See further discussion of phase-out schedule below.)

The gradual phasing out of cages and wells means that employers may continue to use existing fixed ladders during the 20-year phase-out period, even if the existing fixed ladders are equipped only with cages and wells. However, during the 20-year phase out period, when employers install new fixed ladders or replace a portion of a section on an existing fixed ladder, final paragraphs (b)(9)(i)(B) and (C) require them, respectively, to install a new fixed ladder equipped with a ladder safety or personal fall arrest system (when replacing the entire ladder) or equip the replacement section (*e.g.,* a ladder with multiple, offset sections) with a ladder safety system or personal fall arrest system (when replacing a portion of an existing fixed ladder). At the end of 20 years, final paragraph (b)(9)(i)(D) specifies that all fixed ladders must be equipped with ladder safety or personal fall arrest systems. (OSHA notes that after the 20-year phase out period ends employers may still have or equip fixed ladders with cages and wells, but OSHA will not consider them to be a means of fall protection.)

The proposed rule would have allowed employers to use cages, wells, ladder safety systems, or personal fall arrest systems when the length of a climb is less than 24 feet regardless of the height of the ladder (proposed § 1910.28(b)(9)(i)). When the total length of a climb on a fixed ladder is at least 24 feet, the proposed rule would have allowed employers to equip the fixed ladder with a ladder safety system, personal fall arrest system, cage or well (proposed § 1910.28(b)(9)(ii)). OSHA is phasing in the requirement to equip fixed ladder with ladder safety systems/personal fall arrest systems and phasing out the use of cages and wells as a means of fall protection because there is wide recognition in general industry that cages and wells neither prevent workers from falling off ladders nor protect them from injury when a fall occurs (*e.g.,* Exs. OSHA–S041–2006–0666–0198; 113; 155; 185; 198; 329 (1/21/2011), pgs. 18–19, 259). In general, stakeholders said cages and wells simply ''contain employees in the event of a fall and direct them to a lower landing'' rather than preventing them from hitting a lower level (Ex. 113; *see also* Exs. OSHA–S041–2006–0666–0198; 155; 185; 198; 329 (1/21/2011), pgs. 18–19, 259)). In addition, they also said fixed ladder cages and wells may result in severe injury or fatality and increase the severity of fall injuries (Ex. 113; 185; 198; OSHA–S041–2006–0666–0198). Therefore, they said OSHA should require that fixed ladders be equipped with ladder safety systems or personal fall arrest systems (Exs. OSHA–S041–2006–0666–0198; OSHA–S041–2006–0666–0354; 113; 155; 185; 198; 329 (1/21/2011), pgs. 18–19, 259).

As far back as 1990, when OSHA first raised the question about the effectiveness of cages and wells as a means of fall protection on fixed ladders, Siebe North, Inc., a manufacturer of ladder safety and personal fall protection systems, said OSHA should require that fixed ladders be equipped with ladder safety systems or personal fall arrest systems:

> Except to the extent that a cage or well will change the trajectory of a fall so that the victim falls directly to the base of the ladder, we are unaware of *any* empirical or other data which suggests that a cage or well will otherwise result in a fall which is not a free fall—or, more importantly, a fall likely to result in less severe injury than would be caused by a free fall of the same distance. (Indeed, most falls of any significant distance in cages, and probably in wells as well, are likely to add to the victim's trauma due to impacts with the cage or well during the course of the fall.)
>
> * * * * *
>
> As already noted, except to the extent that it directs the victim's falling body to the base of the ladder, a cage or well provides no protection for the falling climber. On the other hand, where a ladder safety device is used, a climber's fall is stopped in 2 feet or less, with no trauma from this short fall. When a fall *occurs,* a ladder safety device alone will *both save a life and prevent injury,* no matter where in the climb the fall begins. On the other hand, a cage or well will do neither. If the ladder is equipped with only a cage or well, whether a falling climber dies or merely lives with severe injury depends entirely on the length of the fall since the cage or well will have no protective effect (Ex. OSHA–S041–2006–0666–0198) (emphasis in original).

In response to the 2010 proposed rule, a number of commenters also agreed that employers need to equip fixed ladders with ladder safety systems/personal fall arrest systems because cages and wells are not effective fall protection measures (Exs. 113; 185; 198; 329 (1/18/2011), p. 96; 329 (1/21/2011), p. 259). For example, CSG said:

> [C]ages should not be used as an individual method of fall protection, but only in conjunction with a personal fall arrest/cable-and-rail system or a twin-leg lanyard. CSG recognizes that a cage system allows a measure of security. However, if a person does fall in a cage, OSHA is correct that the cage will direct the person to the ground, likely resulting in a severe injury or fatality (Ex. 198).

ISEA agreed with CSG (Ex. 185). The Oregon Department of Transportation (DOT) added:

> Ladder cages are an old technology used for decades before ladder safety systems were ever developed . . . [C]ages and wells are designed to ''. . . contain employees in the event of a fall and direct them to a lower landing.'' Cages provide little fall protection and no fall prevention. They do give a sense to the climber of being contained, and do provide a surface to rest against for a winded climber, but will not prevent a fall. Falls in cages can be very gruesome with the faller entangling themselves in the cage as they fall, sometimes tearing off body parts (Ex. 113).

Similarly, Ellis testified that OSHA should prohibit the use of cages and wells for fall protection because he said they are ineffective:

> [T]his may be the time to withdraw cages since they are ineffective. I refer to the [Health and Safety Executive] Report on their website relating to cages and the testing that's being done to show that they're incapable of stopping falls. It may not be OSHA's best move to keep citing a device that fails to work which most people would admit that you're not get stopped in a fall. The best that happens in a fall inside a cage is to be a—have a feeling of being contained. . . . (Ex. 329 (1/21/2011, p. 259)).

The Health and Safety Executive (HSE) report Ellis cited was

''Preliminary investigation into the fall-arresting effectiveness of ladder safety hoops'' (Research Report 258–2004).[53] The Executive Summary states:

> After studying the information from the references, the survey, from the accident database and the results from testing, it seems clear that caged ladders cannot provide positive fall-arrest capability, especially in the case of the three-upright design which was tested as part of this research. There is every possibility of a fall down the cage to the ground or other platform.
>
> There would appear, or so it seems, a possibility to stop the fall of a worker in certain circumstances, but this depends upon the attitude of the worker both before the fall and during the fall, and whether or not the worker manages to catch part of his or her body in one of the cage apertures, or manages to trap themselves in the cage some other way. In any event, it is a chance occurrence, and the opinion is that even if the worker could be caught by the cage, it could lead to significant if not fatal injury.
>
> The accidents reviewed indicate that workers fall down cages to the next level and are rarely caught. Injuries have been reported. Even if a fall is halted by limb entanglement within a cage, rescue would be extremely difficult process to carry out successfully (Ex. 392).

OSHA believes there is substantial evidence in the rulemaking record to support eliminating the use of cages and wells as a means of fall protection on fixed ladders. Therefore, for the reasons discussed above, OSHA is phasing out their use and requiring that employers equip fixed ladders with ladder safety systems or personal fall arrest systems according to the schedule established in final paragraph (b)(9)(i).

OSHA believes that gradually phasing out the use of cages and wells as a means of fall protection over 20 years and requiring employers to provide ladder safety systems/personal fall arrest systems prospectively (that is, when installing new fixed ladders or replacing a portion of an existing fixed ladder section) is a safe, cost-effective way to increase worker protection beyond the existing and proposed rules, and will not pose difficulties or undue burdens for employers. For example, ladder safety and personal fall arrest systems generally are less costly and easier to install on fixed ladders than cages and wells. OSHA believes that providing 20 years to phase out cages and wells gives employers ample time to plan and carry out this transition as part of their normal business and replacement cycles, instead of retrofitting fixed ladders. According to the FEA, the useful life of a large majority of fixed ladders will be exhausted within 20 years.

Several stakeholders specifically recommended that OSHA prospectively require new fixed ladder be equipped with ladder safety systems/personal fall arrest systems (Exs. OSHA–S041–2006–0666–0198; 113; 329 (1/21/2011), p. 18–19). For example, Siebe North supported installing ladder safety systems/ personal fall arrest systems ''in the design stage'' because ''ladder safety devices can be engineered into and installed as part of the original ladder installation without any extra hazardous exposure to the installation workers,'' adding that ''well or cage installations hazards will always be significantly greater than the installation hazards for ladder safety devices'' (Ex. OSHA–S041–2006–0666–0198). The American Wind Energy Association said:

> Technology in fall protection has developed to the point where suitable solutions exist for the protection of climbers for fixed ladders. At a minimum, new installation of fixed ladders, that meet the trigger heights and length listed, should include falling-object for workers regardless of the industry. The wind industry is an example of a new industry that has embrace ladder-climbing systems across-the-board (Ex. 329 (1/21/2011), pgs. 18–19).

Siebe North also indicated that requiring employers to install ladder safety systems/personal fall arrest systems instead of cages/wells was cost effective, ''For a 50-foot climb, a ladder safety device would cost about $500 installed, but a case or well would cost in excess of $1,500'' (Ex. OSHA–S041–2006–0666–0198). Clear Channel Outdoor indicated that equipping billboard ladders with ladder safety systems/personal fall arrest systems would cost significantly less than installing cages and wells (Ex. 329 (1/18/2011), pgs. 134–35). Ameren Corporation recommended grandfathering in all existing ladders ''due to the potential financial impact'' (Ex. 189).

As mentioned, OSHA believes the prospective application of the requirement to equip fixed ladders with ladder safety systems or personal fall arrest systems will not pose financial hardship on employers. According to CSG, it is ''common'' for fixed ladders manufactured today to be equipped with ladder safety systems (Ex. 329 (1/18/2011), p. 104).

As mentioned, final paragraph (b)(9)(i) also establishes the cage and well phase-out dates for existing, new, replacement, and eventually all fixed ladders (*i.e.,* a final deadline when employers may no longer use cages and wells as a means of fall protection on any fixed ladder):

Existing fixed ladders.[54] Final paragraph (b)(9)(i)(A) requires that employers ensure existing fixed ladders are equipped with at least one of the following four devices no later than November 19, 2018:

- A cage;
- A well;
- A ladder safety system; or
- A personal fall arrest system.

Although the existing rule requires that employers already must have installed cages or wells on fixed ladders, the record indicates some have not. Therefore, OSHA is giving employers two years to come into compliance with the existing rule (existing § 1910.27). Providing two years will ensure that employers have adequate time to order and install devices on fixed ladders and will reduce costs for employers who have ordered and not yet installed new fixed ladders equipped with cages or wells. Although the final rule is phasing out the use of cages and wells as a fall protection device, final paragraph (b)(9)(i) allows employers to continue to use existing fixed ladders that have a cage or well, but not ladder safety or personal fall arrest system, until:

- The fixed ladder, cage, or well, of portion of it is replaced (final paragraph (b)(9)(i)(C)); or
- November 18, 2036 (final paragraph (b)(9)(i)(D)), whichever comes first.

This means that employers may not have to install ladder safety or personal fall arrest systems on their existing fixed ladders for up to 20 years. However, OSHA believes that many employers already have installed ladder safety systems and personal fall arrest systems or will install those systems long before the 20-year deadline comes due.

Like final paragraph (b)(9)(i)(A), ANSI/ASC A14.3–2008 (Section 1.6.1) generally permits employers to use existing fixed ladders without change. The requirements of ANSI/ASC A14.3–2008 do not apply to existing fixed ladders, provided that the ladder was in compliance with a Federal, state, or national consensus standard at the time it was installed and there is documentation available to substantiate that (Section 1.6.1(1)), or a person competent in structural design determines that any differences in the existing ladder are such that its performance ''will not substantially deviate from the requirements'' of ANSI/ASC A14.3–2008 (Section 1.6.1(2)).

[53] The HSE Report is available at *http://www.hse.gov.uk/research/rrpdf/rr258.pdf.*

[54] For purposes of final paragraph (b)(9)(i)(A), the term ''existing fixed ladder'' includes any fixed ladder installed before November 19, 2018.

OSHA believes that most fixed ladders, except for some used in outdoor advertising, already have at least one of the four devices final paragraph (b)(9)(i)(A) requires and, therefore, will be able to continue using those ladders under the final rule. At a minimum, OSHA believes that most existing fixed ladders have cages or wells, which the existing rule (§ 1910.27(d)(1)(i)) has required since the Agency adopted it pursuant to section 6(a) of the OSH Act (29 U.S.C. 655(a)). Evidence discussed in the FEA also indicates that a significant percentage of employers already have ladder safety or personal fall arrest systems on existing fixed ladders.

For fixed ladders that do not have any fall protection, which appears to be the case in the outdoor advertising industry, final paragraph (b)(9)(i)(A) requires that employers install a cage, well, ladder safety system, or personal fall arrest system before November 19, 2018. OSHA believes that most of those employers will install ladder safety or personal fall arrest systems during that time. First, according to the FEA, those systems generally are less expensive than cages or wells. Second, even ANSI/ASC A14.3–2008 requires the use of ladder safety systems for some climbs (Sections 4.1.3, 4.1.4, 4.1.4.2). However, the Agency notes that employers also will be in compliance if they install cages or wells on existing fixed ladders during the first two years after the final rule is published.

One commenter, Ameren, said OSHA should make allowances for employers who have ordered fixed ladders but not yet received and installed them (Ex. 189). They said that it may take up to one year to receive a fixed ladder after placing the order. Final paragraph (b)(9)(i)(A) gives employers two years to install fall protection devices on their fixed ladders. As mentioned, OSHA considers ladders installed during this two-year period to be ''existing fixed ladders,'' which means employers may install any of the four devices specified in final paragraph (b)(9)(i)(A). Thus, employers will not have to change their orders if they purchased fixed ladders equipped with a well or cage. That said, OSHA believes many employers will change their orders to ladder safety or personal fall arrest systems which are less expensive than cages and wells and brings employers into compliance with final paragraph (b)(9)(i)(D) without having to make changes when the final phase-out deadline comes due.

New fixed ladders. Final paragraph (b)(9)(i)(B) requires that employers ensure new fixed ladders they install on and after November 19, 2018 are equipped with a ladder safety system or personal fall arrest system. Requiring that new fixed ladders, rather than existing fixed ladders, be equipped with ladder safety or personal fall arrest systems makes the final rule primarily prospective. OSHA believes that employers should not have any difficulty complying with this approach.

OSHA believes virtually all new fixed ladders manufactured and installed today are available with ladder safety and personal fall arrest systems. Allowing employers two years to begin equipping new fixed ladders with ladder safety or personal fall arrest systems gives employers adequate time to identify companies that manufacture fixed ladders equipped with these systems. OSHA notes that the 2-year phase-in also gives ladder manufacturers time to ensure their ladder safety and personal fall arrest systems comply with the personal fall protection system criteria in the final rule (final § 1910.29).

OSHA points out that final paragraph (b)(9)(i)(B) does not prohibit employers from also installing cages and wells on new fixed ladders in addition to ladder safety or personal fall arrest systems. Cages and wells can provide a way for workers to rest while they are climbing and working on fixed ladders. However, OSHA stresses that employers may not use cages and wells instead of providing ladder safety and personal fall arrest systems. In addition, employers must ensure that the cages and wells are compatible with and do not interfere with the ladder safety or personal fall arrest systems. (See final paragraph (b)(9)(iv) for further discussion.)

Unlike final paragraph (b)(9)(i)(B), ANSI/ASC A14.3–2008 does not require that employers ensure new fixed ladders they install are equipped with ladder safety systems or personal fall arrest systems; but rather allows employers to install new ladders that only have cages or wells in some situations. For example, that standard allows employers to install new fixed ladders equipped with only cages where the length of any climb is less than 24 feet even though the top of the ladder is at a distance greater than 24 feet above a lower level (Section 4.1.2). Similarly, A14.3–2008 allows employers to install only cages or wells on new multiple-section fixed ladders that do not have a single length of climb exceeding 24 feet, provided each ladder section is offset horizontally from adjacent sections and there is a landing platform for safe access/egress (Section 4.1.4.1). That standard only requires employers to use ladder safety systems when a single length of climb exceeds 24 feet (Section 4.1.3) or the length of climb on multiple section ladders exceeds 50 feet (Section 4.1.4.2).

Final paragraph (b)(9)(i)(B) does not adopt the approach in ANSI/ASC A14.3–2008. As discussed above, evidence in the record shows that cages and wells do not prevent workers from falling off ladders or protect workers from injury if they fall (*e.g.,* Exs. 113; 155; 185; 198; OSHA–S041–2006–0666–0198). OSHA believes the final rule, requiring that employers ensure new fixed ladders are equipped with ladder safety systems or personal fall arrest systems, is more protective than ANSI/ASC A14.3–2008. In addition, OSHA believes the final rule is easier to understand and follow than specifying the type of fall protection employers must provide based on the length of the worker's climb, as A14.3–2008 requires.

Replacement. Final paragraph (b)(9)(i)(C) requires that employers ensure when a fixed ladder, cage, or well, or any portion of a section thereof is replaced, a personal fall arrest system or ladder safety system is installed in at least that section of the fixed ladder, cage, or well where the replacement is located. Unlike final paragraph (b)(9)(i)(B), which does not become effective until November 19, 2018, any replacement installed after the final rule becomes effective, which is January 17, 2017, must be equipped with a ladder safety system or personal fall arrest system.

Final paragraph (b)(9)(i)(C) does not require that employers install ladder safety or personal fall arrest systems when they make minor repairs to fixed ladders, cages, or wells, such as replacing a bolt or repairing a weld on a cage. However, when employers determine that they cannot simply make a repair to a section or a portion of a section of a fixed ladder, cage, or well but must replace that portion or section, employers must ensure the replacement is equipped with a ladder safety or personal fall arrest system. OSHA believes the inspection requirement in final § 1910.22(d) will help employers identify when simple repairs or corrections will be adequate and when the situation, such as a condition that affects the structural integrity of the fixed ladder, cage, or well, necessitates replacement of the fixed ladder, cage, or well section.

OSHA also notes that when ''a portion of a section'' of a fixed ladder, cage, or well needs replacement, the final rule only requires the employer to install a ladder safety or personal fall arrest system in that ''section of the fixed ladder, cage, or well where the replacement is located.'' The final rule does not require employers to install a ladder safety or personal fall arrest system on the entire fixed ladder when a portion of one section needs replacement. For example, only part of a 50-foot section of a cage, well or multi-section ladder might need replacement because of damage. Final paragraph (b)(9)(i)(C) only requires that the employer replace that 50-foot section of the ladder, cage, or well with a ladder safety system or personal fall arrest system, not all sections. OSHA believes that a ''section'' of a fixed ladder equipped with a cage or well most likely will not exceed 50 feet. In this regard, ladder sections are the length of ladder between landings or platforms, and final paragraph (b)(9)(iii) requires that fixed ladders that have cages or wells must have landing platforms at least every 50 feet.

The approach ANSI/ASC A14.3–2008 follows when existing fixed ladders are replaced, modified, or repaired differs from the final rule in two respects. First, when existing fixed ladders are replaced, modified, or repaired, the ANSI/ASC standard specifies that employers may install cages or wells instead of ladder safety systems or personal fall arrest systems in some situations (see discussion of final paragraph (b)(9)(i)(B)). Second, the ANSI/ASC standard requires that employers only have to install cages, wells, or ladder safety systems when they make repairs to more than 25 percent of the whole ladder. OSHA believes that requiring employers to install personal fall arrest or ladder safety systems when repairs necessitate replacement of a portion of a fixed ladder, cage, or well is more protective than allowing employers to wait until more than 25 percent of the fixed ladder is in need of repair. In fact, the final rule prohibits that approach. Section 1910.22(d)(2) requires that hazardous conditions be repaired immediately and, if that is not possible, guarded so workers cannot use the walking-working surface until it is fixed (final § 1910.22(d)(2)). Moreover, as discussed above, the record indicates that installing ladder safety systems or personal fall arrest systems instead of cages or wells also is more protective.

Again, this provision does not prohibit employers from keeping those portions of a cage or well that are functioning properly, or installing a new cage or well, provided the employer also installs a personal fall arrest or ladder safety system as final paragraph (b)(9)(i)(B) requires, and the cage or well does not interfere with the fall protection system.

Final deadline. Finally, final paragraph (b)(9)(i)(D) establishes the final deadline for employers to ensure that all fixed ladders that extend more than 24 feet above a lower level are equipped with ladder safety or personal fall arrest systems, which, as mentioned, is 20 years after OSHA publishes the final rule. By that date (November 18, 2036), and thereafter, employers must ensure that all fixed ladders are equipped with personal fall arrest or ladder safety systems, even if the ladders have cages or wells.

OSHA set the extended phase-out period to take into account normal replacement and average useful life of fixed ladders, cages, and wells. After 20 years, OSHA estimates that the large majority of fixed ladders will have been replaced or in need of replacement. Even ANSI/ASC A14.3–2008 notes that while ''[fixed] ladders are designed for extended service,'' they ''are neither designed nor intended to possess an infinite safe useful life'' (Section 9.1.3).

OSHA also believes the extended phase-out lessens the compliance burden on employers, provides a smooth transition to update ladder systems, and allows employers to install ladder safety and personal fall arrest systems according to normal replacement schedules. In addition, OSHA believes that, through replacement and new installations, the vast majority of fixed ladders will have ladder safety or personal fall arrest systems before the time the final deadline arrives.

Final paragraph (b)(9)(ii) adds new requirements for one-section fixed ladders that are equipped with personal fall arrest systems or ladder safety systems and fixed ladders equipped with those systems on more than one ladder section. For these ladders, the final rule requires that employers ensure:

- The personal fall arrest or ladder safety system provides protection throughout the entire vertical distance of the ladder, including all ladder sections (final paragraph (b)(9)(ii)(A)); and
- The ladder has rest platforms provided at least every 150 feet (final paragraph (b)(9)(ii)(B)).

In final paragraph (b)(9)(ii)(A), OSHA clarified the proposed language (''vertical distance'') so the Agency could eliminate the need for the proposed note to paragraph (b)(9). OSHA stresses that the entire vertical distance of a fixed ladder includes all sections of a ladder, as well as any vertical distance in between ladder sections (sometimes referred to as ''entire length of climb''). This means that employers must protect workers for the entire vertical distance of fixed ladders equipped with ladder safety or personal fall arrest systems. The final provision also addresses the hazard of attempting to connect to a ladder safety or personal fall arrest system part way through a climb (*i.e.,* at 24 feet), which would require that the worker release one hand from the ladder, and thereby increase the risk of falling. This requirement is consistent with the construction fall protection standard and ANSI A14.3–2008 (Section 7.1.6).

OSHA notes that final paragraph (b)(9)(ii)(A) does not apply when only one section of a multiple-sectioned fixed ladder has a personal fall arrest system or ladder safety system and the other sections have only cages or wells. In this case, final paragraph (b)(9)(i)(C) applies, and employers need only ensure that the ladder safety or personal fall arrest system protects the worker during that section of the climb. However, when one-section fixed ladders and multiple sections of a fixed ladder have a ladder safety or personal fall arrest system, final paragraph (b)(9)(ii)(A) applies, and the employer must ensure the system protects the worker throughout the entire climb. The Agency does not believe that complying with final paragraph (b)(9)(ii)(A) should pose difficulties for employers. Rather, OSHA believes that if employers must install a ladder safety or personal fall arrest system, it is likely they will install the system on the entire fixed ladder (including all ladder sections). This is particularly true if the employer anticipates that other sections of the fixed ladder, cage, or well also will need replacement at some point.

Paragraph (b)(9)(ii)(B), like the proposal, requires that employers ensure fixed ladders that have personal fall arrest or ladder safety systems also have landing platforms at intervals of at least every 150 feet. This final provision generally is consistent with OSHA's construction ladder standard and ANSI A14.3–2008. OSHA's ladder standard for construction requires that fixed ladders with self-retracting lifelines have rest platforms every 150 feet, while the ANSI standard requires that fixed ladders equipped with ladder safety systems have rest platforms at the same intervals (Section 4.1.4.2). OSHA received no comments on the proposed provision and finalizes it as discussed.

Final paragraph (b)(9)(iii), like proposed paragraph (b)(9)(ii)(C), applies during the gradual phase out of cages and wells. The final rule requires that employers ensure ladder sections that have cages or wells:

• Are offset from adjacent sections (final paragraph (b)(9)(iii)(A)); and

• Have landing platforms provided at maximum intervals of 50 feet (final paragraph (b)(9)(iii)(B)).

Final paragraph (b)(9)(iii) is the same as the ladder standard for construction (§ 1926.1053(a)(19)(iii)). ANSI/ASC A14.3–2008 requires that each section of multiple section ladders equipped with only cages or wells be horizontally offset from adjacent sections and have landing platforms to provide safe access/egress (Section 4.1.4.1). Figure 5a in the A14.3 standard specifies platform landings at intervals of at least 50 feet. The existing rule in § 1910.27(d)(2), however, requires landing platforms at 30-foot intervals if the fixed ladder has a cage or well, and at 20-foot intervals when there is no cage or well. OSHA based the existing rule on the ANSI A4.13–1956 rule in effect at the time. OSHA believes that making final paragraph (b)(9)(iii) consistent with the construction ladder requirements and the current ANSI A14.3–2008 standard will allow workers who perform both general industry and construction activities to use the same fixed ladders while cages and wells are being phased out. OSHA notes that once employers equip fixed ladders with a ladder safety or personal fall arrest system this provision no longer applies, even if the ladder also still has the cage or well.

David Hoberg, with DBM Consultants, supported the provision requiring that fixed ladders have landing platforms, stating:

> [H]aving climbed ladders of up to 125 feet and supervised persons using them, you would not believe the difference a landing makes. A hand cramping stops the climb. And try climbing a ladder as a first responder wearing 100 lbs. of gear where there is no landing to stage equipment or rest or take action (Ex. 206).

The provision is finalized with minor reorganization for clarity.

Final paragraph (b)(9)(iv) is a new provision OSHA added to the final rule that allows employers to use cages and wells in combination with personal fall arrest and ladder safety systems, provided the cages and wells do not interfere with the operation of the system. The proposed rule did not specifically address this issue, but ANSI A14.3–2008 (Section 4.1.6) allows the use of ladder safety systems in combination with a cage. OSHA is adding this provision to clarify that employers do not have to remove cages or wells when they install a required ladder safety or personal fall arrest system, provided the cage or well does not interfere with the operation of the required ladder safety or fall protection system. If a cage or well prevents a personal fall arrest or ladder safety system from operating properly, then the employer must remove the cage or well to protect workers from falling or otherwise incurring an injury.

OSHA received one comment about using ladder safety or personal fall arrest systems in combination with cages or wells. Ellis urged that OSHA prohibit the use of ladder safety devices inside ladder cages because the rear bars of ladder cages can ''pitch the body forward which is tantamount to free fall'' (Ex. 155). The Agency believes that the language addressing interference in final paragraph (b)(9)(iv) resolves Ellis' concern without limiting employer flexibility or compromising worker safety.

Outdoor advertising. Final paragraph (b)(10) addresses fall hazards on fixed ladders used in outdoor advertising (billboards). Final paragraph (b)(10), in combination with final paragraph (b)(9), revises the proposed rule to require that employers ensure their workers use fall protection while climbing fixed ladders that extend more than 24 feet above a lower level. This provision ensures that workers in outdoor advertising will have the same protection from fall hazards as other general industry workers who climb fixed ladders.

The effect of the final rule is to phase out the fall protection exception that OSHA established in the 1991 Gannett variance (56 FR 8801 (3/1/1991)) and the 1993 directive extending the variance to the entire outdoor advertising industry (Fixed Ladders Used on Outdoor Advertising Structures/Billboards in the Outdoor Advertising Industry, STD 01–01–014 (1/26/1993)). (Hereafter, the Gannett variance and OSHA directive are collectively referred to as ''outdoor advertising directive.'') The outdoor advertising directive excepted that industry from complying with existing requirements that fixed ladders have cages or wells (existing § 1910.27(d)(1)(ii)), and landing platforms (existing § 1910.27(d)(2)). The effect of the directive is that workers in the outdoor advertising industry may climb fixed ladders, in some situations, without conventional fall protection (*e.g.,* cages, wells, and ladder safety and personal fall arrest systems), provided employers ensure that:

• Each worker wears a safety belt or harness with an appropriate 18-inch rest lanyard when climbing up to 50 feet or heights up to 65 feet from grade on a combination ladder consisting of a portable ladder and a fixed ladder;

• Each worker keeps both hands free of tools or materials when climbing;

• Each worker uses a ladder safety system for climbs on fixed ladders that exceed 50 feet or when the ladder ascends to heights that exceed 65 feet above grade;

• Each worker who climbs fixed ladders equipped with ladder safety devices uses those devices properly and follows appropriate procedures for inspection and maintenance of those devices;

• The employer ensures proper maintenance and use of ladder safety devices that are installed on fixed ladders;

• Each worker uses an appropriate fall protection system after reaching the work position; and

• Each qualified climber receives training and demonstrates the physical capability to perform necessary climbs safely. In this regard, the employer must ensure that: The worker's physical condition is such that climbing will not impair the worker's health or safety; the worker completes training consisting of classroom training, observing an experienced qualified climber, and actual climbing under close supervision using redundant safety equipment; and the worker works without fall protection only after demonstrating the necessary ability and skill in climbing (STD 01–01–014).

The proposed rule would have codified the specifications contained in the outdoor advertising directive, thus allowing outdoor advertising workers to continue climbing fixed ladders without fall protection so long as they complied with all of the provisions the directive included.

The final rule, however, does not adopt the proposal. Instead, final paragraph (b)(10)(i) specifies that the fall protection requirements for fixed ladders in final paragraph (b)(9) also apply to fixed ladders used in outdoor advertising. This means that outdoor advertising employers must ensure, in accordance with final paragraph (b)(9)(i)(A), that fixed ladders are equipped with a ladder safety system, personal fall arrest system, cage, or well before November 19, 2018. In addition, they must follow the schedule in final paragraph (b)(9)(i) for gradually phasing in the installation of ladder safety and personal fall arrest systems on fixed ladders.

Final paragraph (b)(10)(i) also requires that employers in outdoor advertising follow other provisions in revised subparts D and I, such as the inspection and maintenance requirements in final § 1910.22, the training requirements in final § 1910.30, and the criteria for personal fall protection systems in § 1910.140.

Final paragraph (b)(10)(ii) establishes the requirements that outdoor advertising employers must follow during the phase-in period (two years) they have to install a cage, well, ladder safety system or personal fall arrest system. During this period when outdoor advertisers have not yet installed fall protection, employers must ensure that each worker:

- Receives training and demonstrates the physical capability to perform the necessary climbs in accordance with final § 1910.29(h) (final paragraph (b)(10)(ii)(A));
- Wears a body harness equipped with an 18-inch rest lanyard (final paragraph (b)(10)(ii)(B));
- Keeps both hands free of tools or material while climbing the fixed ladder (final paragraph (b)(10)(ii)(C)); and
- Is protected by a fall protection system upon reaching the work position (final paragraph (b)(10)(ii)(D)).

The requirements in final paragraph (b)(10)(ii) are limited and temporary. First, they only apply to fixed ladders used in outdoor advertising that are not equipped with any type of fall protection. Once a fixed ladder used for outdoor advertising is equipped with one of these systems, the requirements in final paragraph (b)(10)(ii) no longer apply. Instead, the requirements in final paragraphs (a) and (b)(9), final § 1910.29, and final § 1910.140 apply to outdoor advertising employers and fixed ladders used in outdoor advertising.

Second, final paragraph (b)(10)(ii) is only a temporary provision. It is applicable only before November 19, 2018. As of November 19, 2018, final paragraph (b)(9)(i)(A) requires that employers must ensure all existing fixed ladders, including those used for outdoor advertising activities, are equipped with a cage, well, ladder safety system, or personal fall arrest system. Thus, as of November 19, 2018, the requirements in final paragraph (b)(10)(ii) no longer apply and the provision, in essence, expires. In their place, as stated above, the requirements in paragraphs (a) and (b)(9), as well as other fall protection system requirements in the final rule, apply to outdoor advertising employers. OSHA notes that the requirements in final § 1910.29(h), which apply when workers climb fixed ladders without fall protection to perform outdoor advertising activities, also are temporary. As of November 19, 2018, the requirements in § 1910.29(h) no longer will apply since, in accordance with final paragraph (b)(9)(i)(A), all fixed ladders used for outdoor advertising will be required to be equipped with a personal fall arrest system, ladder safety system, cage, or well.

Final paragraph (b)(10)(ii)(A) requires that outdoor advertising employers ensure that each worker who climbs a fixed ladder that is not equipped with a personal fall arrest system, ladder safety system, cage, or well, receives training and demonstrates the physical ability to climb fixed ladders. Employers may comply with the training final paragraph (b)(10)(ii)(A) requires by ensuring that workers have completed a training or apprenticeship program, provided the program includes hands-on training on climbing ladders safely, performance observation combined with formal classroom or on-the-job training, and retraining as necessary (final § 1910.29(h)(2) and (3)).

OSHA notes that employers must ensure the requirement in final paragraph (b)(10)(ii)(A) to demonstrate physical capability must include either a physical examination or observation of the worker performing actual climbing activities (final § 1910.29(h)(1)). Final § 1910.29(h) discusses in detail the training and physical capacity requirements in final paragraph (b)(10)(ii)(A). OSHA notes that this training is in addition to the training outdoor advertising employers must provide to their workers under final § 1910.30.

Final paragraph (b)(10)(ii)(B) requires that outdoor advertising employers ensure workers who climb fixed ladders without fall protection wear body harnesses equipped with an 18-inch rest lanyard. OSHA's intention in requiring that outdoor advertising workers wear body harnesses with rest lanyards is that employers must ensure workers tie off to the fixed ladder when they need to rest during the climb.

The final rule differs from proposed (b)(10)(i) and outdoor advertising directive, both of which permit outdoor advertising employers to provide a body harness or body belt for workers to use for resting during a climb. However, as discussed in final § 1910.140, the final rule does not permit the use of body belts as a part of a personal fall arrest system; thus, OSHA deleted body belts from final paragraph (b)(10)(ii)(B). This revision also makes the final provision consistent with OSHA's construction industry rule, which also does not allow use of body belts for personal fall arrest (§ 1926.502(d)).

Final paragraph (b)(10)(ii)(C) requires employers to ensure that workers engaged in outdoor advertising keep both hands free of tools or material when climbing fixed ladders. This requirement ensures that workers use their hands exclusively for climbing and not carrying tools and material up and down fixed ladders. When workers climb fixed ladders without fall protection, it is essential that they maintain balance and body control. Carrying tools and materials in their hands while they climb may cause workers to lose their balance, which could result in a fall. Both the proposed rule at paragraph (b)(10)(vi) and the outdoor advertising directive include this requirement. In addition, it is consistent with final paragraphs § 1910.23(b)(12) and (13), the construction standard (§ 1926.1053(b)(21) and (22)), and ANSI A14.3–2008 (Section 9.2.1 and 9.2.2).

Final paragraph (b)(10)(ii)(D), like the proposed rule at paragraph (b)(10)(vii) and the outdoor advertising directive, requires outdoor advertising employers to provide workers who climb fixed ladders with, and ensure that they use, a fall protection system once they reach the work position/platform. Thus, when workers step onto the work platform, they must be tied off or otherwise protected from falling (*e.g.,* guardrails). OSHA believes this requirement is necessary because outdoor advertising employers typically install platforms at great heights. The final provision allows employers to use any type of fall protection system specified by final paragraph (b)(1) to protect workers from falling off an unprotected side or edge, including guardrail, safety net, travel restraint, positioning, or personal fall arrest systems.

OSHA requested comment in the proposed rule about eliminating the qualified climber exception for the outdoor advertising industry and instead require fixed ladders used in outdoor advertising to be equipped with the same fall protection as other fixed ladders under the general industry standard (75 FR 28869). In response, OSHA received many comments. A number of commenters, including several fall protection equipment manufacturers, safety organizations, and safety professionals who provide fall protection services, opposed retaining the qualified climber exception in the final rule (Exs. 155; 185; 198; 250). For several reasons, these commenters opposed including in the final rule a qualified climber exception for any industry. These reasons included the dangers of climbing without fall protection; the questionable need for the qualified climber exception in the outdoor advertising industry when compared to other industries; and the ready availability of feasible and easy to use fall protection (*e.g.,* Exs. 155; 185; 198; 205; 250). For example, American Society of Safety Engineers (ASSE) said:

The idea that it is somehow acceptable to climb high distances without fall protection contradicts OSHA's proposed fixed ladder standard requiring a ladder safety system or a cage/well when the total length of a climb exceeds 24 feet. Our members fail to understand why fixed ladders between 24–50 feet in height used in outdoor advertising should be different than other industry ladders used at the same heights. Further, the technology is readily available to provide protections for the fixed ladder (Ex. 127).

ISEA and CSG also voiced opposition to a qualified climber exception for outdoor advertising:

Their situation is not unique. Right now there are many systems available to provide fall arrest as soon as these workers leave the ground. In fact, this type of equipment is used today, so the burden on employers is slight.

OSHA asks about technological and economic feasibility of fall protection for this type of work. Because this industry is constantly improving its offerings and developing new solutions for employers and employees, it is safe to say there has been marked improvement in ladder systems over the past 20 years. In addition, ladder climbing systems are becoming increasingly common.

Finally, Assistant Secretary Michaels has been speaking about fostering a greater culture of safety in U.S. workplaces. Providing an exemption from use of fall protection for those working at dangerous heights seems to run counter to this message (Exs. 185; 198).

The Society of Professional Rope Access Technicians (SPRAT) agreed, saying:

[I]n light of advances in technology and accepted practices for safe alternatives such as Rope Access, twin lanyards, and lead climbing, elimination of the Qualified Climber provision may be timely and appropriate. Variations on these concepts are already accepted methodologies in international fall protection regulations, including ISO, BSA, and Australia. Granted, a 100% tie-off approach may be onerous to implement all at once, but implementation could be phased over several years to help ameliorate the impact (Ex. 205).

Ellis made a similar comment:

This concept of a safe climber who does not need fall protection on ladders or step bolts for climbing towers is a timeworn concept whose day has passed. Protection should be required. Use of rope access teams for work at heights . . . and always using fall protection is what has already arrived in many countries of the world including most of Europe, Australia and South Africa (Ex. 155).

Finally, Damon, Inc., opposed the qualified climber exception because it suggests that older, experienced workers climb better with age while data actually shows that ''older workers have a disproportionate share of fatal falls from ladders'' (Ex. 250).

Many commenters, primarily those in the outdoor advertising industry (Exs. 121; 260; 359; 369) and employees of Lamar Advertising (Lamar) (*e.g.,* Exs. 75; 80; 81; 82; 83; 84; 85; 86; 87; 88; 89; 90; 91; 92; 93; 94; 95; 99; 104; 105; 106; 128), supported codifying the outdoor advertising directive for fixed ladders used in outdoor advertising. For example, Clear Channel Outdoor, Inc. (CCO), and the Outdoor Advertising Association of America (OAAA) supported codifying the outdoor advertising directive because the industry has been operating under it for over two decades (Exs. 121; 329 (1/18/2011, pgs. 113–116)). Many Lamar employees also said they followed the requirements of the outdoor advertising directive for more than two decades and are familiar with the requirements. In this regard, Joseph Shopshear, a Lamar operations manager, said Lamar based its worker safety programs on the Gannett variance, and that ''[t]he Gannett Variance is a very important first step in our safety program and other safety related programs and has been since my employment began with Lamar'' (Ex. 81). Similarly, William DeVine, another Lamar operations manager, said the Gannett variance is the ''forefront'' of the company's safety meetings, the qualified climber qualifications, and the ''backbone'' of their training program (Ex. 94). Therefore, he:

[U]rge[s] OSHA to allow this variance to remain in effect. Any other legislation could immediately affect my job and others around me . . . I do support the Gannet[t] Variance wholeheartedly and request that it remain permanent in the newest legislation . . . The Gannett Variance as written will continue to protect me and my fellow climbers and provide the safest of work environments . . . (Ex. 94)

Several commenters said that OSHA should codify the qualified climber exception for outdoor advertising because they have not experienced any fatalities related to climbing fixed ladders without fall protection, and falls are ''extremely rare'' (Exs. 106; 260; 329 (1/18/2011, pgs. 113–19); 369). For example, Mike Gentile, another Lamar operations manager, said, ''There has been over a million climbs made by all billboard personnel in California in the past ten (10) years on fixed ladders. To date, I am not aware of one single fall'' (Ex. 106). CCO, which asserted in its comments on the proposed rule that ''CCO employees simply do not fall from fixed ladders'' (Ex. 121), expanded on this assertion in its post-hearing comments, stating:

The past eighteen years has clearly established that the Gannett Variance works very well for this industry. There have been zero fatalities and industry is aware of only one fall from a fixed ladder, one, despite literally millions of climbs. The hard evidence proves that the variance works and the numbers could only get worse if the variance is not codified into the new regulations (Ex. 369).

OAAA, reporting on information from industry members, said, ''From a safety standpoint, our companies report that no deaths due to falls from fixed ladders have occurred in the past five years; of the 15,840,000 climbs over the past 5 years, our companies are aware of only one fall from a fixed ladder'' (Ex. 260). OAAA estimated that its members, which it said comprise 90 percent of the market, have a total of 1,800 climbers.

The International Sign Association (ISA) also supported retaining the qualified climber exception because of the industry's safety record, noting, ''It is our understanding that the safety record of outdoor advertising professionals has been excellent over the last decade, and that changing the rule would impose unnecessary costs and technical requirements'' (Ex. 161).

CCO said it would be too costly to retrofit fixed ladders with fall protection (Exs. 121; 369). They claimed that it would cost the company in excess of $80 million to retrofit its 60,000 existing structures (Ex. 121).[55] In its post-hearing comments, CCO revised and supplemented its cost information on retrofitting fixed ladders with fall protection, noting, ''[T]he installation of cages and wells would cost approximately $1,400 for first 20 feet and $1,050 for each twenty foot section after. Accordingly the cost depends upon the height of the unit'' (Ex. 369). CCO stated further:

Clear Channel Outdoor is one of the largest outdoor advertising businesses in the USA. Many of the remaining companies are very small ''mom and pop'' types of operations. While Clear Channel has always met or exceeded regulatory requirements, the additional cost to comply would not only be a significant impact on the company, it could potentially put the smaller operations out of business due to additional financial burden to meet the new requirements.

Clear Channel Outdoor has in excess of 20,000 structures domestically. If one were to remove the structures greater than fifty feet that were address[ed] earlier in these

[55] CCO submitted a pre-hearing comment, Ex. 121, and a post-hearing comment, Ex. 369. In the earlier of CCO's two comments, the company appeared to be describing compliance costs for the entire set of billboard ''faces'' owned and operated by the company (60,000 structures, $80 million), whereas in the later comment the company appeared to be restricting its cost discussion to 20,000 billboard structures that reach elevations above a certain height and require a compliance response.

questions you would be left with approximately 16,000 structures. If one were to divide that number in half to allow for structures less than twenty-four feet of ladder climber and specialty structures without ladders, there would still be around 8,000 structures that would be affected by the proposed codification of the Gannett Variance with heights in excess of twenty-four feet of climb (twenty-five feet is the typical average mentioned in question 1). To install cages on this number of structures would be approximately $12,000,000. To install vertical fall protection would be approximately $2,200,000. While looking at the percentage of cost on new builds individually may not appear to be that much, to retrofit structures that are already in existence to meet new requirements would be extremely expensive.

Additionally, guardrails, cages and wells could potentially obscure advertising copy. This could result in a diminishment of sales and possibly have a catastrophic financial impact on all outdoor advertisers (Ex. 369).

Citizens for a Scenic Wisconsin, Inc. (CFSW), raised a similar concern about requiring fall protection on fixed ladders used for outdoor advertising. CFSW pointed out that the Federal Highway Administration allows catwalks or handrails for non-conforming billboards, and the Highway Beautification Act (HBA) of 1965 allows non-conforming billboards to remain in place until they are destroyed, abandoned, discontinued, or removed. CFSW concluded, ''If existing non-conforming billboards cannot be safely serviced then their advertising message will eventually become obsolete or so weathered and worn that it will become discontinued or abandoned, and ordered removed without compensation as the HBA intended'' (Ex. 217).

Two commenters supported applying the qualified climber option to industries other than outdoor advertising. For example, Verallia said limiting the qualified climber option only to outdoor advertising was ''too restrictive,'' and recommended that OSHA expand the qualified climber provision to other industries, stating:

There are many other tasks that are routinely performed in general industry that are comparable. Without attempting to provide a comprehensive list of such tasks, one example is the infrequent, but not uncommon, need to climb a ''smoke stack'' in order to perform emissions testing. The ''stack tester'' is only at the elevated level for a relatively short amount of time. This task, and surely many others, are comparable to that of the ''outdoor advertiser'' and should also come within the proposed standard at 1910.28(b)(10) (Ex. 171).

OSHA notes that neither CCO nor OAAA supported allowing existing fixed ladders used for outdoor advertising to remain in place and prospectively applying the fall protection requirements to fixed ladders erected in the future. OAAA said, ''It could be difficult to support a grandfather provision due to the fact that a new regulatory requirement could foster inconsistent application of climbing methods which ultimately could increase overall risk to climbers. Essentially a double standard is created'' (Ex. 359). OAAA stated further that ''[t]here is concern that two training systems will be required in the future, one for grandfather structures and another separate program for new structures and fixed ladders. Thus, this can be costly as well as potentially strain overall company safety efforts'' (Ex. 359). Finally, OAAA noted that ''[w]e concur with the use of new technologies to protect our workers and professional climbers,'' but ''recommend that OSHA not list specific equipment in the standard so as to give employers the flexibility to use new technologies as they become available'' (Ex. 260). A number of Lamar employees agreed, saying that listing fall protection system in the final rule would make the rule ''outdated as soon as it was published'' (*e.g.,* Exs. 75; 92; 93; 99; 101).

For a number of reasons, OSHA believes that it is necessary and appropriate to eliminate the qualified climber exception in the outdoor advertising industry. First, workers are at risk of death and injury climbing to elevated heights on fixed ladders without fall protection (no matter how often) and OSHA believes employers in outdoor advertising are aware of these risks. For example, CCO, one of the largest companies in the outdoor advertising industry, said they already have equipped a number of fixed ladders with fall protection systems (Ex. 369). CCO added that the average height at which those fall protection systems protect their workers is 18 feet, which is well below the height at which fall protection is required in the outdoor advertising directive. OSHA also notes that the outdoor advertising industry did not oppose the proposal's requirement that fixed ladders used in outdoor advertising be equipped with ladder safety systems or personal fall arrest systems when those ladders exceed 50 feet or for climbs that exceed 65 feet, which is an acknowledgement that workers climbing fixed ladders without fall protection are exposed to great risk.

As demonstrated in the FEA, falls from ladders are a significant cause of worker deaths and injuries. The FEA indicates that on average, falls kill 47 general industry workers and injure 10,716 workers each year. OAAA said their member companies reported no deaths and only one fall involving their 1,800 climbers for the years 2005 to 2010 (Ex. 260). OSHA's Integrated Management Information System (IMIS) data indicate that since the 1991 Gannett Variance there have been at least three falls from fixed ladders in the outdoor advertising industry, one of which resulted in death.[56]

The IMIS data also show a large number of falls, in servicing outdoor advertising structures; however, the data do not identify the location of the workers on the structures when they fell (Ex. 393). Therefore, OSHA cannot determine definitively whether the falls were from fixed ladders. However, OSHA believes that at least some of these falls could have occurred while workers were climbing the fixed ladder or transitioning from the fixed ladder to the work platform because the incident narratives state that workers were not using fall protection (or were not tied off) when they fell. Since the outdoor advertising directive requires that employers ensure their workers use fall protection at all times when they are on work platforms, OSHA believes that workers may have been on fixed ladders or transitioning from fixed ladders to the work platform when they fell. As such, OSHA believes that there may actually be more than the three falls (noted above) related to climbing without fall protection.

Second, OSHA believes that requiring outdoor advertising employers to ensure their workers use ladder safety systems or personal fall arrest systems when they are on fixed ladders will reduce the risk of falls when workers are transitioning from fixed ladders to work platforms (or from the work platform to the fixed ladder). Stakeholders, including many Lamar Advertising workers, admitted that transitioning from fixed ladders to work platforms is an ''important'' safety concern (*e.g.,* Exs. 85; 86; 90; 92; 103; 104; 105. *See also,* Ex. 329 (1/18/2011), p. 333). OAAA agreed, saying the final rule must ensure ''safe transitions'' from fixed ladders to landing surfaces (Ex. 260). IMIS data show falls occurred in the outdoor advertising industry when workers were

[56] OSHA derives IMIS data from investigations of employer accident reports. Since OSHA only requires that employers report accidents that involve a fatality or the hospitalization of three or more workers, the Agency believes that IMIS data may understate the number of non-fatal injuries. IMIS Fatality and Catastrophe Investigation Summaries are found on OSHA's Web site at: *http://www.osha.gov/pls/imis/accidentsearch.html.*

The referenced falls are in Ex. 393 under the following inspection numbers: 310696489; 126063924; and 126062694.

transitioning between the fixed ladder and the landing/work platform (Ex. 393). As such, OSHA finds that qualified climber training programs have not adequately addressed the significant risk associated with transitioning to/from fixed ladders without work platforms and the requirement that employers ensure workers use ladder safety systems or personal fall arrest systems while climbing fixed ladders is needed. Requiring that workers must be tied off at all times (both on the fixed ladder and work platform) will reduce the risk of worker falls during fixed ladder/platform transitions. For example, when workers leave the work platform they can slip or lose their balance when turning to climb back down the ladder. At this point the workers may not see the first rung on the ladder and must feel for a foothold as they transition from the platform to the fixed ladder. If workers are tied off, falls will be stopped even if their balance is lost, their foot slips off a ladder rung, or they lose their grip on the ladder or other hand hold.

Third, OSHA believes that requiring outdoor advertising employers to use fall protection on fixed ladders will help to ensure that their workers also continue to use fall protection (*i.e.,* be tied off) at all times when they are on outdoor advertising work platforms, which will reduce fatal falls from those platforms. The outdoor advertising directive, issued in 1993, requires that employers ensure their workers use fall protection at all times while on work platforms. However, IMIS data from 1993–2010 indicate that 23 falls from outdoor advertising work platforms occurred during that time because either employers did not provide fall protection for workers or did not ensure workers were properly tied off. Of those falls, 13 resulted in worker deaths (Ex. 393). OSHA believes if employers must provide and ensure workers use fall protection when they start climbing fixed ladders to work platforms that those workers will be more likely to remain tied off when they reach, and work on, the platforms.

OSHA notes that requiring that workers in outdoor advertising use fall protection when they climb fixed ladders makes the final rule consistent with the construction ladder standard (§ 1926.1053(a)(18) and (19)) and other standards the Agency recently revised (§§ 1910.269 and 1926.954). Those standards require that workers, including specially trained workers similar to qualified climbers in outdoor advertising, use fall protection while climbing fixed ladders, poles, towers, and similar structures. For example, the construction ladder standard requires that employers provide workers climbing fixed ladders above 24 feet with, and ensure that they use, ladder safety devices, self-retracting lifelines (*i.e.,* personal fall arrest system), cages, or wells (§ 1926.1053(a)(19)).

OSHA's revised general industry (§ 1910.269) and construction (29 CFR part 1926, subpart V) electric power generation standards added a requirement that qualified employees must use fall protection while climbing or changing locations on poles, towers, or similar structures, unless the employer can demonstrate that fall protection is not feasible or presents a greater hazard to the employees (§§ 1910.269(g)(2)(iv)(C)(*3*) and 1926.954(b)(3)(iii)(C))(79 FR 20315 (4/11/2014)). As originally adopted, § 1910.269 (adopted by OSHA in 1994) did not require that qualified employees use fall protection when climbing poles, towers, and similar structures unless conditions (*e.g.,* ice, high winds, presence of contaminants) could cause workers to lose their grip or footing. However, because of the incidence of fall fatalities and ready availability of personal fall protection systems (*e.g.,* personal fall arrest systems, pole straps), OSHA added a provision to § 1910.269 specifically requiring that qualified employees use fall protection (§ 1910.269(g)(2)(iv)(C)(*3*))(79 FR 20399–20401). OSHA believes the rationale for eliminating the qualified employee exception from § 1910.269 also is applicable to outdoor advertising.

OSHA is requiring that outdoor advertising employers provide fall protection on fixed ladders because it is clear that, like the utility industry, there are technologically feasible means of fall protection available that are currently in use to protect workers in outdoor advertising. Indeed, since 1993 the outdoor advertising directive has required that employers install ladder safety systems, and ensure that workers use them, when climbs on fixed ladders exceed 50 feet or when the fixed ladder ascends to a height of more than 65 feet above grade. During the period since OSHA issued the directive, manufacturers developed new types of personal fall protection systems, specifically personal fall arrest systems, for climbing fixed ladders, and these systems are readily available, effective, and easy to use (*e.g.,* Exs. 127; 185; 198). OSHA included these systems in the construction fall protection standard issued in 1994, and their use is commonplace today. As mentioned, OSHA also required the use of fall protection systems, such as personal fall arrest systems, in the 2014 revisions to § 1910.269 and § 1926.954. OSHA also notes that, in the current rulemaking, several stakeholders submitted information to the record about fall protection systems that are readily available and effective in protecting workers climbing fixed ladders (Exs. 127; 155; 185; 198; 205).

The record also shows that it is economically feasible for the outdoor advertising industry to comply with the final requirement to ensure that employers provide and ensure their workers use fall protection systems while climbing fixed ladders in outdoor advertising. Many, if not most, fixed ladders manufactured today have ladder safety systems or personal fall arrest systems (*i.e.,* self-retracting line or cable) that meet the requirements of final paragraph (b)(9) of this section and final § 1910.29. The FEA and the record for this rulemaking indicate that these systems are reasonably priced and economically feasible. In the FEA, OSHA estimates that the cost of purchasing and installing a ladder safety system or personal fall arrest system is about $1,050. In their post-hearing comments, CCO's cost estimates for installing ladder safety or personal fall arrest systems are lower than OSHA's cost estimates, suggesting that OSHA's estimate is conservative (Ex. 369).

OSHA also believes the fall protection requirement is economically feasible because the FEA estimates that employers will need to equip only a small percentage of existing outdoor advertising structures with fall protection. OAAA estimates there are approximately 450,000 existing structures (Exs. 260; 359; 369). Employers in outdoor advertising will not have to install fall protection on fixed ladders that do not extend more than 24 feet above a lower level (final paragraph (b)(9)(i)(A)) or that already are equipped with fall protection. As such, in the FEA, OSHA estimates that employers will need to equip only about 21,000 existing outdoor advertising structures with a fall protection system by November 19, 2018. In the Preliminary Economic Analysis (PEA) of the proposed rule, OSHA included a similar estimate (*i.e.,* 20,490 outdoor advertising structures extend more than 20 feet above a lower level); OAAA provided this estimate to OSHA based on their member comments and a survey (Ex. OSHA–2007–0072–0046, p. A–9). Neither OAAA nor any other employer in the outdoor advertising industry challenged OSHA's estimate. In fact, OAAA's and CCO's comments generally support OSHA's conclusion that employers will need to equip only a small percentage of existing outdoor advertising structures with fall protection systems (Exs. 260; 359; 369).

The framework of the final rule, when read in the context of final paragraph (b)(9)(i) of this section, provides employers with substantial control flexibility, which further ensures the final rule is economically feasible. Specifically, the final rule allows outdoor advertising employers to equip existing ladders (that have no fall protection) with a cage, well, ladder safety system, or personal fall arrest system (final paragraph (b)(9)(i)(A)), while the existing rule, absent the outdoor advertising directive, would require outdoor advertising employers to equip the fixed ladders with cages or wells (existing § 1910.27(d)(1)(ii)). As mentioned earlier in this preamble, this flexibility allows employers to equip fixed ladders with the least costly fall protection system, which the record indicates are ladder safety or personal fall arrest systems (Ex. 369; *see also* FEA). OSHA notes that CCO, one of the largest outdoor advertising companies, said it would cost approximately $12 million to install cages or wells on 8,000 existing fixed ladders, but only $2.2 million to install ladder safety systems or personal fall arrest systems (*i.e.,* ''vertical fall protection'') on those fixed ladders (Ex. 369).

In addition, giving employers in outdoor advertising two years to install a fall protection system on fixed ladders lessens the economic impact of the final rule and further shows the requirement is economic feasible. For example, it gives employers time to identify and evaluate various types of fall protection systems, negotiate with manufacturers and vendors to select the most cost-effective system that best satisfies their needs, and train workers in the use of that equipment. Moreover, OSHA notes that the final rule gives outdoor advertising employers two years to comply with the requirement that their workers use fall protection while climbing fixed ladders while revised § 1926.954 gave employers only one year to comply with the fall protection requirement.

Gradually phasing in over 20 years the requirement that fixed ladders be equipped with ladder safety systems or personal fall arrest systems also significantly lessens the economic impact on employers, including those in outdoor advertising. To illustrate, if outdoor advertising employers currently use fixed ladders equipped only with cages or wells, the final rule gives these employers 20 years to install ladder safety or personal fall arrest systems. This extended phase-in period allows employers to install fall protection systems as part of their normal replacement or business cycles rather than retrofitting fixed ladders immediately. In sum, OSHA believes the combination of flexibility to use controls that are less expensive than those the existing rule required, extended compliance time, and gradual phase-in of ladder safety systems and personal fall arrest systems ensures the final rule is economically feasible and will not threaten the industry's ''long-term profitability'' or substantially alter its competitive structure. (*Forging Indus. Ass'n* v. *Secretary of Labor,* 773 F.2d 1436, 1453 (4th Cir. 1985) (en banc) (*Noise*)).

Finally, OSHA believes requiring employers in outdoor advertising to provide and ensure that workers use fall protection when climbing fixed ladders is reasonable and appropriate because, as a number of commenters said, the outdoor advertising industry and the fixed ladders it uses are not unique with regard to fall protection (Exs. 155; 185; 198). Therefore, OSHA believes that it is no longer necessary or warranted for it to except the outdoor advertising industry from the requirements to use fall protection while climbing fixed ladders. Stakeholders in the outdoor advertising industry did not argue that the elevated heights encountered in outdoor advertising are not dangerous, or that fall hazards or work conditions in outdoor advertising are unique compared to other industries. Moreover, they did not argue that the fall protection systems used by workers in other industries when climbing fixed ladders will not work, or are not a feasible means of worker protection, in the outdoor advertising industry.

Regarding comments recommending that OSHA not list specific fall protection systems in the final rule because such a list would soon become outdated, OSHA notes that the Agency has dealt with issues like this in the past. If an employer has information about a new method of fall protection that will provide worker protection equivalent to the protection afforded to workers by the final rule, it can approach the Agency and seek permission to use it through a request for interpretation or a variance.

Stairways. Final paragraph (b)(11), which generally is consistent with existing §§ 1910.23(d)(1) and 1910.24(h) and proposed paragraph (b)(11), requires that employers protect workers from falling off stairway landings and the exposed sides of all stairways. Stairways, as defined in the final rule in § 1910.21(b)), include standard stairs, ship stairs, spiral stairs, and alternating tread-type stairs.

Final paragraph (b)(11)(i), like the proposal, requires that employers ensure each worker exposed to an unprotected side or edge of a stairway landing that is four feet or more above a lower level is protected by a guardrail [57] or stair rail system.[58] The final requirement is consistent with the requirements for stairway landings specified by the existing general industry standard in § 1910.24(h) and the construction standard in § 1926.1052(c)(12). The final provision is also consistent with A1264.1–2007 (Section 7.1), the National Fire Protection Association (NFPA) Life Safety Code—NFPA 101–2012 (Section 7.1.8), and the International Code Council International Building Code (IBC)—IBC–2012 (Section 1013.2). OSHA notes that NFPA and IBC require guards on open-sided walking surfaces located more than 30 inches above the floor or grade below. Unlike final paragraph (b)(1), which allows employers to protect workers using one of several fall protection options, final paragraph (b)(11)(i) requires that employers provide guardrails or stair rails on unprotected sides and edges of stairway landings and stairways. OSHA believes that limiting the fall protection options to stair rails or guardrails is necessary, because the other fall protection options in final paragraph (b)(1) (*i.e.,* safety net, travel restraint, and personal fall arrest systems) are not appropriate or practical to use on stairways, which workers use regularly and routinely to access workplace areas. Using the other options could prevent, or significantly encumber or impede, workers from using the stairways and freely moving around the worksite. By contrast, guardrail and stair rail systems provide continuous protection while allowing workers to freely access stairs and worksites.

Final paragraph (b)(11)(ii), consistent with existing § 1910.23(d)(1) and proposed paragraph (b)(11)(ii), requires that employers ensure each flight of stairs having at least three treads and at least four risers is equipped with a stair rail system and handrails as specified in Table D–2. Table D–2 specifies the type and number of stair rails and handrails employers must provide based on the width and configuration of the stairs.

[57] The final rule defines guardrail system as a barrier erected along an unprotected side, edge or other walking-working surface to prevent workers from falling to a lower level (final § 1910.21(b)).

[58] The final rule defines stair rail or stair rail system as a barrier erected along the exposed or open side of stairways to prevent workers from falling to a lower level (final § 1910.21(b)).

NFPA commented on the proposed table, saying that it was potentially misleading (Ex. 97). In particular, NFPA said the third column (''One open side'') did not clearly specify that, in addition to providing a handrail on the ''one open side,'' employers also must provide a handrail on the ''enclosed side'' (Ex. 97). NFPA noted that OSHA should not expect employers to know that they must meet the requirements for both the ''enclosed side'' and for ''one open side'' to be in compliance with the final rule. NPFA, therefore, made the following two recommendations to revise the third column of the proposed table: (1) For stairways that are 44–88 inches wide, NFPA recommended, ''One stair rail system with handrail on open side and one handrail on enclosed side''; and (2) for stairways that are greater than 88 inches, NFPA recommended, ''One stair rail system with handrail on open side, one handrail on enclosed side, and one intermediate handrail located in the middle of the stair.'' OSHA agrees that NFPA's recommendations clarify the information provided in the proposed table, and incorporates them in final Table D–2.

Final paragraph (b)(11)(iii), like the proposal, requires that employers ensure ship stairs and alternating tread-type stairs are equipped with handrails on both sides. Both of those types of stairs have slopes that are 50 to 70 degrees from the horizontal, and OSHA believes that workers need handrails on both sides to safely climb those stairs. This requirement is consistent with IBC–2012 (Section 1009.13 and .14) and NFPA 101–2012 (Section 7.2.11). OSHA did not receive any comments on the proposed provision and adopts paragraph (b)(11) with only minor changes for clarity.

Scaffolds and rope descent systems. Final paragraph (b)(12), like the proposal, requires that employers protect workers from falls who are working on scaffolds and who are using rope descent systems. The final rule defines a scaffold in part as a temporary elevated or suspended platform and its supporting structure, including anchorage points, that support workers, equipment, materials, and other items (final § 1910.21(b)). As defined in the final rule, a rope descent system, also known as controlled descent equipment or apparatus, is a suspension device that allows the worker to descend in a controlled manner, usually in a chair (seatboard) (final § 1910.21(b)).

Final paragraph (b)(12)(i), like the proposal, makes the general industry standard consistent with the construction standard by requiring the employer to ensure that workers on scaffolds are protected from falling in accordance with 29 CFR part 1926, subpart L. The final rule deletes the existing general industry scaffold provisions and, instead, requires that employers comply with the requirements in the construction scaffold standards. The requirements in the construction scaffold standard are more comprehensive and up to date than the existing rule, which OSHA adopted in 1971. OSHA notes the existing rule, like the construction standard, requires that employers provide fall protection when workers on scaffolds are 10 feet or more above a lower level (see *e.g.,* existing § 1910.28(b)(15), (c)(14), (d)(7), (f)(15), (g)(5), (h)(8), (k)(5), (m)(7), (o)(2), (p)(7); § 1926.451(g)(1)).

Final paragraph (b)(12)(ii), like the proposal, requires that employers ensure workers using rope descent systems four feet or more above lower levels are protected from falling by a personal fall arrest system. OSHA reminds employers that if they use vertical lifelines to protect workers using RDS, the lifeline must be attached to a separate anchorage (see final § 1910.140(c)(12)). The construction fall protection standard includes a similar requirement (§ 1926.502(d)(15)). OSHA did not receive any comments on the proposed provision and finalizes it with only minor editorial change.

Work on low-slope roofs. Final paragraph (b)(13) is a new provision that establishes fall protection requirements when employees perform work on low-slope roofs. OSHA is adding this provision to make the general industry standard more consistent with the construction fall protection standard, which includes a provision addressing roofing work performed on low-slope roofs (§ 1926.501(b)(10)). Many stakeholders urged OSHA to incorporate the construction provision in the final rule (see *e.g.,* Exs. 121; 124; 164; 171; 180; 189; 192; 207; 226; 251).

The final rule defines low-slope roof as ''a roof having a slope less than or equal to 4 in 12 (vertical to horizontal)'' (§ 1910.21(b); *see also* § 1926.500(b)). A ''4 in 12'' slope means, for example, the slope does not exceed a 4-foot vertical rise for every 12 feet in the horizontal length of the roof.[59]

Under paragraph (b)(13), the type of fall protection measures employers must use on low-slope roofs depends upon the distance they work from the roof edge.[60] The final rule divides work on low-slope roofs into three zones:

- Work performed less than 6 feet from the roof edge;
- Work performed 6 feet to less than 15 feet from the roof edge; and
- Work performed 15 feet or more from the roof edge.

Work performed less than 6 feet from the roof edge—Final paragraph (b)(13)(i), like the construction standard (§§ 1926.501(b)(10) and 1926.502(f)) requires that employers use conventional fall protection systems (*i.e.,* guardrail systems, safety net systems, personal fall protection systems) when they work less than 6 feet from the edge of a low-slope roof. OSHA believes that using a conventional fall protection system is necessary to protect workers from falling when they work that close to the roof edge, including the edge of low-slope roofs. Without conventional fall protection, an inadvertent slip or trip this close to the edge could propel the worker off the roof.

Work performed 6 feet to less than 15 feet from the roof edge—Final paragraph (b)(13)(ii), which applies when employees work at least 6 feet but less than 15 feet from the roof edge, requires that employers protect workers from falling by using:

- A conventional fall protection system; or
- A designated area, but only when the employer is performing work ''that is both infrequent and temporary.''

The final rule defines ''designated area'' as ''a distinct portion of a walking-working surface delineated by a warning line in which employees may perform work without additional fall protection'' (final § 1910.21(b)). The definition of designated area is similar to the construction standard's ''warning line system,'' defined as a barrier erected on a roof to warn employees that they are approaching an unprotected roof side or edge, and which designates an area in which roofing work may take place without the use of guardrail, body belt, or safety net systems to protect employees in that area (§ 1926.500(b)).

In the preamble to the construction fall protection standard, OSHA explained how warning line systems work:

[59] In the preamble to the proposed rule, OSHA mistakenly indicated that a ''4 in 12'' slope is a slope that is 10 degrees or less. NIOSH noted correctly in its comments that ''[a] slope of 10 degrees or less from the horizontal requires a slope of 2 in 12 (9.5 degrees)'' (Ex. 164). Therefore, for the purposes of this final rule, a low-slope roof has a slope of 4 in 12 or less, which is a slope of less than 20 degrees.

[60] OSHA notes that final paragraph (b)(13) only applies to unprotected ''edges'' of low-slope roofs. As such, employers must protect workers from holes on roofs, including skylights, in accordance with final paragraph (b)(3).

[A] warning line ''serves to warn and remind employees that they are approaching or working near a fall hazard by providing direct physical contact with the employee. The contact attracts the employee's attention, enabling the employee to stop in time to avoid falling off the roof'' (59 FR 40672, 40689 (8/9/1994)).

OSHA intends the use of designated areas and warning lines in the final rule to work in the same way.

The use of designated areas in the final rule is very limited. Final paragraph (b)(13)(ii), like the construction standard, only allows employers to use designated areas for work performed at least six feet from the roof edge. When work that is at least 6 feet from the edge of a low-slope roof, OSHA believes the use of fall protection alternatives is appropriate in certain situations. As far back as the 1990 proposed rule, OSHA said that working a ''six foot (1.8m) distance [from the edge of a low-slope roof] is sufficient to allow an employee to stop moving toward the fall hazard after realizing the perimeter has been contacted'' (55 FR 13360, 13376 (4/10/1990)).

That said, working as close as 6 feet from the edge of a roof, even a low-slope roof, may pose some risk of falling. To address that risk, the final rule further limits the use of designated areas at that distance to work that is ''both infrequent and temporary'' (final § 1910.28(b)(13)(ii)). The proposed rule limited designated areas to work ''of a temporary nature'' (proposed § 1910.29(d)(1)(ii)). In the preamble to the proposed rule, OSHA said, ''Designated areas may only be used for temporary, relatively infrequent work'' (75 FR 28895). OSHA believes the language in the final rule more clearly expresses OSHA's proposed intent.

For purposes of the final rule, ''temporary'' means that the duration of the task the worker performs is brief or short. Temporary and brief or short tasks generally include those that a worker is able to perform in less time than it takes to install or set up conventional fall protection. When the duration of a task is this short and the work is performed at least 6 feet from the edge of a low-slope roof, OSHA believes worker exposure to fall hazards is very limited. OSHA agrees with stakeholders who said that requiring employers to install conventional fall protection in these instances could increase worker exposure substantially (*e.g.,* Exs. 165). Conversely, when it takes more time to complete a job than it takes to install or set up conventional fall protection (*e.g.,* personal fall protection system), OSHA believes that the use of conventional fall protection is necessary because the duration of and potential for exposure to fall hazards is more significant; such exposure is extensive and prolonged.

Temporary tasks also include those that workers are able to complete at one time rather than repeatedly climbing up or returning to the roof or requiring more than one workshift to complete. When jobs take that long to complete or involve repeated exposure, OSHA believes the risk of falls increases significantly. For purposes of the final rule, OSHA intends that ''temporary'' tasks generally are limited to ''simple'' tasks and ''short-term . . . scheduled maintenance or minor repair activities'' (Ex. 165). OSHA agrees with SMACNA's comment that temporary and simple tasks are those that do not require ''significant equipment, personnel, and other resources'' or a level of exposure that ''long-term'' or ''complicated'' maintenance and repair work does (Ex. 165).

Although the final rule does not place a specific time limit on what constitutes a temporary task, OSHA agrees with SMACNA that short duration tasks generally are those that take less than ''1–2 hours'' to complete (Ex. 165; *see also* Exs. 124; 171; 236). Examples of temporary tasks include changing a filter in a roof-top HVAC system, replacing a part on a satellite dish, caulking or resealing the flashing around a skylight, or sweeping a chimney.

The term ''infrequent,'' for purposes of the final rule, means that the task or job is performed only on occasion, when needed (*e.g.,* equipment breakdown), on an occasional basis, or at sporadic or irregular intervals. Infrequent tasks include work activities such as annual maintenance or servicing of equipment, monthly or quarterly replacement of batteries or HVAC filters, and responding to equipment outage or breakdown. In these instances, the frequency of exposure to fall hazards is very limited.

By contrast, tasks performed or repeated on a daily, routine or regular basis are not infrequent activities within the meaning of the final rule. Infrequent jobs also do not include those that workers perform as a primary or routine part of their job or repeatedly at various locations during a workshift. A task may be considered infrequent when it is performed once a month, once a year, or when needed.

The designated area provision in final paragraph (b)(13)(ii) generally is modelled on the construction fall protection standard, which allows employers to use ''warning line systems'' when they perform roofing work at least six feet from the edge of a low-slope roof (§ 1926.501(b)(10)). However, the final rule also differs from the construction standard in several respects. The construction provision is limited to ''roofing work,'' which that standard defines as ''the hoisting, storage, application, and removal of roofing equipment and materials, including related insulation, sheet metal and vapor barrier work, but not the construction of roof decks'' (§§ 1926.500(b)). Roofing jobs typically take a significant amount of time to complete (hours or days). As a result, workers have prolonged exposure to fall hazards. Therefore, the construction standard requires that employers performing roofing work as close as 6 feet from the roof edge must use conventional fall protection systems, warning line systems used in combination with conventional fall protection, or warning line systems in combination with safety monitoring systems. The construction standard included alternative fall protection options for roofing work because the ''Agency recognized [conventional fall protection] systems could pose feasibility problems during roofing work; therefore, the rule allows other choices of fall protection methods'' (Letter to Mr. Anthony O'Dea (12/15/2003); 59 FR 40688–89).[61] Some stakeholders said the same feasibility issues are present in general industry (Exs. 192; 226; 236). Southern Company, for instance, said there are no suitable anchorage points for securing personal fall protection systems on some roofs (Ex. 192).

OSHA is including the designated area provision in final paragraph (b)(13)(ii) for work that is both temporary and infrequent primarily for other reasons. First, as mentioned, adding the designated area provision for work on low-slope roofs makes the final rule more consistent with the construction fall protection standard, which is one of the main goals of this rulemaking. In addition, making the general industry and construction standards more consistent will make compliance easier for employers who perform both general industry and construction activities. Many stakeholders supported including the designated area provision for this reason (*e.g.,* Exs. 121; 124; 164; 165; 171; 180; 189; 192; 195; 207; 226; 236; 251; 254).

Second, when the slope of the roof is low, workers are at least 6 feet from the

[61] OSHA letter to Mr. O'Dea available at: *http://www.osha.gov/pls/oshaweb/owadisp.show_document?p_table=INTERPRETATIONS&p_id=24682.*

roof edge, and their time in the area is both brief and infrequent, OSHA believes there is very limited exposure to fall hazards. As far back as the 1990 proposed rule, OSHA said ''it would be unreasonable to require employers to install guardrail systems in a designated area'' (55 FR 13375).

Third, when the duration of the task is very short, OSHA believes the physical reminder that warning lines provide can effectively alert and remind workers that they are approaching the roof edge and must not get any closer. Fourth, OSHA agrees with stakeholders that requiring employers to spend the time installing conventional fall protection in instances when the task is brief and infrequent may pose a greater risk of falling than the task itself (Exs. 124; 165; 171).

Fifth, allowing employers to use designated areas instead of conventional fall protection when they perform tasks that require less time to complete than installing conventional fall protection significantly limits the duration of the job, thereby increasing efficiency and cost-effectiveness. Allowing employers to use designated areas reduces the cost of the job and also makes it easier for them to assign one-person jobs, which a number of stakeholders do (*e.g.,* Exs. 150; 165).

Finally, the final rule allows the use of designated areas only in very limited situations. The proposed rule would have allowed greater use of designated areas. OSHA believes that the limitations incorporated in final paragraph (b)(13)(ii) (*i.e.,* work that is performed on low-slope roofs, that is performed at least 6 feet from the edge and that is both temporary and infrequent) ensures that designated areas are used only where the duration and frequency of exposure is extremely limited. In these situations, OSHA believes that the use of designated areas provides adequate protection and does not compromise worker safety.

OSHA believes the designated area provision in the final rule also is more protective than the construction standard. As mentioned, the construction standard allows employers to use warning line systems in combination with a safety monitoring system when performing roofing work (*i.e.,* work that involves prolonged exposure to fall hazards) 6 feet or more from the roof edge (§ 1926.501(b)(10)). The construction standard does not limit the use of warning line systems to work that is both temporary and infrequent. It also does not require employers to demonstrate that all conventional fall protection systems are infeasible in order to use a safety monitoring system. By contrast, the final rule does not permit employers to use safety monitoring systems unless the employer first demonstrates that all conventional fall protection systems are infeasible.

OSHA notes that some commenters (Exs. 124; 165; 171) opposed requiring employers to establish designated areas (*i.e.,* erect warning lines) for short duration jobs performed within 15 feet from the roof edge could (Ex. 171). Some stakeholders supported excepting work that is both temporary and infrequent from the requirement to use warning lines for work performed 6 feet to less than 15 feet from the roof edge (Exs. 165; 207). For example, SMACNA said:

> Where is the hazard if the HVAC work does not require the worker to be within 15 feet of the roof edge . . . and the worker is only on the roof for a specific purpose (repair or maintain equipment) and for a short time . . . ? (Ex. 165).

OSHA disagrees with SMACNA. When employers perform any work, including work that is both temporary and infrequent in nature, as close as 6 feet from the edge of a low-slope roof, the Agency believes that some protection is necessary because there is or may be some risk of falling.

SBA Office of Advocacy said requiring employers to erect warning lines for short duration tasks could ''present an independent hazard'' (Ex. 124). They reported, ''[Small business representatives] expressed concern about situations where employees are working on rooftops during simple, short-duration projects and would be required to construct physical barriers as 'Designated Areas' that may actually increase the risk of falls and introduce other safety hazards'' (Ex. 124; *see also* Ex. 171).

OSHA's experience with warning line systems in the construction industry does not support SBA Office of Advocacy's claim that using designated areas for brief tasks poses a greater hazard and the commenter did not provide any evidence to support their claim. Moreover, SBA Office of Advocacy recommended that OSHA make the final rule consistent with the construction fall protection standard, which, as mentioned, does not exempt ''short duration projects'' from providing any fall protection (conventional or designated areas) at this distance from the edge of low-slope roofs the requirements to provide fall protection. That said, OSHA believes the allowances that final paragraphs (b)(13)(ii) and (iii) include for employers who perform work that is both infrequent and temporary, provides substantial flexibility and should not pose any significant compliance difficulties.

Work performed 15 feet or more from the roof edge—Final paragraph (b)(13)(iii), which applies to work performed 15 feet or more from the edge of a low-slope roof, requires that employers protect workers from falling by:

- Using a conventional fall protection system or a designated area. If, however, the work is both infrequent and temporary, employers do not have to provide any fall protection (final paragraph (b)(13)(iii)(A)); and
- Implementing and enforcing a work rule prohibiting employees from going within 15 feet of the roof edge without using fall protection in accordance with final paragraphs (b)(13)(i) and (ii) (final paragraph (b)(13)(iii)(B)).

Final paragraph (b)(13)(iii) generally is consistent with OSHA's longstanding enforcement policy regarding construction work performed at least 15 feet from the edge of low-slope roofs (see *e.g.,* letter to Mr. Anthony O'Dea (12/15/2003);[62] letter to Mr. Keith Harkins (11/15/2002);[63] letter to Mr. Barry Cole (5/12/2000)[64]). OSHA set forth its policy in the letter to Mr. Barry Cole:

> At 15 feet from the edge [of a roof] . . . , a warning line, combined with effective work rules, can be expected to prevent workers from going past the line and approaching the edge. Also, at that distance, the failure of a barrier to restrain a worker from unintentionally crossing it would not place the worker in immediate risk of falling off the edge. Therefore, we will apply a *de minimus* policy for non-conforming guardrails 15 or more feet from the edge under certain circumstances. Specifically, we will consider the use of certain barriers that fail to meet the criteria falling-object a guardrail a *de minimus* violation of the guardrail criteria in § 1926.502(b) where all of the following are met:
>
> 1. A warning line is used 15 feet or more from the edge;
> 2. The warning line meets or exceeds the requirements in § 1926.502(f)(2);
> 3. No work or work-related activity is to take place in the area between the warning line and . . . the edge;
> 4. The employer effectively implements a work rule prohibiting the employees from going past the warning line.

[62] OSHA letter to Mr. O'Dea available at: *http://www.osha.gov/pls/oshaweb/owadisp.show_document?p_table=INTERPRETATIONS&p_id=24682.*

[63] OSHA letter to Mr. Harkins available at: *https://www.osha.gov/pls/oshaweb/owadisp.show_document?p_table=INTERPRETATIONS&p_id=24552.*

[64] OSHA letter to Mr. Cole available at: *https://www.osha.gov/pls/oshaweb/owadisp.show_document?p_table=INTERPRETATIONS&p_id=24802.*

In one respect, final paragraph (b)(13)(iii) differs from and provides more flexibility than the construction enforcement policy. When employers perform work that is both temporary and infrequent at least 15 feet from the roof edge, the final rule does not require them to provide any fall protection (using conventional fall protection or warning lines). OSHA believes this limited exception eases compliance for employers without compromising worker safety.

Comments in the record support an exception for work that is temporary and infrequent and performed at least 15 feet from the roof edge (Exs. 165; 207). For example, SMACNA said:

> [A] work procedure such as a simple filter change or belt adjustment to an HVAC system, especially if the unit is in the middle of a large roof does not warrant placement of a physical warning line (Ex. 165).

EEI noted, ''Some flat roofs in general industry settings could be the size of several football fields'' (Ex. 207). OSHA agrees that requiring employers to erect a warning line in that situation could take more time than simply performing a very brief task.

Many stakeholders supported the use of the use of designated areas ''where work is performed away from the immediate fall hazard, such as in the center of the rooftop'' (Ex. 180; *see also* Exs. 171; 207; 226). Verallia concurred, noting that less is needed to protect or warn workers the further the work area is from the roof edge (Ex. 171). EEI also said conventional fall protection was not necessary when workers are not near the roof edge, ''OSHA should not require protection from fall hazards on large flat roofs when the hazard can be controlled by keeping all workers a specified distance away from the roof edge'' (Ex. 207). AFSCME agreed, saying that air-handling systems and other equipment often are located in the middle of the roof (Ex. 226).

Other stakeholders, however, said OSHA should not require any fall protection, including a warning line, for any task performed ''a safe distance'' from the edge of a low-slope roof (Exs. 165; 207; 236; 254). For example, MCAA, whose member companies construct, install, and service mechanical systems (*e.g.,* HVAC systems), said:

> Most of the time, [HVAC] units are a safe distance from the edge of the roof and/or skylights, and can be accessed and serviced safely without the use of a ''designated area'' or other fall protection/prevention systems. Under this proposed rule . . . HVAC technicians would have to erect a temporary, designated area perimeter line to comply with the standard. MCAA believes that this requirement would create unintended hazards, which would be much more likely to cause injury or death to workers (Ex. 236).

MCAA's argument is not persuasive. MCAA did not provide any data or other information to support its claim that requiring employers to erect a warning would be more likely to cause injury or death than working without any protection. Moreover, MCAA recommended that OSHA make the final rule consistent with the low-slope roof provision in the construction standard. That provision requires employers to use designated area perimeter lines for all roofing work if the employer does not use conventional fall protection.

In conclusion, OSHA believes that the limitations on the use of designated areas in final paragraphs (b)(13)(i), (ii) and (iii), taken together, provide appropriate protection from fall hazards while affording employers greater control flexibility.

Slaughtering facility platforms. Final paragraph (b)(14) specifies new requirements OSHA added to the final rule addressing fall protection for work performed on the unprotected working side of platforms in slaughtering facilities. As mentioned in the discussion of final paragraph (b)(1)(ii) earlier in this preamble, the working side is the side of the platform where workers are in the process of performing a work operation.

Final paragraph (b)(14)(i) requires that employers protect workers from falling off the unprotected working side of slaughtering facility platforms that are four feet or more above a lower level. Employers must protect those workers by providing:

- A guardrail system (final paragraph (b)(14)(i)(A)); or
- A travel restraint system (final paragraph (b)(14)(i)(B)).

The proposed rule in § 1910.28 addressed slaughtering facility platforms, as well as the working sides of loading racks, loading docks, and teeming platforms, in paragraph (b)(1). Proposed paragraph (b)(1)(vi) required that employers provide guardrail systems on the working side of slaughtering house platforms unless they could demonstrate that providing guardrail systems was infeasible. If an employer could demonstrate infeasibility, workers could work on the working side of these platforms without guardrails or any other fall protection when: the work operation on the working side is in progress (see proposed paragraph (b)(1)(vi)(A)); the employer restricts access to the platform to authorized workers (proposed paragraph (b)(1)(vi)(B)); and the employer trained the authorized workers in accordance with proposed § 1910.30(b)(1)(vi)(C).

OSHA proposed the exception for the working sides of these platforms because information available to the Agency at the time indicated that there may be technological feasibility issues with using guardrail systems while workers are working on certain platforms. OSHA requested comment on this issue, including whether there are other feasible means to protect workers working on the unprotected side of platforms (see 75 FR 28889).

Commenters said employers often use travel restraint systems on the working side of slaughtering facility platforms, and, therefore, OSHA should not provide an exception. For example, Damon, Inc., said, ''I have worked with several packing houses that have successfully implemented restraint systems'' (Ex. 251). Likewise, the representative of the United Food and Commercial Workers Union (UFCW) commented:

> My gravest concern is with 1910.28(b)(vi), specifically OSHA's proposed exception to the requirement for guardrails or other fall protection on the working side of platforms in slaughtering facilities. This exception is inappropriate and not protective of the thousands of workers who would be affected. Work platforms in the meatpacking industry are becoming increasingly common and are built to greater heights. Many employers, including Cargill Meat Solutions in Dodge City, KS have successfully implemented travel restraint systems for use on these platforms. Just as there is no question about the feasibility of these systems, there should be no question about the compelling need for them. There is a compelling need in meatpacking plants. Falls from platforms in slaughtering facilities are especially dangerous because of the universal use of knives and other sharp instruments (Ex. 159).

These comments and other information in the record convince OSHA that using fall protection on the working side of slaughtering facility platforms is feasible. Therefore, to eliminate any confusion, OSHA decided to specify fall protection requirements for slaughtering facility platforms in a separate provision in the final rule.

Final paragraph (b)(14)(ii) specifies that when the employer can demonstrate it is infeasible to use guardrail or travel restraint systems, they can perform the work on slaughtering facility platforms without a guardrail or travel restraint system, provided:

- The work operation for which fall protection is infeasible is in process (final paragraph (b)(14)(ii)(A));
- The employer restricts access to the platform to authorized workers (final paragraph (b)(14)(ii)(B)); and

• The employer ensures authorized workers receive training in accordance with final § 1910.30 (final paragraph (b)(14)(ii)(C)).

The language in final paragraph (b)(14)(ii) is the same as the language in the exception for working sides of loading rack, loading dock, and teeming platforms (final paragraph (b)(1)(ii)).

Walking-working surfaces not otherwise addressed. Final paragraph (b)(15), like proposed paragraph (b)(13), applies to walking-working surfaces that other paragraphs in final § 1910.28(b) do not address specifically, such as ramps. Final paragraph (b)(15), like final paragraph (b)(1)), requires that employers must protect each worker on a walking-working surface not addressed elsewhere in final paragraph (b) or other subparts in 29 CFR part 1910 from falling four feet or more to a lower level using:

• Guardrail systems (final paragraph (b)(15)(i));

• Safety net systems (final paragraph (b)(15)(ii)); or

• Personal fall protection systems, such as personal fall arrest systems, travel restraint systems, and positioning systems (final paragraph (b)(15)(iii)).

Final paragraph (b)(15) does not retain the proposed fall protection measure of designated areas (proposed paragraph (b)(13)(ii)). However, final paragraph (b)(15) still gives employers the same level of control flexibility that proposed and final paragraph (b)(1)(i) provides for all unprotected sides and edges. The final rule also is consistent with the construction fall protection standard (§ 1926.501(b)(15)).

OSHA included this provision in the final rule to protect workers from all fall hazards in general industry regardless of whether final paragraph (b) in this section specifically mentions the particular walking-working surface or fall hazard. Therefore, this provision ensures that general industry employers will protect their workers from falling whenever and wherever a fall hazard is present in their workplaces. OSHA did not receive any comments on the proposed provisions and adopts it as discussed.

Paragraph (c)—Protection From Falling Objects

Final paragraph (c), like the proposed rule, requires that employers protect workers from being struck by falling objects, such as objects falling through holes or off the sides or edges of walking-working surfaces onto workers below. When workers are at risk of being struck by falling objects, the final rule requires that employers ensure that workers wear head protection meeting the requirements of 29 CFR part 1910, subpart I. In addition, final paragraph (c) requires that employers protect workers using one or more of the following:

• Erecting toeboards, screens, or guardrail systems to prevent objects from falling to a lower level (final paragraph (c)(1));

• Erecting canopy structures and keeping potential falling objects far enough from an edge, hole, or opening to prevent them from falling to a lower level (final paragraph (c)(2)); or

• Barricading the area into which objects could fall, prohibiting workers from entering the barricaded area, and keeping objects far enough from the edge or opening to prevent them from falling to the lower level (final paragraph (c)(3)).

Final paragraph (c) simplifies the rule by consolidating into a single paragraph all of the provisions that address falling objects in the existing standard (§ 1910.23(b)(5) and (c)(1)) and the proposed rule (paragraphs (b)(3)(iii), (b)(5)(i), (b)(14)(ii)). The final rule is consistent with the proposal and patterned on the construction standard (§ 1926.501(c)). OSHA did not receive any comments on the proposed protection from falling object requirements and adopts final paragraph (c) as discussed.

Section 1910.29—Fall Protection Systems and Falling Object Protection—Criteria and Practices

Final § 1910.29, like the proposed rule, establishes system criteria and work-practice requirements for fall protection systems and falling object protection specified by final § 1910.28, Duty to have fall protection systems and falling object protection,[65] and § 1910.140, Personal fall protection equipment.

As discussed earlier in this preamble, final §§ 1910.28, 1910.29, 1910.30, and 1910.140 establish new provisions that provide a comprehensive approach to fall and falling object protection in general industry. Final § 1910.28 specifies that employers must provide fall and falling object protection for workers exposed to fall and falling object hazards, and select a system that the final rule allows them to use in particular situations or operations.

[65] The final rule revised the title for § 1910.29 to state that it establishes criteria and practices for both fall protection systems and falling object protection. Although the proposed title only listed fall protection systems, it also included criteria and systems for protecting workers from falling objects. OSHA believes stakeholders understood the proposed rule covered both fall protection systems and falling object protection, the final rule makes it clear and explicit.

Final § 1910.29 requires that employers ensure the fall protection system and falling object protection they select meet the specified criteria and practice provisions. Finally, § 1910.30 requires that employers ensure workers exposed to fall and falling object hazards and who must use fall protection systems and falling object protection receive training on those hazards and how to use the required protection properly. OSHA notes that the final rule adds a requirement that employers provide training for personal fall protection systems to existing § 1910.132.

In general, OSHA patterned the system criteria and work practice requirements in final § 1910.29 to be consistent with its construction standards (§§ 1926.502 and 1926.1053). OSHA believes that making the general industry fall protection system and falling object protection criteria requirements consistent with the construction standards will make the final rule easier to understand than the existing general industry standard, and make compliance easier for employers who perform both general industry and construction activities. In many situations employers should be able to use the same fall protection systems and falling object protection for both activities, which helps to minimize compliance costs. As mentioned in the preamble to final § 1910.28, many commenters supported making the general industry fall and falling object protection requirements consistent with those in the construction industry.

Final § 1910.29, like the proposed rule, reorganizes the existing rule so that the format of the final rule is consistent with the format in the construction fall protection standard in § 1926.502. OSHA believes this reorganization will make the final rule easier to understand and follow because many employers already are familiar with and follow the construction requirements.

Final § 1910.29 also draws provisions from, and is consistent with, national consensus standards addressing personal fall protection systems and falling object protection, including:

• ANSI/ASC A14.3–2008, American National Standards for Ladders–Fixed (A14.3–2008) (Ex. 8);

• ANSI/ASSE A1264.1–2007, Safety Requirements for Workplace Walking/Working Surfaces and Their Access; Workplace, Floor, Wall and Roof Openings; Stairs and Guardrails Systems (A1264.1–2007) (Ex. 13); and

• ANSI/ASSE A10.18–2012, Safety Requirements for Temporary Roof and Floor Holes, Wall Openings, Stairways, and Other Unprotected Edges in

Construction and Demolition Operations (A10.18–2012) (Ex. 388); and

• National Fire Protection Association (NFPA) 101–2012, Life Safety Code (NFPA 101–2012) (Ex. 385).

Paragraph (a)—General Requirements

Final paragraph (a) establishes general requirements that are applicable to the fall protection systems and falling object protection covered by final 29 CFR part 1910.

In final paragraph (a)(1), OSHA specifies that employers ensure all fall protection systems and falling object protection that 29 CFR part 1910 requires meet the requirements in § 1910.29. Accordingly, the requirements of § 1910.29 apply to fall protection systems and falling object protection that other part 1910 standards require if those standards do not establish specific criteria and work practices. For example, final paragraph (a)(1) requires that ladder safety systems on fixed ladders used at sawmills (§ 1910.265)) must comply with requirements in § 1910.29(i) because § 1910.265 does not specify criteria that ladder safety systems must meet.

When employers elect to use a personal fall protection system, final paragraph (a)(1) specifies that employers must ensure those systems meet the applicable requirements in 29 CFR part 1910, subpart I, namely final §§ 1910.132, General requirements, and 1910.140, Personal fall protection equipment. Final § 1910.140 establishes personal fall protection system criteria and work practice requirements, while § 1910.132 establishes provisions that apply to all personal protective equipment (PPE), including personal fall protection systems. For example, § 1910.132(a) requires that employers provide, use, and maintain PPE, including personal fall protection systems, in a reliable condition, and § 1910.132(c) specifies that employers ensure that the design and construction of PPE is safe for the work the employee is performing. In addition, § 1910.132(d) requires that employers perform a hazard assessment and ''[s]elect PPE that properly fits each affected employee,'' while § 1910.132(h) requires, with a few exceptions, that employers must provide PPE, including personal fall protection systems, at no cost to the worker.

Final paragraph (a)(1) revises the proposed rule slightly by deleting the reference to ''body belts and body harnesses,'' because they are components of personal fall protection systems. OSHA did not receive any comments on proposed paragraph (a)(1) and adopts the provision with the change discussed.

Final paragraph (a)(2) specifies that employers must provide and install all fall protection systems and falling object protection required by final subpart D, and comply with all other applicable requirements of final subpart D, before any worker begins work that necessitates fall or falling object protection. Final paragraph (a)(2), requires that employers take a proactive approach to managing fall and falling object hazards by installing, for example, fall protection systems or components (*e.g.,* a vertical lifeline), so the systems are in place and available for use whenever there is potential worker exposure to fall hazards. OSHA believes that a proactive approach will encourage employers to anticipate and evaluate whether their workers may be on walking-working surfaces where a potential fall or falling object hazard exists and install systems (*e.g.,* guardrail systems, toeboards) or attachment (tie-off) points (*e.g.,* anchorages, tieback anchors) so that workers can use such protection readily when needed.

OSHA believes such proactive planning and action already are part of the standard operating procedures for many employers. OSHA also believes that such pre-planning will encourage and guide employers to use the most effective and protective measures to address fall and falling object hazards. OSHA did not receive any comments on proposed paragraph (a)(2) and adopts the provision with the clarification discussed above.

Paragraph (b)—Guardrail Systems

Final paragraph (b) contains system requirements employers must follow to ensure guardrail systems they use will protect workers from falling to lower levels. In developing final paragraph (b), OSHA carried forward, with some revision, many of the requirements from the existing rule (*e.g.,* existing § 1910.23), and also drew the requirements from the construction fall protection standard in § 1926.502(b).

The Agency believes that the revised guardrail requirements make the final rule easier to understand than the existing general industry rule, reflect current technology and work practices, and ensure consistency among guardrail requirements throughout general industry. For example, OSHA reorganized the final rule so the same guardrail system requirements (final paragraph (b)) apply uniformly to all walking-working surfaces, in turn making the requirement easier to understand than the existing general industry rule, which separately lists the guardrail requirements for floor holes, open-sided floors, platforms, runways, and stairways. In addition to the explanations below for each of the guardrail system requirements, OSHA notes that the preamble to § 1926.502 (59 FR 40733) also provides useful explanatory material for each of the guardrail system provisions in § 1926.502(b).

Final paragraph (b)(1) specifies requirements for the minimum and maximum height of guardrail systems. Final paragraph (b)(1) carries forward the existing requirement (existing § 1910.23(e)(1)) that employers must ensure the top edge of the top rails of guardrail systems is 42 inches above the walking-working surface, which is consistent with the proposal and the construction fall protection standard (§ 1926.502(b)(1)). The final rule allows the height of guardrails to deviate from the 42-inch required height by up to three inches, plus or minus, which also is consistent with the construction standard. Final paragraph (b)(1) clarifies in objective terms (''plus or minus 3 inches'') the language in the existing provision that the guardrail height may deviate from 42 inches by a ''nominal'' amount. OSHA believes that a deviation of no more than three inches from the 42-inch guardrail height constitutes a ''nominal'' deviation that will not compromise worker protection. The Agency believes that continuing this allowance provides flexibility for employers if they make changes to walking-working surfaces (*e.g.,* adding carpet, installing grating, and replacing flooring) that may slightly reduce the effective height of the guardrail (see 55 FR 13374).

Final paragraph (b)(1) also is consistent with A10.18–2012 (Section 4.1.2) and A1264.1–2007 (Section 5.4). A1264.1–2007 (Section 5.4) requires that guardrails have a minimum height of 42 inches, but does not specify a maximum height. A note to that standard explains that, generally, ''guardrails are 42 to 45 inches in height'' (Section E5.4).

Final paragraph (b)(1) also revises the existing rule (existing § 1910.23(e)(1)) to allow employers to erect guardrail systems that exceed the 45-inch height limit, provided the employer ensures that the higher guardrails comply with all other requirements in paragraph (b). The final rule is consistent with the requirement in the construction fall protection standard (§ 1926.502(b)(1)), which permits an increase in the top rail height ''when conditions warrant.'' OSHA believes that such conditions also exist in general industry, and that exceeding the 42-inch height requirement will not impact worker safety as long as employers comply with the other provisions of final paragraph (b). While the proposed rule allowed higher guardrail systems in these situations ''when conditions warrant,'' OSHA did not adopt that phrase in the final rule because the Agency concluded that no other conditions are necessary to ensure employee safety as long as the employer satisfies the other provisions of final paragraph (b). OSHA believes that adding this exception to the final rule will make compliance easier for employers who perform both general industry and construction activities. Neither the A10.18–2012 nor the A1264.1–2007 standards include this exception to the guardrail height limit. Ameren supported ''relaxing the 'maximum' '' height requirement for the reasons OSHA delineated (Ex. 189).

In the preamble to the proposed rule, OSHA said it was considering adding a provision that would allow employers to use barriers ''as the functional equivalent of guardrails'' (75 FR 28894). Such a provision would permit employers to use barriers as guardrails even if the height of the barriers is as low as 30 inches provided the total sum of the height and depth of the barrier is 48 inches. Using this formula, an employer could use a barrier with a height of 36 inches if the depth of the barrier were at least 12 inches. OSHA notes that the 1990 proposal, which the Agency did not adopt, included the provision as an alternative means of complying with the 42-inch guardrail height requirement (55 FR 13374). The preamble to the 1990 proposal explained that the National Bureau of Standards recommended a formula from its 1976 report, ''A Model Performance Standard for Guardrails.''

OSHA received one comment about the potential provision. Thomas Kramer, of LJB, Inc., supported incorporating the provision in the final rule, stating, ''This reference would allow a number of parapets associated with roof fall hazards to be used as a compliant physical barrier. It would have the added value of providing the building owner with a very low cost, if any cost at all, solution to protecting workers on a roof,'' and further commenting that ''[c]learly, this proposed revision is technologically feasible'' (Ex. 367).

For the following reasons, OSHA decided not to add a provision allowing the use of barriers as functional equivalents of guardrail systems. First, incorporating the provision would make the final rule inconsistent with the construction fall protection standard, which is contrary to a major goal of the rulemaking. Similarly, neither A10.18–2012 nor the A1264.1–2007 include the provision.

Second, the formula from the 1976 report ''A Model Performance Standard for Guardrails,'' which forms the basis for the potential provision, is almost 40 years old. The documents and codes the report references are even older. OSHA believes that industry practices over the last 40 years overwhelmingly complied with the 42-inch guardrail requirement in the existing rule as well as the construction fall protection and ANSI standards, eliminating the need for this alternative.

Finally, OSHA does not believe the provision will provide fall protection that is as effective as the final rule. The Agency believes there is a risk of workers falling over barriers that are one-half foot or more lower than the required 42-inch guardrail height. In particular, OSHA does not believe a barrier with a height of 36 inches provides adequate protection from falls even when the barrier depth is 12 inches. OSHA believes it would be too easy for workers to fall over barriers that are one-half foot lower than the required height, and that the 12-inch barrier depth would not provide adequate protection from going over the barrier. OSHA expressed much the same rationale when it decided not to propose a provision that would allow existing guardrails that are 36 inches in height. In the proposed rule OSHA said that it did not consider 36-inch high guardrails to be as safe as the required 42-inch high guardrails (75 FR 28894).

OSHA notes that the 1990 proposed rule would have allowed a 36-inch minimum height for existing guardrail systems instead of the required 42 inches (55 FR 13360 (4/10/1990)). In particular, the earlier proposal would have codified the 1981 OSHA directive classifying as a *de minimus* violation any existing guardrail having a height of 36 inches (STD 01–01–010). OSHA issued the directive because it recognized that employers likely erected guardrails under pre-OSHA building codes (55 FR 13373). As mentioned, however, OSHA did not propose allowing this alternative in the 2010 proposal because of safety concerns. In addition, due to those concerns, OSHA also announced that it was going to rescind the directive and previous interpretations treating 36-inch height guardrails as *de minimus* violations (see 75 FR 28894 n.2).

OSHA received several comments recommending that the Agency not rescind the directive and instead adopt a provision allowing employers to continue using existing guardrails that have a height of 36 inches. Mercer ORC questioned OSHA's statement in the proposal that guardrails 36 inches in height are not as ''equally safe'' as guardrails with a height of 42 inches (Ex. 254). However, they provided no evidence to support deviating from the height requirements in the construction fall protection standard and both A10.18–2012 and A1264.1–2007. Mercer ORC also said OSHA should estimate the costs associated with replacing the lower-height guardrails and the number of injuries prevented by having guardrails that are 39 inches in height (Ex. 254). Mercer ORC stated:

> Clearly, if people have been writing to OSHA to ask about guardrails that are less than the ''42 inches nominal'' in the existing rule, there are likely to be significant numbers of workplaces that have these non-standard guardrails in place. OSHA should either quantify the benefits and costs of this rule change or grandfather those guardrail installations that occurred prior to the effect date of the new rules (Ex. 254).

The New York City Department of Environmental Protection (NYCDEP) commented that requiring 42-inch guardrails would ''impact'' many NYCDEP facilities (Ex. 191). They said the 42-inch height requirement ''will not provide a benefit to our employees commensurate with the costs and will encumber funds that could be used for more efficacious health and safety initiatives.''

OSHA does not agree with Mercer ORC and NYCDEP that requiring guardrails to be 42 inches in height will impose significant costs to a substantial number of workplaces. They did not provide any evidence showing that a 36-inch guardrail height better effectuates the purposes of the OSH Act than the proposed 42-inch height. In fact, the requirement that employers ensure guardrails be 42 inches high (plus or minus 3 inches) has been in place since OSHA adopted the Walking-Working Surfaces standards in 1972 from then-existing national consensus standards (ANSI A12.1–1967, Section 7.1) (38 FR 24300 (9/6/1973)). Moreover, the guardrail height requirements in those consensus standards were adopted years before 1972. A1264.1–2007 and A10.18–2012 also require that guardrail heights be at least 42 inches.

OSHA points out the directive OSHA issued in 1981 allowing guardrails to have a minimum height of 36 inches instead of 42 inches only applied to guardrails existing at that time. OSHA believes that the vast majority of guardrails in use today are 42 inches (plus or minus 3 inches) in height. Therefore, OSHA does not believe that employers will experience significant difficulty bringing any remaining guardrails into compliance with this final standard. Accordingly, the final rule does not allow existing guardrails that are less than 39 inches in height. Moreover, OSHA hereby rescinds OSHA Directive STD 01–01–010 and all subsequent letters of interpretation allowing guardrails to have a minimum height of 36 inches.

Mr. M. Anderson raised a different point regarding the 42-inch guardrail height requirement, saying that the requirement will pose a problem for historic buildings, which often have low guardrails:

> This will present an infeasible-to-fix problem for historic sites. Many historic balustrades are less than the required 42 [inches]. In order to comply with this height requirement, balustrades will have to be replaced thereby changing the historic aesthetic of the building. This seems to go against the Historic Preservation Act (Ex. 139).

OSHA did not receive comments from any other stakeholders concerning historic buildings and historic preservation requirements. To the extent that any employer encounters such a problem, the employer may use one of the other means of fall protection authorized by § 1910.28 (*e.g.,* safety net systems or personal fall protection systems).

Final paragraph (b)(2), like the proposed rule, requires that employers install intermediate protective members, such as midrails, screens, mesh, intermediate vertical members, solid panels, or equivalent intermediate members between the walking-working surface and the top edge of the guardrail system when there is not a wall or parapet that is at least 21 inches (53 cm) high. Whatever intermediate protective member employers use, the final rule requires that employers install them as follows:

- Install midrails midway between the top edge of the guardrail system and the walking-working surface. Since the final rule requires that guardrail systems be 42 inches high (plus or minus three inches), employers must install midrails approximately 21 inches above the horizontal walking-working surface (final paragraph (b)(2)(i));
- Install screens, mesh, and solid panels from the walking-working surface to the top rail and along the entire opening between top rail supports (final paragraph (b)(2)(ii));
- Install intermediate vertical members, such as balusters, no more than 19 inches apart (final paragraph (b)(2)(iii)); and
- Install other equivalent intermediate members, such as additional midrails and architectural panels, so that openings are not more than 19 inches wide (final paragraph (b)(2)(iv)).

OSHA drew the requirements in final paragraph (b)(2) from the construction fall protection standard in § 1926.502(b)(2), which has almost identical requirements. The existing rule in § 1910.23(e)(1) and (e)(3)(v)(*c*) only address the installation of midrails. OSHA believes final paragraph (b)(2) provides more clarity and flexibility than the existing rule. Final paragraph (b)(2) includes examples of different types of intermediate members that employers may use, and identifies the placement/installation criteria for each type. In addition, the final rule does not require that employers install intermediate protective members when the guardrail system is on a wall or parapet that is at least 21 inches high, which is consistent with the construction fall protection standard. OSHA believes it is not necessary to install intermediate protective members where a wall or parapet reaches at least the same height as that required for a midrail.

OSHA received one comment on proposed paragraph (b)(2). Ellis Fall Safety Solutions (Ellis), recommended that guardrails made of wire cable use at least three wires so the space between cables does not exceed 19 inches (Ex. 155). OSHA does not believe it is necessary to add such language to the final rule. The requirements on ''intermediate members'' and ''other equivalent intermediate members'' include wire cables; thus, the final rule in paragraphs (b)(2)(iii) and (iv) already require that wire cable installed in a guardrail system leave no opening in the system that exceeds 19 inches.

OSHA added language to final paragraph (b)(2) to clarify that solid panels are an example of a protective intermediate member. This addition makes the final provision consistent with final paragraph (b)(5).

Final paragraphs (b)(3) and (4) are companion provisions that establish strength requirements for guardrail systems. Final paragraph (b)(3), like the proposed rule, requires that employers ensure guardrail systems are capable of withstanding, without failure, a force of at least 200 pounds applied in a downward or outward direction within two (2) inches of the top edge, at any point along the top rail. Final paragraph (b)(3) generally is consistent with the existing rule in §§ 1910.23(e)(3)(iv) and (e)(3)(v)(*b*). The final rule is almost identical to the construction fall protection standard in § 1926.502(b)(3), and consistent with A10.18–2012 (Section 4.1.4).

The term ''failure,'' as defined in final § 1910.21(b), means a load refusal (*i.e.,* the point at which the load exceeds the ultimate strength of a component or object), breakage, or separation of a component part. Conversely, ''without failure'' means a guardrail system must have adequate strength to withstand at least 200 pounds applied downward or outward within two inches of the top edge of top rail, without a load refusal, breakage, or separation of component parts. OSHA believes that if the guardrail system can withstand application of such force, even if the system has some minor deformation, it will be capable of preventing a worker from falling. OSHA believes minor deformation that does not affect the structural integrity or support capabilities of the guardrail system does not constitute failure as the final rule defines it.

OSHA also has removed the language in the existing standard that requires supporting posts to be spaced not more than 8 feet apart. OSHA believes the performance language of final paragraph (b)(3) is adequate, and also provides greater flexibility. In some cases an 8-foot distance between posts may not be adequate to meet the 200-pound strength requirement, while in other situations and with certain materials, the guardrail will maintain a 200-pound force with the supporting posts installed at distances greater than 8 feet apart. Employers must install supporting posts at whatever distance is necessary to meet the strength requirement of the final rule, without failure.

OSHA received two comments on proposed paragraph (b)(3). Peter Catlos recommended that the final rule, at a minimum, specify test methods or requirements for load concentrations and rates when applying the 200-pound test load (Ex. 203). Without specifying load concentrations and rates, or test methods, Mr. Catlos said the referenced 200-pound minimum load requirement ''is not definitive'' (Ex. 203).

Consistent with Section 6(b)(5) of the OSH Act, final paragraphs (b)(3) and (4) use a performance-based approach that establishes the strength objective employers must meet when testing a guardrail. The A10.18–2012 standard (Section 4.1.4) and the A1264.1–2007 standard (Section 5.6.1) follow a similar approach. As such, OSHA believes the strength requirement, which also is identical to the requirement in the construction fall protection standard, is protective, clear, and functional.

Final paragraph (b)(3) gives employers flexibility to use whatever test methods or manufacturer information they want so long as those methods and specifications meet the same strength requirement as the final rule. OSHA notes that A1264.1–2007 and American Society for Testing and Materials (ASTM) E985–00e1–2006 Standard Specification for Permanent Metal Railing Systems and Rails for Buildings, provide helpful guidance for meeting the 200-pound strength requirement.

The other commenter, Ellis, recommended that OSHA revise the 200-pound strength requirement to 276 pounds (*i.e.,* the 95th percentile for men) (Ex. 155). He said that, according to the National Health and Nutrition Examination Survey, the average weight of workers increased about 1½ to 2 pounds a year since the 1950s, adding, ''Heavier workers deserve to be protected and just because ANSI and OSHA have not updated their standards for effectively 40 years does not mean we should stay with out of date values'' (Ex. 155). OSHA does not believe the change Ellis proposes is necessary. The 200-pound strength requirement in A10.18–2012 (Section 4.1.4) and A1264.1–2007 (Section 5.6.1) is a minimum strength requirement.

Finally, Ellis said OSHA should prohibit using guardrail systems as anchorages for personal fall protection systems unless a registered structural engineer approves, marks, or labels the systems for such use. OSHA does not believe it is necessary to add Ellis' recommendation to the final rule because § 1910.140 requires that personal fall protection system anchorages be capable of supporting 5,000 pounds. However, final paragraph (b)(3) only requires that guardrail systems be capable of withstanding a force of at least 200 pounds, which means that guardrail systems are not capable of serving as anchorages unless they also meet the requirements anchorages in final rule § 1910.140. OSHA, received no other comments and is adopting in this final rule paragraph (b)(3) as discussed.

Final paragraph (b)(4), like the proposed rule, requires that employers ensure that when the 200-pound test load is applied in a downward direction, the top rail of the guardrail system does not deflect to a height of less than 39 inches above the walking-working surface. Deflection refers to the distance or degree a structure moves or displaces when a load is applied to the structure. To illustrate, employers must ensure that application of the required minimum test load to the top rail of a 42-inch guardrail system does not reduce its height by more than three inches. If the load or stress placed on a guardrail system, regardless of its height, reduces the height of the system to less than 39 inches, it is not likely to be tall enough to prevent workers from falling over the top rail. Therefore, final paragraph (b)(4) specifies that employers must ensure the height of their guardrail systems, deflected or not, is never less than 39 inches high.

Final paragraph (b)(4) is almost identical to the construction fall protection standard in § 1920.502(b)(4). The A10.18–2012 standard (Section 4.1.4) specifies that guardrails shall not deflect more than 3 inches in any direction. Since that standard does not allow any nominal deviation in the guardrail height, it means that standard limits the deflected height to not less than 39 inches high.

OSHA received comments from Mr. Catlos and Ellis on proposed paragraph (b)(4). Ellis opposed allowing the guardrail system to deflect as much as 3 inches, stating, ''[Three inches of] movement specified in 1926.502 is too great and 1.5 [inches] should be [the maximum] when over half the male worker [center of gravity] exceeds 39 [inches]'' (Ex. 155). OSHA believes that a guardrail system that has a height of at least 39 inches, as final paragraph (b)(4) requires (*i.e.,* ''42 inches, plus or minus 3 inches''), is adequate to protect a worker from falling over the top rail. OSHA drew final paragraph (b)(4) from the construction fall protection standard, and the Agency is not aware of any data indicating workers are falling over guardrail systems that have a height of at least 39 inches. OSHA also notes the final rule is consistent with A10.18–2012 (Section 4.1.4), indicating final paragraph (b)(4) has wide stakeholder acceptance.

Mr. Catlos raised concerns that the proposed language on deflection does not include a horizontal deflection allowance or limit (Ex. 203). He pointed out that proposed paragraph (b)(3) includes both vertical and horizontal load test requirements, and he said that, for consistency, final paragraph (b)(4) should include a horizontal load test and deflection allowance, in addition to the vertical allowance. OSHA disagrees with the commenter for the following reasons. First, the final rule focuses on ensuring that guardrail systems maintain a minimum height, so that if workers fall into or onto the guardrail they are protected from falling over the top rail.

Second, Mr. Catlos did not say what would constitute an appropriate horizontal load test deflection allowance and OSHA believes that allowing a horizontal deflection in addition to the vertical allowance, may result in failure of the guardrail system to protect workers from falling. For example it may break or permanently deform in a way that affects the structural integrity of the guardrail system. Such deformation may adversely affect the structural integrity or support capabilities of the system when workers lean on or fall into the top rail of a guardrail that is not perpendicular to the horizontal walking-working surface. In this regard, Mr. Catlos did not provide any data indicating that horizontal deflection of the guardrail system would not result in system failure. Additionally, OSHA is concerned that after repeated horizontal deflection, the guardrail could be reduced in height to below 39 inches, which is below the minimum height requirement that final paragraph (b)(1) requires.

Third, OSHA believes that allowing a horizontal deflection when vertical deflection already reduces the height of guardrail systems may put workers at risk of falling over the top rail. This is true especially when vertical deflection reduces the height of the top edge of a guardrail system to 39 inches. OSHA does not believe Mr. Catlos presented a compelling argument to support deviating from the construction fall protection standard § 1926.502(b)(4) by adding a horizontal deflection allowance to final paragraph (b)(4). Therefore, OSHA is adopting in this final rule paragraph (b)(4) as discussed.

Final paragraph (b)(5), like the proposal, requires that employers ensure midrails, screens, mesh, intermediate vertical members, solid panels, and other equivalent members, are capable of withstanding, without failure, a force of at least 150 pounds applied in any downward or outward direction at any point along the intermediate member.

The existing standard does not contain a strength requirement for midrails and this omission has resulted in confusion. OSHA drew the proposed requirement from the construction fall protection standard in § 1926.502(b)(5). In the preamble to that rule, OSHA explained that a strength test of 150 pounds was adequate for intermediate structures because they do not serve the same purpose as the top rails of guardrail systems (59 FR 40672, 40697 (8/9/1994)). Workers often place forces on top rails (*e.g.,* leaning over the top rail) that they do not place on intermediate members; if workers fall onto a guardrail, they most likely will strike the top rail, not the intermediate member. Therefore, OSHA believes that midrails and other intermediate members do not need deflection limits.

The A1264.1–2007 standard (Section 5.6.1) requires that intermediate members be capable of withstanding a slightly higher horizontal load limit (*i.e.,* 160 pounds) applied in a downward (*i.e.,* perpendicular) direction at the midpoint and mid-height. OSHA notes that A1264.1–2007 (Section 5.6.1) also includes a 3-inch horizontal deflection allowance. The A10.18–2012 standard does not include a load test for midrails and other intermediate members. Although the final rule only requires a 150-pound load test, OSHA believes, nonetheless, that the final rule is more protective than the A1264.1–2007 standard because it does not permit a 3-inch horizontal deflection allowance. OSHA did not receive any comments on the proposal and adopts it as discussed above.

Final paragraph (b)(6), like the proposed rule, requires that employers ensure guardrail systems are smooth-surfaced to protect workers from injury, such as punctures or lacerations, and to prevent catching or snagging of workers' clothing. The final rule is based on the existing requirement in § 1910.23(e)(1) and (e)(3)(v)(*a*), and A1264.1–2007 (Section 5.4). The final rule also is consistent with the construction fall protection standard in § 1926.502(b)(6), as well as A10.18–2012 (Section 4.1), which specifies that guardrails be free of ''sharp edges, splinters, or similar conditions.''

The Agency believes it is important that guardrail systems have smooth surfaces to prevent injuries. For example, workers can cut or puncture their hands or other parts of their bodies, when they grab or lean against guardrails that have protruding nails. Similarly, protruding nails can catch workers' clothing which can damage protective clothing or cause workers to trip or fall. OSHA did not receive any comments on the proposed rule and adopts it with the changes discussed above.

Final paragraph (b)(7), like the proposed rule, requires that employers ensure the ends of top rails and midrails do not overhang the terminal posts, except where the overhang does not pose a projection hazard for workers. Top and midrails that extend past the terminal post may cause a worker's clothing or tool belt to catch which could result in a fall. However, the final rule allows top rails and midrails to overhang the terminal posts provided they do not pose a projection hazard. For example, employers may shape top rails and midrails so snag hazards do not exist. The provision is almost identical to the existing rule in § 1910.23(e)(1) and the construction fall protection standard in § 1926.502(b)(7). The final rule is consistent with the A1264.1–2007 standard at Sections 5.4 and 5.6.3. OSHA did not receive any comments on the proposed provision and OSHA adopts the requirement as proposed.

Final paragraph (b)(8), like the proposed and construction fall protection standards(§ 1926.502(b)(8)), prohibits employers from using steel and plastic banding for top rails or midrails in guardrail systems. The preamble to the construction fall protection standard explained that although banding, particularly steel banding, often can withstand a 200-pound load, it also can tear easily if twisted (59 FR 40698). In addition, workers can cut their hands when they seize steel or plastic banding, especially in a fall, since banding often has sharp edges. OSHA notes that, like the construction fall protection standard, final paragraph (b)(8) does not prohibit the use of steel or synthetic rope on top rails and midrails because rope does not have sharp edges. OSHA reminds employers, as discussed in final paragraph (b)(15) and similar to the construction rule, that manila or synthetic rope used for top rails must be inspected as necessary to ensure the rope meets the strength requirements of this section. OSHA did not receive any comments on the proposed provision and adopts it as discussed above.

Final paragraph (b)(9), like the proposed rule, requires that employers ensure top rails and midrails of guardrail systems are at least one-quarter inch in diameter or thickness. The final rule applies to all top rails and midrails, regardless of the material employers use for those rails. The final rule uses both ''diameter'' and ''thickness'' because top rails and midrails may have different shapes (*e.g.,* cylindrical or rectangular).

OSHA based final paragraph (b)(9) on the construction fall protection standard (§ 1926.502(b)(9)). The final paragraph ensures that whatever material an employer uses for top rails or midrails, it is not so narrow that workers grabbing onto the top rail or midrail may cut their hands. Such injuries could occur if employers use narrow, high strength rope or wire for top rails or midrails. To eliminate the possibility of injury, employers must ensure that all top rails and midrails are at least one-quarter inch in diameter/thickness. OSHA did not receive any comments on the proposed provision and adopts it is discussed above.

Final paragraph (b)(10) requires that employers using guardrail systems at hoist areas place a removable guardrail section or, in the alternative, chains or a gate consisting of a top and midrail, across the access opening between guardrail sections when workers are not performing hoisting operations. This requirement ensures workers do not fall through an opening accidentally when materials are not being hoisted. It also gives employers flexibility in determining how to effectively guard access openings at hoist areas.

OSHA stresses that employers may use chains and gates as an alternative to removable guardrails, but only when the chains and gates provide a level of safety that is ''equivalent'' to the level of protection provided by removable guardrails. As defined in final § 1910.21(b), ''equivalent'' means that the alternative means ''will provide an equal or greater degree of safety.''

OSHA clarified final paragraph (b)(10) in response to comments stakeholders raised on several issues. First, in response to a comment from Mercer ORC (Ex. 254), the final rule clarifies that employers may use any of the following three alternatives to guard openings to hoist areas:

- Removable guardrail sections;
- Chains that provide protection at least at the top and midrail level; or
- A gate consisting of a top rail and midrail.

A typographical error (*i.e.,* missing comma) in the proposed rule made it appear that employers could only use a removable guardrail section or ''chain gate.'' However, OSHA believes that both chains and gates that include protection at the top rail and midrail levels provide protection at hoist areas that is equivalent to removable guardrail sections.

Second, on a related issue, Mercer ORC requested clarification about whether a ''chain gate'' must have one or two chains (Ex. 254). Final paragraph (b)(10) clarifies that any alternative the employer uses to guard the access area when workers are not performing hoisting operations must have a top rail and a midrail to provide workers with protection that is equivalent to a guardrail system. OSHA does not believe that a single bar or chain provides protection that is equivalent to a guardrail system. This clarification is consistent with OSHA's 1990 proposed rule and letters of interpretation on the use of gates and chains to protect workers from falling through access openings in hoist areas when they are not performing hoisting operations (*e.g.,* Letter to Mr. Stephen Hazelton (5/23/2005 [66]); letter to Mr. Erich Bredl (1/15/

[66] OSHA letter to Mr. Stephen Hazelton available at: *https://www.osha.gov/pls/oshaweb/*

Continued

1993)[67]). In the letter to Mr. Bredl, OSHA said ''employee protection at access openings [must] be equivalent to that of the guardrail system.''

Finally, Ellis opposed the use of chains to guard access openings at hoist areas (Ex. 155). He said chains ''cannot meet the sag requirements of the standard and an overbalance hazard can occur'' (Ex. 155). OSHA does not agree with Ellis' recommendation, noting that neither the proposed nor final rules establish a sag requirement for chains used at hoisting areas. In addition, OSHA notes that Ellis does not explain or provide any information about what constitutes an ''overbalance'' hazard. Nevertheless, OSHA clarified the language in final paragraph (b)(10) to indicate that chains and gates are alternatives that employers may use instead of removable guardrail sections when they provide a level of safety equivalent to guardrails. However, if chains sag so low that they do not meet the minimum guardrail height requirements (see final paragraph (b)(1)), or are not as effective as a removable guardrail section in preventing workers from falling through access openings, employers would have to use removable guardrail sections or a gate instead.

The final rule is almost identical to the proposed rule and construction fall protection standard in § 1926.502(b)(10), and OSHA adopts it with the clarifications discussed above.

Final paragraphs (b)(11) through (13) establish criteria for the use of guardrail systems to protect employees working near holes. Final paragraph (b)(11) requires that employers ensure that when guardrail systems are used around holes, they are installed on all unprotected sides or edges of the hole. As discussed earlier in this preamble, final § 1910.21(b) defines ''hole'' as ''a gap or open space in a floor, roof, horizontal walking-working surface, or similar surface that is at least 2 inches (5 cm) in its least dimension.''

The final rule consolidates into one provision the various requirements in the existing rule that pertain to criteria for protecting workers from falling through holes. Final paragraph (b)(11) is almost identical to the proposed rule, and OSHA's construction fall protection industry standard in § 1926.502(b)(11). OSHA did not receive any comments on the proposed provision and finalizes it as discussed.

Final paragraph (b)(12), like the proposed rule and construction fall protection standard (§ 1926.502(b)(12)), establishes requirements for guardrail systems erected around holes through which materials may be passed. The final rule requires:

- When workers are passing materials through a hole, employers must ensure that not more than two sides of the guardrail system are removed (final § 1910.29(b)(12)(i)); and
- When workers are not passing materials through the hole, employers must ensure a guardrail system is installed on all unprotected sides and edges, or close the hole with a cover (final § 1910.29(b)(12)(ii)).

The final rule reorganizes and revises the proposed provision to make it easier to understand and follow. Final paragraph (b)(12) also updates the existing rule in § 1910.23(a)(7), which does not contain a provision addressing guarding holes when workers pass materials through the holes. The final rule generally is consistent with A1264.1–2007 (Section 3.5) and A10.18–2012 (Section 7.1). OSHA notes the A1264.1 standard allows employers to use an attendant if a hole is uncovered and guardrails are removed. However, OSHA believes that requiring guardrails on all sides of the hole is more protective than using an attendant.

The final rule allows employers to remove guardrail sections on no more than two sides of a hole when materials are being passed through the hole (paragraph (b)(12)(i)). In other words, the final rule does not allow the other guardrail sections to be removed during the time materials are moving through the hole to protect other workers who may be in the area. Final paragraph (b)(12)(ii) also protects workers by requiring guardrails on all unprotected sides of the hole or covering it when workers are not passing materials through the hole. OSHA did not receive any comments on the proposed provision and finalizes it as discussed.

Final paragraph (b)(13), similar to the proposed rule and construction fall protection standard (§ 1926.502(b)(13)), requires that employers using guardrail systems around holes that are points of access, such as ladderway openings, protect workers from walking or falling into the hole by installing gates at the opening in the guardrail system (final paragraph (b)(13)(i)), or offsetting the opening from the hole so workers cannot walk or fall into the hole (final paragraph (b)(13)(ii)). The final rule also revises the proposed criteria for such gates by specifying that they:

- Must be self-closing;
- Must either slide or swing away from the hole; and
- Be equipped with top rails and midrails or equivalent intermediate members that meet the requirements in final paragraph (b) (final paragraph (b)(13)(i)).

The final provision is consistent with A1264.1–2007 (Section 3.2 and E3.2). The ANSI/ASSE standard requires that ladderway floor openings be guarded to prevent workers from falling into the hole and explicitly notes self-closing gates that swing away from the ladderway hole and offsets are two methods of guarding those openings.

OSHA revised the proposed criteria for guardrail opening gates for two reasons. First, the revisions make final paragraph (b)(13) consistent with final § 1910.28. As discussed, final § 1910.28(b)(3)(iv) replaced ''swinging gate'' with ''self-closing gate'' to give employers flexibility to use sliding gates at guardrail access openings. OSHA believes sliding gates that are self-closing are as effective as swinging gates that self-close and are readily available and in use today.

Second, the revisions in the final rule respond to stakeholder questions and recommendations urging OSHA to identify more clearly the criteria for access opening gates must meet (Exs. 68; 254; 366). For example, Eric Bredl, with Intrepid Industries Inc., a safety gate manufacturer, said the final rule needs to clarify and define ''safety gate (swinging gate)'' used at openings in guardrail systems used around points of access holes (*e.g.,* ladderways):

> There have been many interpretations as to what constitutes a safety gate. It is not well defined, nor has it been well defined for several years (Ex. 68).

Mr. Bredl also requested that OSHA clarify whether gates used at guardrail openings must be equipped with midrails:

> [T]he OSHA wording of this proposal does not clarify that the space to be protected must conform to the guardrail. Does OSHA want to allow a single member (chain or single bar) or two bars that are less than 19'' apart as adequate protection for ladderway openings? (Ex. 366).

Similarly, Mercer ORC said OSHA needs to define the ''specific type of gate'' it intends to require for gates used for guardrail openings near points of access holes, and answer the following questions about midrails:

> Must a ''swinging gate'' have both a top rail and midrail, like a standard railing? Or is a gate with only a top rail adequate to prevent an employee from walking ''directly into the hole''? The existing rule is silent on the issue, but OSHA implied in the 1990 proposal and,

owadisp.show_document?p_table=INTERPRETATIONS&p_id=25100.

[67] OSHA letter to Mr. Erich Bredl available at: *https://www.osha.gov/pls/oshaweb/owadisp.show_document?p_table=INTERPRETATIONS&p_id=20991.*

in subsequent discussions and letters of interpretation, has stated that a two-rail configuration is required (Ex. 254).

Mercer ORC opposed requiring that guardrail opening gates be equipped with midrails, saying that several companies and a safety gate manufacturer indicated that OSHA's ''interpretation has not been accepted by a large number of employers'' (Ex. 254).

Although Mr. Bredl acknowledged that when OSHA first issued the 1990 proposed rule, which would have required that guardrail opening gates comply with guardrail requirements (*i.e.,* have tops rails and midrails), ''this was 'foreign' to industry'' (Ex. 366). However, he added that ''[s]ince then, a majority of protection devices have both a top rail and a midrail similar to that of the guardrail'' (Ex. 366).

The purpose of guardrail opening gates used around holes that serve as points of access (*e.g.,* ladderways) is, when open, to provide a means of access to holes, and, when closed, to provide guardrail protection that meets of the guardrail criteria in final paragraph (b). Accordingly, final paragraph (b) requires, among other things, that guardrails have both top rails and midrails or equivalent intermediate members, such as screens, solid panels, or intermediate vertical members, to ensure that closed access gates provide adequate guardrail protection.

OSHA believes that employers should not experience difficulty complying with the final rule. If an existing gate does not have a midrail or equivalent intermediate member, OSHA believes it is feasible for employers to add one. Therefore, OSHA adopts final paragraph (b)(13) with the revisions and clarification discussed above.

Final paragraph (b)(14), which is almost identical to the proposal, and the construction fall protection standard in § 1926.502(b)(14), requires that employers ensure guardrail systems on ramps and runways are installed along each unprotected side or edge. The existing rule in § 1910.23(c)(2) and A1264.1–2007 (Section 5.2) contain similar requirements for runways, but do not specifically address guarding ramps. OSHA believes it is appropriate to apply this provision to ramps as well as runways because both walking-working surfaces can have open sides. In addition, like runways, ramps can have open sides that are four feet or more above a lower level, which presents a fall hazard to workers. OSHA did not receive any comments on the proposal and adopts it as discussed above.

Final paragraph (b)(15), similar to the proposed rule, requires that employers ensure manila and synthetic rope[68] used for top rails or midrails of guardrail systems are inspected as frequently as necessary to ensure that the rope continues to meet the strength requirements in final paragraphs (b)(3) (top rails) and (b)(5) (midrails) of this section. OSHA believes inspecting manila and synthetic rope is important to ensure that it remains in serviceable condition, and that workers are not at risk of harm due to damage or deterioration. OSHA drew this requirement from the Agency's construction fall protection standard in § 1926.502(b)(15). The existing rule does not include a similar provision.

OSHA received two comments on the proposed provision. The National Institute for Occupational Safety and Health (NIOSH) recommended that OSHA incorporate in final paragraph (b)(15) the strength requirements for midrails (final paragraph (b)(5)) in addition to the strength requirements for top rails (final paragraph (b)(3)) (Ex. 164). OSHA agrees and incorporates the midrail strength requirements in final paragraph (b)(15).

Peter Catlos opposed allowing employers to use manila, plastic, or synthetic rope for top rails and midrails. He pointed out, ''Based on the mechanical characteristics of these materials, such as high elongation and high elastic recovery, guardrails could be constructed that meet the requirements of the § 1910.29(b) as written, yet offer no practical restraint whatsoever, thereby creating an unsafe condition'' (Ex. 203). OSHA believes that requiring employers to inspect ropes ''as necessary'' helps to ensure that the top rails and midrails made of such rope will continue to comply with the strength requirements in final § 1910.29(b)(3) and (5).

Final paragraph (b) includes an informational note that OSHA proposed as paragraph (b)(16). The note reminds employers that criteria and practice requirements for guardrail systems on scaffolds used in general industry are in the construction scaffold standards (29 CFR part 1926, subpart L, Scaffolds). This provision is a companion to final § 1910.28(b)(12)(i), which requires that employers protect employees working on scaffolds in accordance with the construction scaffold standards. These companion provisions ensure that employers who use scaffolds to perform both general industry and construction activities will have one consistent set of requirements to follow. OSHA believes this approach will increase understanding of, and promote compliance with, the final rule, a conclusion Ameren supported because it would promote consistent application for employers who use scaffolds to perform both general industry and construction activities (Ex. 189). OSHA did not receive any comments opposing the proposed provision and adopts the note as discussed.

Ellis recommended OSHA include additional guardrail criteria in the final rule (Ex. 155). He recommended prohibiting guardrails from being used as personal fall protection anchorages unless approved and marked by a registered structural engineer, and that horizontal rails in wood guardrails be attached on the inside of the posts so the nails are not pushed out in a fall.

With regard to using guardrails as personal fall protection anchorages, final § 1910.140 requires that anchorages be capable of supporting 5,000 pounds. Therefore, unless the guardrail is designed to meet all the requirements for anchorages in final § 1910.140, they already are prohibited from such use.

Although OSHA agrees with Ellis on the placement of wood rails, the Agency does not believe it is necessary to regulate guardrail systems to this detail. Employers are responsible for ensuring that guardrail systems are erected to meet the strength requirements specified in the final rule.

Paragraph (c)—Safety Net Systems

Final paragraph (c), like the proposed rule, requires that general industry employers ensure all safety net systems they use meet the criteria and practice requirements in 29 CFR part 1926, subpart M, Fall protection. Neither the existing subpart D nor other provisions in 29 CFR part 1910 address safety net systems.

Final § 1910.28 allows employers to use safety net systems to protect workers on several types of elevated walking-working surfaces, including unprotected sides and edges, wall openings, and low-slope roofs. To ensure that the requirements for safety net systems used in general industry are consistent with, and are as protective as, the construction requirements, OSHA requires employers working in general industry to follow the construction criteria and practice requirements for safety net systems. Incorporating by reference the construction safety net system requirements also eliminates unnecessary repetition of the construction requirements.

[68] Synthetic rope includes plastic rope, therefore, OSHA does not carry forward in the final rule the term ''plastic.''

OSHA received two comments on this requirement, both of which supported making the general industry requirements for safety net system criteria and practices as protective as those in the construction fall protection standard in § 1926.502(c) (Exs. 155; 226). The American Federation of State, County and Municipal Employees (AFSCME) said the requirements for safety net systems used in general industry should be ''no less'' protective than the provisions in the construction standard (Ex. 226). In the same comment, AFSCME raised an issue about the difference in testing requirements for safety net systems and personal fall arrest systems and anchorages, saying the 400-pound drop-test requirement for safety net systems is ''stricter'' than the requirement for personal fall arrest systems and anchorages (Ex. 226). OSHA notes the 400-pound drop-test requirement is consistent with the construction fall protection standard in § 1926.502(c)(4)(i).

OSHA agrees with the commenters that the safety net system requirements in the final rule should be as protective as the requirements in the construction fall protection standard. In addition, OSHA believes that making the general industry and construction requirements consistent will make the rule easier to understand and follow for those employers who perform both general industry and construction operations.

In the proposal, OSHA also requested comment about whether the final rule should require that employers meet the requirements for safety net systems in the construction fall protection standard or list the specific construction safety net system requirements in the final rule (75 FR 28895). Ellis supported incorporating the construction standard by reference (Ex. 155). AFSCME, however, recommended that OSHA include the specific safety net system criteria and practice requirements in final § 1910.29(c), stating, ''Referencing the construction standard, CFR § 1926.502(c), may not be helpful to employers who normally do not use the construction standards; therefore information on the requirements and testing of the safety net systems should be covered in the General Industry Standard'' (Ex. 226).

After reviewing the record, OSHA decided to incorporate by reference into this final rule the safety net system requirements in the construction fall protection standard. OSHA notes that the final rule also incorporates by reference the construction scaffold requirements. OSHA does not agree with AFSCME that general industry employers who do not use construction standards will have a difficult time obtaining them. OSHA's construction standards are readily available online at *www.osha.gov*, along with other guidance materials, which will facilitate obtaining, and complying with, the construction safety net provisions. In addition, OSHA believes that having a single set of safety net system requirements to follow should make compliance easier for employers who perform both general industry and construction activities.

Ellis raised another issue about safety nets. He recommended that the final rule allow the use of ''platform nets'' in general industry, provided those nets also complied with the requirements in the construction standard in § 1926.502(c). He observed, ''[Platform nets] are not only for catching falling workers they are also for working from if the mesh or fabric is tight enough to prevent the foot from going through. These nets . . . are finding considerable use around the world for construction and maintenance work and provide both access and a walking-working surface'' (Ex. 155).

The final rule does not prohibit the use of platform nets. However, if employers also use platform nets for fall protection, the nets must meet the criteria and practice requirements in the construction fall protection standard.

Paragraph (d)—Designated Areas

Final paragraph (d), like the proposed rule, establishes criteria and practices for ''designated areas,'' which the final rule in § 1910.21(b) defines as ''a distinct portion of a walking-working surface delineated by a warning line in which employees may perform work without additional fall protection.'' Designated areas are non-conventional controls for addressing fall hazards.

As mentioned earlier in this preamble, final § 1910.28(b)(13) limits the use of designated areas to one situation: Work on low-slope roofs. The final rule in § 1910.21(b) defines ''low-slope roof'' as ''a roof that has a slope less than or equal to a ratio of 4 in 12 (vertical to horizontal).'' Final § 1910.28(b)(13) limits the use of designated areas to work on low-slope roofs performed at least six (6) feet from the roof edge and requires that employers use conventional controls (*e.g.,* guardrail systems, safety net systems, personal fall arrest systems) if workers are less than six (6) feet from the roof edge. In the area that is 6 feet to less than 15 feet from the edge, employers may use designated areas when their employees perform work that is both temporary and infrequent. Where employers perform work that is 15 feet or more from the edge, they also can use a designated area for any work (*i.e.,* without regard to frequency or duration of the work). In addition, the final rule does not require that employers provide any fall protection or use a designated area when employees perform work that is both temporary and infrequent and the work is 15 feet or more from the roof edge.

Proposed § 1910.28(b)(1), (7), and (13) allowed general industry employers to use designated areas in additional situations: On unprotected sides and edges of walking-working surfaces, at wall openings, and on walking-working surfaces the final rule does not specifically address. However, as discussed in the preamble to § 1910.28, OSHA believes that employers must use designated areas, like warning line systems in the construction fall protection standard, only in ''a few, very specific situations'' (see, *e.g.,* letter to Mr. Keith Harkins (11/15/2002)[69]). Allowing the use of designated areas only on low-slope roofs makes the final rule consistent with limited use specified by the construction standard for non-conventional controls. (See further the discussion of designated areas in the preamble to final § 1910.28(b).)

Final paragraph (d)(1) establishes general criteria and practice requirements for the use of designated areas on low-slope roofs. Final paragraph (d)(1) revises the proposed requirements by deleting, as unnecessary, the language in proposed paragraph (d)(1)(iii) requiring employers use designated areas only on ''surfaces that have a slope from horizontal of 10 degree or less,'' since that is now contained in the definition of a low-slope roof.

Final paragraph (d)(1)(i), like the proposed rule, requires that employers ensure workers remain within the designated area during work operations. Going outside of the designated area will increase the risk of a worker falling off the roof edge. If workers must go outside the designated area, they must be protected by conventional fall protection systems. OSHA did not receive any comments on the proposed requirement and finalizes it as discussed.

Final paragraph (d)(1)(ii), similar to the proposed rule, requires that employers delineate the perimeter of designated areas with a warning line.

[69] Letter to Mr. Keith Harkins available on OSHA's Web site at: *https://www.osha.gov/pls/oshaweb/owadisp.show_document?p_table=INTERPRETATIONS&p_id=24552.*

The final rule in § 1910.21(b) defines ''warning line'' as ''a barrier erected to warn employees that they are approaching an unprotected side or edge, and which designates an area in which work may take place without the use of other means of fall protection.''

Final paragraph (d)(1)(ii) also specifies warning lines may consist of ropes, wires, tape, or chains that employers ensure meet the requirements of final paragraphs (d)(2) and (3). Final paragraphs (d)(2) and (3) contain specific requirements for warning lines, for example, they must be installed so the lowest point of the line, including sag, is not less than 34 inches (86 cm) and not more than 39 inches (99 cm) above the walking-working surface (final paragraph (d)(2)(i)).

The final rule generally is consistent with the requirements for warning line systems in the construction fall protection standard in § 1926.502(f)(1).

Northrop Grumman Shipbuilding (NGS) recommended that OSHA give employers more flexibility to demarcate designated areas by using materials other than ropes, wires, tape, chains, and supporting devices, stating:

> [W]e recommend that a contrasting color marking on the floor or roof surface be another acceptable means of delineating the designated area. Note that this is similar to the options provided in proposed 1910.28(b)(8) for pits. Colored markings are the best means to permanently mark pathways and work areas for maintenance of rooftop equipment, thus eliminating the hazards associated with getting stanchions and rope or chain to the job site. Stanchions typically cannot be permanently attached to rooftops because they will damage the roof surface and they cannot be left in place because they pose a projectile hazard in the event of high winds (Ex. 180).

OSHA agrees that using warning line materials made of contrasting colors, such as brightly-colored ropes or tape makes the line ''clearly visible,'' which final paragraph (d)(2)(iv) requires. However, OSHA believes that painting the surface of the roof instead of attaching warning line materials to supporting devices does not provide a clearly visible perimeter throughout the designated area as required by final paragraph (d)(2)(iv). To be clearly visible, OSHA believes materials used to demarcate a designated area need to be high enough above the walking-working surface to be visible from a distance at least 25 feet away, as well as anywhere within the designated area, and not obscured by materials, tools, and equipment that may be in the designated area.

NGS also pointed out that the proposed rule would allow employers to apply floor markings, instead of erecting warning lines, to demarcate vehicle repair, services, and assembly pits (see proposed and final § 1910.28(b)(8)(ii)). OSHA does not consider the working conditions on low-slope roofs to be similar enough to the working conditions at vehicle repair, service, and assembly pits to permit the use of floor markings. OSHA allows employers to apply floor markings to delineate vehicle repair, service, and assembly pits that are less than 10 feet deep because the pits often are so close together that using warning lines would impede movement of vehicles and equipment around and over the pits, which is not true for work on low-slope roofs.

Final paragraph (d)(2) establishes criteria and practice requirements for warning lines. As part of these requirements, final paragraph (d)(2)(i) specifies that employers ensure warning lines have a minimum breaking strength of 200 pounds. The proposed rule in paragraph (d)(2)(ii) would have required that employers ensure the warning line has a 500-pound minimum breaking or tensile strength and, after being attached to the stanchions, is capable of supporting the loads applied to the stanchions as prescribed in proposed paragraph (d)(2)(i). Proposed paragraph (d)(2)(i) also would have required that stanchions be capable of resisting, without tipping over, a force of at least 16 pounds applied horizontally against the stanchion. The force would have been required to be applied 30 inches above the work surface. OSHA drew the proposed requirement from the construction warning line system requirements for roof work performed on low-slope roofs (see § 1926.502(f)(2)(iv)). OSHA explained in the proposal that the requirement would ensure the warning line is ''durable and capable of functioning as intended, regardless of how far apart the stanchions are placed'' (75 FR 28896). In addition, OSHA said the proposed strength requirement would ensure that employers use substantial materials for warning lines, such as chains, ropes, or heavy cord. OSHA also requested comment on the appropriateness of requiring warning lines to have a tensile strength of 500 pounds (similar to construction warning line system requirements), which ''assures the line is made of material more substantial than string'' (75 FR 28896).

Several stakeholders indicated carrying stanchions that meet the proposed strength requirement would be infeasible or create a greater hazard for workers (Exs. 165; 171; 296). For example, the National Chimney Sweep Guild (NCSG) said, ''The technician would be exposed to a greater fall hazard while transporting numerous stanchions weighing over 50 pounds to the roof.'' Later, NCSG stated, ''Stanchions would not meet the specified stability criterion unless they were either weighted to the point where they create an unacceptable fall hazard or attached to the roof'' (Ex. 296). The Sheet Metal and Air Conditioning Contractors' National Association (SMACNA) agreed, stating, ''The placement of a designated area by the construction of a barrier system (rope, wire or chain supported by stanchions meeting specific design criteria) would create more safety hazards due to the transporting of barrier materials up to the roof'' (Ex. 165). Verallia recommended that OSHA also reconsider the companion requirement in proposed paragraph (d)(2)(i) addressing the stability of stanchions, noting:

> With respect to the specified size of the stanchions, 16 pounds resistance may be insufficient in some cases, while . . . completely unnecessary in others. The further the area is from the unprotected edge, the less is required to adequately protect (or warn) the affected employees.
>
> The size and form of stanchions (or comparable barriers) should be left to the discretion of the employer, as long as they are effective in putting the employee on notice that a fall hazard may exist. . . . Moreover, there is an additional concern that the use and handling of 16-pound resistant stanchions could itself present an independent hazard and/or cause damage to roofs or working surfaces (Ex. 171).

After analyzing the entire rulemaking record on designated areas, OSHA has determined that the proposed 500-pound breaking strength requirement is not necessary to warn workers they are approaching a fall hazard on a low-slope roof. Therefore, in the final rule OSHA replaces the proposed requirement with a 200-pound minimum breaking strength requirement, which is consistent with the requirement for control lines in controlled access zones in the construction fall protection standard in § 1926.502(g)(3)(iii). OSHA believes that the strength requirement in the final rule, combined with the other requirements in final paragraph (d)(2), will ensure that the delineation of designated areas is sturdy and provides adequate warning to workers.

In addition, in response to these commenters, the final rule also deletes the stanchion stability requirement specified by proposed paragraph (d)(2)(i), which would have required that employers ensure stanchions are ''capable of resisting, without tipping over, a force of at least 16 pounds (71

N) applied horizontally against the stanchion,'' The Agency drew proposed paragraph (d)(2)(i) from the construction warning line system requirements in § 1926.502(f)(2)(iii). OSHA believes this deletion will give employers greater flexibility in selecting supporting devices to delineate designated areas. OSHA will consider employers who erect designated area warning lines that meet the requirements of proposed paragraphs (d)(2)(i) and (d)(2)(ii) (*i.e.,* using stanchions that meet the 16-pound force resistance) to be in compliance with the final rule; however, OSHA notes the final rule does not require that stanchions meet those requirements.

Final paragraph (d)(2)(ii), like proposed paragraph (d)(2)(iv), requires that employers install warning lines so the lowest point, including any sag, is not less than 34 inches or more than 39 inches above the walking-working surface. The final rule is consistent with the warning line system requirement in the construction fall protection standard in § 1926.502(f)(2)(ii).

NGS recommended that the final rule permit employers to use contrasting color marking on the floor or roof instead of erecting warning lines at 34 to 39 inches above the walking-working surface (Ex. 180). As discussed above, the final rule does not include NGS' recommendation. OSHA believes the warning line height specified in the final rule is necessary to adequately warn workers that they are approaching the boundary of a designated area. At a height of between 34 to 39 inches, warning lines will be more visible than if employers paint them on the surface of the roof. Moreover, at the height the final rule requires, warning lines will be visible even if equipment, tools, or objects are near the warning line.

OSHA also rejects NGS's recommendation because painting warning lines on surfaces makes them permanent, thus suggesting that employers may use designated areas for any operation regularly or routinely performed on a low-slope roof, rather than performing work in these areas that is both temporary and infrequent. As discussed earlier in this preamble, employers must provide conventional fall protection for routine, regular, or frequent work performed within 15 feet of the edge of low-slope roofs.

Final paragraph (d)(2)(iii) requires that employers ensure warning lines are supported in such a manner that pulling on one section of the line will not result in slack being taken up in any adjacent sections causing the line to fall below the limit of 34 inches at any point, as specified in (d)(2)(ii). Proposed paragraph (d)(2)(iii) and the construction fall protection standard in § 1926.502(f)(2)(v) require that taking up slack in adjacent sections of a warning line must not cause the supporting devices to tip over. The final rule revises the proposed provision for two reasons. First, the revised language ensures that the warning line will be visible at all times because it will remain at the height specified in final paragraph (d)(2)(ii). Second, the revisions ensure employers remain in compliance with final paragraph (d)(2)(ii). OSHA did not receive any comments on the proposal and adopts the requirement with the revisions discussed above.

Final paragraph (d)(2)(iv) requires that employers ensure warning lines are clearly visible from a distance of 25 feet away and anywhere within the designated area. The final rule clarifies proposed paragraph (d)(2)(v) by recasting the provision in plain language that is easier to understand than the proposed paragraph.

The proposed rule would have required that employers ensure the warning line is clearly visible from any unobstructed location within the designated area up to 25 feet away, or at the maximum distance a worker may be positioned away from the warning line, whichever is less. The final rule states more clearly than the proposed provision that employers must erect warning lines that are clearly visible within the designated area, regardless of where the employee is working in that area. That is, the warning line must be clearly visible when the worker is approaching the line. Whether the designated area is large or small, the final rule also requires that the warning line be visible at least 25 feet away. For large designated areas, requiring that warnings lines be visible at least 25 feet away ensures that workers have adequate warning when approaching fall hazards. Such warning is particularly necessary when workers use mobile mechanical equipment that can cover distances quickly. If workers cannot clearly see warning lines until the mobile equipment they are operating is near the boundary of the designated area, they may not be able to stop in time to prevent going past the boundary or over the edge of the roof. For designated areas that are small and close to the roof edge (*e.g.,* 6 feet from the edge), the 25-foot minimum visibility range adequately prepares workers for approaching the hazard zone.

As the proposal noted, there is a possibility that a portion of the warning line could be obstructed. This remains true in the final rule. As long as the boundaries of the designated area are clearly visible within 25 feet and anywhere within the area, obstructions of some portion of the line are permissible.

The construction fall protection standard in § 1926.502(f)(2)(i) and (g)(3)(i) requires employers to flag warning lines with high-visibility material at least every 6 feet to ensure that the lines are visible. OSHA believes there is a greater need for visibility aids in construction operations because the work may be at leading edges or other areas close to the roof edge. Also, construction work is more likely than work in general industry to shift from one part of the roof to another because construction work often involves performing tasks that are not temporary and infrequent. Therefore, OSHA believes that it is appropriate to give general industry employers greater flexibility to select the measures they believe will make the warning line ''clearly visible.'' Accordingly, employers are free to comply with the final rule by flagging warning lines.

Final paragraph (d)(2)(v), like proposed paragraph (d)(3)(i), requires that employers erect warning lines as close to the work area as the task permits. This provision, like final paragraph (d)(2)(iv), helps to make warning lines as clearly visible as possible without interfering with the work employees perform. It also eases compliance for employers. Instead of placing warning lines 6 feet or 15 feet around the entire roof, employers can simply erect the warning line around the specific area where employees are working. This will make compliance easier for many employers, one of whom said, ''Some flat roofs in general industry settings could be the size of several football fields'' (Ex. 207).

Finally, OSHA believes the performance-based approach in the final rule gives employers flexibility to determine the distance that makes the warning line most clearly visible, without interfering with the work being performed. OSHA did not receive any comments on the proposed requirement and adopts it with the clarification discussed above.

Final paragraph (d)(2)(vi), similar to proposed paragraph (d)(3)(ii), requires that employers erect warning lines not less than 6 feet (1.8 m) from the roof edge for work that is both temporary and infrequent, or not less than 15 feet (4.6 m) for other work. OSHA believes the minimum distance of six feet for work that is temporary and infrequent provides an adequate safety zone that allows workers to stop moving toward the fall hazard after reaching or contacting the perimeter line of the designated area and provides an adequate safety zone should a worker trip and fall at the edge of the designated area. This final provision is almost identical to the six-foot safety zone required for warning line systems in the construction fall protection standard in § 1926.502(f)(1)(i). OSHA added the requirement that warning lines not be erected less than 15 feet from the roof edge for other work to be consistent with final paragraph § 1910.28(b)(13)(iii) and OSHA's enforcement policy discussed above. OSHA did not receive any comments on the proposed requirement and adopts it as discussed.

Final paragraph (d)(3), like proposed paragraph (d)(3)(iii), establishes minimum distances from an unprotected side or edge for erecting warning lines when workers use mobile mechanical equipment to perform work that is both temporary and infrequent in a designated area. In such cases, the final rule requires that employers erect warning lines: (1) Not less than 6 feet from the unprotected side or edge that is parallel to the direction in which workers are using the mechanical equipment; and (2) not less than 10 feet from the unprotected side or edge that is perpendicular to the direction in which workers are operating the mechanical equipment. When mobile mechanical equipment is used to perform other work, a warning line must be erected at least 15 feet from the roof edge.

The purpose of this final provision is to provide additional distance for the worker to stop the mechanical equipment from moving toward an unprotected side or edge. The 10-foot minimum distance provides a safety zone that takes into account the momentum of the equipment workers may be using. Final paragraph (d)(3), which OSHA renumbered in the final rule to make it easier to follow, is consistent with the construction fall protection standard in § 1926.502(f)(1)(ii). OSHA did not receive any comments on the proposed provision and finalizes it as discussed above.

Proposed paragraph (d)(4), which the final rule does not retain, required that employers provide clear access paths to designated areas. The proposal specified that the path have warning lines on both sides attached to stanchions that comply with the strength, height, and visibility requirements in proposed paragraph (d)(2). OSHA drew the proposed rule from the warning line system requirements in the construction fall protection standard in § 1926.502(f)(1)(iii) and (iv).

OSHA requested comment on whether the proposed requirement is necessary to protect general industry workers when they travel to and from designated areas. AFSCME supported the proposed requirement, stating, ''We believe that such an access path to the designated area is absolutely necessary for work on roofs when other fall protection is not provided'' (Ex. 226). Other commenters recommended that OSHA give employers more flexibility in delineating access paths to designated areas (Exs. 180; 189). In this regard, NGS recommended allowing employers to use contrasting color markings painted on the roof to designate access paths (Ex. 180), while Ameren said OSHA should consider allowing employers to use rubber mats for access paths (Ex. 189).

Several commenters recommended that OSHA delete the proposed requirement. Ameren urged OSHA to delete the proposed requirement because it ''could be burdensome if the path of travel to a work area on a roof is down the center of the roof especially if the delineation must be along the entire route and not just around the 'work area' '' (Ex. 189). Clear Channel Outdoor, Inc. (CCO) said the proposed requirement was not necessary:

> Based upon CCO's experience that employees do not trip or fall when traversing to and from the access ladder, CCO does not believe that installing an access path with safety cables or stations adds to safety in any measurable way. Accordingly, CCO supports the designated work area concept, but does not believe that a designated access path is necessary (Ex. 121).

Some commenters said the proposed access path requirement was not necessary because most of the work they perform on low-slope roofs is not near the edge of the roof (Exs. 165; 189; 236).

Based on stakeholder comments and other information in the record, OSHA decided not to retain proposed paragraph (d)(4) in the final rule. OSHA agrees with commenters that the proposed access path requirement is not necessary, especially on large roofs that require employers to erect long access paths. Evidence in the record suggests that many low-slope roofs in general industry are quite large. For example, Edison Electric Institute (EEI) commented that ''[s]ome flat roofs in a general industry setting could be the size of several football fields'' (Ex. 207). Although OSHA is deleting the proposed access path requirement, the Agency stresses that employers still must train workers, in accordance with final § 1910.30, about the potential fall hazards in the work area, which includes accessing the work area, and the proper set-up and use of designated areas.

Paragraph (e)—Covers

Final paragraph (e) addresses criteria and practices for covers that employers use to protect workers from falling into a hole in a walking-working surface, including holes in floors, roofs, skylights, roadways, vehicle aisles, manholes, pits, and other walking-working surfaces. The final rule consolidates and updates the cover criteria and practice requirements in the existing rule (*e.g.,* existing §§ 1910.23(a)(5), (8), and (9), and 1910.23(e)(7) and (8)). In addition, the final rule consolidates the proposed cover requirements, which are similar to those in the construction fall protection standard in § 1926.502(i).

Final paragraph (e)(1) requires that employers ensure any cover they use to prevent workers from falling into a hole in a walking-working surface is capable of supporting, without failure, at least twice the maximum intended load that may be imposed on the cover at any one time. The final rule clarifies and simplifies the proposed rule, and makes it consistent with other provisions in the final rule, by replacing the proposed language with ''maximum intended load,'' which OSHA consistently uses throughout the final rule. The final rule in § 1910.21(b) defines ''maximum intended load'' as the total load (weight and force) of all employees, equipment, vehicles, tools, materials, and other loads the employer reasonably anticipates to be applied to a walking-working surface at any one time; in this case, the walking-working surface is a cover. The final rule is consistent with A10.18–2012 (Section 7.1.1.4), which requires that trench and manhole covers support at least twice the maximum intended load.

The language in the final rule differs from the proposal, the construction fall protection standard, and the existing rule. The proposed and construction rules require that covers in roadways and vehicle aisles be capable of supporting ''twice the maximum axle load of the largest vehicle expected to cross over the cover'' (see proposed paragraph (e)(1) and § 1926.502(i)(1)), and that all other covers support ''twice the weight of employees, equipment, and materials imposed on the cover at any one time'' (proposed paragraph (e)(2)). The existing rule in § 1910.23(e)(7) states that trench, conduit, and manhole covers must support a truck rear-axle load of at least

20,000 pounds, and that floor-opening covers consist of ''any material that meets the strength requirements.'' [70]

OSHA believes that using the single, uniform term ''maximum intended load'' makes the final rule easier to understand than the proposed rule, and is consistent with a number of other requirements in the final rule. In addition, the term clearly states that covers must be capable of supporting twice the weight and force expected to be placed on them. By using the term ''maximum intended load,'' which includes the weight and force of all vehicles, equipment, tools, materials, workers, and other loads, OSHA consolidates the cover requirements into a single provision that applies the same, uniform criteria to all covers. OSHA also believes that establishing a uniform standard for all covers eliminates potential confusion and needless repetition.

Ellis commented that the proposed rule did not define the ''adequacy and walkability'' of covers (Ex. 155). The Agency believes that paragraph (e)(1) of the final rule establishes ''adequacy'' criteria using performance-based measures (*i.e.,* support twice the maximum intended load), which is consistent with the OSH Act at Section 6(b)(5). OSHA believes this performance-based approach also gives employers flexibility in selecting the material for a cover that they believe best meets the requirement in final paragraph (e)(1). Thus, employers may use covers made of the materials Ellis suggests so long as the cover supports twice the maximum intended load. In this regard, Ellis noted:

> A cover may be a plywood board or perhaps OSB or temporarily and more dangerously a section of drywall to keep out dust and weakens when wet. The new to America Platform Nets should be accommodated for maintenance work to allow walkable fabric covers to be used for walking across holes and open spaces (Ex. 155).

OSHA notes that Appendix A of A10.18–2012 (Ex. 388) provides information on hole covers, including material used for them, that provide additional guidance on the issue Ellis raises. As for ''walkability,'' if the employer anticipates that an employee will walk across a hole cover, the cover must meet the requirements of final § 1910.22.

Final paragraph (e)(2) (proposed paragraph (e)(3)) requires that employers secure covers to prevent accidental displacement. Accidental displacement of hole covers can occur due to a number of factors. For example, weather conditions such as wind, floods, snow, and ice can cause covers to become displaced. Heavy equipment running back and forth over covers also can loosen or displace them.

The final rule expands and revises both the existing and proposed rules. The final rule expands existing § 1910.23(a)(9), which only applies to ''floor holes,'' to include holes in any walking-working surface that employers protect with covers. Final paragraph (e)(2) expands and revises the proposed rule in two ways. First, the final rule eliminates, as unnecessary, the examples in proposed paragraph (e)(3) of conditions that may cause displacement of covers. Second, the final rule revises the proposed language to make clear that employers must keep covers firmly secured at all times. The proposed rule in paragraph (e)(3), like the construction fall protection standard in § 1926.502(i)(3), only specified that employers secure covers firmly ''when installed.'' However, in light of Ellis' comment that ''[l]ong-term covers which are acknowledged to be weak or degrade in the elements should have minimum requirements to follow for safety and structural inspection'' (Ex. 155), OSHA believes it is important to clarify that employers ensure that covers remain firmly secured after installation.

The final rule does not retain proposed paragraphs (e)(4) and (5). Proposed paragraph (e)(4) required that employers ensure covers were color coded or marked with the word ''HOLE'' or ''COVER'' to warn workers of the hazard. Proposed paragraph (e)(5) specified that proposed paragraph (e)(4) did not apply to cast-iron manhole covers or steel grates, such as those on streets and roadways. OSHA drew both proposed requirements from the construction fall protection standard in § 1926.502(i)(4).

In the proposed rule, OSHA requested comment on the need to include proposed paragraph (e)(4) in the final rule and information on the extent to which employers already mark or color code covers. OSHA received one comment on the proposed requirement. NGS said the proposed requirement was not necessary because ''[t]he proposed standard already requires that covers be properly designed, constructed and secured, thus engineering out the hazard'' (Ex. 180). OSHA agrees with this comment; the requirements in final paragraphs (e)(1) and (2), that employers ensure covers are strong enough to support the weight to be placed on them and are secured in place at all times, eliminates the need to also color code or label them as a hazard. Covers that meet the requirements of the final rule are not hazards. Therefore, OSHA deletes proposed paragraph (e)(4) because it is unnecessary.

Since the final rule does not carry forward the proposed marking requirement, proposed paragraph (e)(5) exempting certain covers from that requirement is no longer necessary. NGS also said that proposed paragraph (e)(5) is not necessary (Ex. 180). They pointed out that ''[m]anhole covers and steel grates are already exempt from the marking requirement'' (Ex. 180). OSHA agrees. Final paragraphs (e)(1) and (2) provide adequate protection; therefore, the Agency is not carrying forward the provision in the final rule.

Paragraph (f)—Handrails and Stair Rail Systems

Final paragraph (f) sets criteria and practice requirements for handrails and stair rail systems. These requirements cover height, finger clearance, surfaces, stair rail openings, handholds, projection hazards, and strength. The final rule in § 1910.21(b) defines ''stair rail system'' as a barrier erected along the exposed or open side of stairways to prevent workers from falling to a lower level, while ''handrails'' are rails used to provide workers with a handhold for support.

In final paragraph (f)(1), which addresses handrail height criteria, OSHA revised the language on measuring height criteria to make it uniform and consistent throughout final paragraph (f)(1). For example, final paragraph (f)(1) incorporates uniform terminology (*i.e.,* leading edge, top surface) and simplifies how to measure handrail height. The final rule adopts the method in A1264.1–2007, which specifies that handrails be measured from the leading edge of the tread to the top of the handrail (paragraph (f)(1)(i)). New Figures D–12 and D–13 show how to make this measurement.

Final paragraph (f)(1)(i) requires that employers ensure each handrail is not less than 30 inches and not more than 38 inches high, as measured from the leading edge of the stair tread to the top surface of the handrail. The height criteria in final paragraph (f)(1)(i) differs from the handrail height in both the existing and proposed rules. Existing § 1910.23(e)(5)(ii) requires that handrails be between 30 and 34 inches in height. The proposed rule required the height of handrails to be between 30 and 37 inches as measured from the upper surface of the top rail to the surface of the tread, in line with the face of the riser at the forward edge of the tread, which is consistent with both the

[70] OSHA notes that A10.18–2012 (Section 7.1.1.3) is consistent with the proposed rule.

construction stairways standard in § 1926.1052(c)(6) and A10.18–2012 (Section 6.2). The A1264.1–2007 standard, on the other hand, specifies that the handrail height must be not less than 34 inches or not more than 38 inches as measured from the tread to the top of the handrail.

OSHA revised the final rule in response to a comment from the National Fire Protection Association (NFPA), which pointed out that the NFPA 101 Life Safety Code, an ''ANSI-accredited national expert code,'' permits a 38-inch maximum handrail height (Ex. 97). NFPA recommended that the final rule also allow a 38-inch handrail height so handrails built in accordance with the NFPA 101–2012, Life Safety Code (Ex. 385) would not be ''non-compliant'' (Ex. 97). NFPA also said that their recommendation was ''technically sound as borne out by the research of Jake Pauls while he was on staff at the National Research Council Canada in the 1970s and 1980s'' (Ex. 97). In addition, NFPA appeared to suggest a 38-inch maximum handrail height would provide support for a broader range or workers (*i.e.,* taller workers) without compromising the protection of any worker (Ex. 97).

OSHA agrees that handrails built in accordance with NFPA 101 are acceptable, and is adopting this recommendation in the final rule; therefore, in the final rule the Agency increased the maximum handrail height by one inch, from 37 inches to 38 inches, which Figure D–12 illustrates. Since both the existing and proposed handrail height requirements come within revised final paragraph (f)(1)(i), OSHA does not expect that employers will have any problems complying with the final rule. The final rule simply provides employers with greater compliance flexibility.

Final paragraph (f)(1)(ii) establishes the height requirement for stair rail systems. Employers must ensure:

• The height of stair rail systems installed *before* the effective date of the final rule, which is January 17, 2017, is not less than 30 inches as measured from the leading edge of the stair tread to the top surface of the top rail (paragraph (f)(1)(ii)(A)); and

• The height of stair rail systems installed *on or after* the effective date is not less than 42 inches as measured from the leading edge of the stair tread to the top surface of the top rail (paragraph (f)(1)(ii)(B)).

The final rule revises the requirements in both the existing and proposed rules. The existing rule in § 1910.23(e)(2) requires that the height of a stair railing be not less than 30 inches nor more than 34 inches as measured from the upper surface of the stair tread to the top edge of the top rail. The final rule eliminates the maximum height requirement for existing stair rail systems.

The proposed rule would have raised the minimum height of new and replacement stair rails to 36 inches. The final rule, however, requires that new and replacement systems be at least 42 inches in height. In the proposed rule, OSHA explained that a 36-inch minimum height would make the general industry requirement consistent with the construction stairways standard in § 1926.1052(c)(3), and would afford a reasonable level of safety to workers (75 FR 28897). However, OSHA also discussed a University of Michigan study indicating that the minimum stair rail system height should be 42 inches, and also suggested that even 42 inches may not be adequate (Ex. OSHA–S041–2006–0666–0004). OSHA also noted that A1264.1–2007 (Section 5.5) establishes a 42-inch maximum stair rail system height. The Agency requested comment about raising the minimum stair rail system height to 42 inches.

OSHA received one comment. NFPA recommended raising the minimum height of stair rail systems to 42 inches, which would make the final rule consistent with the NFPA 101 Life Safety Code (Ex. 97). NFPA indicated that a 42-inch minimum stair rail system height would be more protective than the proposed height, and that research supported the 42-inch minimum height. Accordingly, NFPA stated, ''A minimum 42-inch high guard is needed to prevent a ninety-fifth percentile male from falling over the rail upon striking the side of a stair. This was documented in Jake Pauls' work of the 1970s and 1980s while he was on staff at the National Research Council Canada'' (Ex. 97). NFPA also said that the University of Michigan study supported raising the minimum stair rail system height. OSHA agrees that NFPA's recommendation would make the final rule more protective for a broader range of workers than the proposed rule and, therefore, requires that stair rail systems installed on or after the effective date of the final rule be at least 42 inches as measured from the leading edge of the stair tread to the top surface of the top rail. OSHA notes A10.18–2012 (Sections 4.1.2 and 5.2) requires that stair rail systems be 42 inches, plus or minus three inches.

OSHA also requested comment about whether the final rule should establish a maximum height for stair rail systems like A1264.1–2007. In the preamble to the proposal, OSHA said the purpose of stair rail systems is to prevent workers from falling over the edge of open-sided stairways, and that eliminating a maximum height would give employers greater flexibility to install stair rail systems they considered to be safer (75 FR 28897).

OSHA notes that the 42-inch stair rail height (final paragraph (f)(1)(ii)(B)) is prospective. It only applies to new and replacement stair rail systems installed on or after January 17, 2017.

Under the proposed rule, the new height requirements would have taken effect 90 days after the effective date, and Ameren recommended lengthening the phase-in period, saying, ''Lead time for material orders are often quite longer than three months often up to years to order material for large capital projects.'' Ameren stated later, ''Stipulations of 'ordered' material should be imposed in regard to the date of the final rule because the time between ordering and placing into service is often greater than 90 days'' (Ex. 189).

However, OSHA believes 60 days gives employers adequate time to come into compliance with the final rule and to change the specifications of any stair rail systems they have on order. The NFPA 101 Life Safety Code has been in place for a number of years, and the NFPA said that today stair rail systems ''are being installed at a minimum 42-inch height for compliance with nationally-recognized, expert model codes like NFPA 101 Life Safety Code'' (Ex. 97). Accordingly, OSHA believes most employers already are in compliance with the final rule, and the remainder will be able to comply with this prospective requirement when the final rule becomes effective. The final rule will not affect existing stair rail systems; therefore, there is no requirement to retrofit stair rail systems. The final rule will continue to allow stair rails installed before the new requirement takes effect to meet the existing requirement.

Finally, OSHA deleted the proposed note to paragraphs (f)(1)(i) and (ii) because it is unnecessary. The proposed note explained the criteria for measuring the height of handrails and stair rail systems. The final rule includes the measurement criteria in final paragraphs (f)(1)(i) and (ii). OSHA believes this deletion makes the final rule easier to read and follow than the proposal.

Final paragraph (f)(1)(iii) permits employers to use the top rail of stair rail systems as a handrail only when:

• The height of the stair rail system, which Figure D–13 illustrates, is not less than 36 inches and not more than

38 inches as measured at the leading edge of the stair tread to the top edge of the top rail (final paragraph (f)(1)(iii)(A)); and

- The top rail of the stair rail system meets the other handrail requirements in final paragraph (f) of this section (final paragraph (f)(1)(iii)(B)).

The proposed provision was consistent with the construction stairways standard in § 1926.1052(c)(7), which also allows employers to use top rails of stair rail systems as a handrail under specified conditions. OSHA believes a top rail of a stair rail system, under some conditions, may effectively and safely perform the function of both a stair rail system and handrail. Allowing employers to use stair rail top rails as handrails under these conditions provides employers with compliance flexibility without compromising worker safety when employers comply with the required conditions of use.

In response to NFPA's comments, OSHA revised final paragraph (f)(1)(iii) in three ways. First, for the reasons discussed final paragraph (f)(1)(i), the final rule raises the required height of stair rail top rails used as handrails to not less than 36 inches, but not more than 38 inches, from the proposed height of not less than 36 inches, but not more than 37 inches. This change makes the final rule consistent with the NFPA 101 Life Safety Code, and will protect a broader range of workers (Ex. 97).

Second, because the final rule requires that all stair rail systems installed on or after the effective date, which is January 17, 2017, must be at least 42 inches in height, final paragraph (f)(1)(iii)(A) is only applicable to stair rail systems installed before the effective date. Third, OSHA adds to the final rule the requirement that employers may use stair rails as handrails only if the stair rails also meet the other requirements in paragraph (f). NFPA recommended that OSHA allow the use of stair rails as handrails only if they also meet the handhold requirements in proposed paragraph (f)(5). NFPA recommended an addition to the proposed provision, stating:

> [The addition] recognize[s] the stair rail as an acceptable handrail not only based on height but if it additionally provides the handhold required of a handrail. The user would not otherwise know that the stair rail needs graspability as the provision of 1910.29(f)(5) is written to have applicability to handrails, not specifically to stair rails that are at an appropriate height so as to serve as a handrail (Ex. 97).

OSHA agrees with NFPA that the final standard should only allow employers to use stair rail top rails as handrails if the top rail ''has the shape and dimension necessary so employees can grasp it firmly to avoid falling'' (see final paragraph (f)(5)). However, OSHA also believes that employers can use stair rails as handrails only if the stair rails also meet other handrail requirements such as having smooth surfaces (see final paragraph (f)(3)) and no projection hazards (see final paragraph (f)(6)). OSHA revises the final rule accordingly.

Final paragraph (f)(2) requires that employers ensure there is a finger clearance of at least 2.25 inches between handrails (including the top rail of a stair rail system being used as handrails) and any other object (such as a wall). Workers need adequate clearance space so they are able to maintain a firm grasp on the handrail while they go up and down workplace stairs.

The proposed rule would have required a three-inch minimum clearance for handrails and stair rails. OSHA explained that the proposed minimum clearance would make the general industry rule consistent with the construction stairways standard (§ 1926.1052(c)(11)), which also requires a minimum clearance of three inches for handrails that will not be a permanent part of the structure being built.

In 1990, OSHA first proposed revising the existing three-inch finger clearance requirement to a minimum of 1.5 inches. OSHA explained that the revision would make the rule consistent with local building codes; ANSI A12.1–1973, Safety Requirements For Floor and Wall Openings, Railings, and Toeboards; draft revised A1264.1; and ANSI A117.1–1986, Providing Accessibility and Usability for Physically Handicapped People (Ex. OSHA–S041–2006–0666–0054). The A1264.1–2007 (Section 5.9) standard eventually adopted a 2.25-inch minimum finger clearance.

In the 2010 proposal, OSHA said it proposed to retain the existing three-inch minimum clearance so the general industry rule would be consistent with the construction stairways standard, thereby facilitating compliance for employers who perform both general industry and construction activities. OSHA also said the difference between the three-inch minimum clearance in the proposed, existing, and construction standards and the 2.25-inch minimum clearance in A1264.1–2007 was not ''significant'' (75 FR 28897). Nonetheless, OSHA asked for comment on whether the Agency should adopt the 2.25 inch requirement instead.

NFPA submitted a comment recommending that OSHA adopt a 2.25-inch minimum clearance for handrails, which the NFPA 101 Life Safety Code requires, for the following reasons:

> (1) for consistency among the model codes [which require only a 2.25-inch finger clearance], (2) so that owners operators are not surprised with a violation after complying with the model codes, and (3) because there is no technical basis for requiring more than 2¼ inches in order to provide a usable handrail. Remember that for years and years the model codes' minimum finger clearance was 1½ inches but concerns over users skinning their knuckles on rough wall surfaces led to research that identified the 2¼ inch criterion as necessary and adequate (Ex. 97).

NFPA also disagreed with the Agency's characterization of the difference between OSHA's existing and proposed three-inch minimum finger clearance and the 2.25 clearance in A1264.1–2007 as ''not significant,'' stating:

> Where a 3-inch finger clearance is used for handrails at both sides of a stair in place of a 2¼-inch finger clearance, the stair's rated egress capacity drops by 5 persons. Owners of new buildings want to maximize egress capacity with respect to the space allotted to a stair, and the loss of egress credit for 5 persons is significant. So compliance with the proposed OSHA requirement will add cost (Ex. 97).

With the exception of NFPA's claim that a three-inch clearance will increase building construction costs, OSHA finds convincing NFPA's reasons for recommending a 2.25-inch minimum clearance space. A 2.25-inch minimum finger clearance will make the final rule consistent with NFPA 101 as well as ANSI/ASSE A1264.1–2007, and the International Building Code–2012 (IBC–2012). OSHA believes that following those consensus standards will prevent confusion and ensure the final rule complies with section 6(b)(8) of the OSH Act. In addition, since 2.25 inches is a minimum clearance, employers may continue to use a three-inch clearance. Therefore, OSHA believes the 2.25-inch minimum clearance in the final rule provides greater compliance flexibility for employers.

Final paragraph (f)(3) requires that employers ensure handrails and stair rail systems are smooth-surfaced to protect workers from injury, such as punctures or lacerations, and to prevent catching or snagging of clothing, including protective clothing. OSHA revises the final provision to make it consistent with final (b)(6), for guardrail systems.

The final provision is consistent with the existing rules for stair rails in § 1910.23(e)(3)(v)(*a*) and handrails in § 1910.23(e)(5)(i), as well as the construction stairways standard in

§ 1926.1052(c)(8). The A10.18–2012 standard (Section 5.2) also contains a similar requirement that stairways ''shall be free of sharp edges, splinters, or similar conditions.'' OSHA did not receive any comments on the proposed provision and adopts it as discussed.

Final paragraph (f)(4), like the proposed rule, requires that employers ensure no opening in a stair rail system exceeds 19 inches at its least dimension. Final § 1910.21(b) defines ''stair rail system'' as a barrier erected along the ''exposed or open side of stairways to prevent employees from falling to a lower level.'' Stair rail systems, like guardrail systems, need to limit the openings in the exposed or open sides of stairways to prevent workers from falling through to a lower level. Limiting the openings also can prevent objects from falling through the opening and hitting workers who are below, although openings that are 19 inches apart may not prevent some objects from falling.

The final provision is consistent with the construction fall protection and stairways standards in §§ 1926.502(b)(2)(iii) and (iv) and 1926.1052(c)(4)(iii) and (iv), respectively, for openings in stair rail and guardrail systems. The existing rule in § 1910.23(e)(1) requires a midrail ''approximately halfway between the top rail and the [walking-working surface].'' OSHA did not receive any comments on the proposed provision and adopts it as discussed above.

Final paragraph (f)(5), like the proposed rule, requires that employers ensure handrails (including top rails of stair rail systems serving as handrails (final paragraph (f)(1)(iii)), have the shape and dimension necessary so workers can grasp the handrail firmly. The final rule is similar to the construction stairways standard in § 1926.1052(c)(9). The existing rule at existing § 1910.23(e)(5)(i) requires that handrails be of a rounded or other section that furnishes an adequate handhold to avoid falling. Similarly, the A1264.1–2007 standard (Section 5.8) requires that handrails be rounded with a cross sectional design that furnishes an adequate handhold for anyone grasping it to avoid failing. A10.18–2012 (Section 6.3) also requires a handhold to grasp to avoid falling.

OSHA received a comment from NFPA saying the proposed requirement was too vague. In its comment, NFPA stated:

> The provision . . . requires someone to judge whether a handrail's shape and dimensions provide a firm handhold for employees. The requirement is too performance-based without providing guidance as to what is intended with respect to a 'firm' handhold. Its enforcement will be subjective (Ex. 97).

NFPA recommended that OSHA instead adopt the following language on handhold criteria from the NFPA 101 Life Safety Code:

> Handrails conforming with one of the following features are deemed to comply with the requirement for handhold: (i) The handrail has a circular cross section with an outside diameter of not less than 1¼ in. (3 cm) and not more than 2 in. (5 cm), or (ii) the handrail has a shape that is other than circular with a perimeter dimension of not less than 4 in. (10 cm), but not more than 6¼ in. (16 cm), and with the largest cross-sectional dimension not more than 2¼ in. (6 cm)(Ex. 97).

OSHA does not believe it is necessary to add to final paragraph (f)(5) the specification language NFPA recommends. Requirements on handrail and stair rail system handholds have been in place for many years, and OSHA is not aware of any employers experiencing difficulties in ensuring handrails, and top rails serving as handrails, are of the size and dimension that provide a handhold that workers can grasp firmly. OSHA also believes that retaining the performance-based language gives employers flexibility to select the shape and size of handrail that will provide the most effective handhold in particular workplace situations. For example, the performance-based language allows employers to take advantage of anthropometric testing and research to select the size and shape of handrails that provide a firm grasp for the broadest range of workers. Although OSHA is not adopting the language NFPA recommends, the Agency notes that employers who install handrails and top rails of stair rails systems that meet the specification of the NFPA 101 Life Safety Code will be in compliance with final paragraph (f)(5).

Final paragraph (f)(6), like the proposed rule, requires that employers ensure the ends of handrails and stair rail systems do not present any projection hazard. OSHA drew the final provision from the existing general industry rule in § 1910.23(e)(5)(i) and the construction stairways standard in § 1926.1052(c)(10). The final rule also is consistent with A1264.1–2007 (Section 5.8).

OSHA believes it is necessary to prevent or eliminate projection hazards so workers do not walk or fall into a protruding handrail or stair rail system and get injured. Projection hazards also can snag or catch workers' clothing or equipment and cause workers to lose their balance and fall on, or down, the stairway. A fall on a stairway could seriously injure, or even kill, a worker. OSHA did not receive any comments on the proposed rule and adopts the provision as discussed above.

Final paragraph (f)(7), similar to the proposed rule, requires that employers ensure handrails, and the top rails of stair rail systems, are capable of withstanding, without failure, a force of at least 200 pounds applied in any downward or outward direction within 2 inches of any point along the top edge of the rail.

OSHA believes it is necessary that handrails and top rails on stair rail systems be able to withstand a force of at least 200 pounds to protect workers from falling to a lower level when they lean on or over handrails and top rails, or if they fall against a rail. If handrails and top rails cannot support a 200-pound force, workers could receive serious injuries or die from falling over the open or exposed side of the stairway.

The proposed rule required that handrails and top rails be capable of withstanding the specified test load ''without permanent deformation or a loss of support.'' The final rule replaces the proposed language with the term ''without failure.'' Final § 1910.21(b) defines ''failure'' as a load refusal, breakage, or separation of component parts. It is the point at which the ultimate strength is exceeded which encompasses loss of support. Failure does not include all ''permanent deformation,'' but rather deformation that reduces the structural integrity or support capability of a part or member. OSHA believes the term ''without failure'' clearly reflects the type of deformation the final rule addresses. In addition, OSHA uses the term ''without failure'' throughout the final rule (*e.g.,* final paragraphs (b)(3), (b)(5), (e)(1), and (i)(6)), which should facilitate understanding of the final rule, and help to ensure consistent interpretation of the final rule.

The final rule is almost identical to the construction stairways standard in § 1926.1052(c)(5). The existing general industry rule included strength-criteria requirements (''200 pounds applied in any direction at any point'') for ''completed'' stair rail systems (see existing § 1910.23(e)(3)(iv)) and handrail mountings (see existing § 1910.23(e)(5)(iv)). Similarly, the A1264.1–2007 standard (Section 5.6.1) specifies that completed railing systems must be able to withstand a concentrated load of 200 pounds ''applied in any direction, except up, at the midpoint between posts without exceeding maximum allowable deflection.'' OSHA did not receive any comments on the proposed provision and adopts it with the revised language discussed above.

Paragraph (g)—Cages, Wells, and Platforms Used With Fixed Ladders

Final paragraph (g) establishes criteria and practice requirements for cages, wells, and platforms used with fixed ladders. As discussed above in this preamble, final § 1910.28 limits, and eventually phases out, the use of cages and wells as a means of fall protection on fixed ladders. After the final phase-out deadline, employers must ensure all fixed ladders have ladder safety systems or personal fall arrest systems to protect workers from falling to a lower level. Final paragraph (g) includes an informational note reminding employers that final § 1910.28 establishes the requirements that employers must follow on the use of cages and wells as a means of fall protection. OSHA notes that the requirements in final paragraph (g) do not apply once a ladder safety system or personal fall arrest system has been installed on the fixed ladder as required by final § 1910.28(b)(9).

Final paragraph (g)(1), similar to the proposed rule, requires that employers ensure cages and wells installed on fixed ladders are designed, constructed, and maintained to permit easy access to, and egress from the ladder that they enclose. The final rule divides the other proposed requirements into separate provisions, which makes the final rule easier to understand and follow.

