Cointegration results suggest that financial traders' influence of crude oil futures prices is desirable. For example, then-CFTC economists, Büyükşahin, Harris, and Haigh show how the increased presence of swap dealers, hedge funds, and other financial traders have led to the cointegration of various crude oil futures contracts (the nearby contract, the one-year contract, and the two-year contract).[1593] This co-integration result by these economists suggests that there was a long-term relation between the strength of price cointegration and the market activities of financial traders,[1594] but this result does not suggest any harm to the marketplace or price discovery from the cointegration of various crude oil contracts. The authors conjecture that the greater market activity by these traders can ''enhance market quality'' through ''enhance[d] linkages among various futures prices'' that make these commodity markets ''more informationally efficient.'' [1595]

Both research papers [1596] are correct that, respectively, there is increased comovement between crude oil prices with financial investments and cointegration between nearby, one-year, and two-year crude oil futures contracts. At least for the crude oil market, these price linkages exist. However, one cannot obtain, using comovement and cointegration techniques, decisive evidence on whether this effect improves market efficiency; such a conclusion involves interpreting the informational linkages between the markets. To the extent that the paper by Büyükşahin, Harris, and Haigh moves beyond establishing the linkage to inferring that the linkage has salutary effects on commodity markets, that conclusion was not empirically tested, because it was not modelled explicitly. At most, these studies establish the existence of such price linkages.

Financialization Comovement Literature

Some studies have examined ''financialization'' by using comovement analysis to ask whether increased investment flows into commodity indices (typically composed with substantial long futures positions) are correlated with increases in futures prices or the volatility of commodity futures prices across many different types of studies. Some of these financializaton comovement studies have looked to whether these investment flows decrease the risk premium for holding a long futures contract, thereby causing a non-transient increase in the long futures contract price (which, in turn, may increase the price of the underlying commodity).

There is consensus in the economic literature that equities and commodities no longer exhibit the strong negative correlations that index fund investment managers may have sought in hedging their portfolios. In recent years there has been an increased positive correlation between equity and commodity prices since 2008.[1597] There is also substantial consensus among economists who study this issue that risk premiums for holding long futures contracts have decreased due to financialization.[1598]

However, there is a divergence of views among economists on the impacts, if any, on the large positions taken by index funds on commodity futures prices or price volatility.[1599] These hypothesized effects of financialization are debated among academics, practitioners, and policymakers. Results of studies that test for a bubble component in commodity futures prices—regardless of the cause—are decidedly mixed.[1600]

Commission-affiliated economists have confirmed a general decrease in volatility associated with financialization, a salutary effect associated with increased liquidity.[1601] In theoretical models outside the comovement methodology, competition from index investment reduces the risk premium that accrues to long position holders, and this can have the net effect of lowering the cost of hedging to traditional physical market participants.[1602] Some economists rely upon the efficient market hypothesis that market prices fully incorporate all the available public ''information'' into prices—in support of conclusion that financialization provides benefits such as better price discovery, liquidity, and transfer of risks to entities better

prepared to assume it.[1603] Comovement and cointegration analyses are some of the statistical tools used to test whether these purported benefits of greater market participation hold true under particular market conditions.

While competition and increased trading volume can generally help markets, inflows do not universally benefit market welfare. In a paper by Cheng, Kirilenko, and Xiong, the authors use comovement methodology to conclude that in times of distress, financial traders reduce their net long position, causing risk to flow from financial traders to commercial hedgers.[1604] ''[J]ust when the uncertainty in the economy was rising, the number of futures contracts used by commercial hedgers to hedge their risk was going down.'' [1605]

Cheng, Kirilenko, and Xiong argue that tests such as Granger, which look to whether financial traders' positions and futures prices are negatively correlated when they trade to accommodate hedgers, overlook an important lesson from the distressed financial literature.[1606] When financial entities trade in response to their own financial distress, their trades may be correlated positively to futures price changes. These correlations may net out, so that any significant correlation between their positions and price changes may be masked by trading during financial distress.[1607]

Using cointegration techniques and non-public trading data, then-CFTC economists, Büyükşahin and Robe demonstrate that the correlations between equity indices and commodities increase with greater participation by financial speculators.[1608] There is no such effect for other types of traders. In concert with the work of Cheng, Kirilenko, and Xiong, they find that this cointegration effect, the price linkages between equity indices and investible commodities, is lower during times market stress.

Another comovement study provided an empirical link between commodity index investment and futures price movements, including increased price volatility.[1609] Tang and Xiong find that the increasing presence of index traders in commodity futures markets improves risk sharing in these markets with concomitant volatility spillover from outside markets. This study finds evidence of volatility spillovers from the financial crisis in the 2006–2009 time period, spillovers that may have been a key driver of recent commodity price volatility.[1610]

This Tang and Xiong finding of volatility ''spillovers'' is frequently cited by commenters in support of position limits. However, some academics are skeptical of their results. Irwin and Sanders concede that the Tang and Xiong paper ''appears to offer concrete evidence'' of some form of financialization, but offers several reasons to view these findings with caution.[1611]

Tang and Xiong's results do not necessarily point to lasting difficulties associated with the integration of financial and commodity markets. Instead, they argue that commodity markets were not integrated with financial markets prior to the development of commodity index funds. In their paper, Tang and Xiong view financialization as a ''process'' which helps explain ''the synchronized price boom and bust of a broad set of seemingly unrelated commodities'' during the 2006–2008 time period.[1612]

A problem with this line of reasoning that critics have identified is that there could be other factors which lead to increased correlation between equities and futures during this time period. After all, 2006–2009 was an eventful time where broad macroeconomic factors held sway and could have led to large positive correlations between these markets. According to many, one of the factors leading to the influx of investment funds in during the 2006–2008 time period was negative correlations between commodities returns and equities returns. Yet this factor is less prevalent today. ''The positive correlation between the agriculture ETFs and S&P 500 suggests that the diversification benefits of using an agricultural index have decreased.'' [1613]

Some commenters have pointed to studies such as Tang and Xiong's in support of the position limits rule.[1614] However, most financial investors' exposure to commodities through commodity index funds or ETFs would not be prevented by position limits. Studies on the price returns or price volatility effect of commodity index funds are thus not directly relevant to the placement of position limits on individual commodities contract.[1615] Moreover, commodity index funds are not the only large investors whose activities may affect commodity futures prices.[1616]

A paper by Korniotis contains an important caveat in the financialization debate: The effects of financialization may vary widely depending on the type of commodity.[1617] Crude oil is an important component of the S&P Goldman-Sachs Commodity Index

(GSCI), more so than industrial metals. Federal Reserve Board economist George Korniotis found that there was cointegration between metals with and without futures contracts that did not weaken as financial speculation increased in the marketplace and the spot prices for industrial metals were unrelated to the GSCI.

With the exceptions discussed in detail above, many of the studies in this vein do not warrant detailed discussion. Even well-executed economic studies using comovement methodology that do not focus on position limits may be of little or marginal relevance.[1618]

Herding

There are other possible ways in which additional trading volume may not be an unalloyed benefit to the wellbeing of a marketplace. A few comovement studies attempt to test for the existence of ''herding.'' This is a formalized version of price trending. The idea here is that traders may initiate a trade with the expectation that positive-feedback traders will purchase the traded instruments at a higher price later.[1619] Some economists argue that financialization aggravates ''herding'' behavior and herding creates price bubbles.[1620] Others dispute any such effect.[1621]

Though the evidence for herding is meager, the underlying idea is consistent with accepted and theoretically plausible results on risk premia. Risk premiums rise with the volatility of the futures markets, and risk premiums depend in part on speculators' hedging pressure and inventory levels.[1622]

Agricultural Commodities and Financialization

Agricultural economists have reached similarly conclusions on the cointegration of financial speculators and food prices. While there are respectable empirical results suggesting that financial speculation have affected some recent agricultural commodity price dynamics, there is no unanimity in the academic community on conclusive empirical evidence of the causal dynamics, breadth, and magnitude of such effects.[1623]

c. Models of Fundamental Supply and Demand and Related Methods

i. Description

Some economists have developed economic models for the supply and demand of a commodity. These models often include theories of how storage capacity and use affect supply and demand, often a critical factor in the case of physical commodities and their inter-temporal price (that is, their price over time). Using models of supply and demand, the economists then attempt to arrive at a ''fundamental'' price (or price return) for commodity based on the model. Specifically, the economists look at where the model is in equilibrium with respect to quantities supplied and quantities demanded to arrive at this price. The fundamental price given by such a model is then compared with actual prices. The economists look for deviations between the fundamental price, based on the model, and the actual price of the commodity. When pursuing this method, economists look for whether the price deviations are statistically significant. When there are statistically significant deviations of the actual price from market fundamentals, they infer that the price is not driven by market fundamentals.

Many of these studies present a model for one particular commodity or set of commodities. Some looked at volatile markets. Others used at very predictable markets.

We group together for analysis a diverse set of studies that fall within this broad category of economic models of fundamental supply and demand. Some asserted that their models generally could explain prices. Some papers were neutral. And some papers reached the conclusion that market fundamentals could not explain certain price data in the markets they studied.

ii. Advantages

This methodology is well-recognized and accepted means for detecting price deviations. This is a centuries-old technique, as old as the quantification of economics. The model forces the economist to explain supply and demand. This requirement thus provides welcome transparency.

Moreover, the models are auditable: When the fundamental price deviates from the actual price, the economists may well be able to look at the model and see which aspects of supply and/or demand created the deviation. If the economist cannot ascertain the source of the deviation, (1) the economist may seek to add additional variables to the models for supply or demand to better model supply and demand or (2) conclude that this unexplained deviation is empirical support for the existence of a non-fundamental price.

Another advantage of this model is that the loose language of ''bubble'' is replaced by the term ''non-fundamental price.'' The model supplies an economically motivated specification for the price of a commodity. This feature permits deeper economic analysis and debate on whether a non-fundamental price exists without a digression into debates about what the term ''bubble'' means.[1624]

Continued

iii. Disadvantages

As applied to position limits, this approach has several drawbacks as well.

First and foremost, the analyses and conclusions that flow from these studies are only as good as the models themselves. Specifically, the price benchmark is based on the model, and an analysis of deviation from the benchmark is only as strong as the model itself. These models incorporate many simplifying assumptions. Market behavior and the real world in general, are much more complicated.

Moreover, these models do not function well when there is a supply shock or when demand falls precipitously. Another disadvantage is model construction using variables that are highly correlated with the price. If the correlation between price and a variable is too high, then using the variable in the model may permit the variable to function as a proxy for price. This will hobble the model's ability to detect price deviations.

A substantial disadvantage of this model is the inherent difficulty of modelling fundamentals of supply and demand in a market of any complexity. Or even, in a model, in anticipating or measuring the impact of large macroeconomic trends. For example, economists have a notoriously bad track record of predicting economic recessions. Thus it is difficult to conclude that a model with a few variables, designed without this hindsight, would be successful in predicting how crude oil prices would behave during the advent of an economic recession. With hindsight, economists know now that September 2008 was at the outset of a substantial global recession, or at least a point of dramatic decrease in the output of the world economy. And with hindsight, it is apparent that the recession dramatically reduced the demand for crude oil. But at the outset of a recession, a model designed without knowledge of the recession (or of its severity) might confuse a statistically significant deviation of actual crude oil prices for the fundamental price derived from the model.

In addition, while this statistical method replaces the loose language of ''bubbles'' with a statistically derived fundamental price, studies offering economic analysis of the fundamentals of price and demand do not eliminate all subjectivity in determining whether a non-fundament price has occurred. An economist will often obtain from these models a ''price band,'' a band for which prices falling within that range remain reflective of fundamental supply and demand. Prices outside the price band are non-fundamental prices. Determining the height of the band depends on what is viewed as a statistically significant deviation, by definition. But determining what a statistically significant deviation is requires the economist to make an assumption that can be quite consequential. The economist must set a level of price changes that his or her model will ignore as attributable merely to chance. Nothing in underlying statistics of the price data will provide the economist with this level. If the level is fixed so that the price band is relatively tall, less prices are likely to be labelled statistically significant deviation by the test.

iv. Analysis of Specific Papers Using Fundamental Models

Crude Oil Models

Even before 2007, there were suspicions about prices in the crude oil market. The Governor of the Federal Reserve Board said in 2004: ''The sharp increases and extreme volatility of oil prices have led observers to suggest that some part of the rise in prices reflects a speculative component arising from the activities of traders in the oil markets.'' [1625] Then the price of crude oil doubled from June 2007 to June 2008, and then rapidly declined in the second-half of 2008. Many economists thereafter published papers saying that the increase in demand up to June 2008 and/or the decrease in demand for September 2008 crude oil could not be explained by market fundamentals. Many attempted to infer from this fact that speculative trading was causing changes in crude oil prices or price volatility.

To understand these papers' strengths and weaknesses, it is important to appreciate a critical factor about crude oil market economics—storage.[1626] Data on storage is often used to study crude oil prices for speculative price influences.

Crude oil is storable, and so its price reflects, in particular, the demand for crude oil inventory. Speculators influence the spot price of crude oil by placing physical crude oil into storage when future prices are anticipated to be higher and out of storage when future prices are anticipated to be lower. Given this, some economists have studied crude oil storage to determine whether crude oil inventories could be contributing to the boom and bust in crude oil prices during the 2007–2008 time period. Specifically, using models of fundamental supply and demand, they study the elasticity of crude oil prices to determine whether the effect of speculators' trading on crude oil inventories could affect crude oil prices.

Several economists have examined above-ground oil inventories in the United States during this 2007–2008 timeframe and examined the interplay of crude oil inventories and prices. They concluded that the short-term elasticity of crude oil demand would have had to have been unusually low—quite inelastic—for inventory demand to fully explain the unusual crude oil prices in 2007–2008. (Price inelasticity of demand means that the price of crude oil is sensitive to changes in quantity demand: A small decrease in demand is likely to cause a large drop in price, for example, when the short-term elasticity of demand is inelastic, all else being equal.) From this, they conclude that speculative traders' effect on inventory demand was unlikely to be a complete explanation for the 2007–2008 crude oil price swings. That is, it would be unlikely for speculators to be able to (at least easily) cause substantial movements in crude oil prices by speculators' influence on the amount of crude oil stored in above-ground crude oil inventories.[1627]

Nonetheless, inventories may still explain part of the unusual price behavior of crude oil in 2007–2008. Even if the short-term elasticity of demand would have to have been very small in absolute value, speculation may have also affected below-ground inventories.[1628]

Many economists conclude that there was a substantial demand shock to crude oil during this time period, a

[1628] Hamilton, *Causes and Consequences of the Oil Shock of 2007–2008,* Brookings Paper on Economic Activity (2009) (below-ground inventories should also be considered and are not included in the data) (concluding that speculative trading did affect both the speed and magnitude of the price decline in 2008).

demand arising from the onset of a global recession. As the deep recession of 2008 and 2009 began to set in, there was a decrease in demand for September 2008 crude oil in the crude oil futures market. It is unlikely that a demand shock associated with the recession was anticipated by the marketplace, including speculators, given the notorious difficulty of predicting recessions. Kilian and Murphy [1629] assert, if a global recession causes the demand shock, the economics of the crude oil market suggests that there is little policymakers can do to prevent this kind of price bubble from appearing in the crude oil market at the outset of the recession.[1630]

Several economists wrote papers suggesting that their results indicated that crude oil price changes during this time period reflected uneconomic or ''bubble-like'' behavior. Generally, these authors find that their models of supply and demand could not track well the run up in crude oil prices to around $145 in mid-2008 or the bust to close to $30 a barrel just a few weeks later, and they concluded that activity by speculators in these markets was or might be affecting the rapid crude oil price changes.[1631]

These studies do not, in total, lead to consensus. There are distinctive differences and disagreement in the papers on the existence of excessive speculation in the crude oil market during 2007–2009. Even within the Federal Reserve system, there is disagreement, for instance, Plante and Yücel, in *Did Speculation Drive Oil Prices? Futures Market Points to Fundamentals,*[1632] and Juvenal and Petrella, in *Speculation in the Oil Market.*[1633]

The methodology of fundamentals of supply and demand does not zero in precisely on causation and leaves room for interpretation of why a price does not follow modelled supply and demand behavior. Labelling prices ''bubbles'' caused by speculation simply because one does not understand or cannot otherwise account for price movements is problematic. One explanation for the failure of these models to track such fast-moving prices that is speculative activity is at work. But there are other explanations. On some level, there is a tautological error in labelling price changes as ''bubble-like'' simply because economists could not, as of a certain time and with certain model, otherwise explain or predict price movements. These models are trying to explain very complex phenomena and make difficult choices on how to use imperfect data.

Some models performed better at modelling the real-world crude oil prices, using models of fundamental supply and demand, by selecting one of the stronger proxies for crude oil, such as the Dry Baltic Index or macroeconomic variables such as global gross domestic product as explanatory variables.[1634]

One of the best studies in this area is Hamilton, *Causes and Consequences of the Oil Shock of 2007–2008.*[1635] He concludes that fundamentals of supply and demand are responsible for most of the run-up in prices, while speculative trading may have increased both the speed and absolute magnitude of the mid-2008 decline in prices. As to the first point, he concludes that while oil prices may have been ''too high'' in July 2008, ''low price elasticity of demand, and the failure of physical production to increase'' are more likely the predominant causes than ''speculation per se.'' [1636] He acknowledges, however, that the speed and magnitude of the price decline in mid-2008 may have been induced, in part, by speculative trading.

Given this mixed result, both proponents and opponents of position limits cite various aspects of this Hamilton study. His study follows the data closely; his model discusses key issues such as inventory. He does not leap to strained interpretations based on theoretical model assumptions. When his model does not provide a full explanation for price behavior based on supply and demand, he does not simply jump to the conclusion that speculation is at work. Instead, he offers measured

Papers using this methodology reach a broad range of conclusions. *See also* Eckaus, The Oil Price Really is a Speculative Bubble (working paper 2008) (reject the hedging pressure hypothesis that inventory positions are an important determinant of risk premiums, and concludes that oil prices are speculative because he cannot perceive a reason for the prices based on supply and demand); Morana, Oil Price Dynamics, Macro-finance Interactions and the Role of Financial Speculation, at 206–226, Journal of Banking & Finance, Vol. 37, Issue 1 (Jan. 2013) (concluding that there is excessive speculation in the crude oil market that did lead to a substantial price impact in 2007–2008); Sornette, Woodard and Zhou, The 2006–2008 Oil Bubble and Beyond: Evidence of Speculation, and Prediction, Physica A. (2009) (find evidence of a bubble, but only based upon an undocumented model largely presented by graphs); Stevans and Sessions, Speculation, Futures Prices, and the U.S. Real Price of Crude Oil, American Journal of Social and Management Science (2010) (contending that there is ''hoarding'' in the crude oil market and that elimination of the longer-term futures contracts would curb excessive speculation); Weiner, Speculation in International Crises: Report from the Gulf, Journal of Int'l Business Studies (2005) (a combination of political and market events, not speculation, was behind the price volatility in 1990–1991); Breitenfellner, Crespo, and Keppel, Determinants of Crude Oil Prices: Supply, Demand, Cartel, or Speculation?, at 134, Monetary Policy and the Economy (2009) (concluding ''it is conceivable'' that interaction between crude oil production and financial markets exacerbated pressure on crude oil prices, but finding no proof of this).

[1632] Plante and Yücel, Did Speculation Drive Oil Prices? Futures Market Points to Fundamentals (working paper Federal Reserve of Dallas 2011) (crude oil data for the 2007–2009 time period ''are consistent with how a well-functioning futures market would behave,'' and if speculation had been to blame, there would have been ''very large positive spreads . . . followed by significant increases in inventory'').

[1633] Juvenal and Petrella, Speculation in the Oil Market (working paper of Federal Reserve Bank of St. Louis 2012) (concluding that speculation played a ''significant role'' in both the price increases in 2008 and the subsequent collapse, but they did not carefully model ''excess speculation.'' Instead, they interpreted the second principle component as being ''excess speculation'' even though the second component may be assigned many other interpretations or even be deemed uninterpretable.).

[1634] *E.g.,* Kilian and Murphy, The Role of Inventories and Speculative Trading in the Global Market for Crude Oil, Journal of Applied Econometrics (2010). In the construction of his study, Kilian used a shipping index, the Dry Baltic Index. In shipping, a predominant factor in the cost of shipping is the cost of crude oil. By using the Dry Baltic Index to attempt to compose a model to explain crude oil prices, the economist chose a variable which would naturally be highly correlated to crude oil prices. However, by using a proxy, the effectiveness of the model is lessened. It is unclear whether the results are attributable to fundamentals driving crude oil prices or crude oil prices driving the Dry Baltic Index. *See also* Morana, Oil Price Dynamics, Macro-finance Interactions and the Role of Financial Speculation, pp. 206–226, Journal of Banking & Finance, Vol. 37, Issue 1 (Jan. 2013) (careful, large-scale modeling of the oil market macro-finance interface, finding the existence of ''excess speculation'' in these markets using Workings T and other tests, and concluding that financial factors may have up to a 30 percent contribution to oil price fluctuations). *Id.* at p.220 (using Working's T and model to conclude that there is a significant liquidity effect associated with non-fundamental financial shocks in the oil market, leading to a higher real oil price without affecting inventories); *id.* at 223–224 (macro-finance factors played a larger role than ''financial factors'' in the 2007–2009 crude oil ''price shock,'' but ''excessive speculation'' did have a price impact).

[1635] Hamilton, Causes and Consequences of the Oil Shock of 2007–2008, Brookings Paper on Economic Activity (2009).

judgments on the possibility that speculation may have affected the precipitous mid-2008 crude oil price decline and presents statistical evidence that this *may have* occurred.

Other Studies Based on Supply and Demand Models

A discussion of crude oil prices during the 2007–2008 timeframe is illustrative of other commodities during this time period. For example, there is considerable comovement between the real price of crude oil and the real price of other industrial commodities during times of major fluctuation in global real activity (such as global recessions).[1637] All commodities during this time period were buffeted by macroeconomic factors, including a global recession, and a deep one at that during 2008 and 2009.

Outside of the crude oil context, there are some noteworthy studies of fundamental supply and demand that bear on the position limits rulemaking.

Allen, Litov, and Mei, in *Large Investors, Price Manipulation, and Limits to Arbitrage: An Anatomy of Market Corners,*[1638] examine historical corners and squeezes in security and commodity markets and conclude that a corner or squeeze may induce arbitragers to exit the market, since arbitragers will only take short positions when the prospect of profits is high enough. Two papers, Gorton, Hayashi, Rouwenhorst, *The Fundamentals of Commodity Futures Returns,*[1639] and Ederington, Dewally, and Fernando, *Determinants of Trader Profits in Futures Markets,*[1640] offer empirical support for the hedging pressure hypothesis: That the returns on long futures positions vary inversely with inventory and price volatility.[1641] Haigh, Hranaiova, and Overdahl, in *Hedge Funds, Volatility, and Liquidity Provisions in the Energy Futures Markets,*[1642] suggest that hedge funds supply liquidity and that there is little linkage between price volatility and hedge fund position change. They claim that hedge fund participation in futures markets, at least as of 2007, was not injecting unwarranted volatility into futures prices.[1643]

Other papers on the fundamentals of supply and demand do not bear directly on position limits. Some discuss matters far afield from the impact of positions on price or other matters bearing on position limits.[1644] Others rest on unreliable model assumptions.[1645]

How Index Fund Speculation Can Drive Up Commodity Prices, Journal of Agricultural and Applied Economics (2010) (most of the changes in spot prices can be attributed to shifts in demand and supply, and failure to account properly for these inputs in the coffee price generation process may lead to serious overestimation of the effects of speculation; nevertheless, asserting without detailed analysis that speculation is an important part of the coffee price generation process), Gupta and Kamzemi, Factor Exposures and Hedge Fund Operational Risk: The Case of Amaranth (working paper 2009) (trying to explain the behavior of Amaranth on the mistaken notion that a hedge fund should be diversified); Henderson, Pearson and Wang, New Evidence on the Financialization of Commodity Markets (working paper 2012) (analysis founded on questionable assumption that commodity link note investors are uninformed investors); Van der Molen, Speculators Invading the Commodity Markets (working paper 2009) (data handling problems: Dataset which covers twenty years, while the variable index speculators is only available for two to three years, and assumes that net position is in indication of index speculators).

d. Switching Regressions

i. Switching Regression Analysis Described

In a switching regression analysis, an economist poses the existence of a model with more than one state. In the particular context of position limits, there are typically two states: (1) A normal state—where prices are viewed as what they theoretically should be following market fundamentals and (2) a second state—often described as a ''bubble'' state in these papers. Using price data, authors of these studies calculate the probability of a transition between these two states. The point of transition between the two states under this methodology is called a structural ''breakpoint.'' Examination of these breakpoints permits the researcher to date and time the existence of a second state, such as a bubble state.

These authors sometimes find empirical support in the data for the existence of a second state by calculating the probability of breakpoints. When the probability is high enough, the research will say that there is evidence for a second state.

ii. Advantages

A variant of this method was first published in 1973. It is fairly well-credentialed within academia. If there are two states of the world, it makes sense that distinct states would have different economic models. Because switching regressions uses at least a two-state regression, this method satisfies the economist's view that different states would be better described using different models. A one-size-fits-all model, applied to varying economic states, could potentially be compromised in order to accommodate disparate states.

This model is flexible, allowing for many different specifications (of model design) as explanatory variables of speculative positions and futures prices.

When using this method, the economic researcher permits the data itself to choose the structural breakpoints. This differs from some other statistical methods, where the economic researcher may choose exogenously, based on interpretation of the data or historical knowledge, where and when a transition to a supposed bubble state occurs. The model's selection of the breakpoint permits data to be tested against known historical events and thus lend a measure of credence to the model's choices for structural breaks.

The model also permits close study of particular time periods. An economist may well be aware of historical events that were market-transition events such as ''bubbles,'' and this method permits the economist to zero-in on that time period and to investigate potential causes and/or confounding events associated with a suspected market transition.[1646]

iii. Disadvantages

This method has a significant disadvantage that is highlighted in the position limit context. This statistical technique tests for a second state. There could, however, be reasons for a non-normal state other than a ''bubble'' state. This method leaves quite a bit to economic interpretation of the model, not raw data analysis, to reach their inference that the second state is a ''bubble'' state.

While the existence of a second state may indicate a ''bubble'' state and may indicate a problem with excessive speculation, this statistical method cannot definitively prove these inferences, even if position data were used in the analysis. The probability of the existence of second state in these studies in only circumstantial evidence of (1) a ''bubble'' state and (2) a ''bubble'' state caused by excessive speculation.

Consider an example of why data alone cannot explain why a deviation from a normal market state is a bubble state: The case of feeder cattle. If there is a drought and feed becomes scarce and expensive, the cattlemen may sell off part of their herd. Prices of feeder cattle may then drop in the short term as well, because cattleman may sell young calves, too. But subsequently, because so many cattle have been slaughtered, there is a shortage of feeder cattle the next season and the prices of feeder cattle rise. So in this case, there is theoretical and empirical support for two states, but they correspond to non-drought and drought states and not normal and ''bubble'' state. Switching regression analysis if applied to feeder cattle prices during a time period encompassing both drought and non-drought state would not establish the existence of what we could typically view as a ''bubble'' in the post-drought price rise.[1647] In any event, none of this price phenomenon can be viewed as a problem of ''excessive speculation.'' One could still use the ill-defined word ''bubble'' to describe the second state, but it would be a dearth of rainfall, not excessive speculation, which created this second state.

The theoretical level of the analysis, and in particular the lack of firm empirical data linking non-normal states to speculative ''bubble'' markets, are weaknesses of this statistical method. The studies following this method do not provide categorical proof of the existence of speculative ''bubble'' markets and they do not provide statistical evidence of whether positions limits would be effective in ameliorating ''bubble'' markets.[1648]

iv. Analysis of Studies Reviewed That Used Switching Regression

Five studies used a standard form of switching regressions analysis.[1649]

[1646] This method is particularly good at ''accommodating'' abrupt shifts in market data. Some statistic methods, such as those based on linear regression, may have difficulty with volatile data or data discontinuity. This method is also particularly well-suited for studying policy changes. For example, if the Federal Reserve makes a policy change that is expected to have a long-term, but not necessarily an immediate, impact, this method will permit an economist to infer, based on the model, the duration of the lag before the policy change begins to affect the markets.

[1647] This example is taken from an academic paper not within the administrative record that found non-fundamental (or ''bubble'') prices in crude oil and feeder cattle markets. Brooks et al, Boom and Busts in Commodity Markets: Bubbles or Fundamentals? (working paper 2014).

[1648] These models are difficult to design well in this context for several other reasons. The economist is making an informed, probabilistic inference that a transition has occurred. This inference is more than a seat-of-the-pants determination, but it is less than a mathematical certainty. The result of this statistical method is also highly dependent upon what set of data the econometrician selects for analysis. An economic model founded on this method should be given more credence when it is applied to more than one dataset and the results are replicated with different data. Selection of controlling variables that would account for position data is a difficult task with this statistical model. The data-driven nature of the model does not help in selection of proper controlling and explanatory variables. Ingenuity is required to design explanatory variables that would account well for position data.

[1649] These are: Cifarelli and Paladino, Commodity Futures Returns: A non-linear Markov Regime Switching Model of Hedging and Speculative Pressures (working paper 2010) (concluding that speculation, not supply and demand factors, drive some daily price swings in certain energy futures); Chevallier, Price Relationships in Crude oil Futures: New Evidence from CFTC Disaggregated Data, Environmental Economics and Policy Studies (2012) (the influence of financial investors through the S&P GSCI Energy Spot may have contributed to price changes in the crude oil market) (discussed in ensuing text); Hache and Lantz, Speculative Trading & Oil Price Dynamic: A Study of the WTI Market, Energy Economics, Vol. 36, 340 (March 2013) (cannot reject hypothesis that variations in the positions of non-commercial players may have played a ''destabilising role in petroleum markets'' and ''speculative trading can be considered an important factor during market instability and 'oil bubbling' process''); Lammerding, Stephan, Trede, and Wifling, Speculative Bubbles in Recent Oil Price Dynamics: Evidence from a Bayesian Markov Switching State-Space Approach, Energy Economics Vol. 36 (2013) (claims to find robust evidence of ''bubbles'' in oil prices associated with speculation); and Sigl-Grüb and Schiereck,

Continued

Three studies used a related methodologies, multi-state regressions or conditional correlations.[1650]

Most of these studies are not helpful because they do not use position data or because they have technical issues.[1651] It is difficult to perform these types of studies well. A study finding the existence of transitions between states can be unconvincing if it does not have solid theoretical and economic justifications for the data selected and the model's design. Many of the disadvantages of this methodology, discussed above, find expression in these papers.

However, there is one switching regression study worthy of further discussion in our view. It is well-executed and employs position data: Chevallier, *Price Relationships in Crude oil Futures: New Evidence from CFTC Disaggregated Data.*[1652] Of course, it inherits all the difficulties of speculative position data, such as the difficulty separating hedgers from speculators. Yet Chevallier's effort does persuasively suggest the existence of two states in price structure during 2008 crude oil market price swings. His paper suggests that with highly inelastic supply and demand, the influence of financial investors through the S&P GSCI Energy Spot may have contributed to price changes in the crude oil market.

Using switching regressions, Chevallier attempts to reconcile two strands of economic literature: Papers that posit the predominance of supply and demand fundamentals and other papers that investigate speculative trading. Chevallier employs macroeconomic variables, proxies for supply and demand fundamentals, and speculative positions (net open position of speculators) in his model specifications. Using switching regression analysis, he concludes that one cannot eliminate the possibility of speculation (a reason why the physical commodity may move into and out of storage) as one of the main reasons behind the 2008 oil price swings.

This is an important result. Other economic studies using models of supply and demand purport to explain the 2008 price swings in crude oil without incorporating speculation into demand. Chevallier's paper suggests that speculation cannot be ruled out as a cause. Specifically, using net speculative positions as one of his variables in his test, he found that this variable was statistically significant on crude oil futures natural logarithm of price returns during the 2008 time period.[1653]

This result posits that speculation may have played some role during the 2008 crude oil futures price swings. It suggests that studies that look only to supply and demand without incorporating speculative demand to explain the crude oil market in 2008 may be overlooking an important factor. The switching regression methodology in this context functions as a cross-check to determine whether models of fundamental supply and demand can, in fact, account for all the price swings in crude oil during this time. In at least this particular commodity market and timeframe, Chevallier's finding that net speculative positions are correlated with crude oil future prices suggests a price effect from net speculative positions.

e. Eigenvalue Stability

i. Description

Some economists have run regressions on price and time-lagged values of price. They estimate the time-lagged regression over short time internals. They do this to detect, through examination of specific terms in their lagged price model, unusual price changes. In technical terms, they use a difference equation for lagged price with different estimated values (*i.e.,* coefficients) for different time-lagged price variables. They then solve for the roots of that characteristic equation and look for the eigenvalues (latent values) with absolute value greater than one. They conclude that eigenvalue indicates that the price of the commodity is in an ''exploding'' state or a ''bubble.'' [1654]

ii. Advantages and Disadvantages

This method can be applied after-the-fact to historical data to try to ascertain whether past price changes constituted a ''bubble.'' Or it can be applied to real-time data to predict whether a current state of affairs is a ''bubble.'' For these reasons, some economists perceive, as an advantage of this method, the ability through statistical means to date and time ''bubbles'' in prices.

On the other hand, this method is based on a model and the results of any analysis are only as strong as the model. The model is limited to price data and a constant. Models using this technique do not permit the study authors to include other explanatory variables. This is a disadvantage because it is likely that there are variables of interest other than lagged prices when considering whether price instability exists. For example, someone interested in position limits would want to include an explanatory variable such as speculative positions in the regressions, but this technique does not permit this.

Further, the model allows for wide discretion in the number of lagged prices used. The studies' authors often look at ''goodness of fit'' results to determine how many lags to select, seeking to set the model based upon the data. This step may make the model uniquely tailored to a particular dataset but not easily applicable to another. Put another way, selecting an important model feature based on testing of the data runs the risk of a selection that is not based on any theoretical or economic fact, but instead on ad hoc assumptions made by the modelers and any idiosyncrasies of the dataset.[1655]

iii. Analysis

Economists using this methodology attempt to find the existence of price ''bubbles'' using eigenvalue stability methods. Three such papers were

Speculation and Nonlinear Price Dynamics in Commodity Futures Markets, Investment Management and Financial Innovations, Vol. 77, pp. 59–73 (2010) (''short-run autoregressive behavior'' of commodity markets is driven not only by fundamentals but also by trading of speculators).

[1650] These are: Fan and Xu, What Has Driven Oil Prices Since 2000? A Structural Change Perspective, Energy Economics (2011) (multi-state); Baldi and Peri, Price Discovery in Agricultural Commodities: The Shifting Relationship Between Spot and Futures Prices (working paper 2011) (multi-state); Silvernnoinen and Thorp, Financialization, Crisis and Commodity Correlation Dynamics, Journal of Int'l Financial Markets, Institutions, and Money (2013) (conditional correlations). All three of these papers are of mixed methodology, applying switching regression analysis to relationships between prices that are viewed by the papers' authors as cointegrated.

[1651] For example, the study by Sigl-Grüb and Schiereck employs a smooth transition (as opposed to an abrupt change) between states. Unfortunately, the study's model does not have a high goodness-of-fit values (all adjusted-R^2 are below 0.05 and most are below 0.01), nor fundamental economic explanatory variables (only lagged prices and speculative positions in the transition component between states). These are shortcomings. In particular, the latter omission may overstate the importance of speculative positions.

[1652] Chevallier, *Price Relationships in Crude oil Futures: New Evidence from CFTC Disaggregated Data,* Environmental Economics and Policy Studies (2012).

[1653] Specifically, Chevallier found that in the first state, the coefficient of the logarithmic returns of net speculative positions is positive and significant (1 percent level). In the second state, this coefficient is negative and mildly significant (10 percent level). Chevallier's results show statistically significant relationships between the volume of speculative positions in particular and logarithmic price returns.

[1654] *See, e.g.,* Goyal and Tripathi, Regulation and Price Discovery: Oil Spot and Futures Markets at 15–16 (working paper 2012) (describing methodology in more detail).

[1655] Even if there were not such problems, the methodology has an insurmountable theoretical difficulty. The use of the ''unit root'' test, as a part of this eigenvalue methodology, is an inherently suspect way of identifying explosive price behavior. That is because the unit root tests rely upon a small a set of observations to approximate long-term price behavior.

submitted.[1656] All the authors find ''evidence'' of various ''bubbles.'' However, in none of these studies is there reasonable empirical evidence to support the inferential leap between instability, ''bubbles,'' and excess speculation. In particular, for all of these studies, there is no link made in the data between price instability and positions. These studies do not use position data. The problem inheres in the method, which, while purporting to detect the existence of ''bubbles,'' does not permit the research to link supposed bubble to speculative positions.

In modern markets, prices can change rapidly for many reasons. The ''explosion'' of a price over a short time interval does not necessarily reflect uneconomic behavior or a price ''bubble.'' It could simply represent a ''shock.'' That shock need not come from speculative activity. The price path may not be smooth. For this reason, these models are conceptually flawed when applied to commodity prices and commodity futures prices.

For example, in Gilbert, *Speculative Influences on Commodity Futures Prices,*[1657] Gilbert uses a variant of this methodology in an early section of his paper to find ''clear evidence'' of ''bubble periods'' for copper and soybeans lasting days and weeks.[1658] He finds unexplained price increases in crude oil for periods of time that are ''insufficient to qualify as bubbles.'' [1659] Using just price data, and not positions, Gilbert's attribution of lingering price spikes cannot be attributed to speculative positions.[1660]

There is a subtler disadvantage that inheres in the inference between the identification of price growth without bound and the existence of a bubble. To examine intervals where a price series is appearing to grow without bound and to infer that that implies a bubble is problematic. A time series for price of an asset is unlikely to tend to infinity because, eventually, this would likely lead to infeasible prices (generally, in the absence of hyperinflation). We do not expect the real price of an asset, which is the price is adjusted for inflation, to grow without bound.

2. Theoretical Models

Some economic papers cited in this rulemaking perform little or no empirical analysis and instead, present a general theoretical model that may bear, directly or indirectly, on the effect of excessive speculation in the commodity marketplace. Within the 26 theoretical model papers in the administrative record, there is a subset of papers which may be viewed as generally supportive or disapproving of position limits. Because these papers do not include empirical analysis, they contain many untested assumptions and conclusory statements. In the specific context of academic analysis of position limits (as opposed to policy formulation) theories are useful but must be tested empirically.

Theoretical Papers Directly or Indirectly Support Position Limits

Two studies presented theoretical models establishing the risk of price manipulation in the derivatives markets, including cash-settled contracts, suggesting that position limits might be particularly helpful in cash-settled contracts.[1661] A few studies presented theoretical reasons why financial investors might increase or ''destabilize'' commodity futures prices [1662] or the spot price.[1663]

Theoretical Studies Indirectly Criticizing at Least Some Position Limits

On the other hand, there were theoretical papers that reached conclusions which could be helpful to position limit skeptics, such as the power of the marketplace to ''self-discipline'' would-be excessive speculators.[1664] Some papers offer theoretical grounds for the concern that more restrictive or ''extreme'' position limits might increase price volatility.[1665]

Even these papers are not firm in their opposition. In *The Self-Regulation of Commodity Exchanges: The Case of Market Manipulation,* Journal of Law and Economics (1995),[1666] Craig Pirrong (an economic expert for ISDA/SIFMA in the position limits rulemaking) argues that there ''is no strong theoretical or empirical reason to believe that self-regulating exchanges effectively deter corners.'' [1667] He simply disagrees that other forms of regulation such as position limits ''could do better.'' [1668] Pirrong does not discount the harm of price manipulation. Pirrong's *Manipulation of the Commodity Futures Market Delivery Process,*[1669] documents these harms.[1670]

Other Theoretical Papers

A set of papers suggest that there can be excessive speculation in oil without

a significant increase in crude oil inventories.[1671] The remaining theoretical papers in the administrative record focus on useful economic background on price manipulation; [1672] comovement effects in the equity or options markets,[1673] high-frequency trading,[1674] or other matters of marginal relevance.[1675]

3. Surveys and Opinions

The remaining 73 papers are survey pieces. Some of these papers provide useful background material.[1676] But on the whole, these survey pieces offer opinion unsupported by rigorous empirical analysis. These papers, if they presented statistics at all, presented descriptive statistics. An inherent difficulty with this approach is that the facts that the author presents to support the author's theory may be incomplete and not fully representative of economic reality.

While they may be useful for developing hypotheses, they often exhibit policy bias and are not neutral, reliable bases for judgments in the academic context (again, as opposed to the judgments of policymakers).[1677]

We have reviewed all 73 papers in this category and discuss below only those few that add marginal value to the empirical analyses discussed above.

a. Frenk and Turbeville (Better Markets)

Frenk and Turbeville, in *Commodity Index Traders and the Boom/Bust Cycle in Commodities Prices,*[1678] present a survey of economic literature that incorporates some empirical testing for the price impact of index fund ''rolling'' of commodity index fund positions. Rolling refers to the time when commodity index funds, such as those tracking a popular commodity index such as the Standard & Poor's Goldman Sachs Commodity Index (GSCI), must roll forward their expiring futures contracts to maintain their (typically long) positions.[1679] Frenk and Turbeville argue that the index fund roll ''systematically distorts forward commodities futures price curves toward a contango [1680] state, which is likely to contribute to speculative 'boom/bust' cycles. . . .'' [1681]

This set of inferences is problematic for several reasons. First, it depends on the current existence of a price impact from rolling. Yet the roll price impact is a market phenomenon that may no longer be as substantial as it once was. The market now has general knowledge of the influx of commodity index traders and their established rolling behavior. Moreover, many ETFs announce in their prospectus how they will trade, and most large exchange-traded funds now ''sunshine'' their rolls: To announce to the market in advance when and how they will roll.[1682] These trends have lessened the price impact of the rolls.

Moreover, the Frenk and Turbeville article ascribes the contango state of commodity futures prices to the price impact of roll without empirical analysis to support a causal link. There has historically been an alternation between contango and backwardation in the crude oil commodity market: This phenomenon has been attributed to changes in short-term supply or demand, increased market participation on the long side to earn the risk premium associated with going long, and other reasons, but not the technical aspects of commodity index rolls.[1683] Frenk and Turbeville's article is unpersuasive in ascribing large boom/bust cycles in price to waning and temporary price impacts of rolls.

Several other survey papers posit the existence of a speculative bubble in price due to speculation along the lines of the Frenk and Tuberville article. But these studies also do not present an empirical analysis to support this conclusion.[1684]

[1671] Avriel and Reisman, *Optimal Option Portfolios in Markets with Position Limits and Margin Requirements,* Journal of Risk (2000) (a theoretical model suggesting that speculation may push crude oil prices above the price level is justified by physical-market fundamentals without necessarily resulting in a significant increase in oil inventories); Pierru and Babusiaux, *Speculation without Oil Stockpiling as a Signature: A Dynamic Perspective* (working paper 2010); Routledge, Seppi, and Spatt, *Equilibrium Forward Curves for Commodities,* Journal of Finance (2000) (important work on the theory of storage). *See* Parsons, *Black Gold & Fool's Gold: Speculation in the Oil Futures Market* at 82, 106–107 (Economia 2009) (not a theoretical model paper, but a survey piece, that indicates that if oil prices were driven above the level determined by fundamental factors of supply and demand by forces such as speculation, storage would not necessarily increase; an argument that this would occur ''overlooks how paper oil markets have been transformed'' and ''successful innovations in the financial industry made it possible for paper oil to be a financial asset in a very complete way'').

[1672] Kyle and Viswanathan, How to Define Illegal Price Manipulation, American Economic Review (2008); Westerhoff, Speculative Markets and the Effectiveness of Price Limits, Journal of Economic Dynamics and Control (2003) (discussing when price limits can be welfare-improving).

[1675] Morris, Speculative Investor Behavior and Learning, Quarterly Journal of Economics (1996); Kyle and Wang, Speculation Duopoly with Agreement to Disagree: Can Overconfidence Survive the Market Test?, Journal of Finance (1997); Leitner, Inducing Agents to Report Hidden Trades: A Theory of an Intermediary, Review of Finance (2012); Sockin and Xiong, Feedback Effects of Commodity Futures Prices (working paper 2012); Froot, Scharfstein, and Stein, Herd on the Street: Informational Inefficiencies in a Market with Short Term Speculation (working paper 1990) (theoretical paper discussing herding); Dicembrino and Scandizzo, The Fundamental and Speculative Components of the Oil Spot Price: A Real Option Value (working paper 2012).

[1676] Basu and Gavin, What Explains the Growth in Commodity Derivatives?, Federal Reserve Bank of St. Louis (2011), provides an excellent analysis of the factors driving rapid increases in volume in commodity derivatives trading. *See* also Easterbrook, Monopoly, Manipulation, and the Regulation of Futures Markets, Journal of Business (1986); Pirrong, Squeezes, Corners, and the Anti-Manipulation Provisions of the Commodity Exchange Act, Regulation (1994).

[1677] For example, a CME Group white paper, Excessive Speculation and Position Limits in Energy Derivatives Markets (undated), lacks empirical data or other economically valid supporting analysis. It also uses confusing terminology. For example, CME quotes a Wall Street Journal survey of economists, which in turn summarily concludes: ''[t]he global surge in food and energy prices is being driven primarily by fundamental market conditions, rather than an investment bubble.'' *Id.* at p.5. Even economists who find some price impact from outsized speculative positions would not disagree that, in the main, prices remain determined ''primarily'' by market fundamentals. And many of these economists finding price impact would not ascribe the result to an ''investment bubble.''

[1678] Frenk and Turbeville, Commodity Index Traders and the Boom/Bust Cycle in Commodities Prices (Better Markets 2011).

[1679] *See id.* at 8–9 for a description of the mechanics of the roll. *See also* Mou, Limits to Arbitrage and Commodity Index Investment: Front-Running the Goldman Roll (working paper 2011).

[1680] *See id.* at 5–6 for a description of contango, an upward-sloping forward price curve for a commodity. Market participants may view contango as evidence that commodity prices will increase in the future.

[1681] *Id.* at 2. *See id.* at 4 (focusing on crude oil and wheat price spreads before, during, and after the role from January 1983 to June 2011).

[1682] Otherwise, other market participants may assume that the rolling activity reflects an informed trader reacting to market fundamentals and the roll could well impair the price discovery function of the commodities market. See Urbanchuk, Speculation and the Commodity Markets, at p. 12 (working paper 2011) (''traders can misinterpret an index inflow as a bullish statement by a trader with superior information''). While not every large institutional trader has to ''sunshine,'' those that announce their rolling timing in their prospectus are bound by SEC rules to follow their prospectus procedures.

[1683] *See* Parsons, Black Gold & Fool's Gold: Speculation in the Oil Futures Market, at 99–101, Economia (2009) (discussing crude oil market economics that explain why crude oil futures prices are sometimes in contango); id. at 101 (''Although oil futures fluctuate between backwardation and contango, on average they have been backwarded'').

b. Senate Reports

i. Senate Report on Oil and Gas Prices

The U.S. Senate staff report on oil prices concludes that increased participation by speculators in the energy commodity futures markets has had an effect on energy prices.[1685] Other survey pieces assert that market fundamentals fully explain commodity price spikes.[1686] These survey articles do not present rigorous statistical models to support their competing conclusions.

The Senate report points out that fundamental supply and demand were factors increasing energy prices.[1687] But it determines that these factors ''do not tell the whole story.'' [1688] It asserts that the large purchases of crude oil futures contractors by financial speculators ''have, in effect, created an additional demand for oil. . . .'' [1689] The report acknowledges that the price effect is ''difficult to quantify,'' and cites unspecified analysts on estimated price impact.[1690]

But in the general economics of the futures market, demand for futures contracts does not necessarily increase the demand for, or price of, the physical commodity. In the particular context of the crude oil markets, as discussed above, demand for ''paper oil'' may not directly translate into spot price impact due to storage economics.[1691]

Regarding price effect, the Senate report relies on anecdotal evidence because of the difficulty in quantification. The Senate report cites reports from energy industry participants that financial speculators have caused the price of oil to rise.[1692] The report also acknowledges that analyses of the effect of speculation on these energy markets have reached divergent conclusions.[1693]

The Senate Report does not analyze how position limits would ameliorate the problem it identifies. While not all the speculators referenced in this report would be affected by a position limit rule, the Senate Report does list Brian Hunter, then a trader in natural gas for Amaranth Advisors hedge fund, among the top 2005 energy traders.[1694] These reports, which include factual recitation and anecdotal evidence, contain no models or methods that can be audited by economists.

ii. Senate Report on Wheat

The Senate staff report concerning wheat [1695] surveys economic literature and certain market data, but, like the Senate Report on oil and gas prices, this report does not use statistical or theoretical models to reach an economically rigorous conclusion. The Senate wheat report does include anecdotal evidence: Virtually all of the commercial traders interviewed by the Senate staff ''identified the large presence of index traders in the Chicago market as a major cause'' of a problem with price convergence in wheat in 2008.[1696] The staff report states that the demand for wheat futures contracts has itself increased the price of wheat futures contracts relative to the cash market for wheat:

> These index traders, who buy wheat futures contracts and hold them without regard to the fundamentals of supply and demand in the cash market for wheat, have created a significant additional demand for wheat futures contracts that has as much as doubled the overall demand for wheat futures contracts. Because this significant increase in demand in the futures market is unrelated to any corresponding supply or demand in the cash market, the price of wheat futures contracts has risen relative to the price of wheat in the cash market. The very large number of index traders on the Chicago exchange has, thus, contributed to ''unwarranted changes'' in the prices of wheat futures relative to the price of wheat in the cash market. These ''unwarranted changes'' have, in turn, significantly impaired the ability of farmers and other grain businesses to price crops and manage price risks over time, thus creating an undue burden on interstate commerce. The activities of these index traders constitute the type of excessive speculation that the CFTC should diminish or prevent through the imposition and enforcement of position limits as intended by the Commodity Exchange Act.[1697]

However, there are other reasons that can also explain this 2008 price divergence. The CME wheat contract was poorly designed to account for the cost of storage, and this has been cited as a reason for the price divergence between futures and spot wheat contracts during the 2008 time period. When CME revised its wheat contract, this price divergence dissipated.[1698]

That said, the more formal statistical studies discussed throughout establish rationales for concern with index traders that are grounded in more rigorous economic reasoning. There are circumstances when a large volume of financial index investment flows may causes market prices to deviate from fundamental values.[1699] Alternatively, a

Speculative Bubble, at p.8, MIT Center for Energy and Env'l Research (2008) (''there is no reason based on current and expected supply and demand that justifies the current price of oil''); Parsons, Black Gold & Fool's Gold: Speculation in the Oil Futures Market, Economia (2009) (explaining why, on a theoretical level, the absence of large crude oil inventories does not preclude a crude oil price bubble); Tokic, Rational destabilizing speculation, positive feedback trading, and the oil bubble of 2008, Energy Economics (2011) (survey with theoretical model adjunct). *See also* Urbanchuk, Speculation and the Commodity Markets, at 8–9 (working paper 2011) (observing that the share of corn futures held by commercial traders has fallen from more than 70 percent in January 2005 to about 40 percent in August 2011); id. at 12 (arguing that speculators are a major factor behind the sharp increase in the level and volatility of corn prices in 2011 because ''traders can misinterpret an index inflow as a bullish statement by a trader with superior information''); Inamura, Kimata, et al., Recent Surge in Global Commodity Prices (Bank of Japan Review March 2011) (contending that global monetary policies have tended to boost commodity prices).

[1696] Excessive Speculation in the Wheat Market at 11–12.

[1697] *Id.* at 12.

[1698] See supra note 1547. When CME revised its wheat contract, this price divergence dissipated. The futures wheat contract, at expiration, had a valuable real option to store the wheat at a below-market price. This may have been a primary reason why it was more valuable at expiration than spot wheat.

[1699] *See* Aulerich, Irwin, and Garcia, Bubbles, Food Prices, and Speculation: Evidence from the CFTC's Daily Large Trader Data Files, at pp.2–3, NBER Conference on Economics of Food Price Volatility (2012) (summarizing that this could happen when (1) the futures market is insufficiently liquid to absorb large order flow, (2) the index traders are in effect noise traders who make arbitrage risky, or (3) large order flow on the long

Continued

classical economist would argue that prices are still determined by supply and demand, but that the aggregate risk appetite for financial assets affects the demand for commodities through a more complicated process than previously envisioned.

For reasons similar to the Senate Report on Oil and Gas Prices, the Senate Report on Wheat is less useful to an academic than it may be to policymakers.

iii. Senate Report on Natural Gas

A similar analysis applies to the Senate report on natural gas, *Excessive Speculation in the Natural Gas Market.* The report, which focuses at length on Amaranth's natural gas trading, does not include a statistical analysis of empirical data and, as the minority report notes, some '' facts . . . support the conclusion that Amaranth's trading activity was the primary cause of'' natural gas price spikes,'' but other facts point to market fundamentals.[1700]

The report does argue that if Amaranth's large-scale speculative trading was causing ''large jumps in the price differences'' and prices that were ''ridiculous,'' [1701] the current regulatory regime would be unable to prevent this price disruption.[1702]

4. Comments That Consist of Economic Studies or Discuss Economics in Depth

Several comment letters perform substantial summary analysis of other economic studies bearing on position limits, present original economic analysis or formal economic studies. These submissions thus warrant individual analysis. The following submissions are summarized and analyzed in this section:

(A) the February 10, 2014, comment letter by Markus Henn of World Economic, Ecology & Development, including, as an attachment, a November 26, 2013, list of studies entitled ''Evidence on the Negative Impact of Commodity Speculation by Academics, Analysis and Public Institutions'' (''Henn Letter''); [1703]

(B) the analysis of Philip K. Verleger of the economic consulting firm PKVerleger LLC, attached as Annex A to the February 10, 2014 comment letter by the International Swaps and Derivatives Association (ISDA) and the Securities Industry and Financial Markets Association (SIFMA) (''2/10/14 ISDA/SIFMA Comment Letter'');

(C) the analysis of Craig Pirrong, Professor of Finance at the University of Houston Business School, attached as Annex B to the 2/10/14 ISDA/SIFMA Comment Letter;

(D) two studies by Sanders and Irwin, *The ''Necessity'' of New Position Limits in Agricultural Futures Markets: The Verdict from Daily Firm-Level Position Data* (working paper 2014), and *Energy Futures Prices and Commodity Index Investment: New Evidence from Firm-Level Position Data* (working paper 2014);

(E) two studies by Hamilton and Wu, *Effects of Index-Fund Investing on Commodity Futures Prices,* International Economic Review, Vol. 56, No. 1 (February 2015), and *Risk Premia in Crude Oil Futures Prices,* Journal of International Money and Finance (2013) (submitted as second paper in the same electronic comment submission); and

(F) materials that CME Group submitted for inclusion in the administrative record, include 3 sets of materials submitted on March 28, 2011 (first set, second set, and third set); an undated CME study on conditional spot-month limits; and a CME Group's white paper, *Excessive Speculation and Position Limits in Energy Derivatives Markets.*[1704]

a. The Markus Henn List of Studies

Markus Henn's February 10, 2014, comment letter acknowledges that there is an ongoing debate about whether speculators can dominate a marketplace and exacerbate market volatility and market prices. He nonetheless asks the Commission to take into account a list of studies he submits with his letter. He then presents numerous economic studies as well as media articles.

As a group, this list of studies, opinion pieces, and news articles documents the existence of concern and suspicion about large speculative positions in commodity markets. Many of the studies cited by the Henn Letter look for evidence of financialization and in this sense suffer from interpretational bias.[1705] As a group, these opinion pieces and studies do not consistently seek alternative explanations for their conclusions. As Markus Henn acknowledges in his cover letter, these papers are part of an ongoing debate among economists, not conclusive evidence of the harmful effects of excessive speculation.

Three of the most persuasive papers, persuasive insofar as they employ well-accepted, defensible, scientific methodology, document and present facts and results that can be replicated, and are on point regarding issues relevant to position limits, cited in the Henn Letter involve the crude oil market during the financial crisis: Singleton, *Investor Flows and the 2008 Boom/Bust in Oil Prices* (March 23, 2011 working paper); [1706] Hamilton and Wu, *Risk Premia in Crude Oil Futures Prices,* Journal of International Money and Finance (2013) (an earlier working paper version is cited by Henn); and Hamilton, *Causes and Consequences of the Oil Shock of 2007–2008,* Brookings Paper on Economic Activity (2009). The first two conclude that there is a statistical link between the volume of speculative positions and a component of price, risk premium, at least for some commodities in some timeframes. Hamilton's *Causes and Consequences of the Oil Shock of 2007–2008* concludes that the oil price run-up was caused by strong demand confronting stagnating world production, but the price collapse was perhaps not driven by fundamentals.

side of the market is seen erroneously as traders taking bullish positions based on valuable information about market fundamentals). *See id.* at pp.3–4 (observing contrasting findings depending on impact of index trading depending on liquidity of the agricultural commodity market); Singleton, Investor Flows and the 2008 Boom/Bust in Oil Prices, at 5–8 (March 23, 2011 working paper) (learning about economic fundamentals with heterogeneous information may induce excessive price volatility, drift in commodity prices, and a tendency towards booms and busts); Tang and Xiong, Index Investment and Financialization of Commodities, at p.30, Financial Analysts Journal (2012) (''the price of an individual commodity is no longer simply determined by its supply and demand''); *id.* at 29–30 (''Instead, prices are also determined by a whole set of financial factors such as the aggregate risk appetite for financial assets'').

[1700] *Id.* at 135 (while price of natural gas declined after Amaranth's demise, ''this alone does not prove Amaranth's ability to elevate prices above supply and demand fundamentals'').

[1701] *Id.* at 3.

[1702] *Id.* at 3 (NYMEX exchange did not have routine access to Amaranth's trading positions on ICE, and therefore NYMEX could not have a complete and accurate view of whether ''a trader's position . . . is too large.'' In addition, there were no accountability limits on the ICE exchange).

[1703] *See* Letter from Markus Henn, World Economic, Ecology & Development, to CFTC (Feb. 10, 2014), available at *http://comments.cftc.gov/PublicComments/ViewComment.aspx?id=59628&SearchText=henn. See also,* Markus Henn, Evidence on the Negative Impact of Commodity Speculation by Academics, Analysis and Public Institutions, (Nov. 26, 2013), available at *http://comments.cftc.gov/PublicComments/ViewComment.aspx?id=59628&SearchText=henn.*

[1704] The CME white paper, while technically not submitted formally by CME in the administrative record, warrants individualized analysis. It is cited in the Commission's December 2013 Position Limits Proposal; it is posted on the CME Group's Web site; and it is cited in arguments by such commenters as MFA. (MFA February 9, 2014 comment letter at 11–12, n.26).

[1705] *Id.*

[1706] Markus Henn cites the 2011 version of the Singleton paper, which is the only version of this paper in the administrative record. A subsequent May 2012 version is available from Professor Singleton's Stanford Web site at *http://web.stanford.edu/~kenneths/.*

b. Verleger's Analysis, Attached to ISDA/SIFMA Comment Letter

Philip K. Verleger provided an analysis as a retained expert for ISDA. Annex A to the 2/10/14 ISDA/SIFMA Comment Letter. He contends, without quantitative modelling or empirical evidence, that in the energy markets ''unwarranted price fluctuations'' have historically been due to ''confluence of contributing factors'' such as weather, geopolitical events, or changes in industry structure. 2/10/14 ISDA/SIFMA Comment Letter, Annex A at pp. 2–3. In passing, he opines, without analysis or citation, that the high energy prices in 2008 ''are attributable to environmental regulation.'' *Id.* Verleger also asserts that his expertise is in the energy markets, yet opines (contrary to many comment letters from other energy market participants) that the energy markets are ''subject to conditions and dynamics'' of other commodity markets. *Id.* at p.2. For these reasons, we view Verleger's analysis as weak and conclusory and lacking in economic rigor and empirical data.

By way of further example, Verleger contends that if the position limits rule had been in effect in 2013, oil prices would have been $15 per barrel higher and the cost to American consumers would have been roughly $100 billion. Annex A at p.3. He provides no quantitative reasoning in support of these numbers.[1707]

Verleger also asserts that exploration for sources of energy has resulted in a large increase in oil supply in recent years, and states that these companies use swaps and futures to hedge their position. *Id.* at p.7. He then summarily asserts that independent companies exploring for and developing oil and gas production would ''not have achieved this success without hedging'' and that hedging would not have occurred if the Commission's position limits had been in place. *Id.* at p.8. Verleger overlooks several critical facts.

First, companies actively engaged in oil and gas exploration might either qualify for bona fide hedging treatment or fall within the position limit. As to non-spot month limits, Verleger concedes that ''it may be argued that the initial non-spot month position limits are high enough (109,000 contracts for crude as an example)'' to avoid liquidity impacts. *Id.* at 12.[1708]

Second, he argues that these exploration companies have ''benefited indirectly because passive investors such as retirement funds have taken long positions in commodities through the swap markets,'' and suggests that with position limits there would be an absence of non-commercials to take positions opposite oil and gas development companies. *Id.* at 9. To the contrary, with the Commission's disaggregation exemption for managed funds (the independent account controller exemption), there is no basis to believe that there will be a shortage of long positions in the market. He presents no empirical evidence to support his thesis that position limits could thus ''adversely affect[ ] investment in the oil and gas industry.'' [1709]

Third, the way energy derivatives markets work, if there is demand on the short side of the market, this may create liquidity on the long side of the market to transact with at some price. Verleger himself notes the diversity of market participants—commodity-based exchange-traded funds, hedge funds, retirement funds, and the like—and does not document that the exclusion of a particular long would reduce liquidity from the marketplace. For example, commodity-based exchange-traded funds trade intermediate long positions for their investors, and if the funds themselves could not take long positions in the market, there is no reason to assume that the investors might through other vehicles take long positions. Verleger has an expressed fear, not an analysis, that liquidity in markets will be harmed by position limits.[1710]

c. Pirrong's Analysis, Attached to ISDA/SIFMA Comment Letter

Professor Pirrong agrees that the nation's commodity markets have been subject to significant and disruptive corners and squeezes, such as the Hunt Silver episode of 1979–1980.[1711] He concedes that the ''ability of position limits to prevent corners and squeezes could provide a justification for application of these limits during the spot month,'' at least in theory.[1712] He concedes that in theory there is such a thing as ''sudden and unwarranted price fluctuations.'' [1713] Subject to these concessions, Pirrong opposes many aspects of the rule. Overall, Pirrong argues that position limits are an undesirable solution to an economic problem that has not been proven to exist.[1714] We analyze below his objections only when and to the extent that they rest on economic arguments.

i. Amaranth and the Possible Utility of Position Limits in Non-Spot Months

Pirrong states that the possibility of a corner or a squeeze ''provides no justification of the necessity of imposing position limits outside the spot month.'' [1715] Pirrong argues that Amaranth's market activity in 2006 is not evidence of the utility of position limits in the non-spot month. *Id.* at p.2, ¶ 7. In this context, Pirrong discusses corners and squeezes as the rationale for non-spot month position limits. *Id.* However, the Commission's December 2013 Position Limits Proposal discusses rationales other than corners and squeezes: Economic factors such as outsized market power, disorderly liquidation, and the ability to manipulate prices.

In the context of non-spot month position limits, Pirrong focusses just on corners and squeezes. If that were the only regulatory concern, his analysis on this, *see id.* at ¶¶ 27–30, would be largely correct. Many traders exit futures contracts before the spot month because they are there for the exposure, for price risk transfer, not to make or take delivery.

One key reason why ETFs ''sunshine-trade'' their rolls—announcing in their prospectus when they will roll—is because rolling these large positions in non-spot months can have a price impact, apart from corners and squeezes.[1716]

A good example of the risk of price impact in non-spot months from outsized positions, apart from corners

[1707] Verleger argues that limits in the non-spot month would have an especially chilling effect, ''very likely leading to, among other things, higher energy prices;'' and that position limits should not apply to cash-settled markets because traders holding cash-settled contracts do not have any ability to influence the physical market prices of commodities. *Id.* at 2–3. Pirrong also makes these arguments but provides further analysis, so we discuss this critique in subsection C below.

[1708] *See* Berg, The Rise of Commodity Speculation: From Villainous to Venerable, at p.263 (UN FAO 2011) (former CBOT trader suggests that spot month limit positions should be in place for at least a few days in the non-spot months to lesson price distortions from the roll).

[1709] *Id.*

[1710] *See, e.g.,* id. at 12 (after observing that non-spot month limits are high enough to perhaps not impact the market, stating that non-spot limits will ''adversely affect the ability of commercial participants to use some futures market'').

[1716] Sanders and Irwin, The ''Necessity'' of New Position Limits in Agricultural Futures Markets: The Verdict from Daily Firm-Level Position Data, at p.19 (working paper 2014) (preannounced trades can have a ''sunshine trading'' effect of increasing liquidity and lowering trading costs). *See, e.g.,* Frenk and Turbeville, Commodity Index Traders and the Boom/Bust Cycle in Commodities Prices (Better Markets 2011) (very large institutional players rolls have had a temporary price impact that is expensive to the ETF investors).

and squeezes, is Amaranth. Amaranth's position was so large that it may have impacted price by virtue of its outsized market position in not just the spot month, but other months. Amaranth may have influenced prices not just upon liquidation, not just when banging the close in the spot month, but also well before then, according to a congressional study cited in the Commission's December 2013 Position Limits Proposal.[1717]

An economist could argue that because the commodity futures price should reflect all demand, Amaranth's very large positions in the non-spot month was appropriately incorporated in market prices. After all, at a given point in time and price, demand is defined as the quantity desired by all those who are willing and able to hold a commodity futures position. Prof. Pirrong's approach does conceive of the possibility that outsized market power in the non-spot month or the price impact of Amaranth's positions could have deleterious effects on the marketplace. From a classical economical perspective, Amaranth's outsized market position in the non-spot months is just an input into price demand.

However, outsized market power may have economic outcomes that are undesirable. Outsized market power permits a player to do more than ''bang the close,'' and Amaranth's natural gas trading is an example of this. One could influence prices in the swaps market through such aggregation of market powers or one could manipulate related markets. Amaranth's exercise of market power may have been real and substantial. Even after it left the natural gas market, its activities may have left a lasting price effect. That is, prices of the underlying commodity, natural gas, may have been higher when Amaranth was in the market (including in the non-spot months), and prices were substantially less for a substantial time period after Amaranth left the market.[1718] Pirrong's discussion of Amaranth does not address this economic history or its possible relevance to non-spot position limits. Although Pirrong criticizes the Commission for not engaging in a ''rigorous empirical analysis'' of Amaranth (2/10/14 ISDA/SIFMA Comment Letter, Annex B, at p.2, ¶ 10), the establishment of outsized market power in economics is more straight forward in the case of Amaranth. The question is whether the disappearance of an Amaranth from the market with its formerly outsized position led to a significant decline in price.

By focusing simply on Amaranth's activities in the spot month, Prof. Pirrong does not discuss the potential for harm arising from Amaranth's outsized positions in the non-spot month. If someone is exerting market power, they can cause a negative externality for other purchases of natural gas if they, for example, bid up the price of natural gas. A higher price for a natural gas purchaser due to another entity's trading may simply be an example of a healthy market at work. However, there is definite harm to purchasers of natural gas if the price they pay is higher for reasons that are associated with another market participant's price influence though the exertion of market power.

Pirrong does not provide a direct factual rebuttal to the Senate investigative report finding that Amaranth's speculative activity affected overall price levels in natural gas. He argues that the Commission's reliance upon a Senate investigatory report would not be ''accepted as evidence of causation in any peer reviewed academic work.'' [1719] *Id.* at 2, ¶ 9. Prof. Pirrong is correct that the Commission has not, in the case of Amaranth, shown causation: That it was Amaranth's departure from the markets that caused the natural gas price decline in substantial part, as opposed to confounding factors (such as, in the case of natural gas, evidence that the upcoming winter would be warmer than expected). However, proof of causation is not required for publication in peer reviewed journals in a case such as this.

To establish evidence of causation, one would need a theoretical model and empirical evidence to support it. There have been peer-reviewed studies on Amaranth such as one cited in the Commission's December 2013 Position Limits Proposal.[1720] That study observed that not just a Senate investigatory committee, but one of the exchanges that Amaranth was trading on, was alarmed by their exercise of market power in months prior to the spot months. The New York Mercantile Exchange (NYMEX) on August 9, 2006: [1721]

> called Amaranth with continued concern about the September 2006 contract and warned that October 2006 was large as well and they should not simply reduce the September exposure by shifting contracts to the October contract. In fact, by the close of business that day, Amaranth increased their October 2006 position by 17,560 positions and their ICE positions by 105.75

This study documents that even though many of the Amaranth positions were not with NYMEX, and instead with ICE, these positions were extremely large relative to the average daily trading volume of the largest natural gas futures exchange. ''In some cases, the positions are hundreds of times the 30-day average daily trading volume.'' [1722]

Pirrong also argues as a normative matter that the costs exceed the benefits. While he concedes that it is ''plausible'' that a sudden liquidation of a large position by a trader facing distress'' could ''cause sudden and unwarranted price fluctuations,'' he argues that there is ''no evidence that this problem occurs with sufficient frequency, or has sufficiently damaging effects, to warrant continuously imposed constraints on risk transfer.'' *Id.* at 6, ¶ 27. The Commission considers the costs and benefits formally elsewhere in this release.

ii. The Possible Harms of Corners and Squeezes

Pirrong also questions the extent of harm associated with activities such as the Hunt brothers. 2/10/14 ISDA/SIFMA Comment Letter, Annex B, at pp. 2–3. He downplays the harms of corners and squeezes. *Id.* at ¶¶ 11–12, 38–43.

Prof. Pirrong is incorrect in asserting that the Commission's view was groundless. In the December 2013 Position Limits Proposal, the Commission did ground its concern about outsized speculative positions in particular examples. The Commission did present evidence of inefficient resource allocation with respect to the Hunt brothers. It is as much a public

[1717] There have been other examples of price manipulations that extended over a period of months. See CFTC staff, A Study of the Silver Market, Report To The Congress In Response To Section 21 Of The Commodity Exchange Act, Part One at 2–4, 9–10 (May 29, 1981) (price of silver rose and fell over a period of months, with long futures positions in silver held by members of the Hunt family in the summer and fall of 1979 and prices peaking in late January 1980, and prices falling though the first quarter of 1980); *id.,* Part Two at p.100 (''behavior of silver prices during 1979–80 appears consistent with, but is not entirely explained by, fundamental developments in the silver market over this period''); p.112 (Hunt family acquired actual and potential control of approximately 18 percent of world silver market and stood for delivery on a significant portion of their futures contracts, causing silver prices to rise significantly).

[1718] This observation presumes no other confounding events such as the occurrence of warmer winter. Unfortunately, we do not know whether or not the lower price resulted from the exit of Amaranth, the warmer winter, something else, or some combination of the preceding.

[1719] *Id.* at 2, ¶ 9.

[1720] *See* Ludwig Chincarini, Natural Gas Futures and Spread Position Risk: Lessons from the Collapse of Amaranth Advisors LLC, Journal of Applied Finance (2008).

[1721] *Id.* at p.24.

[1722] *Id.* at p.22.

policy matter as an economic matter how position limits fare as a solution to the question of these negative externalities. Even if one assumes away the existence of market imperfections, as Pirrong does, one is still left to contend with the consequences of what Pirrong assumes to be natural market events. In the case of the Hunt brothers, the Commission gave multiple examples of negative externalities in the broader economy. People sold their silverware which was melted down into silver bars. A photo supply company dependent on silver supply went out of business.[1723]

Pirrong's assumption that persons act optimally at any given moment does not mean, across time, that resources have been allocated efficiently. While much of economic analysis is static, dynamic effects over time can have inefficient allocation of resources, intertemporally. It may have been optimal for a possessor of silverware to melt down their silver into silver bars during the Hunt silver market disruption, but just a few months later a possessor of silverware would likely prefer silverware to silver bars. *See* Pirrong's *Manipulation of the Commodity Futures Market Delivery Process,* at p. 383, Journal of Business (1993) (futures market manipulations ''distorts prices and creates deadweight losses;'' ''causes shorts to utilize real resources to make excessive deliveries;'' and ''distorts consumption'').

Pirrong thus errs in asserting that the Commission does not provide an ''empirical basis'' for ''inefficient allocation of resources.'' 2/10/14 ISDA/SIFMA Comment Letter, Annex B, at p.3.

iii. Claim That the Spot-Month Limits Are Arbitrary

Pirrong claims that spot month limits are set too low at 25 percent of deliverable supply. *Id.* at p.8, ¶¶ 38–40. He contends that a single long trader has to control over 50 percent of deliverable supply to perfect a corner. *Id.* at ¶ 40. He is incorrect. Assuming, quite reasonably, that long commercials are going to stay in the market and consume, because it would be very expensive for them to leave the market, a certain percentage of deliverable supply is ''locked up'' in this sense. For example, a natural gas utility needs to deliver natural gas for its customers to heat their homes (among other things) and would therefore still take delivery of a substantial percentage of the deliverable supply of natural gas.

Pirrong says that ''[f]ive or more perfectly colluding traders each with positions at the 25 percent level might be able to manipulate the market.'' *Id.* at p.8, ¶ 41. However, these five traders do not all need to collude in order to permit one of them to manipulate price. Some of these traders may simply be those who value the commodity highly, much higher than the market price, and therefore will not let go of their contractual right to delivery. Such commercials may be willing to stay and pay a higher price, even when a corner is in effect, because the cost, for example, of not providing natural gas to customers to heat their homes is substantially more.

Many exchanges, including CME, set position limits lower than 25 percent. It is hard for Pirrong to argue that 25 percent is excessively low when it is higher than CME limits for all of the 19 CME-traded commodities covered by the proposed CFTC position limits.

Pirrong's final critique of spot month limits is his assertion that application of the same limits to short and long positions is arbitrary. *Id.* at p.9, ¶¶ 42–43. The reasons he gives for this are problematic and not well-developed. Pirrong states that for storable commodities, manipulation by long traders is more likely than with short traders. *Id.,* ¶ 42. It may well be more difficult to manipulate price through a corner or squeeze as a short because there is generally a fixed limit for deliverable supply (unless one creates the impression that there is more deliverable supply than there is). Moreover, shorts may well have a bona fide hedging exemption anyway. However, for shorts as well as longs, position limits help to ensure an orderly exit and a smoother delivery process. For example, a short trader with a large position might take a partially offsetting long position in an illiquid market in the spot month; this might cause unwarranted price volatility due to the price impact of establishing the offsetting long position.

Pirrong criticizes the depth of the Commission's basis for treating short and long positions symmetrically, he also does not suggest an alternative or explain how a proper ratio should be calculated.[1724]

iv. Whether Position Limits Cause Economic Harm

Pirrong contends that commodity ETFs, pension funds, and other ''real money'' investors would be harmed by position limits and that this is unfair because not all such market participants impose the same risks. 2/10/14 ISDA/SIFMA Comment Letter, Annex B, at pp.3–4, ¶¶ 16–18. The claim that it is ''unfair'' to impose limits on all market players uniformly is a policy argument, not an economic argument.

d. Hamilton/Wu Papers on Risk Premia and Effects of Index Fund Investing

Professors James Hamilton and Jing Cynthia Wu of the University of California at San Diego and University of Chicago Business School, respectively, authored a well-executed set of papers (well-executed because they used reasonably defensible models with relatively transparent assumptions and data sources) that examine the effect of positions on prices.

Their paper, Hamilton and Wu, *Risk Premia in Crude Oil Futures Prices,* Journal of International Money and Finance (2013), is a well-reasoned explanation for how outsized speculative futures positions could impact risk premium, the return for accepting undiversifiable risk, a component of the return of holding a commodity futures contract. Examining the crude oil futures market, they find that crude oil risk premia fundamentally changed in response to financial investor flows into the crude oil market. *Id.* at p.31.

Hamilton and Wu found that, for crude oil futures, risk premiums, post-2005, were smaller than they were in the pre-2005 sample. This study contains an important conclusion founded in the interplay of positions and prices in the crude oil markets:

> While traders taking the long position in near contracts earned a positive return on average prior to 2005, that premium decreased substantially after 2005, becoming negative when the slope of the futures curve was high. This observation is consistent with the claim that historically commercial producers paid a premium to arbitrageurs for the privilege of hedging price risk, but in more recent periods financial investors have become natural counterparties for commercial hedgers.

Hamilton and Wu, *Risk Premia in Crude Oil Futures Prices,* at p.10, Journal of International Money and Finance (2013).

Their paper tests the idea that risk premia have been bid down by long, speculative investments in the crude oil market. That is, they test the idea that the futures price has become higher as

[1723] December 2013 Position Limits Proposal 78 FR at 75680, 75689.

[1724] Pirrong argues that the Commission's cost-benefit analysis fails to identify, let alone analyze, important potential costs. 2/10/14 ISDA/SIFMA Comment Letter, Annex B, at 4–6. The Commission addresses all commenter criticisms in the cost-benefit section of this release. Pirrong also argues that the Commission's bona fide hedging exemptions are unnecessarily narrow and critiques the Commission's decision to establish different position limits for cash-settled (as opposed to delivery-settled) contracts. The Commission addresses such comments in the relevant sections of this release.

it has been bid up by long speculators, so the return from holding the long futures contract has been lowered. In theory, this phenomenon would make hedging cheap for the short side of the market, but would also increase the price of the futures, all else being equal.

Hamilton and Wu use a two-factor model for price: The futures contract price less the rational expectation of the futures price equals the risk premium, the component of price associated with holding the price risk of the futures contract. A commodity that is more likely to be affected by long passives in this way is crude oil, because (1) crude oil as a commodity dominates these indices—substantial portion of the GSFI for example; (2) the economics of storage.

All else being equal, if outsized market positions affect price, we should expect risk premium to be the component of price that would be affected when market participants take outsized positions. That is because risk premium is a return for taking on undiversifiable risk. A risk premium does not include that portion of risk that can be easily diversified through other instruments. Through the workings of market, a participant who takes on a price exposure will expect to be compensated through a premium for bearing this risk. For a futures commodity contract, there are many components of the return, and the risk premium is only one of them. It can be a fairly small component, although the fraction depends on the commodity and other the market conditions.

Hamilton and Wu construct a theoretical price return: The return of holding a long futures contract based on a rational expectations model. Hamilton and Wu, *Risk Premia in Crude Oil Futures Prices,* Journal of International Money and Finance (2013). Their risk premium is the difference between futures return and theoretical price return. They find that risk premiums for crude oil decreased over time and became more volatile. While Hamilton and Wu listed many assets in the paper's introductory discussion of the theoretical model, in their empirical analysis they use two factors, that involve only futures price data. This omission fails to take into account potentially relevant data about the level of various commodities in storage [1725] and observations about other financial assets.[1726] Consequently, there may be some disconnect between their theoretical and their empirical model. This may mean that the study's theoretical price return is on less sound theoretical footing than it may first appear. Nevertheless, the benchmark rational expectation return may still be a suitable approximation.