Consistent with the OSH Act (29 U.S.C. 655, 6(b)(5)), final paragraph (g)(1) replaces the specification requirements for cages and wells in existing § 1910.27(d) with performance-based language that specifies the performance objective of the final rule (*e.g.,* to permit easy access and egress). The existing rule, on the other hand, specifies that cages extend down the ladder to a point not less than 7 feet nor more than 8 feet above the base of the ladder, and flare not less than 4 inches at the bottom. The existing rule also requires that the cages extend a minimum of 42 inches above the top of the landing a fixed ladder is served by. OSHA believes that the final rule's performance-based approach also provides flexibility to employers. OSHA includes Figure D–15 in the final rule, which provides an example of acceptable cage construction and dimensions.

Final paragraph (g)(1) adds language specifying that employers ensure cages and wells, in addition to being designed and constructed to provide easy access to and egress from the fixed ladder, are maintained in that condition. This language reinforces the general maintenance and safe access and egress requirements in final § 1910.22. OSHA did not receive any comments on the proposed rule and adopts the provision with the clarifications discussed above.

Final paragraph (g)(2), like proposed paragraph (g)(1), requires that employers ensure cages and wells are continuous throughout the length of the fixed ladder, except for access, egress, and other transfer points. Requiring that cages and wells cover the entire length of the fixed ladder is necessary to ensure that cages and wells are effective in containing and directing workers to a lower landing.

Final paragraph (g)(2) recasts into plain language two provisions in the existing general industry rule and is consistent with the construction ladder standards that address the length of cages on fixed ladders. Both the existing general industry and construction standards require that cages extend along the fixed ladder to a point that is not less than seven feet nor more than eight feet above the base of the ladder (see existing § 1910.27(d)(1)(iv) and § 1926.1053(a)(20)(vii)). These standards also require that the tops of cages extend at least 42 inches above the top of the platform or the point of access at the top of the ladder (see existing § 1910.27(d)(1)(iii) and § 1926.1053(a)(20)(viii)). A14.3–2008 (Sections 6.1.2.4 and 6.1.2.5) also includes similar requirements. OSHA did not receive any comments on the proposed rule and adopts it with the revised performance-based language discussed above.

Final paragraph (g)(3), similar to proposed paragraph (g)(1), requires that employers ensure cages and wells are designed, constructed, and maintained so they contain workers in the event of a fall and direct them to a lower landing. Like final paragraph (g)(1), and consistent with the OSH Act (29 U.S.C. 655, 6(b)(5)), final paragraph (g)(3) replaces detailed specification requirements in the existing rule in § 1910.27(d) with performance-based language. OSHA believes the performance-based language gives employers greater flexibility in designing, constructing, and maintaining cages and wells than the existing standard. OSHA did not receive any comments on the proposed provisions and finalizes the provision as discussed above.

Final paragraph (g)(4), like existing § 1910.27(d)(2)(ii) and proposed paragraph (g)(2), requires that employers ensure landing platforms used with fixed ladders provide workers with a horizontal surface that is at least 24 inches by 30 inches. The final rule is consistent with ANSI A14.3–2002.

OSHA notes that fixed ladder platforms, like other walking-working surfaces, also must comply with the load requirements in final § 1910.22(b). That is, fixed ladder platforms must be capable of supporting the maximum intended load that employers will impose on them. OSHA did not receive any comments on the proposed requirement and adopts it as discussed.

Paragraph (h)—Outdoor Advertising

Final paragraph (h) establishes temporary criteria and practice requirements for employers engaged in outdoor advertising (billboard) operations (hereafter referred to as ''outdoor advertising operations'' and ''outdoor advertising employers''). As final § 1910.28(b)(9) and (10) specify, and the note to this paragraph reinforces through its reference to § 1910.28, outdoor advertising employers may allow their workers [71] to climb fixed ladders without fall protection until November 19, 2018, which is two years after publication of the final rule. After that date, outdoor advertising employers must provide fall protection in accordance with final § 1910.28(b)(9), Fixed ladders, and the requirements in this paragraph no longer apply.

The effect of final § 1910.28(b)(9) and (10) is to phase out the exception to the fall protection requirements that apply to climbing fixed ladders that OSHA provided in a variance granted in 1991 to Gannett Outdoor (56 FR 8801 (3/1/1991)), and extended to all outdoor advertising operations in a 1993 OSHA directive (Fixed Ladders Used on Outdoor Advertising Structures/Billboards in the Outdoor Advertising Industry, STD 01–01–014 (1/26/1993)) (Ex. 51).

Final paragraph (h) specifies the requirements that apply during the phase out period. OSHA drew the requirements in proposed and final paragraph (h) from the 1993 outdoor advertising directive. OSHA stresses that during the phase out period, outdoor advertising employers must: (1) Ensure workers climbing fixed ladders wear a body harness equipped with an 18-inch rest lanyard (final § 1910.28(b)(10)(ii)(B)); and (2) ensure workers are protected by a fall

[71] The proposed rule in § 1910.21(b) referred to these workers as ''qualified climbers,'' which the proposal defined as workers engaged in outdoor advertising operations who, by virtue of their physical capabilities, training, work experience, and job assignment, the employer authorizes to climb fixed ladders without using fall protection. Since the final rule phases out the use of qualified climbers in two years, on November 19, 2018, OSHA does not use the term in this final rule.

protection system once they reach the work position (final § 1910.28(b)(10)(ii)(D)).

Final paragraph (h)(1), like the proposed rule, requires that outdoor advertising employers ensure that each worker who climbs fixed ladders without fall protection is physically capable to perform those duties that employers may assign. To ensure that workers are physically capable, final paragraph (h)(1) requires that employers either observe workers performing actual climbing activities, or ensure workers undergo a physical examination.

Final paragraph (h)(1) clarifies the proposed rule by making explicit that the determination of a worker's physical capability, whether demonstrated by actual observation of climbing or by physical examination, must include whether workers are physically capable of climbing fixed ladders without fall protection as a regular part of their job duties. OSHA believes the key aspect of physical capability is the ability to climb without using fall protection. Such climbing requires particular strength, agility, and vigilance to prevent falling. Although most employers ensure workers are physically capable to do the job, OSHA believes that the additional language clarifies that the physical examination also must consider whether the worker has the physical ability to climb fixed ladders without fall protection. OSHA added the phrase ''including climbing fixed ladders without using fall protection'' to the final provision to clarify that one of the duties that workers in the outdoor advertising industry may be assigned is climbing fixed ladders that are not equipped with a ladder safety system or personal fall arrest system. Only after demonstrating the necessary ability and skill in climbing may employers allow workers to climb without using fall protection (see discussion in final § 1910.28(b)(10)).

OSHA received one comment on the proposed provision. Ellis said OSHA should eliminate the outdoor advertising exception ''unless medical qualification is added;'' however, he did not provide any explanation to support the recommendation (Ex. 155). If Ellis is recommending that physical examinations include a ''medical qualification'' component, OSHA believes that the vast majority of all standard physical examinations include medical tests. In addition, OSHA believes that appropriate physical examinations to determine physical ability to climb fixed ladders without fall protection include medical tests such as blood pressure, electrocardiogram, blood, pulmonary, vision, balance, reflex, and other similar medical examinations. As such, OSHA does not believe it is necessary to specify required medical tests in the final rule.

Ellis appears to be recommending that employers must ensure workers have both a physical examination and perform actual climbing activities to demonstrate they are physically capable of climbing fixed ladders without fall protection. OSHA believes the current requirement does not need to be changed because the Agency is phasing out climbing fixed ladders without fall protection. OSHA notes, however, that outdoor advertising employers are free to provide their workers with both a physical examination and have them perform actual climbing activities to demonstrate physical capability.

Final paragraphs (h)(2) and (3) are companion requirements that specify what training employers must provide (final paragraph (h)(2)) and how they must provide it (final paragraph (h)(3)) to ensure workers have the necessary skills to climb fixed ladders without fall protection. OSHA notes that the training outdoor advertising employers must provide in final paragraphs (h)(2) and (3) is in addition to the training they must provide under final § 1910.30.

Final paragraph (h)(2), similar to the proposed rule, requires that outdoor advertising employers ensure their workers who climb fixed ladders without fall protection (1) successfully complete a training or apprenticeship program that includes hands-on training for the safe climbing of ladders, (including fixed ladders without fall protection and portable ladders); and (2) receive retraining as necessary to ensure they maintain necessary skills.

Successful completion of a training or apprenticeship program means workers are proficient in all aspects of the job, including climbing without fall protection. For example, workers who successfully finish their training or apprenticeship program will know at least (1) how to safely transition from fixed ladders to work platforms and portable ladders; (2) the correct angle for safely climbing portable ladders; (3) how to properly attach to ladder safety systems and personal fall arrest systems at certain ladder heights and when transitioning to work platforms; and (4) the impacts of various environmental conditions on safely climbing fixed ladders without fall protection and what action to take. These training tasks address particularly dangerous climbing conditions, and OSHA believes completion of training or an apprenticeship program is only successful if workers are proficient in these types of tasks. If an employer observes, or has reason to believe, that workers are no longer proficient in climbing fixed ladders without fall protection, final paragraph (h)(2) requires that they provide retraining to restore the worker's proficiency.

OSHA notes that final paragraph (h)(2), like the proposal includes language specifying that employee training on safe climbing must include ''hands-on'' training. OSHA believes that workers must have opportunities to train on ladders and with the equipment they will use to perform their work (*e.g.,* rest lanyards) in order to become proficient in climbing fixed ladders without fall protection. OSHA did not receive any comments on proposed paragraph (h)(2) and adopts it with only minor editorial change.

Final paragraph (h)(3), like the proposed rule, requires that outdoor advertising employers ensure workers possess the skill to climb ladders safely as demonstrated through:

• Formal classroom training or on-the-job training; and

• Performance observations.

To develop the necessary skills and proficiency to climb fixed ladders without fall protection, OSHA believes that worker training must consist of two components: Formal classroom training or on-the-job training on safe climbing of ladders, and worker demonstration of proficiency of ladder climbing skills. Employers must ensure workers receive formal classroom or on-the-job training, and then are personally observed demonstrating their skills and proficiency before considering a training or apprenticeship program to be ''successfully completed.'' OSHA stresses that workers must successfully complete the training and demonstration of climbing skills and proficiency before employers may allow or assign workers to climb ladders unsupervised as part of their job. The same is true for on-the-job training, which is not ''learn as you work'' training. The purpose and structure of on-the-job training must be to teach workers and help them develop, through observation and practice, the necessary skills and proficiency to climb fixed ladders without fall protection before assigning them to perform regular climbing jobs unsupervised. OSHA did not receive any comments on the proposed provision and adopts it as discussed above.

Final paragraph (h)(4), like the proposed rule, requires that employers permit workers to climb fixed ladders without fall protection only if such climbing is part of their routine work activities. As OSHA explained in the preamble to the proposed rule, it is essential that workers regularly perform climbing tasks so they retain knowledge of proper climbing practices and maintain climbing proficiency, including physical capabilities (75 FR 28898).

Ellis recommended eliminating ''qualified climbers'' unless OSHA requires that employers supervise all climbing on fixed ladders (Ex. 155). OSHA does not believe Ellis' recommendation is needed. The final rule requires that outdoor advertising workers who climb fixed ladders without fall protection receive extensive training before employers assign them to perform regular climbing activities. That training includes classroom or hands-on training plus observation of worker climbing proficiency. In addition, employers must train those workers in fall and equipment hazards, and provide retraining as necessary (see final § 1910.30). OSHA believes the training requirements in the final rule are adequate to ensure that outdoor advertising workers have the skills necessary to climb fixed ladders unsupervised without fall protection during the phase-out period. Therefore, OSHA did not adopt the commenter's recommendation.

Paragraph (i)—Ladder Safety Systems

Final paragraph (i) establishes criteria and practice requirements for ladder safety systems permanently attached to fixed ladders or immediately adjacent to such ladders. A ladder safety system is a system designed to eliminate or reduce the possibility of falling from a ladder (see definition of ''ladder safety system'' in final § 1910.21(b)). According to this definition, it usually consists of the following:

- A carrier, also called ''a lifeline,'' which is a rigid or flexible track attached to or adjacent to the fixed ladder;
- A safety sleeve, which is moving component that travels on the carrier;
- A lanyard;
- Connectors; and
- A body harness.

Although the existing rule (§ 1910.21(e)(13)) defines ''ladder safety devices,'' which serve the same purpose as ladder safety systems, the existing rule does not specify criteria or practice requirements for those devices. As a result, OSHA drew many of the proposed ladder safety system criteria and practice requirements from the construction ladder standard (§ 1926.1053(a)(22) and (23)).[72] OSHA also drew ladder safety system criteria and practice from A14.3–2008.

Final paragraph (i)(1) requires that employers must ensure each ladder safety system allows workers to climb up and down the fixed ladder with both hands free for climbing. The final rule also specifies that the design of the ladder safety system must be such that it does not require that workers continuously hold, push, or pull any part of the system while they are climbing. Final paragraph (i)(1) is consistent with the construction ladder standard in § 1926.1053(a)(22)(ii) and A14.3 (Section 7.3.1).

In commenting on the proposed rule, NGS pointed out:

> Some forms of ladder safety systems (*i.e.* rope grabs) may require the employee to periodically hold up a lever to adjust the position of the grab on the rope. This is not continual and the employee can make this adjustment while in a stationary position on the ladder. Once the grab is re-positioned, the employee can climb before stopping and re-adjusting the grab (Ex. 180).

The purpose of the proposed provision was to ensure that the ladder safety system allows workers to use both hands while they are in the process of climbing up and down the fixed ladder; it does not prohibit them from using their hands to position or adjust components of the ladder safety system, such as rope grabs, while stopping and standing in place at certain points along the ladder. OSHA believes the ladder safety system lanyard will protect workers from falling to a lower level in these situations; however, their hands must be free when they resume climbing. The final rule clarifies the provision by adding the term ''continuously'' in place of ''continually.'' OSHA believes this change reinforces clearly that workers need to hold onto the ladder with both hands while climbing, but they may perform tasks when they stop climbing.

Final paragraph (i)(2), like the proposed rule, requires that employers ensure the connection between the carrier or lifeline and the point of attachment to the body harness or belt does not exceed 9 inches in length. The purpose of this provision is to limit the length of any fall and resulting arrest forces. The final rule ensures that no fall exceeds 18 inches, which will limit the arresting forces. The final rule is almost identical to the construction ladder standard in § 1926.1053(a)(22)(iv). The A14.3–2008 standard (Section 7.3.3) also limits the lanyard length to 9 inches.

Ellis commented that OSHA should prohibit the use of body belts with ladder safety systems, and pointed out that the A14.3–2008 standard specifies harnesses instead of body belts as part of a ladder safety system (Ex. 155). He added that ''[a]ll manufacturers have changed at this stage to harness[es] for this climbing device'' (Ex. 155). OSHA agrees that most employers provide body harnesses for use with ladder safety systems because harnesses distribute arresting forces across a broader portion of the body, which makes them safer than body belts. However, since the final rule limits the lanyard length to 9 inches, the maximum free fall will be 18 inches. OSHA believes a maximum free fall of 18 inches will not put an excessive arresting force on workers even if they are using body belts instead of harnesses. As such, like the construction ladder standard, OSHA does not believe it is necessary to prohibit the use of body belts with ladder safety systems.

Final paragraph (i)(3), like the proposed rule, requires employers to ensure that mountings for rigid carriers are attached at each end of the carrier, with intermediate mountings spaced, as necessary, along the entire length of the carrier so the system has the strength to stop worker falls. The requirements in the final rule are consistent with the construction ladder standard (§ 1926.1053(a)(23)(i)). The A14.3–2008 standard (Section 7.3.4) also requires that rigid carriers on ladder safety systems have mountings at the end of each carrier and intermediate mountings along the carrier. However, that standard establishes specification requirements for intermediate mountings instead of the performance-based language in the final rule. A14.3–2008 requires intermediate mountings spaced along the carrier in accordance with manufacturer's recommendations, and installed within one foot below each splice on the carrier, with at least one mounting every 25 feet.

The purpose of final paragraph (i)(3) is to ensure the ladder safety system carrier remains in place and supports the worker, if a fall occurs, by attaching the carrier (or lifeline) firmly to the fixed ladder throughout the length of the ladder. To ensure that the carrier has the strength necessary to hold a falling worker, the final rule requires that employers install an adequate number of mountings spaced ''as necessary'' along the entire carrier length. OSHA believes that manufacturer's instructions likely identify the number

[72] The construction standard allows the use of body harnesses or body belts with ladder safety systems.

and spacing of intermediate mountings they believe are necessary to firmly secure the carrier. However, some carriers may need additional mountings to ensure they are able to support the arresting forces of a falling worker. For example, as the standard indicates, if a carrier consists of several sections, employers may need to use additional intermediate mountings. Therefore, the final rule requires that employers put intermediate mountings at those places along the carrier (*e.g.,* by any splice on the carrier) where they are necessary to ensure the carrier has the strength to stop workers from falling to a lower level. OSHA believes requiring that employers install and space the mountings ''as necessary'' will ensure that employers inspect and evaluate where intermediate mountings are needed when they install ladder safety systems. OSHA did not receive any comments on the proposed provision and adopts it as explained above.

Final paragraph (i)(4), similar to the proposed rule, requires that employers ensure flexible carriers have mountings attached at each end of the carrier. The final rule also requires the installation of cable guides for flexible carriers at least 25 feet apart, but not more than 40 feet apart, along the entire length of the carrier. The final rule is consistent with both the construction ladder standard (§ 1926.1053(a)(23)(ii)) and A14.3–2008 (Section 7.3.5). The purpose of the requirement is to ensure the system has the strength necessary to stop worker falls and, as the construction ladder standard indicates, to prevent wind damage to the ladder safety system and its components. OSHA did not receive any comments on the proposed provision and finalizes it with the clarifications discussed above.

Final paragraph (i)(5), like the proposed rule, reinforces final paragraphs (i)(3) and (i)(4) by requiring employers to ensure that the design and installation of mountings and cable guides do not reduce the design strength of the ladder. The final rule is consistent with both the construction ladder standard in § 1926.1053(a)(23)(iii) and A14.3–2008 (Section 7.1.4). OSHA did not receive any comments on the proposed provision and adopts it with a minor change for clarity.

Final paragraph (i)(6), like the proposed rule, requires that employers ensure ladder safety systems and their support systems are capable of withstanding, without failure, a drop test consisting of an 18-inch drop of a 500-pound weight. This drop test, therefore, must arrest and suspend the 500-pound weight without damage to or failure of the ladder safety system and its support system and without the test weight hitting a lower level (such as the ground). The final rule is consistent with both the construction ladder standard in § 1926.1053(a)(22)(i) and A14.3–2008 (Section 7.1.3).

Ellis recommended that the final rule include a test to determine whether horizontal thrust will cause the ladder safety system to fail (Ex. 155). He also recommended that the final rule incorporate the program of eight tests Great Britain's Health and Safety Executive established. OSHA notes the A14.3 Committee did not adopt those tests, and footnote 7 in the A14.3–2008 standard states there is no scientific determination currently available (in 2008) on this issue to support any action. Ellis did not provide any evidence to support adopting his recommendation.

Ameren recommended that OSHA only require that employers comply with the ladder safety systems criteria and practice requirements when they install new or replacement fixed ladders and ladder safety systems, stating, ''It could very easily be financially burdensome for an employer to replace safe, operating systems to meet proposed requirements'' (Ex. 189). The final rule basically follows the approach Ameren recommends. The final rule (final § 1910.28(b)(9)) does not require that employers immediately install ladder safety systems (or personal fall arrest systems) on existing fixed ladders (*i.e.,* ladders installed before November 19, 2018) that have a cage or well. The final rule requires those employers to install a ladder safety system or personal fall arrest system: (1) When the employer replaces the fixed ladder or a section of it; or (2) by November 18, 2036, which is the final deadline for installing ladder safety systems (or personal fall arrest systems) on all fixed ladders.

Paragraph (j)—Personal Fall Protection Systems

Final paragraph (j), like the proposed rule, requires that body belts, body harnesses, and other components used in personal fall arrest systems, work positioning systems, and travel restraint systems, meet the applicable requirements in final § 1910.140. The final § 1910.140 preamble discusses the criteria and practice requirements for those personal fall protection systems, and addresses stakeholder comments.

Paragraph (k)—Protection From Falling Objects

As discussed earlier in this preamble, the final rule in § 1910.28(c) requires that employers protect workers from being hit by falling objects by keeping objects, including tools, materials, and equipment, far enough away from the exposed edge to prevent them from falling to a lower level, and by using one or more of the following falling object protection measures: (1) Toeboards, screens, or guardrail systems; (2) canopy structures; or (3) barricading the area and prohibiting workers from entering the barricaded area.

Final paragraph (k) establishes criteria and practice requirements for the measures that final § 1910.28(c) requires. The existing rule in § 1910.23(e)(4) contains limited requirements for toeboards and guardrails, and OSHA drew criteria and practice requirements for these measures from the construction fall protection standard in § 1926.502(j), A10.18–2012 (Section 4.1.5), and A1264.1–2007 (Section 5.7).

Final paragraph (k)(1) establishes criteria and practice requirements for toeboards, which the final rule in § 1910.21(b) defines as a low protective barrier that is designed to prevent materials, tools, and equipment from falling to a lower level. The final definition also specifies that toeboards protect workers from falling to a lower level.

Final paragraph (k)(1)(i), similar to proposed paragraph (k)(1), requires that employers ensure toeboards, when used for falling object protection, are erected along the exposed edge of the overhead walking-working surface for a length that is sufficient to protect workers below. In determining how much of the walking-working surface must have toeboards, employers not only must provide toeboards where objects are placed or piled, but also take into account that objects may move or roll on a walking-working surface before going over an exposed edge. In addition, employers must consider where employees may be working on a lower level. The final rule is consistent with the construction fall protection standard in § 1926.502(j)(1). OSHA did not receive any comments on the proposed provision and adopts it as proposed, with minor editorial revisions.

Final paragraph (k)(1)(ii), like proposed paragraph (k)(2)(i), requires that employers ensure the minimum vertical height of toeboards is 3.5 inches, as measured from the top edge of the toeboard to the level of the walking-working surface. The existing rule in § 1910.23(e)(4) requires a four-inch nominal vertical toeboard height, but does not indicate the permissible deviation from that height. However, to make the provision consistent with the construction fall protection standard, OSHA proposed and adopts a 3.5-inch minimum vertical toeboard height. The final rule also is consistent with A1264.1–2007 (Section 5.7) and A10.18–2012 (Section 4.1.5).

OSHA stresses that, like the construction fall protection standard in § 1926.502(j)(3), the required 3.5-inch toeboard height is the minimum height. If employers have objects or materials near the toeboard that are higher than the toeboard, they must ensure the toeboard height is sufficient to prevent the objects from falling over the edge to a lower level, as specified in final paragraph (k)(2). OSHA notes that when objects are piled higher than the toeboard, final paragraph (k)(2) requires employers to erect guardrail systems that have paneling or screening installed from the top edge of the toeboard to the top rail or midrail of the guardrail system. (See further discussion of final paragraph (k)(2) below.) OSHA did not receive any comments on the proposed requirement and finalizes it as discussed above.

Final paragraph (k)(1)(iii), similar to existing § 1910.23(e)(4) and proposed paragraph (k)(2)(i), requires that employers ensure toeboards do not have an opening or clearance of more than 0.25 inches above the walking-working surface. This is measured from the walking-working surface to the bottom of the toeboard. The purpose of this requirement is to ensure that objects cannot fall off the walking-working surface through any drainage openings in the toeboard. The final rule is consistent with the construction fall protection standard (§ 1926.502(j)(3)), A10.18–2012 (Section 5.7), and A1264.1–2007 (Section 4.1.5).

Final paragraph (k)(1)(iv) is a companion provision to final paragraph (k)(1)(iii). Like proposed (k)(2)(i), it requires that employers ensure toeboards are solid or, if they have openings, the openings do not exceed 1 inch at their greatest dimension. OSHA acknowledges that the toeboards employers use in outdoor work areas may need drainage openings to prevent water from collecting on the walking-working surface, resulting in slips and falls. Therefore, this provision, along with final paragraph (k)(1)(iii), requires employers to ensure that such drainage openings do not exceed a height of ¼ inch or a length of 1 inch. These provisions are substantively the same as the proposed language. However, the final rule (paragraphs (k)(1)(iii) and (iv)) simplifies and clarifies the proposed provision. The final rule separates the requirements into two provisions, which makes them easier to understand, and removes unnecessary language (*e.g.,* ''vertical''). The final rule also clarifies the requirements by specifying more clearly than the proposal that no opening in the toeboard shall exceed 1 inch in length (final paragraph (k)(1)(iv)) and 0.25 inches in height (final paragraph (k)(1)(iii)). These maximum dimensions will ensure that objects cannot fall through any opening in a toeboard.

OSHA did not receive any comments on the requirements in proposed paragraph (k)(2)(i) and adopts final paragraphs (k)(1)(iii) and (iv) as discussed above.

Final paragraph (k)(1)(v), like proposed paragraph (k)(2)(ii), requires that employers ensure toeboards used around vehicle repair, service, and assembly pits (pits) have a minimum height of 2.5 inches. The height is measured from the walking-working surface to the top edge of the toeboard. The final rule also includes an exception, which specifies that employers do not have to erect toeboards along the exposed edges of a pit if they can demonstrate the toeboard would prevent access to a vehicle that is over the pit.

The final rule recognizes that shorter toeboards are adequate to protect workers from being hit by falling objects when vehicles are over the pit because the space between the toeboard and the vehicles is small enough to prevent most objects from falling into the pit. When vehicles are not over the pit, toeboards are not necessary because employees are not working in the pit and, thus, not exposed to a falling object hazard. Therefore, the exception is necessary because toeboards, even short ones, would prevent workers from accessing the vehicle to perform repair, service, or assembly work.

The final rule clarifies the proposed toeboard exception in two respects. First, the final rule states more clearly than the proposal that the toeboard exception applies only when ''employers can demonstrate'' that erecting toeboards would prevent access to a vehicle. In the preamble to the proposal, OSHA explained that employers have the duty to show that toeboards would prevent vehicle access (75 FR 28899). The final rule adds that language to the regulatory text to clarify this requirement.

Second, the final rule clarifies that the exception is limited. It only applies to those parts and sections of exposed edges where erecting toeboards would prevent access to a vehicle that is over a pit. The final rule still requires that employers erect toeboards at other exposed edges. OSHA did not receive any comments on the proposed provision and exception, and finalizes them with the clarifications explained above.

Final paragraph (k)(1)(vi), like proposed paragraph (k)(4), requires that employers ensure toeboards are capable of withstanding, without failure, a force of at least 50 pounds, applied in any downward or outward direction at any point along the toeboard. OSHA drew the requirement from the construction fall protection standard in § 1926.502(j)(2). The existing rule in § 1910.23(e)(4) does not include this requirement; rather, the existing provision specifies that employers securely fasten toeboards and they be made of ''any substantial material.''

As defined in final § 1910.21(b), ''failure'' means a load refusal (*i.e.,* the point at which the load exceeds the ultimate strength of a component or object), breakage, or separation of component parts. Therefore, ''without failure'' means a toeboard must have adequate strength to remain in place and intact after applying 50 pounds in a downward or outward direction at any point along the toeboard. OSHA believes that the language in final rule and the construction fall protection standard is clearer, and provides employers with better guidance on compliance, than the existing rule. OSHA did not receive any comments on the proposed requirement and finalizes it as discussed above.

Final paragraph (k)(2)(i), like proposed (k)(3), establishes criteria and practice requirements where tools, equipment, or materials are piled higher than the toeboard. Where such items are piled higher than the toeboard, the employer must install paneling or screening from the toeboard to the midrail of the guardrail system and for a length that is sufficient to protect employees below. If the items are piled higher than the midrail, the employer must install paneling or screening to the top rail of the guardrail and for a length that is sufficient to protect employees below.

The final provision uses the same approach as the construction fall protection standard in § 1926.502(j)(4) when objects are piled higher than the toeboard. The construction standard requires that employers install paneling or screening from the walking-working surface or toeboard to the top of the guardrail or midrail. In addition to requiring that employers use guardrail systems in such cases, final § 1910.28(c)(2) requires that employers must protect workers from falling objects by keeping objects far enough from the exposed edges to prevent them from falling to a lower level. OSHA believes that this two-pronged approach provides effective redundancy that will prevent falling objects from injuring or killing workers on lower levels. In addition, OSHA believes that following a similar approach to that in the construction standard will make compliance easier for employers who perform both general industry and construction activities.

OSHA notes final paragraph (k)(2)(i) requires that employers use guardrail systems equipped with ''paneling or screening'' rather than vertical members specified in final § 1910.29(b). Even though the final rule requires that the distance between vertical members must not exceed 19 inches, OSHA believes that some items, such as heavy tools, can fall through those openings. Paneling, such as solid paneling, or screening will prevent piled objects from falling through the guardrail system to a lower level.

Final paragraph (k)(2)(i), like proposed paragraph (k)(5), also requires that employers ensure the paneling or screening they install extends for a distance along the guardrail system that is sufficient to protect workers below from falling objects. The final rule is consistent with the guardrail requirement in final paragraph (b)(2) of this section, and the construction fall protection standard in § 1926.502(j)(4). Final paragraph (k)(2)(i) also is consistent with existing § 1910.23(e)(4). The A1264.1–2007 standard (Section 5.7) allows employers to use guardrail systems equipped with screening or additional toeboards, to protect workers from falling objects.

Final paragraph (k)(2) consolidates into one provision the proposed criteria and practice requirements for guardrail systems used as falling object protection (see proposed paragraphs (k)(3) and (5)). OSHA believes this consolidation makes the final rule easier to understand and follow than the proposal.

OSHA notes that, except when specified elsewhere, guardrail systems used for falling object protection also must meet the guardrail requirements in final paragraph (b) of this section, such as the strength requirements for paneling and screening (see final paragraph (b)(5)).

OSHA received one comment on the proposed rule. Ellis supported the proposed requirement to install barriers to prevent objects from falling through openings (Ex. 155). He also recommended that materials used for paneling or screening include sheet metal, gratings, and netting (Ex. 155). OSHA notes that A1264.1–2007 (Section 5.7) requires that paneling or screening used for falling object protection have at least 18-gauge thickness. Although the final rule uses performance-based language, OSHA notes that paneling or screening that meets the ANSI/ASSE standard would comply with final paragraph (k)(2).

Final paragraph (k)(2)(ii), like proposed paragraph (k)(5), requires that employers ensure openings in guardrail systems are small enough to prevent objects from falling through the openings. The final rule is consistent with the construction fall protection standard in § 1926.502(j)(5). OSHA is adopting the proposed rule with only minor editorial change.

Final paragraph (k)(3) establishes requirements for using canopies as falling object protection. Like proposed paragraph (k)(6), the final rule establishes a performance-based provision requiring that employers ensure canopies are strong enough to prevent collapse and penetration when struck by any falling object. The final rule adds language clarifying that the strength requirements in final paragraph (k)(3) only apply to canopies that employers use to protect workers from falling objects, not to all canopies. OSHA did not receive any comments on the proposed measure and finalizes the provision with the editorial change discussed above.

Paragraph (l)—Grab Handles

Final paragraph (l) specifies criteria and practice requirements for grab handles that employers provide, such as at a hoist area. Workers often use grab handles when they lean through or over the edge of the access opening to facilitate hoisting operations. The final rule in § 1910.21(b) defines a ''hoist area'' as any elevated access opening to a walking-working surface through which equipment or materials are loaded or received.

The final rule does not retain a portion of proposed § 1910.28(b)(2)(ii), which required that employers provide a grab handle on each side of the access opening at hoist areas whenever guardrail systems, gates, or chains are removed to facilitate a hoisting operation and a worker must lean through the opening or over the edge of the access opening. However, if employers do provide grab handles, final paragraph (l) requires that they must ensure the grab handles meet the criteria and practice requirements in final paragraph (l). The existing rule requires that employers provide grab handles on each side of wall openings and holes, and on ''extension platforms onto which materials can be hoisted for handling'' (see existing § 1910.23(b)(1)(i) and (ii)), and also establishes criteria that wall opening grab handles must meet (see existing § 1910.23(e)(10)). Neither the construction fall protection standard in § 1926.501 nor any national consensus standard requires the use of grab handles at hoist areas.

OSHA decided to retain the criteria and practice requirements in final paragraph (l) to clarify that employers who provide grab handles must ensure those handles are safe and effective. Moreover, retaining the criteria and practice requirements addresses Ameren's recommendation that OSHA explain what qualifies as a grab handle in the final rule, requesting that OSHA ''be specific as to not cause confusion or misinterpretation'' (Ex. 189).

Final paragraph (l)(1), like the proposed rule, requires that grab handles employers provide must be at least 12 inches in length. This final provision is consistent with the existing rule in § 1910.23(e)(10). OSHA believes that 12-inch handles will provide workers with an adequate grip space.

Final paragraph (l)(2), similar to existing § 1910.23(e)(10) and the proposed rule, specifies that grab handles employers install at hoist access openings must provide at least three inches of clearance from the framing or opening. OSHA believes a three-inch clearance is essential to ensure workers have adequate space to wrap their hands around the handle and grip it firmly, if they lean out of the opening during hoisting operations, thereby preventing falls.

Final paragraph (l)(3), like the proposed rule, specifies that grab handles employers provide must be capable of withstanding a maximum horizontal pull-out force equal to two times the maximum intended load or 200 pounds, whichever is greater. The existing rule in § 1910.23(e)(10) has similar language requiring that grab handles be capable of withstanding 200 pounds applied horizontally at any point along the handle. OSHA believes the required strength criteria will ensure that grab handles remain in place when workers hold onto them and lean their bodies out of an access opening. OSHA is adopting final paragraph (l) with the clarifications discussed.

Section 1910.30 Training Requirements

Final § 1910.30, like the proposed rule, adds training requirements to 29 CFR part 1910, subpart D (subpart D). OSHA drew most of the new training requirements from the construction fall protection standard (29 CFR 1926.503). Final § 1910.30 requires training on fall and equipment hazards and, in certain situations, retraining. The final training requirements are performance based, and give employers flexibility to tailor the requirements and training methods to their workforce and workplace.

Some commenters said that employers are not providing fall protection training, which puts employees at significant risk of injury (Exs. 329 (1/19/2011, p. 86); 329 (1/20/2011, p. 99)). One worker testified that he received no training at any company where he worked, saying, ''It was learn as you go'' (Ex. 329 (1/19/2011, p. 86)).

OSHA believes that the new training requirements are necessary, and effective worker training is one of the most critical steps employers can take to prevent employee injuries and fatalities. Generally, commenters supported adding training requirements to subpart D (Exs. 53; 73; 96; 127; 172; 189; 205; 216; 222; 226; 329 (1/19/2011, pgs. 22, 24); 364). For example, the AFL–CIO said, ''[T]raining requirements are necessary to ensure that workers can identify the fall hazards they face in their workplaces and understand how they can be protected'' (Ex. 172). The American Society of Safety Engineers (ASSE) agreed, saying, ''[A]ppropriate training is a key element of managing every kind of workplace safety risks'' (Ex. 127).

The National Grain and Feed Association (NGFA) stated, training ''programs are vital, first and foremost, to safeguard lives and prevent injuries'' (Ex. 329 (1/20/2011, p. 248)). Sam Terry, president of Sparkling Clean Window Company, and Dana Taylor, executive vice president of Martin's Window Cleaning, also stressed that proper training is critical to reduce workplace injuries and illnesses (Exs. 222; 362). Mr. Terry said, ''The lack of proper training is probably the most significant contributor to accidents and incidents when suspended work is performed'' (Ex. 362). He added that most, if not all, of the accidents involving rope descent systems and suspended scaffolding since 1977 that he reviewed ''could have been prevented if the employees had received proper training'' (Ex. 163). Similarly, Mr. Russell Kendzior, president of the National Floor Safety Institute (NFSI), stated, ''Approximately 8 percent of all slips, trips and falls are directly caused by improper or lack of employee training'' (Ex. 329 (1/21/2011, p. 204)). The International Window Cleaning Association (IWCA), which has spent years researching and analyzing accident data and industry practices, told OSHA that ''inadequate training'' was one of the leading causes of accidents among window cleaners (Ex. 364).

Some commenters, however, opposed the proposed training requirements. Mr. Charles Lankford, of Rios & Lankford International Consulting, opposed the application of some training requirements because they do not exempt employers who rely exclusively on guardrails or safety net systems. He said, ''[Those] systems . . . are completely passive in their protective characteristics and do not require any special knowledge on the part of the protected employees'' (Ex. 368). OSHA does not agree with the commenter. Regardless of whether a fall protection system is passive, it will be effective only if it is installed, inspected, used, maintained, and stored properly and safely. OSHA believes that workers need special and specific knowledge to perform these tasks correctly. For example, to ensure that safety net systems protect employees in the event of a fall, employees must know, or be able to calculate, how much weight the net will hold in the particular situation. Therefore, OSHA believes that workers who use any type of fall protection system must receive proper training. (See discussion of final paragraph (b)(1) for additional explanation.)

The National Chimney Sweep Guild (NCSG) opposed the proposed training requirements for workers who use personal fall protection systems, saying that they duplicated and overlapped the personal protective equipment (PPE) training that § 1910.132(f) requires:

> This would place an inappropriate and unnecessary burden on employers, employees and compliance personnel in sorting out the confusion presented by the redundant, overlapping and varying provisions addressing the same issues. Furthermore, unless the rule would allow sweeps to receive generic hazard training (rather than site-specific training), this requirement would be economically infeasible for sweeps (Ex. 150).

As explained in the proposal, OSHA acknowledges that some of the training requirements in § 1910.30 may overlap those in § 1910.132. To the extent that any provisions do overlap, OSHA does not believe that it burdens employers because training that complies with one standard satisfies the employer's obligation under the other standard. That said, OSHA believes that the training requirements in final §§ 1910.30 and 1910.132(f) complement each other and, therefore, ensure that workers receive comprehensive training. For example, final § 1910.30(a)(3)(i) requires that employers train workers how to recognize the need for PPE while § 1910.132(f)(1)(i) requires that employers train employees to know what PPE is necessary and fits. Also, § 1910.30(a)(iii) requires that employers train workers in the correct and safe use of personal fall protection systems, while § 1910.132(f)(1)(iv) requires training on the limitations of those systems.

The final rule does not require that training be site-specific; that is, provided the site where employees are performing the job. However, to be effective the training that employers provide needs to address the hazards which their employees may be exposed. OSHA believes that NCSG already may be providing this training. For example, NCSG said they provide shop classes at individual businesses as well as on-the-job training. In addition NCSG said the chimney sweep training program lasts six to 12 months and during that training workers are ''exposed to a lot of different situations'' (Ex. 329 (1/18/2011), p. 274).

Commenters also supported OSHA's performance-based approach to the training requirements. For example, the National Cotton Ginners' Association (NCGA) (Ex. 73) and the Texas Cotton Ginners' Association (TCGA) (Ex. 96) both said, ''We believe it is most beneficial to keep this section general so that each employer may review their own operation to determine which employees need to receive specific training.''

Paragraph (a)—Fall Hazards

Final paragraph (a), like the proposed rule, contains training requirements related to fall hazards.[73] Final paragraph (a)(1), like the proposal, requires that employers train each employee who uses a personal fall protection system. Final § 1910.21(b) defines personal fall protection system as ''a system an employee uses to provide protection from falling or to safely arrest an employee's fall if one occurs.'' Personal fall protection systems include personal fall arrest, travel restraint, and positioning systems (§ 1910.21(b)).

Final paragraph (a)(1) also requires that employers train each worker required to receive training under subpart D. Subpart D requires worker training in several situations, including:

- When employees use a rope descent system (RDS) (§ 1910.27(b)(2)(iii));
- When employees work on an unguarded working side of a platform

[73] The final rule defines fall hazard as ''any condition on a walking-working surface that exposes an employee to a risk of harm from a fall on the same level or to a lower level'' (final § 1910.21(b)). However, for the purposes of final paragraph (a), ''fall hazards'' refers to the risk of falling four (4) feet or more to a lower level, except for falling into or onto dangerous equipment; for this exception, there is no limit to the distance an employee may fall to a lower level.

used on slaughtering facilities, loading racks, loading docks, or teeming platforms (§ 1910.28(b)(1)(iii)(C) and (b)(14)(ii)(C)); and

- When employees operate motorized equipment on dockboards not equipped with fall protection (*e.g.,* guardrails) (§ 1910.28(b)(4)(ii)(C)).

In the proposed rule, OSHA invited comment on whether the final rule should expand the scope of the fall hazard training in paragraph (a)(1) to cover all fall hazards over four feet (including ladders); training on the safe use of ladders; and training to avoid slips, trips, and falls on the same level of a walking-working surface (75 FR 28900). Some commenters urged OSHA to expand the scope of the training requirements. For instance, Mr. Bill Kojola of the AFL–CIO said, ''It is our view that the training requirements in the final rule need to be expanded to include training for all workers exposed to fall hazards over 4 feet (including those using ladders), those using portable guardrails, and for all workers using portable and fixed ladders'' (Ex. 172; *see also* Ex. 329 (1/20/2011, p. 221)). He pointed out that the construction fall protection standard (§ 1926.503(a)(1)) requires that employers train each employee ''who might be exposed to fall hazards,'' noting further that ''[i]f OSHA is committed to harmonizing its fall protection standards across industries . . . it needs to expand the final [rule] . . . and provide training for all workers who are exposed to fall hazards'' (Ex. 172).

Mr. Kojola also urged OSHA to expand training to cover ''the hazards of falls on the same level'' (Ex. 363). He cited the testimony of Mr. Kendzior (NFSI) who said that the current annual cost of falls to the same level ''tops more than 80 billion dollars a year'' (Ex. 363, citing Ex. 329 (1/21/2011, p. 201)).

The American Federation of State, County and Municipal Employees (AFSCME) also supported expanding the scope of paragraph (a)(1), stressing the importance of training for employees who use ladders:

> Training should not be limited to workers who used a specific fall protection system. All workers should have hazard recognition training that includes prevention of falls from any height or surface. Because ladders are so common in the workplace, they are often considered ''safe.'' Yet many incident reports include injuries or near misses using a ladder. Any worker who is required to use a ladder in his/her work duties should get basic information on use, care, and limitations of ladders (Ex. 226).

Ellis Fall Safety Solutions also supported adding ladder training to the final rule (Ex. 155).

On the other hand, some commenters opposed expanding the scope of the training requirements. NCGA and TCGA both said:

> It is a difficult task to predict where falls may occur in an individual operation and it becomes an insurmountable task to predict where falls are most likely to occur on a general industry basis. Having a more prescriptive list of instances in this section may lead an employer to focus on the list, rather than focusing on the areas of highest risk in his individual facility (Exs. 73; 96).

After analyzing the comments and other information in the record, OSHA decided to adopt the proposed fall hazard training scope without substantive change. For several reasons, OSHA believes that the scope of final paragraph (a)(1) is appropriate, and it is not necessary to expand the paragraph's scope. First, the scope of final § 1910.30(a)(1) is broad. It requires that employers train all workers who use personal fall arrest systems, travel restraint systems, and positioning systems. The final rule, like the proposal, gives employers great flexibility in selecting what type of fall protection system to use, and OSHA believes that many employers will use personal fall protection systems to protect their workers from fall hazards.

Second, in addition to the workers who must receive training under final paragraph (a)(1), final § 1910.30(b) requires that employers also train each worker who uses equipment covered by subpart D in the proper use, inspection, care, maintenance, and storage of that equipment. The equipment includes, but is not limited to, ladder safety systems, safety net systems, portable guardrails, and mobile ladder stands and platforms. Thus, as AFL–CIO, AFSCME, and other commenters recommended, employers must train each worker who uses fixed ladders equipped with ladder safety systems so they know the proper use, inspection, care, maintenance, and storage of that equipment.

Third, employees are also protected by the inspection, control, work practice, and design requirements in subpart D. For instance, final § 1910.23 specifies many design and work practice requirements for portable ladders. Under the final rule, employers are responsible for providing portable ladders that comply with the design requirements, as well as for ensuring that their workers understand and follow the work practices in § 1910.23. OSHA believes that the measures in the final rule, taken as a whole, establish an effective plan to protect workers from slip, trip, and fall hazards.

In final paragraph (a)(1), OSHA added language to clarify the date by which employers must train workers who use personal fall protection systems or who are required to be trained on fall hazards as specified elsewhere in subpart D. Additionally, the Agency added language to the final rule requiring employers to train workers before the worker can be exposed to the fall hazard. As noted in the preamble to the proposed rule, OSHA intended to include this language in the regulatory text (75 FR 28899). Accordingly, employers must train their current workers after OSHA publishes the final rule, and train newly-hired workers before initially assigning them to a job where they may be exposed to a fall hazard. To give employers adequate time in which to develop and provide initial training, OSHA is allowing employers six months, on or before May 17, 2017, to train their workers in the requirements specified in § 1910.30(a).

Edison Electric Institute (EEI) said OSHA should not require employers to provide initial training if they have previously trained workers:

> The proposed regulation should allow employers to consider previously delivered training as compliant. Employers should not be required to retrain employees just because the new regulation is finalized. Work practices by many employers will not be changed by the new regulation and they should not be required arbitrarily to retrain employees (Ex. 207).

OSHA agrees with EEI's comment. An employer whose workers have received training, either from the employer or another employer, that meets the requirements of final § 1910.30(a) will not need to provide additional initial training. However, many of the training requirements in final § 1910.30 are new, and if the initial training workers already have received does not meet all of the requirements in the final rule, employers will need to provide initial training on those requirements.

OSHA does not think the requirement to provide training for workers whose previous training does not meet the final rule or to provide initial training for new workers will pose significant difficulties for employers. Many commenters said that they train workers annually or continually (Ex. 329 (1/19/2011, pgs. 25, 45, 240, 413); 329 (1/20/2011, p. 284)). Since the final rule allows employers six months to provide initial training that complies with final § 1910.30, OSHA believes that most employers will be able to work the required training into their existing annual or continuing training schedule.

Finally, in final paragraph (a)(1), OSHA deleted the second sentence of the proposed paragraph, and moved to it to final paragraph (a)(3). That sentence specified topics that training must cover (*i.e.,* recognize the hazards of falling and understand the procedures to be followed to minimize the hazards), and OSHA believes it is most appropriate to group these topics with the other training topics in final paragraph (a)(3).

Final paragraph (a)(2), like the proposed rule, requires that employers ensure a qualified person trains each worker in the requirements specified in § 1910.30(a). Final § 1910.21(b) defines ''qualified'' as a person who, by possession of a recognized degree, certificate, or professional standing, or who by extensive knowledge, training, and experience has successfully demonstrated the ability to solve or resolve problems relating to the subject matter, the work, or the project. OSHA believes that having a person who has a degree, certificate, or professional standing (hereafter ''degree'') or extensive knowledge, training, and experience (hereafter ''extensive knowledge'') in fall hazards, and who demonstrates ability to solve problems related to fall hazards, will help to ensure that employees receive effective training. Moreover, to stress the importance of this requirement and its application to all the training that § 1910.30 requires, OSHA made a separate provision for this requirement in the final rule.

OSHA notes that the construction fall protection standard, instead of specifying that a qualified person must train workers, requires that employers ensure that a competent person is qualified to train workers in each of the items and topics specified in § 1926.503(a)(2)(i)–(viii). Despite the difference in language between final §§ 1910.30(a)(2) and 1926.503(a)(2), OSHA believes the standards are consistent. OSHA believes that competent persons [74] ''qualified'' to train workers in all of the subjects and topics in the § 1926.503, or final § 1910.30, must have the capabilities of qualified persons. Accordingly, they must have capabilities (*i.e.,* extensive knowledge and demonstrated ability to solve or resolve issues) beyond those capabilities specified for competent persons (*i.e.,* to identify hazards and take corrective measures).

[74] A ''competent person,'' is defined by the construction rule (§ 1926.32(f)), as one who is capable of identifying existing and predictable hazards in the surroundings or working conditions that are unsanitary, hazardous, or dangerous to employees, and who has authorization to take prompt corrective measures to eliminate them.

For purposes of the final rule, a trainer must have, at a minimum, a ''degree'' that addresses, or ''extensive knowledge'' of: The types of fall hazards, how to recognize them, and the procedures to minimize them; the correct procedures for installing, inspecting, operating, maintaining, and disassembling personal fall protection systems; and the correct use of personal fall protection systems and other equipment specified in § 1910.30(a)(1). Because of the breadth of knowledge and demonstrated ability trainers in the final rule must have, OSHA believes that specifying that qualified persons must train workers best describes the capabilities necessary for training workers in the subjects § 1910.30(a) requires.

OSHA received several comments about the ''qualified'' person requirement in proposed paragraph (a)(2). Some commenters supported the proposed requirement. For instance, Mark Reinhart, owner of Award Window Cleaning Services (AWCS), said, ''[T]raining must be by a person or persons that are experienced in the correct training procedures and competent in each area of training'' (Ex. 216). He told of a company where he worked that used a veteran window cleaner to train a worker who, in turn, trained another worker:

> The problem was they were all trained to be risk takers—no safety lines, no three points of contact on ladders, no safety for the public, nothing at all about fall protection. So my employer put me at risk without knowing or researching the industry to find best practices or rules governing the window cleaning industry (Ex. 216).

Mr. Andrew Horton, safety training coordinator with Service Employees International Union (SEIU) Local 32BJ, recommended OSHA require that only approved outreach trainers conduct training (Ex. 329 (1/19/2011, p. 26)).

On the other hand, some commenters opposed the ''qualified'' person requirement in proposed (a)(2). One commenter said the requirement was ''too stringent and restrictive'' (Ex. 329 (1/20/2011, p. 298)). Mr. Lankford said that requiring qualified persons to train workers meant that trainers would have to be ''a specialist in fall protection, such as a vendor, manufacturer or consultant-trainer'' and not a ''crew chief, foreman, operations person or similar positions, even if knowledgeable'' (Ex. 368). Based on his interpretation of proposed paragraph (a)(2), Mr. Lankford concluded, ''There is no convincing argument that the training would not be equally effective if provided by a competent person'' (Ex. 368).

OSHA believes Mr. Lankford's interpretation of proposed paragraph (a)(2) is not accurate. The definition of ''qualified'' in the final rule (§ 1910.21(b)) allows employers to have crew chiefs, supervisors, operations personnel, or other individuals train workers, provided they have the necessary ''degree'' or ''extensive knowledge'' outlined in the definition of qualified, and specified in final § 1910.30(a). Final § 1910.30(a)(2) does not require that trainers possess a degree if they have the necessary knowledge, training, and experience. In fact, OSHA believes that many employers will draw upon the extensive knowledge and experience of their staffs to provide effective training. OSHA also notes that final § 1910.30(a)(2) does not require that employers use qualified persons who are employees. Employers are free to use outside personnel to train workers.

Mr. Lankford and EEI also raised concerns that requiring a qualified person to train workers would prohibit employers from using different training formats and technologies (Exs. 207; 368). Mr. Lankford said, ''The [qualified person] requirement seems to exclude the use of audio-visual or computer-based-training for the purpose of complying with this requirement'' (Ex. 368). Addressing the same issue, EEI said:

> The OSHA regulation should allow employers to use technology to deliver training. Stand up training by a qualified person is not the only effective method of training. The OSHA regulation should allow employers to use computer based training, web based training, and video training to meet fall protection training requirements (Ex. 207).

Final paragraph (a)(2) does not require or prohibit a specific format for delivering training to workers. OSHA supports the use of different formats (*e.g.,* classroom, audio-visual, demonstration, practical exercises, field training, written) and new technology (*e.g.,* online, interactive computer-based, web-based) to train workers in accordance with § 1910.30. Thus, final paragraph (a)(2) allows employers to use video-based training and computer-based training, provided that:

- A qualified person, as defined in § 1910.21(b), developed or prepared the training;
- The training content complies with the requirements in final § 1910.30; and
- The employer provides the training in a manner each worker understands (§ 1910.30(d)).

OSHA discusses this issue in further detail in the explanation of final paragraph (d) below.

OSHA notes that employers may provide training using a format that is web based or interactive computer-based. In such cases, a qualified person must be available to answer any questions workers may have to comply with final paragraph § 1910.30(a)(2).

Final paragraph (a)(3) specifies the minimum subjects and topics that fall hazard training must cover. Final paragraph (a)(3) requires that employers provide training in at least the following topics:

- The nature of fall hazards in the work area and how to recognize them (final paragraph (a)(3)(i));
- The procedures that must be followed to minimize the hazards (final paragraph (a)(3)(ii));
- The correct procedures for installing, inspecting, operating, maintaining, and disassembling the personal fall protection systems that the worker uses (final paragraph (a)(3)(iii)); and
- The correct use of personal fall protection systems and equipment, including, but not limited to, proper hook-up, anchoring, and tie-off techniques, and methods of equipment inspection and storage as specified by the manufacturer (final paragraph (a)(3)(iv)).

OSHA drew most of the requirements in final paragraph (a)(3) from the construction fall protection standard (§ 1926.503(a)(1) and (2)). However, OSHA revised final paragraph (a)(3) in several ways. First, as discussed above under final paragraph (a)(1), OSHA added to final paragraph (a)(3) the requirements to train workers in hazard recognition and the procedures to minimize fall hazards, which were in proposed paragraph (a)(1).

Second, OSHA revised final paragraph (a)(3)(iv), proposed paragraph (a)(2)(iv), to eliminate training employees on the ''limitations'' of personal fall protection systems. OSHA believes it is not necessary to include that requirement in final paragraph (a)(3) because § 1910.132(f)(1)(iv) already requires training that addresses the limitations of PPE, which includes personal fall protection systems.

Third, final paragraph (a)(3) does not include the proposed requirement that employers train workers in the use and operation of ''guardrail systems, safety net systems, warning lines used in designated areas, and other protection'' (proposed paragraph (a)(2)(iii)). OSHA does not believe this provision is necessary because final paragraph (b) already addresses most of these fall protection systems and measures.

Finally, OSHA changed the word ''erecting'' to ''installing'' in final paragraph (a)(3)(ii) (proposed paragraph (a)(2)(ii)). OSHA believes this clarification more accurately expresses the intent of the proposed paragraph.

Although commenters generally supported the required worker training topics and subjects outlined in final paragraph (a)(3) (Exs. 53; 189; 216; 226), others said OSHA should increase or eliminate some of the training requirements. Mr. Horton said that window cleaners need more detailed training than what OSHA proposed (Ex. 329 (1/19/2011, p. 22)). The Society of Professional Rope Access Technicians (SPRAT) recommended that OSHA specify ''at least topics for knowledge, skills, and capabilities for each level of employee,'' and require specific training and certification by an industry organization for rope access (Ex. 205). OSHA did not incorporate SPRAT's recommendations in the final rule. The Agency believes that the performance-based language in the final rule provides flexibility for employers, and does not prohibit employers from providing more specialized training or requiring certification or demonstration of the employee's knowledge, skills, and capabilities.

Ameren Corporation opposed requiring training to install and disassemble personal fall protection systems. Ameren said such training was not always necessary because some employees may not perform these tasks (Ex. 189). OSHA agrees that employers need not train employees in tasks that they do not perform. However, under the final rule, if a worker has to install and disassemble personal fall protection systems, the employer must ensure the worker knows how to perform those tasks safely and correctly before beginning the work.

Paragraph (b)—Equipment Hazards

Final paragraph (b), like the proposed rule, contains training requirements related to equipment hazards. The provisions require that employers ensure workers are trained in the following:

- The proper care, inspection, storage, and use of equipment covered by subpart D (final paragraph (b)(1));
- How to properly place and secure dockboards to prevent unintentional movement (final paragraph (b)(2));
- How to properly rig and use a rope descent system (RDS) (final paragraph (b)(3)); and
- How to properly set up and use designated areas (final paragraph (b)(4)).

Final paragraph (b)(1) applies to the extent that workers use equipment covered by subpart D. Under this provision employers must train workers in equipment as well as fall protection systems that final paragraph (a) does not cover. Therefore, as mentioned above, training in final paragraph (b)(1) must cover equipment such as safety net systems, ladder safety systems, warning lines, portable guardrails, and motorized materials handling equipment used on dockboards.

EEI said that OSHA should not require training in portable guardrails because ''the purpose and use of these devices is obvious'' (Ex. 207). While some workers may know how to set up and use portable guardrails, the same is not true for all workers, particularly new workers. Thus, final paragraph (b)(1) must cover portable guardrails to protect all workers from falls.

OSHA added language to final paragraph (b)(1) to clarify the date by which employers must train workers in equipment hazards. Accordingly, employers must train their current workers after OSHA publishes the final rule, and train newly hired workers before initially assigning them to a job where they may be exposed to a fall hazard. To give employers adequate time in which to develop and provide initial training, OSHA is allowing employers six months, until May 17, 2017, to provide the required training.

Like final paragraph (a), employers whose workers have received training, either from the employer or another employer, that meets the requirements of final § 1910.30(b) will not need to provide additional initial training to those workers. However, the training requirements in final § 1910.30 are new, and if the initial training workers already have received does not meet all of the requirements in the final rule, employers will need to provide initial training on those requirements.

Final paragraph (b)(2) requires employers to train workers who use dockboards on how to properly place and secure them to prevent unintentional movement. The Agency believes training in the proper positioning of dockboards (*e.g.,* adequate overlap, secure position) to avoid unintentional movement is needed to help prevent worker injury. OSHA did not make any substantive changes to proposed paragraph (b)(2) and did not receive any comments. OSHA has adopted paragraph (b)(2) with only minor revisions for clarity.

Final paragraph (b)(3) requires employers to train workers who use RDS in the proper rigging and use of the equipment, in accordance with § 1910.27. The final rule eliminates the retraining requirement specified for RDS in proposed paragraph (b)(3) because final paragraph (c) of final § 1910.30

already requires retraining. A number of commenters supported OSHA's RDS training requirements, particularly in the window cleaning industry (Exs. 65; 66; 76; 137; 222; 362; 364). Gerard McEneaney, business representative of the Window Cleaners Division of SEIU Local 32BJ, also supported the RDS training requirements, stating, ''RDS relies heavily on training, workplace practices, and administrative controls to overcome its inherent dangers'' (Ex. 329 (1/19/11, p. 17)). OSHA notes that workers using RDS are exposed to fall hazards and must use personal fall arrest systems; therefore, employers must train them as required by final § 1910.30(a).

Paragraph (b)(4) is a new paragraph that OSHA added to the final rule requiring employers to train each worker who uses a designated area in the proper set up and use of the area. OSHA inadvertently left this training requirement out of the proposed rule. But OSHA intended to include this requirement in the proposed rule, and the preamble noted that ''it is essential for authorized employees in designated areas'' to be trained (75 FR 28889). Under the final rule in some situations OSHA permits employers to protect workers from ''unprotected sides and edges'' on low-slope roofs by using designated areas, which final § 1910.21(b) defines as ''a distinct portion of a walking-working surface delineated by a warning line in which work may be performed without additional fall protection.''

Designated areas are not conventional fall protection systems or engineering controls. Designated areas are alternative fall protection methods that are effective only when set up and used correctly and safely. This alternative method relies heavily on employers properly delineating the designated area and successfully keeping workers within that area. To ensure workers follow the requirements for designated areas, OSHA believes it is important that employers train them so they know when they can use designated areas and how to set up designated areas and work in them safely.

Paragraph (c)—Retraining

Final paragraph (c), like the proposal, requires that employers retrain workers when they have reason to believe that those workers do not have the understanding and skill that final paragraphs (a) and (b) require. In particular, final paragraph (c) requires that employers retrain workers in situations including, but not limited to, the following:

- When workplace changes render previous training obsolete or inadequate (final paragraph (c)(1));
- When changes in the types of fall protection systems or equipment workers use renders previous training obsolete or inadequate (final paragraph (c)(2)); or
- When inadequacies in a worker's knowledge or use of fall protection systems or equipment indicate that the worker does not have the requisite understanding or skill necessary to use the equipment or perform the job safely (final paragraph (c)(3)).

The training requirements in this section impose an ongoing responsibility on employers to maintain worker proficiency. As such, when workers are no longer proficient, the employer must retrain them in the requirements of final paragraphs (a) and (b) before workers perform the job again. Examples of when retraining is necessary include:

- When the worker performs the job or uses equipment in an unsafe manner;
- When the worker or employer receives an evaluation or information that the worker is not performing the job safely; or
- When the worker is involved in an incident or near-miss.

Several commenters supported the proposed retraining requirements. For example, Andrew Horton, representing the SEIU Local 32BJ Window Cleaning Apprentice Training Program, said retraining is ''imperative whenever there are changes in the working conditions, or there is an indication that prior training has not been effective'' (Ex. 329 (1/19/2011, p. 24)).

OSHA received only one comment opposing retraining. Mr. Steve Smith of Verallia said the proposed retraining requirement was ''too subjective and vague to allow for consistent application and/or enforcement.'' He recommended that OSHA require ''training upon initial employment and annually thereafter,'' which OSHA's portable fire extinguisher standard requires (§ 1910.157) (Ex. 171).

OSHA disagrees that the performance-based language in proposed paragraph (c) is too vague and subjective. OSHA believes that final paragraph (c) specifies clearly when retraining is necessary. The language in final paragraph (c) is similar to the retraining provisions in other OSHA standards, including the PPE (§ 1910.132(f)(3)), lockout/tagout (§ 1910.147(c)(7)(iii)), and powered industrial truck standards (§ 1910.178(l)(4)). Those standards have been effective in ensuring that workers receive additional training when necessary. OSHA also believes that the performance-based retraining requirements in final paragraph (c) provide greater flexibility for employers than requiring annual retraining.

OSHA also disagrees with Mr. Smith's recommendation that OSHA limit the final rule to ''training upon initial employment and annually thereafter.'' This language appears to require that employers must train new workers, but would not have to train current employees after OSHA publishes the final rule. As discussed above, OSHA believes that employers need to provide retraining to current workers in accordance with final § 1910.30 when previous training is obsolete or inadequate. Finally, OSHA believes that identifying the specific situations when employers must provide retraining more precisely targets the real need for additional training than does an inflexible requirement such as annual training. Therefore, OSHA believes the final rule will be more effective, and will provide employers with more flexibility, than the alternative Mr. Smith recommends.

Paragraph (d)—Training Must Be Understandable

Final paragraph (d), like the proposed rule, requires that employers provide information and training to each worker in a manner that the employee understands. This language indicates that employers must provide information and instruction in a manner that workers receiving the training are capable of understanding so they will be able to perform the job in a safe and proper manner.

The final rule makes clear that training must account for the specific needs and learning requirements of each worker. For example, if a worker does not speak or adequately comprehend English, the employer must provide training in a language that the worker understands. Also, if a worker cannot read, employers will need to use a format, such as audio-visual, classroom instruction, or a hands-on approach, to ensure the worker understands the training they receive. Similarly, if a worker has a limited vocabulary, the employer must provide training using vocabulary the worker comprehends.

An increasing number of employers are using computer-based and web-based training (Exs. 207; 329 (1/20/2011, p. 191); 368). In such situations, final paragraph (d) requires that employers ensure that workers have adequate computer skills so they can operate the program and understand the information presented. Moreover, to ensure that employees ''understand'' computer-based training, as well as other types of training, OSHA believes it may be necessary for employers to ensure that a qualified person is available to answer questions and clarify information. For example, when employers use computer-based training, they could make a qualified person ''available'' through an interactive computer program (*e.g.,* WebEx), or have a qualified person present to answer questions. (For additional information on making training understandable, see OSHA's Training Standards Policy Statement).[75]

OSHA believes that employers should not have difficulty complying with final paragraph (d), or any other provision in § 1910.30. Many industry, labor, and professional organizations; training consultants; vendors; and manufacturers already provide employers with training and training materials to ensure that workers understand how to perform the job and use equipment correctly and safely (Exs. 329 (1/18/2011, pgs. 82, 117, 186, 258); 329 (1/20/2011, pgs. 182, 287); 329 (1/21/2011, pgs. 9, 92, 200, 206)).

A number of commenters said they already provide bi-lingual or multi-lingual training (Exs. 329 (1/19/2011, pgs. 118, 241, 319, 352, 413, 416, 462)). In addition, training and professional organizations have bi-lingual training materials available. For instance, the International Window Cleaning Association Safety Certification Program provides a bi-lingual study curriculum (Ex. 222).

Many commenters said they already use different formats (*e.g.,* classroom, audiovisual, demonstration, practical exercises, field training, written) and new technology (*e.g.,* interactive computer-based, web-based) to ensure that training is understandable (Ex. 329 (1/18/2011, pgs. 148, 258)). Commenters also said they use testing and training evaluation to ensure employees understand training (Ex. 329 (1/20/2011, p. 318)). Some commenters also supported certification of employee training by independent groups (*e.g.,* professional organizations) (Exs. 205; 222; 364).

Some commenters said they are using ''interactive training'' to make training understandable. For instance, SEIU Local 32BJ said their window cleaner training programs are ''highly interactive'' (Ex. 329 (1/19/2011, pgs. 120–121)), and they support requiring ''interactive'' training. Diane Brown, senior health and safety specialist with AFSCME, agreed, stating, ''Training should be as interactive as possible. We support . . . [adopting] training methods that ensure workers get the information they need'' (Ex. 226). Eric Frumin, health and safety director with Change to Win, stated:

> [I]t's not sufficient for OSHA to simply require employers to provide training in a language that workers understand. . . . It's one of the most important advances in OSHA rulemaking, to assure that the training is not only done in a language the workers understand, but that it's interactive, that workers have a chance to ask questions (Ex. 329 (1/19/2011, p. 119)).

Some commenters said OSHA should require that employers use specific training methods and techniques. For example, SEIU said training should include ''some combination of hands-on and classroom training methods that have been so successful in our training'' (Ex. 329 (1/19/2011, pgs. 25–26)). Ellis Fall Safety Solutions said that training methods must include the following:

> [T]here has to be a written curriculum, a presentation and written or recorded tests [that] see if the material has been picked up and the final thing is to check by observing discretely if the work is being done to the proper methodology that was taught. All these are subject to verification by a CSHO (Ex. 155).

Some commenters said that supervision is necessary to ensure training is successful. For instance, Mr. Frumin said, ''You can't take the chance that someone didn't understand the training. You've got to supervise them,'' (Exs. 329 (1/19/2011, pgs. 122–23); 329 (1/21/2011, p. 21)).

OSHA agrees that many of the training methods and elements the commenters recommend can help to make workplace training understandable, and generally supports their use. The Agency also believes that the final rule should give employers flexibility to develop training programs and use those training methods that best fit the needs of their workers and workplace. Therefore, OSHA finalizes paragraph (d) with only minor revisions for clarity.

OSHA also received comment on other training issues, including whether the final rule should require a minimum amount of time for worker training. Mr. Horton of SEIU Local 32BJ urged that OSHA mandate that training be a ''minimum number of hours to prevent any inadvertent or negligent training failures'' (Ex. 329 (1/19/2011, p. 25)). In contrast, Mr. Robert Miller, senior safety supervisor with Ameren Corporation, said OSHA should not set time requirements for providing training because it would interfere with the performance-based approach in the proposed rule (Ex. 189). Proposed § 1910.30 did not require that training meet a minimum time requirement, and there is no minimum time requirement for training in final § 1910.30. OSHA notes that the preliminary and final economic analysis include times for training, but the Agency notes that it included those times only for the purpose of the estimating the costs of the final rule.

Finally, ASSE suggested that § 1910.30 include a specific reference to the ANSI/ASSE Z490.1 consensus standard (Criteria for Accepted Practices in Safety, Health and Environmental Training) as a source of guidance information for employers (Ex. 127). That voluntary standard establishes criteria for safety, health, and environmental training programs. OSHA agrees that the consensus standard may be a valuable source of information about training programs. However, it does not address walking-working surfaces or fall and equipment hazards and OSHA has decided to not reference the standard in the final rule.

B. Final § 1910.140

OSHA is adding a new section to subpart I Personal Protective Equipment (PPE) (29 CFR 1910, subpart I) to address personal fall protection systems, which include personal fall arrest, travel restraint, and positioning systems (29 CFR 1910.140). The new section establishes requirements for the design, performance, use, and inspection of personal fall protection systems and system components (*e.g.,* body harnesses, lifelines, lanyards, anchorages).

OSHA also is adding two non-mandatory appendices that provide information to help employers select, test, use, maintain, and inspect personal fall protection equipment (Appendix C) and examples of test methods for personal fall arrest and positioning systems to ensure that they meet the requirements of § 1910.140 (appendix D).

In the final rule, OSHA adapts many provisions from its other fall protection standards, primarily Powered Platforms for Building Maintenance (29 CFR 1910.66, appendix C); Personal Fall Arrest Systems in Shipyard Employment (29 CFR 1915.159); Positioning Device Systems in Shipyard Employment (29 CFR 1915.160); and Fall Protection in Construction (29 CFR part 1926, subpart M). These adaptations ensure that OSHA fall protection rules are consistent across various industries. OSHA notes that other standards also require the use of

[75] OSHA's Training Standards Policy Statement is available from OSHA's website at: *https://www.osha.gov/dep/standards-policy-statement-memo-04-28-10.html.*

personal fall protection systems (Vehicle-Mounted Elevating and Rotating Work Platforms (Aerial Lifts) (29 CFR 1910.67(c)(2)(v)); Telecommunications (29 CFR 1910.268(g)); and Electric Power Generation, Transmission, and Distribution (29 CFR 1910.269(g)); however, the requirements and criteria in those standards generally are not comprehensive or broadly applicable.

Similar to the final rule revising 29 CFR part 1910, subpart D, final § 1910.140, when appropriate, also draws from national consensus standards addressing personal fall protection systems. Those standards include:

- ANSI/ALI A14.3–2008, American National Standards for Ladders—Fixed (A14.3–2008) (Ex. 8);
- ANSI/ASSE A10.32–2012, Personal Fall Protection Used in Construction and Demolition Operations (A10.32–2012) (Ex. 390);
- ANSI/ASSE Z359.0–2012, Definitions and Nomenclature Used for Fall Protection and Fall Arrest (Z359.0–2012) (Ex. 389);
- ANSI/ASSE Z359.1–2007, Safety Requirements for Personal Fall Arrest Systems, Subsystems, and Components (Z359.1–2007) (Ex. 37);
- ANSI/ASSE Z359.3–2007, Safety Requirements for Positioning and Travel Restraint Systems (Z359.3–2007) (Ex. 34);
- ANSI/ASSE Z359.4–2013, Safety Requirements for Assisted-Rescue and Self-Rescue Systems (Z359.4–2013) (Ex. 22);
- ANSI/ASSE Z359.12–2009, Connecting Components for Personal Fall Arrest System (Z359.12–2009) (Ex. 375); and
- ANSI/IWCA I–14.1–2001, Window Cleaning Safety (I–14.1–2001) (Ex. 10).

The final rule adopts a number of the provisions in proposed § 1910.140 with only minor, non-substantive technical or editorial changes. For many of these provisions, OSHA did not receive any comments from the public. Other provisions in the final rule include revisions based on information in the record and comments OSHA received. OSHA also revised provisions in the proposed rule to clarify the final rule, thereby making it easier for employers, workers, and others to understand.

Section 1910.140—Personal Fall Protection Systems

Paragraph (a)—Scope and Application

Paragraph (a) of the final rule specifies that employers must ensure each personal fall protection system that part 1910 requires complies with the performance, care, and use criteria specified in § 1910.140. This section defines ''personal fall protection system'' as a system that workers use to provide protection from falling, or safely arrest a fall if one occurs (§ 1910.140(b)). As mentioned earlier, personal fall protection systems include personal fall arrest, travel restraint, and positioning systems.

OSHA notes that not only does § 1910.140 apply to the new and revised requirements in subpart D, but also it applies to existing requirements in part 1910 that mandate or allow employers to protect workers from fall hazards using personal fall protection systems (§§ 1910.66; 1910.67; 1910.268; and 1910.269).

OSHA believes that the scope of final § 1910.140 and the requirements the final rule establishes are necessary. Importantly, OSHA did not receive any comments opposing the scope and application in paragraph (a). OSHA believes that without establishing design and performance criteria, there is risk that personal fall protection systems, particularly personal fall arrest systems, may fail and put workers at risk of harm. Such failure can occur for a number of reasons, including using:

- The wrong or inadequate system (especially one that is not strong enough for the particular application in which it is being used);
- A system not tested or inspected before use;
- A system not rigged properly;
- A system that does not have compatible components; or
- A system on which workers are not properly trained.

For several reasons, OSHA believes that employers should not experience significant difficulty complying with the final rule. Most of the requirements in the final rule come from OSHA's existing fall protection standards, as well as national consensus standards addressing fall protection, which also have been in place for years and represent industry best practices. Accordingly, OSHA believes that virtually all personal fall protection systems manufactured today meet the requirements in those standards as well as final § 1910.140. In addition, to assist employers in complying with the rule, OSHA includes an appendix in the final rule to provide employers with readily accessible information that will help them comply with final § 1910.140.

Paragraph (b)—Definitions

Final paragraph (b) defines terms that are applicable to final § 1910.140. OSHA believes that defining key terms will make the final rule easier to understand and, thereby, will increase compliance.

OSHA drew most of the definitions in paragraph (b) from existing OSHA and national consensus standards on fall protection. For instance, many of the terms in this paragraph also are found in the Powered Platforms standard (§ 1910.66(d) and appendix C); construction standards (§§ 1926.450(b), 1926.500(b) and 1926.1050(b)), and the shipyard employment PPE standard (§ 1915.151). OSHA believes that having consistent definitions across the Agency's standards will increase understanding of OSHA's fall protection rules, decrease the potential for confusion, and enhance worker safety. Having consistent definitions also will help to increase understanding and compliance for workers engaged in more than one type of work, such as general industry and construction activities.

Final paragraph (b) differs from the proposed rule in several respects. First, the final rule does not retain the proposed definitions for the following terms because OSHA does not use these terms in final § 1910.140: ''buckle'' and ''carrier.'' Second, final paragraph (b) adds two new terms to the proposed definitions: ''carabiner'' and ''safety factor.'' Third, the final rule also substantially modifies the definition of ''competent person'' from the proposed rule. OSHA believes that additional revisions, particularly those made in response to commenter suggestions, clarify the meaning of the terms, and ensure that they reflect current industry practice.

OSHA carries forward the following terms and definitions from the proposed rule without change, or with mostly minor editorial and technical changes. In revising final paragraph (b), OSHA used plain and performance-based language. The Agency believes these types of revisions make the terms and definitions easy for employers and workers to understand. OSHA believes many of the remaining definitions are ''terms of art'' universally recognized by those who use personal fall protection systems. Even so, OSHA still received comments on a number of the definitions, as discussed below.

Anchorage. The final rule, like the proposal, defines ''anchorage'' as a secure point of attachment for equipment such as lifelines, lanyards, or deceleration devices. The definition in the final rule is consistent with the one in OSHA's Powered Platforms, construction, and shipyard employment fall protection standards (§§ 1910.66, appendix C, Section I(b); 1915.151(b); 1926.500(b)) as well as the definition in

A10.32–2012 (Section 2.4) and Z359.0 (Section 2.5).

OSHA notes that the anchorage definition in the Powered Platforms standard requires that the anchorage must be ''independent of the means of supporting or suspending the employee.'' The final rule also includes this requirement in § 1910.140(c)(12), discussed below. OSHA did not receive any comments on the proposed definition.

Belt terminal. As defined in the final rule, this term means an end attachment of a window cleaner's positioning system used to secure the body harness or belt to the window cleaner's belt anchor. The term is specific to fall protection for window cleaning operations.

Neither existing OSHA fall protection standards nor I–14.1–2001 define the term. Although OSHA believes the meaning of ''belt terminal'' is clear, the Agency is including the definition in the final rule to clarify the system or criteria of requirements for window cleaner's positioning systems (see discussion of § 1910.140(e)). OSHA did not receive any comments or opposition to including the definition, and adopts the definition as proposed.

Body belt. The final rule defines ''body belt'' as a strap with means both for securing it about the waist and for attaching it to other components such as a lanyard used with positioning, travel restraint, or ladder safety systems. The definition of ''body belt'' in final rule generally is consistent with OSHA's Powered Platforms, construction, and shipyard employment fall protection standards (§§ 1910.66, appendix C, Section I(b); 1915.151(b); 1926.500(b)). However, those definitions do not specify with which systems employers may use body belts. The final rule clarifies that employers may use body belts only with positioning, travel restraint, and ladder safety systems, and the final rule adds language specifying that employers cannot use body belts with personal fall arrest systems (see discussion in § 1910.140(d)(3)). Including this language makes the final definition consistent with the definition in A10.32. That standard defines ''body belt,'' which it also refers to as a safety or waist belt, as ''support which is used for positioning, restraint or ladder climbing only'' (A10.32–2012, Section 2.8).

The Z359.0 standard uses the term ''body support'' instead of body belt, and defines it as ''an assembly of webbing arranged to support the human body for fall protection purposes, including during and after fall arrest'' (Section 2.17). A note to the definition explains that body support generally refers to a harness (full body, chest, chest-waist) or body belt. OSHA did not receive any comments on the definition and adopts the definition as proposed.

Body harness. The final rule defines ''body harness'' as straps that secure about a worker in a manner that distributes fall arrest forces over at least the worker's thighs, pelvis, waist, chest, and shoulders should a fall occur. The final rule specifies that a body harness also is a means for attaching it to other components of a personal fall protection system.

The final rule is nearly identical to the definition of ''body harness'' in OSHA's Powered Platforms, construction, and shipyard employment fall protection standards (§§ 1910.66, appendix C, Section I(b); 1915.151(b); 1926.500(b)), as well as the definition of ''body support'' in A10.32 (Section 2.9). The Z359.0 standard includes definitions of various types of body harnesses, including chest harnesses, chest-waist harnesses, evacuation harnesses, full-body harnesses, and positioning harnesses. The definition in the final rule is consistent with the ''full body harness'' definition in Z359.0 (Section 2.83).

In the proposal, OSHA requested comment on whether the Agency should define other types of harnesses in the final rule, specifically those harnesses that do not have a waist strap or component (75 FR 28903). ISEA (Ex. 185) and CSG (Ex. 198) both said that ISEA-member companies reported that it was more common for body harnesses not to have waist straps. They said this type of harness distributes fall arrest forces over the entire torso and has assemblies that prevent the shoulder straps from separating to the extent that the worker could fall out of the harness. OSHA concludes that this type of harness meets the definition of ''body harness,'' and it is not necessary to revise the term. However, in the final rule, OSHA did not include the other specific types of body harnesses (*e.g.,* chest-waist, chest) listed in Z359.0. The other types of harnesses do not spread fall arrest forces across a broad area of the body, and the final rule does not permit their use.

With one exception, the definition in the final rule also is consistent with I–14.1–2001. The definition of ''body harness'' in I–14.1–2001 permits the distribution of fall arrest forces over ''any combination'' of the thighs, pelvis, waist, chest, and shoulders, rather than across all of those parts of the worker's body combined (Section 2). The final rule, by contrast, does not incorporate the ''any combination'' language in I–14.1. OSHA believes that adopting the language from I–14.1–2001 would allow employers to use harnesses that concentrate fall arrest forces in a small anatomical area, rather than across the entire torso and thighs. The dangers of concentrating fall arrest forces in a limited anatomical area (*e.g.,* waist and chest only) are well documented. In the proposed rule, OSHA discussed research of Dr. Maurice Amphoux, *et al.* conducted on the use of thoracic harnesses for personal fall arrest. Their study concluded that such harnesses are not suitable for personal fall arrest because the forces transmitted to the body during post-fall suspension constricted the rib cage and could cause asphyxiation (75 FR 28903). The proposed rule also identified an increased danger of falling out of chest-waist harnesses. Therefore, OSHA believes that the definition of ''body harness'' in the final rule is more protective than the one in I–14.1–2001.

Carabiner. The final rule defines carabiner as a connector comprised generally of a trapezoidal or oval-shaped body with a closed gate or similar arrangement that may be opened to attach another object. When released, the carabiner gate automatically closes to retain the object. There are generally three types of carabiners:

- Automatic locking, with a self-closing and self-locking gate that remains closed and locked until intentionally unlocked and opened for connection or disconnection;
- Manual locking, with a self-closing gate that must be manually locked by the user and that remains closed and locked until intentionally unlocked and opened by the user for connection or disconnection; and
- Non-locking, with a self-closing gate cannot be locked.

Commenters recommended that OSHA apply to carabiners the same criteria applicable to snaphooks (Exs. 185; 198). For example, the International Safety Equipment Association (ISEA) said that applying the snaphook performance criteria to carabiners would ensure that the final rule specifically covers the two most common types of connectors (Ex. 185). OSHA agrees, and added a definition of carabiner to the final rule that is almost identical to the one in Z359.0–2012 (Section 2.20) and A10.32–2012 (Section 2.12). Those definitions note that there are three types of carabiners: Automatic locking (*i.e.,* self-closing and self-locking), manual locking, and non-locking. The final rule, like Z359.0 and A10.32, only allows the use of automatic-locking carabiners and snaphooks.

Competent person. In the final rule, OSHA defines a ''competent person'' as a person who:

- Is capable of identifying existing and predictable hazards in any personal fall protection system or component as well as in their application and uses with related equipment; and
- Has the authorization to take prompt corrective measures to eliminate the identified hazards.

The definition in the final rule differs from the proposed definition in two ways. First, the final rule requires that the competent person be capable of identifying both ''existing and predictable hazards,'' while the proposal specified that the competent person identify existing ''hazardous or dangerous conditions.'' Second, the final rule adds language specifying that competent persons must have authority to take prompt, corrective actions to eliminate the hazards that they identified. These changes expand the definition of competent person and make the final rule consistent with the definition applicable to OSHA's construction standards (§ 1926.32), as well as the definition in Z359.0–2012 (Section 2.30) and A10.32–2012 (Section 2.16).

Under the final rule employers must ensure that the worker(s) they select to be the competent person(s) have the capability and competence to identify existing hazards and predictable hazards (*i.e.,* hazards likely to occur when using personal fall protection systems, components, and related equipment). Competent persons working with personal fall protection systems in construction already must be able to identify both existing and predictable hazards. OSHA believes that requiring the same of competent persons in general industry establishments that also perform construction activities should not pose a problem, especially since they may be the same person.

OSHA added the language requiring that competent persons have authority to take prompt corrective action in response to the large number of commenters who urged OSHA to adopt that language from OSHA's construction standards (§ 1926.32), Z359.0, and A10.32. OSHA did not include the language in the proposed rule because the Agency believed that competent persons dealing with personal fall protection systems in general industry were likely to serve a different function than competent persons in the construction industry (75 FR 28904). In the preamble to the proposed rule, OSHA said that the competent person in general industry most likely would be an outside contractor who specializes in fall protection systems, designs fall protection systems, and/or provides fall protection training. OSHA said it would be unlikely that employers would grant an outside contractor authority over work operations. In addition, OSHA said it did not believe the definition of competent person in § 1926.32 was widely recognized and accepted in general industry. Thus, in the proposed rule OSHA used the definition of competent person from appendix C of § 1910.66.

By contrast, when OSHA promulgated the construction fall protection standards, the Agency applied the definition of ''competent person'' in § 1926.32 because the Agency found that the construction industry widely recognized the term, which OSHA adopted in 1971 pursuant to Section 6(a) of the OSH Act (29 U.S.C. 655(a)). However, commenters on the proposed rule said that the construction industry definition is as widely known, accepted, and used in general industry as it is in the construction industry (Exs. 74; 122). They urged OSHA to incorporate the construction industry definition of competent person in § 1910.140.

Many commenters who disagreed with the proposed definition said that it is essential that the competent person have authority to take prompt corrective action when they find hazards (Exs. 69; 74; 185; 190; 198; 226). They argued that the duty of the competent person is to ensure that personal fall protection systems, components, and related equipment are safe, and they cannot carry out that duty without having the ability to take corrective action to keep the system working properly and the workplace safe. In addition, they said that employers, workers, fall protection equipment suppliers, and national consensus standards all operate with the expectation that a competent person will have authority to take action when needed to correct problems. The American Foundry Society, for instance, pointed out:

> Without any such authority, a competent person under this definition will be put in the position of being able to recognize the hazard, but likely not be able [to] do anything about it. That is not a truly competent person and does not reflect the needed level of competence to help ensure worker safety (Ex. 190).

Similarly, ISEA said that OSHA's proposed definition amounted to a subject matter expert rather than a competent person. They asserted that the rule must define a competent person as one who is on site; has authority to shut down work operations if there are imminent hazards; and take PPE, including personal fall protection systems, out of service if needed (Ex. 185).

The American Federation of State, County and Municipal Employees (AFSCME) (Ex. 226) also supported giving the competent person authority to take prompt, corrective action. AFSCME said that many employers may seek outside assistance in assessing the risks and types of fall protection systems, but that no outside party should be an employer's competent person:

> It is more likely that an internal supervisor would be given the responsibility for ensuring the employer's fall protection systems are in place, equipment is inspected, and that employees are trained and using equipment properly. This person or persons should be competent in the meaning of the standard, and should have the authority to correct hazards when found (Ex. 226).

ISEA made a similar point, saying that it was in the best interest of worker protection to have an on-site accountable decision maker because the competent person would be able to examine the personal fall protection systems, components, and related equipment and know firsthand the risks involved. Armed with that knowledge, ISEA said an on-site competent person would be less likely to take risks with workers' lives. ISEA said that manufacturers and other knowledgeable sources who are not on-site will not have the knowledge to make service-life decisions about fall arrest equipment. Capital Safety Group (CSG) (Ex. 198) agreed, saying that on-site, accountable decision makers who are fully aware of the risks associated with fall protection equipment are less likely to put workers' lives in jeopardy. Access Rescue (Ex. 69) and Extreme Access, Inc. (Ex. 74), expressed similar concerns.

OSHA agrees with commenters that, to ensure workers have safe personal fall protection systems, components, and related equipment the competent person must have authority to take necessary corrective action when they identify hazards. In addition, adding the language to the final rule will make the definition consistent with the widely known term in OSHA's construction standard and national consensus standards, which should increase employer compliance.

OSHA also agrees with commenters that, to carry out their role, competent persons should be on-site. With appropriate training and experience, OSHA believes that a worker at the worksite can function as the competent person.

Connector. The final rule, like the proposal, defines ''connector'' as a device used to couple or connect together parts of a personal fall protection system. Examples of connectors include snaphooks, carabiners, buckles, and D-rings.

The definition in the final rule is derived from OSHA's Powered Platforms, construction, and shipyard employment fall protection standards, as well as Z359.0–2012 (Section 2.36) and A10.32–2012 (Section 2.18). The definition of ''connector'' in those standards includes information explaining that connectors may be independent components of a personal fall protection system or integral parts sewn into the system. Since the final rule permits employers to use connectors that are either independent or integral components of a personal fall protection system, OSHA does not believe it is necessary to include the explanatory material in the final definition of ''connector.'' OSHA did not receive any comments and adopts the definition as proposed.

D-ring, as used in the final rule, is a connector used in:

- Harnesses, as an integral attachment element or fall arrest attachment;
- Lanyards, energy absorbers, lifelines, or anchorage connectors as an integral connector; or
- A positioning or travel restraint system as an attachment element.

''Integral'' means the D-ring cannot be removed (*e.g.,* sewn into the harness) from the body harness without using a special tool. The final rule is consistent with A10.32–2012, which defines ''integral'' to mean ''[n]ot removable from the component, subsystem or system without destroying or mutilating any element or without use of a special tool'' (Section 2.30).

Although OSHA's existing fall protection standards do not define ''D-ring,'' the final rule is consistent with Z359.0–2012 (Section 2.41). The A10.32–2012 standard does not explicitly define ''D-ring,'' but the definition of ''connector'' includes D-ring as an example of an integral component of a body harness. The definition also says a D-ring is a connector sewn into a body harness or body belt (Section 2.18). OSHA did not receive any comments on the proposed definition and has adopts the definition with minor editorial revisions.

Deceleration device, like in the proposed rule, is defined as any mechanism that serves to dissipate energy during a fall. The final rule is similar to the definition in OSHA's Powered Platforms, construction, and shipyard employment fall protection standards (§§ 1910.66, appendix C, Section I(b); 1915.151(b); 1926.500(b)), and almost identical to the definition in A10.32–2012 (Section 2.19). The definition in those standards also provides examples of deceleration devices that employers may use to dissipate energy during a fall, including rope grabs, rip-stitch lanyards, specially woven lanyards, tearing or deforming lanyards, and automatic self-retracting lifelines or lanyards.

Although the Z359.0 standard does not define ''deceleration device,'' it includes definitions for ''energy (shock) absorber,'' ''fall arrester,'' and ''self-retracting lanyard'' (Sections 2.46, 2.60, 2.159). In the Powered Platforms and construction fall protection rulemakings, commenters recommended replacing ''deceleration device'' with those terms. OSHA also received similar recommendations in this rulemaking (Exs. 121; 185; 198). For instance, ISEA (Ex.185) and CSG (Ex. 198) recommended defining ''fall arrester'' and ''energy absorber'' because they said ''deceleration device'' is not a commonly used term. Clear Channel Outdoor, Inc. (Ex. 121), also supported replacing ''deceleration device'' with the terms in Z359.0 ''to increase consistency.'' By contrast, Ameren said ''deceleration device'' was ''standard verbiage'' in OSHA fall protection standards, and removing the term was not necessary ''[a]s long as there is no confusion with the terms'' (Ex.189).

OSHA agrees with Ameren that using the term ''deceleration device'' makes the final rule consistent with OSHA's other fall protection standards and would eliminate, rather than generate, confusion. In the preamble to the final construction fall protection standard, OSHA explained why the Agency was not adding definitions for ''fall arrester'' and ''energy absorber,'' stating:

> It was suggested that [deceleration device] be eliminated and replaced with three terms, ''fall arrester,'' ''energy absorber,'' and ''self-retracting lifeline/lanyard'' because the examples listed by OSHA in its proposed definition of deceleration device serve varying combinations of the function of these three suggested components. In particular, it was pointed out that a rope grab may or may not serve to dissipate a substantial amount of energy in and of itself. The distinction that the commenter was making was that some components of the system were ''fall arresters'' (purpose to stop a fall), others were ''energy absorbers'' (purpose to brake a fall more comfortably), and others were ''self-retracting lifeline/lanyards'' (purpose to take slack out of the lifeline or lanyard to minimize free fall). OSHA notes, however, that it is difficult to clearly separate all components into these three suggested categories since fall arrest (stopping) and energy absorption (braking) are closely related. In addition, many self-retracting lifeline/lanyards serve all three functions very well (a condition which the commenter labels as a ''subsystem'' or ''hybrid component''). OSHA believes that the only practical way to accomplish what is suggested would be to have test methods and criteria for each of the three component functions. However, at this time, there are no national consensus standards or other accepted criteria for any of the three which OSHA could propose to adopt.
>
> In addition, OSHA's approach in the final standard is to address personal fall arrest equipment on a system basis. Therefore, OSHA does not have separate requirements for ''fall arresters,'' ''energy absorbers,'' and ''self-retracting lifeline/lanyards'' because it is the performance of the complete system, as assembled, which is regulated by the OSHA standard. OSHA's final standard does not preclude the voluntary standards writing bodies from developing design standards for all of the various components and is supportive of this undertaking (59 FR 40672 (8/9/1994) (citing 54 FR 31408, 31446 (7/28/1989))).

OSHA believes the preamble discussion in the earlier rulemakings holds true today and supports only including the definition of ''deceleration device'' in the final rule. Accordingly, the final rule adopts the definition of ''deceleration device'' specified in the proposal.

Deceleration distance. The final rule, like the proposal, defines ''deceleration distance'' as the vertical distance a falling worker travels before stopping, that is, the distance from the point at which the deceleration device begins to operate to the stopping point, excluding lifeline elongation and free fall distance. The final rule also states that ''deceleration distance'' is the distance between the location of a worker's body harness attachment point at the moment of activation of the deceleration device during a fall (*i.e.,* at the onset of fall arrest forces), and the location of that attachment point after the worker comes to a full stop.

The definition in the final rule is almost identical to the definition in OSHA's Powered Platforms, construction, and shipyard employment fall protection standards (§§ 1910.66, appendix C, Section I(b); 1915.151(b); 1926.500(b)), but does not reference body belts because the final rule prohibits the use of body belts in personal fall arrest systems. The final rule also is consistent with A10.32–2012 (Section 2.20) and with the definition and explanatory note in Z359.0–2012 (Section 2.40). OSHA did not receive any comments on the proposed definition of ''deceleration device'' and adopts the proposed definition.

Equivalent. The final rule defines ''equivalent'' as alternative designs, equipment, materials, or methods that the employer can demonstrate will provide an equal or greater degree of safety for workers compared to the designs, equipment, materials, or methods the final rule specifies. The definition in the final rule is essentially the same as the definition in OSHA's Powered Platforms, shipyard employment, and construction fall protection standards (§§ 1910.66(d) and appendix C, Section I(b); 1915.151(b); 1926.500(b)). A crucial element of the definition is that the employer has the burden to demonstrate that the alternative means are at least as protective as the designs, materials, or methods the standard requires.

Verallia (Ex. 171) commented that the proposed definition was ''too subjective and vague to allow for consistent application and/or enforcement.'' Verallia also said the proposal outlined the skill set necessary to be a ''qualified'' person, and that it should be sufficient if a qualified person selects the alternative designs, equipment, materials, or methods. OSHA disagrees with Verallia's characterization of the proposed definition. Since 1974, OSHA used the same definition of ''equivalent'' in various standards (*e.g.,* §§ 1910.21(g)(6); 1926.450(b)). Over this period, the Agency experienced no problems achieving consistent application of the definition, and employers did not report that the term is too vague. To the contrary, OSHA believes that employers support the definition of ''equivalent'' because it gives them flexibility in complying with the final rule, provided that they can show that their selected methods, materials, or designs provide equal or greater level of safety for workers. Accordingly, the final rule adopts the proposed definition with only minor changes for clarity.

Free fall, like in the proposed rule, is defined as the act of falling before the personal fall arrest system begins to apply force to arrest the fall. The final definition is almost the same as the definition in OSHA's Powered Platforms, construction, and shipyard employment fall protection standards (§§ 1910.66, appendix C, Section I(b); 1915.151(b); 1926.500(b)). It also is identical to the definition in Z359.0–2012 (Section 2.73), and is consistent with the definition in A10.32–2012 (Section 2.26). OSHA did not receive any comments on the proposed definition and finalizes it as proposed.

Free fall distance means the vertical displacement of the fall arrest attachment point on the worker's body harness between the onset of the fall and just before the system begins to apply force to arrest the fall. The distance excludes deceleration distance, lifeline and lanyard elongation, but includes any deceleration device slide distance or self-retracting lifeline/lanyard extension before the devices operate and fall arrest forces occur.

The definition in the final rule is essentially the same as the definition in OSHA's Powered Platforms, construction, and shipyard employment fall protection standards (§§ 1910.66 appendix C, Section I(b); 1915.151(b); 1926.500(b)). In addition, the final rule is consistent with the definition in Z359.0–2012 (Section 2.74) and A10.32–2012 (Section 2.27). OSHA did not receive any comments on the proposed definition.

Lanyard, like in the proposed rule, is defined as a flexible line of rope, wire rope, or strap that generally has a connector at each end to connect a body harness or body belt to a deceleration device, lifeline, or anchorage. The definition in the final rule is almost identical to the Powered Platforms standard (§ 1910.66(b) and appendix C, Section I(b)), and consistent with the definition in OSHA's construction and shipyard employment fall protection standards (§§ 1915.151(b) and 1926.500(b)). The definition in the final rule also is consistent with Z359.0–2012 (Section 2.94) and A10.32–2012 (Section 2.31), although the definition in A10.32 does not include body belts. OSHA did not receive any comments on the proposed definition, and adopts the definition as proposed.

Lifeline. The final rule, like the proposal, defines ''lifeline'' as a component of a personal fall protection system that connects other components of the system to the anchorage. A lifeline consists of a flexible line that either connects to an anchorage at one end to hang vertically (a vertical lifeline), or connects to anchorages at both ends to stretch horizontally (a horizontal lifeline).

The final rule is consistent with the definition of lifeline in Z359.0–2012 (Section 2.96) and A10.32–2012 (Section 2.33), however, it differs slightly from OSHA's Powered Platforms, construction, and shipyard employment fall protection standards (§§ 1910.66(b) and appendix C, Section I(b); 1915.151(b); 1926.500(b)). OSHA's existing standards only apply to personal fall arrest systems, and define ''lifeline'' as a component of such a system. The final definition specifies that a lifeline is a component of a personal fall protection system, which includes fall arrest, positioning, and travel restraint systems. The final definition also includes some minor editorial revisions. OSHA did not receive any comments on the proposed definition and adopts the definition as discussed.

Personal fall arrest system, like the proposed rule, is defined as a system used to arrest a worker's fall from a walking-working surface. As the final rule specifies, a personal fall arrest system consists of a body harness, anchorage, and connector. The means of connecting the body harness and anchorage may be a lanyard, deceleration device, lifeline, or suitable combination of these means. In the final rule, OSHA fully details what the components of personal fall arrest systems include, specifically, the various means of connecting body harnesses and anchorages (*i.e.,* lanyards, deceleration devices, lifelines, or a suitable combination of these means). OSHA believes that fully clarifying the components will help employers and workers better understand the personal fall arrest system requirements in the final rule.

The definition in the final rule is consistent with OSHA's Powered Platforms, construction, and shipyard employment fall protection standards (§§ 1910.66(b) and appendix C, Section I(b); 1915.151(b); 1926.500(b)). Those OSHA standards, however, specify that a fall arrest system may consist of either a body harness or a body belt. Since the time OSHA promulgated those standards, the Agency phased out the use of body belts in personal fall arrest systems due to safety concerns. Effective January 1, 1998, OSHA banned the use of body belts as part of personal fall arrest systems in the construction and shipyard employment standards (§§ 1926.502(d); 1915.159), and this final rule also prohibits their use in personal fall arrest systems.

The final rule is consistent with Z359.0–2012 (Section 2.115) and A10.32–2012 (Section 2.38). The consensus standards, like the final rule and OSHA's existing standards, require the use of body harnesses in personal fall arrest systems, and prohibit body belts.

Personal fall protection system, as defined in the final rule, means a system (including all components) that employers use to provide protection for employees from falling or to safely arrest a fall if one occurs. The final definition identifies examples of personal fall protection systems, including personal fall arrest systems, positioning systems, and travel restraint systems. Neither existing OSHA fall protection standards nor national consensus standards define personal fall protection system.

Some commenters (Exs. 155; 185; 198) said that OSHA should not use ''personal fall protection system'' because employers could interpret the term to include passive devices such as guardrails. They suggested using only the term ''personal fall arrest system.'' In addition, Ellis Fall Safety Solutions (Ellis) (Ex. 155) recommended that the term ''personal fall protection system'' only include systems that use body harnesses; in other words, limited to personal fall arrest systems.

OSHA does not believe that employers will mistake the term ''personal fall protection system'' to include passive fall protection devices such as guardrails and safety nets. The Z359.0–2012 standard includes two types of fall protection systems: Active and passive. Z359.0 defines ''active fall protection system'' as a fall protection system that requires workers ''to wear or use fall protection equipment'' (Section 2.2), and lists fall restraint, fall arrest, travel restriction, and administrative controls as examples. The Z359.0 standard, however, defines ''passive fall protection system'' as one ''that does not require the wearing or use of fall protection equipment,'' such as safety nets and guardrail systems (Section 2.113). Like the distinction that the Z359.0 standard draws between active and passive fall protection systems, OSHA believes that using the term ''personal fall protection system'' establishes the same type of distinction. That is, a personal fall protection system is one that employers must ensure that workers actively use to protect them, while a passive fall protection system, such as a guardrail, is one that does not require any action by workers to be safe, so long as employers maintain the system properly. OSHA believes this distinction is helpful, and that the regulated community recognizes and understands the distinction. Therefore, the term is carried forward in the final rule.

OSHA revised the final definition to expressly clarify the Agency's intent in the proposed rule that personal fall protection systems include all components of those systems.

Positioning system (*work-positioning system*). The final rule, like the proposal, defines ''positioning system'' as a system of equipment and connectors that, when used with a body harness or body belt, allows an employee to be supported on an elevated vertical surface, such as a wall or window sill, and work with both hands free. Positioning systems also are called ''positioning system devices'' and ''work-positioning equipment.''

The definition in the final rule is essentially the same as the definition in OSHA's construction and shipyard employment fall protection standards (§§ 1915.151(b), 1926.500(b)). The final rule also is similar to A10.32–2012 (Section 2.39, 2.40) and Z359.0–2012 (Section 2.120). Weatherguard Service, Inc. (Ex. 168) supported the proposed definition.

A note to the definition in Z359.0 explains that ''a positioning system used alone does not constitute fall protection,'' and that a separate system that provides backup protection from a fall is necessary (Section E2.120). Ellis (Ex. 155), who also commented on OSHA's positioning system requirements, supported adding such a requirement to the final rule. OSHA did not incorporate this recommendation (see discussion in final paragraph (e) (positioning systems)). OSHA adopts the proposed definition with minor editorial changes.

Qualified, like in the proposed rule, describes a person who, by possession of a recognized degree, certificate, or professional standing, or who by extensive knowledge, training,[76] and experience has successfully demonstrated the ability to solve or resolve problems relating to the subject matter, work, or project. This definition is identical to the one in final § 1910.21(b). The final definition is almost identical to the definition applicable to OSHA's construction standards (§ 1926.32(m)), and similar to the definition in the shipyard employment fall protection standard (§ 1915.151(b)). In addition, the definition in the final rule is consistent with the definition used in A10.32–2012 (Section 2.41).

The final rule, however, differs from the definition in the Powered Platforms standard (§ 1910.66, appendix C, Section I(b)) and Z359.0–2012. Those standards require that qualified persons have a degree, certification, or professional standing, *and* extensive knowledge, training and experience. OSHA explained in the proposed rule that to require qualified persons to meet the definition in the Powered Platforms standard would mean that the qualified person ''would most likely need to be an engineer'' (75 FR 28905).

Several commenters opposed the proposed definition of ''qualified'' and supported the definition of qualified in § 1910.66 and Z359.0 (Exs. 155; 193; 367). They also recommended revising the definition to specifically require that only engineers could serve as qualified persons. For example, Ellis said:

> In America, anchorages are mostly guesswork and this does not do justice to ''the personal fall arrest system'' term that OSHA is seeking to establish unless the engineering background is added. Furthermore the design of anchorages can easily be incorporated into architects and engineers drawings but is presently not because there is no requirement for an engineer. This simple change may result in saving over one half the lives lost from falls in the USA in my opinion (Ex. 155).

Penta Engineering Group added:

> OSHA proposes to require that horizontal lifelines be designed, installed and used under the supervision of a qualified person and that they be part of a complete fall arrest system that maintains a factor of safety of two. To allow a person without an engineering degree and professional registration would not only be dangerous but would be contradictory to every current requirement for other building systems as required by the building codes. Further, in this specific instance, the design of a horizontal lifeline presents specific engineering challenges that should not be performed by anyone without the professional standing and experience to do so (Ex. 193).

Thomas Kramer of LJB, Inc., agreed, stating:

> We take exception with the change from ''AND'' to ''OR.'' A person with a structural engineering degree does not necessarily know the full requirements (clearances, proper PPE selection, use and rescue procedures, etc.) of a personal fall arrest system. That knowledge can be obtained only through special training or experience in the subject matter. Vice versa, someone with knowledge of the system requirements may not know how to properly design an anchorage support and can only gain this knowledge through a professional degree. As stated in our previous comments, many building codes only allow a professional engineer to design and stamp a building design or changes to the loading of a structure. The explanation to make 1910 consistent with the existing construction and shipyard employment standard is not a good enough reason in our opinion. OSHA states that personal fall protection systems will ''in some cases, [may] involve their design and use.'' By using the word ''OR,'' the proposed regulation eliminates the need for an engineer's involvement. The ANSI/ASSE Z359.0–2007 standard uses ''AND''. These consensus standards are developed with a considerable level of thought and consideration and were recently vetted by the industry, so we suggest OSHA reconsider this change (Ex. 367).

OSHA did not adopt the commenters' recommendations for several reasons. First, as discussed in the proposed rule, OSHA based the definition of ''qualified'' on the definitions in its construction and shipyard employment fall protection standards (§§ 1915.151(b); 1926.500(b)). For years, those definitions have been effective because they specify that employers must ensure the design, installation, and

[76] ''Training'' may include informal, or on-the-job, training.

use of components of personal fall protection systems (such as lifelines) protect workers from falls. Adopting the same definition as OSHA's other fall protection standards and final § 1910.21(b) also ensures consistency, which OSHA believes will increase both employer understanding and compliance with the requirement.

Second, the Agency believes the performance-based definition in the final rule gives employers flexibility in selecting a qualified person who will be effective in performing the required functions. The performance-based definition also allows employers to select the qualified person who will be the best fit for the particular job and work conditions. Employers are free to use qualified persons who have professional credentials and extensive knowledge, training, and experience, and OSHA believes many employers already do so.

Finally, the workers the employer designates or selects as qualified persons, the most important aspect of their qualifications is that they must have ''demonstrated ability'' to solve or resolve problems relating to the subject matter, work, and project. Having both professional credentials and knowledge, training, and experience will not protect workers effectively if the person has not demonstrated capability to perform the required functions and solve or resolve the problems in question.

When the person the employer designates as a qualified person has demonstrated the ability to solve or resolve problems, which may include performing various complex calculations to ensure systems and components meet required criteria, the qualifications of that person are adequate. OSHA also notes that an employer may need to select different qualified persons for different projects, subject matter, or work to ensure the person's professional credentials or training, experience, and knowledge are sufficient to solve or resolve the problems associated with the subject matter, work, or project. For example, the employer may determine that an engineer is needed for a particular project, and the final rule provides the employer with that flexibility. Accordingly, OSHA adopts the definition of qualified as proposed.

OSHA disagrees with Ellis' assertion that architects and engineers are not designing anchorages into drawings because, according to Ellis, § 1910.140 does not require qualified persons to be engineers. OSHA believes that building owners and others work with engineers and architects in the planning stage to design anchorage points into buildings and structures so that the anchorages will effectively support personal fall protection systems used to perform work on the building. OSHA also believes that the number of building owners consulting engineers about the design of anchorages will increase under the final rule. Section 1910.27 of the final rule requires that, when employers use rope descent systems (RDS), building owners must provide information to employers and contractors ensuring that a qualified person certify building anchorages as being capable of supporting at least 5,000 pounds (29 CFR 1910.27(b)(1)). OSHA believes that building owners will likely consult and work with engineers to ensure that all building anchorages, including anchorages that support RDS and personal fall protection systems, meet the requirements in § 1910.27. Thus, OSHA does not believe it is necessary to limit the definition of ''qualified'' person to engineers to ensure that building owners include building anchors in building design plans.

Rope grab, like the proposed rule, is defined as a deceleration device that travels on a lifeline and automatically, using friction, engages the lifeline and locks to arrest a worker's fall. A rope grab usually employs the principle of inertial locking, cam or lever locking, or both.

The final rule is essentially the same as the definition in OSHA's Powered Platforms, construction, and shipyard employment fall protection standards (§§ 1910.66, appendix C, Section I(b); 1915.151(b); 1926.500(b)). The A10.32 and Z359.0–2012 standards do not define ''rope grab,'' but the definition of ''fall arrester'' in Z359.0 (Section 2.60) is similar to the definition in this final rule. In addition, the explanatory note to the ''fall arrester'' definition identifies a ''rope grab'' as an example of a fall arrester. The A10.32–2012 standard requires rope grabs to automatically lock (Section 5.4.3). OSHA did not receive any comments on the proposed definition of ''rope grab,'' and the final rule adopts it as proposed.

Safety factor. The final rule adds a definition for safety factor, also called a factor of safety. OSHA defines safety factor as the ratio of the design load and ultimate strength of the material. Generally, the term refers to the structural capacity of a member, material, equipment, or system beyond actual or reasonably anticipated loads; that is, how much stronger the member, material, equipment, or system is than it usually needs to be to support the intended load without breaking or failing. A safety factor is an additional or extra margin of safety that provides assurance the system or equipment is able to support the intended load (*e.g.,* a safety factor of two).

The new definition is the same as the one proposed in subpart D and is consistent with the one in § 1926.32(n). OSHA believes that adding this term will increase employer understanding and compliance with the requirements in this section.

Self-retracting lifeline/lanyard (SRL) is also a type of deceleration device. The final rule, like the proposal, defines an SRL as containing a drum-wound line that a worker can slowly extract from, or retract onto, a drum under slight tension during normal movement. At the onset of a fall, the device automatically locks the drum and arrests the fall.

The definition in the final rule is consistent with OSHA's Powered Platforms and construction fall protection standards (§§ 1910.66, appendix C, Section I(b); 1926.500(b)) and with Z359.0–2012 (Section 2.159) and A10.32–2012 (Section 2.46). There were no comments on the proposed definition, and the final rule adopts it as proposed.

Snaphook. The final rule, like the proposal, defines ''snaphook'' as a connector comprised of a hook-shaped body with a normally closed gate, or a similar arrangement, that the user may open manually to permit the hook to receive an object. When the user releases a snaphook, it automatically closes to retain the object. Opening a snaphook requires two separate actions, meaning the user must squeeze the lever on the back before engaging the front gate.

The final definition, like the proposal, identifies two general types of snaphooks—an *automatic-locking* type (also called self-locking or double locking), which the final rule permits employers to use, and a *non-locking* type, which the final rule prohibits. An automatic-locking type snaphook has a self-closing and self-locking gate that remains closed and locked until intentionally unlocked and opened for connection or disconnection. By contrast, a non-locking type has a self-closing gate that remains closed, but not locked until the user intentionally opens it for connection or disconnection (see discussion of § 1910.140(c)(9)).

The definition in the final rule is the same as the definition in OSHA's Powered Platforms and construction fall protection standards (§§ 1910.66, appendix C, Section I(b); 1926.500(b)). It also is consistent with Z359.0–2012 (Section 2.168) and A10.32–2012 (Sections 2.50, 2.50.1, 2.50.2). OSHA received two comments on the snaphook definition, from CSG (Ex. 198) and ISEA (Ex. 185), both of which supported the proposed definition. OSHA adopts the definition as proposed.

Travel restraint (tether) line is a component of a travel restraint system. Specifically, the final rule, like the proposal, defines it as a rope or wire rope used to transfer forces from a body support to an anchorage or anchorage connector in a travel restraint system. The purpose of a travel restraint (tether) line is to secure workers in such a way as to prevent them from reaching an unprotected edge and falling off the elevated surface on which they are working.

The definition in the final rule is the same as the definition in OSHA's shipyard employment fall protection standard (§ 1915.151(b)). The definition in § 1915.151(b) notes that manufacturers do not necessarily design travel restraint lines to withstand forces resulting from a fall. OSHA did not receive any comments on the proposed definition, and the final rule adopts the definition as proposed.

Travel restraint system is a type of personal fall protection system that consists of a combination of an anchorage, anchorage connector, lanyard (or other means of connection), and body support that an employer uses to eliminate the possibility of a worker going over the edge of a walking-working surface. The final rule revises the proposed definition in two ways. First, the final rule defines ''travel restraint system'' to specify that it is a system a worker uses to eliminate the possibility of falling from the unprotected edge of an elevated walking-working surface. The proposed definition said the purpose of travel restraint systems was to ''limit travel to prevent exposure to a fall hazard.'' OSHA believes the final definition more clearly explains the ultimate purpose of travel restraint systems than the proposed definition.

Second, the final definition deletes the second sentence of the proposed definition, which stated that a travel restraint system ''is used such that it does not support any portion of the worker's weight; otherwise the system would be a positioning system or personal fall arrest system.'' OSHA believes the revised language in the final definition is sufficient to convey this requirement. In addition, OSHA addresses this issue in the discussion of § 1910.140(c)(14) below.

The definition in the final rule is consistent with the definition in Z359.0–2012 (Section 2.204) and A10.32–2012 (Sections 2.53). The definition in A10.32 stresses that the purpose of a travel restraint system is to limit travel in such a manner that the user is not exposed to a fall hazard. OSHA did not receive comments on the proposed definition and finalizes the definition as discussed.

Window cleaner's belt, as defined in the final rule, is a component of a window cleaner's positioning system. It is a positioning belt that consists of a waist belt, an integral terminal runner or strap, and belt terminals.

The final rule revises the proposed definition to explicitly clarify that a window cleaner's belt is a component of a window cleaner's positioning system, and thus is designed to support the window cleaner on an elevated vertical surface. OSHA notes that a window cleaner's belt differs from a window cleaner's tool belt, which holds the window cleaner's tools and materials used for performing the job. Employers use the tool belt mainly for convenience of the window cleaner and not as safety equipment. The only commenter on the proposed definition, Weatherguard (Ex. 168), supported the proposed definition. Accordingly, the final rule adopts the definition with the revision discussed above.

Window cleaner's belt anchor (window anchor), as defined in the final rule, is a specifically designed fall-preventing attachment point permanently affixed to a window frame or a part of a building immediately adjacent to the window frame, for direct attachment of the terminal portion of a window cleaner's belt. Workers attach the terminals of the window cleaner's belt to the window anchors to prevent falling while cleaning windows.

OSHA based the final definition on the one in I–14.1–2001 (Section 2). OSHA's existing fall protection standards do not specifically address window cleaning operations, and do not define terms related to those operations. Weatherguard (Ex. 168), the only commenter, supported including the definition in the final rule. The final rule adopts the definition as proposed.

Window cleaner's positioning system, as defined in the final rule, is a system that consists of a window cleaner's belt secured to window anchors. The definition is similar to the general definition of positioning system in the final rule. Weatherguard (Ex. 168), the only commenter, supported the proposed definition and the definition is adopted as proposed.

Paragraph (c)—General Requirements

Paragraph (c) of the final rule specifies the general requirements employers must ensure that each personal fall protection system meets. The general requirements in paragraph (c) are criteria for the common components of personal fall protection systems, such as connectors, anchorages, lanyards and body harnesses. Paragraphs (d) and (e) contain additional requirements for personal fall arrest systems and positioning systems, respectively.

The provisions in final paragraph (c) are drawn from or based on requirements in OSHA's personal fall protection standards, including Powered Platforms (§ 1910.66, appendix C), construction (§ 1926.502), and shipyard employment (§ 1915.160). They also are drawn from national consensus standards addressing fall protection, including Z359.1–2007, Z359.3–2007, A10.32–2012, and I–14.1–2001.

Paragraph (c)(1) of the final rule requires that employers ensure connectors used in personal fall protection systems are made of drop-forged, pressed or formed steel, or equivalent material. Final paragraph (c)(2) requires connectors to have corrosion-resistant finishes, as well as smooth surfaces and edges to prevent damage to interfacing parts of the personal fall protection system.

The requirements in paragraphs (c)(1) and (2) will ensure that connectors retain the necessary strength characteristics for the life of the fall protection system under expected conditions of use, and that the surfaces and edges do not cause damage to the belts or lanyards attached to them. Employers must not allow workers to use personal fall protection equipment if wear and tear reaches the point where equipment performance might be compromised. For example, corroded or rough surfaces can cause wear and tear on connectors and other components of personal fall protection system, which may reduce their strength.

Final paragraphs (c)(1) and (2) are consistent with OSHA's other fall protection standards, including Powered Platforms (§ 1910.66, appendix C, section I, paragraphs (c)(1) and (c)(2)); construction (§ 1926.502(d)(1), (d)(3), and (e)(4)); and shipyard employment (§ 1915.159(a)(1) and (2)). The Z359.1–2007 standard also contains similar requirements. There were no comments on the proposed provisions and OSHA adopts them without substantive change.

When employers use vertical lifelines, paragraph (c)(3) of the final rule requires that employers ensure each worker is attached to a separate lifeline. OSHA believes that allowing more than one worker on the same vertical lifeline would create additional hazards. For example, if one worker falls, another attached worker might be pulled off balance and also fall. The final rule is consistent with OSHA's other fall protection standards (§§ 1910.66, appendix C, section I, paragraphs (c)(3) and (e)(5); 1926.502(d)(10); 1915.159(b)(1)). There were no comments on the proposed provision and it is adopted with only minor editorial changes.

Paragraphs (c)(4) and (5) of the final rule set minimum strength requirements for lanyards and lifelines used with personal fall protection systems. Paragraph (c)(4) requires that employers ensure lanyards and vertical lifelines have a minimum breaking strength of 5,000 pounds. Breaking strength refers to the point at which a lanyard or vertical lifeline will break because of the stress placed on it.

The final rule requires the same strength requirements for vertical lifelines and lanyards as OSHA's other fall protection standards (§§ 1910.66, appendix C, section I, paragraphs (c)(4); 1926.502(d)(9); 1915.159(b)(3)). The strength requirement also is the same as Z359.1–2007. OSHA believes the strength requirements in all of these standards provide an adequate level of safety. (OSHA notes that the final rule also requires that travel restraint (tether) lines be capable of supporting a minimum tensile load of 5,000 pounds (see discussion of paragraph (c)(14)).

The lanyards and vertical lifelines requirement in paragraph (c)(4) also includes self-retracting lifelines/lanyards (SRL) that allow free falls of more than 2 feet, as well as ripstitch, tearing and deforming lanyards. The proposed rule addressed those lifelines and lanyards in paragraph (c)(6); however, that paragraph duplicated paragraph (c)(4), and OSHA removed it from the final rule. Proposed paragraph (c)(4) also included a note, which OSHA re-designated as paragraph (c)(6) of the final rule (see discussion of § 1910.140(c)(6)).

Paragraph (c)(5) of the final rule, like the proposed rule, provides an exception to the 5,000-pound strength requirement for SRL that automatically limit free fall distance to 2 feet or less. The final provision allows a lower strength requirement because the fall arrest forces are less when free falls are limited to 2 feet. These lifelines and lanyards must have components capable of sustaining a minimum tensile load of 3,000 pounds applied to the device with the lifeline or lanyard in the fully extended position. Tensile load means a force that attempts to pull apart or stretch an object, while tensile strength means the ability of an object or material to resist forces that attempt to pull apart or stretch the object or material.

Final paragraph (c)(5) is the same as OSHA's other fall protection standards (§§ 1910.66, appendix C, section I, paragraphs (c)(5); 1926.502(d)(13); 1915.159(b)(4)) and Z359.1–2007 (Section 3.2.8.7) and A10.32–2012 (Section 5.3.1). OSHA received comments on the proposed strength requirements in paragraphs (c)(4) and (5). As far back as the 1990 proposal, one commenter said that the strength requirements for lanyards and vertical lifelines were too high and would be difficult to maintain (75 FR 28907). OSHA acknowledged in the proposed rule that wear and deterioration to personal fall protection systems inevitably would occur from normal use of lanyards and lifelines, and that ultraviolet radiation, water, and dirt also can reduce the strength of lanyards and lifelines.

That said, OSHA believes that employers are able to purchase and maintain personal fall protection system and components that consistently meet the strength requirements in the final rule. These strength requirements have been in place for many years, and virtually all personal fall protection systems manufactured in or for use in the United States meet the requirements in paragraphs (c)(4) and (5). Since 1990, OSHA has not received any information indicating that the strength requirements should not be maintained. However, to ensure that lifelines and lanyards continue to comply with the requirements in paragraph (c)(5), paragraph (c)(18) of the final rule requires that employers inspect personal fall protection systems before each use and immediately remove worn or deteriorated systems and components from service. In addition, § 1910.132(a) requires that employers maintain personal protective equipment in reliable condition.

ISEA and CSG commented on the orientation of SRL with regard to lanyard and lifeline strength requirements. ISEA said:

> [T]he horizontal or vertical orientation of a [self-retracting lanyard] is important because SRL used in a generally horizontal orientation rather than overhead may be subject to higher loadings and greater exposure to sharp or abrasive surfaces. Because the devices are typically anchored at waist height or below, free fall potential is greater (Ex. 185).

CSG agreed, adding that the higher loading of SRL used in horizontal positions reinforced the need for additional training considerations for horizontally oriented SRL (Ex. 198). Both CSG and ISEA added that manufacturers generally include extra provisions for absorbing energy and protecting the lifeline from damage from building edges if the SRL will be used in a horizontal position. OSHA agrees that employers and competent persons should consider the horizontal or vertical orientation of a SRL in selecting and inspecting personal fall protection systems and training workers (§ 1910.30). OSHA notes that appendix C to § 1910.140 addresses the commenters' points so employers will be aware of the issue. OSHA also notes that paragraph (c)(11) of the final rule sets specific requirements when using horizontal lifelines. Neither commenter suggested that OSHA change the language of paragraph (c)(4) or (5). Accordingly, OSHA believes it is not necessary to revise either paragraph in the final rule.

Proposed paragraph (c)(6) also included a provision to establish strength requirements for SRL that do *not* limit free fall distance to not more than 2 feet, as well as for ripstitch, tearing, and deforming lanyards. OSHA proposed to require those types of lanyards and lifelines also be capable of sustaining minimum tensile loads of 5,000 pounds applied to the device when the lifeline or lanyard is in a fully extended position. The proposed provision was identical to requirements in OSHA's Powered Platforms (§ 1910.66, appendix C, Section I, paragraph (c)(5)), shipyard employment (§ 1915.159(b)(4)), and construction (§ 1926.502(d)(13)) fall protection standards. However, Z359.1–2007 and A10.32–2012 do not have a separate provision addressing self-retracting lifelines/lanyards that do not limit free fall distances.

OSHA requested comment on whether proposed paragraph (c)(6) was necessary, or whether paragraph (c)(4) of the final rule adequately addressed the issue (75 FR 28907). The Society of Professional Rope Access Technicians (SPRAT) said it would be acceptable to adopt either proposed provisions (c)(4) through (6) or the requirements in Z359.1 (Ex. 205). However, ISEA and CSG said proposed paragraph (c)(6) was not necessary, and, if OSHA retained the provision in the final rule, the Agency should remove SRL from it (Exs. 185; 198). OSHA believes that paragraph (c)(4) adequately addresses the issue of SRL that do not limit the free fall to a maximum of 2 feet plus ripstitch, tearing, and deforming lanyards; therefore, proposed paragraph (c)(6) is not necessary. Accordingly, OSHA deleted proposed paragraph (c)(6) from the final rule.

In final paragraph (c)(6), OSHA replaces proposed paragraph (c)(6) with the requirement that a competent or qualified person must inspect each knot in lanyards and vertical lifelines, before a worker uses the lanyard or lifeline, to ensure that they still meet the minimum strength requirements in paragraphs (c)(4) and (5). This new requirement is based on the note OSHA included in proposed paragraph (c)(4) warning employers that the use of knots ''may significantly reduce the breaking strength'' of lanyards and vertical lifelines. The debate about whether knots should be permitted in lanyards and lifelines has been ongoing for at least 20 years. Although the proposal did not ban the use of knots, the Agency considered it, noting that Z359.1–2007 prohibits them: ''No knots shall be tied in lanyards, lifelines, or anchorage connectors. Sliding-hitch knots shall not be used in lieu of fall arresters'' (Section 7.2.1). The A10.32–2012 standard also prohibits the use of knots in lifelines, lanyards or other direct-impact components and also prohibits knots used for load-bearing end terminations (Sections 4.5.4 and 5.5.1.3).

As far back as the 1990 proposal, OSHA received comments supporting and opposing the use of knots. In the preamble to that proposed rule, OSHA said available information indicated that knots could be used safely in some circumstances, and that employers should be allowed the flexibility to use them as long as they verify that the strength requirements of the rule continue to be met. OSHA also noted that strength reduction can be a concern because the use of knots in lanyards and vertical lifelines can reduce breaking strength (75 FR 28907).

In this proposed rule, OSHA invited comment on whether the Agency should allow or prohibit the use of knots, or require a competent person to inspect all knots (75 FR 28907). Several commenters said OSHA should prohibit knots in personal fall arrest systems, noting they generally are no longer used in modern fall arrest applications (Exs. 185; 198; 251). Other commenters, including Martin's Window Cleaning Corp. (Martin's) (Ex. 222) and SPRAT (Ex. 205), opposed a prohibition on the use of knots. Martin's said, ''A properly tied knot is much stronger than a swedge or splice,'' which the proposed rule did not prohibit (Ex. 222). SPRAT said appropriately tied knots were useful at the end and throughout rope spans, and cited Cordage Institute data indicating knots commonly used in life-safety systems had an efficiency range of 75–90 percent (Ex. 205). SPRAT also said their employers require that competent persons inspect all knots tied in industrial rope access systems. They added that the rule must require that workers be trained in uses, limitations, and proper inspection techniques of knots and hitches.

At the hearing on the proposed rule, the American Wind Energy Association (AWEA) also opposed banning the use of knots. Grayling Vander Velde, an AWEA member, said, ''Knots are widely used in industrial rope access for competent persons trained and certified in their proper use and limitations,'' and ''line failure due to installation of knots has not shown to be the cause of mainline or backup line failures'' (Ex. 329 (1/21/2011, pgs. 19–20)). He stated that ropes used for fall arrest must meet the 5,000-pound minimum strength requirement in the final rule. Also, he noted that SPRAT's training covers the issue of possible strength reduction in knotted lanyards.

After considering the record as a whole, OSHA continues to believe that knots can be used safely in certain situations, and that the worker making the knot must be adequately trained to know the strength of the rope being used and take into consideration any strength reduction that may occur if a knot is used. As the commenters pointed out, any rope that has a knot must still meet the strength requirements in final paragraphs (c)(4) and (5) to ensure that workers have an appropriate level of safety (Ex. 205). To ensure that lanyards and vertical lifelines that have knots are safe, OSHA added a new requirement in paragraph (c)(6) of the final rule specifying that a competent or a qualified person must inspect each knot to ensure that it meets the minimum strength requirements before any worker uses the lanyard or lifeline. OSHA believes the additional requirement will preserve employer flexibility while providing an adequate level of safety.

Paragraphs (c)(7) through (10) of the final rule establish criteria for D-rings, snaphooks, and carabiners, which are devices used to connect or couple together components of personal fall protection systems. OSHA added ''carabiners'' to these final paragraphs because they are a type of connector commonly used in currently-manufactured personal fall protection systems. Paragraph (c)(7) of the final rule requires that D-rings, snaphooks, and carabiners be capable of sustaining a minimum tensile load of 5,000 pounds. OSHA believes these devices, like lanyards and vertical lifelines, must be able to sustain 5,000-pound loads to ensure worker safety. If the connectors cannot sustain the minimum tensile load, it makes no difference what strength requirements the other components of the system can meet because the system may still fail.

Final paragraph (c)(7) is the same as the strength requirements in OSHA's other fall protection standards (§§ 1910.66, appendix C, Section I, paragraph (d)(6); 1915.159(a)(3); 1926.502(d)(3)). OSHA did not receive any comments on the proposed provision and is adopting it as discussed.

Paragraph (c)(8) of the final rule requires that D-rings, snaphooks, and carabiners be proof tested to a minimum tensile load of 3,600 pounds without cracking, breaking, or incurring permanent deformation. OSHA also added a new requirement to final paragraph (c)(8) specifying that the gate strength of snaphooks and carabiners also must be proof tested to 3,600 pounds in all directions. Since proof testing has been the industry standard since 2007 (Z359.1–2007, Section 3.2.1.7), OSHA believes that connectors of this type already in use meet the requirements of paragraph (c)(8) and no grandfathering is necessary.

The 3,600-pound strength requirement ensures that D-rings, snaphooks, and carabiners meet a safety factor of at least two when used with body harnesses. This strength requirement will, in turn, limit maximum fall arrest forces to 1,800 pounds. Final paragraph (c)(8) is similar to requirements in OSHA's Powered Platform, construction, and shipyard employment fall protection standards (§§ 1910.66, appendix C, Section 1, paragraph (c)(7); 1915.159(a)(4); 1926.502(d)(4)), but those standards do not require proof testing gate strength. The Z359.12–2009 standard is the same as proposed paragraph (c)(8).

A number of commenters supported the proposed requirement (Exs. 155; 185; 198). Several commenters also recommended that OSHA include two additions to the proposed requirement: (1) Proof testing the gate strength of carabiners and snaphooks; and (2) proof testing the gate strength in all directions (Exs. 155; 185; 198). ISEA and CSG said that past interpretations of snaphook strength requirements led to confusion, and that including a gate strength requirement would help to clarify this issue (Exs. 185; 198).

Ellis said adding a requirement that the gate strength of snaphooks and carabiners also be proof tested to 3,600 pounds would make paragraph (c)(8) consistent with the Z359.12–2009 standard, and be more protective than the A10.32–2004 standard, which prescribes a lower gate strength (Ex. 155). Ellis noted that including the recommended additions also would help employers ''avoid incidents from bent hook gates to loose gate fly-by to jamming open scenarios that have plagued the industry for decades when the strength is 220 lbs/350 lbs as in the A10.32–2004'' (Ex. 155). OSHA agrees that the addition will provide greater protection for workers.

Ellis also recommended that OSHA require proof testing snaphook and carabiner gate strength ''in all directions'' (Ex. 155). The purpose of proof testing gate strength in all directions is to ensure that no matter in which direction the pressure is applied, the connector gate will not fail. Such proof testing will provide greater protection for workers, therefore, OSHA added the requirement to proof test the gate strength of snaphooks and carabiners in all directions. Since this testing has been industry practice for several years (see Z359.1–2007, Section 3.2.1.7), OSHA does not believe that employers will have difficulty complying with the new requirement in paragraph (c)(8).

Paragraph (c)(9) of the final rule requires employers to use automatic locking snaphooks and carabiners in personal fall protection systems. Automatic locking snaphooks and carabiners require at least two separate, consecutive actions to open, which reduce the danger of ''rollout'' (*i.e.,* inadvertent opening and disconnecting of components). Non-locking snaphooks are prohibited in a personal fall protection system.

Final paragraph (c)(9) is consistent with OSHA's shipyard employment and construction fall protection standards (§§ 1915.159(a)(5); 1926.502(d)(5)). In addition, Z359.12–2009 (Section 3.1.1.3) and A10.32–2012 (Sections 2.12 and 2.50.1) both require the use of locking snaphooks and carabiners for personal fall protection systems.

In the proposed rule, OSHA explained that as far back as the 1990 proposed rule, commenters expressed widespread support for prohibiting non-locking snaphooks (75 FR 28908). In OSHA's rulemaking on fall protection in the construction industry, several commenters said the rule should mandate the use of locking snaphooks, citing the rollout problems experienced with non-locking (single-action) snaphooks (59 FR 40672, 40705 (8/9/1994)). Those commenters also provided information indicating that locking snaphooks are superior to non-locking snaphooks in minimizing rollout. Based on that and other information in that rulemaking record, OSHA determined that it was necessary to require the use of locking snaphooks in personal fall protection systems used in the construction industry, finding that ''in general, locking snaphooks provide a higher level of protection to workers than the single-action (non-locking) type of snaphooks'' (59 FR 40705).

Likewise, OSHA has determined that locking snaphooks and carabiners are necessary to protect employees in general industry. In the proposed rule, OSHA asked for comment on whether the requirement should be phased in, but received no comment on the issue. OSHA does not believe it is necessary to provide a phase-in period, because the construction rule has been in place since 1998. Accordingly, OSHA believes that manufacturers currently are making personal fall protection systems available with automatic locking snaphooks and carabiners, and most employers already are using snaphooks and carabiners that comply with the final rule.

Paragraph (c)(10) of the final rule prohibits employers from using snaphooks or carabiners for certain connections unless they are designed for that connection. Accordingly, the final rule specifies that employers may connect snaphooks or carabiners to the following objects *only* if the snaphooks and carabiners are designed to be connected:

- Directly to webbing, rope, or wire rope;
- To each other;
- To a D-ring to which another snaphook, carabiner, or connector is attached;
- To a horizontal lifeline; or
- To any object that is incompatibly shaped or dimensioned in relation to the snaphook or carabiner such that unintentional disengagement could occur when the connected object depresses the snaphook or carabiner gate and allows the components to separate.

Final paragraph (c)(10) is the same as OSHA's construction and shipyard employment fall protection standards (§§ 1915.159 (a)(6); 1926.502(d)(6)). The Powered Platforms standard addresses the connection compatibility issue a little differently than this final rule, requiring that snaphooks ''be sized to be compatible with the member to which they are connected so as to prevent unintentional disengagement'' of the snaphook (§ 1910.66, appendix C, Section I, paragraph (d)(8)). Similarly, the Z359.1–2007 standard requires: ''Snaphooks and carabiners shall be compatibly matched to their associated connectors to reduce the possibility of rollout . . . Snaphooks and carabiners shall not be connected to each other'' (Section 7.2.2.). Explanatory notes accompanying this provision state that multiple connections (*e.g.,* two snaphooks, snaphook and webbing) into a single ring are not recommended (Section E7.2.2).

OSHA believes that the final rule will help to reduce the potential of rollout. Certain connections, such as ones that are incompatibly sized or dimensioned, increase the likelihood of rollout, and OSHA believes the provision is needed to provide adequate assurance of worker safety. Accordingly, OSHA adopts the proposed provision, with the addition of ''carabiners,'' a commonly used connector.

In paragraph (c)(11) of the final rule, like the proposal, OSHA establishes two requirements for horizontal lifelines. The provision specifies that employers must ensure horizontal lifelines are: (1) Designed, installed, and used under the supervision of a qualified person (paragraph (c)(11)(i)); and (2) are part of a complete personal fall arrest system that maintains a safety factor of at least two (paragraph (c)(11)(ii)).

Paragraph (c)(11) is the same as OSHA's Powered Platforms (§ 1910.66, appendix C, Section I(c)(9)) and construction fall protection standards (§ 1926.502(d)(8)). In addition, A10.32–2012 contains similar requirements (Section 4.4). Although Z359.1–2007 does not address horizontal lifelines specifically, it provides: ''A PFAS [personal fall arrest system] which incorporates a horizontal lifeline (outside the scope of this standard) shall be evaluated in accordance with acceptable engineering practice to determine that such system will perform as intended'' (Section 3.1.4).

OSHA believes the requirements in paragraph (c)(11) are necessary because horizontal lifelines present unique safety issues. For example, horizontal lifelines may be subject to greater impact loads than the loads imposed by other attached components. Horizontal lifelines also result in potentially greater fall distances than some other fall protection devices. Even a few additional feet of free fall can increase fall arrest forces significantly, possibly to the point of exceeding the strength of the system. In addition, forces applied in a perpendicular direction to a horizontal lifeline create much larger forces at the anchorages. The potential for increased fall arrest forces and impact loads associated with horizontal lifelines explains the need for employers to ensure that personal fall arrest systems used with horizontal lifelines maintain a safety factor of at least two. (See discussion of horizontal lifelines in appendix C to § 1910.140, section (j).)

OSHA received one comment on the proposed provision. Ellis said OSHA should require that horizontal lifelines be positioned overhead when the personal fall arrest system is made ready for use because of increased forces when the line is at waist level. He added, ''Due to stretch the fall factor increases fall distance when the line is below shoulder height'' (Ex. 155). OSHA recognizes that using horizontal lifelines at waist level may be unavoidable in some circumstances. Requiring that a qualified persons design, install, and supervise the use of horizontal lifelines with personal fall arrest systems helps to ensure that issues such as the positioning of horizontal lifelines will be properly considered and resolved before the personal fall arrest system is used.

Paragraph (c)(12) of the final rule, like the proposed rule, requires that employers ensure anchorages used to attach to personal fall protection equipment are independent of any anchorage used to suspend workers or work platforms. This requirement ensures that if the anchorage holding other equipment (such as a powered platform or RDS) fails, the worker will still be protected by the separate, independent anchorage to which the personal fall protection system is secured. The purpose of the requirement, which the shipyard employment and construction fall protection standards also require (§§ 1915.159(a)(8); 1926.502(d)(15)), is to ensure that anchorages used to suspend workers or work platforms are not the anchorages that workers use for their personal fall protection system.

The Industrial Truck Association (ITA) said the provision was not a workable requirement for mobile work platforms such as those on powered industrial trucks:

> On powered industrial trucks that have elevating platforms, such as high-lift order pickers, the anchorage for the lanyard that comprises part of the personal fall protection equipment is necessarily a part of the overhead guard or some other structural member that elevates with the operator platform and through the same mechanism (the lift chains) as the platform. This is inherent in mobile equipment, which cannot depend on some separate fixed anchorage point for the personal fall protection equipment. The concern is that the anchorage used for attaching the personal protective equipment, since it moves up and down with the operator platform, could be considered not ''independent'' of the anchorage being used to support the platform. Since OSHA obviously did not intend by the proposed revision to eliminate the use of high-lift order pickers or other powered industrial truck platforms, it appears that 1910.140(c)(12) requires a clarification for mobile equipment (Ex. 145).

OSHA agrees with the issue the commenter raised and exempts mobile work platforms on powered industrial trucks from the requirement in final paragraph (c)(12) that anchorages be independent. Therefore, OSHA has added language to the final rule to address anchorages used to attach to personal fall protection equipment on mobile work platforms on powered industrial trucks. The new language specifies that those anchorages must be attached to an overhead member of the platform, at a point located above and near the center of the platform. OSHA modeled this language on the anchorage requirements in the national consensus standard on powered industrial trucks (ANSI/ITSDF B56.1–2012, Safety Standard For Low Lift and High Lift Trucks (Ex. 384; Section 7.37)).

Paragraph (c)(13) of the final rule adopts strength requirements for anchorages for personal fall protection systems, and includes a performance-based alternative. The final provision, like the proposal, requires that anchorages either (1) be capable of supporting at least 5,000 pounds for each worker attached, or (2) be designed, installed, and used under the supervision of a qualified person as part of a complete personal fall protection system that maintains a safety factor of at least two. The anchorage strength requirement applies to personal fall arrest, travel restraint, and positioning system anchorages, but not to window cleaner's belt anchors, which are addressed separately in paragraph (e).

Paragraph (c)(13) is the same as the personal fall protection system anchorage requirement in OSHA's Powered Platforms, shipyard employment and construction fall protection standards (§§ 1910.66, appendix C, Section (c)(10); 1915.159(a)(9); 1926.502(d)(15)). The A10.32–2012 standard also contains similar requirements (Section 5.1.1). Although the anchorage requirements in Z359.1–2007 and I–14.1–2001 are similar to the final rule, they differ to some extent. For example, the Z359.1 standard requires:

> Anchorages selected for [personal fall arrest systems] shall have a strength capable of sustaining static loads, applied in the directions permitted by the PFAS, of at least: (a) Two times the maximum arrest force permitted on the system, or (b) 5,000 pounds (22.2kN) in the absence of certification. When more than one PFAS is attached to an anchorage, the anchorage strengths set forth in (a) and (b) above shall be multiplied by the number of personal fall arrest systems attached to the anchorage (Section 7.2.3).

The I–14.1 standard requires that all components of personal fall arrest systems, including anchorages, comply with the Z359.1 standard, with some exceptions, such as window cleaner's belts (Section 9.2.2(a)).

OSHA did not receive any comments opposing proposed paragraph (c)(13), and Ameren specifically supported the performance language alternative: ''Ameren agrees with this language so as to allow use to determine suitable anchorage points because of capacity and not be restricted due to other designations of the equipment'' (Ex. 189).

As discussed above, OSHA believes that all of the strength requirements in the final rule are necessary to provide a reasonable margin of safety for workers. At the same time, the final rule gives employers flexibility in meeting the anchorage strength requirement in specific circumstances. The final rule does not require a 5,000-pound anchorage point in every situation. An employer may use an anchorage that meets a different strength, provided that (1) the anchorage is part of a complete fall protection system, (2) the personal fall protection system maintains a safety factor of at least two, and (3) the anchorage is designed, installed, and used under the supervision of a qualified person.

The Agency anticipates that even employers who cannot achieve 5,000-pound anchorage strength should have no difficulty meeting the alternative 2:1 safety factor. For example, I–14.1–2001 requires that anchorages for positioning systems be capable of supporting 3,000 pounds or at least twice the potential impact load of a worker's fall, whichever is greater (Section 9.2.3(b)). The I–14.1 requirement has been in place for more than 10 years, and employers are familiar with the standard.

Ellis recommended that OSHA require employers using the alternate anchorage strength procedures in (c)(13) to document the anchorage ''with at least a sketch or engineering drawing'' because ''anchorages are mostly guesswork'' (Ex. 155). OSHA believes that the requirement in paragraph (c)(13), that qualified persons design, install, and supervise the use and maintenance of anchorages, is sufficient, and will be more effective in protecting workers than documentation by a person who may not have the qualifications of a qualified person. Qualified persons, as paragraph (b) specifies, must possess the type of qualifications (*i.e.,* recognized degree, certificate, or professional standing or extensive knowledge, training, and experience) that makes them capable of designing anchorages that successfully meet the requirements of the final rule. Or, the qualified person must have demonstrated ability to solve and resolve the issues relating to the subject matter, work, or work project. Final paragraph (c)(13) requires that the qualified person supervise the use of the anchorages, which will ensure the qualified person oversees maintenance of the anchorages so they remain in safe and useable condition. OSHA believes this supervision will go further in providing worker protection than anchorage sketches or drawings.

OSHA notes that an employer may use more than one qualified person to comply with the final rule. For example, some employers may choose to have an outside qualified person design the anchorages to meet the requirements of the final rule and an in-house, on-site qualified person to supervise their installation and use.

Paragraph (c)(14) of the final rule, like the proposed rule, requires that restraint lines in travel restraint systems be capable of sustaining a tensile load of at least 5,000 pounds. OSHA's existing fall protection standards do not include any requirements that specifically address travel restraint systems or lines. The requirement is drawn from two national consensus standards: (1) The A10.32–2012 standard specifies that component parts of travel restraint systems be designed and manufactured to meet the standard's requirements for personal fall arrest systems (Section 4.6.1); and (2) the Z359.3–2007 standard requires that positioning and travel restraint lanyards be capable of sustaining a minimum breaking strength of 5,000 pounds (Section 3.4.8).

OSHA believes the strength requirement for travel restraint lines in final paragraph (c)(14) is necessary for several reasons. First, the requirement ensures that the restraint line provides adequate protection if a restraint line is ever used as a lifeline. For example, if a travel restraint system is not rigged properly or is inadvertently used with a personal fall arrest system, and the worker falls off the walking-working surface, the restraint line essentially becomes a lifeline. Because of this possibility, OSHA believes it is necessary that travel restraint lines have the same 5,000-pound minimum breaking strength required of personal fall protection system lifelines and lanyards (see paragraph (c)(4)).

Second, according to CSG (Ex. 329 (1/18/2011, p. 110)) and Mine Safety Appliances (MSA) (Ex. 329 (1/18/2011, p. 199)) travel restraint systems (including lines and lanyards) currently are designed and manufactured to support a 5,000 pound load. Further, MSA said they were not aware of any company that still manufacturers travel restraint lines that support only 3,000 pounds.

Finally, setting the strength requirement at 5,000 pounds for travel restraint lines makes the provision consistent with other strength requirements in § 1910.140 for components of personal fall protection systems (*e.g.,* D-rings, snaphooks, carabiners, anchorages (paragraphs (c)(7) and (13))). OSHA adopts the provision as discussed.

Paragraph (c)(15) of the final rule requires that employers ensure lifelines are not made of natural fiber rope. Natural fiber rope of the same size is weaker than its synthetic counterpart and may burn under friction. When the employer uses polypropylene rope, the final rule requires that it must contain an ultraviolet (UV) light inhibitor. Final paragraph (c)(15) is consistent with OSHA's Powered Platforms, shipyard employment, and construction fall protection standards (§§ 1910.66, appendix C, Section (c)(11); 1915.159(c)(2); 1926.502(d)(14)). Those standards specify that ropes and straps (webbing) used in lanyards, lifelines, and strength components of body belts and body harnesses be made from synthetic fibers or, with the exception of the construction standard, wire rope; however, those standards do not require that lifelines made of polypropylene rope contain a UV light inhibitor.

The final rule provision also is consistent with Z359.1–2007 and with A10.32–2012, which provide useful guidance to help employers meet the requirement in final paragraph (c)(15). For example, the Z359.1 standard provides: ''Rope and webbing used in the construction of lanyards shall be made from synthetic materials of continuous filament yarns made from light and heat resistant fibers having strength, aging, and abrasion resistant characteristics equivalent or superior to polyamides'' (Section 3.2.3.1). The A10.32 standard specifies, ''Harnesses, lanyards, lifelines and other load-bearing devices shall not be made of natural fibers (including, but not limited to, cotton, manila and leather)'' (Section 4.5.5). The I–14.1–2001 standard requires that all personal fall arrest systems used in window cleaning operations comply with Z359.1, and prohibits ropes made entirely of polypropylene (Sections 6.8, 9.2.2(a)). In addition, the standard requires that all rope and webbing used in suspending RDS seat boards be made of synthetic fiber, preferably nylon or polyester (Section 14.3(d)).

Like the Z359.1 standard, OSHA recognizes that degradation due to exposure to ultraviolet light can be a serious problem, especially for polypropylene rope. However, OSHA believes that polypropylene rope has certain advantages compared to other synthetic materials. Polypropylene rope is strong and flexible, and may be less costly than rope made of other materials. Moreover, many newer polypropylene ropes are made with UV light inhibitors, so employers can use polypropylene rope without the risk of degradation from UV light. The Agency believes the final rule provides adequate protection for workers while embracing technological advances that give employers greater flexibility in complying with paragraph (c)(15). Additionally, OSHA removed ''carriers'' from the final provision. Carriers are used exclusively in ladder safety systems, which are covered in § 1910.23, and not in personal fall protection systems. OSHA did not receive any comments on the proposed provision, and adopts it as discussed.

Paragraph (c)(16) of the final rule, like the proposed rule, requires that all personal fall protection systems and components be used only for worker fall protection. Paragraph (c)(16) also prohibits personal fall protection systems from being used for any other purpose, such as hoisting materials or equipment. The final rule applies to all personal fall protection systems, including personal fall arrest systems, positioning devices and travel restraint systems and components such as anchorages, harnesses, connectors, and lifelines.

The final rule is similar to OSHA's Powered Platforms, shipyard employment and, construction fall protection standards (§§ 1910.66, appendix C, Section I, paragraph (c)(6); 1915.159(c)(9); 1926.502(d)(18)).

OSHA received one comment on the proposed requirement. Although Verallia ''agree[d] with OSHA's goal of using . . . personal fall protection equipment only for its intended purpose,'' they said:

> [A]nchorage points—while clearly performing a function related to the use of personal fall protection—fall outside the intended goal of preserving intact the equipment itself. In other words, anchorage points are designed for and have many uses outside of fall protection in industrial settings. Their occasional use for tasks other than personal fall protection is consistent with their design (Ex. 171).

OSHA agrees anchorages have uses other than for personal fall protection. Anchors are used for suspended work platforms, rope descent systems, and other equipment. For example, using a structural beam as an anchorage does not mean the structural beam can never be used as a structural member. OSHA intends this provision to apply to those components that would typically be found in a personal fall protection kit, *i.e.,* a body harness, lanyards, and connectors. Structural members used as anchorage points will obviously continue to be structural members and do not fall under this provision. However, for example, if a worker is using appropriate webbing tied around a structural member as an anchor point for personal fall protection, that webbing must be used only for personal fall protection, both at that time, and in the future. The webbing (and harness, lanyard, and connectors) must not be used for any other purpose at any other time, such as hoisting materials and equipment.

Paragraph (c)(17) of the final rule, like the proposed rule, requires that any personal fall protection system or its component subjected to impact loading must be removed from service immediately. This requirement applies to impact loading due to a free fall, but not to impact loading during static load testing. The final rule also specifies that the employer must not use the system or component again until a competent person inspects the system or component and determines that it is not damaged and is safe to use for worker personal fall protection.

The final rule is the same as the Powered Platforms, shipyard employment and construction fall protection standards (§§ 1910.66, appendix C, Section I, paragraph (e)(7); 1915.159(c)(6); 1926.502(d)(19)). The Z359.1–2007 (Section 5.3.4) and A10.32–2012 (Section 3.4) standards also require that impact loaded systems and components be removed from service; however, neither standard specifies requirements that allow or prohibit reuse of such equipment.

OSHA believes that paragraph (c)(17) will ensure that employers implement procedures for inspection and evaluation of impact-loaded personal fall protection systems and components to prevent reuse of damaged equipment. OSHA believes that the requirements in paragraph (c)(17), as well as the other requirements in the final rule, provide sufficient safeguards to allow the reuse of impact-loaded personal fall protection systems after the competent person inspects and repairs or replaces the damaged components.

The final rule provides the following safeguards to ensure the dangers of impact-loaded personal fall protection systems are addressed properly before reuse:

- Paragraph (c)(18) of the final rule, discussed below, requires that employers ensure personal fall protection systems are inspected for damage before each use, and remove defective components from service;
- Section 1910.30 of the final rule requires that each worker be trained in the proper inspection of fall protection equipment; and
- Appendix C to § 1910.140 provides useful information on inspecting fall protection equipment and components.

OSHA requested comment on whether the proposed approach provides adequate protection. In particular, OSHA asked for comment on whether the final standard should require destruction of ropes, lanyards, belts, and harnesses subjected to impact loading (75 FR 28909). Impact loading can cause damage to fibers that cannot be discovered easily. OSHA notes these components are relatively inexpensive to replace.

OSHA received comments supporting the proposed requirement (Exs. 185; 198; 251). ISEA (Ex. 185) and CSG (Ex. 198) both said that manufacturers commonly indicate in user instructions and product labels how to handle personal fall protection equipment after an impact, and recommended that: ''OSHA should err on the side of worker protection and recommend that when components of personal fall arrest systems such as ropes, lanyards, or harnesses are impact loaded, they should be permanently taken out of service and disposed of'' (Ex. 185). ISEA and CSG pointed out that some fall protection components have an impact load indicator that alerts users when a product must be taken out of service (Exs. 185; 198). This device makes it easy for employers to know when they need to remove personal fall protection systems and components from service and replace them. One commenter on the 1990 proposed rule said that only manufacturers should inspect systems to determine if they are suitable for reuse (Ex. OSHA–S057–2006–0680–0048).

By contrast, Edison Electric Institute (EEI) opposed requiring removal of equipment subjected to impact loading. EEI said, ''Inspection by a competent person is adequate to determine whether the component is still functional'' (Ex. 207). Similarly, SPRAT opposed the destruction of equipment that is ''retired'' (Ex. 205).

OSHA believes that impact loading may adversely affect the integrity of personal fall protection systems, but also recognizes that many other factors can affect a system's potential capability for reuse after impact loading. These factors include the type of deceleration device used, and the length of the fall. For example, a short fall of one foot may not damage the harness, but a long fall, such as six feet or more, may damage or even destroy the harness. OSHA believes that if an impact-loaded system or component is damaged or fails the employer must remove it from service immediately so a competent person can inspect the system or component and determine whether it can be reused for worker fall protection. However, when a competent person's careful inspection of the entire system and evaluation of the factors involved in the fall indicates no damage has occurred, and the personal fall protection system or component continues to meet the strength requirement and other criteria necessary for continued use, OSHA does not believe it is necessary that employers permanently remove the system or component from use. OSHA notes that the employer should be allowed to reuse such system and components. In addition, OSHA believes that a competent person, as defined in paragraph (b) of the final rule, has the ability to carefully inspect the personal fall protection system and its components, evaluate the various factors involved in the fall, and make a determination about whether the equipment is safe for reuse. Moreover, the competent person has the authority to take prompt corrective action, including prohibiting the reuse of the equipment or any component that may have been damaged.

Paragraph (c)(18) of the final rule, like the proposal, requires that before initial use during each workshift, personal fall protection systems must be inspected for mildew, wear, damage, and other deterioration. The provision also requires that employers remove from service any defective component.

Final paragraph (c)(18) clarifies two key terms: ''before each use'' and ''defective component.'' Proposed paragraph (c)(18) specified that workers must inspect personal fall protection systems ''before each use.'' The final rule expressly clarifies that OSHA's intention in the proposed rule was that workers inspect their personal fall protection systems before initial use during each workshift. Thus, if the personal fall protection system is used in more than one workshift during a day, the system must be reinspected at the start of each of those workshifts.

OSHA also clarifies that the term ''defective component,'' which appendix C to § 1910.140 refers to as a ''significant defect,'' means damage or deterioration that affects the function or strength of the system or component.

The final rule is generally consistent with OSHA's Powered Platforms, construction, and shipyard employment standards (§§ 1910.66, appendix C, Section I(f); 1915.159(c)(5); 1926.502(d)(21)), as well as with Z359.1–2007 (Section 6.1) and A10.32–2012 (Section 4.1).

OSHA believes that paragraph (c)(18), like paragraph (c)(17), will ensure that employers have a procedure in place for inspecting personal fall protection systems and components and removing defective, damaged, or weakened components from service. Appendix C to § 1910.140 provides useful information to help employers with the inspection requirement in the final rule, including a list of the types of defects that can require removal. (See appendix C to § 1910.140, Section (g)).

OSHA received only one comment on inspection of personal fall protection systems. Verallia recommended that OSHA require ''prior to use, each employee must visually inspect the anchorage points for wear and obvious deformities'' (Ex. 171). OSHA does not believe it is necessary to add the language in Verallia's recommendation because paragraph (c)(18) already requires that employers inspect anchorage points. Paragraph (c)(18) requires that employers inspect personal fall protection systems. The definition of personal fall protection system in the final rule identifies personal fall arrest systems, positioning systems, and travel restraint systems as examples of personal fall protection systems. The definitions of each of those systems explain that they consist of various components (''a system of equipment''), including anchorages. Therefore, employers must ensure that the inspection covers every component of the personal fall protection system, including anchorages, so the entire system is safe to use.

Paragraph (c)(19) of the final rule requires employers to ensure that ropes, lanyards, harnesses, and belts used for personal fall protection are compatible with the connectors being used. Although the final rule does not define ''compatible,'' Z359.0–2012 defines compatible as follows:

> Capable of orderly, efficient integration and operation with other elements or components in a system, without the need of special modification or conversion, such that the connection will not fail when used in the manner intended (Section 2.29).

OSHA believes compatibility between personal fall protection components and connectors is essential to prevent hazards such as rollout, exceeding system strength, and long free fall distances that can increase fall arrest forces significantly. For example, a lifeline or harness can disengage from a connector if its size or dimension is incompatibly sized or configured for use with the connector.

In addition, the Agency has found that it is common practice for employers to interchange or replace components of personal fall protection systems (*e.g.,* lanyards, connectors, lifelines, deceleration devices, body harnesses, body belts) with components produced by other manufacturers. Final paragraph (c)(19) gives employers flexibility to continue this practice when they need to replace personal fall protection components. At the same time, the final rule ensures that workers are protected from rollout and other fall hazards regardless of whether the employers uses replacement components from the same or a different manufacturer.

Appendix C to final § 1910.140 provides important information to help employers ensure they maintain compatibility when replacing personal fall protection components. For example, the appendix cautions: ''Any substitution or change to a personal fall protection system should be fully evaluated or tested by a competent person to determine that it meets applicable OSHA standards before the modified system is put to use'' (§ 1910.140, appendix C, Section (d)). OSHA notes that final paragraph (c)(19) and appendix C are consistent with Z359.1–2007 (Section 7.1.7), which requires that connectors, regardless of whether they are integral elements of the personal fall protection system, individual components, or replacements produced by the same or different manufacturers, must be suitably configured to interface compatibly with associated connectors which will be attached to them.

Final appendix C to § 1910.140 states the ideal way for employers to ensure the compatibility of components of personal fall protection systems is to supply workers with complete systems (appendix C to § 1910.140, Section (d)).

The final rule is similar to the shipyard employment fall protection standard, which requires that system components be compatible with ''their hardware'' (§ 1915.159(c)(3)). Both Z359.1–2007 and A10.32–2012 include similar compatibility requirements. For example, A10.32 specifies: ''All equipment used in a fall protection system shall be compatible to limit force levels, maintain system strength, and prevent accidental disengagement'' (Section 1.4.3; *see also* Z359.1–2007 (Section 7.1.1)). These national consensus standards also require that competent persons ensure personal fall protection systems comprised of components and subsystems produced by different manufacturers are compatible (Z359.1–2007 (Section 7.1.10); A10.32–2012 (Section 7.4)).

Commenters raised two concerns about proposed paragraph (c)(19). First, ISEA and CSG seem to imply that the compatibility requirement in final paragraph (c)(19) is not necessary (Exs. 185; 198). For support, they point out that Z359.12 (Section 7.1) requires that snaphooks and carabiners be designed to prevent ''forced rollout,'' which ISEA and CSG appear to believe is an adequate solution without requiring that employers also comply with paragraph (c)(19). In addition, ISEA and CSG pointed out that manufacturers currently are designing connectors to prevent forced rollout. However, the explanatory note in Z359.12 states:

> While connectors which are compliant with ANSI/ASSE Z359.12 reduce the possibility or risk of failure as a result of incompatible connections, they do not eliminate it (Z359.12–2009 (Section E7.1)).

Moreover, OSHA notes that rollout is not the only hazard that component incompatibility can cause. The A10.32–2012 standard specifies that components of personal fall protection systems must be compatible in order ''to limit force levels, maintain system strength, and prevent accidental disengagement'' (Section 1.4.3). Accordingly, OSHA believes the component compatibility requirement in final paragraph (c)(19) is necessary because it will protect workers from all of those hazards.

Second, ASSE argues that it is not feasible to eliminate incompatible connections:

> The reality is that there are too many non-certified anchorages and structural variations where gate loading or pressure on the connector will occur.
>
> It is not enough just to require a locking type snap hook. Connectors that have significantly stronger gates are readily available and have been for many years to the point where ANSI has made it a requirement for construction and design of connectors. Connectors tested and approved to the ANSI Z359.12 standard provide workers with an additional level of security that would help prevent fatalities (Ex. 127).

OSHA does not agree with, and national consensus standards do not support, ASSE's argument. The Z359.12–2012 and A10.32–2012 standards include component compatibility requirements. In addition, the final rule addresses the conditions that ASSE identifies as making the elimination of incompatible connections infeasible. For example, like the ANSI/ASSE standards, the final rule requires that anchorages, connectors, and other components be capable of supporting 5,000 pounds (§ 1910.140(c)(4), (c)(7), and (c)(13)(i)). In addition, final § 1910.27(b)(1) requires that anchorages be certified as meeting the 5,000-pound requirement. The final rule also incorporates a number of other provisions in Z359.12–2012 to ensure workers have ''an additional level of security that would help prevent fatalities.''

ASSE also maintains that the requirement in proposed (c)(19) is not feasible because ''we continue to see fatalities related to incompatible connections and gate failure'' after OSHA included a connector compatibility requirement in § 1910.66, appendix C, and the construction fall protection standard (29 CFR part 1926, subpart M) (Ex. 127). OSHA does not agree with ASSE's conclusion. The fact that accidents, fatalities, injuries, or illnesses may occur after OSHA implements a standard does not mean that the controls the standard requires are not feasible. Rather, it is more likely that those incidents are the result of noncompliance with the connector compatibility requirements in § 1910.66 and the construction fall protection. Accordingly, the final rule adopts the proposed requirement that employers must ensure ropes, belts, lanyards, and harnesses used for personal fall protection are compatible with all connectors used, regardless of whether the components are integral elements of the personal fall protection system, individual components, or replacements produced by the same or different manufacturers.

Paragraph (c)(20) of the final rule, like the proposal, requires that employers ensure all ropes, lanyards, lifelines, harnesses, and belts used for personal fall protection systems are protected from being cut, abraded, melted, or otherwise damaged. OSHA believes that these components of personal fall protection systems need to be protected from the specified hazards, which could cause damage and deterioration that results in components losing strength and failing.

Final paragraph (c)(20) is broader than the requirements in OSHA's shipyard employment and construction fall protection standards (§§ 1915.159(c)(4), 1926.502(d)(11)), which only address protecting lanyards and lifelines from damage. By contrast, Appendix C of the Powered Platforms standard specifies that any component of a personal fall arrest system with any significant defect which might affect its efficiency must be withdrawn from service immediately, or destroyed (§ 1910.66, appendix C, Section III(f)). The Z359.1–2007 and A10.32–2012 standards contain several provisions requiring lifelines, lanyards, ropes, webbing, and other fall protection system components to be protected from the types of damage the final rule specifies.

In addition to protecting fall protection equipment components from cuts, abrasions, and melting, the final rule requires that employers protect fall protection equipment from other damage (*i.e.,* ''otherwise damaged''). Although the final rule does not define ''otherwise damaged,'' OSHA's other fall protection standards and the national consensus standards provide useful guidance about the types of damage that employers need to consider. For example, the shipyard employment standard requires equipment be protected from ''cuts, abrasions, burns from hot work operations and deterioration from acids, solvents, and other chemicals'' (§ 1915.159(c)(4)). Appendix C to the Powered Platforms standard lists a number of hazards: ''Any components with any significant defect, such as cuts, tears, abrasions, mold, or undue stretching; . . . damage due to deterioration; contact with fire, acids, or other corrosives; . . . wearing or internal deterioration of ropes alterations'' (§ 1910.66, appendix C, Section III(f)).

The A10.32–2012 standard requires that employers protect fall protection equipment from abrasion, cutting, welding, electrical, and chemical hazards (Section 7.5). Similarly, Z359.1 requires that fall protection equipment be made of ''abrasive and heat resistant materials'' (Sections 3 and 5). OSHA did not receive any comments on the proposed provision, and adopts paragraph (c)(20) with the minor revisions mentioned above. In addition, appendix C to § 1910.140 includes many hazards employers should consider when inspecting personal fall protection systems (appendix C to § 1910.140, Section (g)).

Paragraph (c)(21) of the final rule, like the proposed rule, requires that employers provide for the prompt rescue of workers in the event of a fall. This requirement is necessary because workers suspended after a fall are in danger of serious injury due primarily to suspension trauma.

The final rule is consistent with the rescue requirements in OSHA's Powered Platforms, shipyard employment, and construction fall protection standards (§§ 1910.66, appendix C, Section I(e)(8); 1915.159(c)(7); 1926.503(d)(20)). Those standards require that employers ''provide for prompt rescue of employees in the event of a fall or shall assure the self-rescue capability of employees'' (Powered Platforms (§ 1910.66, appendix C, Section I(e)(8)).

The final rule also is drawn from three national consensus standards. The A10.32–2012 standard specifies that employers develop a ''project-specific'' rescue plan that provides an appropriate form of employee rescue (Section 7.2.2.). The standard also requires that the rescue plan include providing adequate rescue equipment and training workers in self-rescue or alternate means. The Z359.4–2007 standard provides useful information to assist employers in planning for rescues in the event of a fall. Finally, Z359.1–2007 requires that worker training address fall rescue (Section 7.3.2).

Paragraph (c)(21) of the final rule sets forth two fundamental points: (1) Employers must provide for the rescue of workers when a fall occurs, and (2) the rescue must be prompt. With regard to the first point, the final rule requires that employers must ''provide'' for rescue, which means they need to develop and put in place a plan or procedures for effective rescue. The plan needs to include making rescue resources available (*i.e.,* rescue equipment, personnel) and ensuring that workers understand the plan.

Appendix C to § 1910.140 provides guidance to employers on developing a rescue plan (appendix C to § 1910.140, Section (h)) as does Z359.4–2007. For example, appendix C recommends that employers evaluate the availability of rescue personnel, ladders, and other rescue equipment, such as mechanical devices with descent capability that allow for self-rescue and devices that allow suspended workers to maintain circulation in their legs while they are awaiting rescue. OSHA's Safety and Health Bulletin on Suspension Trauma/Orthostatic Intolerance identifies factors that employers should consider in developing and implementing a rescue plan, including recognizing the signs and symptoms of suspension trauma and factors that can increase the risk of trauma, rescuing unconscious workers, monitoring suspended and rescued workers, providing first aid for workers showing signs and symptoms of orthostatic intolerance (see SHIB 03–24–

2004, updated 2011).[77] ISEA supported requiring employers to have a rescue plan and make available equipment and personnel to provide for prompt rescue after a fall (Ex. 185).

OSHA notes that although an increasing number of employers provide devices that allow workers to rescue themselves, where self-rescue is not possible, the employer must ensure that appropriate rescue personnel and equipment is available for prompt rescue. For example, unconscious workers will not be able to move so they cannot pump their legs to maintain circulation or relieve pressure on their leg muscles. Workers who are seriously injured or in shock also may have difficulty effecting self-rescue.

On the second point, the final rule requires that employers provide ''prompt'' rescue of workers who are suspended after a fall. A number of commenters asked OSHA to clarify the meaning of ''prompt'' rescue, for example, asking whether it means ''immediately'' or ''quickly'' (Exs. 145; 185; 198). ISEA and CSG urged OSHA to require that suspended workers be rescued ''quickly,'' pointing out the life-threatening dangers of suspension trauma and orthostatic intolerance (Exs. 185; 198). In 2000, OSHA adopted the language ISEA and CSG recommends in answering the question of prompt rescue as it applies to the construction fall protection standard: ''[T]he word ''prompt'' requires that rescue be performed quickly—in time to prevent serious injury to the worker'' (Letter to Mr. Charles E. Hill, August 14, 2000).[78]

OSHA's definition of ''prompt'' is performance based. Employers must act quickly enough to ensure that the rescue is effective; that is, to ensure that the worker is not seriously injured. If the worker is injured in the fall, the employer must act quickly enough to mitigate the severity of the injury and increase the survivability of the worker. OSHA's performance-based definition recognizes, and takes into account, the life-threatening dangers of prolonged suspension:

> Orthostatic intolerance may be experienced by workers using fall arrest systems. Following a fall, a worker may remain suspended in a harness. The sustained immobility may lead to a state of unconsciousness. Depending on the length of time the suspended worker is unconscious/immobile and the level of venous pooling, the resulting orthostatic intolerance may lead to death. . . . Unless the worker is rescued promptly using established safe procedures, venous pooling and orthostatic intolerance could result in serious or fatal injury, as the brain, kidneys, and other organs are deprived of oxygen.
>
> Prolonged suspension from fall arrest systems can cause orthostatic intolerance, which, in turn, can result in serious physical injury, or potentially, death. Research indicates that suspension in a fall arrest device can result in unconsciousness, followed by death, in less than 30 minutes (SHIB 03–24–2004).

Because of the potential for severe and even fatal injuries from prolonged suspension, OSHA believes that employers can ensure their rescue operations are effective if they model them on their first-aid plans. To illustrate, in the final rule revising general workplace conditions in shipyard employment (29 CFR part 1915, subpart F), which requires that employers provide ''readily accessible'' first aid, OSHA defined ''readily accessible'' as ''capable of being reached quickly enough to ensure that medical service interventions are effective,'' and noted that ''medical services and first aid must be provided in a timeframe that will ensure their effectiveness in treating an injured or ill employee. Medical services that can be delivered quickly enough to the employee to be effective would be considered readily accessible'' (76 FR 24576, 24600 (5/2/2011)). (For a detailed discussion of effective emergency aid and first aid, see the preamble of the shipyard employment standard (76 FR 24599–664)).

OSHA also finds that the emergency-aid and first-aid response needs to be available within a few minutes ''in workplaces where serious accidents such as those involving falls . . . are possible'' (Letter to Mr. Charles Brogan, January 16, 2007).[79] As ISEA pointed out, the Z359.4–2007 standard recommends that contact be made within six minutes of a fall.

In summary, prompt rescue means employers must be able to rescue suspended workers quickly enough to ensure the rescue is successful—quickly enough to ensure that the worker does not suffer physical injury, such as injury or unconsciousness from orthostatic intolerance, or death. Many employers provide self-rescue equipment so workers can rescue themselves quickly after a fall, ensuring that the rescue is prompt and risks associated with prolonged suspension are minimized. OSHA believes the performance-based approach in the final rule ensures prompt rescue of workers after a fall, while also giving employers flexibility to determine how best to provide prompt and effective rescue in the particular circumstance.

OSHA also received several comments on what the final rule requires to protect workers from orthostatic intolerance. ITA requested that OSHA clarify whether the final rule requires workers to carry self-rescue equipment (Ex. 145). ISEA and CSG recommended that OSHA require employers to equip workers with suspension-relief devices and revise the definition of ''personal fall arrest system'' to include those devices. They said there are widely available devices that permit a suspended worker to relieve pressure from the harness and to ''maintain circulation in the large muscles of legs, reducing the potential for suspension trauma until help arrives'' (Exs. 185; 198). According to ISEA and CSG, the devices are lightweight, portable, and low cost, and workers can carry them as part of the personal fall arrest system. OSHA agrees that the benefits these devices offer are promising, and recommends that employers provide them, particularly in those situations where self-rescue may not be possible.

Paragraph (c)(22) of the final rule requires that workers wear personal fall protection systems with the attachment point of the body harness in the center of the worker's back near shoulder level. The final rule includes one exception—the attachment point may be located in the pre-sternal position if the free fall distance is limited to 2 feet or less.

The final rule differs from OSHA's Powered Platforms, construction, and shipyard employment fall protection standards, which do not permit the attachment point to be located in the pre-sternal position (§§ 1910.66, appendix C, Section I(e)(4); 1915.159(c)(1)(i); 1926.502(d)(17)). OSHA drew the exception for pre-sternal positioning in final paragraph (c)(22) from Z359.1–2007, which permits a front-mounted attachment point when the maximum free fall distance is two feet and the maximum arrest force is 900 pounds (Section 3.2.2.5a). A note to that section explains: ''The frontal attachment element is intended for the use in rescue, work position, rope access, and other ANSI/ASSE Z359.1 recognized applications where the design of the systems is such that only a limited free fall of two feet is permitted'' (Section E3.2.2.5a). The I–14.1–2001 standard incorporates this requirement from Z359.1 (Section 9.2).

[77] Available from OSHA's Web site at: *https://www.osha.gov/dts/shib/shib032404.html*.

[78] Available from OSHA's Web site at: *http://www.osha.gov/pls/oshaweb/owadisp.show_document?p_table=INTERPRETATIONS&p_id=24110*).

[79] Available from OSHA's Web site at: *http://www.osha.gov/pls/oshaweb/owadisp.show_document?p_table=INTERPRETATIONS&p_id=25627*.

The final rule differs from the proposed rule in two respects. First, the language ''or above the employee's head'' has been eliminated from the first sentence of the proposed provision because OSHA believes this language is inaccurate. A properly sized and adjusted harness should not allow the attachment point to be above the wearer's head. Second, the proposal would have required that front-mounted attachment points be limited to situations where the maximum fall arrest force does not exceed 900 pounds. OSHA deleted this requirement in this final rule because the Agency does not believe that the requirement is necessary. Final paragraph (c)(22) permits pre-sternal attachment only when the maximum free fall limit is two feet. OSHA believes this limit is sufficient to ensure fall arrest forces are reduced significantly in the event of a fall. ISEA (Ex. 185) and CSG (Ex. 198) opposed the 900-pound fall arrest requirement, which they said was ''too prescriptive and restrictive.''

Several commenters supported allowing a front-mounted attachment in certain situations, and OSHA did not receive any comments opposing its use. ISEA (Ex. 185) and CSG (Ex. 198) supported allowing front-mounted attachment points because it allowed workers to ''conduct a variety of tasks, such as rotating and leaning.'' AWEA also supported pre-sternal connection points, noting, ''Rope access workers around the world have been employing this technique for decades with excellent results'' (Ex. 329 (1/21/2011, p. 22)).

OSHA believes that allowing pre-sternal attachment when the free fall distance is limited to two feet will have only a minimal effect on the distribution of fall arrest forces, thereby reducing the risk of serious neck and back injury. Such use will make self-rescue easier in specific situations, such as confined spaces, window cleaning, and climbing activities because it is easier to work in front of the body than work behind one's body. In addition, permitting a front-mounted attachment point provides greater flexibility for employers in certain activities, such as climbing or using rope descent systems for window washing. Accordingly, the final rule retains the proposed exception for front-mounted attachment points when the maximum free fall distance is two feet.

Paragraph (d)—Personal Fall Arrest Systems

Paragraph (d) of the final rule establishes specific requirements for using personal fall arrest systems. A personal fall arrest system is one type of personal fall protection system. The final rule defines a personal fall arrest system as a system used to arrest a worker in a fall from a walking-working surface. A personal fall arrest system consists of a body harness, anchorage, and a connector. The means of connection may include a lanyard, deceleration device, lifeline, or a suitable combination of these. OSHA notes that the provisions in paragraph (d) apply in addition to those provisions in paragraph (c), which apply to all types of personal fall protection systems.

Paragraph (d) of the final rule includes some changes in the regulatory text from the proposal that clarify and simplify the language. Those changes do not affect the meaning or purpose of the provisions in paragraph (d). OSHA believes that the changes make the requirements in paragraph (d) easier for employers to understand, which should increase worker safety, and compliance with the final rule. Paragraph (d) consists of two primary components: Paragraph (d)(1) establishes performance criteria for personal fall arrest systems, while paragraph (d)(2) addresses the use of personal fall arrest systems. OSHA based the requirements for personal fall arrest systems on OSHA's Powered Platforms, construction, and shipyard employment fall protection standards (§§ 1910.66, appendix C; 1915.159; 1926.502(d)), as well as on several national consensus standards, including Z359.1–2007, A10.32–2012, and I–14.1–2001.

System performance criteria. The requirements in final paragraph (d)(1), with one exception, are almost identical to the requirements in OSHA's Powered Platforms, shipyard employment, and construction fall protection standards (§§ 1910.66, appendix C, Section I(d)(1); 1915.159(b)(6); 1926.502(d)(16)).[80]

Paragraph (d)(1)(i) of the final rule requires that employers ensure personal fall arrest systems limit the maximum fall arrest forces on a worker to 1,800 pounds. OSHA discussed the requirement extensively in the preamble to the Powered Platforms final rule, noting that the Agency proposed ''a force limit of 10 times the worker's weight or 1,800 pounds (8 kN) whichever is less'' (54 FR 31450). OSHA explained that the Powered Platforms proposed rule was consistent with ANSI A10.14–1975 and a report by the National Bureau of Standards (now the National Institute for Science and Technology) (54 FR 31450). In addition, OSHA said comments from the United States Technical Advisory Group, an advisory group representing both government and private interests, also supported the 1,800-pound maximum fall arrest limit for personal fall arrest systems.

When the Z359.1 standard was first published in 1992, it also incorporated the 1,800-pound maximum fall arrest force for personal fall arrest systems used with body harnesses, and retained the requirement in every update since 1992. The updated versions of Z359.1 (1992, 2002, and 2007) each explained the basis for the 1,800-pound maximum arresting force (MAF) limit as follows:

> The 1,800 pound (8 kN) MAF criteria included in this standard is based on the following considerations. In the mid-1970's medical information developed in France confirmed earlier United States research which observed that approximately 2,700 pounds (12 kN) is the threshold of significant injury incidence for physically fit individuals subjected to drop impacts when wearing harnesses. The French arbitrarily halved the above force and established 1,350 pounds (6 kN) as their national standard for MAF in PFAS. Canada's Ontario Ministry of Labor reviewed this information and elected to establish 1,800 pounds (8 kN) for MAF. This MAF has been in effect since 1979 in the Ontario Provincial standard. Since that time there have been no reported deaths or serious injuries associated with the arresting of accidental falls of individuals. In addition, ISO/TC94/SC4, in working drafts, has established the 1,800 pounds (8 kN) limit on MAF. On the basis of this information, 1,800 pounds (8 kN) is considered the appropriate MAF for inclusion in this standard where harnesses are to be used in arresting falls (Section E3.1.2).

Based on this research, OSHA believes that the 1,800 pound fall arrest force will adequately protect workers. OSHA did not receive any comments opposing the proposed provision, and is adopting it in the final rule with only minor editorial changes.

Paragraph (d)(1)(ii) limits the maximum deceleration distance to 3.5 feet. This requirement pertains only to the operation of the deceleration device itself and not to the 6-foot free fall distance specified in paragraph (d)(2)(ii). The 3.5-foot deceleration distance in this paragraph is in addition to the 6-foot free fall distance. Accordingly, once the free fall ends and the deceleration device begins to

[80] OSHA first promulgated these performance requirements in the Powered Platforms rulemaking (54 FR 31407 (7/28/1989)). In the preamble to that final rule, OSHA said that it intended to apply a future rule to all uses of personal fall arrest systems in general industry, including powered platforms, and that Appendix C to that rule would be superseded by the new rule (54 FR 31445–46). This final rule, like the proposal (75 FR 29146), removes appendix C to OSHA's Powered Platform rule (§ 1910.66). Final § 1910.140 addresses personal fall arrest systems used in all general industry, including powered platforms.

operate, the personal fall arrest system must bring the worker to a complete stop within 3.5 feet. Combining the free fall distance with the deceleration distance means that the total maximum distance a worker may travel during a fall could be 9.5 feet.

The final rule is the same as the requirement in the Powered Platforms, construction, and shipyard employment fall protection standards (§§ 1910.66, appendix C, Section I (d)(1)(iii); 1915.159(b)(6)(iii); 1926.502(d)(16)(iv); also see 54 FR 31450 and 59 FR 40708). Paragraph (d)(1)(ii) also is consistent with Z359.1–2007 (Section 3.1.2). In addition, the 3.5 deceleration distance has been an industry and manufacturer standard for years. OSHA did not receive any comments on the proposed requirement, and the final rule is adopting it as proposed with only minor changes.

Paragraph (d)(1)(iii) requires personal fall arrest systems to have sufficient strength to withstand twice the potential impact energy of the worker free falling a distance of 6 feet, or the free fall distance permitted by the system. In the final rule, OSHA has clarified the provision by removing the proposed language ''whichever is less.'' Both ways of meeting the standard are acceptable and the removed language is unnecessary. OSHA notes that the alternative free fall distance is the one the manufacturer lists in the instructions or specifications for the specific personal fall arrest system.

Compliance with this requirement ensures that the personal fall arrest system will not fail even if subjected to twice the design shock load. For example, a personal fall arrest system harness that just meets the maximum permitted arresting force allowed in final paragraph (d)(1)(i) must be able to withstand an impact force of 3,600 pounds, which is twice the 1,800-pound potential arresting force of a worker using the system falling up to 6 feet. The Agency determined that a safety factor of two is necessary to ensure that the personal fall arrest system will not fail even if there is unavoidable wear on the system as a result of normal use. In practice, fall arrest forces should never approach the design shock load because the free fall distance likely will be 6 feet or less, and because lifelines which absorb energy, often will be used. OSHA also determined that a safety factor of two provides adequate protection and makes the final rule consistent with the approach in OSHA's Powered Platforms, construction, and shipyard employment fall protection standards.

Paragraph (d)(1)(iv) is a new paragraph added to the final rule requiring that fall arrest systems be capable of sustaining the worker within the system or strap configuration without making contact with the worker's neck and chin area. The National Institute for Occupational Safety and Health (NIOSH) recommended adding this provision, saying: ''[S]tudies have shown that during suspended condition, the chest strap and ring of the harness can ride up on the worker's neck if the harness does not fit properly, posing a risk of injury to the worker [Hsiao et al., 2007; Hsiao et al., 2009]'' (Ex. 164).

NIOSH also noted that ''individuals with soft hip and thigh musculature are at increased risk of chest and neck strap interference to the neck and chin area when suspended after a successful arrest of fall'' (Ex. 164). OSHA agrees with NIOSH that a specific requirement is needed to ensure workers are not injured while using a personal fall arrest system. If employers select personal fall arrest systems that do not fit workers properly or fail to train workers in how to use systems properly, the system may not keep the worker safe within the strap configuration or body harness if a fall occurs, or may injure the worker's neck and chin area.

OSHA does not believe that adding the requirement imposes any new burden on employers, but rather reinforces other requirements with which the employer must comply. Specifically, the general requirements that apply to all PPE, including personal fall arrest systems, require that employers ''[s]elect PPE that properly fits each affected employee'' (29 CFR 1910.132(d)(1)(iii)). If the personal fall arrest system does not fit properly, the worker may not be protected adequately if a fall occurs. OSHA also notes that applicable training requirements in its PPE standard require employers to train workers in ''[h]ow to properly don, doff, adjust, and wear PPE'' (29 CFR 1910.132(f)(1)(iii)).

Final paragraph (d)(1)(v), proposed as a note to paragraph (d)(1), makes clear that personal fall arrest systems meeting the criteria and protocols set out in appendix D to § 1910.140 will be deemed to be in compliance with the requirements of paragraphs (d)(1)(i) through (iii) when used by a worker who has a combined tool and body weight of less than 310 pounds. Appendix D provides one method that will allow employers to evaluate the ability of the personal fall arrest system to meet the necessary criteria. However, appendix D is restricted to situations in which the total body and tool weight is less than 310 pounds because the test methods were designed for that weight. If a personal fall arrest system needs to support a greater weight, the test methods in appendix D may still be used, provided the employer modifies them to account for the additional weight, such as by using a heavier or lighter test weight to reflect the heavier or lighter weight of the worker. Ellis supported using the 310-pound weight in final paragraph (d) and in the test methods specified by appendix D to § 1910.140 (Ex. 155).

System use criteria. Final paragraph (d)(2) establishes criteria for the use of personal fall arrest systems. In paragraph (d)(2)(i), OSHA requires that, for horizontal lifelines that may become vertical lifelines, the device used to connect to the horizontal lifeline must be capable of locking in both directions on the lifeline. OSHA believes this requirement is necessary because a horizontal lifeline could become a vertical lifeline if the support lines on one end of a suspended scaffold or similar work platform fail. In this case, if the rope grab does not lock in both directions on the now vertical lifeline, it could fail to hold, allowing the worker to fall. OSHA drew this requirement from the Powered Platforms standard (§ 1910.66, appendix C, Section (I)(e)(2) and the construction standard (§ 1926.502(d)(7)). OSHA did not receive any comments on the proposed provision and is adopting it without substantive change.