In a second paper, *Effects of Index-Fund Investing on Commodity Futures Prices, International Economic Review,* (February 2015), Hamilton and Wu were able to replicate Singleton's result for the crude oil market during the 2006–2009 period. They found an effect from speculative positions of index investors on risk premium in crude oil.[1727] Hamilton and Wu also did not find evidence of speculative positions influencing risk premia in crude oil after 2009. Nor did they find evidence that speculative positions affected the risk premia in the agricultural commodities markets. ''Our conclusion is that although in principle index-fund buying of commodity futures could influence pricing of risk, we do not find confirmation of that in the week-to-week variability of the notional value of reported commodity index trader positions.'' *Id.* at p.193; *see id.* at p.195 (no persuasive evidence that changes in index trader positions is related to risk premium in agricultural commodities, whether the data is studied for change on a weekly or 13-week basis). Consequently, they find only limited evidence for a theoretically reasonable version of the Master's hypothesis, *i.e.,* that long speculators bid down the risk premia and as a result induce a higher futures price in various commodity futures markets. ''Overall,'' Hamilton and Wu conclude, their work indicates that ''there seems to be little evidence that index-fund investing is exerting a measurable effect on commodity futures prices.'' *Id.* at p.204 (adding that it is ''difficult to find much empirical foundation for a view that continues to have a significant impact on policy decisions'').

e. Sanders/Irwin on the ''Necessity'' of Limits and Energy Futures Prices

Professors Dwight Sanders and Scott Irwin submitted two working papers: (1) One paper arguing that new limits on speculation in agricultural futures markets are unnecessary; [1728] and (2) a paper on energy futures prices, using high frequency daily position data for energy markets and concluding that there is no compelling evidence of predictive links between commodity index investment and changes in energy futures prices.[1729]

i. The ''Necessity'' of New Position Limits

In Sanders and Irwin, *The ''Necessity'' of New Position Limits in Agricultural Futures Markets: The Verdict from Daily Firm-Level Position Data* (working paper 2014), the authors use price and position data shared by an unnamed large investment company.[1730] They do various statistical analyses to concluding that the large investment company's roll of its position does not have any lasting price impact on the market. The find that the price impact of the roll is, at most, a small and temporary price impact; there is not a day-over-day impact and the impact is smaller than the bid/ask spread.

This result does not disprove, generally, the possibility that the fund's long, speculative positions impact price because it focuses only on one aspect of the fund's trading: Its rolling of positions. The firm data used is from a large commodity index fund that is registered investment company, and such a firm is likely put into their prospectus how they are going to roll their positions. This pre-announcement of when the commodity index fund will roll may dampen the price impact of these particular changes in position. *See* n.1682 and associated text, *supra;* Aulerich, Irwin, and Garcia, *Bubbles, Food Prices, and Speculation: Evidence from the CFTC's Daily Large Trader Data Files, id.* at p.29 (NBER Conference

[1725] Risk premia may vary based on the amount of a commodity in storage at any given time. While discussing storage as a component of risk premia seems overly technical, in many of these papers, including the Hamilton and Wu paper, it might play an import role. One could go long a crude oil futures contract, or one could buy crude oil and storage it. If you do the latter, you could draw down the physical commodity available for near-term use. Also, the storing of the physical commodity has a real option component to it (one can take the crude oil out of storage and consume it relatively quickly). The value of the real option depends on how much society might need crude oil in storage, and that value depends on how much crude oil is stored elsewhere.

[1726] The papers discussed in the financialization section suggest that the returns of financial assets may affect commodity returns and vice versa.

[1727] Professor Kenneth Singleton found evidence that speculative positions Granger-causing risk premium on weekly time intervals during the 2007 to 2009 period when studying the crude oil futures markets. Singleton, Investor Flows and the 2008 Boom/Bust in Oil Prices (March 23, 2011 working paper).

[1728] Sanders and Irwin, *The ''Necessity'' of New Position Limits in Agricultural Futures Markets: The Verdict from Daily Firm-Level Position Data* (working paper 3/13/2014), comment letter at 1–46.

[1729] Sanders and Irwin, *Energy Futures Prices and Commodity Index Investment: New Evidence from Firm-Level Position Data* (working paper 2/17/2014), comment letter at 47–89.

[1730] *Id.* at 4–5. They argue that this dataset will be more comprehensive than the CFTC's commitment of trader data, but they did not test to verify this assumption. They correctly observe that prior work using CFTC data suffers from limitations in the frequency of data and the availability of swaps data. *Id.* at 3, 5.

2012) (firms preannounce their rolls, and thus these position changes can be anticipated by the marketplace and thus lead to less price impact). Sanders and Irwin's result thus is not obviously extensible to any price impact of this large index fund's positions apart from its positions and trading at the time of roll.

This fund did have days of heavy trading, apart from rolling, but Sanders and Irwin did not study the price impact arising from these changes in position. The fund traded cotton contracts representing 5.8% of average daily trading in cotton and wheat trades constituting 3.5% of average daily volume in the MGEX wheat contract. Sanders and Irwin did not attempt to study price impact on these un-announced trades. They stated that because the sizes of the roll transactions are ''larger than changes in outright position,'' ''investigating the impact of rolling on market spreads'' is ''particularly interesting.'' *Id.* at p.10. On the other hand, the non-roll position changes are presumptively not preannounced to the marketplace, so studying this rich dataset for price impacts from those position changes might also be interesting.

This paper by Sanders and Irwin thus has a limitation of scope based on its focus on just the rolling of positions. This large commodity index fund presumptively pre-announced its rolling of positions in its prospectus. However, this leaves open the question of what would be the effect if this same fund did not pre-announce in the future. The analysis by Sanders and Irwin, if credited as true within a reasonable degree of certainty, would address whether regulators should employ position limits prophylactically to diminish the price impact of any future, non-announced rolls. At least prior to sunshine trading of rolls, there is evidence of a price impact associated with rolling. Frenk and Turbeville, *Commodity Index Traders and the Boom/Bust Cycle in Commodities Prices* (Better Markets 2011).[1731]

Moreover, not all large players pre-announce their rolls. The fact that Sanders and Irwin found no price impact with respect to rolls that were (assumedly) pre-announced does not mean that unannounced rolls might be mistaken for informed trading by the marketplace and cause a price impact.[1732]

Despite these limitations in scope, Sanders and Irwin's article is one of the more useful Granger analysis papers for several reasons.

First, it does present a working definition of ''excessive speculation:'' speculation that is ''causing'' price fluctuations that are ''sudden'' or ''unreasonable'' or ''unwarranted.'' Sanders and Irwin correctly state that their ''definition of excessive speculation seemingly excludes speculation that cannot be shown to *cause* price changes. . . .'' *Id.* at p.3. It is important to note, however, that Sanders and Irwin repeatedly use the word ''necessary'' to analyze the desirability of position limits, which elevates the requirements for establishing causation of price fluctuations to a very high level. High quality economic studies often use empirical data, typically the tools of statistics, to achieve reasonable certainty within a specified degree of error.

Second, the data source is a novel and fairly comprehensive data set. It includes both swaps and futures, and encompasses many different commodities. The data does indicate the volume and nature of this large commodity fund's positions in the market place. All positions taken by the firm during the 2007–2012 time period were long positions, not short positions. *Id.* at p.5. The fund's total position size (including futures and swaps) grew from under $4 billion in 2007 to $12 billion in 2011. *Id.*

Third, with respect to the paper's conclusion on rolling of positions, the statistical result of Sanders and Irwin—concluding that there was no price impact from positions—is stronger than many other studies in some respects. Unlike Hamilton and Wu's work on just a component of the return from holding a futures contract (risk premium), Sanders and Irwin consider the entire return from holding the futures contract. They studied data over a long time period. If their model is correct, they have found evidence against (at least their formulation of) the Masters hypothesis. There is a potential concern, however, with their statistical result. The price equation used for their Granger analysis uses both lagged returns and changes in positions. *See id.* at p.16 (''R_{t-i}'' are lagged returns and ''Positions'' are changes in position in Equation 5a). To the extent that lagged returns and position changes are correlated with each other, their price equation may mask correlations between price returns and position changes.

ii. Energy Futures Prices

Using the same commodity index fund data, Sanders and Irwin examine energy contracts: Crude oil, heating oil, natural gas, and reformulated blend stock gas (with ethanol added). Sanders and Irwin, *Energy Futures Prices and Commodity Index Investment: New Evidence from Firm-Level Position Data* (working paper 2014). This paper attempts to challenge the findings of an impact on price from positions by Singleton, Hamilton and Wu. Sanders and Irwin contend that their richer data source compels a conclusion that positions in commodity energy markets do not impact price.

This paper also has a potential problem with the price return equation. The equation, *see id.* at p. 15 (Equation No. 7), uses lagged returns and positions to test against a correlation with price. Sometimes they use multiple lagged returns. For example, for their natural gas analysis, they used two sets of lagged returns. *Id.* at p.35 (Table 5). Again, use of lagged returns in the price equation can mask a possible correlation.

Sanders and Irwin argue that their results from a richer data source indicate that Singleton and Hamilton and Wu's results may be ''artifacts'' of poor data. They contend that these authors' use of agricultural data as proxy for energy positions was problematic. *Id.* at p.3. They suggest this may explain the differing results of Singleton, as well as Hamilton and Wu.

But there are other explanations for this difference in results. Singleton, Hamilton and Wu focus on risk premium, not, as Sanders and Irwin do, on price returns. This distinction can be quite important in this context. If positions impact price by impacting risk premium, that effect will not necessarily reveal itself in a study of just price returns. Perhaps more fundamentally, Sanders and Irwin and are asking a

[1731] An example of a study that is, in part, forward-looking, is Cheng, Kirilenko, and Xiong, Convective Risk Flows in Commodity Futures Markets (working paper 2012). The authors use comovement methodology to conclude that in times of distress, financial traders reduce their net long position, causing risk to flow from financial traders to commercial hedgers. *See also* Acharya, Ramadorai, and Lochstoer, Limits to Arbitrage and Hedging: Evidence from the Commodity Markets, Journal of Financial Economics (2013) (decreases in financial traders' risk capacity should lead to increases in hedgers' hedging cost, all else being equal).

[1732] Sanders and Irwin's piece does not directly test the effect of pre-existing position limits in these markets. Examining agricultural markets for whether there can be price impact on positions generally is complicated by the fact that the agricultural markets have been subject to federal position limits since 1920s. On the other hand, in the case of a commodity index fund, they may well not be carrying substantial positions into the spot month, and so even their large source of firm data may not be useful for testing the impact or effectiveness of position limits during the spot month.

slightly different question than Hamilton and Wu or Singleton. Sanders and Irwin are attempting to measure speculative position changes impact on price returns over a long time period, February of 2007 to May 2012. Hamilton and Wu, and also Singleton, use narrower timeframes in their papers and find a component of return, the risk premium, during a narrow time window, during a period of economic stress.

f. CME Group Study Submissions

The CME Group filed in the administrative record several studies and reports on March 28, 2011. It did so in three sets, all filed on March 28, 2011.

In the first set, CME filed: *Tackling the Challenges in Commodity Markets and Raw Materials,* European Commission (2011) (2.2.2011); Issues Involving the Use of the Futures Market to Invest in Commodity Indexes, Government Accountability Office Letter to the Hon. Collin Peterson, Chair, House Committee on Agriculture (June 30, 2009); and Korniotis, *Does Speculation Affect Spot Price Levels? The Case of Metals With and Without Futures Markets,* Working Paper of the Finance and Economic Discussion Series, Federal Reserve Board (2009).

In a second set, CME filed: Stoll and Whaley, *Commodity Index Investing and Commodity Futures Prices,* Journal of Applied Finance (2010); and Irwin and Sanders, *The Impact of Index and Swap Funds on Commodity Markets: Preliminary Results* (OECD Food, Agriculture and Fisheries Working Papers, No. 27 2010).

In a third set, CME filed: Celso Brunetti and Bahattin Büyükşahin, *Is Speculation Destabilizing?* (working paper 2009); Bahattin Büyükşahin and Jeffrey H. Harris, *The Role of Speculators in the Crude Oil Futures Market* (working paper 2009); and Interagency Task Force on Commodity Markets, *Interim Report on Crude Oil* (July 2008).

Finally, CME submitted an undated CME study on conditional spot-month limits and CME Group's white paper, *Excessive Speculation and Position Limits in Energy Derivatives Markets.*

As a group, these studies are not new to the Commission. All of these papers, except the CME undated submission on conditional spot limits and the European Commission publication, were cited by the Commission in its December 2013 Position Limits Proposal and so are covered in the above analysis of various studies.[1733]

Conclusion

Economists debate whether ''excessive speculation'' meaning, as an economic matter, a link between large speculation positions and unwarranted price changes or price volatility, exists in these regulated markets, and if so to what degree. The question presented is a surprisingly difficult one to answer. All the empirical studies on this question have drawbacks, and none is conclusive. This inconclusivity is not surprising. It is inevitable, given the economic uncertainties that inhere in the data and the complexity of the question. There are many theoretical and empirical assumptions and leaps, that are needed to transform and interpret raw market data into meaningful and persuasive results. There is no decisive statistical method for establishing evidence for or against position limits in the commodity.

Those studies that use Granger causality methodology tend to conclude that there is no evidence of excessive speculation or its consequences on price returns and price volatility, and many industry commenters opposed to position limits used this methodology. But that methodology is peculiarly sensitive to model design choices, and this review has highlighted the modelling decisions that may have affected the ultimate conclusions of these studies. Moreover, there are countervailing Granger studies showing a link between large speculative positions and price volatility. And studies such as Cheng, Kirilenko, and Xiong, *Convective Risk Flows in Commodity Futures Markets* (working paper 2012), indicate that some Granger studies may mask the impact of speculation in times of financial stress.

Those studies that use comovement and cointegration methods tend to conclude there is evidence of deleterious effects of ''excessive speculation.'' Yet comovement tests for correlation, not causation, and a correlation between large financial trading in the commodity markets and price changes and volatility could be driven by a common causal agent such as macroeconomic factors.

Those studies that use models of fundamental supply and demand reach a whole host of divergent opinions on the subject, each opinion only as strong as the many modelling choices.

In this way, the economic literature is inconclusive. Even clearly written, well-respected papers often contain nuances. It is telling that Hamilton, *Causes and Consequences of the Oil Shock of 2007–2008,* Brookings Paper on Economic Activity (2009), has been cited by both proponents and opponents of position limits.

What can be said with certainty is summarized in the Commission's Notice of Proposed Rulemaking: That large speculative positions and outsized market power pose risks to a well-functioning marketplace. These risks may very well differ depending on commodity market structure, but can in some markets cause real-world price impacts through a higher risk premium as a component of total price. There are also economic studies indicating some correlation between increased speculation and price volatility in times of financial stress, but this correlation does not imply causation.

Comment letters on either side declaring that the matter is settled in their favor among respectable economists are simply incorrect. The best economists on both sides of the debate concede that there is a legitimate debate. This analysis concludes that the academic debate amongst economists about the effects of outsized market positions has reputable and legitimate standard-bearers for opposing positions.

List of Subjects

17 CFR Part 1

Agricultural commodity, Agriculture, Brokers, Committees, Commodity futures, Conflicts of interest, Consumer protection, Definitions, Designated contract markets, Directors, Major swap participants, Minimum financial requirements for intermediaries, Reporting and recordkeeping requirements, Swap dealers, Swaps.

17 CFR Part 15

Brokers, Commodity futures, Reporting and recordkeeping requirements, Swaps.

17 CFR Part 17

Brokers, Commodity futures, Reporting and recordkeeping requirements, Swaps.

17 CFR Part 19

Commodity futures, Cottons, Grains, Reporting and recordkeeping requirements, Swaps.

17 CFR Part 37

Registered entities, Registration application, Reporting and recordkeeping requirements, Swaps, Swap execution facilities.

17 CFR Part 38

Block transaction, Commodity futures, Designated contract markets, Reporting and recordkeeping requirements, Transactions off the centralized market.

17 CFR Part 140

Authority delegations (Government agencies), Conflict of interests, Organizations and functions (Government agencies).

17 CFR Part 150

Bona fide hedging, Commodity futures, Cotton, Grains, Position limits, Referenced Contracts, Swaps.

17 CFR Part 151

Bona fide hedging, Commodity futures, Cotton, Grains, Position limits, Referenced Contracts, Swaps.

For the reasons stated in the preamble, the Commodity Futures Trading Commission proposes to amend 17 CFR chapter I as follows:

PART 1—GENERAL REGULATIONS UNDER THE COMMODITY EXCHANGE ACT

■ 1. The authority citation for part 1 continues to read as follows:

Authority: 7 U.S.C. 1a, 2, 5, 6, 6a, 6b, 6c, 6d, 6e, 6f, 6g, 6h, 6i, 6k, 6l, 6m, 6n, 6o, 6p, 6r, 6s, 7, 7a–1, 7a–2, 7b, 7b–3, 8, 9, 10a, 12, 12a, 12c, 13a, 13a–1, 16, 16a, 19, 21, 23, and 24 (2012).

§ 1.3(z) [Removed and Reserved]

■ 2. Remove and reserve § 1.3(z).

§ 1.47 [Removed and Reserved]

■ 3. Remove and reserve § 1.47.

§ 1.48 [Removed and Reserved]

■ 4. Remove and reserve § 1.48.

PART 15—REPORTS—GENERAL PROVISIONS

■ 5. The authority citation for part 15 continues to read as follows:

Authority: 7 U.S.C. 2, 5, 6a, 6c, 6f, 6g, 6i, 6k, 6m, 6n, 7, 7a, 9, 12a, 19, and 21, as amended by Title VII of the Dodd-Frank Wall Street Reform and Consumer Protection Act, Pub. L. 111–203, 124 Stat. 1376 (2010).

■ 6. In § 15.00, revise paragraph (p) to read as follows:

§ 15.00 Definitions of terms used in parts 15 through 19, and 21 of this chapter.

* * * * *

(p) *Reportable position* means:

(1) For reports specified in parts 17 and 18 and in § 19.00(a)(2) and (a)(3) of this chapter any open contract position that at the close of the market on any business day equals or exceeds the quantity specified in § 15.03 of this part in either:

(i) Any one futures of any commodity on any one reporting market, excluding futures contracts against which notices of delivery have been stopped by a trader or issued by the clearing organization of a reporting market; or

(ii) Long or short put or call options that exercise into the same future of any commodity, or long or short put or call options for options on physicals that have identical expirations and exercise into the same physical, on any one reporting market.

(2) For the purposes of reports specified in § 19.00(a)(1) of this chapter, any position in commodity derivative contracts, as defined in § 150.1 of this chapter, that exceeds a position limit in § 150.2 of this chapter for the particular commodity.

* * * * *

■ 7. In § 15.01, revise paragraph (d) to read as follows:

§ 15.01 Persons required to report.

* * * * *

(d) Persons, as specified in part 19 of this chapter, who either:

(1) Hold or control commodity derivative contracts (as defined in § 150.1 of this chapter) that exceed a position limit in § 150.2 of this chapter for the commodities enumerated in that section; or

(2) Are merchants or dealers of cotton holding or controlling positions for future delivery in cotton that equal or exceed the amount set forth in § 15.03.

* * * * *

■ 8. Revise § 15.02 to read as follows:

§ 15.02 Reporting forms.

Forms on which to report may be obtained from any office of the Commission or via the Internet (*http://www.cftc.gov*). Forms to be used for the filing of reports follow, and persons required to file these forms may be determined by referring to the rule listed in the column opposite the form number.

Form No.	Title	Rule
40	Statement of Reporting Trader	18.04
71	Identification of Omnibus Accounts and Sub-accounts	17.01
101	Positions of Special Accounts	17.00
102	Identification of Special Accounts, Volume Threshold Accounts, and Consolidated Accounts	17.01
204	Statement of Cash Positions of Hedgers	19.00
304	Statement of Cash Positions for Unfixed-Price Cotton “On Call”	19.00
504	Statement of Cash Positions for Conditional Spot Month Exemptions	19.00
604	Statement of Pass-Through Swap Exemptions	19.00

(Approved by the Office of Management and Budget under control numbers 3038–0007, 3038–0009, and 3038–0103.)

PART 17—REPORTS BY REPORTING MARKETS, FUTURES COMMISSION MERCHANTS, CLEARING MEMBERS, AND FOREIGN BROKERS

■ 9. The authority citation for part 17 continues to read as follows:

Authority: 7 U.S.C. 2, 6a, 6c, 6d, 6f, 6g, 6i, 6t, 7, 7a, and 12a, as amended by Title VII of the Dodd-Frank Wall Street Reform and Consumer Protection Act, Pub. L. 111–203, 124 Stat. 1376 (2010).

■ 10. In § 17.00, revise paragraph (b) to read as follows:

§ 17.00 Information to be furnished by futures commission merchants, clearing members and foreign brokers.

* * * * *

(b) *Interest in or control of several accounts.* Except as otherwise instructed by the Commission or its designee and as specifically provided in § 150.4 of this chapter, if any person holds or has a financial interest in or controls more than one account, all such accounts shall be considered by the futures commission merchant, clearing member or foreign broker as a single account for the purpose of determining special account status and for reporting purposes.

* * * * *

■ 11. In § 17.03, revise paragraph (h) to read as follows:

§ 17.03 Delegation of authority to the Director of the Office of Data and Technology or the Director of the Division of Market Oversight.

* * * * *

(h) Pursuant to § 17.00(b), and as specifically provided in § 150.4 of this chapter, the authority shall be designated to the Director of the Office of Data and Technology to instruct a futures commission merchant, clearing member or foreign broker to consider otherwise than as a single account for the purpose of determining special account status and for reporting purposes all accounts one person holds or controls, or in which the person has a financial interest.

* * * * *

■ 12. Revise part 19 to read as follows:

PART 19—REPORTS BY PERSONS HOLDING POSITIONS EXEMPT FROM POSITION LIMITS AND BY MERCHANTS AND DEALERS IN COTTON

Authority: 7 U.S.C. 6g, 6c(b), 6i, and 12a(5), as amended by Title VII of the Dodd-Frank Wall Street Reform and Consumer Protection Act, Pub. L. 111–203, 124 Stat. 1376 (2010).

§ 19.00 General provisions.

(a) *Who must file series ‘04 reports.* The following persons are required to file series ‘04 reports:

(1) *Persons filing for exemption to speculative position limits.* All persons holding or controlling positions in commodity derivative contracts, as defined in § 150.1 of this chapter, in excess of any speculative position limit provided under § 150.2 of this chapter and for any part of which a person relies on an exemption to speculative position limits under § 150.3 of this chapter as follows:

(i) *Conditional spot month limit exemption.* A conditional spot month limit exemption under § 150.3(c) of this chapter for any commodity specially designated by the Commission under § 19.03 for reporting;

(ii) *Pass-through swap exemption.* A pass-through swap exemption under § 150.3(a)(1)(i) of this chapter and as defined in paragraph (2)(ii)(B) of the definition of *bona fide hedging position* in § 150.1 of this chapter, reporting separately for:

(A) *Non-referenced-contract swap offset.* A swap that is not a referenced contract, as that term is defined in § 150.1 of this chapter, and which is executed opposite a counterparty for which the swap would qualify as a bona fide hedging position and for which the risk is offset with a referenced contract; and

(B) *Spot-month swap offset.* A cash-settled swap, regardless of whether it is a referenced contract, executed opposite a counterparty for which the swap would qualify as a bona fide hedging position and for which the risk is offset with a physical-delivery referenced contract in its spot month;

(iii) *Other exemption.* Any other exemption from speculative position limits under § 150.3 of this chapter, including for a bona fide hedging position as defined in § 150.1 of this chapter or any exemption granted under § 150.3(b) or (d) of this chapter; or

(iv) *Anticipatory exemption.* An anticipatory exemption under § 150.7 of this chapter.

(2) *Persons filing cotton on call reports.* Merchants and dealers of cotton holding or controlling positions for futures delivery in cotton that are reportable pursuant to § 15.00(p)(1)(i) of this chapter; or

(3) *Persons responding to a special call.* All persons exceeding speculative position limits under § 150.2 of this chapter or all persons holding or controlling positions for future delivery that are reportable pursuant to § 15.00(p)(1) of this chapter who have received a special call for series '04 reports from the Commission or its designee. Persons subject to a special call shall file CFTC Form 204, 304, 504, or 604 as instructed in the special call. Filings in response to a special call shall be made within one business day of receipt of the special call unless otherwise specified in the call. For the purposes of this paragraph, the Commission hereby delegates to the Director of the Division of Market Oversight, or to such other person designated by the Director, authority to issue calls for series '04 reports.

(b) *Manner of reporting.* The manner of reporting the information required in § 19.01 is subject to the following:

(1) *Excluding certain source commodities, products or byproducts of the cash commodity hedged.* If the regular business practice of the reporting person is to exclude certain source commodities, products or byproducts in determining his cash positions for bona fide hedging positions (as defined in § 150.1 of this chapter), the same shall be excluded in the report, provided that the amount of the source commodity being excluded is de minimis, impractical to account for, and/or on the opposite side of the market from the market participant's hedging position. Such persons shall furnish to the Commission or its designee upon request detailed information concerning the kind and quantity of source commodity, product or byproduct so excluded. *Provided however,* when reporting for the cash commodity of soybeans, soybean oil, or soybean meal, the reporting person shall show the cash positions of soybeans, soybean oil and soybean meal.

(2) *Cross hedges.* Cash positions that represent a commodity, or products or byproducts of a commodity, that is different from the commodity underlying a commodity derivative contract that is used for hedging, shall be shown both in terms of the equivalent amount of the commodity underlying the commodity derivative contract used for hedging and in terms of the actual cash commodity as provided for on the appropriate series '04 form.

(3) *Standards and conversion factors.* In computing their cash position, every person shall use such standards and conversion factors that are usual in the particular trade or that otherwise reflect the value-fluctuation-equivalents of the cash position in terms of the commodity underlying the commodity derivative contract used for hedging. Such person shall furnish to the Commission upon request detailed information concerning the basis for and derivation of such conversion factors, including:

(i) The hedge ratio used to convert the actual cash commodity to the equivalent amount of the commodity underlying the commodity derivative contract used for hedging; and

(ii) An explanation of the methodology used for determining the hedge ratio.

§ 19.01 Reports on stocks and fixed price purchases and sales.

(a) *Information required*—(1) *Conditional spot month limit exemption.* Persons required to file '04 reports under § 19.00(a)(1)(i) shall file CFTC Form 504 showing the composition of the cash position of each commodity underlying a referenced contract that is held or controlled including:

(i) The as of date;

(ii) The quantity of stocks owned of such commodity that either:

(A) Is in a position to be delivered on the physical-delivery core referenced futures contract; or

(B) Underlies the cash-settled core referenced futures contract;

(iii) The quantity of fixed-price purchase commitments open providing for receipt of such cash commodity in:

(A) The delivery period for the physical-delivery core referenced futures contract; or

(B) The time period for cash-settlement price determination for the cash-settled core referenced futures contract;

(iv) The quantity of unfixed-price sale commitments open providing for delivery of such cash commodity in:

(A) The delivery period for the physical-delivery core referenced futures contract; or

(B) The time period for cash-settlement price determination for the cash-settled core referenced futures contract;

(v) The quantity of unfixed-price purchase commitments open providing for receipt of such cash commodity in:

(A) The delivery period for the physical-delivery core referenced futures contract; or

(B) The time period for cash-settlement price determination for the cash-settled core referenced futures contract; and

(vi) The quantity of fixed-price sale commitments open providing for delivery of such cash commodity in:

(A) The delivery period for the physical-delivery core referenced futures contract; or

(B) The time period for cash-settlement price determination for the cash-settled core referenced futures contract.

(2) *Pass-through swap exemption.* Persons required to file '04 reports under § 19.00(a)(1)(ii) shall file CFTC Form 604:

(i) *Non-referenced-contract swap offset.* For each swap that is not a referenced contract and which is executed opposite a counterparty for which the transaction would qualify as a bona fide hedging position and for which the risk is offset with a referenced contract, showing:

(A) The underlying commodity or commodity reference price;

(B) Any applicable clearing identifiers;

(C) The notional quantity;

(D) The gross long or short position in terms of futures-equivalents in the core referenced futures contract; and

(E) The gross long or short positions in the referenced contract for the offsetting risk position; and

(ii) *Spot-month swap offset.* For each cash-settled swap executed opposite a counterparty for which the transaction would qualify as a bona fide hedging position and for which the risk is offset with a physical-delivery referenced contract held into a spot month, showing for such cash-settled swap that is not a referenced contract the information required under paragraph (a)(2)(i) of this section and for such cash-settled swap that is a referenced contract:

(A) The gross long or short position for such cash-settled swap in terms of futures-equivalents in the core referenced futures contract; and

(B) The gross long or short positions in the physical-delivery referenced contract for the offsetting risk position.

(3) *Other exemptions.* Persons required to file '04 reports under § 19.00(a)(1)(iii) shall file CFTC Form 204 reports showing the composition of the cash position of each commodity hedged or underlying a reportable position in units of such commodity and in terms of futures equivalents of the core referenced futures contract, including:

(i) The as of date, the commodity derivative contract held or controlled, and the equivalent core referenced futures contract;

(ii) The quantity of stocks owned of such commodities and their products and byproducts;

(iii) The quantity of fixed-price purchase commitments open in such cash commodities and their products and byproducts;

(iv) The quantity of fixed-price sale commitments open in such cash commodities and their products and byproducts;

(v) The quantity of unfixed-price purchase and sale commitments open in such cash commodities and their products and byproducts, in the case of offsetting unfixed-price cash commodity sales and purchases; and

(vi) For cotton, additional information that includes:

(A) The quantity of equity in cotton held, by merchant, producer or agent, by the Commodity Credit Corporation under the provisions of the Upland Cotton Program of the Agricultural Stabilization and Conservation Service of the U.S. Department of Agriculture;

(B) The quantity of certificated cotton owned; and

(C) The quantity of non-certificated stocks owned.

(4) *Anticipatory exemptions.* Persons required to file '04 reports under § 19.00(a)(1)(iv) shall file CFTC Form 204 monthly on the remaining unsold, unfilled and other anticipated activity for the Specified Period that was reported on such person's most recent initial statement or annual update filed on Form 704, pursuant to § 150.7 (e) of this chapter.

(b) *Time and place of filing reports*—(1) *General.* Except for reports specified in paragraphs (b)(2) or (b)(3) of this section, each report shall be made monthly:

(i) As of the close of business on the last Friday of the month, and

(ii) As specified in paragraph (b)(4) of this section, and not later than 9 a.m. Eastern Time on the third business day following the date of the report.

(2) *Spot month reports.* Persons required to file '04 reports under § 19.00(a)(1)(i) for special commodities as specified by the Commission under § 19.03 or under § 19.00(a)(1)(ii)(B) shall file each report:

(i) As of the close of business for each day the person exceeds the limit during a spot period up to and through the day the person's position first falls below the position limit; and

(ii) As specified in paragraph (b)(4) of this section, and not later than 9 a.m. Eastern Time on the next business day following the date of the report.

(3) *Special calls.* Persons required to file '04 reports in response to special calls made under § 19.00(a)(3) shall file each report as specified in paragraph (b)(4) of this section within one business day of receipt of the special call unless otherwise specified in the call.

(4) *Electronic filing.* CFTC '04 reports must be transmitted using the format, coding structure, and electronic data transmission procedures approved in writing by the Commission.

§ 19.02 Reports pertaining to cotton on call purchases and sales.

(a) *Information required.* Persons required to file '04 reports under § 19.00(a)(2) shall file CFTC Form 304 reports showing the quantity of call cotton bought or sold on which the price has not been fixed, together with the respective futures on which the purchase or sale is based. As used herein, call cotton refers to spot cotton bought or sold, or contracted for purchase or sale at a price to be fixed later based upon a specified future.

(b) *Time and place of filing reports.* Each report shall be made weekly as of the close of business on Friday and filed using the procedure under § 19.01(b)(3), not later than 9 a.m. Eastern Time on the third business day following the date of the report.

§ 19.03 Reports pertaining to special commodities.

From time to time to facilitate surveillance in certain commodity derivative contracts, the Commission may designate a commodity derivative contract for reporting under § 19.00(a)(1)(i) and will publish such determination in the **Federal Register** and on its Web site. Persons holding or controlling positions in such special commodity derivative contracts must, beginning 30 days after notice is published in the **Federal Register**, comply with the reporting requirements under § 19.00(a)(1)(i) and file Form 504 for conditional spot month limit exemptions.

§ 19.04 Delegation of authority to the Director of the Division of Market Oversight.

(1) The Commission hereby delegates, until it orders otherwise, to the Director of the Division of Market Oversight or such other employee or employees as the Director may designate from time to time, the authority in § 19.01 to provide instructions or to determine the format, coding structure, and electronic data transmission procedures for submitting data records and any other information required under this part.

(2) The Director of the Division of Market Oversight may submit to the Commission for its consideration any matter which has been delegated in this section.

(3) Nothing in this section prohibits the Commission, at its election, from exercising the authority delegated in this section.

§§ 19.05–19.10 [Reserved]

Appendix A to Part 19—Forms 204, 304, 504, 604, and 704

BILLING CODE 6351–01–P

CFTC FORM 204

Statement of Cash Positions of Hedgers

NOTICE: Failure to file a report required by the Commodity Exchange Act ("CEA" or the "Act")[2] and the regulations thereunder,[3] or the filing of a report with the Commodity Futures Trading Commission ("CFTC" or "Commission") that includes a false, misleading or fraudulent statement or omits material facts that are required to be reported therein or are necessary to make the report not misleading, may (a) constitute a violation of § 6(c)(2) of the Act (7 U.S.C. 9), § 9(a)(3) of the Act (7 U.S.C. 13(a)(3)), and/or § 1001 of Title 18, Crimes and Criminal Procedure (18 U.S.C. 1001) and (b) result in punishment by fine or imprisonment, or both.

PRIVACY ACT NOTICE

The Commission's authority for soliciting this information is granted in sections 4a, 4c(b), 4i, 4t and 8a(5) of the CEA and related regulations (see, e.g., 17 CFR § 19.00). The information solicited from entities and individuals engaged in activities covered by the CEA is required to be provided to the CFTC, and failure to comply may result in the imposition of criminal or administrative sanctions (*see*, e.g., 7 U.S.C. §§ 9 and 13a-1, and/or 18 U.S.C. 1001). The information requested is most commonly used in the Commission's market and trade practice surveillance activities to (a) provide information concerning the size and composition of the commodity derivatives markets, (b) permit the Commission to monitor and enforce speculative position limits and (c) enhance the Commission's trade surveillance data. The requested information may be used by the Commission in the conduct of investigations and litigation and, in limited circumstances, may be made public in accordance with provisions of the CEA and other applicable laws. It may also be disclosed to other government agencies and to contract markets to meet responsibilities assigned to them by law. The information will be maintained in, and any additional disclosures will be made in accordance with, the CFTC System of Records Notices, available on www.cftc.gov.

[1] This Appendix includes representations of the proposed reporting forms, which would be submitted in an electronic format published pursuant to the proposed rules, either via the Commission's web portal or via XML-based, secure FTP transmission.

[2] 7 U.S.C. section 1, et seq.

[3] Unless otherwise noted, the rules and regulations referenced in this notice are found in chapter 1 of title 17 of the Code of Federal Regulations; 17 CFR Chapter 1 et seq.

BACKGROUND & INSTRUCTIONS

Applicable Regulations:

- 17 CFR § 19.00(a)(1)(iii) and (iv) specify who must file Form 204.
- 17 CFR § 19.00(b) specifies the manner of reporting on series '04 reports, including Form 204.
- 17 CFR § 19.01(a)(3) and (4)(ii) specifies the information required on Form 204.
- 17 CFR § 19.01(b)(1) specifies the frequency (**monthly**), the as of report date (close of business on the last Friday of the month), and the time (9 a.m. Eastern Time on the third business day following the date of the report), for filing Form 204.

As appropriate, please follow the instructions below to generate and submit the required report or filing. Relevant regulations are cited in parentheses () for reference. Unless the context requires otherwise, the terms used herein shall have the same meaning as ascribed in parts 15 to 21 of the Commission's regulations.

Complete Form 204 as follows:

The trader identification fields should be completed by all filers. This updated Form 204 requires traders to identify themselves using their Public Trader Identification Number, in lieu of the CFTC Code Number required on previous versions of the Form 204. This number is provided to traders who have previously filed Forms 40 and 102 with the Commission. Traders may contact the Commission to obtain this number if it is unknown. If a trader has a National Futures Association Identification Number ("NFA ID") and/or a Legal Entity Identifier ("LEI"), he should also identify himself using those numbers. Form 204 requires traders to identify the name of the reporting trader or firm and the contact information (including full name, address, phone number, and email address) for a natural person the Commission may contact regarding the submitted Form 204.

Section A of Form 204 must be completed by all filers who hold stocks and fixed-price cash positions in the cash commodity. Section A contains the following fields:

Date…………………………………	As-of date for reported position
RC or CDC………………………….	Referenced Contract (§ 150.1) used for hedging or Commodity Derivative Contract (§ 150.1) as required by, e.g., a special call (§ 19.00(a)(3))
CRFC………………………………..	Corresponding Core Referenced Futures Contract (§ 150.2(d))
Futures Equivalent in CRFC………..	Quantity of cash commodity hedged, converted to futures equivalents of the CRFC. Short positions should be represented with a minus sign, e.g. 2,000 contract equivalents short = "-2,000"
Cash commodity hedged……………	Cash commodity hedged by the CDC positions, e.g. "crude oil"
Units…………………………………	Units of measure for cash commodity being hedged, e.g. "barrels"
Stock………………………………..	Stocks (§ 19.01(a)(3)(ii))
Fixed Price Purchases ………………	Fixed-price purchase commitments (§ 19.01(a)(3)(iii))
Fixed Price Sales……………………	Fixed-price sale commitments (§ 19.01(a)(3)(iv))
Remaining Anticipated Activity……	Remaining Unsold, Unfilled and Other Anticipated Activity for the Specified Period in Form 704 (§ 150.7(g) and § 19.01(a)(4))

Section B of Form 204 must be completed by all filers who hold unfixed-price cash positions in the cash commodity. Section B contains the following fields:

Date…………………………………..	As-of date for reported position
RC or CDC………………………….	Referenced Contract (§ 150.1) used for hedging or Commodity Derivative Contract (§ 150.1) as required by, e.g., a special call (§ 19.00(a)(3))
CRFC………………………………..	Corresponding Core Referenced Futures Contract (§ 150.2(d))

Futures Equivalent in CRFC………....	Futures Contract Equivalent in terms of CRFC. Short positions should be represented with a minus sign, e.g. 2,000 contract equivalents short = "-2,000"
Cash commodity hedged……………	Cash commodity hedged by the CDC positions, e.g. "crude oil"
Units………………………………….	Units of measure for cash commodity being hedged, e.g. "barrels"
Unfixed-price purchases……………	Unfixed-price purchases (§ 19.01(a)(3)(v))
Unfixed-price sales……………….....	Unfixed-price sales (§ 19.01(a)(3)(v))

Section C of Form 204 must be completed in addition to Sections A and B of Form 204 by filers who hold cotton stocks. Section C contains the following fields:

Equity Stocks………………………. Equity stock in hundreds of 500-lb. bales. Traders must report separately equity stocks held in the trader's capacity as a merchant, producer, and/or agent. (§ 19.01(a)(3)(vi))

Certificated Stocks…………………. Certificated stock in hundreds of 500-lb. bales. (§ 19.01(a)(3)(vi))

Non-certificated Stocks…………….. Non-certificated stock in hundreds of 500-lb. bales. (§ 19.01(a)(3)(vi))

The signature/authorization page must be completed by all filers. This page must include the name and position of the natural person filing Form 204 as well as the name of the reporting trader represented by that person. The trader certifying this Form 204 on the signature/authorization page should note that filing a report that includes a false, misleading or fraudulent statement or omits material facts that are required to be reported therein or are necessary to make the report not misleading, may (a) constitute a violation of § 6(c)(2) of the Act (7 U.S.C. 9), § 9(a)(3) of the Act (7 U.S.C. 13(a)(3)), and/or § 1001 of Title 18, Crimes and Criminal Procedure (18 U.S.C. 1001) and (b) result in punishment by fine or imprisonment, or both.

Submitting Form 204: Once completed, please submit this form to the Commission pursuant to the instructions on [www.cftc.gov] or as otherwise directed by Commission staff. If submission attempts fail, the reporting trader shall contact the Commission at [techsupport@cftc.gov] for further technical support.

Please be advised that pursuant to 5 CFR § 1320.5(b)(2)(i), you are not required to respond to this collection of information unless it displays a currently valid OMB control number.

CFTC Form 204 (XX-XX)
Previous Editions Obsolete

<u>Form 204, Example A</u>- A commercial entity has inventory of 10,000,000 barrels of crude oil, 5,000,000 barrels of crude oil fixed-price sales contracts, and 20,000,000 barrels of crude oil fixed-price purchase contracts. The commercial entity could claim a bona fide hedging exemption for a short position of up to 25,000 contracts in the NYMEX light sweet crude oil futures contract, equivalent to 30,000,000 barrels of crude oil. The commercial entity has other short speculative positions in the futures contract that, absent the bona fide hedging exemption, would cause it to exceed the speculative position limit.

A. Cash positions pursuant to the following paragraphs of § 19.01 (a) (3) (i), (ii), (iii), (iv), and (4)(ii).									
Date	Referenced Contract (RC) Used for Hedging or Commodity Derivative Contract (CDC)	Core Referenced Futures Contract (CRFC)	Quantity of Cash Commodity Hedged in terms of futures equivalents of the CRFC - = short	Cash Commodity Hedged	Units for Cash Commodity (Specify: e.g. tons, cwt, lbs., bu., bbls., etc.)	Stocks Owned	Fixed-Price Purchases	Fixed-Price Sales	Remaining Unsold, Unfilled and Other Anticipated Activity for the Specified Period in Form 704
5/6/2017	CL-NYMEX	CL-NYMEX	25,000	Crude oil	Bbls	10,000,000	20,000,000	5,000,000	0

<u>Form 204, Example B</u>- A commercial entity has filed unfilled anticipated requirements in an initial statement on form 704, Section A, in the amount of 120,000,000 MMBtu of natural gas. The current remaining unfilled anticipated requirements are 70,000,000 MMBtu. The person owns stocks of 20,000,000 MMBtu and has entered into fixed-price purchases of 30,000,000 MMBtu. The combined long cash position is long 50,000,000 MMBtu. The total position being hedged, i.e., the remaining unfilled anticipatory requirements of 70,000,000 MMBtu and the long cash position of 50,000,000 MMBtu, equals a long position of 120,000,000 MMBtu in the cash commodity. The commercial entity reports a futures equivalent short position of 10,000 contracts in the CRFC as a hedge, equivalent to short 100,000,000 MMBtu, which is less than the combined long cash position and the remaining unfilled anticipated requirements. Hence, the cash position is partially hedged.

A. Cash positions pursuant to the following paragraphs of § 19.01 (a) (3) (i), (ii), (iii), (iv), and (4)(ii).									
Date	Referenced Contract (RC) Used for Hedging or Commodity Derivative Contract (CDC)	Core Referenced Futures Contract (CRFC)	Quantity of Cash Commodity Hedged in terms of futures equivalents of the CRFC - = short	Cash Commodity Hedged	Units for Cash Commodity (Specify: e.g. tons, cwt, lbs., bu., bbls., etc.)	Stocks Owned	Fixed-Price Purchases	Fixed-Price Sales	Remaining Unsold, Unfilled and Other Anticipated Activity for the Specified Period in Form 704
5/6/2017	HH-NYMEX	NG-NYMEX	50,000	Natural gas	MMBtu	20,000,000	30,000,000	0	70,000,000

Form 204, Example C- A commercial entity has entered into offsetting unfixed-price purchase and sale contracts in the amount of 25,000,000 MMBtu of natural gas. The hedging position is a futures equivalent long position of 10,000 contracts and a futures equivalent short position of 10,000 contracts.

B. Offsetting Unfixed-Price Purchases and Sales pursuant to § 19.01(a)(3) (v).

Date	Referenced Contract (RC) Used for Hedging or Commodity Derivative Contract (CDC)	Core Referenced Futures Contract (CRFC)	Quantity of Cash Commodity Hedged in terms of futures equivalents of the CRFC	Cash Commodity Hedged	Units for Cash Commodity (Specify: e.g. tons, cwt, lbs., bu., bbls., etc.)	Unfixed-Price Purchases	Unfixed-Price Sales
5/6/2017	HH-NYMEX	NG-NYMEX	25,000	Natural Gas	MMBtu	25,000,000	
	HH-NYMEX	NG-NYMEX	-25,000	Natural Gas	MMBtu		25,000,000

Form 204, Example D– A merchant reportable in cotton futures has the following inventory: no equity stock, 100 bales of certificated stock, and 500 bales of non-certificated stock.

C. Cotton Stocks owned in Section A above pursuant to § 19.01(a)(3)(vi). Report in hundreds of bales (500-lb. bales).

Equity Stock ('00 bales)	Certificated Stocks ('00 bales)	Non-certificated Stocks ('00 bales)

CFTC FORM 304
Statement of Cash Positions for Unfixed-Price Cotton "On Call"

NOTICE: Failure to file a report required by the Commodity Exchange Act ("CEA" or the "Act") [1] and the regulations thereunder,[2] or the filing of a report with the Commodity Futures Trading Commission ("CFTC" or "Commission") that includes a false, misleading or fraudulent statement or omits material facts that are required to be reported therein or are necessary to make the report not misleading, may (a) constitute a violation of § 6(c)(2) of the Act (7 U.S.C. 9), § 9(a)(3) of the Act (7 U.S.C. 13(a)(3)), and/or § 1001 of Title 18, Crimes and Criminal Procedure (18 USC 1001) and (b) result in punishment by fine or imprisonment, or both.

PRIVACY ACT NOTICE

The Commission's authority for soliciting this information is granted in sections 4i and 8 of the CEA and related regulations (see, e.g., 17 CFR § 19.02). The information solicited from entities and individuals engaged in activities covered by the CEA is required to be provided to the CFTC, and failure to comply may result in the imposition of criminal or administrative sanctions (*see*, e.g., 7 U.S.C. §§ 9 and 13a-1, and/or 18 U.S.C. 1001). The information requested is most commonly used in the Commission's market and trade practice surveillance activities to (a) provide information concerning the size and composition of the commodity derivatives markets, (b) permit the Commission to monitor and enforce speculative position limits and (c) enhance the Commission's trade surveillance data. The requested information may be used by the Commission in the conduct of investigations and litigation and, in limited circumstances, may be made public in accordance with provisions of the CEA and other applicable laws. It may also be disclosed to other government agencies and to contract markets to meet responsibilities assigned to them by law. The information will be maintained in, and any additional disclosures will be made in accordance with, the CFTC System of Records Notices, available on www.cftc.gov.

[1] 7 U.S.C. section 1, et seq.

[2] Unless otherwise noted, the rules and regulations referenced in this notice are found in chapter 1 of title 17 of the Code of Federal Regulations; 17 CFR Chapter 1 et seq.

BACKGROUND & INSTRUCTIONS

Applicable Regulations:

- 17 CFR § 19.00(a)(2) specifies who must file Form 304.
- 17 CFR § 19.00(b) specifies the manner of reporting on series '04 reports, including Form 304.
- 17 CFR § 19.02(a) specifies the information required on Form 304.
- 17 CFR § 19.02(b) specifies the frequency (**weekly**), the as of report date (close of business on Friday), and the time (9 a.m. Eastern Time on the third business day following the date of the report), for filing the Form 304.

As appropriate, please follow the instructions below to generate and submit the required report or filing. Relevant regulations are cited in parentheses () for reference. Unless the context requires otherwise, the terms used herein shall have the same meaning as ascribed in parts 15 to 21 of the Commission's regulations.

Complete Form 304 as follows:

The trader identification fields should be completed by all filers. This updated Form 304 requires traders to identify themselves using their Public Trader Identification Number, in lieu of the CFTC Code Number required on previous versions of the Form 304. This number is provided to traders who have previously filed Forms 40 and 102 with the Commission. Traders may contact the Commission to obtain this number if it is unknown. If a trader has a National Futures Association Identification Number ("NFA ID") and/or a Legal Entity Identifier ("LEI"), he should also identify himself using those numbers. Form 304 requires traders to identify the name of the reporting trader or firm and the contact information (including full name, address, phone number, and email address) for a natural person the Commission may contact regarding the submitted Form 304.

Merchants and dealers of cotton must report on Form 304. Report in hundreds of 500-lb. bales unfixed-price cotton "on-call" pursuant to § 19.02(a). Include under "Call Purchases" stocks on hand for which price has not yet been fixed. For each listed stock, report the delivery month, delivery year, quantity of call purchases, and quantity of call sales.

The signature/authorization page must be completed by all filers. This page must include the name and position of the natural person filing Form 304 as well as the name of the reporting trader represented by that person. The trader certifying this Form 304 on the signature/authorization page should note that filing a report that includes a false, misleading or fraudulent statement or omits material facts that are required to be reported therein or are necessary to make the report not misleading, may (a) constitute a violation of § 6(c)(2) of the Act (7 U.S.C. 9), § 9(a)(3) of the Act (7 U.S.C. 13(a)(3)), and/or § 1001 of Title 18, Crimes and Criminal Procedure (18 U.S.C. 1001) and (b) result in punishment by fine or imprisonment, or both.

Submitting Form 304: Once completed, please submit this form to the Commission pursuant to the instructions on [www.cftc.gov] or as otherwise directed by Commission staff. If submission attempts fail, the reporting trader shall contact the Commission at [techsupport@cftc.gov] for further technical support.

Please be advised that pursuant to 5 CFR § 1320.5(b)(2)(i), you are not required to respond to this collection of information unless it displays a currently valid OMB control number.

Statement of Cash Positions for Conditional Spot Month Exemptions

NOTICE: Failure to file a report required by the Commodity Exchange Act ("CEA" or the "Act")[1] and the regulations thereunder,[2] or the filing of a report with the Commodity Futures Trading Commission ("CFTC" or "Commission") that includes a false, misleading or fraudulent statement or omits material facts that are required to be reported therein or are necessary to make the report not misleading, may (a) constitute a violation of § 6(c)(2) of the Act (7 U.S.C. 9), § 9(a)(3) of the Act (7 U.S.C. 13(a)(3)), and/or § 1001 of Title 18, Crimes and Criminal Procedure (18 U.S.C. 1001) and (b) result in punishment by fine or imprisonment, or both.

PRIVACY ACT NOTICE

The Commission's authority for soliciting this information is granted in sections 4a, 4c(b), 4i, 4t and 8a(5) of the CEA and related regulations (see, e.g., 17 CFR § 19.00). The information solicited from entities and individuals engaged in activities covered by the CEA is required to be provided to the CFTC, and failure to comply may result in the imposition of criminal or administrative sanctions (see, e.g., 7 U.S.C. §§ 9 and 13a-1, and/or 18 U.S.C. 1001). The information requested is most commonly used in the Commission's market and trade practice surveillance activities to (a) provide information concerning the size and composition of the commodity derivatives markets, (b) permit the Commission to monitor and enforce speculative position limits and (c) enhance the Commission's trade surveillance data. The requested information may be used by the Commission in the conduct of investigations and litigation and, in limited circumstances, may be made public in accordance with provisions of the CEA and other applicable laws. It may also be disclosed to other government agencies and to contract markets to meet responsibilities assigned to them by law. The information will be maintained in, and any additional disclosures will be made in accordance with, the CFTC System of Records Notices, available on www.cftc.gov.

[1] 7 U.S.C. section 1, et seq.

[2] Unless otherwise noted, the rules and regulations referenced in this notice are found in chapter 1 of title 17 of the Code of Federal Regulations; 17 CFR Chapter 1 et seq.

BACKGROUND & INSTRUCTIONS

Applicable Regulations:

- 17 CFR § 19.00(a)(1)(i) specifies who must file Form 504.
- 17 CFR § 19.00(b) specifies the manner of reporting on series '04 reports, including Form 504.
- 17 CFR § 19.01(a)(1) specifies the information required on Form 504.
- 17 CFR § 19.01(b)(2) specifies the frequency (**daily during the spot month**), the as of report date (close of business for each day a person exceeds the limit, up to and including the day the person's position first falls below the position limit), and the time (9 a.m. Eastern Time on the next business day following the date of the report) for filing Form 504.

As appropriate, please follow the instructions below to generate and submit the required report or filing. Relevant regulations are cited in parentheses () for reference. Unless the context requires otherwise, the terms used herein shall have the same meaning as ascribed in parts 15 to 21 of the Commission's regulations.

Complete Form 504 as follows:

The trader identification fields should be completed by all filers. This new Form 504 requires traders to identify themselves using their Public Trader Identification Number. This number is provided to traders who have previously filed Forms 40 and 102 with the Commission. Traders may contact the Commission to obtain this number if it is unknown. If a trader has a National Futures Association Identification Number ("NFA ID") and/or a Legal Entity Identifier ("LEI"), he should also identify himself using those numbers. Form 504 requires traders to identify the name of the reporting trader or firm and the contact information (including full name, address, phone number, and email address) for a natural person the Commission may contact regarding the submitted Form 504.

Form 504 must be completed for stocks and fixed-price cash positions by all filers claiming a conditional spot month limit exemption. Form 504 contains the following fields:

Date……………………………………..	As of date for reported position (§ 19.01(a)(1)(i))
CRFC…………………………………….	Core Referenced Futures Contract (§ 150.2(d))
Cash commodity……………………….	Cash commodity identification
Units……………………………………..	Units of measure for cash commodity
Stocks…………………………………..	Deliverable stored commodity (§ 19.01(a)(1)(ii))
Fixed-price Purchase………………….	Fixed-price purchase commitments (§ 19.01(a)(1)(iii))
Fixed-price Sale………………………..	Fixed-price sale commitments (§ 19.01(a)(1)(iv))
Unfixed-price Purchase……………….	Unfixed-price purchase commitments (§ 19.01(a)(1)(v))
Unfixed-price Sale……………………..	Unfixed-price sale commitments (§ 19.01(a)(1)(vi))

The signature/authorization page must be completed by all filers. This page must include the name and position of the natural person filing Form 504 as well as the name of the reporting trader represented by that person. The trader certifying this Form 504 on the signature/authorization page should note that filing a report that includes a false, misleading or fraudulent statement or omits material facts that are required to be reported therein or are necessary to make the report not misleading, may (a) constitute a violation of § 6(c)(2) of the Act (7 U.S.C. 9), § 9(a)(3) of the Act (7 U.S.C. 13(a)(3)), and/or § 1001 of Title 18, Crimes and Criminal Procedure (18 U.S.C. 1001) and (b) result in punishment by fine or imprisonment, or both.

Submitting Form 504: Once completed, please submit this form to the Commission pursuant to the instructions on [www.cftc.gov] or as otherwise directed by Commission staff. If submission attempts fail, the reporting trader shall contact the Commission at [techsupport@cftc.gov] for further technical support.

Please be advised that pursuant to 5 CFR § 1320.5(b)(2)(i), you are not required to respond to this collection of information unless it displays a currently valid OMB control number.

CFTC Form 504 (XX-XX)

Form 504 Example. The spot month for the physical-delivery May 2017 NYMEX Henry Hub Natural Gas (NG) futures contract (the CRFC for natural gas) is from the close of business on April 23 through 5:15 p.m. on the last day of trading, April 26, 2017. A trader holds positions in cash-settled natural gas referenced contracts settling on April 25, 2017, that are in excess of the spot month limit of 2,000 contracts, but that do not exceed 10,000 contracts, on each of April 23, 24, and 25, 2017. That trader does not hold any cash-settled referenced contracts settling on April 26, 2017; however, pursuant to § 19.01(b)(2)(i), a person must also report cash positions through the day the person's position first falls below the position limit. Consistent with claiming the conditional spot month limit exemption, the person holds no position in the May 2017 NYMEX NG contract during the spot month. Each line of the report represents each day of this conditional spot month limit exemption.

The person's purchase and sales commitments have the same delivery period as that of the May 2017 NYMEX NG contract. As of the close of business on April 23, 2017, the person holds: natural gas inventory of 10,000,000 MMBtus; fixed-price purchase contracts of 5,000,000 MMBtus; fixed price sales contracts of 10,000,000 MMBtu; unfixed-price cash purchase contracts of 5,000,000 MMBtu; and unfixed-price cash sales contracts of 5,000,000 MMBtu. The contract prices for each of the unfixed-price sales contracts and the unfixed-price purchase contracts are to become fixed 20 percent per business day on April 24, 25, 26, 27, and 28, 2017. The trader does not execute any cash transactions during the spot month.

Cash positions pursuant to § 19.01(a)(1).

CFTC FORM 604
Statement of Pass-Through Swap Exemptions

NOTICE: Failure to file a report required by the Commodity Exchange Act ("CEA" or the "Act")[1] and the regulations thereunder,[2] or the filing of a report with the Commodity Futures Trading Commission ("CFTC" or "Commission") that includes a false, misleading or fraudulent statement or omits material facts that are required to be reported therein or are necessary to make the report not misleading, may (a) constitute a violation of § 6(c)(2) of the Act (7 USC 9), § 9(a)(3) of the Act (7 U.S.C. 13(a)(3)), and/or § 1001 of Title 18, Crimes and Criminal Procedure (18 U.S.C. 1001) and (b) result in punishment by fine or imprisonment, or both.

PRIVACY ACT NOTICE

The Commission's authority for soliciting this information is granted in sections 4a, 4c(b), 4i, 4t and 8a(5) of the CEA and related regulations (*see*, e.g., 17 CFR § 19.00). The information solicited from entities and individuals engaged in activities covered by the CEA is required to be provided to the CFTC, and failure to comply may result in the imposition of criminal or administrative sanctions (see, e.g., 7 U.S.C. §§ 9 and 13a-1, and/or 18 U.S.C. 1001). The information requested is most commonly used in the Commission's market and trade practice surveillance activities to (a) provide information concerning the size and composition of the commodity derivatives markets, (b) permit the Commission to monitor and enforce speculative position limits and (c) enhance the Commission's trade surveillance data. The requested information may be used by the Commission in the conduct of investigations and litigation and, in limited circumstances, may be made public in accordance with provisions of the CEA and other applicable laws. It may also be disclosed to other government agencies and to contract markets to meet responsibilities assigned to them by law. The information will be maintained in, and any additional disclosures will be made in accordance with, the CFTC System of Records Notices, available on www.cftc.gov.

[1] 7 U.S.C. section 1, et seq.
[2] Unless otherwise noted, the rules and regulations referenced in this notice are found in chapter 1 of title 17 of the Code of Federal Regulations; 17 CFR Chapter 1 et seq.

BACKGROUND & INSTRUCTIONS

Applicable Regulations:

- 17 CFR § 19.00(a)(1)(ii) specifies who must file Form 604.
- 17 CFR § 19.00(b) specifies the manner of reporting on series '04 reports, including Form 604.
- 17 CFR § 19.01(a)(2)(i) and (ii) specify the information required on Form 604.
- For pass-through swaps with non-referenced-contract swap offset: 17 CFR § 19.01(b)(1) specifies the frequency (**monthly**), the as of report date (close of business on the last Friday of the month), and the time (9 a.m. Eastern Time on the third business day following the date of the report) for filing Form 604.
- For pass-through swaps with spot-month swap offset: 17 CFR § 19.01(b)(2) specifies the frequency (**daily during the spot month**), the as of report date (close of business for each day a person exceeds the limit, up to and including the day the person's position first falls below the position limit), and the time (9 a.m. Eastern Time on the next business day following the date of the report) for filing Form 604.

As appropriate, please follow the instructions below to generate and submit the required report or filing. Relevant regulations are cited in parentheses () for reference. Unless the context requires otherwise, the terms used herein shall have the same meaning as ascribed in parts 15 to 21 of the Commission's regulations.

Complete Form 604 as follows:

The trader identification fields should be completed by all filers. This new Form 604 requires traders to identify themselves using their Public Trader Identification Number. This number is provided to traders who have previously filed Forms 40 and 102 with the Commission. Traders may contact the Commission to obtain this number if it is unknown. If a trader has a National Futures Association Identification Number ("NFA ID") and/or a Legal Entity Identifier ("LEI"), he should also identify himself using those numbers. Form 604 requires traders to identify the name of the reporting trader or firm and the contact information (including full name, address, phone number, and email address) for a natural person the Commission may contact regarding the submitted Form 604.

Section A of Form 604 must be completed by all filers who hold a non-referenced contract swap offset position. Section A contains the following fields:

Date…………………………………………..	As of date for reported position
Underlying Commodity………………….....	Underlying Commodity or Commodity Reference Price that is not a Referenced Contract (§ 19.01(a)(2)(i)(A))
CRFC………………………………………	Corresponding Core Referenced Futures Contract (§ 150.2(d))
Applicable Clearing Identifier…………….	Clearing Identifier (if swap is cleared) (§ 19.01(a)(2)(i)(B))
Commodity Quantity Unit (CQU)…………	Unit of Measurement for Commodity
Notional Quantity………………………….	Notional Quantity in CQU (§ 19.01(a)(2)(i)(C))
Position in FE in CRFC…………………...	Gross long and short positions in futures equivalents of the CRFC (§ 19.01(a)(2)(i)(D))
Position in RC for offsetting risk………….	Gross long and short positions in referenced contract offset position (§ 19.01(a)(2)(i)(E))

Section B of Form 604 must be completed by all filers who hold a spot-month swap offset position. Section B contains the following fields:

Date…………………………………………..	As of date for reported position
RC or non-RC for swap offset…………....	Underlying Commodity or Commodity Reference Price or Referenced Contract for swap offsetting counterparty's bona fide hedging exemption (§ 19.01(a)(2)(ii))
CRFC………………………………………	Corresponding Core Referenced Futures Contract (§ 150.2(d))
Applicable Clearing Identifier……………	Clearing Identifier (if swap is cleared) (§ 19.01(a)(2)(i)(B))
Commodity Quantity Unit (CQU)……….	Unit of Measurement for Commodity
Notional Quantity…………………………	Notional Quantity in CQU (§ 19.01(a)(2)(i)(C))

Position in FE in CRFC…………………. Gross long and short positions in futures equivalents of the CRFC (§ 19.01(a)(2)(ii)(A))
Position in physical delivery RC
for offsetting risk……………………….... Gross long and short positions in referenced contract offset position (§ 19.01(a)(2)(ii)(B))

The signature/authorization page must be completed by all filers. This page must include the name and position of the natural person filing Form 604 as well as the name of the reporting trader represented by that person. The trader certifying this Form 604 on the signature/authorization page should note that filing a report that includes a false, misleading or fraudulent statement or omits material facts that are required to be reported therein or are necessary to make the report not misleading, may (a) constitute a violation of § 6(c)(2) of the Act (7 U.S.C. 9), § 9(a)(3) of the Act (7 U.S.C. 13(a)(3)), and/or § 1001 of Title 18, Crimes and Criminal Procedure (18 U.S.C. 1001) and (b) result in punishment by fine or imprisonment, or both.

Submitting Form 604: Once completed, please submit this form to the Commission pursuant to the instructions on [www.cftc.gov] or as otherwise directed by Commission staff. If submission attempts fail, the reporting trader shall contact the Commission at [techsupport@cftc.gov] for further technical support.

Please be advised that pursuant to 5 CFR § 1320.5(b)(2)(i), you are not required to respond to this collection of information unless it displays a currently valid OMB control number.

CFTC Form 604 (XX-XX)

Form 604, Example A. A person offsets a long position in a cash-settled milo swap with a notional size of 5,000,000 bushels, using the CBOT Corn futures contract, as a cross-commodity hedge. The milo swap was a bona fide hedging position for the swap counterparty, and was not cleared. For illustrative purposes, the hedge ratio is assumed to be one-to-one between milo and corn.

A. Non-referenced contract swap offset pursuant to § 19.01(a)(2)(i), reported and submitted **monthly** pursuant to § 19.01(b)(1)									
Date	Underlying Commodity or Commodity Reference Price that is not a Referenced Contract (RC)	Core Referenced Futures contract (CRFC)	Applicable Clearing Identifier	Commodity Quantity Units of Measurement (Specify Tons, Lbs., Bu., Bbls., etc.)	Notional Quantity in CQU	Gross Long Position in Futures Equivalent in the CRFC	Gross Short Position in Futures Equivalent in the CFRC	Gross Long Position in the RC for the Offsetting Risk Position in CQU	Gross Short Position in the RC for the Offsetting Risk Position in CQU
6/28/2017	Milo	C-CBOT	NA	Bu	5,000,000	1,000	0	0	5,000,000

Form 604, Example B. A person offsets a cash-settled corn swap with a notional size of 5,000,000 bushels, using the CBOT Corn futures contract during the spot month. An exemption for swap offsets is not permitted in the physical-delivery CBOT Corn futures contract in the last five days of trading. For the May 2017 CBOT Corn futures contract, the last day of trading is May 12 (CBOT rules specify the last trading day as the business day preceding the fifteenth calendar day of the contract month). Hence, the spot month swap offset exemption is not available in the May 2017 CBOT Corn futures contract as of the close of business on May 5, 2017. At that time, the trader must comply with the 600 contract spot month limit, equivalent to 3,000,000 bushels of corn, absent another exemption. Each line represents each day's report for this swap offset position. The spot month for the CBOT Corn futures contract begins at the close of trading two business days prior to the first trading day of the delivery month; hence, April 27, 2017, is the start of the spot month for the May 2017 CBOT Corn futures contract. The corn swap was a bona fide hedging position for the swap counterparty, and was not cleared.

B. Spot-month swap offset pursuant to § 19.01(a)(2)(ii), reported and submitted **daily** pursuant to § 19.01(b)(2) for non-referenced and referenced cash-settled swaps

Date	Underlying Commodity or Referenced Contract for cash-settled swap offsetting BFH exemption of counterparty	Core Referenced Futures contract (CRFC)	Applicabl e Clearing Identifier	Commodity Quantity Units of Measurement (Specify Tons, Lbs., Bu., Bbls., etc.) - CQU	Notional Quantity in CQU	Gross Long Position for Cash-settled Swap in Futures Equivalent in the CRFC	Gross Short Position for Cash-settled Swap in Futures Equivalent in the CFRC	Gross Long Position in the Physical-delivery RC for the Offsetting Risk Position in CQU	Gross Short Position in the Physical-delivery RC for the Offsetting Risk Position in CQU

CFTC FORM 704

INITIAL STATEMENT AND ANNUAL UPDATE FOR ANTICIPATORY BONA FIDE HEDGING POSITIONS

NOTICE: Failure to file a report required by the Commodity Exchange Act ("CEA" or the "Act")[1] and the regulations thereunder,[2] or the filing of a report with the Commodity Futures Trading Commission ("CFTC" or "Commission") that includes a false, misleading or fraudulent statement or omits material facts that are required to be reported therein or are necessary to make the report not misleading, may (a) constitute a violation of § 6(c)(2) of the Act (7 USC 9), § 9(a)(3) of the Act (7 U.S.C. 13(a)(3)), and/or § 1001 of Title 18, Crimes and Criminal Procedure (18 U.S.C. 1001) and (b) result in punishment by fine or imprisonment, or both.

PRIVACY ACT NOTICE

The Commission's authority for soliciting this information is granted in sections 4a, 4c(b), 4i, 4t and 8a(5) of the CEA and related regulations (see, e.g., 17 CFR § 19.00). The information solicited from entities and individuals engaged in activities covered by the CEA is required to be provided to the CFTC, and failure to comply may result in the imposition of criminal or administrative sanctions (*see*, e.g., 7 U.S.C. §§ 9 and 13a-1, and/or 18 U.S.C. 1001). The information requested is most commonly used in the Commission's market and trade practice surveillance activities to (a) provide information concerning the size and composition of the commodity derivatives markets, (b) permit the Commission to monitor and enforce speculative position limits and (c) enhance the Commission's trade surveillance data. The requested information may be used by the Commission in the conduct of investigations and litigation and, in limited circumstances, may be made public in accordance with provisions of the CEA and other applicable laws. It may also be disclosed to other government agencies and to contract markets to meet responsibilities assigned to them by law. The information will be maintained in, and any additional disclosures will be made in accordance with, the CFTC System of Records Notices, available on www.cftc.gov.

[1] 7 U.S.C. section 1, et seq.

[2] Unless otherwise noted, the rules and regulations referenced in this notice are found in chapter 1 of title 17 of the Code of Federal Regulations; 17 CFR Chapter 1 et seq.

BACKGROUND & INSTRUCTIONS

Applicable Regulations:

- 17 CFR § 150.7(a) specifies who must file Form 704.
- 17 CFR § 19.00(b) specifies the manner of reporting on series '04 reports, including Form 704.
- 17 CFR § 150.7(d) specifies the information required on Form 704.
- 17 CFR § 150.7(a) specifies that initial statements on Form 704 must be filed at least 10 days in advance of the date the person expects to exceed position limits. Annual updates must be filed on Form 704 each year thereafter.

As appropriate, please follow the instructions below to generate and submit the required report or filing. Relevant regulations are cited in parentheses () for reference. Unless the context requires otherwise, the terms used herein shall have the same meaning as ascribed in parts 15 to 21 of the Commission's regulations.

Complete Form 704 as follows:

The trader identification fields should be completed by all filers. This new Form 704 requires traders to identify themselves using their Public Trader Identification Number. This number is provided to traders who have previously filed Forms 40 and 102 with the Commission. Traders may contact the Commission to obtain this number if it is unknown. If a trader has a National Futures Association Identification Number ("NFA ID") and/or a Legal Entity Identifier ("LEI"), he should also identify himself using those numbers. Form 704 requires traders to identify the name of the reporting trader or firm and the contact information (including full name, address, phone number, and email address) for a natural person the Commission may contact regarding the submitted Form 704.

Form 704 must be completed by all filers who seek an exemption for anticipated bona fide hedging positions. Form 704 contains the following fields:

Initial Statement or Annual Update	Select Initial Statement if filing for the first time OR Annual Update if filing an annual update to a previously filed Form 704 (§ 150.7(d))
Anticipated Activity............................	Type of anticipated activity; choose Production, Requirements, Royalty Receipts, Service Contract Payments or Receipts. Traders filing for multiple types of anticipated activity must show each type on a new line of Form 704. (§ 150.1 BFH definition paragraphs 3(iii), 4(i),4(ii), 4(iv) or (5)
Cash Commodity..............................	Commodity being hedged (§ 150.7 (d)(1)(i))
Units..	Units of measure for cash commodity being hedged
CRFC..	Corresponding Core Referenced Futures Contract (§ 150.2(d))
Same or Cross-Hedged........................	Identify whether the cash commodity being hedged is the same as the commodity underlying the CRFC (type "S") or whether it is a cross-hedging commodity (type "C-H") (§ 150.7 (d)(1)(iii))
Annual Activity................................	Quantity of annual actual activity for each of the preceding three years if filing an initial statement OR the prior year if filing an annual update. If a filer does not have three years of activity to submit, she may submit a reasonable, supported estimate of anticipated production for review by Commission staff. (§ 150.7 (d)(1)(iv)(A)-(B))
Specific Time Period Claimed.................	Date range for which an anticipatory exemption is being claimed, e.g. 01/01/2017 – 12/31/2017. If filing an annual update, select the amount of time remaining since the initial statement (§ 150.7 (d)(1)(v))
Anticipated for Specified Time...............	Quantity of total anticipated activity over entire specified time period in futures equivalents (§ 150.7 (d)(1)(vi))

Fixed Price Forward Activity………………	Quantity of fixed price forward activity in cash commodity being hedged for the specified time period in futures equivalents (§ 150.7 (d)(1)(vii))
Unsold, Unfilled, Anticipated Activity …….	Unsold or unfilled anticipated production, requirements, royalty receipts, or service contract payments or receipts the risks of which have not been offset with cash positions, of such commodity for the specified time period (§ 150.7 (d)(1)(viii))
Maximum Expected Position………………	The maximum number of long or short positions in referenced contracts expected to be used to offset the risks of anticipated activity (§ 150.7 (d)(1)(ix))

The signature/authorization page must be completed by all filers. This page must include the name and position of the natural person filing Form 704 as well as the name of the reporting trader represented by that person. The trader certifying this Form 704 on the signature/authorization page should note that filing a report that includes a false, misleading or fraudulent statement or omits material facts that are required to be reported therein or are necessary to make the report not misleading, may (a) constitute a violation of § 6(c)(2) of the Act (7 U.S.C. 9), § 9(a)(3) of the Act (7 U.S.C. 13(a)(3)), and/or § 1001 of Title 18, Crimes and Criminal Procedure (18 U.S.C. 1001) and (b) result in punishment by fine or imprisonment, or both.

Submitting Form 704: Once completed, please submit this form to the Commission pursuant to the instructions on [www.cftc.gov] or as otherwise directed by Commission staff. If submission attempts fail, the reporting trader shall contact the Commission at [techsupport@cftc.gov] for further technical support.

Please be advised that pursuant to 5 CFR § 1320.5(b)(2)(i), you are not required to respond to this collection of information unless it displays a currently valid OMB control number.

CFTC Form 704 (XX-XX)

Form 704, Example A – A producer files an initial anticipatory exemption for anticipated production of crude oil for the next three years. The producer had production over the prior three calendar years (15 million, 18 million, and 20 million barrels) and is highly certain of anticipated production for the next 3 calendar years of 20 million barrels per year. The producer has no forward sales; hence, the full 60 million barrels of anticipated production (20 million barrels of anticipated production per year for three years) is unsold anticipated production. The unit of trading for the NYMEX Light Sweet Crude Oil futures contract (CL) is 1,000 barrels. The maximum hedge would be a short position of 60,000 contracts in the NYMEX CL contract.

A. Initial Statement and Annual Update for Anticipatory Activity pursuant to § 150.7 (d)

Check here if filing Initial Statement: ☑

Check here if filing Annual Update: ☐

Anticipated Activity (Production, Requirements, Royalty Receipts, Service Contract Payments or Receipt)	Cash Commodity Underlying Anticipated Activity	Units for Cash Commodity (Specify Tons, CWT, Lbs., Bu., Bbls., etc.)	Core Referenced Futures contract (CRFC)	Cash Commodity Same as (S) or Cross-hedged (C-H) with Core Reference Futures Contract (CRFC)	Annual Production, Requirements, Royalty Receipts, Service Contract Payments or Receipts for Preceding Three Years (One Year if Annual Update)	Specified Time Period (Date Range) for which Anticipatory Hedge Exemption is Claimed	Anticipated Activity for Such specified Time Period in Futures Equivalent	Fixed-Price Forward sales, Inventory, and Fixed Price Forward Purchases	Unsold, Unfilled and Anticipated Activity	Maximum Number of Long or Short Positions in RC expected to be used to offset Anticipated Activity
Production	Crude Oil	(m='000,000) bbls	CL-NYMEX	S	2014-15m 2015-18m 2016-20m	1/1/2017 – 12/31/2019	60,000	0	60,000	-60,000

Form 704, Example B. In 2018, one year after filing the initial statement, the producer in Example A files an annual update. Actual production for the prior year was 20 million barrels, as forecasted. The producer remains highly certain of 40 million barrels of production (20 million barrels of crude oil for each of the next two years). The producer has sold forward 10 million barrels. Hence, remaining unsold anticipated production is 30 million barrels. The maximum hedge would be a short position of 30,000 contracts in the NYMEX CL contract.

BILLING CODE 6351–01–C

PART 37—SWAP EXECUTION FACILITIES

■ 13. The authority citation for part 37 continues to read as follows:

Authority: 7 U.S.C. 1a, 2, 5, 6, 6c, 7, 7a–2, 7b–3, and 12a, as amended by Titles VII and VIII of the Dodd-Frank Wall Street Reform and Consumer Protection Act, Pub. L. 111–203, 124 Stat. 1376.

■ 14. Revise § 37.601 to read as follows:

§ 37.601 Additional sources for compliance.

A swap execution facility that is a trading facility must meet the requirements of part 150 of this chapter, as applicable.

■ 15. In Appendix B to part 37, under the heading Core Principle 6 of Section 5h of the Act—Position Limits or Accountability, revise paragraphs (A) and (B) to read as follows:

Appendix B to Part 37—Guidance on, and Acceptable Practices in, Compliance with Core Principles

* * * * *

Core Principle 6 of Section 5h of the Act—Position Limits or Accountability

(A) *In general.* To reduce the potential threat of market manipulation or congestion, especially during trading in the delivery month, a swap execution facility that is a trading facility shall adopt for each of the contracts of the facility, as is necessary and appropriate, position limitations or position accountability for speculators.

(B) *Position limits.* For any contract that is subject to a position limitation established by the Commission pursuant to section 4a(a), the swap execution facility shall:

(1) Set its position limitation at a level not higher than the Commission limitation; and

(2) Monitor positions established on or through the swap execution facility for compliance with the limit set by the Commission and the limit, if any, set by the swap execution facility.

(a) *Guidance.*

(1) Until a swap execution facility has access to sufficient swap position information, a swap execution facility that is a trading facility need not demonstrate compliance with Core Principle 6(B). A swap execution facility has access to sufficient swap position information if, for example:

(i) It has access to daily information about its market participants' open swap positions; or

(ii) It knows, including through knowledge gained in surveillance of heavy trading activity occurring on or pursuant to the rules of the swap execution facility, that its market participants regularly engage in large volumes of speculative trading activity that would cause reasonable surveillance personnel at a swap execution facility to inquire further about a market participant's intentions or open swap positions.

(2) When a swap execution facility has access to sufficient swap position information, this guidance is no longer applicable. At such time, a swap execution facility is required to demonstrate compliance with Core Principle 6(B).

(b) *Acceptable practices.* [Reserved]

* * * * *

PART 38—DESIGNATED CONTRACT MARKETS

■ 16. The authority citation for part 38 continues to read as follows:

Authority: 7 U.S.C. 1a, 2, 6, 6a, 6c, 6d, 6e, 6f, 6g, 6i, 6j, 6k, 6l, 6m, 6n, 7, 7a–2, 7b, 7b–1, 7b–3, 8, 9, 15, and 21, as amended by the Dodd-Frank Wall Street Reform and Consumer Protection Act, Pub. L. 111–203, 124 Stat. 1376.

■ 17. Revise § 38.301 to read as follows:

§ 38.301 Position limitations and accountability.

A designated contract market must meet the requirements of part 150 of this chapter, as applicable.

■ 18. In Appendix B to part 38, under the heading Core Principle 5 of section 5(d) of the Act: Position Limitations or Accountability, revise paragraphs (A) and (B) to read as follows:

Appendix B to Part 38—Guidance on, and Acceptable Practices in, Compliance with Core Principles

* * * * *

Core Principle 5 of Section 5(d) of the Act: Position Limitations or Accountability

(A) *In general.*—To reduce the potential threat of market manipulation or congestion (especially during trading in the delivery month), the board of trade shall adopt for each contract of the board of trade, as is necessary and appropriate, position limitations or position accountability for speculators.

(B) *Maximum allowable position limitation.*—For any contract that is subject to a position limitation established by the Commission pursuant to section 4a(a), the board of trade shall set the position limitation of the board of trade at a level not higher than the position limitation established by the Commission.