Paragraph (d)(2)(ii) requires the personal fall arrest system to be rigged so that a worker cannot free fall more than 6 feet, nor contact a lower level.[81] The system strength and deceleration criteria for personal fall arrest systems are based on a maximum free fall distance of 6 feet. OSHA based this provision on the Powered Platforms, construction, and shipyard employment fall protection standards (§§ 1910.66, appendix C, Section (I)(e)(3);

[81] In subpart M, Interpretations and Clarifications—Fall Protection, OSHA stated that if the employer has documentation to demonstrate that these maximum arresting forces are not exceeded and that the personal fall arrest system will operate properly, OSHA will not issue a citation for violation of the free fall distance.

U.S. manufacturers of fall protection equipment test their equipment in accordance with test procedures prescribed in ANSI standards (ANSI A10.32 and ANSI Z359) which calls for equipment to be tested based on a 6-foot free fall distance. Unless the equipment has been tested for a free fall greater than 6 feet, the results are unknown. Therefore, if an employer must exceed the free fall distance, the employer must be able to document, based on test data, that the forces on the body will not exceed the limits established by the standard, and that the personal fall arrest system will function properly.

See interpretation M–3 on OSHA's Web site: *http://www.osha.gov/Publications/Const_Res_Man/1926m_interps.html.*

1915.159(b)(6)(i); 1926.502(d)(16)(iii)). The final rule also is similar to Z359.1–2007 (Section 7.2) and A10.32–2012 (Section 5.2.1).

In the final rule, OSHA added an exception that permits a free fall to be more than 6 feet provided the employer can demonstrate the manufacturer designed the system to allow a free fall of more than 6 feet and tested the system to ensure a maximum arresting force of 1,800 pounds is not exceeded. If the system is not designed for such a purpose, allowing a longer free fall distance could mean the strength and deceleration criteria are not adequate to protect the worker. This added language is consistent with OSHA's interpretation of 29 CFR part 1926, subpart M.[82] OSHA did not receive any comments on the proposed provision and is adopting it as discussed.

Body belts. Paragraph (d)(3) of the final rule prohibits employers from using body belts as part of a personal fall arrest systems. The final provision is consistent with A10.32–2012 (Section 1.4.1). OSHA notes that both the construction industry and shipyard employment standards already prohibit the use of body belts as part of personal fall arrest systems (§§ 1915.159; 1926.502(d)). Since 1998, those fall protection standards have prohibited the use of body belts in personal fall arrest systems because, as discussed in the final rule to § 1926.502, workers wearing them have been seriously injured by the impact loads transmitted and by the pressures imposed while suspended after fall arrest. OSHA does not believe that employers will have any difficulty complying with this provision because virtually all personal fall arrest systems manufactured and in use in the United States are equipped with body harnesses, not body belts. ISEA, the only commenter on this provision, supported the ban (Ex. 185) and the Agency adopts the provision as proposed.

Paragraph (e)—Positioning Systems

Paragraph (e) establishes specific requirements for positioning systems, including window cleaner's positioning systems. These requirements apply in addition to the general requirements in paragraph (c), which apply to all types of personal fall protection systems. Positioning systems, which sometimes are called ''work-positioning systems,'' are a type of personal fall protection system. The final rule defines positioning system as a system of equipment and connectors that, when used with its body harness or body belt, allow a worker to be supported on an elevated vertical surface (*e.g.,* wall, window sill, utility pole) and work with both hands free.

OSHA received several general comments on the proposed requirements for positioning systems. For example, Ellis recommended that workers who use positioning systems should have additional fall protection (Ex. 155). OSHA notes that workers using positioning systems are attached to two separate anchor points. If one anchor were to fail, the worker would still be protected from falling by the attachment to the other anchor.

Weatherguard said, ''If OSHA does not want to promulgate the preciseness that is required to accomplish this, a reference to the I–14 Standard would direct readers to what they need to have for compliance'' (Ex.168). Regarding Weatherguard's recommendation, OSHA notes that the Agency drew a number of requirements from I–14.1–2001, and this preamble explains those provisions so employers know what action is necessary to comply with the final rule.

The Tree Care Industry Association (TCIA) expressed concern that workers in their industry would not be allowed to use positioning systems as these systems were defined in the proposed rule (Ex. 174). OSHA notes that the TCIA is commenting on the proposed revision to § 1910.67(c)(2)(v), which permits workers to use positioning systems or personal fall arrest systems when working in aerial lifts. TCIA said:

> Line clearance tree trimmers and other arborists often work in aerial lifts that are elevated to work positions directly *above* high voltage wires, trees, buildings and other structures to trim trees. Notably, this work position is not typical for a lineman either building or maintaining some part of an electrical system. There is a unique and unavoidable job hazard intrinsic in the typical work position of the line clearance tree trimmer that is inadequately addressed by OSHA's current fall protection proposal. To best address this hazard and obtain the greatest protection of affected workers and also to allow for the self-rescue of an aerial lift operator who has fallen, OSHA should allow the use of a body belt and two- to three-foot lanyard. This PPE combination provides for the shortest overall fall distance, and thus provides the greatest protection against fatally dropping into nearby electric wires and secondarily, any other potentially injurious object at a lower level. The short lanyard minimizes free fall, thereby reducing the arresting force in the system. Finally, the attachment at the operator's waist allows for the possibility of self-rescue.
>
> A narrow requirement governing all situations, such as the one OSHA has proposed, does not promote worker safety to the extent that it could or should. It is important for OSHA to preserve the performance-based nature of subpart I requirements and allow the employer to assess the hazards and choose the fall protection that in its estimation will provide the greatest measure of safety in a given situation. The hazard we have illustrated could be addressed with a simple note under 1910.67(c)(2)(v): ''NOTE: If the employer can demonstrate that a greater hazard to the aerial lift operator is created by contact with structures or electrical conductors below the elevated lift, then a body belt and lanyard of up to three feet in length may be employed for fall protection'' (Ex. 174).

Positioning systems, as defined in § 1910.140(b), cannot be used in aerial lifts because the workers are not on a vertical surface such as a wall, but rather on the horizontal surface of the aerial lift bucket. Therefore, OSHA is revising the requirement in § 1910.67(c)(2)(v) to allow workers to use either travel restraint or personal fall arrest systems.

OSHA also addressed the issue of fall protection systems for workers performing construction activities in aerial lifts in a memorandum dated August 22, 2011.[83] That memorandum established the same policy regarding fall protection for construction workers in aerial lifts as the requirement specified by this final rule for general industry workers in aerial lifts. The applicable portion of that memorandum states:

> As has been the Agency's longstanding policy, an employer may comply with OSHA's fall protection requirements for aerial lifts in one of three ways:
>
> 1. Use of a body belt with a tether anchored to the boom or basket (fall restraint system),
> 2. Use of a body harness with a tether (fall restraint system), or
> 3. Use of a body harness with a lanyard (fall arrest system).

Ellis said that OSHA's policy provided a more complete answer to the issue of fall protection for workers in aerial lifts, and recommended that OSHA add the language to the final rule (Ex. 155). OSHA does not believe such a revision is necessary because the final rule already makes clear that personal fall arrest systems can only be used with a body harness and that travel restraint systems may use a body harness or body belt.

System performance requirements. Final paragraph (e)(1) establishes performance criteria for positioning systems. Paragraph (e)(1)(i), like the proposed rule, requires employers to

---

[82] See interpretation M–3 on OSHA's Web site: *http://www.osha.gov/Publications/Const_Res_Man/1926m_interps.html.*

[83] Available from OSHA's Web site at: *http://www.osha.gov/pls/oshaweb/owadisp.show_document?p_table=INTERPRETATIONS&p_id=27731.*

ensure that positioning systems, except window cleaner's positioning systems, are capable of withstanding, without failure, a drop test consisting of a 250-pound weight dropped 4 feet. Although the Z359.3–2007 standard requires a 4-foot drop test with a 300-pound weight, OSHA is maintaining the 250-pound weight in order to make the final rule consistent with OSHA's construction industry rule. Many employers use the same personal fall arrest system for performing both general industry and construction activities. If OSHA were to adopt the weight that Z359.3–2007 incorporates, employers may not be able to use the same equipment for both types of activities. OSHA believes this could lead to confusion and non-compliance. OSHA did not receive any comments on the proposed provision and finalizes the provision as proposed.

Paragraph (e)(1)(ii)(A) of the final rule, like the proposed rule, requires employers to ensure that window cleaners' positioning systems are capable of withstanding, without failure, a drop-test consisting of a 6-foot drop of a 250-pound weight. Paragraph (e)(1)(ii)(B) requires that these systems limit the initial fall arresting force on the falling worker to not more than 2,000 pounds, with a duration not exceeding 2 milliseconds, and any subsequent fall arrest forces do not to exceed 1,000 pounds. Window cleaners' positioning systems have a potential for greater free fall distances. As such, the final rule requires a more rigorous drop test for these systems than for other positioning devices. The rigorous drop test for window cleaners' positioning systems, combined with the limit on initial arresting forces ensures workers will not be injured if a free fall occurs. The final rule uses the same approach for positioning systems as the shipyard employment standard (29 CFR 1915.160(b)(2)).

Final paragraph (e)(1)(iii), proposed as a note, is applicable to paragraphs (e)(1)(i) and (ii) and explains that positioning systems, including window cleaners' positioning systems, meeting the tests methods and procedures outlined in appendix D to § 1910.140 are considered to be in compliance with these provisions. The proposed rule included two notes and, for simplicity, the final rule combined these notes into one provision in the actual regulatory text.

Weatherguard recommended that OSHA reference the I–14.1–2001 standard in the final rule (Ex. 168). The final rule uses provisions from that standard both as a basis for a number of requirements and in the reference section as a resource for further information. There were no other comments and the provisions are finalized as discussed.

Paragraph (e)(1)(iv) addresses criteria applicable to lineman's body belt and pole strap systems. Although positioning equipment used in electric power transmission and distribution work is not to be used as insulation from live parts, when a worker is working near live parts, it is possible that the lineman's body belt and pole strap systems may come into contact with them. As such, it is important that these systems provide some level of insulation.

Paragraphs (e)(1)(iv)(A) through (C) require employers to ensure that a lineman's body belt and pole strap system be capable of passing dielectric and leakage current tests, as well as a flammability test. The requirements in paragraphs (e)(1)(iv)(A) and (B), like the proposed rule, are consistent with those in §§ 1910.269(g)(2)(iii)(G) and 1926.954(b)(2)(vii). OSHA notes that the voltages listed in these paragraphs are alternating currents. OSHA included these tests in the final rule because the Agency believes that requiring positioning straps to be capable of passing the electrical tests in final paragraphs (e)(1)(iv)(A) and (B) will provide an additional measure of protection to workers, for example, if a conductor or other energized part slips and lands on the strap or if the strap slips from the worker's hand and lands on an energized part. The requirements of final paragraphs (e)(1)(iv)(A) and (B) are the same as those in revised § 1910.269 (79 FR 20316 (4/11/2014)). Additionally, the tests in the final rule are equivalent to the ones ASTM F887–12e1 (Section 15.3.1 and Note 2) requires.

Paragraph (e)(1)(iv)(C) is a new paragraph that OSHA added to the final rule requiring that lineman's body belt and pole strap systems meet the flammability test in Table I–7. This test is equivalent to the one in 29 CFR 1926, subpart V. The flammability test in Table I–7 specifies the step-by-step process employers must ensure is followed when lineman's body belt and pole strap systems are tested. The table also includes the specific criteria the strap must meet to pass the flammability test.

OSHA added the flammability test to the final rule because employees working near energized parts must be provided with the same level of protection regardless of whether they are performing general industry or construction activities. OSHA believes lineman's body belt and pole strap systems already meet these requirements, so the final rule will not impose additional costs and burdens on employers.

The proposal contained notes indicating that positioning straps which passed direct current tests at equivalent voltages would be considered to be in compliance with paragraphs (e)(1)(iii)(A) and (B). Because these notes were more in the nature of guidance, OSHA did not carry them forward in the final regulatory text. Nonetheless, this is still a way that employers may demonstrate compliance with the requirements of paragraphs (e)(1)(iii)(A) and (B) of the final rule.

System use criteria for window cleaners' positioning systems. The requirements in paragraph (e)(2) of the final rule, like the proposed rule, contain criteria applicable only to window cleaners' positioning systems and components (*i.e.,* window cleaners' belts and window cleaners' belt anchors). There are no specific requirements for this type of personal fall protection system in existing OSHA standards. Currently, OSHA enforces the general requirement to have fall protection under § 1910.132 (Personal Protective Equipment) as well as under section 5(a)(1) (''general duty clause'') of the OSH Act (29 U.S.C. 654) while performing window cleaning operations and relies on national consensus standards for criteria that such systems need to meet. OSHA believes that including requirements specific to window cleaners' positioning systems in this final rule will enhance compliance by clarifying exactly what requirements apply to these systems.

OSHA drew the requirements in paragraph (e)(2) from the I–14.1–2001 standard that addresses the design, strength, and installation of window cleaners' positioning systems. OSHA believes that these criteria, in conjunction with the general requirements in paragraph (c) that are applicable to all personal fall protection systems, provide a reasonable and necessary level of safety for workers using these systems. OSHA believes that window cleaners' positioning systems and their associated anchors are not used as commonly as they once were. However, since these systems are still used on some buildings, OSHA finds that these minimum requirements are still necessary to ensure workers are protected during window cleaning operations.

Final paragraph (e)(2)(i)(A) requires the employer to ensure that window cleaners' belts are designed and constructed so belt terminals will not pass through the fastenings on the body belt or harness if a terminal comes loose from the window anchor. OSHA believes this requirement is necessary because, if the belt terminal comes loose from the window anchor, the worker will likely fall if the belt is not designed to keep the belt terminals from pulling through the fastenings on the waist belt. There were no comments on the proposed provision and it is finalized with only minor revisions for clarity.

Final paragraph (e)(2)(i)(B), like the proposed rule, requires the employer to ensure that window cleaners' belts be designed and constructed so the length of the runner from the tip of one terminal end to the tip on the other end does not exceed eight feet. This requirement is consistent with I–14.1–2001 (Section 10.2.9(c)) and OSHA believes it is necessary to limit the length of runners to 8 feet so that workers are not leaning too far back from the window they are cleaning. Leaning too far back may cause the worker to lose balance and become inverted, possibly striking the building and becoming injured. There were no comments on the proposed provision and it is finalized without revision.

Final paragraph (e)(2)(ii) requires the employer to ensure that window anchors used for attaching window cleaners' belts are installed in the side of window frames or mullions at a height not less than 42 inches and not more than 51 inches above the window sill. This requirement is consistent with I–14.1–2001 (Section 10.2.5) and OSHA believes it is widely accepted within the industry. Prior to the I–14.1 standard, the provision was also present in the ANSI/ASME A39.1 standard, which dates back to 1933. There were no comments on the proposed provision and it is finalized with only minor revisions for clarity.

Final paragraph (e)(2)(iii) requires that employers ensure window anchors are capable of supporting a minimum load of 6,000 pounds. It is consistent with I–14.1–2001 (Section 10.2.4). The final provision is similar to the proposal but it does not include the proposed requirement that the structures to which window anchors are attached also must support a 6,000-pound minimum load requirement.

Weatherguard opposed the proposed requirement, saying:

> [This requirement was] not consistent with the current codes and standards. The requirement that has been in place for at least the last 60 years is that the anchor be capable of supporting a 6,000-pound load without fracture in the direction that it may be loaded. The structure to which it is attached does not have that requirement (Ex. 168).

OSHA agrees with Weatherguard. In order for the anchor to support the minimum 6,000 pound load, so must the structure to which it is attached. Therefore, OSHA removed the language because it is not necessary.

Final paragraph (e)(2)(iv) like proposed paragraph (e)(2)(vi), requires employers to ensure that window anchors are not used for any purpose other than attaching window cleaners' belts. Window anchors are built for the specific purpose of supporting a worker using a window cleaner's positioning system and OSHA believes they must only be used for their intended purpose. Using the anchors for other purposes may cause deterioration that could result in failure of the anchor when window cleaners then use the anchors. The requirement is consistent with I–14.1–2001 (Section 10.2.1). There were no comments on this provision and it is finalized with only minor editorial revisions for clarity.

Final paragraph (e)(2)(v), like the proposed rule, requires employers to ensure window anchors that have damaged or deteriorated fastenings or supports are removed, or the window anchor head is detached so the anchor cannot be used. If damaged or deteriorated anchors are not removed and replaced, the anchor may fail or break when a window cleaner's positioning system is attached, which could lead to the worker falling and being seriously injured or killed. There were no comments on this provision and it is finalized with editorial revisions for clarity.

Final paragraph (e)(2)(vi), like proposed paragraph (e)(2)(iv), requires employers to ensure rope that has wear or deterioration that affects its strength is not used. OSHA believes that deterioration or wear that significantly reduces a rope's strength may lead to worker death or injury if that rope fails. OSHA realizes that some minimal wear may occur on the sheath of modern kernmantle rope during normal use. That type of wear is expected during the life of the rope, however, if the sheath is so damaged as to expose the core of the rope (which could lead to damage), or other such damage affects the strength of the rope, that rope must be retired and no longer used by workers. There were no comments on this provision and it is finalized with minor editorial revisions for clarity.

Final paragraph (e)(2)(vii), like the proposed rule, requires employers to ensure both terminals of the window cleaner's belt are attached to separate window anchors during any cleaning operation. When the worker is moving into position, entering, or exiting the building or structure before or after cleaning, or traversing to another window, it is not always possible to have both terminals attached to separate window anchors; however, while cleaning the window the terminals must be attached to separate anchors. This requirement is consistent with I–14.1–2001 (Section 5.3.9). There were no comments on this provision and it is carried forward to the final rule with only minor editorial changes.

Final paragraph (e)(2)(viii) requires employers to ensure that no employee works from a window sill or ledge on which there is snow, ice, or any other slippery condition, or one that is weakened or rotted. As in other OSHA requirements (*e.g.,* § 1910.22(a), (b), and (d)) the Agency believes that clean, dry, and firm footing is essential to avoiding slips and falls that may cause injury to workers. This final provision is consistent with I–14.1–2001 (Section 5.3.2). There were no comments on this provision and it is adopted with minor revisions to provide more clarity.

Final paragraph (e)(2)(ix) of the final rule prohibits employers from allowing window cleaning work on a window sill or ledge unless:

- The sill or ledge is a minimum of 4 inches wide and slopes no more than 15 degrees below horizontal (final paragraph (e)(2)(ix)(A)); or,
- The 4-inch minimum width of the sill or ledge is increased 0.4 inches for every degree the sill or ledge slopes beyond 15 degrees, up to a maximum of 30 degrees (final paragraph (e)(2)(ix)(B)).

OSHA believes that this requirement presents the minimum sill or ledge width necessary for workers using window cleaners' positioning systems to safely perform their tasks. This provision is consistent with the A39.1 standard (Section 3.8). No comments were received on this provision and it is adopted with minor revisions for clarity.

Final paragraph (e)(2)(x) requires employers to ensure that the worker attaches at least one belt terminal to a window anchor before climbing through the window opening, and keeps at least one terminal attached until completely back inside the window opening. This provision ensures that the worker is securely attached to at least one anchor before going outside the building and being exposed to a fall. This provision has been revised from the proposed rule for clarity and is also consistent with I–14.1–2001 (Section 5.3.8 and 5.3.10). No comments were received on this provision and it is adopted as discussed.

Final paragraph (e)(2)(xi), like proposed paragraph (e)(2)(xi)(A), requires that employers ensure workers travel from one window to another by returning inside the window opening and repeating the belt terminal attachment procedures at each window as described in final (e)(2)(x), except as provided in paragraph (e)(2)(xii). OSHA believes that it is safer for workers to return to the inside of the building after cleaning a window and re-exit the building at the next window to be cleaned (when using a window cleaner's positioning system) in the vast majority of circumstances. In certain circumstances, the Agency allows travel outside the building, which are described in final paragraph (e)(2)(xii). This provision has been revised from the proposed rule for clarity and also is consistent with I–14.1–2001 (Section 5.3.11). OSHA notes that final paragraph (e)(2)(xii), discussed below, allows workers to move from one window to another while outside the building in certain circumstances. OSHA did not receive any comments on the proposed rule and adopts it with editorial clarifications.

Final paragraph (e)(2)(xii), similar to proposed paragraph (e)(2)(xi)(B), specifies that employers may allow workers to move from one window to another while outside of the building provided:

- At least one window cleaner's belt terminal is attached to a window anchor at all times (final paragraph (e)(2)(xii)(A));
- The distance between window anchors does not exceed 4 feet horizontally. The distance between window anchors may be up to 6 feet horizontally if the window sill or ledge is at least 1 foot wide and the slope is less than 5 degrees below horizontal (final paragraph (e)(2)(xii)(B));
- The sill or ledge between windows is continuous (final paragraph (e)(2)(xii)(C)); and
- The width of the window sill or ledge in front of the mullions is at least six inches wide (final paragraph (e)(2)(xii)(D)).

OSHA believes that all of these conditions must be present and requirements must be met to ensure workers are protected from falling when they move from window to window on the outside of the building. These requirements, for example, ensure that workers always have a continuous walking-working surface (*i.e.,* window sill or ledge) when they move from one window to another and the width and angle of that surface is sufficient so workers are able to maintain firm footing while traversing between windows. The final rule is consistent with I–14.1–2001 (Section 5.3.11).

Final paragraph (e)(2)(xii) differs from the proposed rule in two respects. First, the final rule deletes the proposed requirement prohibiting workers from moving from one window to another on the outside of the building if a window unit is not ''readily accessible.'' Final paragraph (e)(2)(xii)(B) more clearly specifies what OSHA intends by window units being readily accessible; therefore, OSHA does not believe the proposed provision is necessary. Second, the final rule reorganizes and restates the proposed requirement so it is easier for employers to understand and follow. OSHA did not receive any comments on the proposed rule and adopts as discussed.

Appendices to § 1910.140 (Non-Mandatory)

OSHA added two appendices to § 1910.140 that provide information, guidance, and examples pertaining to the types of personal fall protection systems this section regulates. These appendices are not mandatory; *i.e.,* they do not establish any additional obligations, nor impose or detract from any obligations, in § 1910.140.

Appendix C provides information and guidance concerning the use of personal fall protection systems. The information includes considerations for planning, selection of personal fall protection systems, worker training, and maintenance and inspection of personal fall protection systems. Appendix D provides test methods for personal fall arrest and positioning systems.

OSHA drew the appendices from the OSHA construction fall protection standards (29 CFR part 1926, subpart M), which the Agency issued in 1994. OSHA based the appendices in the construction fall protection standards on national consensus standards. In addition, experts on OSHA's construction staff, including engineers, assisted in developing the guidance and test methods in the appendices.

OSHA revised the proposed appendices for several reasons. First, some of the language and terms in the proposed appendices were geared to the construction industry. For example, the proposed appendices used ''rebar hooks,'' which are not used in general industry. OSHA revised the appendices to incorporate language and terms that are familiar to general industry employers and workers and are used in the regulatory text of § 1910.140.

Second, OSHA updated the proposed appendices with information that has become available since OSHA published the construction fall protection standard. For example, Appendix C includes information about the danger of orthostatic intolerance due to prolonged suspension in a personal fall protection system.

Third, OSHA also made changes to the proposed appendices to incorporate recommendations commenters suggested. Those additions are discussed below.

Fourth, OSHA reorganized some of the sections of Appendix C so they follow the same order as the regulatory text of § 1910.140. The Agency believes this reorganization will help employers locate more quickly the information they need to comply with the final rule.

Finally, OSHA made revisions to the appendices to comply with the goals of the Plain Writing Act of 2010 (PWA) (Pub. L. 111–274, enacted January 5, 2010). It was only after OSHA published the proposed rule and appendices that the requirements of the PWA applied to the Agency. The PWA requires that OSHA use plain writing in every ''covered document'' of the Agency that it issues or substantially revises (Pub. L. 111–274, sec. 4(b)). The PWA defines covered documents as ''any document that explains to the public how to comply with a requirement that the Federal Government administers or enforces'' (Pub. L. 111–274, sec. 3(2)(iii)). Since the purpose of these non-mandatory appendices is to help employers comply with the new rule, they meet the PWA's definition of ''covered documents.'' OSHA believes the revisions to the proposed appendices will make them easier to understand and use, thereby increasing compliance with the final rule.

Appendix C to Subpart I of Part 1910—Personal Fall Protection Systems Non-Mandatory Guidelines

OSHA requested comment on whether any of the provisions in appendix C should be included in the regulatory text of § 1910.140, and whether the appendices should include other information.

NIOSH recommended that OSHA consider adding the following information to appendix C regarding harness sizes: ''The employer should ensure sufficient body harness sizes and configurations to accommodate diverse body sizes and shapes in the workforce.'' NIOSH added:

> There have been significant changes in body dimensions among the U.S. civilian population over the last several decades. The diverse workforce in the construction workforce by gender and ethnicity showed a greater variation in range of body dimensions and shapes compared to that in the 1970s and 1980s [citations omitted]. The modern full body harness has evolved to become a more comfortable, easy-to-use body support system that offers a high level of security for a variety of work tasks at height [citations omitted]. Sufficient body harness sizes and configurations to accommodate diverse body

sizes and shapes in the workforce are a critical step to reduce the risk of injury that results from poor user fit and improper size selection. The overall combination of a worker's body dimensions governs the best fit body harness size; body weight and stature alone do not define the best fit (Ex. 164).

OSHA agrees with NIOSH's suggestion and added information to Appendix C recommending that employers consider a broader anthropometric range when selecting personal fall protection systems, including harnesses.

Many commenters from the outdoor advertising industry (Exs. 75; 80; 81; 82; 87; 90; 92; 102; 104; 119; 120; 143) opposed including a list of ''approved equipment'' in Appendix C because employers should be able to use newer or improved safety devices as they become available rather than waiting for devices to be approved in a ''lengthy bureaucratic process.'' For example, Chris McGinty said:

[T]here is some consideration of the creation of a ''list'' of approved equipment. I suggest that this would be an error due to the reality of a safety products industry that is constantly designing, testing and introducing improved or enhanced safety devices. . . . By trying to control the exact brands and models allowable, such a program would invariably be months behind technology and might indirectly lead to losses (Ex. 143).

Appendices C and D do not include a list of approved equipment, systems, components, or devices. In 1999, the Agency reiterated its long held position regarding equipment approval:

OSHA does not approve, endorse, or recommend any particular manufactured product because the manufacturer cannot ensure how the product will be used. The final determination of compliance with OSHA's standards must take into account all factors pertaining to the use of such product at a particular worksite with respect to employee safety and health. This must include an evaluation, through direct observation, or employee work practices and all conditions in the workplace. Therefore, under the Occupational Safety and Health Act of 1970, only the employer is responsible for compliance with the Act and for the safe use of any product by their employees (letter to Ron Oxentenko from Richard Fairfax, Directorate of Compliance Programs, September 17, 1999).[84]

The final rule lists the requirements that employers are responsible for ensuring their personal fall protection systems meet. Appendices C and D both provide guidance that employers may use in evaluating whether the personal fall protection system they are considering will meet the requirements in the final rule.

Regarding paragraph (h) of appendix C, ITA expressed concern about mentioning self-rescue equipment (*e.g.,* equipment with descent capability). ITA was concerned that referring to such equipment would emphasize employee rescue in the design of PPE when, for example, PPE used on powered industrial truck platforms does not currently include self-rescue equipment. ITA believes any mention of self-rescue equipment in Appendix C would have a significant impact in the market, and cautioned OSHA to ensure that such an impact would not occur (Ex. 145).

OSHA does not agree that mentioning self-rescue equipment will cause a significant impact on the market. This equipment has been marketed and readily available for a number of years. OSHA's Powered Platforms standard, issued in 1989, requires that employers provide for prompt rescue or ''shall assure the self-rescue capability of employees'' (§ 1910.66, appendix C, Section I(e)(8)). The construction (1994) and shipyard employment (1996) standards contain the same requirement (§§ 1926.502(d)(20); 1915.159(c)(7)).

In 2000, OSHA responded to an inquiry from Mr. Charles Hill with Southwestern Bell Telephone Company, chair of the National Telecommunications Safety Panel, about whether employers must provide self-rescue equipment when working in bucket trucks and aerial lifts. In 2004, OSHA published a Safety and Health Information Bulletin on Suspension Trauma/Orthostatic Intolerance (SHIB 3–24–2004, updated 2011) that identified self-rescue equipment. The proposed rule also discussed self-rescue equipment for personal fall protection systems (75 FR 28910).

OSHA believes that employers, including members of ITA, are aware of self-rescue equipment and likely have been aware of such equipment for some time. In the past decade, OSHA has not seen any data suggesting that employer awareness of self-rescue equipment has resulted in an adverse impact on the market, nor did ITA provide such data in its comment. Therefore, OSHA does not believe there is likely to be an adverse impact now.

ITA also requested OSHA ''clarify the circumstances when [self-rescue equipment is] deemed to be necessary'' (Ex. 145). OSHA stresses that neither the final rule nor the appendices require that employers provide self-rescue equipment. Rather, the final rule requires that employers provide for ''prompt rescue'' of workers in the event of a fall. To ensure rescue is prompt, employers may use self-rescue equipment, but they also may provide prompt rescue through other means (see detailed discussion of ''prompt'' rescue in the explanation of § 1910.140(c)(21) above).

With regard to paragraph (i) of Appendix C on ''Tie-off considerations'', Ellis suggested that OSHA ''point out the drastic consequences of allowing a SRL [self-retracting lifeline or lanyard] cable or web that passes over almost any edge except wood will break unless there is an energy absorber at the hook end'' (Ex. 155). OSHA agrees that the potential for breakage is greater in the circumstance Ellis describes and believes the language of paragraph (i)(2) of appendix C adequately addresses his concern. OSHA believes that system manufacturers also include such a warning in their instructions and recommendations.

Regarding paragraph (j) of appendix C, Verallia commented that recommending use of ''extreme care'' for horizontal lifelines is ''too subjective and vague'' to be consistently applied or enforced, and that OSHA should clarify or remove the language. OSHA disagrees with this comment. The paragraph on horizontal lifelines says employers should use extreme care in doing a specific task, using multiple tie-offs in horizontal lifelines. The paragraph then explains specifically why employers need to use extreme care (*i.e.,* the movement of one employee falling from a horizontal lifeline may cause other employees to fall). OSHA also explains what employers should do to minimize the hazard. Finally, because of the hazards associated with horizontal lifelines, OSHA explains that qualified persons must design, install, and supervise the use of personal fall protection systems that use horizontal lifelines (§ 1910.140(c)(11)(i)). OSHA believes the appendix and standard are clear, and that employers will be able to understand and comply with the requirements on horizontal lifelines in § 1910.140(c)(11).

In addressing paragraph (n) of appendix C, Verallia asserted that the statement in this paragraph notifying employers that they should ''be aware'' that a personal fall protection system's maximum fall arrest force is evaluated under normal use conditions is too vague, and recommended that this statement be clarified if an employer is going to be potentially subject to enforcement for lack of awareness. OSHA does not agree with Verallia's comment. Not only does paragraph (n) indicate that employers need to understand that testing personal fall

[84] Available on OSHA's website at: *https://www.osha.gov/pls/oshaweb/owadisp.show_document?p_table=INTERPRETATIONS&p_id=22784.*

protection systems is to be performed under normal conditions, but appendix C also reminds employers of this testing requirement. OSHA believes the multiple references to testing personal fall protection systems under normal use conditions are clear and understandable. OSHA also notes that the appendices to § 1910.140 are not mandatory.

Appendix D to Subpart I—Test Methods and Procedures for Personal Fall Protection Systems Non-Mandatory Guidelines

OSHA asked for comment on test methods in appendix D, and whether the Agency should include any test methods in the regulatory text of § 1910.140 or test methods and procedures in Appendix D, and whether any of the test methods need updating.

Ameren recommended that OSHA delete the test methods in appendix D because product testing rests with the manufacturer instead of the end user. Ameren also said that that if OSHA believes it is necessary for employers to test their personal fall arrest systems, appendix D should add an option allowing employers to test systems ''per manufacturer's instructions'' (Ex. 189). Ameren explained:

> Testing of fall protection lies more with the manufacturer of the equipment and less with the end user, whereas the inspection and checking of the equipment lies with the user. As long as a manufacturer is required to meet certain standards prior to selling their products, there should be no need for post purchase testing, hence no requirement for detailed, outlined testing instructions for the employer (Ex. 189).

OSHA does not agree with Ameren's recommendation for several reasons. First, although the final rule does not require that employers personally test the personal fall protection systems they use, some employers conduct their own tests to ensure that systems and equipment meet the requirements of OSHA standards. Appendix D gives those employers the information and flexibility they need to conduct tests on personal fall protection systems.

Second, the final rule and appendices do not require employers to test personal fall protection systems. Employers are free to select personal fall protection systems that manufacturers have tested rather than testing them themselves. However, employers are ultimately responsible for ensuring that the systems they provide to their workers meet the requirements of § 1910.140. Manufacturer instructions and specifications often will explain that equipment or systems have been tested and meet the requirements of an OSHA or national consensus standard. However, when the manufacturer has not tested the system according to appendix D or other recognized test methods, or does not affirm that the system meets the requirements of § 1910.140, then employers cannot use the system without verifying independently that it meets the requirements of § 1910.140. Using such a system without verifying its safety puts workers at risk of harm.

Finally, OSHA stresses that appendix D and the test methods in it are not mandatory. Employers are free to use personal fall protection systems that have been tested using other methods, provided those test methods ensure the systems meet the requirements in § 1910.140.

Penta Engineering Group, Inc. recommended that OSHA add several test methods in appendix D:

> ANSI/IWCA 1–14.1–2001 requires testing anchors by applying a minimum static load of twice the design load in each (primary) direction that the load might be applied and that this outlines a good generic method adequate for load testing tie-back safety anchors at most buildings. Also included in the ANSI/IWCA I–14.1–2001 is that any testing procedure should be developed and performed under the direction of a registered professional engineer. This language should also be part of the proposed rule (Ex. 193.)

OSHA does not believe it is necessary to add test methods in I–14.1 to appendix D. The test methods in appendix D are not mandatory, and personal fall protection systems can be tested using other recognized tests, such as those tests specified in national consensus standards such as I–14.1, provided those test procedures ensure that the systems meet the requirements in § 1910.140. OSHA also does not believe it is necessary to include in the final rule or in Appendix D Penta's recommendation that tests methods be developed and performed under the direction of a registered professional engineer. The test methods in appendix D were developed by experts, including engineers. OSHA believes that testing organizations and manufacturers also test systems under the supervision of experts and qualified persons, which likely include engineers.

SPRAT offered another suggestion regarding test methods. They recommended that OSHA accept markings on equipment as meeting the ANSI Z359 family of standards. They said this would help to ensure test methods and equipment are consistent with and meet current national consensus standards.

OSHA does not agree. The Agency does not have the resources to ensure all manufacturers accurately mark their products. As noted in the final rule and appendices, employers and manufacturers are not required to use the test methods in appendix D. They are free to test personal fall protection systems using other recognized test methods and procedures, including those specified by ANSI and other national consensus standards, provided those test methods ensure that the systems meet the requirements in § 1910.140.

Verallia recommended adding a requirement to paragraph (b)(2) of appendix D requiring that each employee visually inspect anchorage points prior to use (Ex. 171). OSHA does not believe that Verallia's recommendation is appropriate for appendix D. Appendix D addresses methods employers and manufacturers may use for testing personal fall protection systems to ensure they meet the requirements in § 1910.140 prior to the purchase and use of the systems. Verallia's recommendation applies to use of personal fall protection systems after the systems are in use in the workplace. However, OSHA notes that paragraph (c)(18) of the final rule addresses Verallia's recommendation by requiring that the employer ensure the entire personal fall protection system, which the final rule defines to include the anchorage, be inspected before initial use in each workshift. In addition, OSHA added language to Appendix C mentioning this requirement, and included anchorages as one of the examples.

C. Other Revisions to 29 CFR Part 1910

The final rule also includes changes to provisions in subparts F, N, and R of 29 CFR part 1910. Primarily, the changes are technical in nature and are necessary so all sections in part 1910 conform to final subparts D and I.

Most of the changes in subparts F, N, and R update references to final subparts D and I. For example, existing § 1910.265(f)(6)—Sawmills, requires that ladders comply with existing § 1910.27 (Fixed ladders). However, the final rule reorganizes subpart D and the ladder requirements are no longer in § 1910.27. Instead, requirements applicable to ladders are contained in other sections of final subpart D (*i.e.,* §§ 1910.22, 1910.23, 1910.28, 1910.29). To ensure that employers comply with all of the applicable general industry ladder requirements, the final rule revises § 1910.265(f)(6) to specify that ladders must comply with 29 CFR part 1910, subpart D.

Some changes in subparts F, N, and R replace existing references with references to final subparts D and I. For instance, existing § 1910.66—Powered platforms for building maintenance, specifies that employers provide personal fall arrest systems that comply with Appendix C of that section (existing paragraph (f)(5)(ii)(L)). Appendix C established provisions for the use of personal fall arrest systems because, at the time OSHA promulgated § 1910.66, the general industry fall protection requirements did not allow employers to use personal fall arrest systems, as defined in final §§ 1910.21(b) and 1910.140(b). Final subpart D adds provisions allowing employers to use personal fall arrest systems, and final subpart I establishes performance, use, and care criteria for those systems. In conjunction with those revisions to subparts D and I, OSHA revises § 1910.66 to specify that employers comply with the requirements in final subpart I instead of those in appendix C. With the addition of the personal fall arrest system provisions to final subpart I, § 1910.66 Appendix C is no longer necessary; accordingly, the final rule deletes it.

Similarly, in final § 1910.269(c)(2)(i) OSHA replaces references to personal fall arrest system provisions in 29 CFR part 1926, subpart M—Fall Protection, with citations to the personal fall protection requirements in final subpart I.

Finally, the final rule revises subpart F (§ 1910.67(c)(2)(v)) to require that employees wear either a personal fall arrest system or travel restraint system that complies with final subpart I when they are working from an aerial lift. Existing § 1910.67(c)(2)(v) allows employees to wear a body belt and lanyard for fall protection in aerial lifts while the proposed rule would have required that aerial lift operators use a ''positioning system'' or personal fall arrest system. Neither the existing nor proposed rules are consistent with OSHA general industry (§§ 1910.140 and 1910.269) and construction standards (§§ 1926.453, 1926.502, and 1926.954). To resolve this discrepancy, in final § 1910.67(c)(2)(v) OSHA revises the existing and proposed rules in two ways.

First, final § 1910.67(c)(2)(v) eliminates the existing requirement, which specifies that employees use body belts and lanyards for fall protection when working from aerial lifts, because it is not consistent with final subpart I (final § 1910.140(d)(3)). Final subpart I, like the construction fall protection standard (§ 1926.502(d)), prohibits the use of body belts as part of a personal fall arrest system. OSHA has determined, as the Agency did in the construction fall protection rulemaking (59 FR 40672 (8/9/1994)), that body belts must be prohibited because they do not afford a level of protection equivalent to body harnesses and present unacceptable risks in fall arrest situations. Specifically, as OSHA discussed in the explanation of § 1910.140, fall arrest forces are more concentrated for a body belt than a body harness, therefore, the risk of injury in a fall is much greater when workers use a body belt. In addition, in a fall, workers are more likely to slip out of a body belt than a body harness and be killed or seriously injured. Moreover, if a fall occurs, the hazards associated with prolonged suspension in a body belt are substantially more severe than suspension trauma associated with body harnesses. (Also see discussion of the prohibition of body belts in the preamble revising the general industry and construction Electric Power Generation, Transmission, and Distribution and Electric Protective Equipment standards (hereafter referred to as ''subpart V'') (79 FR 20316, 20383–88 (4/11/2014)).

To make final § 1910.67(c)(2)(v) consistent with final subpart I, OSHA replaces the existing provision with the requirement that workers use a personal fall arrest system or travel restraint system that meets the requirements of final subpart I when working from an aerial lift. This revision also makes final § 1910.67 consistent with the construction aerial lift (§ 1926.453(b)(2)(v) note 1) and fall protection standards (§ 1926.502(d)) as well as subpart V (§§ 1910.269(g)(2)(iv)(C)(*1*) and 1926.954(b)(3)(iii)(A) (79 FR 20640, 20700)).[85]

OSHA notes that final subpart I (final § 1910.140(b) and (d)(3)), like the construction aerial lift and fall protection standards, allows the use of body belts with a travel restraint system when employees work from an aerial lift (*See also* letter to Mr. Jessie L. Simmons (5/11/2001) [86]). OSHA allows the use of a body belt with a travel restraint system because the system ''prevents a worker from being exposed to any fall'' (Letter to Mr. Charles E. Hill (8/14/2000)). To ensure that employees using travel restraint systems in aerial lifts are protected, the employer must ensure the lanyard and anchor are arranged so workers are not potentially exposed to falling any distance.

Second, final § 1910.67(c)(2)(v) revises the proposed rule to require that employees must use a personal fall arrest system or travel restraint system when working in an aerial lift. The proposed rule specified, mistakenly so, that employees use a personal fall arrest system or ''positioning system'' for fall protection when they work from an aerial lifts. In actuality, OSHA does not permit employees to use positioning systems when working from an aerial lift (Letters to Mr. Jessie L. Simmons (5/11/2001) and Mr. Charles E. Hill (8/14/2000)). A positioning system is defined in the proposed and final rules as a system that support employees on an elevated ''vertical'' surface, such as a wall or window sill (final §§ 1910.21(b) and 1910.140(b)). However, employees working from aerial lifts are on horizontal surfaces. Positioning systems are ''designed specifically to stop a worker from falling from a static, head-up position'' (Letter to Mr. Jessie L. Simmons (5/11/2001)); however, falls from a horizontal surface, such as an aerial lift, can begin with the worker in other than a static, head-up position (Letter to Mr. Jessie L. Simmons (5/11/2001); also see, 79 FR 20384). The final rule corrects the proposed rule and, in so doing, makes final § 1910.67(c)(2)(v) consistent with subpart V (§§ 1910.269(g)(2)(iv)(C)(*1*) and 1926.954(b)(3)(iii)(A) (79 FR 20640, 20700)).[87]

OSHA received several comments on the proposed revision of § 1910.67(c)(2)(v) (Exs. 59; 174; 183; 207). Darren Maddox, with Central Alabama Electric Coop (CAEC), supported requiring the use of personal fall arrest systems when employees work from aerial lifts (Ex. 59). He pointed out positioning straps do not provide fall protection, and that CAEC's employees now use personal fall arrest systems when working in aerial lifts (Ex. 59). Edison Electric Institute, on the other hand, said OSHA should not require fall protection for employees working in bucket trucks (Ex. 207).

The Utility Line Clearance Coalition (ULCC) and Tree Care Industry Association (TCIA) both recommended

[85] Since final § 1910.67(c)(2)(v) and § 1910.269(g)(2)(iv)(C)(*1*) are consistent, OSHA is eliminating the sentence in § 1910.269(g)(2)(iv)(C)(*1*) stating that final § 1910.67(c)(2)(v) does not apply. OSHA believes the sentence is not necessary and deleting it eliminates any potential for confusion.

[86] Letter available on OSHA's Web site at: *https://www.osha.gov/pls/oshaweb/owadisp.show_document?p_table=INTERPRETATIONS&p_id=24360.*

[87] Stakeholders commenting to the proposed rule appeared to recognize that OSHA's reference to positioning systems might be an error (Exs. 174; 183). For example, ULCC pointed out that the proposed definition of positioning systems does not appear to be applicable to line clearance work from aerial lifts because employees are not working on an elevated vertical surface (Ex. 83).

that OSHA allow employers to use body belts and short lanyards (3-foot maximum length) when their employees work from aerial lifts (Exs. 174; 183). TCIA contended that arborists and line-clearance tree trimmers (collectively referred to as ''line-clearance arborists'') often work in aerial lifts above high voltage wires and using body belts and lanyards provides the ''greatest protection'' against falling into energized power lines (Ex. 174). In addition, they said using a body belt with a short lanyard (*i.e.,* 3 feet) [88] ''provides for the shortest overall fall distance,'' which reduces free fall distances, and thus, fall arrest forces, as well as minimizing the risk of falling into power lines (Ex. 174). TCIA also said that body belts attached at the waist allow for ''the possibility of self-rescue,'' but did not provide further explanation (Ex. 174).

ULCC raised similar arguments supporting the use of body belts and lanyards when line-clearance arborists work from aerial lifts, particularly above power lines. They contended that using belts and lanyards in those situations has not resulted in undue risk to employees and requiring that employees use body harnesses, which typically have longer lanyards, would increase the risk of contact with power lines (Ex. 183). ULCC also argued that using body harnesses puts line-clearance arborists at greater risk of injury from falling into tree limbs and stubs from ''reduction cuts'' (Ex. 183). In addition, they contended line-clearance arborists feeding limbs and brush into chippers are a greater risk of serious injury or death because longer lanyards typically used with body harness could get dragged into the chipper.

ULCC also argued that the proposed rule does not provide an explanation for eliminating the use of body belts and lanyards when working from aerial lifts and fails to provide fall protection options for line-clearance work performed from aerial lifts.

TCIA and ULCC raised these same issues and arguments in the subpart V rulemaking and OSHA addressed them in great detail in the preamble to that final rule (79 FR 20383–88). OSHA did not find TCIA's and ULCC's arguments in the subpart V rulemaking to be convincing and nothing in their comments in this rulemaking changes OSHA's conclusion. Since TCIA's and ULCC's comments in this rulemaking are the same as those they made in the subpart V rulemaking, OSHA incorporates by reference the explanation OSHA provided in final subpart V and need not repeat that full discussion here. For the following reasons, consistent with final subpart V, OSHA has not adopted TCIA's and ULCC's recommendation that employers be permitted to use body belts and lanyards when their employees work from aerial lifts.

First, OSHA does not find persuasive TCIA's and ULCC's argument that body harnesses (*e.g.,* personal fall arrest systems) pose a greater hazard (*e.g.,* falling into an energized power line) than body belts and lanyards when employees, including line-clearance arborists, work from aerial lifts. As mentioned in the explanation of § 1910.140(d)(3) and closely examined in the construction fall protection rulemaking (59 FR 40702–03), body belts do not provide the level of protection that full body harnesses do. Body belts, unlike harnesses, expose workers to greater fall arrest forces and suspension trauma and significant hazards of slipping out of the body belt. In addition, TCIA's recommendation that OSHA allow employers to use body belts with 3-foot lanyards, instead of the required 2-foot lanyard, would expose workers to even greater fall arrest forces. In addition, ULCC's admission that some member employers ''mandate full body harnesses and lanyards'' undercuts their argument that using body harnesses, instead of body belts, exposes workers to ''significantly increased risk, especially when working above energized power lines'' from an aerial lift (Ex. 183).

Second, TCIA's and ULCC's unsupported claim that body belts allow workers to self-rescue is not correct. To the contrary, body belts significantly reduce the possibility of self-rescue after a fall because of the increased probability of serious internal injuries sustained from the initial impact forces, from body belt suspension trauma (especially unconscious suspension), or both.

Third, as discussed in detail in the preamble to final subpart V, OSHA does not consider the risk of falling into power lines to be as serious as TCIA and ULCC portray. Line-clearance arborists do not always work directly over power lines; they may work at the same height, below or to the side of power lines. In any event, stakeholders in the subpart V rulemaking said employers can reduce the risk of falling into power lines, without exposing workers to greater arrest forces and suspension trauma, by using personal fall arrest systems that have shorter lanyards (79 FR 20385).

Fourth, ULCC's argument that using body harnesses with longer harnesses puts line-clearance arborists at risk of getting caught in a chipper is unpersuasive. The final rule does not require that line-clearance arborists wear harness when they are not working on an elevated surface (*i.e.,* when working on the ground). Therefore, employers can eliminate that risk by requiring that line-clearance arborists remove their harnesses when using the chipper.

Employers also can reduce the risk by providing line-clearance arborists with harnesses that have a shorter lanyard.

Fifth, final § 1910.67(c)(2)(v), like subpart V (§ 1910.269(g)(2)(iv)(C)(*1*) and § 1926.954(b)(3)(iii)(A) (79 FR 20640, 20700)) provides employers with two options for protecting employees working in aerial lifts. They may use either a personal fall arrest system or travel restraint system. As mentioned, employers can use personal fall arrest systems that have a short lanyard. Also, since travel restraint systems must prevent a fall of any distance, the final rule allows employers to use either a body belt or body harness with travel restraint systems. OSHA notes, however, that a travel restraint system rigged to allow free fall even a small distance (*e.g.,* 2 feet) would not be an acceptable system under the final rule. For further discussion of the requirement that employers ensure employees use a personal fall arrest system or travel restraint system when working from an aerial lift, see preamble to final subpart V (79 FR 20383–88).

V. Final Economic and Final Regulatory Flexibility Screening Analysis

A. Introduction

This collection of final standards governing occupational exposure to slip, trip, falling-object and fall hazards on walking and working surfaces is a ''significant regulatory action'' under Executive Order 12866. Accordingly, the Office of Regulatory Analysis within OSHA prepared this Final Economic and Final Regulatory Flexibility Screening Analysis (FEA) for the final standard. In developing the FEA, OSHA, to the extent possible given the available resources, endeavored to meet the requirements of OMB's Circular A–4 (OMB, 2003), a guidance document for regulatory agencies preparing economic analyses under Executive Order 12866. In addition to adherence to Executive

[88] OSHA notes that final § 1910.140(e)(1)(i)(B) requires that positioning systems must be rigged to prevent the worker from free falling more than 2 feet. Therefore, TCIA's recommendation that line-clearance arborists be allowed to use 3-foot lanyards is not permitted under the final rule. OSHA also notes that as of April 1, 2015, § 1926.954(b)(3)(iv) requires that work-positioning systems be rigged so workers cannot free fall more than 2 feet.

Order 12866, OSHA developed this final rule with attention to the approaches to rulemaking outlined in Executive Order 13563.

This FEA addresses issues related to the costs, benefits, technological and economic feasibility, and economic impacts (including small business impacts) of the Agency's final revisions to subpart D, Walking-Working Surfaces, and subpart I, Personal Protective Equipment. OSHA's final feasibility and impact analysis builds upon the preliminary economic analysis that OSHA developed in support of the proposed standard and the record developed in this rulemaking. The analysis also evaluates regulatory alternatives to the final rule. The Office of Information and Regulatory Affairs in the Office of Management and Budget reviewed this rule as required by Executive Order 12866. Terminology, analytic methods, and standards appearing in a particular section of this FEA correspond to the source(s) of that section's requirements; for example, the legal concept of ''economic feasibility,'' which is a key subject of section V.G, is not recognized in E.O.s 12866 or 13563 or their associated guidance document, OMB Circular A–4. OSHA uses legal concepts, appropriate under the OSH Act and associated case law but distinct from any concepts in Circular A–4, in discussing economic feasibility (see Section III—Pertinent Legal Authority). Furthermore, OSHA discusses how benefit and cost estimates may differ given the differing analytic approaches set forth by the OSH Act, as interpreted in case law, and Circular A–4.

The purpose of the FEA is to:

- Identify the establishments and industries potentially affected by the final rule;
- Estimate current exposures to slip, trip, and fall hazards in general industry, and assess the technologically feasible methods of controlling these exposures;
- Estimate the benefits of the rule in terms of the number of worker deaths and injuries that employers will prevent by coming into compliance with the standard;
- Evaluate the costs that establishments in the regulated community will incur to achieve compliance with the rule;
- Assess the economic impacts and the economic feasibility of the rule for affected industries; and
- Evaluate the principal regulatory alternatives to the final rule that OSHA considered.

The Regulatory Flexibility Act (5 U.S.C. 601 *et seq.*) requires that a final regulatory flexibility analysis (FRFA) be prepared if an agency determines that a rule will impose a significant economic impact on a substantial number of small entities. To determine the need for a FRFA, OSHA voluntarily prepared a final regulatory flexibility screening analysis that identifies and estimates the impacts of the final standard on small businesses. Based on the screening analysis, presented in the last section of this FEA, the Assistant Secretary certifies that the final rule will not have a significant economic impact on a substantial number of small entities.

This FEA contains the following sections in addition to this Introduction:

- Assessing the Need for Regulation
- Industry Profile
- Benefits, Net Benefits, Cost Effectiveness, and Sensitivity Analysis
- Technological Feasibility
- Costs of Compliance
- Economic Impacts
- Final Regulatory Flexibility Screening Analysis

To develop the FEA, OSHA relied considerably on (1) the record created throughout the history of this rulemaking, (2) an analysis by OSHA's contractor, Eastern Research Group (ERG) (ERG, 2007), and (3) OSHA's Preliminary Economic Analysis (PEA) supporting the Walking-Working Surfaces NPRM and published in the **Federal Register** notice announcing the proposed standard (OSHA, 2010).

1. Reasons for Agency Action

Earlier in this preamble OSHA discussed the major revisions to the existing standards for walking-working surfaces and personal protective equipment (subparts D and I of part 1910) finalized by this rulemaking. OSHA designed the final standards to prevent a significant number of slips, trips, and falls that result in injuries and fatalities in general industry, including falls from ladders, roofs, scaffolds, and stairs.

The final standard also addresses hazards associated with falling objects. However, as noted below in Section D. Benefits, Net Benefits, Cost Effectiveness, and Sensitivity Analysis, and Section F. Costs of Compliance, because the final standard introduces no additional burden on employers beyond existing requirements, and because there were no comments in the record suggesting that additional economic impacts would result, OSHA expects that the final falling-object provisions will involve no new costs or benefits.

Some examples from OSHA's inspection database (OSHA, 2012a and 2007), provided in the following paragraphs, best illustrate the kinds of accidents the standards will prevent, and how the revised standards will prevent them.

A repairperson for a specialty metals producer in Pennsylvania was replacing a water cooling panel (approximately 8-ft. high by 12-ft. long) on a basic oxygen furnace vessel. To access the panel, he placed a ladder on an 8-in. diameter pipe. When the employee attempted either to gain access to the panel or to secure the ladder, he fell 22 feet to the ground. He sustained a blunt-force trauma injury to his head and died. OSHA cited and fined the employer for a violation of § 1910.23(c)(1), Protection of open-sided floors, platforms, and runways, and § 1910.25(d)(2)(i), Use of ladders, along with other standards. OSHA believes that the clarifications of the requirements for the safe use of ladders and the duty to have fall protection will prevent accidents such as the one described above (OSHA, 2007, Inspection No. 123317679).

In a window cleaning operation, two employees were working from boatswain's chairs suspended from a roof by two transportable roof rollers; they lowered their chairs down the side of the building using controlled-descent devices. A third employee was on the roof pushing the rollers back and forth to move his coworkers from window to window. The third employee was moving the roller on one end of the building when one of its wheels slipped off the edge of the parapet wall, causing the rollers, which were tied together, to fall between six and seven stories to the ground. The first two employees, with their lifelines attached only to the suspension point on the rollers, also fell to the ground and sustained serious injuries. When one of the rollers went over the edge, it catapulted the third employee off the roof; that employee fell approximately 84 feet to the ground and died from the fall. In the investigation, OSHA determined that the employer did not anchor the rollers to the roof, and cited the employer for violating the general duty clause (Section 5(a)(1)) of the OSH Act. OSHA believes that compliance with the requirements for rope descent systems in the final standard (§ 1910.27(b)) will help to prevent this type of accident (OSHA, 2007, Inspection No. 303207633).

A 49-year-old service technician fractured five vertebrae and eventually died from the injuries received when he fell 11 feet from a fixed ladder to a concrete landing while performing air-conditioning service work on the roof of a shopping mall. OSHA's investigation of the August 24, 2004, accident identified the likely cause as the absence of uniform spacing between the ladder rungs throughout the climb (the space between the top two rungs/steps was 28 inches, whereas the space between lower rungs was much narrower). Section 1910.23(b)(2) in the final standard requires that, with a few exceptions, the spacing for rungs, cleats, and steps of ladders be not less than 10 inches (25 cm) apart nor more than 14 inches (36 cm) apart, as measured between the center lines of the rungs, cleats, and steps. OSHA believes that compliance with this provision will prevent accidents such as the one described here (OSHA, 2007, Inspection No. 308003953).

As a final example, an employee in a South Dakota feed mill was atop a soybean storage bin gauging the level of the contents when he fell approximately 24 feet onto a concrete surface. The employee suffered head and upper body injuries that resulted in his death. The subsequent OSHA investigation resulted in citations for violations of the general duty clause and provisions in existing subpart D regulating floors, platforms, and railings. OSHA believes that the final revisions to subpart D will remove any ambiguity in the scope or purpose of the rule, which will prevent falls from storage bins and related surfaces (OSHA, 2007, Inspection No. 102761012).

The accidents described above represent a small sample of the many slip-, trip-, and fall-related fatality and injury cases that OSHA's final standards are designed to prevent. Appendix A presents a larger set of preventable fatal workplace accidents taken from the OSHA Integrated Management Information System (IMIS) database for 2006–2010 that involve slips, trips, or falls.[89] To compile the accident dataset, OSHA searched the IMIS database for fatal work place injuries in general industry resulting from falls. The search excluded SIC codes for Construction, Agriculture, and Water Transportation/ Maritime and produced 974 records. Of those 974 records, the dataset in Appendix A focuses on the following types of falls: (1) Falls from ladders (ladders type unspecified, fixed ladders, extension ladders, step ladders, rolling ladders, other ladders); (2) Falls from scaffolds (scaffolds, scaffold ladders); (3) Falls from roofs (roofs, falls through skylights); (4) Falls from walking surfaces (slips, trips); (5) Falls from stairways; (6) Falls involving window washing; (7) Falls involving chimney work; (8) Falls involving manholes; and (9) Other types of falls. These categories alone represented 290 of the possible 974 fatal fall incidents that would be covered by the D&I standard.

When establishing the need for an occupational safety and health standard, OSHA must evaluate available data to determine whether workers will suffer a material impairment of their health or functional capacity resulting from exposure to the safety or health hazard at issue. Prior to promulgating a standard, the Agency also must determine that ''a significant risk of harm exists and can be eliminated or lessened by a change in practices.'' See *Industrial Union Dep't* v. *American Petroleum Institute,* 448 U.S. 607 (1980). *See also* 58 FR 16612, 16614, (March 30, 1993) (OSHA must conclude that the standard it is promulgating will substantially reduce a significant risk of material harm).

OSHA determined that the best available data for quantitatively estimating the risks associated with slips, trips, and falls in general industry come from the Bureau of Labor Statistics (BLS) injury and illness survey and census. OSHA relies on federal survey and census data from recent years to determine the risk to similarly exposed employees across industry in analyzing other safety standards (*e.g.,* Confined Spaces in Construction at 80 FR 25366 (May 4, 2015)).

Other regulatory and non-regulatory entities for research and policymaking widely accept and use these data sets.[90]

As previously discussed in section II of this preamble (Analysis of Risk), OSHA determined that hazards associated with walking and working on elevated, slippery, or other surfaces pose significant risks to employees, and that the revisions to subparts D and I are reasonable and necessary to protect affected employees from those risks. Based on the BLS data showing the number of injuries and fatalities currently occurring and OSHA's judgments about the percentage of these injuries and fatalities that would be averted as a result of the standards, the Agency estimates that full compliance with the revised walking-working surfaces standards will prevent 29 fatalities and 5,842 lost-workday injuries annually. These benefits constitute a substantial reduction of significant risk of material harm for the exposed population of approximately 5.2 million employees in general industry.

2. Feasibility

The Agency must show that the standards it promulgates are technologically and economically feasible. (See 58 FR 16612.) A standard is *technologically feasible* if the protective measures required already exist, available technology can bring the measures into existence, or reasonable designs and developments in technology can create the measures.[91] Protective measures employers take to comply with safety standards generally involve the use of engineering and work-practice controls. Engineering controls include, for example, ladder safety systems, guardrails, toeboards, or other devices or barriers that protect employees from exposures to slip, trip, and fall hazards. Work-practice controls are techniques that employees use to perform their jobs (for example, safe climbing techniques on ladders). Employers also can use administrative controls (such as job rotation) and personal protective equipment (PPE) (such as harnesses and lanyards) to comply with safety standards.

A standard is *economically feasible* if the cost of meeting it does not threaten the existence or competitive structure of an industry. An OSHA standard may be economically feasible even if it imposes costs that will put some marginal firms out of business.[92] As discussed in more detail below, OSHA concludes that the final revisions to subparts D and I are both economically and technologically feasible.

3. Methodological Considerations in Development of the FEA

OSHA prepared an economic analysis to estimate the benefits and costs of the revisions to subparts D and I as required by E.O. 12866. Since 2002, under the direction of the Office and Management and Budget, the Agency ''monetized'' the value of the injuries, illnesses, and fatalities that new standards will prevent, *i.e.,* it monetized the value of expected benefits. Monetized values provide a common metric for both benefits and costs. When preparing an economic analysis in support of a proposed or final rule that is economically significant under E.O. 12866, OSHA presents annual estimates of benefits and costs. The Agency

[89] The IMIS database contains information on over 2.5 million inspections conducted since 1972. The information is continually being updated with new data originating from OSHA federal and state enforcement offices.

[90] See, for example, NIOSH, 2004, and FMCSA, 2010.

[91] See *Society of the Plastics Industry* v. *OSHA,* 509 F.2d, 1301, 1309 (1975); *USWA* v. *Marshall,* 647 F.2d, 1189 (1980); *American Textile Manufacturers* v. *Donovan,* 452 U.S. 490 (1981); and *Building and Construction Trades Dept., AFL–CIO* v. *Brock,* 838 F.2d 1258 (1988)).

[92] See *Industrial Union Dept.* v. *Hodgson,* 499 F.2d 467 (1974); *USWA* v. *Marshall,* 647 F.2d, 1189 (1980); and *American Textile Manufacturers* v. *Donovan,* 452 U.S. 490 (1981)).

believes that this approach offers the simplest and clearest way to assess the economic effects of its standards. Computing annual estimates focuses the Agency's analysis on information from current conditions and recent years, which the Agency deems the best, *i.e.,* most accurate and reliable, information. OSHA typically assumes a ten year annualization period for one-time costs associated with a rule.[93] In the case of this final rule for subparts D and I, adding additional years to the period of the analysis would not change any major policy conclusions.

To characterize the effects of a new standard, the Agency estimates the costs and benefits expected to accrue as regulated entities move from the current state of affairs to full compliance with the rule. Accordingly, OSHA does not include injuries or fatalities already preventable through compliance with existing regulations in its assessment of the benefits expected from compliance with the new standard. Similarly, the Agency does not include the cost of complying with existing standards in its assessment of what it will cost employers to comply with the new standard. The Agency assumes that all employers will fully comply with the standard. OSHA's analysis also assumes that employers incur all costs in the first year following promulgation of the final standard (with ongoing costs incurred annually beginning in Year 1), and that benefits result immediately.

The Agency employs a ''willingness-to-pay'' (WTP) methodology to estimate benefits. Data from the BLS provide the number of expected injuries and fatalities occurring currently and assumed to continue into the future in the absence of this regulatory standard, OSHA makes expert judgments about the percentage of these injuries and fatalities averted as a result of the standard, and the Agency uses WTP estimates from the extant literature to assign monetary values to these injuries and fatalities. OSHA bases its estimates of willingness to pay on empirical studies that statistically analyze the effects of fatality and injury rates on wage rates to arrive at individuals' trade-off between higher wages and an incremental increase in occupational risk. That trade-off allows economists to calculate the implicit value of a statistical life (VSL).[94] Many government regulatory authorities, such as the National Highway Traffic Safety Administration and the Environmental Protection Agency, use the VSL as a metric, but it is particularly appropriate for occupational regulations since it is derived from occupational risks and wages.

The primary alternative to a WTP approach is a ''cost-of-injury'' (COI) approach. The COI approach accounts for the various costs to all parties associated with an injury or fatality, including medical costs, the costs of work disruption from accidents and accident investigations, indirect costs to employers (*e.g.,* absenteeism, hiring costs), lost wages or job opportunities, and rehabilitation expenses. The COI approach results in ascribing costs and benefits to many involved entities: The employer, the employee, workers' compensation programs, health insurance providers, federal disability programs, governmental bodies, and taxpayers, among others. A COI approach does not capture the values of pain and suffering, impacts on families, or similar parameters, and for that reason, the Agency believes that WTP is superior.

The Agency's calculation of benefits and costs adopts the perspective of society as a whole. Compliance costs are borne directly by affected employers but these costs may ultimately be borne by a wide variety of parties including employers, consumers, government, and employees. Benefits accrue to employees, families, insurers, and government, as well as to employers.

4. OSHA's Estimates of Benefits, Costs, and Net Benefits

a. Introduction

Employees throughout general industry are exposed to slip, trip, and fall hazards that cause serious injury and death. OSHA estimates that, on average, approximately 202,066 serious (lost-workday) injuries and 345 fatalities occur annually among workers directly affected by the final standard. Although better compliance with existing safety standards may prevent some of these incidents, research and analyses conducted by OSHA found that many preventable injuries and fatalities would continue to occur even if employers were complying fully with the existing standards. Even if there were full compliance with the existing standards, OSHA estimates that full compliance with the final standard will prevent an additional 5,842 lost-workday injuries and 29 fatalities each year.

An additional benefit of this rulemaking is that it will provide updated, clear, and consistent safety standards for walking and working surfaces and personal fall protection equipment. Most of the existing OSHA standards for walking-working surfaces are over 30 years old and inconsistent with both national consensus standards and more recently promulgated OSHA standards addressing fall protection.

Presently, OSHA's standards for fall protection on walking-working surfaces in general industry differ from the comparable standards for construction work. In most instances, employees use similar work practices to perform similar tasks, irrespective of whether they are performing construction or general industry work. Whether OSHA's construction or general industry standards apply to a particular job depends on whether the employer is altering the system (construction work) or maintaining the system (general industry work). For example, replacing an elevated ventilation system at an industrial site would be construction work if it involves upgrading the system, but general industry work if it involves an in-kind replacement. Since the work practices used by the employees would most likely be identical in both situations, it would ease compliance if OSHA's general industry and construction standards were as consistent as possible. Under OSHA's existing requirements, however, different requirements might apply to similar work practices, *e.g.,* an employer overhauling two or more ventilation systems may have to comply with two different sets of OSHA requirements if one project is considered construction and another general industry. The existing inconsistencies between the construction and general industry standards make it difficult for employers to develop appropriate work practices for their employees. Consequently, employers and

[93] As discussed later in this FEA, fixed ladders, cages, and wells may have a functional life longer than ten years. However, the fall protection equipment and other safety controls applied in this FEA are assumed to have a life of ten years, and the cost analysis for these controls reflects that lifespan. The Agency estimated that fixed ladders have an average life of 30 years. Replacement of the fixed ladders would occur evenly across the 30-year period, and, with a phase-in date 20 years after publication, some ladders still would require replacement anywhere from 1 to 10 years after the 20-year phase-in date. OSHA calculated first-year costs (at Year 0) of installing ladder safety systems for the annual percentage (3.3 percent each year) of the total stock of fixed ladders (24′ to 30′ in height) that from Year 21 to Year 30 will no longer meet the requirements of the standard. Then OSHA used a seven percent discount rate to annualize over 10 years. First-year costs total $8.5 million and annualized costs total $1.2 million. For further details, see Ex. [OSHA Excel Workbook], tabs retrofit_28_calc and retrofit_28.

[94] For example, if workers are willing to pay $50 each for a 1/100,000 reduction in the probability of dying on the job, then the imputed value of an avoided fatality is $50 divided by 1/100,000, or $5,000,000. Another way to consider this result is to assume that 100,000 workers made this trade-off. On average, $5,000,000 would save one life.

For discussion on WTP methodologies, see Viscusi and Aldy (2003).

employees told OSHA that they would like the two standards to match more closely. This final rule achieves that result.

OSHA neither quantified nor monetized several other benefits of the final standard. First, OSHA did not estimate the number of fall injuries prevented that do not result in lost workdays. Second, OSHA did not estimate the improvements in efficiency of compliance associated with clarifying the existing rule and making it consistent with current national consensus standards.

OSHA's benefit estimates are most sensitive when it comes to estimating the percentage of current injuries and fatalities that full compliance with the final standard will avoid. The true benefits of the final standard depend on how well the cases reviewed represent actual fall-related fatalities in general industry.

The Agency believes that its estimate of about 345 annual fatalities in general industry involving slips, trips, and falls is more certain than the estimate of the percentage of fatalities avoided because the estimate of the annual number of baseline fatalities comes from seven years of recent incident data that corroborate eleven prior years of incident data. OSHA's estimate of fatalities avoided is more sensitive because it is based on professional judgment after reviewing incident reports in the record. Moreover, OSHA believes that its benefit estimates have a tendency toward underestimation, as training and work practices adopted in an effort to comply with the final rule will likely increase the use of safety equipment and safer work techniques, thereby further reducing fatalities and injuries.[95]

[95] OSHA notes that the literature on the effectiveness of training indicates positive benefits, but the extent of benefits varies depending on intervention methodology and other factors. See research by the National Institute for Occupational Safety and Health: Cohen and Colligan, 1998, and NIOSH, 2010 (*http://www.cdc.gov/niosh/docs/2010-127/pdfs/2010-127.pdf*).

The impacts exhibit below presents a summary of the annualized costs and benefits for each section of the final standard, assuming a discount rate of seven percent. In addition to estimating annualized costs using a discount rate of seven percent, OSHA, for sensitivity purposes, also used OIRA's recommended alternative discount rate of three percent. Under the alternative scenario of a three-percent discount rate, OSHA estimates that annualized costs would decline from $305.0 million to $297.0 million. For both this scenario and for the primary (seven-percent rate) scenario, OSHA assumed that employers will incur all costs (first-year and recurring) on implementation of the final standard. OSHA also is assuming that the benefits outlined in this section will accrue once the rule takes effect. Section D of this FEA (Benefits, Net Benefits, Cost Effectiveness, and Sensitivity Analysis) describes in detail the other cost-related uncertainties.

BILLING CODE 4510–29–C

b. Changes From OSHA's Preliminary Economic Analysis to This Final Analysis

As shown below in the summary table for Section B of this FEA (Assessing the Need for Regulation), OSHA projects that the final rule will produce annual benefits of 29 fatalities and 5,842 lost-workday injuries prevented, while annualized costs will total $305.0 million. OSHA's preliminary estimate of benefits (in the Preliminary Economic Analysis (PEA) for the proposed rule) was 20 fatalities and 3,706 lost-workday injuries prevented, and the Agency's preliminary estimate of costs in the PEA totaled $173.2 million. The later sections of this FEA explain the reasons for these changes in detail. To summarize, OSHA notes that the primary factors contributing to larger benefits and costs (in relation to the PEA) are: (1) Explicit requirements for ladder safety systems for fixed ladders and structures with step bolts, guardrails for slaughtering platforms, and roof anchor systems for rooftop operations; (2) additional time allotted for inspection of walking-working surfaces for dust and other hazardous substances, consistent with a clarification in the regulatory text; and (3) an increase in the number of workers in outdoor advertising and other activities who will need training in using fall protection equipment.

c. Alternative Regulatory Approaches

To determine the appropriate approach for addressing the occupational risks associated with slips, trips, and falls in general industry, OSHA considered many different factors and potential alternatives. The Agency examined the incidence of injuries and fatalities, and their direct and underlying causes, to ascertain revisions to the existing standards. OSHA reviewed these standards, assessed current practices in the industry, collected information and comments from experts, and scrutinized the available data and research.

OSHA faces several constraints in determining appropriate regulatory requirements. Under Section 3(8) of the OSH Act, OSHA standards must be ''reasonably necessary or appropriate to provide safe or healthful employment and places of employment.'' Also, under Section 6(b)(8) of the OSH Act, to the extent an OSHA standard differs substantially from existing national consensus standards, the Agency must explain why the OSHA standard will better accomplish the purposes of the OSH Act. As noted elsewhere, OSHA standards also must be technologically and economically feasible and cost effective, in the sense of the term as used in the OSH Act as interpreted by the courts.[96] Section IV, Summary and Explanation of the Final Rule, earlier in this preamble, provides a full discussion of the basis for the regulatory requirements in the final rule. The Final Regulatory Flexibility Screening Analysis later in this section of the preamble discusses the regulatory alternatives considered by OSHA. In that section, Table V–34 presents impacts associated with regulatory alternatives for selected provisions of the final standard. OMB's Circular A–4, *Regulatory Analysis,* recommends that agencies ''should analyze at least three options: The preferred option; a more stringent option that achieves additional benefits (and presumably costs more) beyond those realized by the preferred option; and a less stringent option that costs less (and presumably generates fewer benefits) than the preferred option'' (p. 16). This final rule presents the preferred option. The less stringent alternative, rejected by OSHA, would reduce the number of fall-hazard categories requiring training; however, the cost of this alternative would remain significant (but below the cost of $74.2 million for the preferred alternative training requirements), with a reduction in benefits relative to the preferred alternative. OSHA did not explicitly quantify this alternative.

The more stringent alternative would require that employers provide cages, wells, landing platforms, and ladder safety devices for all fixed ladders; the cost of this alternative would be highly significant, while the incremental benefits would be modest relative to the preferred alternative. OSHA notes that the 1990 NPRM estimated the annualized cost for cages, wells, and other safety devices for fixed ladders to be $1.6 billion in 1990 dollars. Evidence in the record suggests that cages and wells are an outdated technology that do not provide adequate fall protection for workers climbing ladders, and that ladder safety devices are a recent development that provide a feasible alternative, or complement, to cages and wells (Exs. 113; 198). Therefore, if employers could not use such devices, the more stringent alternative requiring cages, wells, and landing platforms would be far more expensive than to the final rule.

B. Assessing the Need for Regulation

OSHA previously considered non-regulatory alternatives and established the need for regulation of walking-working surfaces when it promulgated the standard for fall protection in construction (59 FR 40672). The Agency asserts that the same need for regulation applies when employees in general industry are engaged in tasks on walking-working surfaces. Employees in general industry performing work on floors, other ground-level surfaces, or at heights are exposed to a variety of significant hazards—particularly slips, trips, and falls—that can and do cause serious injury and death. Although some of these incidents might have been prevented by better compliance with existing safety standards, research and analyses conducted by OSHA have found that many preventable injuries and fatalities could continue to occur even if employers fully complied with the existing standards. Relative to full compliance with the existing standards, OSHA estimates, in Section D of this FEA, that full compliance with the final standard would prevent an estimated additional 5,842 injuries and 29 fatalities annually.

Executive Order 12866 provides that ''[e]ach agency shall identify the problem that it intends to address [via regulation] . . . including, where applicable, the failures of private markets.'' Executive Order 13563 reiterates that requirement. In the absence of regulations, market failures can prevent free markets from providing the levels of occupational safety—and particularly the levels of safety for workers affected by this standard—that would maximize net benefits to society.

In the absence of regulation, many employees would simply be unaware of the hazards that walking-working surfaces present or the procedures to follow to protect against such hazards. Even those employees with years of experience working at elevated or other surfaces may lack training on fall protection, information about specific fall hazards, or needed equipment for preventing or limiting the impact of falls.

The final standard for walking-working surfaces in general industry addresses these problems. The benefits analysis presented in Section D of this FEA shows that many accidents are

[96] The OSHA Act as interpreted by the courts requires that regulations be cost effective in the sense that no other alternative in the record addressing the same hazards has an equivalent reduction in the risk associated with those hazards; that is, reduces those risks to the same extent at lower cost (*Am. Textile Mfrs. Inst.* v. *Donovan,* 453 U.S. 490, 514 n. 2 (1981); *UAW* v. *OSHA,* 37 F.3d 665, 668 (D.C. Cir. 1994)). This is not a wide ranging invitation to compare cost effectiveness across many risks but a narrow assurance that the exact same effects could not be achieved at less cost. An analysis of regulatory alternatives is provided in Section V.H.8.

potentially preventable with better information on worksite conditions and the provision of the proper procedures and equipment for fall protection. In cases where employers do provide training on fall prevention, that training may be incomplete or ineffective in the absence of a specific set of requirements to train to. OSHA's analysis of benefits and costs, conducted with an orientation toward the OSH Act and associated case law, shows that the benefits of the final standard significantly exceed its costs.

To better understand the market failures that create the need for this rule, it is necessary to examine the economic incentives that underlie employer decisions with respect to workplace safety and health. An employee typically accepts the risks associated with a particular job in return for two forms of compensation—(1) a wage premium for assuming that risk, and (2) expected compensation for damages in the event of occupational injury or illness. The rational profit-maximizing employer will make investments in workplace safety to reduce the level of risk to employees only if such expenditures result in at least an offsetting reduction in the employer's payouts of wage premiums for risk and compensation for damages. To the extent that the sum of the costs of wage premiums and compensation for damages accurately represents the total damages associated with workplace accidents, the rational employer will accordingly arrive at the socially optimal level of accident prevention from an economic efficiency viewpoint.

Consequently, the major possible sources of market failure, resulting in an ''under-provision'' of health and safety, would be either: (1) The existence of occupational accident costs that are borne neither by the employee nor by the employer or (2) the wage premiums or compensation for damages are not fully responsive to changes in employer-specific workplace risk. Both cases apply here.

In the first case, there are some occupational injury and illness costs that are incurred by neither the employer nor the employee. For instance, neither of those two parties has a vested interest in Federal and State taxes that go unpaid as a result of an employee injury. Such taxes typically represent 15 percent (for Social Security alone) to 26 percent of the total value of the income loss to the employee (IRS, 2013; Urban Institute/Brookings, 2012).[97] Tax losses are likely to be significant because (1) workers' compensation payments are not subject to Federal income or Social Security taxes (IRS, 2012), and (2) many studies have found that income losses not compensated by workers' compensation are significant (NASI, 2012). (There are some other possible incentive effects with respect to tax policy that might either encourage or discourage safety, but they represent a small percentage of the total value of a statistical life or injury by comparison.)

In the second case, as discussed below, the costs employers pay in compensation for damages or wage premiums are not fully responsive to changes in employer-specific workplace risk.

Most employers cover—and are required to cover—compensation for injured employees through workers' compensation insurance. (Some very large employers may self-insure in some states.) States highly regulate premiums for workers' compensation insurance and generally employ a combination of a class rating and an experience rating in deriving premiums (NCCI, 2013; Ashford, 2006). The class rating is based on the average risk for employees in the same occupations as those working for the employer. The basis of the experience rating is the employer's actual workers' compensation claims over the past several years. Very small firms are almost entirely class-rated; even medium-sized firms are partly class-rated; and it will take even firms that are fully experience-rated several years before their insurance premium levels fully reflect any change in their workplace safety performance.[98] As a result, most employers will not realize fully or promptly the gains from their expenditures to avoid workplace injury, illness, and fatality risks in the form of reduced workers' compensation premiums. The result is an insufficient level of worker protection from a societal perspective.

Furthermore, workers' compensation covers only a small fraction of most estimates of the willingness to pay to prevent a fatality.[99] Additionally, workers' compensation payments do not fully compensate injuries in that workers' compensation provides no payments for pain and suffering or losses other than lost wages or medical expenses associated with injuries. There is extensive evidence that workers' compensation does not even fully restore wages lost as a result of long-term disability (Ashford, 2006).

Having to pay wage premiums for risk is another economic incentive for employers to mitigate occupational risk. However, wage premiums do not respond to changes in risk level very strongly, due to information asymmetries. For an employer to have an adequate incentive to implement measures that will prevent workplace accidents, it is not sufficient that employees simply know that their work is dangerous, or even know quantitatively that their occupation has a given risk. Employees must know the exact nature and likely quantitative effects of their employer's safety measures and systems; have a reasonable expectation that their employer will continue to provide existing safety measures in the future; and be able to act on their knowledge of risk by readily changing workplaces or changing wage demands in response to differences in levels of risk.[100] OSHA believes that even skilled workers exposed to the risks of slips, trips, and falls (including some persons injured in accidents preventable by the final rule who fall in that category) lack such detailed employer-specific knowledge or the ability to act on it. Further, employees who typically work at a variety of different sites, including sites controlled by multiple employers, will find it particularly challenging to determine future risk levels, as these levels will vary from site to site.

In summary, OSHA believes that: (1) The provisions of the final rule are necessary to assure that employees have the information, procedures, and equipment they need to protect themselves; (2) neither employers nor

[97] The average federal tax rate for 2009 for the middle quintile of household income was 11.1 percent (Urban Institute/Brookings, 2012).

[98] This outcome, of course, reflects an accounting point. Premiums due to class rating, by definition, do not change with an individual employer's injury experience. There is some empirical evidence, using a difference in differences methodology, that (small) firms that move from class to experience rating decrease their total claims by 8 to 12 percent (Neuhauser et al., 2013).

[99] While workers' compensation varies by state, Leigh and Marcin (2012) estimate that the average indemnity benefits for a fatality are $225,919, far less than willingness-to-pay estimates. For example, as explained in Section D of this FEA, OSHA uses a willingness-to-pay measure of $8.4 million per life saved in 2010 dollars. Other agencies use different estimates, but all the values are in the millions of dollars.

[100] Furthermore, bargaining power differences or external constraints must not interfere in the wage setting process—as they do in circumstances of monopsony or multiemployer collective bargaining agreements, for example. Bargaining power differences may occur, for example, in small communities where a single manufacturer may be the employer for certain kinds of skills, or the more general issue that an employee's firm specific skills (such as understanding of unique processes or equipment) are in demand by only a single employer.

employees absorb the full costs of occupational injuries and fatalities; and (3) wage premiums and workers' compensation insurance are not sufficiently responsive to changes in risk to assure that employers will reduce risk to the socially optimal level. The rule is, therefore, necessary to address market failures that result from externalities and information asymmetries that lead to the provision of insufficient levels of worker safety.

C. Profile of Affected Industries, Firms, Workers, and Other Factors of Production

1. Introduction

This section presents OSHA's profile of the firms, establishments, and employees within the industries affected by OSHA's revision to 29 CFR part 1910, subparts D and I. The Agency based this profile on data assembled and organized by its contractor, Eastern Research Group (ERG, 2007), and updated using more recent data from the same data series used previously.

2. Affected Industries and Employees

Revised subparts D and I apply to employers and industries covered by OSHA's standards for general industry in 29 CFR part 1910. Similarly, all other subparts in part 1910 affected by these revisions to OSHA's walking-working surfaces standards would impose requirements on employers in general industry under OSHA's jurisdiction.[101] The general industry category excludes establishments in the agriculture, construction, maritime (longshoring, marine terminal, and shipyards), and mining industries (except for oil and gas extraction). Also excluded from the final standard are employee tasks on surfaces that fall outside of OSHA's jurisdiction due to location or operational status, or those tasks that are subject to unique industry-specific fall protection requirements addressed elsewhere in part 1910, including § 1910.268, Telecommunications, and § 1910.269, Electric power generation, transmission, and distribution. An example of a jurisdictional category excluded from the scope of the final rule based on location or operational status is employee exposure to fall hazards when railroad rolling stock is traveling on rails or trucks are traveling on highways; the Department of Transportation regulates these operations.

The walking-working surfaces covered by the final standards are present in nearly every establishment. Therefore, OSHA assumes that the number of establishments and employees potentially affected by subpart D includes all establishments and employees in general industry. Table V–1 shows the total number of establishments and employees potentially affected by revisions to subpart D, with the data listed in order by the North American Industry Classification System (NAICS) 4-digit industry code (OMB, 2007). Relying on the U.S. Census' Statistics of U.S. Businesses for 2007, OSHA estimates that the final standard will affect 6.9 million establishments employing 112 million employees; the comparable figures in the PEA were 6.7 million establishments and 112 million employees, based on 2006 data. Table V–1 also provides economic profile statistics for the industries covered by the final standard.

For purposes of estimating training requirements with respect to ladders, OSHA estimated that these provisions would apply to the 5.2 million employees engaged in construction, installation, maintenance, repair, and moving operations in general industry. These employees represent the main group of workers affected by the final standards; however, the final standards may affect employees doing other types of operations and some general industry employees engaged in installation, maintenance, and repair operations will not be affected. Therefore, to estimate the population affected, OSHA identified general industry employees in occupational codes involving construction, installation, maintenance and repair. There certainly are ladder users in other occupations, but the occupations OSHA has included also include many persons whose work typically would not involve the use of ladders (*e.g.,* computer repair, electronics repair, or construction work such a plumbing or carpet repair). As a result, while the OSHA list of occupations examined for purposes of costing ladder training may not include all possible persons receiving such training, it is balanced by the inclusion of some occupations that will not need training. This approach assumes that employees in construction occupations, but employed by general industry employers rather than construction employers, routinely engage in what OSHA labels as maintenance (*i.e.,* a general industry activity) rather than construction activities.

In the PEA, OSHA used Census[102] data on payroll and receipts to estimate average revenue per establishment in 2006 for each 4-digit NAICS industry. For this FEA, revenue data for 2007 were available from Census's *Statistics of U.S. Businesses;* Table V–1 reports these revenue data as average receipts per establishment by 4-digit NAICS industry in Table V–1.[103]

BILLING CODE 4510–29–P

[101] For example, subpart F—Powered Platforms, Manlifts, and Vehicle-Mounted Work Platforms, would be affected by the revisions to subparts D and I. For a compilation of all standards affected by these revisions, see the Final Regulatory Text at the end of this document.

[102] "Census" refers to the U.S. Census Bureau.

[103] At the time the Agency was developing this FEA, the most recent year for detailed industry-specific revenue was 2007 Statistics of US Businesses. In the years since that date the US economy has experienced a recession and a recovery. Because new hires were greater in 2007, this had the effect of increasing costs.

[a] Estimated based on 2007 receipts and establishment data from U.S. Census Bureau, Statistics of U.S. Businesses, 2007.

[b] These employment estimates are based on applying the share of workers employed in building and grounds; construction; installation, maintenance, and repair; production; and material-moving occupations as reported by BLS, Occupational Employment Statistics, 2007 to total employment levels as reported by U.S. Census Bureau, Statistics of U.S. Businesses, 2007.

[c] Bureau of Labor Statistics, Occupational Employment Statistics, 2007.

[d] NA: Data not available; term used throughout this FEA.

Source: U.S. Department of Labor, OSHA, Directorate of Standards and Guidance, Office of Regulatory Analysis-Safety.

BILLING CODE 4510–29–P

The parts of the final standard that cover ladders, scaffolds, manhole steps, and other working surfaces are most likely to directly affect employees engaged in maintenance and related activities. To estimate the numbers of such employees, OSHA relied on data from the Bureau of Labor Statistics' (BLS) *Occupational Employment Statistics* (OES) survey documenting employment by detailed occupation using 4-digit NAICS industry codes. The BLS data represent the only source of industry-specific statistics on detailed occupational employment totals. OSHA used these data to estimate the numbers of employees in construction and in maintenance, installation, and repair occupations in each industry, as well as the overall number of production employees.[104] As shown in Table V–1, an estimated 27.8 million employees are in production occupations, while an estimated 5.2 million are in construction, installation, and maintenance and repair occupations.

3. Profile of Potentially Affected Small Entities

To assemble the data necessary for a screening analysis to determine potential impacts on small entities as prescribed by the Regulatory Flexibility Act, OSHA developed profiles of small entities in the industries covered by the final OSHA standards for subparts D and I. OSHA used the Small Business Administration's (SBA) small business criterion for each industry and Census data (taken from the *Statistics of U.S. Businesses*) on employment, payroll, and receipts by entity size to estimate the numbers of entities and associated employment meeting the SBA definitions. When the SBA specified the small business criterion as a revenue threshold, OSHA used the Census data to associate that revenue with a given employment size. The first column of Table V–2 provides OSHA's estimates of SBA-based employment-size criteria. This table shows, for each NAICS industry code, the number of entities and employees, and average receipts per entity, for business units that meet the employment-size criterion. OSHA estimated the numbers of at-risk employees by applying the percentage of at-risk small-entity employees estimated in the PEA to total estimated small-entity employment, after deriving the latter estimate from updated (2007) Census data on the number of affected small entities.

OSHA also used the Census data to develop a profile of entities that employ fewer than 20 employees. Table V–3 provides these estimates.

BILLING CODE 4510–19–P

[104] Production workers include those in building and grounds; construction; installation, maintenance, and repair; production; and material moving occupations. It is possible that employees in construction and related occupations, even though not employed by establishments in construction industries, might perform work regulated by OSHA under its construction standards in 29 CFR part 1926. Therefore, the employers of these workers, depending on the type of work performed, also may have to meet the requirements for fall protection and walking-working surfaces specified in the construction standards. To the extent that these workers may be subject to both the general industry fall protection standard and the construction fall protection standard, the final rule increases harmonization with the construction fall protection standards, rather than generating new costs or worker-safety benefits.

Table V-2
Profile of General Industry Small Business Entities Covered by the Final Standard for Subparts D and I

NAICS	NAICS Description	SBA Employment Size or Annual Receipts Criterion[a]	Entities[b]	Average Receipts per Entity[b]	Total Employees	Estimated Employment in At-Risk Production Occupations (Construction, Installation, Maintenance, and Repair Occupations) [c]
1131	Timber Tract Operations	500	389	$1,203,946	1,853	NA
1132	Forest Nurseries and Gathering of Forest Products	500	169	$978,953	1,521	NA
1133	Logging	500	9,714	$985,859	57,067	2,464

[a] 2016 SBA criteria specified in dollar terms converted to size-class definition based on average revenues for establishment size categories. OSHA applied the most restrictive criteria for 6-digit NAICS to the 4-digit NAICS level.

[b] U.S. Census Bureau, Statistics of U.S. Businesses, 2007.

[c] Based on Bureau of Labor Statistics, Occupational Employment Statistics, 2007. Assumes same share of at-risk production workers in construction, installation, maintenance, and repair occupations as derived for the PEA. For example, for NAICS 8139, OSHA estimated in the PEA that of the 242,744 total number of employees in small firms, 10,542 workers, or 4.3 percent, are in the at-risk production occupations (Table V-2, PEA). For this FEA, applied the at-risk percentage (4.3 percent) to the 2007 figure for employment, 253,206, to derive the number of workers (10,996) in at-risk occupations in NAICS 8139 in 2007.

NA: Data not available.

Table V-3
Profile of General Industry Very Small Business Entities (Fewer Than 20 Employees) Covered by the Final Standard for Subparts D and I (continued)

NAICS	NAICS Description	Entities[a]	Average Receipts per Entity[b]	Total Employees	Estimated Employment in At-Risk Production Occupations (Construction, Installation, Maintenance, and Repair Occupations)[c]

[b] Estimated based on U.S. Census Bureau, Statistics of U.S. Businesses, 2007.

[c] Based on Bureau of Labor Statistics, Occupational Employment Statistics, 2007. Assumes the same share of at-risk production workers in construction, installation, maintenance, and repair occupations as derived for the PEA.

NA: Data not available.

Source: U.S. Department of Labor, OSHA, Directorate of Standards and Guidance, Office of Regulatory Analysis-Safety.

4. Number of Employees Using Fall Protection

Based on analysis by ERG (2007), OSHA estimated the numbers of employees using fall protection equipment by extrapolating results obtained from OSHA's 1999 PPE Cost Survey.[105] This establishment-based survey provided industry-specific estimates of the numbers of workers who used various types of personal fall protection equipment, including body harnesses and body belts. The survey reported the percentage of employees in each industry (by SIC codes) who used these types of personal fall protection equipment. ERG applied the survey findings by first associating the SIC industries covered by the survey with the 4-digit NAICS industry codes, and then multiplying total employment (presented above in Table V–1) by the percentage of employees who used personal fall protection equipment.

Because different employees might use both body harnesses and body belts, OSHA used the combined value of the two percentages in deriving these estimates. For example, if six percent of employees in a given industry used body harnesses while four percent of employees used body belts, OSHA applied the combined percentage (ten percent) as its estimate of the maximum number of employees using either form of fall protection.[106] The survey's design did not permit industry-specific estimates for all industries.

For example, only aggregated estimates are available for several groups of service, wholesale, and retail trade industries. To make the fall protection estimates consistent with the numbers of at-risk employees, OSHA constrained the estimated number of employees using personal fall protection equipment in any industry to be less than or equal to the numbers of employees in construction, installation, maintenance, and repair occupations shown in Table V–1. Table V–4 presents, by the 4-digit NAICS industry code, OSHA's estimate of the number of employees using fall protection equipment.[107] Overall, OSHA estimated that approximately 2.1 million employees in general industry currently use and will continue to use fall protection.

5. Wage Rates

As discussed in detail later in this FEA, OSHA believes that much of the cost impact of the final standard results from the time requirements for additional training and inspections. The Agency based the estimates for these costs on the opportunity cost of the labor time devoted to training, inspections, and installation or deployment of fall protection equipment. OSHA valued these opportunity costs in terms of employees' hourly wages, including benefit and fringe costs. Relying on average hourly earnings as reported by the BLS *Occupational Employment Statistics Survey, 2010,* OSHA constructed a weighted average hourly wage for the specific occupations comprising production employment for each industry. Similarly, OSHA constructed an average hourly production-supervisor wage for each industry.[108] The Agency then multiplied these wages by a mark-up factor to account for fringe benefits. According to the 2010 BLS Employer Costs for Employee Compensation[109] survey (BLS, 2011), this mark-up factor averages 41.5 percent across industries in 2010. The loaded wage rates applied by OSHA in this FEA are in Table V–5.

[105] For a description of the survey, see ERG (1999) in the reference section of this FEA. ERG excluded back-support belts and similar ergonomic devices from the types of personal protective equipment investigated by the survey.

[106] For the PEA, OSHA applied the upper value in the range—six percent in the example given—and not the combined percentage.

[107] The source of the data in Table V–4 is the OSHA PPE Cost Survey. Estimates shown are based on the combined percentage of employees using body harnesses and body belts. See Eastern Research Group, 1999. An ''NA'' indicates that the industry was not within the scope of the survey or that the subset of production employees judged to be subject to this standard was zero (NA) (see Table V–1). In ERG, 1999 (OSHA PPE Survey), see Table A2, PPE Category: Fall Protection; PPE Type: Body Harness; PPE Type: Body Belt, where, by two-, three-, and four-digit SIC codes, the number and percentage of employees using the PPE type is reported. For this FEA, ERG converted SIC codes to NAICS codes; see Ex. [OSHA Excel Workbook], tab Fall_protection.

[108] For example, for NAICS 4871—Scenic and Sightseeing Transportation, Land, NAICS 4872—Scenic and Sightseeing Transportation, Water, and NAICS 4879—Scenic and Sightseeing Transportation, Other, BLS OES did not report production wage and supervisory wage for 2010. Therefore, OSHA's applied as the base wage for production worker ($19.80), the reported value for the next largest available industry sector, NAICS 48–49, Transportation and Warehousing. For the supervisory wage ($27.45) for NAICS 4871, 4872, and 4879, OSHA applied a wage rate taken from a related transportation industry, NAICS 4851, Urban Transit Systems. Applying the fringe-benefit markup factor of 41.5 percent raised the production worker wage to $28.01 and the supervisory wage to $38.83.

[109] BLS (2010) reported a value of 41.5 percent for all private industry for June 2010.

[a] Source: OSHA PPE Cost Survey. Estimate based on the combined percentage of employees using body harnesses and body belts. See Eastern Research Group, 1999. An "NA" indicates that the industry was not within the scope of the survey or that the subset of production employees judged to be subject to this standard was zero (NA) (see Table V-1). In ERG, 1999 (OSHA PPE Survey), see Table A2, PPE Category: Fall Protection; PPE Type: Body Harness; PPE Type: Body Belt, where by two-, three-, and four-digit SIC code, the number and percentage of employees using PPE type is reported. For this FEA, ERG converted SIC codes to NAICS codes; see Ex. [OSHA Excel Workbook], tab Fall_protection.

[b] Number using fall protection constrained to be less than or equal to the number of at-risk employees in construction, installation, maintenance, and repair occupations as shown in Table V-1.

[c] Due to rounding, the number shown may differ from the product of total employment multiplied by the percentage of employees using fall protection.

Source: U.S. Department of Labor, OSHA, Directorate of Standards and Guidance, Office of Regulatory Analysis, based on U.S. Census Bureau, Statistics of U.S. Businesses for 2002 and 2006; ERG, 2007; and ERG, 1999.

6. Other Factors of Production Profiled for This FEA

Factors of production relevant to the final cost analysis included not only establishments, employers, and employees in general industry, but also the following walking and working surfaces:

- Manhole Steps and Rungs
- Stepbolts on Utility and Communication Poles and Towers
- Commercial and Residential Buildings (Window Cleaning) and
- Fixed Ladders

Details on the sources, count, dimensions, and other factors are provided in the cost discussions below in Section E.

D. Benefits, Net Benefits, Cost Effectiveness, and Sensitivity Analysis

1. Introduction

This section reviews the populations in general industry that are at risk of occupational injury or death due to hazards associated with slips, trips, or falls to lower levels, and assesses the potential benefits associated with the changes to subparts D and I resulting from the final rule. OSHA believes that compliance with the final rule will yield substantial benefits in terms of lives saved, injuries avoided, and reduced accident-related costs. Applying updated accident data and incorporating information from the record, OSHA revised its preliminary estimate of (1) the baseline level of risk and (2) prevented deaths and injuries due to the final rule.

As described in Section C of this FEA (Industry Profile) above, the employees affected by the final standard work largely in construction, installation, maintenance, and repair. According to the Bureau of Labor Statistics' 2007 Occupational Employment Statistics survey, there are approximately 112.3 million employees in industries within the scope of this final rule: 5.2 million employees engaged in construction, installation, maintenance, and repair operations in general industry that OSHA judges will need ladder training because these occupations are the most likely to use ladders in their work; [110] and 2.1 million employees in general industry using personal fall protection equipment. The rule also affects workers in a variety of specific kinds of work who may enter manholes using step bolts, use scaffolds or rope descent systems, etc. The inclusion of construction occupations assumes that employees in construction occupations, but employed by general industry rather than construction employers, routinely engage in what OSHA labels as maintenance (*i.e.,* a general industry activity) rather than construction activities.

This section first examines the available data on the number of baseline injuries and fatalities among affected employees; then assesses the extent to which the standard can prevent those injuries and fatalities; and finally estimates some of the economic benefits associated with the prevented injuries and fatalities. This final standard would produce benefits to the extent that compliance prevents injuries and fatalities that would otherwise occur.

2. Profile of Fall Accidents

a. Fall Fatalities

OSHA examined fall fatalities using two databases. As a baseline for determining the average number of fall fatalities per year, OSHA examined data from the BLS *Census of Fatal Occupational Injuries* (CFOI) for 2006 through 2012. To provide a more detailed breakdown of the kinds of falls

[110] Ladder use is not limited to these occupations, and there are many persons in these occupations that do not use ladders. OSHA examined ladder fatalities recorded by BLS from 2011 through 2014 and found that 68 percent of ladder fatalities were in the occupations OSHA included as needing ladder training. However, of the 5.2 million included, many such as computer and electronics repair technicians and auto mechanics have low rates of ladder fatalities indicating that ladders are likely rarely used in th*ese occupations.* Over two million of those included as always needing ladder training are thus unlikely to need ladder training. This potential overestimate of ladder training costs is probably countered by the number of other workers who potentially use ladders but are excluded from the 5.2 million, such as 950,000 grounds maintenance workers who provide over 5 percent of ladder fatalities. The remaining 27 percent of ladder fatalities are very widely dispersed; ladder fatalities are found in every major occupational group.

included in this total, OSHA in the PEA examined CFOI data for a longer period: 1992 to 2002. For this FEA, OSHA has updated the detailed breakdown using data from 2006–2010 and applies this updated breakdown of the kinds of affected falls to the 2006–2012 fatality data.[111]

Distinguished from the larger category of all falls—*i.e.,* a set of accidents that includes falls on the same level, falls to a lower level, and jumps to a lower level—the narrower category of falls to a lower level consists of the types of falls directly addressed by most of the changes to OSHA's requirements by this final standard. As shown in Table V–6, the CFOI reported 283 and 279 fatal falls to lower levels for 2006 and 2007, respectively, in industries covered by the final standard; for the five most recent years for which the data were available, fatal falls to a lower level declined to an average of 252 fatalities. For purposes of estimating the overall rate of fall fatalities for this benefits analysis, OSHA took the average of these seven years—*i.e.,* 261 fall fatalities to a lower level per year. Over the seven-year period, the Professional, Scientific, and Technical Services industry and the Administrative and Support Services industry (NAICS codes 541 and 561, respectively) accounted for 27 percent of the fatal falls, while the Manufacturing (NAICS codes 31–33) and Transportation (NAICS code 48) industries accounted for 9.6 and 7.1 percent of the fall fatalities, respectively. Among all three-digit NAICS codes affected by the standard, BLS reported the highest number of fatal falls in NAICS code 561, Administrative and Support Services. Although not shown in the table, a large majority of the fatalities for Administrative and Support Services—86 percent for the seven-year period 2006–2012—occurred in the industry concerned with services to buildings and dwellings (NAICS code 5617).

[111] Beginning in 2011, BLS revised the system for reporting types of fatal fall events. The detailed fatality events shown below in Tables V–11 were no longer available after 2010.

[a] Reference year 2011 is the first year in which the IIF program used the Occupational Injury and Illness Classification System (OIICS), version 2.01, when classifying Event or Exposure, Primary Source, Secondary Source, Nature, and Part of Body. Due to substantial differences between OIICS 2.01 and the original OIICS structure, which was used from 1992 to 2010, data for these case characteristics from 2011 forward should not be compared to prior years. The data shown in this table are presented for convenience of illustration; a comparison across the two time spans mentioned above is not intended.

[b] Includes falls from ship, boat, not elsewhere classified.

Source: U.S. Department of Labor, OSHA, Directorate of Standards and Guidance, Office of Regulatory Analysis, based on BLS, Census of Fatal Occupational Injuries, 2006-2012.

To assess the benefits of this rule, it is necessary to determine not only the total annual number of fall fatalities, but also the number of various types of fall fatalities. Quantifying the various types of fatal falls is necessary because the final standard will prevent fall fatalities to different degrees for different types of falls. Table V–7 shows, for the 5-year period 2006 to 2010, the breakdown of fall fatalities by type of fall based on CFOI data. As shown, falls to a lower level (distinguished from falls on the same level) accounted for about 77 percent of total fall fatalities.[112] On a sector-by-sector basis, falls to a lower level as a percentage of all fatal falls ranged from 50 percent for the Educational Services (1.4 of 2.8, unrounded) and Health Care and Social Assistance sectors (6.4 of 12.8, unrounded) to 91 percent for the Administration and Support and Waste Management and Remediation Services sector (64 of 74.6, unrounded). As Table V–7 also shows, fatal falls from ladders averaged 56 per year over the 5-year period, while fatal falls from scaffolds averaged 13 per year.

[112] The average for 2006–2010 shown in Table V–7 (333 fatalities) differs from the baseline estimate applied in OSHA's benefits analysis (345 fatalities; see Table V–11) due to the addition of two years (2011 and 2012) in OSHA's estimate of the baseline average. See Ex. [OSHA Excel Workbook], tab Prevented Fatalities '06–'12.

81 - Other services	18	14	5	1	1
Total [b]	**333**	**255**	**56**	**25**	**13**

Notes: Titles for industry sectors use BLS' classifications and correspond to 2-digit NAICS. Data in the table are rounded.

N/A – Indicates no data reported or data that did not meet BLS publication criteria.

[a] Totals for falls to a lower level include other types of falls to lower levels not shown separately. Therefore, the number of falls from a ladder, roof, and scaffold may not sum to the total number of falls to a lower level.

[b] Totals include falls in industries not shown separately in the table. Therefore totals may not equal the sum of the data for the industry sectors shown in the table.

Source: U.S. Dept. of Labor, OSHA, Directorate of Standards and Guidance, Office of Regulatory Analysis-Safety, based on BLS, Census of Fatal Occupational Injuries, 2006–2010.

b. Fall Injuries

Table V–8, based on BLS's *Survey of Occupational Injuries and Illnesses,* shows the average number of lost-workday injuries due to falls in general industry, by type of fall, for 2006–2012. The number of falls to lower level (48,379) and the number of falls on same level (137,079) were calculated as the average of injury data reported by BLS for 2006–2012. OSHA allocated the average number of falls to a lower level (48,379) among the different fall to a lower level categories based on the average distribution of falls to a lower level for 2006–2010.[113] The estimate of other falls is derived as the difference between total falls and the sum of falls to lower level and falls on same level. As Table V–8 shows, unlike fall fatalities, falls to a lower level represent a relatively small share of injurious, non-fatal, falls. This table forms the basis for OSHA's estimate of the number of lost-workday injuries prevented by the final standard.

Table V–9, also based on BLS's *2010 Survey of Occupational Injuries and Illnesses,* provides additional details about the lost-workday injury rates for the two major categories of falls: Falls to a lower level and falls to the same level. Excluding industry groups for which the data are incomplete, the combined fall injury rate ranges from a low of 3.2 cases per 10,000 workers in NAICS 518 (Internet Service Providers, Web Search Portals, and Data Processing Services) to a high of 72.0 per 10,000 employees in NAICS 481 (Air Transportation). Of the 81 affected industries with reported fall injury data, 17 had fall injury rates in excess of 30 cases per 10,000 employees, while 28 had fall injury rates between 20 and 30 cases per 10,000 employees.

Table V–10, also based on BLS's *2010 Survey of Occupational Injuries and Illnesses,* shows lost-workday fall-related injury rates by specific type of fall, disaggregated by the major industry sectors covered by the final standard. The majority of accidents in the fall-to-same-levelcategory are falls to a floor, walkway, or other surface.

[113] Data on injuries associated with types of fall to lower level were reported only up until 2010.

Table V-8

Estimated Annual Number of Lost-Workday Falls in Workplaces Affected by the Final Standard

Type of Fall		Annual Average Number of Falls, 2006-2012
Fall to lower level		48,379
	Fall down stairs or steps	14,726
	Fall from floor, dock, or ground level	3,987
	Fall from ladder	10,805
	Fall from piled or stacked material	370
	Fall from roof	429
	Fall from scaffold, staging	597
	Fall from building girders or other structural steel	134
	Fall from nonmoving vehicle	9,188
	Fall to lower level, n.e.c.	7,230
	Fall to lower level, unspecified	921
Fall on same level		137,079
Other falls (incl. ship, boat)		16,609
Total		**202,066**

BILLING CODE 4510–29–C

Among falls addressed by the final standard, the annual number of falls to a lower level resulting in a lost-workday injury ranges from 4.7 per 10,000 employees for the Financial Activities sector to 8.1 per 10,000 employees for the Trade, Transportation, and Utility sector. Among specific types of falls to a lower level, falls from ladders represent 7.5 percent of all falls in the Manufacturing sector as reflected in an injury rate of 1.3 cases per 10,000 employees. Among other sectors, the injury rate from falls from ladders ranges from 0.4 per 10,000 employees in the Education and Health Services sector to 2.0 per 10,000 employees in the Trade, Transportation, and Utility sector and in the Other Services sector.

In several sectors, falls down stairs or steps represent a major share of injuries from falls to a lower level. The provisions in the final standard requiring guardrails, handrails, and training would protect employees from these types of falls. The final rule addresses directly falls from floor holes, loading docks, roofs, and scaffolding, but these falls constitute much smaller shares of nonfatal fall accidents.

3. Fatalities and Injuries Prevented by the Final Subpart D and I Standard

a. Fatalities Prevented

OSHA's final standard for subparts D and I contains safety requirements designed to prevent falls involving ladders, rope descent systems, unguarded floor holes, and unprotected platform edges, among other conditions. In this FEA, OSHA classifies these types of falls as ''falls to [a] lower level.'' ''Falls on the same level'' include slips and trips from floor obstructions or wet or slippery working surfaces. The final rule has relatively few new provisions addressing falls on the same level and therefore OSHA has assigned a preventability rate of 1 percent (*i.e.,* the percentage of fatal incidents that the Agency estimates will be prevented by the final rule) to these types of falls.

Combining the data in Tables V–6 and V–7 with other fatality data from BLS, Table V–11 shows the estimated number of annual fatalities from falls in general industry. Based on 2006–2012 data, OSHA calculated an average of 345 fatal falls per year, 261 fatal falls to a lower level per year, and 75 fatal falls to the same level. OSHA allocated the average number of falls to a lower level (261) among the different fall categories based on overall fatal fall accident experience from 2006 to 2010 derived from the BLS *Census of Fatal Occupational Injuries* summarized in table V–7.[114] On this basis, an estimated 261 fatalities per year resulted from falls to a lower level, while the remaining 84 fatalities resulted from falls on the same level or other types of falls.

In examining the costs of the proposed standard, ERG found, after reviewing inspection results, that most employers are generally in compliance with the existing subpart D standards that have been in place for over 30 years (see Table V–15 in the PEA). However, this general compliance does not necessarily mean that many of the observed fall fatalities and injuries are not the result of failure to comply with existing standards. For example, even if employers are complying with a standard 99.9 percent of the time, it is still possible that many current fall fatalities could still be the result of the 0.1 percent level of employer noncompliance.

BILLING CODE 4510–29–P

[114] See ERG, 2007 (Ex. OSHA–2007–0072–0046), p. 4–10, for further explanation of OSHA's methodology for applying historic percentages to types of falls. *See also* Ex. [OSHA Excel Workbook], tab Prevented Fatalities '06–'12 for details on the application of the distribution of falls from 2006–2010 to the baseline average number of fatal falls for 2006–2012 in the final benefits analysis.

Table V-11
Estimated Fatalities Prevented per Year by Compliance with the Final Standard

Type of Fall		2006-2010 Distribution of Fall to Lower Level by Type of Fall	Estimated Annual Number of Fatal Falls by Type	Incremental Prevention Resulting from Compliance with the Final Standard		Estimated Annual Fatalities Prevented by Final Standard[a]
Fall to lower level			261			
	Fall down stairs or steps	7.7%[b]	20	Low	5.0%	1.0
	Fall from floor, dock, or ground level	5.5%	14	High	10.0%	1.4
	Fall from ladder	22.0%	57	High	20.0%	11.4
	Fall from piled or stacked material	0.2%	1	High	10.0%	0.1
	Fall from roof	9.8%	25	High	20.0%	5.1
	Fall from scaffold, staging	5.2%	13	Very High	40.0%	5.4
	Fall from building girders or other structural steel	1.7%	4	High	10.0%	0.4
	Fall from nonmoving vehicle	22.3%	58	None	0.0%	0.0
	Fall to lower level, n.e.c.	25.7%	67	Low	5.0%	3.4
	Fall to lower level, unspecified	1.8%	3	Uncertain	2.5%	0.1
Fall on same level			75	Low	1.0%	0.7
Other falls (incl. ship, boat			10	Low	2.5%	0.2

BILLING CODE 4510–29–C

For the purposes of the analysis summarized in Table V–11, OSHA did not perform a quantitative analysis of how many fatal falls full and complete compliance with the existing standard could prevent. However, a qualitative examination of the fatal falls to a lower level shows that full and complete compliance with the existing standard could prevent a majority, and perhaps a large majority, of these falls. For the PEA, and for this FEA, OSHA and its contractor used expert judgment to estimate preventability factors associated with the new rule taking account of considerations that most falls might be prevented by existing rules. The preventability factors are then the percentage of existing falls, many of which are preventable by existing rules, that would be prevented by this new final rule. On the other hand, these preventability factors assume, as do the cost estimates, full compliance with the new rule. On the benefits side, the estimated number of preventable falls is based on estimates of the number of actual current falls that are preventable by full compliance with the new standard. On the cost side, costs are estimated as the cost of going from baseline compliance to full compliance with the new rule. In order to achieve consistency between costs and benefits estimates, both must reflect the same assumptions regarding existing compliance with the new rule.

OSHA also considered, and in some cases adopted, the approach of using consensus standards as a baseline. As will be discussed in detail in the cost chapter, in some cases OSHA assumed full compliance with consensus standards for purposes of both benefits and costs. In such cases, OSHA estimated neither costs nor benefits where the OSHA rule did not go beyond consensus standards. However, where consensus standards involve training or work practices required of even the smallest firms who may not even be aware of consensus standards, OSHA estimated both costs and benefits from the existing baseline. This baseline might yield overestimates of true impacts because many follow the consensus standard, but there is some reasonable chance that employers are more likely to meet an OSHA requirement than a consensus standard.

A comparison of the existing and new standards shows that the new provisions largely concern training and inspections, with requirements for additional or more stringent engineering or work-practice controls being less prominent (see Section F (Costs of Compliance) below in this FEA). Nonetheless, OSHA's final cost analysis assigns engineering controls and personal protective equipment to operations and activities that were not assigned such controls in the PEA, including costs for repairs or replacements of equipment as a result of equipment failing inspections. In addition, the new standard simplifies and clarifies certain provisions, and, compared to the existing standard, better aligns them with various national consensus standards. OSHA finds that the benefits in terms of reductions in fatal falls result from increased training, inspections, and certifications (*i.e.,* roof anchor certification) in preventing falls.

In the PEA, OSHA based its analysis of accident prevention on ERG's professional judgment and two published studies.[115] The studies show that well-designed training programs are an effective means of improving workplace safety. A review of the literature by the National Institute for Occupational Safety and Health concerning the benefits of training reported that the studies showed consistently that improved and expanded training increased hazard recognition and promoted adoption of safe work practices. However, the magnitude of the effect of increased training on accident rates remains uncertain (Cohen and Colligan, 1988). Further, analysis of past OSHA experience shows that requiring training programs does not ultimately prevent the majority of accidents addressed by the training. One study of OSHA benefits estimates for 6 standards promulgated between 1990 and 1999 found that OSHA had routinely estimated greater numbers of accidents potentially prevented than had actually occurred (Seong and Mendeloff, 2004). OSHA's accident prevention estimates ranged from 40 to 85 percent of relevant classes of accidents. The article shows that such levels of prevention did not in fact occur. The article goes on to discuss the issue of why effects were overestimated and states:

> Why has OSHA usually overestimated the effects? One point that OSHA staff emphasized in response to these findings was that the figures they produce should not be viewed as ''predictions;'' rather, they are estimates of what the impact would be if there were full compliance with the standard.
>
> OSHA staff is well aware that there is not full compliance with OSHA standards. However, despite its lack of realism, the assumption of full compliance seems generally reasonable given the task that the regulatory analysts face. OSHA is required by statute to demonstrate that its standards are technologically and economically feasible, and this demonstration must be made under the assumption that there is full compliance. And if costs are estimated under this assumption, then calculations of the benefits these costs would generate should arguably use it as well.
>
> However, there is a point at which the full compliance assumption does go beyond reasonableness. OSHA appears to assume that if a standard requires workers to avoid working in a hazardous manner or provides them training to change their behaviors, then all such unsafe behavior will be eliminated. This assumption creates the potential for estimating unrealistically large reductions in injuries. When training and work practices are major components of a standard, OSHA should be required to analyze their impacts in a more deliberative and realistic fashion. (Seong and Mendeloff, 2004)

OSHA continues to feel it is important to present full compliance estimates, but agrees with the article that such an assumption should not imply that the training can be expected to prevent accidents as if all lessons provided in training are automatically applied by all workers.

In addition to less than full compliance, there are some methodological limitations to the time trend approach used by Seong and Mendeloff. First they assume that compliance begins on the effective date of the regulation. In reality, some employers begin compliance with new regulations before they are finalized, while others do not start to comply until long after a regulation goes into effect. Many employers start applying many of the provisions of a proposed standard at the time of proposal, in part to get ahead of the curve; to the extent their change in practices is anticipatory of OSHA setting or revising standards, it should be attributed to the OSHA policy. Other employers do not respond to a regulation as soon as it is promulgated. OSHA itself frequently lets employers off with a warning rather than citation in the first year of enforcement of a standard. Finally there is a surprising amount of year-to-year variation in fatality data which create a great deal of noise that makes the effects of rules difficult to interpret. Seong and Mendeloff analyze the results of OSHA analyses from 17 to 27 years ago. OSHA personnel are acknowledged in the articles credits, and OSHA has continued to believe that OSHA should take account of this article in its benefits analysis. In order to assure that this was done, OSHA has shared this concern with its contractors where appropriate. As a result of consideration of this article, OSHA has made clear that reviewers of safety benefits analysis would apply certain principles in their review. First, expert analysts were informed on past overestimates, with the hope that experts would gain in accuracy from feedback on their past inaccuracies and biases. Secondly,

[115] The term ''prevention rate'' as used in this FEA, refers to prevention of both injuries and fatalities.

benefits analyses should not assume that changes in training requirements can be expected to have large changes in incident prevented unless there are also changes in engineering controls or strong prohibitions on practices. Third, the higher the estimate, the greater would be the justification required beyond stating this was the best judgment of the experts. One possible effect of applying these principles is that the highest preventability factor that was applied in the PEA was lower than the lowest preventability factors in the studies the Seong and Mendeloff (2004) article reviewed.

A second major issue is that the failure of OSHA regulations to achieve the anticipated benefits maybe partly due to failure of employers to comply with the regulations. As noted by Seong and Mendeloff, OSHA routinely assume full compliance with regulations for legal reasons. In some cases, if compliance is lower than 100 percent, benefits and costs will be proportionally reduced, with no effect on whether benefits exceed costs. For example, if twenty percent of establishments in an industry are out of compliance with a provision in the baseline, and these twenty percent cause ten percent of all fall fatalities, then if only ten percent come into compliance, rather than twenty percent, accidents would still be reduced by five percent. Under this scenario, a finding that benefits exceed costs under full compliance would be maintained at a lower compliance level, as long as those out of compliance are a homogeneous group.

There is, however, the possibility that those out of compliance are not a homogeneous group but consist of the two subgroups, one of which has found other ways of preventing the same kind of falls, and one of which are ''bad actors'' who make no efforts of any kind to prevent falls. In this case, if compliance is only by those in the safer group, the effects of noncompliance would not simply be proportional. Such a situation might be particularly likely if there is noncompliance with an existing rule and OSHA adds provisions designed to assure greater compliance. For example, almost all trenching fatalities are the result of complete failure to comply with existing shoring requirements. An attempt to improve compliance by increasing recordkeeping, training, and certification might have little effect on the bad actors who simply fail to use shoring at all while imposing additional costs on those already following existing shoring requirements. If only those in compliance with the existing rule also follow these new provisions, then there would be costs without benefits. OSHA has reviewed this rule and does not believe that this is the case for the provisions of this rule.

Because of the importance of this issue, OSHA examines the effects of possible overestimation of benefits and of noncompliance on both costs and benefits in the sensitivity analysis.

For the PEA, OSHA estimated the number of fatal falls potentially prevented by compliance with the proposed standard, categorized by type of fall. Since proposed subpart D focused heavily on ladder safety, OSHA judged the highest impact—15 percent—would be in preventing fatal falls from ladders. For other types of fatal falls directly addressed in the proposal (*e.g.,* falls from floor or dock), OSHA judged a more moderate impact of 10 percent. For other types of fatal falls (*e.g.,* falls down stairs or steps), OSHA judged a relatively low prevention impact (5 percent). For the several types of fatal falls not specifically defined by the BLS injury survey (fall to lower level, n.e.c., and fall to lower level, unspecified), OSHA judged a level of preventability (2.5 percent). (See the PEA (Ex. 1) and ERG, 2007 (Ex. 46), pp. 4–10 to 4–14.)

For falls from roofs, OSHA judged in the PEA that compliance with the provisions in proposed subpart D addressing safety systems, work practices, and training associated with the fall hazards encountered on roof surfaces—including the requirements referenced in national consensus standards such as ANSI/ASSE A1264.1–2007, Safety Requirements for Workplace Walking/Working Surfaces and Their Access; Workplace, Floor, Wall and Roof Openings; Stairs and Guardrail Systems—would result in a prevention rate of 15 percent. Therefore, in the preliminary analysis of benefits, OSHA applied a prevention rate of 15 percent to roof accidents.

For this final analysis of benefits, OSHA increased the prevention rate for roofs to 20 percent because the final standard: (1) Significantly strengthened fall protection for chimney sweeps (see Section F Costs of Compliance below in this FEA for a discussion of the control measures that OSHA used for the chimney-cleaning services industry), and (2) in greater detail, through association with an analogous standard for construction, extended fall protection in the form of designated areas and work rules intended to limit the movement of workers to within 15 feet of the roof edge when fall protection is not installed and available for use (see Section F below for a discussion of fall protection on rooftops across industries covered by § 1910.28, Duty to have fall protection). OSHA's final analysis of compliance costs for rooftop inspections addressed by final § 1910.28(b)(13), Work on low-slope roofs, includes costs for the installation of fall-arrest anchorages for the small percentage of inspections that identify hazardous conditions at or near roof edges (see discussion in the section ''Cost Estimates'', below). These additional rooftop inspections and fall-system enhancements are expected to contribute to the benefits of reduced fatalities and injuries.

Two chimney-sweep accidents reported in OSHA's IMIS database (OSHA, 2012a) illustrate the benefits achievable under the final standard. In the first accident (Inspection No. 311734842), an employee of a Maryland chimney-sweep business died from impact injuries to the head and neck after apparently falling 15 feet. Although no one witnessed the accident, it appears, based on evidence at the scene and an interview with the homeowner, that the employee was using a 12-foot section of a ladder to gain access to three roof levels: the primary roof, the porch roof, and the roof peak. Inspectors found no roof perimeter guardrail or anchorage-based personal fall protection equipment at the site. OSHA believes the final standard at § 1910.28 would prevent such a fall because the employer would have to provide fall protection for an employee exposed to a height of four feet or greater.

In a second chimney-cleaning accident identified by OSHA (Inspection No. 307309054), employees of an air-duct and chimney-service company were installing a protective cap on a chimney. One of the employees was using a 2-foot stepladder leaning against the chimney chase to access the top of the chimney when he fell 24 feet. OSHA's investigation of the fatality showed that the employee was not using personal fall protection equipment, a safety measure required by the final standard.

For this final analysis of benefits, OSHA increased the prevention rate for ladders to 20 percent (from 15 percent in the PEA) because the requirement in the final rule for safety systems on all fixed ladders, including outdoor advertising, will substantially reduce the number of ladder-related accidents.

In addition, OSHA believes that the increased level of worker training on ladder safety systems required by the final rule, and the heightened recognition of the fall hazards associated with ladder safety systems resulting from this training, will yield a higher percentage of accident avoidance than preliminarily estimated by the Agency in the PEA.

OSHA also increased the prevention rate for falls to lower level, not elsewhere classified, to 5 percent (from 2.5 percent in the PEA) based on the requirements for step bolts in the final rule. OSHA revised its preliminary estimate of the prevention rate based on its determination that employers will increase use of ladder safety systems combined with personal fall protection on structures covered by the final rule that currently use only step bolts or ladders without ladder safety systems, such as pole-mounted lights at sports and performance arenas and other tall structures.

For falls from scaffolds or staging, OSHA judged a prevention rate of 40 percent in the PEA. No commenters raised objections to this estimate, so OSHA retained it for this FEA. OSHA believes that this estimate is reasonable because, according to OSHA and BLS accident data, approximately 40 percent of lost-workday scaffold accidents involve rope-descent systems. Therefore, in view of the final standard's comprehensive coverage of these systems, OSHA believes that it is reasonable to expect that the final standard will prevent at least 40 percent of deaths and injuries associated with scaffolds.

In addition, Table V–11 shows that falls from scaffolds or staging is a leading category of falls in general industry. According to the Bureau of Labor Statistics, such falls caused an average of 18 deaths and 1,474 lost-workday injuries yearly over a recent eleven-year period (1992–2002). For the PEA, OSHA reviewed a subset of scaffold accidents recorded in the Agency's Integrated Management Information System (IMIS) database to expand ERG's analysis of the extent to which the proposed standard would prevent accidents involving commercial window cleaning to gain additional information on prevention of fatal falls (OSHA, 2009). Accordingly, OSHA reviewed 36 incidents (some involving multiple casualties) that occurred during the period January 1995 to October 2001 in which a fall from an elevated scaffold or a similar surface during commercial window cleaning operations either killed or injured workers in general industry. OSHA then applied expert judgment to make determinations about which of these incidents would be preventable by full compliance with each of the following standards:

1. The existing standard for walking-working surfaces;

2. A 1991 memorandum to regional administrators that describes the safe use of descent-control devices (*i.e.,* rope-descent systems or RDSs) by employees performing building exterior cleaning, inspection, and maintenance (OSHA, 1991a), which were incorporated into ANSI/IWCA I–14.1, Window Cleaning Safety Standard; or

3. The final standard.

Table V–12 below summarizes OSHA's analysis of the IMIS window cleaning incidents. Table V–12 shows that the existing standard did not account for incidents in three of the four cause-of-incident categories. The existing standard could not account for these incidents because it has no provisions that directly regulate RDSs. Accordingly, OSHA believes that full compliance with the existing standard would not prevent these incidents.

Table V-12

Fall Incidents Associated with the Use of Scaffolds during Window Cleaning

Cause of Incident	Incidents Prevented by:[a] Existing Standard	OSHA 1991 Memo	Final Standard
Malfunction/Mishandling of Rope Descent System or Lifelines	NA[b]	19	21
Anchorage Failure	NA	7	8
Inadequate Training	NA	12	14
Other Factors (suspension scaffold hardware, manlift, powered platform, roof top equipment, safety belt)	5	NA	6
Number of incidents believed to be preventable	5	20	36

[a]OSHA assigned some incidents to more than one standard because provisions in the standards provided similar fall protection.

[b]NA: No provision in the document addressing this cause.

Source: U.S. Department of Labor, OSHA, Directorate of Standards and Guidance.

The 21 RDS incidents in the category titled ''Malfunction/Mishandling of Rope Descent System or Lifelines'' typically involved a malfunction in, or unsafe use of, an RDS rope descent systems (including lifelines). OSHA determined that safety conditions specified in its 1991 memorandum could prevent 19 of these incidents. The final rule could prevent these 19 RDS incidents, as well as the remaining two RDS incidents. As noted earlier, OSHA's existing subpart D would not prevent any of the RDS incidents in this category.

One of the primary causes of accidents in commercial window cleaning is the failure of the rooftop anchorage to support the suspended scaffold, the second cause-of-incident category in Table V–12. The final standard requires that employers use proper rigging, including sound anchorages and tiebacks, with RDS. OSHA identified eight incidents in the IMIS database for which anchorage failure contributed to the incident. In OSHA's judgment, all eight anchorage-related incidents involved factors addressed by the final standard and, therefore, would be preventable under that standard. All but one of these eight incidents involved factors addressed by the 1991 OSHA memo.

The third cause-of-incident category in Table V–12 addresses accidents that are less likely to occur when employers train workers adequately—for example, in the proper use of harnesses and lifelines. OSHA identified 14 incidents in the IMIS database in which death or injury to a worker would be preventable had the worker applied the training required by the final standard. Of these 14 cases, 12 involved factors addressed by the 1991 OSHA memo.

Other factors that led to a fall from elevation, such as equipment failure involving suspension scaffolds and powered platforms, contributed to the death or injury of workers during window cleaning operations. The fourth cause-of-incident category in Table V–12 addresses these incidents. OSHA determined that provisions in the existing standard would prevent four of these incidents, while the provisions of the final standard would prevent six of them. The 1991 OSHA memo had no provisions that would prevent these incidents.

OSHA believes that this analysis illustrates some of the complexities in assigning benefits to the final standard. Chief among these complexities is the assumption that full compliance with the final standard will prevent fatalities not preventable by the existing standard due to the addition in the final standard of major requirements addressing window cleaning operations.

Second, there is the question of the proper baseline for such an analysis. Prior to publication of the final standard, while OSHA did not have a rule addressing RDSs or anchorages for these systems and suspended scaffolds, OSHA could use national consensus standards and enforcement policies, in concert with the general duty clause, to prompt employers to prevent falls to lower levels. Therefore, reductions in fall-related incidents likely occurred as a result of this enforcement practice, even if OSHA applied this practice irregularly. However, OSHA has not treated the 1991 memo as the baseline for either benefits or costs, but has instead estimated costs for most activities required by the 1991 memo and benefits from the current levels of compliance.

Third, there is the issue, already discussed, of how to treat the benefits of training requirements. OSHA normally assumes full compliance with a rule for the purposes of both benefit and cost analysis. For some provisions in a rule, the Agency can readily determine whether full compliance with the rule would prevent an incident. However, for training provisions, it is difficult to determine whether full compliance with the training requirements would prevent the incidents the training is addressing (Seong and Mendeloff, 2004). OSHA's resulting estimate of the effects of the training requirements is specified by Table V–11. According to OSHA's determinations summarized in Table V–12, adequate training, if the instructions in training were followed, could have prevented up to 14 of the 36 window cleaning fall-related incidents reported in IMIS.

Based on the PEA and the rulemaking record, and applying the fatality-prevention rate for scaffolds explained above, OSHA concludes that the final standards will prevent 29 fall fatalities a year, *i.e.,* the final standards would prevent approximately 8 percent of the fatal falls in general industry.

b. Injuries Prevented

For the purposes of estimating the number of lost-workday injuries prevented by the final standards, OSHA applied the same prevention factors to lost-workday injuries that it assigned to the defined categories of fatal falls. Table V–13 shows, by type of fall, the distribution of lost-workday injuries for general industry; these injury categories duplicate the categories in Table V–8. The BLS data show that, for non-fatal falls to a lower level, 30.4 percent of injuries are due to falls down stairs or steps, while 22.3 percent are the result of falls from ladders. Averaging total lost-workday fall injuries for 2006–2012, OSHA estimates that 202,066 lost-workday fall injuries occur each year for work operations directly affected by the final revisions to subparts D and I (see Ex. [OSHA Excel Workbook], tabs Injury Fall % 2006–2012 and Prevented Injuries '06–'12).

For this FEA, OSHA notes a significant addition to its preliminary analysis of benefits. In the PEA, OSHA primarily focused on the benefits of preventing falls to a lower level because of the relatively greater certainty of accident avoidance associated with the required control strategies that OSHA anticipates employers will apply to ladders, scaffolds, rope descent systems, roofs, and other elevated surfaces after the Agency issues the final rule. However, based on testimony in the record (Exs. 329 (1/20/2011, pp. 42, 60–61); 329 (1/21/2011, pp. 200–203); 330), OSHA expanded its analysis to include the benefits of preventing slips, trips, and falls on the same level. As shown in Table V–8, 2006–2012 BLS data indicate that falls on the same level resulted in 137,079 lost-workday injuries in work activities in general industry affected by the final rule. OSHA estimates that the provisions of final subpart D addressing general conditions (§ 1910.22) will prevent 1 percent of these accidents, or 1,371 injuries. The 1% prevention rate assumes that the time employers will expend to inspect (two hours per year) and correct hazards (20 minutes for the 10 percent of establishments with unsafe conditions) in compliance with 1910.22(d) will lead to this reduction. This estimate is uncertain, and we examined other prevention rates in our sensitivity analysis.[116]

Using the prevention estimates described above for falls on the same level and the prevention estimates applied to fatal incidents involving falls to a lower level, OSHA estimates that compliance with final subparts D and I will prevent 5,842 lost-workday fall injuries annually. OSHA recognizes that this prevented-injuries estimate is a 58 percent increase over the preliminary estimate (*i.e.,* 3,706 prevented injuries); however, OSHA believes that this estimate accurately captures the full range of accidents that the final rule addresses.

BILLING CODE 4510–29–P

[116] Other sections of the standard may indirectly prevent falls on the same level.

Table V-13
Estimated Lost-Workday Injuries per Year Prevented by Compliance with Final Subparts D and I

Type of Fall	Distribution of Falls Resulting in Lost Workdays by Type	Estimated Annual Number of Nonfatal Falls by Type	Incremental Prevention Resulting from Compliance with the Final Standards		Estimated Annual Injuries Prevented by the Final Standards[a]
Fall to lower level	24.0%	48,379			
Fall down stairs or steps	30.4%[b]	14,726	Low	5.0%	736
Fall from floor, dock, or ground level	8.2%	3,987	High	10.0%	399
Fall from ladder	22.3%	10,805	High	20.0%	2,161
Fall from piled or stacked material	0.8%	370	High	10.0%	37
Fall from roof	0.9%	429	High	20.0%	86
Fall from scaffold, staging	1.2%	597	Very High	40.0%	239
Fall from building girders or other structural steel	0.3%	134	High	10.0%	13
Fall from nonmoving vehicle	19.0%	9,188	None	0.0%	0
Fall to lower level, n.e.c.	14.9%	7,230	Low	5.0%	362
Fall to lower level, unspecified	1.9%	921	Uncertain	2.5%	23
Fall on same Level	67.8%	137,079	Very Low	1.0%	1,371
Other falls (incl. ship, boat)	8.2%	16,609	Uncertain	2.5%	415
Totals	**100.0%**	**202,066**			**5,842**

Note: Due to rounding, figures may not sum to totals shown.

[a]Prevented injuries calculated as the product of annual nonfatal falls and the incremental prevention rate, by type.

[b] Distribution percentages for this category and the nine categories below it are calculated as percentage of fall to a lower level. Distribution percentage for fall on same level and other falls are calculated as percentage of total falls in general industry.

4. Nonquantifiable Benefits

As noted earlier in this FEA, OSHA did not estimate the improvements in the efficiency of compliance associated with clarifying the existing rule and making it consistent with current national consensus standards. In addition to the benefits associated with those factors, OSHA anticipates that improvements to its walking-working surfaces standard in general industry will yield further benefits. In the following exhibit and in the discussion that follows, OSHA highlights the key substantive differences introduced by the final rule.

4. Nonquantifiable Benefits

Exhibit V-2: Revised Subparts D&I and Existing Standards for Fall Protection in General Industry – Key Substantive Differences

Existing Standard (Subpart D, unless otherwise indicated)	Revised Standard	Comment
§1910.22 General requirements, paragraph (a)(3) "Housekeeping." requires that every floor, working place, and passageway shall be kept free from protruding nails, splinters, holes, or loose boards.	**§1910.22 General requirements**, paragraph (a)(3) Surface conditions, requires that the employer ensure that walking-working surfaces are maintained free of hazards such as sharp or protruding objects, loose boards, corrosion, leaks, spills, snow, and ice.	Expanded list will strengthen employer duty to maintain hazard-free surfaces.

Exhibit V-2: Revised Subparts D&I and Existing Standards for Fall Protection in General Industry – Key Substantive Differences (continued)		
Existing Standard (Subpart D, unless otherwise indicated)	Revised Standard	Comment
Consensus standards only.	**§ 1910.24 Step bolts and manhole steps**, paragraph (a)(1) Step bolts, requires that the employer ensure that each step bolt installed on or after January 17, 2017 in an environment where corrosion may occur is constructed of, or coated with material that protects against corrosion. § 1910.24 Step bolts and manhole steps, paragraph (b)(2) Manhole steps, requires the employer must ensure that each manhole step installed on or after January 17, 2017 • has a corrugated, knurled, dimpled, or other surface that minimizes the possibility of an employee slipping; and • is constructed of, or coated with, material that protects against corrosion if the manhole step is located in an environment where corrosion may occur.	New section addresses hazards of unsafe step bolts and manhole steps.
Consensus standards only.	**§1910.27 Scaffolds and rope descent systems**, paragraph (b)(1) Rope descent systems, requires that before any rope descent system is used, the building owner must inform the employer, in writing, that the building owner has identified, tested, certified, and maintained each anchorage so it is capable of supporting at least 5,000 pounds (268 kg) in any direction, for each employee attached. The information must be based on an annual inspection by a qualified person and certification of each anchorage by a qualified person, as necessary, and at least every 10 years. Paragraph (b)(ii) in that section requires that the employer must ensure that no employee uses any anchorage before the employer has obtained written information from the building owner that each anchorage meets the requirements of paragraph (b)(1)(i) of this section. The employer must keep the information for the duration of the job.	New provision specifies requirement for building anchorage certification and inspection for use of suspended scaffolds.

Exhibit V-2: Revised Subparts D&I and Existing Standards for Fall Protection in General Industry – Key Substantive Differences (continued)		
Existing Standard (Subpart D, unless otherwise indicated)	Revised Standard	Comment
Generally consensus standards only, except: §1910.28 **Safety requirements for scaffolding**, paragraph (a)(21) "General requirements for all scaffolds", requires that only treated or protected fiber rope shall be used for or near any work involving the use of corrosive substances or chemicals.	**§1910.27 Scaffolds and rope descent systems**, paragraph (b)(2) Rope descent systems, requires that the employer ensure: • that no rope descent system is used for heights greater than 300 feet (91 m) above grade unless the employer demonstrates that it is not feasible to access such heights by any other means or that those means pose a greater hazard than using a rope descent system; • that the rope descent system is used in accordance with instructions, warnings, and design limitations set by the manufacturer or under the direction of a qualified person; • that each employee who uses the rope descent system is trained in accordance with §1910.30; • that the rope descent system is inspected at the start of each workshift that it is to be used. The employer must ensure damaged or defective equipment is removed from service immediately and replaced; • that the rope descent system has proper rigging, including anchorages and tiebacks, with particular emphasis on providing tiebacks when counterweights, cornice hooks, or similar non-permanent anchorages are used; and • that each employee uses a separate, independent personal fall arrest system that meets the requirements of 29 CFR part 1910, subpart I.	New RDS section codifies consensus standard and best practices.

Exhibit V-2: Revised Subparts D&I and Existing Standards for Fall Protection in General Industry – Key Substantive Differences (continued)		
Existing Standard (Subpart D, unless otherwise indicated)	**Revised Standard**	**Comment**
Generally consensus standards only, except: **§1910.28 Safety requirements for scaffolding**, paragraph (a)(21) "General requirements for all scaffolds" requires that only treated or protected fiber rope shall be used for or near any work involving the use of corrosive substances or chemicals.	**§1910.27 Scaffolds and rope descent systems**, paragraph (b)(2) Rope descent systems, requires that the employer must ensure: • that all components of each rope descent system, except seat boards, are capable of sustaining a minimum rated load of 5,000 pounds (22.2 kN). Seat boards must be capable of supporting a live load of 300 pounds (136 kg); • that prompt rescue of each employee is provided in the event of a fall; • that the ropes of each rope descent system are effectively padded or otherwise protected, where they can contact edges of the building, anchorage, obstructions, or other surfaces, to prevent them from being cut or weakened; • that stabilization is provided at the specific work location when descents are greater than 130 feet (39.6 m); • that no employee uses a rope descent system when hazardous weather conditions, such as storms or gusty or excessive wind, are present; • that equipment, such as tools, squeegees, or buckets, is secured by a tool lanyard or similar method to prevent it from falling; and • that the ropes of each rope descent system are protected from exposure to open flames, hot work, corrosive chemicals, and other destructive conditions.	New RDS section codifies consensus standard and best practices.

Exhibit V-2: Revised Subparts D&I and Existing Standards for Fall Protection in General Industry – Key Substantive Differences (continued)

Existing Standard (Subpart D, unless otherwise indicated)	Revised Standard	Comment
§1910.27 Fixed ladders, paragraph (d)(2) "Special requirements" requires that when ladders are used to ascend to heights exceeding 20 feet (except on chimneys), landing platforms must be provided for each 30 feet of height or fraction thereof, except that, where no cage, well, or ladder safety device is provided, landing platforms must be provided for each 20 feet of height or fraction thereof. In addition, each ladder section shall be offset from adjacent sections. Where installation conditions (even for a short, unbroken length) require that adjacent sections be offset, landing platforms must be provided at each offset.	**§1910.28 Duty to have fall protection**., paragraph (b)(9) Fixed ladders, requires that for fixed ladders that extend more than 24 feet (7.3 m) above a lower level, the employer must ensure: • that each fixed ladder installed before November 19, 2018 is equipped with a personal fall arrest system, ladder safety system, cage, or well; • that each fixed ladder installed on or after November 19, 2018, is equipped with a personal fall arrest system or a ladder safety system; • that when a fixed ladder, cage, or well, or any portion of a section thereof, is replaced, a personal fall arrest system or ladder safety system is installed in at least that section of the fixed ladder, cage, or well where the replacement is located; and • That on and after November 18, 2036, all fixed ladders are equipped with a personal fall arrest system or a ladder safety system.	In outdoor advertising and other industries where fixed ladders are climbed frequently, additional protection provided at heights above 24 ft.

Exhibit V-2: Revised Subparts D&I and Existing Standards for Fall Protection in General Industry – Key Substantive Differences (continued)		
Existing Standard (Subpart D, unless otherwise indicated)	Revised Standard	Comment
	§1910.28 Duty to have fall protection, paragraph (b)(13) Work on low-slope roofs, requires: • that when work is performed less than 6 feet (1.6 m) from the roof edge, the employer must ensure each employee is protected from falling by a guardrail system, safety net system, travel restraint system, or personal fall arrest system; • that when work is performed at least 6 feet (1.6 m) but less than 15 feet (4.6 m) from the roof edge, the employer must ensure each employee is protected from falling by using a guardrail system, safety net system, travel restraint system, or personal fall arrest system, The employer may use a designated area when performing work that is both infrequent and temporary; and • that when work is performed 15 feet (4.6 m) or more from the roof edge, the employer must: (1) protects each employee from falling by a guardrail system, safety net system, travel restraint system, or personal fall arrest system, or a designated area. The employer is not required to provide any fall protection provided the work is both infrequent and temporary; and (2) implements and enforces a work rule prohibiting employees from going within 15 feet (4.6 m) of the roof edge without using fall protection in accordance with paragraphs (b)(13)(i) and (ii) of this section. The employer is not required to provide any fall protection provided the work is both infrequent and temporary.	New provision addresses risks on low-slope roofs.

Exhibit V-2: Revised Subparts D&I and Existing Standards for Fall Protection in General Industry – Key Substantive Differences (continued)

Existing Standard (Subpart D, unless otherwise indicated)	Revised Standard	Comment
	§1910.30 Training requirements, paragraph (a)(1) Fall hazards requires that before any employee is exposed to a fall hazard, the employer must provide training for each employee who uses personal fall protection systems or who is required to be trained as specified elsewhere in this subpart. Moreover, employers must ensure employees are trained in the requirements of this paragraph on or before May 17, 2017. Paragraph (a)(2) of that section requires the employer must ensure that each employee is trained by a qualified person. Paragraph (a)(3) of that section requires the employer to train each employee in at least the following topics: (i) The nature of the fall hazards in the work area and how to recognize them; (ii) The procedures to be followed to minimize those hazards; (iii) The correct procedures for installing, inspecting, operating, maintaining, and disassembling the personal fall protection systems that the employee uses; and (iv) The correct use of personal fall protection systems and equipment specified in paragraph (a)(1) of this section, including, but not limited to, proper hook-up, anchoring, and tie-off techniques, and methods of equipment inspection and storage, as specified by the manufacturer. §1910.30 Training requirements, paragraphs (b)(1), requires that the employer train each employee on or before May 17, 2017 in the proper care, inspection, storage, and use of equipment covered by this subpart before an employee uses the equipment. Paragraph (b)(2) of that section requires the employer train each employee who uses a dockboard to properly place and secure it to prevent unintentional movement. Paragraph (b)(3) of that section requires the employer train each employee who uses a rope descent system in proper rigging and use of the equipment in accordance with §1910.27. Paragraph (b)(4) of that section requires the employer train each employee who uses a designated area in the proper set-up and use of the area.	New requirements for training on fall and equipment hazards ensure communication on, and remediation of hazards.

Exhibit V-2: Revised Subparts D&I and Existing Standards for Fall Protection in General Industry – Key Substantive Differences (continued)		
Existing Standard (Subpart D, unless otherwise indicated)	**Revised Standard**	**Comment**
§1910.132 **General Requirements**, paragraph (d)(1) Hazard assessment and equipment selection, requires that the employer assess the workplace to determine if hazards are present, or are likely to be present, which necessitate the use of personal protective equipment (PPE). If such hazards are present, or likely to be present, the employer must: • select, and have each affected employee use, the types of PPE that will protect the affected employee from the hazards identified in the hazard assessment; • communicate selection decisions to each affected employee; and, • select PPE that properly fits each affected employee. Note: Non-mandatory Appendix B contains an example of procedures that would comply with the requirement for a hazard assessment. Paragraph (d)(2) of that section requires that the employer shall verify that the required workplace hazard assessment has been performed through a written certification that identifies the workplace evaluated; the person certifying that the evaluation has been performed; and the date(s) of the hazard assessment. The written certification must be identified as the document certifying the hazard assessment.	Hazard Assessment requirements in Subpart I are now applied to fall protection PPE.

BILLING CODE 4510–29–C

Earlier in this preamble, in the summary and explanation of final § 1910.28 Duty to have fall protection and falling-object protection, OSHA described the means by which the final standard provides greater flexibility in controls than is found in the current walking-working standard for preventing slip, trip, and fall accidents. OSHA believes that expanding control flexibility will produce nonquantifiable benefits, and in the following discussion, the Agency reiterates the factors that will help generate the nonquantified benefits supplementing the quantified benefits shown in Impacts Exhibit V–1 and in Tables V–11 and V–13 in this FEA.

This rule, like the construction fall protection standard, allows general industry employers, similar to construction employers, to protect workers from falls hazards by choosing from a range of acceptable fall protection options. The existing general industry standard, however, mandated the use of guardrail systems as the primary fall protection method (*e.g.,* see existing § 1910.23(c)).

The 1990 proposed revision of subpart D continued to require the use of guardrail systems. However, in the 2003 notice reopening the record, OSHA acknowledged that it may not be feasible to use guardrails in all workplace situations (68 FR 23528, 23533 (5/2/2003)) and requested comment on whether the Agency should allow employers to use other fall protection systems instead of guardrails. Commenters overwhelmingly favored this approach, which the construction fall protection standard adopted in 1994. In response to comments and OSHA's history and experience with the construction fall protection standard, the Agency proposed allowing employers to select from a range of fall protection options instead of requiring employers to comply with the existing mandate to use guardrail systems.

OSHA is adopting the proposed approach for several reasons. First, OSHA believes giving general industry employers flexibility in selecting fall and falling-object protection systems allows them to select the system or method that they determine will work best for the particular work operation and location. Such flexibility allows employers to consider factors such as exposure time, availability of appropriate attachment points, feasibility, cost effectiveness, and cost constraints when selecting the appropriate fall protection system for the work activity.

Second, providing control flexibility allows general industry employers to take advantage of advances in fall protection technology developed since OSHA adopted the existing rule. The existing rule, by contrast, limited choices in fall protection technology.

Third, making the final rule consistent with the construction standard ensures that employers who have workers engaged in both general industry and construction activities are able to use the same fall and falling-object protection while performing both types of activities. It eliminates the need to purchase different fall protection systems when their workers perform general industry operations. Thus, making the general industry and construction rules consistent ensures that final rule is a cost-effective approach for reducing significant risk of harm. As a result, OSHA believes that the additional flexibility and consistency achieved by this final rule in providing fall protection will reduce worker deaths and injuries.

OSHA believes the comprehensive approach to fall protection (that is, duty to provide fall protection, mandatory criteria for controls, regular inspections, and training) that the final rule and the construction fall protection standard incorporate will provide equivalent or greater protection than the existing rule. In addition, the greater flexibility the final rule affords employers will allow them to select the fall protection option that works best in the specific situation and is the most cost-effective protective measure capable of reducing or eliminating significant risk of harm. Moreover, the comprehensive approach in the final rule, like the construction fall protection standard, recognizes that, in some instances, it may not be possible to use guardrail systems or other passive controls to protect workers from falls. For example, employers may not be able to install permanent systems such as guardrails when they do not own the building or structure on which their employees are working. OSHA believes the final rule addresses the concerns of these commenters without limiting employer flexibility or compromising worker safety.

As mentioned, the final rule limits fall protection choices in some situations where the Agency determined that passive/permanent systems provide the requisite level of protection. For example, in final paragraph (b)(5), OSHA specifically requires the use of guardrails on runways and similar walkways. Likewise, guardrail systems or travel restraint systems are the only systems that employers may use to protect workers on slaughter-house platforms (see final paragraph (b)(14)). In these cases, OSHA limited employers' choices to those systems that are possible to use on those walking-working surfaces and that provide an adequate and appropriate level of safety.

The final rule also establishes criteria and work practices addressing personal fall protection systems (§ 1910.140). These criteria include minimum strength and load, locking, and compatibility requirements for components of personal fall protection systems, such as lines (vertical lifelines, self-retracting lines, travel restraint lines), snaphooks, and anchorages. The work practices include requiring employers to ensure inspection of personal fall protection systems before the initial use during each work shift, and to ensure that a competent or qualified person inspects each knot in a lanyard or vertical lifeline. OSHA believes that these criteria and work practices, in conjunction with the training and retraining requirements in the final rule, provide a combination of controls and redundancies that will help to ensure that personal fall protection systems are effective in protecting workers from falls hazards.

c. Public Comment on Benefits

OSHA requested comment on the Agency's preliminary analysis of the scaffold accidents described above, and on the various approaches used to determine the estimated benefits achievable from compliance with the other provisions of the proposed standard. The following discussion presents OSHA's summary of the public comments received on OSHA's preliminary benefits analysis.

The National Chimney Sweep Guild (NCSG) questioned the benefits of a fall protection system that involved the use of an anchorage, travel restraint lines, and harnesses for repair and maintenance activities on a residential roof:

> Given that the average time on the roof for a typical chimney service is between five and twenty minutes, we believe it is clear that the installation of a single roof anchor (taking 45 to 90 minutes) would expose the chimney sweep to greater hazards for a longer period of time. Installation of the anchor requires extra equipment to be taken to the roof, and increases the number of ground to roof trips. We believe one of the highest hazards is the ladder to roof transition, both getting onto and off of the roof. The work required to install the roof anchor(s) would significantly increase the number of ladder to roof to ladder transition cycles. Furthermore, the anchor would not provide any fall protection during the period before the sweep could attach to it or during the period after the sweep detached from it.
>
> In conclusion, the installation of a roof anchor point roughly equals the cost of an

average chimney cleaning or inspection service, requires significantly more ladder to roof to ladder transitions, keeps the technician working on the roof for a substantially longer period of time than would be required to perform the average chimney cleaning or inspection service, and would not provide fall protection for the ladder to roof and roof to ladder transitions. Accordingly, we believe it is clear that it is economically infeasible (in the rare circumstance where it would be acceptable to a homeowner) and would expose the technician to a greater hazard to require the installation of the anchor(s) that would be necessary to use a personal fall arrest system, a travel restraint system or a safety net while performing the great majority of the tasks performed by sweeps (Ex. 150, pp. 30–31).

In this quotation, NCSG argued that, in many cases, the installation of a roof anchor would involve greater hazard, and challenged OSHA's determination that it is feasible to apply these fall protection systems for chimney or other roof work.

With respect to the issue of greater hazard, while some chimney sweep jobs are relatively short (*e.g.,* chimney cleaning and inspection, minor repairs), some are much longer than five to 20 minutes (*e.g.,* substantial and major installations and repairs) (Exhibit 150). A simple chimney cleaning job typically involves no time on the roof except possibly a short inspection of the exterior of the chimney after the cleaning is finished (Ex. 150; 329 (1/18/2011, p. 267, 270, 276–277, 301)). OSHA has modified the rules so roof anchorages are not required for inspections prior to starting work or after completing work (§ 1910.28(a)(2)(ii)). As a result, most short chimney cleaning and inspection jobs will not require use of anchorages and fall protection. In those situations where work actually needs to be done on a roof, and thus more time will be required on the roof, OSHA has modified the rule to except requirements for anchorages in situations where employers can demonstrate that installing anchorages for personal fall arrest systems as well as using any other conventional fall protection is infeasible or creates a greater hazard (§ 1910.28(b)(1)(ii)). Because the length of chimney sweep jobs varies widely as does the time to install anchors, individual determinations on whether installation of personal fall protection anchorages would make the job more dangerous than not using the required fall protection are required. Where anchorages are infeasible or create a greater hazard, employers must develop and implement a fall protection plan, including implementing other control measures, to eliminate or reduce fall hazard hazards for workers.

OSHA also differs with the NCSG's statement above with respect to time requirements and expense for installing fall protections. In response to a question from the OSHA panel on the feasibility and potential benefits of anchorage and lifeline systems on roofs, a representative of the Industrial Safety Equipment Association stated in the public hearing:

In the event of existing construction there are permanent roof anchors that can be installed on residential structures and other types of facilities, buildings and so on that can be installed after the construction. And depending upon the type of construction, those can range in cost anywhere from, you know, $35 to a few hundred dollars. And they have varying degrees of installation, again depending upon the type of structure.

There are also—if it's new construction there are different construction techniques where the anchors can be installed, for instance, on the roof truss before the truss is put up into place so that the anchor's already up there and then you can use first man type systems to anchor your lifeline on the ground before the worker has to climb to do the work at the height.

So there are various types of roof anchor products. And you know, I would—every fall protection equipment manufacturer manufactures a number of different types specifically for the roofing industry (Ex. 329 (1/18/2011), pp. 176–177).

OSHA also notes that where an employer can show that it is not feasible to use guardrails, safety nets, or personal fall protection systems in work on residential roofs (or it creates a greater hazard), the final rule requires the employer to develop and implement a fall protection plan and training meeting the requirements of the construction standard (final rule § 1910.28(b)(1)(ii)).

Charles Lankford of Rios & Lankford Consulting International challenged OSHA's finding in the PEA that fatalities involving falls represent a risk so significant that only a revised standard with a scope covering all of general industry will address the problem:

The relative ranking of falls appears to have more to do with the falling rate of workplace homicides than with an increase in fatal falls, since the rate of fatal falls has remained fairly constant at around 5 and 6 fatal falls per million employees for decades.

While it is true that fatal falls were 14% of all fatalities (2009 BLS data), this was not evenly distributed among the industrial sectors. In the ''goods producing'' sector, falls were the second (or third) leading cause of death, and were ten times more likely than a homicide to be the cause of death. This is the major category that includes mining, agriculture, construction and manufacturing.

In contrast, in the service sector, falls were the third (or fourth) leading cause of death. In the service sector overall, homicides were twice as likely to be the cause of death as a fall. In some NAIC codes, homicides were 4 times more likely to be the cause of death than a fall. The service sectors where fatal falls were relatively more likely were: (1) Durable goods wholesale; (2) utilities; (3) information; and (4) administrative and waste services.

I've focused on fatal falls data rather than non-fatal falls because the non-fatal data are more subject to variations from record-keeping interpretations, data initiatives, etc.

Never-the-less historical incident rates for non-fatal falls also do not display an increasing fall problem. The all-industries non-fatal fall incidence rate has declined every year since 2003 (the oldest year in the BLS Table I consulted), so the decline in rates is not attributable to the current recession. If we exclude 2008 and 2009 data, manufacturing did not show a change. Yet 2006 and 2007 showed lower injury incidence rates than 2003 and 2004 (Ex. 368).

In response to Mr. Lankford's comment, OSHA notes that, combining data taken from Tables V–1 and V–13, the roughly 5.2 million workers directly exposed to fall hazards had approximately 187,000 lost-workday injuries resulting from falls each year, or 36 injuries per 1,000 workers annually. The hazards faced by these employees are similar, even though they work in a broad range of industries. OSHA believes, as indicated by Mr. Lankford's comment, that the risk of fall-related injuries, combined with the risk of fall-related fatalities, remained at a constant rate in recent years and that the final rule will help prevent a substantial number of them. Accordingly, OSHA concludes that falls constitute a safety threat best addressed by the final rule's revisions to existing subparts D and I.

d. Monetized Benefits, Net Benefits, and Cost Effectiveness

The previous section showed that OSHA judges that complete compliance with the revised standard will result in the prevention of 29 deaths and 5,842 lost-workday injuries each year. Consistent with current federal regulatory methodologies recommended by OMB Circular A–4, discussed below, the Agency assigned a dollar value to these safety benefits.

In estimating the value of preventing a fatality, OSHA followed the approach established by the U.S. Environmental Protection Agency (EPA). EPA's *Guidelines for Preparing Economic Analyses* provides a detailed review of methods used to estimate mortality-risk values, and summarizes the values obtained in the literature (EPA, 2000). Synthesizing the results from 26 relevant studies, EPA arrived at a mean value for a statistical life (VSL) of $4.8 million (in 1990 dollars). EPA recommends this central estimate, updated for inflation, for application in regulatory analyses.

Viscusi and Aldy (2003) presented a metaanalysis of studies in the economics literature that used a willingness-to-pay (WTP) methodology to estimate the imputed value of life-saving programs, and arrived at a value of approximately $7.0 for each avoided fatality. Applying the GDP deflator (U.S. BEA, 2010), this $7.0-million base number in 2000 dollars yields an estimate of $8.7 million in 2010 dollars for each fatality avoided.

This VSL estimate is consistent with EPA's estimate, and is also within the range of the substantial majority of such estimates in the literature ($1 million to $10 million per statistical life), as discussed in OMB Circular A–4 (OMB, 2003). Applying a VSL of $8.7 million to the estimated number of prevented fatalities, OSHA estimates that the dollar value of the benefits associated with preventing fatal accidents from compliance with revised subparts D and I will be $252.3 million annually.

OSHA also reviewed the available research literature regarding the dollar value of preventing an injury. In the paper cited immediately above, Viscusi and Aldy conducted a critical review of 39 studies estimating the value of a statistical injury (Viscusi and Aldy, 2003). In their paper, Viscusi and Aldy reviewed the available WTP literature to identify a suitable range of estimates; using WTP to value non-fatal injuries is the approach recommended in OMB Circular A–4.

Viscusi and Aldy found that most studies resulted in estimates in the range of $20,000 to $70,000 per injury (in 2000 dollars), although several studies resulted in higher estimates. That some studies used an overall injury rate, and others used only injuries resulting in lost workdays, partly explains the variation in these estimates. The injuries prevented by final subparts D and I often involve hospitalization and, therefore, are likely to be more severe than the majority of lost-workday injuries. In addition, injuries resulting from falls involve more pain and suffering, more expensive treatments, and generally longer recovery periods than other lost-workday injuries.[117]

Thus, it is reasonable to believe that the value of a statistical injury for this rulemaking will be in the upper part of the reported range of estimates. Nevertheless, in the preliminary benefits analysis discussed in the PEA, OSHA used a mid-range estimate—$50,000—to assess monetized benefits for injuries and, for this FEA, raised that estimate to $62,000 (2010 dollars) to account for a rise in the cost of living since 2000, the base year for the monetized values estimated by Viscusi and Aldy when the authors published their 2003 study. Thus, with an estimated 5,842 injuries a year prevented by the final standards, OSHA determined that the dollar value of prevented injuries through compliance with revised subparts D and I will total $362.2 million annually.

OSHA estimates that the combined dollar value of prevented fatalities and injuries through compliance with the final revisions to subparts D and I will total $615 million per year. Comparing gross monetized benefits with costs of compliance (discussed in more detail in section V.F, below), OSHA estimates that the net monetized benefits of the final standard will be $310 million ($615 million in benefits—$305.0 million in compliance costs; all figures rounded). Table V–14 summarizes the compliance costs, benefits, net benefits, and cost effectiveness of the final standards.

There are other benefits of the final standards that OSHA neither quantified nor monetized. First, OSHA did not estimate the number of fall injuries prevented that do not result in lost workdays. Second, OSHA did not estimate improvements in the efficiency of compliance associated with clarifying the existing rule and bringing it into closer correspondence with current voluntary standards.

BILLING CODE 4510–29–P

[117] In 2009, the median number of days away from work was 14 days for falls to a lower level, whereas the median number of days away from work for all events or exposures leading to injury or illness was 8 days (BLS, 2012). For more discussion of this issue, see Part II of this document.

Table V-14
Net Benefits of the Final Subparts D and I Standards
(millions of 2010 dollars)

Annualized Costs[a]	
§1910.22 General Requirements	$33.2
§1910.23 Ladders	$11.3
§1910.24 Step Bolts and Manhole Steps	$18.0
§1910.27 Scaffolds and Rope Descent Systems	$71.6
§1910.28 Duty to Have Fall Protection	$55.9
§1910.29 Fall Protection Systems Criteria and Practices	$13.1
§1910.30 Training Requirements	$74.2
§1910.132 General Requirements	$12.7
§1910.140 Personal Fall Protection Systems	$11.0
Rule Familiarization	$4.1
Total Annual Costs	**$305.0**
Annual Benefits	
Number of Injuries Prevented	5,842
Number of Fatalities Prevented	29
Monetized Benefits (assuming $62,000 per injury and $8.7 million per fatality prevented)	**$615.0**
Injuries not Resulting in Lost Workdays and Improved Compliance Efficiency	Unquantified
Net Benefits (benefits minus costs)	**$310.0**

[a] Data may not sum to totals due to rounding. The monetized benefit per fatality avoided is $8.7 million (in 2010 dollars, after applying the GDP deflator to $7.0 million in 2000 dollars).

BILLING CODE 4510–29–C

E. Technological Feasibility

OSHA reviewed the substantial evidence collected throughout this rulemaking, including the data and comments submitted to the record in response to the earlier proposed standard published on April 10, 1990, the notice reopening the record published on May 2, 2003, and the recent NPRM (May 24, 2010). Accordingly, OSHA determined that compliance with the final revisions to subparts D, I, and other subparts in 29 CFR part 1910 (general industry), as described in this final rule, is technologically feasible. This subsection presents the details of this conclusion with regard to specific requirements.

1. Technological Feasibility for Final Subpart D (Walking-Working Surfaces)

General Requirements (§ 1910.22)

Section 1910.22 of final subpart D revises existing requirements addressing housekeeping, safe aisles and passageways, covers and guardrails, and floor-loading protection, and introduces new requirements associated with broad areas of safety on walking-working surfaces. Final paragraphs (a), (b), (c), and (d) of this section address, respectively, surface conditions, application of loads, access and egress, and inspection, maintenance, and repair. OSHA received no testimony in the record suggesting that there would be feasibility concerns with final § 1910.22.

Final paragraph (a) requires that employers keep all walking-working surfaces in a clean, dry, orderly, and sanitary condition, and free of hazards such as sharp or protruding objects, loose boards, corrosion, leaks, and spills. Data in OSHA's inspection file analyzed by ERG (ERG, 2007) indicate a high level of compliance with similar requirements in existing subpart D, suggesting that there have been few, if any, technical challenges to employers; therefore, this provision is technologically feasible.

Final § 1910.22(b) requires that employers ensure that each walking-working surface can support the maximum intended load for that surface. This language restates and simplifies the existing regulatory text, and should not present any technological feasibility difficulties. The next provision, final § 1910.22(c), requires that employers provide employees with, and ensure that they use, a safe means of access and egress to and from walking-working surfaces. Although new, this requirement, in OSHA's judgment, will not impose any duties on employers beyond the limits of feasibility.

Paragraph (d) of final § 1910.22 requires employers to regularly inspect and maintain, as necessary, all walking and working surfaces in a safe condition. Employers also must correct and repair all hazardous conditions on walking-working surfaces before employees use them, and guard the surfaces until completing repairs to prevent employee use. A qualified employee must perform or supervise any correction or repair that involves the structural integrity of a walking-working surface. Employers can accomplish the inspection, maintenance, repair, and guarding of surfaces with technologically feasible and currently available methods.

Ladders (§ 1910.23)

Final § 1910.23 covers ladders. Accordingly, final § 1910.23(a) specifies that the section applies to all ladders except for ladders used only for firefighting, rescue operations, tactical law enforcement operations, or training for these operations, and ladders designed into, or are an integral part of, a machine or piece of equipment. In addition, final § 1910.23(b) provides general requirements for all ladders; final paragraph (c) addresses portable ladders; final paragraph (d) presents standards for fixed ladders; and final paragraph (e) addresses mobile ladder stands and mobile ladder stand platforms. OSHA based the requirements in this section partly on current American National Standards Institute (ANSI) standards, A14 series. The ANSI standards provide guidelines for industry, and are generally compatible with current industry practices and technology. Since manufacturers make and test virtually all manufactured ladders to meet these ANSI standards, OSHA believes there will be few problems regarding technological feasibility.

Most of the requirements for ladders in final subpart D do not represent any change from existing OSHA requirements. For both existing and new requirements, current and readily available technology is capable of meeting or exceeding the design and strength criteria specified for ladders. The final language is clearer and more concise than the existing regulatory text. Moreover, OSHA introduced greater compliance flexibility into the final standard, such as in the case of the range provided in the spacing requirements for rungs, cleats, and steps (see final § 1910.23(b)).

Comments submitted to the docket in response to the 1990 proposed rule generally confirmed OSHA's preliminary conclusion that compliance with the proposed requirements for ladders would be technologically feasible. Although several commenters addressed the appropriateness or the costs associated with the proposed ladder requirements, they did not question the technological feasibility of the requirements. Similarly, during the reopening of the record following publication of the 2010 NPRM, commenters raised concerns about the potential costs for protecting workers on ladders in particular circumstances (see, for example, Exs. 121; 301; 342) or the rationale for excluding ladders from the duty to provide fall protection for heights above four feet (Ex. 185). However, there was no evidence presented that would suggest that the final standard for ladders is technologically infeasible.

OSHA grouped training in the proper care, use, and inspection of ladders with other training requirements under final § 1910.30. Compliance with these training requirements does not require any additional or new technology.

Step Bolts and Manhole Steps (§ 1910.24)

Final subpart D provisions for step bolts and manhole steps address basic criteria for the safe design, construction, and use of these components. For example, final § 1910.24(a)(3) specifies uniform spacing of step bolts between 12 inches (30 cm) and 18 inches (46 cm) measured center to center, while § 1910.24(b)(2)(iv) requires uniform spacing of manhole steps not more than 16 inches (41 cm) apart. Although these requirements will be new to subpart D, OSHA based the engineering criteria on consensus standards established by the American Society for Testing and Materials (ASTM), which have wide acceptance throughout industry. Therefore, OSHA believes that existing technology is capable of meeting these performance criteria and that this technology is feasible to apply.

Stairways (§ 1910.25)

Section 1910.25 in the final standard describes OSHA safety specifications for stairs, and covers all types of stairs except stairs serving floating roof tanks; stairs on scaffolds; stairs designed into machines or pieces of equipment; and stairs on self-propelled motorized equipment. Requirements in this section address the obligations to install handrails, stair-rail systems, and guardrail systems, as necessary. Other requirements in this section describe design specifications such as the appropriate load capacities that stairs must be able to support, minimum vertical clearances for different types of stairs, the height of risers, the depth of treads, and the proper angle of stairs. These requirements are not substantially different from the requirements of the existing standard; OSHA drew the requirements from NFPA and ANSI consensus codes, indicating that industry already adopted the requirements as a feasible industry practice using existing technology.

Dockboards (§ 1910.26)

Section 1910.26 provides for the safe movement of personnel and equipment on dockboards (defined in the final standard to include bridge plates and dock plates), and relocates, updates, and clarifies requirements for dockboards located in existing § 1910.30, Other working surfaces. The design, construction, and maintenance of these surfaces must be such as to support their maximum intended load and prevent transfer vehicles from running off the edge. According to final § 1910.26(c), employers must secure portable dockboards with anchors or other means, when feasible, to prevent displacement while in use. Other requirements in this section prevent the sudden displacement of vehicles on dockboards that are in use, and require handholds or other means for safe handling. Compliance with the final requirements for dockboards does not necessitate the use of any new technologies, materials, or production methods; thus, this section is technologically feasible.

Scaffolds and Rope Descent Systems (§ 1910.27)

Section 1910.27 introduces to subpart D the existing requirements for scaffolds in the construction standards. Thus, for final subpart D, OSHA directly references subpart L in 29 CFR part 1926. In addition, new requirements for rope descent systems will include inspection prior to each workshift; proper rigging; a separate personal fall arrest system; minimum strength criteria for lines used to handle loads; establishment of rescue procedures; effective padding for ropes; and stabilization for descents greater than 130 feet. In addition, final § 1910.27(b)(2) prohibits the use of rope descent systems for heights greater than 300 feet (91 m) above grade unless the employer can demonstrate that it is not feasible to access such heights by any other means or those other means pose a greater hazard than using RDS. Although new to subpart D, industry adopted these and other specifications for the safe use of scaffolds many years ago owing to the publication of ANSI I–14.1–2001, Window Cleaning Safety (Ex. 14), and a March 12, 1991, OSHA memorandum to Regional Administrators addressing the ANSI standard and the provisions listed above (Ex. OSHA–S029–2006–0662–0019). Therefore, OSHA judges the requirements in this new section on scaffolds to be technologically feasible.

Duty To Have Fall Protection and Falling-Object Protection (§ 1910.28)

Section 1910.28 restates, clarifies, and adds flexibility and consistency to existing OSHA requirements for providing fall protection to employees. In addition to general requirements for the strength and structural integrity of walking-working surfaces (with reference to § 1910.29, Fall and falling-object protection systems criteria and practices), this section of the final rule also includes detailed specifications on the following surfaces for which employers have a duty to provide fall protection:

- Unprotected sides and edges;
- Hoist areas;
- Holes;
- Dockboards;
- Runways and similar walkways;
- Dangerous equipment;
- Wall openings;
- Repair pits, service pits, and assembly pits less than 10 feet in depth;
- Fixed ladders (that extend more than 24 feet (7.3 m) above a lower level);
- Outdoor advertising (billboards);
- Stairways;
- Scaffolds and rope descent systems;
- Work on low-slope roofs;
- Slaughtering facility platforms; and
- Walking-working surfaces not otherwise addressed.

Hazards on walking-working surfaces can include accidental displacement of materials and equipment. To prevent objects from falling to lower levels and to protect employees from the hazards of falling objects, final § 1910.28(c) requires head protection and screens, toeboards, canopy structures, barricades, or other measures.

The final subpart D standards reaffirm the existing Agency interpretation and enforcement practice that fall protection is generally necessary for fall hazards associated with unprotected sides or edges of any surface presenting a fall hazard of four feet or more. In this regard, the obligation of employers to provide fall protection remains substantially unchanged from existing requirements in final subpart D.

Whereas the existing requirements specify that employers must protect employees by installing standard guardrail systems or equivalent systems, the final standard more clearly allows employers to provide fall protection through any of several methods, including guardrails, personal fall arrest systems, and safety nets. OSHA recognizes that some work surfaces may present difficult challenges for applying fall protection. One participant in the 1990 NPRM (Ex. OSHA–S041–2006–0666–0194) pointed out that maintenance work may require that employees be on equipment such as compressors, turbines, or pipe racks at elevations in the range of 4 to 10 feet above lower surfaces, and that guardrails, platforms, ladders, or tying off would not always be possible in such situations. In the current rulemaking for walking-working surfaces, the Sheet Metal and Air Conditioning Contractors National Association (SMACNA) (Ex. 165) appeared to express a similar concern with respect to the duty to provide fall protection in a manufacturing plant. OSHA notes that its enforcement procedures allow special consideration in unique circumstances when compliance with a particular standard may not be feasible or appropriate.[118]

In general, employers should be able to address and eliminate employee exposures to potential slip, trip, and fall hazards by planning and designing adequate facilities and work procedures. Based on widespread industry practice, OSHA concludes that the fall protection requirements specified by this section of the final standards are technologically feasible.

Fall Protection Systems and Falling-Object Protection—Criteria and Practices (§ 1910.29)

In § 1910.29, OSHA specifies or provides references for revised criteria for fall protection systems such as guardrail systems; handrails; stair rail systems; cages, wells, and platforms used with fixed ladders; toeboards; designated areas; travel restraint systems; safety net systems; grab handles; and fall protection for the outdoor advertising industry. Final § 1910.140, discussed at length below, provides criteria for personal fall protection systems that OSHA is adding to existing subpart I through this rulemaking.

With regard to guardrail systems (§ 1910.29(b)), the final subpart D standards do not substantially modify existing requirements involving height, strength, or other criteria. In some circumstances on low slope roofs for

[118] See OSHA's Field Operation Manual: *http://www.osha.gov/OshDoc/Directive_pdf/CPL_02-00-150.pdf.*

which the existing standard requires guardrails (or equivalent protection), the final standard allows employers to use designated areas.

Rather than explicitly requiring midrails in guardrail systems as in the existing subpart D standards, the final subpart D standards use performance-oriented criteria that allow midrails, screens, mesh, intermediate members, solid panels, or equivalent intermediate structural members. Compliance with the existing standards would generally also meet the requirements of the final standards. Furthermore, the final standard allows the employer to choose any of a wide variety of currently used and readily available guardrail system materials and designs to meet the performance-oriented criteria. Based on these considerations, the final subpart D requirements for guardrail systems are technologically feasible.

Final § 1910.29(c) references the construction standards to specify criteria for safety net systems. The criteria for safety nets established through this final rulemaking include requirements for drop tests and inspections for each safety net installation. Other criteria for safety nets established in final subpart D involve design and strength standards. Employers can achieve all of these criteria by using existing and commonly available safety net systems. The final requirements for installing safety net systems reflect basic safety considerations already adopted by manufacturers of equipment and by employers. Readily available and currently used technology is capable of meeting these requirements.

The final standard introduces the option of designated areas (see final § 1910.29(d)) as a means of fall protection available to employers, in addition to other acceptable fall protection measures in certain circumstances on low slope roofs. The technology necessary to implement this option consists of basic materials such as rope, wire, or chain, and supporting stanchions. Employers can achieve the strength, height, and visibility criteria specified in the final standard for designated areas with currently available materials and technology.

Requirements for covers for holes in floors, roofs, and other walking-working surfaces in the final standard (see final § 1910.29(e)) simplify and consolidate the proposed requirements for covers and now consist of two new provisions requiring that the cover: (1) Is capable of supporting without failure, at least twice the maximum intended load that may be imposed on the cover at any one time; and (2) Is secured to prevent accidental displacement. The performance-oriented criteria applicable to covers allow for the application of a wide variety of technological solutions.

Requirements in final subpart D for handrail and stair rail systems (§ 1910.29(f)) specify criteria for height, strength, finger clearance, and type of surface, among others. Employers currently meet these criteria with existing technology, and a wide variety of different materials and designs are available to comply with the requirements.

New requirements in final paragraph (g) of this section specify that landing platforms, as well as all platforms used with fixed ladders and cages and wells, provide a horizontal surface that meets specified dimensions are feasible considering the availability of appropriate materials and engineering expertise. Final § 1910.29(g) also sets criteria for ladder cages and wells, if used on fixed ladders. OSHA notes that the Agency is phasing out the use of cages and wells as a means of fall protection on fixed ladders. See full discussion in summary and explanation of § 1910.28(b)(9).

Final paragraph (h) includes requirements for qualifying employees to climb ladders on outdoor advertising that expire two years after publication of the final standard (see § 1910.28(b)(10)). After this two-year period, employers in outdoor advertising must provide one or more of the fall protection systems specified in § 1910.28 for employees who climb fixed ladders. Although new to subpart D, the training and other administrative controls that characterize the development and protection of those working without fall protection have been around for many years. Furthermore, evidence in the record indicates that some employers in outdoor advertising are now providing conventional fall protection for ladders (Ex. 369). Therefore, OSHA concludes that there will be few, if any, technological hurdles for industry to implement the provisions for qualified climbers before and after the two-year expiration date.

Final paragraph (i) establishes criteria and practice requirements for ladder safety systems permanently attached to fixed ladders or immediately adjacent to such ladders. A ladder safety system is a conventional fall protection system designed to eliminate or reduce the possibility of falling from a fixed ladder (see definition of ''ladder safety system'' in final § 1910.21(b)). According to this definition, it usually consists of the following:

- A carrier, which is a rigid or flexible track attached to or adjacent to the fixed ladder;
- A safety sleeve, which is moving component that travels on the carrier;
- A lanyard;
- Connectors; and
- A body harness.

Although the existing rule at § 1910.21(e)(13) addresses ''ladder safety devices,'' which serve the same purpose as ladder safety systems, the existing rule does not specify criteria or practice requirements for those devices. As a result, OSHA drew many of the proposed ladder safety system criteria and practice requirements from the construction ladder standard at § 1926.1053(a)(22) and (23). The construction standard allows the use of body harnesses or body belts with ladder safety systems. OSHA also drew ladder safety system criteria and practice from ANSI/ASC A14.3–2008. The Agency notes the national consensus standard does not include the use of body belts with ladder safety systems.

As noted above, the ladder safety system criteria and practice requirements in the final standard have been published in an OSHA construction standard and in a national consensus standard, and therefore any technological feasibility concerns for the range of structures encountered in general industry would very likely have been addressed in the proceedings that led to those publications. Therefore, OSHA concludes that the final requirements for ladder safety systems are technologically feasible.

Final paragraph (j), like the proposed rule, requires that body belts, body harnesses, and other components of personal fall arrest systems, work-positioning systems, and travel restraint systems, meet the applicable requirements in final § 1910.140. Employers currently meet these criteria with existing technology, and a wide variety of different materials and designs are available to comply with the requirements.

Final § 1910.29(k) clearly specifies criteria for systems that provide falling-object protection. OSHA redrafted the provisions in the existing standard addressing toeboards using specification language found in the OSHA construction standard (§ 1926.502(j)(3)) and with national consensus standards (ANSI/ASSE A10.18–2012 (Section 5.7), and ANSI/ASSE A1264.1–2007 (Section 4.1.5) while other requirements for guardrail systems and canopies specified in the design criteria are within current engineering norms. Therefore, OSHA concludes that the falling-object protection provisions are technologically feasible.

Lastly, final paragraph (l) contains design and strength criteria for grab handles. For the most part, these requirements are consistent with the requirements for grab handles in existing subpart D and are, therefore, technologically feasible.

Training Requirements (§ 1910.30)

Section 1910.30 introduces requirements specifying that employees receive training from a qualified person, and that the training, which applies to personal fall protection equipment, prepare employees to recognize fall hazards in the work area, in the procedures to follow to minimize these hazards, and in the installation, inspection, operation, maintenance, disassembly, and correct use of personal fall protection equipment. Employers also must train workers in the proper care, inspection, storage, and use of equipment subpart D covers before workers use that equipment, such as dockboards, RDS, and designated areas. Employers must retrain employees when changes occur in the workplace or in the types of fall protection systems or equipment used that renders the previous training obsolete or inadequate, or employees exhibit an absence of understanding or skill needed to use the equipment or perform the job safely; employers also must train employees in a manner the employees understand. Because of extensive evidence in the record that the training required under the final standard has widespread acceptance throughout industry (Exs. 53; 73; 96; 127; 172; 189; 205; 216; 222; 226; 329 (1/18/2011), pgs. 82, 117, 186, 258; 329 (1/19/2011), pgs. 22, 24; 329 (1/20/2011), pgs. 182, 287; 329 (1/21/2011), pgs. 9, 92, 200, 206; 364), such training will not present technological feasibility concerns.

2. Technological Feasibility for Final Subpart I (Personal Protective Equipment)

General Requirements (§ 1910.132)

Revised § 1910.132(g) of subpart I in this final rulemaking requires that employers conduct hazard assessments and training in accordance with the requirements in § 1910.132(d) and (f) in workplaces when employers provide personal fall protection equipment to employees. Survey data indicate that a significant percentage of employers currently assess the occupational fall hazards encountered by their employees, and that a similarly large percentage of employers train their employees in the proper use of personal fall protection equipment (OSHA, 1994). These hazard assessment and training requirements, therefore, will not present technological feasibility concerns.

Personal Fall Protection Systems (§ 1910.140)

The final subpart D standards include provisions for personal fall protection systems, including components such as harnesses, connectors, lifelines, lanyards, anchorages, and travel restraint lines. Section 1910.140 of subpart I specifies the criteria that these components must meet when employees use them.

The revisions to the walking-working surfaces and fall protection systems described in the final rule include revisions to several subparts in 29 CFR part 1910 other than subparts D and I. For purposes of this analysis, the determinations of technological feasibility described in this FEA include the revisions of these other subparts.

The requirements applicable to personal fall protection systems specified by this final rulemaking codify basic safety criteria for these systems. These criteria reflect common industry safety practices, and currently and readily available equipment meets these criteria. The final standards generally do not require changes in current technology or practices for employers who use standard safety equipment and follow standard safety procedures. The current and ready availability of personal fall protection systems, including personal fall arrest systems, positioning systems, and travel restraint systems, and the application of these technologies in diverse industrial activities and circumstances, demonstrate the technological feasibility of these requirements in the final standard.

3. Summary of Technological Feasibility

In conclusion, OSHA determined that compliance with the final revisions to subparts D, I, and other affected subparts of 29 CFR part 1910 is technologically feasible. Thus, there is no technological hindrance to the significant improvement of employee safety on walking and working surfaces resulting from implementation of this final rule.

F. Costs of Compliance

1. Introduction

This subsection presents OSHA's final analysis of the compliance costs associated with the final standard for walking-working surfaces and fall protection in general industry. Following discussion on the public comments addressing OSHA's preliminary estimate of compliance costs and OSHA's response to those comments, the cost analysis proceeds into a discussion of the assumptions used in the analysis. OSHA based its final analysis of compliance costs largely on the cost analysis conducted by OSHA's contractor, Eastern Research Group (ERG, 2007), and the Preliminary Economic Analysis. The presentation below focuses on what constitutes the regulatory baseline (*i.e.,* current conditions) from which OSHA measured the costs, impacts, and benefits of the final rule. The Agency also discusses the effect of consensus standards and the compliance rates for the existing rule on the cost analysis (*i.e.,* when codification of existing consensus standards results in little to no incremental costs for the final rule).

Following the discussion of baseline assumptions, the next subsection reviews the final rule on a paragraph-by-paragraph basis for those paragraphs that potentially could result in costs to industry. The final subsection examines one-time costs to bring employers into compliance with the rule, as well as the annual costs for training new employees and retraining existing employees. OSHA presents the cost estimates by affected industry, and by applicable provision. The final subsection concludes with a discussion and tables that summarize the costs for each section of the standard, and aggregates them to estimate total costs.

2. Public Comments on the Preliminary Cost Analysis

OSHA requested comment on the assumptions, unit costs, and analytical methods applied in the preliminary cost analysis for proposed subparts D and I. The discussion below summarizes the public comments addressing OSHA's preliminary cost analysis and OSHA's response to those comments.

The Sheet Metal and Air Conditioning Contractors National Association (SMACNA) was critical of OSHA's estimate of compliance costs, stating:

> A review of the anticipated costs indicates that OSHA has under-estimated the actual costs to employers to comply with the requirements of these rules. SMACNA encourages OSHA to conduct further outreach to employers to find the true costs associated with the revisions to company operations, purchasing equipment and conducting training that these proposed standards would require. With over 5 million small businesses affected by these requirements (OSHA's data), it is fair and prudent upon OSHA to outreach to these companies by convening a Small Business Regulatory Enforcement Fairness Act panel. (Ex.165, p. 5.)

With respect to the convening of a Small Business Regulatory Enforcement Fairness Act (SBREFA) panel, OSHA in the NPRM certified that the proposed standard would not have a significant impact on a substantial number of small firms, which satisfied the statutory requirements at the time OSHA published the NPRM. Other stakeholders who also requested that OSHA convene a SBREFA panel include the National Federation of Independent Businesses (Ex. 173) and the U.S. Chamber of Commerce (Ex. 202). With respect to SMACNA's assertion that OSHA underestimated compliance costs, SMACNA did not provide any further details to support its statement, and, therefore, OSHA has no basis to evaluate the criticism.

ORC HSE Networks, a division of Mercer LLC, expressed concerns about the proposed requirement, found in § 1910.29(b)(1), that the top edge of guardrail systems be 42 inches (107 cm), plus or minus 3 inches (8 cm), above the walking-working surface. Mercer's comment reads as follows:

> In a footnote on page 28894 of the May 24 notice of proposal, OSHA stated that it decided not to include existing guardrails having top edges as low as 36 inches from the working surface in any of the ''grandfathering'' provisions of this rule despite such a provision having been included in the previous proposals and acknowledged as a ''de minimis'' violation of the existing standard in various OSHA letters of interpretation. While OSHA states that it does not consider 36 inches to be ''equally safe'' to the ''42 inches nominal'' requirement in the existing standard or the 42 inches plus or minus three inches in the proposed rules, OSHA provided no rationale or support for this proposed decision.
>
> OSHA's economic and benefits analyses should estimate the number of injuries that would be prevented if existing guardrails that have heights between 36 and 39 inches must be replaced with those having at least a 39-inch height. In addition, OSHA should determine the costs that will be associated with replacing guardrails with top edge heights between 36 and 39 inches and include them in the regulatory and economic feasibility analyses for these rules. Clearly, if people have been writing to OSHA to ask about guardrails that are less than the ''42 inches nominal'' in the existing rule, there are likely to be significant numbers of workplaces that have these non-standard guardrails in place. OSHA should either quantify the benefits and costs of this rule change or grandfather those guardrail installations that occurred prior to the effective date of the new rules. Only new or remodeled facilities should be required to follow the new requirement for top edge height of guardrails. (Ex. 170, p. 6.)

As noted in the NPRM (75 FR 28894), the proposed provision for the height of guardrail systems was essentially the same as the existing requirement in § 1910.23(e)(1). Despite proposed grandfathering of guardrails with heights as low as 36 inches (above the working surface) under the two previous proposals (1973 and 1990), OSHA believes that in the 40 or so years since it issued the existing standard, a large percentage of the walking-working surfaces protected by guardrails are in compliance with the 39-inch minimum-height standard. In the absence of data in the record on the range of heights of guardrails throughout industry, OSHA believes that the percentage of guardrail systems not meeting the minimum height requirement is low. Therefore, if OSHA's belief is correct, the additional cost burden and economic impacts for employers not in compliance with the final height requirement would be relatively insubstantial and, therefore, would not present economic feasibility concerns.

Corporate Cleaning Services, a leading window washing company in Chicago, urged OSHA to consider the economic ramifications of limiting the permitted distance when using rope descent systems (RDS) to 300 feet (Ex. 126). In written testimony, Corporate Cleaning Services stated that the use of suspended scaffolds could add up to 30 percent to the time required to complete a job compared with RDS. By comparison, in a post-hearing comment, Valcourt Building Services estimated that the cost increase would range from 10 to 20 percent if it had to use a permanent scaffold installation as an alternative to RDS (Ex. 358). In response to these comments, OSHA in this FEA estimated the costs and economic impact of the 300-foot distance limitation for RDS specified in the final rule. OSHA discusses the revised cost estimate below under § 1910.27, Scaffolds and rope descent systems.

Charles Lankford of Rios & Lankford Consulting International argued that OSHA's requirement, under the paragraph for general conditions, that walking-working surfaces be designed, constructed, and maintained free of recognized hazards would impose legal responsibilities, and hence, legal costs, on employers that OSHA neglected in the PEA. Mr. Lankford stated:

> My review of the risk-benefit analysis in the proposed rule did not find that OSHA considered the costs of defending from citations being issued after the collapse of a surface the employer did not have tested or evaluated by an engineer after a plant purchase, that might have resulted in a fatality. It is reasonable to expect that litigation costs arising from new regulations should be included in an estimate of costs, when conducting a risk-benefit analysis.
>
> OSHA does not seem to have considered all the ramifications, or having considered them, opted to leave them in a grey area so as to more broadly enforce these provisions to the detriment of employers. (Ex. 368.)

OSHA agrees with Mr. Lankford that the failure of employers to exercise due diligence in ensuring the safety of workers on surfaces could result in torts and other legal expenses. However, the probability of legal liability will diminish to the extent that employers expend the resources necessary to achieve compliance with more stringent fall protections.

In a comment to the record and testimony at the public hearing, the National Chimney Sweep Guild (NCSG) expressed concerns about the costs and economic feasibility of compliance with the proposed standard for the businesses performing chimney-cleaning services and other related work on residential roofs (Exs. 150; 296; 329 (1/18/2011), p. 342; 365). The following post-hearing comment summarizes the views voiced by NCSG throughout the rulemaking:

> If adopted and enforced as proposed, the provisions of the Proposed Rule that address the structural integrity and condition of walking-working surfaces, the use of ladders, and the selection and use of fall protection would: (1) substantially affect the manner in which chimney sweeps perform their work; (2) expose sweeps (and/or the roofing trade) to greater hazards than current industry practices; (3) threaten the continuing economic viability of the chimney sweeps industry; and (4) threaten the availability of chimney inspection, sweeping and repair services at affordable prices, which would be expected to result in less chimney inspections/sweeping/repairs and a significant increase in residential fires and/or an increase in falls by homeowners or other self-employed individuals who would perform these tasks. (Ex. 365, pp. 2–3.)

Below under the heading ''Cost estimates'' and in section H, Regulatory Flexibility Screening Analysis, OSHA addresses NCSG's concerns.

3. Cost Assumptions

a. Baseline for Estimating Costs

The Office of Management and Budget's guidance on regulatory analysis (OMB, 2003) discusses how to develop a baseline against which to measure the costs and benefits of a rule. The baseline should be the best assessment of conditions absent the proposed standard, and is frequently assumed to resemble the present practice broadly observed among affected employers (although the more technically correct approach from a benefit cost analysis viewpoint, where feasible, is to project the hypothetical future state of the world in the absence of the rule). The baseline for this final cost analysis, then, includes rates of compliance with existing subparts D and I, as well as with applicable national consensus standards. For a discussion on the theoretical underpinnings for the use of consensus standards as a baseline in OSHA's cost analysis, see ERG, 2007.

OSHA analyzed Agency inspections for fiscal year 2005 that resulted in a citation (OSHA, 2006a); see Table V–15. The first column in the table presents cases for which OSHA issued a citation for any reason, and the other columns in the table indicate cases of non-compliance with a section of 29 CFR part 1910, subpart D. Table V–15 may overstate the noncompliance rate because it does not include inspections for which no citations were issued.

Source: ERG, 2007, based on analysis of OSHA's Integrated Management Information System inspection database (OSHA, 2006a).

Based on the analysis presented in Table V–15, OSHA determined that upper-bound non-compliance rates for floor-guarding requirements in current § 1910.23 vary by industry. For example, the Finance, Insurance, and

Real Estate category has the lowest non-compliance rate (2.8 percent), while Wholesale Trade has the highest non-compliance rate (13.6 percent). For the requirements for fixed industrial stairs, the non-compliance rates are quite low, ranging from 0 percent (Finance, Insurance, and Real Estate) to 2.7 percent (Wholesale Trade). For the remaining sections (portable wood ladders, portable metal ladders, fixed ladders, scaffolding, and manually propelled mobile ladder stands and scaffolds), non-compliance rates do not exceed 1.9 percent.

Thus, for §§ 1910.25 through 1910.29, the assumption of 100 percent industry compliance with the existing requirements may be reasonable.[119] That is, employers will incur costs only when the final requirements exceed the existing requirements. OSHA requested comments on rates and levels of non-compliance with respect to existing requirements in subpart D, but received no comments; therefore, OSHA applied the preliminary compliance estimates for existing subpart D in this FEA.

If meeting an existing requirement also would meet the final requirement, OSHA did not assign costs to the provision. For example, the existing language for § 1910.27(b)(1)(iii) states that the clear length of a rung or cleat in a fixed ladder shall be a minimum of 16 inches. Final § 1910.23(b)(4)(iii) states that rungs and steps on rolling ladders used in telecommunication centers must have a minimum clear step or rung width of 8 inches (20 cm). A rolling ladder in telecommunications that meets existing requirements (16 inches) would also meet the new requirements (a minimum of 8 inches); hence, OSHA assigned no costs to the final requirement. Later in this cost analysis, a detailed provision-by-provision examination of potential costs will provide further concrete examples of OSHA's application of estimates of current industry compliance and practices.

[119] OSHA implicitly considered the costs for all industrial sectors to meet the existing standards when it published those standards.

b. Compliance With National Consensus Standards

In some instances, the final rule's provisions reflect existing national consensus standards, and OSHA used information on adherence to those standards to estimate compliance rates with the concerned provisions. Due to general adherence to national consensus standards, for purposes of this analysis, national consensus standards serve as the ''baseline'' against which OSHA measured the incremental costs and benefits of the final standard. If the final standard requires a level of safety equivalent to that in an existing consensus standard, then there is no difference between the final standard and the baseline except that the final standard would be mandatory rather than voluntary. Thus, the costs are those costs associated with the change from a voluntary standard to a mandatory standard. In such cases, OSHA assumes employers in compliance with the voluntary consensus standard incur no additional costs to meet the final rule's requirements. Only that part of the employer population that currently does not comply with the voluntary standards would incur these costs. If, however, the final standard is more stringent than the consensus standard, OSHA assumed that employers who are not already following practices that would constitute compliance with the final standard would incur compliance costs solely attributable to the final OSHA standard.

ERG developed a logic-flow diagram outlining the process for identifying costs associated with new regulatory language (see ERG, 2007, Figure 3–2). The starting point is a side-by-side, provision-by-provision comparison of the existing and final regulatory language. In many cases, the language changed to enhance comprehension of the regulation without changing the scope of activities covered or its requirements. In some cases, the final language gives the employer alternative methods of compliance that provide protection for employees equivalent to the original standard, thereby resulting in *no* costs to the employer.

If there is a change from the existing to the final standard, the second decision point is to determine whether the final standard is equivalent to an existing consensus standard. If it is, then there would be no costs associated with the final standard for those employers already meeting the consensus standard, but there would be costs for those employers currently not meeting the consensus standard.

Table V–16 lists the national consensus standards used in subparts D and I and the associated section of the final rule for subparts D and I that refer to each of these consensus standards.

Table V-16
Final Subpart D Requirements and Associated National Consensus Standards

Subpart D Section	National Consensus Standard
§1910.22 General Requirements	ANSI/ASSE A1264.2-2012, Standard for the Provision of Slip Resistance on Walking/Working Surfaces.

At the next decision point, if the final standard differs from the existing requirements, the presence or absence of a ''grandfather'' provision determines whether employers incur costs to retrofit and upgrade to the new requirements when the standard becomes effective or when employers replace infrastructure or equipment at a time of their choosing. OSHA discusses the cost effects of grandfather provisions in more detail below and in the ERG report (ERG, 2007).

Some equipment addressed by the final standard, such as portable ladders or mobile ladder stands, is commercially available to employers in ready-to-use condition. OSHA believes that manufacturers design and fabricate such equipment, in virtually all cases, to meet current consensus standards because equipment manufacturers seek to avoid: (1) The small market represented by employers that would purchase non-compliant equipment, and (2) the liabilities associated with manufacturing non-compliant equipment.

Typically, employers use architects, engineers, and/or contractors to design, fabricate, and install certain types of site-specific equipment. While it is conceivable that an employer might insist on installing nonconforming equipment, OSHA believes that professional standards for architects and engineers, local building codes, and potential liability concerns dictate that virtually all employers voluntarily use equipment conforming to existing national consensus standards. For these reasons, OSHA concludes that compliant equipment will be available to meet the final requirements of subparts D and I. For example, final § 1910.23(b)(1) specifies that ladder rungs and steps must be parallel, level, and uniformly spaced when the ladder is in a position for use. While existing § 1910.25(c)(2)(i)(b) covers steps, no existing OSHA standard covers rungs. However, current national consensus standards cover both rungs and steps (see Table V–16).

Likewise, the spacing requirements for the steps of step stools and the rungs, steps, and cleats of ladders covered by final paragraphs § 1910.23(b)(3) and (4) are new (*i.e.,* not in the existing standard); however, the current consensus standard for ladders includes these spacing requirements. Similarly, final § 1910.23(d)(7) requires that grab bars on fixed ladders extend 42 inches (1.1 m) above the access level or landing platform served by the ladder. While the existing standard does not have a similar provision, the provision is in the ANSI 14.3–2008 standard for fixed ladders. Therefore, OSHA did not assign costs to final § 1910.23(d)(7).

In conclusion, for establishing a baseline, OSHA assumed that equipment and work practices met the national consensus standard in effect at the time of installation, and did not estimate costs when the provisions in the final standard and the current national consensus standards were equivalent. For additional analysis of the interface between national consensus standards and OSHA standards, see ERG, 2007, pp. 3–6 and 3–14.

c. Compliance Using the Least-Cost Method

Consistent with past practice, OSHA assumed that employers would meet a regulatory requirement by choosing the least expensive means to do so. For example, under final § 1910.28(b)(1), an employer can meet the duty to have fall protection for an employee on a walking-working surface with an unprotected side or edge by using: (A) Guardrail systems, (B) safety net systems, or (C) personal fall protection systems such as personal fall arrest, travel restraint, or work-positioning systems. If (A)–(C) are not feasible or create a greater hazard for residential roofing work, the final standard permits a fourth option, *i.e.,* developing and implementing a specified fall protection plan. The existing standard only specifies options (A)–(C); therefore, OSHA assigned no costs to § 1910.28(b)(1) except when there were ambiguities in the scope of the existing standard, such as its application to loading docks or teeming platforms.

In some cases, when the final rule gives an employer a lower-cost compliance option than is currently available, the employer could realize a cost savings. However, OSHA did not estimate such savings in this analysis.

d. No Costs Due to Grandfathering Provision

Table V–17 lists the paragraphs in the final standard with new requirements, but which also have a ''grandfather'' provision for existing conditions. A grandfather provision exempts equipment that currently is in place from requirements that strengthen or upgrade the safety features of the equipment. Therefore, employers do not incur costs associated with modifying or replacing equipment covered by these paragraphs.

Table V-17
Paragraphs in Final Subpart D with Grandfather or Delayed-Implementation Provisions

Paragraph	Subject
§1910.24(a)(1)	The employer must ensure that step bolts installed on or after January 17, 2017 in an environment where corrosion may occur are constructed of, or coated with, material that protects against corrosion.
§1910.24(a)(7)	The employer must ensure that step bolts installed on or after January 17, 2017 are capable of supporting at least four times their maximum intended load.
§1910.24(b)(1)	The employer must ensure that manhole steps are capable of supporting their maximum intended load.
§1910.24(b)(2)	The employer must ensure that manhole steps installed on or after January 17, 2017: (i) Have a corrugated, knurled, dimpled, or other surface that minimizes the possibility of an employee slipping; (ii) are constructed of, or coated with, material that protects against corrosion in an environment where corrosion may occur; (iii) have a minimum clear step width of 10 inches (25 cm); (iv) are uniformly spaced at a vertical distance not more than 16 inches (41 cm) apart, measured center to center between steps. The spacing from the entry and exit surface to the first manhole step may differ from the spacing between the other steps; (v) have a minimum perpendicular distance between the centerline of the manhole step to the nearest permanent object in back of the step of at least 4.5 inches (11 cm); and (vi) are designed, constructed, and maintained to prevent the employee's foot from slipping or sliding off the end.

Table V-17
Paragraphs in Final Subpart D with Grandfather or Delayed-Implementation Provisions (continued)

Paragraph	Subject
§1910.25(b)(5)	The employer must ensure that, when a door or a gate opens directly on a stairway, a platform is provided, and the swing of the door or gate does not reduce the effective usable depth to: (i) Less than 20 inches (51 cm) for platforms installed before January 17, 2017; and (ii) less than 22 inches (56 cm) for platforms installed on or after January 17, 2017.
§1910.26(b)	The employer must ensure that dockboards put into service on or after January 17, 2017 are designed, constructed, and maintained to prevent transfer vehicles from running off the dockboard edge. Exception: When the employer demonstrates there is no hazard of transfer vehicles running off the dockboard edge, the employer may use dockboards that do not have run-off protection.
§1910.28(b)(9)	The employer must ensure: (A) Existing fixed ladders. Each fixed ladder installed before November 19, 2018 is equipped with a personal fall arrest system, ladder safety system, cage, or well; (B) New fixed ladders. Each fixed ladder installed on or after November 19, 2018, is equipped with a personal fall arrest system or a ladder safety system; (C) Replacement. When a fixed ladder, cage, or well, or any portion of a section thereof, is replaced, a personal fall arrest system or ladder safety system is installed in at least that section of the fixed ladder, cage, or well where the replacement is located; and (D) Final deadline. On and after November 18, 2036, all fixed ladders are equipped with a personal fall arrest system or a ladder safety system.
§1910.29(f)(1)(ii)	The employer must ensure: (A) The height of stair rail systems installed before January 17, 2017 is not be less than 30 inches (76 cm) from the leading edge of the stair tread to the top surface of the top rail; and (B) the height of stair rail systems installed on or after January 17, 2017 is not less than 42 inches (107 cm) from the leading edge of the stair tread to the top surface of the top rail.

4. Cost Impacts for Final Subparts D (Walking-Working Surfaces)

This subsection provides a brief paragraph-by-paragraph review of the final rule. OSHA took a two-step approach to determining the cost impacts of the final rule. First, the Agency looked at requirements that represent changes from the existing walking working surfaces and personal protective equipment standards to determine whether they might involve additional incremental costs. That analysis is described in this subsection and subsection 5. In subsection 6, ''Cost Estimates,'' OSHA discusses how it reached an estimate of the costs for each provision OSHA identified as involving additional costs.

Table V–18 summarizes the paragraphs in the final subparts D and I that represent changes from the existing standards and might result in costs to employers if current industry practice falls short of the requirements of the rule. In the PEA, these costs primarily involved inspection and training; for this FEA, OSHA also identified significant costs for engineering and administrative controls and personal protective equipment. For the purpose of this analysis, OSHA distinguished between informal and formal training. For example, final § 1910.23(b)(11) states that an employee must face the ladder when ascending or descending. For this provision, OSHA assumed that employers provide such instruction on an in-house basis (*e.g.,* ''on-the-job'' training), using materials such as OSHA training videos. When employers deliver training on an ongoing, less formal basis, OSHA did not assign a tracking or recordkeeping cost to it. However, as indicated in the table, OSHA attributed employer costs (and employee benefits, as discussed later in this FEA) to such provisions, where OSHA judged that additional training would be required beyond baseline practice.[122] When the regulatory text uses the words ''trained'' or ''training,'' OSHA assumed that employers would deliver the instruction on a more formal basis, possibly hiring a contractor to deliver the training. OSHA assumed that an employer would maintain documentation of all formal training and, thus, assigned a cost for this administrative task.

[122] See the discussion later in this section and Ex. [OSHA Excel Workbook], tabs one_time_23 and annual_23, for details on the training costs attributed to the final requirements for ladders under § 1910.23(b) and (c).

Table V-18
Paragraphs of the Final Standards for Subparts D and I Evaluated Further for Cost Impacts

Paragraph	Subject
§1910.22(b)	The employer must ensure that each walking-working surface can support the maximum intended load for that surface.
§1910.22(d)(1)	The employer must inspect walking-working surfaces regularly and as necessary, and maintain them in a safe condition.
§1910.22(d)(2)	The employer must correct and repair any hazardous conditions on walking-working surfaces before employees use the surfaces. If the employer cannot make the correction or repair immediately, then they must guard the hazardous conditions to prevent employees from using the surfaces until the hazard is corrected or repaired.
§1910.22(d)(3)	The employer must ensure that a qualified person performs or supervises any correction or repair that involves the structural integrity of the walking working surface.
§1910.23(b)(11)	The employer must ensure that when ascending or descending a ladder, the employee faces the ladder. [This is a training requirement.]
§1910.23(b)(12)	The employer must ensure that each employee uses at least one hand to grasp the ladder when progressing up and down the ladder. [This is a training requirement.]
§1910.23(b)(13)	The employer must ensure that an employee climbing up or down a ladder must not carry any object or load that could cause the employee to lose balance and fall. [This is a training requirement.]
§1910.23(c)(5)	Employers may not use portable, single-rail ladders. [This is a training requirement.]
§1910.23(c)(6)	The employer must ensure that ladders are not moved, shifted, or extended while occupied by employees. [This is a training requirement.]
§1910.23(c)(9)	The employer must ensure that ladders used on slippery surfaces are secured and stabilized. [This is a training requirement.]
§1910.23(c)(10)	The employer must ensure that both rails support the top of non-self-supporting ladders, unless the ladder is equipped with a single support attachment. [This is a training requirement.]
§1910.23(c)(11)	The employer must ensure that the side rails of a ladder used to access an upper landing extend at least 3 feet above the landing surface. [This is a training requirement.]
§1910.23(e)(1) – (e)(3)	The employer must ensure mobile ladder stands and platforms meet requirements for such design specifications as step width, load capacity, work surface height, and the provision of stair handrails.

Table V-18
Paragraphs of the Final Standards for Subparts D and I Evaluated Further for Cost Impacts (continued)

Paragraph	Subject
§1910.23(e)(1)(viii)	The employer must ensure that mobile ladder stands and platforms are not moved when occupied by an employee. [This is a training requirement.]
§1910.24(a)(8)	The employer must inspect[123] each step bolt at the start of the workshift and maintain the step bolts in accordance with §1910.22.
§1910.24(b)(2)(i)	The employer must provide manhole steps with slip resistant surfaces.
§1910.24(b)(2)(ii)	The employer must provide manhole steps that are protected against corrosion
§1910.24(b)(2)(vi)	The employer must ensure that manhole steps are designed, constructed, and maintained to prevent the employee's foot from slipping or sliding off the end of the manhole step.
§1910.24(b)(3)	The employer must inspect[124] each manhole step before each workshift and maintain the steps in accordance with §1910.22.
§1910.27(b)(2)(iii)	The employer must ensure that employees who use rope descent systems receive training in accordance with §1910.30.
§1910.27(b)(2)(iv) and (b)(2)(v)	The employer must ensure that rope descent systems used by employees are inspected at the start of each workshift and have proper rigging, including anchorages and tiebacks.
1910.28(b)(1)	Employee must be protected while working on a surface with an unprotected side or edge from falling 4 feet (1.2 m) or more to a lower level.
§1910.28(b)(4)(i)	The employer must install guardrails or handrails on dockboards.
§1910.28(b)(9)(i)(A)-(D)	Employers must ensure that existing, new, and replaced ladders and ladder sections are equipped with the specified fall protection systems, cages, or wells (depending on implementation date, cages and wells may not be considered fall protection systems).
§1910.28(b)(10)(ii)(A)	The employer must ensure that each employee who climbs fixed ladders on billboards receives the training and demonstrates the physical capability to perform the necessary climbs in accordance with §1910.29(h).

[123] The requirement in the proposed standard that step bolts be "visually inspected" was revised in the final standard to read that step bolts be "inspected."

[124] The requirement in the proposed standard that manhole step be "visually inspected" was revised in the final standard to read that manhole steps be "inspected."

Table V-18
Paragraphs of the Final Standards for Subparts D and I Evaluated Further for Cost Impacts (continued)

Paragraph	Subject
§1910.28(b)(10)(ii)(C)	The employer must ensure that employees have both hands free of tools or material while ascending or descending fixed ladders on billboards. [This is a training requirement.]
§1910.28(b)(13)	The employer must protect employees from falls on low slope roof by using a guardrail systems, safety net system, travel restraint system, personal fall arrest system, or designated area .
§1910.28(b)(14)(i)	The employer must protect employees on slaughtering facility platforms falling 4 feet or more by using: (A) Guardrail systems; or (B) Travel restraint systems.
§1910.28(b)(15)	The employer must protect employees from fall hazards on surfaces not otherwise addressed through guardrails, safety net systems, or personal protection systems.
§1910.29(b)(15)	The employer must inspect top rails or midrails made of manila or synthetic rope to ensure the rope continues to meet strength requirements
§1910.29(h)(1)	Employers must determine, through observation of actual climbing activities or by physical examination, that each employee who climbs a fixed ladder in outdoor advertising operations is physically capable of performing the assigned duties.
§1910.29(h)(2)	Employers must train, and retrain as necessary, employees to safely climb fixed ladders in outdoor advertising operations.
§1910.30(a)	The employer must provide training for each employee who uses personal fall protection systems or who requires training as specified elsewhere in the standard before exposing the employees to fall hazards.
§1910.30(b)	The employer must train each employee on the proper: care, inspection, storage, and use of equipment covered by the standard before the employee uses the equipment such as dockboards, rope descent systems, and designated areas.
§1910.30(c)	The employer must retrain an employee when the employer has reason to believe that the employee does not have the understanding and skills required by paragraphs (a) and (b) of §1910.30.
§1910.132(d)	The employer must conduct a hazard assessment of the workplace to determine the need for personal fall protection equipment; select, and have affected employees use, the requisite personal fall protection equipment; communicate the selection decisions to each affected employee; select equipment that fits the affected employees properly; and verify in writing that the hazard assessment was performed.

Table V-18
Paragraphs of the Final Standards for Subparts D and I Evaluated Further for Cost Impacts (continued)

Paragraph	Subject
§1910.132(f)	The employer must provide training to each employee who is required to use fall protection equipment.
§1910.140(c)(18)	The employer must inspect personal fall protection systems before their initial use each workshift for mildew, wear, damage, and other deteriorations, and remove defective systems from service.

Source: U.S. Department of Labor, OSHA, Directorate of Standards and Guidance, Office of Regulatory Analysis-Safety.

Finally, three requirements in the standard specify that employers must provide training in accordance with § 1910.30 or the equivalent:

- § 1910.27(b)(2)(iii): Rope descent systems;
- § 1910.28(b)(1)(ii)(C): Unprotected sides and edges; and
- § 1910.28(b)(4)(ii)(C): Dockboards.

The costs for § 1910.30 include the costs for the three paragraphs listed above.

In the following subsection, organized by regulatory provision, OSHA discusses the potential cost implications of the new requirements. OSHA described earlier in this cost analysis final changes to the existing standard that likely will result in little or no costs; OSHA does not address these changes in the discussion below.

General Requirements (§ 1910.22)

§ 1910.22(b). This provision specifies general requirements, one of which is that employers must ensure that the walking-working surface has the strength to support employees safely. From the standpoint of compliance costs, OSHA believes that employers can meet this requirement by performing a 5- to 10-minute inspection of the surface or reviewing engineering diagrams of the structure. In rare circumstances, an employer might need to spend 15 to 30 minutes determining if the work can proceed. OSHA discusses the costs for this provision later in this subsection in connection with the duty to inspect walking-working surfaces as part of the general requirements specified under § 1910.22(d) (see ''Cost estimates'' below).

§ 1910.22(c). The employer must provide employees with, and ensure that they use, a safe means of access to, and egress from, one walking-working surface to another. The language in existing § 1910.22(b) specifies that employers must keep aisles and passageways clear, in good repair, and with no obstruction across or in the aisles that could create a hazard to employees. For the PEA, OSHA generalized the terms ''aisles'' and ''passageways'' in proposed § 1910.22(c) to cover all means of access and egress. The terminology in the proposed rule was consistent with that in a National Fire Protection Association consensus standard (NFPA 101). Thus, OSHA assigned no costs to proposed § 1910.22(c) in the PEA and, with no comment in the record objecting to that decision, OSHA assigned no costs to § 1910.22(c) in this FEA.

§ 1910.22(d). This new provision sets forth requirements for the employer to inspect regularly and as necessary, and maintain in a safe condition, walking-working surfaces; guard hazardous conditions to prevent employee use until the employer corrects or repairs the hazard; and have a qualified person inspect perform or supervise any correction or repair work that involves the structural integrity of a walking-working surface. OSHA considered the costs for these safe work practices below under ''Cost estimates'' (for the duty to have fall protection; § 1910.28).

Ladders (§ 1910.23)

§ 1910.23(a). This paragraph specifying the application final standard covers all ladders, except when the ladder is used in emergency operations such as firefighting, rescue, and tactical law enforcement operations, or training for these operations or designed into or is an integral part of machines or equipment. Special wood ladders specifically excluded in the existing standard, including fruit picker's ladders, combination step and extension ladders, stockroom step ladders, aisle-way step ladders, shelf ladders, and library ladders are now included under the final standard. In the PEA, OSHA assumed that these ladders met consensus standards for wooden ladders (see Table V–16) and, therefore, OSHA expected that employers would incur no costs with the expanded application. After reviewing the record, OSHA reached the same conclusion for this FEA.

Final § 1910.23(b)(4) specifies a minimum clear rung, step, or cleat width of 11.5 inches for portable ladders and 16 inches for fixed ladders; thus, the distance from the centerline to the inside edge of the ladder ranges from roughly 6 to 8 inches. Adding the existing requirement of 2.5 inches from the nearest edge of the ladder to the nearest edge of the structure or equipment to the 6- to 8-inch centerline width required by the final standard results in a step-across width of 8.5 to 10.5 inches for the purposes of the final standard. Thus, any fixed ladder that meets the existing requirements also meets the final requirements. OSHA assigned no costs to this paragraph in the PEA. Therefore, absent comment by the public or any other evidence in the record that would alter this preliminary assessment, the Agency assigned no costs for this paragraph in this FEA.

§ 1910.23(b)(4)(iii). This paragraph concerns rolling ladders in communications centers, which OSHA moved to this final rule from existing § 1910.268(h)(5), Telecommunications. Thus, as this is not a new requirement, it has no costs.

§ 1910.23(b)(4)(iv). This paragraph is a new requirement that addresses the minimum clear width for stepstools, which OSHA defines as a type of portable ladder (§ 1910.21(b)). The final rule specifies that stepstools must have a minimum clear width of at least 10.5 inches instead of the 11.5-inch minimum clear width that the final rule requires for other portable ladders. Although OSHA did not receive any comments on this issue, the Agency

added this provision to make the rule consistent with ANSI/ALI national consensus standards for wood and metal portable ladders (A14.1–2007 and A14.2–2007). OSHA assigned no costs to this paragraph in the PEA, and absent comment by the public or any other evidence in the record that would alter this preliminary assessment, the Agency assigned no costs for this paragraph in this FEA.

§ 1910.23(b)(9). Both the existing and proposed standards had a requirement to inspect ladders before use. In the PEA, OSHA determined that the inspection frequency would not increase under the proposed standard. Therefore, OSHA concluded that employers would incur no additional costs associated with this requirement and, after reviewing the record following publication of the NPRM, reached the same conclusion for this FEA.

§ 1910.23(b)(11)–(13); § 1910.23(c)(5) and (6) and (9)–(11). These eight paragraphs include instructions to employees on the proper use of ladders. Final § 1910.23(c)(5) prohibits the use of single rail ladders, which OSHA finds is a training requirement. The wide availability of permitted ladders means that there are no equipment costs associated with this prohibition. In the PEA, OSHA also concluded that training would cover the other six provisions, and reached the same conclusion for this FEA. OSHA considered training costs below under ''Cost estimates.''

§ 1910.23(c)(12) and (13). These provisions state that employers are not to tie or fasten ladders and ladder sections together to provide added length unless the design of the ladders permits such use, nor are employers to place ladders on boxes, barrels, or other unstable bases to obtain additional height. These provisions are essentially identical to current paragraphs §§ 1910.25(d)(2)(v) and 1910.26(c)(3)(vi), which specify that neither wood nor metal portable ladders may be spliced, tied, or fastened together or elevated on unstable surfaces to create a longer section or higher reach unless the manufacturer has designed the equipment for such a purpose. These provisions, both in the existing and final standards, might cause employers to incur a cost if it is necessary to purchase longer ladders, or ladders that they can fasten together. During the comment period, OSHA received no data estimating the frequency of such occurrences but, presumably, they are rare. Thus, OSHA did not assign a cost to these paragraphs in this final analysis.

§ 1910.23(d)(1). As proposed, fixed ladders installed 90 days after the effective date of the final standard must be capable of supporting two live loads of at least 250 pounds each, additional concentrated loads of 250 pounds each, plus anticipated loads caused by ice build-up and other conditions. Each rung must be capable of supporting at least a single concentrated load of 250 pounds. The language in this proposed requirement reflected the consensus standard in ANSI A14.3–2002. The language in the existing standard, however, specifies a single concentrated load of 200 pounds.

As discussed earlier in this preamble, OSHA removed paragraph (d)(2) of the proposed rule from the final rule because OSHA believes that the performance criteria specified in final § 1910.23(d)(1) provide an adequate level of safety for employees. Therefore, because paragraph (d)(1) reflects industry practice as documented in ANSI A14.3–2002, there are no costs associated with this provision.

§ 1910.23(d)(12)(i). This final provision requires that employers measure ''step-across distance'' from the centerline of the steps or rungs of a fixed ladder. The existing definition measures step-across distance from the nearest edge of the ladder to the nearest edge of the structure or equipment. The minimum distance under the final standard is 7 inches, and under the existing standard it is 2.5 inches; the maximum distance in the final standard is 12 inches, identical to the current standard. OSHA assigned no costs to this paragraph in the PEA and, although the minimum step-across distance in the proposed standard differed significantly from that in the current standard, no commenters objected to the proposed expansion in minimum step-across distance. Therefore, OSHA assigned no costs to this provision in this FEA.

§ 1910.23(d)(12)(ii). The final standard specifies that the step-across distance from the centerline of the steps or rungs of a fixed ladder to the access point of the platform edge for side-step ladders must be not less than 15 and not more than 20 inches. Based on Figure D–10 in the existing standard, the maximum space from the edge of the ladder to the platform (*i.e.,* access point) is 12 inches. As noted in the previous paragraph, the centerline width for a fixed ladder ranges from roughly 6 to 8 inches. The total step-across distance under the existing standard ranges from 18 to 20 inches. Thus, a fixed ladder that meets the existing requirements also meets the final requirements. Therefore, OSHA assigned no costs to this paragraph in the PEA and OSHA assigned no costs to this provision in this FEA.

§ 1910.23(e). Paragraph (e)(1)(viii) (which impede or prohibit moving occupied mobile ladder stands and platforms) are the only paragraphs in this provision that do not have a corresponding requirement in a national consensus standard. However, these are work practice requirements that employers can meet through ladder safety training and enforcement. See the subsection titled ''Cost estimates'' below.

All other provisions in § 1910.23(e) meet the national consensus standard in the ANSI A14 series. An analysis of fiscal year 2005 OSHA inspection data for violations of existing subpart D indicate that the failure to provide safe ladders is low (*e.g.,* 0.2 percent of the violations were for portable wood ladders, 0.4 percent were for metal ladders, and 0.8 percent were for fixed ladders). Based on these data, OSHA infers that there is nearly 100 percent compliance with the provisions of the current consensus standards. Therefore, OSHA assigned no costs for equipment upgrades required by these paragraphs. However, OSHA assigned costs for the time it would take to ensure new ladders meet the technical specifications found in § 1910.23(e); see ''Cost estimates'' below.

Step Bolts and Manhole Steps (§ 1910.24)

The requirements for step bolts are new to subpart D. In the preliminary regulatory impact analysis for the 1990 proposed rule, OSHA noted, ''Manufactured products, such as ladders, step bolts, manhole steps . . . generally meet or exceed proposed OSHA specifications'' (OSHA, 1990a). A 2003 OSHA interpretation document comments that OSHA believes that the IEEE 1307–1996 consensus standard, in most cases, prevents or eliminates serious hazards (OSHA, 2003a). IEEE 1307–1996 defines ''failure'' in a step bolt as occurring when it is bent more than 15 degrees below the horizontal, and § 1910.24(a)(9) in the final standard for subpart D mirrors that definition. Because IEEE revised the standard in 2004, OSHA, in the most recent PEA for subparts D and I, assumed that industry was using the more up-to-date consensus standard. For this FEA, OSHA continues to assume that industry is complying with the 2004 IEEE standard.

§ 1910.24(a)(1). This provision reads, ''[The employer must ensure:] Each step bolt installed on or after January 17, 2017] in an environment where corrosion may occur is constructed of,

or coated with, material that protects against corrosion.'' The national consensus standard applicable to this requirement is ASTM A394–08, Specification for Steel Transmission Tower Bolts, Zinc-Coated and Bare. The appendix to the consensus standard notes that the purchaser shall specify the dimensions of ladder bolts, step bolts, and equipment-support bolts. The ASTM standard describes three types of bolts covered by the standard:

- Type 0: Hot-dip, zinc-coated bolts made of low or medium carbon steel (ASTM 394–08, Section 1.1.1);
- Type 1: Hot-dip, zinc-coated bolts made of medium carbon steel, quenched and tempered (ASTM 394–08, Section 1.1.2); and
- Type 3: Bare (uncoated), quenched and tempered bolts made of weathering steel (ASTM 394–08, Section 1.1.4).[125]

Appendix A.2 of the consensus standard mentions that bolts should be Type 0 unless agreed upon by the manufacturer and purchaser. That is, the default condition is to use zinc-coated bolts; therefore, such bolts would meet the OSHA requirement for corrosion resistance. Presumably, the use of any other bolt type means that the manufacturer and purchaser agreed that the bolt is appropriate for the intended environment and use. Since manufacturers of step bolts are unlikely to make non-compliant step bolts, OSHA assigned no costs to § 1910.24(a)(1) in the PEA and also assigned no cost to this provision in this FEA.

§ 1910.24(a)(6). This provision reads, ''[The employer must ensure:] Each step bolt installed before January 17, 2017 is capable of supporting its maximum intended load.'' In the final standard, OSHA revised the proposed text by reducing the implementation period after the publication date of the final standard from 90 days to 60 days, a change that OSHA believes will not impose significant costs on employers.

The requirement that a step bolt must be capable of supporting its maximum intended load is consistent with IEEE 1307–2004, Standard for Fall Protection for Utility Work. Section 9.1.1.1(d) in that standard reads:

> Step bolts shall [b]e capable of supporting the intended workload [as defined for the application specified by the appropriate ANSI standard(s)], but in no case shall the minimum design live load be less than a simple concentrated load of 271 kg (598.4 lb) applied 51 mm (2 inches) from the inside face of the step bolt head.

Therefore, OSHA assigned no costs to this provision in the PEA and, after considering all factors associated with this provision, did not alter this estimation for this FEA.

§ 1910.24(a)(7). This paragraph requires that step bolts installed on or after 60 days after publication of the final rule be capable of supporting four times their maximum intended load. As discussed in the preamble to the proposed rule, OSHA considered a ⅝-inch bolt as meeting this requirement, and bolts of that size are readily available. Therefore, in the PEA OSHA determined that there would be no incremental costs associated with this provision.

In prehearing comments, The Southern Company questioned OSHA's proposed load criterion, stating, ''Instead of using the four times the maximum intended load, OSHA should consider using the criteria of the NESC or IEEE 1307'' (Ex. 192, p.3). OSHA noted earlier in the summary and explanation for this paragraph that, under this performance-based final rule, employers may use a range of methodologies, including criteria found in consensus standards, to determine the load capabilities of step bolts. Therefore, since bolt manufacturers are producing bolts that meet these design criteria, OSHA believes that there will be little, if any, additional cost burden on employers who must use step bolts that meet OSHA's load requirement, and, therefore, assigned no compliance costs to this provision in the final rule.

§ 1910.24(a)(8) and § 1910.24(b)(3). Under these paragraphs of the final standard, employers must inspect step bolts and manhole steps at the start of each workshift. OSHA considered inspection costs below under ''Cost estimates.''

§ 1910.24(b). Table V–19 summarizes the language in the final standard for manhole steps, along with the corresponding section of ASTM C478–13. The following three requirements in this provision exceed the requirements specified in a national consensus standard for steps in precast concrete manhole sections:

- Manhole steps must have slip-resistant surfaces such as corrugated, knurled, or dimpled surfaces;
- Manhole steps must be constructed of, or coated with, material that protects against corrosion in an environment where corrosion may occur; and
- The design of manhole steps must prevent the employee's foot from slipping or sliding off the end of the manhole step.

ASTM C478–13 permits the use of uncoated or untreated ferrous steps as long as they are at least 1 inch in cross-section, but is silent with regard to a slip-resistant surface or design. Because the final requirements appear to exceed the requirements in the consensus standard, the PEA determined that there would be incremental costs for slip-resistant and corrosion-resistant surfaces when employers rebuild or replace a manhole section. Moreover, the specifications in the final standard, unlike the consensus standard, define when a step fails while still in the manhole; thus, as noted in the PEA, there would also be step replacement costs associated with this provision. OSHA discusses these costs below under ''Cost estimates.''

[125] ATSM removed type 2 bolts from the standard in 2005.

Table V-19 Manhole Steps

Provision	Language	Related ASTM C478-13
§1910.24(b)(1)	The employer must ensure that manhole steps are capable of supporting their maximum intended load.	16.6.1.3
§1910.24(b)(2)	The employer must ensure that manhole steps installed on or after January 17, 2017.	
§1910.24(b)(2)(i)	Are provided with slip-resistant surfaces such as corrugated, knurled, or dimpled surfaces.	
§1910.24(b)(2)(ii)	Are constructed of, or coated with, material that protects against corrosion in an environment where corrosion may occur.	16.5.1
§1910.24(b)(2)(iii)	Have a minimum clear step width of 10 inches (25 cm).	16.5.2
§1910.24(b)(2)(iv)	Are uniformly spaced at a vertical distance of not more than 16 inches (41 cm) apart, measured center to center between steps. The spacing from the entry and exit surface to the first manhole step may differ from the spacing between the other steps.	16.4.1
§1910.24(b)(2)(v)	Have a minimum perpendicular distance between the centerline of the manhole step to the nearest permanent object in back of the step of at least 4.5 inches (11 cm).	16.5.3[126]
§1910.24(b)(2)(vi)	Are designed, constructed, and maintained to prevent the employee's foot from slipping or sliding off the end.	
§1910.24(b)(3)	The employer must ensure that manhole steps are inspected before initial use during a workshift, and is maintained in accordance with §1910.22.	

(a) Empty cells in this column indicate that no comparable ASTM C478-13 provision exists.

Source: U.S. Department of Labor, OSHA, Directorate of Standards and Guidance.

[126] ASTM C478–13, Section 16.5.3, specifies that the rung or cleat shall project a uniform clear distance of four inches minimum ±1/4 in. from the wall to the embedment side of the rung. The OSHA distance in the final standard measures from the centerline of the manhole step. Thus, if a step is at least an inch wide, a step that meets the ASTM 4-inch requirement also would meet the OSHA 4.5-inch requirement.

Stairways (§ 1910.25)

§ 1910.25(b)(5). The existing standard states that employers must provide a platform for doors or gates that open directly onto a stairway, and the swing of the door must not reduce the effective width to less than 20 inches. In the final standard, platforms installed before 60 days after the publication date of the final rule need only comply with the existing requirements; therefore, there are no retrofit costs to employers. For platforms installed on or after 60 days from the publication date of the final rule, the effective width increases to 22 inches.[127] Employers will have an incremental cost when replacing a platform with one that has two inches of additional clearance.

Commenting on the proposed revision to this paragraph, Ameren Corporation expressed concerned about the proposed 90-day grandfathering timeline:

> Lead time for material orders are often quite longer than three months often up to years to order material for large capital projects. Small projects with possibly only a small amount of material being required shouldn't have much of an issue of complying depending on the manufacturer capabilities and their imposed deadlines. Stipulations of ''ordered'' material should be imposed in regard to the date of the final rule because the time between ordering and placing into service is often greater than 90 days. (Ex. 189, p. 6.)

In response, OSHA recognizes that, as Ameren indicates, some large projects may require a lead-time longer than 60 to 90 days. However, OSHA also believes that most, if not all, manufacturers of such platforms should be familiar with the associated consensus standard, ANSI A1264.1–2007, and, therefore, produce platforms now that meet the 22-inch clearance requirement. OSHA believes that most contracts, as a usual and customary practice, already incorporate into the cost of the product the minimal increase in material cost borne by the employer to meet the clearance specification. For the reasons given above under the subsection titled ''Compliance with national consensus standards,'' OSHA estimated no incremental costs for this provision (§ 1910.25(a)(6)) in the PEA and, for these same reasons, did not take incremental costs for the provision (§ 1910.25(b)(5)) in the final standard.

§ 1910.25(d). Existing § 1910.24(b) does not permit spiral stairways except under special conditions. Employers cannot use spiral stairs under final § 1910.25(d) unless the stairs meets specific design specifications. Therefore, employers must modify or replace existing spiral staircases that do not meet these requirements. However, spiral staircases are likely to be relatively rare in commercial or industrial settings given that they are exceptions to the existing rule. Thus, OSHA did not assign costs to § 1910.25(d) in the PEA. Given that no commenters objected to this preliminary cost estimate, OSHA is estimating no costs for this paragraph in this FEA.

§ 1910.25(e). OSHA developed this paragraph in response to a comment made to an OMB-initiated, government-wide effort to reform regulation in the U.S. manufacturing sector. This comment, submitted by the Copper and Brass Fabricators Council, stated that OSHA required the use of fixed stairs when ship stairs or spiral stairways would be safer (OMB, 2005).

Employers typically install ship stairs with slopes of 50 degrees or greater; however, the existing standard for fixed stairs addresses stairs installed at angles between 30 and 50 degrees, but does not specifically address ship stairs. Recently, OSHA issued an interpretation stating that if ship stairs conformed to the 1990 proposed standard for subpart D,[128] the Agency would consider slopes up to 70 degrees to be *de minimis* violation of the existing standard[129] (OSHA, 2006b and 2006c). OSHA believes that most existing ships stairs conform to the 1990 proposed standard, and therefore the Agency assigned no costs to § 1910.25(e) in the PEA, nor did it assign costs to § 1910.25(e) in this FEA.

§ 1910.25(f). The existing standard does not expressly mention alternating tread-type (tread) stairs. A letter of interpretation from OSHA to a manufacturer of alternating tread stairs concluded that these stairs are safe (OSHA, 1981). NFPA 101, Section 7.2.11 (NFPA, 2012) also addresses alternating tread stairs. As discussed in the PEA, any alternating tread stair that meets the requirements of NFPA 101 would also meet the requirements in § 1910.25(f); accordingly, the PEA determined that this provisions does not impose a new cost burden on employers. Thus, in this FEA, OSHA did not assign costs to this provision.

Dockboards (§ 1910.26)

§ 1910.26(b). The text for this provision states that the employer must ensure dockboards put into initial service on or after January 17, 2017 are designed, constructed, and maintained to prevent transfer vehicles from running off the dockboard edge. Exception: When the employer demonstrates there is no hazard of transfer vehicles running off the dockboard edge, the employer may use dockboards that do not have run-off protection.

The definition of a dockboard in ANSI MH30.2–2005, Section 2.2, contains the language ''as well as providing a run-off guard, or curb,'' similar to the requirement in this final provision. OSHA believes, as it stated in the PEA, that nearly all dockboards manufactured currently conform to the ANSI standard; however, should an employer encounter an older, out-of-compliance dockboard, OSHA believes that the costs for them to comply with the final standard will be minimal. Therefore, in the absence of comment on this analysis, OSHA is not assigning costs in this FEA for final § 1910.26(b).

§ 1910.26(e). The text for this provision reads, ''[The employer must ensure:] Portable dockboards are equipped with handholds or other means to permit safe handling of dockboards.'' The requirement in final § 1910.26(e) that portable dockboards have handholds or other means to permit safe handling is essentially the same requirement specified in existing § 1910.30(a)(4), which OSHA based on ANSI/ASME B56.1, American Society of Mechanical Engineers, Safety Standard for Low Lift and High Lift Trucks. Therefore, OSHA believes that commercial dockboards likely come equipped with handholds and that any additional costs associated with this provision will be minimal. Thus, OSHA in this FEA did not assign costs for final § 1910.26(e).

Scaffolds and Rope Descent Systems (§ 1910.27)

§ 1910.27(a). This paragraph extends the construction industry requirements for scaffolds (except rope descent systems) to general industry. OSHA believes that many general industry employers who use scaffolds also perform work covered by the construction industry standards and are already familiar, and in compliance, with the construction industry scaffold standards. Therefore, linking the final standard for scaffolds in general

[127] The 22-inch clearance requirement for new structures matches ANSI A1264, Section 6.11.

[128] The 1990 proposed standard allowed ship stairs that are designed with slopes between 50 degrees and 70 degrees from the horizontal; have open risers; have treads that are four inches (10 cm) in depth, 18 inches (46 cm) in width, and a vertical rise between tread surfaces of six and one-half inches to 12 inches (16 cm to 30 cm); and have handrails that are installed on both sides of the ship stairs and meet § 1910.28 (within the existing standard). (55 FR 13400.)

[129] See OSHA's Field Operation Manual: *https://www.osha.gov/OshDoc/Directive_pdf/CPL_02-00-148.pdf.*

industry to the scaffold requirements in 29 CFR part 1926 resolves any inconsistencies between the scaffold requirements for the construction and general industries. OSHA received no comment on this analysis in the PEA. Thus, as in the PEA, OSHA attributed no costs to this paragraph in this FEA.

§ 1910.27(b)(1). When employers use rope descent systems (RDS; also known as controlled-descent devices) for building maintenance, the final standard requires that the building owner or its representative provide to the building-maintenance contractor (the employer) written documentation of identified, tested, certified, and maintained anchorages capable of supporting at least 5,000 pounds (268 kg), in any direction, for each employee attached. As OSHA noted in the PEA, it would appear from the documentation associated with the industry consensus standard, ANSI/IWCA I–14.1, that the International Window Cleaning Association (IWCA) customarily finds from information its members receive that many buildings lack the required anchorages. A key provision of that consensus standard is a written work plan (Section 1.7), and the IWCA Web site urges window cleaning enterprises to develop written plans and coordinate their operations with building owners. Accordingly, the IWCA Web site states:

> The intent of the [IWCA I–14.1] standard was not to stop window cleaning, it was to improve the level of safety of our industry by having a shared responsibility between the window cleaner and the building owner. If you have outdated equipment or are using equipment that doesn't meet the standard, phase it out. If you have buildings you're working on that are dangerous and are using creative rigging, phase them out and work with the building owners toward compliance. (IWCA, 2014.)

ANSI/IWCA I–14.1, Section 17, lists options for roof support equipment, including:

- Parapets, cornices, and building anchorages (Section 17.1);
- Davits and davit fixtures (a crane-like structure, Section 17.2);
- Sockets (Section 17.3);
- Tiebacks (Section 17.4);
- Counterweighted outriggers (Section 17.5);
- Parapet clamps and cornice hooks (Section 17.6); and
- Overhead monorail tracks and trolleys (Section 17.7);

Several of these options, such as counterweighted outriggers, are transportable and likely supplied by the contractor. Thus, the work plan delineates how the employer is to perform the work using a mix of contractor and property-owner equipment. The consensus standard provides several acceptable options for roof support equipment, and specifies that both the contractor and property owner concur with the work plan, and that the work plan describe how the contractor will perform the job safely. For the PEA, OSHA presumed that voluntary compliance with the consensus standard is likely to be high. However, as described in detail below, comments in the record indicate that industry compliance with the provision for sound anchorages varies considerably. In the PEA, OSHA assigned no costs for equipment; however, the Agency did estimate costs for inspections and certification that anchorages meet requirements. OSHA discusses these costs below in the subsection titled ''Cost estimates.''

§ 1910.27(b)(2)(i). Rope descent systems are an alternative to powered platforms. The final rule states that employers cannot use rope descent systems at heights greater than 300 feet unless they demonstrate that it is not feasible to access such heights by any other means or that those means pose a greater hazard to employees than using a rope descent system. The wording of the final rule is consistent with the industry consensus standard, ANSI/IWCA I–14.1, 2001. Accordingly, both the IWCA consensus standard and the final OSHA standard (1) prohibit the use of rope descent systems for descents exceeding 300 feet, and (2) contain an exclusion clause, which, in the case of the IWCA standard, provides that the requirement apply unless ''access cannot safely and practicably be obtained by other means.'' Because both the IWCA and OSHA standards contain a similar exclusion clause, the OSHA requirement is no more restrictive than the consensus standard.

Since this is a work-practice as opposed to an equipment-specification requirement, incremental costs are attributable to the OSHA standard only to the extent that employers would not voluntarily comply with the IWCA standard and to the extent that employers provide excess-risk documentation to OSHA. Employers, therefore, would incur costs from this provision only when (1) a building is 300 feet tall or higher, and (2) there is an alternative to the rope descent system that is feasible and at least as safe as an RDS. For the PEA, ERG examined a database developed by the Council on Tall Buildings and Urban Habitat (CTBUH) and identified slightly more than 1,900 buildings in the United States that are 300 feet (91.7 m) tall or higher (CTBUH, 2006). Over 25 percent of these buildings are in New York City, where state law does not allow the use of rope descent systems for window cleaning (DiChacho, 2006). Accordingly, ERG derived an estimate of 1,500 potentially affected buildings nationwide (ERG, 2007). For the PEA, OSHA assumed that some of these 1,500 buildings have permanently installed power platforms for access to the exterior of the building, and further assumed that using a platform would be less expensive than setting up an RDS.

For this FEA, OSHA examined the CTBUH database described above and determined that, currently: Approximately 1,960 existing buildings are 300 feet or higher; of that total, roughly 600 buildings with a height of 300 feet or greater are in New York City; and two states—California and Minnesota—have statutes that limit the RDS descent distance to, respectively, 130 feet and 300 feet (CA–DIR, 2012; Minnesota, 2012). After subtracting the number of buildings in those three states from the total, OSHA conservatively estimates that the 300-foot limit specified by this final standard would affect 1,300 buildings with a height of 300 feet or greater.[130]

The final set of buildings for which § 1910.27(b)(2) could result in costs are those buildings for which employers use RDS due to technical factors specific to a building's history, architecture, or style of operation. For example, to wash regularly the windows of a tall building with many sharp angles or tiered levels, management may find it cost-effective to contract for RDS rather than powered platforms. OSHA expects that there will be additional costs to the building owners in these situations because of factors discussed below under ''Cost estimates.''

§ 1910.27(b)(2)(ii)–(xiii). With one exception, these paragraphs in the final standard codify safety provisions presented in the 1991 memorandum to OSHA's Regional Administrators, which are similar to the requirements now specified in the national consensus standard, ANSI/IWCA I–14.1 (OSHA, 1991b). The safety provisions in this ANSI standard that mirror the OSHA memo are:

- Training employees in the use of the equipment;

[130] Valcourt Building Services estimated that 2.6 percent of its window washing operations involve buildings that are 300 feet or greater in height (Ex. 358). If OSHA applies that percentage to the number of all commercial buildings subject to the suspended scaffolds standard and, therefore, potentially affected by the 300-foot limit (DOE, 2006), the resulting estimate is significantly greater than the CTBUH estimate. This finding suggests that Valcourt's operations involve an unusually large proportion of buildings that are taller than 300 feet.

• Inspecting the equipment each day before use and removing of damaged equipment from service;

• Using proper rigging, including sound anchorages and tiebacks, in all cases, with particular emphasis on providing tiebacks when using counterweights, cornice hooks, or similar non-permanent anchorage systems;

• Using a separate personal fall arrest system;

• When installing lines, using knots, swages, or eye splices when rigging RDS that are capable of sustaining a minimum tensile load of 5,000 pounds;

• Providing prompt rescue of employees;

• Effectively padding ropes where they contact edges of a building, anchorage, obstructions, or other surfaces that might cut or weaken the rope; and

• Providing stabilization at the work location when descents are greater than 130 feet.

A provision in the OSHA memo not duplicated in the ANSI standard is the requirement in final § 1910.27(2)(b)(xi), which specifies that no employee may use an RDS under hazardous weather conditions, such as storms or gusty or excessive wind. OSHA estimates that this new provision is not likely to present a significant burden on employers because of the relatively high levels of current compliance with the provision (see, for example, Ex. 329 (1/19/2011), pp. 213, 346, 411–412) and the Agency's expectation, based on comments in the record (Ex. 329 (1/19/2011), pp. 235–236, 361), that employers will respond to wind conditions by adjusting window cleaning operations to minimize lost revenue and added project costs (for example, scheduling window cleaning operations on short buildings when weather conditions would create a hazard for window cleaning operations on tall buildings).

The proposed regulatory text updated the 1991 OSHA memo by using terminology such as ''prompt rescue'' rather than ''rescue'' and ''harness'' rather than ''body belt,'' but, as it stated in the PEA, OSHA did not believe that these revision would increase compliance costs. Other revisions to the 1991 OSHA memo made in the proposal, and now in the final standard, include the addition of three safety provisions to the original list of safety provisions described above. These three provisions include:

• Using equipment in accordance with the instructions, warnings, and design limitations set by manufacturers or qualified persons (final § 1910.27(2)(b)(ii));

• Securing equipment by a tool lanyard or similar method to prevent equipment from falling (final § 1910.27(2)(b)(xii)); and

• Protecting suspension ropes from exposure to open flames, hot work, corrosive chemicals, or other destructive conditions (final § 1910.27(2)(b)(xiii)).

In the PEA, OSHA stated that the eight safety provisions listed in the 1991 OSHA memo, the provision dealing with wind and other weather hazards, and the additional three provisions described in the previous paragraph, would not impose significant costs on employers. None of the comments submitted to the proposal provided any evidence contradicting this analysis.

OSHA determined in the PEA that the training requirements in proposed § 1910.27(b)(2)(ii), now codified as final § 1910.27(b)(2)(iii), imposed costs on employers. Final § 1910.27(b)(2)(iii) specifies that employers provide training in accordance with § 1910.30. Therefore, OSHA assigned the costs for training beyond that noted in its 1991 memorandum to § 1910.30. OSHA discusses these costs under ''Cost estimates'' below.

The Agency identified two additional provisions, final § 1910.27(b)(2)(xii) and (b)(2)(xiii), in the PEA as having potential costs.[131] The requirement specified by final § 1910.27(b)(2)(xii) to secure equipment is consistent with consensus standard IWCA I–14.1–2001, Section 3.10. Thus, OSHA did not assign incremental costs to this requirement in either the PEA or this FEA.

The requirement in final § 1910.27(b)(2)(xiii) that employers protect suspension ropes from exposure to open flames, hot work, corrosive chemicals, or other destructive conditions, is an extension of the requirement to protect the integrity of the ropes specified in OSHA's 1991 OSHA memorandum. OSHA attributed the costs for meeting this requirement under the training costs estimated in § 1910.30, and described below under ''Cost estimates.''

Duty To Have Fall Protection and Falling Object Protection (§ 1910.28)

The revised regulatory text for final § 1910.28 consolidates the fall protection requirements in the existing rule, with two major revisions. First, comments submitted in response to the reopening of the rule in 2003 recommended that the fall protection requirements in subpart D be consistent with the requirements in subpart M of the construction standards. The final text for § 1910.28 makes the general industry fall protection requirements consistent with the construction requirements, which may impose additional costs on employers in general industry. In addition, the existing standard does not address the use of restraint systems, designated areas, or safety net systems, nor does the existing standard clarify when employers can use personal fall protection systems. In contrast, the final standard allows employers to choose from various options in providing fall protection, *i.e.,* it is not as restrictive as the existing standard, which primarily requires use of guardrails.

In the proposal, OSHA requested public comment on the expenses that employers typically would incur to comply with this requirement. Stakeholders raised concerns about the compliance burden of this provision when conducting routine inspections on roofs. These stakeholders included the Property Casualty Insurers Association of America (Ex. 98), the Massachusetts Institute of Technology (MIT; Ex. 156), the National Roofing Contractors Association (NRCA; Ex. 197), and the U.S. Chamber of Commerce (Ex. 202). MIT's comments, presented below, are typical of these responses:

Under Subpart D—Walking-Working Surfaces, Section 1910.21(a) reads as follows: (a) Scope and application. This subpart applies to all general industry workplaces. It covers all walking-working surfaces unless specifically excluded by individual sections of this subpart. Following paragraph (a), MIT recommends adding the following narrow exception: ''Exception: The provisions of this subpart do not apply when employees are making routine inspections, investigations, or assessments of workplace conditions.'' Reason for comment: Periodic routine inspections, investigations, and assessments should be allowed on flat roof tops without installing guard rails, designated areas, or fall restraint/arrest systems. Employees engaged in routine inspections, investigations, and assessments of workplace conditions are exposed to fall hazards for very short durations, if at all, since they most likely would be able to accomplish their work without going near the danger zone. Requiring the installation of fall protection systems under such circumstances would expose the employee who installs those systems to falling hazards for a longer time than the person performing an inspection or similar work. As a result, the Proposed Rule could potentially create a greater hazard, rather than reducing a hazard. As stated above, the fall protection exemption anticipates that inspectors likely would be able to accomplish their work without going near the danger zone; yet installing such protections for a short time period would be

[131] In the proposal, these two provisions are § 1910.27(b)(2)(x) and (xi).

expensive and time-consuming. If the exception is not included, the Proposed Rule would have a significant impact on EHS personnel checking monitors, researchers inspecting research equipment on roofs, facilities operations investigating roof drains, facilities operations assessments prior to beginning project work, and other similarly-situated employees who regularly conduct such inspections. In addition, individuals who conduct these types of inspections are trained to be very focused on their footing, ever alert, and aware of the hazards associated with falling. Therefore, employees who inspect, investigate, or assess workplace conditions will be more aware of their proximity to an unprotected edge. This proposed exception would be in line with the existing OSHA Construction Standard, 29 CFR 1926.500(a)(1). (Ex. 156.)

OSHA notes that final § 1910.28(a)(2)(ii) provides an exemption stating that when employees are making an inspection, investigation, or assessment of workplace conditions prior to the starting work or after completing all work, the employer does not have to provide fall protection unless fall protection systems or equipment meeting the requirements of § 1910.29 have been installed and are available for workers to use for pre-work and post-work inspections, investigations, or assessments.

§ 1910.28(b)(1). Under this final provision, if a walking-working surface (vertical or horizontal) has an unprotected side or edge that is four feet or more above a lower level, an employer must protect employees from falling by using a guardrail system, safety net system, or personal fall protection system. If the work is on residential roofs and the employer demonstrates that it is infeasible or creates a greater hazard to use a guardrail system, safety net system, or personal fall protection system, then the employer must develop a fall protection plan that meets the requirements of 29 CFR 1926.502(k) and training that meets the requirements of 29 CFR 1926.503(a) and (c). In the existing rule, employers must implement fall protection under the following provisions when the fall hazard is four or more feet:

- § 1910.23(b): Wall openings;
- § 1910.23(c)(1): Open-sided floors or platforms; and
- § 1910.23(c)(2): The open sides of any runway.

Thus, there is no change in the height requirement for fall protection between the existing and final rules. OSHA believes that the language and organization for the final rule is less complex than for the existing rule and provides additional flexibility in the methods used for fall protection. The final rule also allows for exceptional conditions. For example, if it is not feasible or creates a greater hazard to install guardrails or other fall protection systems on a residential roof, then the employer does not have to install these systems and must instead develop and implement the requisite fall protection plan, including implementing other control measures to eliminate or reduce fall hazards for workers, and training. As discussed below under ''Cost estimates,'' OSHA anticipates that the costs for fall protection plans will not exceed the costs for guardrails and fall protection systems and, as demonstrated in employer response to the Construction standard (29 CFR 1926.502(k); 29 CFR 1926.503(a) and (c)), those compliance costs are economically feasible.

Comments to the proposal informed OSHA that chimney cleaning exposes workers to fall hazards resulting from work on residential roofs, and that protection from these fall hazards would require additional control measures. OSHA's analysis of the compliance costs for chimney cleaning, one industry among several industries found in NAICS 56179, Other Services to Buildings and Dwellings, appears below under ''Cost estimates.''

§ 1910.28(b)(2). This final provision requires fall protection in hoist areas when the fall hazard is four feet or greater, and also clarifies the requirements for hoist areas found in existing § 1910.23(b)(1) and (c)(1). Therefore, OSHA assigned no costs to this paragraph in either the PEA or in this FEA.

§ 1910.28(b)(3). The existing rule requires guarding every hole and skylight floor opening. This final provision specifies that employers must use fall protection when an employee might fall more than four feet through a hole. Thus, the new language harmonizes the fall protection requirement for holes with the requirements for unprotected sides and edges and hoist areas. The new language also permits employers to meet the requirement using covers, guardrail systems, travel restraint systems, or personal fall arrest systems.

The final revision to § 1910.28(b)(3) also provides protection for stairway floor holes, ladderway floor holes, and hatchways and chute-floor holes, and updates existing § 1910.23(a) by incorporating the best practices found in industry consensus standards (notably ANSI/ASSE A1264.1–2007). This subparagraph also clarifies application of the provision (*e.g.,* provides an exception for stairways used less than once per day). Furthermore, employers must construct guardrail systems to protect holes in accordance with final § 1910.29, Fall protection criteria. OSHA noted in the PEA that these requirements have been part of an OSHA standard or industry consensus standards for at least 15 years and, therefore, the incremental cost burden to employers would likely be minimal. OSHA could identify no data in the record that contradicted its preliminary finding of minimal cost impact and, therefore, carried the minimal impact estimate forward in this FEA.

§ 1910.28(b)(4). This final provision requires guardrails or handrails on dockboards to protect an employee from falls of four feet or more. There is an exception for cases when employers use dockboards exclusively for material handling operations performed with motorized equipment. In these cases, neither guardrails nor handrails are necessary if the fall hazard is 10 feet or less and employees received the training specified by § 1910.30. OSHA discusses the costs for installing handrail or guardrail systems for dockboards later in this subsection, and assigned the training costs to § 1910.30 (see ''Cost estimates'' below).

§ 1910.28(b)(6). The existing rule § 1910.23(c)(3) requires a standard railing and toe board for walking-working surfaces above dangerous equipment. This final provision bases the required controls on the potential fall distance. For potential falls of less than four feet onto or into dangerous equipment, the employer can cover or guard the dangerous equipment to eliminate the hazard. For potential falls of four feet or more, the employer must use guardrail systems, safety net systems, travel restraint systems, or personal fall arrest systems to protect employees from the fall hazard. For both the PEA and this FEA, OSHA assumed that employers already implemented the required controls under the existing standard using the least-cost method; therefore, OSHA assigned no costs to this paragraph in either the PEA or this FEA.

§ 1910.28(b)(7). For openings, the final standard limits the need for fall protection to cases for which the inside bottom edge of the opening is less than 39 inches above a walking-working surface and the bottom edge of the outside of the opening is four feet (1.2 m) or more above a lower level. The employer can use a guardrail system, a safety net system, a travel restraint system, or a personal fall arrest system to meet this requirement. In the PEA, OSHA stated that it believed that current industry practice was to protect employees exposed to openings; therefore, the Agency estimated no costs

for this paragraph in the PEA. OSHA received no comments in the record that contradicted this preliminary assessment and, therefore, assigned no costs to paragraph (b)(7) in this FEA.

§ 1910.28(b)(8). Existing § 1910.21(a)(2) classified pits, in general, as floor openings. In this final provision, pits that are 4 feet and less than 10 feet in depth used for repair, service, or assembly operations need not have a fall protection system provided employers demarcate, with floor markings, warning lines, stanchions, or some combination thereof, a (minimum) 6-foot perimeter around the pit, limit access to that demarcated area to trained and authorized employees, and post readily visible caution signs. In the PEA, OSHA did not assign incremental costs to paragraph (b)(8) because an employer would only incur costs for caution signs and floor markings if they were less expensive than the fall protection system required under the existing standard. In addition, existing § 1910.145 already requires an employer to post caution signs where needed, and existing § 1910.144 specifies the content of the signs. OSHA assumed that most employers have signs and marking materials readily available and, therefore, assigned no incremental costs to this paragraph in the PEA. There was no evidence submitted to the record to justify revising this preliminary assessment; therefore, OSHA in this FEA estimates that any additional compliance costs associated with this paragraph will be minimal.

The final rule provides more than one method to comply with § 1910.28(b)(8). That is, an employer may use a conventional fall protection system or implement specific safe work practices (*i.e.,* marking, stanchions, posting, and limiting access). When the alternative method—the use of safe work practices—is less expensive than the method specified in the existing rule (guardrails), an employer likely would incur lower costs to comply with the paragraph. As stated in the PEA, OSHA concluded that the new provision may reduce costs for some employers; however, OSHA did not quantify the cost savings in the preliminary analysis, nor did it do so in this final analysis.

§ 1910.28(b)(9). The existing regulatory text specifies landing platforms, cages, wells, or ladder safety devices as means of providing fall protection for fixed ladders. The 1990 proposal for subpart D permitted some workers to climb fixed ladders without the use of ladder safety devices, cages, or wells if they were qualified climbers and met other, specified conditions. In particular, employers could use qualified climbers to climb fixed ladders only if they did so no more than twice a year and it would be a greater hazard to the employee to install the fall protection system than to climb the ladder without fall protection (which OSHA believed rarely occurs).

In paragraph (b)(9) and elsewhere in the final standard, OSHA no longer permits employers to use qualified climbers beginning two years after publication of the final rule. In addition, after two years employers must equip new fixed ladders and replacement ladders and ladder sections with ladder safety systems or personal fall arrest systems. However, employers still can meet the fall protection requirement for existing fixed ladders extending more than 24 feet above a lower level by using cages, wells, personal fall arrest systems, and ladder safety systems for 20 years after publication of the final rule; after 20 years, employers must use either personal fall arrest systems or ladder safety systems for fixed ladders. For this FEA, OSHA assigned costs for using ladder safety systems on fixed ladders. OSHA's describes its analysis of costs for fall protection on fixed ladders below in ''Cost estimates.''

§ 1910.28(b)(10). These final paragraphs address fall hazards in outdoor advertising, also known as billboards. Existing subpart D has no requirements specific to billboards. However, for analytical purposes, the existing fixed ladder requirements cover the fixed ladder portion of a billboard. Existing § 1910.27(d)(1) requires cages or wells for ladders more than 20 feet in length. In the PEA, OSHA assumed that under proposed § 1910.28(b)(10)(i), an employee climbing the fixed ladder portion of a billboard up to 50 feet in length would need to use either a body belt or a body harness with an appropriate 18-inch rest lanyard to tie off to the fixed ladder, and that these additional options, when not already deployed, would be less expensive than cages or wells. Further, proposed § 1910.28(b)(10)(iv) required employers to properly maintain and use any ladder safety system installed on fixed ladders; according to ERG, this requirement is consistent with widespread industry practice (ERG, 2007). Thus, in the PEA, OSHA assigned no incremental compliance costs to these paragraphs. However, OSHA received a comment from the outdoor advertising industry in response to the proposal stating that ladder safety systems are not in widespread use for the initial 50-foot climb (or 65 feet from grade) on fixed ladders connected to billboards (see Exs. 329 (1/18/2011), pp. 143–146; 359, pp.7–8). Therefore, OSHA revised its preliminary analysis in this FEA to indicate that a significant percentage of outdoor advertising employers will need to install ladder safety systems on fixed ladders. OSHA presents its estimate of the costs for those systems below in ''Cost estimates.''

Final § 1910.28(b)(10)(ii)(A) requires employees in outdoor advertising who climb a fixed ladder be qualified climbers as specified in § 1910.29(h) when the fixed ladder does not come equipped with a cage, well, personal fall arrest system, or a ladder safety system. Therefore, OSHA assigned the costs for this paragraph to § 1910.29(h). In doing so, the Agency conservatively assumed in both the PEA and in this FEA that all employees in NAICS 5418 (Advertising and Related Services) who climb fixed ladders will receive training as qualified climbers (see the discussion for § 1910.29(h) below). OSHA notes that the provision for qualified climbers in outdoor advertising will expire two years after publication of the final rule, at which time employers must use other means and methods of fall protection. The Agency assigned the costs of fall protection for these workers after the second year as initial and ongoing costs (see the discussion below under ''Cost estimates).''

Final § 1910.28(b)(10)(ii)(B) requires that qualified climbers in outdoor advertising wear a body harness equipped with an 18-inch (46 cm) rest lanyard. Both the proposed rule at paragraph (b)(10)(i) and OSHA's outdoor advertising directive contain a similar requirement. The lanyard allows workers to tie off to the fixed ladder and rest during the climb. Proposed paragraph (b)(10)(i) and outdoor advertising directive both include a requirement permitting employers to provide, and allow workers to use, a body harness or body belt. However, the final rule does not permit the use of body belts as a part of a personal fall arrest system, thus OSHA deleted body belts from final § 1910.28(b)(10)(ii)(B). This also makes the final provision consistent with OSHA's construction industry rule, which does not allow body belts to be used for personal fall arrest (§ 1926.502(d)).

According to comment from the Outdoor Advertising Association of America (OAAA), OAAA's training program emphasizes ''the duty to provide fall protection for employees working above 4–6 feet including equipment such as harnesses, lanyards and any supplemental PPE uses.'' (Ex. 359) Therefore, because the use of harnesses and lanyards is central to the training program of the leading outdoor advertising industry association, OSHA anticipates that there will be no additional costs associated with the requirement in the final standard that qualified climbers be outfitted with full body harnesses. Proposed § 1910.28(b)(10)(vi), now codified as final § 1910.28(b)(10)(ii)(C), specifies that the employee is to have both hands free of tools and material while climbing up or down the ladder. In the PEA, OSHA assigned a cost to this paragraph; in this FEA, the Agency discusses these costs below under ''Cost estimates.''

Under final § 1910.28(b)(10)(ii)(D), climbers must use an appropriate fall protection system after they reach their work positions. OSHA attributed the cost of these systems to the existing standard for fixed ladders. Thus, the Agency estimated no additional costs for equipment required by this provision in either the PEA or in this FEA.

Proposed § 1910.28(b)(10)(iii) required that employers follow inspection procedures for ladder safety systems. Final § 1910.29(i) now delineates the inspection procedures identified in the proposed requirement. OSHA did not specify in the proposed rule the frequency of inspection, but in the PEA assumed that inspections would occur prior to each use. OSHA assigned costs to this paragraph in the PEA, and discusses these costs below under ''Cost estimates'' in this FEA.

Final paragraph (b)(11) requires that employers protect workers from falling off stairway landings and the exposed sides of all stairways. Stairways, as defined in the final rule in § 1910.21(b)), includes standard stairs, ship stairs, spiral stairs, and alternating tread-type stairs. As noted earlier in the summary and explanation of the final standard, final paragraph (b)(11)(i), like the proposal, requires that employers ensure each worker exposed to an unprotected side or edge of a stairway landing that is four feet or more above a lower level is protected by a guardrail or stair rail system. The final requirement is consistent with the requirements for stairway landings specified by the existing general industry standard in § 1910.24(h) and the construction standard in § 1926.1052(c)(12). The final provision is also consistent with A1264.1–2007 (Section 7.1), NFPA101–2012 (Sections 7.1.8 and 7.2.2.4.5), and ICC IBC–2012 (Section 1013.2), except that NFPA and IBC require guards on open-sided walking surfaces that are located more than 30 inches above the floor or grade below.

Final paragraph (b)(11)(ii), consistent with existing § 1910.23(d)(1) and proposed paragraph (b)(11)(ii), requires that employers ensure each flight of stairs having at least three treads and at least four risers is equipped with a stair rail system and handrails as specified in Table D–2.

Final paragraph (b)(11)(iii), like the proposal, requires that employers ensure ship stairs and alternating tread-type stairs are equipped with handrails on both sides. Both of those types of stairs have slopes that are 50 to 70 degrees from the horizontal, and OSHA believes that workers need handrails on both sides to safely climb those stairs. This requirement is consistent with ICC IBC–2012 (Section 1009.15) and NFPA 101–2012 (Section 7.2.11.2).

In the PEA, OSHA recognized that compliance with existing consensus standards for stairways and stairway landings will eliminate much of the employee exposure to fall hazards addressed by proposed § 1910.28(b)(11). Therefore, the Agency estimated no costs for this paragraph in the PEA. OSHA received no comments in the record that contradicted this preliminary assessment. Because as shown above in Table V–16, updated versions of the same consensus standards for stairways apply to the final standard, OSHA assigned no costs to paragraph (b)(11) in this FEA.

§ 1910.28(b)(12). Final § 1910.28(b)(12)(i), which addresses the duty to provide fall protection for employees on scaffolds, refers to the construction standards at 29 CFR part 1926, subpart L (Scaffolds), thereby avoiding any inconsistencies between the general industry and construction standards. Fall protection on scaffolds in the construction standards generally follows consensus standards; thus, in the PEA, based on the estimated high level of current compliance with the construction standards or consensus standards, OSHA assigned no costs to this paragraph, and retained that cost estimate for this FEA.

Final § 1910.28(b)(12)(ii) requires that employers ensure that each employee using a rope descent system more than four feet (1.2 m) above is protected from falling by a lower level using a personal fall arrest system. Such systems must meet the requirements of 29 CFR part 1910, subpart I. OSHA addresses the costs associated with rope descent systems in ''Cost estimation'' below as part of the discussion of § 1910.27, Scaffolds and rope descent systems.

§ 1910.28(b)(13) and (14). These two paragraphs are new to final subpart D and introduce additional compliance costs for employers specializing in, respectively, rooftop services (paragraph (b)(13)) and work on platforms and other elevated surfaces in animal slaughtering and animal processing plants (paragraph (b)(14)). Discussion of these costs appears in the next subsection, ''Cost estimates.''

§ 1910.28(b)(15). OSHA proposed this paragraph covering walking-working surfaces not otherwise addressed by the standard to clarify existing § 1910.23(c)(3), which requires a railing and toeboard for these types of surfaces. In the final rule, the revised language restricts the requirement to working surfaces four feet or more above a lower level, and permits the employer to comply with the paragraph by using a guardrail, safety net system, travel restraint system, or personal fall arrest system. Assuming that employers will choose the least-cost compliance option and that current industry use of conventional fall protection is widespread, OSHA in the PEA assigned costs to one surface, stepbolts, that appeared to be newly affected. OSHA determined that this requirement for protection on stepbolts will primarily affect establishments in NAICS 51, Information, and NAICS 7113, Promoters of performing arts, sports, and similar events, and that the preferred fall protection will be ladder safety systems. In the next subsection, ''Cost estimates'', OSHA discusses its final analysis of costs for this paragraph.

§ 1910.28(c). Final paragraph (c) requires that employers protect workers from being hit by falling objects, such as objects falling through holes or off the sides or edges of walking-working surfaces onto workers below. In addition, final paragraph (c) requires that employers protect workers using one or more of the following measures:

- Erecting toeboards, screens, or guardrail systems to prevent objects from falling to a lower level (final paragraph (c)(1));
- Erecting canopy structures and keeping potential falling objects far enough from an edge or opening to prevent them from falling to a lower level (final paragraph (c)(2)); or
- Barricading the area into which objects could fall, prohibiting workers from entering the barricaded area, and keeping objects far enough from the edge or opening to prevent them from falling to the lower level (final paragraph (c)(3)).

Final paragraph (c) simplifies the final rule by consolidating into a single paragraph all of the provisions that address falling objects found in the existing standard at § 1910.23(b)(5) and (c)(1) and the proposed rule at paragraphs (b)(3)(iii), (b)(5)(i), (b)(14)(ii)). The final rule is consistent with the proposal and patterned on the construction standard (§ 1926.501(c)).

Therefore, because the final standard introduces no additional burden on employers beyond existing requirements, and because there were no comments in the record suggesting that additional economic impacts would result, OSHA expects that final paragraph (c) will impose no new costs.

Fall Protection Systems and Falling Object Protection—Criteria and Practices (§ 1910.29)

Final § 1910.29, like the proposed rule, establishes system criteria and work practice requirements for fall protection systems and falling object protection specified by final § 1910.28, Duty to have fall protection and falling object protection, and § 1910.140, Personal fall protection equipment.

Final § 1910.29 requires that employers ensure the fall protection system and falling object protection they select meets the specified criteria and practice provisions. In general, OSHA patterned the system criteria and work practice requirements in final § 1910.29 to be consistent with its construction standards (§§ 1926.502 and 1926.1053). As mentioned in the preamble to final § 1910.28 and § 1910.29, many commenters supported making the general industry fall and falling object protection requirements consistent with those in the construction industry (*e.g.,* Exs. 124; 155; 194).

Final § 1910.29 reorganizes the existing rule so that the format of the final rule is consistent with the format in the construction fall protection standard at § 1926.502 and also draws provisions from, and is consistent with, national consensus standards addressing personal fall protection systems and falling object protection, including:

- ANSI/ASC A14.3–2008: American National Standards for Ladders–Fixed (A14.3–2008) (Ex. 8);
- ANSI/ASSE A1264.1–2007, Safety Requirements for Workplace Walking/Working Surfaces and Their Access; Workplace, Floor, Wall and Roof Openings; Stairs and Guardrails Systems (ANSI/ASSE A1264.1–2007)(Ex. 13); and
- ANSI/ASSE A10.18–2012, Safety Requirements for Temporary Roof and Floor Holes, Wall Openings, Stairways, and Other Unprotected Edges in Construction and Demolition Operations (ANSI/ASSE A10.18–2012) (Ex. 388).

Final paragraph (b) contains system requirements employers must follow to ensure guardrail systems they use will protect workers from falling to lower levels. In developing final paragraph (b), OSHA carried forward, with some revision, many of the requirements from the existing rule (*e.g.,* existing § 1910.23), and drew the requirements from the construction fall protection standard at § 1926.502(b).

OSHA analyzed the potential economic impacts of final § 1910.29(b) and anticipates that only paragraphs (b)(13) and (15) could potentially impose significant cost impacts, while the existence of the consensus standards listed above and other factors affecting current practice will result in no costs for all other paragraphs in § 1910.29(b). The Agency's review of the impacts associated with paragraphs (b)(13) and (15) is given immediately below.

§ 1910.29(b)(13). This final paragraph revises a related provision in the proposed standard by specifying that guardrail systems used around points of access (*e.g.,* ladderways) must have a self-closing gate that slides or swings away from the hole, with the gate constructed with a top rail, midrail, and latch or, alternatively, are offset to prevent a worker from walking or falling into the hole.

In two separate comments, Intrepid Industries, Inc. (Intrepid), recommended that OSHA clarify the proposed requirement by recognizing recent technological developments in ladderway gates. Intrepid noted in its comments that when OSHA published the 1990 proposal, multiple horizontal rails were "'foreign' to industry,'" that since publication of the 1990 proposal, "a majority of protection devices have both a top rail and a mid rail similar to that of the guardrail . . . ," and that such gates are equivalent in strength and design to guardrail systems and are widely available throughout industry (Exs. 68; 366). Therefore, having adopted Intrepid's recommended clarification in the final rule, OSHA estimates that few affected employers will need to replace current ladderway gates, resulting in a negligible cost burden for employers. Accordingly, as in the PEA, OSHA did not assign any costs to this provision.

§ 1910.29(b)(15). This final paragraph, as did the proposal, requires that employers inspect manila, plastic, or synthetic rope used for top rails or midrails as frequently as necessary to ensure that it meets the specified strength requirements. OSHA addresses the inspection costs for this final paragraph below in "Cost estimates."

§ 1910.29(c). Both the proposed and final paragraphs require that employers ensure safety net systems meet the requirements in the construction standards at 29 CFR part 1926, subpart M, thus avoiding any inconsistencies between general industry and construction standards. Given that the safety net system requirements in the construction standards follow current consensus standards, OSHA in the PEA estimated that this requirement had no incremental costs. OSHA received no comments to the proposal addressing this analysis and, therefore, attributed no costs to final § 1910.29(c) in this FEA.

§ 1910.29(h). This final paragraph outdoor advertising operations, and sets forth the criteria for the use of qualified climbers, which it limits to these operations. In the PEA, OSHA modeled the costs to train and, as necessary, retrain qualified climbers. That is, OSHA assumed that qualified climbers required training beyond that now required for fixed ladders and, furthermore, OSHA believed that employers would incur additional costs associated with the requirement that the employer observe the performance to ensure the qualified climber has the skills necessary to perform the climb safely.

The final standard permits the use of qualified climbers up to two years after publication of the rule, after which outdoor advertising employers must protect employees engaged in outdoor advertising from fall hazards in accordance with provisions of § 1910.28. Therefore, although OSHA's estimate of costs associated with the criteria enumerated in § 1910.29(h) would not apply two years after publication of the final rule, OSHA retained those costs in this final analysis to account for any training costs connected with transitioning to the use of ladder safety systems or other fall protection measures on fixed ladders. OSHA discusses the cost estimates for final § 1910.29(h) below under "Cost estimates."

The other requirements in final § 1910.29, include the requirements found in final paragraphs (d) Designated areas, (e) Covers, and (f) Handrail and stair rail systems, (g) Cages, wells, and platforms used with fixed ladders, (i) Ladder safety systems, (j) Personal fall protection systems, (k) Protection from falling objects, and (l) Grab bars (specified as "Grab handles" in the NPRM). OSHA in the PEA noted that there already is significant, widespread compliance with the proposed requirements among general industry employers, resulting in the proposed requirements imposing minimal incremental cost burden on employers. OSHA requested feedback from the public on this analysis, but received no comments to this request. Therefore, in this FEA, OSHA assigned no costs to paragraphs (d) Designated areas, (e)

Covers, (f) Handrail and stair rail systems, (g) Cages, wells, and platforms used with fixed ladders, (i) Ladder safety systems, (j) Personal fall protection systems, (k) Protection from falling objects, and (l) Grab bars.

Training Requirements (§ 1910.30)

This new section requires that employers in general industry train their employees regarding fall and equipment hazards, and retrain them when necessary. In the PEA, OSHA assumed that an employer that trains employees in compliance with § 1910.30 would choose to maintain records of the training, and the cost estimates in the PEA took account of this time burden on employers. The training costs estimated for proposed § 1910.30 included requirements from other proposed paragraphs that specify that the employer must conduct the training in accordance with proposed § 1910.30 (see Table V–18 for examples). OSHA discusses these costs in more detail below under ''Cost estimates''; in this analysis, incremental training costs apply only to the percentage of establishments that do not already provide regular safety training.

5. Cost Impacts for Final Subpart I (Personal Protective Equipment)

In the NPRM, OSHA proposed to add a new section, § 1910.140, to 29 CFR part 1910, subpart I, to address personal fall protection equipment. The proposed text for § 1910.140 added specific design and performance requirements for personal fall protection systems to existing subpart I. In addition, the proposed standard required that the provisions for hazard assessment found in existing § 1910.132 apply as well to personal fall protection systems.

The text of the final standard is virtually identical to that of the proposed rule, and although a number of commenters raised concerns about the technical specifications and criteria that would apply to personal fall protection systems, OSHA received few, if any, comments directly addressing the PEA. The discussion below describes OSHA's general treatment of costs for subpart I; the next subsection, ''Cost estimates,'' provides additional details on the specific method for estimating costs.

§ 1910.132(g). Existing § 1910.132(g) lists the personal protective equipment standards under 29 CFR part 1910, subpart I, that are subject to the requirements specified in existing § 1910.132(d) and (f). Paragraph (d) of § 1910.132 requires employers to assess the workplace to identify any potential hazards and the need for PPE, while § 1910.132(f) requires employers to train employers, at specified times, on the application limits of the equipment; proper hook-up, anchoring, and tie-off techniques; methods of care, use, and disposal; and proper methods of equipment inspection and storage. Final § 1910.132(g) adds the personal fall protection equipment regulated under § 1910.140 to the list of covered personal protective equipment. In the PEA, OSHA identified significant costs in connection with the proposed requirement; the Agency discusses the costs associated with this final requirement below under ''Cost estimates'' (for §§ 1910.140, Personal fall protection systems, and 1910.30, Training).

§ 1910.140(c)(18). 29 CFR 1910.140 is a new section that OSHA is adding to subpart I Personal Protective Equipment (PPE) (29 CFR part 1910, subpart I) to address personal fall protection systems, which include personal fall arrest, travel restraint, and positioning systems. The new section establishes requirements for the design, performance, use, and inspection of personal fall protection systems and system components (*e.g.,* body harnesses, lifelines, lanyards, anchorages).

Similar to the final rule revising 29 CFR part 1910, subpart D, final § 1910.140, when appropriate, also draws from national consensus standards addressing personal fall protection systems, details of which are provided in Section IV.B. of this document. Therefore, with the exception of one paragraph in § 1910.140, paragraph (c)(18), OSHA in the PEA estimated that current industry practice is widespread, and there were no comments objecting to that preliminary estimate. Final § 1910.140(c)(18) requires that employers inspect personal fall protection systems prior to the initial use during each workshift. In the PEA, OSHA identified significant costs in connection with the proposed requirement; the Agency discusses costs for this final paragraph below under ''Cost estimates.''

6. Cost Estimates

This subsection presents OSHA's detailed estimates of the costs associated with the final rule, provision by provision. These compliance costs represent the incremental burden incurred by employers beyond the current baseline of fall-related safety expenditures. OSHA did not estimate potential cost savings to industry from increased flexibility in meeting specific requirements, such as using personal fall protection systems rather than the currently mandated handrail/guardrail systems, even if some of the new requirements might be safer than the currently mandated requirements.[132]

For a number of cost categories, there were no public comments on the PEA. For those cases, OSHA updated the applied unit wage and the numbers of affected employers and employees to reflect the revised profile, but retained the cost methodology used in the PEA. For provisions in the final standard for which OSHA adjusted the preliminary cost estimate, the Agency describes the form of the cost revision and the public comments that lead to the final cost estimate.

a. Estimated Compliance Costs by Provision in the Final Standard for Subpart D

Labor costs associated with compliance with the final standard generally involve additional employer and supervisor time for training and inspection. OSHA took the number of establishments and employees from *Statistics of U.S. Businesses: 2007.* The Agency based the number of employees covered by subparts D and I on the share of employees working in building and grounds; construction;[133] installation, maintenance, and repair; production; and material-moving occupations reported by the Bureau of Labor Statistics, *Occupational Employment Statistics* (BLS, 2007). See section C above in this FEA for additional industry-profile information.

OSHA based employee and supervisor wages (see Table V–5) on data reported by the Bureau of Labor Statistics through their *Occupational Employment Statistics* program (BLS, 2010). OSHA adjusted wages to include the cost of benefits, and determined estimated benefits from data provided from the Bureau of Labor Statistics, *Employer Costs for Employee Compensation—*

[132] The Agency assumed that the new requirements are at least as effective in employee protection as the requirements provided by the existing requirements.

[133] As noted earlier in this FEA, production workers include workers in building and grounds; construction; installation, maintenance, and repair; production; and material-moving occupations. It is possible that employees in construction and related occupations, even though not employed by establishments in construction industries, might perform work regulated by OSHA under its construction standards in 29 CFR part 1926. Therefore, the employers of these workers, depending on the type of work performed, also may have to meet the requirements for fall protection and walking-working surfaces specified in the construction standards. For the purpose of estimating costs, however, OSHA assumed that the general industry standards cover these employees.

June 2011 (released September 2011).[134] The Agency based current compliance rates on OSHA inspection statistics for fiscal year 2005 (see Table V–15); it determined the fraction of businesses that already provide regular safety training from information in the *National Occupational Exposure Survey* conducted by the National Institute for Occupational Safety and Health (NIOSH, 1988). See Table V–20, below.

Table V-20
Fraction of Businesses Providing Regular Safety Training

General Requirements (§ 1910.22)

Final § 1910.22 contains three paragraphs with new requirements:

- § 1910.22(d)(1): Perform regular and periodic inspection, and maintenance, of walking-working surfaces;
- § 1910.22(d)(2): Correct and repair hazardous conditions on walking-working surfaces, and guard unsafe conditions until corrected or repaired; and
- § 1910.22(d)(3): Have a qualified person perform or supervise any

[134] Throughout the discussion below, wages that include benefits are also referred to as "loaded" wages.

correction or repair that involves the structural integrity of a walking-working surface.

There were no public comments that addressed OSHA's preliminary approach to estimating costs the costs for these paragraphs. For the final standard, OSHA revised all three provisions from the proposed language for clarification.

For the purpose of estimating costs for § 1910.22(d)(1), OSHA in the PEA assumed that a significant percentage of facilities already include regular and periodic inspections of walking-working surfaces. OSHA used the non-compliance rates for floor-guarding in proposed § 1910.23 (which has the highest non-compliance rates, see Table V–15) to estimate the number of establishments that need to perform regular and periodic inspections of walking-working surfaces. OSHA assumed that a supervisor would spend 15 minutes every quarter performing the inspection, for a total of 1 hour per year. Based on these unit costs, OSHA preliminarily estimated that the total annual inspection cost would be $15.3 million.

Relative to the existing and proposed standards, the final standard provides more specificity in the types of hazards for which employers will be inspecting walking-working surfaces (namely, protruding or sharp objects, loose boards, corrosion, leaks and spills). Included among the inspected surfaces will be residential roofs (addressed in § 1910.28(b)(1)), low-slope roofs (§ 1910.28(b)(13)), and slaughtering facility platforms (§ 1910.28(b)(14)), surfaces whose inclusion in the scope of the proposed standard is recognized by OSHA in this final notice. As a result of further analysis of these affected surfaces, OSHA believes that regular and periodic inspections will be more extensive than determined in the PEA. For this final analysis, OSHA raised the quarterly inspection time from 15 minutes to 30 minutes. Therefore, OSHA estimated the final cost for paragraph § 1910.22(d)(1) to be $32.8 million.[135]

For estimating the costs of § 1910.22(d)(2), OSHA in the PEA projected that within a year, 10 percent of affected establishments would identify an unsafe condition, and that it takes an employee 15 minutes to set up a guard mechanism (*e.g.,* cones, barriers). The Agency assumed incremental material costs to be negligible since it is likely that most employers currently stock guard equipment but only occasionally deploy it. Estimated compliance costs for this provision were $0.23 million in the PEA and are $0.25 million in this FEA.[136]

For § 1910.22(d)(3), OSHA in the PEA estimated that it takes five minutes for a supervisor or qualified person to inspect the repair of the unsafe condition. Final § 1910.22(d)(3) was revised to read that when any correction or repair involving the structural integrity of the walking-working surface is conducted, a qualified person must perform or supervise the correction or repair. Applying the five-minute time unit across all affected employers, OSHA preliminarily estimated that the costs for a supervisor or qualified person to inspect repairs would total $0.13 million, and, applying the five-minute unit for this FEA, determined that final costs will be slightly higher, at $0.14 million for performance or supervision of the correction or repair.

Summing costs for the three paragraphs in final § 1910.22(d) with cost impacts, the total estimated cost for compliance with § 1910.22(d) is, after rounding, $33.2 million per year.

Ladders (§ 1910.23)

In the PEA, eight paragraphs in proposed § 1910.23 specify new training requirements for protecting employees from slip, trip, and fall hazards during operations involving ladders. Table V–21 summarizes these eight new training requirements.

[135] For timber tract operations (NAICS 1131), costs are estimated by multiplying together 450 establishments (see Table V–1), 9.6 percent noncompliance rate for existing floor guarding requirements (see Table V–15), two hours per supervisor, and a $26.10 hourly loaded wage (see Table V–5), yielding a result of $2,263. Analogous calculations are performed for each industry and summed to produce the total of $32.8 million.

[136] For example, OSHA estimated the costs to correct unsafe conditions for timber tract operations (NAICS 1131) in the following way. Total guarding cost = no. of affected establishments * (1 − current compliance rate) * percent with an unsafe condition * time to set up guarding * employee hourly loaded wage = 450 establishments (1 − 90.4 percent) * 10 percent * 0.25 hours * $19.99 = $22. Analogous calculations are performed for each industry and summed to produce the total of $0.25 million.

Table V-21
Training Requirements Under §1910.23 – Ladders

Paragraph	Subject
§1910.23(b)(11)	When ascending or descending a ladder, the employee must face the ladder.
§1910.23(b)(12)	Each employee must use at least one hand to grasp the ladder when progressing up and down the ladder.
§1910.23(b)(13)	Employees must not carry any object or load that could cause the employee to lose their balance and fall.
§1910.23(c)(5)	Prohibits use of portable single rail ladders.
§1910.23(c)(6)	Prohibits moving, shifting, or extending a ladder occupied by employees.
§1910.23(c)(9)	Secure and stabilize non-self-supporting ladders used on slippery surfaces.
§1910.23(c)(10)	Place the top of a non-self-supporting ladder with the two rails supported unless it is equipped with a single support attachment. [New for wood ladders.]
§1910.23(c)(11)	When using portable ladders to gain access to an upper landing surface, the ladder siderails must extend at least three feet (0.9 m) above that upper landing surface. [New for metal ladders.]
§1910.28(e)(1)(viii)	The employer must ensure that mobile ladder stands and platforms are not moved when occupied by an employee.

Source: U.S. Department of Labor, OSHA, Directorate of Standards and Guidance, Office of Regulatory Analysis-Safety.

The PEA determined that employers could address all eight of these new provisions in a single training session. In addition, OSHA determined that employers can comply with these provisions using informal training; therefore, the Agency did not include administrative costs for employers. For this FEA, OSHA added a ninth provision, § 1910.23(c)(9), addressing stabilization of ladders on slippery surfaces, to its analysis of costs, and applied the same cost modeling parameters here as it did in the PEA.

OSHA's Web site includes a resource center with a loan program for training videos (OSHA, 2012b). The index lists 12 training videos for ladders and stairways, with run times ranging from 5 to 19 minutes, for an average of 12 minutes. Accordingly, for the purposes of estimating costs for ladder safety training, OSHA in the PEA and this FEA applied a 15-minute training period per video.

In OSHA's cost model, employers can train 10 employees per session, with one supervisor in attendance. OSHA further assumed that employers incur $1 in materials cost for handouts for each employee trained.

Some establishments already provide regular safety training. For each affected NAICS industry, OSHA applied an estimate for the percentage of employees already providing training. OSHA's derived its industry-by-industry baseline estimate for safety training from the NIOSH *National Occupational Exposure Survey* (NOES) database (NIOSH, 1988). Although these data are over 25 years old, the NIOSH NOES survey is still the primary source for such information, and covers a broad range of industries. No comment in the record suggested that the NIOSH NOES survey data are no longer accurate. Furthermore, OSHA believes that the proportion of employees already offered regular safety training likely increased over the past two decades; hence, the Agency most likely overestimated the training costs.

The cost to train employees at establishments that do not offer regular safety training is a one-time cost annualized over a 10-year period at a discount rate of 7 percent. Summing across all affected employers, the total first-year cost is $11.5 million, with an annualized cost of $1.6 million.[137]

[137] For gambling industries (NAICS 7132), costs are estimated by first multiplying together 5,240 employees (see Table V–1) and the 33.6 percent rate of not yet providing training (=1–0.664 shown in Table V–20), yielding an estimate of 1,761 employees that do not yet receive training. Next, this estimate is multiplied by the sum of worker

Continued

New employees who begin affected jobs also will need training. For the purpose of estimating this cost, OSHA in the PEA assumed that training received from a prior employer was not sufficient to meet the proposed subpart D requirement. ERG's analysis of 2002 hires data collected by the Bureau of Labor Statistics (ERG, 2007) formed the basis in the PEA for OSHA's analysis of the annual costs of training employees new to the workforce; for this FEA, OSHA used 2007 BLS industry hires-rate data to correspond to the employment levels (2007) used in the analysis. Table V–22 below summarizes these data for the NAICS codes affected by this final standard. Under these assumptions, the estimated cost is $5.4 million per year to train new employees in ladder safety.

Table V-22
Industry Hires Rates Applied in OSHA's Cost Analysis

Industry	NAICS	2007 Annual Hires Rates
Mining and Logging	1133 21	45.4
Durable Goods Manufacturing	321, 327, 33	29.8
Nondurable Goods manufacturing	31, 322, 323, 324, 325, 326	36.9
Wholesale trade	42	34.9
Retail trade	44 -45	58.8
Transportation, warehousing, and utilities	22, 48-49	36.3
Information	51	31.2
Finance and Insurance	52	31.7

In the PEA, to estimate the costs of mobile ladder stands and mobile ladder stand platforms that conform to the design requirements specified in § 1910.23(e), OSHA's cost formula included all establishments potentially covered by proposed subpart D. OSHA assumed that the typical lifetime for a ladder is five years; thus, one-fifth of the establishments would purchase a ladder meeting the design requirements each year.[138] Furthermore, OSHA assumed that a supervisor from each establishment would take five minutes to read ladder specifications to ensure that, prior to purchase, the ladder met the requirements for that type ladder. With these assumptions, the estimated annual cost for § 1910.23(e) was $3.8 million in the PEA; in this FEA, allowing for the increase in the number of affected establishments and updated wage rates (generally upward), annual total costs for final § 1910.23(e) are $4.2 million.[139]

Step Bolts and Manhole Steps (§ 1910.24)

Step bolts. In estimating the cost of the step-bolt inspection requirement specified by proposed paragraph (a)(8) in the PEA, OSHA identified three types of structures requiring step bolts and pole steps:

- Utility poles;
- Communication structures; and
- Pole-mounted lights in sports and performance arenas.

Final paragraph (a)(8) requires that employers ensure step bolts are

time costs (0.25 hours times an $18.80 hourly production worker loaded wage (see Table V–5)), materials costs ($1 per employee) and instructor time costs (0.25 hours times a $38.66 hourly supervisor loaded wage (see Table V–5), divided by 10 to reflect a 10-worker class size), yielding a result of $11,736 (= $8,274 labor cost + $1,761 materials cost + $1,701 instructor cost). Analogous calculations are performed for each industry and summed to produce the total of $11.5 million.

[138] Underlying this assumption is the likelihood that some establishments will purchase more than one ladder in a given year, or will purchase more than one ladder over the five-year span.

[139] For grantmaking and giving services (NAICS 8132), costs are estimated by first multiplying together 16,356 establishments (see Table V–1) and the 20 percent rate applied in ladder replacement, yielding an estimate of 3,271 establishments that will be purchasing a ladder. Next, this estimate is multiplied by the sum of worker time costs (5 minutes/60 minutes = 0.083 hours times a $29.89 hourly production supervisor loaded wage (see Table V–5)), yielding a result of $8,147. Analogous calculations are performed for each industry and summed to produce the total of $4.2 million.

inspected at the start of each work shift and maintained in accordance with § 1910.22. OSHA addresses the cost impacts of final paragraph (a)(8) in the following discussion.

Utility poles. According to the *2007 Utility Data Institute Directory of Electric Power Producers and Distributors,* there are 6,297,596 miles of distribution lines in the United States (Platts, 2007).[140] According to ERG, the most recent mileage estimate available for overhead distribution lines was 4.1 million miles in 1996, or about two-thirds of total line miles (NCAMP, 1997). Considering the maturity of the electric-power industry in the United States, OSHA assumed that there has not been a significant increase in overhead line miles since 1996, with most new lines probably built underground. Assuming one utility pole for every 100 feet of line, OSHA estimated that there are 216,480,000 utility poles in the United States. According to a 2004 highway safety study, this estimate is 2.5 times the number of reported utility poles on highways in 1999 (NCHRP, 2004); therefore, OSHA's estimate appears to be reasonable.

OSHA assumed that employees in the affected industry group—NAICS 2211, Electric Power Generation, Transmission and Distribution—climb one percent of the poles once each year and that it takes a production worker (at an hourly wage of $45.11, including benefits) one minute to inspect the step bolts on a pole. Therefore, the estimated annual cost in the PEA for inspecting step bolts was $1.5 million. In the absence of any comment on the record taking exception to this analysis, in this FEA, OSHA estimated the cost for this requirement to be $1.6 million, allowing for an increase in wages since publication of the NPRM.

Communication structures. For the PEA, ERG estimated that there are roughly 190,000 fixed-ladder structures in the communications industry (see ERG, 2007, Appendix A). This estimate encompasses communication structures with fixed ladders and step bolts. Fixed ladders, however, have an existing requirement for inspection, while step bolts do not. To narrow the estimate to fixed ladders with step bolts, ERG searched an FCC database (Antenna Structure Registration (ASR)) and determined that most communication structures meet at least one of the following criteria:

- Height is 200 feet or higher;
- Height <199 feet if within 5 miles of an airport and fails the glide calculation (part 17 requirement); or
- Height of the extension (*e.g.,* beyond the building roof) is 20 feet or more.

ERG assumed that these structures are more likely to have fixed ladders rather than step bolts. As of May 2007, there were approximately 93,000 structures in the ASR database. Communication structures that are not in the ASR database are smaller and, thus, more likely to have step bolts. ERG calculated that the difference between the total number of structures (190,000) and the number in the ASR database (93,000) would represent the number of structures that could potentially have step bolts. Following ERG's methodology, OSHA's cost model projected that employees climb each of the 97,000 structures with step bolts once a year and that spend one minute inspecting the structure before climbing it. These unit estimates resulted in an annual cost of $0.05 million ($50,000) for NAICS 51 (Information) in the PEA; with 2010 loaded hourly wages ranging from $21.64 to $32.60 for production workers across sixteen four-digit industry codes in NAICS 51, the annual cost is approximately $0.04 million ($43,000) in this FEA (average wages for production workers in NAICS 51 fell from 2008 to 2010).

Sports and performance arenas. According to the 2002 census, there were 1,699 establishments in NAICS 7113, Promoters of performing arts, sports, and similar events, with facilities (Census, 2002). For the PEA, ERG was unable to estimate the number of step bolts at each facility, but instead assumed that employers spent one hour per year inspecting all step bolts at each facility (OSHA assumed that a production worker would conduct the inspection). Therefore, in the PEA, OSHA calculated that annual costs would total $0.034 million ($34,000) for NAICS 7113. For this FEA, annual costs for NAICS 7113 total $0.050 million ($50,000) after updating the number of facilities (2,613) per the 2007 Census and applying the 2010 loaded hourly wage of $19.08 for production workers in NAICS 7113.

Summing costs for utility poles, communication structures, and sports and performance arenas, OSHA estimated in the PEA that the total annual inspection costs for step bolts would be $1.54 million; for this FEA, total inspection costs are $1.72 million.

In the proposal, OSHA requested, but did not receive: (1) Comment on the extent to which employers currently conduct visual inspection [141] of step bolts in the telecommunications and electric-utility industries, and in sports and performance arenas; (2) comment on the assumptions underlying its analysis of costs; and (3) information on the potential impacts of the proposed requirements on climbing surfaces with step bolts safely. Therefore, in this FEA, OSHA adjusted the cost estimates in the PEA only to the extent that wages and the number of establishments changed since it published the PEA.

For this final economic analysis, OSHA included, within the total costs for the final standards for step bolts under final § 1910.24, the costs for repairing or replacing defective step bolts identified in inspections required by the final rule. Based on a review of OSHA 2005 inspection data for the Transportation and Utility sectors, OSHA calculated that 0.34% of inspected step bolts will be found to be out of compliance.[142] Applying this step bolt failure rate to the total number of step bolts in affected NAICS industries (*see* above) yields an estimated 7,727 step bolts repaired or replaced yearly. At a unit cost of $4.50 or $14.75 per step bolt depending on the NAICS code [143] and an installation time of fifteen minutes, annual costs for repair or replacement of step bolts are expected to total approximately $0.3 million. (*See* Ex. [OSHA Excel Workbook], Tab annual_24_stepbolts.).

Summing costs for inspection of step bolts and repair or replacement of defective step bolts, OSHA estimates that the costs for the provisions addressing step bolts under final § 1910.24 will total $2.0 million.

Manhole steps. Final paragraph (b) addresses the design, capacity, and use of manhole steps. As discussed earlier,

[140] The final Electric Power Generation, Transmission, and Distribution; Electrical Protective Equipment standard requires that employers follow the fall protection requirements in 29 CFR part 1910, subpart I (79 FR 20315 (4/11/2014); see § 1910.269(g) in this final rule).

[141] The requirement in the proposed standard that step bolts be ''visually inspected'' was revised in the final standard to read that step bolts be ''inspected''.

[142] Of 38,714 OSHA inspections in 2005, 11,469 resulted in citations, of which 1,301 were in Transportation or Utility industries. One hundred and fifty-six citations in Transportation/Utility referenced Subpart D, and of that total, 15 citations referenced 1910.24, Fixed industrial stairs, the existing standard judged by OSHA to be most closely associated with the final provision for step bolts. (See *https://www.osha.gov/dep/enforcement/enforcement_results_05.html*). Therefore, (11,469 citations/38,714 inspections) * (156 Transportation/Utility citations in Subpart D/1,301 total Transportation/Utility citations) * (15 industrial stairs citations/156 Subpart D citations) = 0.34% probability of a scaffolds citation in Transportation/Utility sector.

[143] NAICS 22: $4.50; NAICS 51, 71: $14.75. See Ex. [OSHA Excel Workbook], Tab annual_24_stepbolts).

three requirements in final paragraph (b)(2) exceed the requirements specified in a national consensus standard, ASTM C478–13, for steps in precast concrete manhole sections:

• Manhole steps must have slip-resistant surfaces such as corrugated, knurled, or dimpled surfaces;

• Manhole steps must be constructed of, or coated with, material that protects against corrosion in an environment where corrosion may occur; and

• The design of manhole steps must prevent the employee's foot from slipping or sliding off the end of the manhole step.

OSHA expects that employers will identify any deficiencies in manhole steps through compliance with final paragraph (b)(3); that provision requires that employers ensure manhole steps are inspected at the start of the work shift, and maintained in accordance with § 1910.22. In estimating the cost of the manhole-step inspection requirement specified by proposed paragraph (b)(3) in the PEA, OSHA estimated there are between 6.6 million and 13.2 million manholes, with a mid-point estimate of 9.9 million, nearly all of which are in water, sewage, and related utilities. Of these manholes, approximately 85 percent, or 8.4 million manholes, are 20 feet or less in depth, while the remainder, 15 percent or 1.5 million manholes, are more than 20 feet in depth. In the PEA, OSHA estimated that employees would enter 10 percent of all manholes, on average, and that it would take one minute to inspect the steps prior to entering the manhole. That analysis resulted in an estimated annual cost of $0.4 million for the industry most affected by this requirement, NAICS 2213 (Water, sewage, and other systems). After updating the wage rate for production workers in NAICS 2213, OSHA's final estimate for inspection of manhole equipment, including steps, totals $0.5 million.

Other industries also use manholes for access, such as electric-power generation, transmission, and distribution (NAICS 2211) and natural-gas distribution (NAICS 2212). ERG, however, had no data on the number of manholes for those industry groups, and although OSHA assumed in the PEA that the costs would be proportional to the number of manholes estimated for water and sewage systems, OSHA was not able to estimate costs for NAICS 2211 and 2212. The Agency requested, but did not receive, public comment in the proposal on the impact of the inspection requirement on these and any other affected industries. Therefore, for this FEA, OSHA assumed that, for NAICS 2211 and 2212, employers seldom encounter manholes, and that when they do encounter manholes, they routinely inspect the manhole steps to ensure that the steps meet or exceed the requirements of the final rule. Therefore, OSHA determined that, under the final standard, any incremental costs for manhole fall protection in NAICS 2211 and 2212 will not be significant.

Employers would incur costs for slip-resistant and corrosion-resistant manhole step surfaces required by proposed paragraphs (b)(2)(i) and (ii) in the future because employers would replace manholes with steps at the end of their useful life. As described above, OSHA estimates there are 9.9 million manholes, of which 85 percent are 20 feet or less in depth and 15 percent are more than 20 feet in depth. In the PEA, OSHA assumed that manholes less than or equal to 20 feet in depth used portable ladders, fixed ladders, and steps in equal shares, resulting in 2.9 million manholes with steps, while it assumed that manholes more than 20 feet in depth used fixed ladders and steps in equal shares, resulting in 0.7 million manholes with steps. This analysis, therefore, indicates that the proposed requirement would affect 3.6 million manholes. The manhole step selected from vendor lists in the PEA had a per-unit cost of $8.50, and OSHA assumed that this price included a 10 percent premium for the steps to meet the proposed requirements (ERG, 2007).

Applying the unit values and methodological assumptions described above for this FEA, OSHA estimated annual replacement costs for steps by applying a 10 percent rate for annual entry of manholes and, of that number, applying a 10-percent rung failure rate. At the incremental cost of $0.85 each (10 percent of $8.50 per rung), the estimated annual replacement cost for steps is $0.03 million ($31,000). OSHA estimated annual replacement costs for all manhole-access equipment (including steps, but excluding manhole covers) assuming a baseline of ten percent and further assuming that employers would replace 5 percent of this equipment each year and would install steps every 16 inches. Accordingly, the estimated yearly manhole replacement cost is $1.6 million, and combining this cost with OSHA's final estimate of costs for inspection of manhole equipment, including steps ($0.5 million), OSHA derives a total cost of $2.1 million for manhole fall protection under the final rule (after rounding).

For this FEA, OSHA has included the labor costs for annual replacement of manhole steps or rungs that are judged to be out of compliance with the final standard. OSHA applied a baseline compliance rate of ten percent for affected utilities, estimated that removal of the old rung or step and replacement with a new one will involve 15 minutes of labor per rung or step (hourly loaded wage of $30.47 for a production worker in NAICS 2213 (water, sewage utilities)), and multiplied unit labor cost times the total number of affected steps, or 1.83 million steps after adjusting for baseline.[144] Combining those cost factors, the Agency estimates that labor costs for removal and replacement of defective rungs or steps will total $13.9 million.

Combining costs for inspections and repair of step bolts and manhole steps, OSHA estimates that the final costs associated with § 1910.24, Stepbolts and manhole steps, will total $16.0 million.

Scaffolds and Rope Descent Systems (§ 1910.27)

Training. Paragraph (b)(2)(ii) of proposed § 1910.27 and paragraph (b)(2)(iii) of the final § 1910.27 specify training requirements for rope descent systems. As described earlier in this ''Costs of Compliance'' section, OSHA attributed costs for any training beyond what is done as a result of the 1991 OSHA memorandum on descent-control devices to final § 1910.30 (see below).

Sound anchorages. In the PEA, costs assigned to ensure sound anchorages as required by proposed § 1910.27(b)(iv) involved: (1) A qualified/competent person who would inspect the rigging and anchorages on buildings annually, and (2) a professional engineer who would certify the soundness of the rigging and anchorages every 10 years.

According to an industry expert contacted by ERG, an estimated 3.0 million window cleaning descents take place annually at 750,000 buildings in the U.S. (ERG, 2007). In the absence of comments on the PEA in the proposal, OSHA is retaining these estimates in this FEA for the inspection and certification requirements specified by final § 1910.27(b)(1)(i). Using data collected by the Department of Energy (DOE) for surveys on energy use, ERG compared this estimate with the number of commercial and residential buildings with four or more floors. The *2003*

[144] 1.06 million steps or rungs in manholes less than 20 ft. deep (28,611 in single-rung manholes and 1,144,440 in multi-rung manholes) + 780,000 steps or rungs in manholes more than 20 ft. deep (7,425 in single-rung manholes and 853,875 in multi-rung manholes) = 2.03 million steps or rungs (100% − 10% baseline) = 1.83 million steps or rungs. See Document ID [OSHA Excel Workbook], Tab materials_24_manholes.

Commercial Buildings Energy Consumption Survey identified about 140,000 commercial buildings nationwide (DOE, 2006). The *2001 Residential Energy Consumption Survey* (RECS) identified about 2.4 million apartment buildings with 5 to 10 floors, 0.9 million apartment buildings with 11 to 20 floors, and an unspecified number of buildings with more than 20 floors (DOE, 2004). Summing the three categories of residential buildings, ERG estimated that there are approximately 3.3 million residential buildings in the U.S. with five or more floors.[145]

OSHA assumed that each commercial building has its windows cleaned annually, thereby accounting for 140,000 of the estimated 750,000 window cleanings per year. If the 3.3 million residential buildings account for the remaining 610,000 cleanings, each of these buildings would, on average, have its windows cleaned every five to six years.

ERG's industry expert estimated that a minimum of 20 percent of the building owners complied with the anchorage-inspection requirement, and that the number was increasing. However, comments submitted to the Agency in response to the 2003 reopening were inconsistent regarding the likelihood that building owners inspect their anchorages on a periodic basis. Amodeo (2003) noted that some clients view ANSI I–14.1 as voluntary and resist having inspections. Kreidenweis (2003) commented that engineers seldom inspect anchorages.[146] In contrast, Lebel (2003) noted that many buildings have a roof plan and identified anchorages (*i.e.* anchorages designated for use in window cleaning), certified by a professional engineer. Zeolla (2003) stated that most buildings that invest in anchors are inspecting them. On the basis of these comments, OSHA in the PEA estimated that 25 percent of the approximately 750,000 buildings cleaned every year undergo anchor certification on a consistent basis.

OSHA's final standard provides more detailed requirements for anchorages used with rope descent systems than the proposed standard. Final § 1910.27(b)(1)(i) states that before any rope descent system is used, the building owner must inform the employer, in writing, that the building owner has identified, tested, certified, and maintained each anchorage so it is capable of supporting at least 5,000 pounds (268 kg), in any direction, for each employee attached. The information must be based on an annual inspection by a qualified person and certification of each anchorage by a qualified person, as necessary, and at least every 10 years.

Therefore, for this FEA, OSHA revised upward its estimate of the baseline level for anchor certification. Accordingly, OSHA believes that the current baseline is at least 35 percent nationwide, and may be much higher in some markets. For example, the owner of Chicago's largest window cleaning company testified in OSHA's public hearings on the NPRM that in Chicago, 60 to 70 percent of building owners provide documentation of anchor certification (Ex. 329 (1/19/2011), p. 218). Similarly, the owner of one of Houston's leading window cleaning companies testified that every building owner that he works with provides certification of anchorages (Ex. 329 (1/19/2011), p. 310). Recognizing that in some smaller markets, anchor certification may not be as widespread or frequent as suggested by these commenters, OSHA applied a baseline level of 35 percent for anchor certification and inspection in estimating costs for this requirement in the FEA.

Therefore, if 65 percent of the approximately 750,000 buildings that have windows cleaned each year must now comply with the final inspection and certification requirement, then OSHA estimates that 487,500 buildings will require annual inspections and decennial certifications. In the PEA, OSHA further assumed that a production supervisor would perform the annual inspections, and that it would take this supervisor one hour to perform the inspection. Annual costs in the PEA for the building inspections totaled $16.7 million; after adjusting wage rates to 2010 levels and applying the revised baseline estimate, OSHA in this FEA estimates annual costs of $14.1 million for the inspection of building roof anchorages.

Table V–23 summarizes the range in costs for a professional engineer to certify building anchorages; OSHA drew these cost estimates from comments in the record, and adjusted the estimates to 2003 dollars using as the deflator the *Consumer Price Index—All Urban Consumers* (BLS, 2007). The costs range from a low of $175 to a high of $2,500; this range probably represents the variation in building sizes, complexity of anchorage arrangements, and regional standards. The median value is $1,000, which is the estimate (in 2005 dollars) applied by OSHA in the PEA.

Table V-23. Estimated Cost for the Certification of Building Anchorages

	Estimated Cost			Estimated Cost (2003 Dollars)	
Source	Low	High	Year	Low	High
Bright, 2007	$300	$1,500	2006	$274	$1,369
Kreidenweis, 2003	$1,000	$2,500	2003	$1,000	$2,500
Lebel, 2003	$175	$1,000	2003	$175	$1,000
Wright, 2003	$400		2003	$400

[145] Since publication of the PEA, DOE released the results from its 2009 Residential Energy Consumption Survey (RECS) (DOE, 2013). According to the 2009 RECS, 1.9 million apartment buildings have 5 to 10 floors, 0.9 million apartment buildings have 11 to 20 floors, and 0.4 million apartment buildings have more than 20 floors. Summing the three categories of residential buildings, OSHA estimates that there are approximately 3.3 million residential buildings with five or more floors, a total that is identical to OSHA's preliminary estimate of 3.3 million residential buildings with at least five floors. Therefore, OSHA applied its preliminary estimate of tall residential buildings for this final analysis.

[146] OSHA notes that in the 2010 Proposed Rule, the Agency requested comment on inspection and maintenance of rooftop anchorages but nowhere stated that a revised OSHA standard would require an engineer to perform those duties.

A cost breakdown of inspections and anchor installations provided by Valcourt Building Services (Valcourt; Ex. 358) confirms OSHA's preliminary estimate of the cost for the certification of building anchorages; Valcourt's quote for initial roof certification was $1,090. For this final cost analysis, OSHA applied the ratio of the 2011 GDP deflator and the 2005 GDP deflator to its preliminary estimate to derive an estimate of $1,122 in 2011 dollars for initial roof anchor certifications.

Assuming, as indicated earlier, that building owners would certify building anchorages every 10 years, OSHA estimates that 48,750 buildings (one-tenth of 487,500 buildings) would need anchorage certification each year. At an average cost of $1,122 for certification, annual costs for anchorage certification would total $54.7 million.

During the course of decennial certifications and annual inspections, engineers will determine that a small percentage of anchorages will need replacement due to failure to meet building codes or other applicable requirements. For this final economic analysis, OSHA has included the cost for the purchase and installation of replacement anchorages. Based on a review of OSHA 2005 inspection data for the Service industry sector (NAICS 54–81), OSHA calculated that 0.23% of inspected anchorages will be found to be out of compliance.[147] Applying this anchorage failure rate to the annual number of affected buildings, 750,000 building, yields an estimated 1,734 anchors replaced yearly. At a unit cost of $1,000 per anchor[148] and an installation time of three hours, annual costs for replacement of roof anchors are expected to total approximately $1.9 million. (See Ex. [OSHA Excel Workbook], Tab annual_27.)

Summing costs for inspecting and certifying building anchorages and replacing faulty anchors, OSHA estimates that annual costs would total $71.1 million for employer compliance with the anchorage inspection and certification requirements specified by final § 1910.27(b)(1).

RDS distance limitation. Final § 1910.27(b)(2)(i) prohibits the use of a rope descent system (RDS) for heights greater than 300 feet (91 m) above grade unless the employer can demonstrate that it is not feasible to access heights above 300 feet by any other means or that these other means result in a greater hazard to employees than an RDS. Based on comments in the record (Exs. 126; 163; 219; 222; 358), and as discussed earlier in this section, OSHA expects that there are 1,300 buildings over 300 feet tall subject to this limitation. In written testimony, Valcourt Building Services estimated that limiting the RDS distance to 300 feet would lead to an increase in window cleaning costs ranging from 10 to 20 percent (Ex. 358, p. 4). In a comment submitted in response to the 2003 Notice, Braco Window Cleaning Service, Inc. estimated that the 300-ft. limit to RDS would lead to an increase in prices of 30 percent for building owners (Kreidenweis, 2003). As noted earlier in this analysis of costs, Corporate Cleaning Services estimated that the RDS distance limit would increase costs for use of suspended scaffolds by up to 30 percent (Ex. 126). Combining the Braco and Corporate Cleaning estimates of percentage cost increase with the Valcourt range of percentage cost increase, OSHA estimates that if a typical window cleaning job on a tall building takes 24 hours for a 4-person crew (production worker loaded wage in NAICS 5617—Services to Buildings and Dwellings is $19.39), then applying the midpoint of the range of 10 percent to 30 percent (*i.e.,* 20 percent) to the number of affected buildings results in an annual increased labor cost of $484,000.

In addition to the labor costs associated with this distance limitation, a small fraction of affected buildings will now need to acquire suspended scaffolds (*i.e.,* swing stages) or powered platforms to service windows at distances over 300 feet from the building roof. OSHA believes that building owners will elect to purchase or contract with window cleaning services to purchase the least expensive system that delivers the appropriate level of safety. According to Valcourt, transportable swing-stage systems are available for $25,000 per unit, and that approximately 10 percent of the affected buildings that they service would need to purchase such units (Ex. 358, p. 4). Therefore, applying the unit cost for suspended scaffolds to 10 percent of affected buildings (10 percent of 1,300 buildings, or 130 buildings), OSHA estimates that employers will incur first-year costs of $3.25 million. Annualized over 10 years, equipment costs associated with the RDS height limitation will total $463,000.

Duty To Have Fall Protection and Falling-Object Protection (§ 1910.28)

Table V–24 lists the requirements in this section that are likely to result in new cost burdens on employers.

[147] Of 38,714OSHA inspection in 2005, 11,469 resulted in citations, of which 1,938 were in Service industry sector (NAICS 54–81). One hundred and sixty-two citations in the Service industry sector referenced Subpart D, and of that total, 15 citations referenced 1910.28, Scaffolds, the existing standard judged by OSHA to be most closely associated with the final provision for anchorages stabilizing suspended scaffolds. (See *https://www.osha.gov/dep/enforcement/enforcement_results_05.html* and Document ID [OSHA Excel Workbook], Tab Compliance.) Therefore, (11,469 citations/38,714 inspections) * (162 Service industry sector citations in Subpart D/1,938 Service industry sector citations) * (15 Scaffolds citations/162 Subpart D citations) = 0.23% probability of a scaffolds citation in Service industry sector.

[148] Google shopping: Grainger roof anchor.

Table V-24
New Requirements in Final §1910.28, Duty to Have Fall Protection

Paragraph	Subject
§1910.28(b)(1)	The employer must protect employees working on a surface from falls of four feet or greater to a lower level by any of the controls detailed in this paragraph.
§1910.28(b)(4)(ii)(C)	Those employee have been trained [on dockboards] in accordance with §1910.30.
§1910.28(b)(9)	Requirements for proper fall protection systems for fixed ladders that extend more than 24 feet above a lower level; prohibits after specified dates the use of cages and wells for the purpose of fall protection in the absence of personal fall protection systems or ladder safety systems.
§1910.28(b)(10)(ii)	Employees who climb fixed ladders on billboards not equipped with fall protection must receive training and demonstrate the physical capability to perform the necessary work in accordance with §1910.29(h), and meet other requirements specified for qualified climbers; prohibits use of qualified climbers two years after publication of the final rule. Costs associated with training assigned to final §1910.29(h).
§1910.28(b)(13)	For work performed on low-sloped roofs that are 4 feet (1.2 m) or more above a lower level, the employer must protect each employee from falling by using a guardrail system, safety-net system, travel restraint system, personal fall arrest systems, or designated areas; requirements for fall protection depends on the distance the employee is from the roof edge and the type of work being performed.
§1910.28(b)(14)	For slaughtering facility platforms, the employer must protect each employee from fall hazards on the unprotected working side of a platform that is 4 feet (1.2 m) or more above a lower level by using a guardrail system or a travel restraint system. When the employer can demonstrate the use of a the use of a guardrail or travel restraint system is not feasible, the work may be done without guardrails or a travel restraint system provided: (A) The work operation for which fall protection is infeasible is in process; (B) Access to the platform is limited to authorized employees; and (C) The authorized employees are trained in accordance with §1910.30.

Table V-24
New Requirements in Final §1910.28, Duty to Have Fall Protection (continued)

Paragraph	Subject
§1910.28(b)(15)	Employers having walking-working surfaces 4 feet (1.2 m) or more above a lower level not otherwise addressed by final subpart D must protect employees from falling by using a guardrail system, safety-net system, travel restraint system, or personal fall arrest system.

Source: U.S. Department of Labor, OSHA, Directorate of Standards and Guidance, Office of Regulatory Analysis-Safety.

The following discussion presents, by requirement, the details of OSHA's cost analysis for this section.

Chimney-cleaning services. OSHA received comments indicating that the chimney cleaning industry would incur additional costs, when compared to its current practices, and therefore OSHA has included these costs in its analysis. To protect chimney sweeps from falls after they ascend to residential and commercial roofs using ladders or lifting devices, OSHA's cost model determined that, for the roughly 6,000 chimney-sweep companies nationwide, affected employers will use a roof anchor kit that includes a 14-inch steel roof anchor, 50-foot lifeline and hardware assembly, and a 3-foot shock-absorbing lanyard and full-body harness with a unit cost of $368. In addition, employers will need two harnesses, at $118 per unit, to equip the typical two-man or three-man crews involved in each job; the cost model assigned three calls daily for each chimney-sweep crew. Based on comments in the record (Ex. 329 (1/18/2011), pp. 97, 101, 162, 176–178), OSHA estimates that 10 percent of chimney-sweep employers currently protect their workers from falls in accordance with the requirements of this final standard. In addition to the initial equipment costs annualized over 10 years, employers will incur the following labor and equipment costs:

- Pre-installation of anchors requiring one-half hour of a production worker's time, at a loaded wage = $19.39/hour, per anchor;
- Monthly replacement of roof anchors due to deterioration; and
- A production worker's time of five minutes per job to use the lifeline and lanyard system (productivity loss).

Combining annualized initial costs and annual recurring costs for fall protection of chimney sweeps (NAICS 56179), OSHA estimates that the new costs associated with this industry will total $12.7 million, or $2,124 per chimney-sweep company each year.[149]

In post-hearing comments, the National Chimney Sweep Guild stated that compliance with the proposed standard is infeasible and would pose a greater hazard during sweep activities typically performed by their members (Ex. 342, p. 3). However, the sweeps guild did not provide information or data on the extent of the infeasibility that the requirement would impose on NCSG members. Indeed, OSHA notes that NCSG's quoted price for the initial installation of a roof anchor-system ($578) (Ex. 365) is consistent with OSHA's estimate of combined up-front cost for (1) a roof anchor kit ($368), (2) monthly replacement of a worn roof anchor ($67) per company, (3) a full-body harness ($118) for each of the sweeps, and (4) labor for installation of each new or replaced anchor ($18); Section H of this FEA demonstrates that these costs are feasible economically.

In response to NCSG's concerns, OSHA notes that final § 1910.28(b)(1) provides an exception to the duty for fall protection for work on residential roofs when an employer can demonstrate that it is not feasible, or creates a greater hazard, to use guardrail, safety-net, or personal fall arrest systems. In such a case, the employer must develop and implement a fall protection plan that meets the requirements of 29 CFR 1926.502(k) and training that meets the requirements of 29 CFR 1926.503(a) and (c). Based on comment in the record by NCSG (Exs. 342; 365), OSHA determined that, for a small percentage of chimney-sweep jobs, chimney-sweep employers will find it infeasible to install roof anchors or other fall protection systems for technological, contractual, or other reasons. In these cases, the employer must develop a fall protection plan and provide training in accordance with the requirements in subpart M of the construction standards cited above. For this FEA, OSHA did not estimate the costs for fall protection plans and training because it believes that these costs will not exceed the equipment and labor costs described previously. Therefore, OSHA determined that the total cost for employers to protect their employees from fall hazards during chimney-sweep jobs ($12.8 million, or $2,128 per chimney-sweep company) is the maximum or worst-case value.

Dockboards. Final § 1910.28(b)(4) would require installation of guardrails or handrails to protect employees on dockboards from falls of four feet or more to a lower level. Employers with dockboards having maximum heights that are less than four feet would not incur costs under this paragraph. This final provision exempts dockboards presenting a fall hazard of four feet up to 10 feet from this requirement when the employer uses the ramp exclusively for material-handling operations with motorized equipment. To qualify for the exception, employers must train their employees in accordance with § 1910.30. OSHA discusses the training costs for this provision later in this section.

---

[149] Initial equipment (capital) cost = roof anchor kit * no. of chimney sweep companies * (1 − industry baseline) + full body harness unit cost * no. of chimney sweep companies * sweeps needing harness * (1 − industry baseline) = $368 * 6,000 * (100% − 10%) + $118 * 6,000 * 2 * (100% − 10%) = $3,261,600

Initial system installation = no. of chimney sweep companies * time to pre-install anchors * production worker loaded wage * (1 − industrybaseline) = 6,000 * 0.5 hour * $19.39 * (100% − 10%) = $52,581.

Annual costs = roof anchor unit costs * no. of chimney sweep companies * monthly anchors per company * months per year + production worker loaded wage * lifeline productivity loss * sweep calls per day * workdays per year * no. of chimney sweep companies * (1 − industry_baseline) = $66.95 * 6,000 * 1 * 12 + $19.39 * .083 hours * 3 * 250 * 6,000 * (100% − 10%) = $4,820,400 + $6,572,621 = $11,393,021.

Additional, relatively minor training and other costs related to hazard communication and rule familiarization bring the total annualized costs for chimney cleaning services to approximately $12.7 million.

ERG estimated that a substantial proportion of dockboards would either not incur costs due to height or would fall under the exception. Thus, OSHA believes that any costs incurred under this provision are unlikely to be substantial. In the proposal, OSHA requested, but did not receive, comment on the potential impacts associated with the duty to protect employees on dockboards from falls. Therefore, OSHA applied its preliminary estimate of non-substantial costs associated with dockboard fall protection in this final analysis.

Fixed Ladders. To address fall safety on fixed ladders that extend more than 24 feet above a lower level, as specified under final § 1910.28(b)(9), OSHA estimates that, of the approximately 3.1 million fixed ladders over 20 feet in height (ERG, 2007, Table A.1), around 328,000 fixed ladders are between 24 and 30 feet high. Beginning 20 years after publication of the final rule, employers would face additional requirements for fixed ladders beyond those found in voluntary consensus standards (notably ANSI–ASC A14.3–2008[150]) and the existing OSHA standards. Accordingly, employers must provide workers making climbs of 24 to 30 feet on fixed ladders 20 years after publication of the final standard with additional protections not currently provided by existing voluntary and mandatory industry standards. While much of general industry uses the affected ladders, this use occurs mainly in manufacturing and industrial buildings (105,000 ladders), silos (85,000), water tanks and water towers (53,000), ski lift towers (29,000), communications towers (25,000), and six other types of structures with fixed ladders (30,000) (see Ex. [OSHA Excel Workbook], Tab retrofit_28). The total for all affected fixed ladders is approximately 328,000 (after rounding).

OSHA assigned costs for fall protection on fixed ladders as follows:

- The Agency distributed ladders among NAICS codes according to the number of affected establishments in the industry represented by a NAICS code; for example, if the 85,000 silos with fixed ladders were primarily in NAICS 3111, Animal Food Manufacturing, OSHA distributed the costs of ladder safety systems among the 1,817 establishments in NAICS 3111;
- OSHA averaged the cost of two leading ladder safety systems (DBI, Miller; average total upfront cost = $983, including two-hour installation by a production supervisor; the systems are 30 feet in length, and include the cable, cable sleeve, and carabiner);
- The Agency estimated that fixed ladders have an average life of 30 years, that replacement of the fixed ladders would occur evenly across a 30-year period (10,921 ladders replaced each year by new ladders equipped with a safety system), and, with a phase-in date 20 years after publication, some ladders still would require replacement anywhere from one to 10 years after the 20-year phase-in date;
- OSHA calculated first-year costs, then used a seven percent discount rate to annualize over 10 years; first-year costs total $8.5 million, and annualized costs total $1.2 million;
- Billboards with fixed ladders greater than 20 ft. were each assigned a 30-ft. ladder safety system; initial costs of $20.1 million were annualized over ten years, resulting in annualized costs of $2.9 million.

Therefore, the initial costs for fall protection on fixed ladders total $28.6 million, with annualized costs of $4.1 million.

Outdoor advertising (billboards). This provision, § 1910.28(b)(10), covers the use of fixed ladders on billboards serviced by the outdoor-advertising industry. Based on discussions with the Outdoor Advertising Association of America, ERG estimated that the number of billboards with fixed ladders over 20 feet is approximately 20,500 (ERG, 2007). Employees climb billboards from one to more than 12 times a year, whenever they have to change the copy on the billboard. For the purposes of estimating costs, ERG assumed that an employee climbs each billboard an average of six times a year, totaling 123,000 climbs (20,500 billboards × six climbs). Per the requirement in § 1910.140(c)(18) that personal fall protection systems must be inspected before initial use during each workshift, each time an employee climbs a billboard, ERG estimated that the employee takes two minutes to inspect the ladder safety system (246,000 minutes or 4,100 hours).[151] Employees who climb billboards are generally in NAICS 5418 (Advertising and Related Services). In 2010, the average wage, including benefits, for this category was $22.76/hr. Thus, the estimated total cost to inspect ladder safety systems on billboards is approximately $93,000 per year.

As specified in § 1910.28(b)(10)(ii), until the requirement for fall protection on fixed ladders in outdoor advertising becomes effective two years after publication of the final standard, employees who routinely climb fixed ladders on billboards must satisfy the criteria for qualified climbers found in § 1910.29(h), *i.e.,* must undergo training, demonstrate the capacity to perform the necessary climbs safely, use a body harness equipped with an 18-inch rest lanyard, have both hands free of tools or material when ascending or descending a ladder, use a fall protection system upon reaching the work position. For the purpose of estimating costs, OSHA determined that all employees who climb billboards are qualified climbers and that the training for a qualified climber includes instruction on having both hands free while ascending or descending the ladder (see final § 1910.29(h)(2)). After the two-year phase-in period, employers will protect employees from fall hazards using on billboards using ladder safety systems, cages or wells, and personal fall arrest systems, which will require substantively identical training to the training specified by final § 1910.29(h)(2). For the PEA, OSHA assigned the costs to train a qualified climber under proposed § 1910.28(b)(10)(v) through § 1910.29(h); for this FEA, OSHA applied the same cost methodology (*i.e.,* assigned costs to § 1910.29(h)).

Low-slope roofs. Final § 1910.28(b)(13) standard requires employers to protect employees working on low-sloped roofs and exposed to fall hazards that are four feet (1.2 m) or more to lower levels. If the employee is working less than six feet (1.8 m) from the edge of the roof, the employer must use a guardrail system meeting the requirements of § 1910.29 of the subpart, a travel restraint system meeting the requirements of subpart I of the part, or a personal fall arrest system meeting the requirements of subpart I of the part. If the employee is working at a distance more than six feet (1.8 m) but less than 15 feet from the roof's edge, employers must protect the employees using a guardrail system meeting the requirements of § 1910.29 of the subpart, a travel restraint system meeting the requirements of subpart I of this part, a personal fall arrest system

[150] In ANSI–ASC A14.3–2008, American National Standard for Ladders—Fixed—Safety Requirements, the following provisions lead OSHA to infer that the use of ladder safety systems for ladder heights above 24 feet has become accepted industry practice.

4.1.2 A cage or ladder safety system shall be provided where the length of climb is less that [sic] 24 feet but the top of the ladder is at a distance greater than 24 feet above ground level, floor, or roof (See Fig. 3).

4.1.3 A ladder safety system shall be provided where a single length of climb is greater than 24 feet . . . .

[151] The costs for inspecting ladder safety systems prior to use in outdoor advertising are separate from the costs for overall inspection of fall protection systems discussed below under § 1910.140(c)(18).

meeting the requirements of subpart I of this part, or, if the work is infrequent and temporary, work in a designated area meeting the requirements of § 1910.29 of the subpart. Finally, if the work is taking place 15 feet or more from the edge of the roof, the employer is not required to provide fall protection or use a designated area provided the work is both infrequent and temporary and the employer implements and enforces a work rule prohibiting employees from going within 15 feet (4.6 m) of the roof edge without using fall protection in accordance with paragraphs (b)(13)(i) and (ii).

To estimate compliance costs for this provision, OSHA determined that the most significant incremental burden involves inspections or assessments of rooftop conditions prior to performing any work on the roof. The Agency assumed that most work on rooftops is infrequent and temporary, and occurs in areas that are six to 15 feet from the roof edge, thereby eliminating the need for guardrails, travel restraint systems, and personal fall arrest systems, and using designated areas instead.

Similarly, for work performed 15 feet (4.6 m) or more from the roof edge, OSHA anticipates that most employers will adapt, at minimal cost, existing company work rules and training programs to comply with the final rule. As discussed earlier in this Preamble, OSHA's choice of regulatory text for § 1910.28(b)(13)(iii) makes the final rule consistent with OSHA policy specified in a series of Agency interpretations of the construction fall protection standard for work performed 15 feet or more from the edge of a roof (see, *e.g.,* letter to Mr. Anthony O'Dea (12/15/2003);[152] letter to Mr. Keith Harkins (11/15/2002);[153] letter to Mr. Barry Cole (5/12/2000) [154]).

For work six feet or less from the roof edge with extensive fall exposure, and for work that is less than 15 feet from the edge that is not infrequent and temporary, OSHA believes that, where feasible, the majority of employers currently provide conventional fall protection (guardrails, travel restraint systems, or personal fall arrest systems) and therefore compliance costs will be insubstantial. OSHA bases this estimate in part because the final rule is consistent with provisions in the construction standard that require employers to provide conventional fall protection for workers exposed to unprotected sides and edges, and most leading edges (§ 1926.501(b)(1) and (2)). In addition, OSHA recognizes that awareness of existing consensus standards on fall protection—including ANSI A1264.1–2007, Safety Requirements for Workplace Walking/Working Surfaces and Their Access; Workplace, Floor, Wall and Floor Openings; Stairs and Guardrail Systems—have heightened use of conventional fall protection at roof perimeters and will minimize any incremental costs associated with final § 1910.28(b)(13).

Assuming one affected rooftop per affected establishment, OSHA estimated that twice per year, with the exception of establishments in agriculture, forestry, fishing, and hunting, affected employers would direct a production worker to conduct a five-minute assessment of all fall-related conditions on the low-slope roofs of facilities (the inspection time includes any follow-up assessment addressing safety concerns). Summing these labor costs across all affected NAICS codes, OSHA estimates that employer expenditures for inspection of low-slope roofs will total $34.2 million annually in this FEA.

A small percentage of roof-top inspections are expected to reveal to employers the need for conventional fall protection near unprotected sides and edges. Basing calculations on 2005 OSHA inspection data, OSHA estimates that, depending on the NAICS sector, the probability of identifying an unguarded hazard during a rooftop climb and inspection will range from 0.07% to 0.28%. Applying these probabilities to the number of inspections (described above) and assuming that any enhancement of fall safety will be roughly equivalent to a fifteen-minute labor expense in the installation of an anchor ($67) suitable for use with a personal lifeline and full-body harness (fully supplied at the baseline), OSHA estimates that the costs for addressing hazards identified in rooftop climbs and inspections will total $1.85 million. (See Ex. [OSHA Excel Workbook], Tab annual_28.)

Summing employer expenditures for roof inspections and the costs of correcting the hazards identified in those inspections, total costs will be approximately $36.1 million.

Slaughtering facility platforms. Final § 1910.28(b)(14) is a new provision not in the proposal that requires employers to protect each employee on the unprotected working side of a slaughtering facility platform that is four feet (1.2 m) or more above a lower level from falling by using guardrails or travel restraint systems. When the employer can demonstrate that using guardrail systems or travel restraint systems is not feasible, employees may perform the work without guardrails or a travel restraint system provided that the work operation for which guardrails or travel restraint systems are infeasible is in process, the employer limits access to the platform to authorized employees, and trains the authorized employees in accordance with § 1910.30.

To derive compliance costs for this provision, OSHA estimated that, of the 3,817 establishments in NAICS 3116, Animal slaughtering and processing, 25 percent are currently in compliance. The Agency based this estimate on comments by the United Food and Commercial Workers at the OSHA public hearing (Ex. 329 (1/20/2011), pp. 63, 90) indicating that a few large meatpacking plants already installed travel restraint systems for fall protection on slaughter (kill) platforms. OSHA believes that, while the meatpacking plants identified in the rulemaking record determined that travel restraint systems are technologically feasible, other affected plants will choose instead to install guardrails at a cost that is potentially lower than the cost of travel restraint systems. Therefore, the Agency estimated that, on average, 10 platforms per establishment will need fall protection and that each establishment will install two portable guardrails, at an initial cost of $256 per guardrail, on the unprotected working side of slaughter-facility platforms stations, with the installation taking 10 minutes of labor per guardrail (production worker wage = $17.19/hour). OSHA estimates that initial costs for 2,863 establishments in NAICS 3116 will total $14.7 million. Annualized over 10 years at a seven percent discount rate, compliance costs will sum to a little under $2.1 million per year for employers in animal slaughtering and processing facilities.

Walking-working surfaces not otherwise addressed. In final § 1910.28(b)(15), OSHA introduces a duty to provide fall protection for surfaces not otherwise addressed in this section. Among the surfaces affected by this catch-all paragraph are stepbolts. OSHA determined that this requirement for protection on stepbolts will primarily affect establishments in NAICS 51, Information, and NAICS 7113, Promoters of performing arts, sports, and similar events, and that the preferred fall protection will be ladder

[152] OSHA letter to Mr. O'Dea available at: *http://www.osha.gov/pls/oshaweb/owadisp.show_document?p_table=INTERPRETATIONS&p_id=24682.*

[153] OSHA letter to Mr. Harkins available at: *https://www.osha.gov/pls/oshaweb/owadisp.show_document?p_table=INTERPRETATIONS&p_id=24552.*

[154] OSHA letter to Mr. Cole available at: *https://www.osha.gov/pls/oshaweb/owadisp.show_document?p_table=INTERPRETATIONS&p_id=24802.*

safety systems. For NAICS 51, OSHA estimated there were 97,000 step-bolt structures requiring ladder safety systems across 16 four-digit NAICS industries (6,063 structures per NAICS industry). After accounting for significant baseline use of ladder safety systems (80 percent in OSHA's estimation), the Agency assigned costs for the purchase and installation of these systems at $908/unit. Similarly, for NAICS 7113, OSHA assigned costs for the purchase and installation of ladder safety systems ($908/unit) for 2,613 structures with stepbolts (the estimated baseline use of ladder safety systems was again 80 percent). Annualized over 10 years at a seven percent discount rate, costs were $2.7 million.

Fall Protection Systems and Falling-Object Protection—Criteria and Practices (§ 1910.29)

For proposed § 1910.29, OSHA determined that two requirements would impose significant new burdens on employers. Below are the details of OSHA's approach to estimating costs for this section of the standard.

Inspection of manila, plastic, or synthetic rope. The final regulatory text for § 1910.29(b)(15) requires inspection of manila, plastic, or synthetic rope used as rails and specifies that employers conduct such inspections as frequently as necessary to ensure that the rope meets the strength requirements specified in that section. The estimated inspection cost, then, would be the product of the:

• Number of guardrail systems;
• Proportion that use manila, plastic, or synthetic rope used as toprails or midrails;
• Number of inspections per year;
• Time required for each inspection (hours); and
• Average wage per inspector per industry ($/hr.).

For the PEA, OSHA lacked data on the proportion of guardrail systems that use manila, plastic, or synthetic rope as top rails or midrails. However, OSHA considered it likely that employers would include the inspection of these alternate materials for toprails and siderails in the inspections performed under § 1910.22, the general inspection requirements for walking-working surfaces for safety. Therefore, OSHA allocated no additional costs to this provision in the PEA.

For this FEA, OSHA estimated that a small percentage of employers would identify defective rope (in rail systems) as a result of the inspections implied by final § 1910.29(b)(15) and that these employers would purchase and install replacement rope. At $2.12 per foot for an estimated 20-foot (rescue-grade) guardrail rope with a working load limit of 900 lb. to 1,195 lb., and after accounting for baseline compliance with current floor guarding regulations (see Ex. [OSHA Excel Workbook], tab annual_29_b), and with an installation time of 10 minutes, OSHA estimates that the costs for repair or replacement of guardrail rope will total $0.67 million.

Outdoor advertising. Final § 1910.29(h) concerns the use of qualified climbers in the outdoor-advertising/billboard industry. Qualified climbers are an option available only to this industry for two years following publication of the final standard. Final paragraph (h) requires that qualified climbers:

• Be physically capable of performing the climbing duties (§ 1910.29(h)(1));
• Undergo training or an apprenticeship program (§ 1910.29(h)(2));
• Be retrained as necessary (§ 1910.29(h)(2));
• Have the skill necessary to climb ladders, as demonstrated through formal classroom training or on-the-job training, and personal observation (§ 1910.29(h)(3)); and
• Perform climbing duties as one of their routine work activities (§ 1910.29(h)(4));

For the purposes of estimating costs, OSHA in the PEA assumed that 90 percent of the employees in the outdoor advertising industry who climb already had training as qualified climbers. Thus, there would be one-time costs associated with qualifying the remaining 10 percent of climbers. OSHA annualized these costs over 10 years at a rate of seven percent. The industry incurs annual costs for:

• Classroom training of new employees (§ 1910.29(h)(2) and (h)(3)));
• Retraining of employees as necessary (§ 1910.29(h)(2));
• Employer performance observation (§ 1910.29(h)(3)); and
• Administrative costs to document training and retraining.

For calculating one-time costs in the PEA, OSHA estimated that 713 out of 7,132 of the employees (10 percent) who perform construction, installation, maintenance, and repair operations in NAICS 5418 (Advertising and related services) would need to undergo training to be qualified climbers.

The National Association of Tower Erectors developed a climber-training standard with varying levels of expertise (authorized, competent, and competent rescuer), but does not offer training itself (NATE, 2006). The OSHA Training Institute offers three-day and four-day training courses in fall protection, the fees for which range from $549 to $795. Commercial courses in fall protection reviewed by ERG on the internet in the mid-2000s ranged from one to five days with costs ranging from $500 to $2,500 per course (ERG, 2007). The prices include materials and the trainer's time.

For the purpose of estimating costs, OSHA in the PEA estimated that employers could meet the requirements in the proposed standard by sending employees to a four-day training course at a cost of $1,500 for the course and $684 for the employee's time (based on an average wage of $21.39/hour for 32 hours), for a total of $2,184. Furthermore, the Agency estimated that the administrative tasks to document the training would require 15 minutes of a supervisor's time ($36.22/hour) for every 10 employees trained. OSHA in the PEA estimated that the one-time cost to qualify the estimated 713 climbers would be $1.56 million, and the annualized cost would be $0.22 million per year.[155] For this FEA, the Agency updated the employee's wage rate ($22.76/hour), the supervisor's wage rate ($36.07/hour), and the number of affected employees (10 percent of 8,000, or 800 employees), resulting in an estimated one-time cost of $1.78 million, with an annualized cost of $0.25 million at a seven percent discount rate over 10 ten years.

For the purposes of estimating the annual costs associated with this provision, OSHA, consistent with the method presented in the PEA, applied the following unit estimates and assumptions:

• A supervisor observes each of the estimated 8,000 qualified climbers for 15 minutes per quarter or 1 hour per qualified climber per year;
• A supervisor spends 15 minutes per year per qualified climber on administrative tasks for training and retraining;
• Ten percent of the climbers need retraining;
• Retraining consists of an eight-hour refresher course at a cost of $500; and
• The turnover rate is 47 percent;
• In the absence of this rule, no newly-hired workers would receive training that is compliant with the rule's requirements.

Based on these estimates and assumptions, OSHA determined that the annual cost of this provision would be $12.2 million, of which $11.6 million

[155] Employers may offer on-the-job training, and would presumably do so if the costs are less than the costs of commercial training. Thus, the estimated costs presented here may be conservative.

involves training new hires.[156] OSHA requested comment in the proposal on the assumptions and unit-cost estimates that it applied in its analysis of costs for qualified-climber training. In a post-hearing comment, the Outdoor Advertising Association of America (OAAA) provided data on the estimated number of sign structures (120,000 units), professional climbers (1,800 climbers), and climbs on fixed ladders (14,400 climbs per day) for OAAA member companies (Ex. 260). Although OAAA's figure for the number of climbers (1,800) is considerably lower than OSHA's estimate (8,000), OSHA notes that not all outdoor advertisers are OAAA members. Without further data on the number of professional climbers in the industry, OSHA was not able to further refine its preliminary estimate that all employees in NAICS 5418, Advertising and Related Services, involved with construction, installation, maintenance, and repair operations would be affected by the requirement for qualified-climber training. Therefore, other than applying the Census-related update from 7,132 affected workers to 8,000 affected workers, OSHA applied the PEA methodology to this FEA without change.

Training Requirements (§ 1910.30)

Fall hazards and equipment hazards. Final § 1910.30(a) addresses training with respect to fall hazards for employees who use personal fall protection systems or who must receive the training specified elsewhere in subpart D before the employer exposes employees to a fall hazard. This provision requires that a qualified person conduct the training and the training:

- Include the types of fall hazards found in the workplace;
- Describe the procedures employees are to follow to minimize these hazards;
- Address the correct and safe procedures for installing, inspecting, operating, maintaining, and disassembling the personal fall protection systems the employee uses; and
- Address the correct and safe use of personal fall protection systems and equipment specified by this section, including, but not limited to, proper hook-up, anchoring, and tie-off techniques, and methods of equipment inspection and storage, as specified by the manufacturer.

Final § 1910.30(b) addresses training with respect to equipment hazards. In particular, employers must train employees in the proper:

- Care, storage, use, and inspection of equipment covered by subpart D before their use in accordance with recognized industry practices and manufacturer's recommendations;
- Placement and securing of dockboards to prevent unintentional movement;
- Rigging and safe use of rope descent systems; and
- Set-up and use of designated areas.

OSHA included the costs for training required under final § 1910.27(b)(2) (Use of rope descent systems), § 1910.28(b)(1) (Unprotected sides and edges), and § 1910.28(b)(4) (Dockboards) in the cost estimate for final § 1910.30.

In a previous analysis, ERG estimated the number and percent of employees by industry that use personal protective equipment (PPE) such as body belts and body harnesses (ERG, 1999; Ex. 318). For the PEA, OSHA applied these industry-specific percentages to the number of at-risk employees in 2007 to estimate the number of employees that need the type of training required under § 1910.30. For this FEA, OSHA applied the preliminary industry-specific PPE percentages to the number of at-risk employees to derive an estimate of employees requiring PPE training.

Some companies already provide this training. OSHA used data from the NOES survey (described above) to estimate, by NAICS code, the level of training already provided. For the purpose of estimating costs in the PEA, OSHA assumed that employees not already trained and using personal fall protection systems would undergo six hours of training on fall hazards and equipment hazards to address the requirements in proposed § 1910.30(a) and (b)(1). For this FEA, OSHA applied the PEA's per-employee estimate of six hours of training for determining the costs of final § 1910.30(a) and (b)(1).

In the PEA cost model, OSHA assigned employees in the utility, sewage, and communications industry sectors (NAICS 2211–2213 and 5121–5191) an additional half-day of training to specifically address the proposed requirements for step bolts (for a total of 10 hours of training). Similarly, the Agency assigned employees in NAICS codes 4881 through 4884 (support activities for transportation by air, rail, water, and road, respectively) a half-day of training specifically to address requirements for dockboards. OSHA assigned window washers, found in NAICS 5617 (Services to buildings and dwellings), an entire day of training on rope descent systems (for a total of 14 hours of training). OSHA applied these preliminary training-cost estimates to this FEA. In addition, for this FEA, OSHA applied an hour of training on the use of fall protection equipment to employees in every NAICS code, except those codes listed immediately above, for which OSHA's PPE cost survey (ERG, 1999) indicated the presence of employees who use fall protection equipment.

As specified in the final standard, a qualified person provides the required training. For the purpose of estimating costs, OSHA (as it did in the PEA and also in this FEA) assumed that the qualified person conducts the training at the workplace for a fee of $500 per day. The training fee includes instruction, travel, lodging, and per diem expenses, as well as hand-out materials. Employers incur this fee for every 10 employees (*i.e.,* a class size of 10 employees). OSHA estimates that a supervisor would spend 15 minutes per employee per year performing administrative tasks such as maintaining and updating training records.

The estimated total initial one-time cost for final § 1910.30(a) and (b) is $123.6 million. The annualized cost over 10 years at a discount rate of seven percent is $17.6 million. There also is an annual cost for training new employees on PPE and dockboards. OSHA applied BLS hires rates to estimate the annual number of new employees requiring training;[157] the estimated annual cost for this requirement is $54.6 million.

Ameren Corporation appeared to believe that OSHA's time estimates of course durations used in its cost algorithms for training implied that the Agency would enforce minimal time standards for training. Ameren stated, ''There should be no time requirement. This moves away from performance based completely. The training should

[156] OSHA assumes that qualified climbers could not transfer their training from one employer to another employer.

[157] The BLS 2007 hires rates applied in the analysis are as follows: Mining and Logging (NAICS 1133, 2111)—45.4 percent; Durable Goods Manufacturing (NAICS 321, 33)—29.8 percent; Nondurable Goods Manufacturing (NAICS 31, 322, 323, 324, 325, 326)—36.9 percent; Transportation, Warehousing, and Utilities (NAICS 22, 48–49)—36.3 percent; Wholesale Trade (NAICS 42)—34.9 percent; Retail Trade (NAICS 44–45)—58.8 percent; Information (NAICS 51): 31.2 percent; Finance and Insurance (NAICS 52): 31.7 percent; Real Estate and Rental Leasing (NAICS 53)—47.6 percent; Professional and Business Services (NAICS 54–56)—63.1 percent; Educational Services (NAICS 61)—30.7 percent; Health Care and Social Assistance (NAICS 62)—35.4 percent; Arts, Entertainment, and Recreation (NAICS 71)—81.8 percent; Accommodation and Food Services (NAICS 72)—82.8 percent; and Other Services (NAICS 81)—41.9 percent. The annual number of affected new employees totals 233,328 within 6.9 million affected establishments, or 0.03 employees per affected establishment.

cover the elements of all the fall protection systems that an employee will encounter and the uses, restrictions, etc. of each'' (Ex. 189). In response, OSHA notes that the time estimates used in its cost analyses for training and other requirements for a safety program are only to illustrate the Agency's estimates of typical or average times to complete these requirements, and that actual times may vary substantially from these estimates.

Retraining. Final § 1910.30(c) concerns the need to retrain employees whenever the employer has reason to believe that retraining is necessary for safety purposes. This need can occur because of changes in the workplace, fall protection systems, or fall protection equipment that render previous training invalid; or finding that employee knowledge or use of fall protection systems or equipment is no longer adequate. In the PEA, OSHA assumed that retraining already occurs at establishments that have training programs in place. For the remaining employees, OSHA assumed that five percent require retraining each year. OSHA estimated that the retraining course consists of a one-hour supervisor-led refresher course that focuses on the areas in which the employee is deficient. For this FEA, the estimated annual costs for retraining total $2.0 million.

b. Estimated Compliance Costs by Provision in the Final Standard for Subpart I

Hazard assessment. Final § 1910.132(d) requires an employer to assess the workplace to determine if hazards are present or are likely to be present. In the PEA, OSHA assumed that the time needed by an employer to walk around the workplace, assess the potential hazard, and determine the appropriate PPE and training needed by the employees would vary with the size of the establishment. OSHA used the number of employees as an indicator of establishment size. OSHA estimated the time required for the hazard assessment as:

- 1 to 19 employees: 1 hour
- 20 to 99 employees: 2 hours
- 100 to 499 employees: 3 hours
- 500+ employees: 4 hours

Furthermore, OSHA assumed:

- All establishments in the forestry, oil and gas, utility, manufacturing, and transportation sectors (NAICS 1131 through 3399 and 4811 through 4931) would perform a hazard assessment because of the high level of risk involved in these sectors;
- Half the establishments in wholesale and retail sales (NAICS 4231 through 4543) would have slip, trip, or fall hazards such that they would be required to perform a hazard assessment;
- One-quarter of the establishments in the service industries (NAICS 5111 through 8139) would have slip, trip, or fall hazards such that they would be required to perform a hazard assessment; and
- According to the original Regulatory Impact Analysis for PPE and as reported in the 2013 Information Collection Request for PPE in general industry, 47 percent of establishments conduct the initial hazard assessment as a usual and customary practice.[158]

This analysis resulted in a one-time cost of $79.0 million in the PEA, with an annualized cost of $11.3 million at seven-percent discount rate over 10 years. For this FEA, after adjusting for differences in wages and industry size and composition since the publication of the NPRM, one-time costs for the hazard-assessment requirement were $85.2 million, with annualized costs of $12.1 million.

In addition to the costs for assessing hazards in walking-working environments where the use of fall protection will be necessary, OSHA anticipates that employers will incur expenditures to address any hazards identified during the assessments. According to 2005 OSHA inspection data, the likelihood of a compliance violation of current Subpart D ranges from 0.24 percent (of inspections) for the Finance and Insurance industry sector to 0.81 percent for Wholesale Trade sector. Multiplying these noncompliance rates by the annual number of new employers entering business (determined by NAICS code as the product of a 7 percent establishment turnover rate and the number of establishments) and the cost of a typical correction—the purchase and ten-minute installation of a 6-ft. portable guardrail ($256 per guardrail + labor)—OSHA estimates that the costs for correcting hazards identified by the assessments required under § 1910.132(d) will total $0.52 million. (See Ex. [OSHA Excel Workbook], tabs Compliance and Hazard Assessment & Training.)

Summing the costs for hazard assessment and hazard correction implied by compliance with final § 1910.132(d), OSHA estimates that total costs for this provision will be approximately $12.7 million.

Ameren Corporation questioned whether, in light of existing OSHA standards, OSHA's assignment of costs for this provision was necessary. Ameren stated, ''This seems to be redundant whereas currently assessing fall protection needs is performed in accordance to the specific standard in which it is addressed'' (Ex. 189). In response, OSHA notes that, prior to the publication of the fall protection requirements in final subpart I, no standard explicitly requiring hazard assessment for fall protection in the workplace existed for general industry; therefore, OSHA must account for the incremental compliance burden resulting from these requirements.

PPE training. Final § 1910.132(f) requires that employers train employees before they use PPE in the workplace. OSHA included the costs for this final provision in the costs for § 1910.30, described earlier.

PPE inspection. Final § 1910.140(c)(18) requires employers to inspect that personal fall protection systems before the initial use during each work shift for mildew, wear, damage, and other deterioration, and remove defective components from service. For the purposes of estimating costs, OSHA in the PEA assumed that *on average* each production employee who requires fall protection wears a personal fall protection system regularly, performs the required inspection *once a week* at the beginning of every workweek, works 50 weeks per year, and takes one minute to inspect the fall protection system (wage rates varied across four-digit NAICS codes). Beginning with a baseline estimate of the number of workers using fall protection (2.1 million employees), OSHA accounted for current PPE inspection (''current compliance'') by applying results from the NIOSH NOES database. In its use of that survey, OSHA regarded the percentage of employers conducting safety training as a reasonable proxy for PPE inspection. Reducing the affected workforce by the percentage currently conducting PPE inspection, OSHA derived a final estimate of 362,000 affected employees. OSHA's estimated cost for this provision in the PEA was approximately $7.3 million per year; for this FEA, the Agency estimated the cost to perform the inspection to be $10.2 million a year.

Inspection of personal fall arrest systems will likely lead to the discovery of defective PPE, resulting in costs to repair or replace out-of-compliance PPE. OSHA expects that most employers will

[158] See the Information Collection Request For Personal Protective Equipment (PPE) For General Industry (29 CFR Part 1910, Subpart I)) Office of Management and Budget (OMB) Control No. 1218–0205 (January 2013), p. 5. Docket No. OSHA–2013–0004, Document ID 0002.

opt to replace faulty PPE; to simplify the calculation of costs, OSHA conservatively chose one of the most expensive types of PPE needing replacement, a full-body harness ($118 per unit) and applied a non-compliance rate to the percentage of employers who at the baseline (*i.e.,* lacking NIOSH NOES training) are currently not conducting PPE inspection. To estimate the rate of non-compliance, OSHA identified current Subpart M, Fall Protection, § 1926.502, Fall protection systems criteria and practices, in the construction CFR, as the standard analogous to final § 1910.140. The OSHA inspection database for the most recent fiscal year (2015) reports that of 38,029 inspections in NAICS 23, Construction, 544 inspections, or 1.43 percent, resulted in citations for violation of § 1926.502.[159] Applying this PPE criteria violation rate in Construction, 1.43 percent, to the number of affected establishments in general industry, and multiplying that product times the unit cost of harnesses, OSHA estimates that the cost for replacing defective PPE under § 1910.140 will total $0.85 million.

Summing the costs for PPE inspection and PPE replacement, OSHA estimates that employers will incur $11.0 million in new costs associated with the final provisions under § 1910.140.

Rule Familiarization

For this final economic analysis, OSHA has added an estimate for the compliance expenditures incurred by employers to gain familiarity with the final rule. OSHA estimated costs for rule familiarization by applying the methodology described above for Hazard Assessment and Training (§ 1910.132(d)), shown in the following exhibit. All other training costs associated with the final standard are addressed above under § 1910.30.

For the industries with less than 100 percent share needing hazard assessment, OSHA applied the estimated percentage to the time assumptions shown in Exhibit V–3. For example, for a very small (<20 employees) retail establishment: 50% needing familiarization * 10 minutes = 5 minutes per employer. For the industries where 100 percent of establishments will conduct hazard assessment, the average unit time per employment range (1–19, 20–99, etc.) shown in the exhibit was multiplied times the entire number of number of establishments whose employment falls within the range, by four-digit NAICS industry.[160] All affected NAICS industries and establishments were costed. Labor costs were calculated using supervisor loaded wage, by NAICS industry. Costs for rule familiarization are expected to total $28.5 million in first-year costs, or $4.1 million per year when annualized over ten years.

Exhibit V-3 Rule Familiarization

Baseline Assumptions			
Rule Familiarization (minutes)		Share of Establishments Needing Hazard Assessment	
		Forestry, etc.	100.0%
		Oil and gas	100.0%
		Utility	100.0%
		Manufacturing	100.0%
1-19 Employees	10	Transportation	100.0%
20-99 Employees	15	Wholesale	50.0%
100-499 Employees	20	Retail	50.0%
500+ Employees	30	Service	25.0%

[160] For example, for NAICS 2211: Electric power generation, transmission and distribution, in the Utility industry sector, the cost calculation was as follows: ((1,529 very small establishments * 0.17 hours) + (152 small establishments * 0.25 hours) + (30 mid-size establishments * 0.33 hours) + (44 large establishments * 0.5 hours)) * ($54.24 production worker supervisor hourly wage for NAICS 2211) = $17,620. Analogous calculations were performed for each industry and summed to produce a total of $28.5 million in first-year costs. See Ex. [OSHA Excel workbook], tab Rule Familiarization.

7. Cost Summary

Tables V–25 through V–27 summarize the costs by industry for each paragraph in the final standard. Table V–25 lists the first-year costs, which employers incur once to comply with the new requirements. For evaluating economic impacts, OSHA annualized these one-time costs over a 10-year period at a discount rate of 7 percent. Total first-year costs for final subparts D and I are $319.5 million, with annualized costs for the first year of $45.5 million.

Table V–26 lists the recurring annual costs, such as inspections, training new employees, and maintaining safe conditions when fall hazards remain; OSHA estimates these costs to be $259.0 million. Table V–27 lists the annual costs by industry, which include the sum of the recurring costs and the annualized one-time costs; OSHA estimated these costs at $305.0 million.

Listing annualized costs in descending order by section of the rule, OSHA projects that the most costly provisions address training programs ($74.2 million), scaffolds and rope descent systems ($71.6 million), duty to have fall protection and falling-object protection ($55.9 million), and general requirements ($33.2 million). Of these final costs, the most significant change in costs from the PEA involve the costs associated with the duty to have fall protection and falling-object protection (§ 1910.28) ($55.9 million in FEA vs. $0.09 million in the PEA) because the strengthened requirements for fixed ladders, roof edges, slaughtering platforms, and step bolts lead to additional employer expenditures for equipment and labor.

For the category with the second largest compliance costs, scaffolds and rope descent systems, the final standard provides greater specificity than the proposal regarding the need for proper rigging, including sound anchorages and tiebacks. The final rule at § 1910.27(b)(1)(i) and (ii) states that before any rope descent system is used, the building owner must inform the employer, in writing that the building owner has identified, tested, certified, and maintained each anchorage so it is capable of supporting at least 5,000 pounds (22.2 kN) in any direction, for each employee attached and, moreover, that the employer must ensure that no employee uses any anchorage before the employer has obtained written information from the building owner that each anchorage meets the requirements of paragraph (b)(1)(i). Finally, the employer must keep the information on building anchorages for the duration of the job. The information must be based on an annual inspection conducted by a qualified person, with certification of each anchorage performed by a qualified person, as necessary, but at least every 10 years. As described earlier in this cost analysis, OSHA assumed that building owners and employers would comply with this requirement by scheduling periodic inspections and certifications of building anchorages.

Because of the hazards associated with cleaning windows of office buildings and other tall structures while suspended on scaffolds or other devices (see Table V–6 for the number of reported fatalities in NAICS 561, Administrative and Support Services), OSHA raised the issue of proper safety during window cleaning in the 2003 notice that reopened the rulemaking record, and in the 2010 NPRM. In those notices, OSHA requested comment on the hazards associated with window cleaning and the safe practices recommended and implemented for the use of rope descent systems (68 FR 23534; 75 FR 28862). OSHA based its analysis of the costs of ensuring sound anchorages and rigging, described above, as well as the Agency's analysis of the costs for protecting workers on rope descent systems and suspended scaffolds, on the experiences and observations of the industry representatives who responded to OSHA's request for comment in 2003 and in OSHA's 2010 NPRM; therefore, the Agency believes that the record fully supports this cost analysis.

BILLING CODE 4510–29–C

G. Economic Feasibility and Regulatory Flexibility Screening Analysis

1. Introduction

OSHA determined that the costs of complying with the requirements of final subparts D and I will not impose substantial economic impacts on employers in the industries affected by the final rule. The costs imposed by the final standards are modest, and the increased safety and reduction in injuries and fatalities associated with the standards will reduce employers' direct and indirect costs. OSHA based this final economic-impacts analysis on the PEA, the rulemaking record, and revisions to OSHA's preliminary data as described above in section C (''Profile of Affected Industries, Firms, and Workers'') and section F (''Costs of Compliance'').

Table V–28 summarizes OSHA's final estimate of impacts (annualized costs) for the two-digit NAICS industry groups affected by the final standards. ''Minimum'' and ''Maximum'' refer to the lowest and highest costs among the four-digit NAICS industries categorized within the two-digit group. The following section discusses OSHA's methodology for assessing the significance of the impacts at the aggregate level presented in Table V–29 and at levels of greater industry detail.

2. Economic Screening Analysis

To determine whether the final rule's projected costs of compliance would raise issues of economic feasibility for employers in affected industries, *i.e.,* would adversely affect the competitive structure of the industry, OSHA first compared compliance costs, annualized at a 7 percent discount rate, to industry revenues and profits. OSHA then examined specific factors affecting individual industries for which compliance costs represent a significant share of revenue, or for which the record contains other evidence that the standards could have a significant impact on the competitive structure of the industry.

As noted, OSHA examined the potential impacts of the final rule two ways, *i.e.,* as a percentage of revenues and as a percentage of profits. Table V–29 presents the estimated average receipts and profits by establishment and industry. In the PEA, OSHA, applying the methodology employed by ERG (ERG, 2007), estimated 2006 receipts based on 2002 receipts and payroll data from U.S. Census Bureau, *Statistics of U.S. Businesses, 2002,* and payroll data from U.S. Census Bureau, *Statistics of U.S. Businesses, 2006*. For that calculation, OSHA assumed that the ratio of receipts to payroll remained unchanged between 2002 and 2006.

For this FEA, OSHA applied *Statistics of U.S. Businesses, 2007* data on establishments, firms, and revenue at the four-digit NAICS level. OSHA estimated profits from ratios of net income to total receipts as reported for 2000–2008 (nine-year average) by the U.S. Internal Revenue Service, *Corporation Source Book* (IRS, 2009). Profit data were not available at disaggregated levels for all industries; therefore, OSHA used profit rates at more highly aggregated levels for such industries.

BILLING CODE 4510–29–P

Table V-28
Summary of Cost Impacts Associated with OSHA's Final Standards for Subparts D and I

NAICS	Sector Title	Average Cost per Establishment, Annualized with a 7% Discount Rate		Ratio of Average Annualized Cost to Revenues		Ratio of Average Annualized Cost to Profits	
		Minimum	Maximum	Minimum	Maximum	Minimum	Maximum
11	Agriculture, Forestry, Fishing, and Hunting	$9	$15	0.001%	0.001%	0.015%	0.039%
21	Mining*	$237	$237	0.001%	0.001%	0.005%	0.005%

[a] Estimated based on receipts data from U.S. Census Bureau, Statistics of U.S. Businesses, 2007.

[b] Estimated from average of the yearly ratios of net income to total receipts as reported by the U.S. Internal Revenue Service, Corporation Source Book, 2000–2008. Data were not available at disaggregated levels for all industries; OSHA used profit rates at more highly aggregated levels for such industries.

*Profit rate imputed from corresponding 3-digit NAICS industry.

**Profit rate imputed from corresponding 2-digit NAICS industry.

Source: U.S. Department of Labor, OSHA, Directorate of Standards and Guidance, Office of Regulatory Analysis-Safety.

OSHA compared the baseline financial data with total annualized incremental costs of compliance by computing compliance costs as a percentage of revenues and profits. The Agency considers this impact assessment for all firms, presented in Tables V–28 and V–29, to be a screening analysis and the first step in OSHA's analysis of whether the compliance costs potentially associated with the final standards would lead to significant impacts on establishments in the affected industries. The impact of the final standards on the viability of establishments in a given industry depends, to a significant degree, on the price elasticity of demand for the services sold by establishments in that industry.

Price elasticity refers to the relationship between the price charged for a service and the quantity of that service demanded; that is, the more elastic the relationship, the less able is an establishment to pass the costs of compliance through to its customers in the form of a price increase, and the more it will have to absorb the costs of compliance from its profits. When demand is inelastic, establishments can recover most of the costs of compliance by raising the prices they charge for that service; under this scenario, profit rates remain largely unchanged, and the industry remains largely unaffected. Therefore, any impacts are primarily on the consumers using the relevant services. However, when demand is elastic, establishments cannot recover all the costs simply by passing the cost increase through in the form of a price increase. Instead, they must absorb some of the increase from their profits, commonly by both reducing the quantity of goods and services produced and reducing total profits, though, in some cases, profits rate may remain unchanged. If demand is not perfectly elastic and if at least some of the costs in question are variable rather than fixed, ''when an industry is subject to a higher cost, it does not simply swallow it, it raises its price and reduces its output, and in this way shifts a part of the cost to its consumers and a part to its suppliers,'' as the court stated in *American Dental Association* v. *Secretary of Labor* (984 F.2d 823, 829 (7th Cir. 1993)).

The court's summary is in accordance with micro-economic theory (subject to some caveats discussed below). In the long run, firms can only remain in business if their profits are adequate to provide a return on investment that ensures that investment in the industry will continue. Over time, because of rising real incomes and productivity, firms in most industries are able to maintain adequate profits. As technology and costs change, however, the long-run demand for some products increases and the long-run demand for other products decreases. In the face of rising external costs, firms that otherwise have a profitable line of business may have to increase prices to stay viable. Commonly, increases in prices result in reduced quantity demanded, but rarely eliminate all demand for the product. Whether this decrease in production results in smaller production for each establishment within the industry or in closing some plants within the industry, or a combination of these two effects, depends on the cost and profit structure of individual firms within the industry.

If demand is completely inelastic (*i.e.,* price elasticity is 0), then the impact of variable compliance costs (that is, costs that depend directly on the quantity of output produced) that are 1 percent of revenues for each firm in the industry would result in a 1 percent increase in the price of the product or service, with no decline in quantity demanded. Such a situation represents an extreme case, but might be correct in situations in which there are few if any substitutes for the product or service in question, or if the products or services of the affected sector account for only a small portion of the income of its consumers.

If demand is perfectly elastic (*i.e.,* the price elasticity is infinitely large), then no increase in price is possible and before-tax profits would decrease by an amount equal to the costs of compliance (minus any savings resulting from improved employee health and/or reduced insurance costs) should the industry attempt to keep producing the same amount of goods and services. Under this scenario, if the costs of compliance are such a large percentage of profits that some or all plants in the industry can no longer invest in the industry and receive an adequate return on investment, then some or all of the firms in the industry will close. The scenario of perfectly elastic demand can only arise when there are other goods and services that are, in the eyes of the consumer, perfect substitutes for the goods and services the affected establishments produce.

A common intermediate case would be a price elasticity of one. In this situation, if the costs of compliance amount to 1 percent of revenues and are entirely variable rather than fixed, then production would decline by 1 percent and prices would rise by 1 percent over the long run. In this case, the industry revenues would stay the same, with somewhat lower production, but with similar profit rates. However, consumers would get less of the product or the service for their expenditures, and producers would have lower total profits; this, as the court described in *American Dental Association* v. *Secretary of Labor,* is the more typical case.

If compliance costs are fixed—that is, they do not depend on quantity of output produced—they cannot be passed through to consumers in the short run. In the medium- to long-run, however, some producers may exit the industry, or new producers may fail to enter an industry to replace natural exit, thus decreasing total supply, increasing prices, and reducing the portion of costs borne by producers that remain in the industry (except in the case of perfectly elastic demand, as discussed above).

However, there is still the question of whether these costs will reduce significantly the industry's competitive structure. For example, if an industry faces a 20 percent increase in costs due to a standard, and its product has an elasticity of demand of one, the industry may likely remain viable. However, if the standard leads to closing all small firms in the industry, this result would indicate that standard impaired the competitive structure of the industry. For this reason, when costs are a significant percentage of revenues, OSHA examines the differential costs by size of firm and other classifications that may be important.

As indicated by the impact estimates shown in Tables V–28 and V–29, OSHA determined that, for all affected establishments in general industry, revenue impacts will not exceed 0.2 percent for any affected industry group, and profit impacts will not exceed 3.1 percent for any affected industry group. Therefore, the economic impact of the final rule will most likely consist of a small increase in prices of less than 0.2 percent for the goods and services provided by the affected employers. It is unlikely that a price increase of the magnitude of 0.2 percent will significantly reduce the quantity of goods or services demanded by the public or any other affected customers or intermediaries. If industry can recoup substantially the compliance costs of the final rule with such a minimal increase in prices, there may be little effect on profits.

In general, for most establishments, it would be unlikely that they could not pass some of the compliance costs along in the form of increased prices. In the event that unusual circumstances may inhibit even a price increase of 0.2 percent, profits in the majority of affected industries would decrease by a maximum of about 0.1 percent.

In profit-earning entities, a combination of increases in prices or reduction in profits generally can absorb compliance costs. As discussed above, the extent to which the impacts of cost increases affect prices or profits depends on the price elasticity of demand for the products or services produced and sold by the entity.

Given the small incremental increases in prices potentially resulting from compliance with the final standards, and the lack of readily available substitutes for the products and services provided by the covered industry sectors, OSHA expects demand to be sufficiently inelastic in each affected industry to enable entities to substantially offset compliance costs through minor price increases without experiencing any significant reduction in total revenues or in net profits.

Positive net benefits of a regulation can only be realized in the presence of an externality or other market failure; until now, society externalized many of the costs associated with the injuries and fatalities resulting from the hazards addressed by the final rule. That is, the prices of goods and services did not reflect the costs incurred by society from the fall-related injuries and death that occur during the production of these goods and services. The workers who suffer the consequences associated with the fall hazards also assume some of the costs of production. To the extent that society externalizes fewer of these costs, the price mechanism will enable the market to produce a more socially efficient allocation of resources. However, reductions in externalities alone do not necessarily increase efficiency or social welfare unless the benefits outweigh the costs of achieving the reductions.

OSHA concludes that compliance with the requirements of the final standards is economically feasible in every affected industry sector. The Agency basis this conclusion on the criteria established by the OSH Act, as interpreted in relevant case law. In general, the courts hold that a standard is economically feasible if there is a reasonable likelihood that the estimated costs of compliance ‘‘will not threaten the existence or competitive structure of an industry, even if it does portend disaster for some marginal firms’’ (*United Steelworkers of America* v. *Marshall,* 647 F.2d 1189, 1272 (D.C. Cir. 1980)). As demonstrated by this FEA and the supporting evidence, the potential impacts associated with achieving compliance with the final rule fall well within the bounds of economic feasibility in each industry sector.

OSHA does not expect compliance with the requirements of the final standards to threaten the viability of entities, or the existence or competitive structure of any of the affected industry sectors. In addition, based on an analysis of the costs and economic impacts associated with this rulemaking and the review of the record, OSHA concludes that the effects of the final rule on international trade, employment, wages, and economic growth for the United States would be negligible.

H. Regulatory Flexibility Screening Analysis

1. Introduction

The Regulatory Flexibility Act, as amended in 1996, requires the preparation of a Final Regulatory Flexibility Analysis (FRFA) for any rule that determined to have a significant economic impact on a substantial number of small entities (5 U.S.C. 601–612). Under the provisions of the law, each such analysis must contain:

- A description of the impact of the rule on small entities;
- A statement of the need for, and objectives of, the rule;
- The response of the Agency to any comments filed by the Chief Counsel for Advocacy of the Small Business Administration in response to the proposed rule, and a detailed statement of any revisions made to the proposed rule in the final rule as a result of these comments;
- A statement of the significant issues raised by the public comments in response to the initial regulatory flexibility analysis, a statement of the assessment of the agency of such issues, and a statement of any revisions made in the proposed rule as a result of such comments;
- A description and an estimate of the number of small entities to which the rule will apply, or an explanation of why no such estimate is available;
- A description of the projected reporting, recordkeeping, and other compliance requirements of the rule, including an estimate of the classes of small entities that will be subject to the requirements and the type of professional skills necessary for preparation of the report or record; and
- A description of the steps the agency took in the final rule to minimize the significant economic impact on small entities consistent with the stated objectives of the applicable statutes, including a statement of the factual, policy, and legal reasons for selecting the alternative adopted in the final rule, and why the agency rejected each of the other significant alternatives to the rule considered by the agency that affect the impact on small entities.

To determine the need for a FRFA, OSHA conducted a regulatory flexibility screening analysis to assess the potential impacts of the proposed standards on affected small entities. On the basis of the screening analysis, presented below, the Assistant Secretary certifies that it does not expect the final standards for walking-working surfaces and personal protective equipment to have a significant impact on a substantial number of small entities.