(a) *Guidance.*

(1) Until a board of trade has access to sufficient swap position information, a board of trade need not demonstrate compliance with Core Principle 5(B) with respect to swaps. A board of trade has access to sufficient swap position information if, for example:

(i) It has access to daily information about its market participants' open swap positions; or

(ii) It knows, including through knowledge gained in surveillance of heavy trading activity occurring on or pursuant to the rules of the designated contract market, that its market participants regularly engage in large volumes of speculative trading activity that would cause reasonable surveillance personnel at a board of trade to inquire further about a market participant's intentions or open swap positions.

(2) When a board of trade has access to sufficient swap position information, this guidance is no longer applicable. At such time, a board of trade is required to demonstrate compliance with Core Principle 5(B) with respect to swaps.

(b) *Acceptable Practices.* [Reserved]

* * * * *

PART 140—ORGANIZATION, FUNCTIONS, AND PROCEDURES OF THE COMMISSION

■ 19. The authority citation for part 140 continues to read as follows:

Authority: 7 U.S.C. 2(a)(12), 12a, 13(c), 13(d), 13(e), and 16(b).

§ 140.97 [Removed and reserved]

■ 20. Remove and reserve § 140.97.

PART 150—LIMITS ON POSITIONS

■ 21. The authority citation for part 150 continues to read as follows:

Authority: 7 U.S.C. 1a, 2, 5, 6, 6a, 6c, 6f, 6g, 6t, 12a, 19, as amended by Title VII of the Dodd-Frank Wall Street Reform and Consumer Protection Act, Pub. L. 111–203, 124 Stat. 1376 (2010).

■ 22. Revise § 150.1 to read as follows:

§ 150.1 Definitions.

As used in this part—

Bona fide hedging position means—

(1) *Hedges of an excluded commodity.* For a position in commodity derivative contracts in an excluded commodity, as that term is defined in section 1a(19) of the Act:

(i) Such position is economically appropriate to the reduction of risks in the conduct and management of a commercial enterprise and is enumerated in paragraph (3), (4) or (5) of this definition; or

(ii) Is otherwise recognized as a bona fide hedging position by the designated contract market or swap execution facility that is a trading facility, pursuant to such market's rules submitted to the Commission, which rules may include risk management exemptions consistent with Appendix A of this part; and

(2) *Hedges of a physical commodity—general definition.* For a position in commodity derivative contracts in a physical commodity:

(i) Such position:

(A) Represents a substitute for transactions made or to be made, or positions taken or to be taken, at a later time in a physical marketing channel;

(B) Is economically appropriate to the reduction of risks in the conduct and management of a commercial enterprise;

(C) Arises from the potential change in the value of—

(*1*) Assets which a person owns, produces, manufactures, processes, or merchandises or anticipates owning, producing, manufacturing, processing, or merchandising;

(*2*) Liabilities which a person owes or anticipates incurring; or

(*3*) Services that a person provides, purchases, or anticipates providing or purchasing; or

(ii)(A) *Pass-through swap offsets.* Such position reduces risks attendant to a position resulting from a swap in the same physical commodity that was executed opposite a counterparty for which the swap would qualify as a bona fide hedging position pursuant to paragraph (2)(i) of this definition (a pass-through swap counterparty), *provided that* the bona fides of the pass-through swap counterparty may be determined at the time of the transaction;

(B) *Pass-through swaps.* Such swap position was executed opposite a pass-through swap counterparty and to the extent such swap position has been offset pursuant to paragraph (2)(ii)(A) of this definition; or

(C) *Offsets of bona fide hedging swap positions.* Such position reduces risks attendant to a position resulting from a swap that meets the requirements of paragraph (2)(i) of this definition.

(iii) *Additional requirements for enumeration or other recognition.* Notwithstanding the foregoing general definition, a position in commodity derivative contracts in a physical commodity shall be classified as a bona fide hedging position only if:

(A) The position satisfies the requirements of paragraph (2)(i) of this definition and is enumerated in paragraph (3), (4), or (5) of this definition;

(B) The position satisfies the requirements of paragraph (2)(ii) of this definition, *provided that* no offsetting position is maintained in any physical-delivery commodity derivative contract during the lesser of the last five days of trading or the time period for the spot month in such physical-delivery commodity derivative contract; or

(C) The position has been otherwise recognized as a non-enumerated bona fide hedging position by either a designated contract market or swap execution facility, each in accordance with § 150.9(a); or by the Commission.

(3) *Enumerated hedging positions.* A bona fide hedging position includes any of the following specific positions:

(i) *Hedges of inventory and cash commodity purchase contracts.* Short positions in commodity derivative contracts that do not exceed in quantity ownership or fixed-price purchase contracts in the contract's underlying cash commodity by the same person.

(ii) *Hedges of cash commodity sales contracts.* Long positions in commodity derivative contracts that do not exceed in quantity the fixed-price sales contracts in the contract's underlying cash commodity by the same person and the quantity equivalent of fixed-price sales contracts of the cash products and by-products of such commodity by the same person.

(iii) *Hedges of unfilled anticipated requirements. Provided that* such positions in a physical-delivery commodity derivative contract, during the lesser of the last five days of trading or the time period for the spot month in such physical-delivery contract, do not exceed the person's unfilled anticipated requirements of the same cash commodity for that month and for the next succeeding month:

(A) Long positions in commodity derivative contracts that do not exceed in quantity unfilled anticipated requirements of the same cash commodity, for processing, manufacturing, or use by the same person; and

(B) Long positions in commodity derivative contracts that do not exceed in quantity unfilled anticipated requirements of the same cash commodity for resale by a utility to its customers.

(iv) *Hedges by agents.* Long or short positions in commodity derivative contracts by an agent who does not own or has not contracted to sell or purchase the offsetting cash commodity at a fixed price, *provided that* the agent is responsible for merchandising the cash positions that are being offset in commodity derivative contracts and the agent has a contractual arrangement with the person who owns the commodity or holds the cash market commitment being offset.

(4) *Other enumerated hedging positions.* A bona fide hedging position also includes the following specific positions, *provided that* no such position is maintained in any physical-delivery commodity derivative contract during the lesser of the last five days of trading or the time period for the spot month in such physical-delivery contract:

(i) *Hedges of unsold anticipated production.* Short positions in commodity derivative contracts that do not exceed in quantity unsold anticipated production of the same commodity by the same person.

(ii) *Hedges of offsetting unfixed-price cash commodity sales and purchases.* Short and long positions in commodity derivative contracts that do not exceed in quantity that amount of the same cash commodity that has been bought and sold by the same person at unfixed prices:

(A) Basis different delivery months in the same commodity derivative contract; or

(B) Basis different commodity derivative contracts in the same commodity, regardless of whether the commodity derivative contracts are in the same calendar month.

(iii) *Hedges of anticipated royalties.* Short positions in commodity derivative contracts offset by the anticipated change in value of mineral royalty rights that are owned by the same person, *provided that* the royalty rights arise out of the production of the commodity underlying the commodity derivative contract.

(iv) *Hedges of services.* Short or long positions in commodity derivative contracts offset by the anticipated change in value of receipts or payments due or expected to be due under an executed contract for services held by the same person, *provided that* the contract for services arises out of the production, manufacturing, processing, use, or transportation of the commodity underlying the commodity derivative contract.

(5) *Cross-commodity hedges.* Positions in commodity derivative contracts described in paragraph (2)(ii), paragraphs (3)(i) through (iv) and paragraphs (4)(i) through (iv) of this definition may also be used to offset the risks arising from a commodity other than the same cash commodity underlying a commodity derivative contract, *provided that* the fluctuations in value of the position in the commodity derivative contract, or the commodity underlying the commodity derivative contract, are substantially related to the fluctuations in value of the actual or anticipated cash position or pass-through swap and no such position is maintained in any physical-delivery commodity derivative contract during the lesser of the last five days of trading or the time period for the spot month in such physical-delivery contract.

(6) *Offsets of commodity trade options.* For purposes of this definition, a commodity trade option, meeting the requirements of § 32.3 of this chapter for a commodity option transaction, may be deemed a cash commodity purchase or sales contract, as appropriate, *provided that* such option is adjusted on a futures-equivalent basis. By way of example, a commodity trade option with a fixed strike price may be converted to a futures-equivalent basis, and, on that futures-equivalent basis,

deemed a cash commodity sale, in the case of a short call option or long put option, or a cash commodity purchase, in the case of a long call option or short put option.

Calendar spread contract means a cash-settled agreement, contract, or transaction that represents the difference between the settlement price in one or a series of contract months of an agreement, contract or transaction and the settlement price of another contract month or another series of contract months' settlement prices for the same agreement, contract or transaction.

Commodity derivative contract means, for this part, any futures, option, or swap contract in a commodity (other than a security futures product as defined in section 1a(45) of the Act).

Commodity index contract means an agreement, contract, or transaction that is not a location basis contract or any type of spread contract, based on an index comprised of prices of commodities that are not the same or substantially the same.

Core referenced futures contract means a futures contract that is listed in § 150.2(d).

Eligible affiliate. An eligible affiliate means an entity with respect to which another person:

(1) Directly or indirectly holds either:

(i) A majority of the equity securities of such entity, or

(ii) The right to receive upon dissolution of, or the contribution of, a majority of the capital of such entity;

(2) Reports its financial statements on a consolidated basis under Generally Accepted Accounting Principles or International Financial Reporting Standards, and such consolidated financial statements include the financial results of such entity; and

(3) Is required to aggregate the positions of such entity under § 150.4 and does not claim an exemption from aggregation for such entity.

Eligible entity[1] means a commodity pool operator, the operator of a trading vehicle which is excluded or who itself has qualified for exclusion from the definition of the term ''pool'' or ''commodity pool operator,'' respectively, under § 4.5 of this chapter; the limited partner or shareholder in a commodity pool the operator of which is exempt from registration under § 4.13 of this chapter; a commodity trading advisor; a bank or trust company; a savings association; an insurance company; or the separately organized affiliates of any of the above entities:

(1) Which authorizes an independent account controller independently to control all trading decisions for positions it holds directly or indirectly, or on its behalf, but without its day-to-day direction; and

(2) Which maintains:

(i) Only such minimum control over the independent account controller as is consistent with its fiduciary responsibilities and necessary to fulfill its duty to supervise diligently the trading done on its behalf; or

(ii) If a limited partner or shareholder of a commodity pool the operator of which is exempt from registration under § 4.13 of this chapter, only such limited control as is consistent with its status.

Entity means a ''person'' as defined in section 1a of the Act.

Excluded commodity means an ''excluded commodity'' as defined in section 1a of the Act.

Futures-equivalent means

(1) An option contract, whether an option on a future or an option that is a swap, which has been adjusted by an economically reasonable and analytically supported risk factor, or delta coefficient, for that option computed as of the previous day's close or the current day's close or contemporaneously during the trading day, and converted to an economically equivalent amount of an open position in a core referenced futures contract, *provided however,* if a participant's position exceeds position limits as a result of an option assignment, that participant is allowed one business day to liquidate the excess position without being considered in violation of the limits;

(2) A futures contract which has been converted to an economically equivalent amount of an open position in a core referenced futures contract; and

(3) A swap which has been converted to an economically equivalent amount of an open position in a core referenced futures contract.

Independent account controller[2] means a person—

(1) Who specifically is authorized by an eligible entity, as defined in this section, independently to control trading decisions on behalf of, but without the day-to-day direction of, the eligible entity;

(2) Over whose trading the eligible entity maintains only such minimum control as is consistent with its fiduciary responsibilities to fulfill its duty to supervise diligently the trading done on its behalf or as is consistent with such other legal rights or obligations which may be incumbent upon the eligible entity to fulfill;

(3) Who trades independently of the eligible entity and of any other independent account controller trading for the eligible entity;

(4) Who has no knowledge of trading decisions by any other independent account controller; and

(5) Who is registered as a futures commission merchant, an introducing broker, a commodity trading advisor, an associated person or any such registrant, or is a general partner of a commodity pool the operator of which is exempt from registration under § 4.13 of this chapter.

Intercommodity spread contract means a cash-settled agreement, contract or transaction that represents the difference between the settlement price of a referenced contract and the settlement price of another contract, agreement, or transaction that is based on a different commodity.

Intermarket spread position means a long (short) position in one or more commodity derivative contracts in a particular commodity, or its products or its by-products, at a particular designated contract market or swap execution facility and a short (long) position in one or more commodity derivative contracts in that same, or similar, commodity, or its products or its by-products, away from that particular designated contract market or swap execution facility.

Intramarket spread position means a long position in one or more commodity derivative contracts in a particular commodity, or its products or its by-products, and a short position in one or more commodity derivative contracts in the same, or similar, commodity, or its products or its by-products, on the same designated contract market or swap execution facility.

Location basis contract means a commodity derivative contract that is cash-settled based on the difference in:

(1) The price, directly or indirectly, of:

(i) A particular core referenced futures contract; or

[1] The definition of the term, eligible entity, was amended by the Commission in a final rule published on December 16, 2016 (81 FR 91454, 91489). The unamended version of the definition presented here is included solely to maintain the continuity of this regulatory section and for the convenience of the reader. The definition of the term, eligible entity, is not a subject of this reproposal and will be revised when the amended definition takes effect on February 14, 2017.

[2] The definition of the term, independent account controller, was amended by the Commission in a final rule published on December 16, 2016 (81 FR 91454, 91489). The unamended version of the definition presented here is included solely to maintain the continuity of this regulatory section and for the convenience of the reader. The definition of the term, independent account controller, is not a subject of this reproposal and will be revised when the amended definition takes effect on February 14, 2017.

(ii) A commodity deliverable on a particular core referenced futures contract, whether at par, a fixed discount to par, or a premium to par; and

(2) The price, at a different delivery location or pricing point than that of the same particular core referenced futures contract, directly or indirectly, of:

(i) A commodity deliverable on the same particular core referenced futures contract, whether at par, a fixed discount to par, or a premium to par; or

(ii) A commodity that is listed in Appendix B to this part as substantially the same as a commodity underlying the same core referenced futures contract.

Long position means, on a futures-equivalent basis, a long call option, a short put option, a long underlying futures contract, or a swap position that is equivalent to a long futures contract.

Physical commodity means any agricultural commodity as that term is defined in § 1.3 of this chapter or any exempt commodity as that term is defined in section 1a(20) of the Act.

Pre-enactment swap means any swap entered into prior to enactment of the Dodd-Frank Act of 2010 (July 21, 2010), the terms of which have not expired as of the date of enactment of that Act.

Pre-existing position means any position in a commodity derivative contract acquired in good faith prior to the effective date of any bylaw, rule, regulation or resolution that specifies an initial speculative position limit level or a subsequent change to that level.

Referenced contract means a core referenced futures contract listed in § 150.2(d) or, on a futures equivalent basis with respect to a particular core referenced futures contract, a futures contract, options contract, or swap that is:

(1) Directly or indirectly linked, including being partially or fully settled on, or priced at a fixed differential to, the price of that particular core referenced futures contract; or

(2) Directly or indirectly linked, including being partially or fully settled on, or priced at a fixed differential to, the price of the same commodity underlying that particular core referenced futures contract for delivery at the same location or locations as specified in that particular core referenced futures contract.

(3) The definition of referenced contract does not include any guarantee of a swap, a location basis contract, a commodity index contract, or a trade option that meets the requirements of § 32.3 of this chapter.

Short position means, on a futures-equivalent basis, a short call option, a long put option, a short underlying futures contract, or a swap position that is equivalent to a short futures contract.

Speculative position limit means the maximum position, either net long or net short, in a commodity derivatives contract that may be held or controlled by one person, absent an exemption, such as an exemption for a bona fide hedging position. This limit may apply to a person's combined position in all commodity derivative contracts in a particular commodity (all-months-combined), a person's position in a single month of commodity derivative contracts in a particular commodity, or a person's position in the spot month of commodity derivative contacts in a particular commodity. Such a limit may be established under federal regulations or rules of a designated contract market or swap execution facility. An exchange may also apply other limits, such as a limit on gross long or gross short positions, or a limit on holding or controlling delivery instruments.

Spot month means—

(1) For physical-delivery core referenced futures contracts, the period of time beginning at the earlier of the close of business on the trading day preceding the first day on which delivery notices can be issued by the clearing organization of a contract market, or the close of business on the trading day preceding the third-to-last trading day, until the contract expires, except as follows:

(i) For *ICE Futures U.S. Sugar No. 11* (SB) referenced contract, the spot month means the period of time beginning at the opening of trading on the second business day following the expiration of the regular option contract traded on the expiring futures contract until the contract expires;

(ii) For *ICE Futures U.S. Sugar No. 16* (SF) referenced contract, the spot month means the period of time beginning on the third-to-last trading day of the contract month until the contract expires;

(iii) For *Chicago Mercantile Exchange Live Cattle* (LC) referenced contract, the spot month means the period of time beginning at the close trading on the fifth business day of the contract month until the contract expires;

(2) For cash-settled core referenced futures contracts:

(i) [Reserved]

(3) For referenced contracts other than core referenced futures contracts, the spot month means the same period as that of the relevant core referenced futures contract.

Spread contract means either a calendar spread contract or an intercommodity spread contract.

Swap means ''swap'' as that term is defined in section 1a of the Act and as further defined in § 1.3 of this chapter.

Swap dealer means ''swap dealer'' as that term is defined in section 1a of the Act and as further defined in § 1.3 of this chapter.

Transition period swap means a swap entered into during the period commencing after the enactment of the Dodd-Frank Act of 2010 (July 21, 2010), and ending 60 days after the publication in the **Federal Register** of final amendments to this part implementing section 737 of the Dodd-Frank Act of 2010.

■ 23. Revise § 150.2 to read as follows:

§ 150.2 Speculative position limits.

(a) *Spot-month speculative position limits.* No person may hold or control positions in referenced contracts in the spot month, net long or net short, in excess of the level specified by the Commission for:

(1) Physical-delivery referenced contracts; and, separately,

(2) Cash-settled referenced contracts;

(b) *Single-month and all-months-combined speculative position limits.* No person may hold or control positions, net long or net short, in referenced contracts in a single month or in all months combined (including the spot month) in excess of the levels specified by the Commission.

(c) For purposes of this part:

(1) The spot month and any single month shall be those of the core referenced futures contract; and

(2) An eligible affiliate is not required to comply separately with speculative position limits.

(d) *Core referenced futures contracts.* Speculative position limits apply to referenced contracts based on the core referenced futures contracts listed in Table Core Referenced Futures Contracts:

CORE REFERENCED FUTURES CONTRACTS

Commodity type	Designated contract market	Core referenced futures contract [1]
Legacy Agricultural	Chicago Board of Trade	Corn (C).

CORE REFERENCED FUTURES CONTRACTS—Continued

Commodity type	Designated contract market	Core referenced futures contract [1]
		Oats (O).
		Soybeans (S).
		Soybean Meal (SM).
		Soybean Oil (SO).
		Wheat (W).
		Hard Winter Wheat (KW).
	ICE Futures U.S.	Cotton No. 2 (CT).
	Minneapolis Grain Exchange	Hard Red Spring Wheat (MWE).
Other Agricultural	Chicago Board of Trade	Rough Rice (RR).
	Chicago Mercantile Exchange	Live Cattle (LC).
	ICE Futures U.S.	Cocoa (CC).
		Coffee C (KC).
		FCOJ–A (OJ).
		U.S. Sugar No. 11 (SB).
		U.S. Sugar No. 16 (SF).
Energy	New York Mercantile Exchange	Light Sweet Crude Oil (CL).
		NY Harbor ULSD (HO).
		RBOB Gasoline (RB).
		Henry Hub Natural Gas (NG).
Metals	Commodity Exchange, Inc.	Gold (GC).
		Silver (SI).
		Copper (HG).
	New York Mercantile Exchange	Palladium (PA).
		Platinum (PL).

[1] The core referenced futures contract includes any successor contracts.

(e) *Levels of speculative position limits*—(1) *Initial levels.* The initial levels of speculative position limits are fixed by the Commission at the levels listed in Appendix D to this part; *provided however,* compliance with such initial speculative limits shall not be required until January 3, 2018, which date shall be the initial establishment date for purposes of paragraphs (e)(3) and (4) of this section.

(2) *Subsequent levels.* (i) The Commission shall fix subsequent levels of speculative position limits in accordance with the procedures in this section and publish such levels on the Commission's Web site at *http://www.cftc.gov*.

(ii) Such subsequent speculative position limit levels shall each apply beginning on the close of business of the last business day of the second complete calendar month after publication of such levels; *provided however,* if such close of business is in a spot month of a core referenced futures contract, the subsequent spot-month level shall apply beginning with the next spot month for that contract.

(iii) All subsequent levels of speculative position limits shall be rounded up to the nearest hundred contracts.

(3) *Procedure for computing levels of spot-month limits.* (i) No less frequently than every two calendar years, the Commission shall fix the level of the spot-month limit no greater than one-quarter of the estimated spot-month deliverable supply in the relevant core referenced futures contract. Unless the Commission determines to rely on its own estimate of deliverable supply, the Commission shall utilize the estimated spot-month deliverable supply provided by a designated contract market. If the Commission determines to rely on its own estimate of deliverable supply, then the Commission shall publish such estimate for public comment in the **Federal Register**; provided however, that the Commission may determine to fix the level of the spot-month limit at a level, recommended by the designated contract market listing the relevant core referenced futures contract for good cause shown, that is less than one-quarter of the estimated spot-month deliverable supply, or not to change the level of the spot-month limit.

(ii) *Estimates of deliverable supply.* (A) Each designated contract market in a core referenced futures contract shall supply to the Commission an estimated spot-month deliverable supply. A designated contract market may use the guidance regarding deliverable supply in Appendix C to part 38 of this chapter. Each estimate must be accompanied by a description of the methodology used to derive the estimate and any statistical data supporting the estimate, and must be submitted no later than the following:

(*1*) For energy commodities, January 31 of the second calendar year following the most recent Commission action establishing such limit levels;

(*2*) For metals commodities, March 31 of the second calendar year following the most recent Commission action establishing such limit levels;

(*3*) For legacy agricultural commodities, May 31 of the second calendar year following the most recent Commission action establishing such limit levels; and

(*4*) For other agricultural commodities, August 31 of the second calendar year following the most recent Commission action establishing such limit levels.

(B) Notwithstanding paragraph (e)(3)(ii)(A) of this section, each designated contract market may petition the Commission not less than two calendar months before the due date for submission of an estimate of deliverable supply under paragraph (e)(3)(ii)(A) of this section, recommending that the Commission not change the spot-month limit. Such recommendation should include a summary of the designated contract market's experience administering its spot-month limit. The Commission shall determine not less than one calendar month before such due date whether to accept the designated contract market's recommendation. If the Commission accepts such recommendation, then the designated contract market need not submit an estimated spot-month deliverable supply for such due date.

(4) *Procedure for computing levels of single-month and all-months-combined limits.* No less frequently than every two calendar years, the Commission shall fix the level, for each referenced contract, of the single-month limit and the all-

months-combined limit. Each such limit shall be based on 10 percent of the estimated average open interest in referenced contracts, up to 25,000 contracts, with a marginal increase of 2.5 percent thereafter; *provided however,* the Commission may determine not to change the level of the single-month limit or the all-months-combined limit.

(i) *Time periods for average open interest.* The Commission shall estimate average open interest in referenced contracts based on the largest annual average open interest computed for each of the past two calendar years. The Commission may estimate average open interest in referenced contracts using either month-end open contracts or open contracts for each business day in the time period, as practical.

(ii) *Data sources for average open interest.* The Commission shall estimate average open interest in referenced contracts using data reported to the Commission pursuant to part 16 of this chapter, and open swaps reported to the Commission pursuant to part 20 of this chapter or data obtained by the Commission from swap data repositories collecting data pursuant to part 45 of this chapter. Options listed on designated contract markets shall be adjusted using an option delta reported to the Commission pursuant to part 16 of this chapter. Swaps shall be counted on a futures equivalent basis, equal to the economically equivalent amount of core referenced futures contracts reported pursuant to part 20 of this chapter or as calculated by the Commission using swap data collected pursuant to part 45 of this chapter.

(iii) *Publication of average open interest.* The Commission shall publish estimates of average open interest in referenced contracts on a monthly basis, as practical, after such data is submitted to the Commission.

(iv) *Minimum levels. Provided however,* notwithstanding the above, the minimum levels shall be the greater of the level of the spot month limit determined under paragraph (e)(3) of this section or 5,000 contracts.

(f) *Pre-existing positions*—(1) *Pre-existing positions in a spot-month.* Other than pre-enactment and transition period swaps exempted under § 150.3(d), a person shall comply with spot month speculative position limits.

(2) *Pre-existing positions in a non-spot-month.* A single-month or all-months-combined speculative position limit established under this section shall not apply to any commodity derivative contract acquired in good faith prior to the effective date of such limit, *provided however,* that if such position is not a pre-enactment or transition period swap then that position shall be attributed to the person if the person's position is increased after the effective date of such limit.

(g) *Positions on foreign boards of trade.* The aggregate speculative position limits established under this section shall apply to a person with positions in referenced contracts executed on, or pursuant to the rules of a foreign board of trade, *provided that:*

(1) Such referenced contracts settle against any price (including the daily or final settlement price) of one or more contracts listed for trading on a designated contract market or swap execution facility that is a trading facility; and

(2) The foreign board of trade makes available such referenced contracts to its members or other participants located in the United States through direct access to its electronic trading and order matching system.

(h) *Anti-evasion provision.* For the purposes of applying the speculative position limits in this section, a commodity index contract used to circumvent speculative position limits shall be considered to be a referenced contract.

(i) *Delegation of authority to the Director of the Division of Market Oversight.* (1) The Commission hereby delegates, until it orders otherwise, to the Director of the Division of Market Oversight or such other employee or employees as the Director may designate from time to time, the authority in paragraph (e) of this section to fix and publish subsequent levels of speculative position limits, including the authority not to change levels of such limits, and the authority in paragraph (e)(3)(iii) of this section to relieve a designated contract market from the requirement to submit an estimate of deliverable supply.

(2) The Director of the Division of Market Oversight may submit to the Commission for its consideration any matter which has been delegated in this section.

(3) Nothing in this section prohibits the Commission, at its election, from exercising the authority delegated in this section.

(j) The Commission will periodically update these initial levels for speculative position limits and publish such subsequent levels on its Web site at: *http://www.cftc.gov.*

■ 24. Revise § 150.3 to read as follows:

§ 150.3 Exemptions.

(a) *Positions which may exceed limits.* The position limits set forth in § 150.2 may be exceeded to the extent that:

(1) Such positions are:

(i) Bona fide hedging positions that comply with the definition in § 150.1, *provided that:*

(A) For non-enumerated bona fide hedges, the person has not otherwise been notified by the Commission under § 150.9(d)(4) or, under rules adopted pursuant to § 150.9(a)(4)(iv)(B), by the designated contract market or swap execution facility; and

(B) For anticipatory bona fide hedging positions under paragraphs (3)(iii), (4)(i), (4)(iii), (4)(iv) and (5) of the bona fide hedging position definition in § 150.1, the person complies with the filing requirements found in § 150.7 or the filing requirements adopted, in accordance with § 150.11(a)(3), by a designated contract market or swap execution facility, as applicable;

(ii) Financial distress positions exempted under paragraph (b) of this section;

(iii) Conditional spot-month limit positions exempted under paragraph (c) of this section;

(iv) Spread positions recognized by a designated contract market or swap execution facility, each in accordance with § 150.10(a), or the Commission, *provided that* the person has not otherwise been notified by the Commission under § 150.10(d)(4) or by the designated contract market or swap execution facility under rules adopted pursuant to § 150.10(a)(4)(iv)(B); or

(v) Other positions exempted under paragraph (e) of this section; and that

(2) The recordkeeping requirements of paragraph (g) of this section are met; and further that

(3) The reporting requirements of part 19 of this chapter are met.

(b) *Financial distress exemptions.* Upon specific request made to the Commission, the Commission may exempt a person or related persons under financial distress circumstances for a time certain from any of the requirements of this part. Financial distress circumstances include situations involving the potential default or bankruptcy of a customer of the requesting person or persons, an affiliate of the requesting person or persons, or a potential acquisition target of the requesting person or persons.

(c) *Conditional spot-month limit exemption.* The position limit set forth in § 150.2 may be exceeded for natural gas cash-settled referenced contracts, *provided* that such positions do not exceed 10,000 contracts and the person holding or controlling such positions does not hold or control positions in spot-month physical-delivery referenced contracts.

(d) *Pre-enactment and transition period swaps exemption.* The speculative position limits set forth in § 150.2 shall not apply to positions acquired in good faith in any pre-enactment swap, or in any transition period swap, in either case as defined by § 150.1; *provided however,* that a person may net such positions with post-effective date commodity derivative contracts for the purpose of complying with any non-spot-month speculative position limit.

(e) *Other exemptions.* Any person engaging in risk-reducing practices commonly used in the market, which they believe may not be specifically enumerated in the definition of bona fide hedging position in § 150.1, may request:

(1) An interpretative letter from Commission staff, under § 140.99 of this chapter, concerning the applicability of the bona fide hedging position exemption; or

(2) Exemptive relief from the Commission under section 4a(a)(7) of the Act.

(3) Appendix C to this part provides a non-exhaustive list of examples of bona fide hedging positions as defined under § 150.1.

(f) *Previously granted exemptions.* (1) Exemptions granted by the Commission under § 1.47 of this chapter for risk management of positions in financial instruments shall not apply to positions in financial instruments entered into after the effective date of initial position limits implementing section 737 of the Dodd-Frank Act of 2010.

(2) Exemptions for risk management of positions in financial instruments granted by a designated contract market or swap execution facility shall not apply to positions in financial instruments entered into after the effective date of initial position limits implementing section 737 of the Dodd-Frank Act of 2010, *provided that,* for positions in financial instruments entered into on or before the effective date of initial position limits implementing section 737 of the Dodd-Frank Act of 2010, the exemption shall apply for purposes of position limits under § 150.2 if the exemption:

(i) Applies to positions outside of the spot month only; and

(ii) Was granted prior to the compliance date provided under § 150.2(e)(1).

(g) *Recordkeeping.* (1) Persons who avail themselves of exemptions under this section, including exemptions granted under section 4a(a)(7) of the Act, shall keep and maintain complete books and records concerning all details of their related cash, forward, futures, futures options and swap positions and transactions, including anticipated requirements, production and royalties, contracts for services, cash commodity products and by-products, and cross-commodity hedges, and shall make such books and records, including a list of pass-through swap counterparties, available to the Commission upon request under paragraph (h) of this section.

(2) Further, a party seeking to rely upon the pass-through swap offset in paragraph (2)(B) of the definition of ''bona fide hedging position'' in § 150.1, in order to exceed the position limits of § 150.2 with respect to such a swap, may only do so if its counterparty provides a written representation (*e.g.,* in the form of a field or other representation contained in a mutually executed trade confirmation) that, as to such counterparty, the swap qualifies in good faith as a ''bona fide hedging position,'' as defined in § 150.1, *provided that* the bona fides of the pass-through swap counterparty may be determined at the time of the transaction. That written representation shall be retained by the parties to the swap for a period of at least two years following the expiration of the swap and furnished to the Commission upon request.

(3) Any person that represents to another person that a swap qualifies as a pass-through swap under paragraph (2)(ii)(B) of the definition of ''bona fide hedging position'' in § 150.1 shall keep and make available to the Commission upon request all relevant books and records supporting such a representation for a period of at least two years following the expiration of the swap.

(h) *Call for information.* Upon call by the Commission, the Director of the Division of Market Oversight or the Director's delegee, any person claiming an exemption from speculative position limits under this section must provide to the Commission such information as specified in the call relating to the positions owned or controlled by that person; trading done pursuant to the claimed exemption; the commodity derivative contracts or cash market positions which support the claim of exemption; and the relevant business relationships supporting a claim of exemption.

(i) *Aggregation of accounts.* Entities required to aggregate accounts or positions under § 150.4 of this part shall be considered the same person for the purpose of determining whether they are eligible for a bona fide hedging position exemption under paragraph (a)(1)(i) of this section with respect to such aggregated account or position.

(j) *Delegation of authority to the Director of the Division of Market Oversight.* (1) The Commission hereby delegates, until it orders otherwise, to the Director of the Division of Market Oversight or such other employee or employees as the Director may designate from time to time, the authority in paragraph (b) of this section to provide exemptions in circumstances of financial distress.

(2) The Director of the Division of Market Oversight may submit to the Commission for its consideration any matter which has been delegated in this section.

(3) Nothing in this section prohibits the Commission, at its election, from exercising the authority delegated in this section.

■ 25. Revise § 150.5 to read as follows:

§ 150.5 Exchange-set position limits.

(a) *Requirements and acceptable practices for commodity derivative contracts subject to federal position limits.* (1) For any commodity derivative contract that is subject to a speculative position limit under § 150.2, a designated contract market or swap execution facility that is a trading facility shall set a speculative position limit no higher than the level specified in § 150.2.

(2) *Exemptions to exchange-set limits*—(i) *Grant of exemption.* Any designated contract market or swap execution facility that is a trading facility may grant exemptions from any speculative position limits it sets under paragraph (a)(1) of this section, *provided that* exemptions from federal limits conform to the requirements specified in § 150.3, *and provided further* that any exemptions to exchange-set limits not conforming to § 150.3 are capped at the level of the applicable federal limit in § 150.2.

(ii) *Application for exemption.* Any designated contract market or swap execution facility that grants exemptions under paragraph (a)(2)(i) of this section:

(A) Must require traders to file an application requesting such exemption in advance of the date that such position would be in excess of the limits then in effect, *provided however,* that it may adopt rules that allow a trader to file an application for an enumerated bona fide hedging exemption within five business days after the trader assumed the position that exceeded a position limit.

(B) Must require, for any exemption granted, that the trader reapply for the exemption at least on an annual basis.

(C) May deny any such application, or limit, condition, or revoke any such exemption, at any time, including if it determines such positions would not be in accord with sound commercial practices, or would exceed an amount that may be established and liquidated in an orderly fashion.

(3) *Pre-enactment and transition period swap positions.* Speculative position limits set forth in § 150.2 shall not apply to positions acquired in good faith in any pre-enactment swap, or in any transition period swap, in either case as defined by § 150.1. *Provided however,* that a designated contract market or swap execution facility that is a trading facility shall allow a person to net such position with post-effective date commodity derivative contracts for the purpose of complying with any non-spot month speculative position limit.

(4) *Pre-existing positions*—(i) *Pre-existing positions in a spot-month.* A designated contract market or swap execution facility that is a trading facility must require compliance with spot month speculative position limits for pre-existing positions in commodity derivative contracts other than pre-enactment and transition period swaps.

(ii) *Pre-existing positions in a non-spot month.* A single-month or all months-combined speculative position limit established under § 150.2 shall not apply to any commodity derivative contract acquired in good faith prior to the effective date of such limit, *provided however,* that such position shall be attributed to the person if the person's position is increased after the effective date of such limit.

(5) *Aggregation.* Designated contract markets and swap execution facilities that are trading facilities must have aggregation rules that conform to § 150.4.

(6) *Additional acceptable practices.* A designated contract market or swap execution facility that is a trading facility may:

(i) Impose additional restrictions on a person with a long position in the spot month of a physical-delivery contract who stands for delivery, takes that delivery, then re-establishes a long position;

(ii) Establish limits on the amount of delivery instruments that a person may hold in a physical-delivery contract; and

(iii) Impose such other restrictions as it deems necessary to reduce the potential threat of market manipulation or congestion, to maintain orderly execution of transactions, or for such other purposes consistent with its responsibilities.

(b) *Requirements and acceptable practices for commodity derivative contracts in a physical commodity as defined in § 150.1 that are not subject to the limits set forth in § 150.2*—(1) *Levels at initial listing.* At the time of each commodity derivative contract's initial listing, a designated contract market or swap execution facility that is a trading facility should base speculative position limits on the following:

(i) *Spot month position limits*—(A) *Commodities with a measurable deliverable supply.* For all commodity derivative contracts not subject to the limits set forth in § 150.2 that are based on a commodity with a measurable deliverable supply, the spot month limit level should be established at a level that is no greater than one-quarter of the estimated spot month deliverable supply, calculated separately for each month to be listed (Designated Contract Markets and Swap Execution Facilities may refer to the guidance in paragraph (b)(1)(i) of Appendix C of part 38 of this chapter for guidance on estimating spot-month deliverable supply);

(B) *Commodities without a measurable deliverable supply.* For commodity derivative contracts that are based on a commodity with no measurable deliverable supply, the spot month limit level should be set at a level that is necessary and appropriate to reduce the potential threat of market manipulation or price distortion of the contract's or the underlying commodity's price or index.

(ii) *Individual non-spot or all-months combined position limits.* For agricultural or exempt commodity derivative contracts not subject to the limits set forth in § 150.2, the individual non-spot or all-months-combined levels should be equal to or less than the greater of: The level of the spot month limit; or 5,000 contracts, when the notional quantity per contract is no larger than a typical cash market transaction in the underlying commodity. If the notional quantity per contract is larger than the typical cash market transaction, then the individual non-spot month limit or all-months combined limit level should be scaled down accordingly. If the commodity derivative contract is substantially the same as a pre-existing commodity derivative contract, then the designated contract market or swap execution facility may adopt the same limit as applies to that pre-existing commodity derivative contract.

(iii) *Commodity derivative contracts that are cash-settled by referencing a daily settlement price of an existing contract.* For commodity derivative contracts that are cash-settled by referencing a daily settlement price of an existing contract listed on a designated contract market or swap execution facility that is a trading facility, the cash-settled contract should adopt spot-month, individual non-spot-month, and all-months combined position limits comparable to those of the original price referenced contract.

(2) *Adjustments to levels.* Designated contract markets and swap execution facilities that are trading facilities should adjust their speculative limit levels as follows:

(i) *Spot month position limits.* The spot month position limit level should be reviewed no less than once every twenty-four months from the date of initial listing and should be maintained at a level that is:

(A) No greater than one-quarter of the estimated spot month deliverable supply, calculated separately for each month to be listed; or

(B) In the case of a commodity derivative contract based on a commodity without a measurable deliverable supply, necessary and appropriate to reduce the potential threat of market manipulation or price distortion of the contract's or the underlying commodity's price or index.

(ii) *Individual non-spot or all-months-combined position limits.* Individual non-spot or all-months-combined levels should be based on position sizes customarily held by speculative traders on the contract market or equal to or less than the greater of: The spot-month position limit level; 10% of the average combined futures and delta adjusted option month-end open interest for the most recent calendar year up to 25,000 contracts, with a marginal increase of 2.5% thereafter; or 5,000 contracts. In any case, such levels should be reviewed no less than once every twenty-four months from the date of initial listing.

(3) *Position accountability in lieu of speculative position limits.* A designated contract market or swap execution facility that is a trading facility may adopt a bylaw, rule, regulation, or resolution, substituting for the exchange-set speculative position limits specified under this paragraph (b), an exchange rule requiring traders to consent to provide information about their position upon request by the exchange and to consent to halt increasing further a trader's position or to reduce their positions in an orderly manner, in each case upon request by the exchange as follows:

(i) *Physical commodity derivative contracts.* On a physical commodity derivative contract that is not subject to the limits set forth in § 150.2, having an average month-end open interest of 50,000 contracts and an average daily volume of 5,000 or more contracts during the most recent calendar year and a liquid cash market, a designated contract market or swap execution facility that is a trading facility may adopt individual non-spot month or all-months-combined position accountability levels, *provided however,* that such designated contract market or swap execution facility that is a trading facility should adopt a spot month speculative position limit with a level no greater than one-quarter of the estimated spot month deliverable supply.

(ii) *New commodity derivative contracts that are substantially the same as an existing contract.* On a new commodity derivative contract that is substantially the same as an existing commodity derivative contract listed for trading on a designated contract market or swap execution facility that is a trading facility, which has adopted position accountability in lieu of position limits, the designated contract market or swap execution facility may adopt for the new contract when it is initially listed for trading the position accountability levels of the existing contract.

(4) *Calculation of trading volume and open interest.* For purposes of this paragraph, trading volume and open interest should be calculated by:

(i) *Open interest.* (A) Averaging the month-end open positions in a futures contract and its related option contract, on a delta-adjusted basis, for all months listed during the most recent calendar year; and

(B) Averaging the month-end futures equivalent amount of open positions in swaps in a particular commodity (such as, for swaps that are not referenced contracts, by combining the notional month-end open positions in swaps in a particular commodity, including options in that same commodity that are swaps on a delta-adjusted basis, and dividing by a notional quantity per contract that is no larger than a typical cash market transaction in the underlying commodity), except that a designated contract market or swap execution facility that is a trading facility shall include swaps in their open interest calculation only if such entities administer position limits on swap contracts of their facilities.

(ii) *Trading volume.* (A) Counting the number of contracts in a futures contract and its related option contract, on a delta-adjusted basis, transacted during the most recent calendar year; and

(B) Counting the futures-equivalent number of swaps in a particular commodity transacted during the most recent calendar year, except that a designated contract market or swap execution facility that is a trading facility shall include swaps in their trading volume count only if such entities administer position limits on swap contracts of their facilities.

(5) *Exemptions*—(i) *Hedge exemption.* (A) Any hedge exemption rules adopted by a designated contract market or a swap execution facility that is a trading facility should conform to the definition of bona fide hedging position in § 150.1 and may provide for recognition as a non-enumerated bona fide hedge in a manner consistent with the process described in § 150.9(a).

(B) Any hedge exemption rules adopted under paragraph (b)(5)(i)(A) of this section may allow a person to file an application for enumerated hedging positions, which application should be filed not later than five business days after the person assumed the position that exceeded a position limit.

(ii) *Other exemptions.* A designated contract market or swap execution facility may grant other exemptions for:

(A) *Financial distress.* Upon specific request made to the designated contract market or swap execution facility that is a trading facility, the designated contract market or swap execution facility that is a trading facility may exempt a person or related persons under financial distress circumstances for a time certain from any of the requirements of this part. Financial distress circumstances include situations involving the potential default or bankruptcy of a customer of the requesting person or persons, an affiliate of the requesting person or persons, or a potential acquisition target of the requesting person or persons.

(B) *Conditional spot-month limit exemption.* Exchange-set spot-month speculative position limits may be exceeded for cash-settled contracts, *provided that* such positions should not exceed two times the level of the spot-month limit specified by the designated contract market or swap execution facility that is a trading facility, that lists a physical-delivery contract to which the cash-settled contracts are directly or indirectly linked, and the person holding or controlling such positions should not hold or control positions in such spot-month physical-delivery contract.

(C) *Intramarket spread positions and intermarket spread positions,* each as defined in § 150.1, *provided that* the designated contract market or swap execution facility, in considering whether to grant an application for such exemption, should take into account whether exempting the spread position from position limits would, to the maximum extent practicable, ensure sufficient market liquidity for bona fide hedgers, and not unduly reduce the effectiveness of position limits to:

(*1*) Diminish, eliminate, or prevent excessive speculation;

(*2*) Deter and prevent market manipulation, squeezes, and corners; and

(*3*) Ensure that the price discovery function of the underlying market is not disrupted.

(iii) *Application for exemption.* Traders should be required to apply to the designated contract market or swap execution facility that is a trading facility for any exemption from its speculative position limit rules. In considering whether to grant such an application for exemption, a designated contract market or swap execution facility that is a trading facility should take into account whether the requested exemption is in accord with sound commercial practices and results in a position that does not exceed an amount that may be established and liquidated in an orderly fashion.

(6) *Pre-enactment and transition period swap positions.* Speculative position limits should not apply to positions acquired in good faith in any pre-enactment swap, or in any transition period swap, in either case as defined by § 150.1. *Provided however,* that a designated contract market or swap execution facility that is a trading facility may allow a person to net such position with post-effective date commodity derivative contracts for the purpose of complying with any non-spot month speculative position limit.

(7) *Pre-existing positions*—(i) *Preexisting positions in a spot-month.* A designated contract market or swap execution facility that is a trading facility should require compliance with spot month speculative position limits for pre-existing positions in commodity derivative contracts other than pre-enactment and transition period swaps.

(ii) *Pre-existing positions in a non-spot month.* A single-month or all-months-combined speculative position limit should not apply to any commodity derivative contract acquired in good faith prior to the effective date of such limit, *provided however,* that such position should be attributed to the person if the person's position is increased after the effective date of such limit.

(8) *Aggregation.* Designated contract markets and swap execution facilities that are trading facilities must have aggregation rules that conform to § 150.4.

(9) *Additional acceptable practices.* Particularly in the spot month, a

designated contract market or swap execution facility that is a trading facility may:

(i) Impose additional restrictions on a person with a long position in the spot month of a physical-delivery contract who stands for delivery, takes that delivery, then re-establishes a long position;

(ii) Establish limits on the amount of delivery instruments that a person may hold in a physical-delivery contract; and

(iii) Impose such other restrictions as it deems necessary to reduce the potential threat of market manipulation or congestion, to maintain orderly execution of transactions, or for such other purposes consistent with its responsibilities.

(c) *Requirements and acceptable practices for excluded commodity derivative contracts as defined in section 1a(19) of the Act*—(1) *Levels at initial listing.* At the time of each excluded commodity derivative contract's initial listing, a designated contract market or swap execution facility that is a trading facility should base speculative position limits on the following:

(i) *Spot month position limits.*—(A) *Excluded commodity derivative contracts with a measurable deliverable supply.* For all excluded commodity derivative contracts that are based on a commodity with a measurable deliverable supply, the spot month limit level should be established at a level that is no greater than one-quarter of the estimated spot month deliverable supply, calculated separately for each month to be listed (Designated Contract Markets and Swap Execution Facilities may refer to the guidance in paragraph (b)(1)(i) of Appendix C of part 38 of this chapter for guidance on estimating spot-month deliverable supply);

(B) *Excluded commodity derivative contracts without a measurable deliverable supply.* For excluded commodity derivative contracts that are based on a commodity with no measurable deliverable supply, the spot month limit level should be set at a level that is necessary and appropriate to reduce the potential threat of market manipulation or price distortion of the contract's or the underlying commodity's price or index.

(ii) *Individual non-spot or all-months combined position limits.* For excluded commodity derivative contracts, the individual non-spot or all-months-combined levels should be equal to or less than the greater of: The level of the spot month limit; or 5,000 contracts, when the notional quantity per contract is no larger than a typical cash market transaction in the underlying commodity. If the notional quantity per contract is larger than the typical cash market transaction, then the individual non-spot month limit or all-months combined limit level should be scaled down accordingly. If the commodity derivative contract is substantially the same as a pre-existing commodity derivative contract, then the designated contract market or swap execution facility may adopt the same limit as applies to that pre-existing commodity derivative contract.

(iii) *Commodity derivative contracts that are cash-settled by referencing a daily settlement price of an existing contract.* For excluded commodity derivative contracts that are cash-settled by referencing a daily settlement price of an existing contract listed on a designated contract market or swap execution facility that is a trading facility, the cash-settled contract should adopt spot-month, individual non-spot-month, and all-months combined position limits that are comparable to those of the original price referenced contract.

(2) *Adjustments to levels.* Designated contract markets and swap execution facilities that are trading facilities should adjust their speculative limit levels as follows:

(i) *Spot month position limits.* The spot month position limit level for excluded commodity derivative contracts should be reviewed no less than once every twenty-four months from the date of initial listing and should be maintained at a level that is necessary and appropriate to reduce the potential threat of market manipulation or price distortion of the contract's or the underlying commodity's price or index.

(ii) *Individual non-spot or all-months-combined position limits.* Individual non-spot or all-months-combined levels should be based on position sizes customarily held by speculative traders on the contract market or equal to or less than the greater of: the spot-month position limit level; 10% of the average combined futures and delta adjusted option month-end open interest for the most recent calendar year up to 25,000 contracts, with a marginal increase of 2.5% thereafter; or 5,000 contracts. In any case, such levels should be reviewed no less than once every twenty-four months from the date of initial listing.

(3) *Position accountability in lieu of speculative position limits.* A designated contract market or swap execution facility that is a trading facility may adopt a bylaw, rule, regulation, or resolution, substituting for the exchange-set speculative position limits specified under this paragraph (c), an exchange rule requiring traders to consent to provide information about their position upon request by the exchange and to consent to halt increasing further a trader's position or to reduce their positions in an orderly manner, in each case upon request by the exchange as follows:

(i) *Spot month.* On an excluded commodity derivative contract for which there is a highly liquid cash market and no legal impediment to delivery, a designated contract market or swap execution facility that is a trading facility may adopt position accountability in lieu of position limits in the spot month. For an excluded commodity derivative contract based on a commodity without a measurable deliverable supply, a designated contract market or swap execution facility that is a trading facility may adopt position accountability in lieu of position limits in the spot month. For all other excluded commodity derivative contracts, a designated contract market or swap execution facility that is a trading facility should adopt a spot-month position limit with a level no greater than one-quarter of the estimated deliverable supply;

(ii) *Individual non-spot or all-months combined position limits.* On an excluded commodity derivative contract, a designated contract market or swap execution facility that is a trading facility may adopt position accountability levels in lieu of position limits in the individual non-spot month or all-months-combined.

(iii) *New commodity derivative contracts that are substantially the same as an existing contract.* On a new commodity derivative contract on an excluded commodity derivative contract that is substantially the same as an existing commodity derivative contract listed for trading on a designated contract market or swap execution facility that is a trading facility, which has adopted position accountability in lieu of position limits, the designated contract market or swap execution facility may adopt for the new contract when it is initially listed for trading the position accountability levels of the existing contract.

(4) *Calculation of trading volume and open interest.* For purposes of this paragraph, trading volume and open interest should be calculated by:

(i) *Open interest.* (A) Averaging the month-end open positions in a futures contract and its related option contract, on a delta-adjusted basis, for all months listed during the most recent calendar year; and

(B) Averaging the month-end futures equivalent amount of open positions in swaps in a particular commodity (such as, for swaps that are not referenced contracts, by combining the notional month-end open positions in swaps in a particular commodity, including options in that same commodity that are swaps on a delta-adjusted basis, and dividing by a notional quantity per contract that is no larger than a typical cash market transaction in the underlying commodity), except that a designated contract market or swap execution facility that is a trading facility should include swaps in their open interest calculation only if such entities administer position limits on swap contracts of their facilities.

(ii) *Trading volume.* (A) Counting the number of contracts in a futures contract and its related option contract, on a delta-adjusted basis, transacted during the most recent calendar year; and

(B) Counting the futures-equivalent number of swaps in a particular commodity transacted during the most recent calendar year, except that a designated contract market or swap execution facility that is a trading facility should include swaps in their trading volume count only if such entities administer position limits on swap contracts of their facilities.

(5) *Exemptions*—(i) *Hedge exemptions.* Any hedge exemption rules adopted by a designated contract market or a swap execution facility that is a trading facility should conform to the definition of bona fide hedging position in § 150.1.

(ii) *Other exemptions for excluded commodities.* A designated contract market or swap execution facility may grant, in addition to the exemptions under paragraphs (b)(5)(ii)(A), (b)(5)(ii)(B), and (b)(5)(ii)(C) of this section, a risk management exemption pursuant to rules submitted to the Commission, including for a position that is consistent with the guidance in Appendix A of this part.

(iii) *Application for exemption.* Traders should be required to apply to the designated contract market or swap execution facility that is a trading facility for any exemption from its speculative position limit rules. Such exchange may allow a person to file an application after the person assumed the position that exceeded a position limit. In considering whether to grant such an application for exemption, a designated contract market or swap execution facility that is a trading facility should take into account whether the requested exemption is in accord with sound commercial practices and results in a position that does not exceed an amount that may be established and liquidated in an orderly fashion.

(6) *Pre-enactment and transition period swap positions.* Speculative position limits should not apply to positions acquired in good faith in any pre-enactment swap, or in any transition period swap, in either case as defined by § 150.1. *Provided however,* that a designated contract market or swap execution facility that is a trading facility may allow a person to net such position with post-effective date commodity derivative contracts for the purpose of complying with any non-spot month speculative position limit.

(7) *Pre-existing positions*—(i) *Pre-existing positions in a spot-month.* A designated contract market or swap execution facility that is a trading facility should require compliance with spot month speculative position limits for pre-existing positions in commodity derivative contracts.

(ii) *Pre-existing positions in a non-spot month.* A single-month or all-months-combined speculative position limit should not apply to any commodity derivative contract acquired in good faith prior to the effective date of such limit, *provided however,* that such position should be attributed to the person if the person's position is increased after the effective date of such limit.

(8) *Aggregation.* Designated contract markets and swap execution facilities that are trading facilities should have aggregation rules for excluded commodity derivative contracts that conform to § 150.4.

(9) *Additional acceptable practices.* A designated contract market or swap execution facility that is a trading facility may impose such other restrictions on excluded commodity derivative contracts as it deems necessary to reduce the potential threat of market manipulation or congestion, to maintain orderly execution of transactions, or for such other purposes consistent with its responsibilities.

(d) *Requirements for security futures products.* For security futures products, position limitations and position accountability requirements are specified in § 41.25(a)(3) of this chapter.

■ 26. Revise § 150.6 to read as follows:

§ 150.6 Ongoing application of the Act and Commission regulations.

This part shall only be construed as having an effect on position limits set by the Commission or a designated contract market or swap execution facility, including any associated recordkeeping and reporting regulations. Nothing in this part shall be construed to affect any other provisions of the Act or Commission regulations, including but not limited to those relating to manipulation, attempted manipulation, corners, squeezes, fraudulent or deceptive conduct or prohibited transactions, unless incorporated by reference.

■ 27. Add §§ 150.7 through 150.11 to read as follows:

§ 150.7 Requirements for anticipatory bona fide hedging position exemptions.

(a) *Statement.* Any person who wishes to avail himself of exemptions for unfilled anticipated requirements, unsold anticipated production, anticipated royalties, anticipated services contract payments or receipts, or anticipatory cross-commodity hedges under the provisions of paragraphs (3)(iii), (4)(i), 4(iii), 4(iv), or (5), respectively, of the definition of bona fide hedging position in § 150.1 shall file an application on Form 704 with the Commission in advance of the date the person expects to exceed the position limits established under this part. Filings in conformity with the requirements of this section shall be effective ten days after submission, unless otherwise notified by the Commission.

(b) *Commission notification.* At any time, the Commission may, by notice to any person filing an application or annual update on Form 704, specify its determination as to what portion, if any, of the amounts described in such filing does not meet the requirements for bona fide hedging positions. In no case shall such person's anticipatory bona fide hedging positions exceed the levels specified in paragraph (f) of this section.

(c) *Call for additional information.* At any time, the Commission may request a person who has on file an application or annual update Form 704 under paragraph (a) of this section to file specific additional or updated information with the Commission to support a determination that the application or annual update on file accurately reflects unsold anticipated production, unfilled anticipated requirements, anticipated royalties, or anticipated services contract payments or receipts.

(d) *Initial statement and annual update.* Initial Form 704 concerning the classification of positions as bona fide hedging pursuant to paragraphs (3)(iii), or 4(i), 4(iii), 4(iv) or anticipatory cross-commodity hedges under paragraph (5) of the definition of bona fide hedging position in § 150.1 shall be filed with the Commission at least ten days in advance of the date that such positions would be in excess of limits then in effect pursuant to section 4a of the Act.

Each person that has filed an initial statement on Form 704 for an anticipatory bona fide hedge exemption shall provide annual updates on the utilization of the anticipatory exemption, including actual cash activity utilizing the anticipatory exemption for the preceding year, as well as the cumulative utilization since the filing of the initial or most recent annual statement. Such statements shall set forth in detail for a specified operating period the person's anticipated activity, *i.e.,* unfilled anticipated requirements, unsold anticipated production, anticipated royalties, or anticipated services contract payments or receipts, and explain the method of determination thereof, including, but not limited to, the following information:

(1) *For each anticipated activity:* (i) The type of cash commodity underlying the anticipated activity;

(ii) The name of the actual cash commodity underlying the anticipated activity and the units in which the cash commodity is measured;

(iii) An indication of whether the cash commodity is the same commodity (grade and quality) that underlies a core referenced futures contract or whether a cross-hedge will be used and, if so, additional information for cross hedges specified in paragraph (d)(2) of this section;

(iv)(A) Annual production, requirements, royalty receipts or service contract payments or receipts, in terms of futures equivalents, of such commodity for the three complete fiscal years preceding the current fiscal year, if filing an initial statement; or

(B) For the prior fiscal year if filing an annual update;

(v) The specified time period for which the anticipatory hedge exemption is claimed;

(vi) Anticipated production, requirements, royalty receipts or service contract payments or receipts, in terms of futures equivalents, of such commodity for such specified time period;

(vii) Fixed-price forward sales, inventory, and fixed-price forward purchases of such commodity, including any quantity in process of manufacture and finished goods and byproducts of manufacture or processing (in terms of such commodity);

(viii) Unsold anticipated production, unfilled anticipated requirements, unsold anticipated royalty receipts, and anticipated service contract payments or receipts the risks of which have not been offset with cash positions, of such commodity for the specified time period; and

(ix) The maximum number of long positions and short positions in referenced contracts expected to be used to offset the risks of such anticipated activity.

(2) *Additional information for cross hedges.* Cash positions that represent a commodity, or products or byproducts of a commodity, that is different from the commodity underlying a commodity derivative contract that is expected to be used for hedging, shall be shown both in terms of the equivalent amount of the commodity underlying the commodity derivative contract used for hedging and in terms of the actual cash commodity as provided for on Form 704. In computing their cash position, every person shall use such standards and conversion factors that are usual in the particular trade or that otherwise reflect the value-fluctuation-equivalents of the cash position in terms of the commodity underlying the commodity derivative contract used for hedging. Such person shall furnish to the Commission upon request detailed information concerning the basis for and derivation of such conversion factors, including:

(i) The hedge ratio used to convert the actual cash commodity to the equivalent amount of the commodity underlying the commodity derivative contract used for hedging; and

(ii) An explanation of the methodology used for determining the hedge ratio.

(e) *Monthly reporting.* Monthly reporting of remaining anticipated hedge exemption shall be reported on Form 204, along with reporting other exemptions pursuant to § 19.01(a)(3)(vii) of this chapter.

(f) *Maximum sales and purchases.* Sales or purchases of commodity derivative contracts considered to be bona fide hedging positions under paragraphs (3)(iii)(A) or (4)(i) of the bona fide hedging position definition in § 150.1 shall at no time exceed the lesser of:

(1) A person's anticipated activity (including production, requirements, royalties and services) as described by the information most recently filed pursuant to this section that has not been offset with cash positions; or

(2) Such lesser amount as determined by the Commission pursuant to paragraph (b) of this section.

(g) *Delegation of authority to the Director of the Division of Market Oversight.* (1) The Commission hereby delegates, until it orders otherwise, to the Director of the Division of Market Oversight or such other employee or employees as the Director may designate from time to time, the authority:

(i) In paragraph (b) of this section to provide notice to a person that some or all of the amounts described in a Form 704 filing does not meet the requirements for bona fide hedging positions;

(ii) In paragraph (c) of this section to request a person who has filed an application or annual update on Form 704 under paragraph (a) of this section to file specific additional or updated information with the Commission to support a determination that the Form 704 filed accurately reflects unsold anticipated production, unfilled anticipated requirements, anticipated royalties, or anticipated services contract payments or receipts; and

(iii) In paragraph (d)(2) of this section to request detailed information concerning the basis for and derivation of conversion factors used in computing the cash position provided in any applications or annual updates filed on Form 704.

(2) The Director of the Division of Market Oversight may submit to the Commission for its consideration any matter which has been delegated in this section.

(3) Nothing in this section prohibits the Commission, at its election, from exercising the authority delegated in this section.

§ 150.8 Severability.

If any provision of this part, or the application thereof to any person or circumstances, is held invalid, such invalidity shall not affect other provisions or application of such provision to other persons or circumstances which can be given effect without the invalid provision or application.

§ 150.9 Process for recognition of positions as non-enumerated bona fide hedges.

(a) *Requirements for a designated contract market or swap execution facility to recognize non-enumerated bona fide hedging positions.* (1) A designated contract market or swap execution facility that elects to process non-enumerated bona fide hedging position applications to demonstrate why a derivative position satisfies the requirements of section 4a(c) of the Act shall maintain rules, submitted to the Commission pursuant to part 40 of this chapter, establishing an application process for recognition of non-enumerated bona fide hedging positions consistent with the requirements of this section and the general definition of bona fide hedging position in § 150.1. A designated contract market or swap execution facility may elect to process non-enumerated bona fide hedging position applications for positions in commodity derivative contracts only if, in each case:

(i) The commodity derivative contract is a referenced contract;

(ii) Such designated contract market or swap execution facility lists such commodity derivative contract for trading;

(iii) Such commodity derivative contract is actively traded on such designated contract market or swap execution facility;

(iv) Such designated contract market or swap execution facility has established position limits for such commodity derivative contract; and

(v) Such designated contract market or swap execution facility has at least one year of experience and expertise administering position limits for a referenced contract in a particular commodity. A designated contract market or swap execution facility shall not recognize a non-enumerated bona fide hedging position involving a commodity index contract and one or more referenced contracts.

(2) A designated contract market or swap execution facility may establish different application processes for persons to demonstrate why a derivative position constitutes a non-enumerated bona fide hedging position under novel facts and circumstances and under facts and circumstances substantially similar to a position for which a summary has been published on such designated contract market's or swap execution facility's Web site, pursuant to paragraph (a)(7) of this section.

(3) Any application process that is established by a designated contract market or swap execution facility shall elicit sufficient information to allow the designated contract market or swap execution facility to determine, and the Commission to verify, whether the facts and circumstances in respect of a derivative position satisfy the requirements of section 4a(c) of the Act and the general definition of bona fide hedging position in § 150.1, and whether it is appropriate to recognize such position as a non-enumerated bona fide hedging position, including at a minimum:

(i) A description of the position in the commodity derivative contract for which the application is submitted and the offsetting cash positions;

(ii) Information to demonstrate why the position satisfies the requirements of section 4a(c) of the Act and the general definition of bona fide hedging position in § 150.1;

(iii) A statement concerning the maximum size of all gross positions in derivative contracts for which the application is submitted;

(iv) Information regarding the applicant's activity in the cash markets for the commodity underlying the position for which the application is submitted during the past year; and

(v) Any other information necessary to enable the designated contract market or swap execution facility to determine, and the Commission to verify, whether it is appropriate to recognize such position as a non-enumerated bona fide hedging position.

(4) Under any application process established under this section, a designated contract market or swap execution facility shall:

(i) Require each person intending to exceed position limits to submit an application, to reapply at least on an annual basis by updating that application, and to receive notice of recognition from the designated contract market or swap execution facility of a position as a non-enumerated bona fide hedging position in advance of the date that such position would be in excess of the limits then in effect pursuant to section 4a of the Act;

(ii) Notify an applicant in a timely manner if a submitted application is not complete. If an applicant does not amend or resubmit such application within a reasonable amount of time after such notice, a designated contract market or swap execution facility may reject the application;

(iii) Determine in a timely manner whether a derivative position for which a complete application has been submitted satisfies the requirements of section 4a(c) of the Act and the general definition of bona fide hedging position in § 150.1, and whether it is appropriate to recognize such position as a non-enumerated bona fide hedging position;

(iv) Have the authority to revoke, at any time, any recognition issued pursuant to this section if it determines the recognition is no longer in accord with section 4a(c) of the Act and the general definition of bona fide hedging position in § 150.1; and

(v) Notify an applicant in a timely manner:

(A) That the derivative position for which a complete application has been submitted has been recognized by the designated contract market or swap execution facility as a non-enumerated bona fide hedging position under this section, and the details and all conditions of such recognition;

(B) That its application is rejected, including the reasons for such rejection; or

(C) That the designated contract market or swap execution facility has asked the Commission to consider the application under paragraph (a)(8) of this section.

(5) An applicant's derivatives position shall be deemed to be recognized as a non-enumerated bona fide hedging position exempt from federal position limits at the time that a designated contract market or swap execution facility notifies an applicant that such designated contract market or swap execution facility will recognize such position as a non-enumerated bona fide hedging position.

(6) A designated contract market or swap execution facility that elects to process non-enumerated bona fide hedging position applications shall file new rules or rule amendments pursuant to part 40 of this chapter, establishing or amending requirements for an applicant to file reports pertaining to the use of any such exemption that has been granted in the manner, form, and frequency, as determined by the designated contract market or swap execution facility.

(7) After recognition of each unique type of derivative position as a non-enumerated bona fide hedging position, based on novel facts and circumstances, a designated contract market or swap execution facility shall publish on its Web site, on at least a quarterly basis, a summary describing the type of derivative position and explaining why it was recognized as a non-enumerated bona fide hedging position.

(8) If a non-enumerated bona fide hedging position application presents novel or complex issues or is potentially inconsistent with section 4a(c) of the Act and the general definition of bona fide hedging position in § 150.1, a designated contract market or swap execution facility may ask the Commission to consider the application under the process set forth in paragraph (d) of this section. The Commission may, in its discretion, agree to or reject any such request by a designated contract market or swap execution facility.

(b) *Recordkeeping.* (1) A designated contract market or swap execution facility that elects to process non-enumerated bona fide hedging position applications shall keep full, complete, and systematic records, which include all pertinent data and memoranda, of all activities relating to the processing of such applications and the disposition thereof, including the recognition by the designated contract market or swap execution facility of any derivative position as a non-enumerated bona fide hedging position, the revocation or modification of any such recognition, the rejection by the designated contract market or swap execution facility of an application, or the withdrawal, supplementation or updating of an application by the applicant. Included among such records shall be:

(i) All information and documents submitted by an applicant in connection with its application;

(ii) Records of oral and written communications between such designated contract market or swap execution facility and such applicant in connection with such application; and

(iii) All information and documents in connection with such designated contract market's or swap execution facility's analysis of and action on such application.

(2) All books and records required to be kept pursuant to this section shall be kept in accordance with the requirements of § 1.31 of this chapter.

(c) *Reports to the Commission.* (1) A designated contract market or swap execution facility that elects to process non-enumerated bona fide hedging position applications shall submit to the Commission a report for each week as of the close of business on Friday showing the following information:

(i) For each commodity derivative position that had been recognized that week by the designated contract market or swap execution facility as a non-enumerated bona fide hedging position, and for any revocation or modification of a previously granted recognition:

(A) The date of disposition,

(B) The effective date of the disposition,

(C) The expiration date of any recognition,

(D) Any unique identifier assigned by the designated contract market or swap execution facility to track the application,

(E) Any unique identifier assigned by the designated contract market or swap execution facility to a type of recognized non-enumerated bona fide hedging position,

(F) The identity of the applicant,

(G) The listed commodity derivative contract to which the application pertains,

(H) The underlying cash commodity,

(I) The maximum size of the commodity derivative position that is recognized by the designated contract market or swap execution facility as a non-enumerated bona fide hedging position,

(J) Any size limitation established for such commodity derivative position on the designated contract market or swap execution facility, and

(K) A concise summary of the applicant's activity in the cash markets for the commodity underlying the commodity derivative position; and

(ii) The summary of any non-enumerated bona fide hedging position published pursuant to paragraph (a)(7) of this section, or revised, since the last summary submitted to the Commission.

(2) Unless otherwise instructed by the Commission, a designated contract market or swap execution facility that elects to process non-enumerated bona fide hedging position applications shall submit to the Commission, no less frequently than monthly, any report such designated contract market or swap execution facility requires to be submitted by an applicant to such designated contract market or swap execution facility pursuant to rules required under paragraph (a)(6) of this section.

(3) Unless otherwise instructed by the Commission, a designated contract market or swap execution facility that elects to process non-enumerated bona fide hedging position applications shall submit to the Commission the information required by paragraphs (c)(1) and (2) of this section, as follows:

(i) As specified by the Commission on the Forms and Submissions page at *www.cftc.gov*;

(ii) Using the format, coding structure, and electronic data transmission procedures approved in writing by the Commission; and

(iii) Not later than 9:00 a.m. Eastern time on the third business day following the date of the report.

(d) *Review of applications by the Commission.* (1) The Commission may in its discretion at any time review any non-enumerated bona fide hedging position application submitted to a designated contract market or swap execution facility, and all records required to be kept by such designated contract market or swap execution facility pursuant to paragraph (b) of this section in connection with such application, for any purpose, including to evaluate whether the disposition of the application is consistent with section 4a(c) of the Act and the general definition of bona fide hedging position in § 150.1.

(i) The Commission may request from such designated contract market or swap execution facility records required to be kept by such designated contract market or swap execution facility pursuant to paragraph (b) of this section in connection with such application.

(ii) The Commission may request additional information in connection with such application from such designated contract market or swap execution facility or from the applicant.

(2) If the Commission preliminarily determines that any non-enumerated bona fide hedging position application or the disposition thereof by a designated contract market or swap execution facility presents novel or complex issues that require additional time to analyze, or that an application or the disposition thereof by such designated contract market or swap execution facility is potentially inconsistent with section 4a(c) of the Act and the general definition of bona fide hedging position in § 150.1, the Commission shall:

(i) Notify such designated contract market or swap execution facility and the applicable applicant of the issues identified by the Commission; and

(ii) Provide them with 10 business days in which to provide the Commission with any supplemental information.

(3) The Commission shall determine whether it is appropriate to recognize the derivative position for which such application has been submitted as a non-enumerated bona fide hedging position, or whether the disposition of such application by such designated contract market or swap execution facility is consistent with section 4a(c) the Act and the general definition of bona fide hedging position in § 150.1.

(4) If the Commission determines that the disposition of such application is inconsistent with section 4a(c) of the Act and the general definition of bona fide hedging position in § 150.1, the Commission shall notify the applicant and grant the applicant a commercially reasonable amount of time to liquidate the derivative position or otherwise come into compliance. This notification will briefly specify the nature of the issues raised and the specific provisions of the Act or the Commission's regulations with which the application is, or appears to be, inconsistent.

(e) *Review of summaries by the Commission.* The Commission may in its discretion at any time review any summary of a type of non-enumerated bona fide hedging position required to be published on a designated contract market's or swap execution facility's Web site pursuant to paragraph (a)(7) of this section for any purpose, including to evaluate whether the summary promotes transparency and fair and open access by all market participants to information regarding bona fide hedges. If the Commission determines that a summary is deficient in any way, the Commission shall notify such designated contract market or swap execution facility, and grant to the designated contract market or swap execution facility a reasonable amount of time to revise the summary.

(f) *Delegation of authority to the Director of the Division of Market Oversight.* (1) The Commission hereby delegates, until it orders otherwise, to the Director of the Division of Market Oversight or such other employee or employees as the Director may designate from time to time, the authority:

(i) In paragraph (a)(8) of this section to agree to or reject a request by a designated contract market or swap execution facility to consider a non-enumerated bona fide hedging position application;

(ii) In paragraph (c) of this section to provide instructions regarding the submission to the Commission of information required to be reported by a designated contract market or swap execution facility, to specify the manner for submitting such information on the Forms and Submissions page at *www.cftc.gov*, and to determine the format, coding structure, and electronic data transmission procedures for submitting such information;

(iii) In paragraph (d)(1) of this section to review any non-enumerated bona fide hedging position application and all records required to be kept by a designated contract market or swap execution facility in connection with such application, to request such records from such designated contract market or swap execution facility, and to request additional information in connection with such application from such designated contract market or swap execution facility or from the applicant;

(iv) In paragraph (d)(2) of this section to preliminarily determine that a non-enumerated bona fide hedging position application or the disposition thereof by a designated contract market or swap execution facility presents novel or complex issues that require additional time to analyze, or that such application or the disposition thereof is potentially inconsistent with section 4a(c) of the Act and the general definition of bona fide hedging position in § 150.1, to notify the designated contract market or swap execution facility and the applicable applicant of the issues identified, and to provide them with 10 business days in which to file supplemental information; and

(v) In paragraph (e) of this section to review any summary of a type of non-enumerated bona fide hedging position required to be published on a designated contract market's or swap execution facility's Web site, to determine that any such summary is deficient, to notify a designated contract market or swap execution facility of a deficient summary, and to grant such designated contract market or swap execution facility a reasonable amount of time to revise such summary.

(2) The Director of the Division of Market Oversight may submit to the Commission for its consideration any matter which has been delegated in this section.

(3) Nothing in this section prohibits the Commission, at its election, from exercising the authority delegated in this section.

§ 150.10 Process for designated contract market or swap execution facility exemption from position limits for certain spread positions.

(a) *Requirements for a designated contract market or swap execution facility to exempt from position limits certain positions normally known to the trade as spreads.* (1) A designated contract market or swap execution facility that elects to process applications for exemptions from position limits for certain positions normally known to the trade as spreads shall maintain rules, submitted to the Commission pursuant to part 40 of this chapter, establishing an application process for exempting positions normally known to the trade as spreads consistent with the requirements of this section. A designated contract market or swap execution facility may elect to process applications for such spread exemptions only if, in each case:

(i) Such designated contract market or swap execution facility lists for trading at least one contract that is either a component of the spread or a referenced contract that is a component of the spread;

(ii) The contract, in paragraph (a)(1)(i) of this section, in a particular commodity is actively traded on such designated contract market or swap execution facility;

(iii) Such designated contract market or swap execution facility has established position limits for at least one contract that is either a component of the spread or a referenced contract that is a component of the spread; and

(iv) Such designated contract market or swap execution facility has at least one year of experience and expertise administering position limits for at least one contract that is either a component of the spread or a referenced contract that is a component of the spread. A designated contract market or swap execution facility shall not approve a spread exemption involving a commodity index contract and one or more referenced contracts.

(2) Spreads that a designated contract market or swap execution facility may approve under this section include:

(i) Calendar spreads;

(ii) Quality differential spreads;

(iii) Processing spreads; and

(iv) Product or by-product differential spreads.

(3) Any application process that is established by a designated contract market or swap execution facility under this section shall elicit sufficient information to allow the designated contract market or swap execution facility to determine, and the Commission to verify, whether the facts and circumstances demonstrate that it is appropriate to exempt a spread position from position limits, including at a minimum:

(i) A description of the spread position for which the application is submitted;

(ii) Information to demonstrate why the spread position should be exempted from position limits, including how the exemption would further the purposes of section 4a(a)(3)(B) of the Act;

(iii) A statement concerning the maximum size of all gross positions in derivative contracts for which the application is submitted; and

(iv) Any other information necessary to enable the designated contract market or swap execution facility to determine, and the Commission to verify, whether it is appropriate to exempt such spread position from position limits.

(4) Under any application process established under this section, a designated contract market or swap execution facility shall:

(i) Require each person requesting an exemption from position limits for its spread position to submit an application, to reapply at least on an annual basis by updating that application, and to receive approval in advance of the date that such position would be in excess of the limits then in effect pursuant to section 4a of the Act;

(ii) Notify an applicant in a timely manner if a submitted application is not complete. If an applicant does not amend or resubmit such application within a reasonable amount of time after such notice, a designated contract market or swap execution facility may reject the application;

(iii) Determine in a timely manner whether a spread position for which a complete application has been submitted satisfies the requirements of paragraph (a)(4)(vi) of this section, and whether it is appropriate to exempt such spread position from position limits;

(iv) Have the authority to revoke, at any time, any spread exemption issued pursuant to this section if it determines the spread exemption no longer satisfies the requirements of paragraph (a)(4)(vi) of this section and it is no longer appropriate to exempt the spread from position limits;

(v) Notify an applicant in a timely manner:

(A) That a spread position for which a complete application has been submitted has been exempted by the designated contract market or swap execution facility from position limits, and the details and all conditions of such exemption;

(B) That its application is rejected, including the reasons for such rejection; or

(C) That the designated contract market or swap execution facility has asked the Commission to consider the application under paragraph (a)(8) of this section; and

(vi) Determine whether exempting the spread position from position limits would, to the maximum extent practicable, ensure sufficient market liquidity for bona fide hedgers, and not unreasonably reduce the effectiveness of position limits to:

(A) Diminish, eliminate or prevent excessive speculation;

(B) Deter and prevent market manipulation, squeezes, and corners; and

(C) Ensure that the price discovery function of the underlying market is not disrupted.

(5) An applicant's derivatives position shall be deemed to be recognized as a spread position exempt from federal position limits at the time that a designated contract market or swap execution facility notifies an applicant that such designated contract market or swap execution facility will exempt such spread position.

(6) A designated contract market or swap execution facility that elects to process applications to exempt spread positions from position limits shall file new rules or rule amendments pursuant to part 40 of this chapter, establishing or amending requirements for an applicant to file reports pertaining to the use of any such exemption that has been granted in the manner, form, and frequency, as determined by the designated contract market or swap execution facility.

(7) After exemption of each unique type of spread position, a designated contract market or swap execution facility shall publish on its Web site, on at least a quarterly basis, a summary describing the type of spread position and explaining why it was exempted.

(8) If a spread exemption application presents complex issues or is potentially inconsistent with the purposes of section 4a(a)(3)(B) of the Act, a designated contract market or swap execution facility may ask the Commission to consider the application under the process set forth in paragraph (d) of this section. The Commission may, in its discretion, agree to or reject any such request by a designated contract market or swap execution facility.

(b) *Recordkeeping.* (1) A designated contract market or swap execution facility that elects to process spread exemption applications shall keep full, complete, and systematic records, which include all pertinent data and memoranda, of all activities relating to the processing of such applications and the disposition thereof, including the exemption of any spread position, the revocation or modification of any exemption, the rejection by the designated contract market or swap execution facility of an application, or the withdrawal, supplementation or updating of an application by the applicant. Included among such records shall be:

(i) All information and documents submitted by an applicant in connection with its application;

(ii) Records of oral and written communications between such designated contract market or swap execution facility and such applicant in connection with such application; and

(iii) All information and documents in connection with such designated contract market's or swap execution facility's analysis of and action on such application.

(2) All books and records required to be kept pursuant to this section shall be kept in accordance with the requirements of § 1.31 of this chapter.

(c) *Reports to the Commission.* (1) A designated contract market or swap execution facility that elects to process spread exemption applications shall submit to the Commission a report for each week as of the close of business on Friday showing the following information:

(i) The disposition of any spread exemption application, including the exemption of any spread position, the revocation or modification of any exemption, or the rejection of any application, as well as the following details:

(A) The date of disposition,

(B) The effective date of the disposition,

(C) The expiration date of any exemption,

(D) Any unique identifier assigned by the designated contract market or swap execution facility to track the application,

(E) Any unique identifier assigned by the designated contract market or swap execution facility to a type of exempt spread position,

(F) The identity of the applicant,

(G) The listed commodity derivative contract to which the application pertains,

(H) The underlying cash commodity,

(I) The size limitations on any exempt spread position, specified by contract month if applicable, and

(J) Any conditions on the exemption; and

(ii) The summary of any exempt spread position newly published pursuant to paragraph (a)(7) of this section, or revised, since the last summary submitted to the Commission.

(2) Unless otherwise instructed by the Commission, a designated contract market or swap execution facility that elects to process applications to exempt spread positions from position limits shall submit to the Commission, no less frequently than monthly, any report such designated contract market or swap execution facility requires to be submitted by an applicant to such designated contract market or swap execution facility pursuant to rules required by paragraph (a)(6) of this section.