2. Impact of the Final Rule on Small Entities

Based on the PEA and comments in the rulemaking record, OSHA estimated compliance costs and economic impacts for small entities affected by the final rule. Tables V–2 and V–3 in Section C presented, respectively, the profiles for two classes of general industry entities: Those entities classified as small according to Small Business Administration (SBA) criteria, and those entities with fewer than 20 employees. OSHA assigned costs to small entities by first determining the per-employee compliance costs for those cost items that are a function of the number of affected employees at a facility, and the per-establishment cost for those items that do not vary with establishment size. OSHA then calculated, by industry, the average number of employees for each of the two classes of small entities, multiplied these averages by per-employee compliance cost, and then added the establishment-based cost to determine the average compliance cost for each class of small entity. The Agency then multiplied these average costs by the numbers of small entities to produce the total compliance costs in each industry incurred by small entities.

Table V–30 shows the resultant annualized compliance costs by industry sector for SBA-defined small entities, while Table V–31 shows the costs for entities with fewer than 20 employees. Compliance costs for SBA-defined small entities totaled $202.6 million, compared to $305.1 million for all entities. Compliance costs for entities with fewer than 20 employees totaled $161.6 million.

OSHA calculated the economic impacts of these costs by comparing average compliance costs with average receipts and profits. Tables V–32 and V–33 display the results of these calculations by four-digit NAICS industry sectors; these results are OSHA’s final assessment of impacts on

SBA-defined small entities and entities with fewer than 20 employees (''very small entities''). Among SBA-defined small entities, compliance costs were less than three percent of profits for nearly all industries, and larger than one percent for only two industries: NAICS 2213, Water, Sewage and Other Systems (5.3 percent); and NAICS 5617, Services to Buildings and Dwellings (2.6 percent). For entities with fewer than 20 employees, compliance costs as a percent of profits were less than five percent for nearly all industries, and larger than two percent for only two industries: NAICS 2213, Water, Sewage and Other Systems (11.7 percent); and NAICS 5617, Services to Buildings and Dwellings (4.2 percent).

For one industry group, chimney-cleaning services, found in NAICS 56179, Other Services to Buildings and Dwellings, OSHA estimates that, for the approximately 6,000 establishments providing chimney-cleaning services affected by the final rule, economic impacts could be significant. OSHA estimates that compliance costs could reach 0.6 percent of pre-regulation revenue if the establishments passed all costs forward to customers (primarily homeowners) or, at the other extreme, costs could approach 15.4 percent of pre-regulation profits if the establishments passed none of the costs forward to customers, but instead absorbed the costs from profits. For several reasons, OSHA believes that demand for chimney-cleaning services is relatively inelastic and, therefore, cost impacts are more likely to result in price adjustments than profit reduction.

On the question of passing compliance costs forward to customers, the National Chimney Sweep Guild noted in a pre-hearing comment:

> Unless the homeowner is willing to pay for this added time, then each job becomes less profitable. Furthermore, the additional time required to perform the work would significantly reduce the number of jobs that could be performed per day to the point where the business would have to double its staff to perform the same number of jobs and the business would no longer be profitable. Especially in the current economic climate, homeowners are generally unwilling to absorb these added costs. (Ex. 296, p. 29.)

OSHA disagrees with this comment because, first, all employers providing chimney-cleaning services would face the new requirements at the same time and, therefore, would have few incentives to hold the price of the services steady at pre-regulation levels with the expectation of gaining enough additional business to offset the compliance costs.

Second, chimney-cleaning services involve almost exclusively domestic American businesses. Therefore, international-trade factors would not present competitive pressures to keep prices at the baseline levels (thereby reducing profits).

Third, under the final rule, in the event that conventional fall protection is infeasible or creates a greater hazard, employers could develop a fall protection plan, the costs of which are likely to be minimal because templates for such plans should be readily available on the Internet. In such cases, employers likely would pass the cost forward to customers.

Finally, OSHA believes the increase in price resulting from the cost increase would be modest. Accordingly, the price increase would not dissuade homeowners from continuing a contractual relationship with chimney-cleaning services.

Table V-32
Average Cost Impacts on Small Business Entities Affected by OSHA's Final Revision to Subparts D and I
(per Entity, by 4-Digit NAICS Code)

NAICS	Industry	SBA Employment Size Criterion [a]	Estimated Receipts, 2007 ($1,000)[b]	Entities [c]	Average Receipts per Entity	Profit Rate [d]	Estimated Profits per Entity	Estimated Cost of the Final Rule	Average Cost per Entity	Ratio of Average Cost to Revenues	Ratio of Average Cost to Profits
8139	Business, Professional, Labor, Political, and Similar Organizations	20	$68,099,014	60,844	$1,119,240	2.05% *	$22,932	$832,384	$13.68	0.001%	0.060%

[a] SBA criteria specified in dollar terms converted to size-class definition based on average revenues for different size establishments. Most restrictive criterion for 6-digit NAICS applied to the 4-digit NAICS level.

[b] Estimated based on 2007 receipts and payroll data from U.S. Census Bureau, Statistics of U.S. Businesses, 2007, and payroll data from U.S. Census Bureau, Statistics of U.S. Businesses, 2007.

[c] U.S. Census Bureau, Statistics of U.S. Businesses, 2007.

[d] Estimated from average of the yearly ratios of net income to total receipts as reported by the U.S. Internal Revenue Service, Corporation Source Book, 2000 – 2008. Data were not available at disaggregated levels for all industries; OSHA used profit rates at more highly aggregated levels for such industries.

*Profit rate imputed from corresponding 3-digit NAICS industry.

**Profit rate imputed from corresponding 2-digit NAICS industry.

BILLING CODE 4510–29–C

OSHA's impact analysis for small entities indicates that one other industry, NAICS 2213—Water, sewage and other systems, will experience significant profit impacts under a worst-case scenario: Costs are 5.3 percent of profits for entities defined as small by the SBA, and costs are 11.7 percent of profits for entities with fewer than twenty employees. While profit impacts at these levels suggest that utilities in NAICS 2213 may have to reduce operations substantially if they are unable to pass forward to customers the approximately $3,441 in annualized compliance costs, OSHA expects that most water and sewage employers will not experience profit impacts of that severity. First, whereas the estimate of revenue per small entity (fewer than 100 employees) in 2007 is approximately $823,000 (Tables V–2 and V–32), according to 2012 Census data, revenue per small entity in NAICS 2213 rose to $956,000. Assuming those higher per-entity revenues continued up until the scheduled compliance with this final standard, the impacts of costs on revenue and profit would be less severe than suggested using the 2007 receipts data.

Moreover, there is reason to think that OSHA's data understates actual profits for small utilities. Many small utilities are organized as cooperatives and a modest percentage of utilities file income tax returns as S Corporations, and the tax law allows both types of entities to pass profits back to members without being taxed as income at the business level. According to IRS data,[161] of the 3,216 tax returns filed by utilities (NAICS 22) as S corporations in 2012, only 2,693 S-corporation utilities reported net income, suggesting that of the 5,973 firms in NAICS 22 in 2012, just under 9 percent ((3,216 S returns filed—2,693 S returns with net income)/ 5,973 total returns in NAICS 22) may have had profit that was not reported as income on the corporate return. However, they would have been included in the balance sheet data that formed the basis for the calculation of the average profit rate, 5.4 percent, for NAICS 2213. As evidence supporting this conclusion, IRS data indicate that for S utility corporations that reported net income, 2012 profit rates averaged 9.7 percent.[162] Therefore, if the overall nine-year (2000–2008) average profit rate for NAICS 2213 underestimates the actual profit rate for the industry, impacts resulting from compliance with this final standard may be overstated in Tables V–32 and V–33.

3. A Statement of the Need for, and Objectives of, the Rule

Employees in general industry performing construction, installation, maintenance, and repair tasks are exposed to a range of significant slip, trip, and fall hazards that cause serious injury and death. OSHA estimates that approximately 202,100 serious injuries and 345 fatalities occur annually among these employees. Although employers could prevent some of these incidents with increased compliance with existing safety standards, research and analyses conducted by OSHA found that many preventable injuries and fatalities would continue to occur even if employers achieved full compliance with the existing standards. Without counting incidents that employers could potentially prevent by complying fully with existing standards, OSHA estimates that full compliance with these final standards would prevent 5,842 additional injuries and 29 fatalities annually, even with full compliance with the existing standard.

As explained above, additional benefits associated with this rulemaking involve providing updated, clear, and consistent safety standards regarding fall protection in general industry to the relevant employers, employees, and interested members of the public. The existing OSHA standards for walking-working surfaces in general industry are over 30 years old and inconsistent with the more recently promulgated standards addressing fall protection in construction. OSHA believes that the final updated standards are easier to understand and to apply than the existing standard, thereby benefiting employers and employees by facilitating compliance and improving safety.

4. Response to Comments Filed by the Small Business Administration

The Small Business Administration's Chief Counsel for Advocacy (SBA Advocacy) submitted comments into the rulemaking record following publication of the NPRM. SBA Advocacy's comments (Ex. 124) covered four broad areas; OSHA addresses each area below.

Area 1: ''OSHA should not include vague, overly-broad, 'general duty clause' type requirements.''

OSHA's response: SBA Advocacy expressed concern that some provisions, such as proposed § 1910.22(a)(3) which required employers to ''ensure that all surfaces are designed, constructed and maintained free of recognized hazards,'' lacked detail and precise definition, and would, therefore, place an unreasonable compliance burden on employers. In the final standards, OSHA revised the proposed language of paragraph (a)(3) to provide specific examples of the types of hazards addressed by this provision—*e.g.,* protruding or sharp objects, spills. The final regulatory text no longer requires that employers identify and correct all ''recognized'' hazards.

Area 2: ''OSHA should further synchronize the proposed general industry rule with the existing construction standard.''

OSHA's response: OSHA believes that, to the extent possible given the technological and work-organization differences between general industry and construction, the final standards mesh closely with the construction fall protection standards. Whenever possible, to avoid duplication, inconsistency, or overlap, the final standards reference the OSHA construction standards (for example, § 1910.27(a), Scaffolds; § 1910.28(b)(12), Scaffolds and rope descent systems; and § 1910.29(b), Guardrail systems reference part 1926).

Area 3: ''OSHA should not expand its reading of Section 1910.22 to regulate combustible dust.''

OSHA's response: As noted in this preamble and in the preamble to the NPRM, OSHA interprets the housekeeping provisions in subpart D as applying to combustible-dust accumulations associated with fire and explosion hazards. Regarding this interpretation, one court stated that ''the housekeeping standard is not limited to tripping and falling hazards, but may be applied to [a] significant accumulation of combustible dust'' (*Con Agra, Inc.* v. *Occupational Safety and Health Review Commission,* 672 F.2d 699, 702 (8th Cir. 1982), citing *Bunge Corp.* v. *Secretary of Labor,* 638 F.2d 831, 834 (5th Cir. 1981), which reached the same conclusion). Following publication of the NPRM, OSHA received no evidence that the regulated community had technological or economic concerns about including combustible dust in the scope of the housekeeping section of final subpart D. Therefore, OSHA will continue to regulate combustible-dust hazards on walking-working surfaces in this final standard.

Area 4: ''OSHA should not regulate commercial motor vehicles (trucks) under the proposed rule.''

OSHA's response: Based on comments and testimony received on both the 2003 Reopening Notice and the 2010 Proposed Rule, OSHA finds it is sometimes feasible to provide fall protection for rolling stock where it is not contiguous or next to a structure.

[161] See *https://www.irs.gov/uac/soi-tax-stats-s-corporation-statistics*, Table 1: Returns of Active Corporations, Form 1120S and Table 2: Returns with Net Income, Form 1120S.

[162] See *https://www.irs.gov/uac/soi-tax-stats-s-corporation-statistics*, Table 2: Returns with Net Income, Form 1120S. For Utilities in 2012, Total net income (less deficit) = $689,965 thousand, or $690.0 million, and Total Receipts = $7,112,150 thousand, or $7.1 billion. Profit rate = $690 million/$7.1 billion = 9.7 percent.

However, OSHA still believes that additional information and data analysis is needed in order to determine an appropriate course of action. Therefore, this Final Rule does not include any specific requirements for fall protection on rolling stock and motor vehicles and OSHA's current existing enforcement policies on rolling stock and motor vehicles will remain in effect. This issue is discussed further in the Summary and Explanation for final rule § 1910.21(a).

5. Issues Raised Regarding the Small Business Regulatory Enforcement Fairness Act

The U.S. Chamber of Commerce (''the Chamber'') addressed the absence of a review process under the Small Business Regulatory Enforcement Fairness Act (5 U.S.C. 601 *et seq.*) (SBREFA) during this rulemaking, stating:

> OSHA's decision to forgo SBREFA panel review for this rulemaking is even more troubling when one considers that the agency has undertaken SBREFA reviews with a number of rulemakings that have impacted a smaller number of workplaces and employees than this proposed walking-working surfaces revision will impact. . . . [T]his rulemaking will have a direct effect on a wide array of employers, both large and small, across all types of operations. This rulemaking is broader in application than many of the rulemakings noted above, with new requirements for training, and associated levels of personal protection. There are a large number of variables that will determine how these requirements will actually impact employers, especially small employers, and the agency would have benefited from the opportunity to obtain data and information from small employers. This is particularly true with respect to OSHA's effort to synchronize the general industry and construction industry provisions where small businesses are most likely to be confused and would have been able to provide useful input on achieving this goal. The scope of this regulation is so broad, and it will impose fall protection on so many workplaces for the first time, that OSHA should have conducted a panel to gather from affected entities direct information on how to better tailor this regulation. The Chamber urges OSHA to conduct a SBREFA panel review before proceeding to a final regulation. (Ex. 202, p. 2.)

In response to the concerns of the Chamber and the other stakeholders that expressed similar views (*i.e.,* the Sheet Metal and Air Conditioning Contractors National Association (Ex. 165) and the National Federation of Independent Business (Ex. 173), OSHA notes that throughout the rulemaking process, during the public hearings and on other occasions (including during the 2003 reopening of the record for a request for information), OSHA solicited and received comment from small firms on a variety of issues. Topics that involved input from small firms included, for example, safety on fixed ladders in outdoor advertising (Exs. 136; 229), the design of guardrails and gates at ladderway openings (Exs. 68; 366), use of rope descent systems for window cleaning (Exs. 69; 76), and protection of utility workers when ascending and descending stepbolts (Ex. 155). In developing and finalizing its final standards for subparts D and I, OSHA thoroughly considered the concerns expressed by small firms and other stakeholders representing the views of small firms, and revised requirements as appropriate.

6. Information Regarding the Small Entities Covered by the Final Rule

OSHA's analysis of the impacts of this final rule includes an analysis of the type and number of small entities impacted by the final rule. The final rule primarily impacts workers performing installation, maintenance, and repair tasks throughout general industry. To determine the number of small entities potentially affected by this rulemaking, OSHA used the definitions of small entities developed by the Small Business Administration for each industry. In section C of this FEA, OSHA discussed its methodology for determining the number of affected small entities, and presented its estimates of the number in Table V–2. As shown in that table, OSHA estimates that the final standards would cover 5.1 million small entities, employing 43.8 million workers, including 2.3 million workers directly exposed to slip, trip, and fall hazards. Industries (four-digit NAICSs) expected to have the highest number of affected at-risk employees include automotive repair and maintenance (390,000 employees), wired telecommunications carriers (170,000 employees), and lessors of real estate (84,000).

7. Administrative Costs for Employers

OSHA issued the existing standards in subpart D in 1971 under Section 6(a) of the Occupational Safety and Health Act of 1970 (the Act) (29 U.S.C. 655). During the period since OSHA issued existing subpart D, interested parties recommended revisions to its standards. In addition, the majority of the existing OSHA standards for walking-working surfaces are inconsistent with numerous national consensus standards and the more recently issued OSHA standards addressing fall protection elsewhere in general industry (*e.g.,* § 1910.66, Powered platforms for building maintenance) and construction (*e.g.,* § 1926 Subpart M—Fall Protection).

Section F, Costs of Compliance, above described, for categories of employee training, the administrative costs for employers. Accordingly, OSHA does not consider the costs to document the training and retraining of employees to be recordkeeping, but rather typical expenses involved in administering a safety program.

8. Minimizing the Economic Impact on Small Entities

OSHA evaluated several alternatives to the final standards to ensure that the requirements would accomplish the stated objectives of applicable statutes and minimize the economic impact on small entities. For example, OSHA considered an alternative that would exempt small entities from the rule; however, the Agency rejected this alternative because it would unduly jeopardize the safety and health of affected employees. Throughout Section IV of this document, Summary and Explanation of the Final Rule, OSHA discusses other alternatives considered, generally in response to public comment.

In developing the final rule, especially establishing compliance or reporting requirements or timetables that affect small entities, OSHA took the resources available to small entities into account. OSHA clarified, consolidated, and simplified the compliance and reporting requirements applicable to small entities to the extent practicable. Wherever possible, OSHA allowed the employer multiple options to control fall hazards. Therefore, OSHA made every effort to provide maximum flexibility in the choice of controls required by the final rule.

To demonstrate the relative economic efficiency (*i.e.,* cost effectiveness) of the final subpart D standards, OSHA selected eight provisions from these standards for which it considered alternative controls, but rejected these controls as inefficient from a cost-effectiveness perspective. The table below presents OSHA's evaluation of the potential impacts associated with these alternative controls for the eight provisions.

BILLING CODE 4510–29–P

Table V-34

Impacts Associated with Regulatory Alternatives for Selected Provisions in Final Subpart D

Provision	Control(s) Specified by Provision	Alternative Control(s)	Potential Impacts of Alternative Control(s)
Section 1910.23, paragraph (a) Ladders	Covers all ladders except for machine-integrated or firefighting, rescue, and tactical law-enforcement ladders.	All ladders in scope.	Probably not significant in costs, but not justified with respect to benefits.
Section 1910.24, paragraphs (a)(1), (a)(7), and (b)(2) Step bolts and manhole steps	Design changes to step bolts and manhole steps on new installations performed on or after 60 days after the standard's effective date must meet specified strength and design criteria.	Eliminate grandfathering of older structures.	Requirement to ensure that all step bolts and manhole steps meet the strength and design criteria in revised subpart D would require technical resources that could exceed the capacity of affected industries in the near term given the need to inspect all existing manholes and make changes to many of them; benefits would not justify the large costs.
Section 1910.25, paragraph (b)(8) Stairways	When employees use ship stairs and spiral stairs as the primary means of egress, the stairs must meet the requirements specified by the standard.	Prohibit ship stairs and spiral stairs in all new installations.	Potentially large costs with few benefits.
Section 1910.26(b) Dockboards	This provision requires that dockboards put into service at least 60 days after the effective date of the final rule be designed, constructed, and maintained to prevent transfer vehicles (such as hand trucks) from running off the edge. An exception allows the employer to use dockboards that do not have run-off protection when the employer can demonstrate that there is no hazard of the equipment running off the edge.	Specify the means of achieving the desired performance (specific dockboard design requirements).	Probably modest costs but with few benefits.

Table V-34
Impacts Associated with Regulatory Alternatives for Selected Provisions in Final Subpart D (continued)

Provision	Control(s) Specified by Provision	Alternative Control(s)	Potential Impacts of Alternative Control(s)
Section 1910.27(b)(2)(i) Use of rope descent systems	Paragraph (b)(2)(i) prohibits the use of a rope descent system (RDS) at heights greater than 300 feet (91.4 m) above grade unless the employer demonstrates that it is not feasible to access such heights by any other means or that those means pose a greater hazard than using a rope descent system.	Allow use of RDS at all heights.	As OSHA demonstrated earlier in this FEA, impacts of the primary choice will be manageable due to the current availability of (1) powered platforms, swing-stage equipment, or other systems for washing windows on tall buildings, and (2) the managerial and technical expertise for combining RDS and other types of equipment. The impact of the alternative control would be heightened risk of exposure to unexpected wind gusts and other factors that could jeopardize safe control of the RDS for descents greater than 300 feet.
Section 1910.28 Duty to have fall protection and falling-object protection	The final rule allows employers to choose from several options in providing fall protection across generic walking-working surfaces. These include conventional fall protection systems such as guardrail systems, safety-net systems, and personal fall protection systems (restraint systems, personal fall arrest systems, and positioning systems) and, in some instances, non-conventional means. An example of non-conventional means would be establishing a designated area in which an employee is to work.	Provided detailed specifications, on a surface by surface basis, the means of achieving compliance.	Depending on specifications, costs could be substantial with modest benefits.

BILLING CODE 4510–29–C

Table V-34
Impacts Associated with Regulatory Alternatives for Selected Provisions in Final Subpart D (continued)

Provision	Control(s) Specified by Provision	Alternative Control(s)	Potential Impacts of Alternative Control(s)
Section 1910.28(b)(8) Repair pits, service pits, and assembly pits less than 10 feet in depth	This provision requires employers to limit access to the edge (within 6 feet (1.8 m)) of the pit to trained, authorized employees ((b)(8)(i)); mark the floor or place warning lines and stanchions to designate the unprotected area ((b)(8)(ii)); and post caution signs to warn employees of the unprotected area ((b)(8)(iii)).	Require conventional fall protection systems such as guardrails, or personal fall arrest or travel restraint systems.	Potentially significant costs with feasibility/practicability concerns.
Section 1910.28(b)(9) Fixed ladders (that extend more than 24 feet (7.3 m) above a lower level	This provision requires no fall protection for employees exposed to falls from fixed ladders of 24 feet (7.3 m) in length or less above a lower level. If the employer uses an existing cage or well, each section must be offset from adjacent sections with landing platforms at maximum intervals of 50 feet (15.2 m). If an employer uses a ladder safety system or personal fall arrest system, there must be rest platforms at maximum intervals of 150 feet (45.7 m).	For fixed ladders, require employers to provide cages, wells, landing platforms, and ladder safety systems comprehensively.	Major costs and modest benefits; tens of thousands of fixed ladders would need cages, wells, and landing platforms.

Source: U.S. Department of Labor, OSHA, Directorate of Standards and Guidance, Office of Regulatory Analysis-Safety.

OSHA also considered non-regulatory alternatives in determining the appropriate approach to reducing occupational hazards associated with work on elevated or slippery surfaces in general industry. The Agency discusses these alternatives in Section B of this FEA.

I. Sensitivity Analyses

1. Introduction

In this subsection, OSHA presents the results of two different types of sensitivity analysis to demonstrate how robust the estimates of net benefits are to changes in selected cost and benefit parameters. In the first sensitivity analysis (the ''standard sensitivity analysis''), OSHA makes a series of isolated changes to individual cost and benefit parameters to determine their effects on the Agency's estimates of annualized costs, benefits, and net benefits. In the second sensitivity analysis—the ''break-even sensitivity analysis''—OSHA investigates isolated changes to individual cost and benefit parameters, but with the objective of determining the magnitude of the changes needed for annualized costs to equal annualized benefits. The Agency is conducting these analyses for informational purposes only.

2. Sensitivity Analysis for Specific Parameters

OSHA provides below a sensitivity analysis of some assumptions underlying the Agency's estimates of the annualized costs and benefits of the final rule. The calculations underlying the Agency's estimate that the compliance costs, benefits, and economic impacts associated with this rulemaking are generally linear and additive. Accordingly, the changes in the costs or benefits should generally be proportional to variations in the relevant input parameters. For example, if the estimated time for supervisors to inspect the conditions of walking-working surfaces (to ensure that they are free of hazards) increased by 100 percent, the corresponding labor costs for that task also should increase by 100 percent.

OSHA evaluated a series of such changes in input parameters to test the validity of the general conclusions derived from the economic analysis. Overall, OSHA found these conclusions to be robust as even sizeable changes in the values of several input parameters did not substantially alter the estimates of the costs, benefits, or net benefits. Furthermore, the rule produces significant positive net benefits regardless of the revisions made to costs, benefits, or the discount rate. Table V–35 below provides the summary results of these sensitivity tests. In each sensitivity test, parameters other than the ones tested remained unchanged.

In the first sensitivity test, OSHA adjusted the estimated noncompliance rates applied to the costs for the requirements for inspections and hazard corrections in final § 1910.22(d). When OSHA doubles the noncompliance rates (deriving noncompliance rates that range from 6 percent to 27 percent), annualized costs rise by $33.2 million (10.9 percent), with total compliance costs summing to $338.2 million, and net benefits are reduced by an equal amount ($33.32 million), to a level of $276.4 million. In the benefits sensitivity analysis, OSHA also considered the effect of changing these provisions on benefits.

In the second sensitivity test on costs, when OSHA increased by 100 percent the estimated time for supervisors to inspect walking-working surfaces for the presence of hazards (from one hour to two hours), the estimated total costs of compliance increased by $33 million annually, or about 11 percent of overall costs. In the third sensitivity test on costs, OSHA increased a set of values for variables critical to the estimated compliance costs for fall protection on fixed ladders as follows:

- Increased the estimate of the number of fixed ladders per establishment by 100 percent (0.45 to 0.9); and
- Increased the installation time for ladder safety systems by 100 percent (two hours to four hours).

This sensitivity test increased the estimated annualized compliance costs by $0.4 million annually, about 0.1 percent of overall costs.

In the fourth sensitivity test on costs, OSHA extended from 20 years to 25 years after publication of the rule the date when OSHA would no longer accept cages and wells for fall protection, thereby requiring employers to install other forms of fall protection such as ladder safety systems on fixed ladders that extend more than 24 feet above a lower level. This sensitivity test decreased the estimated annualized compliance costs by $1.0 million annually, or about 0.3 percent of overall costs.

In the fifth sensitivity test on costs, OSHA retrofitted all fixed ladders over 20 feet in length with ladder safety systems (not just those ladders that extend more than 24 feet above a lower level) according to a 20-year deadline specified by final § 1910.28(b)(9)(i)(D), with the result that costs increased by $10.1 million annually, or 3.3 percent of overall costs.

OSHA believes this stringent test represents a highly unlikely scenario because the current consensus standard for fixed ladders—ANSI A14.3–2008, American National Standard for Ladders—Fixed—Safety Requirements—requires use of a ladder safety system only for single climbs in excess of 24 feet, whereas the 2002 version of that standard prescribed the use of ladder safety systems for climbs in excess of 50 feet. Furthermore, current § 1910.27(d)(5) permits the use of ladder safety devices instead of cages on tower, water-tank, and chimney ladders over 20 feet in unbroken length. In addition, evidence in the record suggests that firms with a choice of a cage/platform or ladder safety systems generally install ladder safety systems for ladders reaching heights above 30 feet, and that safety engineers are now designing solutions using ladder safety systems for fall protection during all long ladder climbs (Exs. 127; 369). Therefore, OSHA believes that only a small percentage of fixed ladders, *i.e.,* ladders between 24 and 30 feet in height, would require retrofitting with ladder safety systems 20 years after publication of the final rule.

In a sixth sensitivity test on costs, OSHA increased by 100 percent the estimated time for employee training, which increased the estimated costs of compliance by $54.1 million annually, or about 18 percent of overall costs.

Finally, in a seventh sensitivity test on costs, OSHA increased by 100 percent the estimated time for a supervisor to conduct a hazard assessment needed before issuing personal fall protection equipment. This sensitivity test increased the estimated costs of compliance by $11.6 million annually, or roughly 4 percent of overall costs.

In addition, OSHA examined the effect on annualized costs and benefits of changing the discount rate. Changing the discount rate from seven percent, used in the base case, to three percent would reduce the estimated costs of the final rule from $305.0 million to $297.0 million per year (while leaving estimated annual benefits unaffected), thereby increasing the estimated net benefits by $7.9 million. For both this scenario and for the primary (seven-percent rate) scenario, with the exception of the 20-year deadline for installation of specific types of fall protection on certain fixed ladders, OSHA assumed that employers would incur all costs (first-year and recurring) upon implementation of the final standards (*i.e.,* no phase-in provisions).

OSHA also assumed that the benefits outlined in this section will begin accruing once the rule takes effect.

OSHA recognizes that there is not one uniform approach to estimating the marginal cost of labor. For the economic analysis in support of the final rule, OSHA has estimated the marginal costs of labor as wages plus a fringe benefit rate of 41.5% (which includes some fixed costs such as health insurance). However, this approach does not account for overhead costs. For illustrative purposes in the context of this sensitivity analysis, OSHA has modified the cost estimates by including an overhead rate when estimating the marginal cost of labor. It is important to note that there is not one broadly accepted overhead rate in academic literature and estimating the most appropriate overhead rate for this FEA would require significant modeling, including as regards the interaction between overhead costs and the equipment and other costs that have been separately estimated. Further, the Department has not further analyzed an appropriate quantitative adjustment. Therefore, DOL adopted for the purposes of this specific exercise an overhead rate of 17%. This rate has been used by the EPA in its final rules (see for example, EPA Electronic Reporting under the Toxic Substances Control Act Final Rule, June 17, 2013), and is based upon a Chemical Manufacturers Association study.[163]

Using an overhead rate of 17% would increase costs by $24.4 million per year, or 8.0 percent above the best estimate of costs. (See Table V–35)

OSHA also performed sensitivity tests on a set of input parameters used to estimate the benefits of the final rule. In the first test, OSHA estimated that the final preventability rates for falls from ladders (20 percent), falls from roofs (20 percent), and falls to lower levels not elsewhere classified (5 percent) did not increase from the estimates applied in the PEA, but instead remained the same for this FEA (*i.e.,* 15 percent, 15 percent, and 2.5 percent, respectively). As a result of using the (lower) preliminary preventability rates, the estimated monetized benefits fell by $89.6 million annually relative to final monetized benefits, or about 15 percent of overall benefits.

In a second benefits sensitivity test, OSHA reduced the preventability rate for falls on the same level from 1 percent to 0 percent. As a result, monetized benefits fell 13.8 percent ($85.0 million) to $530.0 million, and net benefits fell to $225.0 million.

In a third benefits sensitivity test, OSHA doubled the preventability rate for falls on the same level from 1 percent to 2 percent. As a result, monetized benefits rose 13.8 percent ($85.0 million) to $699.6 million, and net benefits rose to $394.6 million.

BILLING CODE 4510–29–P

[163] The uncertainty surrounding the appropriate amount of overhead cost to include in loaded wages may be observed in the range of estimates that other Agencies have included for overhead rates specific to their requirement. For example, recent regulatory impact analyses conducted by agencies of the Department of Health and Human Services (HHS) have featured doubling of base wages to account for both fringe benefits and overhead. DOL's Employee Benefits Security Administration (EBSA) includes overhead costs that are substantially higher than EPA's and more variable across employee types than HHS's, as presented in detail at *www.dol.gov/ebsa/pdf/labor-cost-inputs-used-in-ebsa-opr-ria-and-pra-burden-calculations-march–2016.pdf.*

Table V-35
Sensitivity Tests for the Economic Analysis of the Final Standards on Walking-Working Surfaces

Cost Parameters

Variable	OSHA's Current Estimate	New Parameter Value	Change in Annualized Costs (million)	Percentage Change in Annualized Costs	Annualized Costs (million)	Net Benefit (million)
OSHA's Best Estimate of Total Annualized Costs:					**$305.0**	**$310.0**
Floor Guarding Non-Compliance Rate (applied in inspection costs)	Non-compliance rate doubles	6% to 27%	$33.2	10.9%	$338.2	$276.4
Supervisor time to inspect walking-working surfaces for hazards	Average of 30 minutes per establishment per quarter (2 hours per year)	4 hours	$32.8	10.8%	$337.8	$287.2
Number of fixed Ladders per establishment; time to install ladder safety system; percent of fixed ladders added or replaced each year	Number of fixed ladders per establishment: 0.45	0.9 ladders	$0.4	0.1%	$305.3	$319.6
	Time to install ladder safety system: 2 hours	4 hours				
	Grace period for retrofitting fixed ladders with safety devices: 20 years	25 years	-$1.0	-0.3%	$304.0	$320.9
	Retrofitting all ladders longer than 20 feet instead of ladders between 24 and 30 feet	3,059,106 ladders	$10.1	3.3%	$315.1	$309.9

Benefit Parameters						
Variable	OSHA's Best Estimate	New Parameter Value	Change in Annualized Benefits (million)	Percentage Change in Annualized Benefits	Annualized Benefits (million)	Net Benefit (million)
OSHA's Best Estimate of Total Annualized Benefits:					**$615.0**	**$310.0**
Preventability rates for falls from ladders, roofs, or lower levels not elsewhere classified	Ladders – 20%	15%	-$89.6	-14.6%	$525.0	$220.0
	Roofs – 20%	15%				
	Lower Levels, N.E.C. – 5%	2.5%				
Preventability Rate for Falls on Same Level	Percentage falls prevented reduced to 0%	0%	-$85.0	-13.8%	$529.6	$224.6
	Percentage falls prevented doubles to 2%	2%	$85.0	13.8%	$699.6	$394.6

Source: U.S. Department of Labor, OSHA, Directorate of Standards and Guidance, Office of Regulatory Analysis-Safety.

OSHA's benefits estimates are most sensitive when it comes to estimating the percentage of current injuries and fatalities avoided by full compliance with the final standards. OSHA closely examined available reports of fatalities related to the provisions in the existing and final standards and found that full compliance with the final standards would prevent 29 fatalities, or approximately 9 percent of all slip-, trip-, and fall-related fatalities in general industry (including, among the global group, accidents not directly addressed by the final standards). The true benefits of the final rule depend on how well these fatalities represent actual fall-related fatalities in general industry that compliance with the final rule would prevent. OSHA believes that the benefits in this FEA (see Table V–11) are representative of actual prevented fatalities; however, an average estimate such as presented here can mask year-to-year variations.

The Agency believes that its estimate of annual fatalities involving slips, trips, and falls (about 345) in general industry is a much less sensitive estimate of actual fatalities than the estimate of the percentage of fatalities avoided. The estimate of the annual number of baseline fatalities is derived from 7 years of recent accident data with percent-distributed averages corroborated by 11 prior years of data, whereas the estimate of percentage of fatalities avoided is based on professional judgment (the determinations from which were placed into the record and reviewed by rulemaking stakeholders). Furthermore, as noted earlier, OSHA believes that its benefits estimates are low. Specifically, the Agency believes the training and work-practices requirements specified by the final standards would likely improve the use and application of safety equipment (including personal fall protection equipment), thereby further reducing fatalities and injuries.

In conclusion, these sensitivity tests demonstrate that even with relatively large variations in the input parameters, there are no large changes in the estimates of compliance costs or benefits.

3. Sensitivity Analysis With Respect to Noncompliance and Possible Overestimation of Benefits

In the benefits section, OSHA noted that an article by Seong and Mendeloff suggested that OSHA had, in a period of 17 to 27 years ago, estimated reductions in fatalities that were not in fact reflected in the observed data over the next ten years. All of the analyses in question assumed full compliance with the rule, as does this analysis. The resulting failures to meet observed declines could have been the result of either failure to comply with OSHA's rule, or overestimates of the effectiveness of OSHA's rule. OSHA believes that it was a combination of the two—there were both overestimates of effectiveness and failures to comply with the rule. Unfortunately, there are no studies that enable us to distinguish between the two phenomena. Further, OSHA believes that its estimates for this rule reflect lessons learned from the Seong and Mendeloff article. Still OSHA believes it is important to analyze the possibilities that the article might reflect OSHA's current practice and that it might reflect the possibility that OSHA's overestimates are solely due to noncompliance with the rule.

In Appendix A, OSHA derives a set of factors for reducing OSHA's benefits estimates based on the assumption that Seong and Mendeloff's observations correctly state the standard's effectiveness rates. These factors represent a possible correction to OSHA's base estimates. The exact possible correction factors and their limitations are given in Appendix A to this FEA.

Using these correction factors, OSHA found that the standard would prevent from 9 fatalities and 1,753 non-fatal injuries (=0.3*29 and 0.3*5,842), with a value of $184 million, to 14 fatalities and 2,746 non-fatal injuries (=0.47*29 and 0.47*5,842), with a value of $289 million. If application of these correction factors to OSHA's estimation methodology better represent the true benefits of the rule, then this lower range of benefits would be more compliant with OMB Circular A–4, than the 29 fatalities and 5,842 non-fatal injures presented at the summary results elsewhere in this FEA.

If lack of employer compliance is the only driver of the disparities between OSHA's estimates and actual declines in fatalities and if non-compliance is close to homogeneous across employers covered by this rule (in other words, if baseline slip, trip and fall injuries are not largely concentrated amongst bad actors who do not attempt to comply with OSHA standards), then the appropriate cost estimates to compare to the above benefits estimate would be $91 million (=0.3*$305 million) to $143 million (=0.47*$305 million), and net benefits remain positive.

To the extent that OSHA has not corrected any overestimation of effectiveness that is not the result of noncompliance, then costs could exceed benefits. As noted, OSHA is aware of the possible overestimation for reasons other than less than full compliance and has tried to correct this overestimation.

4. Break-Even Sensitivity Analysis

This break-even sensitivity analysis determines how much cost and benefits would have to vary for the costs to equal benefits. According to the Agency's models for estimating costs and monetized benefits, the final standards generate considerable positive net benefits; that is, expected benefits are much greater than expected costs. Only significant errors in OSHA's analysis would bring true net benefits to, or below, zero. Therefore, in the first break-even sensitivity test in this analysis, which addresses cost, for net monetized benefits to fall to zero, for example, the Agency would have to underestimate the number of buildings with anchorages subject to inspection and certification by two-fold (from about 750,000 buildings to 1.5 million buildings), and would also have to underestimate the number of employees requiring training by four-fold (from 504,000 to 2.0 million). In this case, estimated compliance costs would rise to roughly $593 million annually, thereby approaching the value of estimated monetized benefits and reducing the net monetized benefits approximately to zero.

In a second break-even sensitivity test in this analysis, which addresses benefits, OSHA examined how much its estimate of the final rule's aggregate benefits in terms of avoided fatalities and injuries would have to decline for the costs to equal the benefits, thereby eliminating the net monetized benefits. Net monetized benefits would decline to zero if, for example, the Agency overestimated fatalities prevented by the final standards by roughly 93 percent (if prevented fatalities were 15 rather than 29) and overestimated injuries prevented by the standards by roughly 108 percent (if prevented injuries were 2,814 rather than 5,842).

OSHA believes that a ten percent overestimate of fatalities is unlikely given the conservative (low) accident preventability rates projected for many provisions of the final standards. Further, OSHA notes, as discussed earlier, that some of the other benefits of the rule are non-quantifiable, such as the benefits resulting from making several provisions in this final standard compatible with provisions in the Agency's construction fall protection standards. OSHA believes that these benefits would increase the overall net benefits of the final rule.

Appendix A. Derivation of Prevention Factor Adjustments

To derive possible quantitative adjustment factors from the Seong and Mendeloff study OSHA examined each of their case studies. In most cases, Seong and Mendeloff did not derive a quantitative difference between what happened and what OSHA estimated. Instead their goal was to qualitatively establish that overestimation was routine and in some cases extremely large. To derive quantitative estimates from this data requires making some assumptions. First, OSHA has assumed that all declines that actually occurred are attributable to a new standard. This will tend to overestimate the effectiveness of standards. Second, in some cases declines take place over time, and are significant over the long run but show little effect in the first year. If there is no decline in early years but a major one thereafter, OSHA has developed two estimates, one based on the first year and one based on what happened over time.

- Scaffolding for General Industry (61 FR 46026, August 30, 1996): OSHA originally predicted that the scaffolding rule would reduce fatalities by 59 percent, whereas Seong and Mendeloff find an actual reduction of 21 percent, yielding a realized-to-projected effectiveness ratio of 0.36 (=0.21/0.59).
- Electrical Work Practices for General Industry (55 FR 31984, August 6, 1990)—OSHA's predicted reduction was 41.4 percent. The actual decrease was negligible immediately upon finalization of the rule and up to 48 percent in the latter portion of the post-implementation decade, thus yielding a range of ratios from 0 (=0/0.414) if the immediate post-implementation result is interpreted as the amount attributable to the rule, or up to 0.61 (=0.25/0.414 where 0.25 is the annualization over a ten-year period with a 7 percent discount rate of a reduction pattern that rises linearly from 0 immediately upon finalization to 48 percent after a decade) if the longer-term reduction is interpreted as attributable to the rule.
- Process Safety Management (PSM) in General Industry (57 FR 6356, February 24, 1992)—OSHA's predicted reduction was 40 percent in the first five years and at least 80 percent in subsequent years, and the actual decrease was a reduction of around 50 percent in the first year (though a substantial portion of this was probably attributable to the rule taking effect in a recession) and then no further decreases in subsequent years, yielding a ratio of 0.88 (=0.54/0.61 where 0.54 and 0.61 are annualizations over a ten-year period with a 7 percent discount rate of the reduction patterns just listed).
- Permit-Required Confined Spaces for General Industry (58 FR 4462, January 14, 1993)—OSHA's predicted reduction was 85 percent, and the actual decrease is described by Seong and Mendeloff as probably at least 50 percent (though the discussion of relative results in greater- and lesser-affected states undermines the claim of the rule's effectiveness), yielding a ratio of 0.59 (=0.5/0.85).
- Electrical Power Generation (59 FR 4320, January 31, 1994)—OSHA's predicted reduction was 68 percent, but actual deaths ''dipped in 1993, the year the standard became effective, then went back to their pre-standard levels through 1997,'' and subsequently dropped by one-third or one-half, depending on the measure used. The resulting ratios range from approximately 0 (=0/0.68) if the immediate post-implementation result is interpreted as the amount attributable to the rule, up to 0.41 (=0.28/0.68 where 0.28 is the annualization over a ten-year period with a 7 percent discount rate of a reduction pattern of zero in the first four years and 50 percent subsequently) if the longer-term reduction is interpreted as attributable to the rule.
- Logging Operations (59 FR 51672, October 12, 1994)—OSHA's predicted reduction was 70 percent, but there is no indication that injuries decreased at all, yielding a ratio of 0 (=0/0.7).

The average of the six ratios ranges from 0.3, if the lower end of a range is used, to 0.47, if the higher end is used.

Appendix B. Fatal Accidents on Walking-Working Surfaces Preventable by the Final Standards (2006–2010 OSHA IMIS)

BILLING CODE 4510–29–P

Fatal Accidents on Walking-Working Surfaces Preventable by the Final Standards (2006-2010 OSHA IMIS)

Accident Summary Number / Accident Inspection Number	Year	Brief Description of Accident	Abstract	SIC: Description	Number of Fatalities	Source of Injury	Event Type	Environmental Factor
Fall From Ladder (Type Unspecified)								
200677102 / 311087571	2007	Employee Is Killed in Fall From Ladder Cleaning Windows	At approximately 11:00 a.m. on December 4, 2007, Employee #1, a window cleaner, was cleaning windows on the fourth floor of a building. The employer provided a boatswain chair, rope, and other window washing equipment and briefly showed Employee # 1 how to assemble correctly the metallic ladder. The employer did not provide any job specific training and did not develop a site-specific fall protection plan. Employee #1 was not using any fall protection devices and was not using the boatswain chair that was provided. He was descending a ladder when he lost his balance and fell 30 ft straight down parallel to the ladder and hit the middle section of the ladder before striking his head on the ground. He sustained a blunt trauma to the head and was bleeding through the eyes, mouth and	7349: Building Maintenance Services, NEC	1	Ladder	Fall (From Elevation)	Other
Fall From Fixed Ladders								
202087847 / 309444396	2006	Employee Is Killed in Fall From Fixed Ladder	At approximately 7:15 a.m. on November 27, 2006, Employee #1 was working in the filling/packaging department at a cat litter manufacturing plant. He was ascending a fixed ladder to retrieve a defective package from a conveyor. The ladder was damaged and lightly coated with cat litter dust. Employee #1 was killed when he fell from the 12-ft tall ladder and struck his head on the concrete floor.	2812: Alkalies and Chlorine Manufacturing	1	Ladder	Fall (From Elevation)	Other

Fatal Accidents on Walking-Working Surfaces Preventable by the Final Standards, continued (2006-2010 OSHA IMIS)

Accident Summary Number / Accident Inspection Number	Year	Brief Description of Accident	Abstract	SIC: Description	Number of Fatalities	Source of Injury	Event Type	Environmental Factor
200823839 / 311250302	2008	Employee Dies After Sustaining Leg Injury From Fall	At approximately 8:00 p.m. on May 21, 2008, Employee #1 was feeding a plastic sheet into . . . [a] trim press . . . . He used fixed industrial stairs to access the canopy and feed the sheet into the trim press. The stairs to this trim press had a missing top rail on one of the open sides and the rungs had worn slip resistant material. As he worked, he may have slipped or lost his balance, falling from the ladder. He struck the ground and sustained blunt force trauma to his left thigh. The accident was not reported that day, and Employee #1 visited a medical center and emergency room on May 22 and May 23. On the evening of May 23, he was admitted to the intensive care, where he continued to receive treatment, but died at 2:40 a.m. on May 24.	3089: Plastics Products, NEC	1	Bodily Motion	Other	Other
			Fall From Step Ladder					
201681913 / 310853262	2009	Employee Is Killed in Fall From Ladder	On January 29, 2009, Employee #1, a truck driver, and Coworker #1, a mechanic, were working on a reefer semi-trailer in the maintenance shop. The refrigeration unit had been removed from the front of the semi-trailer and plywood had been bolted over the hole. Employee #1 and Coworker #1 positioned two portable step ladders in front of the semi- trailer in order to apply sealant on the plywood and semi-trailer seam. Employee #1 climbed a damaged 8-ft step ladder to apply sealant to the top seam. He fell off the ladder onto the concrete floor and suffered severe injuries and died. Although there were no witnesses, it appeared that Employee #1 was standing on the top step of the damaged ladder when he fell. The employer had not provided ladder safety training.	4214: Local Trucking With Storage	1	Ladder	Fall (From Elevation)	Work-Surface/Facil.-Layout Cond.

Fatal Accidents on Walking-Working Surfaces Preventable by the Final Standards, continued (2006-2010 OSHA IMIS)

Accident Summary Number / Accident Inspection Number	Year	Brief Description of Accident	Abstract	SIC: Description	Number of Fatalities	Source of Injury	Event Type	Environmental Factor
200515070 / 314596982	2010	Employee Falls From Ladder and Dies	On June 10, 2010, Employee #1, along with coworker #1, 2, 3, 4 and 5 were on site to do construction work to the interior of a building. They were working on a construction of a new, handicapped building entrance, construction of a new foyer, and construction of a common bathroom area. Employee #1 along with Coworkers #1 and 3 were working on the common bathroom area. Each employee was working independently on different sections of the bathroom. The bathroom was framed in at this point, with some sheet rock already installed. They were continuing installation of sheetrock. Coworker #1 was working near the outside windows (west), Employee #1 was working in the opposite side of the bathroom (east), on the upper, more intricate pieces of the wall, and Coworker #3 was working on the top of a utility closet in the bathroom (central section of bathroom). Each one could see the other one working. Employee #1 was utilizing a step ladder to reach the higher portions of the bathroom. The heights were greater than 10 ft. The step ladder being used was a . . . 12- ft. fiberglass stepladder. The step ladder was propped up against the wall near the corner so Employee #1 could reach the upper corner to finish the pieces surrounding the existing structural steel of the building. Employee #1 was not utilizing the step ladder in accordance with the manufacturer's recommendations . . . . Employee #1 remained in the common bathroom area, working, while Coworker #1, 2, 3 and 4 took their lunch breaks . . . Coworker #3 went to the last known working location of Employee #1, the bathroom, and found him lying lifeless at the base of the step ladder he was using. Coworker #3 immediately ran out to the other employees, and called 911. The Minneapolis Police and EMS arrived at the scene. Employee #1 was treated by the EMS, and later pronounced DOA.	6512: Nonresidential Building Operators	1	Working Surface	Fall (From Elevation)	Other

			Fall From Rolling Ladder					
200082865 / 310182233	2007	Employee Is Killed When He Falls	On January 26, 2007, Employee #1 was inventorying material that was stored on metal shelving racks. He was using a rolling ladder to reach the upper shelves of the rack. He could not reach the material stored on an upper shelf located 10 ft off the floor and climbed onto the rack. He fell from the rack and landed on the floor. He received back and head injuries and was hospitalized and died later.	5943: Stationery Stores	1	Ladder	Fall (From Elevation)	Work-Surface/Facil.-Layout Cond.
200263945 / 314914094	2010	Employee Is Killed in Fall From Rolling Ladder Tower	On September 13, 2010, Employee #1, working in the tool department, attempted to assist a customer by climbed a rolling ladder tower to access product located on product racking approximately nine feet from floor level. Employee #1 left the top level of the ladder stand and climbed onto the product rack. Employee #1 then attempted to reboard the ladder stand from the storage rack when he fell approximately 9 feet to the concrete floor. Employee #1 suffered fatal head injuries.	5211: Lumber and Other Building Materials	1	Ladder	Fall (From Elevation)	Other
			Fall From Ladder (Others)					
200830990 / 307606905	2006	Employee Is Brain Dead in Fall From Ladder	On February 7, 2006, an employee fell approximately 7 ft, when the portable metal ladder stand that he was using tipped over. The employee suffered severe head trauma and was later pronounced brain dead. A wheel was missing from the ladder at the time of the inspection.	7699: Repair Services, NEC	1	Ladder	Fall (From Elevation)	Other

202450326 / 309674034	2006	Employee Is Killed in Fall From Platform	On January 12, 2006, Employee #1 was working alone at night, greasing fittings on a loading platform that was 11 feet above the ground. The loading platform consisted of an adjustable ladder leading to a guardrail system, which lowers to the top of a tanker truck when loading. The guardrails become fall protection for employees, when they are opening the valves on the top of the truck. When there are no trucks at the loading platform, the adjustable ladder assembly is kept in the raised, stored position. An automatic foot locks the clips into place over a "pin" or "bolt" to keep the assembly from descending inadvertently. It is believed that Employee #1 leaned against the adjustable ladder assembly while greasing fittings on the platform and the assembly descended unexpectedly, causing him to lose his balance and fall to the ground, striking his head on the concrete pad area, resulting in his death. The accident was not witnessed. Inspection of the ladder assembly revealed that the "pin" or "bolt" part of the foot lock was missing.	2874: Phosphatic Fertilizers	1	Ladder	Fall (From Elevation)	Work-Surface/Facil.-Layout Cond.
202087946 / 309444941	2007	Employee Dies in Fall From Crane	At approximately 12:15 a.m. on January 12, 2007, Employee #1 was working as part of a crew that was cleaning and serving a 370-[t]on . . . [c]rane. The maintenance crew had parked and locked out the crane, and removed the worm gear box casing, so that the service crew could access the worm gear. The trolley was parked approximately 90-in. away from the trolley stop. This left one side of the platform open to an approximate 110 ft to 115 ft fall hazard. Employee #1 was descending a 6-ft metal rung ladder from the bridge of the crane and was killed when he slipped and fell while attempting to place his foot on the trolley rail. He struck the crane during his fall and landed on the new worm gear which was lying on the ground.	8999: Services, NEC	1	Working Surface	Fall (From Elevation)	Work-Surface/Facil.-Layout Cond.

200555217 / 311523609	2008	Employee Falls From Ladder, Later Dies	At approximately 8:30 a.m. on April 15, 2008, Employee #1was descending a ladder on oil drilling rig #6. Employee #1 was wearing a body harness that was hooked into the rig's counter weighted ladder climbing device. For some reason, the self-retracting lifeline was not in place. Employee #1 fell approximately 60 ft to the rig floor. Employee #1 sustained head and back injuries. Employee #1 was flown to a local hospital, where he died on April 17, 2008.	1381: Drilling Oil and Gas Wells	1	Working Surface	Fall (From Elevation)	Other
201282910 / 311037931	2008	Employee Dies After Fall From Ladder	At approximately 8:15 a.m. on February 18, 2008, Employee #1 responded to a call to repair a leaking tractor-trailer. Upon arrival at the site, Employee #1 used a 12-foot folding ladder to reach the top of the trailer, which measured 13.25 feet high. While sealing the leak, Employee #1 fell from the ladder. He landed on his back and struck his head on the ground. Employee #1 was taken to a nearby hospital, where he died.	7549: Automotive Services, NEC	1	Bodily Motion	Struck Against	Work-Surface/Facil.-Layout Cond.
200997674 / 313126807	2009	Employee Falls From Crane	On June 6, 2009, Employee #1, a maintenance supervisor . . . was on a charging crane, he was going up an 88-foot vertical ladder on the crane trolley, while his crew was about to-do a cable change on the 75-ton auxiliary hook. Employee #1 slipped off the ladder and fell backwards approximately 80 feet to the ground, he was also observed hitting a spreader beam on the floor level during the fall and severing his right leg. Employee #1 was pronounced dead at the scene by paramedics and the Coroner Investigator. No fall protection equipment was used by Employee #1 or any the other employees on the crew. Fall protection was available by company and Employee #1 had knowledge of its availability.	3312: Blast Furnaces and Steel Mills	1	Ladder	Fall (From Elevation)	Work-Surface/Facil.-Layout Cond.

201353026 / 308436013	2006	Employee Is Killed in Fall From Roof	On February 1, 2006, Employee #1 was working as a heating, ventilation, and air conditioning (HVAC) mechanic, performing scheduled maintenance on the HVAC units at a . . . restaurant. There were three HVAC units on the restaurant roof, which was about 15-feet high. Along the edge of the roof, there was a 15-inch wide, 19-inch high parapet. Employee #1 climbed a portable metal ladder and took a garden-type water hose, connected to a spigot at ground level, onto the roof. Carrying the hose to the opposite side of the roof from where the ladder was located, he apparently walked either backward or sideways, not watching where he was walking. He walked into the parapet wall and fell from the roof, sustaining injuries to his head, knees, left hand, and left wrist. He was taken to a local hospital, where he was pronounced dead. The cause of death was a closed head injury due to blunt impact to his head and neck. His injuries included head fractures, hemorrhage, and contusions.	7623: Refrigeration Service and Repair	1	Working Surface	Fall (From Elevation)	Work-Surface/Facil.-Layout Cond.
202461596 / 310112602	2006	Employee Falls From Elevation and Is Killed	On May 9, 2006, an employee was engaged in a roof cleaning operation consisting of cleaning lint collection traps from dryer stacks. A forklift basket attachment, not secured to the forklift blades, containing cleaning equipment, was lifted to the roof approximately 20 ft above the ground. Upon completion of the cleaning operation, the employee stepped onto the basket attachment to load a hand truck, when the attachment flipped off the forks. The employee fell from the attachment onto a metal tote located at ground level. The employee was then struck by the falling attachment, which weighed approximately 400 lbs. The employee was transported to . . . [the h]ospital where he died from chest trauma at approximately 6:00 p.m.	7218: Industrial Launderers	1	Other	Struck By	Other

200841732 / 309292282	2008	Fatal Fall From A Roof	On November 05, 2009, at approximately 9:40 AM, Employees #1 and #2 were performing roofing work on the roof of building #3 at [a steel plant]. The employees were replacing 27.5-in. wide and 10-ft., 6-in. long, 2.5-in. corrugation, light green translucent roof sheets with 35.5-in. by 12-ft. corrugated sheet metal. Both employees were exposed to 40 ft., 7 in. fall hazards from the eave of the roof and an approximate 70-ft. fall hazard through a fiberglass panel that gave way under the weight of the . . . accident victim. Both employees were wearing harnesses; however, neither employee was tied off at the time of the accident. The lifeline was connected by placing a locking type snap hook at the peak of the roof, in such a manner, as to negate the locking mechanism of the snap hook. At the time of the . . . accident, both employees were installing the last piece of corrugated sheet metal. As Employee #1 was screwing in the corrugated sheet metal, Employee #2 was standing beside and a little behind Employee #1, in order to help hold him in place due to the slippery condition of the corrugated sheet metal. Employee #2 slipped and fell backward through a fiberglass panel, which gave way under Employee #2's weight. Employee #2 fell approximately 70 ft. to his death into the interior of the building. Employee #2 landed on a dirt floor, inside the building. Employee #2 died from severe brain trauma.	3312: Blast Furnaces and Steel Mills	1	Buildings / Structures	Fall (From Elevation)	Work-Surface/Facil.-Layout Cond.

201781168 / 109332866	2009	Employee Falls From Roof, Later Dies	At approximately 5:00 p.m. on March 13, 2009, Employee #1 was working alone removing old paint using a water blast machine on a flat roof of a building, when he fell approximately 35 ft from the edge of the roof. Employee #1 was taken to the hospital, where he later died from his injuries.	5999: Misc. Retail Stores, NEC	1	Other	Fall (From Elevation)	Other
200925600 / 312945629	2009	Employee Dies After Fall From Roof	On February 10, 2009, Employee #1 was an inspector for a company that performed special inspections. He was on the roof of a four story residential building being constructed. The roof had a 5:12 pitch. He was expecting the nail pattern for the roof sheathing and was walking along the ridge. He lost his footing, slid down the roof, and fell approximately 40 to 45 ft to the ground. Employee #1 died at the hospital. He had not been wearing a harness with a secured lanyard nor was he otherwise protected from fall hazards while performing this job.	8711: Engineering Services	1	Buildings / Structures	Fall (From Elevation)	Work-Surface/Facil.-Layout Cond.
314190943 / 314190943	2010	Employee Is Killed in Fall From Roof	On September 23, 2010, Employee #1 was located on the roof of a three-story building to remove a tree limb that was too close to the roof, causing damage. As Employee #1 cut the limb with a hand saw, it broke prematurely due to the weight on the cut. Employee #1 was knocked from the roof, landing on the lower level of the building, and was killed. The accident investigation revealed that Employee #1 was not wearing any type of fall arrest equipment at the time of the incident.	6513: Apartment Building Operators	1	Hand Tool (Manual)	Fall (From Elevation)	Work-Surface/Facil.-Layout Cond.

202473849 / 307185066	2007	Employee Is Injured in Fall Through Skylight, Later Dies	On June 15, 2007, an employee, a general laborer, was on the roof of the building, alone, and engaged in cleaning a skylight with a broom. The broom broke, and he lost his balance, falling through the unguarded skylight. The employee fell over 15 feet to the concrete floor below. The employee was not wearing any personal fall protection gear such as a harness, lanyard, etc. No means of fall protection was used at the jobsite at the time of the incident. The employee's supervisor was not onsite, but was aware of the task that the employee was performing. The employer did not establish safe procedures for employees to follow when cleaning skylights, such as the use of personal fall protection devices and/or guardrails. A coworker was working inside the building, and took the employee to . . . [the h]ospital. The employee sustained internal injuries and was treated and released from the hospital after five days. The employee died eight days after the incident.	6531: Real Estate Agents and Managers	1	Other	Fall (From Elevation)	Other
201371119 / 310226568	2007	Employee Is Killed in Fall Through Skylight	On February 15, 2007, an employee, a second shift foreman fell through a skylight, while traversing across the snow covered roof of the foundry while en route to the sand bin house. As he approached the northwest corner of the roof, he stepped on the corner of the snow covered sky light. He apparently lost his balance and fell onto the dome shaped plastic cover. The cover broke under his weight causing him to fall approximately 30 feet to the concrete floor of the foundry. Several coworkers immediately ran to his aid and called the emergency medical services. He was made comfortable until the paramedics arrived, who attempted cardio pulmonary resuscitation. The employee was non-responsive and was transported to the . . . hospital . . . where he was pronounced dead	3321: Gray and Ductile Iron Foundries	1	Working Surface	Fall (From Elevation)	Work-Surface/Facil.-Layout Cond.

201763059 / 311661094	2008	Employee Is Killed in Fall Through Skylight	On January 7, 2008, Employee #1, a journeyman lineman, was working as part of a four-man crew to replace a burned-out, pole-mounted transformer. The pole was inaccessible by truck because of its proximity to an industrial strip center on its south side and a drainage ditch, with a slope of approximately 12 degrees, on its north side. The pole was located approximately 253 feet east of a hard-surface parking lot. The crew determined that they would replace the transformer manually, using a jib, blocks, and generator-powered electric cathead. The crew had difficulty lowering the old transformer to the ground because the industrial strip center, located 66 inches south of the pole, prevented a good angle on the tag lines. However, they did successfully remove the old transformer. Because of the difficulty they had experienced in removing the old transformer, the crew decided that they would raise the new transformer to the level of the roof and then throw the tag lines onto the roof. The crew thought this would result in a better tag line angle, which would allow them to pull the transformer away from the pole and facilitate positioning and bolting it into place. The cathead was used to raise the transformer to the level of the roof, and Employee #1 threw his tag line onto the roof. Employee #1 and a helper then walked over to a ladder, which was erected approximately 240 feet west of the pole. They climbed the ladder and walked east across the 1 to 12 pitch metal roof of the industrial strip center building. The helper walked east along the edge of the building, while Employee #1 walked southeast, approximately 50 feet. Employee #1 stepped onto a fiberglass skylight and fell approximately 17 feet to the concrete floor of the shop. Employee #1 was killed and declared dead at the scene.	4911: Electric Services	1	Working Surface	Fall (From Elevation)	Work-Surface/Facil.-Layout Cond.

202529566 / 309915676	2009	Employee Is Killed in Fall Through Unguarded Skylight	At approximately 3:30 p.m. on July 22, 2009, Employee #1 and his supervisor were on a roof to remove bees from an air conditioning unit. The bees chased Employee #1, and he fell through an unguarded skylight located partway between the hatch and the air conditioner. He fell 25 ft striking a concrete floor and died.	5531: Auto and Home Supply Stores	1	Buildings / Structures	Fall (From Elevation)	Work-Surface/Facil.-Layout Cond.
201262862 / 315148437	2010	Employee Is Killed in Fall Through Skylight	At approximately 12:20 p.m. on December 22, 2010, Employee #1 was working at a facility of a firm that manufactured rubber and plastic hoses and belts. Employee #1 had been employed at the facility since August 10, 2010, and he had been with the corporation since July 1, 1984. Employee #1 was on the roof to investigate the origin of a water leak from a chiller. The employer had three other employees who went up onto the roof on a regular basis to check equipment and conduct other inspection checks. Employee #1 was a plant manager and would not normally have gone up to the roof to view the leaking chiller. The supervisor of maintenance, however, wanted to show Employee #1 where the leak was coming from and how they were going to fix it. The supervisor of maintenance stated that he did not see if Employee #1 slipped. He did see Employee #1 lose his balance while near the skylight and fall through. The supervisor of maintenance was the only one accompanying Employee #1 while he was on the roof. Employee #1 fell through a skylight made of an acrylic plastic dome. It was not equipped with a skylight guard or standard railing on all four sides. He fell 23 feet. Employee #1 was rushed to the hospital, but he was pronounced dead at approximately 3:00 p.m. According to the medical examiner's report, Employee #1 sustained multiple . . . traumatic injuries resulting from the fall	3052: Rubber and Plastics Hose and Belting	1	Buildings / Structures	Fall (From Elevation)	Work-Surface/Facil.-Layout Cond.

200980670 / 307815050	2006	Employee Is Killed in Fall From Scaffold	On February 14, 2006, Employee #1 was working from scaffolding that was approximately 30-feet tall. The scaffolding was directly above a drilling rig cellar that was about 10-feet deep. While Employee #1, thought to be collecting tools, was on the scaffold, he fell into the cellar, killing him. Employee #1's hard hat was found on the scaffolding directly above the cellar, with Employee #1 below. The accident investigation revealed that Employee #1 was not wearing fall protection, and the injuries found on his body were consistent with a fall from a scaffold. There were no witnesses.	1381: Drilling Oil and Gas Wells	1	Other	Fall (From Elevation)	Work-Surface/Facil.-Layout Cond.
202341905 / 311442859	2007	One Employee Is Killed, One Is Injured in Fall From Scaffold	On December 7, 2007, Employees #1 and #2 were preparing to do window washing from the roof of a 46-story building. A two-point suspended scaffold platform detached from the building's permanent window washing rig that was anchored to the roof. It slid out into position to go down, when the cables slipped from their attachment points. Employees #1 and #2 fell with the scaffold to the ground. Employees #1 was pronounced dead on the scene and Employee #2 was transported in critical condition to Cornell hospital. Employees #1 and #2 did not put on their safety harnesses or install their life lines. The life lines and harnesses, and a bucket of hot water and soap were found on the roof next to the scaffold rig. Two new cables were installed just 30 days earlier, and this was the first time the scaffold was being used after the cable installation.	7349: Building Maintenance Services, NEC	1	Buildings / Structures	Fall (From Elevation)	Work-Surface/Facil.-Layout Cond.

202472106 / 311106298	2007	Employee Is Killed in Fall From Boatswain Chair	On June 15, 2007, an employee was making sure that a coworker, a new trainee, was geared up properly and that all of his equipment was properly secured. Both men were in the process of cleaning the windows of a seven story resort building. They were using a boatswain chair as the chosen form of scaffolding. As the coworker was getting ready to access his chair, the employee told him to wait and watch him to see the safest and most effective way to gain access to the chair and begin the descent down the building. The employee apparently did not check his own gear before accessing the chair. When he climbed over the parapet wall, he fell to the ground. The coworker called the emergency medical services as he went down stairs to see how the employee was doing. Once there, the coworker began cardio-pulmonary resuscitation until the help arrived. The employee was killed.	7349: Building Maintenance Services, NEC	1	Bodily Motion	Fall (From Elevation)	Other
200643831 / 310999206	2007	Employee Falls Off Scaffold, Later Dies	On June 12, 2007, Employee #1 was working on a scaffold, taking measurements, at a height of 15 feet. He fell to the concrete slab below and later died from his injuries.	5051: Metals Service Centers and Offices	1	Working Surface	Fall (From Elevation)	Work-Surface/Facil.-Layout Cond.
200624237 / 310711106	2007	Employee Dies After Fall in Church Sanctuary	On January 6, 2007, Employee #1 was using a scaffold or a ladder to reach the 25-ft high ceiling in a church sanctuary. He was either replacing ceiling tiles or repairing a light fixture. He received unspecified injuries when he fell. He was hospitalized and died on January 14, 2007.	7349: Building Maintenance Services, NEC	1	Working Surface	Fall (From Elevation)	Other

He fell backwards off the scaffold striking his head on a concrete driveway. He suffered a concussion and was killed.	3471: Plating and Polishing	1	Other	Card-Vasc./Resp. Fail.	Other
200074391 / 314619925	2010	Employee Dies Falling From High Scaffold	Employee #1 and two coworkers were on a 25-ft scaffold, setting it up in order to perform maintenance on an aircraft. The center of the work platform was equipped with sliding floor panels, which allowed the sections of floor to open up around the tail of the aircraft. On top of the floor panels was a rolling platform the maintenance workers would stand on, while servicing the aircraft. Employee #1 and a coworker, pushed the rolling platform toward the tail of the aircraft, to put it into position, and discovered that six of the sliding floor panels directly below were open instead of closed. Subsequently, Employee #1 fell through the opening in the floor of the platform as he pushed the rolling platform forward, landing on the concrete ground below. Employee #1 passed away as a result of injuries suffered.	4581: Airports, Flying Fields, & Services	1	Working Surface	Fall (From Elevation)	Work-Surface/Facil.-Layout Cond.

201762903 / 311046049	2007	Employee Is Killed in Fall From Scaffolding	On May 26, 2007, Employee #1 and several other employees were scheduled to sandblast and paint the inside of a petrochemical tank that was approximately 45 feet in diameter and approximately 60 feet in height. The tank had a floating roof, which was lowered to allow installation of the scaffolding from which the men would work. Employee #1 attempted to lower himself from the scaffold using the ladder installed on the ends of the scaffolding. One witness said that the ladder broke as Employee #1 was descending and he fell approximately 20 feet to the floating roof. Attempts were made by the other employees present to render CPR, but they failed to revive Employee #1. He was pronounced dead at the scene a short time later. (Note: Employee fell from ladder, not scaffold.)	2911: Petroleum Refining	1	Ladder	Fall (From Elevation)	Other
200556223 / 314767468	2010	Employee Dies After Fall From Scaffold	At approximately 7:00 a.m. on October 8, 2010, Employee #1 was a foreman and was climbing a scaffold ladder on the south side of the exterior of the building. He was climbing to the work area on a scaffold platform at a higher level. Employee #1 was approximately 27 ft above the lower landing when a coworker heard a loud noise that was not described. The coworker called out to Employee #1 but he did not respond. Coworkers then observed Employee #1 release his grip on the ladder. Employee #1 was injured when he fell approximately 41 ft to the ground. Employee #1 died from an illness or injury that was not specified.	9999: Nonclassifiable Establishments	1	Bodily Motion	Fall(From Elevation)	Other

202498119 / 311734842	2008	Employee Is Killed By Fall While Cleaning Chimney	On February 20, 2008, Employee #1 was attempting to clean a house chimney. According to the Coroner's report, Employee #1 sustained impact injuries to the head and neck. Based on the chimney sweep process and the home owner interview, Employee #1 walked across two sections of the house roof to gain access to the chimney top. Employee #1 was equipped with only one ladder to gain access to the porch roof and primary roof levels, with the final destination being the roof peak. A section of aluminum ladder was observed secured to the main roof of the house with hooks that overlapped the peak of the roof. Employee #1 had used a 12-foot section of ladder to access the porch roof from the ground. He then had to pull that section up onto the porch roof and set it up to access the ladder on the main roof. The section of ladder Employee #1 used to access the porch roof was also lying on the ground along with the cleaning equipment he had used to clean the flu. There were no witnesses to Employee #1 falling. It is not known if Employee #1 was climbing the section of ladder while accessing the main roof from the porch or if he fell while setting the ladder up to access the main roof. The minimum height Employee #1 could have fallen would be approximately 15 feet. (The ground slopped away from the end of the porch where the employee was found) The metal sloped porch roof was snow covered. Neither a personal fall arrest system nor guard rails were used. Employee #1 was working alone which was against company policy, which states that two people are required on these worksites. The home owner even told Employee #1 to come back if it was not safe. The cause of death was head and neck injuries.	7349: Building Maintenance Services, NEC	1	Ladder	Fall (From Elevation)	Work-Surface/Facil.-Layout Cond.

BILLING CODE 4510–29–C

VI. Federalism

OSHA has reviewed the final rule in accordance with Executive Order (E.O.) 13132 on Federalism (64 FR 43255 (8/10/1999)). This E.O. requires that Federal agencies, to the extent possible, refrain from limiting state policymaking discretion; consult with states prior to taking action that restricts state policy options; and take action that has federalism implications only where (1) there is ''constitutional and statutory authority'' for such action, and (2) the problem is of ''national significance'' (E.O. 13132, Section 3(b)).

Section 4 of E.O. 13132 allows Federal agencies to preempt state law, but only (1) where the Federal statute contains an express preemption provision or there is some other clear evidence that Congress intended preemption of state law, or (2) where the exercise of state authority conflicts with the exercise of Federal authority under the Federal statute. The E.O. further provides that Federal agencies must limit any such preemption of state law to the extent possible.

The final rule complies with E.O. 13132. The FEA (Section V) and other information in the rulemaking record shows that worker exposure to walking-working surface hazards, particularly fall hazards, is very widespread. Workers throughout general industry are exposed to walking-working surface hazards that can result in slips, trips and falls and other injuries and fatalities. According to the Bureau of Labor Statistics (BLS) data, slips, trips, and falls are a leading cause of workplace fatalities and injuries in general industry. As discussed in the Analysis of Risk section (Section II), workplace deaths due to slips, trips, and falls are second only to motor-vehicle accidents as the leading cause of worker fatalities.

Congress enacted the Occupational Safety and Health Act of 1970 (OSH Act) (29 U.S.C. 651 *et seq.*) ''to assure so far as possible every working man and woman in the nation safe and healthful working conditions'' (29 U.S.C. 651(b)). To achieve that objective, Congress expressly authorizes the Secretary of Labor to promulgate occupational safety and health standards applicable to businesses affecting interstate commerce (29 U.S.C. 655(a)).[164]

Section 18 of the OSH Act addresses the role of states in regulating workplace safety and health issues (29 U.S.C. 667). Section 18(a) provides that the OSH Act does not prevent states from asserting jurisdiction under state law over a workplace safety and health issue with respect to which no Federal OSHA standard is in effect (29 U.S.C. 667(a)). Where Federal OSHA has regulated an occupational safety and health issue, Section 18(b) gives states the option of developing and enforcing their own occupational safety and health standards through establishment of a State Plan. Section 18(b) specifies: ''Any State which, at any time, desires to assume responsibility for development and enforcement therein of occupational safety and health standards relating to any occupational safety or health issue with respect to which a Federal standard has been promulgated . . . shall submit a State plan for the development of such standards and their enforcement.''

Section 18(c) provides that the Secretary of Labor will issue approval of a State Plan if the plan provides for the development and enforcement of standards for occupational safety and health that are at least as effective in providing safe and healthful workplaces as federal OSHA standards. (29 U.S.C. 667(c)). State Plan standards may have different or additional requirements from OSHA's standards.

Currently, 27 U.S. states and territories, including New York, have OSHA-approved State Plans. However, the New York State Plan is limited in coverage; it is one of five state and local government only State Plans (29 CFR part 1956, subpart F). As such, the New York State Plan only covers state and local government workers and does not cover private sector employers or employees.

Approximately 40 years before Congress passed the OSH Act, New York's legislature had enacted a statute addressing the ''[p]rotection of the public and of persons engaged at window cleaning and cleaning of exterior surfaces of buildings''[165] (N.Y. Lab. Law sec. 202). Section 202 requires that workers be provided with safe means for cleaning windows and exterior surfaces, and not be required or allowed to clean any window or exterior surface unless such means are in place for the ''prevention of accidents and for the protection of the public and of such persons engaged in such work'' (N.Y. Lab. Law sec. 202). The statute applies to all employers whose employees clean windows and exterior surfaces of covered buildings as well as to owners, lessees, agents, and managers of such buildings.

Section 202 also authorized the Industrial Board of Appeals (Industrial Board) to ''make rules to effectuate the purposes of the section.'' It specifies that those rules shall be applicable exclusively throughout the state, notwithstanding any other general or local law or regulation, and that the Commissioner of Labor shall have ''exclusive authority'' to enforce sec. 202 and the rules issued thereunder (N.Y. Lab. Law sec. 202). Pursuant to sec. 202, the Industrial Board has issued regulations for the ''protection of persons engaged at window cleaning;'' however, they do not include specific provisions directed at protecting the public (N.Y. Comp. Codes R. & Regs. part 21). The regulations specify, among other things, that employees shall not be permitted to clean windows other than ''in accordance with an *authorized means and methods*'' (N.Y. Comp. Codes R. & Regs. sec. 21.3(b)(2) (emphasis added)). The following means and methods are the only ones the regulations authorize employers to use for cleaning windows:

- Working from safe surfaces;
- Working from window sills or ledges;
- Working from ladders;
- Working from boatswain's chairs;
- Working from scaffolds (12 N.Y. Comp. Codes & Regs. sec. 21.4).

The authorized means and methods do not include rope descent systems (RDS)[166] or identify whether

[164] The OSH Act defines an ''occupational safety and health standard'' as ''a standard which requires conditions, or the adoption or use of one or more practices, means, methods, operations or processes, reasonably necessary or appropriate to provide safety and healthful employment and places of employment'' (29 U.S.C. 652(8)).

[165] New York Lab. Law sec. 2(13) defines ''public building'' to include ''a factory building, an office building, a mercantile building, a hotel building, a theatre building, a warehouse building, an apartment building, a state or municipal building, a school, a college or university building, a building containing a place of public assembly maintained or leased for pecuniary gain, or any other building more than one story high except a dwelling house less than three stories high or occupied by less than three families'' (*See also,* N.Y. Comp. Codes R. & Regs. sec. 21.2(k)). Section 202 excepts the following public buildings from coverage: Multiple dwellings six or fewer stories in height; any building three or fewer stories in height in cities, towns or villages with a population of less than 40,000; and windows or exterior surfaces of any building the Industrial Board of Appeals may exempt from the requirement.

[166] The final rule defines a rope descent system as a suspension system that allows an employee to descend in a controlled manner and, as needed, stop at any point during the descent. A rope descent system usually consists of a roof anchorage, support rope, a descent device, carabiner(s) or shackle(s), and a chair (seatboard). A rope descent system also is called controlled descent equipment or apparatus. Rope descent systems do not include industrial rope access systems (final § 1910.21(b)). The final rule requires that RDSs be used in

Continued

''boatswain's chairs'' [167] include RDSs. However, New York State Department of Labor (NYSDOL) advisory standards on practices and procedures for the use of boatswain's chairs expressly prohibit employers from using controlled descent devices (CDDs) [168] for window cleaning (Advisory Standards for Construction, Operation and Maintenance of Suspended Scaffolds used for Window Cleaning and Light Maintenance, 101–1, 101–3 Design Components, sec. 9(b)(ii)).

The final rule (§ 1910.27(b)), on the other hand, allows employers to use RDSs for activities performed at elevated heights, including window cleaning. Final § 1910.27(b)(2)(i) limits the use of RDSs to elevations not exceeding 300 feet above grade; however, employers may use RDSs at greater heights if they can demonstrate that it is not feasible to access such heights by any method other than an RDS or other means pose a greater hazard than using an RDS.

OSHA received many comments on the proposed rule. Many stakeholders, including window cleaning companies and window cleaners, supported allowing employers to use RDSs, including at heights above 300 feet (*e.g.,* Exs. 138; 147; 163; 184; 221; 242; 243; 329 (1/19/2011, pgs. 326–29). Also, many stakeholders, including many New York window cleaners, opposed the proposed rule (*e.g.,* Exs. 131; 224; 311; 313; 314; 316; 319; 329 (1/19/2011; pgs. 5–8, 17–19; 354). They urged that OSHA, like New York, prohibit the use of RDSs for window cleaning and indicated concerns about the potential preemptive effect of the final rule on New York's window cleaning laws and regulations.

The question of whether a state law is preempted by Federal law is one of congressional intent (*Gade* v. *National Solid Wastes Management,* 505 U.S. 88, 96 (1992)). In *Gade,*[169] a five-justice majority said the language of Section 18 of the OSH Act indicates Congress' intent to preempt state occupational safety and health regulations relating to an issue that Federal OSHA already has regulated, unless the state has an OSHA-approved State Plan (*Id.,* at 98).

A four-justice plurality determined the state law, absent an approved State Plan, is impliedly pre-empted'' (*Id.,* at 98 (Congress' intent is ''implicitly contained in the [OSH Act's] structure and purpose'')). The plurality said language in Section 18(b) requiring that a state ''shall submit a State plan'' for approval if it desires to assume responsibility for developing and enforcing standards on an occupational safety and health issue that Federal OSHA has regulated, evidences Congress' intent to preempt where there is no approved plan:

> The unavoidable implication of [Section 18(b)] is that a State may not enforce its own occupational safety and health standards without obtaining the Secretary's approval (*Id.,* at 99).

The plurality noted that other parts of Section 18 also support preemption absent an approved plan (*Id.,* at 100–102). Looking at Section 18 as a whole, the plurality was persuaded that Congress sought ''to promote occupational safety and health while at the same time avoiding duplicative, and possibly counterproductive, regulation'' (*Id.,* at 102). Therefore, they concluded that, absent an approved plan, any state regulation of an OSHA-regulated occupational safety or health issue is preempted as being in conflict with ''the full purposes and objectives'' of the OSH Act. The plurality also concluded that allowing a state without a -State Plan to supplement Federal OSHA standards, even non-conflicting laws,[170] would be inconsistent with the ''federal scheme of establishing uniform federal standards, on one hand, and encouraging States to assume full responsibility of their own OSH programs, on the other'' (*Id.,* at 103).

The Court also reached the same conclusion regarding the preemptive effect of a law that regulates public as well as workplace safety and health (*i.e.,* a ''dual impact'' law). The five-justice majority said that any state law ''designed to promote safety and health in the workplace falls neatly within the Act's definition of an 'occupational safety and health standard' '' (*Id.,* at 105). According to the Court, the fact such a state law also may have a non-occupational purpose or impact ''does not render it any less of an occupational safety and health standard for purposes of preemption analysis'':

> [I]t would defeat the purpose of section 18 if a state could enact measures stricter than OSHA's and largely accomplished through regulation of worker safety and health simply by asserting a non-occupational purpose for the legislation' (*Id.,* at 106, citing *National Solid Wastes Management Assn.* v. *Killian,* 918 F.2d 671, 679 (7th Cir. 1990)).

Therefore, the Court said it must look at the ''effects of the law'' as well legislature's professed purpose (*Id.,* at 105). Applying this test, the Court determined that, in the absence of an approved state plan, the OSH Act preempts all state law that ''constitutes, in a direct, clear and substantial way, regulation of worker health and safety'' (*Id.,* at 107).[171]

Based on the following, OSHA finds that sec. 202 ''directly, substantially, and specifically regulates occupational safety and health.'' Although the title of sec. 202 specifies that its purpose is ''[p]rotection of the public and of persons engaged at window cleaning and cleaning of exterior surfaces of buildings,'' the language in sec. 202 clearly indicates it is promulgated primarily for the protection of workers rather than the public. For example, Section 202 directs employers and contractors to ''provide safe means'' for workers to clean windows and building surfaces and ''require his employees . . . to use the equipment and safety devices'' while cleaning windows and building surfaces, but does not contain any requirements directed at members of the public. As such, protection of the

---

conjunction with a separate personal fall arrest system to protect workers if a fall occurs (§ 1910.27(b)(2)(vi)).

[167] Existing § 1910.21(f)(2) defines a boatswain's chair as a ''seat supported slings attached to a suspended rope, designed to accommodate one workman in a sitting position.'' OSHA's construction cranes and derricks standard, revised in 2010, defines boatswain's chair as ''a single-point adjustable suspension scaffold consisting of a seat or sling (which may be incorporated into a full body harness) designed to support one employee in a sitting position'' (29 CFR 1926.1401). In the proposed rule OSHA characterized rope descent systems as ''a variation of a single-point adjustable suspension scaffold'' (proposed § 1910.21(b)). Several stakeholders said OSHA's characterization was not accurate because RDS and controlled descent devices only travel downward whereas single-point adjustable suspension scaffolds, such as boatswain's chairs, can go up and down. (Exs. 62; 168; 205). The final rule clarifies that RDS are not a boatswain's chair or a type of single-point adjustable suspension scaffold (final § 1910.21(b)).

[168] The definition of ''rope descent system'' (RDS) in final § 1910.21(b) states that RDS also are called CDDs.

[169] *Gade* addressed the preemptive effect of OSHA's Hazardous Waste Operations and Emergency Response standard (29 CFR 1910.120) on Illinois laws establishing training and license requirements for hazardous waste equipment operators and workers. Illinois did not have an approved State Plan at the time.

[170] OSHA notes that New York's laws and regulations and final § 1910.27 are not non-conflicting regulations. Rather, it is ''a physical impossibility'' for employers and employees to comply with both the final rule, which allows the use of RDSs, and New York's regulations, which prohibit their use (*Gade,* 505 U.S. at 98). If employers use RDSs in accordance with final § 1910.27(b) to clean windows up to 300 feet above grade, they violate New York's regulations.

[171] OSHA notes that the Court in *Gade* recognized an exception to the OSH Act's preemption of state regulations for ''laws of general applicability'' (*Gade,* 505 U.S. 107). Laws of general applicability regulate the conduct of workers ''simply as members of the general public'' (*Id.*). Like the Court, OSHA has consistently taken the position the OSH Act does not preempt state laws promulgated primarily for the purpose of protecting public safety, such as building, electrical and fire codes (CSP 01–03–004, The Effect of Preemption on the State Agencies without 18(b) Plans (3/13/1981)).

public appears to be a residual benefit of sec. 202's requirements to protect workers. The legislative history of sec. 202 also reinforces that it is primarily ''directed at workplace safety'' (*Gade,* at 107). Section 202, as originally enacted in 1930, only applied to ''persons engaged at window cleaning.'' It wasn't until 1970 that the legislature expanded the scope of sec. 202 to cover ''protection of the public.''

The title of the Industrial Board regulations that implement sec. 202, ''Protection of persons employed at window cleaning—structural requirements, equipment and procedure,'' also support that sec. 202 is primarily directed to protecting workers (N.Y. Comp. Codes R. & Regs. Part 21). The regulations' findings of fact reinforce this:

> The board finds that the trade, occupation or process of cleaning the windows of public buildings involves such elements of danger to the lives, health or safety of persons employed therein as to require special regulations for the protection of such persons, in that such trade, occupation or process necessarily involves the constant hazard of falling from dangerous heights and creates a substantial risk of serious injury to such persons and others (12 N.Y. Comp. Codes & Regs. 21.0).

In addition to the ''authorized means and methods'' employers must use to clean windows, the regulations as well as the advisory standards also establish work practice and equipment requirements employers and workers must follow. Like OSHA standards, New York's laws and regulations establish the means and methods ''reasonably necessary or appropriate to provide safety and health employment and places of employment'' for workers who clean windows and exterior surfaces of public buildings.

Looking at sec. 202 and its implementing regulations and advisory standards as a whole, the substantial effect they have on workplace safety and health shows they are occupational safety and health standards within the meaning of the OSH Act. Since New York's laws regulate the same occupational safety and health issue as the final rule, pursuant to *Gade,* they can be saved from preemption only if New York has an OSHA-approved State Plan. As mentioned, New York has an approved State Plan, but it only covers state and local government employees. New York has not submitted a State Plan covering private employees for approval by the Secretary of Labor. Absent such a plan, New York's laws and regulations, to the extent that they cover private employees, are preempted as being in conflict with ''the full purposes and objectives'' of the OSH Act (*Gade,* at 98). That said, New York's laws remain in effect for state and local government employees, and, to the extent that New York's laws are at least as effective as OSHA's standard, state and local government employees are prohibited from using RDS when they clean windows.

Finally, OSHA notes Congress saved two areas from federal preemption. In addition to section 18(a), discussed above, Section 4(b)(4) of the OSH Act evidences Congress' clear intent to preserve state laws that that create liability for personal injury (*Gade,* 505 U.S. at 96). Section 4(b)(4) states: ''Nothing in this Act shall be construed to supersede or in any manner affect any workmen's compensation law or to enlarge or diminish of affect in any other manner, the common law or statutory rights, duties or liabilities of employers and employees under any law with respect to injuries, diseases, or death of employees arising out of, or in the course of, employment'' (29 U.S.C. 653(b)(4)).

Section 202 creates a private right of action for violations of the window cleaning regulations (N.Y. Comp. Codes R. & Regs. Part 21), which the New York courts have consistently upheld (See *e.g., Pollard* v. *Trivia Bldg. Corp.,* 291 N.Y. 19 (1943); *Bauer* v. *Female Academy of the Sacred Heart* (767 N.E.2d 1136 (N.Y. 2002)).

Since *Gade,* courts routinely have upheld state tort laws against preemption challenges so long as the state laws do not create conflict with an OSHA standard (See *Lindsey* v. *Caterpillar,* 480 F.3d. 202,212 (3d. Cir. 2007) (''We join with those courts whose holdings have formed a 'solid consensus that [Section 4(b)(4)] operates to save state tort rules from preemption' '')). Explaining the rationale behind Section 4(b)(4)'s savings clause, the courts noted that the OSH Act is primarily preventive in nature and does not provide private remedies for injuries (*Irwin* v. *St. Joseph's Intercommunity Hospital,* 665 N.Y.S.2d 773, 778–79 (App. Div. 1997) (citing cases)).

Although Section 4(b)(4) does not protect NYSDOL's ability to enforce § 202 and the regulations implementing it, OSHA believes § 202 survives preemption to the extent that it provides workers with a private right of action for damages for injuries.

VII. State-Plan Requirements

When Federal OSHA promulgates a new standard or more stringent amendment to an existing standard, the 27 States and U.S. Territories with their own OSHA-approved occupational safety and health plans must:

- Amend their standards to reflect the new standard or amendment; or
- Show OSHA why such action is unnecessary; for example, because an existing State standard covering this area is ''at least as effective'' as the new Federal standard or amendment (29 CFR 1953.5(a)).

The State standard must be at least as effective as the final Federal rule, must be applicable to both the private and public (State and local government employees) sectors, and must be completed within 6 months of the promulgation date of the final Federal rule. When OSHA promulgates a new standard or amendment that does not impose additional or more stringent requirements than an existing standard, State-Plan States are not required to amend their standards, although the Agency may encourage them to do so.

The 21 States and one U.S. Territory with OSHA-approved occupational safety and health plans covering private employers and State and local government employees are: Alaska, Arizona, California, Hawaii, Indiana, Iowa, Kentucky, Maryland, Michigan, Minnesota, Nevada, New Mexico, North Carolina, Oregon, Puerto Rico, South Carolina, Tennessee, Utah, Vermont, Virginia, Washington, and Wyoming. In addition, four States and one U.S. Territory have OSHA-approved State Plans that apply to State and local government employees only: Connecticut, Illinois, New Jersey, New York, and the Virgin Islands.

This final rule results in more stringent requirements for the work it covers. Therefore, States and Territories with OSHA-approved State Plans must adopt comparable amendments to their standards within 6 months of the date of publication of this final rule in the **Federal Register** unless they demonstrate that such amendments are not necessary because their existing standards are at least as effective in protecting workers as this final rule. Each State Plan's existing requirements will continue to be in effect until it adopts the required revisions.

VIII. Unfunded Mandates Reform Act

OSHA reviewed this final rule according to the Unfunded Mandates Reform Act of 1995 (''UMRA''; 2 U.S.C. 1501 *et seq.*) and Executive Order 13132 (64 FR 43255 (Aug. 10, 1999)). As discussed in the Final Economic Analysis and Final Regulatory Flexibility Screening Analysis, OSHA estimates that compliance with this final rule would require general industry private-sector employers to expend about $246.5 million each year. However, while this final rule establishes a federal mandate in the private sector, it is not a significant regulatory action within the meaning of Section 202 of the UMRA (2 U.S.C. 1532).

OSHA standards do not apply to State or local governments except in States that have elected, under a voluntary agreement, to adopt a State Plan that OSHA has approved. State Plan States enforce compliance with their State standards on public sector entities, and these agreements specify that these State standards must be equivalent to OSHA standards. Thus, although OSHA has included compliance costs for the affected public-sector entities in its analysis of the expected impacts associated with the final rule, the final rule does not involve any unfunded mandates being imposed on any State or local government entity. Consequently, this final rule does not meet the definition of a ''Federal intergovernmental mandate'' (see Sec. 421(5) of the UMRA (2 U.S.C. 658(5))). Therefore, for the purposes of the UMRA, the Agency certifies that this final rule does not mandate that State, local, and tribal governments adopt new, unfunded regulatory obligations.

IX. Consultation and Coordination With Indian Tribal Governments

OSHA reviewed this final rule in accordance with Executive Order 13175, (65 FR 67249 (Nov. 9, 2000)) and determined that it does not have ''tribal implications'' as defined in that order. The final rule does not have substantial direct effects on one or more Indian tribes, on the relationship between the Federal government and Indian tribes, or on the distribution of power and responsibilities between the Federal government and Indian tribes.

X. Office of Management and Budget Review Under the Paperwork Reduction Act of 1995

The final general industry Walking-Working Surfaces (29 CFR part 1910, subpart D) and Personal Protective Equipment (Fall Protection PPE) (29 CFR part 1910, subpart I) standards, like the proposed rule, contain collection of information (paperwork) requirements that are subject to review by the Office of Management and Budget (OMB) under the Paperwork Reduction Act of 1995 (PRA–95) (44 U.S.C. 3501 *et seq.*), and OMB regulations (5 CFR part 1320). The PRA–95 defines ''collection of information'' to mean, ''the obtaining, causing to be obtained, soliciting, or requiring the disclosure to third parties or the public, of facts or opinions by or for an agency, regardless of form or format'' (44 U.S.C. 3502(3)(A)).

Under PRA–95, a Federal agency cannot conduct or sponsor a collection of information unless OMB approves it and the collection of information displays a currently valid OMB control number. In addition, notwithstanding any other provision of law, no employer shall be subject to penalty for failing to comply with a collection of information that does not display a currently valid OMB control number.

OSHA has OMB approval for the collection of information requirements contained in both existing subparts D and I. These Information Collection Requests (ICRs) (paperwork burden hour and cost analysis), both of which expire August 31, 2019, are titled:

- Standard on Walking-Working Surfaces (29 CFR part 1910, subpart D), OMB control number 1218–0199; and
- Personal Protective Equipment (PPE) for General Industry (29 CFR part 1910, subpart I), OMB control number 1218–0205.

In accordance with PRA–95 (44 U.S.C. 3506(c)(2)), OSHA included revised ICRs for subparts D and I in the proposed rule and solicited public comment (75 FR 28862, 29129 (5/24/2010)). OSHA also submitted the revised ICRs to OMB for review as PRA–95 requires (44 U.S.C. 3507(d)). On July 26, 2010, OMB issued a Notice of Action (NOA) for the revised subpart D ICR, filing comment on the request that did not approve the request at that time and stating: ''Terms of the previous clearance remain in effect.''

On October 11, 2010, OMB issued a NOA for the revised subpart I ICR, also filing comment on the proposed revisions to the ICR and stating: ''OMB is not approving the collection of information in the proposed rule at this time. Prior to publication of the final rule, the agency should provide a summary of all comments related to the information collection requirements contained in the proposed rule and a description of any changes made in response to these comments.'' OSHA did not receive any public comments on the burden estimates in the proposed revised ICRs. However, the Agency received a number of comments on the proposed rule, discussed earlier in this preamble, that include information relevant to the paperwork analysis. OSHA addresses these comments in detail in the final ICR for subparts D and I.

Concurrent with publication of this final rule, the Department is submitting ICRs to revise the authority for the information collections under the Paperwork Reduction Act. The Department will publish an additional **Federal Register** notice to announce the final OMB disposition on those requests.

Title: Standard on Walking—Working Surfaces (29 CFR part 1910, subpart D).

Type of Review: Revision of a currently approved collection.

OMB Control Number: 1218–0199.

Affected Public: Business or other for-profits; Federal Government; State, Local, or Tribal Government.

Total Estimated Number of Respondents: 750,000.

Total Estimated Number of Responses: 1,032,860.

Total Estimated Annual Burden Hours: 498,803.

Total Estimated Annual Cost Burden (Capital and start-up cost component): $54,697,500.

Description of Collections of Information:

Final subpart D contains several new collection of information requirements and removes three existing collection of information requirements from this ICR.

Final § 1910.22—General requirements. Final § 1910.22(b), like the proposal, requires that employers ensure each walking-working surface can support the maximum intended load for that surface. The existing rule requires that building officials mark on plates the loads they have approved and securely affix them in a conspicuous place in the space to which they relate. The existing rule also requires that the plates not be removed or defaced and be replaced, if they are.

This final rule replaces the specifications in the existing rule (§ 1910.22(d)(1)) with performance-based language and, in so doing, deletes the collection of information requirement. In the preamble of the proposed and final rules, OSHA explained that the specification requirement in the existing rule was not necessary for two reasons: (1) Load-limit information is available in building plans and from other sources, and (2) maximum loads are taken into consideration when surfaces are designed.

Under the final rule, employers can obtain information about current walking-working surfaces from plates posted in accordance with the existing rule. For new buildings, structures and walking-working surfaces, employers can obtain information on load limits in various ways, such as from building plans, local codes, third-party certification, or self-evaluations.

Final § 1910.23—Ladders. Final § 1910.23 (b)(10) requires that any ladder with structural or other defects immediately be tagged ''Dangerous: Do

Not Use,'' or with ''similar language in accordance with § 1910.145, and removed from service until it is repaired or replaced.'' Section 1910.145 specifies that, depending on the nature of the hazard, tags must contain a ''signal'' word and ''major message'' (§ 1910.145(f)(4)). The ''signal'' word must be ''Danger,'' ''Caution,'' ''Biological Hazard,'' or ''BIOHAZARD'' or the tag may use the biological hazard symbol (§ 1910.145(f)(4)(i)(A)). The major message, which can be in written text, pictographs or both, must indicate ''the specific hazardous condition or instruction to be communicated to the employee'' (§ 1910.145(f)(4)(i)(B) and (f)(4)(iii)).

The existing rule also requires tagging defective ladders, but the requirement only applies to portable wood and metal ladders (§§ 1910.25(d)(1)(x) and 1910.26(c)(2)(vii), respectively). In addition, the subpart D ICR only takes paperwork burden hours and costs for portable metal ladders, not wood ones. This is because the existing standard for wood ladders provides the specific language that employers must use for the tags on defective ladders (''Dangerous: Do Not Use''). When OSHA supplies the exact language that employers must provide to employees, the Agency is not required to take paperwork burdens because the requirement does not come within the definition of ''collection of information'' under PRA–95 (5 CFR 1320.3(c)(2)).

In the proposed rule, the Agency proposed removing the word ''Dangerous'' from the existing tag language and requiring that tags state ''Do Not Use'' or similar language that complies with § 1910.145. After further analysis, however, OSHA concluded that retaining the signal word is necessary to get workers' attention in order to provide them with basic information that a hazard exists and they must not use the ladder. OSHA did not receive any comments on proposed paragraph (b)(10).

OSHA notes that the final rule applies the tagging requirement to all ladders final § 1910.23 covers, which includes fixed ladders, mobile ladder stands and mobile ladder stand platforms in addition to portable wood and metal ladders. As a result, the final rule expands the collection of information requirement.

Section 1910.27—Scaffolds and rope descent systems. Final § 1910.27, like the proposed rule, establishes requirements for scaffolds and rope descent systems (RDS) used in general industry. The requirements are designed to protect workers whose duties require them to work at elevations, whether on scaffolds or RDS.

Final paragraph § 1910.27(a), like the proposed rule, replaces the existing general industry scaffold standards (§§ 1910.28 and 1910.29) with the requirement that employers ensure scaffolds used meet the requirements in the construction scaffolds standards (29 CFR part 1926, subpart L). As the record indicated, many general industry employers use scaffolds to perform both general industry and construction activities. OSHA believes that allowing employers to comply with the same scaffold requirements regardless of whether they are performing general industry or construction activities will increase understanding of and compliance with the final rule, and thus, provide greater protection for workers.

By replacing the existing general industry requirements, the final rule deletes the collection of information requirement in existing § 1910.28(e)(3). That provision requires that employers ensure outrigger scaffolds are constructed and erected in accordance with table D–16, if they are not designed by a licensed professional engineer, and keep a copy of the detailed drawings and specifications at the job.

Final paragraph § 1910.27(b), like the proposal, adds new requirements that addresses the use of RDS. Final paragraphs (b)(1)(i) and (ii) contain a new collection of information requirement. Final paragraph (b)(1) requires that, before any RDS is used, the building owner must inform the employer in writing (final paragraph (b)(1)(i)), and the employer must obtain written information from the building owner (final paragraph (b)(1)(ii)), that the building owner has identified, tested, certified, and maintained each anchorage to ensure it is capable of supporting at least 5,000 pounds in any direction for each worker attached. The final rule specifies that the written information the building owner provides must be based on:

- An annual inspection; and
- A certification of each anchorage, as necessary, and at least every 10 years.

The requirement that anchorages be certified ''as necessary'' means the building owner must have a qualified person recertify any anchorage when the owner knows or has reason to believe recertification is needed (final paragraph (b)(1)(i)). The final rule gives building owners flexibility in determining when anchorage recertification is necessary. As discussed in Section IV, factors or conditions indicating that recertification may be needed include, but are not limited to, an accident involving the use of an RDS; a report of damage to an anchorage, major alteration to the building; exposure of the anchorage to destructive industrial substances; and location of the building in an area that might accelerate corrosion, such as areas having exposure to high rainfall, high humidity, or sea air.

Final paragraph (b)(1)(ii) requires that employers keep the written information obtained from the building owner for the duration of the job.

OSHA believes the requirement that building owners provide written information on anchorages to employers is essential to ensure that employers know the anchorages are safe for their workers who use RDS. In addition, the requirement that employers retain the written information throughout the job is important to keep workers informed about which anchorages are safe to use. This is particularly true if the job involves multiple workshifts or work crews, the employer adds new workers during the job, or there are changes in on-site supervisors.

Final § 1910.28—Duty to have fall protection and falling object protection. Final § 1910.28 requires that employers provide protection for each employee exposed to fall and falling object hazards.

Final paragraph (b)(1)(ii) is a new requirement. The provision requires that when the employer can demonstrate that it is not feasible or creates a greater hazard to use a guardrail, safety net, or personal fall protection systems on residential roofs, the employer must develop and implement a fall protection plan that meets the requirements of 29 CFR 1926.502(k). This requirement was added to the final rule based on public comment to allow employers greater flexibility in using PPE on residential roofs and to be more consistent with OSHA's construction's fall protection standard.

Final paragraph (b)(8)(iii), like the proposal, is a new requirement that addresses fall hazards associated with repair, service, and assembly pits less than 10 feet deep. The provision requires that employers post readily-visible warning signs in pit areas that state ''Caution—Open Pit'' and also comply with the requirements in § 1910.145.

The proposed standard would have required that employers post caution signs stating ''Caution—Open Floor'' or a ''similar legend.'' In the revised ICR published in the proposed rule, OSHA said proposed § 1910.28(b)(8)(iii) contains a new collection of information requirement and took a paperwork burden. The final rule, however, does not permit employers to post signs that contain a ''similar legend;'' it requires that employers must post signs that state ''Caution—Open Floor.'' Therefore, OSHA is not taking paperwork burden hours or costs because, as mentioned, information supplied by the Federal government to the recipient for the purpose of disclosure to the public is not a collection of information under PRA–95.

Title: Personal Protective Equipment (PPE) for General Industry (29 CFR part 1910, subpart I).

Type of Review: Revision of a currently approved collection.

OMB Control Number: 1218–0205.

Affected Public: Business or other for-profits; Federal Government; State, Local, or Tribal Government.

Total Estimated Number of Respondents: 3,500,000.

Total Estimated Number of Responses: 2,220,281.

Total Estimated Annual Burden Hours: 3,745,218.

Total Estimated Annual Cost Burden (Capital and start-up cost component): $0.

Description of Collections of Information:

Final § 1910.140, like the proposed rule, adds a new section to subpart I that addresses personal fall protection systems, such as personal fall arrest systems, travel restraint systems and positioning systems. Although final § 1910.140 does not contain any collection of information requirements, employers whose workers use a personal fall protection system also must comply with § 1910.132. Section 1910.132(d)(2) requires employers certify in writing they have performed the required workplace hazard assessment (§ 1910.132(d)(1)) to determine whether fall or falling-object hazards are present, or likely to be present, that make the use of personal fall protection systems necessary. The written certification must identify the date and workplace assessed and the person who is certifying that the hazard assessment was performed. In addition, the written document must identify that it is a workplace hazard assessment certification. The written certification requirement is a collection of information under PRA–95.

At the time OSHA published the proposed rule, general industry employers also were required to comply with § 1910.132(f)(4). That provision required employers to certify in writing that each worker has received and understood the PPE training. The standard also required that the written certification specify name of each employee trained plus the date and content of the training. In the revised ICR that OSHA published in the proposed rule, the Agency said § 1910.132(f)(4) imposes a new information collection requirement for personal fall protection systems and took a paperwork burden. Thereafter, as part of the Standards Improvement Project—Phase III final rule, OSHA deleted § 1910.132(f)(4) (76 FR 33590, 6/8/3011). Therefore, OSHA has removed the information collection requirement from the final ICR for Personal Protective Equipment (PPE) for General Industry.

XI. Dates

Effective Date. The final rule generally becomes effective and enforceable 60 days after publication of this document in the **Federal Register**, which is January 17, 2017. Information collections subject to OMB approval will take effect on the date OMB approves the Department's request to revise the information collection authority under PRA–95 or the date the rule otherwise becomes effective and the compliance date has arrived, whichever date is later. The Department will publish a document in the **Federal Register** to announce OMB's disposition of the Department's requests to revise the Paperwork Reduction Act authority for the information collections.

Compliance Dates. Most of the requirements in the final rule are existing provisions that OSHA is retaining and updating. OSHA believes that employers already are in compliance with those provisions and, therefore, it is not necessary to give additional time to comply with them.

However, for some of the new requirements in the final rule, OSHA is providing employers with additional time to come into compliance. The extended compliance dates give employers time to get familiar with the new requirements, evaluate changes they may need to make, purchase equipment necessary to comply with the final rule, and develop and present required training. In addition, the extended compliance dates allows employers to upgrade their fall protection systems as part of the normal ''business cycle'' or ''useful life'' of equipment (*i.e.,* cage, well, fixed ladder), which reduces compliance costs.

The following table specifies the amount of additional time OSHA is giving employers to certify anchorages, equip fixed ladders with fall protection, and train workers:

Final Subpart D Section and Requirement	Compliance Date
§1910.27(b)(1) – Certification of anchorages	November 20, 2017
§1910.28(b)(9)(i)(A) – Deadline by which employers must equip existing fixed ladders with a cage, well, ladder safety system, or personal fall arrest system	November 19, 2018
§1910.28(b)(9)(i)(B) – Deadline by which employers must begin equipping new fixed ladders with a ladder safety system or personal fall arrest system	November 19, 2018
§1910.28(b)(9)(i)(D) – Deadline by which all fixed ladders must be equipped with a ladder safety system or personal fall arrest system	November 18, 2036
§1910.30(a) and (b) – Deadline by which employers must train employees on fall and equipment hazards	May 17, 2017

For additional information about these compliance deadlines, see discussion of §§ 1910.27(b)(1), 1910.28(b)(9), and 1910.30 in Section IV.

List of Subjects in 29 CFR Part 1910

Falls, Fall arrest, Fall protection, Fall restraint, Guardrails, Incorporation by reference, Ladders, Occupational safety and health, Scaffolds, Stairs, Walking-working surfaces.

Authority and Signature

This document was prepared under the direction of David Michaels, Assistant Secretary of Labor for Occupational Safety and Health. This action is taken pursuant to sections 29 U.S.C. 653, 655, 657; Secretary of Labor's Order No. 1–2012 (77 FR 3912 (1/25/2012)); and 29 CFR part 1911.

Signed at Washington, DC, on October 4, 2016.

David Michaels,

Assistant Secretary of Labor for Occupational Safety and Health.

Final Regulatory Text

For the reasons set forth in the preamble, OSHA amends part 1910 of title 29 of the Code of Federal Regulations as follows:

PART 1910—OCCUPATIONAL SAFETY AND HEALTH STANDARDS

■ 1. The authority citation for part 1910 continues to read as follows:

Authority: 29 U.S.C. 653, 655, 657; Secretary of Labor's Order Numbers 12–71 (36 FR 8754), 8–76 (41 FR 25059), 9–83 (48 FR 35736), 1–90 (55 FR 9033), 6–96 (62 FR 111), 3–2000 (65 FR 50017), 5–2002 (67 FR 65008), 5–2007 (72 FR 31159), 4–2010 (75 FR 55355), or 1–2012 (77 FR 3912), as applicable.

Sections 1910.6, 1910.7, 1910.8 and 1910.9 also issued under 29 CFR 1911. Section 1910.7(f) also issued under 31 U.S.C. 9701, 29 U.S.C. 9a, 5 U.S.C. 553; Public Law 106–113 (113 Stat. 1501A–222); Pub. L. 11–8 and 111–317; and OMB Circular A–25 (dated July 8, 1993) (58 FR 38142, July 15, 1993).

§ 1910.6 [Amended]

■ 2. Amend § 1910.6 by:

■ a. In paragraph (e)(9), removing ''1910.68(b)(12)'' and ''1910.179(c)(2);''; and

■ b. Removing and reserving paragraphs (h)(8) and (j)(1).

■ 3. Revise subpart D to read as follows:

Subpart D—Walking-Working Surfaces

Sec.

Authority: 29 U.S.C. 653, 655, and 657; Secretary of Labor's Order No. 12–71 (36 FR 8754), 8–76 (41 FR 25059), 9–83 (48 FR 35736), 1–90 (55 FR 9033), and 1–2012 (77 FR 3912), as applicable; and 29 CFR part 1911.

§ 1910.21 Scope and definitions.

(a) *Scope.* This subpart applies to all general industry workplaces. It covers all walking-working surfaces unless specifically excluded by an individual section of this subpart.

(b) *Definitions.* The following definitions apply in this subpart:

Alternating tread-type stair means a type of stairway consisting of a series of treads that usually are attached to a center support in an alternating manner such that an employee typically does not have both feet on the same level while using the stairway.

Anchorage means a secure point of attachment for equipment such as lifelines, lanyards, deceleration devices, and rope descent systems.

Authorized means an employee who the employer assigns to perform a specific type of duty, or allows in a specific location or area.

Cage means an enclosure mounted on the side rails of a fixed ladder or fastened to a structure behind the fixed ladder that is designed to surround the climbing space of the ladder. A cage also is called a ''cage guard'' or ''basket guard.''

Carrier means the track of a ladder safety system that consists of a flexible cable or rigid rail attached to the fixed ladder or immediately adjacent to it.

Combination ladder means a portable ladder that can be used as a stepladder, extension ladder, trestle ladder, or stairway ladder. The components of a combination ladder also may be used separately as a single ladder.

Dangerous equipment means equipment, such as vats, tanks, electrical equipment, machinery, equipment or machinery with protruding parts, or other similar units, that, because of their function or form, may harm an employee who falls into or onto the equipment.

Designated area means a distinct portion of a walking-working surface delineated by a warning line in which employees may perform work without additional fall protection.

Dockboard means a portable or fixed device that spans a gap or compensates for a difference in elevation between a loading platform and a transport vehicle. Dockboards include, but are not limited to, bridge plates, dock plates, and dock levelers.

Equivalent means alternative designs, equipment, materials, or methods, that the employer can demonstrate will provide an equal or greater degree of safety for employees compared to the designs, equipment, materials, or methods specified in this subpart.

Extension ladder means a non-self-supporting portable ladder that is adjustable in length.

Failure means a load refusal, breakage, or separation of component parts. A load refusal is the point at which the ultimate strength of a component or object is exceeded.

Fall hazard means any condition on a walking-working surface that exposes an employee to a risk of harm from a fall on the same level or to a lower level.

Fall protection means any equipment, device, or system that prevents an employee from falling from an elevation or mitigates the effect of such a fall.

Fixed ladder means a ladder with rails or individual rungs that is permanently attached to a structure, building, or equipment. Fixed ladders include individual-rung ladders, but not ship stairs, step bolts, or manhole steps.

Grab bar means an individual horizontal or vertical handhold installed to provide access above the height of the ladder.

Guardrail system means a barrier erected along an unprotected or exposed side, edge, or other area of a walking-working surface to prevent employees from falling to a lower level.

Handrail means a rail used to provide employees with a handhold for support.

Hoist area means any elevated access opening to a walking-working surface through which equipment or materials are loaded or received.

Hole means a gap or open space in a floor, roof, horizontal walking-working surface, or similar surface that is at least 2 inches (5 cm) in its least dimension.

Individual-rung ladder means a ladder that has rungs individually attached to a building or structure. An individual-rung ladder does not include manhole steps.

Ladder means a device with rungs, steps, or cleats used to gain access to a different elevation.

Ladder safety system means a system designed to eliminate or reduce the possibility of falling from a ladder. A ladder safety system usually consists of a carrier, safety sleeve, lanyard, connectors, and body harness. Cages and wells are not ladder safety systems.

Low-slope roof means a roof that has a slope less than or equal to a ratio of 4 in 12 (vertical to horizontal).

Lower level means a surface or area to which an employee could fall. Such surfaces or areas include, but are not limited to, ground levels, floors, roofs, ramps, runways, excavations, pits, tanks, materials, water, equipment, and similar surfaces and structures, or portions thereof.

Manhole steps means steps that are individually attached to, or set into, the wall of a manhole structure.

Maximum intended load means the total load (weight and force) of all employees, equipment, vehicles, tools, materials, and other loads the employer reasonably anticipates to be applied to a walking-working surface at any one time.

Mobile means manually propelled or moveable.

Mobile ladder stand (ladder stand) means a mobile, fixed-height, self-supporting ladder that usually consists of wheels or casters on a rigid base and steps leading to a top step. A mobile ladder stand also may have handrails and is designed for use by one employee at a time.

Mobile ladder stand platform means a mobile, fixed-height, self-supporting unit having one or more standing platforms that are provided with means of access or egress.

Open riser means the gap or space between treads of stairways that do not have upright or inclined members (risers).

Opening means a gap or open space in a wall, partition, vertical walking-working surface, or similar surface that is at least 30 inches (76 cm) high and at least 18 inches (46 cm) wide, through which an employee can fall to a lower level.

Personal fall arrest system means a system used to arrest an employee in a fall from a walking-working surface. It consists of a body harness, anchorage, and connector. The means of connection may include a lanyard, deceleration device, lifeline, or a suitable combination of these.

Personal fall protection system means a system (including all components) an employer uses to provide protection from falling or to safely arrest an employee's fall if one occurs. Examples of personal fall protection systems include personal fall arrest systems, positioning systems, and travel restraint systems.

Platform means a walking-working surface that is elevated above the surrounding area.

Portable ladder means a ladder that can readily be moved or carried, and usually consists of side rails joined at intervals by steps, rungs, or cleats.

Positioning system (work-positioning system) means a system of equipment and connectors that, when used with a body harness or body belt, allows an employee to be supported on an elevated vertical surface, such as a wall or window sill, and work with both hands free. Positioning systems also are called ''positioning system devices'' and ''work-positioning equipment.''

Qualified describes a person who, by possession of a recognized degree, certificate, or professional standing, or who by extensive knowledge, training, and experience has successfully demonstrated the ability to solve or resolve problems relating to the subject matter, the work, or the project.

Ramp means an inclined walking-working surface used to access another level.

Riser means the upright (vertical) or inclined member of a stair that is located at the back of a stair tread or platform and connects close to the front edge of the next higher tread, platform, or landing.

Rope descent system means a suspension system that allows an employee to descend in a controlled manner and, as needed, stop at any point during the descent. A rope descent system usually consists of a roof anchorage, support rope, a descent device, carabiner(s) or shackle(s), and a chair (seatboard). A rope descent system also is called controlled descent equipment or apparatus. Rope descent systems do not include industrial rope access systems.

Rung, step, or cleat means the cross-piece of a ladder on which an employee steps to climb up and down.

Runway means an elevated walking-working surface, such as a catwalk, a foot walk along shafting, or an elevated walkway between buildings.

Scaffold means any temporary elevated or suspended platform and its supporting structure, including anchorage points, used to support employees, equipment, materials, and other items. For purposes of this subpart, a scaffold does not include a crane-suspended or derrick-suspended personnel platform or a rope descent system.

Ship stair (ship ladder) means a stairway that is equipped with treads, stair rails, and open risers, and has a slope that is between 50 and 70 degrees from the horizontal.

Side-step ladder means a type of fixed ladder that requires an employee to step sideways from it in order to reach a walking-working surface, such as a landing.

Spiral stairs means a series of treads attached to a vertical pole in a winding fashion, usually within a cylindrical space.

Stair rail or stair rail system means a barrier erected along the exposed or open side of stairways to prevent employees from falling to a lower level.

Stairway (stairs) means risers and treads that connect one level with another, and includes any landings and platforms in between those levels. Stairways include standard, spiral, alternating tread-type, and ship stairs.

Standard stairs means a fixed or permanently installed stairway. Ship, spiral, and alternating tread-type stairs are not considered standard stairs.

Step bolt (pole step) means a bolt or rung attached at intervals along a structural member used for foot placement and as a handhold when climbing or standing.

Stepladder means a self-supporting, portable ladder that has a fixed height, flat steps, and a hinged back.

Stepstool means a self-supporting, portable ladder that has flat steps and side rails. For purposes of the final rule, stepstool includes only those ladders that have a fixed height, do not have a pail shelf, and do not exceed 32 inches (81 cm) in overall height to the top cap, although side rails may extend above the top cap. A stepstool is designed so an employee can climb and stand on all of the steps and the top cap.

Through ladder means a type of fixed ladder that allows the employee to step through the side rails at the top of the ladder to reach a walking-working surface, such as a landing.

Tieback means an attachment between an anchorage (*e.g.,* structural member) and a supporting device (*e.g.,* parapet clamp or cornice hook).

Toeboard means a low protective barrier that is designed to prevent materials, tools, and equipment from falling to a lower level, and protect employees from falling.

Travel restraint system means a combination of an anchorage, anchorage connector, lanyard (or other means of connection), and body support that an employer uses to eliminate the possibility of an employee going over the edge of a walking-working surface.

Tread means a horizontal member of a stair or stairway, but does not include landings or platforms.

Unprotected sides and edges mean any side or edge of a walking-working surface (except at entrances and other points of access) where there is no wall, guardrail system, or stair rail system to protect an employee from falling to a lower level.

Walking-working surface means any horizontal or vertical surface on or through which an employee walks, works, or gains access to a work area or workplace location.

Warning line means a barrier erected to warn employees that they are approaching an unprotected side or edge, and which designates an area in which work may take place without the use of other means of fall protection.

Well means a permanent, complete enclosure around a fixed ladder.

§ 1910.22 General requirements.

(a) *Surface conditions.* The employer must ensure:

(1) All places of employment, passageways, storerooms, service rooms, and walking-working surfaces are kept in a clean, orderly, and sanitary condition.

(2) The floor of each workroom is maintained in a clean and, to the extent feasible, in a dry condition. When wet processes are used, drainage must be maintained and, to the extent feasible, dry standing places, such as false floors, platforms, and mats must be provided.

(3) Walking-working surfaces are maintained free of hazards such as sharp or protruding objects, loose boards, corrosion, leaks, spills, snow, and ice.

(b) *Loads.* The employer must ensure that each walking-working surface can support the maximum intended load for that surface.

(c) *Access and egress.* The employer must provide, and ensure each employee uses, a safe means of access and egress to and from walking-working surfaces.

(d) *Inspection, maintenance, and repair.* The employer must ensure:

(1) Walking-working surfaces are inspected, regularly and as necessary, and maintained in a safe condition;

(2) Hazardous conditions on walking-working surfaces are corrected or repaired before an employee uses the walking-working surface again. If the correction or repair cannot be made immediately, the hazard must be guarded to prevent employees from using the walking-working surface until the hazard is corrected or repaired; and

(3) When any correction or repair involves the structural integrity of the walking-working surface, a qualified person performs or supervises the correction or repair.

§ 1910.23 Ladders.

(a) *Application.* The employer must ensure that each ladder used meets the requirements of this section. This section covers all ladders, except when the ladder is:

(1) Used in emergency operations such as firefighting, rescue, and tactical law enforcement operations, or training for these operations; or

(2) Designed into or is an integral part of machines or equipment.

(b) *General requirements for all ladders.* The employer must ensure:

(1) Ladder rungs, steps, and cleats are parallel, level, and uniformly spaced when the ladder is in position for use;

(2) Ladder rungs, steps, and cleats are spaced not less than 10 inches (25 cm) and not more than 14 inches (36 cm) apart, as measured between the centerlines of the rungs, cleats, and steps, except that:

(i) Ladder rungs and steps in elevator shafts must be spaced not less than 6 inches (15 cm) apart and not more than 16.5 inches (42 cm) apart, as measured along the ladder side rails; and

(ii) Fixed ladder rungs and steps on telecommunication towers must be spaced not more than 18 inches (46 cm) apart, measured between the centerlines of the rungs or steps;

(3) Steps on stepstools are spaced not less than 8 inches (20 cm) apart and not more than 12 inches (30 cm) apart, as measured between the centerlines of the steps;

(4) Ladder rungs, steps, and cleats have a minimum clear width of 11.5 inches (29 cm) on portable ladders and 16 inches (41 cm) (measured before installation of ladder safety systems) for fixed ladders, except that:

(i) The minimum clear width does not apply to ladders with narrow rungs that are not designed to be stepped on, such as those located on the tapered end of orchard ladders and similar ladders;

(ii) Rungs and steps of manhole entry ladders that are supported by the manhole opening must have a minimum clear width of 9 inches (23 cm);

(iii) Rungs and steps on rolling ladders used in telecommunication centers must have a minimum clear width of 8 inches (20 cm); and

(iv) Stepstools have a minimum clear width of 10.5 inches (26.7 cm);

(5) Wooden ladders are not coated with any material that may obscure structural defects;

(6) Metal ladders are made with corrosion-resistant material or protected against corrosion;

(7) Ladder surfaces are free of puncture and laceration hazards;

(8) Ladders are used only for the purposes for which they were designed;

(9) Ladders are inspected before initial use in each work shift, and more frequently as necessary, to identify any visible defects that could cause employee injury;

(10) Any ladder with structural or other defects is immediately tagged ''Dangerous: Do Not Use'' or with similar language in accordance with § 1910.145 and removed from service until repaired in accordance with § 1910.22(d), or replaced;

(11) Each employee faces the ladder when climbing up or down it;

(12) Each employee uses at least one hand to grasp the ladder when climbing up and down it; and

(13) No employee carries any object or load that could cause the employee to lose balance and fall while climbing up or down the ladder.

(c) *Portable ladders.* The employer must ensure:

(1) Rungs and steps of portable metal ladders are corrugated, knurled, dimpled, coated with skid-resistant material, or otherwise treated to minimize the possibility of slipping;

(2) Each stepladder or combination ladder used in a stepladder mode is equipped with a metal spreader or locking device that securely holds the front and back sections in an open position while the ladder is in use;

(3) Ladders are not loaded beyond the maximum intended load;

Note to paragraph (c)(3): The maximum intended load, as defined in § 1910.21(b), includes the total load (weight and force) of the employee and all tools, equipment, and materials being carried.

(4) Ladders are used only on stable and level surfaces unless they are secured or stabilized to prevent accidental displacement;

(5) No portable single rail ladders are used;

(6) No ladder is moved, shifted, or extended while an employee is on it;

(7) Ladders placed in locations such as passageways, doorways, or driveways where they can be displaced by other activities or traffic:

(i) Are secured to prevent accidental displacement; or

(ii) Are guarded by a temporary barricade, such as a row of traffic cones or caution tape, to keep the activities or traffic away from the ladder;

(8) The cap (if equipped) and top step of a stepladder are not used as steps;

(9) Portable ladders used on slippery surfaces are secured and stabilized;

(10) The top of a non-self-supporting ladder is placed so that both side rails are supported, unless the ladder is equipped with a single support attachment;

(11) Portable ladders used to gain access to an upper landing surface have side rails that extend at least 3 feet (0.9 m) above the upper landing surface (see Figure D–1 of this section);

(12) Ladders and ladder sections are not tied or fastened together to provide

added length unless they are specifically designed for such use;

(13) Ladders are not placed on boxes, barrels, or other unstable bases to obtain additional height.

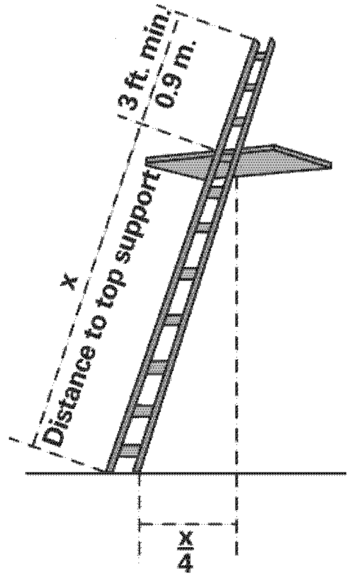

Figure D-1 -- Portable Ladder Set-up

(d) *Fixed ladders.* The employer must ensure:

(1) Fixed ladders are capable of supporting their maximum intended load;

(2) The minimum perpendicular distance from the centerline of the steps or rungs, or grab bars, or both, to the nearest permanent object in back of the ladder is 7 inches (18 cm), except for elevator pit ladders, which have a minimum perpendicular distance of 4.5 inches (11 cm);

(3) Grab bars do not protrude on the climbing side beyond the rungs of the ladder that they serve;

(4) The side rails of through or side-step ladders extend 42 inches (1.1 m) above the top of the access level or landing platform served by the ladder. For parapet ladders, the access level is:

(i) The roof, if the parapet is cut to permit passage through the parapet; or

(ii) The top of the parapet, if the parapet is continuous;

(5) For through ladders, the steps or rungs are omitted from the extensions, and the side rails are flared to provide not less than 24 inches (61cm) and not more than 30 inches (76 cm) of clearance. When a ladder safety system is provided, the maximum clearance between side rails of the extension must not exceed 36 inches (91 cm);

(6) For side-step ladders, the side rails, rungs, and steps must be continuous in the extension (see Figure D–2 of this section);

(7) Grab bars extend 42 inches (1.1 m) above the access level or landing platforms served by the ladder;

(8) The minimum size (cross-section) of grab bars is the same size as the rungs of the ladder.

(9) When a fixed ladder terminates at a hatch (see Figure D–3 of this section), the hatch cover:

(i) Opens with sufficient clearance to provide easy access to or from the ladder; and

(ii) Opens at least 70 degrees from horizontal if the hatch is counterbalanced;

(10) Individual-rung ladders are constructed to prevent the employee's feet from sliding off the ends of the rungs (see Figure D–4 of this section);

(11) Fixed ladders having a pitch greater than 90 degrees from the horizontal are not used;

(12) The step-across distance from the centerline of the rungs or steps is:

(i) For through ladders, not less than 7 inches (18 cm) and not more than 12 inches (30 cm) to the nearest edge of the structure, building, or equipment accessed from the ladders;

(ii) For side-step ladders, not less than 15 inches (38 cm) and not more than 20 inches (51 cm) to the access points of the platform edge;

(13) Fixed ladders that do not have cages or wells have:

(i) A clear width of at least 15 inches (38 cm) on each side of the ladder centerline to the nearest permanent object; and

(ii) A minimum perpendicular distance of 30 inches (76 cm) from the centerline of the steps or rungs to the nearest object on the climbing side. When unavoidable obstructions are encountered, the minimum clearance at the obstruction may be reduced to 24 inches (61 cm), provided deflector plates are installed (see Figure D–5 of this section).

Note to paragraph (d): Section 1910.28 establishes the employer's duty to provide fall protection for employees on fixed ladders, and § 1910.29 specifies the criteria for fall protection systems for fixed ladders.

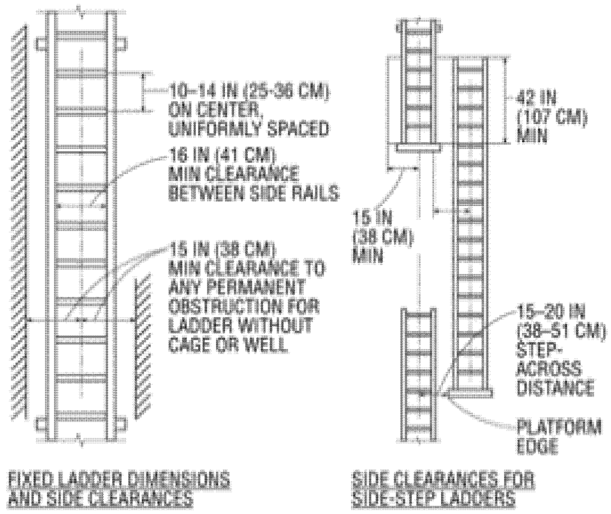

Figure D-2 -- Side-Step Fixed Ladder Sections

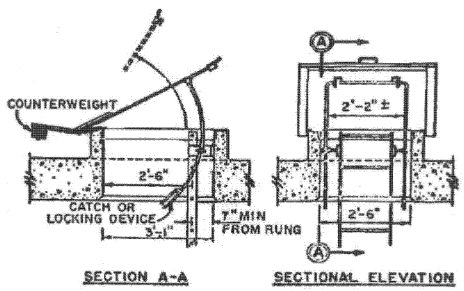

Figure D-3 – Example of Counterbalanced Hatch Cover at Roof

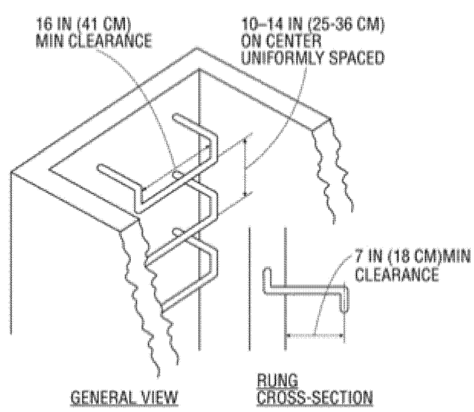

Figure D-4 -- Individual Rung Ladder

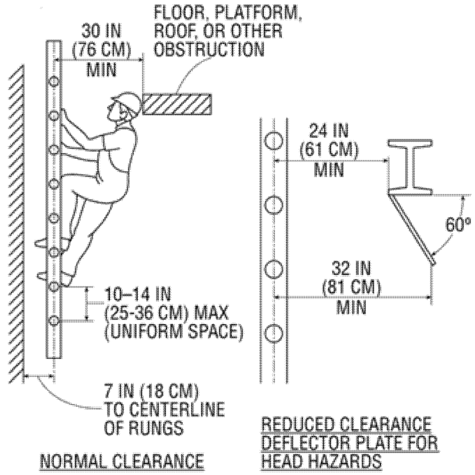

Figure D-5 -- Fixed Ladder Clearances

(e) *Mobile ladder stands and mobile ladder stand platforms*—(1) *General requirements.* The employer must ensure:

(i) Mobile ladder stands and platforms have a step width of at least 16 inches (41 cm);

(ii) The steps and platforms of mobile ladder stands and platforms are slip resistant. Slip-resistant surfaces must be either an integral part of the design and construction of the mobile ladder stand and platform, or provided as a secondary process or operation, such as dimpling, knurling, shotblasting, coating, spraying, or applying durable slip-resistant tapes;

(iii) Mobile ladder stands and platforms are capable of supporting at least four times their maximum intended load;

(iv) Wheels or casters under load are capable of supporting their proportional share of four times the maximum intended load, plus their proportional share of the unit's weight;

(v) Unless otherwise specified in this section, mobile ladder stands and platforms with a top step height of 4 feet (1.2 m) or above have handrails with a vertical height of 29.5 inches (75 cm) to 37 inches (94 cm), measured from the front edge of a step. Removable gates or non-rigid members, such as chains, may be used instead of handrails in special-use applications;

(vi) The maximum work-surface height of mobile ladder stands and platforms does not exceed four times the shortest base dimension, without additional support. For greater heights, outriggers, counterweights, or comparable means that stabilize the mobile ladder stands and platforms and prevent overturning must be used;

(vii) Mobile ladder stands and platforms that have wheels or casters are equipped with a system to impede horizontal movement when an employee is on the stand or platform; and

(viii) No mobile ladder stand or platform moves when an employee is on it.

(2) *Design requirements for mobile ladder stands.* The employer must ensure:

(i) Steps are uniformly spaced and arranged, with a rise of not more than 10 inches (25 cm) and a depth of not less than 7 inches (18 cm). The slope of the step stringer to which the steps are attached must not be more than 60 degrees, measured from the horizontal;

(ii) Mobile ladder stands with a top step height above 10 feet (3 m) have the top step protected on three sides by a handrail with a vertical height of at least 36 inches (91 cm); and top steps that are 20 inches (51 cm) or more, front to back, have a midrail and toeboard. Removable gates or non-rigid members, such as chains, may be used instead of handrails in special-use applications; and

(iii) The standing area of mobile ladder stands is within the base frame.

(3) *Design requirements for mobile ladder stand platforms.* The employer must ensure:

(i) Steps of mobile ladder stand platforms meet the requirements of paragraph (e)(2)(i) of this section. When the employer demonstrates that the requirement is not feasible, steeper slopes or vertical rung ladders may be used, provided the units are stabilized to prevent overturning;

(ii) Mobile ladder stand platforms with a platform height of 4 to 10 feet (1.2 m to 3 m) have, in the platform area, handrails with a vertical height of at least 36 inches (91 cm) and midrails; and

(iii) All ladder stand platforms with a platform height above 10 feet (3 m) have guardrails and toeboards on the exposed sides and ends of the platform.

(iv) Removable gates or non-rigid members, such as chains, may be used on mobile ladder stand platforms instead of handrails and guardrails in special-use applications.

§ 1910.24 Step bolts and manhole steps.

(a) *Step bolts.* The employer must ensure:

(1) Each step bolt installed on or after January 17, 2017 in an environment where corrosion may occur is constructed of, or coated with, material that protects against corrosion;

(2) Each step bolt is designed, constructed, and maintained to prevent the employee's foot from slipping off the end of the step bolt;

(3) Step bolts are uniformly spaced at a vertical distance of not less than 12 inches (30 cm) and not more than 18 inches (46 cm) apart, measured center to center (see Figure D–6 of this section). The spacing from the entry and exit surface to the first step bolt may differ from the spacing between the other step bolts;

(4) Each step bolt has a minimum clear width of 4.5 inches (11 cm);

(5) The minimum perpendicular distance between the centerline of each step bolt to the nearest permanent object in back of the step bolt is 7 inches (18 cm). When the employer demonstrates that an obstruction cannot be avoided, the distance must be at least 4.5 inches (11 cm);

(6) Each step bolt installed before January 17, 2017 is capable of supporting its maximum intended load;

(7) Each step bolt installed on or after January 17, 2017 is capable of supporting at least four times its maximum intended load;

(8) Each step bolt is inspected at the start of the workshift and maintained in accordance with § 1910.22; and

(9) Any step bolt that is bent more than 15 degrees from the perpendicular in any direction is removed and replaced with a step bolt that meets the requirements of this section before an employee uses it.

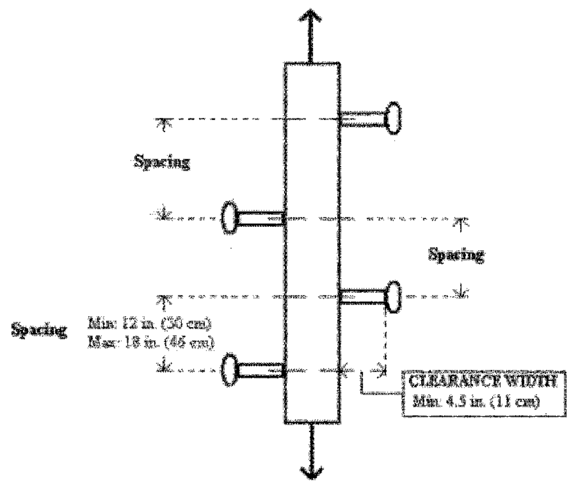

Figure D-6 -- Step Bolt Spacing

(b) *Manhole steps.* (1) The employer must ensure that each manhole step is capable of supporting its maximum intended load.

(2) The employer must ensure that each manhole step installed on or after January 17, 2017:

(i) Has a corrugated, knurled, dimpled, or other surface that minimizes the possibility of an employee slipping;

(ii) Is constructed of, or coated with, material that protects against corrosion if the manhole step is located in an environment where corrosion may occur;

(iii) Has a minimum clear step width of 10 inches (25 cm);

(iv) Is uniformly spaced at a vertical distance not more than 16 inches (41 cm) apart, measured center to center between steps. The spacing from the entry and exit surface to the first manhole step may differ from the spacing between the other steps.

(v) Has a minimum perpendicular distance between the centerline of the manhole step to the nearest permanent object in back of the step of at least 4.5 inches (11 cm); and

(vi) Is designed, constructed, and maintained to prevent the employee's foot from slipping or sliding off the end.

(3) The employer must ensure that each manhole step is inspected at the start of the work shift and maintained in accordance with § 1910.22.

§ 1910.25 Stairways.

(a) *Application.* This section covers all stairways (including standard, spiral, ship, and alternating tread-type stairs), except for stairs serving floating roof tanks, stairs on scaffolds, stairs designed into machines or equipment, and stairs on self-propelled motorized equipment.

(b) *General requirements.* The employer must ensure:

(1) Handrails, stair rail systems, and guardrail systems are provided in accordance with § 1910.28;

(2) Vertical clearance above any stair tread to any overhead obstruction is at least 6 feet, 8 inches (203 cm), as measured from the leading edge of the tread. Spiral stairs must meet the vertical clearance requirements in paragraph (d)(3) of this section.

(3) Stairs have uniform riser heights and tread depths between landings;

(4) Stairway landings and platforms are at least the width of the stair and at least 30 inches (76 cm) in depth, as measured in the direction of travel;

(5) When a door or a gate opens directly on a stairway, a platform is provided, and the swing of the door or gate does not reduce the platform's effective usable depth to:

(i) Less than 20 inches (51 cm) for platforms installed before January 17, 2017; and

(ii) Less than 22 inches (56 cm) for platforms installed on or after January 17, 2017 (see Figure D–7 of this section);

(6) Each stair can support at least five times the normal anticipated live load, but never less than a concentrated load of 1,000 pounds (454 kg) applied at any point;

(7) Standard stairs are used to provide access from one walking-working surface to another when operations necessitate regular and routine travel between levels, including access to operating platforms for equipment. Winding stairways may be used on tanks and similar round structures when the diameter of the tank or structure is at least 5 feet (1.5 m).

(8) Spiral, ship, or alternating tread-type stairs are used only when the employer can demonstrate that it is not feasible to provide standard stairs.

(9) When paragraph (b)(8) of this section allows the use of spiral, ship, or alternating tread-type stairs, they are installed, used, and maintained in accordance with manufacturer's instructions.

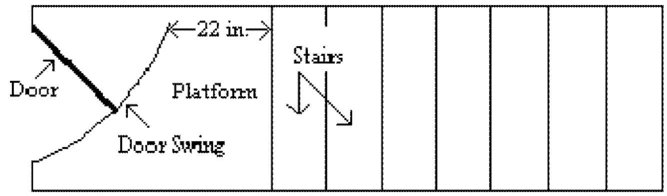

Figure D-7 -- Door or Gate Opening on Stairway

(c) *Standard stairs.* In addition to paragraph (b) of this section, the employer must ensure standard stairs:

(1) Are installed at angles between 30 to 50 degrees from the horizontal;

(2) Have a maximum riser height of 9.5 inches (24 cm);

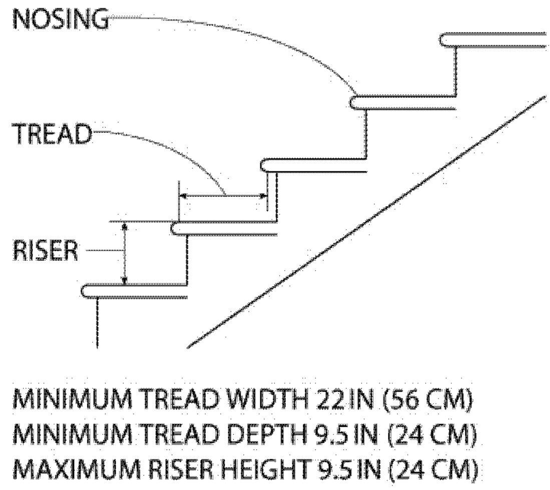
(3) Have a minimum tread depth of 9.5 inches (24 cm); and

(4) Have a minimum width of 22 inches (56 cm) between vertical barriers (see Figure D–8 of this section).

(5) *Exception to paragraphs (c)(2) and (3) of this section.* The requirements of paragraphs (c)(2) and (3) do not apply to standard stairs installed prior to January 17, 2017. OSHA will deem those stairs in compliance if they meet the dimension requirements specified in Table D–1 of this section or they use a combination that achieves the angle requirements of paragraph (c)(1) of this section.

Table D-1-- Stairway Rise and Tread Dimensions

Angle to horizontal	Rise (in inches)	Tread run (in inches)
30 deg. 35'	6 1/2	11
32 deg. 08'	6 3/4	10 3/4
33 deg. 41'	7	10 1/2
35 deg. 16'	7 1/4	10 1/4
36 deg. 52'	7 1/2	10
38 deg. 29'	7 3/4	9 3/4
40 deg. 08'	8	9 1/2
41 deg. 44'	8 1/4	9 1/4
43 deg. 22'	8 1/2	9
45 deg. 00'	8 3/4	8 3/4
46 deg. 38'	9	8 1/2
48 deg. 16'	9 1/4	8 1/4
49 deg. 54'	9 1/2	8



(d) *Spiral stairs.* In addition to paragraph (b) of this section, the employer must ensure spiral stairs:

(1) Have a minimum clear width of 26 inches (66 cm);

(2) Have a maximum riser height of 9.5 inches (24 cm);

(3) Have a minimum headroom above spiral stair treads of at least 6 feet, 6 inches (2 m), measured from the leading edge of the tread;

(4) Have a minimum tread depth of 7.5 inches (19 cm), measured at a point 12 inches (30 cm) from the narrower edge;

(5) Have a uniform tread size;

(e) *Ship stairs.* In addition to paragraph (b) of this section, the employer must ensure ship stairs (see Figure D–9 of this section):

(1) Are installed at a slope of 50 to 70 degrees from the horizontal;

(2) Have open risers with a vertical rise between tread surfaces of 6.5 to 12 inches (17 to 30 cm);

(3) Have minimum tread depth of 4 inches (10 cm); and

(4) Have a minimum tread width of 18 inches (46 cm).

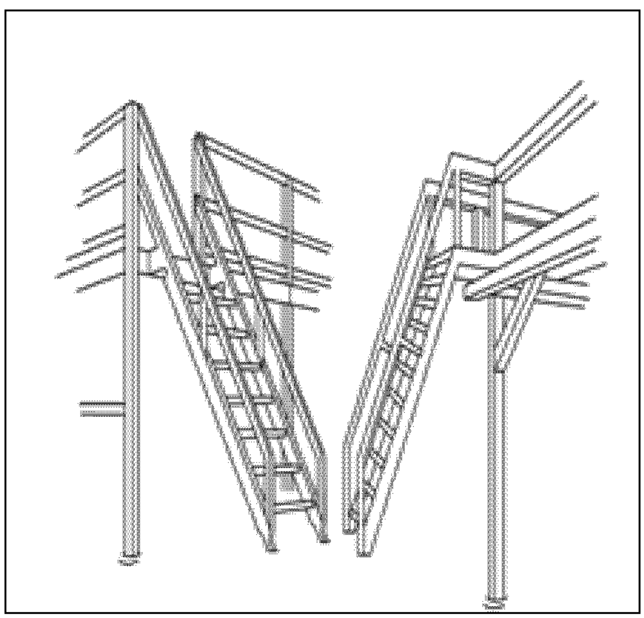


Figure D-9 – Ship Stairs

(f) *Alternating tread-type stairs.* In addition to paragraph (b) of this section, the employer must ensure alternating tread-type stairs:

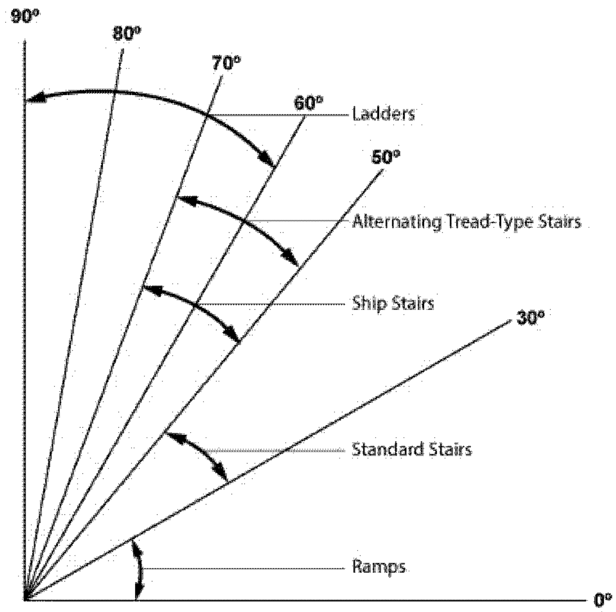
(1) Have a series of treads installed at a slope of 50 to 70 degrees from the horizontal;

(2) Have a distance between handrails of 17 to 24 inches (51 to 61 cm);

(3) Have a minimum tread depth of 8.5 inches (22 cm); and

(4) Have open risers if the tread depth is less than 9.5 inches (24 cm);

(5) Have a minimum tread width of 7 inches (18 cm), measured at the leading edge of the tread (*i.e.,* nosing).



Angle	Type
≤ 30°	Ramps
30° – 50°	Standard Stairs
50° – 70°	Ship Stairs
50° – 70°	Alternating Tread-Type Stairs
60° – 90°	Ladders

Figure D-10 – Angles for Stairs, Ramps, and Ladders

§ 1910.26 Dockboards.

The employer must ensure that each dockboard used meets the requirements of this section. The employer must ensure:

(a) Dockboards are capable of supporting the maximum intended load in accordance with § 1910.22(b);

(b)(1) Dockboards put into initial service on or after January 17, 2017 are designed, constructed, and maintained to prevent transfer vehicles from running off the dockboard edge;

(2) *Exception to paragraph (b)(1) of this section.* When the employer demonstrates there is no hazard of transfer vehicles running off the dockboard edge, the employer may use dockboards that do not have run-off protection.

(c) Portable dockboards are secured by anchoring them in place or using equipment or devices that prevent the dockboard from moving out of a safe position. When the employer demonstrates that securing the dockboard is not feasible, the employer must ensure there is sufficient contact between the dockboard and the surface to prevent the dockboard from moving out of a safe position;

(d) Measures, such as wheel chocks or sand shoes, are used to prevent the transport vehicle (*e.g.* a truck, semi-trailer, trailer, or rail car) on which a dockboard is placed, from moving while employees are on the dockboard; and

(e) Portable dockboards are equipped with handholds or other means to permit safe handling of dockboards.

§ 1910.27 Scaffolds and rope descent systems.

(a) *Scaffolds.* Scaffolds used in general industry must meet the requirements in 29 CFR part 1926, subpart L (Scaffolds).

(b) *Rope descent systems*—(1) *Anchorages.* (i) Before any rope descent system is used, the building owner must inform the employer, in writing that the building owner has identified, tested, certified, and maintained each anchorage so it is capable of supporting at least 5,000 pounds (268 kg), in any direction, for each employee attached. The information must be based on an annual inspection by a qualified person and certification of each anchorage by a qualified person, as necessary, and at least every 10 years.

(ii) The employer must ensure that no employee uses any anchorage before the employer has obtained written information from the building owner that each anchorage meets the requirements of paragraph (b)(1)(i) of this section. The employer must keep the information for the duration of the job.

(iii) The requirements in paragraphs (b)(1)(i) and (ii) of this section must be implemented no later than November 20, 2017.

(2) *Use of rope descent systems.* The employer must ensure:

(i) No rope descent system is used for heights greater than 300 feet (91 m) above grade unless the employer demonstrates that it is not feasible to access such heights by any other means or that those means pose a greater hazard than using a rope descent system;

(ii) The rope descent system is used in accordance with instructions, warnings, and design limitations set by the manufacturer or under the direction of a qualified person;

(iii) Each employee who uses the rope descent system is trained in accordance with § 1910.30;

(iv) The rope descent system is inspected at the start of each workshift that it is to be used. The employer must ensure damaged or defective equipment is removed from service immediately and replaced;

(v) The rope descent system has proper rigging, including anchorages and tiebacks, with particular emphasis on providing tiebacks when counterweights, cornice hooks, or similar non-permanent anchorages are used;

(vi) Each employee uses a separate, independent personal fall arrest system that meets the requirements of subpart I of this part;

(vii) All components of each rope descent system, except seat boards, are capable of sustaining a minimum rated load of 5,000 pounds (22.2 kN). Seat boards must be capable of supporting a live load of 300 pounds (136 kg);

(viii) Prompt rescue of each employee is provided in the event of a fall;

(ix) The ropes of each rope descent system are effectively padded or otherwise protected, where they can contact edges of the building, anchorage, obstructions, or other surfaces, to prevent them from being cut or weakened;

(x) Stabilization is provided at the specific work location when descents are greater than 130 feet (39.6 m);

(xi) No employee uses a rope descent system when hazardous weather conditions, such as storms or gusty or excessive wind, are present;

(xii) Equipment, such as tools, squeegees, or buckets, is secured by a tool lanyard or similar method to prevent it from falling; and

(xiii) The ropes of each rope descent system are protected from exposure to open flames, hot work, corrosive chemicals, and other destructive conditions.

§ 1910.28 Duty to have fall protection and falling object protection.

(a) *General.* (1) This section requires employers to provide protection for each employee exposed to fall and falling object hazards. Unless stated otherwise, the employer must ensure that all fall protection and falling object protection required by this section meet the criteria in § 1910.29, except that personal fall protection systems required by this section meet the criteria of § 1910.140.

(2) This section does not apply:

(i) To portable ladders;

(ii) When employers are inspecting, investigating, or assessing workplace conditions or work to be performed prior to the start of work or after all work has been completed. This exemption does not apply when fall protection systems or equipment meeting the requirements of § 1910.29 have been installed and are available for workers to use for pre-work and post-work inspections, investigations, or assessments;

(iii) To fall hazards presented by the exposed perimeters of entertainment stages and the exposed perimeters of rail-station platforms;

(iv) To powered platforms covered by § 1910.66(j);

(v) To aerial lifts covered by § 1910.67(c)(2)(v);

(vi) To telecommunications work covered by § 1910.268(n)(7) and (8); and

(vii) To electric power generation, transmission, and distribution work covered by § 1910.269(g)(2)(i).

(b) *Protection from fall hazards*—(1) *Unprotected sides and edges.* (i) Except as provided elsewhere in this section, the employer must ensure that each employee on a walking-working surface with an unprotected side or edge that is 4 feet (1.2 m) or more above a lower level is protected from falling by one or more of the following:

(A) Guardrail systems;

(B) Safety net systems; or

(C) Personal fall protection systems, such as personal fall arrest, travel restraint, or positioning systems.

(ii) When the employer can demonstrate that it is not feasible or creates a greater hazard to use guardrail, safety net, or personal fall protection systems on residential roofs, the employer must develop and implement a fall protection plan that meets the requirements of 29 CFR 1926.502(k) and training that meets the requirements of 29 CFR 1926.503(a) and (c).

Note to paragraph (b)(1)(ii) of this section: There is a presumption that it is feasible and will not create a greater hazard to use at least one of the above-listed fall protection systems specified in paragraph (b)(1)(i) of this section. Accordingly, the employer has the burden of establishing that it is not feasible or creates a greater hazard to provide the fall protection systems specified in paragraph (b)(1)(i) and that it is necessary to implement a fall protection plan that complies with § 1926.502(k) in the particular work operation, in lieu of implementing any of those systems.

(iii) When the employer can demonstrate that the use of fall protection systems is not feasible on the working side of a platform used at a loading rack, loading dock, or teeming platform, the work may be done without a fall protection system, provided:

(A) The work operation for which fall protection is infeasible is in process;

(B) Access to the platform is limited to authorized employees; and,

(C) The authorized employees are trained in accordance with § 1910.30.

(2) *Hoist areas.* The employer must ensure:

(i) Each employee in a hoist area is protected from falling 4 feet (1.2 m) or more to a lower level by:

(A) A guardrail system;

(B) A personal fall arrest system; or

(C) A travel restraint system.

(ii) When any portion of a guardrail system, gate, or chains is removed, and an employee must lean through or over the edge of the access opening to facilitate hoisting, the employee is protected from falling by a personal fall arrest system.

(iii) If grab handles are installed at hoist areas, they meet the requirements of § 1910.29(l).

(3) *Holes.* The employer must ensure:

(i) Each employee is protected from falling through any hole (including skylights) that is 4 feet (1.2 m) or more above a lower level by one or more of the following:

(A) Covers;

(B) Guardrail systems;

(C) Travel restraint systems; or

(D) Personal fall arrest systems.

(ii) Each employee is protected from tripping into or stepping into or through any hole that is less than 4 feet (1.2 m) above a lower level by covers or guardrail systems.

(iii) Each employee is protected from falling into a stairway floor hole by a fixed guardrail system on all exposed sides, except at the stairway entrance. However, for any stairway used less than once per day where traffic across the stairway floor hole prevents the use of a fixed guardrail system (*e.g.,* holes located in aisle spaces), the employer may protect employees from falling into the hole by using a hinged floor hole cover that meets the criteria in § 1910.29 and a removable guardrail system on all exposed sides, except at the entrance to the stairway.

(iv) Each employee is protected from falling into a ladderway floor hole or ladderway platform hole by a guardrail system and toeboards erected on all exposed sides, except at the entrance to the hole, where a self-closing gate or an offset must be used.

(v) Each employee is protected from falling through a hatchway and chute-floor hole by:

(A) A hinged floor-hole cover that meets the criteria in § 1910.29 and a fixed guardrail system that leaves only one exposed side. When the hole is not in use, the employer must ensure the cover is closed or a removable guardrail system is provided on the exposed sides;

(B) A removable guardrail system and toeboards on not more than two sides of the hole and a fixed guardrail system on all other exposed sides. The employer must ensure the removable guardrail system is kept in place when the hole is not in use; or

(C) A guardrail system or a travel restraint system when a work operation necessitates passing material through a hatchway or chute floor hole.

(4) *Dockboards.* (i) The employer must ensure that each employee on a dockboard is protected from falling 4 feet (1.2 m) or more to a lower level by a guardrail system or handrails.

(ii) A guardrail system or handrails are not required when:

(A) Dockboards are being used solely for materials-handling operations using motorized equipment;

(B) Employees engaged in these operations are not exposed to fall hazards greater than 10 feet (3 m); and

(C) Those employees have been trained in accordance with § 1910.30.

(5) *Runways and similar walkways.* (i) The employer must ensure each employee on a runway or similar walkway is protected from falling 4 feet (1.2 m) or more to a lower level by a guardrail system.

(ii) When the employer can demonstrate that it is not feasible to have guardrails on both sides of a runway used exclusively for a special purpose, the employer may omit the guardrail on one side of the runway, provided the employer ensures:

(A) The runway is at least 18 inches (46 cm) wide; and

(B) Each employee is provided with and uses a personal fall arrest system or travel restraint system.

(6) *Dangerous equipment.* The employer must ensure:

(i) Each employee less than 4 feet (1.2 m) above dangerous equipment is protected from falling into or onto the dangerous equipment by a guardrail system or a travel restraint system, unless the equipment is covered or guarded to eliminate the hazard.

(ii) Each employee 4 feet (1.2 m) or more above dangerous equipment must be protected from falling by:

(A) Guardrail systems;

(B) Safety net systems;

(C) Travel restraint systems; or

(D) Personal fall arrest systems.

(7) *Openings.* The employer must ensure that each employee on a walking-working surface near an opening, including one with a chute attached, where the inside bottom edge of the opening is less than 39 inches (99 cm) above that walking-working surface and the outside bottom edge of the opening is 4 feet (1.2 m) or more above a lower level is protected from falling by the use of:

(i) Guardrail systems;

(ii) Safety net systems;

(iii) Travel restraint systems; or,

(iv) Personal fall arrest systems.

(8) *Repair pits, service pits, and assembly pits less than 10 feet in depth.* The use of a fall protection system is not required for a repair pit, service pit, or assembly pit that is less than 10 feet (3 m) deep, provided the employer:

(i) Limits access within 6 feet (1.8 m) of the edge of the pit to authorized employees trained in accordance with § 1910.30;

(ii) Applies floor markings at least 6 feet (1.8 m) from the edge of the pit in colors that contrast with the surrounding area; or places a warning line at least 6 feet (1.8 m) from the edge of the pit as well as stanchions that are capable of resisting, without tipping over, a force of at least 16 pounds (71 N) applied horizontally against the stanchion at a height of 30 inches (76 cm); or places a combination of floor markings and warning lines at least 6 feet (1.8 m) from the edge of the pit. When two or more pits in a common area are not more than 15 feet (4.5m) apart, the employer may comply by placing contrasting floor markings at least 6 feet (1.8 m) from the pit edge around the entire area of the pits; and

(iii) Posts readily visible caution signs that meet the requirements of § 1910.145 and state ''Caution—Open Pit.''

(9) *Fixed ladders (that extend more than 24 feet (7.3 m) above a lower level).* (i) For fixed ladders that extend more than 24 feet (7.3 m) above a lower level, the employer must ensure:

(A) *Existing fixed ladders.* Each fixed ladder installed before November 19, 2018 is equipped with a personal fall arrest system, ladder safety system, cage, or well;

(B) *New fixed ladders.* Each fixed ladder installed on and after November 19, 2018, is equipped with a personal fall arrest system or a ladder safety system;

(C) *Replacement.* When a fixed ladder, cage, or well, or any portion of a section thereof, is replaced, a personal fall arrest system or ladder safety system is installed in at least that section of the fixed ladder, cage, or well where the replacement is located; and

(D) *Final deadline.* On and after November 18, 2036, all fixed ladders are equipped with a personal fall arrest system or a ladder safety system.

(ii) When a one-section fixed ladder is equipped with a personal fall protection or a ladder safety system or a fixed ladder is equipped with a personal fall arrest or ladder safety system on more than one section, the employer must ensure:

(A) The personal fall arrest system or ladder safety system provides protection throughout the entire vertical distance of the ladder, including all ladder sections; and

(B) The ladder has rest platforms provided at maximum intervals of 150 feet (45.7 m).

(iii) The employer must ensure ladder sections having a cage or well:

(A) Are offset from adjacent sections; and

(B) Have landing platforms provided at maximum intervals of 50 feet (15.2 m).

(iv) The employer may use a cage or well in combination with a personal fall arrest system or ladder safety system provided that the cage or well does not interfere with the operation of the system.

(10) *Outdoor advertising (billboards).* (i) The requirements in paragraph (b)(9) of this section, and other requirements in subparts D and I of this part, apply to fixed ladders used in outdoor advertising activities.

(ii) When an employee engaged in outdoor advertising climbs a fixed ladder before November 19, 2018 that is not equipped with a cage, well, personal fall arrest system, or a ladder safety system the employer must ensure the employee:

(A) Receives training and demonstrates the physical capability to perform the necessary climbs in accordance with § 1910.29(h);

(B) Wears a body harness equipped with an 18-inch (46 cm) rest lanyard;

(C) Keeps both hands free of tools or material when climbing on the ladder; and

(D) Is protected by a fall protection system upon reaching the work position.

(11) *Stairways.* The employer must ensure:

(i) Each employee exposed to an unprotected side or edge of a stairway landing that is 4 feet (1.2 m) or more above a lower level is protected by a guardrail or stair rail system;

(ii) Each flight of stairs having at least 3 treads and at least 4 risers is equipped with stair rail systems and handrails as follows:

Table D-2 -- Stairway Handrail Requirements

Stair width	Enclosed	One open side	Two open sides	With earth built up on both sides
Less than 44 inches (1.1 m).	At least one handrail	One stair rail system with handrail on open side.	One stair rail system each open side.	
44 inches (1.1 m) to 88 inches (2.2 m).	One handrail on each enclosed side	One stair rail system with handrail on open side and one handrail on enclosed side.	One stair rail system with handrail on each open side.	
Greater than 88 inches (2.2 m).	One handrail on each enclosed side and one intermediate handrail located in the middle of the stair	One stair rail system with handrail on open side, one handrail on enclosed side, and one intermediate handrail located in the middle of the stair.	One stair rail system with handrail on each open side and one intermediate handrail located in the middle of the stair.	
Exterior stairs less than 44 inches (1.1 m).				One handrail on at least one side.

Note to table: The width of the stair must be clear of all obstructions except handrails.

(iii) Each ship stairs and alternating tread type stairs is equipped with handrails on both sides.

(12) *Scaffolds and rope descent systems.* The employer must ensure:

(i) Each employee on a scaffold is protected from falling in accordance 29 CFR part 1926, subpart L; and

(ii) Each employee using a rope descent system 4 feet (1.2 m) or more above a lower level is protected from falling by a personal fall arrest system.

(13) *Work on low-slope roofs.* (i) When work is performed less than 6 feet (1.6 m) from the roof edge, the employer must ensure each employee is protected from falling by a guardrail system, safety net system, travel restraint system, or personal fall arrest system.

(ii) When work is performed at least 6 feet (1.6 m) but less than 15 feet (4.6 m) from the roof edge, the employer must ensure each employee is protected from falling by using a guardrail system, safety net system, travel restraint system, or personal fall arrest system. The employer may use a designated area when performing work that is both infrequent and temporary.

(iii) When work is performed 15 feet (4.6 m) or more from the roof edge, the employer must:

(A) Protect each employee from falling by a guardrail system, safety net system, travel restraint system, or personal fall arrest system or a designated area. The employer is not required to provide any fall protection, provided the work is both infrequent and temporary; and

(B) Implement and enforce a work rule prohibiting employees from going within 15 feet (4.6 m) of the roof edge without using fall protection in accordance with paragraphs (b)(13)(i) and (ii) of this section.

(14) *Slaughtering facility platforms.* (i) The employer must protect each employee on the unprotected working side of a slaughtering facility platform that is 4 feet (1.2 m) or more above a lower level from falling by using:

(A) Guardrail systems; or

(B) Travel restraint systems.

(ii) When the employer can demonstrate the use of a guardrail or travel restraint system is not feasible, the work may be done without those systems provided:

(A) The work operation for which fall protection is infeasible is in process;

(B) Access to the platform is limited to authorized employees; and

(C) The authorized employees are trained in accordance with § 1910.30.

(15) *Walking-working surfaces not otherwise addressed.* Except as provided elsewhere in this section or by other subparts of this part, the employer must

ensure each employee on a walking-working surface 4 feet (1.2 m) or more above a lower level is protected from falling by:

(i) Guardrail systems;

(ii) Safety net systems; or

(iii) Personal fall protection systems, such as personal fall arrest, travel restraint, or positioning systems.

(c) *Protection from falling objects.* When an employee is exposed to falling objects, the employer must ensure that each employee wears head protection that meets the requirements of subpart I of this part. In addition, the employer must protect employees from falling objects by implementing one or more of the following:

(1) Erecting toeboards, screens, or guardrail systems to prevent objects from falling to a lower level;

(2) Erecting canopy structures and keeping potential falling objects far enough from an edge, hole, or opening to prevent them from falling to a lower level; or

(3) Barricading the area into which objects could fall, prohibiting employees from entering the barricaded area, and keeping objects far enough from an edge or opening to prevent them from falling to a lower level.

§ 1910.29 Fall protection systems and falling object protection—criteria and practices.

(a) *General requirements.* The employer must:

(1) Ensure each fall protection system and falling object protection, other than personal fall protection systems, that this part requires meets the requirements in this section. The employer must ensure each personal fall protection system meets the requirements in subpart I of this part; and

(2) Provide and install all fall protection systems and falling object protection this subpart requires, and comply with the other requirements in this subpart before any employee begins work that necessitates fall or falling object protection.

(b) *Guardrail systems.* The employer must ensure guardrail systems meet the following requirements:

(1) The top edge height of top rails, or equivalent guardrail system members, are 42 inches (107 cm), plus or minus 3 inches (8 cm), above the walking-working surface. The top edge height may exceed 45 inches (114 cm), provided the guardrail system meets all other criteria of paragraph (b) of this section (see Figure D–11 of this section).

(2) Midrails, screens, mesh, intermediate vertical members, solid panels, or equivalent intermediate members are installed between the walking-working surface and the top edge of the guardrail system as follows when there is not a wall or parapet that is at least 21 inches (53 cm) high:

(i) Midrails are installed at a height midway between the top edge of the guardrail system and the walking-working surface;

(ii) Screens and mesh extend from the walking-working surface to the top rail and along the entire opening between top rail supports;

(iii) Intermediate vertical members (such as balusters) are installed no more than 19 inches (48 cm) apart; and

(iv) Other equivalent intermediate members (such as additional midrails and architectural panels) are installed so that the openings are not more than 19 inches (48 cm) wide.

(3) Guardrail systems are capable of withstanding, without failure, a force of at least 200 pounds (890 N) applied in a downward or outward direction within 2 inches (5 cm) of the top edge, at any point along the top rail.

(4) When the 200-pound (890–N) test load is applied in a downward direction, the top rail of the guardrail system must not deflect to a height of less than 39 inches (99 cm) above the walking-working surface.

(5) Midrails, screens, mesh, intermediate vertical members, solid panels, and other equivalent intermediate members are capable of withstanding, without failure, a force of at least 150 pounds (667 N) applied in any downward or outward direction at any point along the intermediate member.

(6) Guardrail systems are smooth-surfaced to protect employees from injury, such as punctures or lacerations, and to prevent catching or snagging of clothing.

(7) The ends of top rails and midrails do not overhang the terminal posts, except where the overhang does not pose a projection hazard for employees.

(8) Steel banding and plastic banding are not used for top rails or midrails.

(9) Top rails and midrails are at least 0.25-inches (0.6 cm) in diameter or in thickness.

(10) When guardrail systems are used at hoist areas, a removable guardrail section, consisting of a top rail and midrail, are placed across the access opening between guardrail sections when employees are not performing hoisting operations. The employer may use chains or gates instead of a removable guardrail section at hoist areas if the employer demonstrates the chains or gates provide a level of safety equivalent to guardrails.

(11) When guardrail systems are used around holes, they are installed on all unprotected sides or edges of the hole.

(12) For guardrail systems used around holes through which materials may be passed:

(i) When materials are being passed through the hole, not more than two sides of the guardrail system are removed; and

(ii) When materials are not being passed through the hole, the hole must be guarded by a guardrail system along all unprotected sides or edges or closed over with a cover.

(13) When guardrail systems are used around holes that serve as points of access (such as ladderways), the guardrail system opening:

(i) Has a self-closing gate that slides or swings away from the hole, and is equipped with a top rail and midrail or equivalent intermediate member that meets the requirements in paragraph (b) of this section; or

(ii) Is offset to prevent an employee from walking or falling into the hole;

(14) Guardrail systems on ramps and runways are installed along each unprotected side or edge.

(15) Manila or synthetic rope used for top rails or midrails are inspected as necessary to ensure that the rope continues to meet the strength requirements in paragraphs (b)(3) and (5) of this section.

Note to paragraph (b) of this section: The criteria and practices requirements for guardrail systems on scaffolds are contained in 29 CFR part 1926, subpart L.

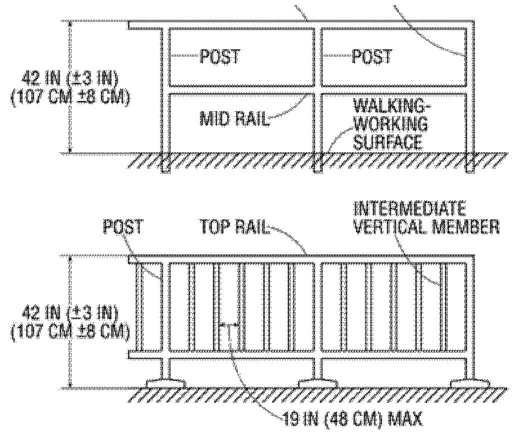


Figure D-11 – Guard Rail Systems

(c) *Safety net systems.* The employer must ensure each safety net system meets the requirements in 29 CFR part 1926, subpart M.

(d) *Designated areas.* (1) When the employer uses a designated area, the employer must ensure:

(i) Employees remain within the designated area while work operations are underway; and

(ii) The perimeter of the designated area is delineated with a warning line consisting of a rope, wire, tape, or chain that meets the requirements of paragraphs (d)(2) and (3) of this section.

(2) The employer must ensure each warning line:

(i) Has a minimum breaking strength of 200 pounds (0.89 kN);

(ii) Is installed so its lowest point, including sag, is not less than 34 inches (86 cm) and not more than 39 inches (99 cm) above the walking-working surface;

(iii) Is supported in such a manner that pulling on one section of the line will not result in slack being taken up in adjacent sections causing the line to fall below the limits specified in paragraph (d)(2)(ii) of this section;

(iv) Is clearly visible from a distance of 25 feet (7.6 m) away, and anywhere within the designated area;

(v) Is erected as close to the work area as the task permits; and

(vi) Is erected not less than 6 feet (1.8 m) from the roof edge for work that is both temporary and infrequent, or not less than 15 feet (4.6 m) for other work.

(3) When mobile mechanical equipment is used to perform work that is both temporary and infrequent in a designated area, the employer must ensure the warning line is erected not less than 6 feet (1.8 m) from the unprotected side or edge that is parallel to the direction in which the mechanical equipment is operated, and not less than 10 feet (3 m) from the unprotected side or edge that is perpendicular to the direction in which the mechanical equipment is operated.

(e) *Covers.* The employer must ensure each cover for a hole in a walking-working surface:

(1) Is capable of supporting without failure, at least twice the maximum intended load that may be imposed on the cover at any one time; and

(2) Is secured to prevent accidental displacement.

(f) *Handrails and stair rail systems.* The employer must ensure:

(1) *Height criteria.* (i) Handrails are not less than 30 inches (76 cm) and not more than 38 inches (97 cm), as measured from the leading edge of the stair tread to the top surface of the handrail (see Figure D–12 of this section).

(ii) The height of stair rail systems meets the following:

(A) The height of stair rail systems installed before January 17, 2017 is not less than 30 inches (76 cm) from the leading edge of the stair tread to the top surface of the top rail; and

(B) The height of stair rail systems installed on or after January 17, 2017 is not less than 42 inches (107 cm) from the leading edge of the stair tread to the top surface of the top rail.

(iii) The top rail of a stair rail system may serve as a handrail only when:

(A) The height of the stair rail system is not less than 36 inches (91 cm) and not more than 38 inches (97 cm) as measured at the leading edge of the stair tread to the top surface of the top rail (see Figure D–13 of this section); and

(B) The top rail of the stair rail system meets the other handrail requirements in paragraph (f) of this section.

(2) *Finger clearance.* The minimum clearance between handrails and any other object is 2.25 inches (5.7 cm).

(3) *Surfaces.* Handrails and stair rail systems are smooth-surfaced to protect employees from injury, such as punctures or lacerations, and to prevent catching or snagging of clothing.

(4) *Openings in stair rails.* No opening in a stair rail system exceeds 19 inches (48 cm) at its least dimension.

(5) *Handhold.* Handrails have the shape and dimension necessary so that employees can grasp the handrail firmly.

(6) *Projection hazards.* The ends of handrails and stair rail systems do not present any projection hazards.

(7) *Strength criteria.* Handrails and the top rails of stair rail systems are capable of withstanding, without failure, a force of at least 200 pounds (890 N) applied in any downward or outward direction within 2 inches (5 cm) of any point along the top edge of the rail.

BILLING CODE 4510–29–P

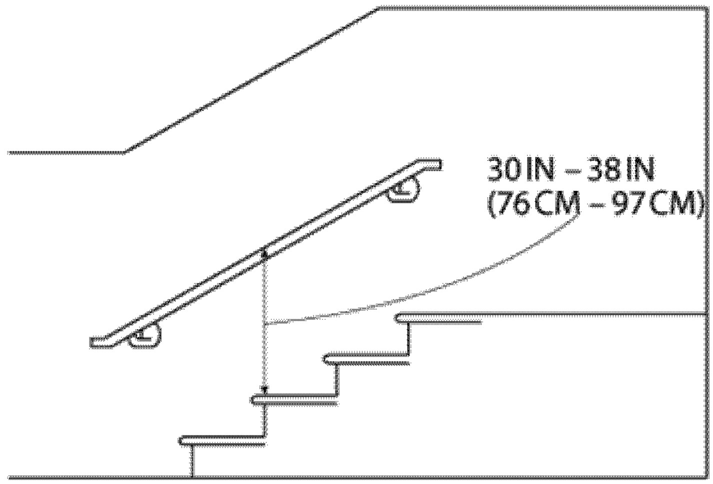

Figure D-12 – Handrail Measurement

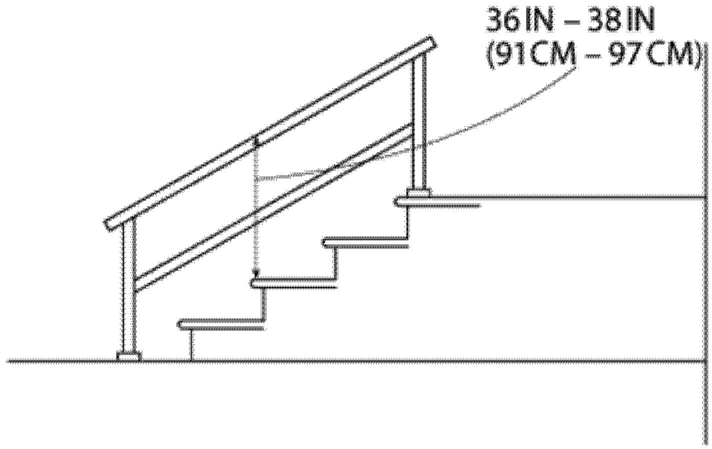

Figure D-13 – Combination Handrail and Stair Rail

BILLING CODE 4510–29–C

(g) *Cages, wells, and platforms used with fixed ladders.* The employer must ensure:

(1) Cages and wells installed on fixed ladders are designed, constructed, and maintained to permit easy access to, and egress from, the ladder that they enclose (see Figures D–14 and D–15 of this section);

(2) Cages and wells are continuous throughout the length of the fixed ladder, except for access, egress, and other transfer points;

(3) Cages and wells are designed, constructed, and maintained to contain employees in the event of a fall, and to direct them to a lower landing; and

(4) Platforms used with fixed ladders provide a horizontal surface of at least 24 inches by 30 inches (61 cm by 76 cm).

Note to paragraph (g): Section 1910.28 establishes the requirements that employers must follow on the use of cages and wells as a means of fall protection.

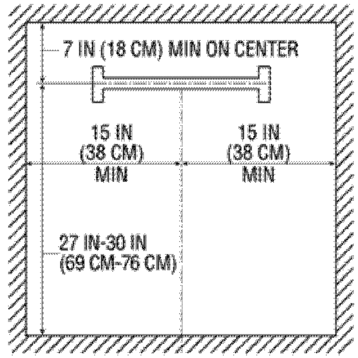

Figure D-14 -- Clearances for Fixed Ladders in Wells

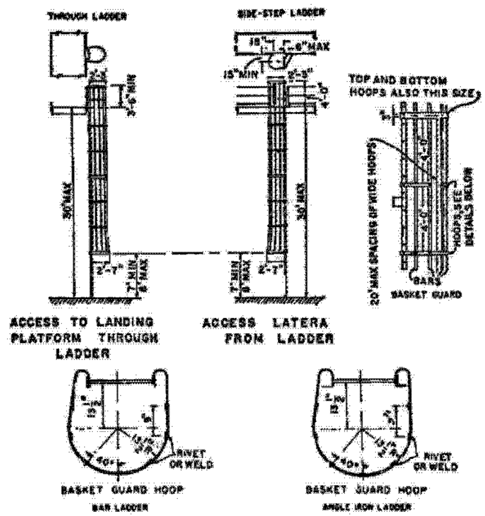

Figure D-15 -- Example of General Construction of Cages

(h) *Outdoor advertising.* This paragraph (h) applies only to employers engaged in outdoor advertising operations (see § 1910.28(b)(10)). Employers must ensure that each employee who climbs a fixed ladder without fall protection:

(1) Is physically capable, as demonstrated through observations of actual climbing activities or by a physical examination, to perform the duties that may be assigned, including climbing fixed ladders without fall protection;

(2) Has successfully completed a training or apprenticeship program that includes hands-on training on the safe climbing of ladders and is retrained as necessary to maintain the necessary skills;

(3) Has the skill to climb ladders safely, as demonstrated through formal classroom training or on-the-job training, and performance observation; and

(4) Performs climbing duties as a part of routine work activity.

(i) *Ladder safety systems.* The employer must ensure:

(1) Each ladder safety system allows the employee to climb up and down using both hands and does not require that the employee continuously hold, push, or pull any part of the system while climbing;

(2) The connection between the carrier or lifeline and the point of attachment to the body harness or belt does not exceed 9 inches (23 cm);

(3) Mountings for rigid carriers are attached at each end of the carrier, with intermediate mountings spaced, as necessary, along the entire length of the carrier so the system has the strength to stop employee falls;

(4) Mountings for flexible carriers are attached at each end of the carrier and cable guides for flexible carriers are installed at least 25 feet (7.6 m) apart but not more than 40 feet (12.2 m) apart along the entire length of the carrier;

(5) The design and installation of mountings and cable guides does not reduce the design strength of the ladder; and

(6) Ladder safety systems and their support systems are capable of withstanding, without failure, a drop test consisting of an 18-inch (41-cm) drop of a 500-pound (227-kg) weight.

(j) *Personal fall protection systems.* Body belts, harnesses, and other components used in personal fall arrest systems, work positioning systems, and travel restraint systems must meet the requirements of § 1910.140.

(k) *Protection from falling objects.* (1) The employers must ensure toeboards used for falling object protection:

(i) Are erected along the exposed edge of the overhead walking-working surface for a length that is sufficient to protect employees below.

(ii) Have a minimum vertical height of 3.5 inches (9 cm) as measured from the top edge of the toeboard to the level of the walking-working surface.

(iii) Do not have more than a 0.25-inch (0.5-cm) clearance or opening above the walking-working surface.

(iv) Are solid or do not have any opening that exceeds 1 inch (3 cm) at its greatest dimension.

(v) Have a minimum height of 2.5 inches (6 cm) when used around vehicle repair, service, or assembly pits. Toeboards may be omitted around vehicle repair, service, or assembly pits when the employer can demonstrate that a toeboard would prevent access to a vehicle that is over the pit.

(vi) Are capable of withstanding, without failure, a force of at least 50 pounds (222 N) applied in any downward or outward direction at any point along the toeboard.

(2) The employer must ensure:

(i) Where tools, equipment, or materials are piled higher than the top of the toeboard, paneling or screening is installed from the toeboard to the midrail of the guardrail system and for a length that is sufficient to protect employees below. If the items are piled higher than the midrail, the employer also must install paneling or screening to the top rail and for a length that is sufficient to protect employees below; and

(ii) All openings in guardrail systems are small enough to prevent objects from falling through the opening.

(3) The employer must ensure canopies used for falling object protection are strong enough to prevent collapse and to prevent penetration by falling objects.

(l) *Grab handles.* The employer must ensure each grab handle:

(1) Is not less than 12 inches (30 cm) long;

(2) Is mounted to provide at least 3 inches (8 cm) of clearance from the framing or opening; and

(3) Is capable of withstanding a maximum horizontal pull-out force equal to two times the maximum intended load or 200 pounds (890 N), whichever is greater.

§ 1910.30 Training requirements.

(a) *Fall hazards.* (1) Before any employee is exposed to a fall hazard, the employer must provide training for each employee who uses personal fall protection systems or who is required to be trained as specified elsewhere in this subpart. Employers must ensure employees are trained in the requirements of this paragraph on or before May 17, 2017.

(2) The employer must ensure that each employee is trained by a qualified person.

(3) The employer must train each employee in at least the following topics:

(i) The nature of the fall hazards in the work area and how to recognize them;

(ii) The procedures to be followed to minimize those hazards;

(iii) The correct procedures for installing, inspecting, operating, maintaining, and disassembling the personal fall protection systems that the employee uses; and

(iv) The correct use of personal fall protection systems and equipment specified in paragraph (a)(1) of this section, including, but not limited to, proper hook-up, anchoring, and tie-off techniques, and methods of equipment inspection and storage, as specified by the manufacturer.

(b) *Equipment hazards.* (1) The employer must train each employee on or before May 17, 2017 in the proper care, inspection, storage, and use of equipment covered by this subpart before an employee uses the equipment.

(2) The employer must train each employee who uses a dockboard to properly place and secure it to prevent unintentional movement.

(3) The employer must train each employee who uses a rope descent system in proper rigging and use of the equipment in accordance with § 1910.27.

(4) The employer must train each employee who uses a designated area in the proper set-up and use of the area.

(c) *Retraining.* The employer must retrain an employee when the employer has reason to believe the employee does not have the understanding and skill required by paragraphs (a) and (b) of this section. Situations requiring retraining include, but are not limited to, the following:

(1) When changes in the workplace render previous training obsolete or inadequate;

(2) When changes in the types of fall protection systems or equipment to be used render previous training obsolete or inadequate; or

(3) When inadequacies in an affected employee's knowledge or use of fall protection systems or equipment indicate that the employee no longer has the requisite understanding or skill necessary to use equipment or perform the job safely.

(d) *Training must be understandable.* The employer must provide information and training to each employee in a manner that the employee understands.

Subpart F—[Amended]

■ 4. Revise the authority citation for subpart F to read as follows:

Authority: 29 U.S.C. 653, 655, and 657; Secretary of Labor's Order No. 12–71 (36 FR 8754), 8–76 (41 FR 25059), 9–83 (48 FR 35736), 1–90 (55 FR 9033), 5–2007 (72 FR 31159), or 1–2012 (77 FR 3912), as applicable; and 29 CFR part 1911.

■ 5. In § 1910.66:

■ a. Revise paragraphs (b)(2)(i), (c)(3), (f)(5)(ii)(L) and (M), (f)(5)(iii)(B), and (j);

■ b. Remove and reserve appendix C; and

■ c. Revise appendix D, paragraph (c)(4).

The revisions read as follows:

§ 1910.66 Powered platforms for building maintenance.

* * * * *

(b) * * *

(2) * * *

(i) Permanent installations in existence and/or completed before July 23, 1990 shall comply with paragraphs (g), (h), (i), (j) and appendix C to subpart I of this part.

* * * * *

(c) * * *

(3) Building owners of all installations, new and existing, shall inform the employer in writing that the installation has been inspected, tested, and maintained in compliance with the requirements of paragraphs (g) and (h) of this section and that all anchorages meet the requirements of § 1910.140(c)(13).

* * * * *

(f) * * *

(5) * * *

(ii) * * *

(L) The platform shall be provided with a secondary wire rope suspension system if the platform contains overhead structures which restrict the emergency egress of employees. A horizontal lifeline or a direct connection anchorage shall be provided as part of a personal fall arrest system that meets the requirements of subpart I of this part for each employee on such a platform.

(M) A vertical lifeline shall be provided as part of a personal fall arrest system that meets the requirements of subpart I of this part for each employee on a working platform suspended by two or more wire ropes, if the failure of one wire rope or suspension attachment will cause the platform to upset. If a secondary wire rope suspension is used, vertical lifelines are not required for the personal fall arrest system, provided that each employee is attached to a horizontal lifeline anchored to the platform.

* * * * *

(iii) * * *

(B) Each single point suspended working platform shall be provided with a secondary wire rope suspension system which will prevent the working platform from falling should there be a failure of the primary means of support, or if the platform contains overhead structures which restrict the egress of the employees. A horizontal life line or a direct connection anchorage shall be provided as part of a personal fall arrest system that meets the requirements of subpart I of this part for each employee on the platform.

* * * * *

(j) *Personal fall protection.* Employees on working platforms shall be protected by a personal fall arrest system meeting the requirements of subpart I of this part and as otherwise provided by this standard.