(3) Unless otherwise instructed by the Commission, a designated contract market or swap execution facility that elects to process applications to exempt spread positions from position limits shall submit to the Commission the information required by paragraphs (c)(1) and (2) of this section, as follows:

(i) As specified by the Commission on the Forms and Submissions page at *www.cftc.gov*;

(ii) Using the format, coding structure, and electronic data transmission procedures approved in writing by the Commission; and

(iii) Not later than 9:00 a.m. Eastern time on the third business day following the date of the report.

(d) *Review of applications by the Commission.* (1) The Commission may in its discretion at any time review any spread exemption application submitted to a designated contract market or swap execution facility, and all records required to be kept by such designated contract market or swap execution facility pursuant to paragraph (b) of this section in connection with such application, for any purpose, including to evaluate whether the disposition of the application is consistent with the purposes of section 4a(a)(3)(B) of the Act.

(i) The Commission may request from such designated contract market or swap execution facility records required to be kept by such designated contract market or swap execution facility pursuant to paragraph (b) of this section in connection with such application.

(ii) The Commission may request additional information in connection with such application from such designated contract market or swap execution facility or from the applicant.

(2) If the Commission preliminarily determines that any application to exempt a spread position from position limits, or the disposition thereof by a designated contract market or swap execution facility, presents novel or complex issues that require additional time to analyze, or that an application or the disposition thereof by such designated contract market or swap execution facility is potentially inconsistent with the Act, the Commission shall:

(i) Notify such designated contract market or swap execution facility and the applicable applicant of the issues identified by the Commission; and

(ii) Provide them with 10 business days in which to provide the Commission with any supplemental information.

(3) The Commission shall determine whether it is appropriate to exempt the spread position for which such application has been submitted from position limits, or whether the disposition of such application by such designated contract market or swap execution facility is consistent with the purposes of section 4a(a)(3)(B) of the Act.

(4) If the Commission determines that it is not appropriate to exempt the spread position for which such application has been submitted from position limits, or that the disposition of such application is inconsistent with the Act, the Commission shall notify the applicant and grant the applicant a commercially reasonable amount of time to liquidate the spread position or otherwise come into compliance. This notification will briefly specify the nature of the issues raised and the specific provisions of the Act or the Commission's regulations with which the application is, or appears to be, inconsistent.

(e) *Review of summaries by the Commission.* The Commission may in its discretion at any time review any summary of a type of spread position required to be published on a designated contract market's or swap execution facility's Web site pursuant to paragraph (a)(7) of this section for any purpose, including to evaluate whether the summary promotes transparency and fair and open access by all market participants to information regarding spread exemptions. If the Commission determines that a summary is deficient in any way, the Commission shall notify such designated contract market or swap execution facility, and grant to the designated contract market or swap execution facility a reasonable amount of time to revise the summary.

(f) *Delegation of authority to the Director of the Division of Market Oversight.* (1) The Commission hereby delegates, until it orders otherwise, to the Director of the Division of Market Oversight or such other employee or employees as the Director may designate from time to time, the authority:

(i) In paragraph (a)(8) of this section to agree to or reject a request by a designated contract market or swap execution facility to consider a spread exemption application;

(ii) In paragraph (c) of this section to provide instructions regarding the submission to the Commission of information required to be reported by a designated contract market or swap execution facility, to specify the manner for submitting such information on the Forms and Submissions page at *www.cftc.gov*, and to determine the format, coding structure, and electronic data transmission procedures for submitting such information;

(iii) In paragraph (d)(1) of this section to review any spread exemption application and all records required to be kept by a designated contract market or swap execution facility in connection with such application, to request such records from such designated contract market or swap execution facility, and to request additional information in connection with such application from such designated contract market or swap execution facility, or from the applicant;

(iv) In paragraph (d)(2) of this section to preliminarily determine that a spread exemption application or the disposition thereof by a designated contract market or swap execution facility presents complex issues that require additional time to analyze, or that such application or the disposition thereof is potentially inconsistent with the Act, to notify the designated contract market or swap execution facility and the applicable applicant of the issues identified, and to provide them with 10 business days in which to file supplemental information; and

(v) In paragraph (e) of this section to review any summary of a type of spread exemption required to be published on a designated contract market's or swap execution facility's Web site, to determine that any such summary is deficient, to notify a designated contract market or swap execution facility of a deficient summary, and to grant such designated contract market or swap execution facility a reasonable amount of time to revise such summary.

(2) The Director of the Division of Market Oversight may submit to the Commission for its consideration any matter which has been delegated in this section.

(3) Nothing in this section prohibits the Commission, at its election, from exercising the authority delegated in this section.

§ 150.11 Process for recognition of positions as bona fide hedges for unfilled anticipated requirements, unsold anticipated production, anticipated royalties, anticipated service contract payments or receipts, or anticipatory cross-commodity hedge positions.

(a) *Requirements for a designated contract market or swap execution facility to recognize certain enumerated anticipatory bona fide hedging positions.* (1) A designated contract market or swap execution facility that elects to process applications for recognition of positions as hedges of unfilled anticipated requirements, unsold anticipated production, anticipated royalties, anticipated service contract payments or receipts, or anticipatory cross-commodity hedges under the provisions of paragraphs (3)(iii), (4)(i), (iii), (iv), or (5), respectively, of the definition of bona fide hedging position in § 150.1 shall maintain rules, submitted to the Commission pursuant to part 40 of this chapter, establishing an application process for such anticipatory bona fide hedges consistent with the requirements of this section. A designated contract market or swap execution facility may elect to process such anticipatory hedge applications for positions in commodity derivative contracts only if, in each case:

(i) The commodity derivative contract is a referenced contract;

(ii) Such designated contract market or swap execution facility lists such commodity derivative contract for trading;

(iii) Such commodity derivative contract is actively traded on such derivative contract market;

(iv) Such designated contract market or swap execution facility has established position limits for such commodity derivative contract; and

(v) Such designated contract market or swap execution facility has at least one year of experience and expertise administering position limits for a referenced contract in a particular commodity.

(2) Any application process that is established by a designated contract

market or swap execution facility shall require, at a minimum, the information required under § 150.7(d).

(3) Under any application process established under this section, a designated contract market or swap execution facility shall:

(i) Require each person intending to exceed position limits to submit an application, and to reapply at least on an annual basis by updating that application, as required under § 150.7(d), and to receive notice of recognition from the designated contract market or swap execution facility of a position as a bona fide hedging position in advance of the date that such position would be in excess of the limits then in effect pursuant to section 4a of the Act;

(ii) Notify an applicant in a timely manner if a submitted application is not complete. If the applicant does not amend or resubmit such application within a reasonable amount of time after notification from the designated contract market or swap execution facility, the designated contract market or swap execution facility may reject the application;

(iii) Inform an applicant within ten days of receipt of such application by the designated contract market or swap execution facility that:

(A) The derivative position for which a complete application has been submitted has been recognized by the designated contract market or swap execution facility as a bona fide hedging position, and the details and all conditions of such recognition;

(B) The application is rejected, including the reasons for such rejection; or

(C) The designated contract market or swap execution facility has asked the Commission to consider the application under paragraph (a)(6) of this section; and

(iv) Have the authority to revoke, at any time, any recognition issued pursuant to this section if it determines the position no longer complies with the filing requirements under paragraph (a)(2) of this section.

(4) An applicant's derivatives position shall be deemed to be recognized as a bona fide hedging position at the time that a designated contract market or swap execution facility notifies an applicant that such designated contract market or swap execution facility will recognize such position as a bona fide hedging position.

(5) A designated contract market or swap execution facility that elects to process bona fide hedging position applications shall file new rules or rule amendments pursuant to part 40 of this chapter, establishing or amending requirements for an applicant to file the supplemental reports, as required under § 150.7(e), pertaining to the use of any such exemption that has been granted.

(6) A designated contract market or swap execution facility may ask the Commission to consider any application made under this section. The Commission may, in its discretion, agree to or reject any such request by a designated contract market or swap execution facility, *provided that,* if the Commission agrees to the request, it will have 10 business days from the time of the request to carry out its review.

(b) *Recordkeeping.* (1) A designated contract market or swap execution facility that elects to process bona fide hedging position applications under this section shall keep full, complete, and systematic records, which include all pertinent data and memoranda, of all activities relating to the processing of such applications and the disposition thereof, including the recognition of any derivative position as a bona fide hedging position, the revocation or modification of any recognition, the rejection by the designated contract market or swap execution facility of an application, or withdrawal, supplementation or updating of an application. Included among such records shall be:

(i) All information and documents submitted by an applicant in connection with its application;

(ii) Records of oral and written communications between such designated contract market or swap execution facility and such applicant in connection with such application; and

(iii) All information and documents in connection with such designated contract market's or swap execution facility's analysis of and action on such application.

(2) All books and records required to be kept pursuant to this section shall be kept in accordance with the requirements of § 1.31 of this chapter.

(c) *Reports to the Commission.* (1) A designated contract market or swap execution facility that elects to process bona fide hedging position applications under this section shall submit to the Commission a report for each week as of the close of business on Friday showing the following information:

(i) The disposition of any application, including the recognition of any position as a bona fide hedging position, the revocation or modification of any recognition, as well as the following details:

(A) The date of disposition,

(B) The effective date of the disposition,

(C) The expiration date of any recognition,

(D) Any unique identifier assigned by the designated contract market or swap execution facility to track the application,

(E) Any unique identifier assigned by the designated contract market or swap execution facility to a bona fide hedge recognized under this section;

(F) The identity of the applicant,

(G) The listed commodity derivative contract to which the application pertains,

(H) The underlying cash commodity,

(I) The maximum size of the commodity derivative position that is recognized by the designated contract market or swap execution facility as a bona fide hedging position,

(J) Any size limitation established for such commodity derivative position on the designated contract market or swap execution facility, and

(K) A concise summary of the applicant's activity in the cash market for the commodity underlying the position for which the application was submitted.

(2) Unless otherwise instructed by the Commission, a designated contract market or swap execution facility that elects to process bona fide hedging position applications shall submit to the Commission the information required by paragraph (c)(1) of this section, as follows:

(i) As specified by the Commission on the Forms and Submissions page at *www.cftc.gov*;

(ii) Using the format, coding structure, and electronic data transmission procedures approved in writing by the Commission; and

(iii) Not later than 9:00 a.m. Eastern time on the third business day following the date of the report.

(d) *Review of applications by the Commission.* (1) The Commission may in its discretion at any time review any bona fide hedging position application submitted to a designated contract market or swap execution facility under this section, and all records required to be kept by such designated contract market or swap execution facility pursuant to paragraph (b) of this section in connection with such application, for any purpose, including to evaluate whether the disposition of the application is consistent with the Act.

(i) The Commission may request from such designated contract market or swap execution facility records required to be kept by such designated contract market or swap execution facility pursuant to paragraph (b) of this section in connection with such application.

(ii) The Commission may request additional information in connection with such application from such designated contract market or swap execution facility or from the applicant.

(2) If the Commission preliminarily determines that any anticipatory hedge application is inconsistent with the filing requirements of § 150.11(a)(2), the Commission shall:

(i) Notify such designated contract market or swap execution facility and the applicable applicant of the deficiencies identified by the Commission; and

(ii) Provide them with 10 business days in which to provide the Commission with any supplemental information.

(3) If the Commission determines that the anticipatory hedge application is inconsistent with the filing requirements of § 150.11(a)(2), the Commission shall notify the applicant and grant the applicant a commercially reasonable amount of time to liquidate the derivative position or otherwise come into compliance. This notification will briefly specify the specific provisions of the filing requirements of § 150.11(a)(2), with which the application is, or appears to be, inconsistent.

(e) *Delegation of authority to the Director of the Division of Market Oversight.* (1) The Commission hereby delegates, until it orders otherwise, to the Director of the Division of Market Oversight or such other employee or employees as the Director may designate from time to time, the authority:

(i) In paragraph (a)(6) of this section to agree to or reject a request by a designated contract market or swap execution facility to consider a bona fide hedge application;

(ii) In paragraph (c) of this section to provide instructions regarding the submission to the Commission of information required to be reported by a designated contract market or swap execution facility, to specify the manner for submitting such information on the Forms and Submissions page at *www.cftc.gov*, and to determine the format, coding structure, and electronic data transmission procedures for submitting such information;

(iii) In paragraph (d)(1) of this section to review any bona fide hedging position application and all records required to be kept by a designated contract market or swap execution facility in connection with such application, to request such records from such designated contract market or swap execution facility, and to request additional information in connection with such application from such designated contract market or swap execution facility or from the applicant; and

(iv) In paragraph (d)(2) of this section to determine that it is not appropriate to recognize a derivative position for which an application for recognition has been submitted as a bona fide hedging position, or that the disposition of such application by a designated contract market or swap execution facility is inconsistent with the Act, and, in connection with such a determination, to grant the applicant a reasonable amount of time to liquidate the derivative position or otherwise come into compliance.

(2) The Director of the Division of Market Oversight may submit to the Commission for its consideration any matter which has been delegated in this section.

(3) Nothing in this section prohibits the Commission, at its election, from exercising the authority delegated in this section.

■ 28. In Part 150, add Appendices A through E to read as follows:

Appendix A to Part 150—Guidance on Risk Management Exemptions for Commodity Derivative Contracts in Excluded Commodities

(1) This appendix provides non-exclusive interpretative guidance on risk management exemptions for commodity derivative contracts in excluded commodities permitted under the definition of bona fide hedging position in § 150.1. The rules of a designated contract market or swap execution facility that is a trading facility may recognize positions consistent with this guidance as bona fide hedging positions. The Commission recognizes that risk management positions in commodity derivative contracts in excluded commodities may not conform to the general definition of bona fide hedging positions applicable to commodity derivative contracts in physical commodities, as provided under section 4a(c)(2) of the Act, and may not conform to enumerated bona fide hedging positions applicable to commodity derivative contracts in physical commodities under the definition of bona fide hedging position in § 150.1.

This interpretative guidance for core principle 5 for designated contract markets, section 5(d)(5) of the Act, and core principle 6 for swap execution facilities that are trading facilities, section 5h(f)(6) of the Act, is illustrative only of the types of positions for which a trading facility may elect to provide a risk management exemption and is not intended to be used as a mandatory checklist. Other positions might also be included appropriately within a risk management exemption.

(2)(a) *No temporary substitute criterion.* Risk management positions in commodity derivative contracts in excluded commodities need not be expected to represent a substitute for a subsequent transaction or position in a physical marketing channel. There need not be any requirement to replace a commodity derivative contract with a cash market position in order to qualify for a risk management exemption.

(b) *Cross-commodity hedging is permitted.* Risks that are offset in commodity derivative contracts in excluded commodities need not arise from the same commodities underlying the commodity derivative contracts. For example, a trading facility may recognize a risk management exemption based on the net interest rate risk arising from a bank's balance sheet of loans and deposits that is offset using Treasury security futures contracts or short-term interest rate futures contracts.

(3) *Examples of risk management positions.* This section contains examples of risk management positions that may be appropriate for management of risk in the operation of a commercial enterprise.

(a) *Balance sheet hedging.* A commercial enterprise may have risks arising from its net position in assets and liabilities.

(i) *Foreign currency translation.* One form of balance sheet hedging involves offsetting net exposure to changes in currency exchange rates for the purpose of stabilizing the domestic dollar accounting value of net assets and/or liabilities which are denominated in a foreign currency. For example, a bank may make loans in a foreign currency and take deposits in that same foreign currency. Such a bank is exposed to net foreign currency translation risk when the amount of loans is not equal to the amount of deposits. A bank with a net long exposure to a foreign currency may hedge by establishing an offsetting short position in a foreign currency commodity derivative contract.

(ii) *Interest rate risk.* Another form of balance sheet hedging involves offsetting net exposure to changes in values of assets and liabilities of differing durations. Examples include:

(A) A pension fund may invest in short term securities and have longer term liabilities. Such a pension fund has a duration mismatch. Such a pension fund may hedge by establishing a long position in Treasury security futures contracts to lengthen the duration of its assets to match the duration of its liabilities. This is economically equivalent to using a long position in Treasury security futures contracts to shorten the duration of its liabilities to match the duration of its assets.

(B) A bank may make a certain amount of fixed-rate loans of one maturity and fund such assets through taking fixed-rate deposits of a shorter maturity. Such a bank is exposed to interest rate risk, in that an increase in interest rates may result in a greater decline in value of the assets than the decline in value of the deposit liabilities. A bank may hedge by establishing a short position in short-term interest rate futures contracts to lengthen the duration of its liabilities to match the duration of its assets. This is economically equivalent to using a short position in short-term interest rate futures contracts, for example, to shorten the duration of its assets to match the duration of its liabilities.

(b) *Unleveraged synthetic positions.* An investment fund may have risks arising from a delayed investment in an asset allocation promised to investors. Such a fund may synthetically gain exposure to an asset class using a risk management strategy of establishing a long position in commodity derivative contracts that does not exceed cash set aside in an identifiable manner, including short-term investments, any funds deposited as margin and accrued profits on such commodity derivative contract positions. For example:

(i) A collective investment fund that invests funds in stocks pursuant to an asset allocation strategy may obtain immediate stock market exposure upon receipt of new monies by establishing a long position in stock index futures contracts (''equitizing cash''). Such a long position may qualify as a risk management exemption under trading facility rules provided such long position does not exceed the cash set aside. The long position in stock index futures contracts need not be converted to a position in stock.

(ii) Upon receipt of new funds from investors, an insurance company that invests in bond holdings for a separate account wishes to lengthen synthetically the duration of the portfolio by establishing a long position in Treasury futures contracts. Such a long position may qualify as a risk management exemption under trading facility rules provided such long position does not exceed the cash set aside. The long position in Treasury futures contracts need not be converted to a position in bonds.

(c) *Temporary asset allocations.* A commercial enterprise may have risks arising from potential transactional costs in temporary asset allocations (altering portfolio exposure to certain asset classes such as equity securities and debt securities). Such an enterprise may hedge existing assets owned by establishing a short position in an appropriate commodity derivative contract and synthetically gain exposure to an alternative asset class using a risk management strategy of establishing a long position in another commodity derivative contract that does not exceed: the value of the existing asset at the time the temporary asset allocation is established or, in the alternative, the hedged value of the existing asset plus any accrued profits on such risk management positions. For example:

(i) A collective investment fund that invests funds in bonds and stocks pursuant to an asset allocation strategy may believe that market considerations favor a temporary increase in the fund's equity exposure relative to its bond holdings. The fund manager may choose to accomplish the reallocation using commodity derivative contracts, such as a short position in Treasury security futures contracts and a long position in stock index futures contracts. The short position in Treasury security futures contracts may qualify as a hedge of interest rate risk arising from the bond holdings. A trading facility may adopt rules to recognize as a risk management exemption such a long position in stock index futures.

(ii) Reserved.

(4) *Clarification of bona fides of short positions.*

(a) *Calls sold.* A seller of a call option establishes a short call option. A short call option is a short position in a commodity derivative contract with respect to the underlying commodity. A bona fide hedging position includes such a written call option that does not exceed in quantity the ownership or fixed-price purchase contracts in the contract's underlying cash commodity by the same person.

(b) *Puts purchased and portfolio insurance.* A buyer of a put option establishes a long put option. However, a long put option is a short position in a commodity derivative contract with respect to the underlying commodity. A bona fide hedging position includes such an owned put that does not exceed in quantity the ownership or fixed-price purchase contracts in the contract's underlying cash commodity by the same person.

The Commission also recognizes as bona fide hedging positions strategies that provide protection against a price decline equivalent to an owned position in a put option for an existing portfolio of securities owned. A dynamically managed short position in a futures contract may replicate the characteristics of a long position in a put option.

(c) *Synthetic short futures contracts.* A person may establish a synthetic short futures position by purchasing a put option and selling a call option, when each option has the same notional amount, strike price, expiration date and underlying commodity. Such a synthetic short futures position is a short position in a commodity derivative contract with respect to the underlying commodity. A bona fide hedging position includes such a synthetic short futures position that does not exceed in quantity the ownership or fixed-price purchase contracts in the contract's underlying cash commodity by the same person.

Appendix B to Part 150—Commodities Listed as Substantially the Same for Purposes of the Definition of Location Basis Contract

The following table lists core referenced futures contracts and commodities that are treated as substantially the same as a commodity underlying a core referenced futures contract for purposes of the definition of location basis contract in § 150.1.

LOCATION BASIS CONTRACT LIST OF SUBSTANTIALLY THE SAME COMMODITIES

Core referenced futures contract	Commodities considered substantially the same (regardless of location)	Source(s) for specification of quality
NYMEX Light Sweet Crude Oil futures contract (CL)	1. Light Louisiana Sweet (LLS) Crude Oil	NYMEX Argus LLS vs. WTI (Argus) Trade Month futures contract (E5). NYMEX LLS (Argus) vs. WTI Financial futures contract (WJ). ICE Futures Europe Crude Diff—Argus LLS vs WTI 1st Line Swap futures contract (ARK). ICE Futures Europe Crude Diff—Argus LLS vs WTI Trade Month Swap futures contract (ARL).
NYMEX New York Harbor ULSD Heating Oil futures contract (HO)	1. Chicago ULSD	NYMEX Chicago ULSD (Platts) vs. NY Harbor ULSD Heating Oil futures contract (5C).
	2. Gulf Coast ULSD	NYMEX Group Three ULSD (Platts) vs. NY Harbor ULSD Heating Oil futures contract (A6). NYMEX Gulf Coast ULSD (Argus) Up-Down futures contract (US). NYMEX Gulf Coast ULSD (Argus) Up-Down BALMO futures contract (GUD). NYMEX Gulf Coast ULSD (Platts) Up-Down BALMO futures contract (1L). NYMEX Gulf Coast ULSD (Platts) Up-Down Spread futures contract (LT).

LOCATION BASIS CONTRACT LIST OF SUBSTANTIALLY THE SAME COMMODITIES—Continued

Core referenced futures contract	Commodities considered substantially the same (regardless of location)	Source(s) for specification of quality
		ICE Futures Europe Diesel Diff—Gulf Coast vs Heating Oil 1st Line Swap futures contract (GOH). CME Clearing Europe Gulf Coast ULSD(Platts) vs. New York Heating Oil (NYMEX) Spread Calendar swap (ELT). CME Clearing Europe New York Heating Oil (NYMEX) vs. European Gasoil (IC) Spread Calendar swap (EHA).
	3. California Air Resources Board Spec ULSD (CARB no. 2 oil).	NYMEX Los Angeles CARB Diesel (OPIS) vs. NY Harbor ULSD Heating Oil futures contract (KL).
	4. Gas Oil Deliverable in Antwerp, Rotterdam, or Amsterdam Area.	ICE Futures Europe Gasoil futures contract (G). ICE Futures Europe Heating Oil Arb—Heating Oil 1st Line vs Gasoil 1st Line Swap futures contract (HOT). ICE Futures Europe Heating Oil Arb—Heating Oil 1st Line vs Low Sulphur Gasoil 1st Line Swap futures contract (ULL). NYMEX NY Harbor ULSD Heating Oil vs. Gasoil futures contract (HA).
NYMEX RBOB Gasoline futures contract (RB)	1. Chicago Unleaded 87 gasoline	NYMEX Chicago Unleaded Gasoline (Platts) vs. RBOB Gasoline futures contract (3C). NYMEX Group Three Unleaded Gasoline (Platts) vs. RBOB Gasoline futures contract (A8).
	2. Gulf Coast Conventional Blendstock for Oxygenated Blending (CBOB) 87.	NYMEX Gulf Coast CBOB Gasoline A1 (Platts) vs. RBOB Gasoline futures contract (CBA). NYMEX Gulf Coast Unl 87 (Argus) Up-Down futures contract (UZ).
	3. Gulf Coast CBOB 87 (Summer Assessment).	NYMEX Gulf Coast CBOB Gasoline A2 (Platts) vs. RBOB Gasoline futures contract (CRB).
	4. Gulf Coast Unleaded 87 (Summer Assessment).	NYMEX Gulf Coast 87 Gasoline M2 (Platts) vs. RBOB Gasoline futures contract (RVG). NYMEX Gulf Coast 87 Gasoline M2 (Platts) vs. RBOB Gasoline BALMO futures contract (GBB). NYMEX Gulf Coast 87 Gasoline M2 (Argus) vs. RBOB Gasoline BALMO futures contract (RBG).
	5. Gulf Coast Unleaded 87	NYMEX Gulf Coast Unl 87 (Platts) Up-Down BALMO futures contract (1K). NYMEX Gulf Coast Unl 87 Gasoline M1 (Platts) vs. RBOB Gasoline futures contract (RV). CME Clearing Europe Gulf Coast Unleaded 87 Gasoline M1 (Platts) vs. New York RBOB Gasoline (NYMEX) Spread Calendar swap (ERV).
	6. Los Angeles California Reformulated Blendstock for Oxygenate Blending (CARBOB) Regular.	NYMEX Los Angeles CARBOB Gasoline (OPIS) vs. RBOB Gasoline futures contract (JL).
	7. Los Angeles California Reformulated Blendstock for Oxygenate Blending (CARBOB) Premium.	NYMEX Los Angeles CARBOB Gasoline (OPIS) vs. RBOB Gasoline futures contract (JL).
	8. Euro-BOB OXY NWE Barges	NYMEX RBOB Gasoline vs. Euro-bob Oxy NWE Barges (Argus) (1000mt) futures contract (EXR). CME Clearing Europe New York RBOB Gasoline (NYMEX) vs. European Gasoline Euro-bob Oxy Barges NWE (Argus) (1000mt) Spread Calendar swap (EEXR).
	9. Euro-BOB OXY FOB Rotterdam	ICE Futures Europe Gasoline Diff—RBOB Gasoline 1st Line vs. Argus Euro-BOB OXY FOB Rotterdam Barge Swap futures contract (ROE).

Appendix C to Part 150—Examples of Bona Fide Hedging Positions for Physical Commodities

A non-exhaustive list of examples meeting the definition of bona fide hedging position under § 150.1 is presented below. With respect to a position that does not fall within an example in this appendix, a person seeking to rely on a bona fide hedging position exemption under § 150.3 may seek guidance from the Division of Market Oversight. References to paragraphs in the examples below are to the definition of bona fide hedging position in § 150.1.

1. Portfolio Hedge Under Paragraph (3)(i) of the Bona Fide Hedging Definition

Fact Pattern: It is currently January and Participant A owns seven million bushels of corn located in its warehouses. Participant A has entered into fixed-price forward sale contracts with several processors for a total of five million bushels of corn that will be delivered by May of this year. Participant A has no fixed-price corn purchase contracts. Participant A's gross long cash position is equal to seven million bushels of corn. Because Participant A has sold forward five million bushels of corn, its net cash position is equal to long two million bushels of corn. To reduce price risk associated with potentially lower corn prices, Participant A chooses to establish a short position of 400 contracts in the CBOT Corn futures contract, equivalent to two million bushels of corn, in the same crop year as the inventory.

Analysis: The short position in a contract month in the current crop year for the CBOT Corn futures contract, equivalent to the amount of inventory held, satisfies the general requirements for a bona fide hedging position under paragraphs (2)(i)(A)–(C) and the provisions associated with owning a commodity under paragraph (3)(i).[1] Because the firm's net cash position is two million bushels of unsold corn, the firm is exposed to price risk. Participant A's hedge of the two million bushels represents a substitute for a fixed-price forward sale at a later time in the physical marketing channel. The position is economically appropriate to the reduction of price risk because the short position in a referenced contract does not exceed the quantity equivalent risk exposure (on a net basis) in the cash commodity in the current crop year. Last, the hedge arises from a potential change in the value of corn owned by Participant A.

2. Lending a Commodity and Hedge of Price Risk Under Paragraph (3)(i) of the Bona Fide Hedging Position Definition

Fact Pattern: Bank B owns 1,000 ounces of gold that it lends to Jewelry Fabricator J at LIBOR plus a differential. Under the terms of the loan, Jewelry Fabricator J may later purchase the gold from Bank B at a differential to the prevailing price of the Commodity Exchange, Inc. (COMEX) Gold futures contract (*i.e.,* an open-price purchase agreement is embedded in the terms of the loan). Jewelry Fabricator J intends to use the gold to make jewelry and reimburse Bank B for the loan using the proceeds from jewelry sales and either purchase gold from Bank B by paying the market price for gold or return the equivalent amount of gold to Bank B by purchasing gold at the market price. Because Bank B has retained the price risk on gold, the bank is concerned about its potential loss if the price of gold drops. The bank reduces the risk of a potential loss in the value of the gold by establishing a ten contract short position in the COMEX Gold futures contract, which has a unit of trading of 100 ounces of gold. The ten contract short position is equivalent to 1,000 ounces of gold.

Analysis: This position meets the general requirements for bona fide hedging positions under paragraphs (2)(i)(A)–(C) and the requirements associated with owning a cash commodity under paragraph (3)(i). The physical commodity that is being hedged is the underlying cash commodity for the COMEX Gold futures contract. Bank B's short hedge of the gold represents a substitute for a transaction to be made in the physical marketing channel (*e.g.,* completion of the open-price sale to Jewelry Fabricator J). Because the notional quantity of the short position in the gold futures contract is equal to the amount of gold that Bank B owns, the hedge is economically appropriate to the reduction of risk. Finally, the short position in the commodity derivative contract offsets the potential change in the value of the gold owned by Bank B.

3. Repurchase Agreements and Hedge of Inventory Under Paragraph (3)(i) of the Bona Fide Hedging Position Definition

Fact Pattern: Elevator A purchased 500,000 bushels of wheat in April and reduced its price risk by establishing a short position of 100 contracts in the CBOT Wheat futures contract, equivalent to 500,000 bushels of wheat. Because the price of wheat rose steadily since April, Elevator A had to make substantial maintenance margin payments. To alleviate its cash flow concern about meeting further margin calls, Elevator A decides to enter into a repurchase agreement with Bank B and offset its short position in the wheat futures contract. The repurchase agreement involves two separate contracts: a fixed-price sale from Elevator A to Bank B at today's spot price; and an open-price purchase agreement that will allow Elevator A to repurchase the wheat from Bank B at the prevailing spot price three months from now. Because Bank B obtains title to the wheat under the fixed-price purchase agreement, it is exposed to price risk should the price of wheat drop. Bank B establishes a short position of 100 contracts in the CBOT Wheat futures contract, equivalent to 500,000 bushels of wheat.

Analysis: Bank B's position meets the general requirements for a bona fide hedging position under paragraphs (2)(i)(A)–(C) and the provisions for owning the cash commodity under paragraph (3)(i). The short position in referenced contracts by Bank B is a substitute for a fixed-price sales transaction to be taken at a later time in the physical marketing channel either to Elevator A or to another commercial party. The position is economically appropriate to the reduction of risk in the conduct and management of the commercial enterprise (Bank B) because the notional quantity of the short position in referenced contracts held by Bank B is not larger than the quantity of cash wheat purchased by Bank B. Finally, the short position in the CBOT Wheat futures contract reduces the price risk associated with owning cash wheat.

4. Utility Hedge of Anticipated Customer Requirements Under Paragraph (3)(iii)(B) of the Bona Fide Hedging Position Definition

Fact Pattern: A Natural Gas Utility A, regulated by State Public Utility Commission, decides to hedge its purchases of natural gas in order to reduce natural gas price risk on behalf of its residential customers. State Public Utility Commission considers the hedging practice to be prudent and allows gains and losses from hedging to be passed on to Natural Gas Utility A's residential natural gas customers. Natural Gas Utility A has about one million residential customers who have average historical usage of about 71.5 mmBTUs of natural gas per year per residence. The utility decides to hedge about 70 percent of its residential customers' anticipated requirements for the following year, equivalent to a 5,000 contract long position in the NYMEX Henry Hub Natural Gas futures contract. To reduce the risk of higher prices to residential customers, Natural Gas Utility A establishes a 5,000 contract long position in the NYMEX Henry Hub Natural Gas futures contract. Since the utility is only hedging 70 percent of historical usage, Natural Gas Utility A is highly certain that realized demand will exceed its hedged anticipated residential customer requirements.

Analysis: Natural Gas Utility A's position meets the general requirements for a bona fide hedging position under paragraphs (2)(i)(A)–(C) and the provisions for hedges of unfilled anticipated requirements by a utility under paragraph (3)(iii)(B). The physical commodity that is being hedged involves a commodity underlying the NYMEX Henry Hub Natural Gas futures contract. The long position in the commodity derivative contract represents a substitute for transactions to be taken at a later time in the physical marketing channel. The position is economically appropriate to the reduction of price risk because the price of natural gas may increase. The commodity derivative contract position offsets the price risk of natural gas that the utility anticipates purchasing on behalf of its residential customers. As provided under paragraph (3)(iii), the risk-reducing position qualifies as a bona fide hedging position in the natural gas physical-delivery referenced contract during the spot month, provided that the position does not exceed the unfilled anticipated requirements for that month and for the next succeeding month.

[1] Participant A could also choose to hedge on a gross basis. In that event, Participant A could establish a short position in the March Chicago Board of Trade Corn futures contract equivalent to seven million bushels of corn to offset the price risk of its inventory and establish a long position in the May Chicago Board of Trade Corn futures contract equivalent to five million bushels of corn to offset the price risk of its fixed-price forward sale contracts.

5. Processor Margins Hedge Using Unfilled Anticipated Requirements Under Paragraph (3)(iii)(A) of the Bona Fide Hedging Position Definition and Anticipated Production Under Paragraph (4)(i) of the Definition

Fact Pattern: Soybean Processor A has a total throughput capacity of 200 million bushels of soybeans per year (equivalent to 40,000 CBOT soybean futures contracts). Soybean Processor A crushes soybeans into products (soybean oil and soybean meal). It currently has 40 million bushels of soybeans in storage and has offset that risk through fixed-price forward sales of the amount of products expected to be produced from crushing 40 million bushels of soybeans, thus locking in its processor margin on one million metric tons of soybeans. Because it has consistently operated its plants at full capacity over the last three years, it anticipates purchasing another 160 million bushels of soybeans to be delivered to its storage facility over the next year. It has not sold the 160 million bushels of anticipated production of crushed products forward. Processor A faces the risk that the difference in price relationships between soybeans and the crushed products (*i.e.,* the crush spread) could change adversely, resulting in reduced anticipated processing margins. To hedge its processing margins and lock in the crush spread, Processor A establishes a long position of 32,000 contracts in the CBOT Soybean futures contract (equivalent to 160 million bushels of soybeans) and corresponding short positions in CBOT Soybean Meal and Soybean Oil futures contracts, such that the total notional quantity of soybean meal and soybean meal futures contracts are equivalent to the expected production from crushing 160 million bushels of soybeans into soybean meal and soybean oil.

Analysis: These positions meet the general requirements for bona fide hedging positions under paragraphs (2)(i)(A)–(C) and the provisions for hedges of unfilled anticipated requirements under paragraph (3)(iii)(A) and unsold anticipated production under paragraph (4)(i). The physical commodities being hedged are commodities underlying the CBOT Soybean, Soybean Meal, and Soybean Oil futures contracts. Such positions are a substitute for purchases and sales to be made at a later time in the physical marketing channel and are economically appropriate to the reduction of risk. The positions in referenced contracts offset the potential change in the value of soybeans that the processor anticipates purchasing and the potential change in the value of products and by-products the processor anticipates producing and selling. The size of the permissible long hedge position in the soybean futures contract must be reduced by any inventories and fixed-price purchases because they would reduce the processor's *unfilled* requirements. Similarly, the size of the permissible short hedge positions in soybean meal and soybean oil futures contracts must be reduced by any fixed-price sales because they would reduce the processor's *unsold* anticipated production. As provided under paragraph (3)(iii)(A), the risk reducing long position in the soybean futures contract that is not in excess of the anticipated requirements for soybeans for that month and the next succeeding month qualifies as a bona fide hedging position during the last five days of trading in the physical-delivery referenced contract. As provided under paragraph (4)(i), the risk reducing short position in the soybean meal and oil futures contract do not qualify as a bona fide hedging position in a physical-delivery referenced contract during the last five days of trading in the event the Soybean Processor A does not have unsold products in inventory.

The combination of the long and short positions in soybean, soybean meal, and soybean oil futures contracts are economically appropriate to the reduction of risk. However, unlike in this example, an unpaired position (*e.g.,* only a long position in a commodity derivative contract) that is *not* offset by either a cash market position (*e.g.,* a fixed-price sales contract) or derivative position (*e.g.,* a short position in a commodity derivative contract) would not represent an economically appropriate reduction of risk. This is because the commercial enterprise's crush spread risk is relatively low in comparison to the price risk from taking an outright long position in the futures contract in the underlying commodity or an outright short position in the futures contracts in the products and by-products of processing. The price fluctuations of the crush spread, that is, the risk faced by the commercial enterprise, would not be expected to be substantially related to the price fluctuations of either an outright long or outright short futures position.

6. Agent Hedge Under Paragraph (3)(iv) of the Bona Fide Hedging Position Definition

Fact Pattern: Cotton Merchant A is in the business of merchandising (selling) cash cotton. Cotton Merchant A does not own any cash commodity, but has purchased the right to redeem a producer's cotton held as collateral by USDA (that is, ''cotton equities'') and, thereby, Cotton Merchant A has incurred price risk. A producer of cotton may borrow from the USDA's Commodity Credit Corporation, posting their cotton as collateral on the loan. USDA permits the producer to assign the right to redeem cotton held as collateral. Once Cotton Merchant A purchases from a producer the right to redeem cotton from USDA, Cotton Merchant A, in effect, is responsible for merchandising of the cash cotton held as collateral by USDA. For the volumes of cotton it is authorized to redeem from USDA, Cotton Merchant A enters into economically appropriate short positions in cotton commodity derivative contracts that offset the price risks of the cash commodities.

Analysis: The positions meet the requirements of paragraphs (2)(1)(A)–(C) for hedges of a physical commodity and paragraph (3)(iv) for hedges by an agent. The positions represent a substitute for transactions to be made in the physical marketing channel, are economically appropriate to the reduction of risks arising from cotton owned by the agent's contractual counterparties, and arise from the potential change in the value of such cotton. The agent does not own and has not contracted to purchase such cotton at a fixed price, but is responsible for merchandising the cash positions that are being offset in commodity derivative contracts. The agent has a contractual arrangement with the persons who own the cotton being offset.

7. Sovereign Hedge of a Pass-Through Swap Under Paragraph (2)(ii) of the Bona Fide Hedging Position Definition Opposite a Deemed Bona Fide Hedge of Unsold Anticipated Production Under Paragraph 4(i)

Fact Pattern: A Sovereign induces a farmer to sell his anticipated production of 100,000 bushels of corn forward to User A at a fixed price for delivery during the expected harvest, by, in effect, granting that farmer a cash-settled call option at no cost. In return for the farmer entering into the fixed-price forward sale at the prevailing market price, the Sovereign agrees to pay the farmer the difference between the market price at the time of harvest and the price of the fixed-price forward, in the event that the market price at the time of harvest is above the price of the forward. The fixed-price forward sale of 100,000 bushels of corn offsets the farmer's price risk associated with his anticipated agricultural production. The call option provides the farmer with upside price participation. The Sovereign faces commodity price risk from the option it granted at no cost to the farmer. To reduce that risk, the Sovereign establishes a long position of 20 call options on the Chicago Board of Trade (CBOT) Corn futures contract, equivalent to 100,000 bushels of corn.

Analysis: The farmer was induced by a long call option granted at no cost, in return for the farmer entering into a fixed-price forward sale at the prevailing market price.The risk profile of the combination of the forward sale and the long call is approximately equivalent to the risk profile of a synthetic long put.[2] A synthetic long put offsets the downside price risk of anticipated production. Under these circumstances of a Sovereign granting a call option to a farmer at no cost, the Commission deems the synthetic position of the farmer as satisfying the general requirements for a bona fide hedging position under paragraphs (2)(i)(A)–(C) and meeting the requirements for anticipated agricultural production under paragraph (4)(i), for purposes of the Sovereign's pass-through swap offset under paragraph (2)(ii). The agreement between the Sovereign and the farmer involves the production of a commodity underlying the CBOT Corn futures contract. Also under these circumstances, the Commission deems the synthetic long put as a substitute for transactions that the farmer has made in the physical marketing channel, because a long put would reduce the price risk associated with the farmer's anticipated agricultural production.

The Sovereign is the counterparty to the farmer, who under these circumstances the Commission deems to be a bona fide hedger for purposes of the Sovereign's pass-through swap offset. That is, the Commission considers the Sovereign's long call position to be a pass-through swap meeting the

[2] Put-call parity describes the mathematical relationship between price of a put and call with identical strike prices and expiry.

requirements of paragraph (2)(ii)(B). As provided under paragraph (2)(ii)(A), the Sovereign's risk-reducing position in the CBOT Corn option would qualify as a pass-through swap offset as a bona fide hedging position, or, alternatively, if the pass-through swap is not a referenced contract, then the pass-through swap offset may qualify as a cross-commodity hedge under paragraph (5), provided the fluctuations in value of the pass-through swap offset are substantially related to the fluctuations in value of the pass-through swap. Such a pass-through swap offset will not qualify as a bona fide hedging position in a physical-delivery futures contract during the last five days of trading under paragraphs (2)(iii)(B) or (5); however, since the CBOT Corn option will exercise into a physical-delivery CBOT Corn futures contract prior to the last five days of trading in that physical-delivery futures contract, the Sovereign may continue to hold its option position as a bona fide hedging position through option expiry.

8. Hedge of Offsetting Unfixed Price Sales and Purchases Under Paragraph (4)(ii) of the Bona Fide Hedging Position Definition

Fact Pattern: Currently it is October and Oil Merchandiser A has entered into cash forward contracts to purchase 600,000 of crude oil at a floating price that references the January contract month (in the next calendar year) for the ICE Futures Brent Crude futures contract and to sell 600,000 barrels of crude oil at a price that references the February contract month (in the next calendar year) for the NYMEX Light Sweet Crude Oil futures contract. Oil Merchandiser A is concerned about an adverse change in the price spread between the January ICE Futures Brent Crude futures contract and the February NYMEX Light Sweet Crude Oil futures contract. To reduce that risk, Oil Merchandiser A establishes a long position of 600 contracts in the January ICE Futures Brent Crude futures contract, price risk equivalent to buying 600,000 barrels of oil, and a short position of 600 contracts in the February NYMEX Light Sweet Crude Oil futures contract, price risk equivalent to selling 600,000 barrels of oil.

Analysis: Oil Merchandiser A's positions meet the general requirements for bona fide hedging positions under paragraphs (2)(i)(A)–(C) and the provisions for offsetting sales and purchases in referenced contracts under paragraph (4)(ii). The physical commodity that is being hedged involves a commodity underlying the NYMEX Light Sweet Crude Oil futures contract. The long and short positions in commodity derivative contracts represent substitutes for transactions to be taken at a later time in the physical marketing channel. The positions are economically appropriate to the reduction of risk because the price spread between the ICE Futures Brent Crude futures contract and the NYMEX Light Sweet Crude Oil futures contract could move adversely to Oil Merchandiser A's interests in the two cash forward contracts, that is, the price of the ICE Futures Brent Crude futures contract could increase relative to the price of the NYMEX Light Sweet Crude Oil futures contract. The positions in commodity derivative contracts offset the price risk in the cash forward contracts. As provided under paragraph (4), the risk-reducing position does not qualify as a bona fide hedging position in the crude oil physical-delivery referenced contract during the spot month.

9. Anticipated Royalties Hedge Under Paragraph (4)(iii) of the Bona Fide Hedging Position Definition and Pass-Through Swaps Hedge Under Paragraph (2)(ii) of the Definition

a. *Fact Pattern:* In order to develop an oil field, Company A approaches Bank B for financing. To facilitate the loan, Bank B first establishes an independent legal entity commonly known as a special purpose vehicle (SPV). Bank B then provides a loan to the SPV. The SPV is obligated to repay principal and interest to the Bank based on a fixed price for crude oil. The SPV in turn makes a production loan to Company A. The terms of the production loan require Company A to provide the SPV with volumetric production payments (VPPs) based on a specified share of the production to be sold at the prevailing price of crude oil (*i.e.,* the index price) as oil is produced. Because the price of crude oil may fall, the SPV reduces that risk by entering into a crude oil swap with Swap Dealer C. The swap requires the SPV to pay Swap Dealer C the floating price of crude oil (*i.e.,* the index price) and for Swap Dealer C to pay a fixed price to the SPV. The notional quantity for the swap is equal to the expected production underlying the VPPs to the SPV. The SPV will receive a floating price at index on the VPP and will pay a floating price at index on the swap, which will offset. The SPV will receive a fixed price payment on the swap and repay the loan's principal and interest to Bank B. The SPV is highly certain that the VPP production volume will occur, since the SPV's engineer has reviewed the forecasted production from Company A and required the VPP volume to be set with a cushion (*i.e.,* a hair-cut) below the forecasted production.

Analysis: For the SPV, the swap between Swap Dealer C and the SPV meets the general requirements for a bona fide hedging position under paragraphs (2)(i)(A)–(C) and the requirements for anticipated royalties under paragraph (4)(iii). The SPV will receive payments under the VPP royalty contract based on the unfixed price sale of anticipated production of the physical commodity underlying the royalty contract, *i.e.,* crude oil. The swap represents a substitute for the price of sales transactions to be made in the physical marketing channel. The SPV's swap position qualifies as a hedge because it is economically appropriate to the reduction of price risk. The swap reduces the price risk associated with a change in value of a royalty asset. The fluctuations in value of the SPV's anticipated royalties are substantially related to the fluctuations in value of the crude oil swap with Swap Dealer C.

b. *Continuation of Fact Pattern:* Swap Dealer C offsets the price risk associated with the swap to the SPV by establishing a short position in cash-settled crude oil futures contracts. The notional quantity of the short position in futures contracts held by Swap Dealer C exactly matches the notional quantity of the swap with the SPV.

Analysis: For the swap dealer, because the SPV enters the cash-settled swap as a bona fide hedger under paragraph (4)(iii) (*i.e.,* a pass-through swap counterparty), the offset of the risk of the swap in a futures contract by Swap Dealer C qualifies as a bona fide hedging position (*i.e.,* a pass-through swap offset) under paragraph (2)(ii)(A). Since the swap was executed opposite a pass-through swap counterparty and was offset, the swap itself also qualifies as a bona fide hedging position (*i.e.,* a pass-through swap) under paragraph (2)(ii)(B). If the cash-settled swap is not a referenced contract, then the pass-through swap offset may qualify as a cross-commodity hedge under paragraph (5), provided the fluctuations in value of the pass-through swap offset are substantially related to the fluctuations in value of the pass-through swap.

10. Anticipated Royalties Hedge Under Paragraph (4)(iii) of the Bona Fide Hedging Position Definition and Cross-Commodity Hedge Under Paragraph (5) of the Definition

Fact Pattern: An eligible contract participant (ECP) owns royalty interests in a portfolio of oil wells. Royalties are paid at the prevailing (floating) market price for the commodities produced and sold at major trading hubs, less transportation and gathering charges. The large portfolio and well-established production history for most of the oil wells provide a highly certain production stream for the next 24 months. The ECP also determined that changes in the cash market prices of 50 percent of the oil production underlying the portfolio of royalty interests historically have been closely correlated with changes in the calendar month average of daily settlement prices of the nearby NYMEX Light Sweet Crude Oil futures contract. The ECP decided to hedge some of the royalty price risk by entering into a cash-settled swap with a term of 24 months. Under terms of the swap, the ECP will receive a fixed payment and make monthly payments based on the calendar month average of daily settlement prices of the nearby NYMEX Light Sweet Crude Oil futures contract and notional amounts equal to 50 percent of the expected production volume of oil underlying the royalties.

Analysis: This position meets the requirements of paragraphs (2)(i)(A)–(C) for hedges of a physical commodity, paragraph (4)(iii) for hedges of anticipated royalties, and paragraph (5) for cross-commodity hedges. The long position in the commodity derivative contract represents a substitute for transactions to be taken at a later time in the physical marketing channel. The position is economically appropriate to the reduction of price risk because the price of oil may decrease. The commodity derivative contract position offsets the price risk of royalty payments, based on oil production, that the ECP anticipates receiving. The ECP is exposed to price risk arising from the anticipated production volume of oil attributable to her royalty interests. The physical commodity underlying the royalty portfolio that is being hedged involves a commodity with fluctuations in value that are substantially related to the fluctuations in value of the swap.

11. Hedges of Services Under Paragraph (4)(iv) of the Bona Fide Hedging Position Definition

a. *Fact Pattern:* Company A enters into a risk service agreement to drill an oil well with Company B. The risk service agreement provides that a portion of the revenue receipts to Company A depends on the value of the light sweet crude oil produced. Company A is exposed to the risk that the price of oil may fall, resulting in lower anticipated revenues from the risk service agreement. To reduce that risk, Company A establishes a short position in the New York Mercantile Exchange (NYMEX) Light Sweet Crude Oil futures contract, in a notional amount equivalent to the firm's anticipated share of the expected quantity of oil to be produced. Company A is highly certain of its anticipated share of the expected quantity of oil to be produced.

Analysis: Company A's hedge of a portion of its revenue stream from the risk service agreement meets the general requirements for bona fide hedging positions under paragraphs (2)(i)(A)–(C) and the provisions for services under paragraph (4)(iv). The contract for services involves the production of a commodity underlying the NYMEX Light Sweet Crude Oil futures contract. A short position in the NYMEX Light Sweet Crude Oil futures contract is a substitute for transactions to be taken at a later time in the physical marketing channel, with the value of the revenue receipts to Company A dependent on the price of the oil sales in the physical marketing channel. The short position in the futures contract held by Company A is economically appropriate to the reduction of risk, because the total notional quantity underlying the short position in the futures contract held by Company A is equivalent to its share of the expected quantity of future production under the risk service agreement. Because the price of oil may fall, the short position in the futures contract reduces price risk from a potential reduction in the payments to Company A under the service contract with Company B. Under paragraph (4)(iv), the risk-reducing position will not qualify as a bona fide hedging position during the spot month of the physical-delivery oil futures contract.

b. *Fact Pattern:* A City contracts with Firm A to provide waste management services. The contract requires that the trucks used to transport the solid waste use natural gas as a power source. According to the contract, the City will pay for the cost of the natural gas used to transport the solid waste by Firm A. In the event that natural gas prices rise, the City's waste transport expenses will increase. To mitigate this risk, the City establishes a long position in the NYMEX Henry Hub Natural Gas futures contract in an amount equivalent to the expected volume of natural gas to be used over the life of the service contract.

Analysis: This position meets the general requirements for bona fide hedging positions under paragraphs (2)(i)(A)–(C) and the provisions for services under paragraph (4)(iv). The contract for services involves the use of a commodity underlying the NYMEX Henry Hub Natural Gas futures contract. Because the City is responsible for paying the cash price for the natural gas used under the services contract, the long hedge is a substitute for transactions to be taken at a later time in the physical marketing channel. The position is economically appropriate to the reduction of price risk because the total notional quantity of the long position in a commodity derivative contract equals the expected volume of natural gas to be used over the life of the contract. The position in the commodity derivative contract reduces the price risk associated with an increase in anticipated costs that the City may incur under the services contract in the event that the price of natural gas increases. As provided under paragraph (4), the risk reducing position will not qualify as a bona fide hedge during the spot month of the physical-delivery futures contract.

12. Cross-Commodity Hedge Under Paragraph (5) of the Bona Fide Hedging Position Definition and Inventory Hedge Under Paragraph (3)(i) of the Definition

Fact Pattern: Copper Wire Fabricator A is concerned about possible reductions in the price of copper. Currently it is November and it owns inventory of 100 million pounds of copper and 50 million pounds of finished copper wire. Copper Wire Fabricator A expects to sell 150 million pounds of finished copper wire in February of the following year. To reduce its price risk, Copper Wire Fabricator A establishes a short position of 6,000 contracts in the February COMEX Copper futures contract, equivalent to selling 150 million pounds of copper. The fluctuations in value of copper wire are expected to be substantially related to fluctuations in value of copper.

Analysis: The Copper Wire Fabricator A's position meets the general requirements for a bona fide hedging position under paragraphs (2)(i)(A)–(C) and the provisions for owning a commodity under paragraph (3)(i) and for a cross-hedge of the finished copper wire under paragraph (5). The short position in a referenced contract represents a substitute for transactions to be taken at a later time in the physical marketing channel. The short position is economically appropriate to the reduction of price risk in the conduct and management of the commercial enterprise because the price of copper could drop. The short position in the referenced contract offsets the risk of a possible reduction in the value of the inventory that it owns. Since the finished copper wire is a product of copper that is not deliverable on the commodity derivative contract, 2,000 contracts of the short position are a cross-commodity hedge of the finished copper wire and 4,000 contracts of the short position are a hedge of the copper inventory.

13. Cross-Commodity Hedge Under Paragraph (5) of the Bona Fide Hedging Position Definition and Anticipated Requirements Hedge Under Paragraph (3)(iii)(A) of the Definition

Fact Pattern: Airline A anticipates using a predictable volume of jet fuel every month based on scheduled flights and decides to hedge 80 percent of that volume for each of the next 12 months. After a review of various commodity derivative contract hedging strategies, Airline A decides to cross hedge its anticipated jet fuel requirements in ultra-low sulfur diesel (ULSD) commodity derivative contracts. Airline A determined that price fluctuations in its average cost for jet fuel were substantially related to the price fluctuations of the calendar month average of the first nearby physical-delivery NYMEX New York Harbor ULSD Heating Oil (HO) futures contract and determined an appropriate hedge ratio, based on a regression analysis, of the HO futures contract to the quantity equivalent amount of its anticipated requirements. Airline A decided that it would use the HO futures contract to cross hedge part of its jet fuel price risk. In addition, Airline A decided to protect against jet fuel price increases by cross hedging another part of its anticipated jet fuel requirements with a long position in cash-settled calls in the NYMEX Heating Oil Average Price Option (AT) contract. The AT call option is settled based on the price of the HO futures contract. The sum of the notional amounts of the long position in AT call options and the long position in the HO futures contract will not exceed the quantity equivalent of 80 percent of Airline A's anticipated requirements for jet fuel.

Analysis: The positions meet the requirements of paragraphs (2)(i)(A)–(C) for hedges of a physical commodity, paragraph (3)(iii)(A) for unfilled anticipated requirements and paragraph (5) for cross-commodity hedges. The positions represent a substitute for transactions to be made in the physical marketing channel, are economically appropriate to the reduction of risks arising from anticipated requirements for jet fuel, and arise from the potential change in the value of such jet fuel. The aggregation notional amount of the airline's positions in the call option and the futures contract does not exceed the quantity equivalent of anticipated requirements for jet fuel. The value fluctuations in jet fuel are substantially related to the value fluctuations in the HO futures contract.

Airline A may hold its long position in the cash-settled AT call option contract as a cross hedge against jet fuel price risk without having to exit the contract during the spot month.

14. Position Aggregation Under § 150.4 and Inventory Hedge Under Paragraph (3)(i) of the Bona Fide Hedging Position Definition

Fact Pattern: Company A owns 100 percent of Company B. Company B buys and sells a variety of agricultural products, including wheat. Company B currently owns five million bushels of wheat. To reduce some of its price risk, Company B establishes a short position of 600 contracts in the CBOT Wheat futures contract, equivalent to three million bushels of wheat. After communicating with Company B, Company A establishes an additional short position of 400 CBOT Wheat futures contracts, equivalent to two million bushels of wheat.

Analysis: The aggregate short position in the wheat referenced contract held by Company A and Company B meets the general requirements for a bona fide hedging position under paragraphs (2)(i)(A)–(C) and the provisions for owning a cash commodity under paragraph (3)(i). Because Company A owns more than 10 percent of Company B, Company A and B are aggregated together as one person under § 150.4. Entities required to aggregate accounts or positions under § 150.4 are the same person for the purpose of determining whether a person is eligible for a bona fide hedging position exemption under § 150.3. The aggregate short position in the futures contract held by Company A and Company B represents a substitute for transactions to be taken at a later time in the physical marketing channel. The aggregate short position in the futures contract held by Company A and Company B is economically appropriate to the reduction of price risk because the aggregate short position in the CBOT Wheat futures contract held by Company A and Company B, equivalent to five million bushels of wheat, does not exceed the five million bushels of wheat that is owned by Company B. The price risk exposure for Company A and Company B results from a potential change in the value of that wheat.

Appendix D to Part 150—Initial Position Limit Levels

Contract	Spot-month	Single month and all months
Legacy Agricultural:		
Chicago Board of Trade Corn (C)	600	62,400
Chicago Board of Trade Oats (O)	600	5,000
Chicago Board of Trade Soybeans (S)	600	31,900
Chicago Board of Trade Soybean Meal (SM)	720	16,900
Chicago Board of Trade Soybean Oil (SO)	540	16,700
Chicago Board of Trade Wheat (W)	600	32,800
ICE Futures U.S. Cotton No. 2 (CT)	1,600	9,400
Chicago Board of Trade KC HRW Wheat (KW)	600	12,000
Minneapolis Grain Exchange Hard Red Spring Wheat (MWE)	1,000	12,000
Other Agricultural:		
Chicago Board of Trade Rough Rice (RR)	600	5,000
Chicago Mercantile Exchange Live Cattle (LC)	450	12,200
ICE Futures U.S. Cocoa (CC)	5,500	10,200
ICE Futures U.S. Coffee C (KC)	2,400	8,800
ICE Futures U.S. FCOJ–A (OJ)	2,800	5,000
ICE Futures U.S. Sugar No. 11 (SB)	23,300	38,400
ICE Futures U.S. Sugar No. 16 (SF)	7,000	7,000
Energy:		
New York Mercantile Exchange Henry Hub Natural Gas (NG)	2,000	200,900
New York Mercantile Exchange Light Sweet Crude Oil (CL)	10,400	148,800
New York Mercantile Exchange NY Harbor ULSD (HO)	2,900	21,300
New York Mercantile Exchange RBOB Gasoline (RB)	6,800	15,300
Metal:		
Commodity Exchange, Inc. Copper (HG)	1,000	7,800
Commodity Exchange, Inc. Gold (GC)	6,000	19,500

New York Mercantile Exchange Palladium (PA)	100	5,000
New York Mercantile Exchange Platinum (PL)	500	5,000

Appendix E To Part 150—Guidance Regarding Exchange-Set Speculative Position Limits

Guidance for Designated Contract Markets

(1) Until such time that a boards of trade has access to sufficient swap position information, a board of trade need not demonstrate compliance with Core Principle 5 with respect to swaps. A board of trade should have access to sufficient swap position information if, for example: (1) It had access to daily information about its market participants' open swap positions; or (2) it knows that its market participants regularly engage in large volumes of speculative trading activity, including through knowledge gained in surveillance of heavy trading activity, that would cause reasonable surveillance personnel at an exchange to inquire further about a market participant's intentions or total open swap positions.

(2) When a board of trade has access to sufficient swap position information, this guidance would no longer be applicable. At such time, a board of trade is required to file rules with the Commission to implement the relevant position limits and demonstrate compliance with Core Principle 5(A) and (B).

Guidance for Swap Execution Facilities

(1) Until such time that a swap execution facility that is a trading facility has access to sufficient swap position information, the swap execution facility need not demonstrate compliance with Core Principle 6(A) or (B). A swap execution facility should have access to sufficient swap position information if, for example: (1) It had access to daily information about its market participants' open swap positions; or (2) if it knows that its market participants regularly engage in large volumes of speculative trading activity, including through knowledge gained in surveillance of heavy trading activity, that would cause reasonable surveillance personnel at an exchange to inquire further about a market participant's intentions or total open swap positions.

(2) When a swap execution facility has access to sufficient swap position information, this guidance would no longer be applicable. At such time, a swap execution facility is required to file rules with the Commission to implement the relevant position limits and demonstrate compliance with Core Principle 6(A) and (B).

PART 151—[REMOVED AND RESERVED]

■ 29. Under the authority of section 8a(5) of the Commodity Exchange Act, 7 U.S.C. 12a(5), remove and reserve part 151.

Issued in Washington, DC, on December 5, 2016, by the Commission.

Christopher J. Kirkpatrick,

Secretary of the Commission.

Note: The following appendices will not appear in the Code of Federal Regulations.

Appendices to Position Limits for Derivatives—Commission Voting Summary, Chairman's Statement, and Commissioners' Statements

Appendix 1—Commission Voting Summary

On this matter, Chairman Massad and Commissioners Bowen and Giancarlo voted in the affirmative. No Commissioner voted in the negative.

Appendix 2—Statement of Chairman Timothy G. Massad

Today, the Commission is issuing a revised position limits proposal. We are also finalizing a separate but related rule on the aggregation of positions. I am pleased that today's actions are unanimous.

Congress directed us to implement a position limits rule to limit excessive speculation. While speculators play a necessary and important role in our markets, position limits can prevent the type of excessive speculation by a few large participants that leads to corners, squeezes and other activity that can distort markets and be unfair to other participants. Position limits can also promote convergence without compromising market liquidity. There are many issues to consider in this rule, but position limits are not a new or untested concept. They have been in place in our markets for decades, either through federal limits or exchange-set limits, and they have worked well.

There are two reasons why I am supporting issuing a reproposal. First, we have made many changes to the 2013 proposal we inherited that are reflected in today's reproposal. Certain aspects have been previously proposed in separate pieces, and I believe the public would benefit from seeing the proposal in its entirety, to better understand how the various changes work together.

Second, the Commission is now in a time of transition. I do not want to adopt a final rule today that the Commission would choose not to implement or defend next year. Our markets and the many end-users and consumers who rely on them are served best by having reasonable and predictable regulation. Uncertainty and inconsistency from one year to the next are not helpful.

Our staff has done a tremendous amount of work to devise a position limits rule that meets the requirements of the law and balances the various concerns at stake. This work has spanned several years, involved review of literally thousands of pages of comments from participants, and included many meetings and public roundtables.

Commissioners Bowen, Giancarlo, and I have also spent substantial time on this issue. We took office together in June 2014 and inherited a proposal that the Commission had issued six months before. As I promised then, we have been working hard to get the rule right. In addition to discussing the issues extensively with staff, we have each had many meetings with market participants and other members of the public. We have each traveled around the country and heard from users of these markets. In particular, I have heard from many smaller, traditional users about the importance of position limits. I have also had the benefit of sponsoring the Agricultural Advisory Committee, whose members have provided important input on these issues.

We have revised the proposed limits themselves in light of substantial work our staff has done to make sure they are based on the latest and best information as to estimated deliverable supply. We have considered a wide range of information, including the recommendations of the exchanges and other data to which the exchanges do not have access. For some contracts, the proposed limits for the spot month are higher than the exchange-set limits today. There have been, for example, substantial increases in estimates of deliverable supply in the energy sector. In other cases, we have accepted recommendations of the exchanges to set federal limits that are actually lower than 25 percent of deliverable supply, because we determined that the requested lower limit was consistent with the overall policy goals and would not compromise market liquidity.

We have proposed further adjustments to the bona fide hedging position definition, to eliminate certain requirements that we have decided are unnecessary, and to address other concerns raised by market participants.

Another substantial difference from the 2013 text is our proposal first made this summer to allow the exchanges to grant non-enumerated hedge exemptions. This process must be subject to our oversight as a matter of law and as a matter of policy, given the inherent tension in the roles of the exchanges as market overseers and beneficiaries of higher trading volumes.

The proposal we are issuing today provides extensive analysis of the impact of the proposed spot and all months limits, which I believe supports the view that the limits should not compromise liquidity while addressing excessive speculation. The analysis shows few existing positions would exceed the limits, and that is without considering possible exemptions.

I recognize there will still be those that are critical of the proposal. Some will complain simply because of the length of the proposal—even though most of that is not rule text, but rather the summaries of the extensive comments and analysis required by law. Others may suggest broadening the bona fide hedge exemption so that it encompasses practically any activity with a business purpose, which is not what Congress said in the law. Still others will argue position limits are not necessary. But while the Commission should consider all comments, it is important to remember that the Commission has a responsibility to implement a balanced rule that achieves the objectives Congress has established.

Finally, while the Commission works to finalize this rule, we still have federal limits for nine agricultural commodities and exchange-set spot month limits for all the physical delivery contracts covered by this rule, which the Commission will continue to enforce.

I want to thank the staff again for their extensive work on this rule, particularly our staff in the Division of Market Oversight, the Office of the Chief Economist and the Office of the General Counsel. Their expertise and dedication on this matter is truly exemplary. I also want to thank Commissioners Bowen and Giancarlo for their very constructive engagement on this issue.

Appendix 3—Statement of Commissioner Sharon Y. Bowen

With today's repreposal, the Commission moves one step closer to the implementation of position limits as directed by Congress in 2010. CFTC staff has worked laboriously with market users and the exchanges we regulate to craft a rule that will protect investors from disruptive practices and manipulation, while simultaneously allowing our markets to serve their critical price-discovery function. I commend staff on their hard work and thank the hundreds of commenters for their insightful feedback. I would also like to thank Chairman Massad and Commissioner Giancarlo on their commitment to this important rule and look forward to its finalization in the near future.

Appendix 4—Statement of Commissioner J. Christopher Giancarlo

Since taking my seat on the Commission, I have traveled to well over a dozen states where I met with many family farmers and toured numerous energy utilities and manufacturing facilities. I have heard the concerns of agriculture and energy producers and consumers about market speculation and the role of position limits.

I have always been open to supporting a well-conceived and practical position limits rule that restricts excessive speculation. That is so long as it protects the ability of America's farmers, ranchers and processors to hedge risks of agricultural commodities and the ability of America's energy producers and distributors to control risks of energy production, storage and distribution.

That is why I believe it is so important to carefully consider the impact of this very complex rule on America's almost nine thousand grain elevators,[1] two million family farms[2] and 147 million electric utility customers.[3] That is why I support putting out this rule as a proposal.

My concern regarding previous earlier proposals has been that they would restrict bona fide hedging activity or harm America's agriculture and energy industries that have been sorely impacted by plummeting commodity prices and service provider consolidation. I am simply not willing to support a poorly designed and unworkable rule that ever after needs to be adjusted through a series of no-action letters and ad hoc staff interpretations and advisories that had become too common at the CFTC in prior years.

While some may view position limits as the ''eternal rule,'' I disagree. The current proposal is very detailed and highly complex. It is over 700 pages in length and has over one thousand footnotes. In some areas, concerns expressed by market participants regarding the 2011 rule that was struck down by the court and the 2013 proposal have been well addressed. In other

[1] U.S. Grain Storage Data, National Grain and Feed Association Web site (last visited Dec. 5, 2016), *https://www.ngfa.org/news-policy-center/resources/grain-industry-data/*.

[2] News Release, Family Farms are the Focus of New Agriculture Census Data, U.S. Department of Agriculture, Mar. 17, 2015, *http://www.usda.gov/wps/portal/usda/usdamediafb?contentid=2015/03/0066.xml&printable=true*.

areas, they do not appear to have been as well addressed.

Notably, the proposal introduces a series of new estimates of deliverable supply that have not been previously presented to the public. It also incorporates concepts introduced in the 2016 supplemental proposal. Given these new additions and the complexity of the proposal, one more round of public comment is appropriate.

I feel comfortable that the proposal before us provides the basis for the implementation of a final position limits rule that I could support. I commend the staff responsible for this proposal for all their hard work in making the significant improvements that are before us. I also extend my gratitude to Chairman Massad and Commissioner Bowen for agreeing to put this proposal before the public for comment.

I welcome commenters' views on the proposal. I expect that with their added insight we can finalize a position limits rule in 2017 that is workable and does not undo years of standard practice in these markets.

BILLING CODE 6351–01–P

FEDERAL REGISTER

Vol. 81 Friday,

No. 251 December 30, 2016

Part IV

Department of Justice

Drug Enforcement Administration

21 CFR Parts 1300, 1301, 1302, et al.

Revision of Import and Export Requirements for Controlled Substances, Listed Chemicals, and Tableting and Encapsulating Machines, Including Changes To Implement the International Trade Data System (ITDS); Revision of Reporting Requirements for Domestic Transactions in Listed Chemicals and Tableting and Encapsulating Machines; and Technical Amendments; Final Rule

DEPARTMENT OF JUSTICE

Drug Enforcement Administration

21 CFR Parts 1300, 1301, 1302, 1303, 1304, 1308, 1309, 1310, 1312, 1313, 1314, 1315, 1316, and 1321

[Docket No. DEA–403]

RIN 1117–AB41

Revision of Import and Export Requirements for Controlled Substances, Listed Chemicals, and Tableting and Encapsulating Machines, Including Changes To Implement the International Trade Data System (ITDS); Revision of Reporting Requirements for Domestic Transactions in Listed Chemicals and Tableting and Encapsulating Machines; and Technical Amendments

AGENCY: Drug Enforcement Administration, Department of Justice.

ACTION: Final rule.

SUMMARY: The Drug Enforcement Administration is updating its regulations for the import and export of tableting and encapsulating machines, controlled substances, and listed chemicals, and its regulations relating to reports required for domestic transactions in listed chemicals, gamma-hydroxybutyric acid, and tableting and encapsulating machines. In accordance with Executive Order 13563, the Drug Enforcement Administration has reviewed its import and export regulations and reporting requirements for domestic transactions in listed chemicals (and gamma-hydroxybutyric acid) and tableting and encapsulating machines, and evaluated them for clarity, consistency, continued accuracy, and effectiveness. The amendments clarify certain policies and reflect current procedures and technological advancements. The amendments also allow for the implementation, as applicable to tableting and encapsulating machines, controlled substances, and listed chemicals, of the President's Executive Order 13659 on streamlining the export/import process and requiring the government-wide utilization of the International Trade Data System (ITDS). This rule additionally contains amendments that implement recent changes to the Controlled Substances Import and Export Act (CSIEA) for reexportation of controlled substances among members of the European Economic Area made by the Improving Regulatory Transparency for New Medical Therapies Act. The rule also includes additional substantive and technical and stylistic amendments.

DATES: This rule is effective January 30, 2017. However, compliance with the revisions to DEA regulations made by this rule is not required until June 28, 2017.

FOR FURTHER INFORMATION CONTACT: Michael J. Lewis, Diversion Control Division, Drug Enforcement Administration; Mailing Address: 8701 Morrissette Drive, Springfield, Virginia 22152; Telephone: (202) 598–6812.

SUPPLEMENTARY INFORMATION:

Outline

I. Background and Purpose

A. Legal Authority

The DEA implements and enforces titles II and III of the Comprehensive Drug Abuse Prevention and Control Act of 1970, as amended. 21 U.S.C. 801–971. Titles II and III are known as the ''Controlled Substances Act'' and the ''Controlled Substances Import and Export Act,'' respectively, and are collectively referred to as the ''Controlled Substances Act'' or ''CSA'' for the purpose of this action. The DEA publishes implementing regulations for these statutes in title 21 of the Code of Federal Regulations (21 CFR), chapter II. The CSA and its implementing regulations are designed to prevent, detect, and eliminate the diversion of controlled substances and listed chemicals into the illicit market while ensuring an adequate supply is available for the legitimate medical, scientific, research, and industrial needs of the United States. Controlled substances have the potential for abuse and dependence and are controlled to protect the public health and safety.

Under the CSA, each controlled substance is classified into one of five schedules based upon its potential for abuse, its currently accepted medical use in treatment in the United States, and the degree of dependence the substance may cause. 21 U.S.C. 812. The initial schedules of controlled substances established by Congress are found at 21 U.S.C. 812(c), and pursuant to 21 U.S.C. 812(a) and (b), the current list of all scheduled substances is published at 21 CFR part 1308. Controlled substances generally include narcotics, stimulants, depressants, and hallucinogens that have a potential for abuse and physical and psychological dependence, as well as anabolic steroids. Listed chemicals are separately classified based on their use and importance to the illicit manufacture of controlled substances (list I or list II chemicals). 21 U.S.C. 802(33)–(35).

Through the enactment of the CSA and its amendments, Congress has established a closed system of distribution making it unlawful to handle any controlled substance (manufacture, distribute, reverse distribute, dispense, conduct research, engage in narcotic treatment or maintenance, import, export, collect, conduct chemical analysis, dispose, or possess) or manufacture, distribute, import, or export any listed chemical except in a manner authorized by the CSA. See *e.g.,* Gonzales v. Raich, 545

U.S. 1, 12–13 (2005) (stating ''The main objectives of the CSA were to conquer drug abuse and to control the legitimate and illegitimate traffic in controlled substances. Congress was particularly concerned with the need to prevent the diversion of drugs from legitimate to illicit channels. To effectuate these goals, Congress devised a closed regulatory system making it unlawful to manufacture, distribute, dispense, or possess any controlled substance except in a manner authorized by the CSA. 21 U.S.C. 841(a)(1), 844(a); H.R. REP. NO. 91–1444, pt. 1 at 3 (1970) (stating: ''Title II: Control and Enforcement.—The bill provides for control by the Justice Department of problems related to drug abuse through registration of manufacturers, wholesalers, retailers, and all others in the legitimate distribution chain, and makes transactions outside the legitimate distribution chain illegal.'').

In order to maintain this closed system of distribution, the CSA requires handlers of controlled substances, unless exempt from registration, to be registered with the DEA at each principal place of business or professional practice where controlled substances are manufactured, distributed, or dispensed. 21 U.S.C. 822. The CSA also requires persons who manufacture or distribute, or who propose to manufacture or distribute, list I chemicals to be registered at each principal place of business or professional practice, unless exempt. 21 U.S.C. 822; 21 CFR 1309.22. A separate registration is also required for each principal place of business where controlled substances or list I chemicals are imported or exported, unless exempt from registration. 21 U.S.C. 958. A ''registrant'' is any person who is registered pursuant to either section 303 or section 1008 of the CSA (codified at 21 U.S.C. 823 or 958).[1] 21 CFR 1300.01(b). Registrants are permitted to possess controlled substances and list I chemicals as authorized by their registration and must comply with the applicable requirements associated with their registration. 21 U.S.C. 822 and 958.

In contrast, a ''regulated person'' means ''a person who manufactures, distributes, imports, or exports a listed chemical, a tableting machine, or an encapsulating machine or who acts as a broker or trader[2] for an international transaction[3] involving a listed chemical, a tableting machine, or an encapsulating machine.'' 21 U.S.C. 802(38). (Tableting machines and encapsulating machines are also commonly known as ''pill presses'' and ''capsule fillers'' respectively.) Regulated persons who engage in ''regulated transactions,'' defined at 21 U.S.C. 802(39),[4] are subject to specific recordkeeping and reporting requirements pursuant to 21 U.S.C. 830, 971; 21 CFR part 1310. In addition, a person located in the United States who is a broker or trader for an international transaction in a listed chemical that is a regulated transaction shall, with respect to that transaction, be subject to all of the notification, reporting, recordkeeping, and other requirements placed upon exporters of listed chemicals. 21 U.S.C. 971(e).

The CSA grants the Attorney General authority to promulgate rules and regulations relating to: The registration of controlled substance and list I chemical handlers; control of the manufacture, distribution, and dispensing of controlled substances; control of the manufacture and distribution of listed chemicals; maintenance and submission of records and reports; and for the efficient execution of her statutory functions. 21 U.S.C. 821–822, 825, 827–831, 871, 952, 954, 956, 958, 971. The Attorney General is further authorized by the CSA to promulgate rules and regulations relating to the registration and control of importers and exporters of controlled substances or listed chemicals. 21 U.S.C. 958(f). The Attorney General has delegated these authorities to the Administrator of the DEA, who in turn redelegated many of these authorities to the Deputy Administrator of the DEA and the Deputy Assistant Administrator of the DEA Office of Diversion Control.[5] 28 CFR 0.100 *et seq*.

Within the DEA, the Diversion Control Division is the strategic focus area that carries out the mandates of the CSA to ensure that adequate supplies of controlled substances and listed chemicals are available to meet legitimate domestic medical, scientific, industrial, and export needs. The Diversion Control Division carries out the mission of the DEA to prevent, detect, and eliminate the diversion of these substances into the illicit drug market. Activities in support of the Diversion Control Division and its mission include: Determination of program priorities; field management oversight; coordination of major investigations; drafting and promulgating regulations; the design and proposal of national legislation; advice and leadership on State legislation/regulatory initiatives; oversight of the importation and exportation of tableting and encapsulating machines, controlled substances, and listed chemicals; establishment of national drug production quotas; activities related to drug scheduling and compliance with international treaty obligations; the design and execution of diplomatic missions; computerized monitoring and tracking of the distribution of certain controlled substances; planning and allocation of program resources; and liaison efforts with industry and their representative associations as well as to the DEA's regulatory and law enforcement counterparts at the federal, State, tribal, and local levels.

B. Purpose of Regulatory Action

1. Executive Order 13659

Section 3 of the President's Executive Order 13659 of February 19, 2014, ''Streamlining the Export/Import Process for America's Businesses,'' directs participating agencies to have capabilities, agreements, and other requirements in place to allow electronic filing through the International Trade Data System (ITDS) and supporting systems of data and other relevant documents (exclusive of applications for permits, licenses, or certifications) required for imported and exported goods. Participating agencies are ''[a]ll federal agencies that require

[1] Unless otherwise noted, all references to registrant(s) in this preamble include persons exempt from DEA registration and persons not registered with the DEA as an importer or exporter who are authorized to perform importing or exporting activities as a coincident activity of their research or chemical analysis registration in accordance with 21 CFR 1301.13(e).

[2] A ''broker'' and ''trader'' are persons that assist in arranging an international transaction in a listed chemical by: negotiating contracts; serving as an agent or intermediary; or bringing together a buyer and seller, a buyer and transporter, or a seller and transporter. 21 U.S.C. 802(43).

[3] An ''international transaction'' is a transaction that involves ''the shipment of a listed chemical across an international border (other than a United States border) in which a broker or trader located in the United States participates.'' 21 U.S.C. 802(42).

[4] The CSA defines a ''regulated transaction'' as being: (1) With certain enumerated exceptions, ''a distribution, receipt, sale, importation, or exportation of, or an international transaction involving shipment of, a listed chemical, or if the Attorney General establishes a threshold amount for a specific listed chemical, a threshold amount, including a cumulative threshold amount for multiple transactions (as determined by the Attorney General, in consultation with the chemical industry and taking into consideration the quantities normally used for lawful purposes), of a listed chemical;'' and (2) ''a distribution, importation, or exportation of a tableting machine or encapsulating machine.'' 21 U.S.C. 802(39).

[5] Due to an internal reorganization, on September 19, 2016, the DEA Office of Diversion Control became the Diversion Control Division. Throughout the document any references referring to the Office of Diversion Control have been updated to reflect this change.

documentation for clearing or licensing the importation and exportation of cargo.'' Section 3 of Executive Order 13659 describes the ITDS as ''an electronic information exchange capability, or ''single window,'' through which businesses will transmit data required by participating agencies for the importation or exportation of cargo.'' Within the ITDS, businesses are able to transmit their import and export data using through an Electronic Data Interchange (EDI), an electronic communication framework providing standards for exchanging data via any electronic means. CBP has identified the Automated Commercial Environment (ACE), and any successor system to ACE, to serve as an authorized EDI for purposes of import and export data required by CBP and participating agencies.

In light of Executive Order 13659, the DEA is updating its regulations regarding the import and export of tableting and encapsulating machines, controlled substances, and listed chemicals. The amendments codify existing practices, incorporate existing procedures and technological advancements, and implement the President's Executive Order on streamlining the export/import process.

Previous DEA regulations specifically required applications for permits, declarations, and other required notices and reports to be filed in paper form, or by electronic means in some circumstances. To comply with Executive Order 13659, the DEA is amending its regulations to integrate DEA procedures related to the importation and exportation of tableting and encapsulating machines, controlled substances, and listed chemicals with the ITDS.

The ITDS excludes applications for permits, licenses, or certifications. In light of this, DEA registrants and regulated persons will continue to use the DEA application and filing process for permit applications that must be completed in advance of importation or exportation; however, the processes will be electronic rather than paper. As a result, DEA registrants or regulated persons applying for permits (DEA Forms 161, 161R, 161R–EEA, and 357) or filing notifications or reports with the DEA will apply or file directly with DEA electronically through the Diversion Control Division secure network application.

The DEA import/export declarations (DEA Forms 236, 486 and 486A), will also be replaced with an electronic process. Upon receipt of a complete declaration through the Diversion Control Division secure network application, DEA will provide the importer or exporter with the notice of receipt that must then be filed with CBP as part of the CBP import or export filing through ACE, or any successor system. DEA will also transmit the declaration information electronically to CBP so that customs officers can validate importations and exportations subject to DEA regulations.

Because of the requirement that regulated persons submit reports of regulated transactions in tableting machines and encapsulating machines to the DEA, the DEA is requiring such domestic regulated transaction reports to be submitted through the DEA Diversion Control Division secure network application, in addition to import and export regulated transactions. Mandatory reporting requirements for domestic regulated transactions are included as part of this rule because it allows for the DEA to create, at one time, an efficient, streamlined reporting structure of regulated activities applicable to tableting and encapsulating machines.

Additionally, this final rule contains amendments that implement section 4, Re-exportation Among Members of the European Economic Area, of the Improving Regulatory Transparency for New Medical Therapies Act, Public Law 114–89, which was signed into law on November 25, 2015. Section 4 amended section 1003 of the Controlled Substances Import and Export Act (21 U.S.C. 953) by making changes to paragraph (f) and adding paragraph (g) that allows for reexportation of controlled substances among members of the European Economic Area.

This rule also includes technical and stylistic changes to several regulations to clarify and simplify the language and to further the goals of the President's memorandum on Transparency and Open Government. 74 FR 4685, Jan. 26, 2009.

2. Pilot Program

The DEA published a general notice in the **Federal Register** announcing, in coordination with U.S. Customs and Border Protection (CBP), a pilot test of the ITDS involving the electronic submission of data related to the importation and exportation of controlled substances and listed chemicals.[6] The pilot program is testing the electronic transmission through CBP's ACE system, of data, forms and documents required by the DEA using the Partner Government Agency (PGA) Message Set and the Document Image System (DIS). The data, forms, and documents will be transmitted for review by the DEA. The PGA Message Set and DIS would enable importers, exporters, and brokers to electronically transmit data required by the DEA directly through ACE; this electronic process will replace certain paper-based processes that are used outside of the pilot program.

The test commenced on August 1, 2016, and will continue until publication of a notice in the **Federal Register**. Any party seeking to participate in the test was instructed to contact their CBP client representative.

The DEA anticipated that this pilot program would help prepare for a successful transition from the paper-based process to the electronic entry and transmission of data to ACE. As of October 25, 2016 there were 35 companies, representing 95 registration numbers, participating in the pilot program.

DEA and CBP have determined that the pilot program has successfully tested the functionality for electronic submission of data related to the importation and exportation of controlled substances and listed chemicals. As a result, the pilot program will be concluded as of the effective date of this final rule. At that time, all importers, exporters, and brokers will be able to use ACE to electronically file required data and documentation associated with the importation and exportation of controlled substances and listed chemicals.

3. Notice of Proposed Rulemaking

The DEA published a notice of proposed rulemaking (NPRM) in the **Federal Register** incorporating all the above changes on September 15, 2016.[7] The NPRM provided an opportunity for

[6] *Electronic Filing of Certain Import/Export Data Relating to Controlled Substances and Listed Chemicals: Announcement of the Partner Government Agency Message Set/Document Image System Test and Request for Participants,* July 15, 2016. 81 FR 46058–89. To be eligible to apply for and participate in the pilot, an applicant had to be a self-filing importer or broker, with the ability to file ACE Entry and Entry Summaries certified for cargo release using a software program that has completed ACE certification testing for the PGA Message Set and DIS, and, if an exporter, must have the ability to file electronically in the Automated Export System (AES) or in ACE AES Direct.

[7] *Revision of Import and Export Requirements for Controlled Substances, Listed Chemicals, and Tableting and Encapsulating Machines, Including Changes to Implement the International Trade Data System; Revision of Reporting Requirements for Domestic Transactions in Listed Chemicals and Tableting and Encapsulating Machines; and Technical Amendments,* September 15, 2016. 81 FR 63575. The DEA's Economic Impact Analysis (EIA), was made available in its entirety under ''Supporting Documents'' in the public docket of this action at *http://www.regulations.gov,* under FDMS Docket ID: DEA–2016–0017 (Docket No. DEA–403).

persons to submit written comments on the proposal on or before October 17, 2016. The DEA specifically solicited comments on the economic impact of the rule, and requested that commenters describe the specific nature of any impact on small entities and provide empirical data to illustrate the extent of such impact.

C. Summary of the Major Provisions of the Regulatory Action

The DEA is finalizing the rule as proposed except where otherwise stated in the paragraphs below.

Below are summaries of provisions contained in the final rule.

1. Mandatory Electronic Applications and Filings

The DEA is amending its regulations to authorize electronic submission of data, and make the procedure mandatory over paper in most circumstances. 21 U.S.C. 958(f). The use of electronic applications and filings is consistent not only with the requirements of Executive Order 13659, but also with the general principles outlined in the Government's Open Data Policy which requires agencies to collect or create information in a way that supports downstream information processing and dissemination. The Open Data Policy states that information should be collected electronically by default.

Executive Order 13659 directs participating agencies to have capabilities, agreements, and other requirements in place to allow electronic filing through ITDS and supporting systems of data and other relevant documents (exclusive of applications for permits, licenses, or certifications) required for imported and exported goods. Businesses are able to transmit their import and export data through using an EDI, an electronic communication framework providing standards for exchanging data via any electronic means. Data is transmitted through the EDI links to ACE, which serves as the single window for CBP.

Mandatory electronic applications and filings allow for the DEA to create an efficient, streamlined reporting structure of regulated activities.

2. Import and Export Permits for Controlled Substances

The DEA is amending its regulations regarding expiration dates associated with imports and exports of controlled substances. The DEA is changing the current expiration period of import and export permits found in §§ 1312.16 and 1312.25 from not more than six months to not more than 180 calendar days after the date of issuance. This change standardizes expiration procedures as not all months have the same number of days.

The DEA is revising §§ 1312.16 and 1312.25 to clearly specify how and under what conditions controlled substance import and export permits may be amended or cancelled after issuance and when a new permit is required instead of an amendment. Registrants will submit a request to amend or cancel an application for an import or export permit, amend an issued import or export permit, or request cancelation of an issued import or export permit to the Administration through the DEA Diversion Control Division secure network application.

Consistent with current practice, importers and exporters will continue to be able to request an amendment to a permit for the following data fields: The National Drug Control number, description of the packaging, or trade name of the product, so long as the description is for the same basic class of controlled substance(s) as in the original permit; the proposed port of entry or export; the proposed date of import or export; the method of transport; any registrant notes; and the justification entered by the importer or exporter for why an import or export is needed to meet the medical, scientific, or other legitimate needs of the United States or foreign jurisdiction. The DEA allows amendments to these fields as these are areas that may be easily mis-keyed or subject to change as part of the normal import and export business practice.

Consistent with current practice, importers and exporters will continue to generally be allowed to amend the base weight of controlled substance(s) listed on their permit prior to the start of an import or export transaction (*i.e.,* prior to shipment). However, also consistent with current practice, exporters will not be allowed to exceed the total base weight of controlled substance(s) listed on the corresponding foreign permit. Neither will exporters be allowed to exceed the strength of a controlled substance product if product strength information has been included on the import permit issued by the foreign competent national authority. Under § 1312.15(a), importers will continue to be allowed to request an amendment to the quantity of controlled substances specified on an import permit once a shipment has arrived at the U.S. customs port of entry if the increase in the amount of controlled substance to be imported is less than 1% of that listed on the issued import permit. Importers and exporters need not request an amendment for the sole purpose of decreasing the amount authorized.

Consistent with current practice, importers and exporters would continue to be able to request that an import or export permit be amended to remove a controlled substance.

However, importers and exporters may not amend permits to add or replace a controlled substance/Administration controlled substance code number to the item(s) to be imported or exported. Importers and exporters who desire to import or export a different controlled substance than that contained on their issued permit or permit application must submit a request for the permit or permit application to be canceled and request a new permit.

The DEA understands that sometimes the incorrect controlled substance is identified on the permit application due to clerical error, for example because a similar item was selected from the drop-down selection in the DEA Diversion Control Division secure network application that was located near the correct item. However, the DEA has closely considered this issue and ultimately determined that because the listed controlled substance proposed to be imported or exported is such a critical element of determining whether or not a permit should be issued and, if issued, the amount allowed to be imported or exported, this element should not be amendable. As stated elsewhere in this preamble, the DEA reminds importers and exporters that the duty to file reports and other documents with the DEA includes the duty that these filings be complete and accurate.

Similarly, in a change from current practice, the DEA is not allowing exporters to amend foreign permit information on permit applications and issued permits.

The DEA understands that sometimes, especially in the case of less experienced exporters, the incorrect foreign permit number is entered onto the permit application. This is often the result of numbers being transposed or a different number on the foreign permit being entered instead of the actual permit identification number. However, similar to the controlled substance identified on the permit, the DEA has closely considered this matter and ultimately determined that, because the authorization from the foreign competent national authority is such a critical element in determining whether a permit can be issued and the amount of the controlled substance to be exported, this element should not be amendable. As stated above and elsewhere in this document, the DEA reminds importers and exporters that the duty to file reports and other documents with the DEA includes the duty that these filings be complete and accurate.

Consistent with current practice, importers and exporters will not be able to request an amendment to a permit for changes to the importer or exporter's name (as it appears on their DEA certificate of registration) or the name of the foreign importer or exporter. The DEA considers the name of the foreign importer or exporter to be a key factor in determining associated risks of the diversion of controlled substances and subsequently whether or not to issue an import or export permit. Therefore, these fields are not amendable.

However, also consistent with current practice, as stated above, the DEA will continue to allow importers and exporters to amend any additional associated company names they are DBA (doing business as) that they wish to have included in the notes section of the permit. The only change from current practice is that such amendments would be required to be made through the DEA Diversion Control Division secure network application.

Importers and exporters will be required to make an official request through the DEA Diversion Control Division secure network application for an amendment. Supplementary information submitted by an importer or exporter through the DEA Diversion Control Division secure network application will not automatically trigger the amendment process. An amendment will have no effect on the date of expiration of the permit; an amended import or export permit will have the same expiration date as the originally issued permit. Importers and exporters will be able to request that an issued import or export permit be canceled provided that no shipment has yet been made.

Under revised § 1312.16(a)(5), registrants and regulated persons will be required to submit all requests for an amendment that would affect the total base weight of each controlled substance, other than those submitted in accordance with § 1312.15(a), at least three business days in advance of the date of release by a customs officer. Three business days are the minimum amount of time that the DEA needs to review this type of requested amendment, approve or deny the request, and transmit the applicable data to the ITDS. All other requests for amendment will be required to be submitted to the DEA at least one business day before the date of release by a customs officer at the port of entry. One business day is the minimum amount of time that the DEA needs to review the requested amendment, approve or deny the request, and transmit the applicable data to the ITDS.

DEA registrants have been able to submit DEA forms electronically for several years, and are familiar with the DEA Diversion Control Division secure network application system. If a DEA registrant needs to change information on an application for a permit that is not amendable, they must submit a new application for a permit. The registrant will follow the same process used with the original submission and submit the forms electronically. The DEA will review the submission, process the document and issue a Transaction Identification Number (TIN). The estimated time to complete the online document is minimal. Requiring the new submission will ensure the integrity of the information in the DEA system as well as what is transmitted to CBP.

To make an allowable amendment, a DEA registrant will access the DEA secure network application and provide the Transaction Identification Number which was assigned with the original submission. The system will provide access to the registrant's application for a permit, and the registrant can then make the appropriate changes. The DEA will review the changes and process the document. To ensure that there is no delay in CBP releasing a product from being imported or exported, the DEA provides the amended documents or new submissions to CBP in its daily feed.

As a result of the ITDS/ACE system relying on the Harmonized Tariff System (HTS) used by CBP to properly release products for import or export, the DEA had to identify the proper HTS codes for the substances under its control. The HTS codes are utilized in ACE and directly correlate to Administration Controlled Substance Code Number. As a result, the DEA will not allow a registrant to amend an application by adding a controlled substance that has a different Administration Controlled Substance Code Number. This will ensure a more streamlined process and will allow CBP to efficiently release product in a timely manner.

Countries that are parties to international drug control treaties have an established competent national authority (CNA) (identified in the United Nations Office on Drugs and Crime publication ''Competent National Authorities Under the International Drug Control Treaties'') that oversees the handling of controlled substances and listed chemicals to include the approval of imports and exports. All CNAs make certain reports to the International Narcotics Control Board (INCB) on the distribution of the substances being imported and exported. The DEA communicates directly with CNAs or through the INCB if issues arise regarding official authorization documents submitted to the DEA by DEA registrants.

For the reasons discussed above, the DEA is also requiring electronic reporting of return information for controlled substances imported or exported under permit procedures.

3. Import and Export Declarations for Controlled Substances

The DEA is also amending §§ 1312.18 and 1312.27 to specify an expiration date for import and export declarations for controlled substances.

Such declarations did not have an expiration date assigned to them; however, permits to import and export controlled substances expire not more than six months after approved under the previous regulation. 21 CFR 1312.16 and 1312.25. Similar to permits, declarations filed with the DEA are sometimes never actually utilized. The DEA is concerned that absence of an expiration date for these declarations may lead to incomplete or inaccurate records in the ITDS. Therefore, declarations expire 180 calendar days after the date the declaration is deemed filed with the Administration.

The DEA is incorporating the mandatory electronic filing of DEA import declarations and DEA export declarations for controlled substances with the DEA into §§ 1312.18 and 1312.27. This requirement is also incorportated into a new § 1312.03 which references a list of applicable forms for part 1312, and will state the declaration forms are electronic. This information is listed multiple in the applicable regulations.

Consistent with current requirements, controlled substance declarations will be required to be filed at least 15 calendar days in advance of the anticipated date of release by a customs officer at the port of entry or port of export. 21 CFR 1312.18(b), 1312.27(a). The DEA is retaining this 15-day-advance filing time period to ensure enough time for the DEA to review the submission for completeness and conduct any necessary follow-up prior to the import/export transaction. Under revised §§ 1312.18(b) and 1312.27(a), controlled substance declarations are not deemed filed until the

Administration issues a transaction identification number. However, the DEA is allowing registrants and regulated persons to proceed with the import or export transaction as soon as the transaction identification number has been issued, regardless of whether 15 calendar days have elapsed since its issuance. Finally, DEA regulations requiring declarations to be completed in triplicate would be eliminated.

The DEA is amending its import/export regulations to describe the procedures relating to amendments following the filing of a controlled substance import or export declaration with implementation of the ITDS. The DEA is changing §§ 1312.18(f) and 1312.27(e) to clearly specify how and under what conditions controlled substance import and export declarations may be amended or cancelled after having been filed and when a new declaration is required instead of an amendment. Registrants and regulated persons will submit a request to amend or cancel a filed declaration to the Administration through the DEA Diversion Control Division secure network application.

Consistent with current practice, importers and exporters will continue to be able to amend a declaration for the following data fields: The National Drug Control number, description of the packaging, or trade name of the product, so long as the description is for the same basic class of controlled substance(s) as in the original declaration; the proposed port of entry or export; the anticipated date of release by a customs officer at the port of entry or port of export; the method of transport; any registrant notes; and the justification entered by the importer or exporter for why an import or export is needed to meet the legitimate scientific or medical needs of the United States or foreign jurisdiction. The DEA allows amendments to these fields as these are areas that may be easily mis-keyed or subject to change as part of the normal import and export business practice.

Importers and exporters will continue to generally be allowed to amend the base weight of controlled substance(s) listed on their filed declaration prior to the start of an import or export transaction (*i.e.,* prior to shipment). However, exporters would not be allowed to exceed the total base weight of controlled substance(s) listed on the corresponding authorization for import issued by the foreign competent national authority. Neither would exporters be allowed to exceed the strength of a controlled substance product if product strength information has been included on the authorization for import issued by the foreign competent national authority. Consistent with § 1312.15(a) for imports of controlled substances under permit procedure, importers under declaration procedures will be allowed to request an amendment to an import declaration regarding the quantity of controlled substances once a shipment has arrived at the U.S. customs port of entry if the increase in the amount of controlled substance to be imported is less than 1% of that listed on the filed declaration. Importers and exporters need not request an amendment for the sole purpose of decreasing the amount authorized.

Importers and exporters will continue to be able to amend a filed import or export declaration to remove a controlled substance. However, importers and exporters will no longer be able to amend declarations to add a new controlled substance or replace a controlled substance with another controlled substance. Instead, importers and exporters who need to make changes to any of these fields will need to cancel the existing declaration and file a new declaration.

The DEA understands that sometimes the incorrect controlled substance is identified on the declaration due to clerical error, for example because a similar item was selected from the drop-down selection in the DEA Office of Diversion Control secure network application that was located near the correct item. However, the DEA has closely considered this issue and ultimately determined that because the identification of the controlled substance proposed to be imported or exported is such a critical element of the closed system of distribution, that this element should not be amendable. As stated elsewhere in this preamble, the DEA reminds importers and exporters that the duty to file reports and other documents with the DEA includes the duty that these filings be complete and accurate.

The DEA is not allowing importers and exporters to amend information related to the authorization to import or export from the foreign competent national authority. The DEA understands that sometimes, especially in the case of less experienced importers and exporters, the incorrect foreign authorization identifier is entered onto the declaration. This is often the result of numbers being transposed or a different number on the foreign permit being entered instead of the actual authorization identifier. However, similar to the identification of the controlled substance to be imported or exported, the DEA has closely considered this matter and ultimately determined that because the authorization from the foreign competent national authority to import or export a controlled substance is such a critical element to the Administration's ability to monitor and ensure the closed system of distribution, this element should not be amendable. As stated above and elsewhere in this document, the DEA reminds importers and exporters that the duty to file reports and other documents with the DEA includes the duty that these filings be complete and accurate.

Importers and exporters will not be able to request an amendment to a filed import or export declaration for changes to the importer or exporter's name (as it appears on their DEA certificate of registration) or the name of the foreign importer or exporter. The DEA considers the name of the foreign importer or exporter to be a key factor in determining associated risks of the diversion of controlled substances. Therefore, these fields would not be amendable.

The DEA will continue to allow importers and exporters to amend any additional associated company names they are DBA (doing business as) that they wish to have included in the notes section of the declaration; such amendments would be required to be made through the DEA Diversion Control Division secure network application.

Importers and exporters will be required to make an official request through the DEA Diversion Control Division secure network application for an amendment. Supplementary information submitted by an importer or exporter through the DEA Diversion Control Division secure network application will not automatically trigger the amendment process. An amendment will have no effect on the date of expiration of the declaration; an amended import or export declaration will have the same expiration date as the originally filed declaration.

Importers and exporters will be able to request that filed import or export declarations be canceled provided that no shipment has yet been made.

Registrants will be required to submit all requests for an amendment that will affect the total base weight of each controlled substance, other than those allowed to be released into the United States pursuant to §§ 1312.18(f) and 1312.16(a)(5), at least three business days in advance of the date of release by CBP. Three business days are the minimum amount of time that the DEA needs to review this type of requested amendment and transmit the applicable data to the ITDS. All other requests for amendment will be required to be submitted to the DEA at least one business day before the anticipated date of release by a customs CBP officer at the port of entry or port of export. One business day is the minimum amount of time that the DEA needs to review and accept the requested amendment and transmit the applicable data to the ITDS.

DEA registrants have been able to submit DEA forms electronically for several years, and are familiar with the DEA Diversion Control Division secure network application system. If a DEA registrant needs to change information on a declaration that is not amendable, they must submit a new declaration. 21 CFR 1312.12, 1312.18, 1312.22, and 1312.27. The registrant will follow the same process used with the original submission and submit the forms electronically. The DEA will review the submission, process the document and issue a Transaction Identification Number (TIN). The estimated time to complete the online document is minimal. Requiring the new submission will ensure the integrity of the information in the DEA system as well as what is transmitted to CBP.

To make an allowable amendment, a DEA registrant will access the DEA Secure Network Application and provide the Transaction Identification Number which was assigned with the original submission. The system will provide access to the registrant's declaration, and the registrant can then make the appropriate changes. The DEA will review the changes and process the document. To ensure that there is no delay in CBP releasing a product from being imported or exported, the DEA provides the amended documents or new submissions to CBP in its daily feed.

As a result of the ITDS/ACE system relying on the Harmonized Tariff System (HTS) used by CBP to properly release products for import or export, the DEA had to identify the proper HTS codes for the substances under its control. The HTS codes are utilized in ACE and directly correlate to Administration Controlled Substance Code Number. As a result, the DEA will not allow a registrant to amend a declaration by adding a controlled substance that has a different Administration Controlled Substance Code Number. This will ensure a more streamlined process and will allow CBP to efficiently release product in a timely manner.

As stated previously all countries that are parties to international drug control treaties have an established CNA that oversees the handling of controlled substances and listed chemicals to include the approval of imports and exports. All CNAs make certain reports to the INCB on the distribution of the substances being imported and exported. The DEA communicates directly with CNAs or through the INCB if issues arise regarding official authorization documents submitted to the DEA by DEA registrants.

For the reasons stated above, the DEA is also requiring mandatory electronic filing of return information for controlled substances imported or exported under declaration procedures.

4. Imports, Exports, and International Transactions for Listed Chemicals

The DEA is amending part 1313 to provide that each regulated person who seeks to import or export a listed chemical that meets or exceeds a threshold quantity, must notify/provide a declaration to the DEA (by filing a DEA Form 486/486A through the DEA Diversion Control Division secure network application) of the intended import or export not later than 15 calendar days before the date of release by a customs officer at the port of entry. Regarding imports and exports for those entities with regular customer and regular importer status, the notification must be filed at least three business days before the date of release by a customs officer at the port of entry. All declarations must be signed and dated by the importer or exporter and must contain the address of the final destination for the shipment.

The DEA is specifying that all listed chemical declarations expire in 180 calendar days, consistent with the controlled substance import/export permits. If release by a customs officer will occur more than 180 calendar days after the declaration is deemed filed, the declarant must submit a new declaration for the transaction.

In § 1313.32 the DEA is incorporating the mandatory electronic filing of notifications of international transactions involving listed chemicals which meet or exceed the threshold amount identified in § 1310.04. The broker or trader must notify the DEA (by filing a DEA Form 486 through the DEA Diversion Control Division secure network application) of the intended international transaction not later than 15 calendar days before the transaction is to take place. The DEA is amending § 1313.32 to require that notifications of international transactions would not be deemed filed until a transaction identification number has been issued by the DEA. This change is designed to ensure that electronically submitted notifications are received by the DEA, are completed, and can be appropriately tracked and monitored; to streamline the notification filing process; and eliminate duplicate filings.

5. Reexportation of Controlled Substances Among Members of the European Economic Area

This final rule implements section 4, Re-exportation Among Members of the European Economic Area, of the Improving Regulatory Transparency for New Medical Therapies Act, Public Law 114–89 (hereinafter ''the 2015 Act''), which was signed into law on November 25, 2015. Section 4 of the 2015 Act amended section 1003 of the Controlled Substances Import and Export Act (CSIEA) (21 U.S.C. 953) by making changes to paragraph (f) and adding paragraph (g), changes that allow for expanded reexportation of certain controlled substances among members of the European Economic Area (EEA). Prior to passage of the 2015 Act, the CSIEA (21 U.S.C. 953(f)) provided, with respect to controlled substances in schedule I or II and narcotic drugs in schedule III or IV, that such substances could be exported from the United States for subsequent reexport from the recipient country (the ''first country'') to another country (the ''second country'')—but with no further reexports from the second country. The 2015 Act removed this latter limitation, provided that every country involved is an EEA country, and provided that the conditions specified in the 2015 Act are met.

In order to effectuate the changes contained in the 2015 Act, the final rule implements the following changes:

- Allowing unlimited reexports among EEA countries.
- Eliminating the 180 day time period to complete reexport (reexport from first country to the second country (ies)).
- No longer requiring bulk substances to undergo further manufacturing processes within the first EEA country if the substance is to be reexported within the EEA.
- No longer requiring that the exporter must provide product and consignee information beyond the first country in advance of (prior to) export from the United States.
- Establishing a new Form 161R–EEA for the reporting of reexports among members of the EEA. (The form is accessed, completed, and submitted through the DEA Diversion Control Division secure network application.)

All other requirements that existed prior to the enactment of the 2015 Act (and which were not modified by Congress in 2015 Act) remain. Additionally, persons who export controlled substances for reexport among members of the EEA are required by the law to provide return information to the Attorney General within 30 days after each reexportation, including certification that the reexportation has occurred and ''information concerning the consignee, country, and product.'' 21 U.S.C. 953(f)(6)(B). Finally, while the new law did not have a direct impact on reexports for nonnarcotic controlled substances in schedules III and IV or controlled substances in schedule V, for the purpose of consistency, the DEA is making corresponding changes to its reexport of controlled substances under declaration procedures found in § 1312.27.

6. Domestic Transaction and Import and Export Reports for Tableting and Encapsulating Machines

The DEA is mandating electronic reporting requirements in § 1310.05 for all regulated transactions involving tableting machines and encapsulating machines, including domestic, import, and export transactions. To standardize and streamline the electronic filing of these reports, the DEA is implementing usage of a new form, DEA Form 452, Reports for Regulated Machines, which covers imports, exports, and domestic regulated transactions of tableting and encapsulating machines. The new form will be accessed, completed, and submitted by regulated persons entirely though the DEA Diversion Control Division secure network application. Upon receipt and review, the Administration will assign each completed report a transaction identification number. The DEA Form 452 will not be deemed filed until the Administration issues a transaction identification number. This change is designed to ensure that electronically submitted reports are indeed received by the DEA, are completed, and can be appropriately tracked and monitored; to streamline the report filing process; and to eliminate duplicate filings.

The DEA Form 452 is used for both domestic transactions and import/export transactions of tableting and encapsulating machines, and the reporting requirements implemented by this final rule differ.

Domestic Transactions: Previously in 21 CFR 1310.05(a)(4) and (b), regulated persons who engaged in a domestic regulated transaction in a tableting or encapsulating machine are required, whenever possible, to make an oral report to the DEA Divisional Office in advance of the transaction, followed by a written report. The new § 1310.05(b)(2) in the final rule, makes the oral reporting mandatory and mandates the electronic filing of the written report. Additionally, the new § 1310.05(b)(2) requires regulated persons to orally report domestic regulated transactions in a tableting machine or an encapsulating machine when an order is placed rather than at the earliest practicable opportunity after the regulated person becomes aware of the circumstances involved. The written report (DEA Form 452) is required to be filed within 15 calendar days after the order has been shipped by the seller.

Import/Export Transactions: The DEA is requiring that the DEA Form 452 be submitted to the DEA through the DEA Diversion Control Division secure network application 15 calendar days before the anticipated date of arrival at the port of entry or port of export. Under this final rule, an importer or exporter may not initiate an import or export transaction involving a tableting machine or encapsulating machine until the regulated person has been issued a transaction identification number from the Administration. The importer or exporter may proceed with the import or export of the machine(s) as soon as the transaction identification number has been issued. These changes are in § 1310.05(c). Additionally, the DEA revised § 1310.06(e)(1)(v) so that reports of importation of tableting or encapsulating machines include the reason for the importation, *i.e.,* medical, commercial, scientific, or other legitimate use of the machine.

The DEA also added paragraph (c)(2) to § 1310.05 to require import shipments of tableting machines or encapsulating machines that have been denied release by customs to be reported to the Administration, through the DEA Diversion Control Division secure network application, within 5 business days of denial. If an importer subsequently receives notice from a customs officer that their shipment will be released into the United States, the importer is required to file an amended DEA Form 452 with the DEA before the shipment may be released. In such circumstances, the regulated person may seek to have the tableting machines or encapsulating machines released by customs upon receipt of a transaction identification number for the refiled and amended DEA Form 452 without regard to the 15-day advance filing requirement.

The DEA is requiring electronic filing of return information, specifying the particulars of the transaction, for tableting and encapsulating machines imported or exported within 30 calendar days after actual receipt of a tableting or encapsulating machine, or within 10 calendar days after receipt of a written request by the Administration to the importer, whichever is sooner. Return information requirements are incorporated into a new paragraph (h) in § 1310.06 and requires the filing of the report with the Administration (on DEA Form 452) utilizing the DEA Diversion Control Division secure network application.

7. Mail Order Reporting for Ephedrine, Pseudoephedrine, Phenylpropanolamine, and Gamma-Hydroxybutyric Acid

The DEA is incorporating mandatory electronic reporting requirements into part 1310 for monthly reports of mail-order transactions involving ephedrine, pseudoephedrine, phenylpropanolamine, and gamma-hydroxybutyric acid (including drug products containing these chemicals or controlled substance) required to be filed in accordance with § 1310.03(c) pursuant to 21 U.S.C. 830(b)(3). To standardize and streamline the electronic filing requirements of these monthly mail-order reports, the DEA is implementing usage of a new form, DEA Form 453. The new form will be accessed, completed, and submitted by regulated persons entirely through the DEA Diversion Control Division secure network application. 21 CFR 1310.03(c) is further revised to reflect that reports would not be deemed filed until the Administration issues a transaction identification number unless they are complete upon submission. This change is designed to ensure that electronically submitted reports are indeed received by the DEA, are complete, and can be appropriately tracked and monitored; to streamline the report filing process; and to eliminate potential duplicate filings. The previous § 1310.06(i), redesignated in this final rule as § 1310.06(k), is revised to reflect that the monthly mail-order information is required to be submitted to the DEA on Form 453. 21 CFR 1310.03(c) is further revised by separately listing the requirement for monthly reports to be submitted by regulated persons who engage in the specified domestic mail-order transactions and export transactions. This revision also more plainly lays out the requirement that the regulated person must be engaged in a transaction with one of the specified chemicals or controlled substance and use or attempt to use the U.S. Postal Service or any private or commercial carrier for both activities in order to be required to file the monthly report. This revision is not intended to impose any different requirements than the current regulation, but only to ease understanding of the reporting requirements. 21 CFR 1310.05(e) would correspondingly be amended to reflect the implementation of the mandatory electronic filing requirement.

The DEA is also technically amending § 1310.05(d) to revise the mailing information in the second sentence and to replace the term ''shall'' in three locations without changing the requirements.

8. Transshipments of Controlled Substances

Applications for transshipment permits are still allowed to be submitted to the DEA via paper in accordance with the existing procedures under § 1312.31 for schedule I controlled substances. Information will be posted to the DEA Diversion Control Division Web site informing persons seeking to transship schedule I controlled substances on how to submit an application for a transshipment permit. Advance notification of transshipments for schedule II, III, and IV controlled substances would also still be allowed to be submitted to the DEA via paper in accordance with the current § 1312.32. The electronic application and filing process is not feasible in such circumstances because foreign IP addresses are blocked by the Department of Justice's firewall and are prevented from accessing the DEA Diversion Control Division secure network application. Although the transshippers themselves would not have direct access to the instructions on the DEA Web site due to the firewall protection, it is the DEA's understanding that most transshippers have someone in the United States as a domestic presence facilitating the transaction who will be able to access the instructions. There is no change from the current operational system. The DEA is explicitly stating in §§ 1312.31 and 1312.32 that a separate filing is required for each shipment, conforming the requirements of this section with the requirements for imports and exports of controlled substances in part 1312.

9. Transshipment of Listed Chemicals

Advance notification is still allowed to be submitted to the DEA via paper in accordance with the existing procedures under § 1313.31 for persons seeking to import a listed chemical that meets or exceeds the threshold reporting requirements into the United States for transshipment. Advance notification is also still allowed to be submitted to the DEA via paper in accordance with the existing procedures under § 1313.31 for persons seeking to transfer, or transship listed chemicals within the United States for immediate exportation. The electronic application and filing process is not feasible in such circumstances because foreign IP addresses are blocked by the Department of Justice's firewall and are prevented from accessing the secure network application on the DEA Diversion Control Division Web site. While a broker or trader for an international transaction might be able to electronically submit the required information from a domestic IP address, for consistency and fairness across all transshipment activities, the DEA is allowing paper applications and notices to continue for all transshipment transactions. Although the transshippers themselves would not have direct access to the instructions on the DEA Web site due to the firewall protection, it is the DEA's understanding that most transshippers have someone in the United States as a domestic presence facilitating the transaction who will be able to access the instructions. There is no change from the current operational system.

D. List of Changes in the Final Rule

This section discusses the minor changes implemented by this final rule that were not discussed in the NPRM. The minor changes include, among others, correcting minor typographical errors and updating citation listings and internal organizational changes within the DEA.

The effective date of this final rule remains 30 days from the date of publication. However, the compliance date was extended to 180 days after the publication of the final rule for all transactions, not only for tableting and encapsulating machines.

The DEA has eliminated the definitions of shipment and split shipment that were proposed in the NPRM. Because of the elimination of these definitions, the DEA has amended §§ 1312.13(e) and 1312.23(e) in a manner that is different than proposed. The language added to this section emphasizes that a shipment of controlled substances is limited to a single transaction between a single importer or exporter and a single consignee on a single loading document, but also that the shipment must occur on a single conveyance as opposed to multiple conveyances. In addition, the language will coincide with current policy by prohibiting a load of goods from being divided into multiple parts to be placed onto more than one conveyance, even if the goods are on the same loading document. A single permit could not be used for this situation above.

In §§ 1310.05, 1312.12, 1312.18, 1312.22, 1312.27, 1313.17, and 1313.27, the 24-hour reporting requirement to the DEA for the denial of imported/exported controlled substances, listed chemicals, tableting or encapsulating machines, has been changed to five business days.

In revised §§ 1312.22(d)(1), 1312.31(d)(4), and 1312.32(b), the phrase ''and the attestation has been notarized'' has been deleted.

II. Discussion of Comments

The DEA received 12 comments on the NPRM. Eleven commenters generally supported this rule while also raising issues of concern and one commenter expressed opposition to the NPRM. Three comments were not posted due to the entire comment containing confidential business information; one comment was not posted because it was unrelated to the NPRM; thus, only eight comments were posted. All of the relevant comments are summarized below, along with the DEA's responses.

A. Electronic Applications and Filings, Generally (5 Issues)

[1] *Comment:* Two commenters asked for clarification regarding the signature requirement applicable to declarations and applications submitted via the DEA Diversion Control Division secure network application.

Response: The user will login to the DEA Diversion Control Division secure network application using the user name and password. Upon completion of any of the forms associated with this rule, the user must submit the form by acknowledging the information on the form is complete and accurate. The acknowledgement serves as a signature. The DEA believes the use of electronic forms will eliminate the need for manual signatures and result in an overall reduction in burden. In addition, this rule does not alter the signature requirements for other documents; the definitions of ''digital signature'' and ''electronic signature'' (as defined in § 1300.03), and the requirements for signatures associated with electronic orders and electronic prescriptions (as found in part 1311) remain unchanged.

[2] *Comment:* Three commenters suggested that the DEA should provide for the continued availability and use of paper forms and hard copy reporting for imports and exports. Two commenters stated that other DEA systems such as CSOS and ARCOS have similar provisions, and in the event that the DEA's electronic system was unavailable for any reason, an alternate method of applying for and approving imports and exports is needed as a

contingency. However, the commenter stated that the DEA needs to have a stable electronic declaration system with no programming issues, because if a glitch in the system occurs, this could result in delayed shipments and significant cost for industry. The commenter stated that it was essential for importers and exporters to continue to have the paper option for more time to correct any information derived from other databases that may be inaccurate. The commenters also requested that CBP provide additional guidance on how and by whom the electronic [CBP] certifications should be submitted, in order to ensure that companies are able to meet all of the DEA legal requirements.

Response: Upon review of results from the ITDS Pilot Program, the DEA is extending the compliance date of the final rule to 180 days after publication for all provisions contained in the rule.[8] The ITDS Pilot Program (discussed above and in the General Notice at 81 FR 46058, July 15, 2016) has been underway since August 2016. Although no system failures or processing errors occurred during the ITDS Pilot Program, the DEA believes that more electronic transactions will provide a better test of the secure network application. The DEA anticipates that, during the extended compliance period, registrants and regulated persons will utilize both the secure network application and the current paper-based system. This will allow DEA to continue to test the integrity of the secure network application and enable DEA to correct any systemic issues while also ensuring an alternate method to conduct business is available so that trade is not impeded.

In response to the request that CBP provide additional guidance on how the electronic certifications should be submitted and by whom, the DEA recommends reviewing the ITDS implementation guidelines on CBP's Web site, *https://www.cbp.gov/document/guidance/dea-implementation-guide-ace.*

[3] *Comment:* Three commenters stated that currently, the only way to submit a Declaration/Application for import/export from an analytical laboratory registrant is by sending a hard copy to the DEA, and that the DEA Diversion Control Division secure network application does not support imports/exports from analytical laboratory registrants. The commenter noted that, since an analytical laboratory is not required to register drug codes on the registration, the drop down list on the secure network application would need to be extensive or a free text box would need to be added. In addition, because there are many drug impurity reference standards that are imported/exported, the commenter suggested that the continued use of a paper-based system for imports/exports from analytical laboratory registrants is necessary until a free text box is added to the secure network application.

Response: As discussed, the DEA is extending the compliance date of the final rule to 180 days after publication for all provisions contained in the rule. The ITDS Pilot Program (as discussed and in the General Notice at 81 FR 46058, July 15, 2016) has been underway since August 2016. Although no system failures or processing errors occurred during the ITDS Pilot Program, the DEA believes an extended compliance date will enable more electronic transactions to test the integrity of the secure network application and ensure DEA can address any systemic issues before mandatory compliance. However, with the implementation of ITDS, the DEA Diversion Control Division secure network application will enable analytical laboratory registrants to provide all of the required information electronically. Any registrant, including analytical laboratories, unable to complete the necessary import/export forms for any reason may contact Diversion Control Division's Regulatory Section at 202–307–7194 or *CSIMEX@usdoj.gov.* Unforeseen issues that prevent any registrant from completing the necessary import/export forms will be resolved on a case-by-case basis.

[4] *Comment:* Two commenters expressed concern that requiring registrants to report the date that the product was released by a customs official as well as the amount released by a customs official is repetitive since the Automated Commercial Environment (ACE) systems will include this information. The commenters requested that the DEA remove this requirement from the proposed rule. In support of their request, the commenters stated that it would be difficult for the registrant to obtain this information since these activities are handled by their brokers, and the registrant does not have access to the ACE system. The commenters went on to say that traditionally, the registrant reports when the substances leave their facility as this is the only date the registrant has direct knowledge of.

Response: The DEA appreciates the commenter's concerns. The DEA believes the release date is available. Some importers/exporters may need to obtain this information from their brokers. To remove the ambiguity created from the ''date of import,'' the DEA chose the date of release by a customs officer. In addition, the DEA is requiring the date the shipment arrives (for imports) or leaves (for exports) the registered location or place of business. These two dates provide the proper accountability of the amounts of controlled substances or listed chemicals.

[5] *Comment:* One commenter expressed concern about the protection of data submitted electronically. The commenter supported the use of electronic submissions to streamline customs procedures, and requested additional information regarding how electronically submitted confidential business information would be protected, especially in light of the significant security and competitive business interests at stake regarding the data contained in such transmissions. The commenter stated that it was essential that CBP take adequate measures to secure and protect this data from public access and release, and suggested that CBP implement training and certification procedures for employees with access to such information.

Response: The DEA cannot respond to questions regarding CBPs information system security practices. All questions regarding CBPs information system security practices should be directed to CBP.

B. Import and Export Permits for Controlled Substances (5 Issues)

[1] *Comment:* One commenter requested that the DEA eliminate the proposed requirement that a translation be notarized when a translation of a foreign government-issued import license or Permit is necessary, because the wording in the current DEA regulations is sufficient. The commenter stated that the requirement that any such translation be notarized is not necessary, because it would place an additional burden on exporters without a commensurate benefit.

Response: The DEA proposed that translations be notarized in order to ensure that translations are complete and accurate. However, the DEA has reviewed this comment and after further consideration has removed the

[8] The final rule will be effective 30 days after publication in the **Federal Register** so registrants and regulated persons may opt to either submit forms and report information electronically via the secure network application in anticipation of the mandatory compliance date, or registrants and regulated persons may continue with paper submissions until the mandatory compliance date. This will not affect DEA's ability to continue to submit data to the ITDS/ACE.

requirement for a notarized translation in §§ 1312.22, 1312.31, and 1312.32. The DEA is retaining the requirement that the translator certify the translation. For the purposes of this requirement, certified translation means that the translator has signed the translation legally attesting to the accuracy of the translation. The regulatory text in §§ 1312.22(d)(1), 1312.31(d)(4), and 1312.32(b) have been modified to reflect this change.

[2] *Comment:* One commenter asked for clarification about what is meant by ''serial number'' and how this information would be used to identify the foreign consignee. The commenter also wanted to know what to do if no such designation is present on the current packaging. Finally, the commenter wanted to know what the definition of ''narcotic'' was in this context.

Response: The DEA proposed to modify § 1312.26 because it required exporters to keep Copy 3 of the export permit along with ''any serial numbers that might appear on packages of narcotic drugs in quantities of one ounce or more in such a manner as will identify the foreign consignee.'' As discussed in the NPRM, with the implementation of ITDS, Copy 3 is obsolete and with this final rule, exporters will be required to keep an ''official record of the export permit,'' rather than Copy 3, with any such serial numbers. As the NPRM did not propose or discuss any other modifications to § 1312.26, the comment will be considered as a basis for potential modifications in the future.

[3] *Comment:* Two commenters sought further modification of the pre-NPRM and pre-final rule regulation at § 1312.22(d)(7) (implemented as § 1312.22(h)(6) by this final rule) which requires that a controlled substance ''will be exported from the first country to the second country (or second countries) no later than 180 days after the controlled substance was exported from the United States.'' As these commenters noted, this 180-day requirement was established by the DEA in the 2007 regulation implementing the Controlled Substance Export Reform Act of 2005 (CSERA), but was not imposed by the CSERA itself. Noting that the 2015 Act contains a provision (21 U.S.C. 953(g)(1)) that eliminates the 180-day requirement for reexports within the EEA, some commenters requested that the DEA remove this requirement for all markets (not just the EEA countries) as they view it as an unnecessary hindrance. One commenter requested that the DEA increase the 180-day requirement to 365 days for reexports outside of the EEA.

Response: This category of comments is outside the scope of the NPRM. As indicated above, the 180-day requirement was implemented in a rulemaking that concluded in 2007 (72 FR 72921, December 26, 2007), and this requirement was *not* issued for public comment in the NPRM. For the reasons stated above and in the NPRM, consistent with the 2015 Act, the DEA eliminated the 180-day requirement for reexports within the EEA. However, the 2015 Act left intact the reexport requirements for reexports outside of the EEA and, accordingly, the NPRM did not reopen for public comment the regulatory requirements for reexports outside the EEA. Rather, with regard to reexports, the NPRM only sought comments on the new regulations that were necessitated by the 2015 Act.[9] While the 180-day requirement for reexports outside the EEA is therefore outside the scope of the NPRM, DEA continues to believe that the justification for the requirement set forth in the 2006 proposed rule (71 FR 61436, October 18, 2006) and 2007 final rule remains valid.

[4] *Comment:* One commenter asked for clarification in reference to adding a reexport market to the list of countries on the Export Declaration after the initial U.S. Export.

Response: All countries that are parties to any of the Conventions referred to in 21 U.S.C. 953(f)(1) will be included in the list of countries when completing forms 161R and 161R–EEA. Countries that are not parties to any of the Conventions will not be included as, consistent with the statute, reexport permits would not be granted for shipments to those countries.

[5] *Comment:* One commenter commented on the DEA's proposed definition of shipment. This commenter stated that the definition of shipment conflicts with how it is used in the DEA's regulations. First, the commenter reasoned that because the definition of shipment is placed in §§ 1300.01 and 1300.02 then this definition will apply to all parts of the DEA's regulations. Second, this commenter noted that the definition of shipment applies only to goods that are imported or exported. By defining shipment in this manner, the commenter reasoned that the term shipment can no longer be used in reference to domestic transactions involving controlled substances and listed chemicals. In addition, the commenter stated that shipment as defined conflicts with the definition of international transaction as set forth in 21 U.S.C. 802(42). International transaction is defined in part as, ''a transaction involving the shipment of listed chemicals across an international border (other than a United States Border) * * *.'' As such, this commenter noted that the CSA contemplates shipments that are not imports into the United States or exporters from the United States.

Response: The DEA appreciates this comment. Based on this comment the DEA has decided to modify the regulation text in a way that is different than what was proposed. To remove the possibility of having the definition of shipment apply to all of DEA's regulations, the DEA is removing the definition of shipment from the definition sections of §§ 1300.01 and 1300.02. In addition, the DEA is removing the definition of split shipment from the same sections. The DEA has modified the text of §§ 1312.13(e) and 1312.23(e) relating to the issuance of import and export permits. The language added in these sections allows for the same intended effect as the proposed language while eliminating the possibility of having the definition of shipment apply to all DEA regulations. Therefore, the introduction of this language will emphasize that a shipment of controlled substances is limited to a single transaction between a single importer or exporter and a single consignee on a single loading document, but also that the shipment must occur on a single conveyance (*e.g.,* one plane, one ship, or one freight train—but not each rail car), as opposed to multiple conveyances (*e.g.,* two planes, two ships, two freight trains, or any combination thereof). In addition, the language will coincide with current policy by prohibiting a load of goods from being divided into multiple parts to be placed onto more than one conveyance, even if the goods are on the same loading document. A single permit could not be used for this situation above.

C. Import and Export Declarations for Controlled Substances (1 Issue)

[1] *Comment:* One commenter requested that the DEA clarify whether an import or export declaration is effective immediately upon assignment of a Transaction Identification Number by the DEA so that the importer or exporter does not need to wait the full 15 days. The commenter also asked for additional clarification to make clear

[9] For formatting purposes, the NPRM renumbered certain regulations relating to reexports outside the EEA, and thus the text of such regulations was included in the proposed rule section of the NPRM. However, the substance of such regulations was not altered from that promulgated in the 2007 final rule.

that if the DEA has not issued a Transaction Identification Number within 15 days of submission of the declaration, the import or export can be shipped, as is currently allowed. The commenter stated that if this was not the case then importers or exporters could have to wait much longer than 15 days for DEA to issue the Transaction Identification Number, which would be a significant change from current practice.

Response: Controlled substances may be imported or exported as soon as a Transaction Identification Number (TIN) is issued. The DEA works expeditiously to confirm the accuracy of the declarations and will issue a TIN as soon as possible. When the TIN is issued for a controlled substances declaration in less than 15 days the importers and exporters may immediately request release by a customs official and do not need to wait for the expiration of the 15 days. Any delay in issuing a TIN is generally due to incomplete or inaccurate information on the declaration form and the submitters delay in providing complete and correct information. The declaration is deemed submitted when a TIN is issued; therefore, in the rare instances where 15 days have elapsed without the issuance of a TIN, the importer or exporter must wait for the TIN and may not request release by a customs official. As a practical matter, in the new ITDS/ACE system the customs official will not release a shipment without DEA's transmission of the TIN (among other data) to CBP.

D. Import and Export Declarations and Notices for Listed Chemicals (13 Issues)

[1] *Comment:* One commenter was concerned with the proposal to require electronic filing of the DEA Form 486 via the Diversion Control Division secure network application. The commenter was concerned whether steps have or will be taken to reduce confusion or delays in releasing an import or export declaration that may be associated with multiple electronic DEA Form 486s but only a single invoice. In addition, the commenter wanted clarification on whether the DEA had consulted with foreign competent national authorities regarding the impact of requiring the processing of multiple electronic DEA Form 486s relating to the same order, in light of the fact that foreign competent authority applications are not limited to a specific number of lines for a particular order or license application.

Response: The DEA appreciates the commenter's concerns. The concerns raised by the commenter are beyond the scope of this rulemaking and will not be addressed. However the DEA does not take issue with the use of multiple Form 486s.

[2] *Comment:* One commenter requested clarification on the differing requirements for an import or export transaction to proceed upon receipt of the TIN. The commenter wanted to know if the DEA intended for exporters to request release from customs immediately after issuance of the TIN as explicitly stated for importers.

Response: The DEA intends to treat importers and exporters the same in regards to the import or export transaction proceeding upon receipt of the TIN. However, allowing listed chemicals to ship before the 15-day notification requirement would be in conflict with 21 U.S.C. 971(a). Referring to import declarations, § 1313.12(b) states that listed chemicals that meet or exceed threshold quantities identified in § 1310.04(f), or which do have an established threshold, may not be imported until a transaction identification number (TIN) has been issued, and the Administrator shall be notified of the importation of the listed chemical not later than 15 days before it takes place. Referring to export declarations, § 1313.21(b) states that exporters may not request that the listed chemical be released until a transaction identification number (TIN) has been issued. The Administrator shall be notified of the importation of the listed chemical not later than 15 days before it takes place. Therefore prior to export or import a TIN has to be issued and importers and exporters have to wait the 15-day period.

[3] *Comment:* Four commenters recommended that the DEA establish a regulatory timeframe by which the agency will issue transaction identification numbers to allow for business certainty. One commenter recommended an initial deadline of three business days for the DEA to review a transaction and issue the transaction identification number. The commenters expressed a concerned about business decisions and timing. They stated that the lack of a definite deadline to issue the transaction identification number will cause delayed or canceled shipments and lost revenues.

Response: The DEA understands the commenters' sensitivity to time and potential for competitive advantage/disadvantage based on timely shipment of products. However, the DEA declines to set a specific timeframe for the issuance of a TIN. The DEA works expeditiously to confirm the accuracy of the declarations and will issue a TIN as soon as possible. Any delay in issuing a TIN is generally due to incomplete or inaccurate information on the declaration form and the submitters' delay in providing complete and correct information.

[4] *Comment:* Two commenters requested that the DEA clarify the discrepancy between whether the timeframe is three calendar days or three business days advance notification before the date of release by customs officers at the port of entry. One commenter suggested that since the time period is so small, the DEA should use its proposed text to require three business days to allow sufficient time for businesses to react to the unexpected delays or unexpected promptness of shipments. The commenter recommends that the DEA add appropriate language within the text of the rule clarifying its statement in the preamble that registrants can proceed with the import or export transaction as soon as the transaction identification number has been issued regardless of whether the three days have passed.

Response: The DEA appreciates the opportunity to correct any errors. After reviewing the language in the preamble the DEA, in two instances, erroneously stated 3 ''calendar'' days, rather than ''business'' days. The DEA has corrected the language in the preamble. The term three ''business'' days is also discussed repeatedly in the preamble and clearly stated in the regulatory text. However, importers and exporters may proceed with the transaction as soon as the TIN is issued regardless of whether the three days have elapsed. The regulatory text has been updated to clarify this requirement.

[5] *Comment:* One commenter requested that the DEA issue waivers/exemptions with respect to the proposed revisions in §§ 1313.12, 1313.14, and 1313.17. These proposed revisions would require that all imported shipments first go to the registered location before being subsequently shipped to the final destination (referred to within the industry as ''drop shipment''). The commenter cited potential shipping risks and the substantial economic hardships small U.S. businesses would face in the competitive world market as a result of the proposed revisions. The commenter also expressed concern about the fact that the proposed revision to § 1313.14, did not specify whether it applied to List I or List II chemicals or both.

Response: The DEA appreciates the commenter's concerns. The proposed revision to § 1313.14 still applies to List I chemicals. ''Drop shipments'' have always been permitted for List II chemicals, and this rulemaking will not change that. However with respect to List I chemicals, page 63598 of the published NPRM stated,

> The final destination for an import of a list I chemical must be the registered location of the registered importer. The import must be received at the registered address of the importer before being moved to another location of the importer or delivered to a customer. The receipt of imported goods is a principal activity of registered list I chemical importers. Pursuant to 21 U.S.C. 958(h), a separate registration is required at each principal place of business where applicants import or export list I chemicals. Accordingly, the final destination of a shipment of an imported list I chemical is the registered location of the registrant. Drop shipments, *i.e.,* deliveries made by an importer directly to a customer without passing through the registered location of the importer, are explicitly prohibited under the proposed revisions to § 1313.14.

[6] *Comment:* Five commenters suggested that the DEA allow listed chemicals to be relieved of the 15-day waiting period as allowed for controlled substances. The commenters stated that the DEA did not explain the reasoning behind this decision, and that it was inconsistent with other DEA regulations that treat controlled substances with stronger regulation than listed chemicals. The commenters recommended that the DEA modify the proposed rule to state that listed chemicals can also proceed with the import or export transaction as soon as the transaction identification number has been issued, regardless of whether the 15 calendar days have elapsed since its issuance

Response: After careful consideration, the DEA has decided not to allow the shipment to proceed when the TIN is issued. As stated above prior to export or import a TIN has to be issued and importers and exporters have to wait the 15-day period.

[7] *Comment:* One commenter stated that the proposed amendments to §§ 1313.12(d) and 1313.21(d) to require an import or export declaration on DEA Form 486 or 486A at least three business day before the date of release by a customs officer exceeds the statutory authority granted to DEA under 21 U.S.C. 971(b). The commenter stated that the previous versions of §§ 1313.12(d) and 1313.21(d) are consistent with the statutory limit on the timing of the waiver for transactions involving regular importers and regular customers.

Response: The DEA appreciates this comment. However, the DEA continues to believe that this modification is within its statutory authority pursuant to 21 U.S.C. 971. As stated in the NPRM it is necessary for DEA to provide customs officers with the necessary information first so that the customs officers can then clear a shipment of relevant listed chemicals. Because of this, the DEA determined that three business days is needed to review all pertinent information relating to the shipment and transmit the data accurately to the ITDS. As a result, the waiver of the entire 15 day period can no longer be applied in these specific instances.

As stated in the NPRM accompanying this final rule, 21 U.S.C. 971(b) provides the DEA with authority to waive the 15 day requirement, by regulation, for imports of listed chemicals by regular importers and exports of listed chemicals between regulated persons and regular customers. The DEA is exercising this authority in the final rule. The DEA does acknowledge that 21 U.S.C. 971(b)(1) requires regulated persons subject to waivers to notify the DEA of the transaction ''at the time of any importation or exportation.'' To maintain the effect of this provision the DEA is allowing registrants to proceed with the import and export transaction as soon as the transaction identification number is issued, regardless of whether the three-calendar day period has concluded. In addition, the DEA considers the notification provided to the DEA by the customs officers at the time of release to meet the requirements of 21 U.S.C. 971(b)(1). With these two allowances the DEA believes that it is meeting the statutory requirements and is setting forth reasonable requirements.

[8] *Comment:* One commenter stated that the wording used in revised §§ 1313.12(d) and 1313.21(d) is ambiguous. The commenter noted that the ''name and description'' of a listed chemical may not appear on the product label, and that DEA labeling requirements apply to controlled substances and not listed chemicals. The commenter suggested that the phrase ''name and description of each listed chemical'' would be better phrased as ''trade name of the listed chemical or mixture containing one or more listed chemical.'' The commenter argues that this wording would be consistent with § 1310.13, which requires an applicant for exemption from registration to provide the DEA with the trade name(s) of it chemical mixture(s).

Response: Under the DEA labeling requirements, the ''name and description'' of a listed chemical does not necessarily mean the trade name. The DEA is looking to determine what the listed chemical is. Therefore the trade name is not the only description that can be used.

[9] *Comment:* One commenter suggested an amendment to the DEA Form Data. The commenter stated that the current wording could require that any waiting period in the consignee country be completed before beginning any waiting period in the United States. The commenter stated that variations in national requirements may result in situations where the consignee is not required to have a permit; this would accommodate situations in which the competent national authority of a consignee may require documentation of a bona fide intent to import prior to issuing a permit; finally this would expedite shipments by allowing concurrent waiting periods in both countries.

Response: The registrant would still be required to abide by the laws of the country of import.

[10] *Comment:* Two commenters expressed concern over the proposed amendment to the language in §§ 1313.17 and 1313.27 to require an importer or exporter to notify the DEA within 24 hours of the denial of the release of an import or export of listed chemicals. The commenters asked that the DEA remove the 24-hour period, because the need for the shortened time frame was not apparent, and cited instances where it might been unworkable because the consignor and customs agents are working different schedules, the denial occurs late Friday or over the weekend, or the business office is closed for 24 or more hours during which customs may have denied the release.

Response: Thank you for your comment. Two commenters expressed similar concerns, and the DEA has decided to change the 24-hour reporting requirement to a 5-business-day reporting requirement. The DEA believes that this will give registrants enough time to notify the DEA and work with Customs to secure a release. See regulation text changes in §§ 1310.05, 1312.12, 1312.18, 1312.22, 1312.27, 1313.17, and 1313.27.

[11] *Comment:* In proposed 21 CFR 1310.05(b)(1), the DEA added several factors that regulated persons may consider when determining whether a loss or disappearance of a listed chemical was unusual or excessive. One commenter stated that they are not certain the added language provides clarity to persons that handle listed chemicals or the DEA field staff. Specifically, the commenter suggested that the determination of whether a loss or disappearance of a listed chemical is unusual or excessive is fact specific and

could vary even within a specific entity. Against this backdrop the commenter suggested that the DEA remove these factors from 21 CFR 1310.05(b)(1). The commenter also suggested that the inclusion of these factors, while being similar to those factors in 21 CFR 1301.74(c), might cause DEA field staff to consider these factors mandatory.

In the alternative to removing the factors from the regulatory text, this same commenter submitted two suggestions. The commenter suggested that listed chemical handlers should consider these factors only if the factors help the handler determine whether a loss is unusual or excessive. In addition, the commenter suggested that the factors should only be applied as to the specific facts surrounding the loss or disappearance.

Lastly, this commenter requested that the DEA discuss its reasoning for using slightly different factors than the agency uses in 21 CFR 1301.74(c) and to discuss the impact to regulated persons based on this change, including the interpretation.

Response: The DEA appreciates this comment. As noted in the text of 21 CFR 1310.05(b)(1) the consideration of these factors is not mandatory. The DEA states that regulated persons should consider, among others, the factors enumerated. The DEA recognizes that each business entity is unique and has different business practices. As a result, by enumerating these factors the DEA is providing factors that may assist the regulated person. The DEA recognizes and recommends that each regulated person will tailor their system to detect unusual or excessive loss or disappearance of listed chemicals to meet their specific business model. As a result, if the regulated person's business practice allows for the consideration of these factors then the DEA would expect the regulated person to consider the factors in determining if the loss or disappearance of a listed chemical is excessive or unusual. The language used by the DEA in § 1310.05(b)(1) allows for this flexibility. Furthermore, the DEA does not believe that the inclusion of these factors will cause DEA field staff to consider these factors mandatory. It should be noted that the factors used in § 1301.74(c) are not mandatory. Based on the above reasoning the DEA does not think it is prudent to amend the language in § 1310.05(b)(1).

[12] *Comment:* One commenter stated that the DEA's Combat Methamphetamine Epidemic Act (CMEA) provided that listed chemicals could only be imported if a valid customer order was in place. The commenter stated that although they had been abiding by the new language, it was challenging and presented an economic disadvantage due to the business nature of the chemicals they were handling.

Response: This comment is outside the scope of this rulemaking, and the DEA has no authority to modify the requirements of the CMEA.

[13] *Comment:* One commenter asked for electronic IDs for two locations—one for the List I Chemical Registered address and one for the List II Place of Business. The commenter stated that they had been told that all electronic entries are to be under the List I registered address electronic ID. The commenter objected to this, stating that the regulations and accepted addresses are different for List I and List II chemicals. For this reason, the commenter stated that there should be two electronic IDs to differentiate List I chemicals from List II chemicals, and that this should be addressed in the regulations since the DEA was requiring electronic filing of the DEA 486 Forms.

Response: The DEA allows more than one system account, one for List I registered location and one for List II place of business. To resolve any issues regarding system account setup or any other questions regarding listed chemicals declarations, please contact the Regulatory Section at 202–307–7194 or *Chemical.IMEX@usdoj.gov.*

E. Reexportation of Controlled Substances Among Members of the European Economic Area (3 Issues)

[1] *Comment:* Several commenters expressed the view that DEA should strike the proposed regulatory text (§ 1312.22(g)(2)) that requires persons who reexport within the EEA to report to DEA, within 30 days after each reexportion, information concerning the consignee, country, and product that was reexported. According to these commenters, this requirement is difficult, if not impossible, for them to comply with because, according to the commenters, they are unable to track the controlled substances once they are transferred to another owner. As to this point, one of the commenters attached a letter from four members of Congress, written seven months after the bill was enacted, stating that holding the manufacturer responsible for complying with this reporting requirement after a product has ''left the manufacturer's ownership'' would be contrary to the intent of the 2015 Act. In addition, commenters assert that the requirement is unnecessary from a diversion control standpoint and that it could cause them to lose sales to foreign competitors who are not subject to this requirement. As to the letter point, some of the commenters assert that the purpose of the reexport provisions of the 2015 Act is to encourage U.S. commerce abroad and to prevent U.S. drug firms from moving U.S. manufacturing jobs overseas. Some of the commenters also contended that their request to strike this requirement is supported by the provision of the 2015 Act (21 U.S.C. 953(g)) that prohibits DEA from issuing any regulation ''which impedes re-exportation of any controlled substance among [EEA] countries.''

Response: While DEA has considered carefully the concerns of the commenters regarding their compliance with the 30-day reporting requirement, the law precludes the interpretation offered by these commenters that would eliminate this requirement once the controlled substances are no longer owned by the exporter. As stated in 21 U.S.C. 953(f)(6)(B), ''In the case of re-exportation among members of the European Economic Area, *within 30 days after each re-exportation,* the person who exported the controlled substance from the United States delivers to the Attorney General documentation certifying that such re-exportation has occurred and information concerning the consignee, country, and product.'' (Emphasis added.) The language of this statute is clear and there is no mention of ownership being a condition precedent to reporting pursuant to 21 U.S.C. 953(f)(6)(B).

As the United States Supreme Court has repeatedly held, ''If the intent of Congress is clear, that is the end of the matter; for the court, as well as the agency, must give effect to the unambiguously expressed intent of Congress.'' *Chevron, U.S.A., Inc.* v. *Natural Resources Defense Council, Inc.,* 467 U.S. 837, 842–843 (1984). Because 21 U.S.C. 953(f)(6)(B) unambiguously requires reporting ''within 30 days after each re-exportation'' within the EEA, and because the statute makes no exception to this requirement based on lack of ownership, DEA is obligated to incorporate this requirement in its regulations.

With regard to the letter from four members of Congress attached by one of the commenters, because this letter was written after the law was enacted, it cannot be considered legislative history. But even if it were part of the legislative history, *Chevron* indicates that the agency cannot rely on it if is inconsistent with the plain language of the statute.

The provision of 21 U.S.C. 953(g) prohibiting DEA from promulgating any regulation that ''impedes'' reexportation within the EEA does not alter this conclusion. Congress could not have meant by this provision that DEA cannot enforce a requirement that Congress itself explicitly enacted. Rather, the logical interpretation of this clause is that DEA cannot impose any *additional* requirements (beyond those imposed by Congress) that would impede reexports within the EEA. As explained in the NPRM, DEA has adhered to this requirement by, for example, omitting from the EEA reexport regulations the requirement in the 2007 regulations that bulk substances undergo further manufacturing processes in the first country before reexporting to the second country.

[2] *Comment:* Two commenters requested that the shipping date should still be acceptable for reexports reported to the DEA, because customs clearance dates are not readily accessible by exporters in the first countries. One commenter expressed concern that requiring first country customs clearance dates would be burdensome and lead to reporting delays. Another commenter stated that for reexports within the EEA, subsequent reexports beyond the second country should not be reportable to the DEA, because this information serves no purpose for the DEA and would be unduly burdensome for U.S. exporters to collect and report.

Response: As stated earlier, the requirement to report the date of release by a customs official remains as proposed. Some importers/exporters may need to obtain this information from their brokers. To remove the ambiguity created from the ''date of import'' and ''date of export,'' the DEA chose the date of release by a customs officer. In addition, the DEA is requiring the date the shipment arrives (for imports) or leaves (for exports) the registered location or place of business. These two dates provide the proper accountability of the amounts of controlled substances or listed chemicals.

[3] *Comment:* One commenter requested that the European Economic Area (EEA) should apply to member countries as of November 25, 2015. For example, this commenter noted that when the 2015 Act was passed on November 25, 2015, the United Kingdom was still a member of the European Union. The commenter suggested that it is unclear whether or not the United Kingdom's EEA membership will be affected after it separates from the European Union. To provide stability in implementing the 2015 Act's provisions, the commenter requested that the DEA consider, for purposes of the 2015 Act, that the EEA countries include those that were members on November 25, 2015.

Response: The 2015 Act is devoid of any language stating that the EEA includes those members as of November 25, 2015. Accordingly, the DEA interprets that for the EEA provisions to apply, the country must be a member at the time the export leaves the United States.

F. Miscellaneous Comments (2 Issues)

Two comments were received that were not within the scope of this rulemaking, and will not be addressed. Both addressed drug scheduling actions that were outside the subject area of this final rule.

III. Section by Section Summary of the Final Rule

A. 21 CFR Part 1300

For purposes of clarity and transparency, the DEA is updating its regulations for consistency of terminology (within DEA regulations, between DEA regulations and the CSA, and between DEA regulations and the regulations of other agencies that regulate imports and exports), to reflect name changes to referenced entities, and to add new definitions. These changes involve both technical and substantive amendments. Additionally, the DEA is making a technical change to more concisely incorporate U.S. obligations under international treaties of drug control, as statutorily codified in the CSA.

B. 21 CFR Part 1301

The DEA is amending §§ 1301.24, 1301.26, to denote the responsibility of customs services of Insular Areas, and not just CBP, to enforce the import and export requirements of the CSA. When controlled substances, listed chemicals, and tableting or encapsulating machines are imported into, or exported from, a U.S. territory (or possession) or an Insular Area of the United States that is not part of the customs territory of the United States, these items are cleared by the customs service of an Insular Area and not CBP.

The DEA is also adding the following citations to be directed to the DEA **Federal Register** Representative: § 1301.34(a)—Filing of written comments regarding application for importation of Schedule I and II substances.

This topic has been added so that comments corresponding to **Federal Register** publications can be sent directly to the **Federal Register** Representative whose responsibility it is to review comments and make them publicly available, as appropriate. The DEA is additionally amending this portion of the table to revise the attention line of the mailing address for the DEA Federal Register Representative. The address will be changed from ''Drug Enforcement Administration, Attn: Federal Register Representative/DRL, 8701 Morrissette Drive, Springfield, VA 22152'' to ''Drug Enforcement Administration, Attn: Federal Register Representative/DRW, 8701 Morrissette Drive, Springfield, VA 22152.'' Additionally, this rule adds the Web address for the Federal eRulemaking Portal, *http://www.regulations.gov,* under the heading ''DEA Federal Register Representative.'' This Web address provides the ability to type short comments directly into the comment field on the Web page or to attach a file for lengthier comments. This change conforms to the DEA's current practice, referenced in the DEA's recent **Federal Register** publications, which requires that comments either be submitted through *http://www.regulations.gov* or be directed to the DEA Federal Register Representative.

C. 21 CFR Part 1302

Corresponding to the removal of ''jurisdiction of the United States'' and the revised definitions of ''export'' and ''import,'' the DEA is making a corresponding technical change to § 1302.07 to reflect those definitional changes. The sealing requirement would be separately stated for imports and exports. This change allows the import statement to clearly reflect that the sealing requirement for imported controlled substances applies regardless of whether the import occurred inside or outside of the customs territory of the United States. Separating the import and export requirements also makes clear that the distinction between the customs territory and the non-customs territory is only applicable to imports and not exports.

D. 21 CFR Part 1303

Corresponding to recent internal DEA reorganization, the mailing addresses for §§ 1303.12(b) and (d), 1303.22, 1304.31(a), 1304.32(a), 1315.22, 1315.32(e) and (g), 1315.34(d), and 1315.36(b), regarding quota applications and reporting, will be moved from the DEA Drug & Chemical Evaluation Section to the UN Reporting & Quota Section under a new corresponding header.

E. 21 CFR Part 1304

The DEA is making a technical amendment to § 1304.02 to reflect that definitions found in § 1300.02, ''Definitions relating to listed chemicals,'' are not applicable to part 1304, that addresses the records and reports that are required of controlled substance handlers. (21 CFR part 1310 addresses records and reports of listed chemicals and certain machines.)

The DEA is also making a technical amendment to amend § 1304.21(d) to separately state reporting requirements concerning imports and exports of controlled substances. The record date for receipt, distribution, other transfer, or destruction will not change. The regulation will be amended to state that the record date for imports or exports of controlled substances is the anticipated date of release by a customs officer for permits and declarations and the date on which the controlled substance was released by a customs officer at the port of entry or port of export.

F. 21 CFR Part 1308

The DEA is making two technical updates to part 1308. First, the DEA is amending § 1308.01 to denote that part 1308 also includes nonnarcotic substances, chemical preparations, veterinary anabolic steroid implant products, prescription products, and anabolic steroid products excluded pursuant to 21 U.S.C. 811. Second, the DEA is amending § 1308.49 to reflect the current requirements of the CSA regarding issuance of temporary scheduling orders. 21 U.S.C. 811(h) was amended by section 1153 of the Food and Drug Administration Safety and Innovation Act of 2012, Public Law 112–144, July 9, 2012, to make temporary scheduling orders effective for two years, with an option to extend for up to one year during the pendency of proceeding under 21 U.S.C. 811(a). The CFR was not updated when the law changed. The DEA is also realigning the paragraphs of § 1308.49 to properly separate the discussion of the circumstances in which a temporary scheduling order will be vacated.

G. 21 CFR Part 1309

The DEA is amending § 1309.32(d) to add ''manufactured'' to the list of business activities each application can include for each list I chemical. Adding ''manufactured'' would accurately reflect an ''activity'' that an applicant could conduct with list I chemicals if appropriately registered. No change is required to DEA Form 510 because ''manufacturer'' is already listed as an option.

The DEA is correcting and updating the cross-reference in § 1309.46(d) by removing the reference ''§ 1309.54'' and replacing it with the reference ''§ 1309.53.'' Section 1309.46(d) currently instructs an applicant to file a request for a hearing pursuant to § 1309.54. However, § 1309.54 is entitled ''Burden of Proof,'' and therefore is an inaccurate cross-reference.

The DEA is correcting and updating the cross-reference in § 1309.51(a) by removing the cross-reference to § 1309.57 and replacing it with the cross-reference ''§ 1309.55.'' Currently, § 1309.57 is a misleading cross-reference since it does not exist in title 21, chapter II of the CFR. The ''Hearings'' section in part 1309 concludes at § 1309.55. The DEA is therefore changing the cross-reference in § 1309.51(a) from ''1309.57'' to ''§ 1309.55.'' Finally, the DEA is correcting two minor typographic issues in § 1309.71: capitalizing the first word of paragraph (b)(5) and adding an ''and'' at the end of paragraph (b)(7).

H. 21 CFR Part 1310

i. Mail Order Reporting for Ephedrine, Pseudoephedrine, Phenylpropanolamine, and Gamma-Hydroxybutyric Acid

The DEA is incorporating mandatory electronic reporting requirements into part 1310 for monthly reports of mail-order transactions involving ephedrine, pseudoephedrine, phenylpropanolamine, and gamma-hydroxybutyric acid (including drug products containing these chemicals or controlled substance) required to be filed in accordance with § 1310.03(c) pursuant to 21 U.S.C. 830(b)(3). To standardize and streamline the electronic filing requirement of these monthly mail-order reports, the DEA is implementing usage of a new form, DEA Form 453. The new form is accessed, completed, and submitted by regulated persons entirely through the DEA Diversion Control Division secure network application. 21 CFR 1310.03(c) is further revised to reflect that reports would not be deemed filed until the Administration issues a transaction identification number unless they are complete upon submission. This change is designed to ensure that electronically submitted reports are indeed received by the DEA, are complete, and can be appropriately tracked and monitored; to streamline the report filing process; and to eliminate potential duplicate filings. The current § 1310.06(i) is revised to reflect that the monthly mail-order information required to be submitted would now be submitted on the DEA Form 453 and is designated as § 1310.06(k). 21 CFR 1310.03(c) is further revised by separately listing the requirement for monthly reports to be submitted by regulated persons who engage in the specified domestic mail-order transactions and export transactions. This revision also more plainly lays out the requirement that the regulated person must be engaged in a transaction with one of the specified chemicals or controlled substance and use or attempt to use the U.S. Postal Service or any private or commercial carrier for both activities in order to be required to file the monthly report. This revision is not intended to impose any different requirements than the current regulation, but only to ease understanding of the reporting requirements. 21 CFR 1310.05(e) would correspondingly be amended to reflect the implementation of the mandatory electronic filing requirement.

The DEA is making a technical amendment to § 1310.05(d) to revise the mailing information in the second sentence and to replace the term ''shall'' in three locations without changing the substantive requirements.

ii. Listed Chemicals and Tableting and Encapsulating Machines

The DEA is amending § 1310.05 to require reports of unusual or excessive loss or disappearance of a listed chemical to be filed through the DEA Diversion Control Division secure network application. When determining whether a loss is unusual or excessive, the guidelines that the regulated person should consider are: (1) The actual quantity of a listed chemical; (2) the specific listed chemical involved; (3) whether the loss or disappearance of the listed chemical can be associated with access to those listed chemical by specific individuals, or whether the loss or disappearance can be attributed to unique activities that may take place involving the listed chemical; and (4) a pattern of losses or disappearances over a specific time period, whether the losses or disappearances appear to be random, and the result of efforts taken to resolve the losses. If known, the regulated person would also need to report whether (1) the specific listed chemical was a likely candidate for diversion and (2) local trends and other indicators of the diversion potential of the listed chemical. This language is similar to the current regulatory language relating to theft and loss of controlled substances in § 1301.74(c).

In addition, the DEA is clarifying in the revised § 1310.05(b)(1) that regulated persons must submit a report of unusual or excessive loss or disappearance whether or not the listed chemical is subsequently recovered. The DEA also has revised § 1310.05(b)(1) to clarify which party has the responsibility for reporting during domestic and international transactions. These changes will streamline the data collection process and allow the DEA to more efficiently respond to diversion as well as to respond to reporting requests concerning these items from the United Nations.

The DEA is also removing the phrase ''whenever possible'' from the oral reporting requirements of the current § 1310.05(b). The DEA believes that the phrase is redundant given the stated requirement that such reports be made ''at the earliest practicable opportunity.'' Removing this phrase would better align the reporting requirements with the statutory language of 21 U.S.C. 830(b)(1).

In response to the above discussed changes, the DEA is restructuring § 1310.05(a) and (b) to reflect the revised reporting structure. Paragraph (a) is addressing those reports made solely to the local DEA office in accordance with the current and revised § 1310.05(a)(1) and (2). Paragraph (b) is addressing those reports made orally to the local DEA office with written reports being submitted through the DEA Diversion Control Division secure network application. The reporting requirements now located in § 1310.05(b) will be transferred to paragraphs (a)(1) and (2), and (b)(1) and (2), as applicable. This change consolidates the reporting requirements for each of the applicable reports into their applicable paragraphs; readers would no longer be required to look at both paragraphs to determine when and how they must initially report these transactions. In addition, the DEA is clarifying § 1310.05(a)(2) that regulated persons must report orally, not in writing, any proposed regulated transaction with a person whose description or other identifying characteristic the Administration has provided to the regulated person. Regulated persons are required to orally report the other types of actions at the earliest practicable opportunity to the Special Agent in Charge of the DEA Divisional Office for the area in which the regulated person making the report is located.

21 CFR 1310.06 is revised to reflect the various changes in §§ 1310.03–1310.05. Cross-citations have been amended to reflect where regulations have been moved and new forms instituted. In § 1310.06(a)(3) regulated persons are required to include the NDC number of the product containing the listed chemical, if applicable, in all records required by § 1310.03(a). If the record contains the NDC number, information about the ''form of packaging'' would not be necessary. The restructuring of § 1310.05(a) also corrects a long-standing typographical error in the previous § 1310.06(c), which incorrectly referenced § 1310.05(a)(4) instead of § 1310.05(a)(3). 21 CFR 1310.06(c) previously stated that a report submitted pursuant to § 1310.05(a)(4), domestic regulated transactions, must include a description of the circumstances leading the regulated person to make the report. However, the corresponding example relates to an unusual loss, which is addressed in the previous § 1310.05(a)(3) (now § 1310.05(b)(1)). The DEA also is making technical amendments in § 1310.06, including replacing the term ''shall'' in paragraphs (a) and (b).

The DEA is standardizing submissions of domestic and import and export regulated transaction reports involving tableting and encapsulating machines through the introduction of a new form, the DEA Form 452. In the revised § 1310.05(b)(2), the DEA is making the oral reporting mandatory and mandating the electronic filing of the written report. The DEA also is providing specific guidelines on when those reports must be given. The revised § 1310.05(b)(2) requires regulated persons to orally report domestic regulated transactions in a tableting machine or an encapsulating machine when an order is placed rather than at the earliest practicable opportunity after the regulated person becomes aware of the circumstances involved. The written report (DEA Form 452) is required to be filed within 15 calendar days after the order has been shipped by the seller.

The previous standard was originally adopted for reporting of domestic regulated transactions for uniformity with the reporting timeframe standard imposed by 21 U.S.C. 830(b)(1)(A) for transactions involving an extraordinary quantity of a listed chemical, an uncommon method of payment or delivery, or other suspicious circumstances. However, the DEA is exercising its authority under 21 U.S.C. 830(b)(1) to impose a different reporting timeframe standard for machines. The revised standards are not only less ambiguous for regulated persons to follow; they also ensure the DEA receives the information in time to take appropriate action as may be necessary. The new DEA Form 452, covers not only import and export regulated transactions of tableting and encapsulating machines required under the current § 1310.05(c) but also the domestic regulated transactions of tableting machines or encapsulating machines required by the previous § 1310.05(a)(4). The requirements for the content of domestic reports were moved from § 1310.06(d) to a new § 1310.06(f), while the requirements for reports of importations and exportations are all contained within § 1310.06(e). The DEA also is amending the recordkeeping requirements in § 1310.06(a) and reporting requirements in § 1310.06(e) and (f) to require the inclusion of information about whether the machine is manual or electric. In § 1310.06(e)(1)(vi) and (f)(3), the DEA is requiring reports of importations and domestic transactions to include any proposed changes to the identifying information of imported machines that will occur after the importation or other transaction.