* * * * *

Appendix C to § 1910.66 [Reserved]

Appendix D to § 1910.66—Existing Installations (Mandatory)

* * * * *

(c) * * *

(4) *Access to the roof car.* Safe access to the roof car and from the roof car to the working platform shall be provided. If the access to the roof car at any point of its travel is not over the roof area or where otherwise necessary for safety, then self-closing, self-locking gates shall be provided. Access to and from roof cars must comply with the requirements of subpart D of this part.

* * * * *

■ 6. In § 1910.67, revise paragraph (c)(2)(v) to read as follows:

§ 1910.67 Vehicle-mounted elevating and rotating work platforms.

* * * * *

(c) * * *

(2) * * *

(v) A personal fall arrest or travel restraint system that meets the requirements in subpart I of this part shall be worn and attached to the boom or basket when working from an aerial lift.

* * * * *

■ 7. In § 1910.68, revise paragraphs (b)(8)(ii) and (b)(12) to read as follows:

§ 1910.68 Manlifts.

* * * * *

(b) * * *

(8) * * *

(ii) *Construction.* The rails shall be standard guardrails with toeboards that meet the requirements in subpart D of this part.

* * * * *

(12) *Emergency exit ladder.* A fixed metal ladder accessible from both the ''up'' and ''down'' run of the manlift shall be provided for the entire travel of the manlift. Such ladders shall meet the requirements in subpart D of this part.

* * * * *

Subpart I—[Amended]

■ 8. Revise the authority citation for subpart I to read as follows:

Authority: 29 U.S.C. 653, 655, 657; Secretary of Labor's Order No. 12–71 (36 FR 8754), 8–76 (41 FR 25059), 9–83 (48 FR 35736), 1–90 (55 FR 9033), 6–96 (62 FR 111), 3–2000 (65 FR 50017), 5–2002 (67 FR 65008), 5–2007 (72 FR 31159), 4–2010 (75 FR 55355), or 1–2012 (77 FR 3912), as applicable; and 29 CFR part 1911.

■ 9. In § 1910.132, revise paragraph (g) to read as follows:

§ 1910.132 General requirements.

* * * * *

(g) Paragraphs (d) and (f) of this section apply only to §§ 1910.133, 1910.135, 1910.136, 1910.138, and 1910.140. Paragraphs (d) and (f) of this section do not apply to §§ 1910.134 and 1910.137.

* * * * *

§ 1910.139 [Added and Reserved]

■ 10. Add reserved § 1910.139.

■ 11. Add § 1910.140 to read as follows:

§ 1910.140 Personal fall protection systems.

(a) *Scope and application.* This section establishes performance, care, and use criteria for all personal fall protection systems. The employer must ensure that each personal fall protection system used to comply with this part must meet the requirements of this section.

(b) *Definitions.* The following definitions apply to this section:

Anchorage means a secure point of attachment for equipment such as lifelines, lanyards, or deceleration devices.

Belt terminal means an end attachment of a window cleaner's positioning system used for securing the belt or harness to a window cleaner's belt anchor.

Body belt means a strap with means both for securing about the waist and for attaching to other components such as a lanyard used with positioning systems, travel restraint systems, or ladder safety systems.

Body harness means straps that secure about the employee in a manner to distribute the fall arrest forces over at least the thighs, pelvis, waist, chest, and shoulders, with a means for attaching the harness to other components of a personal fall protection system.

Carabiner means a connector generally comprised of a trapezoidal or oval shaped body with a closed gate or similar arrangement that may be opened to attach another object and, when released, automatically closes to retain the object.

Competent person means a person who is capable of identifying existing and predictable hazards in any personal fall protection system or any component of it, as well as in their application and uses with related equipment, and who has authorization to take prompt, corrective action to eliminate the identified hazards.

Connector means a device used to couple (connect) parts of the fall protection system together.

D-ring means a connector used:

(i) In a harness as an integral attachment element or fall arrest attachment;

(ii) In a lanyard, energy absorber, lifeline, or anchorage connector as an integral connector; or

(iii) In a positioning or travel restraint system as an attachment element.

Deceleration device means any mechanism that serves to dissipate energy during a fall.

Deceleration distance means the vertical distance a falling employee travels from the point at which the deceleration device begins to operate, excluding lifeline elongation and free fall distance, until stopping. It is measured as the distance between the location of an employee's body harness attachment point at the moment of activation (at the onset of fall arrest forces) of the deceleration device during a fall, and the location of that attachment point after the employee comes to a full stop.

Equivalent means alternative designs, equipment, materials, or methods that the employer can demonstrate will provide an equal or greater degree of safety for employees compared to the designs, equipment, materials, or methods specified in the standard.

Free fall means the act of falling before the personal fall arrest system begins to apply force to arrest the fall.

Free fall distance means the vertical displacement of the fall arrest attachment point on the employee's body belt or body harness between onset of the fall and just before the system begins to apply force to arrest the fall. This distance excludes deceleration distance, lifeline and lanyard elongation, but includes any deceleration device slide distance or self-retracting lifeline/lanyard extension before the devices operate and fall arrest forces occur.

Lanyard means a flexible line of rope, wire rope, or strap that generally has a connector at each end for connecting the body belt or body harness to a deceleration device, lifeline, or anchorage.

Lifeline means a component of a personal fall protection system consisting of a flexible line for connection to an anchorage at one end so as to hang vertically (vertical lifeline), or for connection to anchorages at both ends so as to stretch horizontally (horizontal lifeline), and serves as a means for connecting other components of the system to the anchorage.

Personal fall arrest system means a system used to arrest an employee in a fall from a walking-working surface. It consists of a body harness, anchorage, and connector. The means of connection may include a lanyard, deceleration device, lifeline, or a suitable combination of these.

Personal fall protection system means a system (including all components) an employer uses to provide protection from falling or to safely arrest an employee's fall if one occurs.

Examples of personal fall protection systems include personal fall arrest systems, positioning systems, and travel restraint systems.

Positioning system (work-positioning system) means a system of equipment and connectors that, when used with a body harness or body belt, allows an employee to be supported on an elevated vertical surface, such as a wall or window sill, and work with both hands free. Positioning systems also are called ''positioning system devices'' and ''work-positioning equipment.''

Qualified describes a person who, by possession of a recognized degree, certificate, or professional standing, or who by extensive knowledge, training, and experience has successfully demonstrated the ability to solve or resolve problems relating to the subject matter, the work, or the project.

Rope grab means a deceleration device that travels on a lifeline and automatically, by friction, engages the lifeline and locks so as to arrest the fall of an employee. A rope grab usually employs the principle of inertial locking, cam/lever locking, or both.

Safety factor means the ratio of the design load and the ultimate strength of the material.

Self-retracting lifeline/lanyard means a deceleration device containing a drum-wound line that can be slowly extracted from, or retracted onto, the drum under slight tension during normal movement by the employee. At the onset of a fall, the device automatically locks the drum and arrests the fall.

Snaphook means a connector comprised of a hook-shaped body with a normally closed gate, or similar arrangement that may be manually opened to permit the hook to receive an object. When released, the snaphook automatically closes to retain the object. Opening a snaphook requires two separate actions. Snaphooks are generally one of two types:

(i) Automatic-locking type (permitted) with a self-closing and self-locking gate that remains closed and locked until intentionally unlocked and opened for connection or disconnection; and

(ii) Non-locking type (prohibited) with a self-closing gate that remains closed, but not locked, until intentionally opened for connection or disconnection.

Travel restraint (tether) line means a rope or wire rope used to transfer forces from a body support to an anchorage or anchorage connector in a travel restraint system.

Travel restraint system means a combination of an anchorage, anchorage connector, lanyard (or other means of connection), and body support that an employer uses to eliminate the possibility of an employee going over the edge of a walking-working surface.

Window cleaner's belt means a positioning belt that consists of a waist belt, an integral terminal runner or strap, and belt terminals.

Window cleaner's belt anchor (window anchor) means specifically designed fall-preventing attachment points permanently affixed to a window frame or to a building part immediately adjacent to the window frame, for direct attachment of the terminal portion of a window cleaner's belt.

Window cleaner's positioning system means a system which consists of a window cleaner's belt secured to window anchors.

Work-positioning system (see *Positioning system* in this paragraph (b)).

(c) *General requirements.* The employer must ensure that personal fall protection systems meet the following requirements. Additional requirements for personal fall arrest systems and positioning systems are contained in paragraphs (d) and (e) of this section, respectively.

(1) Connectors must be drop forged, pressed or formed steel, or made of equivalent materials.

(2) Connectors must have a corrosion-resistant finish, and all surfaces and edges must be smooth to prevent damage to interfacing parts of the system.

(3) When vertical lifelines are used, each employee must be attached to a separate lifeline.

(4) Lanyards and vertical lifelines must have a minimum breaking strength of 5,000 pounds (22.2 kN).

(5) Self-retracting lifelines and lanyards that automatically limit free fall distance to 2 feet (0.61 m) or less must have components capable of sustaining a minimum tensile load of 3,000 pounds (13.3 kN) applied to the device with the lifeline or lanyard in the fully extended position.

(6) A competent person or qualified person must inspect each knot in a lanyard or vertical lifeline to ensure that it meets the requirements of paragraphs (c)(4) and (5) of this section before any employee uses the lanyard or lifeline.

(7) D-rings, snaphooks, and carabiners must be capable of sustaining a minimum tensile load of 5,000 pounds (22.2 kN).

(8) D-rings, snaphooks, and carabiners must be proof tested to a minimum tensile load of 3,600 pounds (16 kN) without cracking, breaking, or incurring permanent deformation. The gate strength of snaphooks and carabiners, must be proof tested to 3,600 lbs. (16 kN) in all directions.

(9) Snaphooks and carabiners must be the automatic locking type that require at least two separate, consecutive movements to open.

(10) Snaphooks and carabiners must not be connected to any of the following unless they are designed for such connections:

(i) Directly to webbing, rope, or wire rope;

(ii) To each other;

(iii) To a D-ring to which another snaphook, carabiner, or connector is attached;

(iv) To a horizontal life line; or

(v) To any object that is incompatibly shaped or dimensioned in relation to the snaphook or carabiner such that unintentional disengagement could occur when the connected object depresses the snaphook or carabiner gate, allowing the components to separate.

(11) The employer must ensure that each horizontal lifeline:

(i) Is designed, installed, and used under the supervision of a qualified person; and

(ii) Is part of a complete personal fall arrest system that maintains a safety factor of at least two.

(12) Anchorages used to attach to personal fall protection equipment must be independent of any anchorage used to suspend employees or platforms on which employees work. Anchorages used to attach to personal fall protection equipment on mobile work platforms on powered industrial trucks must be attached to an overhead member of the platform, at a point located above and near the center of the platform.

(13) Anchorages, except window cleaners' belt anchors covered by paragraph (e) of this section, must be:

(i) Capable of supporting at least 5,000 pounds (22.2 kN) for each employee attached; or

(ii) Designed, installed, and used, under the supervision of qualified person, as part of a complete personal fall protection system that maintains a safety factor of at least two.

(14) Travel restraint lines must be capable of sustaining a tensile load of at least 5,000 pounds (22.2 kN).

(15) Lifelines must not be made of natural fiber rope. Polypropylene rope must contain an ultraviolet (UV) light inhibitor.

(16) Personal fall protection systems and their components must be used exclusively for employee fall protection and not for any other purpose, such as hoisting equipment or materials.

(17) A personal fall protection system or its components subjected to impact loading must be removed from service immediately and not used again until a competent person inspects the system or components and determines that it is not damaged and safe for use for employee personal fall protection.

(18) Personal fall protection systems must be inspected before initial use during each workshift for mildew, wear, damage, and other deterioration, and defective components must be removed from service.

(19) Ropes, belts, lanyards, and harnesses used for personal fall protection must be compatible with all connectors used.

(20) Ropes, belts, lanyards, lifelines, and harnesses used for personal fall protection must be protected from being cut, abraded, melted, or otherwise damaged.

(21) The employer must provide for prompt rescue of each employee in the event of a fall.

(22) Personal fall protection systems must be worn with the attachment point of the body harness located in the center of the employee's back near shoulder level. The attachment point may be located in the pre-sternal position if the free fall distance is limited to 2 feet (0.6 m) or less.

(d) *Personal fall arrest systems*—(1) *System performance criteria.* In addition to the general requirements in paragraph (c) of this section, the employer must ensure that personal fall arrest systems:

(i) Limit the maximum arresting force on the employee to 1,800 pounds (8 kN);

(ii) Bring the employee to a complete stop and limit the maximum deceleration distance the employee travels to 3.5 feet (1.1 m);

(iii) Have sufficient strength to withstand twice the potential impact energy of the employee free falling a distance of 6 feet (1.8 m), or the free fall distance permitted by the system; and

(iv) Sustain the employee within the system/strap configuration without making contact with the employee's neck and chin area.

(v) If the personal fall arrest system meets the criteria and protocols in appendix D of this subpart, and is being used by an employee having a combined body and tool weight of less than 310 pounds (140 kg), the system is considered to be in compliance with the provisions of paragraphs (d)(1)(i) through (iii) of this section. If the system is used by an employee having a combined body and tool weight of 310 pounds (140kg) or more and the employer has appropriately modified the criteria and protocols in appendix D, then the system will be deemed to be in compliance with the requirements of paragraphs (d)(1)(i) through (iii).

(2) *System use criteria.* The employer must ensure that:

(i) On any horizontal lifeline that may become a vertical lifeline, the device used to connect to the horizontal lifeline is capable of locking in both directions on the lifeline.

(ii) Personal fall arrest systems are rigged in such a manner that the employee cannot free fall more than 6 feet (1.8 m) or contact a lower level. A free fall may be more than 6 feet (1.8 m) provided the employer can demonstrate the manufacturer designed the system to allow a free fall of more than 6 feet and tested the system to ensure a maximum arresting force of 1,800 pounds (8 kN) is not exceeded.

(3) *Body belts.* Body belts are prohibited as part of a personal fall arrest system.

(e) *Positioning systems*—(1) *System performance requirements.* The employer must ensure that each positioning system meets the following requirements:

(i) *General.* All positioning systems, except window cleaners' positioning systems, are capable of withstanding, without failure, a drop test consisting of a 4-foot (1.2-m) drop of a 250-pound (113-kg) weight;

(ii) *Window cleaners' positioning systems.* All window cleaners' positioning systems must:

(A) Be capable of withstanding without failure a drop test consisting of a 6-foot (1.8-m) drop of a 250-pound (113-kg) weight; and

(B) Limit the initial arresting force on the falling employee to not more than 2,000 pounds (8.9 kN), with a duration not exceeding 2 milliseconds and any subsequent arresting forces to not more than 1,000 pounds (4.5 kN).

(iii) Positioning systems, including window cleaners' positioning systems, that meet the test methods and procedures in appendix D of this subpart are considered to be in compliance with paragraphs (e)(1)(i) and (ii).

(iv) *Lineman's body belt and pole strap systems.* Lineman's body belt and pole strap systems must meet the following tests:

(A) A dielectric test of 819.7 volts, AC, per centimeter (25,000 volts per foot) for 3 minutes without visible deterioration;

(B) A leakage test of 98.4 volts, AC, per centimeter (3,000 volts per foot) with a leakage current of no more than 1 mA; and

(C) A flammability test in accordance with Table I–7 of this section.

Table I-7 -- Flammability Test

Test Method	Criteria for Passing Test
1. Vertically suspend a 19.7-inch (500-mm) length of strapping supporting a 220.5-lb (100-kg) weight; 2. Use a butane or propane burner with a 3-inch (76-mm) flame; 3. Direct the flame to an edge of the strapping at a distance of 1 inch (25mm); 4. Remove the flame after 5 seconds; and 5. Wait for any flames on the positioning strap to stop burning.	Any flames on the positioning strap must self-extinguish. The positioning strap must continue to support the 220.5-lb (100-kg) mass.

(2) *System use criteria for window cleaners' positioning systems.* The employer must ensure that window cleaners' positioning systems meet and are used in accordance with the following:

(i) Window cleaners' belts are designed and constructed so that:

(A) Belt terminals will not pass through their fastenings on the belt or harness if a terminal comes loose from the window anchor; and

(B) The length of the runner from terminal tip to terminal tip is 8 feet (2.44 m) or less;

(ii) Window anchors to which belts are fastened are installed in the side frames or mullions of the window at a point not less than 42 inches (106.7 cm) and not more than 51 inches (129.5 cm) above the window sill;

(iii) Each window anchor is capable of supporting a minimum load of 6,000 pounds (26.5 kN);

(iv) Use of installed window anchors for any purpose other than attaching the window cleaner's belt is prohibited;

(v) A window anchor that has damaged or deteriorated fastenings or supports is removed, or the window anchor head is detached so the anchor cannot be used;

(vi) Rope that has wear or deterioration that affects its strength is not used;

(vii) Both terminals of the window cleaner's belt are attached to separate window anchors during any cleaning operation;

(viii) No employee works on a window sill or ledge on which there is snow, ice, or any other slippery condition, or one that is weakened or rotted;

(ix) No employee works on a window sill or ledge unless:

(A) The window sill or ledge is a minimum of 4 inches (10 cm) wide and slopes no more than 15 degrees below horizontal; or

(B) The 4-inch minimum width of the window sill or ledge is increased 0.4 inches (1 cm) for every degree the sill or ledge slopes beyond 15 degrees, up to a maximum of 30 degrees;

(x) The employee attaches at least one belt terminal to a window anchor before climbing through the window opening, and keeps at least one terminal attached until completely back inside the window opening;

(xi) Except as provided in paragraph (e)(2)(xii) of this section, the employee travels from one window to another by returning inside the window opening and repeating the belt terminal attachment procedure at each window in accordance with paragraph (e)(2)(x) of this section;

(xii) An employee using a window cleaner's positioning system may travel from one window to another while outside of the building, provided:

(A) At least one belt terminal is attached to a window anchor at all times;

(B) The distance between window anchors does not exceed 4 feet (1.2 m) horizontally. The distance between windows may be increased up to 6 feet (1.8 m) horizontally if the window sill or ledge is at least 1 foot (0.31 m) wide and the slope is less than 5 degrees;

(C) The sill or ledge between windows is continuous; and

(D) The width of the window sill or ledge in front of the mullions is at least 6 inches (15.2 cm) wide.

■ 12. Add appendices C and D to subpart I of part 1910 to read as follows:

Appendix C to Subpart I of Part 1910—Personal Fall Protection Systems Non-Mandatory Guidelines

The following information generally applies to all personal fall protection systems and is intended to assist employers and employees comply with the requirements of § 1910.140 for personal fall protection systems.

(a) Planning considerations. It is important for employers to plan prior to using personal fall protection systems. Probably the most overlooked component of planning is locating suitable anchorage points. Such planning should ideally be done before the structure or building is constructed so that anchorage points can be used later for window cleaning or other building maintenance.

(b) Selection and use considerations. (1) The kind of personal fall protection system selected should be appropriate for the employee's specific work situation. Free fall distances should always be kept to a minimum. Many systems are designed for particular work applications, such as climbing ladders and poles; maintaining and servicing equipment; and window cleaning. Consideration should be given to the environment in which the work will be performed. For example, the presence of acids, dirt, moisture, oil, grease, or other substances, and their potential effects on the system selected, should be evaluated. The employer should fully evaluate the work conditions and environment (including seasonal weather changes) before selecting the appropriate personal fall protection system. Hot or cold environments may also affect fall protection systems. Wire rope should not be used where electrical hazards are anticipated. As required by § 1910.140(c)(21), the employer must provide a means for promptly rescuing an employee should a fall occur.

(2) Where lanyards, connectors, and lifelines are subject to damage by work operations, such as welding, chemical cleaning, and sandblasting, the component should be protected, or other securing systems should be used. A program for cleaning and maintaining the system may be necessary.

(c) Testing considerations. Before purchasing a personal fall protection system, an employer should insist that the supplier provide information about its test performance (using recognized test methods) so the employer will know that the system meets the criteria in § 1910.140. Otherwise, the employer should test the equipment to ensure that it is in compliance. Appendix D to this subpart contains test methods which are recommended for evaluating the performance of any system. There are some circumstances in which an employer can evaluate a system based on data and calculations derived from the testing of similar systems. Enough information must be available for the employer to demonstrate that its system and the tested system(s) are similar in both function and design.

(d) Component compatibility considerations. Ideally, a personal fall protection system is designed, tested, and supplied as a complete system. However, it is common practice for lanyards, connectors, lifelines, deceleration devices, body belts, and body harnesses to be interchanged since some components wear out before others. Employers and employees should realize that not all components are interchangeable. For instance, a lanyard should not be connected between a body harness and a deceleration device of the self-retracting type (unless specifically allowed by the manufacturer) since this can result in additional free fall for which the system was not designed. In addition, positioning components, such as pole straps, ladder hooks and rebar hooks, should not be used in personal fall arrest systems unless they meet the appropriate strength and performance requirements of part 1910 (*e.g.,* §§ 1910.140, 1910.268 and 1910.269). Any substitution or change to a personal fall protection system should be fully evaluated or tested by a competent person to determine that it meets applicable OSHA standards before the modified system is put in use. Also, OSHA suggests that rope be used according to manufacturers' recommendations, especially if polypropylene rope is used.

(e) Employee training considerations. As required by §§ 1910.30 and 1910.132, before an employee uses a fall protection system, the employer must ensure that he or she is trained in the proper use of the system. This may include the following: The limits of the system; proper anchoring and tie-off techniques; estimating free fall distance, including determining elongation and deceleration distance; methods of use; and inspection and storage. Careless or improper use of fall protection equipment can result in serious injury or death. Employers and employees should become familiar with the material in this standard and appendix, as well as manufacturers' recommendations, before a system is used. It is important for employees to be aware that certain tie-offs (such as using knots and tying around sharp edges) can reduce the overall strength of a system. Employees also need to know the maximum permitted free fall distance. Training should stress the importance of inspections prior to use, the limitations of the equipment to be used, and unique conditions at the worksite that may be important.

(f) Instruction considerations. Employers should obtain comprehensive instructions from the supplier or a qualified person as to the system's proper use and application, including, where applicable:

(1) The force measured during the sample force test;

(2) The maximum elongation measured for lanyards during the force test;

(3) The deceleration distance measured for deceleration devices during the force test;

(4) Caution statements on critical use limitations;

(5) Limits of the system;

(6) Proper hook-up, anchoring and tie-off techniques, including the proper D-ring or other attachment point to use on the body harness;

(7) Proper climbing techniques;

(8) Methods of inspection, use, cleaning, and storage; and

(9) Specific lifelines that may be used.

(g) Inspection considerations. Personal fall protection systems must be inspected before initial use in each workshift. Any component with damage, such as a cut, tear, abrasion, mold, or evidence of undue stretching, an alteration or addition that might affect its effectiveness, damage due to deterioration, fire, acid, or other corrosive damage, distorted hooks or faulty hook springs, tongues that are unfitted to the shoulder of buckles, loose or damaged mountings, non-functioning parts, or wear, or internal deterioration must be removed from service immediately, and should be tagged or marked as unusable, or destroyed. Any personal fall protection system, including components, subjected to impact loading must be removed from service immediately and not used until a competent person inspects the system and determines that it is not damaged and is safe to use for personal fall protection.

(h) Rescue considerations. As required by § 1910.140(c)(21), when personal fall arrest systems are used, special consideration must be given to rescuing an employee promptly should a fall occur. The availability of rescue personnel, ladders, or other rescue equipment needs to be evaluated since there may be instances in which employees cannot self-rescue (*e.g.,* employee unconscious or seriously injured). In some situations, equipment allowing employees to rescue themselves after the fall has been arrested may be desirable, such as devices that have descent capability.

(i) Tie-off considerations. Employers and employees should at all times be aware that the strength of a personal fall arrest system is based on its being attached to an anchoring system that can support the system. Therefore, if a means of attachment is used that will reduce the strength of the system (such as an eye-bolt/snaphook anchorage), that component should be replaced by a stronger one that will also maintain the appropriate maximum deceleration characteristics. The following is a listing of some situations in which employers and employees should be especially cautious:

(1) Tie-off using a knot in the lanyard or lifeline (at any location). The strength of the line can be reduced by 50 percent or more if a knot is used. Therefore, a stronger lanyard or lifeline should be used to compensate for the knot, or the lanyard length should be reduced (or the tie-off location raised) to minimize free fall distance, or the lanyard or lifeline should be replaced by one which has an appropriately incorporated connector to eliminate the need for a knot.

(2) Tie-off around rough or sharp (*e.g.,* ''H'' or ''I'' beams) surfaces. Sharp or rough surfaces can damage rope lines and this reduces strength of the system drastically. Such tie-offs should be avoided whenever possible. An alternate means should be used such as a snaphook/D-ring connection, a tie-off apparatus (steel cable tie-off), an effective padding of the surfaces, or an abrasion-resistant strap around the supporting member. If these alternative means of tie-off are not available, the employer should try to minimize the potential free fall distance.

(3) Knots. Sliding hitch knots should not be used except in emergency situations. The one-and-one sliding hitch knot should never be used because it is unreliable in stopping a fall. The two-and-two, or three-and-three knots (preferable) may be used in emergency situations; however, care should be taken to limit free fall distances because of reduced lifeline/lanyard strength. OSHA requires that a competent or qualified person inspect each knot in a lanyard or vertical lifeline to ensure it meets the strength requirements in § 1910.140.

(j) Horizontal lifelines. Horizontal lifelines, depending on their geometry and angle of sag, may be subjected to greater loads than the impact load imposed by an attached component. When the angle of horizontal lifeline sag is less than 30 degrees, the impact force imparted to the lifeline by an attached lanyard is greatly amplified. For example, with a sag angle of 15 degrees the force amplification is about 2:1, and at 5 degrees sag it is about 6:1. Depending on the angle of sag, and the line's elasticity, the strength of the horizontal lifeline, and the anchorages to which it is attached should be increased a number of times over that of the lanyard. Extreme care should be taken in considering a horizontal lifeline for multiple tie-offs. If there are multiple tie-offs to a horizontal lifeline, and one employee falls, the movement of the falling employee and the horizontal lifeline during arrest of the fall may cause other employees to fall. Horizontal lifeline and anchorage strength should be increased for each additional employee to be tied-off. For these and other reasons, the systems using horizontal lifelines must be designed only by qualified persons. OSHA recommends testing installed lifelines and anchors prior to use. OSHA requires that horizontal lifelines are designed, installed and used under the supervision of a qualified person.

(k) Eye-bolts. It must be recognized that the strength of an eye-bolt is rated along the axis of the bolt, and that its strength is greatly reduced if the force is applied at right angles to this axis (in the direction of its shear strength). Care should also be exercised in selecting the proper diameter of the eye to avoid creating a roll-out hazard (accidental disengagement of the snaphook from the eye-bolt).

(l) Vertical lifeline considerations. As required by § 1910.140(c)(3), each employee must have a separate lifeline when the lifeline is vertical. If multiple tie-offs to a single lifeline are used, and one employee falls, the movement of the lifeline during the arrest of the fall may pull other employees' lanyards, causing them to fall as well.

(m) Snaphook and carabiner considerations. As required by § 1910.140(c)(10), the following connections must be avoided unless the locking snaphook or carabiner has been designed for them because they are conditions that can result in rollout:

(1) Direct connection to webbing, rope, or a horizontal lifeline;

(2) Two (or more) snaphooks or carabiners connected to one D-ring;

(3) Two snaphooks or carabiners connected to each other;

(4) Snaphooks or carabiners connected directly to webbing, rope, or wire rope; and

(5) Improper dimensions of the D-ring, rebar, or other connection point in relation to the snaphook or carabiner dimensions which would allow the gate to be depressed by a turning motion.

(n) Free fall considerations. Employers and employees should always be aware that a system's maximum arresting force is evaluated under normal use conditions established by the manufacturer. OSHA requires that personal fall arrest systems be rigged so an employee cannot free fall in excess of 6 feet (1.8 m). Even a few additional feet of free fall can significantly increase the arresting force on the employee, possibly to the point of causing injury and possibly exceeding the strength of the system. Because of this, the free fall distance should be kept to a minimum, and, as required by § 1910.140(d)(2), must never be greater than 6 feet (1.8 m). To assure this, the tie-off attachment point to the lifeline or anchor should be located at or above the connection point of the fall arrest equipment to the harness. (Otherwise, additional free fall distance is added to the length of the connecting means (*i.e.,* lanyard)). Tying off to the walking-working surface will often result in a free fall greater than 6 feet (1.8 m). For instance, if a 6-foot (1.8-m) lanyard is used, the total free fall distance will be the distance from the walking-working level to the harness connection plus the 6 feet (1.8 m) of lanyard.

(o) Elongation and deceleration distance considerations. During fall arrest, a lanyard will stretch or elongate, whereas activation of a deceleration device will result in a certain stopping distance. These distances should be available with the lanyard or device's instructions and must be added to the free fall distance to arrive at the total fall distance before an employee is fully stopped. The additional stopping distance may be significant if the lanyard or deceleration device is attached near or at the end of a long lifeline, which may itself add considerable distance due to its own elongation. As required by § 1910.140(d)(2), sufficient distance to allow for all of these factors must also be maintained between the employee and obstructions below, to prevent an injury due to impact before the system fully arrests the fall. In addition, a minimum of 12 feet (3.7 m) of lifeline should be allowed below the securing point of a rope-grab-type deceleration device, and the end terminated to prevent the device from sliding off the lifeline. Alternatively, the lifeline should extend to the ground or the next working level below. These measures are suggested to prevent the employee from inadvertently moving past the end of the lifeline and having the rope grab become disengaged from the lifeline.

(p) Obstruction considerations. In selecting a location for tie-off, employers and employees should consider obstructions in the potential fall path of the employee. Tie-offs that minimize the possibilities of exaggerated swinging should be considered.

Appendix D to Subpart I of Part 1910—Test Methods and Procedures for Personal Fall Protection Systems Non-Mandatory Guidelines

This appendix contains test methods for personal fall protection systems which may be used to determine if they meet the system performance criteria specified in paragraphs (d) and (e) of § 1910.140.

Test methods for personal fall arrest systems (paragraph (d) of § 1910.140).

(a) General. The following sets forth test procedures for personal fall arrest systems as defined in paragraph (d) of § 1910.140.

(b) General test conditions.

(1) Lifelines, lanyards and deceleration devices should be attached to an anchorage and connected to the body harness in the same manner as they would be when used to protect employees.

(2) The fixed anchorage should be rigid, and should not have a deflection greater than 0.04 inches (1 mm) when a force of 2,250 pounds (10 kN) is applied.

(3) The frequency response of the load measuring instrumentation should be 120 Hz.

(4) The test weight used in the strength and force tests should be a rigid, metal cylindrical or torso-shaped object with a girth of 38 inches plus or minus 4 inches (96 cm plus or minus 10 cm).

(5) The lanyard or lifeline used to create the free fall distance should be supplied with the system, or in its absence, the least elastic lanyard or lifeline available should be used with the system.

(6) The test weight for each test should be hoisted to the required level and should be quickly released without having any appreciable motion imparted to it.

(7) The system's performance should be evaluated, taking into account the range of environmental conditions for which it is designed to be used.

(8) Following the test, the system need not be capable of further operation.

(c) Strength test.

(1) During the testing of all systems, a test weight of 300 pounds plus or minus 3 pounds (136.4 kg plus or minus 1.4 kg) should be used. (See paragraph (b)(4) of this appendix.)

(2) The test consists of dropping the test weight once. A new unused system should be used for each test.

(3) For lanyard systems, the lanyard length should be 6 feet plus or minus 2 inches (1.83 m plus or minus 5 cm) as measured from the fixed anchorage to the attachment on the body harness.

(4) For rope-grab-type deceleration systems, the length of the lifeline above the centerline of the grabbing mechanism to the lifeline's anchorage point should not exceed 2 feet (0.61 m).

(5) For lanyard systems, for systems with deceleration devices which do not automatically limit free fall distance to 2 feet (0.61 m) or less, and for systems with deceleration devices which have a connection distance in excess of 1 foot (0.3 m) (measured between the centerline of the lifeline and the attachment point to the body harness), the test weight should be rigged to free fall a distance of 7.5 feet (2.3 m) from a point that is 1.5 feet (46 cm) above the anchorage point, to its hanging location (6 feet (1.83 m) below the anchorage). The test weight should fall without interference, obstruction, or hitting the floor or ground during the test. In some cases a non-elastic wire lanyard of sufficient length may need to be added to the system (for test purposes) to create the necessary free fall distance.

(6) For deceleration device systems with integral lifelines or lanyards that automatically limit free fall distance to 2 feet (0.61 m) or less, the test weight should be rigged to free fall a distance of 4 feet (1.22 m).

(7) Any weight that detaches from the harness should constitute failure for the strength test.

(d) Force test.

(1) General. The test consists of dropping the respective test weight specified in paragraph (d)(2)(i) or (d)(3)(i) of this appendix once. A new, unused system should be used for each test.

(2) For lanyard systems. (i) A test weight of 220 pounds plus or minus three pounds (100 kg plus or minus 1.6 kg) should be used. (See paragraph (b)(4) of this appendix.)

(ii) Lanyard length should be 6 feet plus or minus 2 inches (1.83 m plus or minus 5 cm) as measured from the fixed anchorage to the attachment on the body harness.

(iii) The test weight should fall free from the anchorage level to its hanging location (a total of 6 feet (1.83 m) free fall distance) without interference, obstruction, or hitting the floor or ground during the test.

(3) For all other systems. (i) A test weight of 220 pounds plus or minus 2 pounds (100 kg plus or minus 1.0 kg) should be used. (See paragraph (b)(4) of this appendix.)

(ii) The free fall distance to be used in the test should be the maximum fall distance physically permitted by the system during normal use conditions, up to a maximum free fall distance for the test weight of 6 feet (1.83 m), except as follows:

(A) For deceleration systems having a connection link or lanyard, the test weight should free fall a distance equal to the connection distance (measured between the centerline of the lifeline and the attachment point to the body harness).

(B) For deceleration device systems with integral lifelines or lanyards that automatically limit free fall distance to 2 feet (0.61 m) or less, the test weight should free fall a distance equal to that permitted by the system in normal use. (For example, to test a system with a self-retracting lifeline or lanyard, the test weight should be supported and the system allowed to retract the lifeline or lanyard as it would in normal use. The test weight would then be released and the force and deceleration distance measured).

(4) Failure. A system fails the force test when the recorded maximum arresting force exceeds 2,520 pounds (11.2 kN) when using a body harness.

(5) Distances. The maximum elongation and deceleration distance should be recorded during the force test.

(e) Deceleration device tests.

(1) General. The device should be evaluated or tested under the environmental conditions (such as rain, ice, grease, dirt, and type of lifeline) for which the device is designed.

(2) Rope-grab-type deceleration devices. (i) Devices should be moved on a lifeline 1,000 times over the same length of line a distance of not less than 1 foot (30.5 cm), and the mechanism should lock each time.

(ii) Unless the device is permanently marked to indicate the type of lifelines that must be used, several types (different diameters and different materials), of lifelines should be used to test the device.

(3) Other self-activating-type deceleration devices. The locking mechanisms of other self-activating-type deceleration devices designed for more than one arrest should lock each of 1,000 times as they would in normal service.

Test methods for positioning systems (paragraph (e) of § 1910.140).

(a) General. The following sets forth test procedures for positioning systems as defined in paragraph (e) of § 1910.140. The requirements in this appendix for personal fall arrest systems set forth procedures that may be used, along with the procedures listed below, to determine compliance with the requirements for positioning systems.

(b) Test conditions.

(1) The fixed anchorage should be rigid and should not have a deflection greater than 0.04 inches (1 mm) when a force of 2,250 pounds (10 kN) is applied.

(2) For window cleaners' belts, the complete belt should withstand a drop test consisting of a 250 pound (113 kg) weight falling free for a distance of 6 feet (1.83 m). The weight should be a rigid object with a girth of 38 inches plus or minus 4 inches (96 cm plus or minus 10 cm). The weight should be placed in the waistband with the belt buckle drawn firmly against the weight, as when the belt is worn by a window cleaner. One belt terminal should be attached to a rigid anchor and the other terminal should hang free. The terminals should be adjusted to their maximum span. The weight fastened in the freely suspended belt should then be lifted exactly 6 feet (1.83 m) above its ''at rest'' position and released so as to permit a free fall of 6 feet (1.83 m) vertically below the point of attachment of the terminal anchor. The belt system should be equipped with devices and instrumentation capable of measuring the duration and magnitude of the arrest forces. Failure of the test should consist of any breakage or slippage sufficient to permit the weight to fall free of the system. In addition, the initial and subsequent arresting forces should be measured and should not exceed 2,000 pounds (8.5 kN) for more than 2 milliseconds for the initial impact, or exceed 1,000 pounds (4.5 kN) for the remainder of the arrest time.

(3) All other positioning systems (except for restraint line systems) should withstand a drop test consisting of a 250 pound (113 kg) weight free falling a distance of 4 feet (1.2 m). The weight must be a rigid object with a girth of 38 inches plus or minus 4 inches (96 cm plus or minus 10 cm). The body belt or harness should be affixed to the test weight as it would be to an employee. The system should be connected to the rigid anchor in the manner that the system would be connected in normal use. The weight should be lifted exactly 4 feet (1.2 m) above its ''at rest'' position and released so as to permit a vertical free fall of 4 feet (1.2 m). Failure of the system should be indicated by any breakage or slippage sufficient to permit the weight to fall free to the ground.

Subpart N—[Amended]

■ 13. Revise the authority citation for subpart N to read as follows:

Authority: 29 U.S.C. 653, 655, 657; Secretary of Labor's Order No. 12–71 (36 FR 8754), 8–76 (41 FR 25059), 9–83 (48 FR 35736), 1–90 (55 FR 9033), 6–96 (62 FR 111), 3–2000 (65 FR 50017), 5–2002 (67 FR 65008), 5–2007 (72 FR 31159), 4–2010 (75 FR 55355), or 1–2012 (77 FR 3912), as applicable; and 29 CFR part 1911.

■ 14. In § 1910.178, revise paragraph (j) to read as follows:

§ 1910.178 Powered industrial trucks.

* * * * *

(j) *Dockboards (bridge plates).* See subpart D of this part.

* * * * *

■ 15. In § 1910.179, revise paragraphs (c)(2), (d)(3), and (d)(4)(iii) to read as follows:

§ 1910.179 Overhead and gantry cranes.

* * * * *

(c) * * *

(2) *Access to crane.* Access to the car and/or bridge walkway shall be by a conveniently placed fixed ladder, stairs, or platform requiring no step over any gap exceeding 12 inches (30 cm). Fixed ladders must comply with subpart D of this part.

* * * * *

(d) * * *

(3) *Toeboards and handrails for footwalks.* Toeboards and handrails must comply with subpart D of this part.

(4) * * *

(iii) Ladders shall be permanently and securely fastened in place and constructed in compliance with subpart D of this part.

* * * * *

Subpart R—[Amended]

■ 16. Revise the authority citation for subpart R to read as follows:

Authority: 29 U.S.C. 653, 655, 657; Secretary of Labor's Order No. 12–71 (36 FR 8754), 8–76 (41 FR 25059), 9–83 (48 FR 35736), 1–90 (55 FR 9033), 6–96 (62 FR 111), 5–2007 (72 FR 31159), 4–2010 (75 FR 55355), or 1–2012 (77 FR 3912), as applicable; and 29 CFR part 1911.

■ 17. In § 1910.261, revise paragraphs (c)(15)(ii), (e)(4), (g)(2)(ii), (g)(13)(i), (h)(1), (j)(4)(iii), (j)(5)(i), (k)(6), (k)(13)(i) and (k)(15) to read as follows:

§ 1910.261 Pulp, paper, and paperboard mills.

* * * * *

(c) * * *

(15) * * *

(ii) Where conveyors cross passageways or roadways, a horizontal platform shall be provided under the conveyor, extended out from the sides of the conveyor a distance equal to 1½ times the length of the wood handled. The platform shall extend the width of the road plus 2 feet (61 cm) on each side, and shall be kept free of wood and rubbish. The edges of the platform shall be provided with toeboards or other protection that meet the requirements of subpart D of this part, to prevent wood from falling.

* * * * *

(e) * * *

(4) *Runway to the jack ladder.* The runway from the pond or unloading dock to the table shall be protected with standard handrails and toeboards. Inclined portions shall have cleats or equivalent nonslip surfacing that

complies with subpart D of this part. Protective equipment shall be provided for persons working over water.

* * * * *

(g) * * *

(2) * * *

(ii) The worker shall be provided with eye protection, a supplied air respirator and a personal fall protection system that meets the requirements of subpart I of this part, during inspection, repairs or maintenance of acid towers. The line shall be extended to an attendant stationed outside the tower opening.

* * * * *

(13) * * *

(i) Blow-pit openings preferably shall be on the side of the pit instead of on the top. Openings shall be as small as possible when located on top, and shall be protected in accordance with subpart D of this part.

* * * * *

(h) * * *

(1) *Bleaching engines.* Bleaching engines, except the Bellmer type, shall be completely covered on the top, with the exception of one small opening large enough to allow filling, but too small to admit an employee. Platforms leading from one engine to another shall have standard guardrails that meet the requirements in subpart D of this part.

* * * * *

(j) * * *

(4) * * *

(iii) When beaters are fed from the floor above, the chute opening, if less than 42 inches (1.06 m) from the floor, shall be provided with a guardrail system that meets the requirements in subpart D of this part, or other equivalent enclosures. Openings for manual feeding shall be sufficient only for entry of stock, and shall be provided with at least two permanently secured crossrails or other fall protection system that meet the requirements in subpart D.

* * * * *

(5) * * *

(i) All pulpers having the top or any other opening of a vessel less than 42 inches (107 cm) from the floor or work platform shall have such openings guarded by guardrail systems that meet the requirements in subpart D of this part, or other equivalent enclosures. For manual changing, openings shall be sufficient only to permit the entry of stock, and shall be provided with at least two permanently secured crossrails, or other fall protection systems that meet the requirements in subpart D.

* * * * *

(k) * * *

(6) *Steps.* Steps of uniform rise and tread with nonslip surfaces that meet the requirements in subpart D of this part shall be provided at each press.

* * * * *

(13) * * *

(i) A guardrail that complies with subpart D of this part shall be provided at broke holes.

* * * * *

(15) *Steps.* Steps or ladders that comply with subpart D of this part and tread with nonslip surfaces shall be provided at each calendar stack. Handrails and hand grips complying with subpart D shall be provided at each calendar stack.

* * * * *

■ 18. In § 1910.262, revise paragraph (r) to read as follows:

§ 1910.262 Textiles.

* * * * *

(r) *Gray and white bins.* On new installations guardrails that comply with subpart D of this part shall be provided where workers are required to plait by hand from the top of the bin so as to protect the worker from falling to a lower level.

* * * * *

■ 19. In § 1910.265, revise paragraphs (c)(4)(v), (c)(5)(i), and (f)(6) to read as follows:

§ 1910.265 Sawmills.

* * * * *

(c) * * *

(4) * * *

(v) *Elevated platforms.* Where elevated platforms are used routinely on a daily basis, they shall be equipped with stairways or fixed ladders that comply with subpart D of this part.

* * * * *

(5) * * *

(i) *Construction.* Stairways shall be constructed in accordance with subpart D of this part.

* * * * *

(f) * * *

(6) *Ladders.* A fixed ladder complying with the requirements of subpart D of this part, or other adequate means, shall be provided to permit access to the roof. Where controls and machinery are mounted on the roof, a permanent stairway with standard handrail shall be installed in accordance with the requirements in subpart D.

* * * * *

■ 20. In § 1910.268:

■ a. Revise paragraphs (g)(1);

■ b. Remove paragraph (g)(2);

■ c. Redesignate (g)(3) as (g)(2); and

■ d. Revise paragraph (h).

The revisions read as follows:

§ 1910.268 Telecommunications.

* * * * *

(g) *Personal climbing equipment*—(1) *General.* A positioning system or a personal fall arrest system shall be provided and the employer shall ensure their use when work is performed at positions more than 4 feet (1.2 m) above the ground, on poles, and on towers, except as provided in paragraphs (n)(7) and (8) of this section. These systems shall meet the applicable requirements in subpart I of this part. The employer shall ensure that all climbing equipment is inspected before each day's use to determine that it is in safe working condition.

* * * * *

(h) *Ladders.* Ladders, step bolts, and manhole steps shall meet the applicable requirements in subpart D of this part.

* * * * *

■ 21. In § 1910.269, revise paragraphs (g)(2)(i), (g)(2)(iv)(B), and (g)(2)(iv)(C)(1) to read as follows:

§ 1910.269 Electric power generation, transmission, and distribution.

* * * * *

(g) * * *

(2) * * *

(i) Personal fall arrest systems shall meet the requirements of subpart I of this part.

* * * * *

(iv) * * *

(B) Personal fall arrest systems shall be used in accordance with subpart I of this part.

Note to paragraph (g)(2)(iv)(B): Fall protection equipment rigged to arrest falls is considered a fall arrest system and must meet the applicable requirements for the design and use of those systems. Fall protection equipment rigged for work positioning is considered work-positioning equipment and must meet the applicable requirements for the design and use of that equipment.

(C) * * *

(1) Each employee working from an aerial lift shall use a travel restraint system or a personal fall arrest system.

RIN 1004–AE14

Waste Prevention, Production Subject to Royalties, and Resource Conservation

AGENCY: Bureau of Land Management, Interior.

ACTION: Final rule.

SUMMARY: The Bureau of Land Management (BLM) is promulgating new regulations to reduce waste of natural gas from venting, flaring, and leaks during oil and natural gas production activities on onshore Federal and Indian (other than Osage Tribe) leases. The regulations also clarify when produced gas lost through venting, flaring, or leaks is subject to royalties, and when oil and gas production may be used royalty-free on-site. These regulations replace the existing provisions related to venting, flaring, and royalty-free use of gas contained in the 1979 Notice to Lessees and Operators of Onshore Federal and Indian Oil and Gas Leases, Royalty or Compensation for Oil and Gas Lost (NTL–4A), which are over 3 decades old.

DATES: The final rule is effective on January 17, 2017.

FOR FURTHER INFORMATION CONTACT: Timothy Spisak at the BLM Washington Office, 20 M Street SE., Room 2134LM, Washington, DC 20003, or by telephone at 202–912–7311. For questions relating to regulatory process issues, contact Faith Bremner at 202–912–7441.

Persons who use a telecommunications device for the deaf (TDD) may call the Federal Relay Service (FRS) at 1–800–877–8339 to contact these individuals during normal business hours. FRS is available 24 hours a day, 7 days a week to leave a message or question with these individuals. You will receive a reply during normal business hours.

SUPPLEMENTARY INFORMATION:

I. Table of Contents

II. Executive Summary

A. Background

This final regulation aims to reduce the waste of natural gas from mineral leases administered by the BLM. This gas is lost during oil and gas production activities through venting or flaring of the gas, and through equipment leaks. While oil and gas production technology has advanced dramatically in recent years, the BLM's rules to minimize waste of gas have not been updated in over 30 years. The Mineral Leasing Act of 1920 (MLA) requires the BLM to ensure that lessees ''use all reasonable precautions to prevent waste of oil or gas developed in the land,'' 30 U.S.C. 225, and that leases include ''a provision that such rules . . . for the prevention of undue waste as may be prescribed by [the] Secretary shall be observed,'' *id.* at § 187. The BLM believes there are economical, cost-effective, and reasonable measures that operators can take to minimize gas waste. These measures will enhance our nation's natural gas supplies, boost royalty receipts for American taxpayers, tribes, and States, reduce environmental damage from venting, flaring, and leaks of gas, and ensure the safe and responsible development of oil and gas resources.

The BLM's onshore oil and gas management program is a major contributor to our nation's oil and gas production. The BLM manages more than 245 million acres of land and 700 million acres of subsurface estate, making up nearly a third of the nation's mineral estate. Domestic production from 96,000 Federal onshore oil and gas wells accounts for 11 percent of the Nation's natural gas supply and 5 percent of its oil. In Fiscal Year (FY) 2015, operators produced 183.4 million barrels (bbl) of oil, 2.2 trillion cubic feet (Tcf) of natural gas, and 3.3 billion gallons of natural gas liquids (NGLs) from onshore Federal and Indian oil and gas leases. The production value of this oil and gas exceeded $20.9 billion and generated over $2.3 billion in royalties, which were shared with tribes, Indian allottee owners, and States.[1] Over the past decade, the United States has experienced a dramatic increase in oil and natural gas production due to technological advances, such as hydraulic fracturing combined with directional drilling. Yet the American public has not benefited from the full potential of this increased production, due to venting, flaring, and leaks of significant quantities of gas during the production process. Federal and Indian onshore lessees and operators reported to the Office of Natural Resources Revenue (ONRR) that they vented or flared 462 billion cubic feet (Bcf) of natural gas between 2009 and 2015—enough gas to serve about 6.2 million households for a year, assuming 2009 usage levels.[2]

Venting, flaring, and leaks waste a valuable resource that could be put to productive use, and deprive American taxpayers, tribes, and States of royalty revenues. In addition, the wasted gas may harm local communities and surrounding areas through visual and noise impacts from flaring, and contribute to regional and global air pollution problems of smog, particulate matter, and toxics (such as benzene, a carcinogen). Finally, vented or leaked gas contributes to climate change, because the primary constituent of natural gas is methane, an especially powerful greenhouse gas (GHG), with climate impacts roughly 25 times those of carbon dioxide (CO_2), if measured over a 100-year period, or 86 times those of CO_2, if measured over a 20-year period.[3] Thus, measures to conserve gas and avoid waste may significantly benefit local communities, public health, and the environment.

Congress has directed the BLM to oversee Federal and Indian oil and gas activities under multiple laws, including the MLA, the Mineral Leasing Act for Acquired Lands of 1947 (MLAAL), the Federal Oil and Gas Royalty Management Act (FOGRMA), the Federal Land Policy and Management Act of 1976 (FLPMA), the Indian Mineral Leasing Act of 1938 (IMLA), the Indian Mineral Development Act of 1982 (IMDA), and the Act of March 3, 1909.[4] In particular, the MLA requires the BLM to ensure that lessees ''use all reasonable precautions to prevent waste of oil or gas developed in the land.''[5] Leases issued by BLM must ensure that operations are conducted with ''reasonable diligence, skill, and care'' and that lessees comply with rules ''for the prevention of undue waste.''[6]

Advancing those mandates, this rule replaces the BLM's decades-old NTL–4A requirements related to venting and flaring, and to royalty-free use of oil and gas production; amends the BLM's oil and gas regulations at 43 CFR part 3160 to include requirements for a waste minimization plan; and adds new subparts 3178 and 3179 to 43 CFR part 3170 that address royalty-free use of lease production (subpart 3178) and waste prevention through reduction of venting, flaring and leaks (subpart 3179). This rule will apply to all Federal and Indian (other than Osage Tribe) onshore oil and gas leases as well as leases and business agreements entered into by tribes (including IMDA agreements), as consistent with those agreements and with principles of Federal Indian law.[7]

This rule implements recommendations from several oversight reviews, including reviews by the Office of the Inspector General of the Department of the Interior (OIG) and the Government Accountability Office (GAO). These reviews raised concerns about waste of gas from Federal and Indian production, found that the BLM's existing requirements regarding venting and flaring are insufficient and outdated, and expressed concerns about the ''lack of price flexibility in royalty

[7] Key statutes underpinning this proposed regulation contain exceptions for the Osage Tribe. Specifically, the Osage Tribe is excepted from the application of both the Indian Mineral Leasing Act and the Federal Oil and Gas Royalty Management Act, 25 U.S.C. 396f; 43 U.S.C. 1702(3), 1702(4). The leasing of Osage Reservation lands for oil and gas mining is subject to special Bureau of Indian Affairs regulations contained in 25 CFR part 226.

rates'' [8] and about royalty-free use of gas. The GAO also noted that ''around 40 percent of natural gas estimated to be vented and flared on onshore Federal leases could be economically captured with currently available control technologies.'' [9] The OIG and GAO reports recommended that the BLM update its regulations to require operators to augment their waste prevention efforts, afford the BLM greater flexibility in rate setting, and clarify BLM policies regarding royalty-free, on-site use of oil and gas.

The BLM has engaged in substantial stakeholder outreach in the course of developing this proposal. In 2014, the BLM conducted a series of forums to consult with tribal governments and to solicit stakeholder views to inform the development of this proposed rule, with public meetings (some of which were livestreamed) in Colorado, New Mexico, North Dakota, and Washington, DC.[10] The BLM continued to consult with stakeholders throughout the rule development process, including holding numerous meetings and calls with State and tribal representatives, individual companies, trade associations, and non-governmental organizations (NGOs). The BLM conducted additional outreach with States and tribes where there is extensive oil and gas production from BLM-administered leases. We issued a proposed rule on January 21, 2016, which was published on February 8, 2016, and accepted public comments through April 22, 2016, after extending the comment period. In addition, we held public meetings during the comment period in Farmington, New Mexico; Oklahoma City, Oklahoma; Denver, Colorado; and Dickinson, North Dakota. We also held separate meetings with tribes at each of these locations, and held further government-to-government consultation meetings at the request of several tribes. The BLM received approximately 330,000 public comments on the proposed rule, including approximately 1,000 unique comments.

The BLM is not the only regulator with the responsibility to oversee aspects of onshore oil and gas production, and throughout this rulemaking the BLM has focused on potential interactions of this rule with other Federal, State, or tribal regulatory requirements. For example, the U.S. Environmental Protection Agency (EPA) issued rules in 2012 and early 2016 to control emissions of methane and volatile organic compounds (VOCs) from new, modified and reconstructed oil and gas wells and production equipment, and many States and tribes regulate aspects of the oil and gas production process to address safety, waste, production accountability, and/or air quality concerns. Regulatory agencies often have overlapping authority and may adopt very similar measures to realize those complementary goals, such as improving air quality and reducing waste. For example, measures in this rule that aim to avoid the waste of methane gas through venting or leaks will also reduce methane pollution.

The BLM recognizes that overlapping regulatory regimes can create difficulties for operators, and has therefore very carefully considered and minimized potential overlaps with other Federal, State, or tribal regulations. The BLM aligned the requirements of this new rule with similar requirements adopted by the EPA and States, where practicable, and exempted equipment complying with relevant EPA requirements from overlapping requirements of this rule. In addition, this rule includes a provision that authorizes the BLM to grant variances from particular BLM requirements if a State or tribe demonstrates that a State, local, or tribal regulation imposes equally effective requirements.

It is critical to note, however, that neither EPA nor State and tribal requirements obviate the need for this rule. First, the BLM has an independent legal responsibility and a proprietary interest as a land and resource manager to oversee and minimize waste from oil and gas production activities conducted pursuant to Federal and Indian (other than Osage Tribe) leases, as well as to ensure that development activities on Federal and Indian leases are performed in a safe, responsible, and environmentally protective matter. The BLM's existing venting and flaring requirements are over 30 years old and predate significant technological developments. Updating and clarifying those requirements will make them more effective, more transparent, and easier to understand and administer; and will reduce operators' compliance burdens in some respects. The BLM must carry out its responsibility, delegated by Congress, to ensure that the public's resources are not wasted and are developed in a manner that provides for long-term productivity and sustainability.

Second, as a practical matter, neither EPA nor State and tribal regulations fully address the issue of waste of gas from BLM-administered leases. The EPA regulations are directed at air pollution reduction, not waste prevention; they cover only new, modified and reconstructed sources; and they do not address wasteful routine flaring of associated gas from oil wells, among other things. Similarly, no State or tribe has established a comprehensive set of requirements addressing all three avenues for waste—venting, flaring, and leaks—and only a few States have significant requirements in even one of these areas. The BLM therefore believes this rule is a necessary step in fulfilling its statutory mandate to minimize waste of the public's and tribes' natural gas resources.

B. Summary of Rule

This rule requires operators to take various actions to reduce waste of gas, establishes clear criteria for when flared gas will qualify as waste and therefore be subject to royalties, and clarifies which on-site uses of gas are exempt from royalties. The rule focuses on several key points or processes in the oil and gas production process where waste-prevention actions are most effective and least costly: Venting and flaring of associated gas from development oil wells (routine flaring occurs at oil wells that dispose of gas as a waste product), gas leaks from equipment at the well site or elsewhere on the lease, operation of high-bleed pneumatic controllers and certain pneumatic pumps, gas emissions from storage vessels, downhole well maintenance and liquids unloading, and well drilling and completions. The following discussion summarizes the rule's requirements applicable to each of these aspects of the production process, and also outlines the rule's provisions with respect to royalties, and the interaction between the rule and related EPA and State or tribal regulations.

1. Venting and Flaring

In 2014, operators vented about 30 Bcf and flared at least 81 Bcf of natural gas from BLM-administered leases, totaling 4.1 percent of the total production from those leases in that year, and sufficient gas to supply nearly 1.5 million households with gas for a year.[11] In

2015 operators flared at least 85 Bcf, a 114 percent increase from 2009 levels.[12] Roughly 83 Bcf of this flaring came from oil wells.[13] Analysis of data supplied by the ONRR suggests that most of the flaring was routine flaring of associated gas from development oil wells (as opposed to flaring during exploration, well testing, and emergencies). Over 88 percent of this flaring occurred in North Dakota, South Dakota, and New Mexico.

This rule prohibits venting of natural gas, except under certain specified conditions, such as in an emergency or when flaring is technically infeasible.[14] With respect to flaring, the rule requires operators to reduce wasteful flaring of gas by capturing for sale or using on the lease a percentage of their gas production. The required capture percentage increases over time, and is also adjusted to provide for a base level of ''allowable'' flaring that ramps down over time. This capture requirement builds on the proposed rule's flaring limits, and modifies that approach in response to comments, to make compliance more feasible and less costly, while working towards phasing out routine flaring of associated gas from oil wells by increasing capture. Specifically, beginning one year from the effective date of the final rule, operators must capture 85 percent of their adjusted total volume of gas produced each month. This percentage increases to 90 percent in 2020, 95 percent in 2023, and 98 percent in 2026. An operator's adjusted total volume of gas produced is calculated based on the quantity of high pressure gas produced from the operator's development oil wells that are in production, adjusted to exempt a specified volume of gas per well, which declines over time. Beginning one year from the effective date of the final rule, operators are allowed to exempt 5,400 Mcf gas per well per month, and this quantity declines to 3,600 beginning in 2019, 1,800 in 2020, 1,500 in 2021, 1,200 in 2022, 900 in 2024, and 750 from 2025 on.

The final rule gives operators the option to meet their capture targets on a lease-by-lease basis, or an average basis over all of their Federal or Indian production from development oil wells county-by-county or State-by-State. Giving operators the ability to average their rates of gas capture over geographic areas beyond individual leases enhances flexibility and makes the targets less costly to meet. Similarly, the more extended phasing in of the capture targets eases costs and compliance burdens, while allowing appropriate planning and investment by industry to meet more stringent targets in out years. At the same time, the BLM recognizes that it has a statutory responsibility to ensure that operators minimize waste of public resources. Accordingly, the BLM has structured the capture targets to ensure that operators will achieve overall reductions in wasteful flaring that are comparable to, and eventually slightly greater than, what the BLM estimated would have been achieved under the proposed rule.

The BLM estimates that, once fully implemented, the capture targets will reduce flaring by up to 49 percent relative to 2015 levels. Like the proposed rule, the final rule also retains the BLM's discretion to craft alternative requirements for certain operators that cannot meet the baseline flaring reduction obligations. Specifically, the final rule allows the BLM to adjust the capture target for an operator on an existing lease that demonstrates to the BLM that meeting the target would impose such costs as to cause the operator to cease production and abandon significant recoverable oil reserves under the lease. In assessing the operator's showing, the BLM will consider the costs of gas capture, and the costs and revenues of all oil and gas production on the lease.

As explained in the proposed rule, the initial flaring limitations were intended to motivate operators to increase their capture of gas associated with oil development, since a reduction in flaring is achieved most effectively by an increase in capture. Consequently, flaring limitations and capture requirements are two sides of the same coin. Increasing capture is the BLM's primary goal in imposing these waste prevention requirements, and we concluded that it would be a more direct means of achieving that goal to require capture rather than merely encourage it through the imposition of flaring limits. In modifying the rule in this way, we have determined that both approaches are expected to achieve comparable results, in terms of both increasing capture and reducing wasteful flaring.

In addition, this rule finalizes the proposal to require operators to submit a Waste Minimization Plan when they apply for a permit to drill a new development oil well. Preparation of a Waste Minimization Plan ensures that the operator carefully considers and plans for how it will capture the gas that will be produced, before the operator drills a well. While the provisions of a plan will not be enforceable against the operator, plan submission is mandatory, and the plan must include specific elements listed in the regulations. As in the proposed rule, failure to submit a complete and adequate plan could be grounds for denial of an application for permit to drill (APD).

2. Leaks

Based on our estimates, leaks are the second largest source of vented gas from Federal and Indian leases, accounting for about 4 Bcf of the natural gas lost in 2014.[15] Our analysis indicates that Leak Detection and Repair (LDAR) programs are a cost-effective means of reducing waste in oil and gas production, and multiple studies have found that once leaks are detected, the vast majority can be repaired with a positive return to the operator.[16]

Like the proposed rule, the final rule requires operators to use an instrument-based approach to leak detection. The final rule allows operators to use optical gas imaging equipment, portable analyzers deployed according to the protocol prescribed in EPA's Method 21,[17] or an alternative leak detection device approved by the BLM. In response to comments on the proposed rule, the final rule was revised to be consistent with the EPA's final requirements under 40 CFR part 60 subpart OOOOa, requiring operators to conduct semi-annual inspections at well sites and quarterly inspections at compressor stations. Operators may also request BLM approval of an alternative instrument-based leak detection program; the BLM may approve such a program if it finds that the program would reduce leaked volumes by at least as much as the BLM program. Operators must repair a leak within 30 days of discovery, absent good cause, and verify that the leak is fixed. Operators must also keep records documenting the dates and results of leak inspections, repairs, and follow-up inspections.

3. Reducing Venting From Equipment and Practices

Like the proposed rule, the final rule includes requirements to update old, inefficient equipment and to follow best practices to minimize waste through venting. These provisions address gas losses from pneumatic controllers and pumps, storage vessels, liquids

that in 2009, U.S. residential consumption was approximately 74 Mcf per household with natural gas service).

unloading, and well drilling and completions.

a. Pneumatic Controllers and Pumps

We estimate that on BLM-administered leases in 2014, operators lost about 14.9 Bcf of natural gas from pneumatic controllers and about 2.3 Bcf from pneumatic pumps.[18] A recent study by the consulting firm ICF International (ICF) identified replacement of high-bleed pneumatic controllers (those with bleed rates higher than 6 standard cubic feet (scf)/hour) with low-bleed pneumatic controllers (those with bleed rates of 6 scf/hour or less) as one of the most inexpensive options for reducing methane losses, estimating that replacing these devices would actually save industry $2.65 per Mcf of avoided methane emissions.[19] Like the proposed rule, the final rule requires operators to replace high-bleed pneumatic controllers with low-bleed or no-bleed pneumatic controllers within one year of the effective date of the final rule. This requirement tracks existing requirements in Colorado and Wyoming (in part of the State), and it applies only to pneumatic controllers that are not covered by EPA regulations.

For pneumatic pumps, the final rule requires the operator to replace pneumatic diaphragm pumps that operate 90 or more days per year with zero-emissions pumps, or route the pump exhaust gas to processing equipment. If use of a pneumatic pump is required based on the function the pump must serve, and the operator determines that routing the exhaust gas to processing equipment would be technically infeasible or unduly costly, the operator must route the pneumatic diaphragm pump to a combustor or flare, if one is located on the site.

The BLM modified the requirements in the proposed rule for pneumatic pumps in response to comments and to better align with the EPA's final subpart OOOOa requirements. For example, the BLM eliminated the proposed requirements for chemical injection pumps and diaphragm injection pumps that operate relatively infrequently, as we believe that these pumps vent relatively small quantities of gas. Like the proposed rule, the final rule does not apply to pneumatic pumps that are subject to EPA regulations.

The final rule provides that an operator can receive an exemption from the requirements for pneumatic controllers or pumps if the operator demonstrates and the BLM concurs that replacing the pneumatic pump(s) would impose such costs as to cause the operator to cease production and abandon significant recoverable oil reserves under the lease. In making this determination, the BLM will consider the costs of capture, and the costs and revenues of all oil and gas production on the lease.

b. Storage Vessels

We estimate that 2.94 Bcf of natural gas was lost in 2014 from storage tank venting on Federal and Indian lands.[20] Of that volume, we estimate that 1.54 Bcf was lost from storage vessels used in natural gas production and 1.4 Bcf of gas was lost from storage vessels used in oil production.[21] Tank vapors can be controlled by installing a vapor recovery unit (VRU) or by routing them to a flare or combustor. New, modified and reconstructed vessels used in oil and gas production are already subject to EPA emissions limits, which require that individual storage vessels with VOC emissions equal to or greater than 6 tons per year (tpy) achieve at least a 95 percent reduction in VOC emissions from baseline levels. Colorado and part of Wyoming have similar, somewhat more stringent requirements for storage vessels.[22]

Like the proposed rule, this final rule includes requirements to reduce gas losses from existing storage vessels, which are not covered by the EPA standards. Using the same applicability threshold as EPA and Colorado (6 tpy of VOCs, which the BLM is using as a proxy for natural gas losses since the VOCs in this context are coming from the natural gas from storage vessels), the rule requires operators to route storage vessel vapor gas to a sales line, if the storage vessel has the potential to emit at least 6 tpy of VOCs. If an operator determines that compliance with this requirement is technically infeasible or unduly costly, the operator may instead route the tank vapor gas to a combustor or flare. Like the proposed rule, this final rule allows operators to request an exemption from these requirements if the operator demonstrates, and the BLM concurs, that complying with the requirements would impose such costs as to cause the operator to cease production and abandon significant recoverable oil reserves under the lease. In making this determination, the BLM will consider the costs of compliance, and the costs and revenues of all oil and gas production on the lease.

c. Well Maintenance and Liquids Unloading

We estimate that 3.26 Bcf of natural gas was lost in 2014 during liquids unloading operations on Federal and Indian lands.[23] There are a wide variety of methods for liquids unloading, and technological developments, such as automated well controls and plunger lift systems, now allow liquids to be unloaded with minimal loss of gas. The BLM expects prudent operators to use available technologies and practices to minimize gas losses, and we believe that the failure to use such technologies and practices during liquids unloading constitutes waste.

The final rule does not adopt the provision from the proposed rule that would have prohibited manual well purging from new wells, due to concerns about the technical feasibility of such a ban. Instead, the final rule requires an operator to: (1) Minimize gas vented to unload liquids, consistent with safe operations; (2) optimize the operation of the plunger lift or automated well control system, at wells equipped with such a system, to minimize gas losses from the system to the extent possible; (3) consider other methods for liquids unloading and determine that they are technically infeasible or unduly costly, prior to manually purging a well for the first time; and (4) comply with specified procedures and document venting events when unloading liquids by manual well purging.

d. Reduction of Waste From Drilling, Completion, and Related Operations

We estimate that in 2014, 1.12 Bcf of natural gas was lost during drilling, completion, and refracturing (sometimes referred to by the broader term ''workover'') operations on BLM-administered leases.[24] The EPA requires new hydraulically fractured and refractured oil or gas wells to capture or flare gas that otherwise would be released during drilling and completion operations. The BLM final rule also includes provisions to minimize the waste of gas during these operations by

[18] RIA at 4.

[23] RIA at 3.

[24] RIA at 3.

requiring operators to capture, use, flare, or inject the gas. While we do not expect that these provisions will obligate operators to take any additional actions beyond what they must do to comply with the EPA requirements, we believe it is appropriate for the BLM to adopt its own provisions governing operator conduct, to fulfill its independent statutory obligation to minimize waste of oil and gas resources on BLM-administered leases.

4. Royalty Provisions Governing New Competitive Leases

The final rule revises 43 CFR 3103.3–1, which governs royalty rates applicable to onshore oil and gas leases, to make the rule text parallel to the BLM's statutory authority, which specifies that competitively-issued BLM-administered leases ''shall be conditioned upon the payment of a royalty at a rate of *not less than* 12.5 percent in amount or value of the production removed or sold from the lease.'' 30 U.S.C. 226(b)(1)(A). The final version of 43 CFR 3103.3–1 thus makes clear that for competitive leases issued after the effective date of this rule, the BLM has the flexibility to set rates at or above 12.5 percent. This change finalizes this provision as it was proposed, and responds to findings and recommendations in audits from the GAO. The final rule does not, however, set a new rate for competitively-issued leases.

Like the proposed rule, the final rule specifies the fixed, statutory rate of 12.5 percent for all noncompetitive leases issued after the effective date of the rule, as required by statute.[25] In addition, the final rule makes clear that the royalty rate on all existing leases remains the rate prescribed in the lease or in regulations applicable at the time of lease issuance.

5. Unavoidable Versus Avoidable Losses of Gas

Like the proposed rule, the final rule also updates the pre-existing royalty provisions in NTL–4A to more clearly and specifically define when a loss of gas is considered ''unavoidable'' and royalty-free, and when it is considered ''avoidable'' and subject to royalties. A loss of gas is deemed unavoidable when an operator has complied with all applicable requirements and taken prudent and reasonable steps to avoid waste, and the gas is lost from one of the operations or sources specified in this final regulation, subject to certain limitations. The specified operations and sources include emergencies; well drilling, completions, and tests; normal operations of pneumatic devices and storage vessels; liquids unloading; leaks; equipment or pipeline maintenance requiring depressurization; and residual gas after stripping of natural gas liquids. A loss of gas is also deemed unavoidable when gas is flared from a well that is not connected to a gas pipeline, provided the BLM has not otherwise determined that the loss of gas is avoidable. All other losses of gas, as well as any gas flared in violation of the capture requirement (regardless of whether the well is connected to a pipeline), are deemed avoidable and subject to royalties. By establishing clear-cut categories for unavoidable and avoidable losses, the final rule will dramatically reduce the large number of requests for approval to flare royalty-free that operators have had to file and the BLM has had to process each year.

6. Interaction With EPA and State Regulations

Like the proposed rule, this final rule seeks to minimize regulatory overlap. Thus, if EPA and/or States or tribes have adopted requirements that are at least as effective as and would potentially overlap with the provisions of this rule, the final rule provides a means for operators to comply with the EPA, State, local or tribal requirements in lieu of the BLM requirements. Specifically, in cases in which EPA rules limit venting from equipment or require leak inspections and repairs, those operators that are in compliance with those EPA requirements are deemed, under this rule, to be in compliance with the comparable BLM requirements. With respect to State, local, or tribal rules, the final rule allows a State or tribe to request a variance from a particular BLM regulation. If the variance is granted, the BLM has the authority to enforce the specific provisions of the State, local, or tribal rule for which the variance was granted, in lieu of the comparable provisions of the BLM rule. As clarified in the final rule, the BLM may grant a State or tribal variance request only if the BLM determines that the State, local, or tribal rule would perform at least as well as the BLM provision to which the variance would apply, in terms of reducing waste of oil and gas, reducing environmental impacts from venting and/or flaring of gas, and ensuring the safe and responsible production of oil and gas.

7. Other Provisions

Like the proposed rule, the final rule includes provisions that update and clarify pre-existing BLM requirements regarding when operators may use oil or gas from a lease for production activities without owing royalties on the oil or gas used. In addition, like the proposed rule, the final rule includes provisions specifying when operators must measure the volumes of gas vented or flared, and requiring operators to report to ONRR volumes of gas vented or flared.

8. Summary of Costs and Benefits

Overall, the BLM estimates that the benefits of this rule would outweigh its costs by a significant margin. Under certain assumptions, for example, the rule is expected to produce net benefits ranging from $46 million to $199 million per year (annualizing capital costs using a 7 percent discount rate) or from $50 million to $204 million per year (annualizing capital costs using a 3 percent discount rate).[26]

a. Costs

The BLM estimates that this rule will pose costs ranging from $114–$279 million per year (using a 7 percent discount rate to annualize capital costs) or $110–$275 million per year (using a 3 percent discount rate to annualize capital costs) over the next 10 years.[27] These costs include engineering compliance costs and the social cost of minor additions of carbon dioxide to the atmosphere, resulting from the on-site or downstream use of gas that is newly captured as a result of this rule.[28] The engineering compliance costs presented do not include potential cost savings from the recovery and sale of natural gas (those savings are shown in the summary of benefits).

In some areas, operators have already undertaken, or plan to undertake, voluntary actions to address gas losses. To the extent that operators are already in compliance with the requirements of this final rule, the above estimates overstate the likely impacts of the rule.

We expect that cost impacts on individual operators would be small, even for businesses with less than 500 employees. In the Regulatory Impact Analysis (RIA), we estimate that average costs for a representative small operator would increase by about $55,200, which would result in an average reduction in

[25] 30 U.S.C. 226(c)(1).

[26] BLM, Economic Impact and Regulatory Threshold Analysis for 43 CFR 3178 (Royalty Free Use of Production) and 43 CFR 3179 (Venting and Flaring Requirements) (2015) (hereinafter RIA) at 6.

[27] RIA at 4.

[28] Some gas that would have otherwise been vented would now be combusted on-site or presumably downstream to generate electricity. As described in the RIA, the estimated value of these carbon additions would not exceed $30,000 in any given year.

profit margin of 0.15percentage points.[29]

b. Benefits

We measure the benefits of the rule as the cost savings that the industry would receive from the recovery and sale of natural gas and the environmental benefits of reducing the amount of methane (a potent GHG) and other air pollutants released into the atmosphere. As with the estimated costs, we expect benefits on an annual basis. The BLM estimates that this rule would result in monetized benefits of $209–$403 million per year (using model averages of the social cost of methane with a 3 percent discount rate).[30] We estimate that the final rule would reduce methane emissions by 175,000–180,000 tpy, roughly a 35% reduction in methane emissions from the 2014 estimates, and which we estimate to be worth $189–$247 million per year (this social benefit is included in the monetized benefit above).[31]

Adoption of the final rule will also have numerous ancillary benefits. These include improved quality of life for nearby residents, who note that flares are noisy and unsightly at night; reduced release of VOCs, including benzene and other hazardous air pollutants; and reduced production of nitrogen oxides (NOx) and particulate matter, which can cause respiratory and heart problems.

c. Net Benefits

Overall, the BLM estimates that the benefits of this rule outweigh its costs by a significant margin. The BLM expects net benefits ranging from $46–$199 million per year (using a 7 percent discount rate to annualize capital costs) or $50–$204 million per year (using a 3 percent discount rate to annualize capital costs). Specifically, assuming a 7 percent discount rate to annualize capital costs, we estimate the following annual net benefits in selected years:

- $99–$115 million in 2018;
- $51–$93 million in 2022; and
- $120–$189 million in 2026.

Assuming a 3 percent discount rate to annualize capital costs, we estimate the annual net benefits would be:

- $103–$119 million in 2018;
- $55–$97 million in 2022; and
- $125–$193 million in 2026.[32]

d. Influence on Production

The final rule has a number of requirements that are expected to influence the production of natural gas, NGLs, and crude oil from onshore Federal and Indian oil and gas leases. We estimate the following incremental changes in production, noting the representative share of the total U.S. production in 2015 for context. We estimate additional natural gas production, ranging from 9–41 Bcf per year (representing 0.03–0.15 percent of the total U.S. production), and a reduction in crude oil production ranging from 0.0–3.2 million bbl per year (representing 0–0.07 percent of the total U.S. production). We also expect 0.8 Bcf of gas to be combusted on-site that would have otherwise been vented. Combined, the rule will reduce venting by about 35 and reduce flaring by 49%, depending on the year.[33]

Since the relative changes in production are expected to be small, we do not expect that the final rule will significantly impact the price, supply, or distribution of energy.

e. Royalties

We estimate that this final rule will produce additional royalties of $3–$10 million per year (discounted at 7 percent) or $3–$14 million per year (discounted at 3 percent).[34]

III. Background

The BLM's onshore oil and gas management program is a major contributor to the nation's oil and gas production. The BLM manages more than 245 million acres of land and 700 million acres of subsurface estate, comprising nearly a third of the nation's mineral estate. Domestic production from over 96,000 Federal onshore oil and gas wells accounts for 11 percent of the Nation's natural gas supply and 5 percent of its oil supply. In FY 2015, the ONRR reported that operators produced 183.4 million bbl of oil, 2.6 Tcf of natural gas, and 3.3 billion gallons of NGLs from onshore Federal and Indian oil and gas leases. The production value of this oil and gas exceeded $20.9 billion and generated over $2.3 billion in royalties.[35]

Over the past decade, the United States has experienced a dramatic increase in oil and natural gas production due to technological advances, such as hydraulic fracturing combined with directional drilling. This boost in production has brought many benefits in the form of expanded and more secure domestic supplies, lower prices, increased economic activity in certain regions of the country, and greater royalty revenues for Federal, State, and tribal governments.

At the same time, the American public has not benefited from the full potential of this increased production, as the increase in oil production has been accompanied by significant and growing quantities of wasted natural gas. Between 2009 and 2015, operators on BLM-administered leases wasted enough natural gas to serve over 6.2 million homes for 1 year, according to data reported to ONRR.[36]

A. Impacts of Waste and Loss of Gas

As explained in the proposed rule preamble section IV.B, natural gas is a limited and valuable public resource, which is critical to U.S. energy security and national security. Natural gas also provides significant economic benefits as an energy source for electricity generation and industrial and residential use, and as a feedstock for manufacturing. Royalty payments on natural gas sales provide Federal, State, and tribal governments with over $3 billion in revenues each year.

Venting, flaring, and leaks of natural gas from production on BLM-administered sites waste this limited natural resource and deprive the American public and tribes of the security and economic benefits that this resource, which belongs to the public and tribes, would otherwise provide. In addition to the economic and security losses, the waste of natural gas also imposes public health and environmental costs, in the form of air pollution, such as smog and regional haze; emissions of hazardous air pollutants, some of which are carcinogenic; and emissions of methane, a powerful contributor to global warming and a primary target for reduction under the President's Climate Action Plan.[37] Absent stronger provisions to reduce natural gas waste on Federal lands, the avoidable loss of gas will continue to threaten climate

stability and undermine respiratory and cardiovascular health.

B. Purpose of the Rule

1. Overview

The purpose of this rule is to reduce waste of natural gas owned by the American public and tribes, which occurs during the oil and gas production process. While the BLM already regulates venting and flaring of natural gas during oil and gas production on Federal and Indian (other than Osage Tribe) leases, the current requirements are over 30 years old and do not reflect modern technologies, practices, and understanding of the harms caused by venting, flaring, and leaks of gas. Oversight reviews have also suggested that the current requirements are insufficiently clear in their directives, which complicates implementation for BLM staff and creates uncertainty for oil and gas operators. Today's rule updates the existing provisions to direct operators to take reasonable and common-sense measures to prohibit routine venting, minimize the quantities of natural gas routinely flared, reduce natural gas losses through leaks, and deploy up-to-date technology to reduce routine losses from production equipment.

2. Issues Addressed by Rule

a. Large Quantities of Natural Gas Are Wasted on Federal and Indian Leases

As explained in the proposed rule preamble section IV.H.1, while there is some uncertainty regarding the total volume of natural gas lost during production on public and tribal lands, the volume is unacceptably high.

There is no single definitive source for the total volume of natural gas losses from oil and gas production on Federal Lands. BLM efforts to estimate the total volume are informed by the Oil and Gas Operations Report Part B (OGOR–B) filed with the ONRR, the EPA Greenhouse Gas Inventory,[38] data from the EPA Greenhouse Gas Reporting Program,[39] and numerous studies discussed in the preamble to the proposed rule and provided by commenters. Each data set, however, has limitations. The ONRR data rely on self-reporting, and there is substantial variation in the types of losses that different operators report (and certain types of losses, such as most leaks, are not reported at all). The EPA data are based on emissions factors that are representative rather than actual.[40] Even though data in these programs have recently been updated, they are still incomplete, and recent studies suggest actual emissions may be somewhat, or even substantially, higher than the emissions factors suggest.[41] Thus, we believe that the estimates of losses used to support today's rule, while substantial, are conservative. For purposes of this final rule, ONRR provided the BLM with data evidencing 7 years of vented and flared volumes reported on the OGOR-Bs. The data analyzed included gas flared and vented from both oil and gas wells from 2009 through 2015. During this period, operators reported that they vented or flared a total of 462 Bcf of natural gas, or about 2.7 percent of the 16.8 Tcf of natural gas that was produced from BLM-administered leases from 2009 through 2015.[42] This is enough natural gas to supply over 6.2 million households—or every household in the States of Colorado, Montana, New Mexico, North Dakota, South Dakota, Utah, and Wyoming—for 1 year.[43]

These data are reported by operators on BLM-administered leases, but the production is actually derived from lands with various ownership patterns. Of the vented and flared gas reported to ONRR, 15 percent came from wells extracting only Federal minerals; 8.8 percent came from wells extracting only Indian minerals, and 76.2 percent from wells extracting minerals with mixed ownership (some combination of Federal, Indian, fee (private) and State minerals).

Finally, the BLM notes that available data suggest the problem of natural gas loss on BLM-administered leases is growing. The total amounts of annual reported flaring from Federal and Indian leases increased by over 1000 percent from 2009 through 2015.[44] During this period, reported volumes of flared oil-well gas increased by 318 percent, while reported volumes of flared gas-well gas decreased by 86 percent.[45] The reduction in flaring at gas wells coincides with the adoption of EPA 40 CFR part 60 subpart OOOO (''subpart OOOO'') air pollution requirements, which limit emissions from gas wells hydraulically fractured after August 23, 2011.[46]

Another indicator of the increase of flaring on Federal and Indian lands is the increased number of applications to vent or flare royalty-free that the BLM has received from operators. In 2005, the BLM received just 50 applications to vent or flare gas. In 2011, the BLM received 622 applications, and this doubled again within 3 years to 1,248 applications in 2014. BLM field offices indicate that most of the additional applications were for flaring of associated gas from oil wells in New Mexico, Montana, the Dakotas, and, to a lesser extent, Wyoming.

b. Recent Studies of Venting and Leaks

The proposed rule preamble section IV.H.2 discussed recent efforts to improve our understanding of the quantities of natural gas lost through venting and leaks during the production process, and it highlighted a number of recent studies. These include both ''bottom up'' studies, which attempt to improve the accuracy and understanding of current estimates by conducting site-specific intensive measurements of losses during the production process, and ''top down'' studies, which use aircraft and tracers to quantify atmospheric methane levels and attribute them to oil and gas production activities. Several of these recent studies by government, industry, and environmental organizations suggest that emission levels are higher than those estimated using the DOI and EPA data, and in particular, some studies highlighted emissions levels two to three times higher than those based on EPA data. They also provided information on the distribution of gas leaks, which are heavily concentrated at ''super-emitter'' facilities, and highlighted the challenges in predicting which sites will experience super-emitter conditions. Commenters on the proposed rule pointed to additional studies, some issued after the proposal, that further demonstrate significant gas loss, the potential to reduce such waste through various technologies and practices, and the need for widespread leak detection and repair.

[46] 79 FR 49490 (Aug.16, 2012).

Commenters pointed to both bottom up and top down studies that suggest BLM's estimate of natural gas waste is conservative. For example, EPA's 2016 GHG Inventory was released in April 2016 (after BLM issued its proposed rule), and provides estimates of methane loss from the oil and gas sector that are significantly greater than previous estimates.[47] EPA updated its method for estimating emissions using the latest peer-reviewed science published over the last several years. The data also revealed that emissions had grown by more than 10 percent between 2010 and 2014.

Commenters also referenced a 2013 top-down study led by the National Oceanic and Atmospheric Administration (NOAA) that estimated emissions from an oil and natural gas production field in Uintah County, Utah, using atmospheric measurements in a mass balance approach. The measurements, published in Geophysical Research Letters, suggested an emission rate between 6.2 and 11.7 percent of production, allowing for uncertainties in gas composition and gas production.[48] This is significantly higher than estimates from bottom up inventories, such as the 1.4 percent of production assumed in the 2012 EPA Greenhouse Gas Inventory, and further suggests that natural gas waste is likely underestimated in commonly cited inventories.

In meetings pursuant to E.O. 12866, stakeholders referenced a new study published in *Nature* on October 5, 2016, entitled ''Upward revision of global fossil fuel methane emissions based on isotope database.'' [49] The research was conducted by scientists from NOAA and the Cooperative Institute for Research in Environmental Sciences at the University of Colorado, Boulder. The study relied on the largest isotopic methane source signature database ever assembled to estimate total global methane emissions and identify the sources of emissions. It finds that methane emissions from fossil fuel production are 20% to 60% greater than previous estimates, and that they represent 20% to 25% of global methane emissions. The study also highlights that methane emissions by microbial sources (*e.g.,* cows, agriculture, landfills, and wetlands) are responsible for 58% to 67% of total methane emissions each year, and that these sources drove most of the global increase in methane emissions observed between 2007 and 2013. Thus, the study affirms the potential for methane mitigation from fossil fuel production, while indicating that significant further reductions may be available from expanding mitigation efforts to other sectors as well.

There have also been recent and ongoing studies of so-called ''super-emitters,'' which account for a disproportionate quantity of the losses. One of these is a study by Zavala et al., published on July 7, 2015, in *Environmental Science and Technology.* The study used data collected from gas wells in the Barnett Shale region in Texas to identify unusually high emitters—that is, emissions outliers—by focusing on a site's absolute methane emissions divided by production rate. The study referred to this metric as the proportional loss rate, and demonstrated that sites with ''high proportional loss rates have excess emissions resulting from abnormal or otherwise avoidable operating conditions such as improperly functioning equipment.'' The study then concluded that these sources' ''reduction potential''—that is, their ability to reduce their losses—is likely greater than that suggested by emission-factor based estimates. The study also found that the losses and abnormal operating conditions that characterize these super-emitters are not specific to a given set or type of sources, but can and do occur at different sources over time.[50]

In 2015, a team of scientists at Colorado State University published studies based on direct measurements of emissions from 114 gathering facilities at sixteen different processing plants. The study found that 30 percent of facilities were responsible for approximately 80 percent of the venting. Substantial venting occurred at liquid storage tanks at approximately 20 percent of the facilities where emission rates were four times the average rate. Moreover, the high emitting facilities were generally capable of immediate emission reductions through operating adjustments, such as adjusting the operating pressure of the separation equipment.[51]

In 2012, the City of Fort Worth, Texas, sponsored a study of 375 oil and gas production facilities. It found that thief hatches were the largest source, and pneumatic controllers were the most frequent source, of fugitive emissions at well pads and compressor stations. These leaks were often due to operator error or inadequate maintenance.[52]

Commenters also pointed to the largely random nature of significant leaks. A recent study, authored by Lyon et al., used optical gas imaging to survey 8,220 oil and gas well pads through aerial surveys. The study found only a small correlation between the probability of detection of a leak and site characteristics, such as well count, well age, gas production, oil production, and water production. The stochastic and diverse nature of the sites with leaks, along with the level of waste observed, provides further support for broadly applicable leak detection and repair programs.[53]

Both the Zavala and Lyon studies observed that leak rates are not strongly correlated with well production rates—that is, higher and lower producing wells can both have significant levels of natural gas waste. Specifically, the Zavala study found small producing sites (10–100 Mcf/day) were twice as likely as those sites an order of magnitude larger (100–1,000 Mcf/day) to be among the 5% of sites with the

highest emissions. The Lyon study found that well pad characteristics, such as oil production levels, could only collectively explain about 14% of the variation in observed emissions. While a statistically significant correlation between size and leaks is observed, both studies note that it is a weak linear correlation and that leak occurrence is largely stochastic. The Lyon study found that over 15 percent of the high-emitting sites detected in its survey were low production sites, producing 15 barrel of oil equivalent (BOE) per day or less.[54]

Another recent study by the Colorado Air Pollution Control Division surveyed oil and gas wells over two years using optical gas imaging. The research revealed a significant number of leaks, but also highlighted that it is possible to achieve immediate reduction or minimization of waste from production facilities with timely identification and repair of leaks. The survey spanned from July 2013 through June of 2015 and covered over 4,400 facilities. The optical gas imaging technology identified gas lost through leaks or vents at more than 25 percent of the facilities, with the majority of these leaks or vents occurring at storage tanks.[55]

c. Existing BLM Regulations Need To Be Updated

As discussed in detail in the proposed rule preamble at section IV.E, venting, flaring, and royalty-free uses of oil and natural gas on BLM-administered leases are currently governed by NTL–4A. This ''Notice to Lessees'' was issued by the U.S. Geological Survey on December 27, 1979, before the BLM assumed oversight responsibility for onshore oil and gas development and production. NTL–4A places limitations on venting or flaring of gas-well or oil-well gas, unless approved in writing by BLM. NTL–4A also specifies the circumstances under which an operator owes royalties on oil or gas that is lost from a lease.

In the past 37 years since NTL–4A was issued, oil and gas production technologies and practices have advanced considerably, particularly with the development of modern hydraulic fracturing techniques and directional drilling. Technologies for capturing and using gas on-site, detecting leaks, powering equipment, controlling vapors from storage vessels, removing liquids from gas wells, and many other aspects of the production process have also advanced. Not surprisingly, NTL–4A neither reflects today's best practices and advanced technologies, nor is particularly effective in minimizing waste of public minerals, as the previously described data and studies show. In addition, as discussed in the preamble to the proposed rule, ambiguities have arisen regarding how NTL–4A is interpreted and implemented by various BLM offices and industry entities. There is a compelling need to update these requirements to make them clearer, more effective, and reflective of modern technologies and practices.

d. Concerns Identified Through Oversight

External oversight reviews strongly support the BLM's conclusion that the current NTL–4A requirements need to be updated, and many of the changes made in this rule implement recommendations from relevant oversight reviews. As discussed in the proposed rule, key oversight reviews that influenced the development of this rule include: (1) A December 2007 Royalty Policy Committee (RPC) report, *Mineral Revenue Collection from Federal and Indian Lands and the Outer Continental Shelf,* which recommended that the BLM update its rules and identified many specific actions to improve production accountability; (2) a March 2010 report by the OIG, *BLM and MMS Beneficial Use Deductions,* which recommended that the BLM clarify its requirements for royalty-free use of natural gas; and (3) an October 2010 GAO report, *Federal Oil and Gas Leases—Opportunities Exist to Capture Vented and Flared Gas, Which Would Increase Royalty Payments and Reduce Greenhouse Gases,* which recommended that the BLM update its regulations to take advantage of opportunities to capture economically recoverable natural gas using available technologies.

In July 2016, the GAO issued another report relevant to this rule. The 2016 report entitled, ''*OIL AND GAS—Interior Could Do More to Account for and Manage Natural Gas Emissions,*'' reviewed the DOI's provisions to account for and manage natural gas emissions. The GAO found that DOI agencies, including the BLM and ONRR, have historically focused on determining the volume of natural gas production and accounting for the percent of that volume that is royalty-bearing, but have not focused enough on providing operators clear guidance on how to determine, account for, and report the volumes of natural gas that are *not* royalty bearing. The GAO suggested that lack of specific guidance in these areas has resulted in substantial variation in how operators obtain and report the data, and may result in inaccuracy in the DOI's data on natural gas emissions. The GAO recommended that the BLM provide operators with specific instructions regarding how to estimate natural gas emissions, which the GAO suggests would improve emissions data and better ensure that, when appropriate, royalties are collected on these lost quantities of natural gas. The GAO also addressed recommendations to the ONRR that are closely related to provisions of this rule. For example, the GAO recommended that the ONRR provide additional guidance on how to report royalty-free and royalty-bearing flaring, and how to report unreported or underreported emissions from sources such as tanks. Some of the changes made in today's rule will help clarify the regulatory requirements that relate to some of these reporting concerns.

3. Relationship to Other Federal, State, and Industry Activities

Understanding that other Federal, State and tribal rules also apply to aspects of onshore oil and gas production, the BLM has aimed to ensure that this rule will complement other regulatory requirements. As noted earlier, for example, the EPA issued rules in 2012 and May of 2016 to control emissions of methane and VOCs from new, modified and reconstructed oil and gas wells and production equipment, and many States and tribes also regulate aspects of the production process to address safety, waste, production accountability, and/or air quality concerns.

In updating the BLM regulations, the BLM carefully considered and accounted for these potentially overlapping regimes. Thus, to the maximum extent possible, today's rule aligns its requirements with similar requirements adopted by the EPA or the States, exempts equipment and processes covered by EPA requirements, and authorizes the BLM to grant variances from particular rule provisions if a petitioner State or tribe can show that a State, local, or tribal requirement is at least as effective as the corresponding provision of this rule. The BLM is also committed to working with the EPA to ensure that any future EPA regulations align to the extent possible with the BLM requirements. To

[55] Colorado Department of Public Health and Environment Air Pollution Control Division Colorado Optical Gas Imaging Infrared Camera Pilot Project: Final Assessment July 11, 2016 Author: Tim Taylor

the extent that additional State or tribal regulations are adopted in the future, the State and tribal variance provisions in section 3179.401 provide a mechanism for the BLM to approve compliance with those regulations in lieu of the BLM regulations, where the State or tribal regulations meet the criteria for a variance.

As noted earlier, even though EPA, State, and tribal requirements address some gas waste, there is still a clear need for this rule. For one thing, the BLM has independent legal and proprietary responsibilities to prevent waste in the production of Federal and tribal minerals, as well as to ensure the safe, responsible, and environmentally protective use of BLM-managed lands and resources. This rule will update the BLM's decades-old venting and flaring requirements, and represents an important element of BLM's larger effort to ensure that its oil and gas regulations are effective, transparent, and easy to understand and administer, and that the provisions of those regulations adequately account for significant recent technological advances in the industry.

The BLM also notes that this regulation covers a range of sources and activities that are not adequately addressed by existing BLM, State, or tribal regulations. Further, EPA regulations cover only new, modified, and reconstructed sources, not the many existing and unmodified sources on BLM-administered leases. EPA regulations also do not address flaring or activities such as liquids unloading. Finally, State and tribal regulations are effective only within the jurisdiction of the relevant State or tribe, and State and tribal regulations do not consistently address all the sources of waste BLM seeks to prevent via this rule. Indeed, no State or tribe has requirements covering all the sources of waste addressed by this rule.

In the proposed rule preamble section IV.I.2., the BLM also discussed the commendable efforts that some oil and gas operators have made to reduce waste of gas through venting, flaring, and leaks. While steps in the right direction, these voluntary efforts are insufficient by themselves, given the large and growing volumes of waste. Moreover, for the one specific activity area for which industry has identified a reduction in gas losses over the past few years—well completions at hydraulically fractured gas wells—the decreases appear to be largely driven by the adoption of the EPA subpart OOOO requirements for green completions at those wells.

The following sections provide a brief overview of EPA and State regulations that are particularly relevant to this rulemaking.

a. EPA Regulations

The EPA regulates air pollution from oil and gas production, and since measures to reduce emissions tend to limit releases of natural gas, the EPA's air pollution regulations to reduce emissions from the oil and gas sector have the co-benefit of reducing waste of natural gas and increasing gas capture. BLM very carefully coordinated the waste prevention requirements under today's rule with EPA requirements applicable to some of the same sources, to minimize compliance burdens for operators and to avoid unnecessary duplication.

As explained in section IV.I.3 of the proposed rule preamble, the EPA adopted new source performance standards (NSPS) in 2012 (subpart OOOO) that require new, modified, or reconstructed sources to limit the release of VOCs by requiring that operators use "green completions" at hydraulically fractured natural gas wells.[56] The EPA's NSPS also imposed requirements at gas processing plants and boosting stations.[57]

On September 18, 2015, EPA proposed NSPS standards that would update the 2012 standards to limit methane in addition to VOCs, as described in the BLM proposed rule, to be codified in proposed 40 CFR part 60 subpart OOOOa.[58] This rule also proposed to limit methane and VOC emissions from additional sources not covered under the 2012 subpart OOOO rule. EPA finalized 40 CFR part 60 subpart OOOOa on May 12, 2016, after receiving over 900,000 public comments and holding three public hearings, and the rule went into effect in August 2016. As with the subpart OOOO standards, subpart OOOOa applies only to new, modified, or reconstructed sources, and not to existing equipment and operations. The final OOOOa rule regulates greenhouse gases through limits on methane emissions that owners and operators can meet using readily available and cost-effective technologies.[59] It also requires leak detection and repair at new, modified, and reconstructed sources, and it covers additional new, modified, and reconstructed equipment and activity in the oil and gas production sector not addressed in the subpart OOOO standards, such as hydraulically fractured oil well completions, pneumatic pumps, and fugitive emissions from well sites and compressor stations. The final 40 CFR subpart OOOOa rule includes several changes from the EPA's proposed rule that are particularly noteworthy with respect to the BLM's rulemaking, including: (1) It establishes a fixed semi-annual schedule for monitoring leaks from well sites; (2) it does not adopt a proposed exemption from the LDAR requirements for low-production wells; and (3) it does not adopt proposed requirements to limit emissions from pneumatic piston pumps.

On May 12, 2016, EPA also announced the availability of Control Technique Guidelines (CTGs) to help States reduce VOC emissions from *existing* sources in certain ozone nonattainment areas. Although reducing methane emissions is not the purpose of CTGs, control of VOC emissions also results in co-control of methane emissions. These CTGs identify many of the same types of measures required by the OOOOa standards, but the guidelines are not legally binding. Rather, the CTGs are a set of recommendations that State and local air pollution control agencies must consider when evaluating what they will identify as Reasonably Available Control Technology (RACT) for existing sources covered under State ozone nonattainment plans to implement Clean Air Act requirements, known as State Implementation Plans (SIPs). States are only required to include RACT measures in their SIPs for ozone nonattainment areas whose air quality levels violate the Clean Air Act air quality standard for ozone and are classified as moderate nonattainment or higher.[60] In October of 2015, EPA revised the health-based ambient air quality standard for ozone pollution to 70 parts per billion. The changes to SIPs required to address that pollution would be due to EPA within two years after the ozone classifications are published in the **Federal Register**, which is projected to be no later than Jan. 21, 2021.[61] It appears that few, if any, areas with significant Federal or Indian oil and gas production are likely to be classified as moderate nonattainment or above for the most recent ozone standard. Moreover, even if some areas with

[56] 79 FR 49490, August 16, 2012.

[57] Subpart OOOO imposed emission standards for pneumatic controllers, centrifugal compressors and storage vessels, and required work practices for reciprocating compressors and equipment leaks at gas processing plants. Subpart OOOO also imposed a sulfur dioxide emission standard for sweetening units at gas processing plants.

[60] *I.e.,* nonattainment areas designated "moderate" or above.

[61] These are the attainment dates for areas designated as moderate nonattainment or above.

significant Federal or Indian oil and gas production are identified as having ozone pollution problems, the changes to SIPs required to address that pollution would not likely be due to EPA for a number of years.

The EPA has also taken the first steps to gather information to promulgate regulations that would require subsequent State regulation of existing sources under Clean Air Act (CAA) section 111(d). When the EPA establishes NSPS for new sources in a particular source category, as it did for the oil and gas sector in its OOOOa regulations promulgated in May 2016, the EPA is also required, under CAA section 111(d)(1), to prescribe regulations for States to submit plans establishing emissions performance standards for existing sources in that source category. Acting under this CAA mandate, in March of 2016 the EPA announced its intention to regulate existing oil and gas sources for methane and VOC emissions.[62] To begin this process, the EPA issued a draft information collection request (ICR) on May 12, 2016, and a second draft ICR on September 23, 2016.[63] Once the ICR is approved by the Office of Management and Budget, the ICR is expected to gather a broad range of information on the oil and gas industry regarding emission control efficacy, costs, and timing requirements.[64] The EPA then expects to use this information in developing regulations to guide State plans to reduce emissions from existing sources. This rulemaking would then be followed by State development and adoption of State plans containing enforceable performance standards for sources, State plan approvals by EPA, and subsequent implementation by industry to meet compliance deadlines established in the State plans. Given the length of this process and the uncertainty regarding the final outcomes, and in light of the BLM's independent statutory mandate to prevent waste from Federal and Indian oil and gas leases based on information currently available, the BLM has determined that it is necessary and prudent to update and finalize this regulation at this time.

b. State Regulations

In developing this rule, the BLM consulted with State regulators and reviewed analogous State requirements related to waste of oil and gas resources. Specifically, the BLM reviewed requirements from Alaska, California, Colorado, Montana, North Dakota, Ohio, Pennsylvania, Utah, and Wyoming. Most of these State requirements were discussed in the preamble to the proposed rule, which also explained that these State requirements, and the outcomes they produce, vary widely.[65] As noted in the preamble to the proposed rule, of the States with extensive oil and gas operations on BLM-administered leases, only one has comprehensive requirements to reduce flaring, and only one has comprehensive statewide requirements to control losses from venting and leaks.[66] Furthermore, State regulations do not apply to BLM-administered leases on Indian lands, and States do not have a statutory mandate or trust responsibility to reduce the waste of Federal and Indian oil and gas. Finally, because State laws and regulations are subject to change, BLM reliance on State standards risks additional waste of public resources and adverse environmental impacts to Federal and Indian lands should the State standards change to allow for additional waste and environmental impacts. There is therefore a need for uniform, modern waste reduction standards for oil and gas operations on public and Indian lands across the country. Nonetheless, the BLM did look to some of the most effective State approaches as models. In particular, we have drawn on approaches that Colorado, Wyoming and North Dakota adopted to address rising rates of flaring, waste of minerals, and pollution impacts in those states.

The BLM also notes that at least two States have recently expressed an intent to further reduce methane emissions through regulatory action. On February 1, 2016, California's Air Resources Board proposed new rules to reduce emissions of methane through venting and leaks during oil and gas production, processing, and storage.[67] These proposed rules would require the use of vapor collection systems and the control of vapors with 95 percent efficiency. The rules would limit the use of combustion; however, if a combustion control device must be used, the rules would require the use of a low-emissions incinerator. In January 2016, the Pennsylvania Department of Environmental Protection also announced that it would pursue an enhanced strategy for reducing methane emissions.[68] Importantly, though, neither of these proposed regimes nor any existing State regimes cover the full suite of oil and gas activities addressed by this rule.

C. Legal Authority

Pursuant to a delegation of Secretarial authority, the BLM is authorized to regulate oil and gas activities on Federal and Indian lands under a variety of statutes, including the MLA, the MLAAL, FOGRMA, FLPMA, the IMLA, the IMDA, and the Act of March 3, 1909.[69] These statutes authorize the Secretary of the Interior to promulgate such rules and regulations as may be necessary to carry out the statutes' various purposes.[70]

The MLA rests on the fundamental principle that the public should benefit from mineral production on public lands.[71] A primary instrument for public benefit is the requirement that a lessee return a portion of the proceeds from production to the public through the payment of royalties to Federal, State, and/or tribal governments. For competitively issued leases, the MLA requires the payment of a royalty ''at a rate *not less than* 12.5 percent in amount or value of the production removed or sold from the lease''; for non-competitive leases, the MLA sets the royalty ''at a rate of 12.5 percent in amount or value of the production

[71] *See, e.g., California Co.* v. *Udall,* 296 F.2d 384, 388 (D.C. Cir. 1961) (noting that the MLA was ''intended to promote wise development of . . . natural resources and to obtain for the public a reasonable financial return on assets that 'belong' to the public'').

removed or sold from the lease.'' [72] The BLM is responsible for specifying royalty rates and determining the quantity of produced oil and gas that is subject to royalties under the terms and conditions of a Federal lease.

Another important means of ensuring that the public benefits from mineral production on public lands is minimizing and deterring the waste of oil and gas produced from the Federal mineral estate. To this end, the MLA requires oil and gas lessees to ''use all reasonable precautions to prevent waste of oil or gas developed in the land, . . .'' [73] The MLA requires lessees to exercise ''reasonable diligence, skill, and care'' in their operations and also requires oil and gas lessees to observe ''such rules . . . for the prevention of undue waste as may be prescribed by [the] Secretary.'' [74] Lessees are not only responsible for taking measures to prevent waste, but also responsible for making royalty payments on wasted oil and gas when waste does occur. In FOGRMA, Congress expressly made lessees ''liable for royalty payments on oil or gas lost or wasted from a lease site when such loss or waste is due to negligence on the part of the operator of the lease, or due to the failure to comply with any rule or regulation, order or citation issued under [FOGRMA] or any mineral leasing law.'' [75]

In addition to ensuring that the public benefits from oil and gas production from public lands, the BLM is also tasked with regulating the physical impacts of oil and gas development on public lands. The MLA directs the Secretary to ''regulate all surface-disturbing activities conducted pursuant to any lease'' and to ''determine reclamation and other actions as required in the interest of conservation of surface resources.'' [76] The MLA requires oil and gas leases to include provisions ''for the protection of the interests of the United States . . . and for the safeguarding of the public welfare,'' which includes lease terms for the prevention of environmental harm.[77] The Secretary may suspend lease operations ''in the interest of conservation of natural resources,'' a phrase that encompasses not just conservation of mineral deposits, but also preventing environmental harm.[78] The Secretary also may refuse to lease lands in order to protect the public's interest in other natural resources and the environment.[79] BLM's regulations governing oil and gas operations on the public lands have always required operators to avoid damaging other natural resources or environmental quality.[80]

The MLA additionally requires oil and gas leases to contain ''a provision that such rules for the safety and welfare of the miners . . . as may be prescribed by the Secretary shall be observed . . . .'' [81] This rule helps to ensure safety of workers engaged in the production of oil and gas on Federal and Indian lands by requiring, except in special circumstances, the combustion of natural gas loosed from wells and equipment during production.

FLPMA further authorizes BLM to ''regulate'' the ''use, occupancy, and development'' of the public lands via ''published rules.'' [82] FLPMA also mandates that the Secretary, ''[i]n managing the public lands . . . shall, by regulation or otherwise, take any action necessary to prevent unnecessary or undue degradation of the lands.'' [83] And FLPMA authorizes BLM to ''promulgate rules and regulations to carry out the purposes of this Act and of other laws applicable to the public lands.'' [84] FLPMA expressly declares that the BLM should balance the need for domestic sources of minerals against the need to ''protect the quality of scientific, scenic, historical, ecological, environmental, air and atmospheric, water resources, and archeological values; . . . [and] provide for outdoor recreation and human occupancy and use.'' [85]

FLPMA requires the BLM to manage public lands under principles of multiple use and sustained yield.[86] The statutory definition of ''multiple use'' explicitly includes the consideration of environmental resources. Multiple use is a ''combination of balanced and diverse resource uses that takes into account the long-term needs of future generations for renewable and nonrenewable resources . . . .'' [87] Multiple use also requires resources to be managed in a ''harmonious and coordinated'' manner ''without permanent impairment to the productivity of the land and the quality of the environment.'' [88] Significantly, FLPMA admonishes the Secretary to consider ''the relative values of the resources and not necessarily . . . the combination of uses that will give the greatest economic return or the greatest unit output.'' [89]

Finally, the promulgation of this rule helps to meet the Secretary's statutory trust responsibilities with respect to the development of Indian oil and gas interests. The Secretary's management and regulation of Indian mineral interests carries with it the duty to act as a trustee for benefit of the Indian mineral owners.[90] The Congress has directed the Secretary to ''aggressively carry out [her] trust responsibility in the administration of Indian oil and gas.'' [91] In furtherance of her trust obligations, the Secretary has delegated regulatory authority for administering operations on Indian oil and gas leases to the BLM,[92] which has developed specialized expertise through regulating the production of oil and gas from public lands administered by the Department. In choosing from among reasonable regulatory alternatives for Indian mineral development, the BLM is obligated to adopt the alternative that is in the best interest of the tribe and individual Indian mineral owners.[93] What is in the best interest of the tribe and individual Indian mineral owners is determined by a consideration of all relevant factors, including economic considerations as well as potential environmental and social effects.[94] The BLM believes that this rule is in the best interest of Indian mineral owners because it will prevent unnecessary and excessive losses (''waste'') of natural gas from Indian lands. In so doing, this rule will help ensure that the extraction of natural gas from Indian lands results in the payment of royalties to Indian mineral owners, rather than the waste of

[72] 30 U.S.C. 226(b)(1)(A) (emphasis added); 30 U.S.C. 226(c)(1); *see also* 30 U.S.C. 352 (applying that requirement to leases on acquired land). The same royalty provision is included in the lease instruments for leases of Indian tribal and allotted lands under applicable regulations, although that rate is set at no less than 16⅔%, absent approval of the Secretary. 25 CFR 211.41, 212.41.

[94] *See* 25 CFR 211.3.

the owners' mineral resources.[95] Additionally, the BLM believes tribal members and individual Indian mineral owners who live near Indian oil and gas development will realize environmental benefits as a result of this rule's reductions in flaring and air pollution from Indian oil and gas development. During public comment hearings, the BLM heard from a number of tribal members who raised concerns about the impacts of vented and leaked gas on their health, highlighting in particular increases in ozone pollution and air toxics. Tribal members also detailed the impacts of living near numerous large flares, noting the resulting noise and light pollution. The BLM believes that this rule will help to reduce some of these impacts on tribal members.

In short, the BLM has the authority to manage public and tribal oil and gas resources to reduce waste and ensure environmentally responsible development. In response to the notice of proposed rulemaking, the BLM received many comments asserting a range of different arguments regarding the BLM's exercise of its legal authority in promulgating this rule. The most salient of these arguments are addressed later in this preamble, but the BLM did not make any changes to this rule based on comments about the BLM's authority.

D. Stakeholder Outreach

In 2014 and again in in 2016, the BLM conducted a series of forums to consult with tribal governments [96] and solicit stakeholder views to inform the BLM's development of the proposed and final rules. In 2014, the BLM held public meetings in Denver, Colorado (March 19, 2014), Albuquerque, New Mexico (May 7, 2014), Dickinson, North Dakota (May 9, 2014), and Washington, DC (May 14, 2014).[97] On each of those days, the BLM held a tribal outreach session in the morning and a public outreach session in the afternoon. In advance of the tribal outreach sessions, the BLM sent letters to over 200 tribal leaders that have previously expressed interest in oil and gas related matters. These letters explained generally the proposed rulemaking, invited the tribal leaders to attend the outreach sessions, provided contact persons for further information, and provided an email address for submitting comments. At the 2014 Denver, Colorado, and Washington, DC sessions, the tribal and public meetings were live streamed to allow for the greatest possible participation by interested parties. The tribal outreach sessions also served as initial consultation with Indian tribes to comply with Executive Order 13175, Consultation and Coordination with Indian Tribal Governments.

As part of our pre-proposal outreach efforts, the BLM accepted informal comments generated as a result of the public/tribal outreach sessions through May 30, 2014. A total of 29 unique comments were received: 12 from the oil and gas industry and trade associations, 6 from NGOs representing 37 organizations, 2 from government officials or elected representatives, and 9 from private citizens. Two hundred and sixty comments from private citizens were part of an email campaign.

After the proposed rule was published on February 8, 2016, we conducted a second series of paired outreach meetings, with a tribal meeting each morning and a public meeting each afternoon. We held these meetings at four locations: Farmington, New Mexico (February 16, 2016), Oklahoma City, Oklahoma (February 18, 2016), Denver, Colorado (March 1, 2016), and Dickinson, North Dakota (March 3, 2016). Again, in advance of the tribal outreach sessions, the BLM sent letters to over 200 tribal leaders that have previously expressed interest in oil and gas related matters. These letters explained generally the proposed rule, invited the tribal leaders to attend the outreach sessions, provided contact persons for further information, and provided an email address for submitting comments. The public outreach sessions included a telephone conference call-in number to allow members of the public who could not attend in person to listen live to the proceedings.

In addition, the BLM conducted outreach to States with extensive oil and gas production on BLM-administered leases. Prior to the proposal, the BLM reviewed State regulations and guidance, and contacted State regulatory bodies that oversee aspects of oil and gas production to discuss their requirements and practices. After issuing the proposal, the BLM conducted seven online meeting sessions with State regulators from Alaska, Colorado, New Mexico, North Dakota, Utah (two meetings), and Wyoming.

In response to the proposed rule and these outreach meetings, the BLM received approximately 330,000 total comment submissions from Federal, State, and local governments and agencies, tribal organizations, industry representatives, non-governmental organizations, individuals, and other stakeholders. Of the approximately 330,000 comment submissions, approximately 1,000 were unique comments, with the remaining comments coming from mass-mailing campaigns from several organizations. The BLM closely reviewed and analyzed the comments we received, and made revisions to the proposed rule based on the information, data, analysis, insights, and viewpoints provided in the comments. The final rule reflects the very extensive input that the BLM gathered from these public meetings, discussions with States and tribes, and the public comment process.

IV. Summary of Final Rule

Like the proposed rule, the final rule focuses on key areas in the oil and gas production process where waste-prevention actions are most effective and least costly. Specifically, we are adopting requirements to reduce waste from the following: Venting or flaring of associated gas from producing oil wells; gas leaks from equipment and facilities located at the well site, as well as from compressors located on the lease; operation of high-bleed pneumatic controllers and certain pneumatic pumps; gas emissions from storage vessels; well maintenance and liquids unloading; and well drilling and completions. Based on the available data regarding methane emissions and the numbers and types of sources of gas losses from Federal and Indian leases, we believe that these aspects of the production process offer the best opportunities for reducing waste.

Like the proposed rule, the final rule requires operators to flare gas rather than vent it, except in specified circumstances, such as emergencies, the routine operation of certain equipment, and when flaring is technically infeasible. The final rule then requires operators to avoid wasteful flaring of gas by capturing for sale or using on-site specified percentages of their adjusted total gas production. Beginning one year from the effective date of the final rule, operators must capture 85 percent of their adjusted total gas production each month, and this gradually increases to 98 percent by 2026. An operator's adjusted total gas production is based on the quantity of high pressure gas produced from the operator's development wells that are in

[95] The remainder of this preamble refers to this analysis as the BLM's determination that, as a result of its trust obligations, it has an obligation or mandate to reduce waste from Indian lands, just as it does to reduce waste from BLM-administered Federal Lands.

[96] In developing this rule, the BLM consulted with tribal stakeholders in compliance with 25 U.S.C. 2107, 512 DM 4, and 512 DM 5.

[97] See the BLM oil and gas program's outreach-events page: *http://www.blm.gov/wo/st/en/prog/energy/public_events_on_oil*.

production, adjusted to exempt a specified volume of gas per well. The exempted or ''flaring allowable'' volume declines over time. Beginning one year from the effective date of the final rule, operators are allowed to exempt 5,400 Mcf gas per well per month, and this quantity gradually declines to 750 Mcf by 2025.

With respect to leaks, the final rule largely follows the proposed rule, except that the required frequency of inspection is set at two times a year, and does not vary according to the number of leaks found. Operators must use optical gas imaging equipment or portable analyzers deployed according to Method 21, and leaks must be repaired and retested within specified time frames. The final rule clarifies the approval process for alternative leak detection devices and for operators' individual alternative leak inspection programs.

Like the proposed rule, the final rule includes requirements to update old and inefficient equipment, and to follow best practices to minimize waste through venting. Thus, operators must replace high-bleed pneumatic controllers and certain pneumatic pumps with less wasteful controllers and pumps, and capture or flare any high volumes of gas that would otherwise be vented from tanks. In addition, the final rule requires operators to capture, flare, use, or reinject gas produced during well drilling and well completions, and it limits the quantities of gas that may be vented royalty-free during well testing.

The final rule continues to address whether and when lost oil or gas is royalty-bearing, based on whether the loss is deemed unavoidable (royalty-free) or avoidable (royalty-bearing). Relative to the proposed rule, and after our evaluation of public comments, the final rule somewhat expands the list of circumstances in which a loss of oil or gas is deemed unavoidable (thereby expanding the circumstances under which the loss of gas is considered royalty-free), and retains the proposed approach that all oil or gas that is not specifically defined as unavoidably lost is deemed to be avoidably lost and subject to royalties. Unavoidable losses include oil or gas lost in emergencies, losses from normal equipment operation when the operator is in compliance with all requirements to update equipment, and gas that is flared from wells not connected to a gas pipeline (unless the operator has not met applicable gas capture requirements). Because the BLM believes that it is reasonable to expect operators to reduce waste in order to comply with the final rule's capture percentage requirements, any quantities of flared gas that cause the operator to violate the applicable capture requirements are deemed avoidable losses and subject to royalties.

In addition, the BLM is finalizing the proposed change to the royalty provisions, to align the provisions with the BLM's statutory authority and allow the BLM to set royalties for competitive leases at or above 12.5 percent. At this time, however, the BLM is not setting the royalty rate above 12.5 percent in this regulation.

Like the proposed rule, the final rule aligns the requirements of this rule to the extent practicable with EPA and State requirements. It also avoids potential regulatory overlap by exempting certain equipment covered by relevant EPA rules, and deeming the operator's compliance with relevant EPA requirements to satisfy the BLM requirements as well.

The final rule also allows a State or tribe to request a variance from particular BLM requirements. If the variance is granted, the BLM has authority to enforce the specific provision(s) of the State, local, or tribal rule for which the variance was granted, instead of the comparable provision(s) of the BLM rule. As clarified in the final rule, the BLM may grant a State or tribal variance request if the BLM determines that the State, local, or tribal rule would perform at least as well as the affected BLM regulatory provision in reducing waste of oil and gas, reducing environmental impacts from venting and or flaring of gas, and ensuring the safe and responsible production of oil and gas.

V. Major Changes From Proposed Rule

Based on information that has become available since the proposed rule, and the extensive material BLM received through public comments, the BLM has made changes and adjustments to the proposed regulatory text. This section of the preamble summarizes the most significant of those changes and addresses some of the key public comments.

This section only addresses a few substantive areas in which the BLM made significant changes from the proposed rule. Section VI discusses significant comments received on other aspects of the rule. The final text of all of the rule provisions, and changes made in light of all public comments, are discussed in Section VII, Section by Section. Finally, additional public comments are addressed in the separate Response to Comments document, which is available to the public on the BLM Web site and is part of the rule-making record.

A. Venting Prohibition and Capture Targets

As discussed in section III.B.2.a of this preamble, routine venting and flaring of gas from oil or gas wells waste significant volumes of natural gas. In 2014, for example, operators vented about 30 Bcf and flared at least 81 Bcf from BLM-administered leases—4.1 percent of the total production from those leases in that year, and sufficient gas to supply nearly 1.5 million households with gas for a year.[98] The final rule aims to reduce this waste using a two-pronged approach: A prohibition on venting, and capture targets to reduce flaring.

1. Venting Prohibition

a. Requirements of Final Rule

First, final rule § 3179.6 prohibits venting from oil and gas wells, except under certain enumerated conditions. The circumstances in which venting is permissible include: When flaring is technically infeasible, such as when the gas is not readily combustible or the volumes are small; when the gas is vented during normal operation of an on-site, gas-activated pneumatic pump or controller; when the gas is vented from a storage vessel, provided that § 3179.203 does not require flaring of the gas; when the gas is vented during downhole well maintenance or liquids unloading, provided those operations are conducted in accordance with § 3179.204 of the final rule; and when gas is vented through a leak, provided that the operator is complying with the rule's LDAR provisions in §§ 3179.301–3179.305. Venting is also permissible during ''emergencies,'' which final rule § 3179.105 defines as situations in which the loss of gas is ''uncontrollable,'' and venting or flaring is ''necessary to avoid risk of an immediate and substantial adverse impact on safety, public health, or the environment.'' In addition, venting is allowed if necessary to allow facility or pipeline non-routine maintenance to be performed. Any venting of gas from oil or gas wells that does not fit within one of the circumstances listed in § 3179.6 is a violation of this rule and could result in enforcement actions. In addition, gas vented in violation of this rule will be deemed ''avoidable'' under final rule § 3179.4, and thus subject to royalties under final rule § 3179.5.

[98] BLM analysis of ONRR OGOR–B data provided for 2009–2015 and EPA GHG Inventory data for 2014.

b. Changes From Proposed Rule and Significant Comments

The final venting prohibition largely tracks proposed section § 3179.6, although the BLM modified a few provisions and added additional express exemptions in response to comments received. First, proposed § 3179.6(a)(3), which exempted gas vented from storage vessels subject to conditions specified in § 3179.203, has been renumbered § 3179.6(b)(4) and reworded for clarity. Second, proposed § 3179.6(a)(4), which exempted gas vented during normal operations of natural gas-activated pneumatic controllers and pumps, has been renumbered § 3179.6(b)(3). Third, the BLM added a provision, final rule § 3179.6(b)(5), to clarify that gas may be vented during downhole well maintenance or liquids unloading activities, provided those activities are performed in compliance with § 3179.204. This change responds to comments noting that while this rule requires operators to use best practices to minimize venting from liquids unloading operations, these operations will still release some quantity of gas, and it is not practical to capture and flare that gas regardless of whether the operator uses plunger lifts, manual purging, or another method to unload liquids. Fourth, in response to comments noting that there are additional losses through venting not listed in the proposed provision, the BLM added § 3179.6(b)(6) to the final rule, to clarify that an operator is not required to flare gas that is lost due to leaks, provided the operator is in full compliance with the leak detection and repair requirements in final rule §§ 3179.301–305. Fifth, the BLM added § 3179.6(b)(7) to the final rule, to respond to commenters' concern that some gas is released when pressurized equipment must be depressurized for maintenance, and their assertion that it is difficult and costly to route such infrequent, low-volume emissions to capture or a flare. This exemption from the venting prohibition is limited to venting associated with non-routine maintenance activities. In justifying their request for an exemption for venting associated with maintenance activities, commenters emphasized that these activities release only small quantities of gas in total because they occur infrequently and each incidence involves a relatively small volume of gas. The BLM is aware, however, that activities such as pigging a gathering line may release a not insignificant volume of gas, and, under some circumstances, operators conduct pigging routinely, such as monthly, weekly, or even several times a day. Under those circumstances, the BLM expects that a prudent operator would configure its operations or deploy capture or flaring equipment so as to avoid routine venting, and the final rule requires operators to avoid such routine venting. Finally, the BLM added § 3179.6(b)(8) to the final rule in response to commenters' observations that it may be necessary to vent gas when applicable laws, regulations, or permit terms prohibit flaring in particular areas or at particular times, such as flaring prohibitions that may be imposed in permafrost areas or during an extreme fire hazard.

2. Capture Targets

a. Requirements of Final Rule

The second prong of the final rule's approach to routine venting and flaring is laid out in final rule §§ 3179.7 and 3179.8, which together target routine flaring of associated gas from ''development'' oil wells.[99] These final rule provisions are based on proposed rule §§ 3179.6(b) and 3179.7, respectively, but the provisions have been renumbered and revised in the final rule in response to numerous comments received during the public comment period. This discussion first describes the approach taken in the final rule, and then, in part b., details how this modified approach responds to comments received.

First, in response to comments, the final rule shifts from numerical limits on per-well flaring volumes (the approach taken in proposed rule § 3179.6(b)) to a more flexible approach modeled in part on existing North Dakota rules. The new approach sets targets for the percent of associated gas from development oil wells that must be captured in a given month, either on a per lease/unit/communitized area basis or averaged over a county or state. The capture targets do not, however, apply to the full volume of gas that an operator flares. Instead, like the proposed rule, the final rule allows operators to flare a specified volume of gas that declines over time. In the final rule, however, this allowed flaring has been recast as a ''flaring allowable'' volume that operators can subtract from their total flaring volume *prior* to calculating their capture percentage. Overall, then, the final rule's approach to flaring has three parts: Capture targets, which increase over time; averaging provisions that allow operators to choose whether to comply with the capture targets one lease/unit/communitized area at a time, or instead on an area-wide average basis; and finally, a flaring allowable volume that declines over time, which operators can subtract from their total flaring prior to assessing their compliance with the capture targets.

The mechanics of implementing this approach are as follows. First, final rule § 3179.7 establishes required capture targets that incrementally increase over the first nine years of rule implementation. The schedule for the capture targets is provided in § 3179.7(b)(1)–(4) and reproduced in Table 1:

TABLE 1

Date range	Required monthly capture target (percent of associated gas captured per month)
1/17/2018 through 12/31/2019	85
1/1/2020 through 12/31/2022 ...	90
1/1/2023 through 12/31/2025 ...	95
Beginning 1/1/2026	98

Section 3179.7(c)(3) of the final rule then provides that, in order to demonstrate compliance with the relevant monthly capture target, operators must choose the ''relevant area'' over which they intend to assess their capture percentage(s). An operator may choose whether to comply with the capture targets on each of the operator's leases, units, or communitized areas (the ''lease-by-lease approach,'' see final rule § 3179.7(c)(3)(i)), or instead to comply on a county-wide or state-wide basis (the ''averaging approach,'' see final rule § 3179.7(c)(3)(ii)). An operator that chooses the lease-by-lease approach must demonstrate that *each* lease, unit, or communitized area is *individually* in compliance with the relevant capture target each month. An operator that chooses the averaging approach must notify the BLM by Sundry Notice of its choice by January 1 of the relevant year, and may then demonstrate monthly compliance with the relevant capture target on an area-wide average basis.

The second step to demonstrating compliance with the capture targets, detailed in final rule § 3179.7(c), is for an operator to determine its total volume of gas produced from development oil wells in the relevant

[99] As defined in final rule § 3179.3, a ''development'' oil or gas well is a well ''drilled to produce oil or gas, respectively, from an established field in which commercial quantities of hydrocarbons have been discovered and are being produced.'' The BLM retains the authority to determine whether the well in question is a development oil or gas well. *Id.*

area, subtract the flaring allowable volume, and then divide the result of that calculation into the total volume of gas that the operator sold or used, to determine the operator's actual capture percentage. The operator must then compare its actual capture percentage to the required gas capture percentage for the applicable period, to determine whether the operator meets or exceeds the required capture target for the given month.

More specifically, the volume of gas that the operator sold or used is the volume of gas that the operator sold over the month from all of the operator's development oil wells in the relevant area plus the volume of gas that the operator used on lease, unit, or communitized area across the relevant area. The volume of gas flared is the volume that the operator flared from high pressure flares over the month in the relevant area. The flaring allowable concept derives from the flaring limits introduced in proposed rule § 3179.6(b), and it represents the volume of flared gas that is exempt from the capture target. Flaring allowable equals the total number of development oil wells ''in production'' [100] in the relevant area multiplied by the relevant flaring allowable quantity, which is specified in final rule § 3179.7(c)(2)(i) through (iv) and reproduced in Table 2. The final rule allows an operator to choose whether to calculate each of these volumes—the volumes of gas sold, used, or flared, and the flaring allowable volume—for each BLM-administered lease, unit, or communitized area (under the lease-by-lease approach), or instead to calculate them on an area-wide average basis for all BLM-administered leases, units, and communitized areas in the county or State (under the averaging approach).

TABLE 2

Date range	Monthly flaring allowable per well (Mcf)
1/17/2018 through 12/31/2018	5,400
1/1/2019 through 12/31/2019 ...	3,600
1/1/2020 through 12/31/2020 ...	1,800
1/1/2021 through 12/31/2021 ...	1,500
1/1/2022 through 12/31/2023 ...	1,200
1/1/2024 through 12/31/2024 ...	900
Beginning 1/1/2025	750

[100] As defined in § 3179.7(c)(4), a well is considered ''in production'' after ''a completion, a completion report, or a notice of first production, whichever occurs first, and only during a month in which it produces gas (that is sold or flared) for 10 or more days.''

If the operator's actual capture percentage for a given lease, unit, or communitized area (lease-by-lease approach), or for the county or State (averaging approach), falls short of the required capture target for the given month, then the operator may face enforcement action, and must pay royalties on the excess flared gas, which is considered avoidably lost. The excess flared gas is the volume of gas by which the operator missed its required capture target, and it is calculated as follows:

Excess flared gas = (Required capture target * (total volume of produced gas − flaring allowable)) − (volume of gas sold or used).

Royalties on the excess flared gas would be prorated across an operator's leases, units or communized areas that reported high-pressure flaring during the month.

Alternatively, an operator may request that the BLM establish an alternative capture target under final rule § 3179.8, if three conditions are met: (1) The operator has chosen to comply with the capture target using the lease-by-lease basis rather than the averaging approach; (2) the potentially noncompliant lease was issued before the effective date of this final rule; and (3) the operator demonstrates via Sundry Notice, and the BLM agrees, that the applicable capture percentage under final rule § 3179.7 ''would impose such costs as to cause the operator to cease production and abandon significant recoverable oil reserves under the lease.''

b. Changes From Proposed Rule and Significant Comments

Proposed rule § 3179.6(b) would have imposed a monthly limit on flaring, beginning on the effective date of the final rule, with the specific limit decreasing over the first three years of the final rule. Specifically, the proposed rule would have established a flaring limit of 7,200 Mcf/month per development oil well in production on the lease, unit, or communitized area, for the first year the rule was in effect (proposed rule § 3179.6(b)(1)); 3,600 Mcf/month per development oil well in production on the lease, unit, or communitized area for the second year the rule was in effect (proposed rule § 3179.6(b)(2)); and 1,800 Mcf/month per development oil well in production on the lease, unit, or communitized area for every month beginning in year three and thereafter (proposed rule § 3179.6(b)(3)).

The proposed rule included a broad request for comments on a range of issues relating to this section, including: The feasibility and costs of imposing a long-term limit on routine flaring of associated gas from development oil wells; whether the specific long-term flaring limit should be lower or higher than 1,800 Mcf/month/well, to further reduce flaring or reduce compliance costs, respectively; operators' likely operational response(s) to the imposition of a flaring limit; the feasibility and costs of the proposed three-year timeline for decreasing the flaring limit from 7,200 to 1,800 Mcf/month/well; and the effectiveness of the proposed method and conditions in § 3179.7 for allowing operators to obtain an alternative flaring limit.

The BLM developed the capture target approach in final rule § 3179.7, and the alternative capture target provisions in final rule § 3179.8, after careful consideration of the many comments received on the flaring limit approach set forth in proposed rule §§ 3179.6(b) and 3179.7. In particular, the BLM gave careful consideration to operators' assertions that the numerical values of the proposed flaring limits, the proposed schedule for meeting those limits, and the prescriptive nature of the limits would make it prohibitively expensive—and, in some areas of the country, technically impossible—for operators to comply with the terms of the proposed rule. After reviewing the flaring data provided by these commenters, obtaining additional updated and more detailed data from ONRR, and reanalyzing these provisions, the BLM determined that the final rule should phase in its approach to routine flaring over a longer period of time, and provide operators with more flexibility to take better account of variable conditions on different leases, units, and communitized areas in different parts of the country.

The BLM remains committed to requiring operators to significantly reduce routine flaring of associated gas from development oil wells on BLM-administered leases, thereby increasing gas capture. We have structured final rule §§ 3179.7 and 3179.8 to achieve a comparable volume of flaring reductions as proposed rule §§ 3179.6(b) and 3179.7, although over a somewhat longer timeframe, and then to achieve additional reductions in later years.

The final rule's capture targets and the proposed rules flaring limits operate in a similar manner, with the latter approach a refinement of the former to enhance opportunities for compliance. For example, the long-term flaring limit of 1,800 Mcf/month/well in proposed rule § 3179.6(b)(3) is *exactly* equivalent to a capture target of 100 percent, with a flaring allowable volume of 1,800 Mcf/month/well, applied on a lease-by-lease basis. The final rule phases in a 98 percent (rather than 100 percent) capture target over nine years, and converts the proposed volumetric flaring limits from the proposed rule into declining allowances against the capture target. The differences between proposed rule § 3179.6(b) and final rule § 3179.7(b) are therefore more a matter of form than function, with the final rule designed to achieve flaring reductions comparable to the reductions that the BLM expected from the proposed rule, but to allow operators more compliance flexibility.

That said, the proposed and final approaches to reducing routine flaring do differ in certain key respects, as a result of public comments. The five most significant differences are as follows.

First, the final rule uses specified capture targets, rather than requiring that operators capture 100 percent of their associated gas above fixed volumetric limits as initially proposed, in response to comments indicating that, in some states (notably North Dakota and New Mexico), gas volumes are so high and the availability of capture infrastructure so variable that it is extremely difficult to identify a fixed volumetric limit on flaring that would both be achievable and also provide meaningful reductions in all States. Commenters asserted that given the high gas-to-oil ratios (GOR) in the Bakken basin, there are certain areas where an operator could exceed the proposed flaring limit of 1,800 Mcf/month/well in a period of hours. Commenters argued that even after averaging over a month and across a lease, as the proposed rule would have allowed, the 1,800 Mcf/month/well limit would significantly impact future development in the Bakken and Permian basins. Operators in these areas suggested that allowing averaging of flaring volumes across multiple leases, units, or communitized areas—or even across counties or across a State—would enable operators to use high capture rates in areas with low GOR and/or significant gas capture capability to offset lower capture rates in other areas, and thereby avoid having to curtail production.

Based on these concerns, the BLM restructured the fixed flaring limits as capture targets both to better take account of geographically varying volumes of associated gas and to allow operators some greater flexibility to absorb the impacts of intermittent interruptions or reductions in capture capacity. Final rule § 3179.7, therefore, requires capture of a specified percentage of gas above the flaring allowable volume; this specified capture target incrementally increases from 85 percent in year two (*e.g.,* one year after the effective date of the final rule) to 98 percent in year nine. As noted, this flexible capture target approach is modeled in large part on North Dakota's regulations, which also impose an escalating capture target, as described in the preamble to the proposed rule.[101]

Second, the BLM extended the compliance dates in response to commenters' concern that coming into compliance with a long-term flaring limit of 1,800 Mcf/month/well would take longer than the three years that the BLM had proposed. The final rule postpones the effective date of any capture requirements for one full year after the effective date of the rule. Thereafter, the final rule incrementally increases the required capture targets over a nine year period and incrementally decreases the flaring allowable volumes over an eight year period. Final rule § 3179.7(b) extends the time an operator has to meet the flaring allowable volume of 1,800 Mcf/month/well until calendar year 2021, about four years after the effective date of the final rule (and about two additional years after the 1,800 Mcf/month/well fixed flaring limit would have taken effect under § 3179.6(b)(3) of the proposed rule).

Third, and conversely, the BLM has reduced the long-term flaring allowable volumes that apply once the final rule is fully phased in, in response to other commenters' concerns that the proposed approach allowed significant quantities of wasteful flaring to continue unabated from 2020 on and did not provide sufficient incentives for industry to continue to decrease flaring over time. Natural gas is a valuable resource that should be put to productive use, and the MLA requires that we minimize the waste of public resources, consistent with existing lease obligations. In addition, if the only changes the BLM made to the final rule were to allow averaging over a broad geographic area and to impose capture targets that never ramp up to 100%, the final rule would achieve far less of a reduction in wasteful flaring than the proposed rule. While providing operators more flexibility to reduce flaring at lower costs by shifting from the proposed rule's fixed flaring limits to the final rule's capture targets and allowable flaring volumes, the BLM strived to ensure that the final rule still achieves meaningful flaring reductions, comparable to the reductions that the BLM expected from the proposed rule. The key change necessary to meet that goal was the shift from a fixed long-term flaring limit of 1,800 Mcf/month/well (proposed rule § 3179.6(b)(3)) over three years to a flaring allowable volume that decreases over time to 750 Mcf/month/well in year 2025 (final rule § 3179.7(c)(2)(iv)).

Fourth, the final rule allows greater flexibility in how operators may comply with the capture targets. Commenters indicated that leases, units, and communitized areas vary greatly in both the volumes of associated gas produced from oil wells and the availability of gas capture infrastructure, and asserted that complying with a single flaring limit that applies uniformly to every lease, unit, and communitized area would be prohibitively expensive or even, in some areas of the country, technically impossible. Commenters contended that as a result, they would be forced to submit numerous Sundry Notices under proposed rule § 3179.7 to request alternative flaring limits. Commenters asserted that North Dakota's approach, which allows operators to comply with capture targets on a statewide average basis, would reduce the need to request alternative limits and thus achieve comparable overall flaring reductions at significantly lower cost. The BLM agrees, and has in response to these comments structured the final rule to provide operators with greater discretion in how they choose to comply. Specifically, final rule § 3179.7(c)(3) allows an operator to choose whether to comply with the capture targets on a county- or state-wide average basis, or instead to comply on each lease, unit, or communitized area. This flexibility, too, is modeled on North Dakota's regulations, which allow for compliance on a well-, field-, county- or state-wide basis, as described in the preamble to the proposed rule.[102]

Fifth and finally, the final rule makes certain changes to the alternative flaring provisions (proposed rule § 3179.7, renumbered as final rule § 3179.8) in part to address some commenters' concerns that the proposed renewable 2-year exemption (proposed rule § 3179.7(d)) would allow too many operators to evade the flaring limits and should therefore be eliminated. The changes also account for the change in the final rule from flaring limits to capture targets, and for the BLM's decision to allow operators to choose to demonstrate compliance with the capture targets on an area-wide average basis. Specifically, the BLM deleted the proposed 2-year exemption provision and restyled proposed rule § 3179.7 as an alternative capture target rather than

[101] 81 FR at 6634.

[102] 81 FR at 6634.

an alternative flaring limit. The change to a capture target approach and the decision to allow operators to choose to comply by averaging their flaring over an entire county or State significantly reduce the risk that a single remote lease, unit, or communitized area with high levels of flaring and little or no access to capture infrastructure will make it impossible for an operator to comply. Under the averaging approach, such leases, units, or communitized areas need not receive a blanket exemption from the capture target. Rather, an operator concerned about the ability of a lease, unit, or communitized area to comply with the capture target can either (a) reduce its flaring at other sites in the relevant area to compensate for the high levels of flaring at that remote lease, or (b) apply for an alternative capture target for that lease under final rule § 3179.8 (if the predicate conditions are met). Because fewer leases are likely to raise such concerns under the final rule's capture target approach than under the proposed rule, the BLM anticipates receiving fewer requests for alternative capture targets and having an increased capacity to process such requests on a case-by-case basis.

To set the capture targets and flaring allowable volumes in the final rule, the BLM conducted a detailed analysis of 2015 data submitted to ONRR of sales, on lease use and flaring volumes month-by-month for operators within a state. These data go substantially beyond what was available to BLM in preparing the proposed rule, and while the results show that the proposed rule would have reduced flaring less than we initially estimated, we have higher confidence in the updated estimates. Using the new data to reanalyze the likely flaring reductions from the proposed rule, the BLM estimates that the proposed rule would have reduced the quantity of flared gas in 2020 by 42 percent relative to 2015 levels.

Using the same data and assumptions, the BLM estimates that the final rule's approach, which allows operators to average over their statewide production and establishes a capture target of 98% over time, will reduce the quantity of flared gas in 2020 by roughly 26 percent relative to 2015 levels. With the additional time and flexibility provided in the final rule, operators will be able to plan for and build out the additional infrastructure necessary to capture and transport greater volumes of gas in later years. Thus, the final rule further steps down the allowable flaring volumes after 2020, and likewise steps up the required capture percentages, to achieve almost a 50% reduction in flaring by 2025, 8 years after the rule comes into effect.

Thus, the BLM expects that the final rule's schedule and targets for reducing flaring will achieve a total volume of flaring reductions somewhat greater than the proposed rule, and at lower cost, though over a longer timeframe. Moreover, the final rule establishes a structure in § 3179.7 for reducing routine flaring that could be adapted to achieve more ambitious flaring reductions, if and when the BLM deems those reductions to be technologically feasible and cost effective. The BLM has only specified capture targets and flaring allowable volumes out to 2026. As additional data on flaring become available, and capture technologies improve, the BLM could choose to increase the capture targets further over time, and/or decrease the flaring allowable volumes, through future rulemakings in order to continue to reduce routine flaring of associated gas from BLM-administered leases, units, and communitized areas, consistent with the United States' March 2016 endorsement of the World Bank's Zero Routine Flaring by 2030 Initiative.[103]

B. Leak Detection and Repair

1. Requirements of Final Rule

As discussed in detail in the RIA, we estimate using data from the EPA GHG Inventory that about 4.01 Bcf of natural gas was lost in 2014 as a result of leaks or other fugitive emissions from various components, including valves, fittings, pumps, storage vessels and compressors on well site operations on BLM-administered leases.[104] This quantity of gas would supply nearly 55,000 homes each year.[105]

LDAR programs are a cost-effective means of reducing waste of gas in the oil and gas production process, as indicated by the studies and State programs discussed in the proposed rule, as well as additional information provided since the proposal, which is discussed in the background section III. Provisions in §§ 3179.301 through 3179.305 of the final rule require operators to carry out leak inspections and repairs at their well sites and associated equipment, meeting specified standards for leak detection methodology and frequency, and for the timing of repairs. Within one year of the effective date of the rule (or within 60 days of beginning production, for new sites), operators must use an instrument-based approach to conduct semi-annual inspections at well sites and quarterly inspections at compressor stations. Operators may also request BLM approval of an alternative instrument-based leak detection program, which the BLM may approve if it finds that the program would reduce leaked volumes by at least as much as the BLM program. Operators must repair a leak within 30 days of discovery, absent good cause, and verify that the leak is fixed. Operators must also keep records documenting the dates and results of leak inspections, repairs, and follow-up inspections, and submit annual reports with this information.

Section 3179.301 provides that the leak detection requirements in the final rule apply to sites[106] and associated equipment that is used to produce, process, compress, treat, store, or measure natural gas from or allocated to a Federal or Indian lease (or from a unit or communitized area that includes such a lease), where such sites are upstream of or contain the approved royalty point of measurements. These requirements also apply to each site located on a Federal or Indian lease, and all associated equipment operated by the operator, which is used to store, measure, or dispose of produced water. An operator is not required to inspect sites that contain only a wellhead or wellheads and no other equipment, nor is the operator required to inspect the ''leak components''[107] that are not accessible

In response to multiple requests from industry and NGO commenters, the final rule provides greater specificity on what constitutes a ''leak'', which includes releases not associated with the normal operation of the component (*e.g.,* releases from equipment designed to vent that exceed the quantities and frequencies expected during normal operation of the equipment). Similarly,

[103] ''Zero Routine Flaring by 2030'' is a voluntary initiative introduced by the World Bank in 2015 and endorsed by multiple governments, oil companies, and development institutions. The initiative focuses on the phase-out of routine, high-pressure flaring of the type addressed by the BLM's capture targets in § 3179.7 of the final rule, not flaring for safety and other non-routine reasons. For more information and a list of endorsers, see *http://www.worldbank.org/en/programs/zero-routine-flaring-by-2030.*

[104] RIA at 17.

[105] Based on an estimate of 74 Mcf of gas used per household per year. See footnote 2.

[106] A ''site'' is defined as a discrete area containing a wellhead, wellhead equipment, or other equipment used to produce, process, compress, treat, store, or measure natural gas or store, measure, or dispose of produced water, which is suitable for inspection in a single visit.

[107] Under the definitions in the final rule, ''leak component'' means any component that has the potential to leak gas and can be tested in the manner described in sections 3179.301 through 3179.305 of this subpart, including, but not limited to, valves, connectors, pressure relief devices, open-ended lines, flanges, covers and closed vent systems, thief hatches or other openings on a storage vessel, compressors, instruments, and meters.

releases due to operator error or equipment malfunctions, or from control equipment that does not meet the level of control required by this or other regulations, are also considered leaks. These types of leaks include releases from: A thief hatch left open; a vapor recovery unit that is not operating properly; a tank or combustor that is inadequately sized to handle the throughput of gas; or an intermittent controller that actuates continuously.

Section 3179.301(j) and (k) integrate the final rule with EPA NSPS requirements for operators to conduct a fugitive emissions inspection and repair program. Section 3179.301(j) provides that for new, modified or reconstructed equipment, an operator will be deemed to be in compliance with the BLM LDAR requirements if the operator is in compliance with the EPA subpart OOOOa requirements applicable to the equipment. Paragraph (k) further allows an operator to choose to comply with the EPA fugitive emissions monitoring requirements in subpart OOOOa and apply those requirements to all sites and equipment on a lease not already deemed in compliance with the BLM LDAR provisions, in lieu of complying with the BLM LDAR provisions. This provision allows an operator with new, modified or reconstructed facilities (which must comply with subpart OOOOa) as well as existing facilities (which are not subject to subpart OOOOa) to apply a single leak detection regime to all of their facilities, rather than complying with subpart OOOOa for some facilities and the BLM requirements for others.

The final BLM LDAR provisions also apply to a few specific types of equipment that EPA addresses under requirements that are separate from EPA's subpart OOOOa fugitive emissions program—specifically, certain covers and closed vent systems, and thief hatches or other openings on controlled storage vessels, which are covered under 40 CFR 60.5411a or 60.5395a, rather than under the fugitive emissions requirements in subpart OOOOa. The final rule provides that if an operator chooses to comply with the EPA subpart OOOOa fugitive emissions requirements in lieu of the BLM LDAR requirements for all equipment on a lease, the operator must apply the EPA fugitive emissions requirements to sources covered under 40 CFR 60.5411a or 60.5395a as well.[108] Absent this requirement, these equipment covers, closed vent systems, and openings on controlled storage vessels would not be subject to the BLM's LDAR requirements or the EPA's subpart OOOOa fugitive emission inspection requirements if the operator chose to comply with the EPA requirements in lieu of the BLM requirements.

The final rule requires operators to use an instrument-based approach to leak detection. This is consistent with the proposed rule, and with EPA, Colorado, and Wyoming leak detection requirements. Under final rule § 3179.302, operators must use an optical gas imaging device (also commonly referred to as an infrared camera), or a portable analyzer device capable of detecting leaks and used according to the specifications of Method 21, a protocol prescribed by EPA for effectively using these devices.[109] Use of a portable analyzer device must also be assisted by audio, visual, and olfactory (AVO) inspection, as these devices have much more narrowly-focused leak detection capabilities compared to optical gas imaging, which can be used to scan across broad arrays of equipment. The final rule includes specifications for acceptable optical gas imaging equipment, requires all instruments to be used according to the manufacturer's specifications, and requires the operator of any leak detection instrument to be adequately trained in its proper use.

Final section 3179.302 also allows any person to request and the BLM to approve the use of an alternative monitoring device, accompanied by a monitoring protocol, and, in response to comments, this section also details the information that must be included in a request. The BLM may approve an alternative leak detection device and inspection protocol, if the BLM finds that the alternative would achieve equal or greater reduction of gas lost through leaks, compared with optical gas imaging used as required. The BLM may approve the device for use for all or most applications, or may approve use on a pilot project or demonstration basis. Finally, the BLM will provide public notice of a request for approval of an alternative monitoring device and will post on the BLM Web site a list of each approved monitoring device and protocol, along with any limitations on its use. The BLM intends that the decision to approve the use of an alternative monitoring device would be made only at the national level, by the Director, Deputy Director, or an Assistant Director, as, once approved, the alternative monitoring device could be used anywhere in the country.

Section 3179.303 specifies the required frequency for inspections, which is fully aligned with the requirements of Subpart OOOOa. Operators must inspect each well site at least semi-annually, with consecutive inspections spaced at least four months apart. Operators must inspect each compressor station at least quarterly, with consecutive inspections spaced at least 60 days apart.

In addition to alternative monitoring devices, the final rule allows for BLM approval of alternative monitoring programs. Specifically, like the proposed rule, the final rule allows an operator to request the BLM to approve an alternative instrument-based leak detection program in place of the program specified in the regulations. The BLM may approve the alternative program if it finds that the alternative program would achieve equal or greater reduction of gas lost through leaks compared with the approach specified in the regulations. Because approval of inadequate alternative programs could unintentionally but significantly undermine the effectiveness of the LDAR requirements, the BLM intends that the decision to approve an alternative program would be made only by the relevant BLM State Director, or, with respect to requests that cover operations in more than one State, at the national level by the BLM Director, Deputy Director, or an Assistant Director. In addition, the BLM will post approved alternative programs online both to provide public transparency and to allow other operators to see examples of alternative programs that the BLM believes will be effective.

Section 3179.304 requires operators to repair the leaks that they find. Operators must repair a leak as soon as practicable, and within 30 days of discovery, unless there is good cause to delay the repair. When an operator repairs a leak, the operator must verify that the repair was effective within 30 days of the date of the repair using optical gas imaging, a portable analyzer using Method 21, or a soap-bubble test.

Section 3179.305 requires operators to keep records related to leak detection inspections and repairs, make them available to the BLM upon request, and submit an annual summary report on the previous year's inspection activities.

2. Changes From Proposed Rule

The final rule provisions on leak detection and repair largely track the proposal, however, we adjusted the frequency of inspections, based upon public comments along with a desire to

[108] *See* Section VII, Section by Section, for discussion of treatment of sources exempt from the EPA fugitive emissions program specified in section 43 CFR 60.5397a.

[109] See 40 CFR part 60, appendix A–7.

align these requirements with EPA's final rule, and made other minor adjustments. The BLM had proposed an approach in which the initial required frequency of inspection was semi-annual, but then the frequency varied for each site according to the number of leaks found. An operator that found more than three leaks in each of two inspections would have been required to increase its inspection frequency to quarterly, while an operator that found fewer than three leaks in each of two inspections would have been allowed to drop its inspection frequency to annually. A broad swathe of commenters opposed this approach in the proposed rule (as well as in the EPA's proposed OOOOa). The final rule replaces this approach with a fixed semi-annual rate of inspections for all sites other than compressor stations, and a quarterly inspection rate for compressor stations, consistent with the final OOOOa as well.

Another change from proposed to final rule concerns the effective date of the leak detection requirements. The proposed rule would have imposed the leak detection requirements as of the effective date of the rule, with the first inspection required within six months of that date. In response to comments, the final rule extends the time for initial compliance to give operators one year from the effective date of the rule to make their first inspection.

The BLM made several other changes that adopt commenters' suggestions. We added a provision allowing approval of an alternative, potentially less effective, leak detection program for an operator that demonstrates that compliance with the LDAR requirements would impose such costs as to cause the operator to cease production and abandon significant recoverable oil or gas reserves. We also added a requirement that operators provide an annual summary report on the results of their leak inspections. Consistent with the final subpart OOOOa, the final rule also includes a new exemption from LDAR requirements for sites that contain only a wellhead(s), and no other equipment.

In addition, the BLM made various smaller changes to enhance the clarity of the final rule. The final rule has refined and clarified the specific sites and equipment subject to the leak inspection requirements. The final rule applies to all equipment handling Federal or Indian gas, upstream of and including the site where the royalty measurement point is located—whether the equipment is on or off the lease and regardless of the ownership of the equipment. The final rule also specifies that with respect to equipment associated with the storage, measurement, or disposal of produced water, the leak detection requirements apply only to such equipment operated by the operator and located on the Federal or Indian lease.

The final rule retains and refines the proposed rule's provision allowing an operator to satisfy the leak detection requirements by complying with the EPA leak detection requirements under 40 CFR part 60, subpart OOOOa. First, the final rule provides that for new, modified and reconstructed equipment, an operator that is in compliance with the EPA fugitive emissions requirements will be deemed to be in compliance with the BLM LDAR requirements, without any requirement to file a Sundry Notice and demonstrate compliance, as the BLM had proposed. Second, it clarifies that that an operator who chooses to comply with the EPA fugitive emissions monitoring requirements in subpart OOOOa in lieu of the BLM LDAR requirements must apply the EPA requirements to all sites and equipment on a lease not already deemed in compliance with the BLM LDAR provisions.

The final rule includes this change because leaks from some types of new, modified and reconstructed equipment, such as covers and closed vent systems, and thief hatches on controlled storage vessels, are not covered by the fugitive emissions requirements under subpart OOOOa, but instead are addressed through specific provisions for storage vessel affected facilities and any associated covers and closed vent systems in subpart OOOOa—namely 40 CFR 60.5395a and 60.5411a. These provisions establish comprehensive control programs for storage vessel affected facilities, including separate and distinct inspection regimes. This final rule ensures that if an operator elects to comply with the EPA fugitive emissions requirements in lieu of the BLM leak detection requirements for equipment on a given lease, the operator must apply the EPA fugitive emissions requirements to all equipment covered by the BLM leak detection requirements, including equipment such as covers, closed vent systems, and thief hatches. Absent this provision, operators could potentially avoid any leak detection program with respect to existing sources in these categories.

The final rule also modifies the requirement in the proposed rule that operators who choose to comply with the EPA requirements in lieu of the BLM requirements must file a Sundry Notice demonstrating compliance with the EPA rule. The final rule provides that the operator need only notify the BLM through a Sundry Notice that it is complying with the EPA rule in lieu of the BLM requirements for equipment on a lease. While the BLM needs to know for oversight purposes if an operator has elected not to comply with the BLM requirements, we agree with commenters that requiring a "demonstration" of compliance with the EPA requirements is unnecessary.

As noted earlier, the final rule also contains a more detailed definition of a "leak" than the proposed rule, as well as more detailed specifications of approved leak detection instruments and methods. In addition, the final rule separates approval of an alternative monitoring device and protocol from approval of an operator's alternative leak detection program, and it adds specificity on what is required for each of these. The final rule also adds a required minimum interval between inspections, which was not specified in the proposal, but is consistent with final subpart OOOOa. Other minor changes that align the rule with final subpart OOOOa include: A 30- rather than 15-day period for repair and follow-up inspections; additional detail on what constitutes good cause for delay of repair; and a new, two-year outer limit on the timeline for completing repairs delayed for good cause. In addition, while the proposal had required operators to verify the effectiveness of repair using the same method used to identify the leak, in response to comments, the final rule allows operators to use any approved monitoring instrument or the soap bubble test to verify the effectiveness of repair.

3. Significant Comments

Commenters provided many detailed comments on numerous aspects of the leak detection program. This section highlights the most significant comments; additional comments are addressed in Section V. and the Response to Comments document. Comments addressed here include: Coverage of the program (*i.e.,* which types of operations and equipment should be included in the program); program structure (how inspection frequency is to be determined, and the required frequency of inspection); the instruments and methods to be used for leak detection; opportunities for use of new instruments and methods; requirements for repairs; and potential exemptions from the requirements.

a. Coverage

Comments: Many commenters addressed the coverage of the program. Some commenters supported applying the program broadly to catch as many leaks as possible, while others urged the BLM to use risk-based or other approaches to target the program more narrowly to exclude certain types of sites and equipment and/or to focus on the most likely sources of significant leaks and improve the program's cost-effectiveness.

Some commenters urged the BLM to exclude sites where the commenters asserted that there is less likelihood of leaks and/or smaller leaks. For example, they suggested excluding oil or gas low production wells (also commonly called ''marginal'' or ''stripper'' wells) that produce less than 15 barrels of oil equivalent per day; oil well sites that produce crude oil with either an API gravity less than 18° or a GOR less than 300 scf/bbl; and sites that have just wellheads without co-located production equipment.

Some commenters alleged that wells producing less than 15 BOE per day do not have the potential to emit at the same rate as larger producing facilities or enough production to have significant waste from leaks. Hence, they argued, the costs of LDAR for a marginal well far outweigh any benefits in terms of recovery of lost gas. One commenter stated that sites with marginal wells have less equipment on-site, fewer components that could leak, and thus a smaller likelihood of leaks. Commenters also noted that the EPA proposed to exclude low production wells from its fugitive emissions program, and argued that the BLM should do the same. Some asserted that these wells are only marginally profitable to begin with, and the costs of LDAR could make these wells uneconomical, leading to premature shut-in and a loss of mineral resources. Commenters also recommended that, at minimum, these low production wells should be subject to more relaxed LDAR requirements, such as one-time or annual instrument-based inspections, possibly in combination with AVO inspections, rather than semi-annual instrument-based inspections.

Commenters also asserted that the requirement to inspect for leaks should be limited to certain specified facilities or components because those facilities or components are more likely to leak, and to have higher leak rates. Various commenters recommended that the rule focus on valves, open-ended lines, pumps, or components with potential to operate at or above sales line pressure. Other commenters suggested limiting the LDAR requirements to facilities with components that tend to vibrate or are in thermal operation, and specifically those with controlled storage vessels, compressors, and/or vapor recovery units. Commenters also asserted that the 2013 Carbon Limits Study and the 2014 CAPP study show that compressor stations leak more than well sites, and that components tend to have greater average emissions when subjected to frequent thermal cycling, vibrations or cryogenic service.

In addition, commenters urged the BLM to exclude from the LDAR requirements storage vessels that would not be required to have emission controls under the proposed BLM and final EPA rules (*i.e.,* tanks with the potential to emit less than 6 tpy of VOCs), and equipment designed to vent, such as pneumatic pumps and pneumatic controllers, as well as other types of equipment and sites discussed in Section V.

On the other hand, other commenters strongly opposed narrowing the applicability of the LDAR program, and in particular, excluding low production wells from that program. These commenters cited recent peer-reviewed studies concluding that the occurrence of leaks is fairly random; the probability of a production site being among the highest emitting sites does not increase uniformly with production volumes; and relatedly, both high- and low-producing sites can be associated with high-emitting events. These commenters provided estimates of calculated methane emissions from low production and non-low production wells nationwide based on data reported to EPA and the EPA GHG Inventory, finding that 83 percent of the total methane emissions from oil and gas wells was attributable to low production wells, while only 17 percent was attributable to other wells. The commenters also provided calculations based on an EPA estimate of the cost of semi-annual inspections. These calculations showed, the commenters argued, that even for low production wells, the cost of LDAR compliance would on average be only a small fraction of the annual revenue per well. These commenters further argued that the majority of all existing wells, including those on public lands, meet the definition of ''marginal,'' and that excluding such wells from the LDAR requirements would allow large amounts of gas waste to continue unabated.

Response: The final rule covers largely the same types of sites and equipment as the proposed rule, with a few small exceptions. As discussed above, natural gas leaks during the oil and gas production process are wasteful and can cause significant environmental harm. The BLM is adopting a broadly applicable LDAR requirement to reduce leaks as much as reasonably possible.

The BLM carefully considered numerous and varied approaches that might improve the program's cost-effectiveness by narrowing the coverage of the LDAR program while maintaining its benefits. In evaluating suggestions to exclude certain types of sites from the LDAR requirements, the BLM looked for evidence indicating that the frequency of leaks, size of leaks, and overall amounts of gas lost through leaks relate to the type of site being inspected. In requesting comments on this topic, the BLM had urged commenters to present data or other information to support their assertions, and specifically requested ''information regarding the relationship between well production and levels of leaked methane from a site.'' [110]

With respect to suggestions that the BLM exclude low production wells from the LDAR requirements, we note that roughly 85 percent of wells on Federal and Indian leases are classified as low production wells (*i.e.,* produce 15 barrels of oil equivalent per day or less). Thus, unless these wells are, in fact, unlikely to leak significant volumes of gas, a decision to exclude these wells from the LDAR program would have a significant negative effect on the waste reduction benefits of this rule.

The information submitted by commenters on low production wells does not support their exclusion from the LDAR requirements. As discussed above, some commenters suggested, without providing supporting data, that sites with low production would be expected to lose smaller quantities of gas overall from leaks. However, others disagreed, pointing to the Zavala-Araiza study. As discussed in section III, this study showed that the probability of a production site being among the highest emitting sites does not increase uniformly with production volume, and it found significant opportunities to reduce losses by finding and fixing leaks at lower production wells. These commenters noted that the Lyon et al. study also demonstrates that both high- and low-production sites can be associated with high-emitting events with roughly 15 percent of the identified high-emissions sites in that study being associated with low production wells. Commenters urging an exclusion for low production wells did not provide data refuting these findings. Without additional data on this issue, the BLM simply cannot conclude that low-production sites pose

[110] Proposed Rule at __.

low leak risks and therefore merit exclusion from semi-annual LDAR.

As commenters noted, the EPA had proposed to exclude wells with less than 15 barrels a day oil-equivalent production from the OOOOa fugitive emissions requirements. In the final OOOOa rule, however, the EPA reached the same conclusion as the BLM and dropped the proposed exemption. EPA found that the record for the final rule did not support excluding these wells from the fugitive emissions requirements. In the preamble to the final rule, EPA stated: ''We did not receive data showing that low production well sites have lower GHG (principally as methane) or VOC emissions other [sic] than non-low production well sites. In fact, the data that were provided indicated that the potential emissions from these well sites could be as significant as the emissions from non-low production well sites because the type of equipment and the well pressures are more than likely the same.'' [111] Thus, including low production wells under the BLM requirements also maintains consistency between the BLM and EPA rules.

In addition, the BLM does not anticipate a significant number of individual well shut-ins or any lease-wide shut-ins as a result of the LDAR requirements, even with respect to low production wells. As discussed in the RIA, third-party providers offer LDAR services at a relatively modest cost, and operators may recoup some of the costs of the program through the saved gas. Also, operators have the option to design and request approval of an alternative LDAR program that is less costly for their particular circumstances, provided they can demonstrate that their alternative program is equally effective. Finally, an operator may request approval of an alternative leak detection program that is *not* as effective as the BLM's requirements, if the operator demonstrates that compliance with the BLM's LDAR requirements or an equally effective alternative would be so costly as to cause the operator to cease production and abandon significant recoverable oil or gas reserves under a lease.

With respect to oil well sites that produce crude oil with either an API gravity less than 18° or a gas-to-oil ratio (GOR) less than 300 scf/bbl, as with low production wells, the BLM does not have data to be able to conclude that these oil well sites are likely to be responsible for a sufficiently small quantity of gas lost through leaks that they should be excluded from the LDAR requirements or subject to less stringent requirements.

The BLM does, however, agree with commenters that the risk of leaks is substantially lower at sites with only a wellhead, compared to sites with one or more pieces of production equipment, such as a tank, compressor, dehydrator, or vapor recovery unit. Industry commenters asserted that there is a greater likelihood of leaks from moving or vibrating equipment, or from equipment in thermal operation, because a valve may stick open, vibrations may cause a connection to loosen, or heat may cause a seal to degrade. While the BLM does not have data about the likelihood and/or size of leaks in these circumstances, the BLM's experience in the field supports the general point. In addition, studies have identified many leaks from the identified equipment, including tanks, compressors, and dehydrators.[112] At a wellhead without co-located production equipment, there are significantly fewer components capable of leaking. Exempting these sites from the LDAR requirements will provide some cost savings for operators, and based on the information available, the BLM believes that realizing those savings will have only a minimal impact on the overall benefits of the LDAR program. Moreover, excluding wellhead-only sites is directionally consistent with some of the other suggestions for narrowing program applicability, such as focusing on sites with tanks or compressors. In the final OOOOa rule, the EPA reached the same conclusion and exempted wellhead-only sites from its fugitive emissions requirements.

Other than the exclusion for sites with only a wellhead, the BLM is not limiting the LDAR requirement to covering only certain specified types of equipment or equipment components. BLM does not believe that it has sufficient information to appropriately distinguish between types of production equipment or equipment components on the basis of the likely quantity of gas lost through leaks. In addition, once an operator is at a site conducting a leak detection inspection, inspecting all of the on-site equipment should add little time and cost, particularly when the operator is using optical gas imaging. The BLM believes that trying to identify and exclude specific types of equipment from inspection adds complexity to the inspection system and introduces the likelihood of errors that would allow leaks to escape detection. It is simpler and more effective for operators simply to inspect all of the equipment located at a site. If, however, an operator has data that show it is possible to conduct an equally effective LDAR monitoring program while excluding certain types of equipment, or sites that only have that type of equipment, the operator may submit a proposed alternative monitoring protocol to BLM for review and potential approval.

Some commenters pointed out that pneumatic controllers are designed to vent and argued that these releases should not be considered leaks. The BLM agrees, and has excluded normal operation of this equipment from the final rule's leak definition. The BLM notes, however, that pneumatic controllers can and do malfunction, such as getting stuck in an open position, which can lead to unnecessary losses of gas. Additionally, as other commenters stated, these malfunctions can be identified through leak inspections. The BLM, therefore, believes it would be inappropriate to exclude this equipment from the rule's LDAR requirements.

Commenters make similar arguments with respect to uncontrolled storage vessels (*i.e.,* tanks that are not required to capture or flare their releases), which are allowed to release up to 6 tons per year of VOCs. Commenters argued that venting from an uncontrolled tank is necessary for proper relief of overpressure. Again, the BLM believes that the commenters' concerns should be addressed through the definition of a ''leak,'' which now excludes releases due to normal operation of a storage vessel or pressure relief valve, rather than by removing uncontrolled storage vessels from coverage under the LDAR program.

As an initial point, uncontrolled tanks are not open to the atmosphere—rather, they are typically vapor tight, slightly pressurized, and equipped with a thief hatch to allow measurement of production and a pressure relief valve to allow gas release of overpressure. This standard industry practice, which preserves the product and prevents unlimited release of vapors, was recently reinforced in the BLM's oil measurement rule, 43 CFR subpart 3174. The oil measurement rule requires oil storage tanks, hatches, connections, and other access points to be vapor tight, and it sets specifications for pressure relief valves. Using leak inspections to ensure that thief hatches are closed, seals are sound, and pressure relief valves are operating properly will reduce waste of gas.

[111] 81 FR at 35856.

[112] *See, e.g.,* Warneke, C., Geiger, et al.: Volatile organic compound emissions from the oil and natural gas industry in the Uintah Basin, Utah: oil and gas well pad emissions compared to ambient air composition, Atmos. Chem. Phys., 14, 10977–10988, doi:10.5194/acp-14-10977-2014, 2014.

Moreover, as discussed in section III., recent studies indicate that tanks are a very significant source of lost gas. As noted earlier, the Lyon et al. study, a helicopter survey of over 8,000 oil and gas wells, reported that over 90 percent of the detected emission incidences were from tanks. Similarly, the Colorado State University studies found substantial venting at tanks, and the City of Fort Worth study found that thief hatches are the largest source of fugitive emissions. The BLM believes that including both controlled and uncontrolled storage tanks in the LDAR program will allow operators to identify leaks and malfunctions that allow significant quantities of gas to be lost.

b. Definition of a Leak

Comments: Many commenters noted that the proposed rule did not define a ''leak,'' and they asserted that this would cause confusion, variations in interpretations, and inequitable implementation of these provisions, as well as potentially requiring repairs for very small releases. Some commenters also urged the BLM to define a leak to distinguish it from normal, intended operation (*e.g.,* pneumatic device actuation, crank case ventilation, etc.).

Many commenters suggested that BLM identify the quality or quantity of a release that would trigger repair requirements under the leak detection program. Commenters generally supported defining a leak as any visible hydrocarbon emission detected by use of an optical gas imaging instrument, or the formation of visible bubbles when equipment is tested with soap solution. With respect to portable analyzers, commenters generally supported setting a numeric threshold, but differed on the number. Some commenters urged the BLM to use 10,000 ppm of hydrocarbon as the threshold for a ''leak,'' while others recommended using 500 ppm, stating that this is protective and consistent with the Colorado requirements.

Response: The BLM agrees that the rule should define what constitutes a ''leak'' and has included a definition in the final rule. As noted earlier, the definition excludes losses due to normal operation of equipment intended to vent, provided the releases do not exceed the quantities and frequencies expected during normal operations. The definition further clarifies that ''leaks'' include releases due to operator errors or equipment malfunctions.

The purpose of a leak detection program is to find and fix losses of gas that are not part of normal operations. A prudent operator should conduct reasonable levels of monitoring, staff training, and preventative maintenance to minimize the occurrence and duration of such losses. We are adopting a definition of ''leak'' sufficiently broad in coverage to give operators the incentive to avoid wasteful losses, whether they occur due to aging equipment or due to operator error, including errors in appropriately sizing equipment to handle the quantities of production. As found in multiple recent surveys, all of these types of unnecessary losses occur and they are frequently identified using leak detection methods.

The BLM has also slightly modified the definition of ''leak component,'' and clarified that the inspection requirement applies to leak components at a covered site. Industry commenters had requested that the BLM limit the inspection requirement to specific components on a site. For the reasons previously discussed, the BLM believes it is reasonable to require operators to inspect all pieces of equipment that have the potential to leak gas and that can be tested for leaks. Moreover, as discussed in the proposed rule, repairing leaks generally pays for itself over a reasonably short time-frame through gas savings. To provide additional clarity, the BLM has added to the definition of ''leak component'' examples of specific types of components that are covered, including but not limited to: Valves, connectors, pressure relief devices, open-ended lines, flanges, covers and closed vent systems, thief hatches or other openings on a storage vessel, compressors, instruments, and meters.

With respect to leak thresholds, and consistent with the proposed rule, EPA and State provisions, and commenters' suggestions, the BLM is defining ''leak'' as including ''a visible hydrocarbon emission'' detected using optical gas imaging, or a release of gas forming visible bubbles with soap solution. Including soap solution allows operators to deploy an additional detection methodology that is inexpensive and effective in confirming that leak repairs have worked. The BLM agrees with commenters that portable analyzers can detect extremely small releases, so the rule needs to specify a threshold for the size of leak that requires repair. The final rule identifies 500 ppm as the appropriate threshold. This threshold is consistent with both the Colorado and EPA fugitive emissions programs, and aligning the BLM and other Federal, State and tribal programs is important to enhance clarity and consistency and reduce confusion and costs. Additionally, the BLM does not believe that this threshold is too burdensome for operators because once a leak is identified, repairs are generally cost-effective. On average, many repairs pay for themselves in terms of gas savings, and even if some smaller leaks may cost more to repair than they return in gas savings, we generally expect that the benefits to the public exceed the costs of repair.[113]

c. Inspection Frequency

Comments: Numerous commenters opposed the BLM's proposed approach to the frequency of inspections, under which the frequency would initially be semi-annual, but then could increase or decrease depending on the number of leaks found. Commenters stated that this approach: Is not consistent with Colorado and Wyoming leak detection programs; is confusing, overly complicated, and burdensome; inappropriately relies on past performance, which is not indicative of future performance due to the random nature of leaks; creates an incentive for operators not to find leaks; and incorrectly assumes that loss through leaks is homogenously distributed, rather than heterogeneously distributed, which means that just one leak can be responsible for the majority of the waste.

While commenters generally supported fixed frequency inspections, different commenters supported different frequencies. Some called for quarterly inspections, while others preferred annual. Still others suggested an approach like Colorado's, which requires different frequencies, from monthly to once, depending on the estimated uncontrolled VOC emissions from the highest emitting storage tank at a site.

Commenters supporting a requirement for quarterly inspections asserted that: The costs are reasonable (and lower than calculated by the BLM); Colorado, Wyoming, and other states already require quarterly inspections for many sites; and optical gas imaging is most effective when performed frequently, which can make up for its tendency to miss smaller leaks compared to other leak detection methods. Commenters who recommended annual inspections asserted that: The costs of LDAR programs outweigh the benefits (and are higher than calculated by the BLM); operators find far fewer leaks after the initial inspection, so repeated inspections produce diminishing

[113] Carbon Limits AS report entitled, *Improving utilization of associated gas in US tight oil fields* by Anders Pederstad, April 2015 found on the internet at: *http://www.catf.us/resources/publications/files/Flaring_Report.pdf.*

returns; and even requiring annual inspections will likely cause operators to prematurely shut-in some wells. Commenters also objected to inspection frequencies that differ from EPA and State requirements.

Response: Upon review of the comments, the BLM agrees that requiring leak inspections at a fixed frequency will make the program easier to implement, less burdensome for operators, and more effective. The BLM has concluded that requiring semi-annual inspections is a reasonable approach that balances the leak-detection advantages of more frequent inspections against the associated costs. Further discussion of the cost-effectiveness of this approach is provided in the RIA.

Requiring semi-annual inspections also aligns the BLM and EPA requirements. The BLM notes that it is not possible to align the BLM program's inspection frequency with both EPA requirements and all State requirements because the EPA and States have different inspection frequencies, and frequencies differ even among the States and among different EPA leak detection programs for different sources. The BLM expects that States with comprehensive and effective LDAR requirements that differ from the requirements of this rule are likely to obtain variances under section 3179.401, which would eliminate conflict concerns. Also, as a legal matter, operators on a Federal or Indian lease, unit, or communitized area will be subject to EPA fugitive emissions requirements for their new, modified and reconstructed facilities and BLM LDAR requirements for their existing facilities. By aligning the timing of the BLM and EPA requirements, and separately allowing operators to comply with EPA requirements in lieu of BLM requirements, the rule provides operators with options for implementing a single leak inspection program across all of their facilities on a lease, unit, or communitized area.

d. Instruments/Methods for Leak Detection

Comments: Commenters generally supported allowing the use of optical gas imaging for leak detection, but differed on whether also to allow portable analyzers, or portable analyzers deployed according to Method 21, as an alternative instrument for leak detection. In addition, most commenters opposed the BLM's proposal to allow operators with less than 500 wells within the jurisdiction of a BLM field office to use portable analyzers in lieu of optical gas imaging. Some argued that Method 21 should be an option for all operators, while others argued that the BLM should only allow the use of optical gas imaging, stating that portable analyzers are less effective. Some commenters urged the BLM also to allow use of AVO inspections as the method of leak detection.

Response: Upon reviewing the comments, the BLM has concluded that portable analyzers, if used appropriately and supplemented by AVO inspection, can be as effective as optical gas imaging for leak detection. Thus, the BLM has revised the proposed approach to allow operators to use optical gas imaging, or to use portable analyzers according to Method 21 and supplemented by AVO inspection. The BLM believes that concerns about the accuracy of portable analyzers are ameliorated by requiring the use of Method 21, Determination of Volatile Organic Compounds Leaks, which is a procedure established by the EPA for detecting VOC leaks from process equipment using a portable detecting instrument.[114] Method 21 contains requirements for equipment specifications, performance, calibration, and use to ensure that the analyzers are used properly and will identify leaks that are occurring. The BLM agrees with commenters that allowing the use of portable analyzers according to Method 21 will reduce costs by aligning with existing EPA, State, and local requirements. The BLM did not receive information supporting some commenters' contention that AVO inspections can be as effective as a technology-based program, and thus the final rule does not allow operators to inspect for leaks only using AVO.

e. Approval of Alternative Leak Detection Instruments/Methods and Alternative Leak Detection Programs

Comments: Many commenters strongly supported the provisions allowing the BLM to approve additional technologies and methods for leak detection when they are found to be effective, and they urged the BLM to establish clear criteria for rapid approval of alternative monitoring devices and new technology. Some commenters included alternative monitoring programs in their comments on this topic. Commenters noted ongoing research and development investment in new monitoring technologies and methods, such as the DOE's ARPA–E MONITOR program and the Environmental Defense Fund's Methane Detectors Challenge,[115] and they stated that several new technologies for continuous or periodic monitoring may become commercially available within the next 2 years.

Many commenters urged the BLM to detail the information that must be included in an application for approval of alternative technologies, as well as the process and criteria that the BLM would use to respond to an application. Various commenters emphasized that the process should be rapid, efficient, transparent, predictable, consistent, and rigorous. In addition, commenters suggested that any person should be able to submit an application, and that any operator should be able to use an approved technology.

Response: The BLM agrees on the need for a clear, consistent, and rigorous process and criteria for approval of alternative leak instruments and methods, and we have modified the regulations accordingly. The final rule provides that any person may request approval of an alternative monitoring device and protocol for using that device by submitting a Sundry Notice to the BLM that contains information that the BLM would need to evaluate the effectiveness of the alternative device compared to the base program.

Once a device is approved for general use, any operator may use it without the need for additional notification or approval. Because an approved device could potentially be used by an operator on any Federal or Indian lease, unit, or communitized area, the BLM intends that the request will be evaluated by the BLM Director, Deputy Director, or Associate Director. The BLM may approve the device if the BLM finds that the device would achieve equal or greater reduction of gas lost through leaks compared to optical gas imaging used in a leak detection program that meets the rule requirements. The BLM believes that this is an appropriate criterion for approval because it ensures that the program will achieve its leak reduction goals regardless of the type of leak detection device used. The BLM understands that different types of devices may achieve equivalent results. For example, a device that monitors continuously, but is less sensitive than optical gas imaging, might achieve results equivalent to optical gas imaging due to the gas savings from early detection. The information submitted must be sufficient to support such a

[114] U.S. EPA, *Leak Detection and Repair, A Best Practices Guide* (Oct. 2007) (*https://www.epa.gov/sites/production/files/2014-02/documents/ldarguide.pdf*). 40 CFR part 60, Appendix A–7.

[115] American Petroleum Institute (API). Comments on the ''Waste Prevention, Production Subject to Royalties, and Resource Conservation'' Proposed Rule. Submitted April 22, 2016. Docket ID BLM–2016–0001–9073: Available at *regulations.gov.*

finding, however. Finally, the rule states that the BLM will post online each approved alternative monitoring device and protocol, along with any limitations on its use.

The BLM also clarified the distinction between alternative leak detection devices or methods and alternative leak detection programs, which are both included in the proposed and final rules. Separate from the provisions for approval of an alternative device, the final rule allows an operator to request BLM approval of an alternative leak detection program that uses optical gas imaging, a portable analyzer or another approved device according to approved specifications. As with an alternative device, the final rule spells out the information that an operator would need to submit to request approval of an alternative program. The BLM intends that the request would be reviewed and potentially approved by the BLM State Director (or Director, if the request covers operations in more than one State). The BLM could approve an alternative leak detection program if the BLM finds that the alternative program would achieve equal or greater reduction of gas lost through leaks compared to the leak detection program required under the rule. The rule does not allow other operators to use an alternative leak detection program requested by and approved for a specific operator, as the results may not be transferable. The BLM expects each operator to make a detailed showing, specific to their particular circumstances, that an alternative program would be equally or more effective. For example, an operator might propose a program that included more frequent inspections for some sites and less frequent for others, compared to the final rule requirements, or an operator may be able to deploy an alternative leak detection device or system, approved by the BLM, on a continuous basis and achieve results that would allow for less frequent inspections using optical gas imaging.

f. Timing

Comments: Several commenters recommended that the BLM extend the phase-in period for the proposed LDAR program. They stated that operators or contractors will need time to ramp up LDAR efforts, including acquiring the necessary equipment and hiring and training inspectors. Commenters variously recommended phase-in periods of one year or three years.

Response: The BLM agrees and has modified the final rule to allow for a one year phase-in period. Thus, the first round of leak detection inspections must be completed by January 17, 2018. The BLM notes that equipment manufacturers, service providers, and operators are already taking action to produce and procure leak detection equipment and establish programs in response to EPA's OOOOa requirements published on June 3, 2016. Under those requirements, all operators with new, modified or reconstructed facilities will already be conducting leak detection inspections as of June 3, 2017. Expanding such programs to cover additional well sites should take less time than the initial development and deployment. The BLM also believes that one year from the effective date of the rule will provide ample time to manufacture the needed equipment, given the number of additional sources that will be covered by this rule.

g. Repair Requirements

Comments: Commenters raised several primary concerns. First, many commenters opposed the BLM's proposal to require that an operator verify a repair using the same method used to detect the leak. They noted that it may be more efficient to allow the operator to test a repair using, for example, a soap bubble test than to bring the leak surveyor back to the site to check the repair.

Second, some commenters urged the BLM to allow 30 rather than 15 days for leak repair. Commenters stated that some leaks require more time to repair due to safety issues, availability of personnel or replacement parts, hostile weather conditions, or other logistical issues related to sites being remote, dispersed, unmanned, and un-electrified. One commenter argued that if an operator contracts with a consultant to perform the monitoring, the consultant will not be able to make the repair at the time the leak is detected, thus requiring more time to complete the repairs.

Third, commenters requested more clarification on what would constitute ''good cause'' for delay of repair, noting that where the operator must blowdown (depressurize) the equipment before making the repair, this could release more gas than would be released by the leak prior to the next scheduled equipment blowdown.

Response: The BLM modified the final rule to address each of these concerns, as well as align the rule with the final subpart OOOOa. The BLM agrees that optical gas imaging, portable analyzers using Method 21, and the soap bubble test are all effective means to identify whether a leak has been repaired, and providing operators the flexibility to select a verification method should minimize costs.

The BLM also has modified the final rule to provide operators up to 30 days to make a repair, although the rule still requires operators to repair leaks as soon as practicable. We recognize that some State LDAR programs require repairs to be made sooner—within 5 to 15 days of finding a leak. The requirement to repair leaks as soon as practicable means that many leaks will be repaired upon discovery or within a shorter timeframe than 30 days, as many leaks can be repaired on the spot or as soon as a maintenance technician can get out to the site. However, according to industry commenters, allowing up to 30 days will meaningfully reduce the time and costs involved in filing Sundry Notices for leaks that could not be fixed in 15 days but could be fixed in 30.

The final rule also provides additional detail regarding what constitutes ''good cause'' for delay of repair beyond 30 days. Good cause for delay exists if repair within 30 days is technically infeasible; would require a pipeline blowdown, a compressor station shutdown, or a well shut-in; or would be unsafe to conduct during operation of the unit. In addition, the operator must complete the repair at the earliest opportunity, and in no case may the repair be delayed beyond two years. Technical infeasibility includes a need to order parts, in which case the operator must complete the repair as soon as the parts are available. Where the cause for delay is the need to blowdown or shut-down equipment, the operator must complete the repair during the next equipment blowdown or shutdown that occurs after the leak is found.

h. Interaction With EPA Fugitive Emission Requirements and State LDAR Requirements

Comments: Many commenters argued that the proposed BLM LDAR program overlaps and in some ways conflicts with the EPA fugitive emissions requirements under OOOOa and various State LDAR requirements. These commenters urged the BLM to drop the LDAR program altogether or, at minimum, align the BLM requirements with the EPA and State requirements and/or allow operators to comply with EPA or State requirements in lieu of the BLM requirements.

Response: While the BLM cannot abdicate its statutory responsibility to ensure safe, responsible, and nonwasteful production of public oil and gas resources, the BLM has worked closely with the EPA and consulted with States to align the regulations as much as possible, consistent with the agencies' separate statutory authorities. In final form, the EPA and BLM programs use the same criteria to identify what constitutes a leak that must be repaired, and they require operators to use the same types of leak detection equipment, inspect the same types of sources at the same frequencies, and repair leaks within the same timeframes. In addition, the final rule provides that operators complying with EPA requirements for new, modified and reconstructed equipment are deemed in compliance with the BLM requirements for such equipment, eliminating the possibility of overlap where both regulations apply. Also, the final rule gives operators the option to comply only with the EPA requirements at existing facilities as well.