The DEA also is amending § 1310.06 to require regulated persons who import or export a tableting or encapsulating machine to report return information to the Administration within 30 calendar days of the release of the shipment by customs at the port of entry or port of export, or within 10 calendar days after receipt of a written request by the Administration. The DEA has included the provision for the requirement to submit return information earlier than the 30 days for two reasons. First, it conforms to the changes for controlled substances and listed chemicals in parts 1312 and 1313. Uniformity of requirements should simplify procedures and ease understanding of the requirements by regulated industry. Second, the option to request advance return information allows the DEA to receive information that may be needed for time-sensitive requirements, such as investigations that may need to result in immediate action to protect the public health and safety. Return information is required to be submitted electronically through the DEA Diversion Control Division secure network application on the DEA Form 452. Reports would not be deemed filed until a transaction identification number has been issued by the DEA. Pursuant to § 1310.06(h), importers are required to report specifics on their return, including dates of the transaction, quantities of machines involved, and descriptions of the machines. Consistent with the current requirements, importers also are required to report subsequent transfers of the machines under § 1310.05(b)(2). Reports of transfers after import may be submitted with the return information or separately.

The revisions relating to tableting and encapsulating machines that would standardize the submission of reports of regulated transactions, whether domestic or import/export, and require return information, would enhance the monitoring of these machines and allow the DEA greater ability to detect and prevent their use for the illicit manufacture of controlled substances. While tableting machines and encapsulating machines are commonly used by legitimate companies to produce pharmaceuticals and nutritional supplements, they are also used by traffickers to produce single dosage units of illicit synthetic substances such as methylenedioxymethamphetamine (''MDMA'') (aka ''Molly'' or ''ecstasy''), and other synthetic designer drugs classified as schedule I controlled substances or analogue substances. These machines have also been known to be used by marijuana dispensaries, steroid labs, and counterfeit drug manufacturers.

Regulatory changes in the final rule require importers and exporters to report to the DEA when a shipment has been denied release by a customs officer for any reason, whether or not the denial was based on a violation of DEA regulations. In response to commenters who stated that the 24 hour notification requirement related to import or export denials was unreasonable, the DEA has modified this requirement from 24 hours to 5 business days. The DEA believes that 5 business days strikes a balance between investigative needs without unduly burdening the regulated community. Likewise, by unifying the reporting format for regulated transactions in tableting machines, whether domestic, import, or export, the DEA will be able to monitor the flow of these machines through the distribution chain. This will allow the DEA to better understand and monitor the trade in these machines and to adopt more efficient means of stopping the diversion of tableting and encapsulating machines, and prevent their use in the illicit manufacture of controlled substances.

I. 21 CFR Part 1312

The DEA is making a technical amendment to §§ 1312.11 and 1312.22 to insert a cross-reference to part 1301 of chapter II of title 21 of the Code of Federal Regulations when referencing the registration requirements for the importation of controlled substances.

The DEA is amending § 1312.14 to account for revised distribution procedures for import permits. The DEA is retaining the requirement that an official record of the permit (a ''copy'' under current DEA regulatory terms) accompany the shipment of controlled substances. This is an important tool utilized by the DEA for ensuring compliance with the closed system of distribution by allowing quick initial visual indication of compliance with requirements with the CSA. However, because customs officers will be able to electronically validate the legitimacy of the import permit through ITDS, customs officers will not need to physically detach the official record of the permit for validation. An official record of the permit must instead accompany the shipment until it reaches its final destination. The DEA is also amending § 1312.14 to omit the discussion of the circumstances in which customs officers will refuse entry of a shipment.

The final destination for an import must be the registered location of the importer. (The import must be received at the registered address of the importer before being moved to another location of the importer or delivered to a customer.) The receipt of imported goods is a principal activity of registered importers. Pursuant to 21 U.S.C. 958(h), a separate registration is required at each principal place of business where applicants import or export controlled substances. Accordingly, the final destination of a shipment of imported controlled substances is the registered location of the registrant or regulated person. Drop shipments, *i.e.,* deliveries made by an importer directly to a customer without passing through the registered location of the importer, are explicitly prohibited under the revisions to § 1312.19. Similarly, consistent with current requirements, deliveries may not be made directly to a warehouse exempted from registration pursuant to § 1301.12(b)(1); they must arrive first at the registered location.

A technical amendment to paragraph (a) of § 1312.15 is made to cross-reference § 1312.16, concerning shipments that may be in greater or lesser amount than what is authorized by the import permit.

Associated with the foregoing changes, as discussed earlier in this document, the DEA is amending its regulations regarding expiration dates associated with imports and exports of controlled substances. The DEA is changing the current expiration period of import and export permits found in §§ 1312.16 and 1312.25 from not more than six months to not more than 180 calendar days after the date of issuance. This change will standardize expiration procedures as not all months have the same number of days. The DEA is also amending §§ 1312.18 and 1312.27 to specify an expiration date for import and export declarations for controlled substances. Such declarations do not currently have an expiration date assigned to them; however, permits to import and export controlled substances expire not more than six months after approved under the current regulation. 21 CFR 1312.16 and 1312.25. Similar to permits, at times declarations filed with the DEA are never actually utilized. The DEA is concerned that absence of an expiration date for these declarations may lead to incomplete or inaccurate records in the ITDS. Therefore, the DEA is requiring that declarations expire 180 calendar days after the date the declaration is deemed filed with the Administration.

The DEA is modifying the condition previously found in § 1312.22(a) that requires an application for a permit to export controlled substances to contain an affidavit that the packages of controlled substances for export are labeled in conformance with obligations of the United States under international treaties, conventions, or protocols ''in effect on May 1, 1971.'' The regulation is amended to instead require that such affidavit state that packages of controlled substances for export are labeled in conformance with obligations of the United States under international treaties, conventions, or protocols which are in effect at the time of export or reexport. The DEA does not believe that this change will have any current effect on the regulated community because it is not a new requirement. However, the DEA is taking this opportunity in revising its other import and export regulations to account for any changes in international treaties, conventions, or protocols which might be made in the future.

This final rule includes changes to harmonize, to the extent possible, return information requirements for import and export regulations throughout parts 1310, 1312, and 1313 for tableting and encapsulating machines, controlled substances, and listed chemicals. Although these provisions are similarly structured, the actual content of the return information varies across the regulations to account for international reporting requirements for machines, controlled substances, and listed chemicals. Variations in return reporting requirements also vary among controlled substances, listed chemicals, and tableting and encapsulating machines to maximize the detection, investigation, and prevention of diversion. The DEA has reviewed the return information currently collected for imported and exported controlled substances and is proposing changes.

The DEA is amending §§ 1312.12, 1312.18, 1312.22, and 1312.27 to require registrants or regulated persons, and those exempt from registration to report return information to the Administration following imports and exports of controlled substances authorized by permits and conducted pursuant to filed declarations. The DEA is requiring this information to be submitted within 30 calendar days, or within 10 calendar days after a request from the Administration, whichever is sooner. This regulatory text change is consistent with existing business practice, as importers and exporters generally submit such information to the DEA at the conclusion of transactions. The submission of such reports will allow the United States to meet its obligations under article 19 (Estimates of drug requirements) and article 20 (Statistical returns to be furnished to the Board) of the Single Convention on Narcotic Drugs, 1961, and article 16 (Reports to be furnished by the Parties) of the Convention on Psychotropic Substances, 1971. The DEA will continue to independently collect such return information outside of the single window as the ITDS does not capture all elements of the return information that the DEA needs to submit under those treaty obligations and otherwise adequately monitor the closed system of distribution of imports and exports to detect and prevent diversion. 21 U.S.C. 871(b). Additionally, the timing and frequency of required return information reporting is outside the scope of the single window. Requirements for return information to be submitted to the DEA are already specifically included in § 1312.22(d)(6) for reexported controlled substances pursuant to 21 U.S.C. 953(f)(6).

For imported and exported controlled substances there are four principal pieces of information that the DEA is requiring importers and exporters supply to the DEA in the returns: The date on which the controlled substances arrived/departed the registered location, the date on which a customs officer released the shipment, the actual quantity of controlled substances that arrived/left the registered location, and the actual quantity of controlled substances that a customs officer actually released. The current text in 21 CFR 1312.22 relating to controlled substances exported for subsequent reexportation requires the reporting of the ''date shipped.'' This requirement has been interpreted differently, sometimes as the date it left the facility and sometimes as the date of release by customs. Both dates are needed to adequately monitor the closed system of distribution for import and export transactions.

The DEA is revising §§ 1312.12, 1312.18, 1312.22, and 1312.27 to prohibit the importation/exportation of any shipment of controlled substances denied release by customs at the port of entry or port of export for any reason without resubmission of the permit application or declaration and issuance of a new permit or transaction identification number by the DEA. This change is needed to strengthen the DEA's ability to monitor and detect practices that may render an importer's or exporter's registration inconsistent with the public safety, especially in relation to the DEA's statutory obligation to take into consideration an applicant's compliance with applicable State and local laws and other relevant factors. 21 U.S.C. 823(a), 958(a).

The DEA is amending § 1312.22 to reflect that the Administration has discretion whether to issue a permit for reexport pursuant to 21 U.S.C. 953(f). The revision to § 1312.22(g)(8), like the current regulation, specifies that the exporter must provide ''a brief summary of the facts that warrant the return'' of an export that has been refused or is otherwise unacceptable or undeliverable. The DEA Diversion Control Division secure network application contains a field appropriate for this information within the DEA Form 357. Likewise, the ''written request for reexport'' of a controlled substance subject to declaration requirements, currently required in § 1312.27(b)(5)(iv), can be submitted in a field of the DEA Form 236 in the DEA Diversion Control Division secure network application. As in the current regulations, a refused or otherwise unacceptable or undeliverable controlled substance subject to the declaration requirements could be imported only after the DEA issues ''affirmative authorization in writing.'' A transaction identification number does not serve as such ''affirmative authorization in writing.''

The DEA is amending §§ 1312.22, 1312.31, and 1312.32 to require a certified translation of authorizations issued by foreign competent national authorities that are not issued either entirely in English or bilingual with English. If the foreign authorization, or the certified copy of such, is not written in English or bilingual with another language and English, the registrant must submit with their application or notice a certified translation of the permit or license. For the purposes of this requirement, certified translation will mean that the translator has signed the translation legally attesting to the accuracy of the translation. This change is meant to ensure that these foreign authorizations are complete and accurate, and that the information that they contain are accurately understood and applied to DEA import/export policies and procedures.

In response to commenters who stated that the 24 hour notification requirement related to import or export denials was unreasonable, the DEA has modified this requirement from 24 hours to 5 business days. The DEA believes that 5 business days strikes a balance between investigative needs without unduly burdening the regulated community.

As mentioned above, in response to comments the DEA amended §§ 1312.13(e) and 1312.23(e) in a manner that is different than proposed. The language added to this section will emphasize that a shipment of controlled substances is limited to a single transaction between a single importer or exporter and a single consignee on a single loading document, but also that the shipment must occur on a single conveyance as opposed to multiple conveyances. In addition, the language will coincide with current policy by prohibiting a load of goods from being divided into multiple parts to be placed onto more than one conveyance, even if the goods are on the same loading document. A single permit could not be used for this situation above.

J. 21 CFR Part 1313

The DEA is adding a new § 1313.03 that will consolidate the DEA Form information applicable to part 1313 in a corresponding change for the new § 1312.03. The new § 1313.03 will consist of a table referencing the DEA Form number, form name, information about where the form may be accessed, and where the completed form should be submitted.

The DEA is amending § 1313.12(b) to require that all declarations (DEA Form 486/486A) must be complete and accurate when submitted. Under § 1304.21, registrants must maintain complete and accurate records for controlled substances. That requirement applies to import and export declarations for controlled substances. This revision will impose the same requirement for import/export declarations as for listed chemicals.

Declarations (DEA Forms 486/486A) will not be deemed filed until the transaction identification number has been issued by the DEA. Upon receipt and review, the DEA will assign each declaration a transaction identification number (a unique identifier). Once the declaration is accepted and assigned a transaction identification number, registrants will be able to use the assigned transaction identification number to access the official record of the declaration. While current DEA regulations do not require confirmation of receipt from the DEA prior to importation or exportation pursuant to a declaration, the change is consistent with current practices. Currently, the DEA assigns a Web Tracking Number to each declaration when it is submitted and accepted. The regulatory codification of the issuance of a transaction identification number is designed to ensure that electronically submitted declarations are indeed received by the DEA, are completed, and can be appropriately tracked and monitored; to streamline the declaration filing process; and to eliminate duplicate filings. The fact that the DEA issues a transaction identification number after reviewing the filing does not waive the Administration's right to suspend a shipment under § 1313.41.

The DEA wishes to clarify that import or export transactions may not proceed as soon as the transaction identification number has been issued, because the 15-calendar-day requirement since the filing of DEA Form 486/486A has not changed. Import or export transactions for which the 15-calendar-day notification has been waived, may proceed as soon as the transaction identification number has been issued, regardless of whether the 3 business days have elapsed since filing of DEA Form 486/486A.

The DEA is making changes in the regulatory text to reflect that 21 U.S.C. 830 has been changed to require official records of import declarations involving listed chemicals to be retained for two years.

As discussed above, return information requirements have been harmonized across parts 1310, 1312, and 1313, to the extent possible. The DEA is requiring that return information must be reported within 30 calendar days after release by a customs officer at the port of entry, export, or reexport. All return information for applications or other initial filings that are required to be made electronically through the DEA Diversion Control Division secure network application would likewise be required to be filed electronically through the same system. As with controlled substance return information, the DEA is requiring listed chemical importers and exporters to include both the date a customs officer releases an imported item or releases an item for export, and the date that the shipment arrived at the location of the importer or exporter, the actual quantities of product both when released by a customs officer and at the time of shipment from the exporter's location or arrival at the importer's location, and the actual port of entry or export. These revised reporting requirements will better allow the DEA to track the flow of listed chemicals, and detect and prevent diversion. For example, by tracking and comparing diversion of listed chemicals against the actual port of entry or exit, the DEA will be better able to detect potential weak spots in the import/export system and direct more resources to that region. The DEA also is revising the regulatory text to clarify that the references to ''chemical'' and ''container'' apply to the reporting of subsequent transfers.

The final destination for an import of a list I chemical must be the registered location of the registered importer. The import must be received at the registered address of the importer before being moved to another location of the importer or delivered to a customer. The receipt of imported goods is a principal activity of registered list I chemical importers. Pursuant to 21 U.S.C. 958(h), a separate registration is required at each principal place of business where applicants import or export list I chemicals. Accordingly, the final destination of a shipment of an imported list I chemical is the registered location of the registrant. Drop shipments, *i.e.,* deliveries made by an importer directly to a customer without passing through the registered location of the importer, are explicitly prohibited under the revisions to § 1313.14. Similarly, consistent with current requirements, deliveries may not be made directly to a warehouse exempted from registration pursuant to § 1309.23(b)(1); they must arrive first at the registered location.

The DEA is amending § 1313.22(a) to add a cross-reference to § 1310.04(g) relating to listed chemicals that may be exported. This change will harmonize § 1313.22(a) with § 1313.21(a).

In response to commenters who stated that the 24 hour notification requirement related to import or export denials was unreasonable, the DEA has modified this requirement from 24 hours to 5 business days. The DEA believes that 5 business days strikes a balance between meeting investigative needs and not unduly burdening the regulated community.

K. 21 CFR Part 1314

Corresponding to recent internal DEA reorganization, in § 1314.110, in paragraphs (a)(1) and (2), the phrase ''Import/Export Unit,'' will be removed and in its place ''Regulatory Section, Diversion Control Division,'' will be added.

L. 21 CFR Part 1315

Corresponding to recent internal DEA reorganization, the mailing addresses for §§ 1303.12(b) and (d), 1303.22, 1304.31(a), 1304.32(a), 1315.22, 1315.32(e) and (g), 1315.34(d), and 1315.36(b), regarding quota applications and reporting, will be moved from the DEA Drug & Chemical Evaluation Section to the UN Reporting & Quota Section under a new corresponding header.

M. 21 CFR Part 1316

The DEA is amending § 1316.47(a) to align with the DEA's current practice referenced in all recent **Federal Register** publications that requests for a hearing are to be sent directly to the Hearing Clerk. Specifically, this amendment will remove ''Attention: DEA Federal Register Representative'' from the template letter. Since the paragraph before the template letter states that persons requesting a hearing should refer to § 1321.01 for current mailing addresses, the DEA is not adding an ''Attention'' field in the template letter.

The DEA is amending § 1316.48 so that the filing of notices of appearance corresponds with the DEA's practice that requests for hearing shall be sent to the Hearing Clerk. Specifically, the DEA would remove ''Attention: Federal Register Representative'' from the template letter. Since the paragraph before the template letter states that persons requesting a hearing should see § 1321.01 for current mailing addresses, the DEA is not adding an ''Attention'' field in the template letter.

The DEA is amending § 1316.48 to provide that notices of appearance should be sent to the DEA Hearing Clerk instead of the DEA Administrator so that notices of appearance will be filed in a more efficient manner. The DEA is also amending § 1316.47 to provide that requests for hearing should be sent to the DEA Hearing Clerk instead of the DEA Federal Register Representative so that such requests will be filed in a more efficient manner. In the Table of DEA Mailing Addresses in § 1321.01, DEA is making the corresponding change, and to add §§ 1301.43, 1303.34, 1308.44, and 1316.47(a), regarding requests for hearing or appearance and/or waivers, under the DEA Hearing Clerk heading. These items are being directed to the DEA Hearing Clerk to expedite the hearing process and will lead to fewer delays. The DEA is additionally revising this portion of the table to correct the attention line of the mailing address for the DEA Hearing

Clerk. The address will be changed from ''Drug Enforcement Administration, Attn: Hearing Clerk/LJ, 8701 Morrissette Drive, Springfield, VA 22152'' to ''Drug Enforcement Administration, Attn: Hearing Clerk/OALJ, 8701 Morrissette Drive, Springfield, VA 22152.''

The DEA is adding the following citations to be directed to the DEA Federal Register Representative: § 1301.34(a)—Filing of written comments regarding application for importation of Schedule I and II substances; § 1303.11(c)—Filing of written comments regarding notice of an aggregate production quota; and § 1303.13(c)—Filing of written comments regarding adjustments of aggregate production quotas. These topics have been added so that comments corresponding to **Federal Register** publications can be sent directly to the Federal Register Representative whose responsibility it is to review comments and make them publicly available, as appropriate. The DEA is additionally amending this portion of the table to revise the attention line of the mailing address for the DEA Federal Register Representative. The address will be changed from ''Drug Enforcement Administration, Attn: Federal Register Representative/DRL, 8701 Morrissette Drive, Springfield, VA 22152'' to ''Drug Enforcement Administration, Attn: Federal Register Representative/DRW, 8701 Morrissette Drive, Springfield, VA 22152.'' Additionally, this rule adds the Web address for the Federal eRulemaking Portal, *http://www.regulations.gov,* under the heading ''DEA Federal Register Representative.'' This Web address provides the ability to type short comments directly into the comment field on the Web page or to attach a file for lengthier comments. This change conforms to the DEA's current practice, referenced in the DEA's recent **Federal Register** publications, which requires that comments either be submitted through *http://www.regulations.gov* or be directed to the DEA Federal Register Representative.

N. 21 CFR Part 1321

The DEA is amending the Table of DEA Mailing Addresses found in § 1321.01 to account for changes in this rule as part of the implementation of ITDS. The DEA is also taking this opportunity to implement various technical amendments to the Table of DEA Mailing Addresses.

Pursuant to this final action all import and export applications and filings would be submitted through the DEA Diversion Control Division secure network application. The DEA will amend the Table of DEA Mailing Addresses to retain a reference to the notifications that, prior to this rule, could be made by mail, but will note with an asterisk that those filings must now be made electronically. The CFR sections listed under the DEA Import/Export Unit will be merged with those under the DEA Regulatory Section and placed under the header of ''DEA Regulatory Section.''

The mailing addresses for §§ 1308.21(a), 1308.23(b), 1308.25(a), 1308.31(a), 1308.33(b), and 1310.13(b) will be transferred from the DEA Diversion Control Division to the DEA Drug & Chemical Evaluation Section (DRE), the subject matter experts on excluded and exempted products. This change will allow these matters to be processed in a more efficient manner. The reference to § 1307.22, ''Disposal of Controlled substances by the Administration delivery application,'' will be revised to ''Delivery of surrendered and forfeited controlled substances'' in conformity with the final rule, Disposal of Controlled Substances, 79 FR 53520, Sept. 9, 2014. Corresponding to recent internal DEA reorganization, the mailing addresses for §§ 1303.12(b) and (d), 1303.22, 1304.31(a), 1304.32(a), 1315.22, 1315.32(e) and (g), 1315.34(d), and 1315.36(b), regarding quota applications and reporting, will be moved from the DEA Drug & Chemical Evaluation Section to the UN Reporting & Quota Section under a new corresponding header.

IV. Regulatory Analyses

Executive Orders 12866, Regulatory Planning and Review, and 13563, Improving Regulation and Regulatory Review

This final rule was developed in accordance with the principles of Executive Orders 12866 and 13563. The DEA has determined that this final rule is a significant regulatory action, and accordingly this rule has been submitted to the Office of Management and Budget for review.

By business activity, the DEA estimates this rule will result in a combined annual savings of $424,640 for controlled substances importers, exporters, researchers, and analytical labs; a combined annual cost of $5,011 for listed chemical importers and exporters and tableting and encapsulating machine importers and exporters; and no economic impact for brokers, domestic transactions in tableting and encapsulating machines, and mail order transactions of ephedrine (EPH), pseudoephedrine (PSE), phenylpropanolamine (PPA), or gamma-hydroxybutyric acid (GHB). Therefore, the estimated net annual impact of this rule is a cost savings of $419,629 and the estimated combined annual economic effect is $429,650. The DEA does not anticipate that this rulemaking will have an annual effect on the economy of $100 million or more or adversely affect, in a material way, the economy, a sector of the economy, productivity, competition, jobs, the environment, public health or safety, or State, local, or tribal governments or communities. An economic analysis of the final rule can be found in the rulemaking docket at *http://www.regulations.gov,* under FDMS Docket ID: DEA–2016–0017 (Docket No. DEA–403).

Executive Order 12988, Civil Justice Reform

The regulation meets the applicable standards set forth in sections 3(a) and 3(b)(2) of Executive Order 12988, Civil Justice Reform to eliminate ambiguity, minimize litigation, establish clear legal standards, and reduce burden.

Executive Order 13132, Federalism

This rulemaking does not have federalism implications warranting the application of Executive Order 13132. The rule does not have substantial direct effects on the States, on the relationship between the national government and the States, or the distribution of power and responsibilities among the various levels of government.

Executive Order 13175, Consultation and Coordination With Indian Tribal Governments

This final rule is in accordance with the February 19, 2014, Executive Order 13659, ''Streamlining the Export/Import Process for America's Businesses,'' 79 FR 10657, Feb. 25, 2014. It does not have substantial direct effects on the States, on the relationship between the national government and the States, or the distribution of power and responsibilities between the Federal Government and Indian tribes.

Regulatory Flexibility Act

The Administrator, in accordance with the Regulatory Flexibility Act (5 U.S.C. 601–612) (RFA), has reviewed this rule and by approving it certifies that it will not have a significant economic impact on a substantial number of small entities.

Below is a summary of the threshold analyses conducted by the DEA to support the certification statement above. The complete threshold analysis is available at *http://www.regulations.gov* for easy reference. The DEA specifically solicited written comments regarding the DEA's economic threshold analysis of the impact of these proposed changes. The DEA requested that commenters provide detailed descriptions in their comment of any expected economic impacts, especially to small entities. Commenters were asked to provide empirical data to illustrate the nature and scope of such impact. No comments were received; thus, the analysis that accompanied the NPRM remains unchanged below.

In accordance with the RFA, the DEA evaluated the impact of this rule on small entities. This final rule affects all entities who import or export, or seek to import or export, controlled substances, listed chemicals, tableting and encapsulating machines, or who broker international transactions (from foreign country to another foreign country while in the United States). Additionally, this final rule affects all persons who would be required to report unusual or excessive loss or disappearance of a listed chemical under the control of the regulated person in accordance with proposed revised § 1310.05(b)(1), all persons who are required to report domestic regulated transactions in tableting or encapsulating machines in accordance with proposed revised 21 CFR 1310.05(b)(2), and all persons who are required to report mail order transactions of EPH, PSE, PPA, or GHB in accordance with 21 CFR 1310.03(c). The affected entities include DEA registrants and non-registrants. A DEA registration is required to import or export any controlled substance and most list I chemicals. A DEA registration is not required to import or export some list I chemicals or any list II chemical, to import or export tableting and encapsulating machines, or to broker international transactions. Also, a DEA registration is not required to conduct domestic transactions in tableting and encapsulating machines or mail order transactions of EPH, PSE, or PPA. (Registration is required for mail order transactions of GHB as GHB is a schedule I controlled substance.) The affected entities (DEA registrants and non-registrants) are grouped into ''business activities,'' based on types of activities performed by the entities. The business activities described in this analysis that are required to have DEA registrations are importers/exporters, researchers, analytical labs, and chemical importers/exporters that deal in the list I chemicals requiring registration (referred to as ''DEA-registered listed chemical importers/exporters''). The business activities described in this analysis that are not required to have DEA registrations are chemical importers/exporters that deal in list I chemicals not requiring registration and list II chemicals (referred to as ''non-registered listed chemical importers/exporters''), tableting/encapsulating machine importers/exporters, brokers of international transactions, tableting/encapsulating machine domestic suppliers, and entities selling EPH, PSE, and/or PPA by mail order.

The DEA estimates that 7,840 entities are affected by this rule, which consist of 331 controlled substances importers/exporters; 5,884 researchers; 1,200 analytical labs; 231 DEA-registered listed chemical importers/exporters; 76 non-registered listed chemical importers/exporter; 56 tableting/encapsulating machine importers/exporters; 12 brokers of international transactions; 46 tableting/encapsulating machine domestic suppliers; and 4 entities selling EPH, PSE, PPA, and/or GHB by mail order. Regulated persons potentially reporting unusual or excessive loss or disappearance of a listed chemical would be included in one of the business activities above.

The DEA estimates 7,321 (93.4%) of total 7,840 affected entities are small entities. Specifically, the DEA examined the impact of the proposed changes regarding (1) mandatory electronic permit applications and filings, and (2) 180-calendar-day expiration for all declarations for the 7,321 small entities affected by the final rule, which consist of 310 controlled substances importers/exporters; 5,474 researchers; 1,134 analytical labs; 218 DEA-registered listed chemical importers/exporters; 72 non-registered listed chemical importers/exporters; 54 tableting/encapsulating machine importers/exporters; 11 brokers of international transactions; 44 tableting/encapsulating machine domestic suppliers; and 4 entities selling EPH, PSE, PPA, and/or GHB by mail order.

The DEA is mandating the electronic submission of all permit applications and other required filings and reports associated with the importation or exportation of tableting and encapsulating machines, controlled substances, and listed chemicals. Additionally, the DEA is mandating the electronic submission of all reports associated with the unusual or excessive loss or disappearance of a listed chemical, domestic regulated transactions in tableting or encapsulating machines, and mail order transactions of EPH, PSE, PPA, and GHB. The DEA would cease to accept paper filing of controlled substances import/export permit applications (other than transshipments), controlled substances import/export declarations, listed chemicals import/export declarations, and certain filings and reports specified as discussed previously in this document. Currently, some electronic forms associated with these activities are available online and are in use. Usage rates vary for each form and also vary by business activities. However, as virtually all paper submissions of permit applications and declarations are currently delivered via express common carrier with pre-paid return envelope or account information, savings are anticipated because of this change.

The DEA estimates that each conversion to electronic filing from paper controlled substances import/export permit application and controlled substances import/export declaration will result in an estimated cost savings of $58.75 and $9.75, respectively. Based on DEA's registration data, the DEA assumes all affected entities have information systems capable of completing and submitting online forms and downloading, printing, and transmitting electronic documents at nominal additional cost. Among the affected establishments that hold DEA registrations, 92% of previous applications for registration or renewal of registration were made online. Furthermore, even though the email address is an optional data field, 99% of the registrations have an email address on record. Based on these facts and the high rate of internet penetration in the general U.S. population,[10] it is reasonable to assume virtually all regulated establishments, registrants and non-registrants, have information systems capable of completing and submitting online forms and downloading, printing, and transmitting electronic documents at minimal additional cost. No special software or equipment will be needed to access the DEA Diversion Control Division secure network application.

There are no anticipated cost savings for the conversion to electronic filing from paper for the listed chemicals import/export declarations and tableting

[10] *See* note 15 of the accompanying Economic Impact Analysis (''An estimated 78.1 percent of people in U.S. households had a high-speed Internet connection in 2013. ''Computer and Internet Use in the United States: 2013,'' U.S. Census Bureau, *http://www.census.gov/content/dam/Census/library/publications/2014/acs/acs-28.pdf.*'').

and encapsulating machine import/export notifications since virtually all are currently submitted via online, facsimile, or email, without the use of a common carrier. However, the DEA anticipates an additional cost associated with the new requirement for tableting/encapsulating machine importers/exporters to submit return information within 30 calendar days after the release by a customs officer has taken place or within 10 calendar days after receipt of a written request by the Administration to the exporter/importer, whichever is sooner.

The DEA estimates there will be no economic impact associated with the electronic submission of all reports associated with the unusual or excessive loss or disappearance of a listed chemical, domestic regulated transactions in tableting or encapsulating machines, and mail order transactions of EPH, PSE, PPA, and GHB. While the written reports would be required to be made online, the labor cost of making the report is expected to be the same, whether on paper or online.

Based on the varying number of annual occurrences estimated for each of the business activities, the DEA estimates importers/exporters as a group would save $383,857, researchers as a group would save $4,316, and analytical labs as a group would save $37,567. The DEA estimates tableting/encapsulating machine importers/exporters as a group would have an additional cost of $3,978, for a total net savings of $421,761 for the electronic submissions requirement. (Figures are rounded). Based on the number of affected entities and the cost savings to the business activities as a group, the DEA estimated the average annual cost savings for each affected entity. The DEA estimates importers/exporters, researchers, and analytical labs will save on average $1,160, $1, and $31 per year, respectively, and tableting/encapsulating machine importers/exporters would have a cost of $71 per year.

In addition, the DEA is specifying that all controlled substance and listed chemical declarations expire in 180 calendar days, consistent with the controlled substance import/export permits. If release by a customs officer will occur more than 180 calendar days after the declaration is deemed filed, the declarant must submit a new declaration for the transaction. The 180-calendar-day expiration provision for all controlled substance and listed chemical declarations is estimated to cause a small increase in the number of re-submissions of the declarations. The DEA estimates approximately 1% of all declarations would require re-submissions to replace the expiring declaration, requiring a total of an additional 85 controlled substance declarations and 132 listed chemical declarations per year. The estimated cost of each re-submission of controlled substance declarations and listed chemical declarations, based on estimated labor rates and time to complete the forms, is $13.02 and $7.81, respectively. There is no cost to tableting/encapsulating machine importers/exporters and brokers of international transactions, as this provision does not apply to these business activities. Based on the varying number of annual re-submissions estimated for each of the business activities, the DEA estimates this provision, if promulgated, would cost importers/exporters as a group $1,023, researchers as a group $24, analytical labs as a group $54, chemical importers/exporters as a group $689, and non-registered chemical importers/exporters as a group $344, for a total of $2,132. Based on the number of affected entities and the cost to the business activities as a group, the DEA estimated the average annual cost for each affected entity. The DEA estimates importers/exporters, researchers, analytical labs, chemical importers/exporters, and non-registered chemical importers/exporters will have an average cost impact of $3; $0; $0; $3; and $5 per year, respectively. (Figures are rounded).

In summary, the DEA combined the impact of the two provisions to estimate the net impact to the affected small entities. The DEA estimates an average annual net savings of $1,157 for the 310 controlled substance importers/exporters, an average annual net savings of $1 for the 5,474 researchers, an average annual net savings of $31 for the 1,134 analytical labs, an average annual net cost of $3 for the 218 DEA-registered listed chemical importers/exporters, an average annual net cost of $5 for the 72 non-registered listed chemicals importers/exporters, an annual net cost of $71 for the 54 tableting/encapsulating machine importers/exporters, no economic impact for the 11 brokers of international transactions, no economic impact for the 44 tableting/encapsulating machine domestic suppliers, and no economic impact for 4 entities selling EPH, PSE, PPA, and GHB by mail order.

The DEA evaluated the net economic impact by size category for each of the business activities. The DEA estimates that the average annual cost savings of $1,157 for controlled substance importers/exporters is economically significant, cost savings greater than 1% of annual revenue, for 32 of 310 small importer/exporter entities. None of the remaining 7,011 small entities of the remaining business activities are estimated to be significantly impacted by this final rule. This rule will have a significant economic impact, in form of cost savings, on 32 (0.4%) of the 7,321 affected small entities. It is the DEA's assessment that 0.4% of small entities does not constitute a substantial number. The DEA's evaluation of economic impact by size category indicates that the final rule will not have a significant effect on a substantial number of these small entities.

Unfunded Mandates Reform Act of 1995

The estimated annual impact of this rule is $429,650; thus, the DEA has determined in accordance with the Unfunded Mandates Reform Act of 1995 (UMRA), 2 U.S.C. 1501 *et seq.,* that this action would not result in any federal mandate that may result in the expenditure by State, local, and tribal governments, in the aggregate, or by the private sector, of $100,000,000 or more (adjusted for inflation) in any one year. Therefore, neither a Small Government Agency Plan nor any other action is required under provisions of UMRA.

Paperwork Reduction Act of 1995

Pursuant to section 3507(d) of the Paperwork Reduction Act of 1995 (PRA) (44 U.S.C. 3501 *et seq.*), the DEA has identified the following collections of information related to this final rule and has submitted this collection request to the Office of Management and Budget (OMB) for review and approval. This final rule updates the DEA regulations for import and export of controlled substances, listed chemicals, and tableting and encapsulating machines. The rule also clarifies certain policies and reflects current procedures and technological advancements. It allows for the implementation of the President's Executive Order on streamlining the export/import process, requiring the government-wide utilization of the International Trade Data System (ITDS). The DEA is not authorized to impose a penalty on persons for violating information collection requirements which do not display a current OMB control number, if one is required. Copies of existing information collections approved by OMB may be obtained at *http://www.reginfo.gov/public/do/PRAMain.*

A. Collections of Information Associated With the Final Rule

The DEA is revising existing information collections 1117–0004, 1117–0009 and 1117–0013 by establishing mandatory filing of return information for imports and exports of controlled substances.

Additionally, the DEA is also revising existing information collection 1117–0024 by establishing two new forms for the reporting of transactions with listed chemicals, tableting machines, and encapsulating machines. Specifically, the DEA is creating new DEA Form 452, ''Reports for Regulated Machines.'' The DEA Form 452 will be used by regulated persons to report both domestic regulated transactions as well as import and export regulated transactions of tableting and encapsulating machines. The DEA is also establishing mandatory filing of return information for the importing and exporting of tableting and encapsulating machines that would be incorporated into the DEA Form 452. Additionally, the DEA is revising existing information collection 1117–0024 by establishing a new form for the reporting of unusual or excessive loss or disappearance of a listed chemical. Regulated persons would report this information on new DEA Form 107, ''Reports of Loss or Disappearance of Listed Chemicals.''

The DEA is revising existing information collection 1117–0033 by establishing a new form for reporting mail-order transactions involving specified listed chemicals. Specifically, the DEA is creating new DEA Form 453, ''Report of Mail Order Transactions.'' The DEA Form 453 will be used by regulated persons required to file monthly reports of transactions with nonregulated persons with EPH, PSE, PPA, or GHB (including drug products containing these chemicals or controlled substance) and use or attempt to use the U.S. Postal Service or any private or commercial carrier as well as regulated persons required to file monthly reports of export transactions with EPH, PSE, PPA, or GHB (including drug products containing these chemicals or controlled substance) and use or attempt to use the U.S. Postal Service or any private or commercial carrier.

1. Title: Application for Permit To Export Controlled Substances—DEA Form 161/Application for Permit To Export Controlled Substances for Subsequent Reexport—DEA Form 161R/ Application for Permit To Export Controlled Substances for Subsequent Reexport Among Members of the European Economic Area—DEA Form 161R–EEA

OMB Control Number: 1117–0004.

Form Number: DEA Form 161, 161R, 161R–EEA.

As part of the implementation of the ITDS, the DEA is mandating electronic filing of return information for any person who desires to export or reexport controlled substances listed in schedule I or II, any narcotic substance listed in schedules III or IV, or any non-narcotic substance in schedule II which the Administrator has specifically designated by regulation in § 1312.30, or any non-narcotic substance in schedule IV or V which is also listed in schedule I or II of the Convention on Psychotropic Substances, 1971.

The DEA is amending § 1312.22 to provide clear instructions on the process of return information for controlled substances subject to export permit requirements, which will be submitted electronically as part of the DEA Form 161. Specifically, in § 1312.22 the DEA is requiring that within 30 calendar days after a controlled substance is released by a customs officer at the port of export from the United States in accordance with the permitting process, or within 10 calendar days after receipt of a written request by the Administration to the exporter, whichever is sooner, the exporter must file a report with the Administration through the DEA Diversion Control Division secure network application (available on the DEA Diversion Control Division Web site) that such export has occurred and the specifics of the transaction.

As part of the implementation of ITDS, the DEA is establishing a new DEA Form 161R–EEA, discussed in greater detail below, to be used by registrants or regulated persons who export controlled substances for reexport among members of the European Economic Area. The existing DEA Form 161R would remain in use for exports of controlled substances that will be reexported to countries that are not members of the European Economic Area. The DEA is amending § 1312.22 to provide clear instructions on the process of return information for controlled substances subject to reexport permit requirements that will be reexported outside of the European Economic Area, which will be submitted electronically as part of the DEA Form 161R. Consistent with current requirements, the amended § 1312.22 requires that within 30 calendar days after a controlled substance is released by a customs officer at the port of export the exporter must file a report with the Administration through the DEA Diversion Control Division secure network application (available on the DEA Diversion Control Division Web site) that such export has occurred and the specifics of the transaction. Also consistent with current requirements, the amended text requires that the exporter must additionally electronically file a similar report of return information within 30 calendar days of the controlled substances being exported from the first country to the second country. As noted, the DEA Form 161R, and associated return information, are required to be accessed, completed, and submitted to the DEA through the DEA Diversion Control Division secure network application.

This final rule contains amendments that implement section 4, Re-exportation Among Members of the European Economic Area, of the Improving Regulatory Transparency for New Medical Therapies Act, Public Law 114–89, which was signed into law on November 25, 2015. Section 4 amended section 1003 of the Controlled Substances Import and Export Act (21 U.S.C. 953) by making changes to paragraph (f) and adding paragraph (g) that allows for reexportation of controlled substances among members of the European Economic Area. While other reexports must be completed no later than 180 days after initial export from the United States, controlled substances may continue to be reexported among members of the European Economic Area indefinitely, so long as the statutory conditions are met. As part of the implementation, the DEA is establishing a new DEA Form 161R–EEA, ''Application for Permit to Export Controlled Substances for Subsequent Reexport Among Members of the European Economic Area,'' to be used by registrants or regulated persons who export controlled substances for reexport among members of the European Economic Area. Specifically, in § 1312.22, the DEA is requiring that within 30 calendar days after the controlled substance is released by a customs officer at the port of export the exporter must file a report with the Administration through the DEA Diversion Control Division secure network application of the particulars of the transaction. The exporter must additionally file similar return information within 30 days of the controlled substances being exported from the first country to the second country and for each subsequent reexport among members of the European Economic Area. The DEA considered but ultimately did not choose to propose that such applications would be made electronically on the DEA Form 161R based on the fact that there are different application requirements for the two types of transactions required by the CSA. Most important of these distinctions for tracking purposes are that reexports among members of the European Economic Area do not have a time period for which such transactions will ''close'' (*i.e.,* all return information submitted). While under previous § 1312.22(d)(7) (now § 1312.22(h)(6)), other reexports must be completed no later than 180 days after release by a customs officer at the port of export from the United States, the 2015 Act specifies that controlled substances may continue to be reexported among members of the European Economic Area indefinitely, so long as the statutory conditions are met. As noted, the DEA Form 161R–EEA, and associated return information, would be required to be accessed, completed, and submitted to the DEA through the DEA Diversion Control Division secure network application.

The DEA estimates that there will be 125 respondents to this information collection. The DEA estimates that the frequency of response will vary as DEA Form 161 is required to be completed by each respondent per each occurrence. The DEA estimates there will be a total of 5,386 responses. The DEA estimates, based on data from an already approved collection containing return information, that it will take 5 minutes (online) to provide return information electronically and that the total annual burden will be 449 hours. The DEA estimates that the frequency of response will vary as DEA Form 161R and DEA Form 161R–EEA are required to be completed by each respondent per each occurrence. The DEA estimates there will be a combined total of 789 responses for DEA Form 161R and DEA Form 161R–EEA. Since the distinction between DEA Form 161R and DEA Form 161R–EEA does not currently exist, the DEA does not have an estimated number of responses for the two forms separately. Actual responses will be used for future information collection requests. Since return information is currently required for reexportations, the final rule does not create a new information collection burden for reexportations.

2. Title: Controlled Substances Import/ Export Declaration—DEA Form 236

OMB Control Number: 1117–0009.
Form Number: DEA Form 236.

As part of the implementation of the ITDS, the DEA is mandating electronic filing of return information for any person who desires to import non-narcotic substances in schedules III, IV, and V or to export non-narcotic substances in schedules III and IV and any other substance in schedule V.

The DEA is amending to § 1312.18(e) to provide clear instructions on the process of return information for controlled substances imported under declaration procedures, which will be submitted electronically as part of the DEA Form 236 (Import declaration). The amended regulation would state that within 30 calendar days after actual receipt of a controlled substance at the importer's registered location, or within 10 calendar days after the receipt of a written request by the Administration to the importer, whichever is sooner, the importer must report to the Administration utilizing the secure network application available on the DEA Diversion Control Division Web site certifying that such import occurred and the details of the transaction.

The DEA is amending to § 1312.27(d) in the final rule to provide clear instructions on the process of return information for controlled substances exported and reexported under declaration procedures, which will be submitted electronically as part of the DEA Form 236 (Export declaration). The amended regulation would state that within 30 calendar days after the controlled substance is released by a customs officer at the port of export or within 10 calendar days after receipt of a written request by the Administration to the exporter, whichever is sooner, the exporter must report to the Administration through the DEA Diversion Control Division secure network application (available on the DEA Diversion Control Division Web site) certifying that such export has occurred and the details of the transaction. For reexports under declaration procedures, the amended regulation states that within 30 calendar days after the controlled substance is exported from the first country to the second country, or within 10 calendar days after the receipt of a written request by the Administration to the exporter, whichever is sooner, the exporter must report to the Administration through the DEA Diversion Control Division secure network application (available on the DEA Diversion Control Division Web site) certifying that such export from the first country has occurred and the details of the transaction.

The DEA estimates that there will be 341 respondents to this information collection. The DEA estimates that the frequency of response will vary as DEA Form 236 is required to be completed by each respondent per each occurrence. The DEA estimates there will be a total of 6,026 responses. The DEA estimates, based on data from an already approved collection containing return information, that it will take 5 minutes (online) to provide return information electronically and that the total annual burden will be 502 hours.

3. Title: Application for Permit To Import Controlled Substances for Domestic and/or Scientific Purposes Pursuant to 21 U.S.C. 952

OMB Control Number: 1117–0013.
Form Number: DEA Form 357.

As part of the implementation of the ITDS, the DEA is mandating electronic filing of return information for any person who desires to import any controlled substance listed in schedule I or II or any narcotic controlled substance listed in schedule III, IV, or V or any non-narcotic controlled substance in schedule III which the Administrator has specifically designed by regulation in 21 CFR 1312.30 or any non-narcotic controlled substance in schedule IV or V which is also listed in schedule I or II of the Convention on Psychotropic Substances.

The DEA is adding § 1312.12(d) to provide clear instructions on the process of return information for controlled substances imported under permit procedures, which will be submitted electronically as part of the DEA Form 357. Specifically, in § 1312.12(d), the DEA is requiring that within 30 calendar days of actual receipt of a controlled substance at the importer's registered location, or within 10 calendar days after receipt of a written request by the Administration, whichever is sooner, the importer must report to the Administration through the DEA Diversion Control Division secure network application (available on the DEA Diversion Control Division Web site) that such import occurred and the details of the transaction.

The DEA estimates that there will be 148 respondents to this information collection. The DEA estimates that the frequency of response will vary as DEA Form 357 is required to be completed by each respondent per each occurrence. The DEA estimates there will be a total of 1,024 responses. The DEA estimates, based on data from an already approved collection containing return information, that it will take 5 minutes (online) to provide return information electronically and that the total annual burden will be 85 hours.

4. Title: Reports of Loss or Disappearance of Listed Chemicals—DEA Form 107, and Regulated Transactions in Tableting/Encapsulating Machines—DEA Form 452

OMB Control Number: 1117–0024.
Form Number: DEA Form 107 and DEA Form 452.

As part of the implementation of the ITDS, the DEA is establishing a new DEA Form 452 to be used by regulated persons involved in regulated transactions in tableting or encapsulating machines. The DEA would standardize the current report required in the previous § 1310.05(a)(4) for domestic regulated transactions in a tableting or encapsulating machine as well as the report required in the previous § 1310.05(c) for import and export of tableting and encapsulating machines. DEA Form 452 would be required to be accessed, completed, and submitted to the DEA through the DEA Diversion Control Division secure network application.

Moreover, under both the previous and revised regulation, each regulated person must orally report any domestic regulated transaction in a tableting machine or an encapsulating machine to the Special Agent in Charge of the DEA Divisional Office for the area in which the regulated person making the report is located. The DEA now clarifies that the report must be made when the order is placed with the seller. The regulated person must subsequently file a written report of the domestic regulated transaction (on DEA Form 452) with the Administration through the DEA Diversion Control Division secure network application within 15 calendar days after the order has been shipped by the seller. A report (on DEA Form 452) may contain multiple line entries for more than one transaction.

Additionally, the DEA is mandating filing of return information for the import and export of tableting and encapsulating machines which will be electronically submitted as part of the DEA Form 452. The amended regulation states that within 30 calendar days of the shipment being released by a customs officer at the port of entry or port of export, or within 10 calendar days after the receipt of a written request by the Administration to the importer/exporter, whichever is sooner, the importer/exporter must report to the Administration through the DEA Diversion Control Division secure network application (available on the DEA Diversion Control Division Web site) certifying that such import/export occurred and the details of the transaction. Previously, § 1310.05(c) instructed that regulated persons needed to provide notification of the import or export of a tableting machine or encapsulating machine on or before the date of exportation. However, the DEA has amended § 1310.05(c) in order for DEA Form 452 to be submitted to the DEA at least 15 calendar days before the date of release by a customs officer at the port of entry or port of export in order to allow time for the DEA to review the information and transmit it into the ITDS prior to the actual import or export.

As part of the implementation of the ITDS, the DEA is establishing a new DEA Form 107 to be used by regulated persons involved in reporting unusual or excessive loss or disappearance of a listed chemical. The DEA would standardize the current report required to be filed in the previous § 1310.05(a)(3). Each regulated person must report to the Special Agent in Charge of the DEA Divisional Office for the area in which the regulated person making the report is located any unusual or excessive loss or disappearance of a listed chemical under the control of the regulated person. The regulated person will orally report to the Special Agent in Charge of the DEA Divisional Office at the earliest practicable opportunity after the regulated person becomes aware of the circumstances involved. The regulated person must also file a complete and accurate DEA Form 107 with the Administration through the DEA Diversion Control Division secure network application within 15 calendar days after becoming aware of the circumstances requiring the report. Unusual or excessive losses or disappearances must be reported whether or not the listed chemical is subsequently recovered or the responsible parties are identified and action taken against them. DEA Form 107 would be required to be accessed, completed, and submitted to the DEA through the DEA Diversion Control Division secure network application. While the report would be electronic, the filing requirements are essentially unchanged. The DEA estimates that the reporting burden would continue to be 20 minutes for each report.

Specifically, based on publicly available information and historical data, the DEA estimates that there will be 130 respondents to this information collection, 60 for domestic transactions and 70 for imports or exports. The DEA estimates that the frequency of response will vary as DEA Form 452 is required to be completed by each respondent per each occurrence. As the DEA does not have a strong basis to estimate the number of responses for domestic transactions, the DEA makes an initial estimate (to be refined later) of 52 responses per week for each of 60 respondents, or a total of 3,120 domestic transaction related responses. Based on historical data, the DEA estimates there will be 917 import or export related responses for a grand total of 4,037 responses for domestic transactions, imports, and exports. Because of the information required on the DEA Form 452, the DEA estimates that this form will take 20 minutes to complete, including the oral report for domestic transactions and return information for imports and exports, and that the total annual burden will be 1,346 hours.

5. Title: Report of Mail Order Transactions—DEA Form 453

OMB Control Number: 1117–0033.
Form Number: DEA Form 453.

As part of the implementation of the ITDS, the DEA is establishing a new DEA Form 453, ''Report of Mail Order Transactions,'' to be used by regulated persons required to file monthly reports of transactions with nonregulated persons with ephedrine, pseudoephedrine, phenylpropanolamine, or gamma-hydroxybutyric acid (including drug products containing these chemicals or controlled substance) and use or attempt to use the U.S. Postal Service or a private or commercial carrier as well as regulated persons required to file monthly reports of export transactions with ephedrine, pseudoephedrine, phenylpropanolamine, or gamma-hydroxybutyric acid (including drug products containing these chemicals or controlled substance) and use or attempt to use the U.S. Postal Service or a private or commercial carrier. The DEA would require reports under the previous §§ 1310.03(c) and 1310.06(i) to be submitted on a new DEA Form 453 which would be required to be accessed and submitted to the DEA through the DEA Diversion Control Division secure network application.

Additionally, the form would require the following information: The mail order transaction supplier name and registration number; the purchaser's name and address; the name and address shipped to (if different from purchaser's name and address); the name of the chemical contained in the scheduled listed chemical product and total quantity shipped (*e.g.,* pseudoephedrine, 3 grams); the date of shipment; the product name; the dosage form (*e.g.,* tablet, liquid, powder); the dosage strength; the number of dosage units; the package type; the number of packages; and the lot number. Previously, § 1310.05(e) instructed that regulated persons submit a written report, containing the information listed above, on or before the 15th day of each month following the month in which the distributions took place. However, the DEA is amending part 1310 in order for DEA Form 453 to be submitted to the DEA electronically on or before the 15th day of each month following the month in which the distributions took place.

Specifically, based on historical data, the DEA estimates that there will be 7 respondents to this information collection. The respondents will provide 12 responses per year. The DEA estimates there will be a total of 84 responses per year. The DEA estimates that this form will take 15 minutes to complete and that the total annual burden will be 21 hours.

Rule Text

List of Subjects

21 CFR Part 1300

Chemicals, Drug traffic control.

21 CFR Part 1301

Administrative practice and procedure, Drug traffic control, Exports, Imports, Security measures.

21 CFR Part 1302

Drug traffic control, Exports, Imports, Labeling, Packaging and containers.

21 CFR Part 1303

Administrative practice and procedure, Drug traffic control.

21 CFR Part 1304

Drug traffic control, Reporting and recordkeeping requirements.

21 CFR Part 1308

Administrative practice and procedure, Drug traffic control, Exports, Imports, Reporting and recordkeeping requirements.

21 CFR Part 1309

Administrative practice and procedure, Drug traffic control, Exports, Imports.

21 CFR Part 1310

Drug traffic control, Exports, Imports, Reporting and recordkeeping requirements.

21 CFR Part 1312

Administrative practice and procedure, Drug traffic control, Exports, Imports, Reporting and recordkeeping requirements.

21 CFR Part 1313

Administrative practice and procedure, Drug traffic control, Exports, Imports, Reporting and recordkeeping requirements.

21 CFR Part 1314

Drug traffic control, Reporting and recordkeeping requirements.

21 CFR Part 1315

Administrative practice and procedure, Chemicals, Drug traffic control, Imports, Reporting and recordkeeping requirements.

21 CFR Part 1316

Administrative practice and procedure, Authority delegations (Government agencies), Drug traffic control, Research, Seizures and forfeitures.

21 CFR Part 1321

Administrative practice and procedure.

For the reasons stated in the preamble, the DEA amends 21 CFR parts 1300, 1301, 1302, 1303, 1304, 1308, 1309, 1310, 1312, 1313, 1314, 1315, 1316, and 1321 as follows:

PART 1300—DEFINITIONS

■ 1. The authority citation for part 1300 continues to read as follows:

Authority: 21 U.S.C. 802, 821, 822, 829, 871(b), 951, 958(f).

■ 2. In § 1300.01(b):

■ a. Revise definitions of ''Export'' and ''Import'';

■ b. Add definitions of ''Competent national authority'', ''Customs officer'', ''Port of entry'', ''Port of export'', ''Return information'', and ''United States'', in alphabetical order; and

■ c. Remove the definition of ''Jurisdiction of the United States''.

The revisions and additions read as follows:

§ 1300.01 Definitions relating to controlled substances.

* * * * *

(b) * * *

Competent national authority, for purposes of importation and exportation of controlled substances and listed chemicals, means an entity lawfully entitled to authorize the import and export of controlled substances, and to regulate or enforce national controls over listed chemicals, and included as such in the directory of ''Competent National Authorities Under the International Drug Control Treaties'' published by the United Nations Office on Drugs and Crime. For purposes of exports of narcotic drugs, the term also includes freely associated states authorized to receive such exports pursuant to 48 U.S.C. 1972.

* * * * *

Customs officer means either an Officer of the Customs as defined in 19 U.S.C. 1401(i) (that is, of the U.S. Customs and Border Protection), or any individual duly authorized to accept entries of merchandise, to collect duties, and to enforce the customs laws of any commonwealth, territory, or possession of the United States.

* * * * *

Export means, with respect to any article, any taking out or removal of such article from the United States (whether or not such taking out or removal constitutes an exportation within the meaning of the customs laws, export control laws enforced by other agencies, or related laws of the United States).

* * * * *

Import means, with respect to any article, any bringing in or introduction of such article into the customs territory of the United States from any place outside thereof (but within the United States), or into the United States from any place outside thereof (whether or not such bringing in or introduction constitutes an importation within the meaning of the tariff laws of the United States).

* * * * *

Port of entry means, unless distinguished as being a foreign port of entry, any place at which a customs officer is duly authorized to accept entries of merchandise, to collect duties, and to enforce the various provisions of the customs laws of the United States (whether or not such place is a port of entry as defined in title 19 of the United States Code or its associated implementing regulations). Examples of ports of entry include, but are not limited to, places designated as ports of entry or customs stations in title 19 of the *Code of Federal Regulations* or by the governing customs authority of that area. When shipments are transported under U.S. Customs and Border Protection's immediate transportation procedures, the port of entry shall be the port of final destination.

Port of export means, unless distinguished as being a foreign port of export, any place under the control of a customs officer where goods are loaded on an aircraft, vessel or other conveyance for export outside of the United States. For goods loaded aboard an aircraft or vessel in the United States, that stops at several ports before departing the United States, the port of export is the first port where the goods were actually loaded. For goods off-loaded from the original conveyance to another conveyance (even if the aircraft or vessel belongs to the same carrier) at any port subsequent to the port where the first on-loading occurred in the United States, the port where the goods were loaded onto the last conveyance before departing the United States is the port of export.

* * * * *

Return information means supplemental information required to be reported to the Administration following an import or export transaction containing the particulars of the transaction and any other information as the Administration may specify.

* * * * *

United States, when used in a geographic sense, means all places and waters, continental or insular, subject to the jurisdiction of the United States, which, in addition to the customs territory of the United States, include but are not limited to the U.S. Virgin Islands, Guam, American Samoa, and the Northern Mariana Islands.

■ 3. In § 1300.02(b):

■ a. Add definitions of ''Competent national authority'', ''Customs officer'', ''Export'', ''Import'', ''Port of entry'', ''Port of export'', ''Return information'', and ''United States'', in alphabetical order; and

■ b. Remove definitions of ''Chemical import'' and ''Jurisdiction of the United States''.

The additions read as follows:

§ 1300.02 Definitions relating to listed chemicals.

* * * * *

(b) * * *

Competent national authority, for purposes of importation and exportation of controlled substances and listed chemicals, means an entity lawfully entitled to authorize the import and export of controlled substances, and to regulate or enforce national controls over listed chemicals, and included as such in the directory of ''Competent National Authorities Under the International Drug Control Treaties'' published by the United Nations Office on Drugs and Crime.

Customs officer means either an Officer of the Customs as defined in 19 U.S.C. 1401(i) (that is, of the U.S. Customs and Border Protection), or any individual duly authorized to accept entries of merchandise, to collect duties, and to enforce the customs laws of any commonwealth, territory, or possession of the United States.

* * * * *

Export means, with respect to any article, any taking out or removal of such article from the United States (whether or not such taking out or removal constitutes an exportation within the meaning of the customs laws, export control laws enforced by other agencies, or related laws of the United States).

* * * * *

Import means, with respect to any article, any bringing in or introduction of such article into the customs territory of the United States from any place outside thereof (but within the United States), or into the United States from any place outside thereof (whether or not such bringing in or introduction constitutes an importation within the meaning of the tariff laws of the United States).

* * * * *

Port of entry, unless distinguished as being a foreign port of entry, means any place at which a customs officer is duly authorized to accept entries of merchandise, to collect duties, and to enforce the various provisions of the customs laws of the United States (whether or not such place is a port of entry as defined in title 19 of the United States Code or its associated implementing regulations). Examples of ports of entry include, but are not limited to, places designated as ports of entry or customs stations in title 19 of the *Code of Federal Regulations* or by the governing customs authority of that area. When shipments are transported under U.S. Customs and Border Protection immediate transportation procedures, the port of entry shall be the port of final destination.

Port of export means, unless distinguished as being a foreign port of export, any place under the control of a customs officer where goods are loaded on an aircraft, vessel or other conveyance for export outside of the United States. For goods loaded aboard an aircraft or vessel in the United States that stops at several ports before departing the United States, the port of export is the first port where the goods were loaded. For goods off-loaded from the original conveyance to another conveyance (even if the aircraft or vessel belongs to the same carrier) at any port subsequent to the port where the first on-loading occurred in the United States, the port where the goods were loaded onto the last conveyance before departing the United States is the port of export. For reporting purposes, in the case of an otherwise lawful export occurring by mail, the port of export is the place of mailing.

* * * * *

Return information means supplemental information required to be reported to the Administration following an import or export transaction containing the particulars of the transaction and any other information as the Administration may specify.

* * * * *

United States, when used in a geographic sense, means all places and waters, continental or insular, subject to the jurisdiction of the United States, which, in addition to the customs territory of the United States, include but are not limited to the U.S. Virgin Islands, Guam, American Samoa, and the Northern Mariana Islands.

* * * * *

PART 1301—REGISTRATION OF MANUFACTURERS, DISTRIBUTORS, AND DISPENSERS OF CONTROLLED SUBSTANCES

■ 4. The authority citation for part 1301 continues to read as follows:

Authority: 21 U.S.C. 821, 822, 823, 824, 831, 871(b), 875, 877, 886a, 951, 952, 953, 956, 957, 958, 965.

■ 5. In § 1301.12, revise paragraph (b)(3) to read as follows:

§ 1301.12 Separate registrations for separate locations.

* * * * *

(b) * * *

(3) An office used by a practitioner (who is registered at another location in the same State in which he or she practices) where controlled substances are prescribed but neither administered nor otherwise dispensed as a regular part of the professional practice of the practitioner at such office, and where no supplies of controlled substances are maintained.

* * * * *

■ 6. In § 1301.24, revise paragraph (a)(1) to read as follows:

§ 1301.24 Exemption of law enforcement officials.

(a) * * *

(1) Any officer or employee of the Administration, any customs officer, any officer or employee of the U.S. Food and Drug Administration, and any other Federal or Insular officer who is lawfully engaged in the enforcement of any Federal law relating to controlled substances, drugs, or customs, and is duly authorized to possess or to import or export controlled substances in the course of his/her official duties; and

* * * * *

■ 7. In § 1301.26, revise paragraph (b) introductory text to read as follows:

§ 1301.26 Exemption from import or export requirements for personal medical use.

* * * * *

(b) The individual makes a declaration to an appropriate customs officer stating:

* * * * *

■ 8. In § 1301.34, revise paragraph (c)(2) to read as follows:

§ 1301.34 Application for importation of Schedule I and II substances.

* * * * *

(c) * * *

(2) Employment of security procedures to guard against in-transit losses.

* * * * *

■ 9. In § 1301.74, revise paragraph (c) introductory text to read as follows:

§ 1301.74 Other security controls for non-practitioners; narcotic treatment programs and compounders for narcotic treatment programs.

* * * * *

(c) The registrant must notify the Field Division Office of the Administration in his or her area, in writing, of any theft or significant loss of any controlled substances within one business day of discovery of the theft or loss. Unless the theft or loss occurs during an import or export transaction, the supplier is responsible for reporting all in-transit losses of controlled substances by their agent or the common or contract carrier selected pursuant to paragraph (e) of this section, within one business day of discovery of such theft or loss. In an import transaction, once a shipment has been released by the customs officer at the port of entry, the importer is responsible for reporting all in-transit losses of controlled substances by their agent or the common or contract carrier selected pursuant to paragraph (e) of this section, within one business day of discovery of such theft or loss. In an export transaction, the exporter is responsible for reporting all in-transit losses of controlled substances by their agent or the common or contract carrier selected pursuant to paragraph (e) of this section within one business day of discovery of such theft or loss, until the shipment has been released by the customs officer at the port of export. The registrant must also complete, and submit to the Field Division Office in his or her area, DEA Form 106 regarding the theft or loss. Thefts and significant losses must be reported whether or not the controlled substances are subsequently recovered or the responsible parties are identified and action taken against them. When determining whether a loss is significant, a registrant should consider, among others, the following factors:

* * * * *

PART 1302—LABELING AND PACKAGING REQUIREMENTS FOR CONTROLLED SUBSTANCES

■ 10. The authority citation for part 1302 continues to read as follows:

Authority: 21 U.S.C. 821, 825, 871(b), 958(e).

■ 11. Revise § 1302.07 to read as follows:

§ 1302.07 Labeling and packaging requirements for imported and exported substances.

(a) The symbol requirements of §§ 1302.03 through 1302.05 apply to every commercial container containing, and to all labeling of, controlled substances imported into the customs territory of the United States from any place outside thereof (but within the United States), or imported into the United States from any place outside thereof.

(b) The symbol requirements of §§ 1302.03 through 1302.05 do not apply to any commercial containers containing, or any labeling of, a controlled substance intended for export.

(c) The sealing requirements of § 1302.06 apply to every bottle, multiple dose vial, or other commercial container of any controlled substance listed in schedule I or II, or any narcotic controlled substance listed in schedule III or IV imported into the customs territory of the United States from any place outside thereof (but within the United States), or imported into the United States from any place outside thereof. The sealing requirements of § 1302.06 apply to every bottle, multiple dose vial, or other commercial container of any controlled substance listed in schedule I or II, or any narcotic controlled substance listed in schedule III or IV, exported or intended for export from the United States. These sealing and labeling requirements are in addition to any sealing requirements required under applicable customs laws.

PART 1303—QUOTAS

■ 12. The authority citation for part 1303 continues to read as follows:

Authority: 21 U.S.C. 821, 826, 871(b).

§ 1303.12 [Amended]

■ 13. In § 1303.12:

■ a. In paragraph (b), remove ''Drug and Chemical Evaluation Section, Drug Enforcement Administration'' and add in its place ''UN Reporting and Quota Section, Diversion Control Division''; and

■ b. In paragraph (d), remove ''Drug & Chemical Evaluation Section, Drug Enforcement Administration'' and add in its place ''UN Reporting and Quota Section, Diversion Control Division''.

§ 1303.22 [Amended]

■ 14. In § 1303.22 introductory text, remove ''Drug & Chemical Evaluation Section, Drug Enforcement Administration'' and add in its place ''UN Reporting and Quota Section, Diversion Control Division''.

PART 1304—RECORDS AND REPORTS OF REGISTRANTS

■ 15. The authority citation for part 1304 continues to read as follows:

Authority: 21 U.S.C. 821, 827, 831, 871(b), 958 (e)–(g), and 965, unless otherwise noted.

■ 16. Revise § 1304.02 to read as follows:

§ 1304.02 Definitions.

Any term contained in this part shall have the definition set forth in section 102 of the Act (21 U.S.C. 802) or § 1300.01, § 1300.03, § 1300.04, or § 1300.05 of this chapter.

■ 17. In § 1304.21, revise paragraph (d) to read as follows:

§ 1304.21 General requirements for continuing records.

* * * * *

(d) In recording dates of receipt, distribution, other transfers, or destruction, the date on which the controlled substances are actually received, distributed, otherwise transferred, or destroyed will be used as the date of receipt, distribution, transfer, or destruction (*e.g.,* invoices or packing slips, or DEA Form 41). In maintaining records concerning imports and exports, the registrant must record the anticipated date of release by a customs official for permit applications and declarations and the date on which the controlled substances are released by a customs officer at the port of entry or port of export for return information.

* * * * *

§ 1304.31 [Amended]

■ 18. In § 1304.31(a), remove ''Drug and Chemical Evaluation Section, Drug Enforcement Administration'' and add in its place ''UN Reporting and Quota Section, Diversion Control Division''.

§ 1304.32 [Amended]

■ 19. In § 1304.32(a), remove ''Drug and Chemical Evaluation Section, Drug Enforcement Administration'' and add in its place ''UN Reporting and Quota Section, Diversion Control Division''.

■ 20. In § 1304.33, revise paragraphs (a) and (f)(1) to read as follows:

§ 1304.33 Reports to Automation of Reports and Consolidated Orders System (ARCOS).

(a) *Reports generally.* All reports required by this section shall be filed with the Pharmaceutical Investigations Section, Diversion Control Division, Drug Enforcement Administration on DEA Form 333, or on media which contains the data required by DEA Form 333 and which is acceptable to the Administration. See the Table of DEA Mailing Addresses in § 1321.01 of this chapter for the current mailing address.

* * * * *

(f) *Exceptions.* (1) A registered institutional practitioner that repackages or relabels exclusively for distribution or that distributes exclusively to (for dispensing by) agents, employees, or affiliated institutional practitioners of the registrant may be exempted from filing reports under this section by applying to the Pharmaceutical Investigations Section, Diversion Control Division, Drug Enforcement Administration. See the Table of DEA Mailing Addresses in § 1321.01 of this chapter for the current mailing address.

* * * * *

PART 1308—SCHEDULES OF CONTROLLED SUBSTANCES

■ 21. The authority citation for part 1308 is revised to read as follows:

Authority: 21 U.S.C. 811, 812, 871(b), 956(b), unless otherwise noted.

■ 22. Revise § 1308.01 to read as follows:

§ 1308.01 Scope of this part.

Schedules of controlled substances established by section 202 of the Act (21 U.S.C. 812) and nonnarcotic substances, chemical preparations, veterinary anabolic steroid implant products, prescription products, anabolic steroid products, and cannabis plant material and products made therefrom that contain tetrahydrocannabinols excluded pursuant to section 201 of the Act (21 U.S.C. 811), as they are changed, updated, and republished from time to time, are set forth in this part.

§ 1308.21 [Amended]

■ 23. In § 1308.21(a), remove ''Office of Diversion Control, Drug Enforcement Administration'' and add in its place ''Drug and Chemical Evaluation Section, Diversion Control Division, Drug Enforcement Administration''.

§ 1308.23 [Amended]

■ 24. In § 1308.23(b), remove ''Office of Diversion Control, Drug Enforcement Administration'' and add in its place ''Drug and Chemical Evaluation Section, Diversion Control Division, Drug Enforcement Administration''.

§ 1308.25 [Amended]

■ 25. In § 1308.25(a), remove ''Office of Diversion Control, Drug Enforcement Administration'' and add in its place ''Drug and Chemical Evaluation Section, Diversion Control Division, Drug Enforcement Administration''.

§ 1308.31 [Amended]

■ 26. In § 1308.31(a), remove ''Office of Diversion Control, Drug Enforcement Administration'' and add in its place ''Drug and Chemical Evaluation Section, Diversion Control Division, Drug Enforcement Administration''.

§ 1308.33 [Amended]

■ 27. In § 1308.33(b), remove ''Office of Diversion Control, Drug Enforcement Administration'' and add in its place ''Drug and Chemical Evaluation Section, Diversion Control Division, Drug Enforcement Administration''.

■ 28. Revise § 1308.49 to read as follows:

§ 1308.49 Temporary scheduling.

(a) Pursuant to 21 U.S.C. 811(h) and without regard to the requirements of 21 U.S.C. 811(b) relating to the scientific and medical evaluation of the Secretary of Health and Human Services, the Drug Enforcement Administration may place a substance into Schedule I on a temporary basis, if it determines that such action is necessary to avoid an imminent hazard to the public safety. An order issued under this section may not be effective before the expiration of 30 calendar days from:

(1) The date of publication by the Administration of a notice in the **Federal Register** of its intention to issue such order and the grounds upon which such order is to be issued; and

(2) The date the Administration has transmitted notification to the Secretary of Health and Human Services of the Administration's intention to issue such order.

(b) An order issued under this section will be vacated upon the conclusion of a subsequent rulemaking proceeding initiated under section 201(a) (21 U.S.C. 811(a)) with respect to such substance or at the end of two years from the effective date of the order scheduling the substance, except that during the pendency of proceedings under section 201(a) (21 U.S.C. 811(a)) with respect to the substance, the Administration may extend the temporary scheduling for up to one year.

PART 1309—REGISTRATION OF MANUFACTURERS, DISTRIBUTORS, IMPORTERS AND EXPORTERS OF LIST I CHEMICALS

■ 29. The authority citation for part 1309 continues to read as follows:

Authority: 21 U.S.C. 802, 821, 822, 823, 824, 830, 871(b), 875, 877, 886a, 952, 953, 957, 958.

■ 30. In § 1309.26, revise paragraph (a)(1) to read as follows:

§ 1309.26 Exemption of law enforcement officials.

(a) * * *

(1) Any officer or employee of the Administration, any customs officer, any officer or employee of the U.S. Food and Drug Administration, and any Federal or Insular officer who is lawfully engaged in the enforcement of any federal law relating to listed chemicals, controlled substances, drugs, or customs, and is duly authorized to possess and distribute List I chemicals in the course of his/her official duties; and

* * * * *

■ 31. In § 1309.32, revise paragraph (d) to read as follows:

§ 1309.32 Application forms; contents; signature.

* * * * *

(d) Each application for registration must include the Administration Chemical Code Number, as set forth in § 1310.02 of this chapter, for each List I chemical to be manufactured, distributed, imported, or exported.

* * * * *

§ 1309.46 [Amended]

■ 32. In § 1309.46(d), remove ''§ 1309.54'' and add in its place ''§ 1309.53''.

§ 1309.51 [Amended]

■ 33. In § 1309.51(a), remove ''1309.57'' and add in its place ''1309.55''.

■ 34. In § 1309.71, revise paragraphs (b)(5) and (7) to read as follows:

§ 1309.71 General security requirements.

* * * * *

(b) * * *

(5) The extent of unsupervised public access to the facility;

* * * * *

(7) The procedures for handling business guests, visitors, maintenance personnel, and nonemployee service personnel in areas where List I chemicals are processed or stored; and

* * * * *

PART 1310—RECORDS AND REPORTS OF LISTED CHEMICALS AND CERTAIN MACHINES; IMPORTATION AND EXPORTATION OF CERTAIN MACHINES

■ 35. The authority citation for part 1310 continues to read as follows:

Authority: 21 U.S.C. 802, 827(h), 830, 871(b), 890.

■ 36. Revise the heading of part 1310 to read as set forth above.

■ 37. In § 1310.03:

■ a. In paragraph (b), remove ''Section 1310.05'' and add in its place ''§ 1310.05''; and

■ b. Revise paragraph (c).

The revision reads as follows:

§ 1310.03 Persons required to keep records and file reports.

* * * * *

(c)(1) Each regulated person who engages in a transaction with a nonregulated person which:

(i) Involves ephedrine, pseudoephedrine, phenylpropanolamine, or gamma hydroxybutyric acid (including drug products containing these chemicals or controlled substance); and

(ii) Uses or attempts to use the U.S. Postal Service or any private or commercial carrier must, on a monthly basis, report to the Administration each such transaction conducted during the previous month as specified in §§ 1310.05(e) and 1310.06(k) on DEA Form 453 through the DEA Diversion Control Division secure network application.

(2) Each regulated person who engages in an export transaction which:

(i) Involves ephedrine, pseudoephedrine, phenylpropanolamine, or gamma hydroxybutyric acid (including drug products containing these chemicals or controlled substance); and

(ii) Uses or attempts to use the U.S. Postal Service or any private or commercial carrier must, on a monthly basis, report each such transaction conducted during the previous month as specified in §§ 1310.05(e) and 1310.06(k) on DEA Form 453 through the DEA Diversion Control Division secure network application.

■ 38. In § 1310.05, revise paragraphs (a), (b), (c), (d) and (e) to read as follows:

§ 1310.05 Reports.

(a)(1) Each regulated person must report to the Special Agent in Charge of the DEA Divisional Office for the area in which the regulated person making the report is located any regulated transaction involving an extraordinary quantity of a listed chemical, an uncommon method of payment or delivery, or any other circumstance that the regulated person believes may indicate that the listed chemical will be used in violation of this part. The regulated person will orally report to the Special Agent in Charge of the DEA Divisional Office at the earliest practicable opportunity after the regulated person becomes aware of the circumstances involved and as much in advance of the conclusion of the transaction as possible. The regulated person must file a written report of the transaction(s) with the Special Agent in Charge of the DEA Divisional Office as set forth in § 1310.06 within 15 calendar days after the regulated person becomes aware of the circumstances of the event.

(2) Each regulated person must report to the Special Agent in Charge of the DEA Divisional Office for the area in which the regulated person making the report is located any proposed regulated transaction with a person whose description or other identifying characteristic the Administration has previously furnished to the regulated person. The regulated person will orally report to the Special Agent in Charge of the DEA Divisional Office at the earliest practicable opportunity after the regulated person becomes aware of the circumstances involved. A transaction may not be completed with a person whose description or identifying characteristic has previously been furnished to the regulated person by the Administration unless the transaction is approved by the Administration.

(b)(1) Each regulated person must report to the Special Agent in Charge of the DEA Divisional Office for the area in which the regulated person making the report is located any unusual or excessive loss or disappearance of a listed chemical under the control of the regulated person. The regulated person will orally report to the Special Agent in Charge of the DEA Divisional Office at the earliest practicable opportunity after the regulated person becomes aware of the circumstances involved. Unless the loss or disappearance occurs during an import or export transaction, the supplier is responsible for reporting all in-transit losses of any listed chemical by their agent or the common or contract carrier. In an import transaction, once a shipment has been released by the customs officer at the port of entry, the importer is responsible for reporting all in-transit losses of any listed chemical by their agent or the common or contract carrier. In an export transaction, the exporter is responsible for reporting all in-transit losses of any listed chemical by their agent or the common or contract carrier until the shipment has been released by the customs officer at the port of export. The regulated person must also file a complete and accurate DEA Form 107, in accordance with § 1310.06(d), with the Administration through the DEA Diversion Control Division secure network application within 15 calendar days after becoming aware of the circumstances requiring the report. Unusual or excessive losses or disappearances must be reported whether or not the listed chemical is subsequently recovered or the responsible parties are identified and action taken against them. When determining whether a loss or disappearance of a listed chemical was unusual or excessive, the regulated persons should consider, among others, the following factors:

(i) The actual quantity of a listed chemical;

(ii) The specific listed chemical involved;

(iii) Whether the loss or disappearance of the listed chemical can be associated with access to those listed chemicals by specific individuals, or whether the loss or disappearance can be attributed to unique activities that may take place involving the listed chemical; and

(iv) A pattern of losses or disappearances over a specific time period, whether the losses or disappearances appear to be random, and the result of efforts taken to resolve the losses.

(v) If known, the regulated person should also consider whether the specific listed chemical was a likely candidate for diversion as well as local trends and other indicators of the diversion potential of the listed chemical.

(2) Each regulated person must orally report any domestic regulated transaction in a tableting machine or an encapsulating machine to the Special Agent in Charge of the DEA Divisional Office for the area in which the regulated person making the report is located when the order is placed with the seller. The regulated person also must file a report of the transaction (on DEA Form 452) with the Administration through the DEA Diversion Control Division secure network application within 15 calendar days after the order has been shipped by the seller. A report (DEA Form 452) may list more than one machine for a single transaction. Upon receipt and review, the Administration will assign a completed report a transaction identification number. The report will not be deemed filed until a

transaction identification number has been issued by the Administration.

(c) *Imports and exports of tableting machines and encapsulating machines.* (1) Each regulated person who imports or exports a tableting machine, or encapsulating machine, must file a report of such importation or exportation on DEA Form 452 with the Administration through the DEA Diversion Control Division secure network application, at least 15 calendar days before the anticipated arrival at the port of entry or port of export. In order to facilitate the importation or exportation of any tableting machine or encapsulating machine and implement the purpose of the Act, regulated persons may report to the Administration as far in advance as possible. A separate report (DEA Form 452) must be filed for each shipment, in accordance with § 1310.06(e). Upon receipt and review, the Administration will assign a completed report a transaction identification number. The report will not be deemed filed until a transaction identification number has been issued by the Administration. The importer or exporter may only proceed with the transaction once the transaction identification number has been issued. Any tableting machine or encapsulating machine may be imported or exported if that machine is needed for medical, commercial, scientific, or other legitimate uses. However, an importation or exportation of a tableting machine or encapsulating machine may not be completed with a person whose description or identifying characteristic has previously been furnished to the regulated person by the Administration unless the transaction is approved by the Administration.

(2) *Denied release at the port of entry.* In the event that a shipment of tableting or encapsulating machine(s) has been denied release by a customs officer at the port of entry for any reason, the importer who attempted to import the shipment must, within 5 business days of the denial, report to the Administration that the shipment was denied, the basis for denial, and such other information as is required by § 1310.06(g). Such report must be transmitted to the Administration through the DEA Diversion Control Division secure network application. Upon the importer's report of a denied entry, DEA will assign the report a transaction identification number and the original import notification will be void and of no effect. No shipment of tableting machines or encapsulating machines denied entry for any reason will be allowed entry without a subsequent refiling of an amended DEA Form 452 by the regulated person. In such circumstances, the regulated person may proceed with the release of the tableting machines or encapsulating machines upon receipt of a transaction identification number for the refiled and amended DEA Form 452 without regard to the 15-day advance filing requirement in paragraph (c)(1) of this section, so long as the article is otherwise cleared for entry under U.S. customs laws.