The BLM notes that there are a few small differences between the BLM and EPA programs, but these should not increase compliance burdens for operators. First, while the programs both cover largely the same sources, the programs differ somewhat in their coverage. The BLM LDAR provisions apply to all covers, closed vent systems, and storage vessels, while the EPA fugitive emissions requirements only apply to covers and closed vent systems not subject to § 60.5411a, and thief hatches or other openings on a controlled storage vessel not subject to § 60.5395a. Subpart OOOOa has a separate, detailed set of requirements in § 60.5411a for sources covered by that section, and another set of requirements in § 60.5395a for storage vessel affected facilities, and section 60.5416a prescribes a separate and different leak inspection regime for these sources.

For waste reduction purposes, the BLM did not believe it was necessary to adopt separate requirements for storage vessels, covers and closed vent systems. Instead, the BLM elected to require controls for storage vessels with high levels of gas loss and to include storage vessels, covers, and closed vent systems under the LDAR program. Thus, the final rule provides that operators that choose to comply with the EPA fugitive emissions program in lieu of the BLM leak detection program for both new and existing equipment on a lease must apply the EPA fugitive emissions requirements to all equipment covered by the BLM requirements, including storage vessels, covers and closed vent systems, to ensure that these types of equipment are covered by at least one of the agencies' leak detection requirements.

Second, a few elements of the BLM LDAR requirements are less prescriptive than the EPA requirements, but again, the BLM does not believe that these differences would impose any additional burdens on operators. The BLM regulations do not require operators to develop a monitoring plan or specify their walking path for inspections, nor do they include requirements for scheduling inspection of components that are difficult-to-monitor or unsafe-to-monitor. The BLM record-keeping requirements are also less specific than the EPA requirements. The BLM regulations do not provide specific direction to operators on the proper calibration and use of leak detection instruments, instead simply requiring operators to operate the instruments according to the manufacturer's specifications. Also, the BLM requirements define ''leak component'' slightly more broadly than the EPA definition of ''fugitive emissions component.'' For existing equipment that is not also subject to the EPA requirements, the final rule provides operators the choice of complying with the EPA or the BLM requirements, allowing operators to comply with a single set of requirements for all of their sources if they so choose, or to comply with the somewhat less prescriptive BLM requirements with respect to their existing sources.

With respect to State leak detection requirements, the BLM notes that because requirements differ both among the individual States and between the EPA and the individual State rules, it is not possible to align the BLM requirements with all of the other potentially applicable requirements. In addition, the BLM does not believe it is appropriate to exempt operators from the BLM requirements if they are subject to any State requirement relating to leak detection, as some commenters suggested. That approach would not ensure achievement of an equivalent reduction in gas losses. Instead, the final rule has a variance provision that allows State or local requirements to substitute for any of the BLM requirements under these rules, upon a showing that the State or local requirement at issue would perform at least equally well in terms of reducing the waste of oil and gas, reducing environmental impacts from venting and or flaring of gas, and ensuring the safe and responsible production of oil and gas.

C. Liquids Unloading at New Wells

1. Requirements of Final Rule and Changes From Proposed Rule

The requirements to reduce venting from liquids unloading activities at natural gas wells are generally discussed in Section VII. Section by Section. This section highlights one significant change to those provisions from the proposed rule. In the final rule, liquids unloading activities at new wells are subject to the same best practices and reporting requirements as those at existing wells. The BLM had proposed to prohibit liquids unloading through manual well purging at new wells drilled after the effective date of the rule, but we are not carrying this proposal forward into the final rule.

2. Significant Comments

Comments: Many commenters opposed the proposed well purging prohibition for wells drilled after the effective date of the rule. These commenters stated that even with optimized liquids unloading management and a highly sophisticated automated system, some purging would still be necessary. One commenter asserted that there are a large number of different technologies, tools, and practices for liquids unloading that are matched to an individual well's characteristics at each stage of its lifecycle (*e.g.,* wellbore design, tubular design and condition, use of packers, and the frequency of unloading needed to maintain or increase production), and that no single technique will be adequate or appropriate across the full lifecycle of a well. Others argued that it is inappropriate to have different standards apply to similar wells depending on the date on which they are drilled.

Several commenters apparently assumed that the prohibition on well purging would effectively require operators to install a plunger lift system during initial well construction, and these commenters provided multiple reasons that would not be appropriate. First, they asserted that new wells are not likely to require liquids unloading until later in the life of the well. Second, they argued that the characteristics of the well at the time that deliquification is needed impact the technical feasibility and cost of using methods other than purging for liquids unloading, and that operators are not likely to know during initial construction which option is optimal. Third, commenters contended that installing plunger lift systems at initial construction would also ''lock in'' technology choices that may preclude the use of more appropriate or improved technology when deliquification is needed. Lastly, commenters asserted that even if equipment was installed on new wells to accommodate plunger lifts, by the time liquids unloading is required, the equipment may need to be fixed or replaced.

Other comments supported BLM's proposal to prohibit purging during liquids unloading activities at new wells. They stated that operators could effectively design wells and deploy mitigation technologies in a way that would eliminate emissions, and that these technologies are cost effective. Citing datasets showing that a small minority of wells are responsible for a large amount of venting during liquids unloading events, these commenters also argued that the BLM should address this issue by applying the purging prohibition to these high-emitting existing wells as well.[116]

Response: Upon reviewing the information provided by the commenters, the BLM has determined that it is not appropriate to prohibit manual well purging at new wells. It is often less expensive to design in performance specifications (such as no purging) than to retrofit an existing source. However, in this case, the BLM agrees with commenters that there is no single technology or set of technologies that could appropriately be deployed at all new gas wells to avoid manual purging later in the well's life. The BLM did not intend the proposed purging prohibition to force all new wells to install plunger lift systems, and we do not believe that would be a cost-effective way to minimize venting from liquids unloading activities.

D. Variances Related to State and Tribal Regulations

1. Requirements of Final Rule

Like the proposed rule, the final rule provides a variance procedure to allow an equally or more effective State, local government, or tribal requirement to substitute for the comparable BLM requirement under this subpart. The BLM may grant a variance request submitted by a State or tribe if the BLM State Director finds that the State, local government, or tribal rule or regulation would perform at least as well as the relevant provision of the BLM rule in terms of reducing waste of oil and gas, reducing environmental impacts from venting and/or flaring of gas, and ensuring the safe and responsible production of oil and gas.

The rule identifies what a State or tribe would need to include in a request for a variance. The request must identify the provision or provisions of the BLM requirements from which the State or tribe is requesting a variance, and must identify the State, local, or tribal provisions that would substitute for the BLM provision or provisions. The variance request must also explain why the variance is needed, and demonstrate how the State, local or tribal rules would perform at least as well as the BLM provisions they would replace.

2. Changes From Proposed Rule

The variance provisions in the final rule largely track the proposed rule, with a few additions and clarifications. The criterion for approval of a variance request in the proposed rule was a determination that the State or tribal regulation ''meets or exceeds the requirements of the provision(s) from which the State or tribe is requesting the variance.'' The final rule requires instead a finding that the State or tribal rule ''would perform at least equally well in terms of reducing waste of oil and gas, reducing environmental impacts from venting and/or flaring of gas, and ensuring the safe and responsible production of oil and gas, compared to the particular provision(s) from which the State or tribe is requesting the variance.'' The final rule changes the phrase ''any individual provision of this subpart'' to ''any provision(s) of this subpart,'' to make clear that a variance request can apply to a specific provision or a group of provisions.

The final rule also: Allows local government requirements, in addition to State and tribal requirements, to support a variance request and substitute for BLM requirements; adds a requirement that the State or tribe must notify the BLM of any substantive changes to the State, local government, or tribal rules to be applied under the variance; and clarifies that a variance allows State, local government, or tribal rules to apply in place of the BLM requirements, but does not eliminate Federal enforcement of waste prevention requirements on Federal or Indian leases, units, or communitized areas. Rather, under a variance, the BLM has the authority to enforce the rules identified by the State, locality, or tribe as if the requirements were BLM regulations. The final rule further clarifies that State, local, and tribal enforcement of their own regulations would not be affected by the BLM's approval of a variance.

3. Significant Comments

a. Criteria for Variance Approval and Scope of Variance

Comments: Several commenters expressed concerns with the proposed criteria for BLM approval of a variance request. Many commenters stated that a patchwork of State, Federal, and tribal regulations could cause compliance difficulties and confusion for both the regulators and the regulated entities. These commenters requested that the variance approval criterion be less restrictive, and opposed the proposed language stating that the State or tribal regulation must ''meet or exceed'' the requirements of this rule. Stating that many of the State and tribal regulations that limit venting and flaring are qualitative, not quantitative, commenters asserted that determining what ''meets or exceeds'' the BLM's requirements would be arbitrary. Instead, some commenters suggested that the BLM change the language to ''is consistent with the intent of,'' stating that this would allow State regulations that meet the intent of the proposed rule, and are adequate and complete in achieving similar goals, to meet the variance criterion.

Other commenters suggested changes to make the variance application and approval process more restrictive, or opposed allowing variances altogether. One commenter supported the proposed criteria for approval but suggested strengthening this requirement by specifying how the BLM would evaluate the relative effectiveness of the State program, for example by requiring additional data or modeling to support a variance request. Commenters also requested that variance requests be made publicly available, and that there be an opportunity for the public to comment on the requests.

Several commenters suggested that variances should be allowed for all provisions and for entire State programs, stating that this approach would eliminate an involved process requiring variance requests for specific provisions. Others raised concerns about allowing a programmatic variance, and urged the BLM to limit variances to specific provisions of the rule or allow for a variance only when the State and BLM requirements are duplicative. They noted that in many cases State regulations do not address all of the areas covered by the BLM rule—*i.e.,* venting, flaring, and leaks—and State and tribal regulations may also not cover the same specific sources of these losses as the BLM rule.

Response: The BLM agrees that it could be helpful to add further detail to the proposed criteria for approving a variance. In addition, the BLM agrees that it could be helpful to clarify whether several provisions could be considered together and be found, in combination, to meet the criteria for

[116] *See* EDF, *Comments on Proposed Regulation Order Article 3: Greenhouse Gas Emission Standards for Crude Oil and Natural Gas Facilities: Part II of Comments* 8 (May 22, 2015), *available at http://www.arb.ca.gov/cc/oil-gas/meetings/EDF_5–22–15.pdf.*

approving a variance. The BLM has revised the variance provisions to address both of these issues.

First, the goal of the variance provision is to allow State, local, or tribal regulations to substitute for the BLM requirements where they will produce benefits at least equivalent to the expected benefits of the BLM regulations. The final rule spells out this criterion by identifying three key benefits of the BLM rules: (1) Reducing waste of oil and gas; (2) reducing environmental impacts from venting and/or flaring of gas; and (3) ensuring the safe and responsible production of oil and gas. To replace provisions of the BLM rule with a State or tribal requirement, the State or tribe must demonstrate that their rules would perform at least as well in achieving these benefits.

The final rule would allow States and tribes to request variances for specific sets of provisions, as well as individual provisions. For example, a State that had a leak detection program similar to the BLM program, but with a different required inspection frequency, might request a variance for the frequency provisions or for the whole leak detection program. The State would need to demonstrate that even if the State or local program would identify a different set of leaks compared to the BLM program, overall the State or local program would be at least as effective as the BLM program in reducing an equivalent quantity of gas losses—which would, in turn, reduce waste, reduce the environmental impacts of venting, and enhance safe and responsible production.

The final rule provisions are not, however, structured to support a broad approval of a variance for an entire State, local, or tribal oil and gas production oversight program, and the BLM agrees with the commenters who raised concerns about such an approach. The BLM recognizes that all States and many tribes regulate various aspects of oil and gas production, but different States and tribes focus on different aspects of the production process and aim for different goals. For example, one State may primarily regulate flaring, while another aims primarily to reduce methane emissions from tanks. The focus on at least equivalent performance requires a specific look at the results achieved from a particular provision or set of provisions, and it would not allow approval of, for example, a stringent flaring regime to substitute for leak prevention requirements.

The final rule does not require that variance requests be made publicly available or that there be an opportunity for the public to comment on the requests. In the past, the BLM has not made individual variance requests publicly available or provided an opportunity for public comment.

b. Enforcement Under an Approved Variance

Comments: Commenters requested clarification on who would be responsible for enforcement if a variance were approved. Commenters stated variously that: The State or tribe should enforce the applicable State, local or tribal requirements; States and the BLM should establish memoranda of understanding for enforcement; or the BLM should retain authority to enforce any State, local, or tribal provision for which a variance is granted (noting that States or tribes might lack resources to operate effective enforcement programs).

Response: The final rule clarifies that the variance provisions allow operators to comply with State, local, or tribal requirements in lieu of BLM provisions where a variance has been approved, but the BLM is still responsible for enforcing those requirements insofar as they would replace the BLM requirements. As a practical matter, the BLM and States, localities, or tribes will likely enter into memoranda of understanding to coordinate enforcement activities and efficiently deploy enforcement resources, avoiding overlap or redundancy. Ultimately, however, the BLM remains responsible for ensuring that operators comply with Federal requirements, or in this case, State, local, or tribal requirements that the BLM deems to be an acceptable substitute for the Federal requirements.

This is in contrast to situations in which a Federal agency is authorized by law to formally delegate administration and enforcement of a regulatory program to a State agency. Here, the BLM is not delegating its regulatory or enforcement authority to the State, locality, or tribe. Rather, the BLM is recognizing that, in the absence of a variance, an operator would be required to comply with overlapping requirements. Where States, localities, or tribes have regulations in place that are different from, but at least as effective as, the BLM requirements, applying two sets of requirements is burdensome for operators and would not generate additional benefits. The variance process avoids the potential duplication and inefficiencies that could otherwise occur in this situation, while still holding the BLM responsible for ensuring that operators meet the requirements and produce the benefits for the public that would have been provided under the BLM regulations.

VI. Additional Significant Comments and Responses

This section summarizes and responds to some additional comments on the proposed rule, that, while significant, did not lead to major changes in the final rule, and that are more cross-cutting in nature than the provision-specific comments addressed in the Section VI. Section-by-Section. These include comments on: The interaction between the BLM rule and EPA regulations; the BLM's authority to require flaring of vented gas; when gas should be considered ''avoidably lost''; application of these requirements to units and communitized areas; delays in permitting for natural gas pipeline rights of way; and the interplay between this rule and the BLM's land use planning activities.

A. Interaction With EPA Regulations

Comment: Many commenters raised concerns about how the proposed BLM regulations would interact with EPA regulations on oil and gas production. Some commenters urged the BLM not to finalize some or all of the provisions of this rule, arguing that its provisions regulate air pollution, and that task should be left to EPA. Some of these commenters further suggested that if the BLM does regulate waste from oil and gas production, the BLM should exempt sources covered by the EPA regulations, and align its requirements with the EPA requirements where they overlap, to avoid duplication and inconsistencies. Some commenters highlighted specific provisions that could potentially overlap with EPA's requirements, and expressed concern about differences or conflicts between the two agencies' regulatory regimes.

Response: We discuss the necessity for BLM regulations to reduce waste from oil and gas production in section III.B.3.a of this preamble, and the BLM's legal authority for the rule in section III.C. The BLM agrees with commenters, however, that in those areas covered by both this rule and EPA requirements, the two sets of regulations should align to the maximum extent possible. We have addressed comments raising potential inconsistencies between the proposed BLM text in specific provisions and corresponding EPA text in sections VI.A of this preamble, and in the Section by Section discussion in section VII, where those specific provisions are discussed. The remainder of this section addresses comments on the generalized potential for duplication and overlap.

We do not believe that the final BLM and EPA rules impose conflicting requirements on operators, and we further believe that we have addressed issues of regulatory overlap. First, much of this rule regulates activities or areas that are not regulated by EPA. This includes the rule's provisions on routine flaring during the oil and gas production process, well maintenance and liquids unloading, well drilling, well testing, emergencies, royalties due on lost gas, royalty rates, measurement and reporting of lost gas, and operators' royalty-free use of gas. Second, where both EPA and the BLM regulate an activity, the rules largely apply to different sources. In particular, the BLM requirements on venting from pneumatic controllers, pneumatic pumps, and storage vessels all explicitly apply to existing sources that are *not* subject to EPA's subpart OOOOa, but would be subject to that rule if they were new, modified, or reconstructed sources. In addition, even where the BLM and EPA requirements address the same type of activity, but apply to different sources (existing (BLM) versus new, modified, or reconstructed (EPA)), the agencies have worked together to align the text and substance of the requirements as closely as practicable.

Third, in those few instances in which both agencies regulate an activity and could potentially cover the same source—specifically well completions and leak detection—the BLM final rule provides that an operator can comply with just one set of requirements. Specifically, the rule aligns the BLM's requirements with the corresponding EPA requirements to a substantial degree, and also provides that an operator will be deemed to be in compliance with the BLM rules if the operator complies with the applicable requirements of subpart OOOOa.

Comment: Commenters noted that in addition to the existing EPA regulations of new, modified, and reconstructed air pollution sources at oil and gas facilities, EPA announced in March 2016 its intention to regulate *existing* oil and gas sources under CAA section 111(d), and EPA is currently developing an information collection request (ICR) as the first step in that process. Commenters argued that this EPA action negates any argument that the BLM rule is necessary to address emissions from the existing sources that subpart OOOO and subpart OOOOa do not cover.

Response: The ICR and EPA's intention to conduct a rulemaking under CAA section 111(d) are discussed in detail in section III.B.3.a of this preamble. In summary, establishing emission reduction requirements for existing sources under the CAA would entail the following steps:

- EPA issues a final ICR;
- Industry submits the required information;
- EPA develops and proposes a rule under CAA section 111(d);
- EPA reviews public comment on that proposal and finalizes the CAA section 111(d) rule;
- Because rules under section 111(d) do not have independent effect but are implemented by States, States then develop and submit to EPA State plans to implement the 111(d) rule (a process that generally requires State rulemaking and may require State legislation);
- EPA approves the State Plan (or prescribes a Federal implementation plan where the State fails to submit a satisfactory plan); and
- Industry implements the requirements in time to meet compliance deadlines established in the State plans.

Clearly, it will be many years before existing sources in this sector are subject to binding requirements under CAA section 111(d), and it is not yet evident what shape those requirements will take. Given the substantial uncertainty surrounding the timing and content of any EPA regulation of existing oil and gas sources, the BLM has both the authority and the obligation to act now to rein in the ongoing waste of large quantities of public and Indian natural gas.

B. Authority To Require Flaring of Gas

Citing several specific provisions of the proposed rule that would require operators to flare rather than vent gas that is not captured for sale or use, including the venting prohibition and provisions on storage tanks, several industry commenters asserted that the BLM lacks the authority to require flaring instead of venting of Federal and tribal gas. These commenters argued that the BLM's sole authority is to prevent waste, and a provision that requires flaring rather than venting does not aim at waste prevention because shifting from venting to flaring does not conserve the gas. The sole purpose of such provisions, these commenters asserted, is to regulate air pollution and GHG emissions. Commenters further asserted that regulation of air pollution and GHG emissions is the exclusive province of the EPA, and by extension, the BLM may not regulate in this arena.

For several reasons, the provisions of the rule that require flaring instead of venting are within the BLM's statutory authority. First, as noted above, the MLA grants the BLM the authority to promulgate rules for the prevention of undue waste or for safety purposes.[117] As explained further in the Section by Section analysis in Preamble Section VII, each provision of this rule that requires flaring rather than venting is a waste prevention and/or a safety measure. For instance, the requirement to flare and not vent high-pressure associated gas constitutes waste prevention because any flaring at a given well will likely cause the operator to capture more gas at its other wells in order to stay within the capture percentage under § 3179.7. These provisions therefore fall comfortably within the BLM's waste prevention and safety authority under the MLA, irrespective of the BLM's environmental mandate.

Second, as discussed above, the MLA and FLPMA grant BLM the authority to regulate oil and gas development on the public lands, including to protect the public's interest in other natural resources and the quality of the environment.[118] In its traditional role as manager of the public lands and steward of publically owned resources, BLM must regulate the development of federally owned oil and gas deposits pursuant to principles of multiple use and sustained yield.[119] Under those principles, BLM may consider air quality and GHG emissions when deciding how to regulate mineral-development operations. FLPMA expressly declares that BLM should balance the need for domestic sources of minerals against the need to protect the quality of ''air and atmospheric'' resources.[120] Furthermore, as part of its resource management plans, the BLM has recently exercised its authority under FLPMA to include emission mitigation standards for oil and gas operations.[121]

---

[117] The BLM has acted on the latter authority since DATE: longstanding rules promulgated under the MLA require the operator to ''perform operations and maintain equipment in a safe and workmanlike manner'' and ''take all precautions necessary to provide adequate protection for the health and safety of life and the protection of property.'' 43 CFR 3162.5–3.

[120] 43 U.S.C. 1701(a)(8), (a)(12).

[121] *See, e.g.,* BLM Tres Rios Field Office, *Resource Management Plan and Record of Decision* at II–63 (Feb. 27, 2015), *available at http://www.blm.gov/style/medialib/blm/co/field_offices/san_juan_public_lands/land_use_planning/approved_lrmp.Par.66402.File.dat/Part%20II%20-%20RMP%20Chapter%202.pdf* (setting forth specific standards to mitigate oil and gas emissions that will apply to all approved site-specific projects, including NOx limits for engines, use of ''green completions technology,'' storage tank controls designed to achieve 95% emission reduction, and use of low or no-bleed pneumatics).

Third, the rule's provisions requiring flaring rather than venting further the BLM's trust responsibilities with respect to Indian oil and gas development because they will prevent the waste of gas and will reduce the environmental impacts to Indian lands from oil and gas development. The BLM believes that these provisions, like all the provisions in this rule, are in the best interest of Indian mineral owners and that the extension of these provisions to oil and gas production from Indian lands is therefore justified.

Finally, while the CAA indeed delegates responsibility for implementing its air pollution and GHG emissions control program to EPA, nothing in the Act bars the BLM from considering air pollution and GHG emissions when deciding how to regulate the development of federally owned oil and gas deposits. The EPA and the Department of the Interior have distinct statutory authorities and missions that may, in some cases, result in overlapping policy goals. This rule does not infringe on EPA's prerogative to regulate air quality through source-specific performance standards and cooperation with State partners. Nor does EPA's authority infringe on or otherwise restrict the BLM's mandate to prevent waste from and manage the environmental impacts of activities on public lands and using public resources. The CAA does not displace other Federal agencies' Congressionally-granted authority to address environmental and climate change concerns.[122] Congress may grant agencies overlapping spheres of authority, and such agencies merely have a responsibility to coordinate with each other.[123] The BLM has worked closely with EPA to ensure that this rule and EPA's subpart OOOO and subpart OOOOa regulations harmonize to the maximum extent practicable.

C. ''*Avoidably Lost*'' *Oil or Gas*

As noted above, the MLA requires royalties on oil and gas to be paid as a ''percent in amount or value of the production removed or sold from the lease.'' [124] As interpreted in a judicial decision addressing waste prevention regulations issued by the Department in the 1970's,[125] production ''removed or sold from the lease'' does not include oil or gas that is ''unavoidably lost'' during production. ''Avoidably lost'' oil or gas, on the other hand, constitutes waste and is subject to royalties. As explained in the preamble to the proposed rule, NTL–4A distinguished between ''avoidably lost'' and ''unavoidably lost'' oil and gas, though it defined those terms in a general way that was subject to inconsistent application.[126] In § 3179.4, this rule clarifies the distinction between ''avoidable'' and ''unavoidable'' losses by limiting ''unavoidable'' losses to specific circumstances in which the operator has not been negligent and has complied fully with applicable laws, lease terms, and regulations. Industry commenters objected to this approach on the ground that whether a loss of oil or gas is ''avoidable,'' and therefore royalty-bearing under the MLA, requires a case-by-case evaluation of a lessee's reasonableness in light of the economic circumstances. That is, they argued that a loss of oil or gas should be deemed ''unavoidable'' if taking measures to avoid the loss would have been ''uneconomic'' from the operator's perspective.

For several reasons, the BLM did not change the final rule based on these comments. As an initial matter, there is no statutory or jurisprudential basis for the commenters' position that the BLM must conduct an inquiry into a lessee's economic circumstances before determining a loss of oil or gas to be ''avoidable.'' Although the BLM's practice under NTL–4A has generally been to engage in case-by-case economic assessments before making avoidable/unavoidable loss determinations, the BLM has not always done so [127] and is not legally required to do so. Furthermore, in the absence of clear statutory language or legislative history delineating what should be considered ''avoidably lost'' oil or gas under the MLA, the BLM's past practice does not prohibit it from revising its interpretation of that term. Finally, FOGRMA provides BLM with an independent statutory authorization to impose royalties on oil or gas lost as a result of an operator's negligence or failure to comply with any rule or regulation issued under the mineral leasing laws, without further economic analysis. Specifically, section 308 of FOGRMA, provides that ''[a]ny lessee is liable for royalty payments on oil or gas lost or wasted from a lease site when such loss or waste is due to negligence on the part of the operator of the lease, or due to the failure to comply with any rule or regulation, order or citation issued under this Act or any mineral leasing law.[128]

Some commenters argued that the BLM's existing interpretation of what constitutes an ''avoidable loss'' has become a ''fundamental term'' of the BLM's existing oil and gas lease contracts upon which lessees relied in entering into the contracts and making subsequent business decisions. Citing *Mobil Oil Exploration & Producing Southeast, Inc.* v. *United States,* 530 U.S. 604 (2000), commenters argued that the proposed rule would substantially impair the value of their lease contracts and therefore subject the BLM to contract damages or takings claims.

On the contrary, in promulgating this final rule the BLM is acting within its authority under the MLA and thus within the terms of existing leases. First, the MLA requires lessees to ''use all reasonable precautions to prevent waste of oil or gas,'' [129] and provides the Secretary with the continuing authority to ''prescribe necessary and proper rules and regulations'' in order to carry out the purposes of the MLA.[130] The MLA further requires that each lease contain a provision ''that such rules . . . for the prevention of undue waste as prescribed by [the] Secretary shall be observed.'' [131] The BLM's standard form lease makes clear that the rights granted to the lessee are ''subject to . . . the Secretary of the Interior's regulations and formal orders in effect as of lease issuance, *and to regulations and formal orders hereafter promulgated* when not inconsistent with the lease rights granted or specific provisions of [the] lease.'' [132] Both the

[131] 30 U.S.C. 187.

[132] BLM Form 3100–11 (emphasis added).

plain meaning of this language and the BLM's longstanding interpretation of it extend to ''incorporat[ing] future regulations, even though inconsistent with those in effect at the time of lease execution, and even though to do so creates additional obligations or burdens for the lessee.'' [133] The BLM's legal and contractual authority to update its regulations governing oil and gas leases should thus foreclose successful breach of contract claims based on this rule.

The *Mobil Oil* decision cited by commenters is not pertinent. In that case, a permitting delay mandated by a subsequently enacted statute constituted a breach of the lease because the terms of the lease did not subject it to the burdens of such later-enacted statutes.[134] Today's rule constitutes a ''hereafter promulgated'' regulation to which Federal oil and gas leases are expressly subject. The application of this rule to existing lessees, therefore, does not breach their contract rights because their existing leases incorporate the rule by reference.

That said, the BLM is cognizant that some of the requirements of this rule may pose more substantial burdens for existing lessees than for future lessees, because future lessees can take account of the requirements of the rule in making their leasing decisions. Accordingly, certain sections of the rule, including sections 3179.8 and 3179.201, are structured to reduce the burden on existing lessees. For further discussion of these provisions, see Section VII, Section by Section.

D. Application to Units and Communitized Areas

Some commenters objected to the application of this rule to operations on State and private tracts that are committed to a Federally-approved unit or communitized area. These commenters admit that the BLM has the authority under FOGRMA to regulate oil and gas activities on such tracts for the purposes of royalty accountability, but fail to recognize the various royalty-accountability purposes of this rule, including identifying and imposing royalties on wasteful losses of oil and gas, clarifying the circumstances under which production may be used royalty free, and setting measurement standards for venting and flaring (some of which is royalty bearing). More to the point, though, these commenters did not explain why the BLM's waste prevention authority under the MLA does not extend to the waste of Federal oil and gas that occurs on non-Federal tracts in a Federally-approved unit or communitized area. Commenters cited the BLM's decision not to apply Onshore Oil and Gas Order No. 1 (''Order 1'') to operations on non-Federal lands in units and communitized areas [135] as evidence that the BLM lacks authority to apply this rule to such lands. However, the cited passage from the preamble to Order 1 did not address the scope of the BLM's regulatory authority with respect to non-Federal tracts in Federally-approved units and communitized areas; rather, the passage addressed what was ''appropriate'' in light of the jurisdictional limitations contained in 43 CFR. § 3161.1.

Commenters also asserted that because the regulation of State and private minerals is under the jurisdiction of the States, the BLM lacks the authority to apply its waste prevention regulations to units and communitized areas in a manner that would affect the production of State and private minerals unitized or communitized with Federal minerals. While the BLM agrees that the regulation of State and private minerals is under the jurisdiction of the States, the BLM does not agree that States' jurisdiction over State and private minerals precludes the BLM from promulgating a waste prevention regulation that has incidental impacts on State and private minerals unitized or communitized with Federal or Indian minerals. The purpose of this rule is to ensure that operators take reasonable precautions to prevent the waste of Federal and Indian oil and gas, a matter that BLM has the authority to regulate pursuant to its statutory and trust responsibilities described in Section III.C.

The fact that States and private parties have chosen to enter into unitization or communitization agreements whereby State or private oil or gas is commingled with Federal or Indian oil or gas, and produced concurrently with Federal or Indian oil or gas, does not deprive the BLM of its authority to impose reasonable waste prevention requirements on operators producing Federal or Indian oil or gas.

E. ROW Permitting

Under section 28 of the MLA, the BLM is responsible for granting most of the ROWs for oil and natural gas gathering, distribution, and transportation pipelines and related facilities on public lands. Specifically, the BLM has ROW approval authority for ROWs that cross lands administered by the BLM, or lands administered by two or more Federal agencies,[136] except lands in the National Park System or lands held in trust for Indians or Indian tribes.[137]

Several commenters expressed concern that they have experienced significant delays in obtaining ROW approvals for gathering lines, and that these delays impede producers' ability to capture and sell gas. These commenters stated that the BLM should streamline the ROW approval process. They asserted that accelerating the permitting process for pipeline ROWs would allow energy producers to more easily capture and market gas that might otherwise be flared due to a lack of infrastructure. Some commenters further asserted that the BLM could quickly and easily reduce flaring by processing ROWs in a timely manner, and that streamlining ROW permitting would provide a more cost-effective solution to the problem of gas waste than imposing the requirements in the proposed rule.

Commenters suggested several ways in which the BLM could increase permitting speed for gas gathering lines on Federal land. One commenter stated, for example, that the BLM should expand the use of categorical exclusions under the National Environmental Policy Act (NEPA) when permitting gas gathering lines, and another suggested using a ROW ''corridor'' approval approach, so that small adjustments in a project footprint would not delay the full approval process.

The BLM's experience is that while processing time for ROW applications can sometimes be an issue, particularly in a handful of offices where staff retention has been difficult over the past few years, processing time is not the primary cause of the large volume of current flaring. For example, BLM data indicate that many applications to flare gas come from wells that are already connected to pipeline infrastructure, or for which operators are not seeking ROWs to build new pipelines. For instance, in Dickinson, North Dakota, large volumes of gas are being flared from over 1,700 Federal and Indian oil wells,[138] yet the local BLM field office

[138] Based on internal BLM analysis of North Dakota activity from AFMSS queried on April 16, 2015.

currently has just four ROW applications pending.

While the BLM data indicate that the current speed of the BLM's ROW processing is not a significant factor in the rate of flaring at most wells, the BLM recognizes the importance of timely ROW approvals and continues to make improvements aimed at increasing the efficiency of the ROW permitting process. A variety of factors, some in the BLM's control but some beyond the BLM's control, can impact the timely approval of ROWs and other actions that may be needed to construct a pipeline or gas processing facility. For example, fee land owners may delay or block a pipeline project that crosses both public and private lands, even when the Federal portion of the ROW is permitted. The time period for permitting ROWs may also be extended if, for example: The ROW grant is pending consultation or concurrence from another agency, *e.g.,* pursuant to the Endangered Species Act or Section 106 of the National Historic Preservation Act; the ROW application is incomplete; the corresponding APD has not yet been processed; or a high volume of applications is submitted in a short period of time.

Last year, the BLM instituted key program changes to more quickly process pending oil- and gas-related ROW applications, and we have seen progress as a result of these efforts. These steps included using strike teams to add additional permit-processing resources at high-volume offices, working with the Office of Personnel Management to identify pay strategies to address staff shortages in key offices, and increasing formal training for critical staff. Additionally, particular field offices are actively pursuing other actions to decrease permitting times, including: (1) Coordinating aspects of the pipeline ROW and corresponding APD reviews, so that they occur concurrently rather than consecutively; (2) working with project proponents to minimize surface disturbance to help expedite environmental reviews; (3) fully and consistently utilizing applicable Categorical Exclusions to NEPA to streamline reviews; (4) encouraging project proponents to develop oil and gas Master Development Plans and Master Leasing Plans as well as right-of-way Master Agreements, which are negotiated with a single applicant for processing and monitoring multiple applications covering facilities within a specific geographic area; (5) encouraging unitization to help streamline permitting by avoiding the need for multiple ROWs (or potentially for any ROW at all, if the gas can be gathered and transmitted without crossing Federal or Indian land); and (6) working closely with proponents to determine which projects are priorities.

F. Planning

Finally, many stakeholders requested that the BLM address waste reduction through requirements under the MLA relating to the BLM's land use planning and environmental review processes. Commenters stated that the BLM should use its authority to reduce waste by proactively using all available planning, analysis and permitting tools including Applications for a Permit to Drill (APDs); lease stipulation decisions in resource management plans (RMP); master leasing plans (MLPs); waste minimization plans (WMPs); and unitization agreements. Commenters also stated that the proposed rule fails to exercise the BLM's full authority at the planning and leasing stages, and further, that land-use planning should be used to support well-planned fossil fuel development that would, for example, limit the leasing of lands where infrastructure constraints are expected to be significant, so as to minimize the need for venting or flaring of associated gas.

Commenters asserted that if the BLM conducted more robust NEPA reviews prior to oil and gas development, the reviews would identify additional waste reduction opportunities. Commenters further requested that the rules governing development of RMPs be modified to support the intended purpose of the rule to capture gas and prevent venting or flaring. These commenters also asserted that detailed, site-specific MLPs can support methane capture and waste minimization once an RMP is in place.

Commenters disagreed with the BLM's decision not to propose changes to the BLM land use planning regulations as part of this rulemaking. They suggested that the BLM's failure to link the proposed rule to the BLM's foundational planning and management framework misses opportunities to foster orderly and efficient development of oil and gas that would prevent methane pollution and waste. Some commenters suggested that although changes to the BLM's land use planning rules are not required to enhance the use of planning mechanisms available to the BLM when developing RMPs and MLPs, referencing these tools in the final rule would emphasize their importance.

While the BLM is not making changes to the BLM land use planning regulations or NEPA review processes as part of this rulemaking, as stated in the preamble to the proposed rule, the BLM agrees that the land use planning and NEPA processes are critical to achieving our simultaneous goals of responsible oil and gas development, land stewardship and resource conservation, and protection of air quality on (and reduction of air emissions from) Federal lands.

The BLM already has land use planning and NEPA tools and processes in place that can be used to help achieve the specific goals of this rulemaking—to reduce the wasteful and environmentally harmful loss of gas through venting, flaring, and leaks. The BLM conducts NEPA analyses for both regional planning decisions and project level decisions. These analyses take a hard look at the direct effects, indirect effects, and cumulative effects of the proposed federal action on various resources during the land use planning or project approval process, such as the effects on wildlife, air quality, or recreation opportunities. The BLM's NEPA analyses also quantify GHG emissions associated with the proposed planning decision alternatives under consideration. In particular, the land use planning and NEPA processes for new RMPs and MLPs provide important opportunities to consider the effects of oil and gas development over a larger area and to optimize planned development to minimize impacts from venting and flaring, among other activities. The planning process gives the BLM the opportunity to consider how a specific land management plan could address the timing and location of development of oil and gas and related infrastructure, such as pipelines, and the projected consequences of such decisions in terms of the quantities of vented and flared gas and the impacts associated with those emissions.

Thus, the BLM already has the NEPA processes and tools in place to evaluate the effects of the gas that would be flared, vented, and leaked from proposed oil and gas production, including impacts to wildlife and air quality, as well as GHG emissions, which contribute to climate change. The NEPA analyses can also identify ways to minimize such effects, such as evaluating alternative options for siting and timing of development that would maximize the opportunities for gas capture in lieu of flaring.

In addition, the BLM is in the process of completing a comprehensive update to its land use planning regulations, which should further enhance the opportunities to address gas waste in new oil and gas production approvals. The BLM proposed its new planning regulations in February 2016. The proposed changes would boost public participation and facilitate earlier stakeholder engagement in the planning process. For example, the new planning regulations would provide for a planning assessment at the initiation of an RMP, which would involve stakeholders and other agencies in identifying key issues and obtaining better data early in the process. These new regulations would also enhance the existing opportunities for stakeholders to highlight options to reduce waste from proposed oil and gas production in BLM land use planning.

G. Exemptions Through Sundry Notices

Some commenters expressed concerns that because the rule provides for operators to request various exemptions through submission of Sundry Notices to the BLM, these provisions could impose a paperwork burden on operators and the requests could be difficult for the BLM staff to process in a timely manner. The BLM believes that the number of requests for exemptions will be fairly limited, as the BLM's analysis does not indicate that the costs of these provisions will be substantial for the vast majority of operators. Nevertheless, the BLM recognizes that these are valid concerns, and is committed to minimizing unnecessary paperwork burdens on operators and continuing to streamline its own operations.

Thus, the BLM is providing here some additional information regarding how we expect operators to submit requests and how we may process them, and we will provide additional guidance as we move forward to implement the final rule. Concerns have been raised in this regard with respect to requests for exemption from multiple requirements of the rule for a lease. Specifically, operators have asked whether they could submit a single request for an exemption from multiple provisions of the rule, and how the BLM would evaluate it. The final rule requires an operator to make a demonstration that each requirement for which the operator is requesting an exemption would itself cause the operator to cease production and abandon significant recoverable reserves on the lease. An operator could not simply add up the costs of compliance with multiple requirements of the rule to show that the cumulative costs of the requirements would cause the operator to cease production and abandon significant recoverable reserves under the lease, and thereby obtain an exemption from all of those requirements. In making the showing for a specific requirement, however, the operator could take into account as part of the baseline costs any requirements of the rule for which an exemption is not being requested. In addition, to the extent that there is common data supporting multiple exemption requests, such as the data on production and revenues from a given lease, the BLM intends that an operator would be able to provide that data once on a single submission containing a separate showing for each of the specific requests, rather than providing multiple separate submissions.

VII. Section by Section

This section discusses the final rule provisions, substantial changes from the proposed rule, and some of the most significant comments received. Public comments not addressed in this section or elsewhere in this preamble are addressed in the separate Response to Comments document, which is available on the BLM Web site and is part of the rule-making record.

Part 3100

Section 3103.3–1 Royalty on Production

The final rule's amendments to existing 43 CFR 3103.3–1 focus on existing § 3103.3–1(a)(1), and do five things: (1) Remove two provisions of the existing regulations that are no longer necessary (§ 3103.3–1(a)(1)(i) and (ii)); (2) add a new § 3103–1(a)(2); (3) specify that the royalty rate on all leases existing at the time the rule becomes effective will remain at the rate ''prescribed in the lease or in applicable regulations at the time of lease issuance''; (4) specify the statutory rate of 12.5 percent for all noncompetitive leases issued after the effective date of the final rule; and (5) conform the regulatory regime for competitive leases issued after the effective date of the rule to the regime envisioned by the MLA, which specifies that the royalty rate for all new competitively issued leases be set ''at a rate of not less than 12.5 percent.''[139] All of these changes were in the proposed rule.

The final rule also renumbers existing § 3103–1(a)(2) and (a)(3) as § 3103–1(a)(3) and (a)(4) and makes minor changes to existing § 3103–1(a)(3)) (final § 3103–1(a)(4)) for clarity.

Additionally, the final rule reprints existing §§ 3103–1(b) and (c), for clarity. Finally, the BLM made a minor revision to § 3103.3–1(d) from the proposed rule. To improve the clarity of this provision, final § 3103–1(d) adds the language ''from the gas stream'' in two places that address any helium component that is not conveyed with the mineral estate in a Federal oil and gas lease.

Several commenters stated that a new royalty rate above the current rate of 12.5 percent would create uncertainty in the leasing process, and would disadvantage Federal leases compared with State and private leases and disincentivize investments on Federal lands. One commenter objected to the proposed rule's use of the term ''base rate,'' because the BLM did not provide a definition of that term. The commenter also noted that the proposed rule does not describe the process by which the rate will be determined, to whom it will apply, or how and when it will be reevaluated and reset. One commenter noted that under the BLM's recent regulatory revision of Onshore Oil and Gas Order Number 3, the BLM proposes to authorize commingling allocations and approvals (CAAs) for properties with identical fixed royalty rates. The commenter suggested that a variable royalty rate would have the unintended consequence that most CAAs would not be approved.

Other commenters supported the BLM's proposal to ensure that the royalty rate of 12.5 percent represents a floor and not a ceiling. The commenters contended that this would allow the American public to receive a fair market return on their resources. Some commenters suggested that the royalty rate be raised to 18.75 percent to be in line with the royalty rate assessed on Federal offshore leases. Commenters also noted that the current rate is far below several state rates. One commenter suggested that the increase in royalty rate should be informed by the social and environmental costs of oil and gas production, including the social cost of methane emissions. Another commenter stated that if the BLM were to increase the royalty rate, it should be a constant rate, rather than a sliding scale, as this would reduce administrative and reporting burdens. Some commenters requested that the BLM set the royalty rate at least 60–90 days prior to any lease sale and publish notice in the **Federal Register** and the BLM Web site for public comment.

The BLM did not revise the rule in response to these comments. As stated in the proposed rule preamble, the BLM is not currently proposing to raise the base royalty rate for new competitively issued leases above 12.5 percent; rather, we are conforming the regulatory provisions governing royalty rates for new competitive leases to the

[139] Note that the rule renumbers current 43 CFR 3103.3–1(a)(2) and (3) but does not otherwise change the content of those provisions. Further, the rule does not alter 43 CFR 3103.3–1(b), (c), or (d). Those provisions are reprinted in this rule solely to clarify the numbering of the revised § 3103.3–1, and for ease of reference.

corresponding rate provisions in the MLA. The BLM would engage in additional process before raising the rate.

Section 3160.0–5 Definitions

This amendment to § 3160.0–5 deletes the definition of ''avoidably lost'' that by its terms applies to part 3160. A definition of ''avoidably lost'' is no longer needed for part 3160, and this definition is superseded by the provisions in new subpart 3179, particularly § 3179.4, governing when the loss of oil or gas is deemed avoidable or unavoidable. The BLM did not receive comments on removing this definition and is finalizing this deletion as proposed.

Section 3162.3–1 Drilling Applications and Plans

This section describes the requirements for drilling applications and plans, including the information that an operator must provide with an APD. The BLM is amending this section to add paragraph 3162.3–1(j), which requires that when submitting an APD for an oil well, an operator must also submit a waste minimization plan. Submission of the plan is required for approval of the APD, but the plan will not itself become part of the APD, and the terms of the plan will not be enforceable against the operator.

The purpose of the waste minimization plan is for the operator to set forth a strategy for how the operator will comply with the requirements of subpart 3179 regarding the control of waste from venting and flaring. The waste minimization plan must include information regarding: The anticipated completion date(s) of the proposed well(s); a description of anticipated production from the well(s); certification that the operator has provided one or more midstream processing companies with information about the operator's production plans, including the anticipated completion dates and gas production rates of the proposed well or wells; and identification of a gas pipeline to which the operator plans to connect.

Based on comments received requesting that the information required in the plans be streamlined, the final rule provides that certain kinds of information are only required if an operator cannot identify a gas pipeline with sufficient capacity to accommodate the anticipated production of the proposed well(s). This conditionally-required information includes: A gas pipeline system location map showing the proposed well(s); the name and location of the gas processing plant(s) closest to the proposed well(s); all existing gas trunklines within 20 miles of the well, and proposed routes for connection to a trunkline; the total volume of produced gas, and percentage of total produced gas, that the operator is currently venting or flaring from wells in the same field and any wells within a 20-mile radius of that field; and a detailed evaluation, including estimates of costs and returns, of potential on-site capture approaches.

Some commenters requested that waste minimization plans required by other states, such as North Dakota and New Mexico, should be allowed to satisfy the requirements set forth in this section. The BLM recognizes that some States have similar waste minimization plan requirements under State law. To the extent that an operator is already preparing, under State requirements, a waste minimization plan that meets all or most of the requirements for a waste minimization plan under section 3162.3–1, the BLM requirements should impose little additional burden on the operator. The operator would be able to submit the same plan to the BLM, supplemented as necessary to meet each of the requirements of section 3162.3–1.

Other commenters stated that the preparation and review of the waste minimization plans would be a burden both on applicants and the BLM, because in the commenters' view, the proposed rule significantly underestimated the number of plans that would be required and the time required to prepare them. The commenters asserted that the BLM can be slow in approving APDs, and argued that the review of the additional waste minimization plans could slow the process further. Other commenters suggested that the requirement to prepare a waste minimization plan be limited only to wells that anticipate flaring a high volume of associated gas after completion. The BLM disagrees with these comments and believes that requiring operators to prepare a waste minimization plan for all wells is a reasonable, low cost, and effective way to encourage operators to consider and plan for capturing gas before the development of every new well. As stated previously, however, the final rule streamlines some of the elements required in the plan. Further, the BLM presently plans to review the effectiveness of the plan requirement within 3 years after the final rule's effective date, to assess the costs to operators of preparing the plans, the costs to the BLM of reviewing the plans, and the effectiveness of the plans in driving flaring reductions at new wells.

Commenters also expressed concern that the waste minimization plan requirement could trigger the need for additional analysis under NEPA for non-federal/non-Indian wells within a unit or communitized area. Under existing regulations, wells that are not located on federal or Indian surface and do not pierce federal or Indian minerals are not required to obtain BLM's approval of an APD, even if those wells are within a unit or communitized area from which federal or Indian minerals are produced. Commenters were concerned that the requirement for a waste minimization plan would somehow require those wells to file APDs or subject them to NEPA.

The BLM believes these concerns are unfounded. Operators would be required to submit waste minimization plans only for wells that already require an APD under part 3160—*i.e.,* for wells that are located on federal or Indian surface or pierce federal or Indian minerals. Operators may need to incorporate information in their waste minimization plans regarding wells on a unit or communitized area that do not require APDs (*see, e.g.,* § 3162.3–1(j)(2)(ii), requiring anticipated production information for all wells on a multi-well pad). Also, to the extent that gas from a nonfederal mineral estate is mixed with federal or Indian gas, the waste minimization plan may effectively minimize waste of both federal or Indian and non-federal or non-Indian gas. However, nothing under this provision requires operators to file an APD for any well, much less extends the APD requirements under part 3160 to wells that are not located on federal or Indian surface and do not pierce federal or Indian minerals. Moreover, waste minimization plans are not enforceable, and BLM will only review and approve them in the course of acting on an APD. While the BLM will analyze potential indirect impacts of execution of the waste minimization plan as part of its NEPA analyses for APDs submitted after the rule takes effect, there is no independent federal action here that would trigger NEPA for a waste minimization plan separate from an APD. Other commenters stated that the BLM should strengthen the requirements of the waste minimization plans and make them enforceable. The BLM declined to do so. The BLM believes that waste minimization plans, like the environmental analyses performed under the National Environmental Policy Act, can drive significantly better outcomes by ensuring that the operator and midstream companies have more information at an earlier stage, to allow for better planning and coordination. To achieve that result, however, the plans must be quite detailed and contain all relevant information. The BLM believes that the plan's unenforceability helps achieve that outcome: Because the terms of the plans cannot be enforced against the operator, the BLM avoids creating an incentive for operators to develop very general plans with few specific details. Additionally, the BLM is concerned that circumstances could change between when the plan is developed and when well production begins, making strict adherence to the plan difficult. In such a circumstance, the existence of the plan would still be useful, because operators would have information at their fingertips that would enable them respond nimbly to the changed circumstance, but operators would not be held to the specific terms of the now outdated plan.

Commenters also requested that the BLM make the waste minimization plans publicly available. The BLM already publicly posts APDs for a period prior to approval, and we plan to post the waste minimization plans accompanying the APDs in the same manner, subject to any protections for confidential business information.

Subpart 3178—Royalty-Free Use of Lease Production

Section 3178.1 Purpose

This section states that the purpose of the subpart is to address circumstances in which oil and gas produced from Federal and Indian leases may be used royalty-free. This subpart supersedes those parts of NTL–4A pertaining to oil or gas used for ''beneficial purposes.''

The BLM received a comment on this section requesting that the BLM clarify whether the rule will replace all of NTL–4A, or just those parts ''pertaining to use of oil or gas for beneficial purposes.'' The BLM notes that Subpart 3178 replaces the portion of NTL–4A pertaining to the use of oil or gas for beneficial purposes and Subpart 3179 replaces the portion of NTL–4A pertaining to venting and flaring of produced gas, unavoidably and avoidably lost gas, and waste prevention. Together, the combined revisions to Subparts 3178 and 3179 supersede NTL–4A in its entirety. The BLM disagrees that the regulatory text requires clarification beyond what is stated here, and did not revise this section in response to this comment.

Section 3178.2 Scope of This Subpart

This section specifies which leases, agreements, wells, and equipment are covered by this subpart. The section also states that the term ''lease'' in this subpart includes IMDA agreements, unless specifically excluded in the agreement or unless the relevant provisions of this subpart are inconsistent with the agreement. In the final rule, in response to comments, the BLM edited proposed paragraph (a)(5) to clarify the list of items to which this subpart applies. Paragraph (a)(5) in the final rule provides that this subpart applies to wells and production equipment, and also, under specified circumstances, compressors. Additionally, the final rule omits proposed paragraph (a)(6) relating to coverage of gas lines, as the BLM has determined that gas lines do not ''use'' production for purposes of this subpart.

One commenter suggested replacing ''other facilities'' with ''production equipment,'' and suggested distinguishing compressors that promote production at the wellhead from those that promote pipeline flow. The BLM agrees that these suggested changes improve the clarity of the rule, and we have revised the text accordingly. The text now refers to ''production equipment'' and limits coverage to compressors that both are located on a lease, unit or communitized area and compress production from the same lease, unit or communitized area.

Commenters also suggested distinguishing among flow lines, gathering lines and transmission lines, and requested revisions to highlight the limits of the BLM's authority over gas lines. We believe that these comments are no longer applicable with the elimination of proposed paragraph (a)(6).

Section 3178.3 Production on Which Royalty Is Not Due

This section sets forth the general rule that royalty is not due on oil or gas that is produced from a lease or communitized area and used for operations and production purposes (including placing oil or gas in marketable condition) on the same lease or communitized area without being removed from the lease or communitized area. This section also treats oil and gas produced from unit PAs—that is, the productive areas on a unit—and used for operating and production purposes on the unit, for the same PA, in the same way. Units often include different PAs composed of multiple leases with varied ownership. This section therefore limits royalty-free use of gas from a particular PA to uses that are made on the same unit, to support production from the same unit PA. The reason for this limitation is to prevent excessive use of royalty-free gas by prohibiting a unit operator from using royalty-free production from one PA to power operations on, or treat production from, another PA on the same unit, to the benefit of different owners and to the detriment of the public interest.

As discussed below, § 3178.5 qualifies the general provisions of § 3178.3 by listing specific operations for which prior written BLM approval will be required for royalty-free use.

The BLM received a few relatively technical comments on § 3178.3, which are addressed in the Response to Comments document. The BLM did not make any changes to this section from the proposed rule.

Section 3178.4 Uses of Oil or Gas on a Lease, Unit, or Communitized Area That Do Not Require Prior Written BLM Approval for Royalty-Free Treatment of Volumes Used

This section identifies uses of produced oil or gas that will not require prior written BLM approval for royalty-free treatment. The uses listed in this section involve routine production and related operations. In addition, paragraph (b) clarifies that even when a use is authorized, the royalty-free volume is limited to the amount of fuel reasonably necessary to perform the operation on the lease using appropriately sized equipment. This ensures that royalty-free on-site use remains subject to the requirement to avoid waste of the resource.

While the royalty-free uses described here are generally similar to the uses identified as ''beneficial purposes'' in NTL–4A, this rulemaking further clarifies which uses warrant royalty-free treatment.

In addition, this section clarifies that hot oil treatment is an accepted on-lease use of produced crude oil that does not require prior approval to be royalty-free. In this treatment, oil is not consumed as fuel. Rather, after the oil is pumped back into the well to stimulate production, it is produced again. Although the use of produced crude oil for hot oil treatments on the producing lease, unit, or communitized area has historically been understood by the BLM and by operators as a royalty-free use, it is not specifically addressed in NTL–4A but is now included in this final rule.

As mentioned above, the BLM received comments requesting that other uses of oil or gas be identified as royalty-free, including fuel for power generation, pilot and assist gas, fuel for heating, fuel for ancillary equipment, fuel to treat gas to remove impurities, fuel to run completion and work over equipment, and gas used for gas lift. The BLM agrees that these uses are routine, and therefore should not require prior approval to be royalty-free.

Regarding using oil as a circulating medium in drilling operations, or injecting gas produced from a lease, unit PA, or communitized area into the same lease, unit, PA, or communitized area to increase the recovery of oil or gas, the BLM had proposed to include these uses in the list in § 3178.5 of uses requiring prior approval. As operators are already required to report the use of oil as a circulating medium in drilling operations under Onshore Order Number 1, and the use of gas for injection under applicable regulations in parts 3100, 3160 and 3180 of this title, however, the BLM has decided not to require prior approval for these uses. In addition to the injection of gas for the purpose of increasing the recovery of oil or gas, the BLM has added the injection of gas ''for the purpose of conserving gas'' as a royalty-free use that does not require prior written BLM approval under the final rule. Often, gas injection is used to enhance resource recovery by maintaining or slowing the reservoir pressure decline which leads to higher oil recovery. The BLM also understands that, in some circumstances, excess gas that cannot be captured and sold or used on lease may be injected in order to conserve the gas. This practice occurs in Canada's Bakken field. While not all reservoirs are conducive to gas injection, the BLM believes it important to provide that as an option to conserve any gas that can't be sold immediately.

Finally, this rule does not address some uses that are already defined as royalty-free under ONRR provisions, such as the royalty-free use of residue gas to fuel gas plant operations, as provided in 30 CFR 1202.151(b).

Overall, in response to comments received, the BLM made the following changes in the final rule:

- Modified paragraph (a)(1) to more broadly address the use of fuel to generate power, including the use of fuel to operate ''combined heat and power,'' which is a particularly efficient means of generating power from gas;
- Combined and modified proposed paragraphs (a)(2) and (a)(3) to include artificial lift equipment and completion and workover equipment;
- Renumbered the remaining paragraphs accordingly;
- Added use of gas as a pilot fuel or as assist gas for a flare, combustor, thermal oxidizer, or other control device, as paragraph (a)(5);
- Added treatment of gas to paragraph (a)(6); and
- Added two uses that will not require prior written BLM approval for royalty-free treatment, which were identified in § 3178.5 in the proposed rule as requiring prior approval: (1) Using oil as a circulating medium in drilling operations (paragraph (a)(8)), and (2) injecting gas produced from a lease, unit PA, or communitized area into the same lease, unit PA, or communitized area to for the purposes of conserving gas or increasing the recovery of oil or gas (paragraph (a)(9).
- Added injection of gas that is cycled in a contained gas-lift system, as paragraph (a)(10).

Section 3178.5 Uses of Oil or Gas on a Lease, Unit, or Communitized Area That Require Prior Written BLM Approval for Royalty-Free Treatment of Volumes Used

This section identifies uses of oil or gas that will require prior written BLM approval to be deemed royalty-free. The aim of this section is three-fold: (1) To ensure that the BLM retains discretion to grant royalty-free use where the BLM deems the use to be consistent with the MLA's royalty requirement for oil or gas that is produced and then removed from the lease and sold; (2) to increase uniformity in the administration of the royalty provisions by specifying circumstances that warrant particular BLM attention; and (3) to ensure the BLM's awareness of unusual uses that risk the loss or waste of oil and gas.

For all of the identified uses, operators will be required to submit a Sundry Notice requesting BLM approval to conduct royalty-free activities.

The potentially royalty-free uses identified in this section are as follows:

- *Using oil or gas that was removed from the pipeline at a location downstream of the approved facility measurement point (FMP).* The BLM anticipates that these situations will be quite rare because the tap that operators use to extract and measure gas is generally upstream of the FMP.
- *Using produced gas for operations on the lease, unit PA, or communitized area, after it is returned from off-site treatment or processing to address a particular physical characteristic of the gas.* Physical characteristics that might preclude initial use of gas in lease operations and necessitate off-lease treatment or processing include an unusually high concentration of hydrogen sulfide, or the presence of inert gases or liquid fractions that limit the gas's utility as a fuel. The operator will bear the burden of establishing the necessity of off-lease treatment.
- *Any other types of use for operations and production purposes which are not identified in § 3178.4.* This provision clarifies that the BLM retains discretion to consider approving royalty-free use under circumstances that are not now anticipated.

In response to comments described below, the BLM made the following three changes to the proposed rule requirements: (1) Removed proposed paragraphs (a)(1) and (a)(2) from this section and moved them to § 3178.4 (royalty-free without prior approval); (2) Added language to paragraph (2) (paragraph (4) in the proposed rule) to clarify that the provision applies to the physical characteristics of the gas ''that require the gas to be treated or processed prior to use''; and (3) Removed proposed paragraph (c) and added language to paragraph (b)(1) that indicates that royalties must be paid on volumes when the BLM disapproves a request for royalty-free treatment under this section, and that any approvals for royalty-free treatment will be effective from the date the request was filed. Each change is discussed below along with a summary of the comments that lead to the change.

Several commenters indicated that some of the activities in proposed § 3178.5 should not require prior approval. The BLM agrees and, in response to this and other comments on § 3178.4, moved some provisions to § 3178.4, as described previously.

Additionally, some commenters stated that operators should not be required to seek prior approval for the following two royalty-free uses: Gas removed from a pipeline at a location downstream of the FMP and gas initially removed from a lease, unit participating area, or communitized area for treatment or processing where the gas is returned to the lease, unit, or communitized area for lease operation. The BLM disagrees with these comments and retained these paragraphs in paragraphs (a)(1) and (a)(2) of this section. Gas that is removed from a lease, unit participating area, or communitized area would normally be royalty-bearing. Inclusion of these uses in this section allows the BLM the discretion to approve royalty-free uses under the unique circumstances in which gas is removed and returned to the same lease, unit participating area, or communitized area.

Several commenters also stated that the BLM did not adequately explain why operators must ever receive agency approval for royalty-free use of production. Commenters stated that the BLM must specify the standard or criteria used to evaluate requests for approval. The BLM has determined that royalty-free uses requiring prior approval are uses that do not typically occur, that are not likely to apply to a large number of operators, and that have a higher risk of loss of gas depending on the individual circumstances surrounding the use. These factors warrant individual approval by the BLM on a case-by-case basis, and are not situations in which development of standard approval criteria is appropriate.

Some commenters argued that the BLM should remove the limitation, included in the proposed rule, that gas removed from the lease may only be used on the lease royalty-free if it was removed for treatment or processing ''to address a particular characteristic of the gas.'' The commenters stated that the operator should not have the burden of establishing the necessity of off-lease treatment. In response to this comment, the BLM revised paragraph (a)(2) (paragraph (a)(4) in the proposed rule) to clarify that the provision applies to particular physical characteristics of the gas ''that require the gas to be treated or processed prior to use.''

Some commenters suggested that an identified use should be royalty-free until the BLM denies it, rather than having to wait for the BLM to approve it. In addition, one commenter suggested that if the BLM does not, within 30 days, respond to a Sundry Notice requesting approval, the Notice should be deemed approved. Another commenter requested that approvals should go into effect when the request is filed. In response to these comments, the BLM revised § 3178.5(b)(1) to indicate that approvals will be effective from the date the request was filed. However, if the BLM disapproves a request, the operator must pay royalties on all volumes used, including those used while the request was pending.

Several commenters stated that exceptions for royalty-free use should not be considered, that the rule allows too much royalty-free venting and flaring, or that the rule does not sufficiently restrict royalty-free use that results in emissions to the environment. As stated in the proposed rule preamble, however, royalty-free on-site use is limited to reasonable uses that are not wasteful. The BLM does not intend to grant prior approval of royalty-free uses under § 3178.5 unless it determines, in light of available technology, that the requested use is reasonable and not wasteful. As a result, the BLM did not revise this section in response to these comments.

Section 3178.6 Uses of Oil or Gas Moved Off the Lease, Unit, or Communitized Area That Do Not Require Prior Written Approval for Royalty-Free Treatment of Volumes Used

This section identifies two circumstances in which royalty-free use of oil or gas that has been moved off the lease, unit, or communitized area would be permitted without prior BLM approval. The first situation is where an individual lease, unit, or communitized area includes non-contiguous areas, and oil or gas is piped directly from one area of the lease, unit, or communitized area to another area where it is used, and no oil or gas is added to or removed from the pipeline, even though the oil or gas crosses lands that are not part of the lease, unit, or communitized area. Under this section, the BLM will consider such production as not having been ''removed from the lease.'' This will provide the lessee or operator the same opportunity for royalty-free use as if the lease, unit, or communitized area were one contiguous parcel.

The second situation is where a well is directionally drilled, and the wellhead is not located on the producing lease, unit, or communitized area, but produced oil or gas is used on the same well pad for operations and production purposes for that well. In such situations, the rule allows for royalty-free use at the well pad, without prior approval. Use at off-lease well heads is an established royalty-free use.[140]

Commenters asserted that the language in proposed paragraph (a) that described reasons why oil or gas would be moved off the lease, unit, or communitized area was ambiguous. In response to this comment, the BLM simplified the language in this paragraph to clarify the original intent discussed above. Paragraph (a) of the final rule now states: ''The oil or gas is transported from one area of the lease, unit, or communitized area to another area of the same lease, unit, or communitized area where it is used, and no oil or gas is added to or removed from the pipeline while crossing lands that are not part of the lease, unit, or communitized area; . . . .''

Section 3178.7 Uses of Oil or Gas Moved Off the Lease, Unit, or Communitized Area That Require Prior Written Approval for Royalty-Free Treatment of Volumes Used

This section addresses the royalty treatment of oil or gas used in operations conducted off the lease, unit, or communitized area. When production is removed from the lease, unit, or communitized area, it becomes royalty-bearing unless otherwise provided. This principle is reflected in paragraph (a) of this section, which provides that with only limited exceptions, royalty is owed on all oil or gas used in operations conducted off the lease, unit, or communitized area.

Existing NTL–4A does not include a provision that specifically addresses approving off-lease royalty-free use. Such approval is required, however, under ONRR regulations, which provide, ''All gas (except gas unavoidably lost or used on, or for the benefit of, the lease, including that gas used off-lease for the benefit of the lease when such off-lease use is permitted by the BOEMRE or BLM, as appropriate) produced from a Federal lease to which this subpart applies is subject to royalty.''[141] New § 3178.6 will add clarity and consistency in implementation of that ONRR regulation.

Paragraph (b) of this section identifies circumstances in which, despite the general rule articulated in paragraph (a), the BLM will consider approving off-lease royalty-free use (referred to here as ''off-lease royalty-free uses''). These include situations in which the operation is conducted using equipment or at a facility that is located off the lease, unit, or communitized area (under an approved permit or plan of operations, or at the agency's request) because of engineering, economic, resource protection, or physical accessibility considerations. For example, a compressor that otherwise would have been located on a lease may be sited off the lease because the topography of the lease is not conducive to equipment siting. To be approved for off-lease royalty-free use, the operation would also have to be conducted upstream of the approved FMP. This paragraph reflects the BLM's policy to encourage operators to reduce the amount of surface disturbance associated with oil and gas exploration and development projects. In some cases, centralizing production facilities at a location off the lease may serve that objective.

Paragraph (c) requires the operator to obtain BLM approval for off-lease royalty-free use via a Sundry Notice containing the information required under proposed § 3178.9 of this subpart. In response to a comment described below, in the final rule the BLM added the following provision to paragraph (c)

[140] *Plains Exploration & Production Co.,* 178 IBLA 327, 341 n.16 (2010).

[141] 30 CFR 1202.150(b).

of this section: ''If the BLM disapproves a request for royalty-free treatment for volumes used under this section, the operator must pay royalties on the volumes. If the BLM approves a request for royalty-free treatment for volumes used under this section, such approval will be deemed effective from the date the request was filed.''

Paragraph (d) of this section clarifies that approval of off-lease measurement or commingling under other regulatory provisions does not constitute approval of off-lease royalty-free use. An operator or lessee must expressly request, and submit its justification for, approval of off-lease royalty-free use. The BLM anticipates that generally such approval would be appropriate only in some of the situations in which the BLM has approved measurement at a location off the lease, unit, or communitized area, or has approved commingling production off the lease, unit, or communitized area and allocating production back to the producing properties.

Paragraph (e) of this section addresses circumstances in which equipment located on a lease, unit, or communitized area also treats production from other properties that are not unitized or communitized with the property on which the equipment is located. An operator is allowed to report as royalty-free only that portion of the oil or gas used that is properly allocable to the share of production contributed by the lease, unit or communitized area on which the equipment is located, unless otherwise authorized by the BLM.

A commenter proposed that an identified use should be royalty-free until the BLM denies an application for prior approval, rather than requiring an operator to wait for the BLM to approve the use. As stated above, in response to these comments, the BLM revised § 3178.7(c) to indicate that approvals will be effective from the date the request was filed. However, if the BLM disapproves a request, the operator must pay royalties on all volumes used, including those volumes used during pendency of the request.

Commenters also suggested that the proposed language in paragraph (e) was inconsistent with the BLM's goal of encouraging operators to reduce the amount of surface disturbance because this provision would discourage production from multiple leases. The BLM disagrees. This section indicates that only the portion of the oil or gas used as fuel that is properly allocable to the lease, unit, or communitized area on which the equipment is located (on-lease) is royalty-free; however, the proportion of the oil or gas used from off-lease production may be approved by the BLM for off-lease royalty-free use. The BLM recognizes both the operating efficiency and resource conservation advantages of locating production equipment from multiple wells on a common site. The BLM did not revise this paragraph in response to these comments.

Another commenter suggested that the BLM should approve all requests unless it can demonstrate that particular circumstances related to lease operations justify disallowing royalty-free use. The BLM disagrees with this comment and did not modify the rule in response to this comment. The MLA exempts from royalties production that is used on the lease for lease operations. This rule allows for royalty-free off-lease uses in some cases, including those specified in § 3178.6 as not requiring prior approval. The circumstances described in § 3178.7 give the BLM the flexibility to approve additional off-lease royalty-free uses where the BLM believes those uses are reasonable and not wasteful.

Section 3178.8 Measurement or Estimation of Volumes of Oil or Gas That Are Used Royalty-Free

This section specifies that an operator must measure or estimate the volume of royalty-free gas used in operations upstream of the FMP. In general, the operator is free to choose whether to measure or estimate, with the exception that the operator must in all cases measure the following volumes: (1) Royalty-free gas removed downstream of the FMP and used pursuant to sections 3178.4 through 3178.7; and (2) royalty-free oil used pursuant to sections 3178.4 through 3178.7. When royalty-free oil or gas is removed downstream of the FMP and used pursuant to sections 3178.4 through 3178.7, the operator must apply for a new FMP under section 3173.12 to measure the gas that is removed for use.

If oil is used on the lease, unit or communitized area, it is most likely to be removed from a storage tank on the lease, unit or communitized area. Thus, paragraph (c) also requires the operator to document the removal of the oil from the tank or pipeline.

Paragraph (e) requires that operators use best available information to estimate gas volumes, where estimation is allowed. For both oil and gas, the operator must report the volumes measured or estimated, as applicable, under ONRR reporting requirements. As revisions to Onshore Oil and Gas Orders No. 4 and 5 have now been finalized as 43 CFR subparts 3174 and 3175, respectively, the final rule text now references § 3173.12, as well as § 3178.4 through § 3178.7 to clarify that royalty-free use must adhere to the provisions in those sections. The BLM received few, highly technical comments on this section, which are addressed in the Response to Comments document.

Section 3178.9 Requesting Approval of Royalty-Free Treatment When Approval Is Required

This section describes how to request BLM approval of royalty-free use when prior-approval is required under § 3178.5 or § 3178.7. The operator must submit a Sundry Notice containing specified information, which is necessary for the BLM to determine if approval is appropriate. The information includes a description of the operation to be conducted, the measurement or estimation method, the volume expected to be used, the basis for an estimate (if applicable), and the proposed use of the oil or gas. This section was finalized as proposed, with minor wording changes to improve clarity. The BLM received few, highly technical comments on this section, which are addressed in the Response to Comments document.

Section 3178.10 Facility and Equipment Ownership

This section clarifies that although the operator is not required to own or lease the equipment that uses oil or gas royalty-free, the operator is responsible for all authorizations, production measurements, production reporting, and other applicable requirements. The BLM did not receive significant comments on this section and did not revise this section from the proposed rule.

Subpart 3179—Waste Prevention and Resource Conservation

Section 3179.1 Purpose

As in the proposed rule, this section states that the purpose of subpart 3179 is to implement statutes relating to prevention of waste from Federal and Indian (other than Osage Tribe) leases, conservation of surface resources, and management of the public lands for multiple use and sustained yield. The section also provides that subpart 3179 supersedes those parts of NTL–4A that pertain to venting and flaring of produced gas, unavoidably and avoidably lost gas, and waste prevention.

One commenter stated that BLM should clarify whether subpart 3179 replaces NTL–4A and that NTL–4A is no longer applicable, or if subpart 3179 only supersedes part of NTL–4A. As stated previously, subpart 3178 replaces the portion of NTL–4A pertaining to the use of oil or gas for beneficial purposes, and subpart 3179 replaces the portion of NTL–4A pertaining to flaring and venting of produced gas, unavoidably and avoidably lost gas, and waste prevention. Together, the combined revisions to subparts 3178 and 3179 supersede NTL–4A in its entirety.

Section 3179.2 Scope

This section specifies which leases, agreements, tracts, facilities, and gas lines are covered by this subpart. The section also states that the term ''lease'' in this subpart includes IMDA agreements, unless specifically excluded in the agreement or unless the relevant provisions of this subpart are inconsistent with the agreement. The BLM did not revise this section from the proposed rule.

Some commenters stated that the scope of the rule is too broad. Some commenters suggested limiting its scope to leases with more than 51 percent Federal interest, while others suggested that the BLM clarify that this subpart does not apply to exploration, wildcat, or delineation wells. The BLM disagrees that the scope of the rule is too broad, and did not revise this section based on these comments. As discussed earlier in this Preamble, the BLM has both the authority to ensure that operators take reasonable precautions to prevent the waste of Federal and Indian oil and gas. The fact that this final rule may impact some leases with minority Federal or Indian interest does not deprive the BLM of its authority to impose reasonable waste prevention requirements on operators producing Federal or Indian oil or gas.

Finally, the BLM notes that the rule generally applies to all oil and gas wells, including exploratory, wildcat, and delineation wells. Provisions of the rule that apply more narrowly explicitly indicate the narrower scope; for example, the gas capture requirements in section 3179.7 apply only to ''development oil wells.''

Section 3179.3 Definitions and Acronyms

This section contains definitions for terms that are used in subpart 3179: ''accessible component''; ''automatic ignition system''; ''capture'' and ''capture infrastructure''; ''compressor station''; ''continuous bleed''; ''development oil well'' or ''development gas well''; ''gas-to-oil ratio''; ''gas well''; ''high pressure flare''; ''leak''; ''leak component''; ''liquid hydrocarbon''; ''liquids unloading''; ''lost oil'' or ''lost gas''; ''pneumatic controller''; ''storage vessel''; and ''volatile organic compounds.'' Some defined terms have a meaning particular to this rule. Other defined terms may be familiar to many readers, but are defined in the regulatory text to enhance the clarity of the rule.

In response to comments, the final rule adds several definitions that were not included in the proposed rule, including ''automatic ignition system''; ''continuous bleed''; ''high pressure flare''; ''leak'' and ''leak component'' (which replaced the term ''component'' from the proposed rule); and ''pneumatic controller.'' The final rule also adds a definition of ''compressor station'' that is consistent with the definition in subpart OOOOa, as the final rule leak detection provisions and the subpart OOOOa leak detection provisions both refer to compressor stations. In addition, the definition of ''storage vessel'' has been expanded to clarify the types of vessels covered by section 3179.203. The definitions of ''development oil well'' and ''development gas well'' include minor wording changes for clarity.

Some commenters expressed concerns that the proposed definition of a storage vessel in § 3179.3 does not match the definition provided in subparts OOOO and OOOOa. Commenters asserted that the definition proposed by the BLM applies the 6 tpy VOC threshold for applicability to a whole tank battery, as well as to a single tank, making the proposed rule significantly more stringent than the EPA OOOOa rule, which only applies if an individual storage vessel exceeds the threshold. Commenters also noted that the EPA definition of storage vessel excludes portable tanks temporarily located at the well site, and they recommended that the BLM take the same approach as the EPA by aligning the BLM's definition with the EPA definition. Other commenters supported the BLM's proposed definition of storage vessel, as it could apply the requirements for storage vessels to a collection of low-emitting single tanks that would not otherwise meet the threshold.

Based on input from commenters, the BLM has revised its definition of storage vessel to be largely consistent with the EPA subpart OOOO and subpart OOOOa definitions. The BLM removed the reference to a ''battery of tanks'' and added provisions excluding temporary tanks from the definition of a storage vessel. The BLM believes that this is a reasonable approach. The 6 tpy threshold identifies a quantity of lost gas that is reasonably cost-effective to address at an individual tank, without regard to the type of vessel or fluid stored. Avoiding the same quantity of lost gas from a battery of tanks would effectively lower the tank size threshold for coverage and would be considerably less cost-effective, as the same type of equipment would have to be installed on multiple tanks with smaller releases.

The BLM has also excluded from the definition of storage vessel tanks storing hydraulic fracturing fluid prior to implementation of an approved permanent disposal plan under Onshore Oil and Gas Order No. 7. This revision ensures that the final rule will not overlap with BLM rules governing hydraulic fracturing activities.

Commenters also suggested that the BLM adopt definitions for ''pneumatic controllers'' and ''continuous bleed'' that are consistent with the definitions in subpart OOOOa. The BLM agrees that aligning the definitions in the BLM and EPA rules to the extent possible will reduce the potential for confusion. Accordingly, § 3179.3 includes definitions for ''pneumatic controllers'' and ''continuous bleed'' that are consistent with the definitions of these terms in subpart OOOOa.

In order to provide clarity, BLM has included definitions of ''automatic ignitor system'' and ''high pressure flare'' in the final rule. The final rule defines an ''automatic ignition system'' as an automatic ignitor and, where needed to ensure continuous combustion, a continuous pilot flame. A ''high pressure flare'' is defined as an open-air flare stack or flare pit designed for the combustion of natural gas leaving a pressurized production vessel (such as a separator or heater-treater) that is not a storage vessel.

Section 3179.4 Determining When the Loss of Oil or Gas Is Avoidable or Unavoidable

This section describes the circumstances under which lost oil or gas is classified as ''unavoidably lost.'' ''Avoidably lost'' oil or gas is then defined as oil or gas that is not unavoidably lost. The descriptions in the rule enhance clarity and consistency by listing specific circumstances under which oil and gas may be ''unavoidably lost'' when the operator has not been negligent, has not violated laws, regulations, lease terms or orders, and has taken prudent and reasonable steps to avoid waste.

The rule also defines as ''unavoidably lost'' any produced gas that is vented or flared from a well that is not connected to gas capture infrastructure, if the BLM has not determined that the loss of gas through such venting or flaring is otherwise avoidable.

Finally, this section defines ''avoidably lost'' oil or gas as lost oil or gas that does not meet this section's definition of ''unavoidably lost.'' Also included in the ''avoidably lost'' category is any ''excess flared gas,'' which § 3179.7 defines as the quantity of flared gas by which the operator fell short of the applicable capture requirement specified in that section.

In response to comments received, the final rule added two new items to the list of operations and sources that are considered unavoidably lost: (1) Gas lost during facility and pipeline maintenance, such as when an operator must blow-down and depressurize equipment to perform maintenance and repairs, which includes ''pigging'' of lines to remove liquids, and (2) flaring of gas from which at least 50 percent of natural gas liquids have been removed and captured for market, if the operator has notified the BLM through a Sundry Notice that the operator is conducting such capture.

The final rule also makes the following four clarifications to items that were included on the proposed list of operations and sources that are considered unavoidably lost, and that remain on that list in the final rule: (1) Normal operating losses from a natural gas-activated pneumatic controller or pump are considered unavoidable, provided the controller or pump complies with §§ 3179.201 and 3179.202; (2) normal operating losses from storage vessels and other low pressure production vessels are considered unavoidable provided the vessels are in compliance with §§ 3179.203 and 3174.5; (3) losses from well venting in the course of downhole well maintenance and/or liquids unloading are considered unavoidable provided those operations are conducted in compliance with § 3179.204; and (4) leaks are considered unavoidable, provided the operator has complied with the leak detection and repair requirements of §§ 3179.301 through 3179.305.

The BLM also modified the proposed treatment of gas that is lost from a well that is not connected to a pipeline to align this provision with the revised approach in the final rule that addresses flaring through capture targets instead of flaring limits. The BLM had proposed that gas flared in excess of the applicable flaring limit would be considered avoidable. The final rule deems avoidable any gas that is ''excess'' relative to the capture target. The term ''excess flared gas'' is defined in § 3179.7.

The principle underlying both the proposed and final regulatory text with respect to excess flared gas is that a prudent and reasonable operator will not routinely flare an unlimited quantity of natural gas from a development oil well. In this rulemaking, the BLM is modernizing and clarifying the criteria for determining when incidental and necessary disposal of gas accompanying oil production crosses the line into unreasonable waste of public gas resources, and the final rule expresses these criteria in the form of a gas capture target. When an operator is not meeting the applicable gas capture target, specified in § 3179.7 the BLM deems the excess flared gas volume—that is, the volume that caused the operator to fall short of the capture target—to be waste, avoidable, and subject to royalties.

Several commenters disagreed with BLM's proposed definitions of ''waste'' and ''avoidably lost.'' Many commenters felt that the BLM should maintain the definitions used in NTL–4A, including applying an economic test to determine what degree of capture is economical for the operator. These comments are addressed in section V.C of this preamble.

Some commenters stated that the BLM should consider gas lost during force majeure events as unavoidably lost. The BLM does not agree that all losses during force majeure events should be considered unavoidable. Such events may be out of the control of operators, but they are often expected and operators can therefore plan for them. The final rule does include as justifications for unavoidable loss some specific events that are generally considered force majeure events, such as emergencies. However, the gas capture requirements in the final rule are structured to provide operators substantial flexibility to meet the capture targets without providing a blanket exemption for all events that the operator does not directly control. For example, scheduled maintenance of downstream pipeline or processing plants is neither unexpected nor unusual, and the BLM believes an operator should be able to plan ahead to address those events—for example, by identifying alternative capture approaches or planning to temporarily reduce production or shut in the well to address these circumstances.

Moreover, as described in Preamble Section V.A, Venting Prohibition and Capture Targets, the final rule allows operators to meet the capture target on average over a month at all of the wells on a lease, unit, or communitized area, or alternatively, on average over a month at all of the operator's wells in a county or state. A prudent and reasonable operator will be able to take advantage of this flexibility to ensure that it has captured enough gas over the month, somewhere in the averaging area, to provide itself a sufficient buffer in meeting the gas capture targets to accommodate force majeure events that may not be within its control, but are common and predictable.

Relatedly, some commenters requested that gas lost because of ROW delays should be considered unavoidably lost. This preamble addresses the issue of ROW delays in Section VI.E. For the reasons discussed there, the BLM declines to make this change, which goes to the central premise of the gas capture requirement. The BLM has determined that it is not reasonable for operators to develop oil wells and plan to use flaring as the primary and routine disposal method for the associated gas. Rather, these rules require oil well operators, over time, to plan to capture an increasing percentage of their associated gas. In the near-term, the BLM believes that the gas capture targets, combined with the quantities of allowable flaring and the ability to average, are sufficiently generous to allow operators to manage short-term delays in planned gas pipeline infrastructure with little difficulty, using production deferment and on-site capture at some wells where necessary. Over the longer term, a reasonable operator can continue to use those tools as well as working with the midstream companies to ensure that there is adequate pipeline capacity available to support transport of associated gas prior to building out large well developments.

Many commenters requested that the BLM grandfather all existing determinations of royalty-free flaring. Again, this change would undercut a key goal of this rulemaking: Gradually, over time, to require operators to reduce routine flaring of associated gas from development oil wells. With the generous phase-in schedule for the gas capture targets and the quantities of allowable flaring, this rule requires only modest near-term reductions in flaring from existing wells. The BLM believes that it is entirely reasonable to expect operators to work, over time, to reduce flaring from their existing wells, as well as from new developments. Moreover, for this rule to have any meaningful effect on flaring, it must cover both existing and new development. Allowing all current determinations of royalty-free flaring to persist in perpetuity is unnecessary and would substantially undercut the effectiveness of this rule.

Section 3179.5 When Lost Production Is Subject to Royalty

This section provides that royalties are due on all avoidably lost oil or gas, but not on unavoidably lost oil or gas. We received no significant comments on this section, and the final rule is very similar to the proposed rule with minor wording changes to improve clarity.

Section 3179.6 Venting and Flaring From Gas Wells and Venting Prohibition

This section expressly prohibits all venting and flaring from gas wells, except where the gas is unavoidably lost pursuant to section 3179.4(a). In addition, this section requires operators to flare rather than vent all gas that is not captured, except under certain limited circumstances. Operators will be allowed to vent gas in the following situations: (1) When flaring is technically infeasible—for example if the volumes of gas are too small to operate a flare (such as so-called bradenhead gas), or if the gas is not readily combustible; (2) under emergency conditions, when the loss of gas is uncontrollable or venting is necessary for safety; (3) when the gas is vented through normal operation of a natural gas-activated pneumatic controller or pump; (4) when the gas is vented from a storage vessel, provided that § 3179.203 does not require the combustion or flaring of the gas; (5) when the gas is vented during downhole well maintenance or liquids unloading activities performed in compliance with § 3179.204; (6) when the gas is vented through a leak where the operator is in compliance with § 3179.301–305; (7) when venting the gas is necessary to allow non-routine facility and pipeline maintenance to be performed, such as when an operator must, upon occasion, blow-down and depressurize equipment to perform maintenance or repairs; and (8) when release of gas is unavoidable and flaring is prohibited by Federal, State, local or Tribal law, regulation, or enforceable permit term.

The BLM made the following changes to the proposed rule requirements: (1) Changed the title of this section; (2) added a new section (a) that expressly prohibits venting or flaring gas from gas wells, except where the gas is unavoidably lost pursuant to section 3179.4(a); (3) renumbered paragraphs (a)(1) and (2) paragraphs (b)(1) and (2); (4) moved discussion of venting from a storage vessel from proposed paragraph (a)(3) to paragraph (b)(4) and added language clarifying that such venting is permitted when § 3179.203 does not require combustion or flaring of the gas; (5) renumbered proposed paragraph (a)(4) as paragraph (b)(3) and qualified that venting from a natural gas-activated pneumatic controller or pump is permitted during normal operation and when the pump is in compliance with § 3179.201 and § 3179.202; (6) Added paragraphs (b)(5) through (b)(8) that describe additional cases when venting of gas is permitted (situations 4–8 in the previous paragraph); (7) Removed all of proposed paragraph (b) describing venting or flaring volume limits, because flaring limits are now addressed in a new § 3179.7; and (8) Added a new paragraph (c), which requires that all flares or combustion devices be equipped with an automatic ignition system.

Section 3179.6(a) carries forward NTL–4A's express prohibition on venting and flaring from gas wells. Section IV.A of NTL–4A prohibits the venting or flaring of gas well gas, except for unavoidable losses and short-term venting and flaring during emergencies, well purging and evaluation tests, initial production tests, and wells tests (circumstances now defined as unavoidable in section 3179.4(a)). Similar restrictions on venting and flaring from gas wells were implied in the proposed rule; the BLM has chosen to state this explicitly in the final rule in order to avoid confusion.

Key comments received on this section are discussed in Section III.B.1.b of this preamble. Additional substantial comments received on the venting prohibition provisions are discussed below.

The BLM received comments asserting that the BLM lacked the statutory authority to require operators to flare rather than vent gas that is not captured. Commenters argued that such a requirement does not fall within the BLM's waste-prevention authority under the MLA because shifting from venting to flaring does not prevent waste as the gas is lost in either case. These commenters then argued that the only possible justification for the requirement to flare rather than vent is control of GHGs and other air pollutants, which commenters assert is exclusively within the EPA's domain.

The BLM disagrees with these comments for several reasons. First, the requirement in this section to flare rather than vent does result in waste prevention, because it is paired with provisions that limit total flaring—namely, the gas capture requirements in § 3179.7. Under § 3179.7(c), the denominator in the gas capture percentage calculation is ''the total volume of gas captured over the month plus the total volume of gas flared over the month from high-pressure flares from all of the operator's development oil or gas wells in the relevant area, minus'' a declining ''flaring allowable'' volume.. By requiring that operators shift from venting to flaring, the BLM is effectively increasing operators' flared volume in a given month, which in turn increases the total volume of gas that the operators must capture in that month.

Second, directing associated gas to a flare rather than allowing operators to vent it improves waste accounting because under final rule § 3179.9, operators must measure volumes above 50 Mcf per day that are flared from a high pressure flare stack or manifold. By shifting operators from venting to flaring, § 3179.6 will likely increase the number of operators that must measure their flared gas volumes under § 3179.9. This will, in turn, improve operators' (and the BLM's) waste accounting. Better waste accounting is itself a waste prevention measure, because it gives the BLM and operators a better sense of how much gas is being wasted—and thus how much could be made available for productive use and/or sold to offset the costs of waste prevention equipment.

Third, this requirement constitutes waste prevention when applied to operator flaring during activities regulated under §§ 3179.102, 3179.103, and 3179.104. Under §§ 3179.102 and .103, flaring during well completion and initial production testing that exceeds 20 MMcf/well is treated as avoidably lost gas subject to royalties under § 3179.4(a)(1)(C). The BLM believes that in many instances, the venting prohibition in § 3179.6 may result in operators reaching the 20 MMcf/well royalty flaring threshold sooner, thereby providing an additional financial incentive for operators to reduce waste. Under § 3179.104, all flaring during subsequent well tests that exceeds 24 hours is treated as avoidably lost gas subject to royalties under § 3179.4(a)(1)(D).

Fourth, as discussed above, the requirement to flare rather than vent associated gas is justified as a safety measure under the MLA. It is generally safer to combust methane gas than allow it to vent uncombusted into the surrounding air due to concerns over methane's explosiveness and the risks to workers of hypoxia and exposure to various associated pollutants.[142] Fifth, and as also discussed above, even if the venting prohibition were purely an air quality control measure, the BLM does have the authority to regulate air quality

[142] NIOSH–OSHA Hazard Alert entitled, ''Health and Safety Risks for Workers Involved in Manual Tank Gauging and Sampling at Oil and Gas Extraction Sites,'' February 2016, *www.osha.gov*.

and GHG impacts on and from the public lands, pursuant to FLPMA and the MLA, as discussed in Section III.C of this Preamble.

Several commenters stated that operators should be required to capture *all* natural gas from all wells, with no exceptions, or that if flaring is allowed, combustion devices should be required to have a design destruction efficiency of at least 98%, that enclosed flares should be required, and that flares should be required to be equipped with a continuous pilot light and an auto-ignition system. As discussed in Section III.B.2 of this preamble, the BLM does not believe that it is feasible to eliminate all venting and flaring, but we have revised both the flaring requirements and the circumstances when venting is permitted in response to comments. The BLM also is not adding a requirement for flares to have a design destruction efficiency of 98%. Many existing flares have a design combustion efficiency of 95%, rather than 98%.

The BLM has added a requirement in the final rule that flares must be equipped with an automatic ignition system, which will provide the flare system with an effective method of ignition in the case of interruption. The term ''automatic ignition system'' implies the concept of maintaining an ignition source without specifying a particular type of device, and the BLM believes that operators will utilize devices that are appropriate for the circumstance. The BLM does not believe that requiring a specific device, such as a continuous pilot, would necessarily result in reduced waste relative to a more general requirement for an automatic ignition system.

Some commenters requested that the BLM allow venting when flaring is not economically feasible. The BLM believes that this change is unnecessary, would add substantial ambiguity to the rule, and could significantly weaken the requirement to flare rather than vent. Flaring rather than venting gas that is not being captured is widespread industry practice, due in large part to safety concerns. While there are situations where the quantities of gas are too small or difficult to allow for flaring, the rule explicitly allows venting in lieu of flaring in those situations. It is not clear to the BLM what other circumstances would render flaring ''economically infeasible,'' or what specific concerns the commenter is trying to address.

A commenter seeking to minimize exceptions to the venting prohibition asked the BLM to define the term ''technically infeasible.'' Given the wide variety of situations that are likely to occur on a lease that inform an operator's determination of technical feasibility, the BLM does not believe that it is appropriate to add further specificity to this term. If there is a dispute about the term in a specific case, the BLM has the final say in determining whether flaring is, in fact, technically infeasible.

Section 3179.7 Gas Capture Requirement

Final rule § 3179.7 houses a modified version of the flaring requirements that were in proposed rule s 3179.6. As discussed in Section III.B.2.a, the final rule alters how the proposed rule constrained the quantities of gas lost through flaring, but achieves similar flaring reductions by requiring operators to meet specified monthly capture targets (subject to shrinking flaring allowances), rather than setting per well numeric flaring limits.

Final rule § 3179.7 establishes capture targets that increase over the first nine years of rule implementation. Paragraphs (a) and (b) describe the capture percentage requirements. The schedule for the capture targets is provided in § 3179.7(b)(1)–(4) and is reproduced in Section III.B.2.a of this preamble. Paragraph (c) defines ''capture percentage,'' ''total volume of gas captured,'' ''adjusted total volume of gas produced,'' and ''relevant area.'' Under § 3179.7(c)(3), an operator may choose whether to comply with the capture targets on each of the operator's leases, units or communitized areas, or on a county-wide or state-wide basis. Section 3179.7(c)(4) defines when an oil or gas well is considered ''in production'' and therefore subject to the capture targets in this section. Section 3179.7(d) establishes an equation for determining the quantity of ''excess flared gas''—that is, the volume of flared gas that causes an operator to fall short of the applicable capture target in a given month, and that is therefore subject to royalties. Section 3179.7(e) requires operators to prorate the excess flared gas to each lease, unit, or communitized area that reported high-pressure flaring, for purposes of calculating royalties.

As discussed in Section III.B.2 of this preamble, the BLM developed the capture target approach in final rule § 3179.7 after careful consideration of the many comments received on the flaring limit approach taken in proposed rule § 3179.6(b). The key comments received on § 3179.7 and BLM's response to these comments are also discussed in Section III.B of this preamble. Additional substantive comments received on the proposed flaring provisions are discussed below.

Several commenters asserted that the ability to avoid flaring depends on the capacity of gathering lines, and that operators must prove production for a new oil play and initiate larger scale development before gathering and/or processing companies are willing to invest in infrastructure. These comments informed the revisions to the flaring revisions made in the final rule. The BLM also recognizes that currently the optimal mechanism to capture gas is through connecting to a pipeline, which may take time to achieve in some areas due to lagging infrastructure and capacity constraints. As a result, the final rule provides additional time and flexibility for industry to plan and better coordinate development of production wells with development of pipelines to transport the production. As discussed in section III.B.2, the final rule provides an option for operators to comply with the capture targets on a lease-by-lease, county-wide, or state-wide basis, and also phases in the capture targets over a longer period of time. These changes will allow sufficient time and flexibility to enable industry to better align oil development with gas infrastructure over time.

On the other hand, given the BLM's statutory obligation to reduce waste of gas, the clear technical capability of operators to capture gas, the economic value of the gas, and the environmental impacts of not capturing it, the BLM has determined that it is not reasonable to allow operators to dispose of large quantities of associated gas from development oil wells using routine flaring. The final rule therefore structures the capture targets in a way that the BLM estimates will achieve slightly greater flaring reductions than the proposed rule, albeit over a longer timeframe.

Many commenters asserted that on-site capture technologies are not technically feasible and/or economically viable. In the proposed rule, we discussed research indicating that LNG stripping, CNG, and gas-to-power are commercially mature technologies that are portable, scalable, and have been utilized economically at well sites.[143] Moreover, MJ Bradley released a re-analysis of the economic analysis in the proposal, which suggests that for over 500 of the leases in the BLM data set, the CNG trucking option would have total net benefits that exceed total lessee

[143] 81 FR 6641. See also Carbon Limits. ''*Improving Utilization of Associated Gas in US Tight Oil Fields*''. *2015. Available athttp://www.catf.us/resources/publications/files/Flaring_Report.pdf* y.

costs by approximately $56.5 million over a 10 year period.[144] The BLM agrees with the commenter's assertion that these remote-site capture technologies may not be viable at all well sites. However, they are viable and currently used at some sites. The final rule's option allowing operators to average compliance across all of their wells in a county or State accommodates this heterogeneity in site/technology compatibility: Operators can deploy on-site capture technologies where it is most cost-effective, and use the increased capture rates at those sites to offset continued flaring at other sites. The BLM also notes that leasing on-site capture equipment during the earlier periods of well production, when associated gas levels and corresponding potential revenues are highest, can enhance the cost-effectiveness of the technologies. Leasing allows operators to avoid upfront capital costs associated with purchasing equipment, making it easier to use such equipment only for periods in the well's life when it is most economic to do so. This strategy also allows operators to match equipment size to expected associated gas production volumes at different stages of well production. Finally, on-site capture technology capital costs may continue to decline as the market further matures and achieves greater economies of scale.

Several commenters expressed concern about delays in approvals of ROWs for gas pipelines, and asserted that such delays will prevent operators from complying with the capture targets. These comments are addressed in Section VI.E of this preamble.

Section 3179.8 Alternative Capture Requirement

Section 3179.8 (§ 3179.7 in the proposed rule) describes an alternative process that is available to an operator that cannot meet the capture targets described in final rule § 3179.7. Under § 3179.8, an operator that cannot meet the capture targets may request that the BLM establish an alternative capture target if three conditions are met: (1) The operator has chosen to comply with the capture target using the lease-by-lease, unit-by-unit, or communitized area-by-communitized areas basis rather than the averaging approach; (2) the potentially noncompliant lease was issued before the effective date of this final rule; and (3) the operator demonstrates via Sundry Notice, and the BLM agrees, that the applicable capture percentage under final rule § 3179.7 ''would impose such costs as to cause the operator to cease production and abandon significant recoverable oil reserves under the lease.''

As discussed in Section V.B.2.b of this preamble, § 3179.8 was revised in the final rule to reflect the shift to gas capture targets in final rule § 3179.7. Section 3179.8(a) was also revised to reflect the three conditions discussed above. Section 3179.8 (b) describes the information an operator must submit in the Sundry Notice. The final version of this paragraph makes minor modifications relative to the proposed version, including: Adding the phrase, ''to the extent that the operator is able to obtain this information,'' to the requirements to include pipeline capacity and the operator's projections of the cost associated with installation and operation of gas capture infrastructure; adding cost projections for alternative methods of transportation that do not require pipelines; specifying that the cost projections required in final § 3179.8(b)(5)(i) must be based on the next 15 years or the life of the lease, unit, or communitized area, whichever is less; and dropping the requirement to provide the depths and names of producing formations. Section 3179.8(c) remains similar to the proposed rule (§ 3179.7(c)), with flaring limits changed to capture percentages. The final rule also does not contain the renewable 2-year exemption in proposed § 3179.7(d).

The key comments received on this section and BLM's response to these comments are discussed in Section III.B.2.b of this preamble. Additional substantive comments received on the proposed flaring provisions are discussed below.

Some commenters asserted that the proposed alternative capture and related Sundry Notice requirements were overly burdensome and required submission of confidential information. These commenters contended that oil and gas price and production volume forecasts and pipeline and gas capture costs are considered confidential business information. Commenters also claimed that operators do not have access to information on pipeline capacity.

The BLM does not agree that the Sundry Notice requirements for a request for an alternative capture requirement are unduly burdensome, although the BLM has streamlined the proposed requirements in the final rule where it was possible to do so without losing information that would be necessary to evaluate a request. Commenters did not explain how the BLM would be able to determine whether a request met the criteria for approval absent the required information. Also, operators routinely provide information to the BLM that they consider confidential; if they indicate on the Sundry Notice that the information is considered confidential, the BLM will handle the information in accordance with applicable regulations in 43 CFR part 2. In response to statements that commenters may not have access to information on pipe capacity, the BLM revised the final rule to state that data on pipeline capacity and the operator's projections of the cost associated with installation and operation of gas capture infrastructure is required to the extent that the operator is able to obtain such information.

Some commenters requested that the BLM clarify what ''significant'' means with regard to recoverable oil reserves in § 3179.8(c), while another recommended that the criteria should be based on an economic test that would grant an alternative limit if the return on investment would be too low for a prudent operator to proceed with compliance. Another commenter stated that new wells should also be allowed to apply for alternative limits. Other commenters asserted that the BLM should eliminate or substantially narrow the approval of alternative limits, with one commenter stating that the BLM should determine approval of alternative limits based on a cost-benefit analysis that includes the consideration of environmental benefits.

The BLM did not revise the rule based on these comments, but we are providing here additional clarification on the BLM's interpretation of this standard. The BLM believes that requiring the operator to demonstrate that the applicable capture percentage under § 3179.7 would ''impose such costs as to cause the operator to cease production and abandon significant recoverable oil reserves'' is an appropriate threshold for granting alternative capture requirements. The BLM recognizes that the term ''significant'' is a qualitative rather than quantitative metric. The BLM considered development of a quantitative metric, but determined that setting a quantitative threshold, such as number of days of production lost, might be arbitrary and ineffective. Moreover, the BLM has a history of reviewing and effectively evaluating requests based on similar qualitative criteria. While we do not expect there to be a significant change in the review of these requests from prior practice, as discussed in the preamble to the proposed rule, we do expect that spelling out the requirements and

[144] M.J. Bradley and Associates. ''*Re-analysis of Proposed BLM Flaring Reduction Rule; Projected Costs and Benefits*''. September 9, 2016. Pages 13–14.

qualitative criteria more clearly in today's rule will ensure a more consistent review and approval process.

The BLM notes that the phrase ''cease production and abandon significant recoverable oil reserves'' is not intended to require an operator to demonstrate that the lease could never be developed under any future circumstances. Yet nor would it be sufficient for an operator to show that compliance with the capture targets would cause the operator to shut in the wells on a lease for a limited period of time. Rather, the operator must make a showing that the cost of complying with the capture requirements would cause the operator to shut in the wells on the lease under current market conditions and for the reasonably foreseeable future, taking into account uncertainty regarding the long-term recoverable potential of the lease and reservoir. In other words, the showing should illuminate whether compliance would cause the operator to be deprived of the value of the lease, not simply cause a reduction in profit. For example, depending on the specific economic circumstances of the lease, it may be sufficient for an operator to show that it would have to shut in the wells on a lease for a time period on the order of a year or two. The BLM notes, however, that it is not uncommon for operators to shut in and restart production due to market conditions, and a showing under this exemption should demonstrate a more significant impact that is clearly distinguishable from such normal fluctuations.

With respect to the request to allow an alternative capture target to apply to new wells, the BLM notes that the alternative is limited to existing leases, not existing wells. Thus, the alternative capture target is potentially available with respect to an existing lease with new wells. Moreover, the BLM believes that with the extended phase-in of the capture targets and the state- and county-wide averaging option, operators have ample flexibility to take the capture targets into account as they develop new production wells. Indeed, this rule encourages such planning by requiring operators to submit waste minimization plans with their APDs. Further, the BLM does not believe that the opportunity to request an alternative capture target should be extended to new leases. Operators have broad flexibility to plan to meet the capture targets at the time that they bid on new leases.

Some commenters requested that the Sundry Notices be processed in a timely manner, and that the BLM provide a schedule for applying for and being granted an alternative capture percentage. One commenter suggested that the BLM should align the phase-in of the rule with the time it would take to for the BLM to approve the requests for alternate capture targets. Given that the final rule phases in the capture targets over a longer period of time, the BLM expects that operators will have sufficient time to prepare their Sundry Notice requests for alternative capture targets if needed. Additionally, the BLM does not anticipate receiving a large number of Sundry Notice requests for alternative capture targets, and therefore anticipates that it will have adequate time to review them in a timely manner.

Section 3179.9 Measuring and Reporting Volumes of Gas Vented and Flared

This section (which was § 3179.8 in the proposed rule) requires operators to estimate (using estimation protocols) or measure (using a metering device) all flared and vented gas, whether royalty-bearing or royalty-free. This section further provides that specific requirements apply when the operator is flaring 50 Mcf or more of gas per day from a high pressure flare stack or manifold, based on estimated volumes from the previous 12 months, or based on estimated volumes over the life of the flare, whichever is shorter. Beginning one year from the effective date of the rule, when this volume threshold is met, the operator must measure the volume of the flared gas, or must calculate the volume of the flared gas based on the results of a regularly performed GOR test, so as to allow the BLM to independently verify the volume, rate, and heating value of the flared gas. This section also requires operators to report all volumes vented or flared under applicable ONRR reporting requirements.

This section allows operators that are flaring gas across multiple leases, unit PAs, communitized areas, or non-Federal or non-Indian leases to measure or calculate the flared volumes at a single point. To mitigate environmental impacts, commingling to a single flare may be approved even though the relevant royalty interests may differ. The BLM recognizes that the additional costs of requiring individual flaring measurement and meter facilities for each lease, unit PA, or communitized area are not necessarily justified by the incremental royalty accountability afforded by the separate meters and flares. However, to ensure proper production accountability, the method of allocating the flared volumes to each lease, unit PA, or communitized area must be approved by the BLM where the flared volumes exceed the 50 Mcf/day threshold.

The BLM made the following changes from the proposed rule: The final rule clarifies that (1) this section applies to gas vented and flared from wells, facilities, and equipment on a lease, unit PA, or communitized area, rather than just referencing gas vented and flared from wells; (2) the 50 Mcf/day threshold triggering the requirement to measure is determined by averaging the estimated volumes from a high pressure flare stack or manifold over the previous 12 months, or the life of the flare, whichever is shorter; (3) when the 50 Mcf/day threshold is met, operators have the choice of measuring or calculating the volume of the gas, rather than being required to measure only; (4) the requirement to measure or calculate volumes applies beginning one year from the effective date of the rule; and (5) under new paragraph § 3179.9(c), operators may measure or calculate commingled gas at a single measurement point at the flare, but they must use an allocation method approved by the BLM to allocate the quantities of flared gas across the leases, unit PAs, or communitized areas that can contribute production to a flare that is above the 50 Mcf/day threshold.

The BLM received a range of comments on § 3179.9 (§ 3179.8 in the proposed rule). Some commenters recommended that the BLM disallow estimation of flared or vented gas and requested that gas be measured in all cases or that the threshold for measurement be lowered from 50 Mcf/day. Commenters asserted that requiring measurement and monitoring rather than allowing operators to estimate flared gas volumes will provide the co-benefits of assisting the BLM with compliance assurance, allowing accurate determination of when royalties are due, and further reducing methane emissions.

Other commenters argued that the threshold for measurement should be raised or that the measurement requirement should be eliminated from the rule altogether. One commenter contended that metering simply adds costs and logistical difficulties without providing environmental benefit or reducing waste. Several commenters asserted that metering technology is not available that can accurately or reliably estimate flare gas volumes over the extreme range of pressures and rates typically encountered on producing wells, and that the measurement equipment and methods in Onshore Order 5 and its successor regulations are not applicable to flares. Arguing that there is no current technology that can reliably measure low pressure, low volume, fluctuating gas flow, several commenters recommended that the BLM remove the requirement to measure gas at low-volume flow rates and allow the operator to continue to use the estimation requirements and GOR methodology in NTL–4A. Another commenter asserted that operators would need to install meters on any site where vented and flared gas could potentially exceed the threshold. Several commenters requested clarification on the period over which the flaring must exceed the 50 Mcf/day threshold, with one suggesting that the threshold be based on an average value over a production month.

Like the proposed rule, the final rule maintains the 50 Mcf/day threshold for triggering more specific standards for determining the volume of flared gas, however, the BLM has modified the standards that apply when a flare stack or manifold exceeds that threshold to allow either metering or a rigorous GOR-based approach. The final rule also clarifies that exceedance of the 50 Mcf/day threshold will be determined based on the average quantity of flaring per day over the life of the flare or over the previous 12 months of flaring activity, whichever is shorter. The BLM agrees that the rule should specify the measurement period for exceeding the threshold, and believes that limiting the averaging period of 12 months (or the life of well) provides a good indication of ongoing, current levels of flaring that are high enough to warrant measurement.

Although the BLM received comments arguing for both higher and lower thresholds, the BLM ultimately concluded that a change in the threshold is not warranted. The 50 Mcf/day threshold represents a level of activity of high-pressure flares that can be measured or calculated with a reasonable degree of accuracy. In addition, particularly when measured or calculated on average over a period of time at a single flare stack or manifold, 50 Mcf/day is a sufficiently high level of flaring that it could reasonably be expected to lead to royalty obligations on flared volumes considered ''avoidably lost'' under the final rule. When an operator exceeds this threshold, the operator needs to be able to account accurately for the amount of flaring that occurs and validate its compliance with the capture target, particularly as the ''flaring allowable'' level decreases and the capture target increases in future years.

The BLM has modified the standards that apply to flares that exceed the 50 Mcf/day threshold, however, to allow for either metering or a GOR-based calculation of flare volumes in circumstances where a GOR-based approach would allow the BLM to independently verify the volume, rate, and heating value of the flared gas. As noted above, many commenters argued that metering technology is not available to measure gas volumes at many flares, and they asserted that using GOR-based methods provides sufficient information to accurately calculate flared gas volumes. Other commenters argued that all flared gas volumes should be directly metered.

The BLM believes that technology exists to measure flared volumes, especially on higher-volume flares, and that meters would not be prohibitively expensive to install. For example, the gas measurement requirements in recently adopted subpart 3175 contain standards applicable to metering gas at very-low volume FMPs. These are the BLM's least stringent measurement requirements for gas measurement, and they allow operators to use alternative methods for measuring highly fluctuating gas flows, provided only that the measurements meet the performance goals of section 3175.31. While the specific standards in subpart 3175 are geared to orifice plate measurement, the performance goals for very-low volume FMPs only require that the measurement be verifiable and they do not require the operator to achieve any set level of uncertainty or maintain measurement free of statistically-significant bias. Therefore, the BLM may approve alternate devices for purposes of subpart 3175, such as thermal mass meters, ultrasonic meters, or other technology that industry develops that can provide verifiable measurement, which could also be applicable to measuring flared volumes under this provision. In addition, provisions in newly adopted subparts 3170 and 3175 establish a production measurement team, which will approve technologies for gas metering. Technologies approved by the production measurement team could also be used to comply with the requirements of this section.

Nevertheless, the BLM is sensitive to the performance limitations of many commonly used meters, and the BLM believes that a properly designed GOR-based approach can also produce adequately accurate results. A GOR-based method for calculating volumes of flared gas would use a known GOR and measured volumes of oil production and sold gas. The GOR itself is determined based on a test that directly measures in a controlled manner all of the oil and gas produced by the well over a given period of time. Calculating the volumes of flared gas based on GOR can be quite accurate, if the GOR value used is accurate and the well conditions are relatively stable. Since the GOR will vary as well conditions change, the accuracy of the GOR value for a well can be enhanced by more frequent GOR testing, either on a set frequency and/or in response to changes in the well's production. The BLM expects that to meet the standards of § 3179.9, GOR tests would need to be performed at least monthly for most wells.

Commenters also contended that the rule does not clearly specify the type of gas that must be estimated or measured, and they recommended that the rule not apply to ''unavoidably lost'' gas volumes. The BLM does not agree that measurement should be required only when the volume of avoidably flared gas exceeds the threshold. As a first step to reducing waste through flaring, it is important for both the operator and the BLM to have an accurate understanding of the total quantity of gas that is being flared. While the BLM agrees that estimation techniques can provide a ballpark volume estimate, the BLM believes that direct measurement methods authorized under subpart 3175 more consistently and accurately identify the actual volume of the losses. Furthermore, the BLM notes that if an operator is flaring high pressure gas at a rate of more than 50 Mcf/day, it becomes more likely that the operator is failing to meet capture requirements. If an operator fails to meet capture requirements, then at least a portion of the flared gas is deemed avoidably lost, and therefore royalty bearing.

Several commenters noted that the rule does not provide methods for estimating vented or flared volumes. One commenter asserted that the BLM must require operators to use estimation techniques that provide accurate and reliable estimates of releases, while others recommended that methods currently allowed under NTL–4A should continue to be allowed for estimating associated gas and royalty-free volumes.

The BLM does not believe that it is necessary to specify estimation methods, as the BLM expects the industry to continue to use well-understood and generally accepted engineering practices for estimating quantities of flared gas below the 50 Mcf/day threshold.

Commenters also requested that the BLM make public the data on volumes of gas reported by operators as flared or vented. The BLM agrees that this is important information for the public, and the BLM plans to make this information available, subject to any protections for confidential business information.

Section 3179.10 Determinations Regarding Royalty-Free Flaring

This section (which was § 3179.9 in the proposed rule) provides for a transition period for operators that are operating under existing approvals for royalty-free flaring, as of the effective date of the rule. Further, this section clarifies that nothing in this subpart alters the royalty-bearing status of flaring that occurred prior to January 17, 2017, nor the BLM's authority to determine that status and collect appropriate back-royalties.

Commenters asserted that the rule represents a change in what is considered ''avoidable loss'' and therefore cannot be applied to existing leases. Commenters also requested that the BLM permanently grandfather existing approvals for royalty-free flaring and only apply the rule requirements to wells drilled after the effective date of the rule, arguing that 90 days is too little time to design and construct gas capture infrastructure.

As discussed in Preamble Section III.C, the BLM's legal and contractual authority to update its regulations governing existing oil and gas leases is well established. The BLM has the authority to revise its interpretation of what constitutes ''avoidably lost'' oil and gas and may impose this interpretation on existing leases. The BLM revised the rule, however, to extend the grace period for preexisting approvals to flare royalty free from the 90 days specified in the proposed rule to one year after the final rule becomes effective. After one year, those operators with preexisting royalty-free flaring approvals will become subject to all the provisions of the final rule.

Section 3179.11 Other Waste Prevention Measures

This section clarifies that nothing in this subpart alters the BLM's existing authority under applicable laws, regulations, permits, orders, leases, and unitization or communitization agreements to limit the volume of production from a lease, or to delay action on an APD to minimize the loss of associated gas. Specifically, if production from a new well would force an existing producing well already connected to the pipeline to go offline, then notwithstanding the requirements in 3179.7 and 3179.8, the BLM may limit the volume of production from the new well while gas pressures from the well stabilize. In addition, this section clarifies that, consistent with existing authority, the BLM may delay action on an APD or approve it with conditions related to gas capture and production levels, and can suspend the lease under 43 CFR 3103.4–4 if the lease associated with the APD is not yet producing.

In the final rule, the BLM revised both paragraphs § 3179.11(a) and (b) to add additional specificity regarding the sources of the BLM's existing authority. Specifically, the BLM added to both paragraphs (a) and (b) language to the effect that the BLM may exercise its existing authority ''under applicable laws and regulations, as well as its authority under the terms of applicable permits, orders, leases, and unitization or communitization agreements.''

The BLM received a number of comments on this section. While some commenters expressed support for BLM's authority on this matter, other commenters expressed concern that the BLM could delay approval of APDs due to infrastructure limitations that are out of the control of the operator (*e.g.,* third-party pipeline capacity). One commenter suggested that the proposed requirements would result in curtailment of new production, potentially causing reservoir damage during initial production operations. Another commenter asked the BLM to (1) clarify that this portion of the rule applies to Federal minerals only and (2) explain implementation of the rule for special cases, such as long reach horizontal wells that produce from Federal and non-Federal leases within the same wellbore.

The BLM did not revise this section based on comments received. As stated in the regulatory text, the BLM is exercising existing authority and this section does not expand upon that authority. The intent of this section is to address operators' concerns that gas from their existing wells could be forced offline by new Federal gas production, and to clarify that the BLM already has the authority to remedy such circumstances when appropriate to minimize waste of oil and gas on BLM-administered leases. If implementation of this section could result in the incidental curtailment of non-Federal production, the BLM will coordinate on a case-by-case basis with the relevant State regulatory authorities pursuant to Section 3179.12. As noted in Preamble Section VI.D, the fact that a regulatory provision aimed at Federal and Indian production may have incidental impacts on State or private production does not impinge on the BLM's authority to ensure that operators take reasonable steps to minimize waste of Federal and Indian minerals.

Section 3179.12 Coordination With State Regulatory Authority

This section addresses certain ''mixed ownership'' situations, in which a single well may produce oil and gas from both Federal and/or Indian mineral interests and non-Federal, non-Indian mineral interests. This section provides that to the extent any BLM action to enforce a prohibition, limitation, or order under this subpart might adversely affect production of oil or gas from non-Federal and non-Indian mineral interests, the BLM will coordinate on a case-by-case basis with the State regulatory authority with jurisdiction over that non-Federal and non-Indian production. This is consistent with current practice, in which the BLM and State regulators coordinate closely in regulating and enforcing requirements that apply to operators producing from Federal or Indian interests and from non-Federal, non-Indian mineral interests. The BLM did not revise this section from the proposed rule.

Some commenters asserted that that the propose rule did not indicate what constitutes coordination, and separately, that state-Federal coordination would not reduce duplicative requirements for operators. This provision is aimed at coordinating enforcement of BLM requirements, not intended to address issues related to overlapping state and Federal requirements. The BLM anticipates that its level of coordination will vary by state, and may involve entering into (or revising existing) memoranda of understanding with the relevant State parties.

Section 3179.101 Well Drilling

This section requires that gas reaching the surface as a normal part of drilling operations be used or disposed of in one of four specified ways: (1) Captured and sold; (2) directed to a flare pit or flare stack; (3) used in the operations on the lease, unit, or communitized area; or (4) injected. The final rule specifies that gas may not be vented except under the circumstances specified in § 3179.6(b) or when it is technically infeasible to use or dispose of the gas in one of the ways specified above.

This section also states that gas lost as a result of a loss of well control will be classified as avoidably lost if the BLM determines that the loss of well control was due to operator negligence, in which case it will be subject to royalties.

Several commenters asserted that the proposed requirement that all gas that reaches the surface during drilling be captured and sold, flared, used on-site, or injected is not always technically feasible because such gas can be low pressure, low volume, and intermittent. Commenters also stated that achieving a no-venting standard is not feasible particularly when gas reaches the surface through unplanned gas kicks. Commenters asserted that in these situations, venting the gas can sometimes be the only safe solution.

In response to these comments, in addition to the exceptions described in § 3179.6(b), the final rule states that operators also do not have to use or dispose of gas that reaches the surface in one of the ways specified in § 3179.101(a) if it is technically infeasible to do so. The BLM believes that a technical infeasibility option is necessary to address the situations described by commenters, which we expect to occur rarely, where the operator cannot use or dispose of the gas as specified in § 3179.101(a).

The BLM also received comments asserting that it lacks the authority to require that gas reaching the surface during drilling operations be flared if not captured, used on the lease, or injected. Commenters argued that such a requirement does not fall within the BLM's MLA authority because it is not waste prevention, as the gas is lost whether it is vented or flared. These commenters then argued that the only possible justification for the requirement was control of GHGs and other air pollutants, which commenters assert is exclusively within the EPA's domain.

The BLM disagrees with these comments. Flaring during drilling does not count toward an operator's capture target, so the requirement to flare rather than vent this gas does not achieve waste reduction in that way. Nevertheless, the requirement falls squarely within the BLM's authority because, as discussed in connection with § 3179.6, a requirement to flare rather than vent associated gas is a safety measure under the MLA. It is generally safer to combust methane gas than to allow it to vent uncombusted into the surrounding air due to concerns over methane's explosiveness and the risk of hypoxia and exposure to various associated pollutants. In addition, also as discussed in connection with § 3179.6, the BLM has the authority to regulate air quality and GHG impacts on and from public lands pursuant to FLPMA and the MLA.

Section 3179.102 Well Completion and Related Operations

This section addresses gas that reaches the surface during well completion, post-completion, and fluid recovery operations, after a well has been hydraulically fractured or refractured. It requires the gas to be used or disposed of in one of four specified ways: (1) Captured and sold; (2) directed to a flare pit or stack, subject to a volumetric limitation in section 3179.103; (3) used in the lease operations; or (4) injected. The final rule specifies that gas may not be vented except under the narrow circumstances specified in proposed § 3179.6(b) or when it is technically infeasible to use or dispose of the gas in one of the four ways specified above. It also provides that an operator will be deemed to be in compliance with the gas capture and disposition requirements of § 3179.102(a) if the operator is in compliance with the requirements for control of gas from well completions established under subpart OOOO or subpart OOOOa, or if the well is not a ''well affected facility'' under either of these subparts.

The final rule also allows an exemption from the requirements of § 3179.102(a) if the operator submits a Sundry Notice to the BLM demonstrating that compliance with these requirements would impose such costs as to cause the operator to cease production and abandon significant oil reserves under the lease.

In response to comments described below, we have made several changes to the proposed rule requirements. Specifically, the final rule: (1) Clarifies that sources subject to, and in compliance with, subpart OOOO and subpart OOOOa are deemed to be in compliance with this section, without filing a Sundry Notice (as the proposed rule would have required); (2) limits coverage of this section to hydraulically fractured or refractured well completions; (3) adds text to clarify that a well that does not meet the definition of a ''well affected facility'' under either subpart OOOO or subpart OOOOa, will nevertheless be deemed to be in compliance with this section, since the NSPS provides that existing wells that are refractured and follow the well completion procedures in the NSPS are not affected facilities; (4) adds an exemption for technical infeasibility; and (5) adds an exemption from the requirements of this section when the operator can demonstrate that compliance would cause the operator to cease production and abandon significant recoverable oil reserves under the lease due to the cost of compliance.

Several commenters asserted that the requirements for well completions are duplicative with EPA requirements contained in 40 CFR part 60 subpart OOOO and subpart OOOOa. These EPA rules address emissions from flowback operations following completion of new gas and oil wells using hydraulic fracturing treatment. Commenters asserted that the EPA rules effectively cover all wells, because most new wells utilize hydraulic fracturing, and existing wells that undergo ''recompletion'' hydraulic fracturing will be covered as well, as they are considered a ''modified'' source post-recompletion. Commenters further argued that the BLM should allow for exemptions for wells that comply with either 40 CFR part 60, subpart OOOO or subpart OOOOa, rather than limiting the exemption to wells that comply with subpart OOOOa as the proposed rule would have done. Commenters asserted that several issues related to controlling emissions from well completion operations have already been worked out in detail with the EPA, and these issues would apply to the BLM's rule as well. These issues include inadequate well pressure or gas content during the well completion to operate surface equipment, and the need for an exemption for wells with less than 300 scf of gas per stock tank barrel of oil produced. Other commenters noted that the EPA's well completion requirements in subpart OOOOa do not cover conventional wells because of their low methane and VOC emissions, but that the proposed BLM rule would apply to conventional wells. Commenters also argued that the Sundry Notice requirement to document EPA compliance was an additional and unnecessary burden for sources already regulated elsewhere.

Although we believe that new wells will generally be subject to subpart OOOOa, after considering these comments, we have added language in the final rule stating that wells that are in compliance with either subpart OOOO or subpart OOOOa are deemed to be in compliance with the requirements of this section. We also agree with commenters that filing a Sundry Notice to this effect is unnecessary, and we have not included that proposed requirement in the final rule. We also revised the text to limit the coverage of this section to fractured and refractured wells. Upon consideration of the comments, the BLM agrees that the loss of gas from conventional well completions is very small and that regulating conventional well completions is not a particularly cost-effective way to reduce waste. We also revised the text to clarify that a well that does not meet the definition of a ''well affected facility'' under either subpart OOOO or subpart OOOOa, and is exempt from those subparts on that ground, is deemed to be in compliance with this section. This change aligns the coverage of the BLM requirements with the coverage of the EPA requirements, and it ensures that a well that the EPA exempted from the subpart OOOO and subpart OOOOa requirements would not become subject to the BLM requirements by virtue of that exemption.

The BLM is including requirements for well completions in this rulemaking to satisfy its statutory obligations to prevent waste of oil and gas on Federal lands. The well completion requirements are a key part of a comprehensive regulatory regime reducing waste from development of the public's oil and gas resources. The BLM requirements do not require any additional action from an operator that is in compliance with subparts OOOO and OOOOa. Thus, without imposing any burden on an operator, the BLM requirements provide a backstop in the unlikely event that subparts OOOO or OOOOa are no longer in effect. The BLM does not in any way question the validity of the EPA regulations, but we note that some of the same commenters that claim the BLM regulations are unnecessarily duplicative are separately challenging EPA's subpart OOOOa in court.

Commenters also questioned the technical feasibility of the proposed requirement that all gas that reaches the surface during well completion and post completion, drilling fluid recovery, or fracturing or refracturing must be captured and sold, flared, used on-site, or injected. These commenters contended that gas releases during these stages of development, especially immediately following drilling, may involve small quantities, or gas with low BTU or high contaminant concentrations. As a result, the commenters stated, the compliance options in the proposed rule are cost prohibitive and not technically feasible. They further argued that capturing low quantities of gas requires significant compression capacity to enter a sales line, that gas that does not meet pipeline specifications for sales is unlikely to burn (without makeup gas) or be appropriate for beneficial use, and that reinjection of small volumes produced for a limited time is cost prohibitive.

In response to these comments, the final rule includes an exemption from the requirements for handling gas from a well completion when it is technically infeasible to use or dispose of the gas using any of the four identified options. Commenters also asserted that under the proposed rule, absent an exemption, if using any of the four identified compliance options was technically infeasible, the operator would have been forced to abandon the well. While we do not believe that the requirements for well completions are likely to impose such costs as to cause an operator to abandon the lease, the final rule also includes an exemption from § 3179.102(a) when the operator can demonstrate that compliance would cause the operator to cease production and abandon significant recoverable oil reserves under the lease due to the cost of compliance.

The BLM also received comments asserting that it lacks the authority to require that gas reaching the surface during well completions be flared if not captured, used on the lease, or injected. Commenters argued that such a requirement does not fall within the BLM's MLA authority because it is not waste prevention—*i.e.,* the gas is lost whether it is vented or flared. These commenters then argued that the only possible justification for the requirement was control of GHGs and other air pollutants, which commenters assert is exclusively within the EPA's domain.

The BLM disagrees with these comments for several reasons. First, the requirement in this section to flare rather than vent constitutes waste prevention because (a) all flaring covered by this section and § 3179.103 is subject to a volumetric royalty-free flaring limit of 20 MMcf/well; and (b) flared gas from well completions that exceeds this volumetric limit is treated as avoidably lost gas subject to royalties under § 3179.4(a)(1)(B). This royalty trigger provides an incentive for operators to stay under the 20 MMcf/ well flaring limit—and thus to limit their waste. Second, as discussed in connection with § 3179.6, a requirement to flare rather than vent associated gas is a safety measure under the MLA. It is generally safer to combust methane gas than to allow it to vent uncombusted into the surrounding air due to concerns over methane's explosiveness and the risk of hypoxia and exposure to various associated pollutants. In addition, also as discussed in connection with § 3179.6, the BLM has the authority to regulate air quality and GHG impacts on and from public lands pursuant to FLPMA and the MLA.

Section 3179.103 Initial Production Testing

This section clarifies when gas may be flared royalty-free during a well's initial production test. It provides that gas may be flared royalty-free during initial production testing until the first of the following events: (1) The operator determines that it has obtained adequate reservoir information for the well; (2) 30 days have elapsed; (3) 20 MMcf of gas have been flared (as measured in combination with volumes flared during well completion under section 3179.102); or (4) the beginning of well production. Under any of these scenarios, royalty-free flaring allowed by this section ends when production begins.

Paragraph (b) of this section allows the BLM to approve royalty-free flaring for up to an additional 60 days, if there are well or equipment problems or a need for additional testing to develop adequate reservoir information. Paragraph (d) allows a 90-day period for royalty-free flaring during dewatering and initial evaluation of an exploratory coalbed methane well, and the BLM may approve up to two extensions of 90 days each. This approach recognizes that it generally takes substantially more than 30 days to dewater a coalbed methane well, but the time required can vary considerably between different coalbed methane resources. The operator is required to submit a Sundry Notice to BLM if it wishes to request a longer test period under paragraph (b) or (d) of this section.

In response to comments described below, the final rule includes a new provision in paragraph (c) of this section that allows the BLM to increase the 20 MMcf royalty-free flaring limit by up to an additional 30 MMcf of gas for exploratory wells in remote locations where additional testing is needed in advance of development of pipeline infrastructure. The operator is required submit a Sundry Notice to BLM if it wishes to request this higher limit.

Under any of these circumstances, notwithstanding an extension of the test period, the well will still be subject to the royalty-free flaring limit of 20 MMcf limit or, upon approval through a Sundry Notice, the higher limit specified in paragraph (c) of this section. Volumes vented or flared under this section must be reported to ONRR as directed in § 3179.9 of this subpart.

Several commenters argued that the proposed royalty-free flaring limit of 20 MMcf was too low, and that higher limits are needed due to higher production rates being achieved through advancements in hydraulic fracturing. They further requested that the rule state that the duration and maximum gas volumes for initial production testing do not include the duration of flowback operations and gas volumes produced during those operations. In response to these comments, the BLM added new paragraph (c) of this section (discussed above), which allows the

BLM to increase the 20 MMcf royalty-free flaring limit by up to an additional 30 MMcf of gas for exploratory wells in remote locations where additional testing is needed in advance of the development of pipeline infrastructure. While the BLM believes that for established fields, adequate testing to determine a well's production capacity can be conducted with no more than 20 MMcf of flared gas (including flaring from flowback operations), we recognize that a higher amount of flaring may be necessary for exploratory wells that are located in remote areas where no existing infrastructure exists. To the extent that an operator chooses to conduct additional testing beyond the royalty-free limits established in this section, the operator is free to do so, but the operator is responsible for paying royalties on the flared gas, rather than being able to shift the associated royalty losses to the public.

Section 3179.104 Subsequent Well Tests

The requirement in this section is essentially the same as NTL–4A's requirement regarding subsequent well tests. This section limits to 24 hours any royalty-free flaring during production tests conducted after the initial production test, unless the BLM approves or requires a longer test period. The operator must submit via Sundry Notice its request for a longer test period. Volumes vented or flared under this section must be reported to ONRR as directed in proposed § 3179.9 of this subpart. The BLM received few comments on this provision and made no substantive changes to this provision from the proposed to final rule.

Section 3179.105 Emergencies

This section allows operators to flare (or in some cases vent) royalty-free during an emergency, which is a temporary, infrequent, and unavoidable situation in which the loss of gas is uncontrollable or necessary to avoid immediate and substantial adverse impacts to safety, public health, or the environment. Paragraph (a) further limits royalty-free emergency venting or flaring to a maximum of 24 hours per incident, unless the BLM agrees that the emergency conditions necessitate flaring—and possibly venting—for a longer period. In addition, paragraph (b) clarifies situations that do not constitute an emergency for purposes of royalty assessment, including: More than three failures of the same equipment within any 365-day period; failures from improperly sized, installed, or maintained equipment; failure to limit production when the production rate exceeds the capacity of related equipment or other infrastructure; scheduled maintenance; a situation caused by operator negligence; and when a lease, unit, or communitized area has already experienced three or more emergencies within the past 30 days, except when the BLM determines such emergencies were unanticipated and beyond the operator's control. Volumes vented or flared under this proposed section must be reported to ONRR as directed in § 3179.9 of this subpart.

Based on a number of comments requesting additional clarification, the BLM has added a definition of ''emergency'' to the final text. Additionally, in response to comments stating that certain emergency situations may necessitate flaring beyond 24 hours, the final rule allows operators to flare or vent royalty-free beyond the 24-hour limit, but only when necessary and with BLM approval. While the BLM asserts that in most cases, 24 hours is a sufficient timeframe to address an emergency and/or make an appropriate business decision, we acknowledge that venting or flaring beyond 24 hours might be necessary in a limited number of cases, such as a natural disaster that prevents access to the site.

Some commenters asserted that the BLM was being too strict in limiting royalty-free flaring in emergencies to 3 emergencies in a 30-day period. BLM believes that after multiple incidents in a short timeframe, operators should identify and correct any maintenance or operational issues, and that repetitive, systemic events do not constitute an emergency situation. Commenters also recommended that the BLM remove the provisions listing improper installation and scheduled maintenance as events that do not constitute emergencies. The BLM did not revise the rule based on these comments, as scheduled maintenance is not an unanticipated disruption and improper installation can be avoided through good work practices.

The BLM notes that the provisions on downhole well maintenance in § 3179.204 cover well maintenance activities.

Section 3179.201 Equipment Requirements for Pneumatic Controllers

This section addresses gas losses from pneumatic controllers. Paragraph (a) establishes that this section applies to pneumatic controllers that use natural gas produced from a Federal or Indian lease, or from a unit or communitized area that includes a Federal or Indian lease, if the controllers (1) have a continuous bleed rate greater than 6 scf/hour (''high-bleed'' controllers); and (2) are not covered by EPA regulations that prohibit the new use of high-bleed pneumatic controllers (40 CFR 60, subpart OOOO or subpart OOOOa), but would be subject to those regulations if the controllers were new, modified, or reconstructed sources.

Paragraph (b) of this section requires pneumatic controllers subject to the requirement to be replaced with controllers (including, but not limited to, continuous or intermittent pneumatic controllers) having a bleed rate of no more than 6 scf/hour, subject to the exceptions described below. Paragraph (c) is discussed below, in connection with the exceptions. Under paragraph (d), operators are required to replace such controllers within 1 year from the effective date of the final rule, or within 3 years from the effective date of the rule if the well or facility served by the controller has an estimated remaining productive life of 3 years or less. Under paragraph (e), operators are also required to ensure that pneumatic controllers are functioning within the manufacturers' specifications.

This section provides several exceptions to the replacement requirement in paragraph (b). First, an operator is not required to replace a controller if a high-bleed controller is necessary to perform the needed function. For example, replacement might not be required if a low-bleed controller would not provide a timely response, which would lead to greater waste or create a safety hazard. To avail themselves of this exception, operators must submit a Sundry Notice to the BLM that describes the functional needs requiring the use of higher-bleed controllers. Second, replacement is not required if the controller was routed to a flare device or low-pressure combustor as of the effective date of this rule, and continues to be so-routed. Third, an operator is not required to replace its pneumatic controller if it chooses to route the pneumatic controller exhaust to processing equipment for capture and sale. Fourth, an operator may be exempted from the replacement requirement if it demonstrates through a Sundry Notice (described in paragraph (c)), and the BLM concurs, that replacing the pneumatic controllers on the lease would impose such costs as to cause the operator to cease production and abandon significant recoverable oil reserves under the lease.

In response to comments and to further clarify the section, the BLM made the following four changes to the proposed rule requirements: (1) Clarified that a pneumatic controller is subject to this section if it is not subject to 40 CFR part 60, subparts OOOO or OOOOa, but would be subject to either of those subparts if it were a new, modified, or reconstructed source; (2) clarified that the operator may replace a high-bleed pneumatic controller with a continuous pneumatic controller, an intermittent pneumatic controller, or a non-pneumatic device, as long as the replacement has a bleed rate no greater than 6 scf per hour; (3) clarified that an operator may be exempted from replacement if it was routing the controller exhaust to a flare or a low-pressure combustor device at the time the rule was effective, so long as the operator continues to do so; (4) allowed an operator to be exempted from replacement if it routes the controller exhaust to processing equipment; and (5) included in paragraph (c) the information that must be included in the Sundry Notice to demonstrate that the costs of replacing a pneumatic controller would cause the operator to cease production and abandon significant recoverable oil reserves.

Several commenters requested that the final rule clarify perceived conflicting regulatory coverage between the proposed rule and the EPA's subparts OOOO and OOOOa. Based on these comments, we revised § 3179.201(a)(2) to further qualify that a pneumatic controller is subject to this section if it ''[i]s not subject to any of the requirements of 40 CFR part 60, subpart OOOO or subpart OOOOa, but would be subject to one of those subparts if it were a new, modified, or reconstructed source.'' This change ensures that the BLM requirements do not inadvertently apply to existing equipment that would not be covered by the EPA requirements. We believe this change properly conveys our original intent to cover the same types of pneumatic controllers that EPA rules cover.

Some commenters stated that pneumatic controller exhaust should be allowed to be routed to processing equipment, such as a vapor recovery unit, on-site fuel line, or a control device (in addition to a flare), noting that Wyoming's recent regulation for existing pneumatic controllers in the Upper Green River Basin allow operators this flexibility. The BLM agrees with these comments and as stated previously, revised the rule to state that operators may route the pump to processing equipment. However, the final rule clarifies that with respect to routing pneumatic controller exhaust to a flare or low-pressure combustor, an operator may only be exempted from replacement of the controller if it is already routing such exhaust in this manner as of the effective date of the rule, and continues to do so. The BLM believes that given the low cost and high return on pneumatic controller replacement, spending capital to route controller exhaust to a flare or low-pressure combustor is unlikely to make sense from an economic, practical and waste prevention perspective.

Some commenters stated that the BLM should require the use of zero-bleed devices on leases where on-site electrical grid power is used, or that the BLM should require bleed gas to be routed to a flare or other control device. The final rule does not require the use of zero-bleed pneumatic controllers. Many sites using pneumatic controllers are not connected to the electric grid, and the BLM believes that requiring operators to route gas from pneumatic controllers would impose considerable costs on them and involve technical complications which could impact the cost effectiveness of the replacement requirement. The BLM did clarify in the final rule that operators using pneumatic controllers that have a bleed rate greater than 6 scf per hour have the option to route the exhaust to processing equipment rather than replace the controller.

Many commenters stated that one year is insufficient to replace high-bleed pneumatic controllers and requested that requirements be extended to two or three years. The BLM believes that one year is a sufficient time period for operators to replace high-bleed pneumatic controllers, given the relatively low cost and rapid pay-back period of these replacements, as discussed in section V. Discussion of the Proposed Rule of the preamble to the proposed rule. In addition, as included in the proposed rule, if the well or facility that the pneumatic controller serves has an estimated remaining productive life of three years or less from the effective date of the rule, the operator has three years from the effective date of the rule to replace the pneumatic controller, provided that the operator notifies the BLM through a Sundry Notice.

Several commenters argued that operators should not have to submit a Sundry Notice and wait for BLM approval, if they meet one of the exemptions to the requirements. These commenters also asserted that the requirement for submission of a Sundry Notice (and hence, they assumed, BLM approval) set a higher standard for retaining a high-bleed controller based on functional need than the requirements in 40 CFR part 60, subpart OOOOa, under which they claimed EPA only requires recordkeeping to document why a high bleed pneumatic controller is needed.

As provided in the proposed rule, operators seeking exemptions based on a functional need for the equipment need only notify the BLM of that need and do not have to get the BLM's approval. Further, if the exhaust from the pneumatic controller was already being routed to a flare or other control device on the effective date of the rule, or if the operator chooses to route the exhaust to processing equipment, no notice is required. The BLM only requires a Sundry Notice and approval for exemptions based on the cost of replacing the equipment.

The BLM also received comments asserting that it lacks the authority to require operators who opt not to install low-bleed pneumatic controllers to route their existing pneumatic controllers to a flare device (rather than venting). Commenters argued that such a requirement does not fall within the BLM's MLA authority because it is not waste prevention—*i.e.,* the gas is lost whether it is vented or flared. These commenters then argued that the only possible justification for the requirement was control of GHGs and other air pollutants, which commenters assert is exclusively within the EPA's domain.

The BLM disagrees with these comments. The final rule does not require flaring in lieu of venting as a means of compliance with this section. The primary means of compliance is replacement with a low-bleed pneumatic controller, which prevents waste by reducing the amount of gas diverted to the pneumatic controllers—which, in turn, makes more gas available for capture. An operator is exempted from this requirement if a high-bleed pneumatic controller is required based on functional needs, if the operator directs its controller exhaust to processing equipment for capture, or if the operator is *already* directing the exhaust from the controller to a flare (or low-pressure combustor). The rule therefore imposes no new or additional flaring requirements.

Section 3179.202 Requirements for Pneumatic Diaphragm Pumps

This section establishes requirements for operators with pneumatic diaphragm pumps that use natural gas produced from a Federal or Indian lease, or from a unit or communitized area that includes a Federal or Indian lease. It applies to such pumps if they are not covered under EPA regulations at 40 CFR part 60, subpart OOOOa, but would be subject to that subpart if they were a new, modified, or reconstructed source. It does not apply to pneumatic diaphragm pumps that vent exhaust gas to the atmosphere or that operated fewer than 90 days in the prior calendar year (as documented in a Sundry Notice).

For covered pneumatic pumps, this section requires that the operator either replace the pump with a zero-emissions pump or route the pump exhaust to processing equipment for capture and sale. Alternatively, an operator may route the exhaust to a flare or low pressure combustion device if the operator makes a determination (and notifies the BLM through a Sundry Notice) that replacing the pneumatic diaphragm pump with a zero-emissions pump or capturing the pump exhaust is not viable because (1) a pneumatic pump is necessary to perform the function required, and (2) capturing the exhaust is technically infeasible or unduly costly. If an operator makes this determination and has no flare or low-pressure combustor on-site, or routing to such a device would be technically infeasible, the operator is not required to route the exhaust to a flare or low-pressure combustion device. Further, an operator that is required to replace a pump or route the exhaust gas from a pump either for capture or to a flare or combustion device may be exempt from the requirement if the operator demonstrates through a Sundry Notice, and the BLM concurs, that the cost would impose such costs as to cause the operator to cease production and abandon significant recoverable oil reserves under the lease.

Operators must comply with these requirements no later than one year after the effective date of the rule. In addition, similar to the requirements for pneumatic controllers and based on the same rationale, this section provides that if the estimated remaining productive life of the well or facility is three years or less, the operator is allowed to notify BLM through a Sundry Notice and replace the pneumatic pump no later than three years from the effective date of this section, rather than within one year. The section also requires that pneumatic pumps function within manufacturers' specifications.

The final rule makes five changes to the proposed rule requirements. First, it restructures the requirements as discussed above to require that operators either replace pneumatic diaphragm pumps with zero emission pumps or capture the exhaust for sale. As explained above, the operator may route the exhaust to a flare or low pressure combustor device if it makes a determination that replacing the pump with a zero-emissions pump is not viable because (a) a pneumatic pump is necessary to perform the function required, and (b) capturing the pneumatic pump exhaust is technically infeasible or unduly costly. If an operator makes this determination and has no flare or low pressure combustor on-site (or flaring to such a device would be technically infeasible), the operator is not required to route the exhaust to a flare or low pressure combustion device. Second, in response to comments and as discussed below, the final rule removes chemical injection pumps from inclusion in this section. Third, it adds paragraph (b) stating that an operator is not required to replace a pump if the pump does not vent exhaust gas to the atmosphere (*e.g.,* already is routed to a flare or to capture equipment) or if the operator submits a Sundry Notice to the BLM documenting that the pump(s) operated fewer than 90 individual days in the prior calendar year. Fourth, the final rule clarifies that a pneumatic diaphragm pump is subject to this section if it is not subject to any of the requirements of 40 CFR part 60, subpart OOOOa, but would be subject to that subpart if it were a new, modified, or reconstructed source. Fifth, it adds paragraph (d), which includes information that must be included in the Sundry Notice specified in § 3179.202(f).

Some commenters suggested that the BLM require the use of zero-bleed pumps in all cases except where technically infeasible, while other commenters stated that routing pump exhaust to a flare offers no product recovery potential and does not minimize loss or waste. The BLM agrees that the installation of zero-bleed pumps is technically feasible in many cases. In response to these comments, and to require operators to employ waste minimization practices when feasible, the final rule is restructured to require operators, when feasible, to install zero-bleed pumps or route the pump exhaust to process equipment for capture and sale. However, in making this revision, the BLM does not intend to require operators to replace pumps that are already routed to flare or capture equipment (*i.e.,* pumps that do not currently vent exhaust gas to the atmosphere), and we have added clarifying language to avoid this result. As discussed below, the compliance mechanisms in this section are structured to encourage the prevention of waste.

Some commenters stated that chemical injection and temporary use pumps should be exempt because they have low aggregate emissions and operate intermittently. The BLM agrees that chemical injection pumps release substantially lower quantities of gas than diaphragm pumps. The BLM also recognizes that some diaphragm pumps are used very intermittently or only for a short portions of the year, and that low usages result in low quantities of lost gas. In the final rule, the BLM has specified that the rule does not apply to chemical injection pumps or to diaphragm pumps that operated fewer than 90 individual days in the prior calendar year. This change also aligns the requirements of this section with the requirements for pneumatic pumps under 40 CFR part 60 subpart OOOOa.

Several commenters requested that the final rule clarify perceived conflicting regulatory coverage between the proposed rule and 40 CFR part 60 subpart OOOOa. In addition to the change to chemical injection pumps, we revised § 3179.202(a)(2) to further qualify that a pneumatic diaphragm pump is subject to this section if it ''[i]s not subject to any of the requirements of 40 CFR part 60, subpart OOOOa, but would be subject to that subpart if it were a new or modified source.'' This change ensures that the BLM requirements do not inadvertently apply to existing equipment that would have been exempted under the EPA requirements. We believe this change properly conveys our original intent to cover the same types of pneumatic pumps that EPA rules cover.

Similar to comments received on pneumatic controllers, some commenters stated that pneumatic pumps should be allowed to be routed to processing equipment, such as a vapor recovery unit, on-site fuel line, or a control device (in addition to a flare). The BLM agrees with these comments and revised the rule to state that operators may route the pneumatic pump exhaust to processing equipment for capture and sale, or, under certain conditions described above, to either a low-pressure combustor device or a flare.

Several commenters stated that 1 year is insufficient to replace covered pneumatic pumps and requested that the replacement requirements be extended to 3 years. The BLM believes that one year is a sufficient time period for operators to replace pneumatic diaphragm pumps, or route them to a flare that is already installed on-site, given the relatively low cost and rapid pay-back period of these replacements, as discussed in the preamble to the proposed rule, and the relatively low cost of connecting a pump to a pre-existing on-site flare. Moreover, because the BLM is not including chemical injection pumps in this final rule, operators will need to address far fewer pneumatic pumps than the proposed rule would have required. In addition, as included in the proposed rule, if a well or facility that the pneumatic pump serves has an estimated remaining productive life of three years or less from the effective date of the rule, the operator has three years from the effective date of the rule to complete the replacement, provided that notification is filed through a Sundry Notice.

The BLM also received comments asserting that it lacks the authority to require operators who opt not to install zero-emission pneumatic pumps to route their existing pneumatic pumps to a flare device (rather than venting). Commenters argued that such a requirement does not fall within the BLM's MLA authority because it is not waste prevention—*i.e.,* the gas is lost whether it is vented or flared. These commenters then argued that the only possible justification for the requirement was control of GHGs and other air pollutants, which commenters assert is exclusively within the EPA's domain.

The BLM disagrees with these comments for several reasons. First, the requirement in this section to flare rather than vent associated gas constitutes waste prevention. Requiring operators to (at minimum) direct associated gas that bleeds from their pneumatic pumps to a flare device eliminates the lowest cost method of handling such gas (that is, venting). This, in turn, provides a greater incentive for operators to upgrade to a zero-emission pneumatic pump or capture pump exhaust gas. Upgrading to a zero-emission pneumatic pump prevents waste by reducing the amount of gas diverted to the pneumatic pumps—which, in turn, directs more gas to either a capture line or the high-pressure flare. If an operator chooses to capture, upgrading the pneumatic pump will directly prevent waste by causing more gas to be sold.

Second, as discussed in connection with § 3179.6, a requirement to flare rather than vent associated gas is a safety measure under the MLA. It is generally safer to combust methane gas than to allow it to vent uncombusted into the surrounding air due to concerns over methane's explosiveness and the risk of hypoxia and exposure to various associated pollutants. In addition, also as discussed in connection with § 3179.6, the BLM has the authority to regulate air quality and GHG impacts on and from public lands pursuant to FLPMA and the MLA.

Some commenters raised concerns about differences between the proposed BLM and EPA requirements for pneumatic pumps, asserting that the BLM proposed rules are different and more stringent. First, they asserted that the EPA rule limits ''affected facilities'' to sites with a control device already on-site, while the proposed BLM requirements would apply to pneumatic pumps regardless of whether a control device is present. Second, commenters asserted that the EPA rule only requires operators to route pump emissions to a control device if one already exists on site, while the BLM proposed rule may require replacement with a zero emission pump in such a circumstance.

Some of these concerns were addressed by the EPA's final subpart OOOOa regulations, while other differences are appropriate given the different authorizing statutes and primary foci of the two sets of regulations. As an initial matter, the BLM requirements apply only to pumps that are not subject to subparts OOOO or OOOOa (but would be if the pump was new, modified, or reconstructed), so no pump will be subject to both regulations.

With regard to the first issue described above, the final BLM and EPA rules apply to the same types of pneumatic pumps. In its final rule, EPA noted that there was some confusion regarding the proposed definition of affected facility, and stated that it had modified the regulatory text to clarify that ''all natural gas-driven diaphragm pumps at natural gas processing plants or well sites are affected facilities, except for pumps at well sites that operate less than 90 days per calendar year.'' [145] The final subpart OOOOa text requires operators to maintain records on the control status of all pneumatic pump affected facilities and to include them all in the operators' annual reports. The final BLM rule aligns with the scope and requirements of the final EPA rule in these respects.

With regard to the second issue, the BLM final rule does apply somewhat different requirements to pumps covered by the BLM rule as compared to pumps covered by the EPA rule, due to differences between the two agencies' legal authorities. The legal authority for subpart OOOOa is section 111 of the Clean Air Act, which requires the EPA to set standards of performance for new sources and requires a ''standard of performance'' to be based on the best system of emission reduction (BSER) ''adequately demonstrated.'' [146] As noted in the proposed subpart OOOOa preamble, the EPA did not require zero emissions pumps at facilities other than gas processing plants because the availability of consistent, reliable electrical power at all affected facilities could not be reasonably assumed.[147] The BLM, however, has flexibility to require waste reduction measures at any site where such measures would work, without specifically defining such sites, even if the measures may not be available at all sites. Zero emission pumps are feasible where solar power is adequate to power the pump for its intended function and at sites where other sources of electric power are available. Where they are feasible, our analysis indicates that the cost of replacing a gas-driven pneumatic pump with a zero emission pump is modest and would be at least partially offset by the value of the saved gas.

Additionally, the BLM final rule establishes a preference for operators who do not replace their pumps with a zero-emissions pump to route exhaust gas to capture in lieu of routing to a flare. This emphasis on either replacement or capture is a function of the BLM's waste prevention focus. Thus, unlike subpart OOOOa, the final BLM rule requires operators with a gas-driven pneumatic pump that is currently venting to the atmosphere to replace it with a zero emission pump, if a zero-emission pump would work at that site to perform the function required, or route the exhaust gas to capture. If a zero-emission pump is not viable at that site and routing the exhaust gas to capture is technically infeasible or unduly costly, however, then the operator must comply with a requirement that tracks the requirement under subpart OOOOa—the operator must route the exhaust gas from the pneumatic pump to a flare, if there is already a flare on-site. While the BLM rule establishes an additional requirement on operators, it does not conflict in any way with the EPA rule or increase an operator's burden to comply with both rules. Any pump that is already routed to a flare in compliance with the EPA rule will also be in compliance with the BLM rule. For pumps without a flare on-site, the EPA rule requires no further action, while the BLM rule requires replacement or routing to capture, absent the listed conditions.

The third potential difference that commenters highlighted between the BLM and EPA requirements for pneumatic pumps is the level of documentation required to show that routing to a flare is technically infeasible. To clarify a possible misunderstanding by the commenters, a

[145] 81 FR 35851.

[146] 81 FR 35884.

[147] 80 FR 56625.

requirement to notify the BLM through a Sundry Notice, as specified in this section, is not a requirement to obtain approval from the BLM. Sundry Notices may be used simply for notification purposes, or to obtain approval from the BLM for an action. The final rule specifies the purpose of each requirement to file a Sundry Notice.

Here, the BLM final rule requires an operator to notify the BLM through a Sundry Notice if the operator is not replacing the pump for one of the reasons specified. The operator must also notify the BLM if the operator is not routing the pump to a flare because there is no flare on site or routing to a flare would be technically infeasible. Subpart OOOOa establishes requirements for an engineering evaluation of whether routing to a flare would be technically infeasible, requires the evaluation and determination of technical infeasibility to be certified by a qualified professional engineer, and requires this information to be included in the operator's annual report. Thus, while the specific documentation requirements for pumps covered by the BLM requirements differ from those established by the EPA, both rules require the operator, under specified circumstances, to either route the pump exhaust to a flare or notify the respective agency that the pump meets the criteria for an exemption. The BLM notification requirements are less specific than the EPA requirements, which the BLM believes will make compliance less burdensome for an operator.

Section 3179.203 Storage Vessels

This section addresses gas vented from crude oil, condensate, intermediate hydrocarbon liquid, or produced water storage vessels that contain production from a Federal or Indian lease, or from a unit or communitized area that includes a Federal or Indian lease, and are not subject to 40 CFR part 60, subparts OOOO or OOOOa, but would be if they were new, modified, or reconstructed sources. If such storage vessels have the potential for VOC emissions equal to or greater than 6 tpy, the final rule requires operators to route all gas vapor from the vessels to a sales line. Alternatively, the operator may route the vapor to a combustion device if it determines that routing the vapor to a sales line is technically infeasible or unduly costly. The operator also may submit a Sundry Notice to the BLM that demonstrates that compliance with the above options would cause the operator to cease production and abandon significant recoverable oil reserves under the lease due to the cost of compliance. Operators must meet this requirement no later than one year after the rule becomes effective, or three years after the rule becomes effective if the operator needs to replace the storage vessel in order to comply.

Operators must determine the rate of VOC emissions from the storage vessel within 60 days after this rule is effective, and within 30 days after adding a new source of production to a storage vessel. This determination is based on the maximum average daily throughput for a 30-day period of production, and may take into account any legally and practically enforceable limits in an operating permit or other requirements applicable to the storage vessel. This section no longer applies to a storage vessel whose total uncontrolled VOC emissions rate declines to 4 tpy in the absence of controls for 12 consecutive months.

In response to comments, the BLM has made the following changes to the requirements in the proposed rule: (1) Clarified the exemption for sources subject to 40 CFR part 60, subparts OOOO or OOOOa; (2) extended the initial compliance period from 6 months to 1 year; (3) added a 3-year initial compliance period for operators that must replace storage vessels to comply with the requirements; (4) required gas to be routed to a sales line when that option is neither technically infeasible nor unduly costly, as determined by the operator; (5) added a requirement that operators must determine whether the storage vessel has the potential for VOC emissions equal to or greater than 6 tpy based on the maximum average daily throughput for a 30-day period of production, which may take into account legally and practically enforceable limits applicable to the storage vessel; (6) added a requirement that storage vessels subject to the final rule must be adequately sized to accommodate the operator's production levels and equipped to meet any applicable regulatory requirements for tank vapors; and (7) added a requirement that storage vessels subject to the final rule may only vent through properly functioning pressure relief devices. Each change is discussed below along with a summary of the relevant comments and responses.

Several commenters expressed concerns about differences between the types of new storage vessels that are subject to subparts OOOO or OOOOa and the types of existing storage vessels that would have been subject to the proposed rule. The BLM agrees that applying the requirements of this section, as proposed, to storage vessels "not subject to 40 CFR part 60, subparts OOOO or OOOOa" could encompass storage vessels that neither the EPA nor the BLM intended to cover. In the final rule, § 3179.203(a)(2) covers a storage vessel if it "[i]s not subject to any of the requirements of 40 CFR part 60, subparts OOOO or OOOOa, but would be subject to that subpart if it were a new, modified, or reconstructed source."

Several commenters argued that the proposed initial period of 6 months to comply with the emission reduction provisions was too short. Commenters stated that it would take longer than 6 months to complete engineering studies of existing storage vessels; design, order and construct the control device; and then install the control device. Commenters recommended various time periods ranging from 1 to 3 years. We believe a 1-year initial compliance period is adequate to perform the tasks necessary to install a control device, and we have modified § 3179.203(c) accordingly.

Commenters also stated that in some cases they would likely have to replace an existing tank in order to meet the emission limitations. In such cases, commenters stated that even more time would be needed to obtain capital funding approval and purchase the new storage vessel. In response, we further amended § 3179.203(c) to provide a 3-year initial compliance period when the operator must replace a storage vessel in order to comply with the rule requirements.

In the proposed rule, § 3179.203(c) allowed the operator to choose between routing emissions from storage vessels subject to the rule to a combustion control device, a continuous flare, or a sales line. Some commenters opposed these provisions because they believe BLM should focus on preventing loss of natural resources. The BLM agrees that this rule should focus on gas capture and use whenever possible, and in the final rule, § 3179.203(c) first requires the operator to route tank vapor gas from a storage vessel to a sales line. If the operator determines that routing the emissions to the sales line is technically infeasible or unduly costly, the operator may route the gas to a combustion device.

We also received numerous comments requesting that we align the final rule as much as possible with the requirements finalized by the EPA in subparts OOOO and OOOOa. As stated in the preamble to the proposed rule, the BLM and the EPA understand that aligning our requirements to the extent possible, provides common standards that ease implementation and reduce confusion for both the regulated industry and regulatory agencies.[148] Several small changes in the final rule help clarify the rule and better align it with the final requirements in subparts OOOO and OOOOa. In § 3179.203(b), the rule provides additional guidance to operators on how to make the threshold determination that a storage vessel has the potential for VOC emissions equal to or greater than 6 tpy. Changes to the definition of ''storage vessel'' in § 3179.3 also synchronize the coverage between the two sets of rules, such that these provisions cover the same types of storage vessels that would be covered by subparts OOOO or OOOOa if they were new, modified, or reconstructed.

One commenter suggested that the BLM make it clear that venting from access points or pressure relief devices during normal operation is prohibited. The commenter stated that to account for those instances where venting may be necessary, the BLM could adopt the approach taken by Colorado by specifying those instances where venting is reasonably required, such as for ''maintenance, gauging or safety of personnel and equipment.'' The commenter also recommended that the BLM add a requirement that operators certify that their storage tank facilities are adequately sized in order to capture, convey, and control emissions. They stated that this is required in Colorado and is a direct response to the Air Pollution Control Division and EPA investigations that revealed significant leaks and venting from controlled facilities.

In response to this comment, final rule § 3179.203(f) provides that storage vessels subject to this section must be adequately sized to accommodate production levels and equipped to meet any applicable regulatory requirements for emissions. Also, § 3179.203(g) requires that storage vessels subject to this section may only vent through properly functioning pressure relief devices. We believe both of these provisions embody good engineering practices and should be common practice when operating a storage vessel.

The BLM also received comments asserting that it lacks the authority to require operators who opt not to capture tank vapor gas to route such gas to a flare device (rather than venting). Commenters argued that such a requirement does not fall within the BLM's MLA authority because it is not waste prevention—*i.e.,* the gas is lost whether it is vented or flared. These commenters then argued that the only possible justification for the requirement was control of GHGs and other air pollutants, which commenters assert is exclusively within the EPA's domain.

The BLM disagrees with these comments for several reasons. First, the requirement in this section to flare rather than vent tank vapor gas constitutes waste prevention. Requiring operators to (at minimum) direct tank vapor gas to a flare device eliminates the lowest cost method of handling such gas (*i.e.,* venting), and thereby provides a higher baseline for operators to calculate whether it would be economical to install a VRU to capture the tank vapor gas for sale. The BLM anticipates that this higher baseline may encourage more operators to install VRUs.

Second, as discussed in connection with § 3179.6, a requirement to flare rather than vent associated gas is a safety measure under the MLA. It is generally safer to combust methane gas than to allow it to vent uncombusted into the surrounding air due to concerns over methane's explosiveness and the risk of exposure to various associated pollutants. In addition, also as discussed in connection with § 3179.6, the BLM has the authority to regulate air quality and GHG impacts on and from public lands pursuant to FLPMA and the MLA.

Some commenters requested that the BLM require storage vessel vapors to be combusted at an efficiency of 98%. Storage vessel vapors can be combusted at an efficiency of 98% using an enclosed combustor. However, the BLM has determined that requiring the operator to install an enclosed combustor on a location with an existing flaring system would be relatively costly compared to the benefit of modestly higher combustion efficiency applied to a comparatively small volume of vapor coming from storage vessels flares. The BLM believes that in those instances where storage vessel vapors must be controlled on a site that does not have an existing flare system, the operator will likely elect to install an enclosed combustor rather than a flare, because it will more effectively combust the lower volumes of vapor associated with storage vessels.

Section 3179.204 Downhole Well Maintenance and Liquids Unloading

This section establishes requirements for venting and flaring during downhole well maintenance and liquids unloading. It requires the operator to use practices for such operations that minimize vented gas and the need for well venting, unless the practices are necessary for safety. The rule also requires that for wells equipped with a plunger lift system or an automated well control system, the operator must optimize the operation of the system to minimize gas losses.

For all wells, before the operator manually purges a well for the first time after the effective date of this section, the operator must document in a Sundry Notice that other methods for liquids unloading are technically infeasible or unduly costly. In addition, during any liquids unloading by manual well purging, the person conducting the well purging is required to be present on-site to minimize to the maximum extent practicable any venting to the atmosphere. This section also requires the operator to maintain records of the cause, date, time, duration and estimated volume of each venting event associated with manual well purging, and to make those records available to the BLM upon request.

The operator must notify the BLM by Sundry Notice within 30 days after the first liquids unloading by manual or automated well purging after the effective date of the rule. Additionally, operators must notify the BLM by Sundry Notice within 30 days after the following conditions are met: (1) The cumulative duration of manual well purging events for a well exceeds 24 hours during any production month; or (2) the estimated volume of gas vented in the process of conducting liquids unloading by manual well purging for a well exceeds 75 Mcf during any production month. The final rule also defines ''well purging'' for purposes of this section and requires operators to report to ONRR gas volumes vented during manual and automated downhole maintenance and liquids unloading, including through the operation of plunger lifts.

In response to comments on the proposed rule, we removed the proposed prohibition on well purging for wells drilled after the effective date of this section, as discussed in above in section III.D.3., and made several smaller changes in the final rule: (1) Removing the proposed requirement to flare unrecovered gas during downhole well maintenance and liquids unloading operations; (2) clarifying recordkeeping and reporting requirements and increased the length of time operators have to submit reports; and (3) revising the definition of ''well purging.''

The BLM is aware, and many commenters observed, that flares are not always feasible control options for downhole well maintenance and liquids unloading activities, and we recognize that there may be difficulties separating liquids from the purged gases. For these reasons, we proposed the use of flares

[148] *See, e.g.,* 81 FR 6647.

where other recovery or gas loss reduction technologies cannot be used, and only then when flaring is not technically infeasible or unduly costly (see proposed § 3179.204(a)). Although we attempted in the proposed rule to narrow the use of flares to situations in which they are more likely to be feasible, and provided an option for operators to document those situations where flaring is infeasible, commenters raised several concerns related to safety, cost and feasibility. Upon further review of the information provided by the commenters, we believe there is uncertainty in the ability of operators to be able to consistently and safely operate a flare during these operations.

For these reasons, we did not finalize the proposed flaring requirement. Instead, the final rule requires operators to minimize vented gas during downhole well maintenance and liquids unloading operations, and it specifies best management practices that operators must follow. For wells equipped with a plunger lift system or an automated well control system, these practices include optimizing the operation of the system to minimize gas losses.

Proposed § 3179.204(a) would have required the operator to use best practices to maximize the recovery of gas from downhole well maintenance and liquids unloading operations. Commenters expressed concern that the word ''maximize'' could be construed to imply that the operator must use the technology that provides the absolute highest amount of gas recovery, regardless of other concerns. This is not our intent, as evidenced by our discussion of the proposed requirements in the preamble to the proposed rule. For example, we discuss that some technologies are less costly than others, and that some technologies make more sense to install early in the life of a well rather than later. We also state that we expect most new wells to use plunger lifts, and that the proposed rule would not require (though it would encourage) the use of automated systems.[149] We expect the operator to make an informed and reasoned decision on which technology makes the most sense for each well based on the conditions and economics of the well. To further clarify this, rather than requiring operators to maximize recovery of gas, the final rule requires operators to minimize vented gas and the need for well venting associated with downhole well maintenance and liquids unloading operations.

Several commenters objected to the extent and content of the proposed recordkeeping requirements, but did not identify changes that could be made without compromising the information needed for effective implementation of the rule. The BLM believes the recordkeeping and reporting requirements are essential to verify compliance and to more accurately assess the amount of gas lost through liquids unloading events, including for the purposes of royalty calculations. In response to commenters' concerns, however, the final rule extends the time to submit a Sundry Notice of large quantity liquids unloading events from 14 days to 30 days, to allow operators more time to gather information. Similarly, we have extended the time to submit a Sundry Notice after the first liquids unloading event from 10 days to 30 days.

Some commenters contended that recordkeeping and reporting requirements related to each well purging event are unnecessary, but the BLM does not agree. Large quantities of gas are lost through well purging that cannot be used to supply the country's energy needs and provide no royalty revenues to taxpayers. Building a historical record of the amount of gas lost is key to determining proper management of these events in the future. For example, more accurate knowledge of the amount of gas lost to well purging events will allow operators to make better-informed decisions on the financial viability of each liquids unloading technology. Also, the BLM will be able to better estimate the cost of lost royalties associated with vented gas from well purging activities. We believe these important benefits justify the expenditures related to obtaining and reporting the required records.

A number of commenters asserted that BLM should withdraw the proposed downhole well maintenance and liquids unloading provisions of the rule because of the complexity of the issue. They argued that the BLM does not understand the impacts of the proposed requirements. In particular, they noted EPA's decision not to regulate liquids unloading.

The BLM has engaged numerous stakeholders throughout the rulemaking process to better inform its final rule decisions, and has coordinated closely with the EPA in sharing technical information and expertise.[150] This is an area where differences between the two agencies' approaches stem in large part from their different statutory authorities. As noted above in connection with § 3179.202, the legal authority for 40 CFR part 60 subpart OOOOa is section 111of the Clean Air Act, which requires the EPA to set a standard of performance for new sources and defines a ''standard of performance'' as to be based on the best system of emission reduction (BSER) ''adequately demonstrated.''[151]

In explaining its decision not to regulate liquids unloading at this time, the EPA stated that although it had received valuable information from the public on technologies to reduce emissions, ''the information was not sufficient to finalize a national standard representing BSER for liquids unloading.''[152] The BLM, however, has the flexibility to require a suite of best management practices to achieve waste reduction, as we have done here, rather than being required to identify the best system of emission reduction under the specific criteria in section 111 of the Clean Air Act.

Section 3179.301 Operator Responsibility

This section establishes that the LDAR requirements in §§ 3179.301 through 3179.305 of this subpart apply to oil or natural gas wells and all equipment associated with the well sites that produce, process, compress, treat, store, or measure natural gas from a Federal or Indian lease, or from a unit or communitized area, where the site is upstream of or contains the approved point of royalty measurement. These sections also apply to a site and all equipment operated by the operator and associated with a site that is used to store, measure, or dispose of produced water that is located on a Federal or Indian lease. The sections obligate operators to inspect all equipment that is used to produce, compress, treat, store, or measure natural gas or to store, measure or dispose of produced water for gas leaks from leak components, with the exception of wells and well equipment that have been depressurized, and sites that contain only a well head and no other equipment. The first inspection must occur within one year of the effective date of the rule for sites that have begun production prior to the effective date. For production sites that begin production after the effective date, the first inspection must occur within 60 days of beginning production. For sites that were out of service and brought back into service, the first inspection must occur within 60 days of the date the site is brought back into service and

[149] 81 FR 6655–6656.

[150] 81 FR 6617–6618.

[151] 42 U.S.C. 7411(a)(1).

[152] 81 FR 35846.

re-pressurized. These sections do not apply to a site that contains a wellhead or wellheads and no other equipment, nor to a well or well equipment that has been depressurized.

Operators are required to conduct the inspections during production operations, and to fix any leaks found. Subsequent inspections must be conducted according to the schedule in § 3179.303. Operators may satisfy the requirements of §§ 3179.301 through 3179.305 for all of their equipment on a given lease by complying with the fugitive emissions requirements established under 40 CFR part 60, subpart OOOOa with respect to all equipment covered by the BLM leak detection requirements. This includes equipment such as covers and closed vent systems, and thief hatches and other openings on controlled storage vessels, which if new, modified or reconstructed, are subject to 40 CFR 60.5411a or 60.5395a under OOOOa and not the fugitive emissions requirements under OOOOa. Specifically, the operator must treat each of its sites and equipment as if it were a collection of fugitive emissions components as defined in 40 CFR part 60 subpart OOOOa; comply with the requirements of 40 CFR part 60 subpart, OOOOa that apply to affected facility fugitive emissions components at a well site or compressor station, as applicable, under 40 CFR part 60, subpart OOOOa; and notify the BLM through a Sundry Notice of such compliance.

Several changes were made to this section in response to comments and to provide additional clarity. As discussed in Section V.B.2., § 3179.301(a) clarifies the specific sites and equipment subject to the leak inspection requirements, which apply to all equipment handling Federal or Indian gas, upstream of and including the site where the royalty measurement point is located—whether the equipment is on or off the lease and regardless of the ownership of the equipment. This section also specifies that the leak detection requirements apply to equipment handling produced water only if the equipment is operated by the operator and located on the Federal or Indian lease. The BLM added a provision to § 3179.301(b) stating that the LDAR requirements do not apply to a well or well equipment that has been depressurized, nor to a site that contains a wellhead or wellheads and no other equipment. In § 3179.301(c), the BLM clarified that the operator must inspect for gas leaks from leak components. In conjunction with this change, we added definitions for ''leak'' and ''leak component'' in § 3179.3. We also moved the definition of ''site'' from § 3179.303(a) to § 3179.301(e) and revised the definition for clarity.

Additionally, the BLM moved the requirement in proposed § 3179.303(c) that exempts leak components that are not accessible from the inspection and monitoring requirements to paragraph (d) of this section; added paragraph (f) to specify when the first inspection must take place; and replaced proposed paragraph (e) with new paragraph (j) to provide an exemption for sites and equipment that are in compliance with the fugitive emission requirements under 40 CFR part 60, subpart OOOOa.

This section of the preamble discusses additional comments on the LDAR provisions in § 3179.301, beyond the comments discussed in Section IV.A.d. The BLM made changes to clarify the scope of LDAR coverage in the final rule in response to commenters who asserted that the proposed rule was not entirely clear on the scope of coverage. The final rule now explicitly describes the ''sites'' to which the LDAR provisions apply and no longer makes use of the term ''facilities.'' The proposed rule covered ''facilities,'' as well as compressors that were on lease and operated by the operator, regardless of whether they handled Federal or Indian product. ''Facility'' is defined in section 3170.3 to include a site and associated equipment used to process, treat, store, or measure production from a Federal or Indian lease, unit or communitized area, as well a site and associated equipment used to store, measure, or dispose of produced water. With respect to produced water, the definition of ''facility'' only includes sites on a Federal or Indian lease, unit or communitized area, but the definition is not similarly limited with respect to sites associated with Federal or Indian production. Using the term ''facilities'' to define the coverage of the LDAR program would create a distinction between equipment upstream and downstream of the approved point of royalties measurement on an otherwise covered site. In addition, the BLM has not retained in the final rule the proposed coverage for compressors that do not handle Federal or Indian product. Given the potential for confusion here, we believe that it is clearer to simply specify the sites and equipment subject to the LDAR requirements in the final rule, rather than use the term ''facilities.''

With respect to the LDAR requirements in this rule, the BLM believes it is reasonable and appropriate to apply the requirements to all equipment at a site that is subject to these requirements. Once an operator is already on-site, inspecting additional equipment adds little cost and burden, particularly if the operator is using optical gas imaging technology, and inspecting such equipment offers the same potential additional benefits as any other inspection. Thus, the BLM believes that requiring inspection of all of the equipment at a given site will make the rule more cost-effective in avoiding waste, as compared to exempting inspection of some equipment at a site that is already being inspected. Moreover, the BLM believes that applying the LDAR requirements to most but not all of the equipment at a single site would heighten the potential for inspection errors and confusion, and make administration and tracking of the results more difficult.

Commenters also urged the BLM to exclude from the LDAR requirements the following additional types of sites or equipment, beyond those discussed in Section IV.A.d,: Wells that are shut-in at the time of an LDAR inspection; sites where there is only a small amount of mineral interest from or allocated to a Federal or Indian lease, unit, or communitization agreement; equipment operated by an entity other than the operator; sites with a legally and practically enforceable leak detection and repair requirement in an operating permit, or other enforceable requirement established under a Federal, State, local or tribal authority; and sites located on the North Slope of Alaska.

With respect to wells that are shut-in at the time an inspection occurs, coverage under LDAR depends on whether the shut-in is temporary, or the well or well equipment has been depressurized. Leaks will only be detectable when a well is operating, so the rule provides that leak inspections must occur during production operations. The BLM agrees that a well that has been depressurized is no longer in operation and should not leak, and the BLM has excluded such wells from the LDAR requirements. Depressurized wells that are brought back into service do not need to be inspected until 60 days after the date that the well is re-pressurized. A well that is temporarily shut-in but not depressurized, however, may have significant leaks when it is brought back into production. Exempting such a well from any inspection obligations might provide an incentive for operators to schedule inspections during shut-ins to reduce the number of sites that would need to be inspected.

With respect to leases where the Federal or Indian mineral interest is a minority interest, the BLM has the authority and an obligation to minimize the waste of Federal and Indian mineral resources. The waste of Federal and Indian resources is of no less concern to the BLM when the Federal or Indian interest is a minority interest. Even a small percentage interest could still represent a significant volume of Federal or Indian resources, depending on the reservoir. Also, as a policy matter, the BLM believes that the LDAR requirements of this rule are cost-effective and provide net public benefits. Thus, the BLM does not believe that it is appropriate to arbitrarily limit the benefits of this rule based on the proportion of the Federal or Indian mineral interest at issue in the lease, unit, or communitized area. In the final rule, the BLM has clarified that where a site is upstream of or contains the royalty measurement point, the LDAR provisions cover the site and all equipment associated with it that handles Federal or Indian gas.

Similarly, neither legal nor policy considerations support exempting equipment operated by an entity other than the site operator. The operator is responsible for ensuring that operations conducted pursuant to a Federal or Indian lease are in compliance with the lease terms and applicable regulations.[153] Exempting equipment that is operated by an entity other than the operator could create an incentive for operators to establish contractual arrangements that avoid the LDAR requirements. The BLM believes that through cooperation with contractors that own or operate equipment on the lease, the operator has the practical means of ensuring compliance with the LDAR requirements on lease, regardless of who owns the equipment.

The BLM recognizes that some equipment at the site containing the facility measurement point, such as storage vessels or compressors, may be downstream of the measurement point and may be in control of the purchaser rather than the operator.[154] Nevertheless, as discussed previously, the BLM believes that it is appropriate to require the operator to conduct LDAR on all equipment located at the site. Once the operator is inspecting a given site, particularly when using optical gas imaging, it will add minimal time and cost to inspect additional co-located equipment. It should be noted that, although a facility measurement point may be located on lands not covered by a Federal or Indian lease, unit, or communitization agreement (as might be the case when off-lease measurement occurs pursuant to applicable regulations in 43 CFR subpart 3173), the LDAR requirements of this rule do not apply to sites that are not located on a Federal or Indian lease, unit or communitized area.

In addition, the BLM disagrees with the suggestion to create a blanket exemption from the LDAR requirements for sites with another legally and practically enforceable leak detection and repair requirement in an operating permit or other enforceable Federal, State, local or tribal requirement. The final rule already contains provisions to address overlapping EPA or State requirements, as discussed in sections III.B.3 VI.A. of this preamble. An operator with a specific program contained in its operating permit could, under section 3179.303(b) request approval of that program as an alternative to the BLM requirements, provided the permit program is at least equally effective at detecting and reducing losses from leaks as the BLM requirements. By contrast, exempting any site with existing enforceable LDAR requirements provides no assurance that those requirements will produce results equivalent to the BLM requirement.

The BLM also declines to exclude automatically from the LDAR requirements sites that are located on the North Slope of Alaska. The BLM notes that one operator has argued that conditions on the North Slope make it impossible to meet all of the LDAR requirements, and that the operator has in place alternative practices, equipment, and techniques that reduce the likelihood of leaks and facilitate prompt detection of any that might occur. The final provision allowing the BLM to approve an operator's alternative instrument-based leak detection program is designed to address just this sort of situation.

Certain operators requested that facilities subject to the EPA subpart OOOOa fugitive emissions requirement be exempt from the BLM LDAR requirements. After review of these comments, the BLM agrees that those facilities should not have to comply with both the EPA subpart OOOOa program and a separate BLM LDAR program, and the final rule provides that an operator in compliance with the requirements of subpart OOOOa will be deemed in compliance with the BLM LDAR requirements as well. In addition, even though the BLM and the EPA have largely aligned their leak detection requirements, an operator might prefer to comply with the OOOOa requirements for all of its facilities on a lease, including existing facilities that are not covered by subpart OOOOa, rather than complying with subpart OOOOa for new, modified and reconstructed facilities and the BLM LDAR requirements for existing facilities. Thus, the final rule provides that an operator may satisfy the BLM LDAR requirements by complying with the subpart OOOOa fugitive emission requirements for all sites and equipment on a given lease.

However, by providing that compliance with subpart OOOOa is deemed compliance with the BLM requirements, rather than simply exempting all facilities subject to subpart OOOOa, the BLM maintains enforcement authority if an operator is subject to both subpart OOOOa and the BLM requirements, but complies with neither. Under this approach, a BLM inspector in the field could review information to confirm that the operator is in fact in compliance with one set of leak detection requirements.

Section 3179.302 Approved Instruments and Methods

This section prescribes the types of instruments that an operator must use to inspect for leaks. Specifically, operators must use: (1) An optical gas imaging device such as an infrared camera; (2) a portable analyzer capable of detecting leaks in compliance with Method 21 of 40 CR part 60, appendix A–7; or (3) a leak detection device not listed in this section that has been approved by BLM. The persons using the above devices must be adequately trained in their use.

Anyone may request approval of an alternative monitoring device and protocol by submitting a Sundry Notice with the information specified in paragraph (c) of this section, subject to the approval of the BLM as specified in paragraph (d).

In the final rule, the BLM amended paragraph (a) of this section by removing reference to monitoring methods since this paragraph specifies monitoring equipment, not methods. In paragraph (a)(2), we added a provision that portable analyzers must be operated in compliance with Method 21 rather than manufacturers specifications. We removed from paragraph (a) the proposed option of using a comprehensive program approved by the BLM under § 3179.303(b).

The BLM also added a provision at paragraph (b) that the person operating the leak detection device must be adequately trained in the proper use of the device. We added an option at

[153] *See* Luff Exploration Co., 115 IBLA 134 (1990) (upholding enforcement action against operator based on noncompliant equipment owned and operated by purchaser).

[154] The BLM's jurisdiction over Federal and Indian oil and gas production does not cease at the point of royalty measurement. *See* Wexpro Company, 174 IBLA 57 (2008) (requiring BLM to consider whether use of gas in operations downstream of the royalty measurement point constituted royalty-free ''beneficial use'').

paragraph (c) where any person may request approval of an alternative monitoring device and protocol by submitting a Sundry Notice with the information specified in paragraph (c). The request will be subject to the approval of the BLM as specified in newly added paragraph (d), which includes the requirement that it must be demonstrated that the alternative leak detection device and associated protocol will achieve equal or greater reduction of gas lost through leaks compared to the approach specified in § 3179.302(a)(1). Paragraph (d) also establishes that the BLM will provide public notice of the submission of an alternative device or monitoring protocol for approval, and will post on the BLM Web site a list of each approved alternative monitoring device and protocol and limitations on its use. The final rule also notes that the BLM may approve an alternative device and monitoring protocol for use in all or most applications, or instead just for use on a pilot or demonstration basis.

Please see Section III.A.d for a discussion of major comments received on this section of the proposed rule.

Section 3179.303 Leak Detection Inspection Requirements for Natural Gas Wellhead Equipment and Other Equipment

This section requires operators to conduct initial site inspections within specified timeframes after the effective date of the rule. The section requires the operator initially to conduct site inspections twice a year, with consecutive semiannual inspections conducted at least four months apart; and to conduct compressor station inspections quarterly, with consecutive quarterly inspections conducted at least 60 days apart. The inspection frequencies are fixed.

Paragraph (b) of this section authorizes the BLM to approve an alternative instrument-based leak detection program if the BLM finds that the alternative would achieve equal or greater reduction of gas lost through leaks compared with the approach specified in §§ 3179.302(a)(1) and 3179.303(a). The operator must submit the request through a Sundry Notice. The operator also has the option to request approval of a leak detection program that does not meet the criterion specified in § 3179.303(b) when it can be demonstrated that compliance with the requirements of §§ 3179.301 through 3179.305 would cause the operator to cease production and abandon significant recoverable oil or gas reserves under the lease.

In the final rule, the BLM clarified in paragraph (a) of this section that the operator must inspect leak components at the site, and that the inspection must be conducted using a leak detection device listed under § 3179.302. The BLM is maintaining a semiannual inspection frequency for each site, and added provisions for quarterly inspections of compressor stations. In the final rule, these inspection frequencies are fixed, and the BLM did not finalize the proposed table of variable, performance-based inspection frequencies.

Paragraph (b) of this section allows for BLM approval of an alternative program, if an operator submits an approval request via a Sundry Notice. It is the BLM's intent that those approvals be made at the State office level for intrastate programs, and at the national or Washington office level for interstate programs. Final § 3179.303(b) differs slightly from the proposed version of this provision. First, the final rule specifies that the approval applies to an ''alternative instrument-based leak detection program'' instead of the proposed ''alternative leak detection device, program, or method.'' Next, the rule specifies that the approval is in lieu of complying with paragraph (a) of this section, and that the alternative must achieve equal or greater reduction of gas lost through leaks compared with the approach specified in §§ 3179.302(a)(1) and 3179.303(a). The BLM also added details of what the Sundry Notice must include at § 3179.303(b)(1)–(5), and added paragraph (e) stating that approved alternative LDAR programs will be posted online.

Additionally, the BLM added a provision at paragraph (c) of this section to provide the operator with the option to request approval of a leak detection program that does not meet the criterion specified in § 3179.303(b) when it can be demonstrated that compliance with the requirements of §§ 3179.301 through 3179.305 would cause the operator to cease production and abandon significant recoverable oil or gas reserves under the lease. The BLM also added paragraph (d) setting forth the requirements for the Sundry Notice to support a demonstration under paragraph (c).

Please see Section III.A.d for a discussion of major comments received on this section of the proposed rule.

Section 3179.304 Repairing Leaks

This section requires operators to repair any leak as soon as practicable and no later than 30 calendar days after discovery of the leak, unless there is good cause for repair to take longer. The rule requires the operator to notify the BLM by Sundry Notice if there is good cause to delay the repairs beyond 30 days, and to complete the repair at the earliest opportunity, but in no case longer than 2 years after discovery. The rule also requires the operator to conduct a follow-up inspection, using an authorized method, to verify the effectiveness of the repair within 30 calendar days after the repair, and to make additional repairs within 15 calendar days if the previous repair was not effective. This repair and follow-up process must be followed until the repair is effective. The BLM does not consider an inspection to verify the effectiveness of a repair to be a periodic inspection under § 3179.303.

In the final rule, the BLM increased the time period for completing repairs from the proposed 15 days to 30 days. Operators also have 30 days, as opposed to the proposed 15 days, to verify the effectiveness of the repair through a follow-up inspection. While the proposed rule would have required that the follow-up inspection be carried out using the method originally used to detect the leak, the final rule specifies that any of the instruments specified or approved under § 3179.302(a) or the soap bubble test under EPA's Method 21, section 8.3.3, may be used.

In paragraph (a) of this section in the proposed rule, the BLM specified that the operator must repair any leak ''not associated with normal equipment operations.'' In the final rule, we specify that ''any leak'' must be repaired as soon as practicable, but within 30 days after discovery. In conjunction with this change, we have added to § 3179.3 a definition of ''leak'' that excludes releases due to normal operation of equipment that is intended to vent.

The proposed rule, as well as the final rule, allows the owner to delay repair if a good cause exists. Although ''good cause'' was not defined in the proposed rule, we have added a definition in paragraph (a) of the final rule. Also, the final rule allows the operator up to two years to repair a leak if good cause for delay exists, although the operator must submit a Sundry Notice and repair the leak sooner than 2 years if the opportunity arises. Previously, we had proposed that the operator repair the leak within 15 days after the cause for the delay ceases to exist.

Please see Section III.A.d for a discussion of major comments received on this section of the proposed rule.

Section 3179.305 Leak Detection Inspection, Recordkeeping and Reporting

This section requires operators to maintain records of LDAR inspections and repairs, including dates, locations, methods, where leaks were found, dates of repairs, and dates of follow-up inspections. These records must be made available to the BLM upon request. AVO inspections only have to be documented if they find a leak requiring repair. Paragraph (b) of the section also requires operators to submit to the BLM, by March 31 of each calendar year, an annual summary report on the previous year's LDAR inspection activities. The BLM plans to make these reports available to the public, subject to any protections for confidential business information.

The final rule amends the records that must be maintained. The BLM did not finalize the proposed recordkeeping requirements regarding the equipment or facility inspected, descriptions of each leak, and the date of each leak repair attempt. We clarified, however, that AVO checks need only be documented if they find a leak requiring repair.

Please see Section III.A.d for a discussion of major comments received on this section of the proposed rule.

Section 3179.401 State or Tribal Requests for Variances From the Requirements of This Subpart

This section creates a variance procedure under which the BLM State Director may grant a State or tribe's request to have a State, local or tribal regulation apply in place of a provision or provisions of this subpart. The variance request must: (1) Identify the specific provisions of the BLM requirements for which the variance is requested; (2) identify the specific State, local or tribal regulation that would substitute for the BLM requirements; (3) explain why the variance is needed; and (4) demonstrate how the State, local or tribal regulation will satisfy the purposes of the relevant BLM provisions. The BLM State Director will review a State or tribal variance request. To approve a request, the BLM State Director will determine that the State, local or tribal regulation: (1) Would perform at least equally well in terms of avoiding waste of oil and gas, reducing environmental impacts from venting and/or flaring of gas, and ensuring the safe and responsible production of oil and gas, compared to the particular provision(s) from which the State or tribe is requesting the variance, and (2) would be consistent with the terms of the affected Federal or Indian leases and applicable statutes.

This section also clarifies that a variance granted under this proposed section does not constitute a variance from provisions of regulations, laws, or orders other than subpart 3179, and it reserves the BLM's authority to rescind a variance or modify any condition of approval in a variance. Additionally, this section requires States or tribes with approved variances to notify the BLM in writing of any substantive amendments, revisions, or other changes to the applicable State, local or tribal regulation(s) or rule(s). This section further specifies that if the BLM approves a variance for State, local or tribal regulation(s) or rule(s), the variance can be enforced by the BLM as if the regulation(s) or rule(s) were provided for in this Subpart.

In response to comments received, the BLM made the following changes to the proposed rule requirements: (1) Revised paragraph (a)(1) to change a reference to granting a variance from ''any individual provision of this subpart'' to ''any provisions of this subpart''; (2) revised paragraphs (a)(2)(iv) and (b) to state that the State, local or tribal regulations or rules would ''perform at least equally well in terms of reducing waste of oil and gas, reducing environmental impacts from venting and/or flaring of gas, and ensuring the safe and responsible production of oil and gas, compared to the particular provision(s) from which the State or tribe is requesting the variance''; (3) added text to allow variances for requirements and regulations of local governments, in addition to State and tribal requirements (though the variance request must still come from the State or tribe, not from a locality); (4) added new paragraph (e) that requires the State or tribe that requested the variance to notify the BLM of substantive amendments, revisions, or other changes to the applicable State, local or tribal regulation(s) or rule(s); and (5) added new paragraph (f) that clarifies that if the BLM approves a variance for State, local or tribal regulation(s) or rule(s), the variance can be enforced by the BLM as if the regulation(s) or rule(s) were provided for in this Subpart. Paragraph (f) also clarifies that a State's or tribe's enforcement of its own regulations would not be affected by the BLM's approval of a variance.

Major comments received on variances are discussed in Section III.E.3 of this preamble; additional comments on variances are discussed below.

Some commenters requested that additional entities be allowed to apply for variances, such as local air authorities, multiple State agencies, or operators. Commenters asserted that allowing only States or tribes to request variances causes uncertainty for operators, and that if a State declined to put forth a variance request, companies would bear the cost and burden of complying with multiple regulatory regimes. As stated above, the BLM has modified the rule to allow local requirements, in addition to State and tribal requirements, to substitute for BLM requirements. Regarding the comment that multiple State agencies may need to request a variance, the final rule does not preclude different State or tribal agencies from requesting variances from different provisions of the rule. The BLM has not modified the final rule to allow localities or operators, in addition to States and tribes, to request a variance to be able to comply with State, local or tribal requirements in lieu of the BLM requirements. Specifically with respect to local requirements, the BLM believes that it is important to ensure that the State supports a variance request, and thus that the State prefers the BLM to enforce the State's or locality's requirements rather than federal requirements. Additionally, we believe that a State has the best understanding of its own regulatory requirements and how those compare to the requirements of this rule.

Several commenters asserted that the variance application and approval processes were unclear and/or overly burdensome. These commenters expressed various concerns, including: (1) Lack of a clear and comprehensive description of the information needed to request a variance; (2) lack of timelines for review and approval; (3) lack of criteria by which the BLM would evaluate variance requests; and (4) lack of provisions stating how the BLM will address future modifications to either this rule or State regulations once variances are approved. Commenters were also concerned about the BLM's ability to review variance requests in a timely manner. To address these concerns, comments suggested clarifying the regulatory text as well as developing formal implementation guidance in consultation with the States prior to the effective date of the rule.

In response to these comments, as discussed in Section III.E.2 of this preamble, the final rule provides three specific criteria for evaluating whether it is appropriate to apply the State, local or tribal requirements in lieu of this rule. In addition, the final rule added new paragraph (e) that requires the State or tribe that requested the variance to notify the BLM of substantive amendments, revisions, or other changes to the applicable State, local or tribal regulation(s) or rule(s). This requirement will ensure that the BLM is aware of changes to State, local or tribal regulations that may impact whether the State, local or tribal regulation or requirement continues to meet the variance criteria established in the final rule. Regarding the comments arguing for a timeline for submittal and processing of the variances, the BLM is confident that it will be able to process these requests in a timely manner that will allow sufficient time for operators to have a clear understanding of their compliance requirements.

Some commenters also expressed concern with the proposed BLM State Director review of the variance requests. These commenters asserted that delegating the approval process to the BLM State Director could result in uneven treatment among States. The BLM agrees that achieving consistent implementation of the regulations is an important goal, and this is one reason why the BLM does not believe that decisions on variance requests should be made below the BLM State Director level. Further, the BLM believes that BLM State Directors are in a good position to evaluate how State, local or tribal rules or requirements compare to the requirements of this rule, given their familiarity with the regulatory regimes that apply in the relevant State or States. In addition, once the rule is in effect, the BLM would have the opportunity to issue guidance to enhance coordination among State Directors in evaluating variances, as well as with the BLM Washington office, to help ensure consistency across the BLM State Offices. Finally, the more specific criteria in the final rule for evaluating a variance request will enhance consistency across States.

Some commenters also opposed the proposed provision in § 3179.401(d) stating that the ''BLM reserves the right to rescind a variance or modify any condition of approval.'' These commenters asserted that such a proposal undermines certainty for operators and discourages States and tribes from seeking a variance. Other commenters requested that the BLM include an appeals process for revoked or denied variances, stating that if a variance were requested and denied, States would have no administrative means by which to address the BLM decision without going to court.

The BLM believes that maintaining BLM authority to rescind a variance or modify any condition of approval is necessary to guard against situations in which a variance leads to unintended or unforeseen consequences that run counter to the BLM's determination that the State, local, or tribal regulation performs at least as well as the BLM rule. The BLM expects that such situations will arise infrequently, but the BLM nevertheless believes it is important to include a mechanism for addressing such situations as they occur. After considering the comments, the BLM determined that consideration of waste reduction, environmental, and safety interests outweighs commenters' concerns. As a result, the final rule maintains the BLM's discretion to rescind a variance or modify any condition of approval. Regarding the comments requesting that the BLM include an appeals process for revoked or denied variances, the BLM did not provide for administrative appeals on similar variance decisions under the hydraulic fracturing rule, and the BLM is maintaining this practice in this final rule. Applying this approach also helps to avoid a protracted appeals process with respect to State and tribal variances.

VIII. Analysis of Impacts

A. Description of the Regulated Entities

1. Potentially Affected Entities

Entities that will be directly affected by the rule include most, if not all, entities involved in the exploration and development of oil and natural gas on Federal and Indian lands. According to AFMSS data (as of March 27, 2015), there are up to 1,828 entities that currently operate Federal and Indian leases.[155] We believe that these 1,828 entities will be most affected by the rule, in addition to entities currently involved with drilling and support activities, and any entities that become involved in the future.

The potentially affected entities are likely to fall within one of the following industries, identified by the North American Industry Classification System (NAICS) codes:

- NAICS Code 21111 ''Oil and Gas Extraction''
- NAICS Code 213111 ''Drilling Oil and Gas Wells''
- NAICS Code 213112 ''Support Activities''

According to 2014 data from the U.S. Census Bureau, there were 6,532 entities directly involved in extraction of oil and gas in the United States, 2,121 entities involved in the drilling of wells, and 8,577 entities providing other support functions.[156] Therefore, the approximately 17,000 entities associated with developing, and producing of domestic oil and gas [157] represent an upper bound estimate of the operators that could potentially be affected by this rulemaking.

2. Affected Small Entities

The Small Business Administration (SBA) has developed size standards to carry out the purposes of the Small Business Act.[158] For mining, including the extraction of crude oil and natural gas, the SBA defines a small entity as an individual, limited partnership, or small company, at ''arm's length'' from the control of any parent companies, with fewer than 1,250 employees. For entities drilling oil and gas wells, the threshold is 1,000 employees. For entities involved in support activities, the standard is annual receipts of less than $38.5 million Table 9–3a in the RIA displays the number of establishments in the oil and gas sector using a 1,000 employee cutoff. This table shows that over 99% of the establishments involved in oil and gas extraction and the drilling of oil and gas wells are classified as small.

To estimate a percentage of small firms involved in oil and gas support activities, we reference Table 9–3d of the RIA, which provides the NAICS information for firms involved in oil and gas support activities based on the size of receipts. The most recent data available from the U.S. Census Bureau for establishment/firm size based on receipts is for 2007. Of the firms providing oil and gas support activities in 2007, about 97 percent had annual receipts of less than $35 million and are classified as small.[159]

B. Impacts of the Requirements

1. Overall Costs of the Rule

Overall, the BLM estimates that this rule will pose costs of about $114–279 million per year (with capital costs annualized using a 7% discount rate) or $110–275 million per year (with capital costs annualized using a 3% discount rate).[160] These costs include engineering compliance costs and the social cost of minor additions of carbon dioxide to the

[155] The actual number is expected to be slightly lower due to duplicate entries.

[156] RIA at 122.

[157] U.S. Census Bureau data does not readily differentiate between the number of firms involved in oil development and production activities versus gas development and production.

[158] 13 CFR 121.201.

[159] U.S. Census Bureau does not provide receipt data that allow a break at the $38.5 million threshold as defined by SBA. As such, the 97 percent figure is a slight underestimate.

[160] RIA at 4.

atmosphere.[161] The engineering compliance costs presented do not include potential cost savings from the recovery and sale of natural gas (those savings are shown in the summary of benefits). In some areas, operators have already undertaken, or plan to undertake, voluntary actions to address gas losses. To the extent that operators are already in compliance with the requirements of this rule, the above estimates overstate the likely impacts of the rule.

2. Overall Benefits of the Rule

The benefits of the rule include the additional production of resources from Federal and Indian leases; reductions in venting, flaring, and leaks of gas, including GHG emissions; and increased opportunities for royalties. We measure the benefits of the rule as the cost savings that the industry will receive from the recovery and sale of natural gas and the projected environmental benefits of reducing the amount of GHG pollution released into the atmosphere. As with the estimated costs, we expect benefits on an annual basis.

The BLM estimates that this rule would result in monetized benefits of $209–403 million per year (calculating the monetized emissions reductions using model averages of the social cost of methane with a 3 percent discount rate).[162] We estimate that the rule would reduce methane emissions by 175,000–180,000 tpy, which we estimate to be worth $189–247 million per year (this social benefit is included in the monetized benefit above). We estimate that the rule would reduce VOC emissions by 250,000–267,000 (this benefit is not monetized in our calculations).[163] Overall, we predict the rule will reduce methane emissions by 35% from the 2014 estimates and reduce the flaring of associated gas by 49%, when the capture requirements are fully phased in.[164]

The rule will also have numerous ancillary benefits. These include improved quality of life for nearby residents, who note that flares are noisy and unsightly at night; reduced release of VOCs, including benzene and other hazardous air pollutants; and reduced production of NO_X and particulate matter, which can cause respiratory and heart problems.

[161] Some gas that would have otherwise been vented would now be combusted on-site or downstream to generate electricity. The estimated value of the carbon additions do not exceed $30,000 in any given year.

[162] RIA at 5.

[163] RIA at 106.

[164] *Id.*

3. Net Benefits of the Rule

Overall, the BLM estimates that the benefits of this rule outweigh its costs by a significant margin. The BLM expects net benefits ranging from $46–199 million per year (capital costs annualized using a 7% discount rate) or $50–204 million per year (capital costs annualized using a 3% discount rate).[165]

4. Distributional Impacts

a. Energy Systems

The rule has a number of requirements that are expected to influence the production of natural gas and crude oil from onshore Federal and Indian oil and gas leases. We estimate the following incremental changes in production, noting the representative share of the total U.S. production in 2015 for context. We estimate additional natural gas production ranging from 9–41 Bcf per year (representing 0.03–0.15 percent of the total U.S. production) and a reduction in crude oil production ranging from 0.0–3.2 million bbl per year (representing 0–0.07 percent of the total U.S. production).[166] Separate from the volumes listed above, we also expect 0.8 Bcf of gas to be combusted on-site that would have otherwise been vented. Since the relative changes in production are expected to be small, we do not expect that the rule would significantly impact the price, supply, or distribution of energy.

b. Royalties

The rule is expected to increase natural gas production from Federal and Indian leases, and likewise, is expected to increase annual royalties to the Federal Government, tribal governments, States, and private landowners. For requirements that would result in incremental gas production, we calculate the additional royalties based on that production. We estimate that the rule will result in additional royalties of $3–13 million per year.[167]

Royalty payments are recurring income to Federal or tribal governments and costs to the operator or lessee. As such, they are private transfer payments that do not affect the total resources available to society. An important but sometimes difficult problem in cost estimation is to distinguish between real costs and transfer payments. While transfers should not be included in the economic analysis of the benefits and costs of a regulation, they may be important for describing distributional effects.

[165] RIA at 6. The highs and lows of the benefits and costs do not occur during the same years; therefore, the net benefit ranges presented here do not calculate simply as the range of benefits minus the range of costs presented above.

[166] RIA at 7.

[167] RIA at 8.

c. Small Businesses

The BLM identified up to 1,828 entities that currently operate Federal and Indian leases. The vast majority of these entities are small businesses, as defined by the SBA. We estimated a range of potential per-entity costs, based on different discount rates and scenarios. Those per-entity compliance costs are presented in the RIA.[168]

Recognizing that the SBA defines a small business for oil and gas producers as one with fewer than 1,250 employees, a definition that encompasses many oil and gas producers, the BLM looked at company data for 26 different small-sized entities that currently hold BLM-managed oil and gas leases. The BLM ascertained the following information from the companies' annual reports to the U.S. Securities and Exchange Commission (SEC) for 2012 to 2014. From data in the companies' 10–K filings to the SEC, the BLM was able to calculate the companies' profit margins[169] for the years 2012, 2013 and 2014. We then calculated a profit margin figure for each company when subject to the average annual cost increase associated with this rule. For simplicity, we used the midpoint of the low and high average per-entity cost increase figures, or $55,200, recognizing that this figure includes compliance costs (annualized using a 7% discount rate) and cost savings. For these 26 small companies, a per-entity compliance cost increase of $55,200 would result in an average reduction in profit margin of 0.15 percentage points (based on the 2014 company data). The full detail of this calculation is available in the RIA.[170]

d. Employment

Executive Order 13563 states, ''Our regulatory system must protect public health, welfare, safety, and our environment while promoting economic growth, innovation, competitiveness, and job creation.''[171] An analysis of employment impacts is a standalone analysis and the impacts should not be included in the estimation of benefits and costs.

[168] The BLM conducted a Final Regulatory Flexibility Analysis, RIA at 123–136.

[169] The profit margin was calculated by dividing the net income by the total revenue as reported in the companies' 10–K filings.

[170] RIA at 129.

[171] Executive Order 13563, *Improving Regulation and Regulatory Review* (Jan. 18, 2011).

The rule is not expected to materially impact employment within the oil and gas extraction, drilling, and support industries.[172] As noted previously, the anticipated additional gas production volumes represent only a small fraction of the U.S. natural gas production volumes. Additionally, the annualized compliance costs represent only a small fraction of the annual net incomes of companies likely to be impacted. Therefore, we believe that the rule would not alter the investment or employment decisions of firms or significantly adversely impact employment.

The requirements would require the one-time installation or replacement of equipment and the ongoing implementation of an LDAR program, and labor would be necessary to comply with each of these. The Supporting Statement for the Paperwork Reduction Act describes the labor requirements posed by the rule.

e. Impacts on Tribal Lands

This section presents the costs, benefits, net benefits, and incremental production associated with operations on Indian leases, as well as royalty implications for tribal governments.[173] We estimate that the rule's operation on Indian lands would pose costs ranging from $15–$39 million per year (using a 7% discount rate to annualize capital costs) or $14–$39 million per year (using a 3% discount rate to annualize capital costs).[174] Projected benefits from the rule's operation on Indian lands range from $3–$23 million per year (using model averages of the social cost of methane with a 3 percent discount rate).[175] Net benefits from operation of the rule on leases on Indian lands range from $3–$25 million per year (with capital costs annualized using 7% and 3% discount rates).[176]

For impacts on production from leases on Indian lands, the rule is projected to result in additional natural gas production ranging from 1.1–5.8 Bcf per year and a reduction in crude oil production ranging from 0–320,000 bbl per year.[177] We further estimate that the rule would reduce methane emissions from leases on Indian lands by 22,000 tpy, and would reduce VOC emissions by 30,000–32,000 tpy.[178] We estimate additional royalties from leases on Indian lands of $0.3–1.9 million per year.[179]

IX. Procedural Matters

A. Executive Order 12866, Regulatory Planning and Review[180]

Executive Order 12866 requires agencies to assess the benefits and costs of regulatory actions, and, for significant regulatory actions, submit a detailed report of their assessment to the OMB for review. A rule is deemed significant under Executive Order 12866 if it may:

(a) Have an annual effect on the economy of $100 million or more or adversely affect in a material way the economy, a sector of the economy, productivity, competition, jobs, the environment, public health or safety, or State, local, or tribal governments or communities;

(b) Create a serious inconsistency or otherwise interfere with an action taken or planned by another agency;

(c) Materially alter the budgetary impact of entitlements, grants, user fees, or loan programs or the rights and obligations of recipients thereof; or

(d) Raise novel legal or policy issues arising out of legal mandates, the President's priorities, or the principles set forth in the Executive Order.

After reviewing the requirements, the BLM has determined that the rule is an economically significant regulatory action according to the criteria of Executive Order 12866, and we have prepared a regulatory impact analysis for the rule.

B. Regulatory Flexibility Act and Small Business Regulatory Enforcement Fairness Act of 1996[181]

The Regulatory Flexibility Act as amended by the Small Business Regulatory Enforcement Fairness Act (SBREFA) generally requires an agency to prepare a regulatory flexibility analysis of any rule subject to notice and comment rulemaking requirements under the Administrative Procedure Act, unless the head of the agency certifies that the rule would not have a significant economic impact on a substantial number of small entities.[182] Congress enacted the RFA to ensure that government regulations do not unnecessarily or disproportionately burden small entities. Small entities include small businesses, small governmental jurisdictions, and small not-for-profit enterprises.

The BLM reviewed the Small Business Administration (SBA) size standards for small businesses and the number of entities fitting those size standards as reported by the U.S. Census Bureau in the Economic Census. The BLM concludes that the vast majority of entities operating in the relevant sectors are small businesses as defined by the SBA. As such, the rule will likely affect a substantial number of small entities. The BLM believes, however, that the final rule will not have a significant economic impact on a substantial number of small entities. Although the rule will affect a substantial number of small entities, the BLM does not believe that these effects would be economically significant. The screening analysis conducted by BLM estimates the average reduction in profit margin for small companies will be just a fraction of one percentage point, which is not a large enough impact to be considered significant.

Although it is not required, the BLM nevertheless chose to prepare an Initial Regulatory Flexibility Analysis and Final Regulatory Flexibility Analysis for this rule. Due to the fact that the rule is economically significant and impacts a substantial number of small entities, the BLM believes it is prudent, and potentially helpful to small entities, to provide an IRFA and FRFA for the rulemaking. We do not believe this decision should be viewed as a precedent for other rulemakings.

C. Unfunded Mandates Reform Act of 1995

Under the Unfunded Mandates Reform Act (UMRA), agencies must prepare a written statement about benefits and costs prior to issuing a proposed rule that includes any Federal mandate that is likely to result in aggregate expenditure by State, local, and tribal governments, or by the private sector, of $100 million or more in any 1 year, and prior to issuing any final rule for which a proposed rule was published.

This final rule does not contain a Federal mandate that may result in expenditures of $100 million or more by State, local, and tribal governments, in the aggregate, or by the private sector in any 1 year. Thus, the final rule is also not subject to the requirements of Section 205 of UMRA.

This final rule is also not subject to the requirements of Section 203 of UMRA because it contains no regulatory requirements that might significantly or uniquely affect small governments. It contains no requirements that apply to

[172] RIA at 118.

[173] RIA at 118–120.

[174] RIA at 118.

[175] RIA at 119.

[176] RIA at 119. The highs and lows of the benefits and costs do not occur during the same years; therefore, the net benefit ranges presented here do not calculate simply as the range of benefits minus the range of costs presented above.

[177] *Id.*

[182] 5 U.S.C. 601–612. The exception is found in 5 U.S.C. 605(b).

such governments, nor does it impose obligations upon them.

D. Executive Order 12630, Governmental Actions and Interference With Constitutionally Protected Property Rights (Takings)

Under Executive Order 12630, the final rule would not have significant takings implications. A takings implication assessment is not required. The final rule would establish a limited set of standards under which gas can be flared or vented, and under which an operator can use oil and gas on a lease, unit, or communitized area for operations and production purposes, without paying royalty.

Oil and gas operators on BLM-administered leases are subject to lease terms that expressly require that subsequent lease activities be conducted in compliance with applicable Federal laws and regulations. The final rule is consistent with the terms of those Federal leases and is authorized by applicable statutes. Thus, the final rule is not a governmental action capable of interfering with constitutionally protected property rights, it would not cause a taking of private property, and it does not require further discussion of takings implications under this Executive Order.

E. Executive Order 13132, Federalism

The final rule would not have a substantial direct effect on the States, the relationship between the national government and the States, or the distribution of power and responsibilities among the levels of government. It would not apply to States or local governments or State or local government entities. Therefore, in accordance with Executive Order 13132, the BLM has determined that this final rule does not have sufficient Federalism implications to warrant preparation of a Federalism Assessment.

F. Executive Order 12988, Civil Justice Reform

This final rule would comply with the requirements of Executive Order 12988. Specifically, this rulemaking: (a) Meets the criteria of section 3(a) requiring that all regulations be reviewed to eliminate errors and ambiguity and be written to minimize litigation; and (b) Meets the criteria of section 3(b)(2) requiring that all regulations be written in clear language and contain clear legal standards.

G. Executive Order 13175, Consultation and Coordination With Indian Tribal Governments

In accordance with Executive Order 13175, the BLM has evaluated this rulemaking and determined that it will not have substantial direct effects on federally recognized Indian tribes. Nevertheless, on a government-to-government basis we initiated consultation with tribal governments that the final rule may affect.

In 2014, the BLM conducted a series of forums to consult with tribal governments to inform the development of this proposal. We held tribal outreach sessions in Denver, Colorado (March 19, 2014), Albuquerque, New Mexico (May 7, 2014), Dickinson, North Dakota (May 9, 2014), and Washington, DC (May 14, 2014).[183] At the Denver and Washington, DC sessions, the tribal meetings were live-streamed to allow for the greatest possible participation by tribes and others. The tribal outreach sessions served as initial consultation with Indian tribes to comply with Executive Order 13175. As part of our outreach efforts, the BLM accepted informal comments generated as a result of the public/tribal outreach sessions through May 30, 2014.

After the proposed rule published on February 8, 2016, the BLM conducted another round of outreach meetings, with the tribal sessions taking place in the morning, and the general-public sessions taking place in the afternoon, with a conference call-in number for the public to listen in remotely. These meetings were held at four locations: Farmington, New Mexico (February 16, 2016), Oklahoma City, Oklahoma (February 18, 2016), Denver, Colorado (March 1, 2016), and Dickinson, North Dakota (March 3, 2016).

H. Paperwork Reduction Act

1. Overview

The Paperwork Reduction Act (PRA) [184] provides that an agency may not conduct or sponsor, and a person is not required to respond to, a collection of information, unless it displays a currently valid OMB control number. Collections of information include requests and requirements that an individual, partnership, or corporation obtain information, and report it to a Federal agency. See 44 U.S.C. 3502(3); 5 CFR 1320.3(c) and (k).

This rule contains information collection activities that require approval by the OMB under the PRA. The BLM included an information collection request in the proposed rule. OMB has approved the information collection for the final rule under control number 1004–0211.

2. Summary of Information Collection Requirements

• *Title:* Waste Prevention, Production Subject to Royalties, and Resource Conservation (43 CFR parts 3160 and 3170).
• *Forms:* Form 3160–3, Application for Permit to Drill or Reenter; and Form 3160–5, Sundry Notices and Reports on Wells.
• *OMB Control Number:* 1004–0211.
• *Description of Respondents:* Holders of Federal and Indian (except Osage Tribe) oil and gas leases, those who belong to federally approved units and CAs, and those who are parties to IMDA oil and gas agreements.
• *Respondents' Obligation:* Required to obtain or retain a benefit.
• *Frequency of Collection:* On occasion and monthly.
• *Abstract:* This rule updates standards to reduce wasteful venting, flaring, and leaks of natural gas from onshore wells located on Federal and Indian oil and gas leases, units and CAs.
• *Estimated Number of Responses:* 63,200.
• *Estimated Total Annual Burden Hours:* 82,170 hours.
• *Estimated Total Non-Hour Cost:* None.

3. Discussion of Regulations

Except for the recordkeeping required by 43 CFR 3179.305, the information-collection activities in the final rule involve new uses and burdens for BLM Forms 3160–3 and 3160–5, the use of which has been cleared by OMB under control number 1004–0137, Onshore Oil and Gas Operations (43 CFR part 3160) (expiration date January 31, 2018). After this rule goes into effect, the BLM plans to request that OMB merge the new uses and burdens of Forms 3160–3 and 3160–5 with control number 1004–0137.

The information collection activities in this rule are described below along with estimates of the annual burdens. Included in the burden estimates are the time for reviewing instructions, searching existing data sources, gathering and maintaining the data needed, and completing and reviewing each component of the information collection.

Plan to Minimize Waste of Natural Gas (43 CFR 3162.3–1)

This rule adds a new provision to 43 CFR 3162.3–1 that requires a plan to

[183] More info can be found at: *http://www.blm.gov/wo/st/en/prog/energy/public_events_on_oil.html.*

[184] 44 U.S.C. 3501–3521.

minimize waste of natural gas when submitting an APD for a development oil well. This information is in addition to the APD information that the BLM already collects under OMB Control Number 1004–0137. The required elements of the waste minimization plan are listed at paragraphs (j)(1) through (j)(7).

Request for Approval for Royalty-Free Uses On-Lease or Off-Lease (43 CFR 3178.5, 3178.7, 3178.8, and 3178.9)

Section 3178.5 requires submission of a Sundry Notice (Form 3160–5) to request prior written BLM approval for use of gas royalty-free for the following operations and production purposes on the lease, unit or communitized area:

- Using oil or gas that an operator removes from the pipeline at a location downstream of the facility measurement point (FMP);
- Removal of gas initially from a lease, unit PA, or communitized area for treatment or processing because of particular physical characteristics of the gas, prior to use on the lease, unit PA or communitized area; and
- Any other type of use of produced oil or gas for operations and production purposes pursuant to § 3178.3 that is not identified in § 3178.4.

Section 3178.7 requires submission of a Sundry Notice (Form 3160–5) to request prior written BLM approval for off-lease royalty-free uses in the following circumstances:

- The equipment or facility in which the operation is conducted is located off the lease, unit, or communitized area for engineering, economic, resource-protection, or physical-accessibility reasons; and
- The operations are conducted upstream of the FMP.

Section 3178.9 requires the following additional information in a request for prior approval of royalty-free use under section 3178.5, or for prior approval of off-lease royalty-free use under section 3178.7:

- A complete description of the operation to be conducted, including the location of all facilities and equipment involved in the operation and the location of the FMP;
- The volume of oil or gas that the operator expects will be used in the operation and the method of measuring or estimating that volume;
- If the volume expected to be used will be estimated, the basis for the estimate (*e.g.,* equipment manufacturer's published consumption or usage rates); and
- The proposed disposition of the oil or gas used (*e.g.,* whether gas used would be consumed as fuel, vented through use of a gas-activated pneumatic controller, returned to the reservoir, or some other disposition).

Notification of Choice To Comply on County- or State-Wide Basis (43 CFR 3179.7(c)(3)(ii))

Section 3179.7 requires operators flaring gas from development oil wells to capture a specified percentage of the operator's adjusted volume of gas produced over the relevant area. The ''relevant area'' is each of the operator's leases, units, or communitized areas, unless the operator chooses to comply on a county- or State-wide basis and the operator notifies the BLM of its choice by Sundry Notice by January 1 of the relevant year.

Request for Approval of Alternative Capture Requirement (43 CFR 3179.8(b))

Section 3179.8 applies only to leases issued before the effective date of the final rule and to operators choosing to comply with the capture requirement in section 3179.7 on a lease-by-lease, unit-by-unit, or communitized area-by-communitized area basis. The regulation provides that operators who meet those parameters may seek BLM approval of a capture percentage other than that which is applicable under 43 CFR 3179.7. The operator must submit a Sundry Notice that includes the following information:

- The name, number, and location of each of the operator's wells, and the number of the lease, unit, or communitized area with which it is associated;
- The oil and gas production levels of each of the operator's wells on the lease, unit, or communitized area for the most recent production month for which information is available and the volumes being vented and flared from each well;

In addition, the request must include map(s) showing:

- The entire lease, unit, or communitized area, and the surrounding lands to a distance and on a scale that shows the field in which the well is or will be located (if applicable), and all pipelines that could transport the gas from the well;
- All of the operator's producing oil and gas wells, which are producing from Federal or Indian leases, (both on Federal or Indian leases and on other properties) within the map area;
- Identification of all of the operator's wells within the lease from which gas is flared or vented, and the location and distance of the nearest gas pipeline(s) to each such well, with an identification of those pipelines that are or could be available for connection and use; and
- Identification of all of the operator's wells within the lease from which gas is captured;

The following information is also required:

- Data that show pipeline capacity and the operator's projections of the cost associated with installation and operation of gas capture infrastructure, to the extent that the operator is able to obtain this information, as well as cost projections for alternative methods of transportation that do not require pipelines; and
- Projected costs of and the combined stream of revenues from both gas and oil production, including:
  - The operator's projections of gas prices, gas production volumes, gas quality (*i.e.,* heating value and H_2S content), revenues derived from gas production, and royalty payments on gas production over the next 15 years or the life of the operator's lease, unit, or communitized area, whichever is less; and
  - The operator's projections of oil prices, oil production volumes, costs, revenues, and royalty payments from the operator's oil and gas operations within the lease over the next 15 years or the life of the operator's lease, unit, or communitized area, whichever is less.

Request for Exemption From Well Completion Requirements (43 CFR 3179.102(c) and (d))

Section 3179.102 lists several requirements pertaining to gas that reaches the surface during well completion and related operations. An operator may seek an exemption from these requirements by submitting a Sundry Notice that includes the following information:

(1) The name, number, and location of each of the operator's wells, and the number of the lease, unit, or communitized area with which it is associated;

(2) The oil and gas production levels of each of the operator's wells on the lease, unit or communitized area for the most recent production month for which information is available;

(3) Data that show the costs of compliance; and

(4) Projected costs of and the combined stream of revenues from both gas and oil production, including: the operator's projections of oil and gas prices, production volumes, quality (*i.e.,* heating value and H_2S content), revenues derived from production, and royalty payments on production over the next 15 years or the life of the operator's lease, unit, or communitized area, whichever is less.

The rule also provides that an operator that is in compliance with the EPA regulations for well completions under 40 CFR part 60, subpart OOOO or subpart OOOOa is deemed in compliance with the requirements of this section. As a practical matter, all hydraulically fractured or refractured wells are now subject to the EPA requirements, so the BLM does not believe that the requirements of this section would have any independent effect, or that any operator would request an exemption from the requirements of this section, as long as the EPA requirements remain in effect.

Request for Extension of Royalty-Free Flaring During Initial Production Testing (43 CFR 3179.103)

Section 3179.103 allows gas to be flared royalty-free during initial production testing. The regulation lists specific volume and time limits for such testing. An operator may seek an extension of those limits by submitting a Sundry Notice to the BLM.

Request for Extension of Royalty-Free Flaring During Subsequent Well Testing (43 CFR 3179.104)

Section 3179.104 allows gas to be flared royalty-free for no more than 24 hours during well tests subsequent to the initial production test. The operator may seek authorization to flare for a longer period by submitting a Sundry Notice to the BLM.

Reporting of Venting or Flaring (43 CFR 3179.105)

Section 3179.105 allows an operator to flare gas royalty-free during a temporary, short-term, infrequent, and unavoidable emergency. Venting gas is permissible if flaring is not feasible during an emergency. The regulation defines limited circumstances that constitute an emergency, and other circumstances that do not constitute an emergency. The operator must estimate and report to the BLM on a Sundry Notice the volumes flared or vented in the following circumstances that, as provided by 43 CFR 3179.105, do not constitute emergencies for the purposes of royalty assessment:

(1) More than 3 failures of the same component within a single piece of equipment within any 365-day period;

(2) The operator's failure to install appropriate equipment of a sufficient capacity to accommodate the production conditions;

(3) Failure to limit production when the production rate exceeds the capacity of the related equipment, pipeline, or gas plant, or exceeds sales contract volumes of oil or gas;

(4) Scheduled maintenance;

(5) A situation caused by operator negligence; or

(6) A situation on a lease, unit, or communitized area that has already experienced 3 or more emergencies within the past 30 days, unless the BLM determines that the occurrence of more than 3 emergencies within the 30 day period could not have been anticipated and was beyond the operator's control.

Pneumatic Controllers—Introduction

Section 3179.201 pertains to any pneumatic controller that: (1) Is not subject to EPA regulations at 40 CFR 60.5360 through 60.5390, but would be subject to those regulations if it were a new or modified source; and (2) has a continuous bleed rate greater than 6 standard cubic feet (scf) per hour. Section 3179.201(b) requires operators to replace each high-bleed pneumatic controller with a controller with a bleed rate lower than 6 scf per hour within 1 year of the effective date of the rule, unless (1) the pneumatic controller exhaust is routed to processing equipment; (2) the pneumatic controller exhaust was, as of the effective date of the rule, and continues to be routed to a flare device or low pressure combustor; or (3) one of the following applies:

Notification of Functional Needs for a Pneumatic Controller (43 CFR 3179.201(b)(1))

The operator notifies the BLM through a Sundry Notice that use of a pneumatic controller with a bleed rate greater than 6 scf per hour is required based on functional needs that may include, but are not limited to, response time, safety, and positive actuation, and the Sundry Notice describes those functional needs.

Showing That Cost of Compliance Would Cause Cessation of Production and Abandonment of Oil Reserves (Pneumatic Controllers) (43 CFR 3179.201(b)(4) and 3175.201(c))

The operator demonstrates to the BLM through a Sundry Notice, and the BLM agrees, that replacement of a pneumatic controller would impose such costs as to cause the operator to cease production and abandon significant recoverable oil reserves under the lease. The Sundry Notice must include the following information:

(1) The name, number, and location of each of the operator's wells, and the number of the lease, unit, or communitized area with which it is associated;

(2) The oil and gas production levels of each of the operator's wells on the lease, unit or communitized area for the most recent production month for which information is available;

(3) Data that show the costs of compliance;

(4) Projected costs of and the combined stream of revenues from both gas and oil production, including: The operator's projections of gas prices, gas production volumes, gas quality (*i.e.,* heating value and H_2S content), revenues derived from gas production, and royalty payments on gas production over the next 15 years or the life of the operator's lease, unit, or communitized area, whichever is less; and the operator's projections of oil prices, oil production volumes, costs, revenues, and royalty payments from the operator's oil and gas operations within the lease over the next 15 years or the life of the operator's lease, unit, or communitized area, whichever is less.

Showing in Support of Replacement of Pneumatic Controller Within 3 Years (43 CFR 3179.201(d))

The operator may replace a high-bleed pneumatic controller within 3 years of the effective date of the rule (instead of within 1 year of the effective date) if the operator notifies the BLM through a Sundry Notice that the well or facility that the pneumatic controller serves has an estimated remaining productive life of 3 years or less from the effective date of the rule.

Pneumatic Diaphragm Pumps—Introduction

With some exceptions, section 3179.202 pertains to any pneumatic diaphragm pump that: (1) Uses natural gas produced from a Federal or Indian lease, or from a unit or communitized area that includes a Federal or Indian lease; and (2) Is not subject to EPA regulations at 40 CFR 60.5360 through 60.5390, but would be subject to those regulations if it were a new or modified source. This regulation generally requires replacement of such a pump with a zero-emissions pump or routing of the pump's exhaust gas to processing equipment for capture and sale within 1 year of the effective date of the final rule.

This requirement does not apply to pneumatic diaphragm pumps that do not vent exhaust gas to the atmosphere. In addition, this requirement does not apply if one of the following applies:

Showing That a Pneumatic Diaphragm Pump Was Operated on Fewer Than 90 Individual Days in the Prior Calendar Year (43 CFR 3179.202(b)(2))

A pneumatic diaphragm pump is not subject to section 3179.202 if the operator documents in a Sundry Notice that the pump was operated fewer than 90 days in the prior calendar year.

Notification of Functional Needs for a Pneumatic Diaphragm Pump (43 CFR 3179.202(d))

In lieu of replacing a pneumatic diaphragm pump or routing the pump exhaust gas to processing equipment, an operator may submit a Sundry Notice to the BLM showing that replacing the pump with a zero emissions pump is not viable because a pneumatic pump is necessary to perform the function required, and that routing the pump exhaust gas to processing equipment for capture and sale is technically infeasible or unduly costly.

Showing That Cost of Compliance Would Cause Cessation of Production and Abandonment of Oil Reserves (Pneumatic Diaphragm Pumps) (43 CFR 3179.202(f) and (g))

An operator may be exempted from the replacement requirement if the operator submits a Sundry Notice to the BLM that provides an economic analysis that demonstrates, and the BLM agrees, that compliance with these requirements would impose such costs as to cause the operator to cease production and abandon significant recoverable oil reserves under the lease. The Sundry Notice must include the following information:

(1) Well information that must include: (i) The name, number, and location of each well, and the number of the lease, unit, or communitized area with which it is associated; and (ii) The oil and gas production levels of each of the operator's wells on the lease, unit or communitized area for the most recent production month for which information is available;

(2) Data that show the costs of compliance with paragraphs (c) through (e) of § 3179.202; and

(3) The operator's estimate of the costs and revenues of the combined stream of revenues from both the gas and oil components, including: (i) The operator's projections of gas prices, gas production volumes, gas quality (*i.e.,* heating value and H_2S content), revenues derived from gas production, and royalty payments on gas production over the next 15 years or the life of the operator's lease, unit, or communitized area, whichever is less; and (ii) the operator's projections of oil prices, oil production volumes, costs, revenues, and royalty payments from the operator's oil and gas operations within the lease over the next 15 years or the life of the operator's lease, unit, or communitized area, whichever is less.

Showing in Support of Replacement of Pneumatic Diaphragm Pump Within 3 Years (43 CFR 3179.202(h))

The operator may replace a pneumatic diaphragm pump within 3 years of the effective date of the rule (instead of within 1 year of the effective date) if the operator notifies the BLM through a Sundry Notice that the well or facility that the pneumatic controller serves has an estimated remaining productive life of 3 years or less from the effective date of the rule.

Storage Vessels (43 CFR 3179.203(c))

A storage vessel is subject to 43 CFR 3179.203(c) if the vessel: (1) Contains production from a Federal or Indian lease, or from a unit or communitized area that includes a Federal or Indian lease; and (2) Is not subject to any of the requirements of EPA regulations at 40 CFR part 60, subpart OOOO, but would be subject to that subpart if it were a new or modified source.

Within 60 days after the effective date of this section, and within 30 days after any new source of production is added to the tank, the operator must determine, record, and make available to the BLM upon request, whether the storage vessel has the potential for VOC emissions equal to or greater than 6 tpy based on the maximum average daily throughput for a 30-day period of production. The determination may take into account requirements under a legally and practically enforceable limit in an operating permit or other requirement established under a federal, state, local or tribal authority that limit the VOC emissions to less than 6 tpy.

If a storage vessel has the potential for VOC emissions equal to or greater than 6 tpy, no later than 1 year after the effective date of this section, or 3 years if the operator must and will replace the storage vessel at issue in order to comply with the requirements of this section, the operator must:

(1) Route all tank vapor gas from the storage vessel to a sales line;

(2) If the operator determines that compliance with paragraph (c)(1) of this section is technically infeasible or unduly costly, route all tank vapor gas from the storage vessel to a device or method that ensures continuous combustion of the tank vapor gas; or

(3) Submit an economic analysis to the BLM through a Sundry Notice that demonstrates, and the BLM agrees, based on the information identified in paragraph (d) of this section, that compliance with paragraph (c)(2) of this section would impose such costs as to cause the operator to cease production and abandon significant recoverable oil reserves under the lease.

To support the demonstration described above, the operator must submit a Sundry Notice that includes the following information:

(1) The name, number, and location of each well, and the number of the lease, unit, or communitized area with which it is associated;

(2) The oil and gas production levels of each of the operator's wells on the lease, unit or communitized area for the most recent production month for which information is available;

(3) Data that show the costs of compliance with paragraph (c)(1) or (c)(2) of this section on the lease; and

(4) The operator must consider the costs and revenues of the combined stream of revenues from both the gas and oil components, including: The operator's projections of oil and gas prices, production volumes, quality (*i.e.,* heating value and H_2S content), revenues derived from production, and royalty payments on production over the next 15 years or the life of the operator's lease, unit, or communitized area, whichever is less.

Downhole Well Maintenance and Liquids Unloading—Documentation and Reporting (43 CFR 3179.204(c) and (e))

The operator must minimize vented gas and the need for well venting associated with downhole well maintenance and liquids unloading, consistent with safe operations. Before the operator manually purges a well for liquids unloading for the first time after the effective date of this section, the operator must consider other methods for liquids unloading and determine that they are technically infeasible or unduly costly. The operator must provide information supporting that determination as part of a Sundry Notice within 30 calendar days after the first liquids unloading event by manual or automated well purging conducted after the effective date of this section. This requirement applies to each well the operator operates.

For any liquids unloading by manual well purging, the operator must:

(1) Ensure that the person conducting the well purging remains present on-site throughout the event to minimize to the maximum extent practicable any venting to the atmosphere;

(2) Record the cause, date, time, duration, and estimated volume of each venting event; and

(3) Maintain the records for the period required under § 3162.4–1 and make them available to the BLM, upon request.

Downhole Well Maintenance and Liquids Unloading—Notification of Excessive Duration or Volume (43 CFR 3179.204(f))

The operator must notify the BLM by Sundry Notice, within 30 calendar days, if:

(1) The cumulative duration of manual well purging events for a well exceeds 24 hours during any production month; or

(2) The estimated volume of gas vented in liquids unloading by manual well purging operations for a well exceeds 75 Mcf during any production month.

Leak Detection—Compliance With EPA Regulations (43 CFR 3179.301(j))

Sections 3179.301 through 3179.305 include information collection activities pertaining to the detection and repair of gas leaks during production operations. These regulations require operators to inspect all equipment covered under § 3179.301(a) for gas leaks. Section 3179.301(k) allows an operator to satisfy the requirements of §§ 3179.301 through 3179.305 for all of the equipment on a given lease by notifying the BLM in a Sundry Notice that the operator is applying the EPA subpart OOOOa fugitive emissions requirements to such equipment.

Leak Detection—Request To Use an Alternative Monitoring Device and Protocol (43 CFR 3179.302(c))

Section 3175.302 specifies the instruments and methods that an operator may use to detect leaks. Section 3175.302(d) allows the BLM to approve an alternative monitoring device and associated inspection protocol if the BLM finds that the alternative would achieve equal or greater reduction of gas lost through leaks compared with the approach specified in § 3179.302(a)(1) when used according to § 3179.303(a).

Any person may request approval of an alternative monitoring device and protocol by submitting a Sundry Notice to BLM that includes the following information: (1) Specifications of the proposed monitoring device, including a detection limit capable of supporting the desired function; (2) The proposed monitoring protocol using the proposed monitoring device, including how results will be recorded; (3) Records and data from laboratory and field testing, including but not limited to performance testing; (4) A demonstration that the proposed monitoring device and protocol will achieve equal or greater reduction of gas lost through leaks compared with the approach specified in the regulations; (5) Tracking and documentation procedures; and (6) Proposed limitations on the types of sites or other conditions on deploying the device and the protocol to achieve the demonstrated results.

Leak Detection—Operator Request To Use an Alternative Leak Detection Program (43 CFR 3179.303(b))

Section 3179.303(b) allows an operator to submit a Sundry Notice requesting authorization to detect gas leaks using an alternative instrument-based leak detection program, different from the specified requirement to inspect each site semi-annually using an approved monitoring device.

To obtain approval for an alternative leak detection program, the operator must submit a Sundry Notice that includes the following information:

(1) A detailed description of the alternative leak detection program, including how it will use one or more of the instruments specified in or approved under § 3179.302(a) and an identification of the specific instruments, methods and/or practices that would substitute for specific elements of the approach specified in §§ 3179.302(a) and 3179.303(a);

(2) The proposed monitoring protocol;

(3) Records and data from laboratory and field testing, including, but not limited to, performance testing, to the extent relevant;

(4) A demonstration that the proposed alternative leak detection program will achieve equal or greater reduction of gas lost through leaks compared to compliance with the requirements specified in §§ 3179.302(a) and 3179.303(a);

(5) A detailed description of how the operator will track and document its procedures, leaks found, and leaks repaired; and

(6) Proposed limitations on types of sites or other conditions on deployment of the alternative leak detection program.

Leak Detection—Operator Request for Exemption Allowing Use of an Alternative Leak-Detection Program That Does Not Meet Specified Criteria (43 CFR 3179.303(d))

An operator may seek authorization for an alternative leak detection program that does not achieve equal or greater reduction of gas lost through leaks compared to the required approach, if the operator demonstrates that compliance with the leak-detection regulations (including the option for an alternative program under 43 CFR 3179.303(b)) would impose such costs as to cause the operator to cease production and abandon significant recoverable oil or gas reserves under the lease. The BLM may approve an alternative leak detection program that does not achieve equal or greater reduction of gas lost through leaks, but is as effective as possible consistent with not causing the operator to cease production and abandon significant recoverable oil or gas reserves under the lease.

To obtain approval for an alternative program under this provision, the operator must submit a Sundry Notice that includes the following information:

(1) The name, number, and location of each well, and the number of the lease, unit, or communitized area with which it is associated;

(2) The oil and gas production levels of each of the operator's wells on the lease, unit or communitized area for the most recent production month for which information is available;

(3) Data that show the costs of compliance on the lease with the requirements of §§ 3179.301–305 and with an alternative leak detection program that meets the requirements of § 3179.303(b);

(4) The operator must consider the costs and revenues of the combined stream of revenues from both the gas and oil components and provide the operator's projections of oil and gas prices, production volumes, quality (*i.e.,* heating value and H_2S content), revenues derived from production, and royalty payments on production over the next 15 years or the life of the operator's lease, unit, or communitized area, whichever is less;

(5) The information required to obtain approval of an alternative program under § 3179.303(b), except that the estimated volume of gas that will be lost through leaks under the alternative program must be compared to the volume of gas lost under the required program, but does not have to be shown to be at least equivalent.

Leak Detection—Notification of Delay in Repairing Leaks (43 CFR 3179.304(a))

Section 3179.304(a) requires an operator to repair any leak no later than 30 calendar days after discovery of the leak, unless there is good cause for delay in repair. If there is good cause for a delay beyond 30 calendar days, section 3179.304(b) requires the operator to submit a Sundry Notice notifying the BLM of the cause.

Leak Detection—Inspection Recordkeeping and Reporting (43 CFR 3179.305)

Section 3179.305 requires operators to maintain the following records and make them available to the BLM upon request: (1) For each inspection required under § 3179.303, documentation of the date of the inspection and the site where the inspection was conducted; (2) The monitoring method(s) used to determine the presence of leaks; (3) A list of leak components on which leaks were found; (4) The date each leak was repaired; and (5) The date and result of the follow-up inspection(s) required under § 3179.304. By March 31 each calendar year, the operator must provide to the BLM an annual summary report on the previous year's inspection activities that includes: (1) The number of sites inspected; (2) The total number of leaks identified, categorized by the type of component; (3) The total number of leaks repaired; (4) The total number of leaks that were not repaired as of December 31 of the previous calendar year due to good cause and an estimated date of repair for each leak; and (5) A certification by a responsible officer that the information in the report is true and accurate.

Leak Detection—Annual Reporting of Inspections (43 CFR 3179.305(b))

By March 31 each calendar year, the operator must provide to the BLM an annual summary report on the previous year's inspection activities that includes:

(1) The number of sites inspected;

(2) The total number of leaks identified, categorized by the type of component;

(3) The total number of leaks repaired;

(4) The total number leaks that were not repaired as of December 31 of the previous calendar year due to good cause and an estimated date of repair for each leak.

(5) A certification by a responsible officer that the information in the report is true and accurate to the best of the officer's knowledge.

4. Burden Estimates

The following table details the estimated annual burdens of activities that would involve APDs and Sundry Notices, the use of which has been authorized under Control Number 1004–0137.

ESTIMATED HOUR BURDENS

Type of response A.	Number of responses B.	Hours per response C.	Total hours (column B × column C) D.
Plan to Minimize Waste of Natural Gas, 43 CFR 3162.3–1, Form 3160–3	2,000	8	16,000
Request for Approval for Royalty-Free Uses On-Lease or Off-Lease, 43 CFR 3178.5, 3178.7, 3178.8, and 3178.9, Form 3160–5	50	4	200
Notification of Choice to Comply on County- or State-wide Basis, 43 CFR 3179.7(c)(3)(iii)	200	1	200
Request for Approval of Alternative Capture Requirement, 43 CFR 3179.8(b), Form 3160–5	50	16	800
Request for Exemption from Well Completion Requirements, 43 CFR 3179.102(c) and (d), Form 3160–5	0	0	0
Request for Extension of Royalty-Free Flaring During Initial Production Testing, 43 CFR 3179.103, Form 3160–5	500	2	1,000
Request for Extension of Royalty-Free Flaring During Subsequent Well Testing, 43 CFR 3179.104, Form 3160–5	5	2	10
Reporting of Venting or Flaring, 43 CFR 3179.105, Form 3160–5	250	2	500
Notification of Functional Needs for a Pneumatic Controller, 43 CFR 3179.201(b)(1), Form 3160–5	10	2	20
Showing that Cost of Compliance Would Cause Cessation of Production and Abandonment of Oil Reserves, 43 CFR 3179.201(b)(4) and 3179.201(c), Form 3160–5	50	4	200
Showing in Support of Replacement of Pneumatic Controller within 3 Years, 43 CFR 3179.201(d), Form 3160–5	100	1	100
Showing that a Pneumatic Diaphragm Pump was Operated on Fewer than 90 Individual Days in the Prior Calendar Year, 43 CFR 3179.202(b)(2), Form 3160–5	100	1	100
Notification of Functional Needs for a Pneumatic Diaphragm Pump, 43 CFR 3179.202(d), Form 3160–5	150	1	150
Showing that Cost of Compliance Would Cause Cessation of Production and Abandonment of Oil Reserves, 43 CFR 3179.202(f) and (g), Form 3160–5	10	4	40
Showing in Support of Replacement of Pneumatic Diaphragm Pump within 3 Years, 43 CFR 3179.202(h), Form 3160–5	100	1	100
Storage Vessels, 43 CFR 3179.203(c), Form 3160–5	50	4	200
Downhole Well Maintenance and Liquids Unloading—Documentation and Reporting, 43 CFR 3179.204(c) and (e), Form 3160–5	5,000	1	5,000
Downhole Well Maintenance and Liquids Unloading—Notification of Excessive Duration or Volume, 43 CFR 3179.204(f), Form 3160–5	250	1	250
Leak Detection—Compliance with EPA Regulations, 43 CFR 3179.301(j), Form 3160–5	50	4	200
Leak Detection—Request to Use an Alternative Monitoring Device and Protocol, 43 CFR 3179.302(c), Form 3160–5	5	40	200
Leak Detection—Operator Request to Use an Alternative Leak Detection Program, 43 CFR 3179.303(b), Form 3160–5	20	40	800
Leak Detection—Operator Request for Exemption Allowing Use of an Alternative Leak-Detection Program that Does Not Meet Specified Criteria, 43 CFR 3179.303(d), Form 3160–5	150	20	3,000
Leak Detection—Notification of Delay in Repairing Leaks, 43 CFR 3179.304(a), Form 3160–5	100	1	100
Leak Detection—Inspection Recordkeeping and Reporting, 43 CFR 3179.305	52,000	.25	13,000
Leak Detection—Annual Reporting of Inspections, 43 CFR 3179.305(b), Form 3160–5	2,000	20	40,000
Totals	63,200		82,170

I. National Environmental Policy Act

The BLM prepared a draft environmental assessment (EA) to determine whether issuance of this proposed regulation pertaining to oil and gas waste prevention and royalty clarification would constitute a ''major Federal action significantly affecting the quality of the human environment'' under Section 102(2)(C) of the National Environmental Policy Act (NEPA). This EA was posted for public comment for a period of 75 days, from February 8 through April 22, 2016. During the public comment period for the proposed rule and draft EA, BLM received comments that further informed the analysis of the potential environmental impacts of the rule. In response to these comments, BLM incorporated changes in the final EA, which will be released concomitantly with the rule.

The BLM believes that the rule would benefit the environment by reducing emissions of methane (a potent GHG), VOCs (which contribute to smog), and hazardous air pollutants such as benzene (a known carcinogen). In addition, the rule would reduce light pollution and other impacts from flaring. These reductions would contribute to a more robust environmental quality overall. BLM has determined that the rule may also have a certain degree of adverse environmental impacts, primarily due to land disturbance from increased or accelerated construction of gas gathering lines or pipelines and compressors and/or increased truck traffic on existing disturbed surfaces from the increased use of mobile capture technology. After careful consideration of the impacts and alternatives discussed in the final EA, BLM has determined that this action does not meet the criteria of significance under 40 CFR 1508.27 either in terms of context or intensity; therefore, BLM finds that the promulgation of the rule has no significant impact.

J. Executive Order 13211, Actions Concerning Regulations That Significantly Affect Energy Supply, Distribution, or Use

Under Executive Order 13211, agencies are required to prepare and submit to OMB a Statement of Energy Effects for significant energy actions. This statement is to include a detailed statement of ''any adverse effects on energy supply, distribution, or use (including a shortfall in supply, price increases, and increase use of foreign supplies)'' for the action and reasonable alternatives and their effects.

Section 4(b) of Executive Order 13211 defines a ''significant energy action'' as ''any action by an agency (normally published in the **Federal Register**) that promulgates or is expected to lead to the promulgation of a final rule or regulation, including notices of inquiry, advance notices of proposed rulemaking, and notices of proposed rulemaking: (1)(i) That is a significant regulatory action under Executive Order 12866 or any successor order, and (ii) is likely to have a significant adverse effect on the supply, distribution, or use of energy; or (2) that is designated by the Administrator of (OIRA) as a significant energy action.''

Since the compliance costs for this rule would represent such a small fraction of company net incomes, we believe that the rule is unlikely to impact the investment decisions of firms. Also, the incremental production of gas estimated to result from the rule's enactment constitutes a small fraction of total U.S. production, and any potential and temporary deferred production of oil would likewise constitute a small fraction of total U.S. production. For these reasons, we do not expect that the final rule will significantly impact the supply, distribution, or use of energy. As such, the rulemaking is not a ''significant energy action'' as defined in Executive Order 13211.

K. Executive Order 13563, Improving Regulation and Regulatory Review

Executive Order 13563 reaffirms the principles of E.O. 12866 while calling for improvements in the nation's regulatory system to promote predictability, to reduce uncertainty, and to use the best, most innovative, and least burdensome tools for achieving regulatory ends. The executive order directs agencies to consider regulatory approaches that reduce burdens and maintain flexibility and freedom of choice for the public where these approaches are relevant, feasible, and consistent with regulatory objectives. E.O. 13563 emphasizes further that regulations must be based on the best available science and that the rulemaking process must allow for public participation and an open exchange of ideas. We have developed this final rule in a manner consistent with these requirements.

X. Authors

The principal authors of this rule are: Timothy Spisak and James Tichenor of the BLM Washington Office; Eric Jones of the BLM Moab, Utah Field Office; and David Mankiewicz of the BLM Farmington, New Mexico Field Office; assisted by Faith Bremner of the staff of the BLM's Regulatory Affairs Division.

Dated: November 14, 2016.

Amanda Leiter,

Acting Assistant Secretary, Land and Minerals Management.

43 CFR Chapter II

For the reasons set out in the preamble, the Bureau of Land Management amends 43 CFR parts 3100, 3160 and 3170 as follows:

PART 3100—ONSHORE OIL AND GAS LEASING

■ 1. Amend the authority citation for part 3100 to read as follows:

Authority: 25 U.S.C. 396d and 2107; 30 U.S.C. 189, 306, 359 and 1751; 43 U.S.C. 1732(b), 1733, and 1740; and the Energy Policy Act of 2005 (Pub. L. 109–58).

■ 2. Revise § 3103.3–1 to read as follows:

§ 3103.3–1 Royalty on production.

(a) Royalty on production will be payable only on the mineral interest owned by the United States. Royalty must be paid in amount or value of the production removed or sold as follows:

(1) For leases issued on or before January 17, 2017, the rate prescribed in the lease or in applicable regulations at the time of lease issuance;

(2) For leases issued January 17, 2017:

(i) 12½ percent on all noncompetitive leases;

(ii) A rate of not less than 12½ percent on all competitive leases, exchange and renewal leases, and leases issued in lieu of unpatented oil placer mining claims under § 3108.2–4 of this title;

(3) 16⅔ percent on noncompetitive leases reinstated under § 3108.2–3 of this title plus an additional 2 percentage-point increase added for each succeeding reinstatement;

(4) The rate used for royalty determination that appears in a lease that is reinstated or that is in force for competitive leases at the time of issuance of the lease that is reinstated, plus 4 percentage points, plus an additional 2 percentage points for each succeeding reinstatement.

(b) Leases that qualify under specific provisions of the Act of August 8, 1946 (30 U.S.C. 226c) may apply for a limitation of a 12½ percent royalty rate.

(c) The average production per well per day for oil and gas will be determined pursuant to 43 CFR 3162.7–4.

(d) Payment of a royalty on the helium component of gas will not convey the right to extract the helium from the gas stream. Applications for the right to extract helium from the gas stream will be made under part 16 of this title.

PART 3160—ONSHORE OIL AND GAS OPERATIONS

■ 3. The authority citation for part 3160 continues to read as follows:

Authority: 25 U.S.C. 396d and 2107; 30 U.S.C. 189, 306, 359, and 1751; and 43 U.S.C. 1732(b), 1733, and 1740.

§ 3160.0–5 [Amended]

■ 4. Amend § 3160.0–5 by removing the definition of ''Avoidably lost.''

■ 5. Amend § 3162.3–1 by adding paragraph (j) to read as follows:

§ 3162.3–1 Drilling applications and plans.

* * * * *

(j) When submitting an Application for Permit to Drill an oil well, the operator must also submit a plan to minimize waste of natural gas from that well. The waste minimization plan must accompany, but would not be part of, the Application for Permit to Drill. The waste minimization plan must set forth a strategy for how the operator will comply with the requirements of 43 CFR subpart 3179 regarding control of waste from venting and flaring, and must explain how the operator plans to capture associated gas upon the start of oil production, or as soon thereafter as reasonably possible, including an explanation of why any delay in capture of the associated gas would be required. Failure to submit a complete and adequate waste minimization plan is grounds for denying or disapproving an Application for Permit to Drill. The waste minimization plan must include the following information:

(1) The anticipated completion date of the proposed well(s);

(2) A description of anticipated production, including:

(i) The anticipated date of first production;

(ii) The expected oil and gas production rates and duration from the proposed well. If the proposed well is on a multi-well pad, the plan should include the total expected production for all wells being completed;

(iii) The expected production decline curve of both oil and gas from the proposed well; and

(iv) The expected Btu value for gas production from the proposed well.

(3) Certification that the operator has provided one or more midstream processing companies with information about the operator's production plans, including the anticipated completion dates and gas production rates of the proposed well or wells;

(4) Identification of a gas pipeline to which the operator plans to connect, with sufficient capacity to accommodate the anticipated production of the proposed well(s), and information on the pipeline, including, to the extent that the operator can obtain it, the following information:

(i) Maximum current daily capacity of the pipeline;

(ii) Current throughput of the pipeline;

(iii) Anticipated daily capacity of the pipeline at the anticipated date of first gas sales from the proposed well;

(iv) Anticipated throughput of the pipeline at the anticipated date of first gas sales from the proposed well; and

(v) Any plans known to the operator for expansion of pipeline capacity for the area that includes the proposed well; and

(5) If an operator cannot identify a gas pipeline with sufficient capacity to accommodate the anticipated production of the proposed well(s), the waste minimization plan must also include:

(i) A gas pipeline system location map of sufficient detail, size, and scale as to show the field in which the proposed well will be located, and all existing gas trunklines within 20 miles of the well. The map should also contain:

(A) The name and location of the gas processing plant(s) closest to the proposed well(s), and of the intended destination processing plant, if different;

(B) The location and name of the operator of each gas trunkline within 20 miles of the proposed well;

(C) The proposed route and tie-in point that connects or could connect the subject well to an existing gas trunkline;

(ii) The total volume of produced gas, and percentage of total produced gas, that the operator is currently flaring or venting from wells in the same field and any wells within a 20-mile radius of that field; and

(iii) A detailed evaluation, including estimates of costs and returns, of opportunities for on-site capture approaches, such as compression or liquefaction of natural gas, removal of natural gas liquids, or generation of electricity from gas.

PART 3170—ONSHORE OIL AND GAS PRODUCTION

■ 6. The authority citation for part 3170 continues to read as follows:

Authority: 25 U.S.C. 396d and 2107; 30 U.S.C. 189, 306, 359, and 1751; and 43 U.S.C. 1732(b), 1733, and 1740.

■ 7. Add subparts 3178 and 3179 to part 3170, to read as follows:

Subpart 3178—Royalty-Free Use of Lease Production

Sec.

Subpart 3179—Waste Prevention and Resource Conservation

§ 3178.1 Purpose.

The purpose of this subpart is to address the circumstances under which oil or gas produced from Federal and Indian leases may be used royalty-free in operations on the lease, unit, or communitized area. This subpart supersedes those portions of Notice to Lessees and Operators of Onshore Federal and Indian Oil and Gas Leases, Royalty or Compensation for Oil or Gas Lost (NTL–4A), pertaining to oil or gas used for beneficial purposes.

§ 3178.2 Scope.

(a) This subpart applies to:

(1) All onshore Federal and Indian (other than Osage Tribe) oil and gas leases, units, and communitized areas, except as otherwise provided in this subpart;

(2) Indian Mineral Development Act (IMDA) oil and gas agreements, unless specifically excluded in the agreement or unless the relevant provisions of this subpart are inconsistent with the agreement;

(3) Leases and other business agreements and contracts for the development of tribal energy resources under a Tribal Energy Resource Agreement entered into with the Secretary, unless specifically excluded in the lease, other business agreement, or Tribal Energy Resource Agreement;

(4) Committed State or private tracts in a federally approved unit or communitization agreement defined by or established under 43 CFR subpart 3105 or 43 CFR part 3180; and

(5) All onshore wells, and production equipment located on a Federal or Indian lease or a federally approved unit or communitized area, and compressors located on a Federal or Indian lease or a federally approved unit or communitized area and which compress production from the same Federal or Indian lease or federally approved unit or communitized area.

(b) For purposes of this subpart, the term ''lease'' also includes IMDA agreements.

§ 3178.3 Production on which royalty is not due.

(a) To the extent specified in §§ 3178.4 and 3178.5, royalty is not due on:

(1) Oil or gas that is produced from a lease or communitized area and used for operations and production purposes (including placing oil or gas in marketable condition) on the same lease or communitized area without being removed from the lease or communitized area; or

(2) Oil or gas that is produced from a unit PA and used for operations and production purposes (including placing oil or gas in marketable condition) on the unit, for the same unit PA, without being removed from the unit.

(b) For the uses described in § 3178.5, the operator must obtain prior written BLM approval for the volumes used for operational and production purposes to be royalty free.

§ 3178.4 Uses of oil or gas on a lease, unit, or communitized area that do not require prior written BLM approval for royalty-free treatment of volumes used.

(a) Oil or gas produced from a lease, unit, or communitized area may be used royalty-free for operations and production purposes on the lease, unit, or communitized area without prior written BLM approval in the following circumstances:

(1) Use of fuel to generate power or operate combined heat and power;

(2) Use of fuel to power equipment, including artificial lift equipment, equipment used for enhanced recovery, drilling rigs, and completion and workover equipment;

(3) Use of gas to actuate pneumatic controllers or operate pneumatic pumps at production facilities;

(4) Use of fuel to heat, separate, or dehydrate production;

(5) Use of gas as a pilot fuel or as assist gas for a flare, combustor, thermal oxidizer, or other control device;

(6) Use of fuel to compress or treat gas to place it in marketable condition;

(7) Use of oil to clean the well and improve production, *e.g.,* hot oil treatments. The operator must document the removal of the oil from the tank or pipeline under Onshore Oil and Gas Order No. 3 (Site Security), or any successor regulation;

(8) Use of oil as a circulating medium in drilling operations, if the use is part of an approved Drilling Plan under Onshore Oil and Gas Order No. 1;

(9) Injection of gas for the purpose of conserving gas or increasing the recovery of oil or gas, if the BLM has approved the injection under applicable regulations in parts 3100, 3160, or 3180 of this title; and

(10) Injection of gas that is cycled in a contained gas-lift system.

(b) The volume to be treated as royalty free must not exceed the amount of fuel reasonably necessary to perform the operational function, using equipment of appropriate capacity.

§ 3178.5 Uses of oil or gas on a lease, unit, or communitized area that require prior written BLM approval for royalty-free treatment of volumes used.

(a) Oil or gas produced from a lease, unit, or communitized area may also be used royalty-free for the following operations and production purposes on the lease, unit, or communitized area, but prior written BLM approval is required to ensure that production accountability is maintained:

(1) Use of oil or gas that the operator removes from the pipeline at a location downstream of the Facility Measurement Point (FMP);

(2) Use of gas that has been removed from the lease, unit PA, or communitized area for treatment or processing because of particular physical characteristics of the gas that require the gas to be treated or processed prior to use, where the gas is returned to, and used on, the lease, unit PA, or communitized area from which it was produced; and

(3) Any other types of use of produced oil or gas for operations and production purposes, which are not identified in § 3178.4.

(b)(1) The operator must obtain BLM approval to conduct activities under paragraph (a) of this section by submitting a Form 3160–5, Sundry Notices and Reports on Wells (Sundry Notice) containing the information required under § 3178.9. If the BLM disapproves a request for royalty-free treatment for volumes used under this section, the operator must pay royalties on such volumes. If the BLM approves a request for royalty-free treatment for volumes used under this section, such approval will be deemed effective from the date the request was filed.

(2) With respect to uses under paragraph (a)(1) of this section, the operator must measure the volume of oil or gas used in accordance with Onshore Oil and Gas Orders No. 4 (oil) and 5 (gas) as applicable, or other successor regulations.

(3) With respect to removals under paragraph (a)(2) of this section, the operator must measure any gas returned to the lease, unit, or communitized area under such an approval in accordance with Onshore Oil and Gas Order No. 5 or other successor regulations.

§ 3178.6 Uses of oil or gas moved off the lease, unit, or communitized area that do not require prior written approval for royalty-free treatment of volumes used.

Oil or gas used after being moved off the lease, unit, or communitized area may be treated as royalty free without prior written BLM approval only if the use meets the criteria under § 3178.4 and when:

(a) The oil or gas is transported from one area of the lease, unit, or communitized area to another area of the same lease, unit, or communitized area where it is used, and no oil or gas is added to or removed from the pipeline while crossing lands that are not part of the lease, unit, or communitized area; or

(b) A well is directionally drilled, the wellhead is not located on the producing lease, unit, or communitized area, and oil or gas is used on the same well pad for operations and production purposes for that well.

§ 3178.7 Uses of oil or gas moved off the lease, unit, or communitized area that require prior written approval for royalty-free treatment of volumes used.

(a) Except as provided in § 3178.6(b) and paragraph (b) of this section, royalty is owed on all oil or gas used in operations conducted off the lease, unit, or communitized area.

(b) The BLM may grant prior written approval to treat oil or gas used in operations conducted off the lease, unit, or communitized area as royalty free (referred to as off-lease royalty-free use) if the use is among those listed in § 3178.4(a) and § 3178.5(a) and if:

(1) The equipment or facility in which the operation is conducted is located off the lease, unit, or communitized area for engineering, economic, resource protection, or physical accessibility reasons; and

(2) The operations are conducted upstream of the FMP.

(c) The operator must obtain BLM approval under paragraph (b) of this section by submitting a Sundry Notice containing the information required under § 3178.9. If the BLM disapproves a request for royalty-free treatment for volumes used under this section, the operator must pay royalties on such volumes. If the BLM approves a request for royalty-free treatment for volumes used under this section, such approval will be deemed effective from the date the request was filed.

(d) Approval of measurement or commingling off the lease, unit, or communitized area under other regulations does not constitute approval of off-lease royalty-free use. The operator or lessee must expressly request, and submit its justification for, approval of off-lease royalty-free use.

(e) If equipment or a facility located on a particular lease, unit, or communitized area treats oil or gas produced from properties that are not unitized or communitized with the property on which the equipment or facility is located, in addition to treating oil or gas produced from the lease, unit, or communitized area on which the equipment or facility is located, the operator may report as royalty free only that portion of the oil or gas used as fuel that is properly allocable to the share of production contributed by the lease, unit, or communitized area on which the equipment is located, unless otherwise authorized by the BLM under this section.

§ 3178.8 Measurement or estimation of volumes of oil or gas that are used royalty-free.

(a) The operator must measure or estimate the volumes of royalty-free gas used in operations upstream of the FMP.

(b) The operator must measure the volume of gas that is removed from the product stream downstream of the FMP and used royalty-free pursuant to sections 3178.4 through 3178.7.

(c) The operator must measure the volume of oil that is used royalty-free pursuant to sections 3178.4 through 3178.7. The operator must also document removal of such oil from the tank or pipeline.

(d) If the operator removes oil or gas downstream of the FMP and that oil or gas is used royalty-free pursuant to sections 3178.4 through 3178.7, the operator must apply for an FMP under section 3173.12 to measure the oil or gas that is removed for use.

(e) When estimating gas volumes, the operator must use the best available information to make a reasonable estimate.

(f) Each of the volumes required to be measured or estimated, as applicable, under this subpart, must be reported by the operator following applicable ONRR reporting requirements.

§ 3178.9 Requesting approval of royalty-free treatment when approval is required.

To request written approval of royalty-free use when required under § 3178.5 or § 3178.7, the operator must submit a Sundry Notice that includes the following information:

(a) A complete description of the operation to be conducted, including the location of all facilities and equipment involved in the operation and the location of the FMP;

(b) The volume of oil or gas that the operator expects will be used in the operation, and the method of measuring or estimating that volume;

(c) If the volume of gas expected to be used will be estimated, the basis for the estimate (*e.g.,* equipment manufacturer's published consumption or usage rates); and

(d) The proposed disposition of the oil or gas used (*e.g.,* whether gas used would be consumed as fuel, vented through use of a gas-activated pneumatic controller, returned to the reservoir, or used in some other way).

§ 3178.10 Facility and equipment ownership.

The operator is not required to own or lease the equipment or facility that uses oil or gas royalty free. The operator is responsible for obtaining all authorizations, measuring production, reporting production, and all other applicable requirements.

Subpart 3179—Waste Prevention and Resource Conservation

§ 3179.1 Purpose.

The purpose of this subpart is to implement and carry out the purposes of statutes relating to prevention of waste from Federal and Indian (other than Osage Tribe) leases, conservation of surface resources, and management of the public lands for multiple use and sustained yield. This subpart supersedes those portions of Notice to Lessees and Operators of Onshore Federal and Indian Oil and Gas Leases, Royalty or Compensation for Oil and Gas Lost (NTL–4A),, pertaining to, among other things, flaring and venting of produced gas, unavoidably and avoidably lost gas, and waste prevention.

§ 3179.2 Scope.

(a) This subpart applies to:

(1) All onshore Federal and Indian (other than Osage Tribe) oil and gas leases, units, and communitized areas, except as otherwise provided in this subpart;

(2) IMDA oil and gas agreements, unless specifically excluded in the agreement or unless the relevant provisions of this subpart are inconsistent with the agreement;

(3) Leases and other business agreements and contracts for the development of tribal energy resources under a Tribal Energy Resource Agreement entered into with the Secretary, unless specifically excluded in the lease, other business agreement, or Tribal Energy Resource Agreement;

(4) Committed State or private tracts in a federally approved unit or communitization agreement defined by or established under 43 CFR subpart 3105 or 43 CFR part 3180;

(5) All onshore wells, tanks, compressors, and other equipment located on a Federal or Indian lease or a federally approved unit or communitized area; and

(b) For purposes of this subpart, the term ''lease'' also includes IMDA agreements.

§ 3179.3 Definitions and acronyms.

As used in this subpart, the term:

Accessible component means a component that can be reached, if necessary, by safe and proper use of portable ladders or by built-in ladders and walkways. Accessible components also include components that can be reached by the safe use of an extension on a monitoring probe.

Automatic ignition system means an automatic ignitor and, where needed to ensure continuous combustion, a continuous pilot flame.

Capture means the physical containment of natural gas for transportation to market or productive use of natural gas, and includes reinjection and royalty-free on-site uses pursuant to subpart 3178.

Capture infrastructure means any pipelines, facilities, or other equipment (including temporary or mobile equipment) used to capture, transport, or process gas. Capture infrastructure includes, but is not limited to, equipment that compresses or liquefies natural gas, removes natural gas liquids, or generates electricity from gas.

Compressor station means any permanent combination of one or more compressors that move natural gas at increased pressure through gathering or transmission pipelines, or into or out of storage. This includes, but is not limited to, gathering and boosting stations and transmission compressor stations. The combination of one or more compressors located at a well site, or located at an onshore natural gas processing plant, is not a compressor station.

Continuous bleed means a continuous flow of pneumatic supply natural gas to a pneumatic controller.

Development oil well or *development gas well* means a well drilled to produce oil or gas, respectively, from an established field in which commercial quantities of hydrocarbons have been discovered and are being produced. For purposes of this subpart, the BLM will determine when a well is a development oil well or development gas well in the event of a disagreement between the BLM and the operator.

Gas-to-oil ratio (GOR) means the ratio of gas to oil in the production stream expressed in standard cubic feet of gas per barrel of oil.

Gas well means a well for which the energy equivalent of the gas produced, including its entrained liquefiable hydrocarbons, exceeds the energy equivalent of the oil produced. Unless more specific British thermal unit (Btu) values are available, a well with a gas-to-oil ratio greater than 6,000 standard cubic feet (scf) of gas per barrel of oil is a gas well. Except where gas has been re-injected into the reservoir, a mature oil well would not be reclassified as a gas well even after normal production decline has caused the GOR to increase beyond 6,000 scf of gas per barrel of oil.

High pressure flare means an open-air flare stack or flare pit designed for the combustion of natural gas leaving a pressurized production vessel (such as a separator or heater-treater) that is not a storage vessel.

Leak means a release of natural gas from a component that is not associated with normal operation of the component, when such release is:

(1) A visible hydrocarbon emission detected by use of an optical gas imaging instrument;

(2) At least 500 ppm of hydrocarbon detected using a portable analyzer or other instrument that can measure the quantity of the release; or

(3) Visible bubbles detected using soap solution.

Releases due to normal operation of equipment intended to vent as part of normal operations, such as gas-driven pneumatic controllers and safety release devices, are not considered leaks unless the releases exceed the quantities and frequencies expected during normal operations. Releases due to operator errors or equipment malfunctions or from control equipment at levels that exceed applicable regulatory requirements, such as releases from a thief hatch left open, a leaking vapor recovery unit, or an improperly sized combustor, are considered leaks.

Leak component means any component that has the potential to leak gas and can be monitored in the manner described in sections 3179.301 through 3179.305 of this subpart, including, but not limited to, valves, connectors, pressure relief devices, open-ended lines, flanges, covers and closed vent systems, thief hatches or other openings on a storage vessel, compressors, instruments, and meters.

Liquid hydrocarbon means chemical compounds of hydrogen and carbon atoms that exist as a liquid under the temperature and pressure at which they are measured. The term is used to refer to oil, condensate, liquefied petroleum gas (LPG), liquefied natural gas (LNG), and natural gas liquids (NGL).

Liquids unloading means the removal of an accumulation of liquid hydrocarbons or water from the wellbore of a completed gas well.

Lost oil or lost gas means produced oil or gas that escapes containment, either intentionally or unintentionally, or is flared before being removed from the lease, unit, or communitized area, and cannot be recovered.

Pneumatic controller means an automated instrument used for maintaining a process condition such as liquid level, pressure, delta-pressure, or temperature.

Storage vessel means a tank or other vessel that contains an accumulation of crude oil, condensate, intermediate hydrocarbon liquids, or produced water, and that is constructed primarily of non-earthen materials (such as wood, concrete, steel, fiberglass, or plastic), which provide structural support. A well completion vessel that receives recovered liquids from a well after startup of production following flowback, for a period that exceeds 60 days, is considered a storage vessel under this subpart unless the storage of the recovered liquids in the vessel is governed by § 3162.3–3 of this title. For purposes of this subpart, the following are not considered storage vessels:

(1) Vessels that are skid-mounted or permanently attached to something that is mobile (such as trucks, railcars, barges or ships), and are intended to be located at a site for less than 180 consecutive days. This exclusion does not apply to well completion vessels or to storage vessels that are located at a site for at least 180 consecutive days.

(2) Process vessels such as surge control vessels, bottoms receivers, or knockout vessels.

(3) Pressure vessels designed to operate in excess of 204.9 kilopascals and without emissions to the atmosphere.

(4) Tanks holding hydraulic fracturing fluid prior to implementation of an approved permanent disposal plan under Onshore Oil and Gas Order No. 7.

Volatile organic compounds (VOC) has the same meaning as defined in 40 CFR 51.100(s).

§ 3179.4 Determining when the loss of oil or gas is avoidable or unavoidable.

For purposes of this subpart:

Unavoidably lost oil or gas means lost oil or gas provided that the operator has not been negligent; the operator has complied fully with applicable laws, lease terms, regulations, provisions of a previously approved operating plan, or other written orders of the BLM; and the oil or gas is:

(1) Produced oil or gas that is lost from the following operations or sources, and that cannot be recovered in the normal course of operations, where the operator has taken prudent and reasonable steps to avoid waste:

(i) Well drilling;

(ii) Well completion and related operations;

(iii) Initial production tests, subject to the limitations in § 3179.103;

(iv) Subsequent well tests, subject to the limitations in § 3179.104;

(v) Exploratory coalbed methane well dewatering;

(vi) Emergencies, subject to the limitations in § 3179.105;

(vii) Normal operating losses from a natural gas-activated pneumatic controller or pump that is in compliance with § 3179.201 and § 3179.202;

(viii) Normal operating losses from a storage vessel or other low pressure production vessel that is in compliance with § 3179.203 and § 3174.5(b);

(ix) Well venting in the course of downhole well maintenance and/or liquids unloading performed in compliance with § 3179.204;

(x) Leaks, when the operator has complied with the leak detection and repair requirements in §§ 3179.301–305;

(xi) Facility and pipeline maintenance, such as when an operator must blow-down and depressurize equipment to perform maintenance or repairs; or

(xii) Flaring of gas from which at least 50 percent of natural gas liquids have been removed and captured for market, if the operator has notified the BLM through a Sundry Notice that the operator is conducting such capture; or

(2) Produced gas that is flared or vented from a well that is not connected to a gas pipeline, provided the BLM has not determined loss of gas through such venting or flaring is otherwise avoidable.

Avoidably lost oil or gas means: Lost oil or gas that is not ''unavoidably lost,'' as defined in paragraph (a) of this section; waste oil that became waste oil through operator negligence; and, any ''excess flared gas,'' as defined in § 3179.7.

§ 3179.5 When lost production is subject to royalty.

(a) Royalty is due on all avoidably lost oil or gas.

(b) Royalty is not due on any unavoidably lost oil or gas.

§ 3179.6 Venting prohibition.

(a) Gas well gas may not be flared or vented, except where it is unavoidably lost pursuant to § 3179.4(a).

(b) The operator must flare rather than vent any gas that is not captured, except:

(1) When flaring the gas is technically infeasible, such as when the gas is not readily combustible or the volumes are too small to flare;

(2) Under emergency conditions, as defined in § 3179.105, when the loss of gas is uncontrollable or venting is necessary for safety;

(3) When the gas is vented through normal operation of a natural gas-activated pneumatic controller or pump;

(4) When the gas is vented from a storage vessel, provided that § 3179.203 does not require the combustion or flaring of the gas;

(5) When the gas is vented during downhole well maintenance or liquids unloading activities performed in compliance with § 3179.204;

(6) When the gas is vented through a leak, provided that the operator is in full compliance with §§ 3179.301 through 3179.305;

(7) When the gas venting is necessary to allow non-routine facility and pipeline maintenance to be performed, such as when an operator must, upon occasion, blow-down and depressurize equipment to perform maintenance or repairs; or

(8) When a release of gas is unavoidable under § 3179.4 and flaring is prohibited by Federal, State, local or Tribal law, regulation, or enforceable permit term.

(c) For purposes of this subpart, all flares or combustion devices must be equipped with an automatic ignition system.

§ 3179.7 Gas capture requirement.

(a) Except as provided in § 3179.8, on a monthly basis, each operator must capture for sale or use on site a volume of gas sufficient to meet the ''capture percentage'' requirement specified in paragraph (b) of this section.

(b) Beginning January 17, 2018, the operator's capture percentage must equal:

(1) For each month during the period from January 17, 2018 until December 31, 2019: 85 percent;

(2) For each month during the period from January 1, 2020 until December 31, 2022: 90 percent;

(3) For each month during the period from January 1, 2023 until December 31, 2025: 95 percent; and

(4) For each month beginning January 1, 2026: 98 percent.

(c) The term ''capture percentage'' in this section means the ''total volume of gas captured'' over the ''relevant area'' divided by the ''adjusted total volume of gas produced'' over the ''relevant area.''

(1) The term ''total volume of gas captured'' in this section means: for each month, the volume of gas sold from all of the operator's development oil wells in the relevant area plus the volume of gas from such wells used on lease, unit, or communitized area in the relevant area.

(2) The term ''adjusted total volume of gas produced'' in this section means: the total volume of gas captured over the month *plus* the total volume of gas flared over the month from high pressure flares from all of the operator's development oil wells that are in production in the relevant area, *minus*:

(i) For each month from January 17, 2018 until December 31, 2018: 5,400 Mcf times the total number of development oil wells ''in production'' in the relevant area;

(ii) For each month in calendar year 2019: 3,600 Mcf times the total number of development oil wells in production in the relevant area;

(iii) For each month in calendar year 2020: 1,800 Mcf times the total number of development oil wells in production in the relevant area; and

(iv) For each month in calendar year 2021: 1,500 Mcf times the total number of development oil wells in production in the relevant area;

(v) For each month in calendar years 2022–2023: 1,200 Mcf times the total number of development oil wells in production in the relevant area;

(vi) For each month in calendar year 2024: 900 Mcf times the total number of development oil wells in production in the relevant area; and

(vii) For each month in calendar year 2025 and thereafter: 750 Mcf times the total number of development oil wells in production in the relevant area.

(3) The term ''relevant area'' in this section means:

(i) Each of the operator's leases, units, or communitized areas; or

(ii) All of the operator's development oil wells on leases, units, and communitized areas within a county or within a State, if the operator notifies the BLM by Sundry Notice by January 1, of the relevant year that the operator has chosen to comply on a county- or State-wide basis.

(4) An oil well is considered ''in production'' only after the well has begun producing oil, and only during a month in which it produces gas (that is sold or flared) for 10 or more days.

(d) In any month in which the operator fails to meet the required capture percentage, the ''excess flared gas'' is royalty-bearing under § 3179.4. The term ''excess flared gas'' means:

Excess flared gas = (required capture percentage * adjusted total volume of gas produced over the relevant area) − total volume of gas captured.

(e) For purposes of calculating royalties on an operator's excess flared gas in a given month, the operator must prorate the excess flared gas across the relevant area to each lease, unit or communitized area *that reported high-pressure flaring during the month.*

§ 3179.8 Alternative capture requirement.

(a) With respect to leases issued before the effective date of this regulation, for operators choosing to comply with the capture requirement in § 3179.7 on a lease-by-lease, unit-by-unit, or communitized area-by-communitized area basis, the BLM may approve a capture percentage lower than the applicable capture percentage specified under § 3179.7, if the operator demonstrates, and the BLM agrees, that the applicable capture percentage under § 3179.7 would impose such costs as to cause the operator to cease production and abandon significant recoverable oil reserves under the lease.

(b) To support a demonstration under paragraph (a) of this section, the operator must submit a Sundry Notice that includes the following information:

(1) The name, number, and location of each of the operator's wells, and the number of the lease, unit, or communitized area with which it is associated;

(2) The oil and gas production levels of each of the operator's wells on the lease, unit or communitized area for the most recent production month for which information is available and the volumes being vented and flared from each well;

(3) Map(s) showing:

(i) The entire lease, unit, or communitized area and the surrounding lands to a distance and on a scale that shows the field in which the well or wells are or will be located (if applicable), and all pipelines that could transport the gas from the well or wells;

(ii) All of the operator's producing oil and gas wells, which are producing from Federal or Indian leases (both on Federal or Indian leases and on other properties) within the map area;

(iii) Identification of all of the operator's wells within the lease, unit, or communitized area from which gas is flared or vented, and the location and distance of the nearest gas pipeline(s) to each such well, with an identification of those pipelines that are or could be available for connection and use; and

(iv) Identification of all of the operator's wells within the lease, unit, or communitized area from which gas is captured;

(4) Data that show pipeline capacity and the operator's projections of the cost associated with installation and operation of gas capture infrastructure, to the extent that the operator is able to obtain this information, as well as cost projections for alternative methods of transportation that do not require pipelines;

(5) Projected costs of and the combined stream of revenues from both gas and oil production, including:

(i) The operator's projections of gas prices, gas production volumes, gas quality (*i.e.,* heating value and H_2S content), revenues derived from gas production, and royalty payments on gas production over the next 15 years or the life of the operator's lease, unit, or communitized area, whichever is less; and

(ii) The operator's projections of oil prices, oil production volumes, costs, revenues, and royalty payments from the operator's oil and gas operations within the lease over the next 15 years or the life of the operator's lease, unit, or communitized area, whichever is less.

(c) In establishing an alternative capture requirement under this section, the BLM will set the capture percentage at the highest level that the BLM determines, considering the information identified in paragraph (b) of this section, will not cause the operator to cease production and abandon significant recoverable oil reserves under the lease.

§ 3179.9 Measuring and reporting volumes of gas vented and flared.

(a) The operator must estimate or measure all volumes of gas vented or flared from wells, facilities and equipment on a lease, unit PA, or communitized area and report those volumes under applicable ONRR reporting requirements.

(b) The operator may estimate such volumes, except:

(1) If the operator estimates that the volume of gas flared from a high pressure flare stack or manifold equals or exceeds an average of 50 Mcf per day for the life of the flare, or the previous 12 months, whichever is shorter, then, beginning January 17, 2018 the operator must either:

(i) *Measure* the volume of the flared gas; or

(ii) Calculate the volume of the flared gas based on the results of a regularly performed GOR test and measured values for the volumes of oil production and gas sales, so as to allow *BLM to independently verify the volume, rate, and heating value of the flared gas*; or

(2) If the BLM determines and informs the operator that the additional accuracy offered by measurement is necessary for effective implementation of this Subpart, then the operator must measure the volume of the flared gas.

(c) If measurement or calculation is required under paragraph (b) of this section for a flare that is combusting gas that is combined across multiple leases, unit PAs, or communitized areas, the operator may measure or calculate the gas at a single point at the flare, but must use an allocation method approved by the BLM to allocate the quantities of flared gas to each lease, unit PA, or communitized area.

§ 3179.10 Determinations regarding royalty-free flaring.

(a) Approvals to flare royalty free, which are in effect as of the effective date of this rule, will continue in effect until January 17, 2018.

(b) The provisions of this subpart do not affect any determination made by the BLM before or after January 17, 2017, with respect to the royalty-bearing status of flaring that occurred prior to January 17, 2017.

§ 3179.11 Other waste prevention measures.

(a) If production from an oil well newly connected to a gas pipeline results or is expected to result in one or more producing wells already connected to the pipeline being forced off the pipeline, the BLM may exercise its authority under applicable laws and regulations, as well as its authority under the terms of applicable permits, orders, leases, and unitization or communitization agreements, to limit the production level from the new well until the pressure of gas production from the new well stabilizes at levels that allow transportation of gas from all wells connected to the pipeline.

(b) If gas capture capacity is not yet available on a given lease, the BLM may exercise its authority under applicable laws and regulations, as well as its authority under the terms of applicable permits, orders, leases, and unitization or communitization agreements, to delay action on an APD for that lease, or approve the APD with conditions for gas capture or limitations on production. If the lease for which an APD is submitted is not yet producing, the BLM may direct or grant a lease suspension under 43 CFR 3103.4–4.

§ 3179.12 Coordination with State regulatory authority.

To the extent that any BLM action to enforce a prohibition, limitation, or order under this subpart may adversely affect production of oil or gas that comes from non-Federal and non-Indian mineral interests, the BLM will coordinate, on a case-by-case basis, with the State regulatory authority having jurisdiction over the oil and gas production from the non-Federal and non-Indian interests.

Flaring and Venting Gas During Drilling and Production Operations

§ 3179.101 Well drilling.

(a) Except as provided in § 3179.6 of this subpart, and unless technically infeasible, gas that reaches the surface as a normal part of drilling operations must be:

(1) Captured and sold;

(2) Directed to a flare pit or flare stack to combust any flammable gasses;

(3) Used in operations on the lease, unit, or communitized area; or

(4) Injected.

(b) If gas is lost as a result of loss of well control, the BLM will make a determination of whether the loss of well control is due to operator negligence. Such gas is avoidably lost if the BLM determines that the loss of well control is due to operator negligence. The BLM will notify the operator in writing when it makes a determination that gas was lost due to operator negligence.

§ 3179.102 Well completion and related operations.

(a) Except as provided in § 3179.6, and unless technically infeasible, after a well has been hydraulically fractured or refractured, gas that reaches the surface during well completion, post-completion, and fluid recovery operations must be:

(1) Captured and sold;

(2) Directed to a flare pit or flare stack to combust any flammable gasses, subject to the volumetric limitations in § 3179.103(a)(3);

(3) Used in operations on the lease, unit, or communitized area; or

(4) Injected.

(b) An operator will be deemed to be in compliance with the requirements of paragraph (a) of this section, if the operator is in compliance with the requirements for control of gas from well completions established under 40 CFR part 60, subpart OOOO or subpart OOOOa or if the well is not a ''well affected facility'' under either of those subparts.

(c) The requirements of paragraph (a) of this section will not apply where the operator demonstrates through a Sundry Notice, and the BLM agrees, that compliance with paragraph (a) of this section would impose such costs as to cause the operator to cease production and abandon significant recoverable oil reserves under the lease.

(d) To support a demonstration under paragraph (d) of this section, the operator must submit a Sundry Notice that includes the following information:

(1) The name, number, and location of each of the operator's wells, and the number of the lease, unit, or communitized area with which it is associated;

(2) The oil and gas production levels of each of the operator's wells on the lease, unit or communitized area for the most recent production month for which information is available;

(3) Data that show the costs of compliance with paragraph (a) of this section on the lease; (4) Projected costs of and the combined stream of revenues from both gas and oil production, including: the operator's projections of oil and gas prices, production volumes, quality (*i.e.,* heating value and H_2S content), revenues derived from production, and royalty payments on production over the next 15 years or the life of the operator's lease, unit, or communitized area, whichever is less.

§ 3179.103 Initial production testing.

(a) Gas flared during a well's initial production test is royalty-free under §§ 3179.4(a)(1)(iii) and 3179.5(b) of this subpart until one of the following occurs:

(1) The operator determines that it has obtained adequate reservoir information for the well;

(2) 30 days have passed since the beginning of the production test, except as provided in paragraph (b) and paragraph (d) of this section;

(3) The operator has flared 20 million cubic feet (MMcf) of gas, when volumes flared under this section are combined with volumes flared under § 3179.102(a)(2), except as provided in paragraph (c) of this section; or

(4) Production begins.

(b) The BLM may extend the period specified in paragraph (a)(2) not to exceed an additional 60 days, based on testing delays caused by well or equipment problems or if there is a need for further testing to develop adequate reservoir information.

(c) The BLM may increase the limit specified in paragraph (a)(3) by up to an additional 30 million cubic feet of gas for exploratory wells in remote locations where additional testing is needed in advance of development of pipeline infrastructure.

(d) During the dewatering and initial evaluation of an exploratory coalbed methane well, the 30-day period specified in paragraph (a)(2) of this section is extended to 90 days. The BLM may approve up to two extensions of this evaluation period, of up to 90 days each.

(e) The operator must submit its request for a longer test period or increased limit under paragraphs (b), (c), or (d) of this section using a Sundry Notice.

§ 3179.104 Subsequent well tests.

During well tests subsequent to the initial production test, the operator may flare gas for no more than 24 hours royalty free, unless the BLM approves or requires a longer period. The operator must request a longer period under this section using a Sundry Notice.

§ 3179.105 Emergencies.

(a) An operator may flare or, if flaring is not feasible given the emergency, vent gas royalty-free under § 3179.4(a)(vi) of this subpart during an emergency. For purposes of this subpart, an ''emergency'' is a temporary, infrequent and unavoidable situation in which the loss of gas or oil is uncontrollable or necessary to avoid risk of an immediate and substantial adverse impact on safety, public health, or the environment. For purposes of royalty assessment, an ''emergency'' is limited to a short-term situation of 24 hours or less (unless the BLM agrees that the emergency conditions necessitating venting or flaring extend for a longer period) caused by an unanticipated event or failure that is out of the operator's control and was not due to operator negligence.

(b) The following do not constitute emergencies for the purposes of royalty assessment:

(1) More than 3 failures of the same component within a single piece of equipment within any 365-day period;

(2) The operator's failure to install appropriate equipment of a sufficient

capacity to accommodate the production conditions;

(3) Failure to limit production when the production rate exceeds the capacity of the related equipment, pipeline, or gas plant, or exceeds sales contract volumes of oil or gas;

(4) Scheduled maintenance;

(5) A situation caused by operator negligence; or

(6) A situation on a lease, unit, or communitized area that has already experienced 3 or more emergencies within the past 30 days, unless the BLM determines that the occurrence of more than 3 emergencies within the 30 day period could not have been anticipated and was beyond the operator's control.

(c) Within 45 days of the start of the emergency, the operator must estimate and report to the BLM on a Sundry Notice the volumes flared or vented beyond the timeframes specified in paragraph (b) of this section.

Gas Flared or Vented From Equipment and During Well Maintenance Operations

§ 3179.201 Equipment requirements for pneumatic controllers.

(a) A pneumatic controller that uses natural gas produced from a Federal or Indian lease, or from a unit or communitized area that includes a Federal or Indian lease, is subject to this section if the pneumatic controller:

(1) Has a continuous bleed rate greater than 6 standard cubic feet (scf) per hour; and

(2) Is not subject to any of the requirements of 40 CFR part 60, subpart OOOO or subpart OOOOa, but would be subject to one of those subparts if it were a new, modified, or reconstructed source.

(b) The operator must replace a pneumatic controller subject to this section with a controller (including but not limited to a continuous or intermittent pneumatic controller) having a bleed rate of 6 scf per hour or less within the timeframes set forth in paragraph (d) of this section, unless:

(1) Use of a pneumatic controller with a bleed rate greater than 6 scf per hour is required based on functional needs that may include, but are not limited to, response time, safety, and positive actuation, provided that the operator notifies the BLM through a Sundry Notice that describes the functional needs necessitating the use of a pneumatic controller with a bleed rate greater than 6 scf per hour;

(2) The pneumatic controller exhaust was, as of January 17, 2017 and continues to be, routed to a flare device or low-pressure combustor;

(3) The pneumatic controller exhaust is routed to processing equipment; or

(4) The operator notifies the BLM through a Sundry Notice and demonstrates, and the BLM agrees, based on the information identified in paragraph (c) of this section, that replacement of a pneumatic controller subject to paragraph (a)(1)(i) of this section would impose such costs as to cause the operator to cease production and abandon significant recoverable oil reserves under the lease.

(c) To support a demonstration under paragraph (b)(4) of this section, the operator must submit a Sundry Notice that includes the following information:

(1) The name, number, and location of each of the operator's wells, and the number of the lease, unit, or communitized area with which it is associated;

(2) The oil and gas production levels of each of the operator's wells on the lease, unit or communitized area for the most recent production month for which information is available;

(3) Data that show the costs of compliance with paragraph (b) of this section on the lease;

(4) Projected costs of and the combined stream of revenues from both gas and oil production, including:

(i) The operator's projections of gas prices, gas production volumes, gas quality (*i.e.,* heating value and H_2S content), revenues derived from gas production, and royalty payments on gas production over the next 15 years or the life of the operator's lease, unit, or communitized area, whichever is less; and

(ii) The operator's projections of oil prices, oil production volumes, costs, revenues, and royalty payments from the operator's oil and gas operations within the lease over the next 15 years or the life of the operator's lease, unit, or communitized area, whichever is less.

(d) The operator must replace the pneumatic controller(s) no later than 1 year after the effective date of this section as required under paragraph (b) of this section. If, however, the well or facility that the pneumatic controller serves has an estimated remaining productive life of 3 years or less from the effective date of this section, then the operator may notify the BLM through a Sundry Notice and replace the pneumatic controller no later than 3 years from the effective date of this section.

(e) The operator must ensure pneumatic controllers are functioning within manufacturers' specifications.

§ 3179.202 Requirements for pneumatic diaphragm pumps.

(a) A pneumatic diaphragm pump is subject to this section if it:

(1) Uses natural gas produced from a Federal or Indian lease, or from a unit or communitized area that includes a Federal or Indian lease; and

(2) Is not subject to any of the requirements of 40 CFR part 60, subpart OOOOa, but would be subject to that subpart if it were a new, modified or reconstructed source.

(b) An operator is not required to comply with paragraphs (c) through (h), with respect to a pneumatic diaphragm pump or pumps if:

(1) The pump does not vent exhaust gas to the atmosphere; or

(2) The operator submits a Sundry Notice to the BLM documenting that the pump(s) operated on less than 90 individual days in the prior calendar year.

(c) For each pneumatic diaphragm pump subject to this section and within the timeframes set forth in paragraph (h) of this section, the operator must:

(1) Replace the pump with a zero-emissions pump, which may be an electric-powered pump; or

(2) Route the pump exhaust gas to processing equipment for capture and sale.

(d) As an alternative to compliance with paragraph (c), the operator may route the pump exhaust gas to a flare or low pressure combustor device within the timeframes set forth in paragraph (h) of this section, if the operator determines and notifies the BLM through a Sundry Notice that:

(1) Replacing the pump with a zero-emissions pump is not viable because a pneumatic pump is necessary to perform the function required; and

(2) Routing the pump exhaust gas to processing equipment for capture and sale is technically infeasible or unduly costly.

(e) If the operator has met the criteria in paragraph (d) allowing the operator to use the compliance alternative provided in paragraph (d), but the operator has no flare or low pressure combustor device on site, or routing the exhaust gas to such a flare or low pressure combustor device would be technically infeasible, the operator need take no further action to comply with paragraphs (c) through (h).

(f) An operator that is required to replace a pump or route the exhaust gas from a pump to capture or a flare or combustion device under this section, may nonetheless be exempt from such requirement if the operator submits a Sundry Notice to the BLM that provides an economic analysis that demonstrates, and the BLM agrees, based on the information identified in paragraph (g) of this section, that compliance with the provisions of this section would impose such costs as to cause the operator to cease production and abandon significant recoverable oil reserves under the lease.

(g) The Sundry Notice described in paragraph (f) must include the following information:

(1) Well information must include:

(i) The name, number, and location of each well, and the number of the lease, unit, or communitized area with which it is associated; and

(ii) The oil and gas production levels of each of the operator's wells on the lease, unit or communitized area for the most recent production month for which information is available;

(2) Data that show the costs of compliance with paragraphs (c) through (e) of this section on the lease;

(3) The operator must consider the costs and revenues of the combined stream of revenues from both the gas and oil components and provide:

(i) The operator's projections of gas prices, gas production volumes, gas quality (*i.e.,* heating value and H_2S content), revenues derived from gas production, and royalty payments on gas production over the next 15 years or the life of the operator's lease, unit, or communitized area, whichever is less; and

(ii) The operator's projections of oil prices, oil production volumes, costs, revenues, and royalty payments from the operator's oil and gas operations within the lease over the next 15 years or the life of the operator's lease, unit, or communitized area, whichever is less.

(h) The operator must replace the pneumatic diaphragm pump(s) or route the exhaust gas to capture or to a flare or combustion device no later than 1 year after the effective date of this section, except that if the operator will comply with paragraph (c) of this section by replacing the pneumatic diaphragm pump with a zero-emission pump and the well or facility that the pneumatic diaphragm pump serves has an estimated remaining productive life of 3 years or less from the effective date of this section, the operator must notify the BLM through a Sundry Notice and replace the pneumatic diaphragm pump no later than 3 years from the effective date of this section.

(i) The operator must ensure its pneumatic diaphragm pumps are functioning within manufacturers' specifications.

§ 3179.203 Storage vessels.

(a) A storage vessel is subject to this section if the vessel:

(1) Contains production from a Federal or Indian lease, or from a unit or communitized area that includes a Federal or Indian lease; and

(2) Is not subject to any of the requirements of 40 CFR part 60, subparts OOOO or OOOOa, but would be subject to one of those subparts if it were a new, modified or reconstructed source.

(b) Within 60 days after the effective date of this section, and within 30 days after any new source of production is added to the storage vessel, the operator must determine, record, and make available to the BLM upon request, whether the storage vessel has the potential for VOC emissions equal to or greater than 6 tpy based on the maximum average daily throughput for a 30-day period of production. The determination may take into account requirements under a legally and practically enforceable limit in an operating permit or other requirement established under a federal, state, local or tribal authority that limit the VOC emissions to less than 6 tpy.

(c) If a storage vessel has the potential for VOC emissions equal to or greater than 6 tpy under paragraph (b) of this section, no later than one year after the effective date of this section, or three years if the operator must and will replace the storage vessel at issue in order to comply with the requirements of this section, the operator must:

(1) Route all tank vapor gas from the storage vessel to a sales line;

(2) If the operator determines that compliance with paragraph (c)(1) of this section is technically infeasible or unduly costly, route all tank vapor gas from the storage vessel to a device or method that ensures continuous combustion of the tank vapor gas; or

(3) Submit an economic analysis to the BLM through a Sundry Notice that demonstrates, and the BLM agrees, based on the information identified in paragraph (d) of this section, that compliance with paragraph (c)(2) of this section would impose such costs as to cause the operator to cease production and abandon significant recoverable oil reserves under the lease.

(d) To support a demonstration under paragraph (c) of this section, the operator must submit a Sundry Notice that includes the following information:

(1) The name, number, and location of each well, and the number of the lease, unit, or communitized area with which it is associated;

(2) The oil and gas production levels of each of the operator's wells on the lease, unit or communitized area for the most recent production month for which information is available;

(3) Data that show the costs of compliance with paragraph (c)(1) or (c)(2) of this section on the lease;

(4) The operator must consider the costs and revenues of the combined stream of revenues from both the gas and oil components and provide:

(i) The operator's projections of oil and gas prices, production volumes, quality (*i.e.,* heating value and H_2S content), revenues derived from production, and royalty payments on production over the next 15 years or the life of the operator's lease, unit, or communitized area, whichever is less.

(e) If the rate of total uncontrolled VOCs released from a storage vessel declines to 4 tpy or less for any continuous 12 month period, the requirements of paragraph (c) no longer apply.

(f) Storage vessels subject to this section must be adequately sized to accommodate the operator's production levels and equipped to meet any applicable regulatory requirements regarding tank vapors.

(g) Storage vessels subject to this section may only vent through properly functioning pressure relief devices.

§ 3179.204 Downhole well maintenance and liquids unloading.

(a) The operator must minimize vented gas and the need for well venting associated with downhole well maintenance and liquids unloading, consistent with safe operations.

(b) For wells equipped with a plunger lift system and/or an automated well control system, minimizing gas venting under paragraph (a) includes optimizing the operation of the system to minimize gas losses to the extent possible consistent with removing liquids that would inhibit proper function of the well.

(c) Before the operator manually purges a well for liquids unloading for the first time after the effective date of this section, the operator must consider other methods for liquids unloading and determine that they are technically infeasible or unduly costly. The operator must provide information supporting that determination as part of the Sundry Notice required under paragraph (e) of this section.

(d) For any liquids unloading by manual well purging, the operator must:

(1) Ensure that the person conducting the well purging remains present on-site throughout the event to minimize to the maximum extent practicable any venting to the atmosphere;

(2) Record the cause, date, time, duration, and estimated volume of each venting event; and

(3) Maintain the records for the period required under § 3162.4–1 of this title and make them available to the BLM, upon request.

(e) The operator must notify the BLM by Sundry Notice within 30 calendar days after the first liquids unloading event by manual or automated well purging conducted after the effective date of this section. This requirement applies to each well the operator operates.

(f) The operator must notify the BLM by Sundry Notice, within 30 calendar days, if:

(1) The cumulative duration of manual well purging events for a well exceeds 24 hours during any production month; or

(2) The estimated volume of gas vented in liquids unloading by manual well purging operations for a well exceeds 75 Mcf during any production month.

(g) For purposes of this section, ''well purging'' means blowing accumulated liquids out of a wellbore by reservoir gas pressure, whether manually or by an automatic control system that relies on real-time pressure or flow, timers, or other well data, where the gas is vented to the atmosphere, and it does not apply to wells equipped with a plunger lift system.

(h) Total estimated volumes vented as a result of downhole well maintenance and liquids unloading, including through the operation of plunger lifts and automated well controls, during the production month must be included in volumes reported to ONRR as vented.

Leak Detection and Repair (LDAR)

§ 3179.301 Operator responsibility.

(a) The requirements of §§ 3179.301 through 3179.305 of this subpart apply to:

(1) A site and all equipment associated with it used to produce, process, compress, treat, store, or measure natural gas (including oil wells that also produce natural gas) from or allocated to a Federal or Indian lease, unit, or communitized area, where the site is upstream of or contains the approved point of royalty measurement; and

(2) A site and all equipment operated by the operator and associated with a site used to store, measure, or dispose of produced water, where the site is located on a Federal or Indian lease.

(b) The requirements of §§ 3179.301 through 3179.305 of this subpart do not apply to:

(1) A site that contains a wellhead or wellheads and no other equipment; or

(2) A well or well equipment that has been depressurized.

(c) As prescribed in §§ 3179.302 and 3179.303 of this subpart, the operator must inspect all equipment covered under this section, as provided in paragraph (a) of this section, for gas leaks from leak components.

(d) The operator is not required to inspect or monitor a leak component that is not an accessible component.

(e) For purposes of §§ 3179.301 through 3179.305, the term ''site'' means a discrete area located on a lease, unit, or communitized area, and containing a wellhead, wellhead equipment, or other equipment used to produce, process, compress, treat, store, or measure natural gas or store, measure, or dispose of produced water, which is suitable for inspection in a single visit.

(f) The operator must make the first inspection of each site:

(1) Within one year of January 17, 2017 for sites that have begun production prior to January 17, 2017;

(2) Within 60 days of beginning production for sites that begin production after January 17, 2017; and

(3) Within 60 days of the date when a site that was out of service is brought back into service and re-pressurized.

(g) The operator must make subsequent inspections as prescribed in § 3179.303.

(h) All leak inspections must occur during production operations.

(i) The operator must fix identified leaks as prescribed in §§ 3179.304 and 3179.305 of this subpart. See 43 CFR 3162.5–1 for responsibility to repair oil leaks.

(j) With respect to new, modified or reconstructed equipment, an operator will be deemed to be in compliance with the requirements of this section for such equipment, if the operator is in compliance with the requirements of subpart OOOOa applicable to such equipment.

(k) For each lease, unit, or communitized area, for all covered sites and equipment not already deemed in compliance with the requirements of this section pursuant to paragraph (j), an operator may choose to satisfy the requirements of §§ 3179.301 through 3179.305 by:

(1) Treating each of those sources as if it were a collection of fugitive emissions components as defined in 40 CFR part 60 subpart OOOOa;

(2) Complying with the requirements of 40 CFR part 60 subpart OOOOa that apply to affected facility fugitive emissions components at a well site (or for compressor stations, that apply to affected facility fugitive emissions components at a compressor station) under 40 CFR part 60, subpart OOOOa; and

(3) Notifying the BLM through a Sundry Notice regarding such compliance.

§ 3179.302 Approved instruments and methods.

(a) The operator must use one or more of the following instruments, operated according to the manufacturer's specifications or as specified below, to detect leaks:

(1) An optical gas imaging device capable of imaging a gas that is half methane, half propane at a concentration of 10,000 ppm at a flow rate of less than or equal to 60 grams per hour from a quarter inch diameter orifice;

(2) A portable analyzer device capable of detecting leaks, such as catalytic oxidation, flame ionization, infrared absorption or photoionization devices, used for a leak detection survey conducted in compliance with the relevant sections of Method 21 at 40 CFR part 60, appendix A–7, including section 8.3.1. and assisted by audio, visual, and olfactory inspection; or

(3) A leak detection device not listed in this section that is approved by the BLM for use by any operator under § 3179.302(d) of this subpart.

(b) The person operating any of the leak detection devices listed in or approved under this section must be adequately trained in the proper use of the device.

(c) Any person may request approval of an alternative monitoring device and protocol by submitting a Sundry Notice to BLM that includes the following information:

(1) Specifications of the proposed monitoring device, including a detection limit capable of supporting the desired function;

(2) The proposed monitoring protocol using the proposed monitoring device, including how results will be recorded;

(3) Records and data from laboratory and field testing, including but not limited to performance testing;

(4) A demonstration that the proposed monitoring device and protocol will achieve equal or greater reduction of gas lost through leaks compared with the approach specified in § 3179.302(a)(1) when used according to § 3179.303(a) of this subpart;

(5) Tracking and documentation procedures; and

(6) Proposed limitations on the types of sites or other conditions on deploying the device and the protocol to achieve the demonstrated results.

(d) The BLM may approve an alternative monitoring device and associated inspection protocol, if the BLM finds that the alternative would achieve equal or greater reduction of gas lost through leaks compared with the approach specified in § 3179.302(a)(1) when used according to § 3179.303(a) of this subpart.

(1) The BLM will provide public notice of a submission for approval under section 3179.302(c).

(2) The BLM may approve an alternative device and monitoring protocol for use in all or most applications, or for use on a pilot or demonstration basis under specified circumstances that limit where and for how long the device may be used.

(3) The BLM will post on the BLM Web site a list of each approved alternative monitoring device and protocol, along with any limitations on its use.

§ 3179.303 Leak detection inspection requirements for natural gas wellhead equipment and other equipment.

(a) Except as provided below or otherwise authorized in paragraph (b) of this section, the operator must inspect leak components located on and around the equipment identified in § 3179.301(a) of this subpart for leaks using a leak detection device listed under § 3179.302 according to the following parameters:

(1) The operator must inspect each site at least semi-annually, and consecutive semiannual inspections must be conducted at least 4 months apart; and

(2) The operator must inspect each compressor station at least quarterly, and consecutive quarterly inspections must be conducted at least 60 days apart.

(b) The BLM may approve an operator's request to use an alternative instrument-based leak detection program, in lieu of compliance with the requirements of § 3179.303(a), if the BLM finds that the alternative program would achieve equal or greater reduction of gas lost through leaks compared with the approach specified in §§ 3179.302(a)(1) and 3179.303(a) of this subpart. The operator must submit its request for an alternative leak detection program through a Sundry Notice that includes the following information:

(1) A detailed description of the alternative leak detection program, including how it will use one or more of the instruments specified in or approved under § 3179.302(a) and an identification of the specific instruments, methods and/or practices that would substitute for specific elements of the approach specified in §§ 3179.302(a) and 3179.303(a);

(2) The proposed monitoring protocol;

(3) Records and data from laboratory and field testing, including, but not limited to, performance testing, to the extent relevant;

(4) A demonstration that the proposed alternative leak detection program will achieve equal or greater reduction of gas lost through leaks compared to compliance with the requirements specified in §§ 3179.302(a) and 3179.303(a);

(5) A detailed description of how the operator will track and document its procedures, leaks found, and leaks repaired; and

(6) Proposed limitations on types of sites or other conditions on deployment of the alternative leak detection program.

(c) If the operator demonstrates, and the BLM agrees, that compliance with the requirements of §§ 3179.301–305, including the option for compliance with an alternative leak detection program under § 3179.303(b) would impose such costs as to cause the operator to cease production and abandon significant recoverable oil or gas reserves under the lease, the BLM may approve an alternative leak detection program for that operator that does not meet the criterion specified in § 3179.303(b)(4), but is as effective as possible consistent with not causing the operator to cease production and abandon significant recoverable oil or gas reserves under the lease.

(d) To support a demonstration under paragraph (c) of this section, the operator must submit a Sundry Notice that includes the following information:

(1) The name, number, and location of each well, and the number of the lease, unit, or communitized area with which it is associated;

(2) The oil and gas production levels of each of the operator's wells on the lease, unit or communitized area for the most recent production month for which information is available;

(3) Data that show the costs of compliance on the lease with the requirements of §§ 3179.301–305 and with an alternative leak detection program that meets the requirements of § 3179.303(b);

(4) The operator must consider the costs and revenues of the combined stream of revenues from both the gas and oil components and provide the operator's projections of oil and gas prices, production volumes, quality (*i.e.,* heating value and H_2S content), revenues derived from production, and royalty payments on production over the next 15 years or the life of the operator's lease, unit, or communitized area, whichever is less;

(5) The information required under § 3179.303(b), except that in lieu of the demonstration required under § 3179.303(b)(4), the operator must demonstrate that the alternative program is as effective as possible, consistent with not imposing such costs as to cause the operator to cease production and abandon significant recoverable oil or gas reserves under the lease.

(e) For any BLM approval of an operator's use of an alternative leak detection program under subparagraph (b) or (c) of this section, the BLM will post online the alternative program approved for that operator, including, at minimum, the information required in subparagraph (b)(1), (b)(2), (b)(5), and (b)(6) of this section.

§ 3179.304 Repairing leaks.

(a) The operator must repair any leak as soon as practicable, and in no event later than 30 calendar days after discovery, unless good cause exists for repair requiring a longer period. Good cause for delay of repair exists if the repair (including replacement) is technically infeasible (including unavailability of parts that have been ordered), would require a pipeline blowdown, a compressor station shutdown, a well shut-in, or would be unsafe to conduct during operation of the unit.

(b) If there is good cause for delaying the repair beyond 30 calendar days, the operator must notify the BLM of the cause by Sundry Notice and must complete the repair at the earliest opportunity, for example during the next compressor station shutdown, well shut-in, or pipeline blowdown. In no case may the repair be delayed beyond 2 years.

(c) Not later than 30 calendar days after completion of a repair, the operator must verify the effectiveness of the repair through a follow-up inspection using one of the instruments specified or approved under § 3179.302(a) or a soap bubble test under Section 8.3.3 of EPA Method 21—Determination of Volatile Organic Compound Leaks (40 CFR Appendix A–7 to part 60).

(d) If the repair is not effective, the operator must complete additional repairs within 15 calendar days, and conduct follow-up inspections and repairs until the leak is repaired.

(e) A follow-up inspection to verify the effectiveness of repairs does not constitute an inspection for purposes of § 3179.303.

§ 3179.305 Leak detection inspection recordkeeping and reporting.

(a) The operator must maintain the following records for the period required under § 3162.4–1 of this title and make them available to the BLM upon request:

(1) For each inspection required under § 3179.303 of this subpart, documentation of:

(i) The date of the inspection; and

(ii) The site where the inspection was conducted;

(2) The monitoring method(s) used to determine the presence of leaks;

(3) A list of leak components on which leaks were found;

(4) The date each leak was repaired; and

(5) The date and result of the follow-up inspection(s) required under § 3179.304 paragraph (c) or (d) of this subpart.

(b) By March 31 each calendar year, the operator must provide to the BLM an annual summary report on the previous year's inspection activities that includes:

(1) The number of sites inspected;

(2) The total number of leaks identified, categorized by the type of component;

(3) The total number of leaks repaired;

(4) The total number leaks that were not repaired as of December 31 of the previous calendar year due to good cause and an estimated date of repair for each leak.

(5) A certification by a responsible officer that the information in the report is true and accurate to the best of the officer's knowledge.

(c) AVO checks are not required to be documented unless they find a leak requiring repair.

State or Tribal Variances

§ 3179.401 State or tribal requests for variances from the requirements of this subpart.

(a)(1) At the request of a State (for Federal land) or a tribe (for Indian lands), the BLM State Director may grant a variance from any provision(s) of this Subpart that would apply to all Federal leases, units, or communitized areas within a State or to all tribal leases, units, or communitized areas within that tribe's lands, or to specific fields or basins within the State or that tribe's lands, if the BLM finds that the variance would meet the criteria in paragraph (b) of this section.

(2) A State or tribal variance request must:

(i) Identify the provision(s) of this subpart from which the State or tribe is requesting the variance;

(ii) Identify the State, local, or tribal regulation(s) or rule(s) that would be applied in place of the provision(s) of this subpart;

(iii) Explain why the variance is needed; and

(iv) Demonstrate how the State, local, or tribal regulation(s) or rule(s) would perform at least equally well in terms of reducing waste of oil and gas, reducing environmental impacts from venting and or flaring of gas, and ensuring the safe and responsible production of oil and gas, compared to the particular provision(s) from which the State or tribe is requesting the variance.

(b) The BLM State Director, after considering all relevant factors, may approve the request for a variance, or approve it with one or more conditions, only if the BLM determines that the State, local or tribal regulation(s) or rule(s) would perform at least equally well in terms of reducing waste of oil and gas, reducing environmental impacts from venting and/or flaring of gas, and ensuring the safe and responsible production of oil and gas, compared to the particular provision(s) from which the State or tribe is requesting the variance, and would be consistent with the terms of the affected Federal or Indian leases and applicable statutes. The decision to grant or deny the variance will be in writing and is within the BLM's discretion. The decision on a variance request is not subject to administrative appeals under 43 CFR part 4.

(c) A variance from any particular requirement of this rule does not constitute a variance from provisions of other regulations, laws, or orders.

(d) The BLM reserves the right to rescind a variance or modify any condition of approval.

(e) If the BLM approves a variance under this section, the State or tribe that requested the variance must notify the BLM in writing in a timely manner of any substantive amendments, revisions, or other changes to the State, local or tribal regulation(s) or rule(s) to be applied under the variance.

(f) If the BLM approves a variance under this section, the State, local or tribal regulation(s) or rule(s) to be applied under the variance can be enforced by the BLM as if the regulation(s) or rule(s) were provided for in this Subpart. The State, locality, or tribes' own authority to enforce its regulation(s) or rule(s) to be applied under the variance would not be affected by the BLM's approval of a variance.

48 CFR Chapter 1

Federal Acquisition Regulations; Final Rules

DEPARTMENT OF DEFENSE

GENERAL SERVICES ADMINISTRATION

NATIONAL AERONAUTICS AND SPACE ADMINISTRATION

48 CFR Chapter 1

[Docket No. FAR 2016–0051, Sequence No. 6]

Federal Acquisition Regulation; Federal Acquisition Circular 2005–92; Introduction

AGENCIES: Department of Defense (DoD), General Services Administration (GSA), and National Aeronautics and Space Administration (NASA).

ACTION: Summary presentation of final rules.

SUMMARY: This document summarizes the Federal Acquisition Regulation (FAR) rules agreed to by the Civilian Agency Acquisition Council and the Defense Acquisition Regulations Council (Councils) in this Federal Acquisition Circular (FAC) 2005–92. A companion document, the *Small Entity Compliance Guide* (SECG), follows this FAC. The FAC, including the SECG, is available via the Internet at *http://www.regulations.gov.*

DATES: For effective dates see the separate documents, which follow.

FOR FURTHER INFORMATION CONTACT: The analyst whose name appears in the table below in relation to the FAR case. Please cite FAC 2005–92 and the specific FAR case number. For information pertaining to status or publication schedules, contact the Regulatory Secretariat Division at 202–501–4755.

RULES LISTED IN FAC 2005–92

Item	Subject	FAR Case	Analyst
I	Public Disclosure of Greenhouse Gas Emissions and Reduction Goals—Representation.	2015–024	Gray.
II	Removal of Regulations Relating to Telegraphic Communication	2015–035	Francis.
III	Technical Amendments.		

SUPPLEMENTARY INFORMATION: Summaries for each FAR rule follow. For the actual revisions and/or amendments made by these rules, refer to the specific item numbers and subjects set forth in the documents following these item summaries. FAC 2005–92 amends the FAR as follows:

Item I—Public Disclosure of Greenhouse Gas Emissions and Reduction Goals—Representation (FAR Case 2015–024)

This final rule amends the FAR to establish an annual representation requirement to indicate whether or not and where contractors publicly disclose greenhouse gas emissions and greenhouse gas emission reduction goals or targets. This representation is optional for contractors that received less than $7.5 million in contract awards from the Government during the previous Federal fiscal year. The information obtained from these representations will assist agencies in developing strategies to engage with contractors to reduce supply chain emissions, as directed in the Executive Order 13693, Planning for Federal Sustainability in the Next Decade.

Item II—Removal of Regulations Relating to Telegraphic Communication (FAR Case 2015–035)

This rule amends the FAR to delete the use of ''telegram,'' ''telegraph,'' and related terms. The objective is to delete reference to obsolete technologies no longer in use and replace with references to electronic communications. In addition, conforming changes are made covering expedited notice of termination and change orders.

The rule is not anticipated to have a significant economic impact on small business entities, as the rule provides recognition of current options for transmitting documents between the Government and contractors. The rule also revises the means of disseminating contract termination documents between the Government and contractors; however, this change only affects the Government's responsibility for transmitting termination notices.

Item III—Technical Amendments

Editorial changes are made at FAR 2.101, 7.105, 19.1506, 34.000, 34.005–2, 34.201, 34.203, 42.709, 52.234–2, 52.234–3, and 52.234–4.

Dated: November 10, 2016.

William F. Clark,

Director, Office of Government-wide Acquisition Policy, Office of Acquisition Policy, Office of Government-wide Policy.

Federal Acquisition Circular (FAC) 2005–92 is issued under the authority of the Secretary of Defense, the Administrator of General Services, and the Administrator for the National Aeronautics and Space Administration.

Unless otherwise specified, all Federal Acquisition Regulation (FAR) and other directive material contained in FAC 2005–92 is effective November 18, 2016 except for items I, and II, which are effective December 19, 2016.

Dated: November 10, 2016.

Federal Acquisition Regulation; Public Disclosure of Greenhouse Gas Emissions and Reduction Goals—Representation

AGENCY: Department of Defense (DoD), General Services Administration (GSA), and National Aeronautics and Space Administration (NASA).

ACTION: Final rule.

SUMMARY: DoD, GSA, and NASA are issuing a final rule amending the Federal Acquisition Regulation (FAR) to establish a representation for offerors to indicate if and where they publicly disclose greenhouse gas emissions and greenhouse gas reduction goals or targets.

DATES: *Effective:* December 19, 2016.

FOR FURTHER INFORMATION CONTACT: Mr. Charles Gray, Procurement Analyst, at 703–795–6328 for clarification of content. For information pertaining to status or publication schedules, contact the Regulatory Secretariat Division at 202–501–4755. Please cite FAC 2005–92, FAR Case 2015–024.

SUPPLEMENTARY INFORMATION:

I. Background

DoD, GSA, and NASA published a proposed rule in the **Federal Register** at 81 FR 33192 on May 25, 2016, containing a new FAR provision that will enable the Federal Government to better understand the greenhouse gas management practices of its industry partners. In accordance with the provision, offerors seeking to do business with the Federal Government that are registered in the System for Award Management (SAM) database and received $7.5 million or more in contract awards during the prior Federal fiscal year are required to represent whether or not they publicly disclose their greenhouse gas emissions and their greenhouse gas emissions reduction goals. This representation is voluntary for offerors that received less than $7.5 million during the prior fiscal year.

The information obtained from these representations will assist agencies in developing strategies to engage with offerors to reduce supply chain emissions, as directed in the Executive Order (E.O.) 13693, Planning for Federal Sustainability in the Next Decade. Seventeen respondents submitted comments on the proposed rule.

II. Discussion and Analysis

The Civilian Agency Acquisition Council and the Defense Acquisition Regulations Council (the Councils) reviewed the public comments in the development of the final rule. A discussion of the comments and the changes made to the rule as a result of those comments are provided as follows:

A. Summary of Significant Changes

At FAR 52.212–3, Offeror Representations and Certifications—Commercial Items, the representation at (t)(2)(i) has been revised to clarify that the Greenhouse Gas Protocol Corporate Standard is an example of a greenhouse gas accounting standard, and that the emissions reduction goals are to be made accessible on a publicly accessible Web site.

At FAR 52.223–22, Public Disclosure of Greenhouse Gas Emissions and Reduction Goals—Representation, paragraph (b)(1) has been revised to clarify that the Greenhouse Gas Protocol Corporate Standard is intended to serve as an example of a greenhouse gas accounting standard. In paragraph (b)(2) of the same provision, language has been added to clarify that to disclose emissions reduction goals means to make such goals available on a publicly accessible website.

B. Analysis of Public Comments

1. Support for the Rule

Comment: Most respondents expressed their support for the rule.

Response: The Councils appreciate and note the numerous comments supporting this rule.

2. Legal Authority for the Rule

Comment: One respondent believed that the rule is not supported by adequate legal authority, noting that the statement ''the rule is not based in statute . . .'' appeared in the preamble of the **Federal Register** notice. This respondent further stated that the rule must be based on a grant or rulemaking authority from Congress, and they believed in this instance there is no adequate nexus between the rule and any rulemaking authority granted by Congress.

Response: The authority for this rule is E.O. 13693. The language in question was in relation to 41 U.S.C. 1905, 1906, and 1907, which require a listing of provisions of law that are inapplicable to acquisitions under the simplified acquisition threshold (SAT), or for commercial items including commercially available off-the-shelf (COTS) items.

Statutory rulemaking authority for the FAR is listed in FAR rules as 40 U.S.C. 121(c), 10 U.S.C. chapter 137, and 51 U.S.C. 20113.

3. Concerns Regarding the Need for Public Disclosure and Public Access to Companies' Greenhouse Gas Emissions Inventory

The concerns expressed by respondents in this area generally fell into four categories: (A) General concerns regarding the clarity of the rule; (B) The use of equivalents to the Greenhouse Gas Corporate Protocol Standard; (C) Reporting requirements for offeror's parent company or for companies that are not the owner of facility; and (D) Concerns regarding the proposed reporting thresholds.

(A) General Concerns Regarding the Clarity of the Rule

Comment: Several respondents stated that the rule was unclear regarding its breadth and utility. One respondent commented that such disclosures on a publicly accessible website may compromise trade secrets or be the impetus for an overwhelming number of bid protests and unacceptable delays. Another respondent expressed concern that the Government would capture and use unreliable data generated and reported by a third-party. Others raised concerns regarding the utility to the rule without an industry-by-industry analysis, citing the analytical methodology employed by the Environmental Protection Agency (EPA). Two respondents remarked that the rule was unclear regarding the meaning of the phrase ''available on a publicly accessible Web site.''

Response: This rule does not require offerors to disclose greenhouse gas emissions and/or goals; rather, it requires offerors seeking to do business with the Federal Government to represent whether or not they do make such disclosures, and if so, provide the publicly accessible website. As such, the rule will not lead to the inadvertent disclosure of trade secrets by an offeror.

With regard to the reliability of the data obtained, the representation relates only to information made available by the offeror, regardless of where the information is hosted. Since an offeror that responds affirmatively to the representation is also required to provide the website address, the Government will only be directed to the offeror's publicly accessible information.

This rule does not regulate industry, which is why the analytical techniques employed by the EPA were not used. The purpose of the rule is to obtain a better understanding of Federal supply chain greenhouse gas emissions. Utilizing existing public information significantly reduces the burden on potential offerors while providing useful strategic information and encouraging transparency.

Finally, the plain meaning of the phrase ''available on a publicly accessible Web site'' is that the information must be accessible to the general public.

(B) Equivalents to the Greenhouse Gas Corporate Protocol Standard

Comment: Many respondents requested that the language, ''via a recognized, third-party greenhouse gas emissions reporting program'' be updated with language identifying specific reporting programs or additional standards.

Response: In order for the Federal Government to gain insight into its supplier actions, the regulation does not use language that will limit its awareness of greenhouse gas (GHG) management practices; however, the reference to ''recognized'' standards has been updated in the final rule to ''accounting standards with publicly available and consistently applied criteria'' in order to provide clarity to respondents while allowing insight into any accounting methods used. The standard was intentionally left open, so as not to require any specific accounting or reporting methodology.

To further clarify this intent, the language in the final rule has been amended to state that the Greenhouse Gas Protocol Corporate Standard is intended to serve as an example of greenhouse gas accounting standard, rather than the only acceptable standard.

(C) Reporting Requirements for Offerors' Parent Company or for Companies That Are Not the Owner of the Facility

Comment: Many respondents sought clarification as to an offeror's obligation to report on the greenhouse gas emissions management practices of its parent or controlling entity or when it is not the owner of the facility.

Response: The rule does not obligate offerors to report on the emissions of their parent companies or the emissions management practices of a facility that they do not own.

(D) Concerns Regarding the Proposed Reporting Thresholds

Comment: Although there was support for the $7.5 million threshold, recognizing that it extends to a variety of companies with regard to type, size, and location, a few comments suggested that the $7.5 million threshold was not the best definitive characterization for reporting. Alternative reporting delineations proposed were an annual facility emission of 25,000 tons or more of CO_2 or identification by North American Industry Classification System (NAICS) codes to eliminate small businesses and non-greenhouse gas emitting industries.

Response: In order to gain insight into its supplier actions, the Government does not want to limit its awareness of greenhouse gas management practices by limiting the information to specific emissions thresholds (such as 25,000 tons of CO_2) or NAICS codes. In particular, the use of NAICS codes in this context may impose artificial limitations; when registering in the SAM, offerors select their primary NAICS code, even though they can and do work in other areas.

4. Nitrogen Trifluoride Should Not Be Identified in the FAR as a Greenhouse Gas

Comment: One respondent remarked that the proposal to include nitrogen trifluoride in the definition for greenhouse gases at FAR 23.001 should be withdrawn since, unlike the other six greenhouse gases already listed in the FAR, nitrogen trifluoride is not directly emitted (the direct result of human activity) and therefore cannot be identified and quantified for reporting purposes.

Response: Section 19 of E.O. 13693 identifies nitrogen trifluoride as a greenhouse gas, and for this reason the definition for greenhouse gas at FAR 23.001 includes nitrogen trifluoride.

5. Rule is Vague Regarding Requirements for Disclosure of Emissions Reduction Goals

Comment: Some respondents stated that the requirements for greenhouse gas emissions reduction goals were not sufficiently stringent or specific. Many respondents were concerned that the information obtained from the inventory would be of little use to agencies and could negatively impact any polices developed.

Response: The intent of this rule is not to require greenhouse gas emissions reduction goals, but to gather information regarding whether or not such information is disclosed. To that end, further guidance has been added in the final rule to clarify that to disclose emissions reduction goals means to make such goals available on a publicly accessible website.

Although the concerns regarding the usefulness of the inventory information are noted, the information gathered will be considered with a variety of other factors.

6. The Rule Is Unclear Whether the Information Obtained From the Representations Would Be Used in Individual Procurements

Comment: Several respondents indicated that the purpose and benefit of the rule is obscure. A number of these respondents expressed concern that the representations set forth in the rule would place a company that did not disclose its emissions inventory information at a significant competitive disadvantage in comparison with companies that did disclose during source selection.

Response: The rule does not establish evaluation criteria to be used in a source selection decision.

7. The Rule Requires Reporting of Information Already Reported to Other Agencies, Such as the EPA

Comment: A few respondents stated that certain large facilities and companies already provided greenhouse gas emission information to the EPA and therefore the new reporting in SAM would be redundant.

Response: The representations required by the rule indicate if and where offerors publicly disclose greenhouse gas emissions and greenhouse gas reduction goals rather than specific emission information reported to EPA.

8. The Rule Needs To Specify the Scope of Emissions Being Represented

Comment: Several respondents commented that the rule should specify the scope of greenhouse gas emissions in order to make the disclosure meaningful.

Response: Understanding the source of emissions, (*i.e.,* whether it is a scope 1, 2, or 3 emission) is an important consideration within the broader context of achieving greenhouse gas emission reductions. However, the purpose of the rule is to obtain information regarding whether offerors are publicly disclosing their greenhouse gas emissions. Specifying that the disclosure must include the scope of the greenhouse gas emission would limit the ability of the Government to gather information on all types of reporting practices.

9. The Rule Should Not Exclude Commercial Item or COTS Item Vendors From the Disclosure Requirements

Comment: One respondent remarked that if sellers of commercial items and COTS items are exempted from the rule's disclosure requirements, the rule's benefits would be sub-optimal.

Response: The rule does not provide an exemption for commercial items and COTS items. All offerors that meet or exceed the rule's threshold are required to provide the representation.

10. Out of Scope

Comment: Several respondents submitted comments encouraging the Councils to take a more proactive approach to the rule. These respondents suggested various ways to strengthen the rule, such as—

- Requiring Government agencies to take vendor emission disclosures and emission reduction goals into consideration during source selection;
- Requiring vendors to disclose emissions information and emissions reduction goals, as opposed to indicating ''whether or not'' they disclose;
- Adding an option to have vendors identify ''serious'' or ''substantial'' reduction goals, noting that a 40 percent reduction from the 2008 greenhouse gas baseline was mentioned in E.O. 13693;
- Another respondent observed that the greenhouse gas problem should not be attributed to the companies that sell greenhouse gas-emitting products (such as fuels), but rather, the users that consume these products. This respondent suggested that the Government pursue a revenue neutral course of action.

Response: The Councils note and appreciate the suggestions offered by these respondents; however, they are beyond the scope of the rule. The rule is intended to be a low-burden, minimally intrusive effort to report data in SAM that the Council on Environmental Quality will use to develop an annual inventory, thus allowing for greater insight into the greenhouse gas management practices of the Federal supplier base.

11. Rationale for the Removal of Paragraphs (a) Through (g) at FAR 23.000

Comment: One respondent did not understand the reasoning behind the removal of FAR paragraphs 23.000(a) through (g), as these paragraphs provided the means by which acquisitions based on ''improving the quality of the environment . . .'' and their removal would lead to subjective agency decisions.

Response: FAR 23.000 is an overview of the acquisitions policies and procedures found in part 23. The rule amends the FAR to remove information that is discussed in greater detail in other areas of part 23; however, the scope for the FAR part remains.

12. Consideration of Climate Change Risk

Note: The preamble of the **Federal Register** for the proposed rule solicited public feedback regarding means and methods to enable agencies to evaluate climate change risks and vulnerabilities. One of the approaches put forth in the preamble was the inclusion of a new representation that would allow offerors to indicate whether or not they assess the risks imposed by extreme weather conditions and other climate change effects, including the physical impacts of such risks. It was also suggested that offerors should represent if they do or do not discuss climate change risk in their filings with the Securities and Exchange Commission. The comments received in response to climate change risk assessment are summarized as follows:

Comment: Several respondents recommended including disclosure of vendor climate risk analyses in addition to information about greenhouse gas inventories. One respondent expressed the viewpoint that the preferred location for such disclosure was the Securities and Exchange Commission filing. However, one respondent believed that the ''does/does not'' model will not provide sufficient insight.

Response: The Councils extend their appreciation for the input provided by the public regarding climate change risk assessment. It will be critical to understand climate change risks moving forward.

C. Other Changes

A number of conforming changes were made to the final rule, due to changes made in the FAR text since the publication of the proposed rule.

III. Applicability to Acquisitions at or Below the Simplified Acquisition Threshold, Commercial Items, and Commercially Available Off-the-Shelf Items

This rule establishes a new provision at FAR 52.223–22, Public Disclosure of Greenhouse Gas Emissions and Reductions Goals—Representation, and establishes its commercial item equivalent at FAR 52.212–3, Offeror Representations and Certifications—Commercial Items. The new provision requires offerors that received $7.5 million or more in contracts from the Federal Government during the prior Federal fiscal year, to represent whether or not they publicly disclose their greenhouse gas emissions and whether or not they publicly disclose a quantitative greenhouse gas emissions reduction goal. This information will be used by the Federal Government to assess the scope of greenhouse gas management undertaken by companies seeking to do business with the Federal Government. Application of the provision in solicitations and contracts at or below the SAT and to the acquisition of commercial items, including COTS items, is necessary in order to comply with E.O. 13693. If the requirements of the provision(s) are not made applicable to acquisitions below the SAT, or to acquisitions for commercial items or COTS items, the Government will be unable to obtain valuable information from a large segment of its supplier base, which in turn will undermine the overarching purpose of the rule.

41 U.S.C. 1905 through 1907 make certain provisions of law inapplicable to solicitations and contracts at or below the SAT and to the acquisition of commercial items, including COTS items, unless the FAR Council/ Administrator for Federal Procurement Policy determine that such exemption from the statute(s) would not be in the best interest of the Government. However, 41 U.S.C. 1905 through 1907 are only applicable to statutory provisions, not Executive Orders.

IV. Executive Orders 12866 and 13563

Executive Orders (E.O.s) 12866 and 13563 direct agencies to assess all costs and benefits of available regulatory alternatives and, if regulation is necessary, to select regulatory approaches that maximize net benefits (including potential economic, environmental, public health and safety effects, distributive impacts, and equity). E.O. 13563 emphasizes the importance of quantifying both costs and benefits, of reducing costs, of harmonizing rules, and of promoting flexibility. This is a significant regulatory action and, therefore, was subject to review under Section 6(b) of E.O. 12866, Regulatory Planning and Review, dated September 30, 1993. This rule is not a major rule under 5 U.S.C. 804.

V. Regulatory Flexibility Act

DoD, GSA, and NASA have prepared a Final Regulatory Flexibility Analysis (FRFA) consistent with the Regulatory Flexibility Act, 5 U.S.C. 601, *et seq.* The FRFA is summarized as follows:

> As stated in E.O. 13693, Federal agencies shall increase their efficiency and improve their environmental performance, including the reduction of greenhouse gas emissions across Federal operations and the Federal supply chain. In keeping with this policy, the objective of the rule is to obtain information from offerors that will assist agencies in developing strategies to reduce supply chain greenhouse emissions.
>
> Specifically, the rule amends the Federal Acquisition Regulation to create a new provision in which offerors that received $7.5 million in contract awards during the previous Federal fiscal year (FY) are required to represent whether or not they publicly disclose their greenhouse gas emissions and their greenhouse gas emissions reduction goal. We anticipate this rule will apply to approximately 2,700 small entities, based on an analysis of FY 2015 Federal Data Procurement Data (FPDS).

There were no significant issues raised by the public comments in response to the initial regulatory flexibility analysis. The reporting requirements for the rule are considered to be minimal, and there is no recordkeeping associated with the disclosure representation. The economic impact of the rule is minimized by the fact that only offerors that received Federal awards in excess of $7.5 million in the previous Federal fiscal year are required to make this representation.

Interested parties may obtain a copy of the FRFA from the Regulatory Secretariat Division. The Regulatory Secretariat Division has submitted a copy of the FRFA to the Chief Counsel for Advocacy of the Small Business Administration.

VI. Paperwork Reduction Act

The Paperwork Reduction Act (44 U.S.C. Chapter 35) applies. The rule contains information collection requirements. OMB has cleared this information collection requirement under OMB Control Number 9000–0194, titled: Public Disclosure of Greenhouse Gas Emissions and Reduction Goals—Representation, in the amount of 1,375 burden hours.

List of Subjects in 48 CFR Parts 1, 4, 23, and 52

Government procurement.

Dated: November 10, 2016.

William F. Clark,

Director, Office of Government-wide Acquisition Policy, Office of Acquisition Policy, Office of Government-wide Policy.

Therefore, DoD, GSA, and NASA amend 48 CFR parts 1, 4, 23, and 52 as set forth below:

■ 1. The authority citation for 48 CFR parts 1, 4, 23, and 52 continues to read as follows:

Authority: 40 U.S.C. 121(c); 10 U.S.C. chapter 137; and 51 U.S.C. 20113.

PART 1—FEDERAL ACQUISITION REGULATIONS SYSTEM

1.106 [Amended]

■ 2. Amend section 1.106 in the table following the introductory text, by adding in numerical sequence, FAR segment ''52.223–22'' and its corresponding OMB control number ''9000–0194''.

PART 4—ADMINISTRATIVE MATTERS

■ 3. Amend section 4.1202 by redesignating paragraphs (a)(25) through (32) as paragraphs (a)(26) through (33), respectively; and adding a new paragraph (a)(25) to read as follows:

4.1202 Solicitation provision and contract clause.

(a) * * *

(25) 52.223–22, Public Disclosure of Greenhouse Gas Emissions and Reduction Goals—Representation.

* * * * *

PART 23—ENVIRONMENT, ENERGY AND WATER EFFICIENCY, RENEWABLE ENERGY TECHNOLOGIES, OCCUPATIONAL SAFETY, AND DRUG–FREE WORKPLACE

23.000 [Amended]

■ 4. Amend section 23.000 by removing from the end of the introductory text ''and encouraging the safe operation of vehicles by—'' and adding ''and for encouraging the safe operation of vehicles.'' in its place; and removing paragraphs (a) through (g).

23.001 [Amended]

■ 5. Amend section 23.001 in the definition ''Greenhouse gases'' by removing ''perflourocarbons,'' and adding ''perflourocarbons, nitrogen triflouride,'' in its place.

■ 6. Revise subpart 23.8 heading to read as follows:

Subpart 23.8—Ozone-Depleting Substances and Greenhouse Gases

■ 7. Revise section 23.800 to read as follows:

23.800 Scope of subpart.

This subpart—

(a) Sets forth policies and procedures for the acquisition of items that—

(1) Contain, use, or are manufactured with ozone-depleting substances; or

(2) Contain or use high global warming potential hydrofluorocarbons; and

(b) Addresses public disclosure of greenhouse gas emissions and reduction goals.

■ 8. Amend section 23.802 by—

■ a. Removing from paragraph (a) ''hydrofluorocarbons; and'' and adding ''hydrofluorocarbons;'' in its place;

■ b. Removing from paragraph (b)(2) ''hydrofluorocarbons.'' and adding ''hydrofluorocarbons;'' in its place; and

■ c. Adding paragraphs (c) and (d).

The additions read as follows:

23.802 Policy.

* * * * *

(c) Lead efforts to reduce greenhouse gas emissions at the Federal level in accordance with Executive Order 13693 and the President's Climate Action Plan of June 2013; and

(d) In order to better understand both direct and indirect greenhouse gas emissions that result from Federal activities, require offerors that are registered in the System for Award Management (SAM) database and received $7.5 million or more in Federal contract awards in the prior Federal fiscal year to—

(1) Represent whether they publicly disclose greenhouse gas emissions;

(2) Represent whether they publicly disclose a quantitative greenhouse gas emissions reduction goal; and

(3) Provide the website for any such disclosures.

■ 9. Amend section 23.804 by—

■ a. Revising the section heading;

■ b. Redesignating paragraphs (a)(1) through (8) as paragraphs (a)(1)(i) through (viii), and paragraph (a) introductory text as paragraph (a)(1) introductory text;

■ c. Redesignating the section introductory text as paragraph (a) introductory text, and removing from the newly redesignated paragraph (a) introductory text ''areas, insert'' and adding ''areas, the contracting officer shall insert'' in its place;

■ d. Redesignating paragraph (b) introductory text as paragraph (a)(2) introductory text, and paragraphs (b)(1) and (2) as paragraphs (a)(2)(i) and (ii);

■ e. Redesignating paragraph (c) introductory text as paragraph (a)(3) introductory text, and paragraphs (c)(1) and (2) as paragraphs (a)(3)(i) and (ii);

■ f. Redesignating paragraph (d) introductory text as paragraph (a)(4) introductory text, and paragraphs (d)(1) and (2) as paragraphs (a)(4)(i) and (ii); and

■ g. Adding a new paragraph (b).

The revision and addition reads as follows:

23.804 Contract provision and clauses.

* * * * *

(b) The provision at 52.223–22, Public Disclosure of Greenhouse Gas Emissions and Reduction Goals—Representation, is required only when 52.204–7, System for Award Management, is included in the solicitation (see 52.204–8, Annual Representations and Certifications).

PART 52—SOLICITATION PROVISIONS AND CONTRACT CLAUSES

■ 10. Amend section 52.204–8 by—

■ a. Revising the date of the provision;

■ b. Redesignating paragraphs (c)(1)(xviii) through (xxiii) as paragraphs (c)(1)(xix) through (xxiv), respectively; and

■ c. Adding new paragraph (c)(1)(xviii).

The revision and addition reads as follows:

52.204–8 Annual Representations and Certifications.

* * * * *

Annual Representations and Certifications (Dec 2016)

* * * * *

(c)(1) * * *

(xviii) 52.223–22, Public Disclosure of Greenhouse Gas Emissions and Reduction Goals—Representation. This provision applies to solicitations that include the clause at 52.204–7.)

* * * * *

■ 11. Amend section 52.212–3 by—

■ a. Revising the date of the provision;

■ b. Removing from the introductory text ''Web site located at *https://www.sam.gov/portal*'' and adding ''Web site located at *https://www.sam.gov/portal.*'' in its place;

■ c. Removing from the introductory text of the clause and paragraph (b)(2) ''(c) through (s)'' and adding ''(c) through (t)'' in its place; and

■ d. Adding paragraph (t).

The revision and addition reads as follows:

52.212–3 Offeror Representations and Certifications—Commercial Items.

* * * * *

Offeror Representations and Certifications—Commercial Items (Dec 2016)

* * * * *

(t) *Public Disclosure of Greenhouse Gas Emissions and Reduction Goals.* Applies in all solicitations that require offerors to register in SAM (52.212–1(k)).

(1) This representation shall be completed if the Offeror received $7.5 million or more in contract awards in the prior Federal fiscal year. The representation is optional if the Offeror received less than $7.5 million in Federal contract awards in the prior Federal fiscal year.

(2) *Representation.* [*Offeror to check applicable block(s) in paragraph (t)(2)(i) and (ii)].* (i) The Offeror (itself or through its immediate owner or highest-level owner) [ ] does, [ ] does not publicly disclose greenhouse gas emissions, *i.e.,* makes available on a publicly accessible Web site the results of a greenhouse gas inventory, performed in accordance with an accounting standard with publicly available and consistently applied criteria, such as the Greenhouse Gas Protocol Corporate Standard.

(ii) The Offeror (itself or through its immediate owner or highest-level owner) [ ] does, [ ] does not publicly disclose a quantitative greenhouse gas emissions reduction goal, *i.e.,* make available on a publicly accessible Web site a target to reduce absolute emissions or emissions intensity by a specific quantity or percentage.

(iii) A publicly accessible Web site includes the Offeror's own Web site or a recognized, third-party greenhouse gas emissions reporting program.

(3) If the Offeror checked ''does'' in paragraphs (t)(2)(i) or (t)(2)(ii) of this provision, respectively, the Offeror shall provide the publicly accessible Web site(s) where greenhouse gas emissions and/or reduction goals are reported:_____.

* * * * *

■ 12. Amend section 52.213–4 by—

■ a. Revising the date of the clause; and

■ b. Removing from paragraph (b)(1)(xi) ''FAR 23.804(a))'' and adding ''FAR 23.804(a)(1))'' in its place.

The revision reads as follows:

52.213–4 Terms and Conditions—Simplified Acquisitions (Other Than Commercial Items).

* * * * *

Terms and Conditions—Simplified Acquisitions (Other Than Commercial Items). (Dec 2016)

* * * * *

52.223–11 [Amended]

■ 13. Amend section 52.223–11 by removing from the introductory text ''in 23.804(a)'' and adding ''in 23.804(a)(1)'' in its place.

52.223–12 [Amended]

■ 14. Amend section 52.223–12 by removing from the introductory text ''in 23.804(b)'' and adding ''in 23.804(a)(2)'' in its place.

52.223–20 [Amended]

■ 15. Amend section 52.223–20 by removing from the introductory text ''in 23.804(c)'' and adding ''in 23.804(a)(3)'' in its place.

52.223–21 [Amended]

■ 16. Amend section 52.223–21 by removing from the introductory paragraph ''in 23.804(d)'' and adding ''in 23.804(a)(4)'' in its place.

■ 17. Add section 52.223–22 to read as follows:

52.223–22 Public Disclosure of Greenhouse Gas Emissions and Reduction Goals—Representation.

As prescribed in 23.804(b), insert the following provision:

Public Disclosure of Greenhouse Gas Emissions and Reduction Goals—Representation (Dec 2016)

(a) This representation shall be completed if the Offeror received $7.5 million or more in Federal contract awards in the prior Federal fiscal year. The representation is optional if the Offeror received less than $7.5 million in Federal contract awards in the prior Federal fiscal year.

(b) *Representation. [Offeror is to check applicable blocks in paragraphs (b)(1) and (2).]*

(1) The Offeror (itself or through its immediate owner or highest-level owner) [ ] does, [ ] does not publicly disclose greenhouse gas emissions, *i.e.,* make available on a publicly accessible Web site the results of a greenhouse gas inventory, performed in accordance with an accounting standard with publicly available and consistently applied criteria, such as the Greenhouse Gas Protocol Corporate Standard.

(2) The Offeror (itself or through its immediate owner or highest-level owner) [ ] does, [ ] does not publicly disclose a quantitative greenhouse gas emissions reduction goal, *i.e.,* make available on a publicly available Web site a target to reduce absolute emissions or emissions intensity by a specific quantity or percentage.

(3) A publicly accessible Web site includes the Offeror's own Web site or a recognized, third-party greenhouse gas emissions reporting program.

(c) If the Offeror checked ''does'' in paragraphs (b)(1) or (b)(2) of this provision, respectively, the Offeror shall provide the publicly accessible Web site(s) where greenhouse gas emissions and/or reduction goals are reported:_____.

(End of provision)

[FAC 2005–92; FAR Case 2015–035; Item II; Docket No. 2015–0035, Sequence No. 1]

RIN 9000–AN23

Federal Acquisition Regulation: Removal of Regulations Relating to Telegraphic Communication

AGENCY: Department of Defense (DoD), General Services Administration (GSA), and National Aeronautics and Space Administration (NASA).

ACTION: Final rule.

SUMMARY: DoD, GSA, and NASA are issuing a final rule amending the Federal Acquisition Regulation (FAR) to delete the use of ''telegram,'' ''telegraph,'' and related terms. The objective is to delete references to obsolete technologies no longer in use and replace with references to electronic communications. In addition, conforming changes are made regarding expedited notices of termination and change orders.

DATES: *Effective:* December 19, 2016.

FOR FURTHER INFORMATION CONTACT: Ms. Camara Francis, Procurement Analyst, at 202–550–0935 for clarification of content. For information pertaining to status or publication schedules, contact the Regulatory Secretariat Division at 202–501–4755. Please cite FAC 2005–92, FAR Case 2015–035.

SUPPLEMENTARY INFORMATION:

I. Background

DoD, GSA, and NASA published a proposed rule in **Federal Register** at 81 FR 36245 on June 6, 2016, soliciting public comments on this rule, to amend the FAR to delete the use of the terms ''telegram,'' ''telegraph,'' ''telegraphic,'' and related terminology and make conforming changes to the instructions for expedited notices of termination and change orders.

This rule is consistent with the Office of Federal Procurement Policy (OFPP) memorandum dated December 4, 2014, on transforming the marketplace, which describes ongoing actions to support the needs of a 21st century Government.

Two public comments were received supporting the changes.

II. Discussion and Analysis

The Councils reviewed the public comments in development of the final rule.

A. Summary of Significant Changes

There were no changes made to the rule as a result of the comments received.

B. Analysis of Public Comments

Comment: Two respondents expressed support for the changes, highlighting the benefit of removing outdated terms and modernizing technologies and regulations.

Response: The Government notes the public support for this rule.

III. Executive Orders 12866 and 13563

Executive Orders (E.O.s) 12866 and 13563 direct agencies to assess all costs and benefits of available regulatory alternatives and, if regulation is necessary, to select regulatory approaches that maximize net benefits (including potential economic, environmental, public health and safety effects, distributive impacts, and equity). E.O. 13563 emphasizes the importance of quantifying both costs and benefits, of reducing costs, of harmonizing rules, and of promoting flexibility. This is not a significant regulatory action and, therefore, was not subject to review under Section 6(b) of E.O. 12866, Regulatory Planning and Review, dated September 30, 1993. This rule is not a major rule under 5 U.S.C. 804.

IV. Regulatory Flexibility Act

DoD, GSA, and NASA have prepared a Final Regulatory Flexibility Analysis (FRFA) consistent with the Regulatory Flexibility Act, 5 U.S.C. 601, *et seq.* The FRFA is summarized as follows:

The final rule amends the Federal Acquisition Regulation (FAR) to delete the use of ''telegram,'' ''telegraph,'' and related terms. These terms are replaced with an option for electronic communications. The objective is to delete obsolete technologies no longer in use within the context of the FAR requirements. This proposed rule is consistent with the Office of Federal Procurement Policy (OFPP) memorandum dated December 4, 2014, on transforming the marketplace, which describes ongoing actions to support the needs of a 21st century Government.

There were no significant issues raised by the public in response to the Initial Regulatory Flexibility Analysis provided in the proposed rule.

The final rule would apply to all entities, both small and other than small, performing as contractors or subcontractors on U.S. Government contracts. In 2014 there were about 350,000 active registrants in the System for Award Management (SAM). DoD, GSA, and NASA estimate approximately half of the registrants (175,000) are small entities that will receive a contract or subcontract in a given year. In 2014 small entities received 1,398,605 or about 9 percent of all actions in that year per the Federal Procurement Data System (FPDS). However, the small entities are not expected to be affected by this rule, as the only change provided in this rule is a revision of the means of disseminating contract termination documents between the Government and contractors. This change only affects the Government's responsibility for transmitting termination notices.

Interested parties may obtain a copy of the FRFA from the Regulatory Secretariat Division. The Regulatory Secretariat Division has submitted a copy of the FRFA to the Chief Counsel for Advocacy of the Small Business Administration.

V. Paperwork Reduction Act

The rule does not contain any information collection requirements that require the approval of the Office of Management and Budget under the Paperwork Reduction Act (44 U.S.C. chapter 35).

List of Subjects in 48 CFR Parts 5, 14, 19, 22, 25, 28, 43, 47, 49, 52, and 53

Government procurement.

Dated: November 10, 2016.

William F. Clark,

Director, Office of Government-wide Acquisition Policy, Office of Acquisition Policy, Office of Government-wide Policy.

Therefore, DoD, GSA, and NASA amend 48 CFR parts 5, 14, 19, 22, 25, 28, 43, 47, 49, 52, and 53 as follows:

■ 1. The authority citation for 48 CFR parts 5, 14, 19, 22, 25, 28, 43, 47, 49, 52, and 53 continues to read as follows:

Authority: 40 U.S.C. 121(c); 10 U.S.C. chapter 137; and 51 U.S.C. 20113.

PART 5—PUBLICIZING CONTRACT ACTIONS

5.504 [Amended]

■ 2. Amend section 5.504 by removing from paragraph (d) ''telegrams,''.

PART 14—SEALED BIDDING

14.201–6 [Amended]

■ 3. Amend section 14.201–6 by removing and reserving paragraph (g).

14.202–2 [Removed and Reserved]

■ 4. Remove and reserve section 14.202–2.

■ 5. Amend section 14.208 by revising paragraph (b) to read as follows:

14.208 Amendment of invitation for bids.

* * * * *

(b) Before amending an invitation for bids, the contracting officer shall consider the period of time remaining until bid opening and the need to extend this period.

* * * * *

14.301 [Amended]

■ 6. Amend section 14.301 by removing paragraph (b) and redesignating paragraphs (c) through (e) as paragraphs (b) through (d), respectively.

■ 7. Revise section 14.302 to read as follows:

14.302 Bid submission.

Bids shall be submitted so that they will be received in the office designated in the invitation for bids not later than the exact time set for opening of bids.

■ 8. Amend section 14.303 by revising paragraph (a) to read as follows:

14.303 Modification or withdrawal of bids.

(a) Bids may be modified or withdrawn by any method authorized by the solicitation, if notice is received in the office designated in the solicitation not later than the exact time set for opening of bids. If the solicitation authorizes facsimile bids, bids may be modified or withdrawn via facsimile received at any time before the exact time set for receipt of bids, subject to the conditions specified in the provision prescribed in 14.201–6(v). Modifications received by facsimile shall be sealed in an envelope by a proper official.

(1) The official shall—

(i) Write on the envelope—

(A) The date and time of receipt and by whom; and

(B) The number of invitation for bids; and

(ii) Sign the envelope.

(2) No information contained in the envelope shall be disclosed before the time set for bid opening.

* * * * *

14.407–3 [Amended]

■ 9. Amend section 14.407–3 by removing paragraph (g)(4) and redesignating paragraph (g)(5) as (g)(4).

14.408–1 [Amended]

■ 10. Amend section 14.408–1 by removing from paragraph (d)(2) ''telegrams or electronic transmissions'' and adding ''electronic communications'' in its place.

PART 19—SMALL BUSINESS PROGRAMS

19.302 [Amended]

■ 11. Amend section 19.302 by removing from paragraph (d)(1)(ii) ''telegram,''.

PART 22—APPLICATION OF LABOR LAWS TO GOVERNMENT ACQUISITIONS

22.1003–3 [Amended]

■ 12. Amend section 22.1003–3 by removing from paragraph (d) ''telegraph,''.

PART 25—FOREIGN ACQUISITION

25.401 [Amended]

■ 13. Amend section 25.401, in the table, by removing from paragraph (b)(2)(iii) ''telegraph services,'', and removing ''47 U.S.C. 153(20)'' and adding ''47 U.S.C. 153(24)'' in its place.

PART 28—BONDS AND INSURANCE

28.101–4 [Amended]

■ 14. Amend section 28.101–4 by removing paragraph (c)(6) and redesignating paragraphs (c)(7) through (9) as paragraphs (c)(6) through (8), respectively.

PART 43—CONTRACT MODIFICATIONS

■ 15. Amend section 43.201 by revising paragraph (c) to read as follows:

43.201 General.

* * * * *

(c) The contracting officer may issue a change order by electronic means without a SF 30 under unusual or urgent circumstances, *provided* that the message contains substantially the information required by the SF 30 and immediate action is taken to issue the SF 30.

PART 47—TRANSPORTATION

■ 16. Amend section 47.305–10 by revising paragraph (c) to read as follows:

47.305–10 Packing, marking, and consignment instructions.

* * * * *

(c) If necessary to meet required delivery schedules, the contracting officer may issue instructions by telephone or electronic means. The contracting officer shall confirm telephonic instructions in writing, and confirm electronic instructions if the contracting officer did not receive confirmation of receipt.

* * * * *

PART 49—TERMINATION OF CONTRACTS

■ 17. Amend section 49.102 by revising the introductory text of paragraph (a) to read as follows:

49.102 Notice of termination.

(a) *General.* The contracting officer shall terminate contracts for convenience or default only by a written notice to the contractor (see 49.601). The notice of termination may be expedited by means of electronic communication capable of providing confirmation of receipt by the contractor. When the notice is mailed, it shall be sent by certified mail, return receipt requested. When the contracting office arranges for hand delivery of the notice, a written acknowledgment shall be obtained from the contractor. The notice shall state—

* * * * *

■ 18. Amend section 49.601–1 by—
■ a. Revising the section heading;
■ b. Adding introductory text;
■ c. Removing from paragraph (a) ''telegraphic'', ''[*insert* ''immediately'''', and ''Telegraph'', and adding ''electronic'', ''[*insert* ''immediately, (*today's date*)'''', and ''Provide by electronic means'' in their places, respectively; and
■ d. Removing from paragraph (b) ''telegraphic'', ''[*insert* ''immediately'''', and ''Telegraph'', and adding ''electronic'', ''[*insert* ''immediately, (*today's date*)'''', and ''Provide by electronic means'' in their places, respectively.

The revision and addition reads as follows:

49.601–1 Electronic notice.

The contracting officer may provide expedited notice of termination by electronic means that includes a requirement for the contractor to confirm receipt. If the contractor does not confirm receipt promptly, the contracting officer shall resend the notice electronically, and expedite the letter notice described in 49.601–2. If confirmation of the electronic notice is received, and the electronic notice includes all content in 49.601–2, the contracting officer need not send the letter notice described in 49.601–2.

* * * * *

■ 19. Amend section 49.601–2 by—
■ a. Revising the third and fourth sentences of the introductory text;
■ b. Removing from paragraph (a), ''telegram'' and adding ''electronic notice'' in its places (two times); and
■ c. Revising the introductory text of the Alternate notice.

The revisions read as follows:

49.601–2 Letter notice.

* * * This notice shall be sent by certified mail, return receipt requested, or electronically, provided evidence of receipt is received by the contracting officer. If no prior electronic notice was issued, or if no confirmation of an electronic notice was received, use the alternate notice that follows this notice.

* * * * *

Alternate notice. Substitute the following paragraph (a) for paragraph (a) of 49.601–2, Notice of Termination to Prime Contractors, if no prior electronic notice was issued, or if no confirmation of an electronic notice was received:

* * * * *

PART 52—SOLICITATION PROVISIONS AND CONTRACT CLAUSES

■ 20. Amend section 52.214–3 by revising the date of the provision and paragraph (b) to read as follows:

52.214–3 Amendments to Invitations for Bids.

* * * * *

Amendments to Invitations for Bids DEC 2016

* * * * *

(b)(1) Bidders shall acknowledge receipt of any amendment to this solicitation—

(i) By signing and returning the amendment;

(ii) By identifying the amendment number and date in space provided for this purpose on the form for submitting a bid;

(iii) By letter;

(iv) By facsimile, if facsimile bids are authorized in the solicitation; or

(v) By email, if email bids are authorized in the solicitation.

(2) The Government must receive the acknowledgement by the time and at the place specified for receipt of bids.

■ 21. Amend section 52.214–5 by—
■ a. Revising the date of the provision;
■ b. Removing paragraph (c); and

■ c. Redesignating paragraphs (d) and (e), as paragraphs (c) and (d), respectively.

The revision reads as follows:

52.214–5 Submission of Bids.

* * * * *

Submission of Bids Dec 2016

* * * * *

52.214–13 [Removed and Reserved]

■ 22. Remove and reserve section 52.214–13.

PART 53—FORMS

53.213 [Amended]

■ 23. Amend section 53.213 by removing from paragraph (b) ''(*10/83*)'' and adding ''(*11/2016*)'' in its place.

53.215–1 [Amended]

■ 24. Amend section 53.215–1 by removing from paragraph (b) ''(*10/83*)'' and adding ''(*11/2016*)'' in its place.

53.243 [Amended]

■ 25. Amend section 53.243, introductory text, by removing ''(*10/83*)'' and adding ''(*11/2016*)'' in its place.

■ 26. Revise 53.301–30 to read as follows:

53.301–30 SF 30, Amendment of Solicitation/Modification of Contract.

☐ The above numbered solicitation is amended as set forth in Item 14. The hour and date specified for receipt of Offers ☐ is extended. ☐ is not extended.

Offers must acknowledge receipt of this amendment prior to the hour and date specified in the solicitation or as amended, by one of the following methods:
(a) By completing items 8 and 15, and returning ____________ copies of the amendment; (b) By acknowledging receipt of this amendment on each copy of the offer submitted; or (c) By separate letter or electronic communication which includes a reference to the solicitation and amendment numbers. FAILURE OF YOUR ACKNOWLEDGMENT TO BE RECEIVED AT THE PLACE DESIGNATED FOR THE RECEIPT OF OFFERS PRIOR TO THE HOUR AND DATE SPECIFIED MAY RESULT IN REJECTION OF YOUR OFFER. If by virtue of this amendment you desire to change an offer already submitted, such change may be made by letter or electronic communication, provided each letter or electronic communication makes reference to the solicitation and this amendment, and is received prior to the opening hour and date specified.

12. ACCOUNTING AND APPROPRIATION DATA *(If required)*

13. THIS ITEM APPLIES ONLY TO MODIFICATIONS OF CONTRACTS/ORDERS.
IT MODIFIES THE CONTRACT/ORDER NUMBER AS DESCRIBED IN ITEM 14.

CHECK ONE	
☐	A. THIS CHANGE ORDER IS ISSUED PURSUANT TO: *(Specify authority)* THE CHANGES SET FORTH IN ITEM 14 ARE MADE IN THE CONTRACT ORDER NUMBER IN ITEM 10A.
☐	B. THE ABOVE NUMBERED CONTRACT/ORDER IS MODIFIED TO REFLECT THE ADMINISTRATIVE CHANGES *(such as changes in paying office, appropriation data, etc.)* SET FORTH IN ITEM 14, PURSUANT TO THE AUTHORITY OF FAR 43.103(b).
☐	C. THIS SUPPLEMENTAL AGREEMENT IS ENTERED INTO PURSUANT TO AUTHORITY OF:
☐	D. OTHER *(Specify type of modification and authority)*

E. IMPORTANT: Contractor ☐ is not ☐ is required to sign this document and return __________ copies to the issuing office.

14. DESCRIPTION OF AMENDMENT/MODIFICATION *(Organized by UCF section headings, including solicitation/contract subject matter where feasible.)*

Except as provided herein, all terms and conditions of the document referenced in Item 9A or 10A, as heretofore changed, remains unchanged and in full force and effect.

15A. NAME AND TITLE OF SIGNER *(Type or print)*		16A. NAME AND TITLE OF CONTRACTING OFFICER *(Type or print)*	
15B. CONTRACTOR/OFFEROR *(Signature of person authorized to sign)*	15C. DATE SIGNED	16B. UNITED STATES OF AMERICA *(Signature of Contracting Officer)*	16C. DATE SIGNED

Previous edition unusable

STANDARD FORM 30 (REV. 11/2016)
Prescribed by GSA FAR (48 CFR) 53.243

INSTRUCTIONS *(Back Page)*:

Instructions for items other than those that are self-explanatory, are as follows:

(a) Item 1 (Contract ID Code). Insert the contract type identification code that appears in the title block of the contract being modified.

(b) Item 3 (Effective date).

(1) For a solicitation amendment, change order, or administrative change, the effective date shall be the issue date of the amendment, change order, or administrative change.

(2) For a supplemental agreement, the effective date shall be the date agreed to by the contracting parties.

(3) For a modification issued as an initial or confirming notice of termination for the convenience of the Government, the effective date and the modification number of the confirming notice shall be the same as the effective date and modification number of the initial notice.

(4) For a modification converting a termination for default to a termination for the convenience of the Government, the effective date shall be the same as the effective date of the termination for default.

(5) For a modification confirming the contracting officer's determination of the amount due in settlement of a contract termination, the effective date shall be the same as the effective date of the initial decision.

(c) Item 6 (Issued By). Insert the name and address of the issuing office. If applicable, insert the appropriate issuing office code in the code block.

(d) Item 8 (Name and Address of Contractor). For modifications to a contract or order, enter the contractor's name, address, and code as shown in the original contract or order, unless changed by this or a previous modification.

(e) Items 9, (Amendment of Solicitation Number - Dated), and 10, (Modification of Contract/Order Number - Dated). Check the appropriate box and in the corresponding blanks insert the number and date of the original solicitation, contract, or order.

(f) Item 12 (Accounting and Appropriation Data). When appropriate, indicate the impact of the modification on each affected accounting classification by inserting one of the following entries:

(1) Accounting classification ....
Net increase $ ....

(2) Accounting classification ....
Net decrease $ ....

NOTE: If there are changes to multiple accounting classifications that cannot be placed in block 12, insert an asterisk and the words "See continuation sheet".

(g) Item 13. Check the appropriate box to indicate the type of modification. Insert in the corresponding blank the authority under which the modification is issued. Check whether or not contractor must sign this document. (See FAR 43.103.)

(h) Item 14 (Description of Amendment/Modification).

(1) Organize amendments or modifications under the appropriate Uniform Contract Format (UCF) section headings from the applicable solicitation or contract. The UCF table of contents, however, shall not be set forth in this document.

(2) Indicate the impact of the modification on the overall total contract price by inserting one of the following entries:

(i) Total contract price increased by $ ....

(ii) Total contract price decreased by $..................

(iii) Total contract price unchanged.

(3) State reason for modification.

(4) When removing, reinstating, or adding funds, identify the contract items and accounting classifications.

(5) When the SF 30 is used to reflect a determination by the contracting officer of the amount due in settlement of a contract terminated for the convenience of the Government, the entry in Item 14 of the modification may be limited to --

(i) A reference to the letter determination; and

(ii) A statement of the net amount determined to be due in settlement of the contract.

(6) Include subject matter or short title of solicitation/contract where feasible.

(i) Item 16B. The contracting officer's signature is not required on solicitation amendments. The contracting officer's signature is normally affixed last on supplemental agreements.

48 CFR Parts 2, 7, 19, 34, 42, and 52

[FAC 2005–92; Item III; Docket No. 2016–0052; Sequence No. 5]

Federal Acquisition Regulation; Technical Amendments

AGENCY: Department of Defense (DoD), General Services Administration (GSA), and National Aeronautics and Space Administration (NASA).

ACTION: Final rule.

SUMMARY: This document makes amendments to the Federal Acquisition Regulation (FAR) in order to make editorial changes.

DATES: *Effective:* November 18, 2016.

FOR FURTHER INFORMATION CONTACT: Ms. Hada Flowers, Regulatory Secretariat Division (MVCB), 1800 F Street NW., 2nd Floor, Washington, DC 20405, 202–501–4755. Please cite FAC 2005–92, Technical Amendments.

SUPPLEMENTARY INFORMATION: In order to update certain elements in 48 CFR parts 2, 7, 19, 34, 42, and 52 this document makes editorial changes to the FAR.

List of Subjects in 48 CFR Parts 2, 7, 19, 34, 42, and 52

Government procurement.

Dated: November 10, 2016.

William F. Clark,

Director, Office of Government-wide Acquisition Policy, Office of Acquisition Policy, Office of Government-wide Policy.

Therefore, DoD, GSA, and NASA amend 48 CFR parts 2, 7, 19, 34, 42, and 52 as set forth below:

■ 1. The authority citation for 48 CFR parts 2, 7, and 19 continues to read as follow:

Authority: 40 U.S.C. 121(c); 10 U.S.C. chapter 137; and 51 U.S.C. 20113.

PART 2—DEFINITIONS OF WORDS AND TERMS

■ 2. Amend section 2.101, in paragraph (b)(2) by revising the definition ''Earned value management system'' to read as follows:

2.101 Definitions.

* * * * *

(b) * * *

(2) * * *

Earned value management system means a project management tool that effectively integrates the project scope of work with cost, schedule and performance elements for optimum project planning and control. The qualities and operating characteristics of an earned value management system are described in Electronic Industries Alliance Standard 748 (EIA–748), Earned Value Management Systems. (See OMB Circular A–11, Part 7.)

* * * * *

PART 7—ACQUISITION PLANNING

7.105 [Amended]

■ 3. Amend section 7.105 by removing from paragraph (b)(11) ''American National Standards Institute/Electronics Industries Alliance (ANSI/EIA) Standard–748, Earned Value Management Systems'' and adding ''Electronic Industries Alliance Standard 748 (EIA–748)'' in its place.

PART 19—SMALL BUSINESS PROGRAMS

■ 4. Revise section 19.1506 to read as follows:

19.1506 Women-Owned Small Business Program sole source awards.

(a) A contracting officer shall consider a contract award to an EDWOSB concern on a sole source basis (see 6.302–5(b)(7)) before considering small business set-asides (see 19.203 and subpart 19.5) provided none of the exclusions at 19.1504 apply and—

(1) The acquisition is assigned a NAICS code in which SBA has determined that WOSB concerns are underrepresented in Federal procurement;

(2) The contracting officer does not have a reasonable expectation that offers would be received from two or more EDWOSB concerns; and

(3) The conditions in paragraph (c) of this section exist.

(b) A contracting officer shall consider a contract award to a WOSB concern (including EDWOSB concerns) eligible under the WOSB Program on a sole source basis (see 6.302–5(b)(7)) before considering small business set-asides (see 19.203 and subpart 19.5) provided none of the exclusions at 19.1504 apply and—

(1) The acquisition is assigned a NAICS code in which SBA has determined that WOSB concerns are substantially underrepresented in Federal procurement;

(2) The contracting officer does not have a reasonable expectation that offers would be received from two or more WOSB concerns (including EDWOSB concerns); and

(3) The conditions in paragraph (c) of this section exist.

(c)(1) The anticipated award price of the contract, including options, will not exceed—

(i) $6.5 million for a requirement within the NAICS codes for manufacturing; or

(ii) $4 million for a requirement within any other NAICS codes.

(2) The EDWOSB concern or WOSB concern has been determined to be a responsible contractor with respect to performance.

(3) The award can be made at a fair and reasonable price.

(d) The SBA has the right to appeal the contracting officer's decision not to make a sole source award to either an EDWOSB concern or WOSB concern eligible under the WOSB program.

PART 34—MAJOR SYSTEM ACQUISITION

■ 5. The authority citation for 48 CFR part 34 is revised to read as follows:

Authority: 40 U.S.C. 121(c); 10 U.S.C. chapter 137; and 51 U.S.C. 20113.

Subpart 34.0 [Amended]

■ 6. Remove the heading of subpart 34.0.

34.005–2 [Amended]

■ 7. Amend section 34.005–2 by removing from paragraph (b)(6) ''ANSI/EIA Standard—748'' and adding ''Electronic Industries Alliance Standard 748 (EIA–748)'' in its place.

34.201 [Amended]

■ 8. Amend section 34.201 by removing from paragraph (b) ''American National Standards Institute/Electronics Industries Alliance (ANSI/EIA) Standard—748, Earned Value Management Systems'' and adding ''Electronic Industries Alliance Standard 748 (EIA–748)'' in its place.

34.203 [Amended]

■ 9. Amend section 34.203 by—

■ a. Removing from paragraph (a) ''Notice of Earned Value Management System—Pre-Award IBR'' and adding ''Notice of Earned Value Management System—Preaward Integrated Baseline Review'' in its place; and

■ b. Removing from paragraph (b) ''Notice of Earned Value Management System—Post-Award IBR'' and adding ''Notice of Earned Value Management System—Postaward Integrated Baseline Review'' in its place.

PART 42—CONTRACT ADMINISTRATION AND AUDIT SERVICES

■ 10. The authority citation for 48 CFR part 42 continues to read as follows:

Authority: 40 U.S.C. 121(c); 10 U.S.C. chapter 137; and 51 U.S.C. 20113.

42.709 [Redesignated as Section 42.709–0]

■ 11. Section 42.709 is redesignated as section 42.709–0, and a new section 42.709 is added to read as follows:

42.709 Penalties for Unallowable Costs.

* * * * *

PART 52—SOLICITATION PROVISIONS AND CONTRACT CLAUSES

■ 12. The authority citation for 48 CFR part 52 continues to read as follows:

Authority: 40 U.S.C. 121(c); 10 U.S.C. chapter 137; and 51 U.S.C. 20113.

■ 13. Amend section 52.234–2 by—
■ a. Revising the section and provision headings;
■ b. Removing from paragraph (a) ''ANSI/EIA Standard—748'' and adding ''Electronic Industries Alliance Standard 748 (EIA–748)'' in its place; and
■ c. Removing from paragraph (b)(4) ''ANSI/EIA Standard—748'' and adding ''EIA–748'' in its place.

The revisions read as follows:

52.234–2 Notice of Earned Value Management System—Preaward Integrated Baseline Review.

* * * * *

Notice of Earned Value Management System—Preaward Integrated Baseline Review NOV 2016

* * * * *

■ 14. Amend section 52.234–3 by—
■ a. Revising the section and provision headings;
■ b. Removing from paragraph (a) ''ANSI/EIA Standard—748'' and adding ''Electronic Industries Alliance Standard 748 (EIA–748)'' in its place; and

■ c. Removing from paragraph (b)(4) ''ANSI/EIA Standard—748'' and adding ''EIA–748'' in its place.

The revisions read as follows:

52.234–3 Notice of Earned Value Management System—Postaward Integrated Baseline Review.

* * * * *

Notice of Earned Value Management System—Postaward Integrated Baseline Review NOV 2016

* * * * *

■ 15. Amend section 52.234–4 by—

■ a. Revising the date of the clause;

■ b. Removing from paragraph (a) ''ANSI/EIA Standard—748'' and adding ''Electronic Industries Alliance Standard 748 (EIA–748)'' in its place; and

■ c. Removing from paragraph (b) introductory text ''ANSI/EIA Standard—748'' and adding ''EIA–748'' in its place.

The revision reads as follows:

52.234–4 Earned Value Management System.

* * * * *

Earned Value Management System NOV 2016

* * * * *

DEPARTMENT OF DEFENSE

GENERAL SERVICES ADMINISTRATION

NATIONAL AERONAUTICS AND SPACE ADMINISTRATION

48 CFR Chapter 1

[Docket No. FAR 2016–0051, Sequence No. 6]

Federal Acquisition Regulation; Federal Acquisition Circular 2005–92; Small Entity Compliance Guide

AGENCY: Department of Defense (DoD), General Services Administration (GSA), and National Aeronautics and Space Administration (NASA).

ACTION: Small Entity Compliance Guide.

SUMMARY: This document is issued under the joint authority of DOD, GSA, and NASA. This *Small Entity Compliance Guide* has been prepared in accordance with section 212 of the Small Business Regulatory Enforcement Fairness Act of 1996. It consists of a summary of the rules appearing in Federal Acquisition Circular (FAC) 2005–92, which amends the Federal Acquisition Regulation (FAR). An asterisk (*) next to a rule indicates that a regulatory flexibility analysis has been prepared. Interested parties may obtain further information regarding these rules by referring to FAC 2005–92, which precedes this document. These documents are also available via the Internet at *http://www.regulations.gov.*

DATES: November 18, 2016.

FOR FURTHER INFORMATION CONTACT: For clarification of content, contact the analyst whose name appears in the table below. Please cite FAC 2005–92 and the FAR case number. For information pertaining to status or publication schedules, contact the Regulatory Secretariat Division at 202–501–4755.

RULES LISTED IN FAC 2005–92

Item	Subject	FAR case	Analyst
*I	Public Disclosure of Greenhouse Gas Emissions and Reduction Goals—Representation	2015–024	Gray.
*II	Removal of Regulations Relating to Telegraphic Communication	2015–035	Francis.
III	Technical Amendments.		

SUPPLEMENTARY INFORMATION: Summaries for each FAR rule follow. For the actual revisions and/or amendments made by these rules, refer to the specific item numbers and subjects set forth in the documents following these item summaries. FAC 2005–92 amends the FAR as follows:

Item I—Public Disclosure of Greenhouse Gas Emissions and Reduction Goals—Representation (FAR Case 2015–024)

This final rule amends the FAR to establish an annual representation requirement to indicate whether or not and where contractors publicly disclose greenhouse gas emissions and greenhouse gas emission reduction goals or targets. This representation is optional for contractors that received less than $7.5 million in contract awards from the Government during the previous Federal fiscal year. The information obtained from these representations will assist agencies in developing strategies to engage with contractors to reduce supply chain emissions, as directed in the Executive Order 13693, Planning for Federal Sustainability in the Next Decade.

Item II—Removal of Regulations Relating to Telegraphic Communication (FAR Case 2015–035)

This rule amends the FAR to delete the use of ''telegram,'' ''telegraph,'' and related terms. The objective is to delete reference to obsolete technologies no longer in use and replace with references to electronic communications. In addition, conforming changes are made covering expedited notice of termination and change orders.

The rule is not anticipated to have a significant economic impact on small business entities, as the rule provides recognition of current options for transmitting documents between the Government and contractors. The rule also revises the means of disseminating contract termination documents between the Government and contractors; however, this change only affects the Government's responsibility for transmitting termination notices.

Item III—Technical Amendments

Editorial changes are made at FAR 2.101, 7.105, 19.1506, 34.000, 34.005–2, 34.201, 34.203, 42.709, 52.234–2, 52.234–3, and 52.234–4.

Dated: November 10, 2016.

William F. Clark,

Director, Office of Government-wide Acquisition Policy, Office of Acquisition Policy, Office of Government-wide Policy.