(d) Each regulated bulk manufacturer of a listed chemical must submit manufacturing, inventory and use data on an annual basis as set forth in § 1310.06(j). This data must be submitted annually to the Drug and Chemical Evaluation Section, Diversion Control Division, Drug Enforcement Administration, on or before the 15th day of March of the year immediately following the calendar year for which submitted. See the Table of DEA Mailing Addresses in § 1321.01 of this chapter for the current mailing address. A business entity which manufactures a listed chemical may elect to report separately by individual location or report as an aggregate amount for the entire business entity provided that they inform the DEA of which method they will use. This reporting requirement does not apply to drugs or other products that are exempted under paragraph (1)(iv) or (v) of the definition of regulated transaction in § 1300.02 of this chapter except as set forth in § 1310.06(i)(5). Bulk manufacturers that produce a listed chemical solely for internal consumption are not required to report for that listed chemical. For purposes of these reporting requirements, internal consumption consists of any quantity of a listed chemical otherwise not available for further resale or distribution. Internal consumption includes (but is not limited to) quantities used for quality control testing, quantities consumed in-house, or production losses. Internal consumption does not include the quantities of a listed chemical consumed in the production of exempted products. If an existing standard industry report contains the information required in § 1310.06(j) and such information is separate or readily retrievable from the report, that report may be submitted in satisfaction of this requirement. Each report must be submitted to the DEA under company letterhead and signed by an appropriate, responsible official. For purposes of this paragraph (d) only, the term regulated bulk manufacturer of a listed chemical means a person who manufactures a listed chemical by means of chemical synthesis or by extraction from other substances. The term bulk manufacturer does not include persons whose sole activity consists of the repackaging or relabeling of listed chemical products or the manufacture of drug dosage forms of products which contain a listed chemical.

(e) Each regulated person required to report pursuant to § 1310.03(c) must file a report containing the transaction identification number for each such transaction (if the regulated person is required to obtain a transaction identification number under part 1313 of this chapter) and information set forth in § 1310.06(k), on or before the 15th day of each month following the month in which the distributions took place.

* * * * *

■ 39. Revise § 1310.06 to read as follows:

§ 1310.06 Content of records and reports.

(a) Each record required by § 1310.03(a) must include the following:

(1) The name/business name, address/business address, and contact information (*e.g.,* telephone number(s), email address (es), etc.), and, if required, DEA registration number of each party to the regulated transaction.

(2) The date of the regulated transaction.

(3) The quantity, chemical name, and, if applicable, National Drug Code (NDC) number. If NDC number is not applicable, the form of packaging of the listed chemical or a description of the tableting machine or encapsulating machine (including make, model, serial number, if any, and whether the machine is manual or electric).

(4) The method of transfer (company truck, picked up by customer, etc.).

(5) The type of identification used by the purchaser and any unique number on that identification.

(b) For purposes of this section, normal business records will be considered adequate if they contain the information listed in paragraph (a) of this section and are readily retrievable from other business records of the regulated person. For prescription drug products, prescription and hospital records kept in the normal course of medical treatment will be considered adequate for satisfying the requirements of paragraph (a) of this section with respect to dispensing to patients, and records required to be maintained pursuant to the U.S. Food and Drug Administration regulations relating to the distribution of prescription drugs, as set forth in 21 CFR part 205, will be considered adequate for satisfying the requirements of paragraph (a) of this section with respect to distributions.

(c)(1) Each report required by § 1310.05(a) must include the information as specified by paragraph (a) of this section, the basis for making the report, and, where obtainable, the registration number of the other party, if such party is registered. A report of an uncommon method of payment or delivery submitted in accordance with § 1310.05(a)(1) must also include a reason why the method of payment or delivery was uncommon.

(2) A suggested format for the reports in § 1310.05(a)(1) is provided below:

Supplier:
Registration Number (if registered) ____
Name ____
Address ____
City ____
State ____
Zip ____
Contact Information: ____

Purchaser:
Registration Number (if registered) ____
Name ____
Address ____
City ____
State ____
Zip ____
Contact Information ____
Identification ____

Shipping Address (if different than purchaser Address):
Street ____
City ____
State ____
Zip ____
Date of Shipment ____

Description of Listed Chemical:
Chemical Name ____
Quantity ____
National Drug Code (NDC) Number(s), or Form(s) of Packaging ____

Other:
The basis (*i.e.,* reason) for making the report: ____
Any additional pertinent information:

(d) Each report of an unusual or excessive loss or disappearance of a listed chemical required by § 1310.05(b)(1) (on DEA Form 107), must include the following information:

(1) The name/business name, address/business address, and contact information (*e.g.,* telephone number(s), email address (es), etc.), and, if applicable, DEA registration number of each party to the regulated transaction.

(2) The date (or estimated date) on which unusual or excessive loss or disappearance occurred, and the actual date on which the unusual or excessive loss or disappearance was discovered by the regulated person.

(3) The quantity, chemical name, and National Drug Code (NDC) number, if applicable or if not the form of packaging of the listed chemical.

(4) The type of business conducted by the regulated person, (*e.g.,* grocery store, pharmacy/drug store, discount department store, warehouse club or superstore, convenience store, specialty food store, gas station, mobile retail vendor, mail-order, etc.) if the regulated person is not a DEA registrant.

(e)(1) Each report of an importation of a tableting machine or an encapsulating machine required by § 1310.05(c)(1) (on DEA Form 452) must include the following information:

(i) The name/business name, address/business address, and contact information (*e.g.,* telephone number(s), email address(es), etc.) of the regulated person; the name/business name, address/business address, and contact information (*e.g.,* telephone number(s), email address(es), etc.) of the import broker or forwarding agent, if any;

(ii) A description of each machine (including make, model, serial number, if any, and whether the machine is manual or electric) and the number of machines being received;

(iii) The anticipated date of arrival at the port of entry, and the anticipated port of entry;

(iv) The name/business name, address/business address, and contact information (*e.g.,* telephone number(s), email address(es), etc.) of the consignor in the foreign country of exportation;

(v) The intended medical, commercial, scientific, or other legitimate use of the machine; and

(vi) Any proposed changes in identifying information of the imported machines (*e.g.,* name, brand, serial number, if any, etc.) that will take place after importation.

(2) Each report of an exportation of a tableting machine or an encapsulating machine required by § 1310.05(c)(1) (on DEA Form 452) must include the following information:

(i) The name/business name, address/business address, and contact information (*e.g.,* telephone number(s), email address(es), etc.) of the regulated person; the name/business name, address/business address, and contact information (*e.g.,* telephone number(s), email address(es), etc.) of the export broker (if applicable);

(ii) A description of each machine (including make, model, serial number, if any, and whether the machine is manual or electric) and the number of machines being received;

(iii) The anticipated date of arrival at the port of export, the foreign port and country of entry; and

(iv) The name/business name, address/business address, and contact information (*e.g.,* telephone number(s), email address(es), etc.) of the consignee in the country where the shipment is destined; the name(s)/business name(s) and address(es)/business address(es), and contact information (*e.g.,* telephone number(s), email address(es), etc.) of the intermediate consignee(s) (if any).

(f) Each report of a domestic regulated transaction in a tableting machine or encapsulating machine required by § 1310.05(b)(2) (on DEA Form 452) must include the following information:

(1) The name/business name, address/business address, and contact information (*e.g.,* telephone number(s), email address(es), etc.) of the regulated person; the name/business name, address/business address, and contact information (*e.g.,* telephone number(s), email address(es), etc.) of the purchaser;

(2) A description of each machine (including make, model, serial number, if any, and whether the machine is manual or electric) and the number of machines being received; and

(3) Any changes made by the regulated person in identifying information of the machines (*e.g.,* name, brand, serial number, etc.).

(g) Each report of a denied release by a customs officer at the port of entry of a tableting machine or an encapsulating machine required by § 1310.05(c)(2) must include the following information: the quantity of machines denied release; a concise description of the machines denied release; the date on which release was denied; the port where the denial of release was issued from; and the basis for the denial.

(h) *Return information.* (1) Within 30 calendar days after actual receipt of a tableting or encapsulating machine, or within 10 calendar days after receipt of a written request by the Administration to the importer, whichever is sooner, the importer must file a report with the Administration (on DEA Form 452) specifying the particulars of the transaction utilizing the DEA Diversion Control Division secure network application. This report must include the following information: The date on which a customs officer at the port of entry released the machine(s); the date on which the machine(s) arrived at the final destination; the port of entry where the machine(s) were actually released by a customs officer; the actual quantity of machines released by a customs officer; the actual quantity of machines that arrived at the final destination; a description of each tableting or encapsulating machine imported (including make, model, and serial number, if any); any changes in identifying information of the imported machines (*e.g.,* name, brand, serial number, if any, etc.) that will take place after importation; and any other information as the Administration may from time to time specify. Upon receipt and review, the Administration will assign a transaction identification number to a completed report. The report will not be deemed filed until the Administration has issued a transaction identification number. A single return declaration may include the particulars of both the importation and distribution. For DEA reporting purposes, import responsibilities are concluded upon the receipt of the machines by the importer. Once machines are received by the importer, domestic transaction reporting requirements commence. Distributions of tableting and encapsulating machines from the importer to their customers must be reported as domestic regulated transactions in accordance with § 1310.05(b)(2).

(2) Within 30 calendar days after the tableting or encapsulating machine is released by a customs officer at the port of export, or within 10 calendar days after receipt of a written request by the Administration to the exporter, whichever is sooner, the exporter must file a report with the Administration (on DEA Form 452) through the DEA Diversion Control Division secure network application specifying the particulars of the transaction. This report must include the following information: The date on which the machine(s) was (were) released by a customs officer at the port of export; the actual quantity of machines released; a description of each tableting or encapsulating machine released (including make, model, serial number, if any, and whether the machine is manual or electric); and any other information as the Administration may from time to time specify.

(i) Declared exports of machines which are refused, rejected, or otherwise deemed undeliverable may be returned to the U.S. exporter of record. A brief written report outlining the circumstances must be filed with the Administration through the DEA Diversion Control Division secure network application, following the return at the earliest practicable opportunity after the regulated person becomes aware of the circumstances involved. This provision does not apply to shipments that have cleared foreign customs, been delivered, and accepted by the foreign consignee. Returns to third parties in the United States will be regarded as imports.

(j) Each annual report required by § 1310.05(d) must provide the following information for each listed chemical manufactured:

(1) The name/business name, address/business address, and contact information (*e.g.,* telephone number(s), email address(es), etc.) and chemical registration number (if any) of the manufacturer.

(2) The aggregate quantity of each listed chemical that the company manufactured during the preceding calendar year.

(3) The year-end inventory of each listed chemical as of the close of business on the 31st day of December of each year. (For each listed chemical, if the prior period's ending inventory has not previously been reported to DEA, this report should also detail the beginning inventory for the period.) For purposes of this requirement, inventory shall reflect the quantity of listed chemicals, whether in bulk or non-exempt product form, held in storage for later distribution. Inventory does not include waste material for destruction, material stored as an in-process intermediate or other in-process material.

(4) The aggregate quantity of each listed chemical used for internal consumption during the preceding calendar year, unless the chemical is produced solely for internal consumption.

(5) The aggregate quantity of each listed chemical manufactured which becomes a component of a product exempted from paragraph (1)(iv) or (v) of the definition of regulated transaction in § 1300.02 of this chapter during the preceding calendar year.

(6) Data shall identify the specific isomer, salt or ester when applicable but quantitative data shall be reported as anhydrous base or acid in kilogram units of measure.

(k) Each monthly report required by §§ 1310.03(c) and 1310.05(e) (on DEA Form 453) must provide the following information for each transaction:

(1) Supplier name/business name, address/business address, and contact information (*e.g.,* telephone number(s), email address(es), etc.) and registration number.

(2) Purchaser's name/business name, address/business address, and contact information (*e.g.,* telephone number(s), email address(es), etc.).

(3) Name/business name, address/business address shipped to (if different from purchaser's name/address).

(4) Chemical name, National Drug Code (NDC) number, if applicable, and total amount shipped.

(5) Date of shipment.

(6) Product name (if drug product).

(7) Dosage form (if drug product) (*e.g.,* pill, tablet, liquid).

(8) Dosage strength (if drug product) (*e.g.,* 30mg, 60mg, per dose etc.).

(9) Number of dosage units (if drug product) (*e.g.,* 100 doses per package).

(10) Package type (if drug product) (*e.g.,* bottle, blister pack, etc.).

(11) Number of packages (if drug product) (*e.g.,* 10 bottles).

(12) Lot number (if drug product).

(l) Information provided in reports required by § 1310.05(e) which is exempt from disclosure under section 552(a) of title 5, by reason of section 552(b)(6) of title 5, will be provided the same protections from disclosure as are provided in section 310(c) of the Act (21 U.S.C. 830(c)) for confidential business information.

§ 1310.13 [Amended]

■ 40. In § 1310.13(b), remove ''Office of Diversion Control, Drug Enforcement Administration'' and add in its place ''Drug and Chemical Evaluation Section, Diversion Control Division, Drug Enforcement Administration''.

PART 1312—IMPORTATION AND EXPORTATION OF CONTROLLED SUBSTANCES

■ 41. The authority citation for part 1312 continues to read as follows:

Authority: 21 U.S.C. 952, 953, 954, 957, 958.

■ 42. Add § 1312.03 to read as follows:

§ 1312.03 Forms applicable to this part.

Form	Access/ submission
DEA Form 35, Permit to Import	electronic.
DEA Form 36, Permit to Export	electronic.
DEA Form 161, Application for Permit to Export Controlled Substances	electronic.
DEA Form 161R, Application for Permit to Export Controlled Substances For Subsequent Reexport	electronic.
DEA Form 161R–EEA, Application for Permit to Export Controlled Substances for Subsequent Reexport Among Members of the European Economic Area.	electronic.
DEA Form 236, Controlled Substances Import/Export Declaration	electronic.

Form	Access/ submission
DEA Form 357, Application for Permit to Import Controlled Substances for Domestic And/Or Scientific Purposes	electronic.

■ 43. Revise § 1312.11 to read as follows:

§ 1312.11 Requirement of authorization to import.

(a) No person shall import, or cause to be imported, into the customs territory of the United States from any place outside thereof (but within the United States), or into the United States from any place outside thereof, any controlled substances listed in Schedule I or II, or any narcotic controlled substance listed in Schedule III, IV, or V, or any non-narcotic controlled substance listed in Schedule III which the Administrator has specifically designated by regulation in § 1312.30 or any non-narcotic controlled substance listed in Schedule IV or V which is also listed in Schedule I or II of the Convention on Psychotropic Substances, 1971, unless and until such person is properly registered under the Act (or, in accordance with part 1301 of this chapter, exempt from registration) and the Administration has issued him or her a permit to do so in accordance with § 1312.13.

(b) No person shall import, or cause to be imported, into the customs territory of the United States from any place outside thereof (but within the United States), or into the United States from any place outside thereof, any non-narcotic controlled substance listed in Schedule III, IV, or V, excluding those described in paragraph (a) of this section, unless and until such person is properly registered under the Act (or, in accordance with part 1301 of this chapter, exempt from registration) and has filed an import declaration to do so in accordance with § 1312.18.

(c) A separate permit or declaration is required for each shipment of a controlled substance to be imported.

■ 44. Revise § 1312.12 to read as follows:

§ 1312.12 Application for import permit; return information.

(a) Registered importers, other registrants authorized to import as a coincident activity of their registrations, and persons who in accordance with part 1301 of this chapter are exempt from registration, seeking to import a controlled substance in schedule I or II; any narcotic drug in schedule III, IV, or V; any non-narcotic drug in schedule III that has been specifically designated by regulation in § 1312.30; or any non-narcotic substance listed in schedule IV or V that is also listed in schedule I or II of the Convention on Psychotropic Substances, 1971, must submit an application for a permit to import controlled substances on DEA Form 357. All applications and supporting materials must be submitted to the Administration through the DEA Diversion Control Division secure network application. The application must be signed and dated by the importer and must contain the importer's registered address to which the controlled substances will be imported.

(b) The applicant must include on the DEA Form 357 the registration number of the importer and a detailed description of each controlled substance to be imported including the drug name, dosage form, National Drug Code (NDC) number, the Administration Controlled Substance Code Number as set forth in part 1308 of this chapter, the number and size of the packages or containers, the name and quantity of the controlled substance contained in any finished dosage units, and the quantity of any controlled substance (expressed in anhydrous acid, base or alkaloid) given in kilograms or parts thereof. The application must also include the following:

(1) The name/business name, address/business address, contact information (*e.g.,* telephone number(s), email address(es), etc.), and business of the consignor, if known at the time the application is submitted, but if unknown at that time, the fact should be indicated and the name and address afterwards furnished to the Administration as soon as ascertained by the importer;

(2) The foreign port and country of initial exportation (*i.e.,* the place where the article will begin its journey of exportation to the United States);

(3) The port of entry into the United States;

(4) The latest date said shipment will leave said foreign port or country;

(5) The stock on hand of the controlled substance desired to be imported;

(6) The name of the importing carrier or vessel (if known), or if unknown it should be stated whether the shipment will be made by express, freight, or otherwise, imports of controlled substances in Schedules I or II and narcotic drugs in Schedules III, IV, or V by mail being prohibited);

(7) The total tentative allotment to the importer of such controlled substance for the current calendar year; and

(8) The total number of kilograms of said allotment for which permits have previously been issued and the total quantity of controlled substance actually imported during the current year to date.

(c) If desired, alternative foreign ports of exportation within the same country may be indicated upon the application (*e.g.,* 1. Kolkata, 2. Mumbai). If a permit is issued pursuant to such application, it will bear the names of the two ports in the order given in the application and will authorize shipment from either port. Alternative ports in different countries will not be authorized in the same permit.

(d) *Return information.* Within 30 calendar days after actual receipt of a controlled substance at the importer's registered location, or within 10 calendar days after receipt of a written request by the Administration to the importer, whichever is sooner, the importer must file a report with the Administration through the DEA Diversion Control Division secure network application specifying the particulars of the transaction. This report must include the following information: The date the controlled substance was released by a customs officer at the port of entry; the date on which the controlled substance arrived at the registered location; the actual quantity of the controlled substance released by a customs officer at the port of entry; and the actual quantity of the controlled substance that arrived at the registered location. Upon receipt and review, the Administration will assign a transaction identification number to a completed report. The report will not be deemed filed until the Administration has issued a transaction identification number.

(e) *Denied release at the port of entry.* In the event that a shipment of controlled substances has been denied release by a customs officer at the port of entry for any reason, the importer who attempted to have the shipment released must, within 5 business days of the denial, report to the Administration that the shipment was denied and the reason for denial. Such report must be transmitted to the Administration through the DEA Diversion Control

Division secure network application. This report must include the following information: The quantity of the controlled substance denied release; the date on which release was denied; and the basis for the denied release. Upon the importer's report of a denied release at the port of entry, the DEA will assign the report a transaction identification number and the import permit will be void and of no effect. No shipment of controlled substances denied release for any reason will be allowed to be released into the United States unless the importer submits a new DEA Form 357 and the Administration issues a new import permit.

■ 45. In § 1312.13, revise paragraph (e) to read as follows:

§ 1312.13 Issuance of import permit.

* * * * *

(e) If an importation is approved, the Administrator will issue an import permit bearing his or her signature or that of his or her delegate. Each permit will be assigned a unique permit number. A permit must not be altered or changed by any person after being signed. Any change or alteration upon the face of any permit after it has been signed renders it void and of no effect. Permits are not transferable. The Administrator or his/her delegate will date and certify on each permit that the importer named therein is thereby permitted as a registrant under the Act, to import, through the port of entry named, one shipment of not to exceed the specified quantity of the named controlled substances, shipment to be made before a specified date. Only one shipment may be made on a single import permit. A single import permit shall authorize a quantity of goods to be imported/exported at one place, at one time, for delivery to one consignee, on a single conveyance, at one place, on one bill of lading, air waybill, or commercial loading document; a single permit shall not authorize a quantity of goods to be imported/exported if the goods are divided onto two or more conveyances. The permit must state that the Administration is satisfied that the consignment proposed to be imported is required for legitimate purposes.

* * * * *

■ 46. Revise § 1312.14 to read as follows:

§ 1312.14 Distribution of import permits.

The Administration shall transmit the import permit to the competent national authority of the exporting country and shall make an official record of the import permit available to the importer through secure electronic means. The importer, or their agent, must submit an official record of the import permit and/ or required data concerning the import transaction to a customs officer at the port of entry in compliance with all import control requirements of agencies with import control authorities under the Act or statutory authority other than the Controlled Substances Import and Export Act. The importer must maintain an official record of the import permit (available from the DEA Diversion Control Division secure network application after issuance) in accordance with part 1304 of this chapter as the record of authority for the importation and shall transmit an official record of the permit to the foreign exporter. If required by the foreign competent national authority, the importer shall ensure that an official record of the import permit is provided (*e.g.,* by transmitting an official record of the permit to the foreign exporter who shall transmit such record to the competent national authority of the exporting county). The importer must ensure that an official record of the permit accompanies the shipment of controlled substances to its final destination, the registered location of the importer (*i.e.,* drop shipments are prohibited).

§ 1312.15 [Amended]

■ 47. In § 1312.15:

■ a. In paragraph (a):

■ i. Remove the phrase ''the U.S. Customs Service'' and add in its place ''U.S. Customs and Border Protection or customs service of an Insular Area''; and

■ ii. At the end of the first sentence, add the phrase ''in accordance with § 1312.16(a)''; and

■ b. In paragraph (b):

■ i. Remove the phrase ''the U.S. Customs Service'' and add in its place ''U.S. Customs and Border Protection or customs service of an Insular Area''; and

■ ii. In the final sentence, remove ''Director of the Administration'' and add in its place ''Administrator''.

■ 48. Revise § 1312.16 to read as follows:

§ 1312.16 Amendment, cancellation, expiration of import permit.

(a) Importers may only request that an import permit or application for an import permit be amended in accordance with paragraphs (a)(1) through (7) of this section. Requests for an amendment must be submitted through the DEA Diversion Control Division secure network application. Except as provided in paragraph (a)(5) of this section and § 1312.15(a), importers must submit all requests for an amendment at least one full business day in advance of the date of release by a customs officer. Importers must specifically request that an amendment be made; supplementary information submitted by an importer through the DEA Diversion Control Division secure network application will not automatically trigger the amendment process. While the request for an amendment is being reviewed by the Administration, the original permit will be temporarily stayed and may not be used to authorize entry of a shipment of controlled substances. If the importer's request for an amendment to an issued permit is granted by the Administration, the Administration will immediately cancel the original permit and re-issue the permit, as amended, with a revised permit number. The DEA and importer will distribute the amended permit in accordance with § 1312.14. If a request for an amendment is denied by the Administration, the temporary stay will be lifted; once lifted, the originally issued permit may immediately be used to authorize entry of a shipment in accordance with the terms of the permit, subject to the shipment being compliant with all other applicable laws.

(1) An importer may request that an import permit or application for a permit be amended to change the National Drug Control number, description of the packaging, or trade name of the product, so long as the description is for the same basic class of controlled substance as in the original permit.

(2) An importer may request that an import permit or application for a permit be amended to change the proposed port of entry, the date of release by a customs officer, or the method of transport.

(3) An importer may request that an import permit or application for a permit be amended to change the justification provided as to why an import shipment is needed to meet the legitimate scientific or medical needs of the United States.

(4) An importer may request that an import permit or application for a permit be amended to change any registrant notes.

(5) Prior to departure of the shipment from its original foreign location, an importer may request that an import permit or application for a permit be amended to increase the total base weight of a controlled substance. At the U.S. port of entry, an importer may request that an import permit be amended in accordance with § 1312.15(a). Importers are not required to amend an import permit for the sole purpose of decreasing the total base weight of a controlled substance

authorized to be imported. However, the balance of any unimported authorized quantity of controlled substances on an import permit is void upon entry of a shipment on the issued permit or upon expiration of the unused permit in accordance with paragraph (b) of this section, whichever is sooner. Other than for an amendment to an import permit under § 1312.15(a), importers must submit a request for an amendment to increase the total base weight of a controlled substance at least three business days in advance of the date of release by a customs officer.

(6) An importer may request that an import permit be amended to remove a controlled substance from the permit. However, an importer may not amend an import permit to add or replace a controlled substance/Administration controlled substance code number to the item(s) to be imported. Importers who desire to import a different controlled substance than that contained on their issued import permit or permit application must submit a request for the permit or permit application to be canceled and request a new permit in accordance with § 1312.12.

(7) An importer may not amend the importer's name (as it appears on their DEA certificate of registration) or the name of the foreign exporter as provided in the DEA Form 357. Importers who need to make any changes to any of these fields must submit a request for the permit or permit application to be canceled and request a new permit in accordance with § 1312.12.

(b) An import permit will be void and of no effect after the expiration date specified therein, and in no event will the date be more than 180 calendar days after the date the permit is issued. Amended import permits will retain the original expiration date.

(c) An import permit may be canceled after being issued, at the request of the importer submitted to the Administration through the DEA Diversion Control Division secure network application, provided that no shipment has been made thereunder.

Nothing in this part will affect the right, hereby reserved by the Administration, to cancel a permit at any time for proper cause.

■ 49. In § 1312.18:

■ a. Revise the section heading and paragraphs (b), (c) introductory text, and (c)(3); and

■ b. Add paragraphs (e) through (h).

The revisions and additions read as follows:

§ 1312.18 Import declaration.

* * * * *

(b) Any person registered or authorized to import and seeking to import any non-narcotic controlled substance listed in Schedules III, IV, or V which is not subject to the requirement of an import permit as described in paragraph (a) of this section, must file a controlled substances import declaration (DEA Form 236) with the Administration through the DEA Diversion Control Division secure network application not later than 15 calendar days prior to the anticipated date of release by a customs officer and distribute an official record of the declaration as hereinafter directed in § 1312.19. The declaration must be signed and dated by the importer and must specify the address of the final destination for the shipment, which must be the importer's registered location. Upon receipt and review, the Administration will assign a transaction identification number to each completed declaration. The import declaration is not deemed filed, and therefore is not valid, until the Administration has issued a transaction identification number. The importer may only proceed with the import transaction once the transaction identification number has been issued.

(c) DEA Form 236 must include the following information:

* * * * *

(3) The anticipated date of release by a customs officer at the port of entry, the foreign port and country of exportation to the United States, the port of entry, and the name, address, and registration number of the recipient in the United States; and

* * * * *

(e) *Return information.* Within 30 calendar days after actual receipt of a controlled substance at the importer's registered location, or within 10 calendar days after receipt of a written request by the Administration to the importer, whichever is sooner, the importer must file a report with the Administration through the DEA Diversion Control Division secure network application specifying the particulars of the transaction. This report must include the following information: The date on which the controlled substance was released by a customs officer at the port of entry; the date on which the controlled substance arrived at the registered location; the actual quantity of the controlled substance released by a customs officer at the port of entry; the actual quantity of the controlled substance that arrived at the registered location; and the actual port of entry. Upon receipt and review, the Administration will assign a transaction identification number to a completed report. The report will not be deemed filed until the Administration has issued a transaction identification number.

(f) An importer may amend an import declaration in the same circumstances in which an importer may request amendment to an import permit, as set forth in § 1312.16(a)(1) through (7). Amendments to declarations must be submitted through the DEA Diversion Control Division secure network application. Except as provided in §§ 1312.16(a)(5) and 1312.15(a), importers must submit all amendments at least one full business day in advance of the date of release by a customs officer. Importers must specifically note that an amendment is being made; supplementary information submitted by an importer through the DEA Diversion Control Division secure network application will not automatically be considered an amendment. While the amendment is being processed by the Administration, the original declaration will be temporarily stayed and may not be used to authorize release of a shipment of controlled substances. Upon receipt and review, the Administration will assign each completed amendment a transaction identification number. The amendment will not be deemed filed until the Administration issues a transaction identification number. The DEA and importer will distribute the amended declaration in accordance with § 1312.19. A filed amendment will not change the date that the declaration becomes void and of no effect pursuant to paragraph (g) of this section.

(g) An import declaration may be canceled after being filed with the Administration, at the request of the importer by the importer submitting to the Administration the request through the DEA Diversion Control Division secure network application, provided that no shipment has been made thereunder. Import declarations shall become void and of no effect 180 calendar days after the date the declaration is deemed filed with the Administration.

(h) *Denied release at the port of entry.* In the event that a shipment of controlled substances has been denied release by a customs officer at the port of entry for any reason, the importer who attempted to have the shipment released, within 5 business days of the denial, report to the Administration that the shipment was denied release and the reason for denial. Such report must be transmitted to the Administration through the DEA Diversion Control Division secure network application.

This report must include the following information: The quantity of the controlled substance denied release; the date on which release was denied; and the basis for the denied release. Upon the importer's report of a denied release, the DEA will assign the report a transaction identification number and the import declaration will become void and of no effect. No shipment of controlled substances denied release for any reason will be allowed to be released into the United States until the importer has filed a new import declaration and the Administration has issued a new transaction identification number.

■ 50. Revise § 1312.19 to read as follows:

§ 1312.19 Distribution of import declaration.

The importer must furnish an official record of the declaration (available through the DEA Diversion Control Division secure network application after the Administration issues a transaction identification number) to the foreign shipper. The foreign shipper must submit an official record of the declaration to the competent national authority of the exporting country, if required as a prerequisite to export authorization. The importer, or their agent, must submit an official record of the declaration and/or required data concerning the import transaction to a customs officer at the port of entry in compliance with all import control requirements of agencies with import control authorities under the Act or statutory authority other than the Controlled Substances Import and Export Act. The importer must ensure that an official record of the declaration accompanies the shipment to its final destination, which must only be the registered location of the importer (*i.e.,* drop shipments are prohibited). The importer must maintain an official record of the declaration in accordance with part 1304 of this chapter.

■ 51. Revise § 1312.21 to read as follows:

§ 1312.21 Requirement of authorization to export.

(a) No person shall in any manner export, or cause to be exported, from the United States any controlled substance listed in Schedule I or II, or any narcotic controlled substance listed in Schedule III or IV, or any non-narcotic controlled substance in Schedule III which the Administrator has specifically designated by regulation in § 1312.30 or any non-narcotic controlled substance in Schedule IV or V which is also listed in Schedule I or II of the Convention on Psychotropic Substances, 1971, unless and until such person is properly registered under the Act (or, in accordance with part 1301 of this chapter, exempt from registration) and the Administrator has issued him or her a permit to do so in accordance with § 1312.23.

(b) No person shall in any manner export, or cause to be exported, from the United States any non-narcotic controlled substance listed in Schedule III, IV, or V, excluding those described in paragraph (a) of this section, or any narcotic controlled substance listed in Schedule V, unless and until such person is properly registered under the Act (or, in accordance with part 1301 of this chapter, exempt from registration) and has furnished an export declaration as provided by section 1003 of the Act (21 U.S.C. 953(e)) to the Administration in accordance with § 1312.28.

(c) A separate permit or declaration is required for each shipment of controlled substance to be exported.

■ 52. Revise § 1312.22 to read as follows:

§ 1312.22 Application for export or reexport permit; return information.

(a) Registered exporters, and persons who in accordance with part 1301 of this chapter are exempt from registration, seeking to export controlled substances must submit an application for a permit to export controlled substances on DEA Form 161. Registered exporters, and persons who in accordance with part 1301 of this chapter are exempt from registration, seeking to reexport controlled substances must submit an application for a permit to reexport controlled substances on DEA Form 161R or DEA Form 161R–EEA, whichever applies. All applications and supporting materials must be submitted to the Administration through the DEA Diversion Control Division secure network application. The application must be signed and dated by the exporter and contain the exporter's registered address from which the controlled substances will be exported. Controlled substances may not be exported until a permit number has been issued.

(b) Exports of controlled substances by mail are prohibited.

(c) *Applications.* (1) Except as provided in paragraph (c)(2) of this section, each application for a permit to export or reexport must include the following information:

(i) The exporter's name/business name, address/business address, and contact information (*e.g.,* telephone number(s), email address (es), etc.);

(ii) The exporter's registration number, address, and contact information (*e.g.,* telephone number(s), etc.) from which the controlled substances will be exported;

(iii) A detailed description of each controlled substance to be exported including the drug name, dosage form, National Drug Code (NDC) number, Administration Controlled Substance Code Number as set forth in part 1308 of this chapter, the number and size of the packages or containers, the name and quantity of the controlled substance contained in any finished dosage units, and the quantity of any controlled substance (expressed in anhydrous acid, base, or alkaloid) given in kilograms or parts thereof;

(iv) The name/business name, address/business address, contact information (*e.g.,* telephone number(s), email address(es), etc.) and business of the consignee in the first country (the country to which the controlled substance is exported from the United States), foreign port and country of entry/first country of entry, the port of export, the anticipated date of release by a customs officer at the port of export, the name of the exporting carrier or vessel (if known), or if unknown it should be stated whether the shipment will be made by express, freight, or otherwise), the date and number, if any, of the supporting foreign import license or permit accompanying the application, and the authority by whom such foreign license or permit was issued; and

(v) An affidavit that the packages or containers are labeled in conformance with obligations of the United States under international treaties, conventions, or protocols in effect at the time of the export or reexport. The affidavit shall further state that to the best of the affiant's knowledge and belief, the controlled substances therein are to be applied exclusively to medical or scientific uses within the country to which exported, will not be reexported therefrom and that there is an actual need for the controlled substance for medical or scientific uses within such country, unless the application is submitted for reexport in accordance with paragraphs (f), (g), and (h) of this section. In the case of exportation of crude cocaine, the affidavit may state that to the best of affiant's knowledge and belief, the controlled substances will be processed within the country to which exported, either for medical or scientific use within that country or for reexportation in accordance with the laws of that country to another for medical or scientific use within that country.

(2) With respect to reexports among members of the European Economic Area in accordance with section 1003(f) of the Act (21 U.S.C. 953(f)), the requirements of paragraph (c)(1) of this section shall apply only with respect to the export from the United States to the first country and not to any subsequent export from that country to another country of the European Economic Area.

(d)(1) Except as provided in paragraph (d)(2) of this section, the applicant must also submit with the application any import license or permit or a certified copy of any such license or permit issued by the competent national authority in the country of destination, or other documentary evidence deemed adequate by the Administration, showing: That the merchandise is consigned to an authorized permittee; that it is to be applied exclusively to medical or scientific use within the country of destination; that it will not be reexported from such country (unless the application is submitted for reexport in accordance with paragraphs (f), (g), and (h) of this section); and that there is an actual need for the controlled substance for medical or scientific use within such country or countries. If the import license or permit, or the certified copy of such, is not written in English or bilingual with another language and English, the registrant must also submit with their application a certified translation of the permit or license. For purposes of this requirement, certified translation means that the translator has signed the translation legally attesting the accuracy of the translation. (In the case of exportation of bulk coca leaf alkaloid, the applicant need only include with the application the material outlined in paragraph (c) of this section.)

(2) With respect to reexports among members of the European Economic Area in accordance with section 1003(f) of the Act (21 U.S.C. 953(f)), the requirements of paragraph (d)(1) of this section shall apply only with respect to the export from the United States to the first country and not to any subsequent export from that country to another country of the European Economic Area.

(e) *Return information for exports (on a DEA Form 161).* Within 30 calendar days after the controlled substance is released by a customs officer at the port of export, or within 10 calendar days after receipt of a written request by the Administration to the exporter, whichever is sooner, the exporter must report to the Administration through the DEA Diversion Control Division secure network application the particulars of the transaction. This report must include the following information: The date on which the controlled substance left the registered location; the date on which the controlled substance was released by a customs officer at the port of export; the actual quantity of controlled substance that left the registered location; and the actual quantity of the controlled substance released by a customs officer at the port of export; the actual port of export, and any other information as the Administration may from time to time specify. Upon receipt and review, the Administration will assign a transaction identification number to a completed report. The report will not be deemed filed until the Administration has issued a transaction identification number.

(f) *Reexports outside of the European Economic Area.* Except as provided in paragraph (g) of this section, the Administration may authorize any controlled substance listed in Schedule I or II, or any narcotic drug listed in Schedule III or IV, to be exported from the United States to a country for subsequent export from that country to another country, if each of the following conditions is met, in accordance with section 1003(f) of the Act (21 U.S.C. 953(f)):

(1) Both the country to which the controlled substance is exported from the United States (referred to in this section as the ''first country'') and the country to which the controlled substance is exported from the first country (referred to in this section as the ''second country'') are parties to the Single Convention on Narcotic Drugs, 1961, and the Convention on Psychotropic Substances, 1971;

(2) The first country and the second country have each instituted and maintain, in conformity with such Conventions, a system of controls of imports of controlled substances which the Administration deems adequate;

(3) With respect to the first country, the controlled substance is consigned to a holder of such permits or licenses as may be required under the laws of such country, and a permit or license to import the controlled substance has been issued by the country;

(4) With respect to the second country, substantial evidence is furnished to the Administration by the applicant for the export permit that—

(i) The controlled substance is to be consigned to a holder of such permits or licenses as may be required under the laws of such country, and a permit or license to import the controlled substance is to be issued by the country; and

(ii) The controlled substance is to be applied exclusively to medical, scientific, or other legitimate uses within the country;

(5) The controlled substance will not be exported from the second country;

(6) The exporter has complied with paragraph (h) of this section and a permit to export the controlled substance from the United States has been issued by the Administration; and

(7) *Return information for reexports outside of the European Economic Area (on DEA Form 161R)*—(i) *Return information for export from the United States, for reexport.* Within 30 calendar days after the controlled substance is released by a customs officer at the port of export the exporter must file a report with the Administration through the DEA Diversion Control Division secure network application specifying the particulars of the transaction. This report must include the following information: The date on which the controlled substance left the registered location; the date on which the controlled substance was released by a customs officer at the port of export; the actual quantity of controlled substance released by a customs officer at the port of export; and the actual port of export. Upon receipt and review, the Administration will assign a completed report a transaction identification number. The report will not be deemed filed until the Administration has issued a transaction identification number. In determining whether the exporter has complied with the requirement to file within 30 calendar days, the report shall be deemed filed on the first date on which a complete report is filed.

(ii) *Return information for export from a first country that is or is not a member of the European Economic Area to a country outside of the European Economic Area; return information for export from a first country that is not a member of the European Economic Area to a member of the European Economic Area.* Within 30 calendar days after the controlled substance is exported from the first country to the second country the exporter must file a report with the Administration through the DEA Diversion Control Division secure network application specifying the particulars of the export from the first country. If the permit issued by the Administration authorized the reexport of a controlled substance from the first country to more than one second country, a report for each individual reexport is required. These reports must include the following information: Name of second country; actual quantity of controlled substance shipped; and the date shipped from the first country, the actual port from which the controlled substances were shipped from the first country. Upon receipt and review, the Administration will assign each completed report a transaction identification number. The report will not be deemed filed until the Administration has issued a transaction identification number.

(g) *Reexports among members of the European Economic Area (on DEA Form 161R–EEA).* The Administration may authorize any controlled substance listed in Schedule I or II, or any narcotic drug listed in Schedule III or IV, to be exported from the United States to a country of the European Economic Area for subsequent export from that country to another country of the European Economic Area, if the following conditions and the conditions of paragraphs (f)(1) through (4) and (6) of this section are met, in accordance with section 1003(f) of the Act (21 U.S.C. 953(f)):

(1)(i) The controlled substance will not be exported from the second country, except that the controlled substance may be exported from a second country that is a member of the European Economic Area to another country that is a member of the European Economic Area, provided that the first country is also a member of the European Economic Area; and

(ii) Subsequent to any reexportation described in paragraph (g)(1)(i) of this section, a controlled substance may continue to be exported from any country that is a member of the European Economic Area to any other such country, if—

(A) The conditions applicable with respect to the first country under paragraphs (f)(1) through (4) and (6) of this section and paragraph (g)(2) are met with respect to each subsequent country from which the controlled substance is exported pursuant to this paragraph (g); and

(B) The conditions applicable with respect to the second country under paragraphs (f)(1) through (4) and (6) of this section and paragraph (g)(2) of this section are met with respect to each subsequent country to which the controlled substance is exported pursuant to this paragraph (g).

(2) *Return information for reexports among members of the European Economic Area*—(i) *Return information for export from the United States, for reexport among members of the European Economic Area.* Exporters must comply with the return reporting requirements of paragraph (f)(7)(i) of this section.

(ii) *Reexports among members of the European Economic Area.* Within 30 calendar days after the controlled substance is exported from the first country to the second country, and within 30 calendar days of each subsequent reexport within the European Economic Area, if any, the U.S. exporter must file a report with the Administration through the DEA Diversion Control Division secure network application specifying the particulars of the export. These reports must include the name of country to which the controlled substance was reexported, *i.e.,* another member of the European Economic Area; the actual quantity of controlled substance shipped; the date shipped from the first country, the name/business name, address/business address, contact information (*e.g.,* telephone number(s), email address(es), etc.) and business of the consignee; and the name/business name, address/business address, contact information (*e.g.,* telephone number(s), email address(es), etc.) and business of the exporter. Upon receipt and review, the Administration will assign each completed report a transaction identification number. The report will not be deemed filed until the Administration has issued a transaction identification number.

(h) Where a person is seeking to export a controlled substance for reexport outside of the European Economic Area in accordance with paragraph (f) of this section, the requirements of paragraphs (h)(1) through (7) of this section shall apply in addition to (and not in lieu of) the requirements of paragraphs (a) through (d) of this section. Where a person is seeking to export a controlled substance for reexport among members of the European Economic Area in accordance with paragraph (g) of this section, the requirements of paragraph (h)(4) of this section shall apply in addition to (and not in lieu of) the requirements of paragraphs (a) through (d) of this section.

(1) Bulk substances will not be reexported in the same form as exported from the United States, *i.e.,* the material must undergo further manufacturing process. This further manufactured material may only be reexported to a second country.

(2) Finished dosage units, if reexported, must be in a commercial package, properly sealed and labeled for legitimate medical use in the second country.

(3) Any proposed reexportation must be made known to the Administration at the time the initial DEA Form 161R is submitted. In addition, the following information must also be provided where indicated on the form:

(i) Whether the drug or preparation will be reexported in bulk or finished dosage units;

(ii) The product name, dosage strength, commercial package size, and quantity; and

(iii) The name of consignee, complete address, and expected shipment date, as well as the name and address of the ultimate consignee in the second country.

(4) The application must contain an affidavit that the consignee in the second country, and any country of subsequent reexport within the European Economic Area, is authorized under the laws and regulations of the second and/or subsequent country to receive the controlled substances. The affidavit must also contain the following statements, in addition to the statements required under paragraph (c) of this section:

(i) That the packages are labeled in conformance with the obligations of the United States under the Single Convention on Narcotic Drugs, 1961, the Convention on Psychotropic Substances, 1971, and any amendments to such treaties in effect;

(ii) That the controlled substances are to be applied exclusively to medical or scientific uses within the second country, or country of subsequent reexport within the European Economic Area;

(iii) That the controlled substances will not be further reexported from the second country except as provided by paragraph (f) of section 1003 of the Act (21 U.S.C. 953(f)); and

(iv) That there is an actual need for the controlled substances for medical or scientific uses within the second country, or country of subsequent reexport within the European Economic Area.

(5) If the applicant proposes that the shipment of controlled substances will be separated into parts after it arrives in the first country and then reexported to more than one second country, the applicant must so indicate on the DEA Form 161R and provide all the information required in this section for each second country.

(6) Except in the case of reexports among countries of the European Economic Area in accordance with section 1003(f) of the Act (21 U.S.C. 953(f)), the controlled substance will be reexported from the first country to the second country (or second countries) no later than 180 calendar days after the controlled substance was released by a customs officer from the United States.

(7) Shipments that have been exported from the United States and are refused by the consignee in either the

first or second country, or subsequent member of the European Economic Area, or are otherwise unacceptable or undeliverable, may be returned to the registered exporter in the United States upon authorization of the Administration. In these circumstances, the exporter in the United States must submit a written request for the return of the controlled substances to the United States with a brief summary of the facts that warrant the return, along with a completed DEA Form 357 through the DEA Diversion Control Division secure network application. The Administration will evaluate the request after considering all the facts as well as the exporter's registration status with the Administration. If the exporter provides sufficient justification, the Administration may issue an import permit for the return of these drugs, and the exporter may then obtain an export permit from the country of original importation. The substance may not be returned to the United States until after a permit has been issued by the Administration.

(i) In considering whether to grant an application for a permit under paragraphs (f), (g), and (h) of this section, the Administration shall consider whether the applicant has previously obtained such a permit and, if so, whether the applicant complied fully with the requirements of this section with respect to that previous permit.

(j) *Denied release at the port of export.* In the event that a shipment of controlled substances has been denied release by a customs officer at the port export from the United States for any reason, the exporter who attempted to have the shipment released must, within 5 business days of the denial, report to the Administration that the shipment was denied release and the reason for denial. Such report must be transmitted to the Administration through the DEA Diversion Control Division secure network application. This report must include the following information: The quantity of the controlled substance denied release; the date on which release was denied; the basis for the denied release, the port from which the denial was issued, and any other information as the Administration may from time to time specify. Upon the exporter's report of a denied release, DEA will assign the report a transaction identification number and the export permit will be void and of no effect. No shipment of controlled substances denied release for any reason will be allowed to be released from the United States unless the exporter submits a new DEA Form 161, 161R, or 161R–EEA, as appropriate, and the Administration issues a new export permit.

■ 53. In § 1312.23, revise paragraph (e) as follows:

§ 1312.23 Issuance of export permit.

* * * * *

(e) If an exportation is approved, the Administrator shall issue an export permit bearing his or her signature or that of his or her delegate. Each permit will be assigned a permit number that is a unique, randomly generated identifier. A permit shall not be altered or changed by any person after being signed. Any change or alteration upon the face of any permit after it has been signed renders it void and of no effect. Permits are not transferable. The Administrator or his/her delegate shall date and certify on each permit that the exporter named therein is thereby permitted as a registrant under the Act, to export, through the port of export named, one shipment of not to exceed the specified quantity of the named controlled substances, shipment to be made before a specified date. Only one shipment may be made on a single export permit. A single export permit shall authorize a quantity of goods to be exported at one place, at one time, for delivery to one consignee, on a single conveyance, at one place, on one bill of lading, air waybill, or commercial loading document; a single permit shall not authorize a quantity of goods to be exported if the goods are divided onto two or more conveyances. Each export permit shall be predicated upon, *inter alia,* an import certificate or other documentary evidence issued by a foreign competent national authority.

* * * * *

■ 54. Revise § 1312.24 to read as follows:

§ 1312.24 Distribution of export permit.

The Administration shall transmit the export permit to the competent national authority of the importing country and shall make available to the exporter an official record of the export permit through secure electronic means. The exporter, or their agent, must submit an official record of the export permit and/or required data concerning the export transaction to a customs officer at the port of export in compliance with all export control requirements of agencies with export control authorities under the Act or statutory authority other than the Controlled Substances Import and Export Act. The exporter must maintain an official record of the export permit (available from the secure network application on the DEA Diversion Control Division Web site after the Administration issues a transaction identification number) in accordance with part 1304 of this chapter as the record of authority for the exportation and shall transmit an official record of the export permit to the foreign importer. The exporter must ensure that an official record of the permit accompanies the shipment to its final destination. No shipment of controlled substances denied release for any reason shall be allowed to be released from the United States without subsequent authorization from the Administration.

■ 55. Revise § 1312.25 to read as follows:

§ 1312.25 Amendment, cancellation, expiration of export permit.

(a) Exporters may only request that an export permit or application for an export permit be amended in accordance with paragraphs (a)(1) through (7) of this section. Requests for an amendment must be submitted through the DEA Diversion Control Division secure network application. Except as provided in paragraph (a)(5) of this section exporters must submit all requests for an amendment at least one full business day in advance of the date of release from the port of export. Exporters must specifically request that an amendment be made; supplementary information submitted by an exporter through the DEA Diversion Control Division secure network application will not automatically trigger the amendment process. While the request for an amendment is being reviewed by the Administration, the original permit will be temporarily stayed and may not be used to authorize release of a shipment of controlled substances. If the exporter's request for an amendment to an issued permit is granted by the Administration, the Administration will immediately cancel the original permit and re-issue the permit, as amended, with a revised permit number. The DEA and exporter will distribute the amended permit in accordance with § 1312.24. If a request for an amendment is denied by the Administration, the temporary stay will be lifted; once lifted, the originally issued permit may immediately be used to authorize release of a shipment in accordance with the terms of the permit.

(1) An exporter may request that an export permit or application for a permit be amended to change the National Drug Control number, description of the packaging, or trade name of the product, so long as the description is for the same basic class of controlled substance as in the original permit.

(2) An exporter may request that an export permit or application for a permit be amended to change the proposed port of export, the anticipated date of release by a customs officer, or the method of transport.

(3) An exporter may request that an export permit or application for a permit be amended to change the justification provided as to why an export shipment is needed to meet the legitimate scientific or medical needs of the country of import.

(4) An exporter may request that an export permit or application for a permit be amended to change any registrant notes.

(5) Prior to departure of the shipment from the exporter's registered location, an exporter may request that an export permit or application for a permit be amended to increase the total base weight of a controlled substance. However, the total base weight or the strength of the product (if listed) of a controlled substance may not exceed that permitted for import as indicated on the import permit from the foreign competent national authority. Exporters are not required to amend an export permit for the sole purpose of decreasing the total base weight of a controlled substance authorized to be exported. However, the balance of any unexported authorized quantity of controlled substances on an export permit is void upon release of a shipment on the issued permit or upon expiration of the unused permit in accordance with paragraph (b) of this section, whichever is sooner. Exporters must submit a request for an amendment to increase the total base weight of a controlled substance at least three business days in advance of the date of release from the port of export.

(6) An exporter may request that an export permit be amended to remove a controlled substance from the permit. However, an exporter may not amend an export permit to add or replace a controlled substance to the item(s) to be exported. Exporters who desire to export a different controlled substance than that contained on their issued export permit or permit application must submit a request for the permit or permit application to be canceled and request a new permit in accordance with § 1312.22.

(7) An exporter may not amend the exporter's name (as it appears on their DEA certificate of registration), the name of the foreign importer(s), or the foreign permit information as provided in the DEA Form 161, 161R, or 161R–EEA. Exporters who need to make any changes to any of these fields must submit a request for the permit or permit application to be canceled and request a new permit in accordance with § 1312.22.

(b) An export permit will be void and of no effect after the date specified therein, which date must conform to the expiration date specified in the supporting import certificate or other documentary evidence upon which the export permit is founded, but in no event will the date be more than 180 calendar days after the date the permit is issued.

(c) An export permit may be canceled after being issued, at the request of the exporter submitted to the Administration through the DEA Diversion Control Division secure network application, provided that no shipment has been made thereunder. Nothing in this part will affect the right, hereby reserved by the Administration, to cancel an export permit at any time for proper cause.

■ 56. Revise § 1312.26 to read as follows:

§ 1312.26 Records required of exporter.

In addition to any other records required by this chapter, the exporter must keep a record of any serial numbers that might appear on packages of narcotic drugs in quantities of one ounce or more in such a manner as will identify the foreign consignee, along with an official record of the export permit, in accordance with part 1304 of this chapter.

■ 57. In § 1312.27:

■ a. Revise the section heading and paragraphs (a) and (b); and

■ b. Add paragraphs (d) through (g).

The revisions and additions read as follows:

§ 1312.27 Export/reexport declaration.

(a) Any person registered or authorized to export and seeking to export any non-narcotic controlled substance listed in Schedule III, IV, or V, which is not subject to the requirement of an export permit pursuant to § 1312.23(b) or (c), or any person registered or authorized to export and seeking to export any controlled substance in Schedule V, must file a controlled substances export declaration (DEA Form 236) with the Administration through the DEA Diversion Control Division secure network application not less than 15 calendar days prior to the anticipated date of release by a customs officer at the port of export, and distribute an official record of the declaration as hereinafter directed in § 1312.28. The declaration must be signed and dated by the exporter and must contain the address of the registered location from which the substances will be shipped for exportation. Upon receipt and review, the Administration will issue a completed declaration a transaction identification number. The export declaration is not deemed filed, and therefore not valid, until the Administration has issued a transaction identification number. The exporter may only proceed with the export transaction once the transaction identification number has been issued.

(b)(1) DEA Form 236 must include the following information:

(i) The name/business name, address/business address, contact information (*e.g.,* telephone number(s), email address(es), etc.), and registration number, if any, of the exporter; and the name/business name, address/business address, contact information (*e.g.,* telephone number(s), email address(es), etc.), and registration number of the export broker, if any.

(ii) A detailed description of each controlled substance to be exported including the drug name, dosage form, National Drug Code (NDC) number, Administration Controlled Substance Code Number as set forth in part 1308 of this chapter, the number and size of the packages or containers, the name and quantity of the controlled substance contained in any finished dosage units, and the quantity of any controlled substance (expressed in anhydrous acid, base, or alkaloid) given in kilograms or parts thereof.

(iii) The anticipated date of release by a customs officer at the port of export, the port of export, the foreign port and country of entry, the carriers and shippers involved, method of shipment, the name of the vessel if applicable, and the name, address, and registration number, if any, of any forwarding agent utilized.

(iv) The name/business name, address/business address, and contact information (*e.g.,* telephone number(s), email address(es), etc.) of the consignee in the country of destination, and any registration or license number if the consignee is required to have such numbers either by the country of destination or under United States law. In addition, documentation must be provided to show that:

(A) The consignee is authorized under the laws and regulations of the country of destination to receive the controlled substances; and

(B) The substance is being imported for consumption within the importing country to satisfy medical, scientific or other legitimate purposes.

(v) The reexport of non-narcotic controlled substances in Schedules III and IV, and controlled substances in

Schedule V is not permitted under the authority of 21 U.S.C. 953(e), except as provided below and in paragraph (b)(1)(vi) of this section:

(A) Bulk substances will not be reexported in the same form as exported from the United States, *i.e.,* the material must undergo further manufacturing process. This further manufactured material may only be reexported to a country of ultimate consumption.

(B) Finished dosage units, if reexported, will be in a commercial package, properly sealed and labeled for legitimate medical use in the country of destination.

(C) Any reexportation be made known to DEA at the time the initial DEA Form 236, Controlled Substances Import/Export Declaration is completed, by checking the box marked ''other'' on the certification. The following information will be furnished in the remarks section:

(*1*) Indicate ''for reexport''.

(*2*) Indicate if reexport is bulk or finished dosage units.

(*3*) Indicate product name, dosage strength, commercial package size, and quantity.

(*4*) Indicate name of consignee, complete address, and expected shipment date, as well as, the name and address of the ultimate consignee in the country to where the substances will be reexported.

(*5*) A statement that the consignee in the country of ultimate destination is authorized under the laws and regulations of the country of ultimate destination to receive the controlled substances.

(D) Shipments that have been exported from the United States and are refused by the consignee in either the first or second country, or subsequent member of the European Economic Area, or are otherwise unacceptable or undeliverable, may be returned to the registered exporter in the United States upon authorization of the Administration. In this circumstance, the exporter in the United States must file a written request for reexport, along with a completed DEA Form 236, with the Administration through the DEA Diversion Control Division secure network application. A brief summary of the facts that warrant the return of the substance to the United States along with an authorization from the country of export must be included with the request. DEA will evaluate the request after considering all the facts as well as the exporter's registration status with DEA. The substance may be returned to the United States only after affirmative authorization is issued in writing by DEA.

(vi) The reexport of non-narcotic controlled substances in Schedules III and IV, and controlled substances in Schedule V is permitted among members of the European Economic Area only as provided below:

(A) The controlled substance will not be exported from the second country or a subsequent country, except that the controlled substance may be exported from a second country or a subsequent country that is a member of the European Economic Area to another country that is a member of the European Economic Area, provided that the first country is also a member of the European Economic Area; each country is a party to the Convention on Psychotropic Substances, 1971, as amended; and each country has instituted and maintains, in conformity with such Convention, a system of controls of imports of controlled substances which the Attorney General deems adequate.

(B) Each shipment of finished dosage units, if reexported, must be in a commercial package, properly sealed and labeled for legitimate medical use in the country of destination.

(C) Any reexportation must be made known to DEA at the time the initial DEA Form 236, Controlled Substances Import/Export Declaration is completed, by checking the box marked ''other'' on the certification. In addition to the requirements of paragraph (b) of this section, the following information will be furnished in the remarks section:

(*1*) Indicate ''for reexport among members of the European Economic Area''.

(*2*) Indicate if reexport is bulk or finished dosage units.

(*3*) Indicate product name, dosage strength, commercial package size, and quantity.

(*4*) Indicate the name/business name, address/business address, contact information (*e.g.,* telephone number(s), email address(es) and business of the consignee in the first country).

(*5*) A statement that the consignee in the second country, and any subsequent consignee within the European Economic Area, is authorized under the laws and regulations of the second and/or subsequent country to receive the controlled substances.

(2) With respect to reexports among members of the European Economic Area, the requirements of paragraph (b)(1) of this section shall apply only with respect to the export from the United States to the first country and not to any subsequent export from that country to another country of the European Economic Area.

* * * * *

(d) *Return information*—(1) *Return information for exports.* Within 30 calendar days after the controlled substance is released by a customs officer at the port of export, or within 10 calendar days after receipt of a written request by the Administration to the exporter, whichever is sooner, the exporter must file a report with the Administration through the DEA Diversion Control Division secure network application specifying the particulars of the transaction. This report must include the following information: The date on which the controlled substance left the registered location; the date on which the controlled substance was released by a customs officer; the actual quantity of the controlled substance that left the registered location; and the actual quantity of the controlled substance released by a customs officer at the port of export; the actual port of export. Upon receipt and review, the Administration will assign a completed report a transaction identification number. The report will not be deemed filed until the Administration has issued a transaction identification number.

(2) *Return information for reexports outside of the European Economic Area*—(i) *Return information for export from the United States, for reexport.* Within 30 calendar days after the controlled substance is released by a customs officer at the port of export the exporter must file a report with the Administration through the DEA Diversion Control Division secure network application specifying the particulars of the transaction. This report must include the following information: The date on which the controlled substance left the registered location; the date on which the controlled substance was released by a customs officer at the port of export; the actual quantity of controlled substance released by a customs officer at the port of export; and the actual port of export. Upon receipt and review, the Administration will assign a completed report a transaction identification number. The report will not be deemed filed until the Administration has issued a transaction identification number.

(ii) *Return information for export from a first country that is or is not a member of the European Economic Area to a country outside of the European Economic Area; return information for export from a first country that is not a member of the European Economic Area to a member of the European Economic Area.* Within 30 calendar days after the controlled substance is exported from the first country to the second country the exporter must file a report with the Administration through the DEA Diversion Control Division secure network application specifying the particulars of the export from the first country. If the permit issued by the Administration authorized the reexport of a controlled substance from the first country to more than one second country, a report for each individual reexport is required. These reports must include the following information: Name of second country; actual quantity of controlled substance shipped; the date shipped from the first country; and the actual port from which the controlled substances were shipped from the first country. Upon receipt and review, the Administration will assign each completed report a transaction identification number. The report will not be deemed filed until the Administration has issued a transaction identification number.

(3) *Reexports among members of the European Economic Area*—(i) *Return information for exports from the United States, for reexport among members of the European Economic Area.* Exporters must comply with the return reporting requirements of paragraph (d)(2)(i) of this section.

(ii) *Reexports among members of the European Economic Area.* Within 30 calendar days after the controlled substance is exported from the first country to the second country, and within 30 calendar days of each subsequent reexport within the European Economic Area, if any, the exporter must file a report with the Administration through the DEA Diversion Control Division secure network application specifying the particulars of the export. These reports must include the name of country to which the controlled substance was reexported to another member of the European Economic Area; the actual quantity of controlled substance shipped; the date shipped from the first country, the name/business name, address/business address, contact information (*e.g.,* telephone number(s), email address(es), etc.) and business of the consignee; and the name/business name, address/business address, contact information (*e.g.,* telephone number(s), email address(es), etc.) and business of the exporter. Upon receipt and review, the Administration will assign each completed report a transaction identification number. The report will not be deemed filed until the Administration has issued a transaction identification number.

(e) An exporter may amend an export declaration in the same circumstances in which an exporter may request amendment to an export permit, as set forth in § 1312.25(a)(1) through (7). Amendments to declarations must be submitted through the DEA Diversion Control Division secure network application. Except as provided in § 1312.25(a)(5) exporters must submit all amendments at least one full business day in advance of the date of release by a customs officer. Exporters must specifically note that an amendment is being made; supplementary information submitted by an exporter through the DEA Diversion Control Division secure network application will not automatically be considered an amendment. Upon receipt and review, the Administration will assign each completed amendment a transaction identification number. The amendment will not be deemed filed until the Administration issues a transaction identification number. The DEA and the exporter will distribute the amended declaration in accordance with § 1312.28. A filed amendment will not change the date that the declaration becomes void and of no effect in accordance with paragraph (f) of this section.

(f) An export declaration may be canceled after being filed with the Administration, at the request of the exporter, provided no shipment has been made thereunder. Export declarations shall become void and of no effect 180 calendar days after the date the declaration is deemed filed with the Administration.

(g) *Denied release at the port of export.* In the event that a shipment of controlled substances has been denied release by a customs officer at the port of export for any reason, the exporter who attempted to have the shipment released must, within 5 business days of the denial, report to the Administration that the shipment was denied release and the reason for denial. Such report must be transmitted to the Administration through the DEA Diversion Control Division secure network application. This report must include the following information: The quantity of the controlled substance denied release; the date on which release was denied; and the basis for the denied release. Upon the exporter's report of a denied release, DEA will assign the report a transaction identification number and the export declaration will be void and of no effect. No shipment of controlled substances denied release for any reason will be allowed to be released unless the exporter files a new declaration and the Administration issues a new transaction identification number.

■ 58. Revise § 1312.28 to read as follows:

§ 1312.28 Distribution of export declaration.

(a) The exporter must ensure that an official record of the export declaration (available from the DEA Diversion Control Division secure network application after the Administration issues a transaction identification number) accompanies the shipment of controlled substances to its destination.

(b) The exporter, or their agent, must submit an official record of the export declaration and/or required data concerning the export transaction to a customs officer at the port of export in compliance with all export control requirements of agencies with export control authorities under the Act or statutory authority other than the Controlled Substances Import and Export Act.

(c) The exporter must maintain an official record of the export declaration and return information (both available from the Diversion Control Division secure network application after the Administration issues a transaction identification number) required pursuant to § 1312.27(d) as his or her record of authority for the exportation, in accordance with part 1304 of this chapter.

■ 59. In § 1312.31:

■ a. Revise paragraph (b) introductory text;

■ b. In paragraph (d)(2), remove the word ''and'' at the end of the paragraph;

■ c. In paragrarph (d)(3), remove the period at the end of the paragraph and add ''; and'' in its place; and

■ d. Add paragraph (d)(4).

The revision and addition read as follows:

§ 1312.31 Schedule I: Application for prior written approval.

* * * * *

(b) An application for a transshipment permit must be submitted to the Regulatory Section, Diversion Control Division, Drug Enforcement Administration, at least 30 calendar days, or in the case of an emergency as soon as is practicable, prior to the expected date of arrival at the first port in the United States. See the Table of DEA Mailing Addresses in § 1321.01 of this chapter for the current mailing address. A separate permit is required for each shipment of controlled substance to be imported, transferred, or transshipped. Each application must contain the following:

* * * * *

(d) * * *

(4) If the import license or permit, or the certified copy of such, is not written in English or bilingual with another language and English, the application must include a certified translation of the permit or license. For purposes of this requirement, certified translation means that the translator has signed the translation legally attesting the accuracy of the translation.

* * * * *

■ 60. Revise § 1312.32 to read as follows:

§ 1312.32 Schedules II, III, IV: Advance notice.

(a) A controlled substance listed in Schedules II, III, or IV may be imported into the United States for transshipment, or may be transferred or transshipped within the United States for immediate exportation, provided that written notice is submitted to the Regulatory Section, Diversion Control Division, Drug Enforcement Administration, at least 15 calendar days prior to the expected date of date of arrival at the first port in the United States. See the Table of DEA mailing Addresses in § 1321.01 of this chapter for the current mailing addresses.

(b) A separate advance notice is required for each shipment of controlled substance to be imported, transferred, or transshipped. Each advance notice must contain those items required by § 1312.31(b) and (c). If the export license, permit, or other authorization, issued by a competent national authority of the country of origin, is not written in English or bilingual with another language and English, the notice must be accompanied by a certified translation of the export license, permit, or other authorization. For purposes of this requirement, certified translation means that the translator has signed the translation legally attesting the accuracy of the translation.

PART 1313—IMPORTATION AND EXPORTATION OF LIST I AND LIST II CHEMICALS

■ 61. The authority citation for part 1313 continues to read as follows:

Authority: 21 U.S.C. 802, 830, 871(b), 971.

■ 62. Add § 1313.03 to read as follows:

§ 1313.03 Forms applicable to this part.

Form	Access/ submission
DEA Form 486, Import/Export Declaration for List I and List II Chemicals.	electronic.
DEA Form 486A Import Declaration for ephedrine, pseudoephedrine, and phenylpropanolamine (including drug products containing these chemicals).	electronic.

■ 63. In § 1313.12, revise the section heading and paragraphs (a), (b), (c) introductory text, (d), and (e) introductory text to read as follows:

§ 1313.12 Notification prior to import.

(a) Each regulated person who seeks to import a listed chemical that meets or exceeds the threshold quantities identified in § 1310.04(f) of this chapter or is a listed chemical for which no threshold has been established as identified in § 1310.04(g) of this chapter, must notify the Administration of the intended import by filing an import declaration (on DEA Form 486/486A) not later than 15 calendar days before the date of release by a customs officer at the port of entry. Regulated persons who seek to import a listed chemical below the threshold quantities identified in § 1310.04(f) are not required to file an import declaration in advance of the release by a customs officer.

(b) A complete and accurate declaration (DEA Form 486/486A) must be filed with the Administration through the DEA Diversion Control Division secure network application not later than 15 calendar days prior to the date of release by a customs officer at the port of entry. The declaration must be signed and dated by the importer and must contain the address of the final destination for the shipment, which for List I chemicals must be a registered location of the importer. Upon receipt and review, the Administration will assign a transaction identification number to each completed declaration. The 15 calendar days shall begin on the date that the regulated person submits a completed declaration, without regard to the date that the Administration assigns a transaction identification number. Listed chemicals meeting or exceeding the threshold quantities identified in § 1310.04(f) of this chapter or for which no threshold has been established may not be imported until a transaction identification number has been issued.

(c) The 15-calendar-day advance notification requirement for listed chemical imports may be waived, in whole or in part, for the following:

* * * * *

(d) For imports meeting the requirements of paragraph (c)(1) of this section, the declaration (DEA Form 486/486A) must be filed with the Administration through the DEA Diversion Control Division secure network application at least three business days before the date of release by a customs officer at the port of entry. The declaration must be signed and dated by the importer and must contain the address of the final destination for the shipment, which must be a registered location of the importer (for List I chemicals). Upon receipt and review, the Administration will assign a transaction identification number to each completed declaration. The importer may proceed with the import transaction only once the transaction identification number has been issued.

(e) For importations where advance notification is waived pursuant to paragraph (c)(2) of this section no DEA Form 486 is required; however, the regulated person must submit quarterly reports to the Regulatory Section, Diversion Control Division, Drug Enforcement Administration, not later than the 15th day of the month following the end of each quarter. See the Table of DEA Mailing Addresses in § 1321.01 of this chapter for the current mailing address. The report shall contain the following information regarding each individual importation:

* * * * *

■ 64. Revise § 1313.13 to read as follows:

§ 1313.13 Requirements of import declaration.

(a) Any List I or List II chemical listed in § 1310.02 of this chapter may be imported if that chemical is necessary for medical, commercial, scientific, or other legitimate uses within the United States. Chemical importations into the United States for immediate transfer/transshipment outside the United States must comply with the procedures set forth in § 1313.31 and all other applicable laws.

(b) The DEA Form 486/486A must include the following information:

(1) The name/business name, address/business address, and contact information (*e.g.,* telephone number(s), email address(es), etc.) of the chemical importer; the name/business name, address/business address, and contact information (*e.g.,* telephone number(s), email address(es), etc.) of the broker or forwarding agent (if any); and

(2) The name and description of each listed chemical as it appears on the label or container, the name of each chemical as it is designated in § 1310.02 of this chapter, the size or weight of container,

the number of containers, the net weight of each listed chemical given in kilograms or parts thereof, and the gross weight of the shipment given in kilograms or parts thereof; and

(3) The date of release by a customs officer at the port of entry, the foreign port and country of export, and the port of entry; and

(4) The name/business name, address/business address, and contact information (*e.g.,* telephone number(s), email address(es), etc.) of the consignor in the foreign country of exportation; and

(5) The name/business name, address/business address, and contact information (*e.g.,* telephone number(s), email address(es), etc.) of the person or persons to whom the importer intends to transfer the listed chemical and the quantity to be transferred to each transferee.

(c) Any regulated person importing ephedrine, pseudoephedrine, or phenylpropanolamine must submit, on the import declaration (DEA Form 486A), all information known to the importer on the chain of distribution of the chemical from the manufacturer to the importer. Ephedrine, pseudoephedrine, or phenylpropanolamine include each of the salts, optical isomers, and salts of optical isomers of the chemical.

(d) Import declarations shall become void and of no effect 180 calendar days after the date the declaration is deemed filed with the Administration.

■ 65. Revise § 1313.14 to read as follows:

§ 1313.14 Disposition of import declaration.

The importer, or their agent, must submit an official record of the import declaration and/or required data concerning the import transaction to a customs officer at the port of entry in compliance with all import control requirements of agencies with import control authorities under the Act or statutory authority other than the Controlled Substances Import and Export Act. For List I chemicals, the final destination of the import transaction must only be the registered location of the importer (*i.e.,* drop shipments are prohibited). A regulated person must maintain an official record of the declaration (available from the DEA Diversion Control Division secure network application after the Administration issues a transaction identification number) in accordance with part 1310 of this chapter as the record of the import. Official records of import declarations involving listed chemicals must be retained for two years.

■ 65. In § 1313.15, revise the section heading and paragraph (b) to read as follows:

§ 1313.15 Qualification of regular importers.

* * * * *

(b) Each regulated person making application under paragraph (a) of this section shall be considered a ''regular importer'' 30 calendar days after receipt of the application by the Administration, as indicated on the return receipt, unless the regulated person is otherwise notified in writing by the Administration.

* * * * *

■ 67. In § 1313.16, revise the section heading and paragraph (b) to read as follows:

§ 1313.16 Updated notice for change in circumstances.

* * * * *

(b) After a notice under § 1313.12(a) or (d) is submitted to the Administration, if circumstances change and the importer will not be transferring the listed chemical to the transferee identified in the notice, or will be transferring a greater quantity of the chemical than specified in the notice, the importer must update the notice to identify the most recent prospective transferee or the most recent quantity or both (as the case may be) and may not transfer the listed chemical until after the expiration of the 15 calendar day period beginning on the date on which the update is filed with the Administration, or, if the import is being made by a regular importer or intended for transfer to a regular customer, three business days. The preceding sentence applies with respect to changing circumstances regarding a transferee or quantity identified in an update to the same extent and in the same manner as the sentence applies with respect to changing circumstances regarding a transferee or quantity identified in the original notice under § 1313.12(a) or (d). Amended declarations must be submitted to the Administration through the DEA Diversion Control Division secure network application. The amendment must be signed and dated by the importer. Upon receipt and review, the Administration will assign each completed amendment a transaction identification number. Such shipment of listed chemicals may not be imported into the United States until the transaction identification number has been issued.

* * * * *

■ 68. Revise § 1313.17 to read as follows:

§ 1313.17 Return declaration for imports.

(a) *Return information.* Within 30 calendar days after actual receipt of a listed chemical at the importer's registered location or place of business if not required to be registered, the importer must file a report with the Administration through the DEA Diversion Control Division secure network application specifying the particulars of the transaction. This report must include the following information: The date on which the listed chemical was released by a customs officer at the port of entry; the date on which the listed chemical arrived at the importer's registered location or place of business; the actual quantity of the listed chemical released; the actual quantity of the listed chemical that arrived at the importer's location; the date of any subsequent transfer; a description of the subsequent transfer, including the actual quantity transferred, chemical, container, and name of transferees; the actual port of entry; and any other information as the Administration may specify. A single report may include the particulars of both the importation and distribution. If the importer has not distributed all chemicals imported by the end of the initial 30 calendar day period, the importer must file supplemental reports not later than 30 calendar days from the date of any further distribution, until the distribution or other disposition of all chemicals imported under the import declaration or any amendment or other update is accounted for. Upon receipt and review, the Administration will assign each completed report a transaction identification number. In determining whether the importer has complied with the requirement to file within 30 calendar days, the report shall be deemed filed on the first date on which a complete report is filed.

(b) If an importation for which a DEA Form 486/486A has been filed fails to take place, the importer must report to the Administration that the importation did not occur through the DEA Diversion Control Division secure network application.

(c) *Denied release at the port of entry.* In the event that a shipment of listed chemicals has been denied release by a customs officer at the port of entry for any reason, the importer who attempted to have the shipment released, within 5 business days of the denial, report to the Administration that the shipment was denied release and the reason for denial. Such report must be transmitted to the Administration through the DEA

Diversion Control Division secure network application. This report must include the following information: The quantity of the listed chemical denied release; the date on which release was denied; and the basis for the denied release. Upon the importer's report of a denied release, the DEA will assign the report a transaction identification number and the import declaration will be void and of no effect. No shipment of listed chemicals denied release for any reason will be allowed entry into the United States without a subsequent refiling of an import declaration. Following such refiling the importer may request release of the listed chemicals immediately after receipt of a transaction identification number without regard to the 15 day advance filing requirement in § 1313.12(b).

■ 69. In § 1313.21, revise the section heading and paragraphs (a), (b), (c) introductory text, (d), and (e) introductory text and add paragraph (h) to read as follows:

§ 1313.21 Notification prior to export.

(a) Each regulated person who seeks to export a listed chemical that meets or exceeds the threshold quantities identified in § 1310.04(f) of this chapter, or is a listed chemical for which no threshold has been established as identified in § 1310.04(g) of this chapter, must notify the Administration of the intended export by filing an export declaration (DEA Form 486) not later than 15 calendar days before the date of release by a customs officer at the port of export. Regulated persons who seek to export a listed chemical below the threshold quantities identified in § 1310.04(f) are not required to file an export declaration in advance of the export.

(b) A complete and accurate declaration (DEA Form 486) must be filed with the Administration through the DEA Diversion Control Division secure network application not later than 15 calendar days prior to the date of release by a customs officer at the port of export. The declaration must be signed and dated by the exporter and must contain the address from which the listed chemicals will be shipped for exportation. Upon receipt and review, the Administration will assign a transaction identification number to each completed declaration. The 15 calendar days shall begin on the date that the regulated person files a completed declaration without regard to the date that the Administration assigns a transaction identification number. Exporters may not request release of a listed chemical until a transaction identification number has been issued.

(c) The 15 calendar day advance notification requirement for listed chemical exports may be waived, in whole or in part, for:

* * * * *

(d) For exports meeting the requirements of paragraph (c)(1) of this section, the declaration (DEA Form 486) must be filed with the Administration through the DEA Diversion Control Division secure network application at least three business days before the date of release by a customs officer. The declaration must be signed and dated by the exporter and must contain the address from which the listed chemicals will be shipped for exportation. Upon receipt and review, the Administration will assign a transaction identification number to each completed declaration. The exporter may only proceed with the export transaction once the transaction identification number has been issued.

(e) For exportations where advance notification is waived pursuant to paragraph (c)(2) of this section no DEA Form 486 is required; however, the regulated person must submit quarterly reports with the Regulatory Section, Diversion Control Division, Drug Enforcement Administration, not later than the 15th day of the month following the end of each quarter. See the Table of DEA Mailing Addresses in § 1321.01 of this chapter for the current mailing address. Such report shall contain the following information regarding each individual exportation:

* * * * *

(h) Export declarations shall become void and of no effect 180 calendar days after the date the declaration is deemed filed with the Administration.

■ 70. Revise § 1313.22 to read as follows:

§ 1313.22 Export declaration.

(a) Any List I or List II chemical listed in § 1310.02 of this chapter which meets or exceeds the quantitative threshold criteria established in § 1310.04(f) of this chapter or is a listed chemical for which no threshold has been established as identified in § 1310.04(g) of this chapter, may be exported if that chemical is needed for medical, commercial, scientific, or other legitimate uses.

(b) The export declaration (DEA Form 486) must include all the following information:

(1) The name/business name, address/business address, and contact information (*e.g.,* telephone number(s), email address(es), etc.) of the chemical exporter; the name/business name, address/business address, and contact information (*e.g.,* telephone number(s), email address(es), etc.) of the export broker, if any;

(2) The name and description of each listed chemical as it appears on the label or container, the name of each listed chemical as it is designated in § 1310.02 of this chapter, the size or weight of container, the number of containers, the net weight of each listed chemical given in kilograms or parts thereof, and the gross weight of the shipment given in kilograms or parts thereof;

(3) The anticipated date of release by a customs officer at the port of export, the port of export, and the foreign port and country of entry; and

(4) The name/business name, address/business address, and contact information (*e.g.,* telephone number(s), email address(es), etc.) of the consignee in the country where the chemical shipment is destined; the name(s) and address(es) of any intermediate consignee(s); and a copy of the foreign permit, license or registration issued by the competent national authority of the consignee and any intermediate consignees.

(c) Declared exports of listed chemicals which are refused, rejected, or otherwise deemed undeliverable by the foreign competent national authority may be returned to the U.S. chemical exporter of record. The regulated person must provide notification through the DEA Diversion Control Division secure network application (this does not require a DEA Form 486) outlining the circumstances within a reasonable time following the return. Upon receipt and review, the Administration will assign the completed notice a transaction identification number. The notice will not be deemed filed until the Administration issues a transaction identification number. Listed chemicals so returned may not be reexported until the exporter has filed a new DEA Form 486 and the Administration has issued a new transaction identification number. This provision does not apply to shipments that have cleared foreign customs, been delivered, and accepted by the foreign consignee. Returns to third parties in the United States will be regarded as imports.

■ 71. Revise § 1313.23 to read as follows:

§ 1313.23 Disposition of export declaration.

The exporter, or their agent, must submit an official record of the export declaration and/or required data concerning the export transaction to a customs officer at the port of export in compliance with all export control requirements of agencies with export control authorities under the Act or statutory authority other than the Controlled Substances Import and Export Act. An official record of the declaration (available from the DEA Diversion Control Division secure network application after the Administration issues a transaction identification number) must be maintained by the chemical exporter as the official record of the export in accordance with part 1310 of this chapter. Export declarations involving a listed chemical must be retained for two years.

■ 72. In § 1313.26, revise the section heading and paragraph (b) to read as follows:

§ 1313.26 Updated notice for change in circumstances.

* * * * *

(b) After a notice under § 1313.21(a) is submitted to the Administration, if circumstances change and the exporter will not be transferring the listed chemical to the transferee identified in the notice, or will be transferring a greater quantity of the chemical than specified in the notice, the exporter must update the notice to identify the most recent prospective transferee or the most recent quantity or both (as the case may be). The exporter may not transfer the listed chemical until after the expiration of the 15 calendar day period beginning on the date on which the update is filed with the Administration. Except, if the listed chemical is intended for transfer to a regular customer, the exporter may not transfer the listed chemical until after the expiration of three business days. The preceding sentence applies with respect to changing circumstances regarding a transferee or quantity identified in an update to the same extent and in the same manner as the sentence applies with respect to changing circumstances regarding a transferee or quantity identified in the original notice under paragraph (a) of this section. Amended declarations must be submitted to the Administration through the DEA Diversion Control Division secure network application. The amendment must be signed and dated by the exporter. Upon receipt and review, the Administration will assign each completed amendment a transaction identification number. The amendment will not be deemed filed until the Administration issues a transaction identification number.

* * * * *

■ 73. Revise § 1313.27 to read as follows:

§ 1313.27 Return declaration for exports.

(a) *Return information.* Within 30 calendar days after a listed chemical is released by a customs officer at the port of export, the exporter must file a report with the Administration through the DEA Diversion Control Division secure network application specifying the particulars of the transaction. This report must include the following information: The date on which the listed chemical left the registered location or place of business; the date on which the listed chemical was released by a customs officer at the port of export; the actual quantity of listed chemical that left the registered location or place of business; the actual quantity of the listed chemical released by a customs officer at the port of export; chemical; container; name of transferees; and any other information as the Administration may specify. Upon receipt and review, the Administration will assign a completed report a transaction identification number. The report will not be deemed filed until the Administration has issued a transaction identification number. In determining whether the exporter has complied with the requirement to file within 30 calendar days, the report shall be deemed filed on the first date on which a complete report is filed.

(b) If an exportation for which a DEA Form 486 has been filed fails to take place, the exporter must report to the Administration that the exportation did not occur through the DEA Diversion Control Division secure network application.

(c) *Denied release at the port of export.* In the event that a shipment of listed chemicals has been denied release by a customs officer at the port of export for any reason, the exporter who attempted to have the shipment released must, within 5 business days of the denial, report to the Administration that the shipment was denied release and the reason for denial. Such report must be transmitted to the Administration through the DEA Diversion Control Division secure network application. This report must include the following information: The quantity of the listed chemicals denied release; the date on which release was denied; and the basis for the denied release. Upon the exporter's report of a denied release, DEA will assign the report a transaction identification number and the export declaration will be void and of no effect. No shipment of listed chemicals denied release for any reason will be allowed to be released from the United States without a subsequent refiling of a complete and accurate export declaration. Following such refiling, the exporter may request the release of the listed chemicals immediately after receipt of a transaction identification number without regard to the 15 day advance filing required by § 1313.21(b).

■ 74. In § 1313.31, revise paragraphs (b) introductory text and (b)(7), (8), (14), and (15) to read as follows:

§ 1313.31 Advance notice of importation for transshipment or transfer.

* * * * *

(b) Advance notification must be provided to the Regulatory Section, Diversion Control Division, Drug Enforcement Administration, not later than 15 calendar days prior to the proposed date the listed chemical will transship or transfer through the United States. See the Table of DEA Mailing Addresses in § 1321.01 of this chapter for the current mailing address. A separate notification is required for each shipment of listed chemicals to be transferred or transshipped. The written notification (not a DEA Form 486) must contain the following information:

* * * * *

(7) The name/business name, address/business address, and contact information (*e.g.,* telephone number(s), email address(es), etc.) and type of business of the foreign exporter;

(8) The foreign port and country of export;

* * * * *

(14) The name/business name, address/business address, and contact information (*e.g.,* telephone number(s), email address(es), etc.) and type of business of the consignee at the foreign port or country of entry;

(15) The shipping route from the U.S. port of export to the foreign port or country of entry at final destination;

* * * * *

■ 75. Revise § 1313.32 to read as follows:

§ 1313.32 Notification of international transactions.

(a) A broker or trader must notify the Administration prior to an international transaction involving a listed chemical which meets or exceeds the threshold quantities identified in § 1310.04(f) of this chapter or is a listed chemical for which no threshold has been established as identified in § 1310.04(g) of this chapter, in which the broker or trader participates. Notification must be made not later than 15 calendar days before the transaction is to take place. In order to facilitate an international transaction involving listed chemicals and implement the purpose of the Act, regulated persons may wish to provide advance notification to the Administration as far in advance of the 15 calendar days as possible.

(b) A completed DEA Form 486 must be submitted to the Administration through the DEA Diversion Control Division secure network application, not later than 15 calendar days prior to the international transaction. The DEA Form 486 must be signed and dated by the broker or trader. Upon receipt and review, the Administration will assign a transaction identification number to each completed notification. A notification is not deemed filed, and therefore is not valid, until the Administration assigns the notification a transaction identification number. An international transaction may not take place until after a transaction identification number has been assigned and the expiration of the 15 calendar day period beginning on the date on which the broker or trader submits a complete notification to the Administration.

(c) No person shall serve as a broker or trader for an international transaction involving a listed chemical knowing or having reasonable cause to believe that the transaction is in violation of the laws of the country to which the chemical is exported or the chemical will be used to manufacture a controlled substance in violation of the laws of the country to which the chemical is exported. The Administration will publish a notice of foreign import restrictions for listed chemicals of which DEA has knowledge as provided in § 1313.25.

(d) After a notice under paragraph (a) of this section is submitted to the Administration, if circumstances change and the broker or trader will not be transferring the listed chemical to the transferee identified in the notice, or will be transferring a greater quantity of the chemical than specified in the notice, the broker or trader must amend the notice through the DEA Diversion Control Division secure network application to identify the most recent prospective transferee or the most recent quantity or both (as applicable) and may not transfer the listed chemical until after the expiration of the 15 calendar day period beginning on the date on which the update is submitted to the Administration. The preceding sentence applies with respect to changing circumstances regarding a transferee or quantity identified in an amendment to the same extent and in the same manner as the sentence applies with respect to changing circumstances regarding a transferee or quantity identified in the original notice under paragraph (a) of this section.

(e) For purposes of this section:

(1) The term *transfer*, with respect to a listed chemical, includes the sale of the chemical.

(2) The term *transferee* means a person to whom an exporter transfers a listed chemical.

■ 76. In § 1313.33, revise the paragraphs (b) and (c) to read as follows:

§ 1313.33 Contents of an international transaction declaration.

* * * * *

(b) Any broker or trader who desires to arrange an international transaction, defined in 21 U.S.C. 802(42), involving a listed chemical which meets the threshold criteria set forth in § 1310.04 of this chapter must notify the Administration through the procedures outlined in § 1313.32(b).

(c) The DEA Form 486 must include:

(1) The name/business name, address/business address, and contact information (*e.g.,* telephone number(s), email address(es), etc.) of the chemical exporter; the name/business name, address/business address, and contact information (*e.g.,* telephone number(s), email address(es), etc.) of the chemical importer;

(2) The name and description of each listed chemical as it appears on the label or container, the name of each listed chemical as it is designated in § 1310.02 of this chapter, the size or weight of container, the number of containers, the net weight of each listed chemical given in kilograms or parts thereof, and the gross weight of the shipment given in kilograms or parts thereof;

(3) The anticipated date of release at the foreign port of export, the anticipated foreign port and country of export, and the foreign port and country of entry; and

(4) The name/business name, address/business address, and contact information (*e.g.,* telephone number(s), email address(es), etc.) of the consignee in the country where the chemical shipment is destined; the name(s) and address(es) of any intermediate consignee(s).

■ 77. Revise § 1313.34 to read as follows:

§ 1313.34 Disposition of the international transaction declaration.

The broker or trader must retain an official record of the declaration (DEA Form 486) (available from the DEA Diversion Control Division secure network application after the Administration issues a transaction identification number) as the official record of the international transaction. In accordance with part 1310 of this chapter, declarations involving listed chemicals must be retained for two years.

■ 78. Revise § 1313.35 to read as follows:

§ 1313.35 Return declaration or amendment to Form 486 for international transactions.

(a) Within 30 calendar days after an international transaction is completed, the broker or trader must file a report with the Administration through the DEA Diversion Control Division secure network application about the particulars of the transaction. This report must include the following information: The date(s) on which the listed chemical was released by the foreign customs officer(s) at the port(s); the actual quantity of listed chemical that left the country of export; the actual quantity of the listed chemical released by a customs officer at the port of entry; chemical; container; name of transferees; and the transaction identification and any other information as the Administration may specify. Upon receipt and review, the Administration will assign a completed report a transaction identification number. The report will not be deemed filed until the Administration has issued a transaction identification number.

(b) If an international transaction for which a DEA Form 486 has been filed fails to take place, the broker or trader must report to the Administration that the international transaction did not occur utilizing the DEA Diversion Control Division secure network application as soon as the broker or trader becomes aware of the circumstances.

PART 1314—RETAIL SALE OF SCHEDULED LISTED CHEMICAL PRODUCTS

■ 79. The authority citation for part 1314 continues to read as follows:

Authority: 21 U.S.C. 802, 830, 842, 871(b), 875, 877, 886a.

§ 1314.110 [Amended]

■ 80. In § 1314.110, in paragraphs (a)(1) and (2), remove the phrase ''Import/Export Unit,'' and add in its place ''Regulatory Section, Diversion Control Division''.

PART 1315—IMPORTATION AND PRODUCTION QUOTAS FOR EPHEDRINE, PSEUDOEPHEDRINE, AND PHENYLPROPANOLAMINE

■ 81. The authority citation for part 1315 continues to read as follows:

Authority: 21 U.S.C. 802, 821, 826, 871(b), 952.

■ 82. In part 1315, remove ''Drug & Chemical Evaluation Section, Drug Enforcement Administration'' and ''Drug & Chemical Evaluation Section'' and add in their place ''UN Reporting & Quota Section, Diversion Control Division, Drug Enforcement Administration''.

PART 1316—ADMINISTRATIVE FUNCTIONS, PRACTICES, AND PROCEDURES

Subpart D—Administrative Hearings

■ 83. The authority citation for part 1316, subpart D, continues to read as follows:

Authority: 21 U.S.C. 811, 812, 871(b), 875, 958(d), 965.

■ 84. In § 1316.47, revise paragraph (a) to read as follows:

§ 1316.47 Request for hearing.

(a) Any person entitled to a hearing and desiring a hearing shall, within the period permitted for filing, file a request for a hearing and/or an answer that complies with the following format (see the Table of DEA Mailing Addresses in § 1321.01 of this chapter for the current mailing address):

(Date) ___________________________
Drug Enforcement Administration, Attn: Hearing Clerk/OALJ
(Mailing Address) ___________________
Subject: Request for Hearing
Dear Sir:

The undersigned ___________ (Name of the Person) hereby requests a hearing in the matter of: ___________ (Identification of the proceeding).

(A) (State with particularity the interest of the person in the proceeding.)

(B) (State with particularity the objections or issues, if any, concerning which the person desires to be heard.)

(C) (State briefly the position of the person with regard to the particular objections or issues.)

All notices to be sent pursuant to the proceeding should be addressed to:

(Name) ___________________________
(Street Address) ____________________
(City and State) _____________________
Respectfully yours,
(Signature of Person) _______________

* * * * *

■ 85. Revise § 1316.48 to read as follows:

§ 1316.48 Notice of appearance.

Any person entitled to a hearing and desiring to appear in any hearing, shall, if he or she has not filed a request for hearing, file within the time specified in the notice of proposed rulemaking, a written notice of appearance in the following format (see the Table of DEA Mailing Addresses in § 1321.01 of this chapter for the current mailing address):

(Date) ___________________________
Drug Enforcement Administration, Attn: Hearing Clerk/OALJ
(Mailing Address) ___________________
Subject: Notice of Appearance
Dear Sir:

Please take notice that ___________ (Name of person) will appear in the matter of: ___________ (Identification of the proceeding).

(A) (State with particularity the interest of the person in the proceeding.).

(B) (State with particularity the objections or issues, if any, concerning which the person desires to be heard.).

(C) (State briefly the position of the person with regard to the particular objections or issues.).

All notices to be sent pursuant to this appearance should be addressed to:

(Name) ___________________________
(Street Address) ____________________
(City and State) _____________________

Respectfully yours,
(Signature of Person) _______________

PART 1321—DEA MAILING ADDRESSES

■ 86. The authority citation for part 1321 continues to read:

Authority: 21 U.S.C. 871(b).

■ 87. Revise § 1321.01 to read as follows:

§ 1321.01 DEA mailing addresses.

The following table provides information regarding mailing addresses to be used when sending specified correspondence to the Drug Enforcement Administration.

TABLE OF DEA MAILING ADDRESSES

Code of Federal Regulations Section—Topic	DEA mailing address
DEA Administrator	
1308.43(b)—Petition to initiate proceedings for rulemaking. 1316.23(b)—Petition for grant of confidentiality for research subjects. 1316.24(b)—Petition for exemption from prosecution for researchers.	Drug Enforcement Administration, Attn: Administrator, 8701 Morrissette Drive, Springfield, VA 22152.
DEA Diversion Control Division	
1307.03—Exception request filing. 1307.22—Delivery of surrendered and forfeited controlled substances. 1310.21(b)—Sale by Federal departments or agencies of chemicals which could be used to manufacture controlled substances certification request.[2]	Drug Enforcement Administration, Attn: Diversion Control Division/DC, 8701 Morrissette Drive, Springfield, VA 22152.

TABLE OF DEA MAILING ADDRESSES—Continued

Code of Federal Regulations Section—Topic	DEA mailing address
DEA Regulatory Section	
1301.71(d)—Security system compliance review for controlled substances. 1309.71(c)—Security system compliance review for List I chemicals. 1310.03(c)—Mail-Order reports involving transactions with nonregulated persons or exports.[1] 1310.05(b)(1)—Unusual or excessive loss or disappearance of listed chemicals. 1310.05(b)(2)—Reports of domestic regulated transactions in a tableting machine or an encapsulating machine.[1] 1310.05(c)(1)—Reports of imports and exports of a tableting machine or an encapsulating machine.[1] 1310.05(c)(2)—Report of declared exports of machines refused, rejected, or returned. 1312.12(a)—Application for import permit (DEA Form 357).[1] 1312.18(b)—Import declaration (DEA Form 236) submission.[1] 1312.22(g)(8)—Request for return of unacceptable or undeliverable exported controlled substances.[1] 1312.27(a)—Controlled substances export declaration (DEA Form 236) filing.[1] 1312.31(b)—Controlled substances transshipment permit application. 1312.32(a)—Advanced notice of importation for transshipment or transfer of controlled substances. 1313.12(b)—Authorization to import listed chemicals (DEA Form 486/486A).[1] 1313.12(e)—Quarterly reports of listed chemicals importation. 1313.21(b)—Authorization to export listed chemicals (DEA Form 486).[1] 1313.21(e)—Quarterly reports of listed chemicals exportation. 1313.22(c)—Notice of declared exports of listed chemicals refused, rejected or undeliverable.[1] 1313.31(b)—Advanced notice of importation for transshipment or transfer of listed chemicals. 1313.32(b)(1)—International transaction authorization (DEA Form 486).[1] 1314.110(a)(1)—Reports for mail-order sales. 1314.110(a)(2)—Request to submit mail-order sales reports.	Drug Enforcement Administration, Attn: Regulatory Section/DRG, 8701 Morrissette Drive, Springfield, VA 22152.
DEA Drug & Chemical Evaluation Section	
1308.21(a)—Exclusion of nonnarcotic substance. 1308.23(b)—Exemption for chemical preparations. 1308.24(d)—Exempt narcotic chemical preparations importer/exporter reporting. 1308.24(i)—Exempted chemical preparations listing. 1308.25(a)—Exclusion of veterinary anabolic steroid implant product application. 1308.26(a)—Excluded veterinary anabolic steroid implant products listing. 1308.31(a)—Exemption of a nonnarcotic prescription product application. 1308.32—Exempted prescription products listing. 1308.33(b)—Exemption of certain anabolic steroid products application. 1308.34—Exempted anabolic steroid products listing. 1310.13(b)—Exemption for chemical preparations. 1310.05(d)—Bulk manufacturer of listed chemicals reporting.	Drug Enforcement Administration, Attn: Drug & Chemical Evaluation Section/DRE, 8701 Morrissette Drive, Springfield, VA 22152.
UN Reporting & Quota Section	
1303.12(b)—Application for controlled substances procurement quota (DEA Form 250) filing and request.	Drug Enforcement Administration, Attn: UN Reporting & Quota Section/DRQ, 8701 Morrissette Drive, Springfield, VA 22152.

TABLE OF DEA MAILING ADDRESSES—Continued

Code of Federal Regulations Section—Topic	DEA mailing address
1303.12(d)—Controlled substances quota adjustment request. 1303.22—Application for individual manufacturing quota (DEA Form 189) filing and request for schedule I or II controlled substances. 1304.31(a)—Manufacturers importing narcotic raw material report submission. 1304.32(a)—Manufacturers importing coca leaves report submission. 1315.22—Application for individual manufacturing quota for ephedrine, pseudoephedrine, phenylpropanolamine (DEA Form 189) filing and request. 1315.32(e)—Application for procurement quota for ephedrine, pseudoephedrine, phenylpropanolamine (DEA Form 250) filing and request. 1315.32(g)—Procurement quota adjustment request for ephedrine, pseudoephedrine, and phenylpropanolamine. 1315.34(d)—Application for import quota for ephedrine, pseudoephedrine, phenylpropanolamine (DEA Form 488) request and filing. 1315.36(b)—Request import quota increase for ephedrine, pseudoephedrine, or phenylpropanolamine.	
Pharmaceutical Investigations Section	
1304.04(d)—ARCOS separate central reporting identifier request. 1304.33(a)—Reports to ARCOS.	Drug Enforcement Administration, Attn: ARCOS Unit/DOPT, P.O. Box 2520, Springfield, VA 22152–2520 OR Drug Enforcement Administration, Attn: ARCOS Unit, 8701 Morrissette Drive, Springfield, VA 22152.
DEA Registration Section	
1301.03—Procedures information request (controlled substances registration). 1301.13(e)(2)—Request DEA Forms 224, 225, and 363. 1301.14(a)—Controlled substances registration application submission. 1301.18(c)—Research project controlled substance increase request. 1301.51—Controlled substances registration modification request. 1301.52(b)—Controlled substances registration transfer request. 1301.52(c)—Controlled substances registration discontinuance of business activities notification. 1309.03—List I chemicals registration procedures information request. 1309.32(c)—Request DEA Form 510. 1309.33(a)—List I chemicals registration application submission. 1309.61—List I chemicals registration modification request.	Drug Enforcement Administration, Attn: Registration Section/DRR P.O. Box 2639, Springfield, VA 22152–2639.
DEA Hearing Clerk	
1301.43—Request for hearing or appearance; waiver. 1303.34—Request for hearing or appearance; waiver. 1308.44—Request for hearing or appearance; waiver. 1316.45—Hearings documentation filing. 1316.46(a)—Inspection of record. 1316.47(a)—Request for hearing. 1316.48—Notice of appearance.	Drug Enforcement Administration, Attn: Hearing Clerk/OALJ, 8701 Morrissette Drive, Springfield, VA 22152.
DEA Federal Register Representative	
1301.33(a)—Filing of written comments regarding application for bulk manufacture of Schedule I and II substances.[2] 1301.34(a)—Filing of written comments regarding application for importation of Schedule I and II substances.[2] 1303.11(c)—Filing of written comments regarding notice of an aggregate production quota.[2] 1303.13(c)—Filing of written comments regarding adjustments of aggregate production quotas.[2] 1303.13(c)—Filing of written comments regarding adjustments of aggregate production quotas.[2] 1308.43(g)—Filing of written comments regarding initiation of proceedings for rulemaking.[2]	Drug Enforcement Administration, Attn: Federal Register Representative/DRW, 8701 Morrissette Drive, Springfield, VA 22152. *http://www.regulations.gov/.*

Part V

Environmental Protection Agency

40 CFR Part 63

National Emission Standards for Hazardous Air Pollutants for Chemical Recovery Combustion Sources at Kraft, Soda, Sulfite, and Stand-Alone Semichemical Pulp Mills; Proposed Rule

ENVIRONMENTAL PROTECTION AGENCY

40 CFR Part 63

[EPA–HQ–OAR–2014–0741; FRL–9957–07–OAR]

RIN 2060–AS46

National Emission Standards for Hazardous Air Pollutants for Chemical Recovery Combustion Sources at Kraft, Soda, Sulfite, and Stand-Alone Semichemical Pulp Mills

AGENCY: Environmental Protection Agency (EPA).

ACTION: Proposed rule.

SUMMARY: The Environmental Protection Agency (EPA) is proposing amendments to the National Emission Standards for Hazardous Air Pollutants (NESHAP) for Chemical Recovery Combustion Sources at Kraft, Soda, Sulfite, and Stand-Alone Semichemical Pulp Mills to address the results of the residual risk and technology review (RTR) that the EPA is required to conduct under the Clean Air Act (CAA). These proposed amendments include revisions to the opacity monitoring provisions; addition of electrostatic precipitator (ESP) parameter monitoring provisions; a requirement for 5-year periodic emissions testing; revisions to provisions addressing periods of startup, shutdown, and malfunction (SSM); and technical and editorial changes. The EPA is proposing these amendments to improve the effectiveness of the rule.

DATES: *Comments.* Comments must be received on or before February 28, 2017. Under the Paperwork Reduction Act (PRA), comments on the information collection provisions are best assured of consideration if the Office of Management and Budget (OMB) receives a copy of your comments on or before January 30, 2017.

Public Hearing. A public hearing will be held if requested by January 4, 2017.

ADDRESSES: *Comments.* Submit your comments, identified by Docket ID No. EPA–HQ–OAR–2014–0741, at *http://www.regulations.gov.* Follow the online instructions for submitting comments. Once submitted, comments cannot be edited or removed from *Regulations.gov.* The EPA may publish any comment received to its public docket. Do not submit electronically any information you consider to be Confidential Business Information (CBI) or other information whose disclosure is restricted by statute. Multimedia submissions (audio, video, etc.) must be accompanied by a written comment. The written comment is considered the official comment and should include discussion of all points you wish to make. The EPA will generally not consider comments or comment contents located outside of the primary submission (i.e., on the Web, cloud, or other file sharing system). For additional submission methods, the full EPA public comment policy, information about CBI or multimedia submissions, and general guidance on making effective comments, please visit *http://www2.epa.gov/dockets/commenting-epa-dockets.*

Instructions. Direct your comments to Docket ID No. EPA–HQ–OAR–2014–0741. The EPA's policy is that all comments received will be included in the public docket without change and may be made available online at *http://www.regulations.gov,* including any personal information provided, unless the comment includes information claimed to be CBI or other information whose disclosure is restricted by statute. Do not submit information that you consider to be CBI or otherwise protected through *http://www.regulations.gov* or email. The *http://www.regulations.gov* Web site is an ''anonymous access'' system, which means the EPA will not know your identity or contact information unless you provide it in the body of your comment. If you send an email comment directly to the EPA without going through *http://www.regulations.gov,* your email address will be automatically captured and included as part of the comment that is placed in the public docket and made available on the Internet. If you submit an electronic comment, the EPA recommends that you include your name and other contact information in the body of your comment and with any disk or CD–ROM you submit. If the EPA cannot read your comment due to technical difficulties and cannot contact you for clarification, the EPA may not be able to consider your comment. Electronic files should not include special characters or any form of encryption and be free of any defects or viruses. For additional information about the EPA's public docket, visit the EPA Docket Center homepage at *http://www.epa.gov/dockets.*

Docket. The EPA has established a docket for this rulemaking under Docket ID No. EPA–HQ–OAR–2014–0741. All documents in the docket are listed in the *Regulations.gov* index. Although listed in the index, some information is not publicly available, *e.g.,* CBI or other information whose disclosure is restricted by statute. Certain other material, such as copyrighted material, is not placed on the Internet and will be publicly available only in hard copy. Publicly available docket materials are available either electronically in *Regulations.gov* or in hard copy at the EPA Docket Center, Room 3334, EPA WJC West Building, 1301 Constitution Ave. NW., Washington, DC. The Public Reading Room is open from 8:30 a.m. to 4:30 p.m., Monday through Friday, excluding legal holidays. The telephone number for the Public Reading Room is (202) 566–1744, and the telephone number for the EPA Docket Center is (202) 566–1742.

Public Hearing. A public hearing will be held, if requested by January 4, 2017, to accept oral comments on this proposed action. If a hearing is requested, it will be held at the EPA's Washington, DC campus located at 1201 Constitution Avenue NW., Washington, DC. The hearing, if requested, will begin at 9:00 a.m. (local time) and will conclude at 5:00 p.m. (local time) on January 17, 2017. To request a hearing, to register to speak at a hearing, or to inquire if a hearing will be held, please contact Ms. Aimee St. Clair at (919) 541–1063 or by email at *stclair.aimee@epa.gov.* The last day to pre-register to speak at a hearing, if one is held, will be January 12, 2017.

Additionally, requests to speak will be taken the day of the hearing at the hearing registration desk, although preferences on speaking times may not be able to be fulfilled. Please note that registration requests received before the hearing will be confirmed by the EPA via email. The EPA will make every effort to accommodate all speakers who arrive and register. Because the hearing will be held at a United States governmental facility, individuals planning to attend the hearing should be prepared to show valid picture identification to the security staff in order to gain access to the meeting room. Please note that the REAL ID Act, passed by Congress in 2005, established new requirements for entering federal facilities. If your driver's license is issued by Alaska, American Samoa, Arizona, Kentucky, Louisiana, Maine, Massachusetts, Minnesota, Montana, New York, Oklahoma or the state of Washington, you must present an additional form of identification to enter the federal building. Acceptable alternative forms of identification include: Federal employee badges, passports, enhanced driver's licenses and military identification cards. In addition, you will need to obtain a property pass for any personal belongings you bring with you. Upon leaving the building, you will be required to return this property pass to the security desk. No large signs will be allowed in the building, cameras may only be used outside of the building and demonstrations will not be allowed on federal property for security reasons.

Please note that any updates made to any aspect of the hearing, including whether or not a hearing will be held, will be posted online at *https://www.epa.gov/stationary-sources-air-pollution/kraft-soda-sulfite-and-stand-alone-semichemical-pulp-mills-mact-ii.* We ask that you contact Ms. Aimee St. Clair at (919) 541–1063 or by email at *stclair.aimee@epa.gov* or monitor our Web site to determine if a hearing will be held. The EPA does not intend to publish a notice in the **Federal Register** announcing any such updates. Please go to *https://www.epa.gov/stationary-sources-air-pollution/kraft-soda-sulfite-and-stand-alone-semichemical-pulp-mills-mact-ii* for more information on the public hearing.

FOR FURTHER INFORMATION CONTACT: For questions about this proposed action, contact Dr. Kelley Spence, Sector Policies and Programs Division (Mail Code: E143–03), Office of Air Quality Planning and Standards, U.S. Environmental Protection Agency, Research Triangle Park, North Carolina 27711; telephone number: (919) 541–3158; fax number: (919) 541–3470; and email address: *spence.kelley@epa.gov.* For specific information regarding the risk modeling methodology, contact Mr. James Hirtz, Health and Environmental Impacts Division (Mail Code: C539–02), Office of Air Quality Planning and Standards, U.S. Environmental Protection Agency, Research Triangle Park, North Carolina 27711; telephone number: (919) 541–0881; fax number: (919) 541–0840; and email address: *hirtz.james@epa.gov.* For information about the applicability of the NESHAP to a particular entity, contact Ms. Sara Ayres, Office of Enforcement and Compliance Assurance, U.S. Environmental Protection Agency, USEPA Region 5 (Mail Code: E–19J), 77 West Jackson Boulevard, Chicago IL 60604; telephone number: (312) 353–6266; and email address: *ayres.sara@epa.gov.*

SUPPLEMENTARY INFORMATION:

Preamble Acronyms and Abbreviations. We use multiple acronyms and terms in this preamble. While this list may not be exhaustive, to ease the reading of this preamble and for reference purposes, the EPA defines the following terms and acronyms here:

AEGL acute exposure guideline levels
AERMOD air dispersion model used by the HEM–3 model
ANSI American National Standards Institute
ASME American Society of Mechanical Engineers
ASTM American Society for Testing and Materials

Organization of this Document. The information in this preamble is organized as follows:

I. General Information

A. Executive Summary

1. Purpose of the Regulatory Action

Section 112(f)(2) of the CAA requires the EPA to analyze and address the residual risk associated with hazardous air pollutant emissions from source categories subject to maximum achievable control technology (MACT) standards. This review, known as the residual risk review, is a one-time review that the statute provides will be done within 8 years of issuance of the MACT standard. Section 112(d)(6) of the CAA requires the EPA to review and revise CAA section 112 emissions standards, as necessary, taking into account developments in practices, processes, and control technologies. Emission standards promulgated under CAA section 112 are to be reviewed no less often than every 8 years. The EPA issued the NESHAP for Chemical Recovery Combustion Sources at Kraft, Soda, Sulfite, and Stand-Alone Semichemical Mills (40 Code of Federal Regulations (CFR) part 63, subpart MM) in 2001. The 2001 emission standards are due for review under CAA sections 112(d)(6) and 112(f)(2). In addition to conducting the RTR for subpart MM, we are evaluating the SSM provisions in the rule in light of the United States Court of Appeals for the District of Columbia Circuit decision in *Sierra Club* v. *EPA,* 551 F.3d 1019 (D.C. Cir. 2008). As explained in section IV of this preamble, in the *Sierra Club* case, the D.C. Circuit vacated the SSM exemption provisions in the General Provisions for nonopacity and opacity standards. Finally, the EPA evaluated the rule to determine if additional amendments were warranted or necessary to ensure continuous compliance with the standard and to promote consistency with other standards.

2. Summary of the Major Proposed Revisions

The EPA is not proposing to make any changes pursuant to 112(f)(2) as a result of its residual risk review. The EPA is proposing to reduce opacity limits as a result of the technology review under CAA section 112(d)(6). In addition, we are proposing the following as part of the technology review: Revising the opacity monitoring provisions, requiring ESP parameter monitoring for processes equipped with ESPs, clarifying the monitoring for combined ESP/wet scrubber controls, and providing alternative monitoring for smelt dissolving tank (SDT) wet scrubbers.

As an additional action, we are proposing to improve the compliance provisions of the subpart by proposing to require periodic air emissions performance testing once every 5 years for facilities subject to the standards for Chemical Recovery Combustion Sources at Kraft, Soda, Sulfite, and Stand-Alone Semichemical Pulp Mills. To address the SSM exemptions, we are proposing amendments to subpart MM that will (1) require facilities to meet the standard at all times, including during periods of SSM, and (2) provide alternative monitoring parameters for wet scrubbers and ESPs during these periods. We are also proposing changes to the subpart MM NESHAP and the General Provisions applicability table to eliminate the SSM exemption. To increase the ease and efficiency of data submittal and improve data accessibility, we are proposing to require mills to submit electronic copies of compliance reports, which includes performance test reports.

We are also proposing a number of technical and editorial changes. These changes include the following: Clarifying the location in 40 CFR part 60 of applicable EPA test methods; updating the facility name for Cosmo Specialty Fibers; revising the definitions section in 40 CFR 63.861; corrected misspelling in 40 CFR 63.862(c), revising multiple sections to remove reference to former smelters and former black liquor gasification system at Georgia-Pacific's facility in Big Island, Virginia; revising the monitoring requirements section; revising the performance test requirements section to specify the conditions for conducting performance tests and to revise the ambient O2 concentration in Equations 7 and 8; revising the recordkeeping requirements section in 40 CFR 63.866 to include the requirement to record information on failures to meet the applicable standard; revising the terminology in the delegation of authority section in 40 CFR 63.868 to match the definitions in 40 CFR 63.90; and revising the General Provisions applicability table (Table 1 to subpart MM of part 63) to align with those sections of the General Provisions that have been amended or reserved over time.

3. Costs and Benefits

Table 1 summarizes the costs of this action. See section V of this preamble for further discussion.

TABLE 1—SUMMARY OF THE COSTS OF THIS PROPOSED ACTION

Requirement	Capital cost, $ million	Annual cost, $ million
Change in opacity monitoring provisions for recovery furnaces and lime kilns	42	8.8
ESP parameter monitoring	5.7	1.4

TABLE 1—SUMMARY OF THE COSTS OF THIS PROPOSED ACTION—Continued

Requirement	Capital cost, $ million	Annual cost, $ million
Periodic emissions testing		1.1
Incremental reporting/recordkeeping	0.50	1.9
Total nationwide	48	13

The EPA estimates that the proposed changes to the opacity limits and monitoring allowances will reduce PM emissions by approximately 235 (tons per year) tpy and fine particle ($PM_{2.5}$) emissions by approximately 112 tpy. Periodic testing will tend to reduce emissions by providing incentive for facilities to maintain their control systems and make periodic adjustments to ensure peak performance. Eliminating the SSM exemption will reduce emissions by requiring facilities to meet the applicable standard during SSM periods. See section V of this preamble for further discussion.

B. Does this action apply to me?

Table 2 of this preamble lists the NESHAP and associated regulated industrial source categories that are the subject of this proposal. Table 2 is not intended to be exhaustive, but rather provides a guide for readers regarding the entities that this proposed action is likely to affect. The proposed standards, once promulgated, will be directly applicable to the affected sources. Federal, state, local, and tribal government entities would not be affected by this proposed action. As defined in the *Initial List of Categories of Sources Under Section 112(c)(1) of the Clean Air Act Amendments of 1990* (see 57 FR 31576, July 16, 1992), the ''Pulp and Paper Production'' source category is any facility engaged in the production of pulp and/or paper. The EPA developed the NESHAPs for the source category in phases. This NESHAP, 40 CFR part 63, subpart MM, regulates chemical recovery combustion sources at kraft, soda, sulfite, and stand-alone semichemical pulp mills. The NESHAP for non-combustion sources (40 CFR part 63, subpart S) regulates non-combustion processes at mills that (1) chemically pulp wood fiber (using kraft, sulfite, soda, and semichemical methods), (2) mechanically pulp wood fiber (*e.g.,* groundwood, thermomechanical, pressurized), (3) pulp secondary fibers (deinked and non-deinked), (4) pulp non-wood material, and (5) manufacture paper. This proposal only addresses the RTR for subpart MM, and does not propose any amendments to subpart S.

TABLE 2—NESHAP AND INDUSTRIAL SOURCE CATEGORIES AFFECTED BY THIS PROPOSED ACTION

Source category	NESHAP	NAICS code [a]
Pulp and Paper Production	Chemical Recovery Combustion Sources at Kraft, Soda, Sulfite, and Stand-Alone Semichemical Pulp Mills.	32211, 32212, 32213

[a] North American Industry Classification System.

C. Where can I get a copy of this document and other related information?

In addition to being available in the docket, an electronic copy of this action is available on the Internet through the EPA's Stationary Sources of Air Pollution Web site, a forum for information and technology exchange in various areas of air pollution control. A redline version of the regulatory language that incorporates the proposed changes in this action is available in the docket for this action (Docket ID No. EPA–HQ–OAR–2014–0741). Following signature by the EPA Administrator, the EPA will post a copy of this proposed action at: *https://www.epa.gov/stationary-sources-air-pollution/kraft-soda-sulfite-and-stand-alone-semichemical-pulp-mills-mact-ii.* Following publication in the **Federal Register**, the EPA will post the **Federal Register** version of the proposal and key technical documents at this same Web site. Information on the overall RTR program is available at *http://www3.epa.gov/ttn/atw/rrisk/rtrpg.html.*

D. What should I consider as I prepare my comments for the EPA?

Submitting CBI. Do not submit information containing CBI to the EPA through *http://www.regulations.gov* or email. Clearly mark the part or all of the information that you claim to be CBI. For CBI information on a disk or CD–ROM that you mail to the EPA, mark the outside of the disk or CD–ROM as CBI and then identify electronically within the disk or CD–ROM the specific information that is claimed as CBI. In addition to one complete version of the comments that includes information claimed as CBI, you must submit a copy of the comments that does not contain the information claimed as CBI for inclusion in the public docket. If you submit a CD–ROM or disk that does not contain CBI, mark the outside of the disk or CD–ROM clearly that it does not contain CBI. Information not marked as CBI will be included in the public docket and the EPA's electronic public docket without prior notice. Information marked as CBI will not be disclosed except in accordance with procedures set forth in 40 CFR part 2. Send or deliver information identified as CBI only to the following address: OAQPS Document Control Officer (C404–02), OAQPS, U.S. Environmental Protection Agency, Research Triangle Park, North Carolina 27711, Attention Docket ID No. EPA–HQ–OAR–2014–0741.

II. Background

A. What is the statutory authority for this action?

Section 112 of the CAA establishes a two-stage regulatory process to address emissions of hazardous air pollutants (HAPs) from stationary sources. In the first stage, after the EPA has identified categories of sources emitting one or more of the HAPs listed in CAA section 112(b), CAA section 112(d) requires the Agency to promulgate technology-based NESHAPs for those sources. ''Major sources'' are those that emit or have the potential to emit 10 tpy or more of a single HAP or 25 tpy or more of any combination of HAPs. For major sources, the technology-based NESHAP must reflect the maximum degree of emission reductions of HAPs achievable (after considering cost, energy requirements, and non-air quality health and environmental impacts) and are commonly referred to as MACT standards.

MACT standards must reflect the maximum degree of emissions reduction achievable through the application of measures, processes, methods, systems, or techniques, including, but not limited to, measures that: (1) Reduce the volume of or eliminate pollutants through process changes, substitution of materials, or other modifications; (2) enclose systems or processes to eliminate emissions; (3) capture or treat pollutants when released from a process, stack, storage, or fugitive emissions point; (4) are design, equipment, work practice, or operational standards (including requirements for operator training or certification); or (5) are a combination of the above. CAA section 112(d)(2)(A)–(E). The MACT standards may take the form of design, equipment, work practice, or operational standards where the EPA first determines either that: (1) A pollutant cannot be emitted through a conveyance designed and constructed to emit or capture the pollutant, or that any requirement for, or use of, such a conveyance would be inconsistent with law; or (2) the application of measurement methodology to a particular class of sources is not practicable due to technological and economic limitations. CAA section 112(h)(1)–(2).

The MACT ''floor'' is the minimum control level allowed for MACT standards promulgated under CAA section 112(d)(3) and may not be based on cost considerations. For new sources, the MACT floor cannot be less stringent than the emissions control that is achieved in practice by the best-controlled similar source. The MACT floor for existing sources can be less stringent than floors for new sources, but not less stringent than the average emissions limitation achieved by the best-performing 12 percent of existing sources in the category or subcategory (or the best-performing five sources for categories or subcategories with fewer than 30 sources). In developing MACT standards, the EPA must also consider control options that are more stringent than the floor. We may establish standards more stringent than the floor based on considerations of the cost of achieving the emission reductions, any non-air quality health and environmental impacts, and energy requirements.

The EPA is then required to review these technology-based standards and revise them ''as necessary (taking into account developments in practices, processes, and control technologies)'' no less frequently than every 8 years. CAA section 112(d)(6). In conducting this review, the EPA is not required to recalculate the MACT floor. *Natural Resources Defense Council (NRDC)* v. *EPA,* 529 F.3d 1077, 1084 (D.C. Cir. 2008). *Association of Battery Recyclers, Inc.* v. *EPA,* 716 F.3d 667 (D.C. Cir. 2013).

The second stage in standard-setting focuses on reducing any remaining (*i.e.,* ''residual'') risk according to CAA section 112(f). Section 112(f)(1) of the CAA required that the EPA prepare a report to Congress discussing (among other things) methods of calculating the risks posed (or potentially posed) by sources after implementation of the MACT standards, the public health significance of those risks, and the EPA's recommendations as to legislation regarding such remaining risk. The EPA prepared and submitted the *Residual Risk Report to Congress,* EPA–453/R–99–001 (*Risk Report*) in March 1999. Section 112(f)(2) of the CAA then provides that if Congress does not act on any recommendation in the Risk Report, the EPA must analyze and address residual risk for each category or subcategory of sources 8 years after promulgation of such standards pursuant to CAA section 112(d).

Section 112(f)(2) of the CAA requires the EPA to determine for source categories subject to MACT standards whether promulgation of additional standards is needed to provide an ample margin of safety to protect public health. Section 112(f)(2)(B) of the CAA expressly preserves the EPA's use of the two-step process for developing standards to address any residual risk and the Agency's interpretation of ''ample margin of safety'' developed in the *National Emissions Standards for Hazardous Air Pollutants: Benzene Emissions from Maleic Anhydride Plants, Ethylbenzene/Styrene Plants, Benzene Storage Vessels, Benzene Equipment Leaks, and Coke By-Product Recovery Plants* (Benzene NESHAP) (54 FR 38044, September 14, 1989). The EPA notified Congress in the *Risk Report* that the Agency intended to use the Benzene NESHAP approach in making CAA section 112(f) residual risk determinations (EPA–453/R–99–001, p. ES–11). The EPA subsequently adopted this approach in its residual risk determinations and, in a challenge to the risk review for the Synthetic Organic Chemical Manufacturing source category, the United States Court of Appeals for the District of Columbia Circuit upheld as reasonable the EPA's interpretation that CAA section 112(f)(2) incorporates the approach established in the Benzene NESHAP. See *NRDC* v. *EPA,* 529 F.3d 1077, 1083 (D.C. Cir. 2008) (''[S]ubsection 112(f)(2)(B) expressly incorporates the EPA's interpretation of the Clean Air Act from the Benzene standard, complete with a citation to the **Federal Register**.''); see also, *A Legislative History of the Clean Air Act Amendments of 1990,* vol. 1, p. 877 (Senate debate on Conference Report).

The first step in the process of evaluating residual risk is the determination of acceptable risk. If risks are unacceptable, the EPA cannot consider cost in identifying the emissions standards necessary to bring risks to an acceptable level. The second step is the determination of whether standards must be further revised in order to provide an ample margin of safety to protect public health. The ample margin of safety is the level at which the standards must be set, unless an even more stringent standard is necessary to prevent, taking into consideration costs, energy, safety, and other relevant factors, an adverse environmental effect.

1. Step 1—Determination of Acceptability

The Agency in the Benzene NESHAP concluded that ''the acceptability of risk under section 112 is best judged on the basis of a broad set of health risk measures and information'' and that the ''judgment on acceptability cannot be reduced to any single factor.'' Benzene NESHAP at 38046. The determination of what represents an ''acceptable'' risk is based on a judgment of ''what risks are acceptable in the world in which we live'' (*Risk Report* at 178, quoting *NRDC* v. *EPA,* 824 F. 2d 1146, 1165 (D.C. Cir. 1987) (*en banc*) (''Vinyl Chloride''), recognizing that our world is not risk-free.

In the Benzene NESHAP, we stated that ''EPA will generally presume that if the risk to [the maximum exposed] individual is no higher than approximately one in 10 thousand, that risk level is considered acceptable.'' 54 FR at 38045, September 14, 1989. We discussed the maximum individual lifetime cancer risk (or maximum individual risk (MIR)) as being ''the estimated risk that a person living near a plant would have if he or she were exposed to the maximum pollutant concentrations for 70 years.'' *Id.* We explained that this measure of risk ''is an estimate of the upper bound of risk based on conservative assumptions, such as continuous exposure for 24 hours per day for 70 years.'' *Id.* We acknowledged that maximum individual lifetime cancer risk ''does not necessarily reflect the true risk, but displays a conservative risk level which is an upper-bound that is unlikely to be exceeded.'' *Id.*

Understanding that there are both benefits and limitations to using the MIR as a metric for determining acceptability, we acknowledged in the Benzene NESHAP that ''consideration of maximum individual risk . . . must take into account the strengths and weaknesses of this measure of risk.'' *Id.* Consequently, the presumptive risk level of 100-in-1 million (1-in-10 thousand) provides a benchmark for judging the acceptability of maximum individual lifetime cancer risk, but does not constitute a rigid line for making that determination. Further, in the Benzene NESHAP, we noted that:

> ''[p]articular attention will also be accorded to the weight of evidence presented in the risk assessment of potential carcinogenicity or other health effects of a pollutant. While the same numerical risk may be estimated for an exposure to a pollutant judged to be a known human carcinogen, and to a pollutant considered a possible human carcinogen based on limited animal test data, the same weight cannot be accorded to both estimates. In considering the potential public health effects of the two pollutants, the Agency's judgment on acceptability, including the MIR, will be influenced by the greater weight of evidence for the known human carcinogen.''

Id. at 38046. The Agency also explained in the Benzene NESHAP that:

> ''[i]n establishing a presumption for MIR, rather than a rigid line for acceptability, the Agency intends to weigh it with a series of other health measures and factors. These include the overall incidence of cancer or other serious health effects within the exposed population, the numbers of persons exposed within each individual lifetime risk range and associated incidence within, typically, a 50 km exposure radius around facilities, the science policy assumptions and estimation uncertainties associated with the risk measures, weight of the scientific evidence for human health effects, other quantified or unquantified health effects, effects due to co-location of facilities, and co-emission of pollutants.''

Id. at 38045. In some cases, these health measures and factors taken together may provide a more realistic description of the magnitude of risk in the exposed population than that provided by maximum individual lifetime cancer risk alone.

As noted earlier, in *NRDC* v. *EPA,* the court held that CAA section 112(f)(2) ''incorporates the EPA's interpretation of the Clean Air Act from the Benzene Standard.'' The court further held that Congress' incorporation of the Benzene standard applies equally to carcinogens and non-carcinogens. 529 F.3d at 1081–82. Accordingly, we also consider non-cancer risk metrics in our determination of risk acceptability and ample margin of safety.

2. Step 2—Determination of Ample Margin of Safety

Section 112(f)(2) of the CAA requires the EPA to determine, for source categories subject to MACT standards, whether those standards provide an ample margin of safety to protect public health. As explained in the Benzene NESHAP, ''the second step of the inquiry, determining an 'ample margin of safety,' again includes consideration of all of the health factors, and whether to reduce the risks even further . . . . Beyond that information, additional factors relating to the appropriate level of control will also be considered, including costs and economic impacts of controls, technological feasibility, uncertainties, and any other relevant factors. Considering all of these factors, the Agency will establish the standard at a level that provides an ample margin of safety to protect the public health, as required by section 112.'' 54 FR at 38046, September 14, 1989.

According to CAA section 112(f)(2)(A), if the MACT standards for HAP ''classified as a known, probable, or possible human carcinogen do not reduce lifetime excess cancer risks to the individual most exposed to emissions from a source in the category or subcategory to less than one in one million,'' the EPA must promulgate residual risk standards for the source category (or subcategory), as necessary to provide an ample margin of safety to protect public health. In doing so, the EPA may adopt standards equal to existing MACT standards if the EPA determines that the existing standards (*i.e.,* the MACT standards) are sufficiently protective. *NRDC* v. *EPA,* 529 F.3d 1077, 1083 (D.C. Cir. 2008) (''If EPA determines that the existing technology-based standards provide an 'ample margin of safety,' then the Agency is free to readopt those standards during the residual risk rulemaking.'') The EPA must also adopt more stringent standards, if necessary, to prevent an adverse environmental effect,[1] but must consider cost, energy, safety, and other relevant factors in doing so.

The CAA does not specifically define the terms ''individual most exposed,'' ''acceptable level,'' and ''ample margin of safety.'' In the Benzene NESHAP, 54 FR at 38044–38045, September 14, 1989, the Agency stated as an overall objective:

> In protecting public health with an ample margin of safety under section 112, EPA strives to provide maximum feasible protection against risks to health from hazardous air pollutants by (1) protecting the greatest number of persons possible to an individual lifetime risk level no higher than approximately 1-in-1 million and (2) limiting to no higher than approximately 1-in-10 thousand [*i.e.,* 100-in-1 million] the estimated risk that a person living near a plant would have if he or she were exposed to the maximum pollutant concentrations for 70 years.

The Agency further stated that ''[t]he EPA also considers incidence (the number of persons estimated to suffer cancer or other serious health effects as a result of exposure to a pollutant) to be an important measure of the health risk to the exposed population. Incidence measures the extent of health risks to the exposed population as a whole, by providing an estimate of the occurrence of cancer or other serious health effects in the exposed population.'' *Id.* at 38045.

In the ample margin of safety decision process, the Agency again considers all of the health risks and other health information considered in the first step, including the incremental risk reduction associated with standards more stringent than the MACT standard or a more stringent standard that the EPA has determined is necessary to ensure risk is acceptable. In the ample margin of safety analysis, the Agency considers additional factors, including costs and economic impacts of controls, technological feasibility, uncertainties, and any other relevant factors. Considering all of these factors, the Agency will establish the standard at a level that provides an ample margin of safety to protect the public health, as required by CAA section 112(f). 54 FR 38046, September 14, 1989.

B. What is this source category and how does the current NESHAP regulate its HAP emissions?

The ''Pulp and Paper Production'' source category includes any facility engaged in the production of pulp and/or paper. The EPA developed the NESHAPs for the source category in two phases. The first phase, 40 CFR part 63, subpart S, regulates pulping and paper production processes, and was

[1] ''Adverse environmental effect'' is defined as any significant and widespread adverse effect, which may be reasonably anticipated to wildlife, aquatic life, or natural resources, including adverse impacts on populations of endangered or threatened species or significant degradation of environmental qualities over broad areas. CAA section 112(a)(7).

originally promulgated in 1998. The second phase, 40 CFR part 63, subpart MM, regulates chemical recovery combustion sources at kraft, soda, sulfite, and stand-alone semichemical pulp mills, and was originally promulgated in 2001. Another separate NESHAP, 40 CFR part 63, subpart DDDDD, covers other combustion sources located at pulp mills, such as industrial boilers. This proposal focuses exclusively on the RTR for subpart MM. The EPA is not proposing any amendments to Subpart DDDDD or subpart S in this notice.

Subpart MM of 40 CFR part 63 was promulgated on January 12, 2001 (66 FR 3180). As promulgated in 2001, the subpart MM MACT standard applies to major sources of HAP emissions from chemical recovery combustion sources at kraft, soda, sulfite, and stand-alone semichemical pulp mills. The chemical recovery combustion sources include kraft and soda recovery furnaces, SDTs, and lime kilns; kraft black liquor oxidation (BLO) units; sulfite combustion units; and semichemical combustion units. Subpart S was promulgated on April 15, 1998 (63 FR 18504), and underwent a RTR, with final amendments to subpart S promulgated on September 11, 2012 (77 FR 55698).

This proposal includes both a risk assessment and a technology review of the emission sources in 40 CFR part 63, subpart MM, as well as a risk assessment of the whole facility. The whole facility risk assessment includes emissions from all sources of HAP at the facility, including sources covered by other NESHAP (*e.g.,* boilers covered under 40 CFR part 63, subpart DDDDD; pulp and paper production processes covered under 40 CFR part 63, subpart S; paper coating operations covered under 40 CFR part 63, subpart JJJJ).

According to results of the EPA's 2011 pulp and paper information collection request (ICR), and updates based on more recent information, there are a total of 108 major sources in the United States that conduct chemical recovery combustion operations, including 97 kraft pulp mills, 1 soda pulp mill, 3 sulfite pulp mills, and 7 stand-alone semichemical pulp mills.

Subpart MM of 40 CFR part 63 includes numerical emission limits for recovery furnaces, SDTs, lime kilns, and sulfite and semichemical combustion units. The control systems used by most mills to meet the subpart MM emission limits are as follows:

- Recovery furnaces: ESPs, wet scrubbers, and nondirect contact evaporator (NDCE) furnace design with dry-bottom ESP, and dry particulate matter (PM) return system.
- Smelt dissolving tanks: Wet scrubbers, mist eliminators, and venting to recovery furnace.
- Lime kilns: ESPs and wet scrubbers.
- Sulfite combustion units: Wet scrubbers and mist eliminators.
- Semichemical combustion units: Wet scrubbers, ESPs, and regenerative thermal oxidizers (RTOs).

C. What data collection activities were conducted to support this action?

In February 2011, the EPA issued an ICR, pursuant to CAA section 114, to United States pulp and paper manufacturers to gather information needed to conduct the regulatory reviews required under CAA sections 112(d)(6) and (f)(2). The EPA divided the ICR into three parts. Part I requested available information regarding 40 CFR part 63, subpart S process equipment, control devices, pulp and paper production, bleaching, and other aspects of facility operations to support the subpart S technology review and the review of the Kraft Pulp Mills New Source Performance Standards (NSPS) under 40 CFR part 60, subpart BB. Part II requested updated inventory data for all pulp and paper emission sources to support the residual risk assessment for the pulp and paper sector (including 40 CFR part 63, subparts S and MM) and to supplement the National Emissions Inventory (NEI) for the source category for purposes of detailed residual risk modeling. Part III requested available information on subpart MM chemical recovery combustion equipment, control devices, and other pertinent information, to support the subpart MM technology review and the subpart BB NSPS review. The response rate for the ICR was 100 percent.

D. What other relevant background information and data are available?

In addition to ICR responses, the EPA reviewed a number of other information sources to determine if there have been developments in practices, processes, or control technologies by chemical recovery combustion sources. These include:

- Permit limits from permits submitted with ICR responses and collected from state agencies.
- Information on air pollution control options in the pulp and paper industry from the RACT/BACT/LAER Clearinghouse (RBLC).
- Information on best available techniques in the pulp and paper industry from a 2015 European Commission document, titled *Best Available Techniques (BAT) Reference Document for the Production of Pulp, Paper and Board.*
- Information on the most effective ways to control emissions of $PM_{2.5}$ and $PM_{2.5}$ precursors from sources in various industries, including the pulp and paper industry, from a 2006 State and Territorial Air Pollution Program Administrators/Association of Local Air Pollution Control Officers (STAPPA/ALAPCO) document, titled *Controlling Fine Particulate Matter under the Clean Air Act: A Menu of Options.*
- Stack test data submitted with ICR responses.
- Emissions factors from technical bulletins prepared by the National Council for Air and Stream Improvement, Inc. (NCASI), a major source of environmental data affecting the pulp and paper industry.

III. Analytical Procedures

In this section, we describe the analyses performed to support the proposed decisions for the RTR and other issues addressed in this proposal.

A. How did we estimate post-MACT risks posed by the source category?

The EPA conducted a risk assessment that provides estimates of the MIR posed by the HAP emissions from each source in the source category, the hazard index (HI) for chronic exposures to HAPs with the potential to cause non-cancer health effects, and the hazard quotient (HQ) for acute exposures to HAPs with the potential to cause non-cancer health effects. The assessment also provides estimates of the distribution of cancer risks within the exposed populations, cancer incidence, and an evaluation of the potential for adverse environmental effects. The seven sections that follow this paragraph describe how we estimated emissions and conducted the risk assessment. The docket for this rulemaking contains the following document which provides more information on the risk assessment inputs and models: *Residual Risk Assessment for Pulp Mill Combustion Sources in Support of the December 2016 Risk and Technology Review Proposed Rule.* The methods used to assess risks (as described in the seven primary steps below) are consistent with those peer-reviewed by a panel of the EPA's Science Advisory Board (SAB) in 2009 and described in their peer review report issued in 2010;[2] they are also consistent with the key

[2] U.S. EPA SAB. *Risk and Technology Review (RTR) Risk Assessment Methodologies: For Review by the EPA's Science Advisory Board with Case Studies—MACT I Petroleum Refining Sources and Portland Cement Manufacturing,* May 2010.

recommendations contained in that report.

1. How did we estimate actual emissions and identify the emissions release characteristics?

As discussed in section II.C of this preamble, we used data from Part II of the Pulp and Paper Sector ICR as the basis for the risk assessments for the pulp and paper sector (including 40 CFR part 63, subparts S and MM). Part II of the ICR, which concluded in June 2011, targeted facilities that are major sources of HAP emissions and involved an update of pre-populated NEI data spreadsheets (or creation of new datasets). The NEI is a database that contains information about sources that emit criteria air pollutants, their precursors and HAPs. The NEI database includes estimates of actual annual air pollutant emissions from point and volume sources; emission release characteristic data such as emission release height, temperature, diameter, velocity, and flow rate; and locational latitude/longitude coordinates. We asked pulp and paper mills to refine (or create new) inventories based on their NEI datasets for purposes of detailed residual risk modeling. Refinements included providing additional details for HAP emission sources, providing more specific information on the location and characteristics of emission points (*e.g.,* updating emission release coordinates and parameters), and adding or updating HAP emissions data for each emission release point. We compiled the updated datasets for each individual mill into a pulp and paper Part II emissions database to create the whole facility and MACT source category residual risk modeling files.

The actual annual emissions data in the pulp and paper emissions database include limited data from actual emissions tests and, in most cases, estimates of actual emissions (based on emissions factors) provided by sources surveyed in Part II of the ICR. We received a comprehensive set of emissions test data and emissions estimates that enabled us to conduct risk modeling of detectable HAP emissions for all major source facilities in the MACT source category.

We conducted two substantial quality assurance (QA) efforts on the Part II data in order to create the modeling files needed for the 40 CFR part 63, subpart S residual risk assessment, which included: (1) QA of the updated inventory spreadsheets submitted by each mill prior to import into the compiled database; and (2) QA and standardization of the compiled database.[3] We needed modeling files for both the subpart S category and the whole facility, so our QA efforts focused on data for all emission sources at pulp and paper facilities, including 40 CFR part 63, subpart MM emission sources.

We reviewed the Part II datasets to ensure that the major pulp and paper processes and pollutants were included and properly identified, to ensure that emissions from the various processes were allocated to the correct source category, and to identify emissions and other data anomalies. We also standardized the various codes (*e.g.,* source classification codes (SCCs), pollutant codes), eliminated duplicate records, and checked geographic coordinates. We reviewed emissions release parameters for data gaps and errors, assigned the proper default parameters where necessary, assigned emission process groups to distinguish between processes with related SCCs, and ensured that fugitive release dimensions were specified or given default values where necessary.

We requested comments on the inventory in the preamble to the December 27, 2011, 40 CFR part 63, subpart S proposal. We requested further updates to the mill-specific HAP emissions data used in the risk modeling, if needed. In 2012, we received revisions to inventories for 81 facilities following proposal of the subpart S residual risk review.[4]

While most of the inventory revisions that we received after the proposal made additional refinements to emissions levels and release point details for 40 CFR part 63, subpart S sources, some inventory revisions also made refinements to data for 40 CFR part 63, subpart MM sources. We incorporated revisions to all process types into the inventory to remodel facility-wide risk and perform the complete scope of residual risk modeling for subpart MM emissions sources. We checked the 81 individual revision files to ensure they were incorporated into the main database correctly, and then further reviewed the entire database.

We began compiling an initial draft residual risk modeling input file for use in the 40 CFR part 63, subpart MM residual risk review in September 2014.[5] We made updates to the mill list to account for facilities that recently closed or reopened, and to mill equipment configurations for facilities that recently upgraded equipment. We reviewed the inventory to ensure that each record contained a facility ID, emission unit ID, process ID, and emission release point ID. We cross-walked regulatory codes, SCCs, and emission process groups to identify and correct any inconsistencies that may have been introduced with the inventory updates.

In addition to retaining the emission process groups used in the previous 40 CFR part 63, subpart S modeling effort, we added new emission process groups for 40 CFR part 63, subpart MM sources where necessary. We compared the subpart MM emission process groups with the Part III ICR database to ensure that we included all known recovery furnaces and lime kilns in the inventory for the residual risk modeling. In addition, we reviewed the presence or absence of BLO systems (*i.e.,* because BLO systems are only expected to be present at mills with direct contact evaporator (DCE) recovery furnaces). Finally, we checked the mills to ensure emission process groups included SDTs and sulfite and semichemical recovery equipment, as expected.

We reviewed the pollutant codes in the inventory to ensure the codes and descriptions matched the latest NEI lookup table used by the EPA for risk model input files. We performed extensive QA of the pollutant codes prior to the 40 CFR part 63, subpart S risk modeling, so few updates were required.

We speciated data for a number of HAPs, including chromium, mercury, radionuclides, polycyclic organic matter (POM), and dioxins/furans to facilitate risk modeling. We speciated chromium emissions as hexavalent chromium (chromium VI) and trivalent chromium (chromium III).[6] We speciated mercury emissions as particulate divalent mercury, gaseous divalent mercury, and gaseous elemental mercury. We speciated total POM emissions differently for each emission unit type

[3] These QA efforts are discussed in a November 11, 2011 memorandum in the docket, titled *Inputs to the Pulp and Paper Industry October 2011 Residual Risk Modeling.*

[4] Review of the inventory revisions performed prior to promulgation of 40 CFR part 63, subpart S is documented in a May 8, 2012, memorandum in the subpart S docket (EPA–HQ–OAR–2007–0544), titled *Recommendations Concerning Residual Risk Remodeling for the Pulp and Paper Industry.*

[5] For more information, see the September 30, 2014 memorandum in the docket, titled *Preparation of Residual Risk Modeling Input File for Subpart MM.* The September 2014 memorandum describes the source of the inventory data, discusses quality assurance of the 40 CFR part 63, subpart MM data, provides actual versus allowable and acute risk multipliers for subpart MM sources, and identifies potential outliers and suspect data for further review.

[6] For more information on pollutant speciation, see the September 30, 2014 memorandum in the docket, titled *Preparation of Residual Risk Modeling Input File for Subpart MM.*

based on the most common POM compounds emitted from that unit. We speciated dioxin/furan emissions based on published emissions data in the EPA's dioxin/furan inventory report [7] or, if no speciation profile was available, recalculated the emissions using published emissions factors.[8] Where needed, we added/replaced emissions estimates that were omitted, outdated, out-of-scope, or inconsistent with changes to mill equipment configurations.

We reviewed all records for consistency with respect to the emission release point to ensure each record was characterized by one set of coordinates (latitude and longitude) and one set of stack or fugitive parameters. We checked fugitive parameters to ensure there were no blanks and that the values provided were reasonable and consistent with the required national defaults or other criteria. We reviewed emission points labeled as stacks to ensure no fugitive parameters were identified. We checked exit gas flow rate values against the stack velocity provided to ensure there were no inconsistencies. We mapped the emission point coordinates for each facility to determine if they were properly placed on the mill site. We also added control information from the Part III ICR database or mills' title V permits to the input file for 40 CFR part 63, subpart MM sources.

The emissions inventory for 40 CFR part 63, subpart MM sources identifies emissions of the following HAP known to be persistent and bio-accumulative in the environment (PB–HAPs): Cadmium compounds, lead compounds, mercury compounds, POM, dioxins/furans, and hexachlorobenzene. Risk-based screening levels are available for Tier 1 screening for all of the above PB–HAPs, with the exception of hexachlorobenzene.

Consistent with the EPA's standard practice in conducting risk assessments for source categories, we conducted a two-step process to determine: (1) Whether PB–HAPs are being emitted; and (2) whether they are being released above screening levels. If these releases are significantly above the screening levels and the EPA has detailed information on the releases and the site, a complete multipathway analysis of the site is conducted to estimate pathway risks for the source category.

We considered actual emissions of the ecological HAPs emitted from the 40 CFR part 63, subpart MM source category in the ecological HAP analysis. In addition to the PB–HAPs emitted from the subpart MM source category (except hexachlorobenzene), we considered hydrochloric acid (HCl) and hydrogen fluoride (HF) for ecological HAP modeling. Further information about the multipathway analysis performed for this category follows in section III.B.4 of this preamble.

In 2015, we posted the initial draft risk model input file on our Technology Transfer Network for additional review by interested parties. This review resulted in the submittal of additional mill-specific inventory and receptor revisions. As part of the review, we identified potential outliers and suspect data for 40 CFR part 63, subpart MM sources in the emission inventory and notified facilities to provide an opportunity to review and revise their emissions data, if needed. A total of 40 mills reviewed their emissions data, with 38 of those mills submitting inventory revisions to the EPA.[9]

Inventory revisions primarily included mill name changes; revisions to HAP metal, POM, and dioxin/furan inventory data; and requests for removal of hexachlorocyclopentadiene (HCCPD) data from inventories, particularly for SDTs, since HCCPD is not expected from pulp mill sources. Where necessary, we speciated the revised chromium, mercury, and POM data that the mills provided, using the approaches described above. As part of the review, we identified risk modeling receptors improperly located on mill property for correction in the Human Exposure Model (Community and Sector HEM–3 version 1.1.0) input files before we performed risk modeling for 40 CFR part 63, subpart MM.

After we incorporated the revisions into the input file, we conducted an additional review of the file, which included the following:

- Identified non-40 CFR part 63, subpart MM mills in the inventory and removed them.
- Identified additional mill name changes and incorporated them in the inventory.
- Reviewed fugitive parameters for missing data.
- Identified missing speciated mercury and chromium data and restored the data to the inventory.
- Reviewed location data for mills that submitted inventory revisions and corrected coordinates, as needed.
- Identified records for emissions points with zero emissions for a given pollutant and removed those records from the inventory.
- Conducted emission process group checks, resulting in a revision to an emission process group that reflects a change in SCC, and removal of records with an emission process group no longer applicable (specifically a BLO unit for a mill that no longer operates any DCE recovery furnaces that require a BLO unit).
- Checked mills to ensure they had the expected 40 CFR part 63, subpart MM equipment, comparing the number of recovery furnaces, lime kilns, and SDTs to Part III ICR data to ensure each emission unit was represented in the inventory.
- Reviewed each emission unit for the presence of an emissions value for key expected pollutants (*e.g.,* HAP metals, HCl, methanol, dioxins/furans, POM) and added emissions estimates for those pollutants where needed.[10]
- Replaced obviously errant emissions data (particularly dioxins/furans) with revised estimates calculated based on ICR-reported throughput and emissions factors.
- Rechecked IDs, SCCs, regulatory codes, pollutant codes, duplicate pollutants, and HCCPD deletions.

2. How did we estimate MACT-allowable emissions?

The available emissions data in the RTR emissions dataset include estimates of the mass of HAPs emitted during the specified annual time period. In some cases, these ''actual'' emission levels are lower than the emission levels required to comply with the current MACT standards. The emissions level allowed to be emitted by the MACT standards is referred to as the ''MACT-allowable'' emissions level. We discussed the use of both MACT-allowable and actual emissions in the final Coke Oven Batteries RTR (70 FR 19998–19999, April 15, 2005) and in the proposed and final Hazardous Organic NESHAP RTRs (71 FR 34428, June 14, 2006, and 71 FR 76609, December 21, 2006, respectively). In those actions, we noted that assessing the risks at the MACT-allowable level is inherently reasonable

[7] U.S. Environmental Protection Agency. *An Inventory of Sources and Environmental Releases of Dioxin-Like Compounds in the United States for the Years 1987, 1995, and 2000.* Publication No. EPA/600/P–03/002F. Available at: *http://www.epa.gov/ncea/pdfs/dioxin/2006/dioxin.pdf.* November 2006. Tables 4–14, 4–25, and 5–13.

[9] For further information, see the October 16, 2015 memorandum in the docket, titled *Review of Pulp Mill Inventory Revisions Received in 2015.*

[10] For further information, see the February 16, 2016 memorandum in the docket, titled *Approach for Populating Missing and Erroneous Emissions Estimates for Key HAP in the Subpart MM Residual Risk Modeling Inventory.*

since these risks reflect the maximum level facilities could emit and still comply with national emission standards. We also explained that it is reasonable to consider actual emissions, where such data are available, in both steps of the risk analysis, in accordance with the Benzene NESHAP approach. (54 FR 38044, September 14, 1989.) It is reasonable to consider actual emissions because sources typically seek to perform better than required by emissions standards to provide an operational margin to accommodate the variability in manufacturing processes and control device performance. Facilities' actual emissions may also be significantly lower than MACT-allowable emissions for other reasons such as state requirements, better performance of control devices than required by the MACT standards, or reduced production.

We estimated actual emissions based on the Part II emissions inventory and subsequent site-specific inventory revisions provided by mills. To estimate emissions at the MACT-allowable level, we developed a ratio of MACT-allowable emissions to actual emissions for each source type for the facilities in the 40 CFR part 63, subpart MM source category. We developed this ratio based on the level of control required by the subpart MM MACT standards compared to the level of reported actual emissions from stack test reports provided with Part III survey responses. For example, stack test data indicated that SDTs achieve PM levels of 0.108 pounds per ton (lb/ton) black liquor solids (BLS), on average, while the PM emission limit for existing SDTs is 0.20 lb/ton BLS, so we estimated that MACT-allowable emissions of HAP metals from SDTs (where PM is used as a surrogate) could be as much as 1.8 times higher, and the ratio of MACT-allowable to actual emissions used was 1.8:1 for SDTs.[11]

After developing these ratios for each emission point type in this source category, we next applied these ratios on an emission unit basis to the Part II actual emissions data to obtain risk estimates based on MACT-allowable emissions.

3. How did we conduct dispersion modeling, determine inhalation exposures and estimate individual and population inhalation risks?

Both long-term and short-term inhalation exposure concentrations and health risks from the source category addressed in this proposal were estimated using HEM–3. The HEM–3 performs three primary risk assessment activities: (1) Conducting dispersion modeling to estimate the concentrations of HAPs in ambient air, (2) estimating long-term and short-term inhalation exposures to individuals residing within 50 kilometers (km) of the modeled sources,[12] and (3) estimating individual and population-level inhalation risks using the exposure estimates and quantitative dose-response information.

The air dispersion model used by the HEM–3 model (AERMOD) is one of the EPA's preferred models for assessing pollutant concentrations from industrial facilities.[13] To perform the dispersion modeling and to develop the preliminary risk estimates, HEM–3 draws on three data libraries. The first is a library of meteorological data, which is used for dispersion calculations. This library includes 1 year (2014) of hourly surface and upper air observations for more than 800 meteorological stations, selected to provide coverage of the United States and Puerto Rico. A second library of United States Census Bureau census block[14] internal point locations and populations provides the basis of human exposure calculations (U.S. Census, 2010). In addition, for each census block, the census library includes the elevation and controlling hill height, which are also used in dispersion calculations. A third library of pollutant unit risk factors and other health benchmarks is used to estimate health risks. These risk factors and health benchmarks are the latest values recommended by the EPA for HAPs and other toxic air pollutants. These values are available at *https://www.epa.gov/fera/dose-response-assessment-assessing-health-risks-associated-exposure-hazardous-air-pollutants* and are discussed in more detail later in this section.

In developing the risk assessment for chronic exposures, we used the estimated annual average ambient air concentrations of each HAP emitted by each source for which we have emissions data in the source category. The air concentrations at each nearby census block centroid were used as a surrogate for the chronic inhalation exposure concentration for all the people who reside in that census block. We calculated the MIR for each facility as the cancer risk associated with a continuous lifetime (24 hours per day, 7 days per week, and 52 weeks per year for a 70-year period) exposure to the maximum concentration at the centroid of inhabited census blocks. Individual cancer risks were calculated by multiplying the estimated lifetime exposure to the ambient concentration of each of the HAP (in micrograms per cubic meter ($\mu g/m^3$)) by its unit risk estimate (URE). The URE is an upper bound estimate of an individual's probability of contracting cancer over a lifetime of exposure to a concentration of 1 microgram of the pollutant per cubic meter of air. For residual risk assessments, we generally use URE values from the EPA's Integrated Risk Information System (IRIS). For carcinogenic pollutants without IRIS values, we look to other reputable sources of cancer dose-response values, often using California EPA (CalEPA) URE values, where available. In cases where new, scientifically credible dose response values have been developed in a manner consistent with the EPA guidelines and have undergone a peer review process similar to that used by the EPA, we may use such dose-response values in place of, or in addition to, other values, if appropriate.

The EPA estimated incremental individual lifetime cancer risks associated with emissions from the facilities in the source category as the sum of the risks for each of the carcinogenic HAP (including those classified as carcinogenic to humans, likely to be carcinogenic to humans, and suggestive evidence of carcinogenic potential[15]) emitted by the modeled sources. Cancer incidence and the distribution of individual cancer risks for the population within 50 km of the

[11] For more information, see the September 30, 2014 memorandum in the docket, titled *Preparation of Residual Risk Modeling Input File for Subpart MM.*

[12] This metric comes from the Benzene NESHAP. See 54 FR 38046.

[13] U.S. EPA. Revision to the *Guideline on Air Quality Models: Adoption of a Preferred General Purpose (Flat and Complex Terrain) Dispersion Model and Other Revisions* (70 FR 68218, November 9, 2005).

[14] A census block is the smallest geographic area for which census statistics are tabulated.

[15] These classifications also coincide with the terms "known carcinogen, probable carcinogen, and possible carcinogen," respectively, which are the terms advocated in the EPA's *Guidelines for Carcinogen Risk Assessment,* published in 1986 (51 FR 33992, September 24, 1986). In August 2000, the document *Supplemental Guidance for Conducting Health Risk Assessment of Chemical Mixtures* (EPA/630/R–00/002) was published as a supplement to the 1986 document. Copies of both documents can be obtained from *https://cfpub.epa.gov/ncea/risk/recordisplay.cfm?deid=20533&CFID=70315376&CFTOKEN=71597944.* Summing the risks of these individual compounds to obtain the cumulative cancer risks is an approach that was recommended by the EPA's SAB in their 2002 peer review of the EPA's National Air Toxics Assessment (NATA) titled, *NATA—Evaluating the National-scale Air Toxics Assessment 1996 Data—an SAB Advisory,* available at *http://yosemite.epa.gov/ sab/sabproduct.nsf/214C6E915BB04E14852570CA007A682C/ $File/ecadv02001.pdf.*

sources were also estimated for the source category as part of this assessment by summing individual risks. A distance of 50 km is consistent with both the analysis supporting the 1989 Benzene NESHAP (54 FR 38044, September 14, 1989) and the limitations of Gaussian dispersion models, including AERMOD.

To assess the risk of non-cancer health effects from chronic exposures, we summed the HQ for each of the HAP that affects a common target organ system to obtain the HI for that target organ system (or target organ-specific HI, TOSHI). The HQ is the estimated exposure divided by the chronic reference value, which is a value selected from one of several sources. First, the chronic reference level can be the EPA reference concentration (RfC) (*https://iaspub.epa.gov/sor_internet/registry/termreg/searchandretrieve/glossariesandkeywordlists/search.do?details=&vocabName=IRIS%20Glossary*), defined as ''an estimate (with uncertainty spanning perhaps an order of magnitude) of a continuous inhalation exposure to the human population (including sensitive subgroups) that is likely to be without an appreciable risk of deleterious effects during a lifetime.'' Alternatively, in cases where an RfC from the EPA's IRIS database is not available or where the EPA determines that using a value other than the RfC is appropriate, the chronic reference level can be a value from the following prioritized sources: (1) The Agency for Toxic Substances and Disease Registry (ATSDR) Minimum Risk Level (*http://www.atsdr.cdc.gov/mrls/index.asp*), which is defined as ''an estimate of daily human exposure to a hazardous substance that is likely to be without an appreciable risk of adverse non-cancer health effects (other than cancer) over a specified duration of exposure''; (2) the CalEPA Chronic Reference Exposure Level (REL) (*http://oehha.ca.gov/air/crnr/notice-adoption-air-toxics-hot-spots-program-guidance-manual-preparation-health-risk-0*), which is defined as ''the concentration level (that is expressed in units of micrograms per cubic meter (μg/m^3) for inhalation exposure and in a dose expressed in units of milligram per kilogram-day (mg/kg-day) for oral exposures), at or below which no adverse health effects are anticipated for a specified exposure duration''; or (3), as noted above, a scientifically credible dose-response value that has been developed in a manner consistent with the EPA guidelines and has undergone a peer review process similar to that used by the EPA, in place of or in concert with other values.

As mentioned above, in order to characterize non-cancer chronic effects, and in response to key recommendations from the SAB, the EPA selects dose-response values that reflect the best available science for all HAPs included in RTR risk assessments.[16] More specifically, for a given HAP, the EPA examines the availability of inhalation reference values from the sources included in our tiered approach (*e.g.,* IRIS first, ATSDR second, CalEPA third) and determines which inhalation reference value represents the best available science. Thus, as new inhalation reference values become available, the EPA will typically evaluate them and determine whether they should be given preference over those currently being used in RTR risk assessments.

The EPA also evaluated screening estimates of acute exposures and risks for each of the HAP (for which appropriate acute dose-response values are available) at the point of highest potential off-site exposure for each facility. To do this, the EPA estimated the risks when both the peak (hourly) emissions rate and worst-case dispersion conditions occur. We also assume that a person is located at the point of highest impact during that same time. In accordance with our mandate in section 112 of the CAA, we use the point of highest off-site exposure to assess the potential risk to the maximally exposed individual. The acute HQ is the estimated acute exposure divided by the acute dose-response value. In each case, the EPA calculated acute HQ values using best available, short-term dose-response values. These acute dose-response values, which are described below, include the acute REL, acute exposure guideline levels (AEGL) and emergency response planning guidelines (ERPG) for 1-hour exposure durations. As discussed below, we used conservative assumptions for emissions rates, meteorology, and exposure location.

As described in the CalEPA's *Air Toxics Hot Spots Program Risk Assessment Guidelines, Part I, The Determination of Acute Reference Exposure Levels for Airborne Toxicants,* an acute REL value (*http://oehha.ca.gov/air/general-info/oehha-acute-8-hour-and-chronic-reference-exposure-level-rel-summary*) is defined as ''the concentration level at or below which no adverse health effects are anticipated for a specified exposure duration.'' *Id.* at page 2. Acute REL values are based on the most sensitive, relevant, adverse health effect reported in the peer-reviewed medical and toxicological literature. Acute REL values are designed to protect the most sensitive individuals in the population through the inclusion of margins of safety. Because margins of safety are incorporated to address data gaps and uncertainties, exceeding the REL does not automatically indicate an adverse health impact.

Acute exposure guideline level values were derived in response to recommendations from the National Research Council (NRC). The National Advisory Committee (NAC) for the Development of Acute Exposure Guideline Levels for Hazardous Substances—usually referred to as the AEGL Committee or the NAC/AEGL committee developed AEGL values for at least 273 of the 329 chemicals on the AEGL priority chemical list. The last meeting of the NAC/AEGL Committee was in April 2010, and its charter expired in October 2011. The NAC/AEGL Committee ended in October 2011, but the AEGL program continues to operate at the EPA and works with the National Academies to publish final AEGLs (*https://www.epa.gov/aegl*).

As described in *Standing Operating Procedures (SOP) for Developing Acute Exposure Guideline Levels for Hazardous Substances,* ''The NRC's previous name for acute exposure levels—community emergency exposure levels—was replaced by the term AEGL to reflect the broad application of these values to planning, response, and prevention in the community, the workplace, transportation, the military, and the remediation of Superfund sites'' (*https://www.epa.gov/aegl/process-developing-acute-exposure-guideline-levels-aegls*) *Id.* at 2.[17] The AEGL values represent threshold exposure limits for the general public and are applicable to emergency exposures ranging from 10 minutes to 8 hours. ''The primary purpose of the AEGL program is to develop guideline levels for once-in-a-lifetime, short-term exposures to airborne concentrations of acutely toxic, high-priority chemicals.'' *Id.* at 21. ''More specifically, the AEGL values will be used for conducting various risk assessments to aid in the development of emergency preparedness and prevention plans, as well as real-time

[16] The SAB peer review of RTR Risk Assessment Methodologies is available at *http://yosemite.epa.gov/sab/sabproduct.nsf/4AB3966E263D943A8525771F00668381/$File/EPA-SAB-10-007-unsigned.pdf.*

[17] National Academy of Sciences (NAS), 2001. *Standing Operating Procedures for Developing Acute Exposure Levels for Hazardous Chemicals,* page 2.

emergency response actions, for accidental chemical releases at fixed facilities and from transport carriers.'' *Id.* at 31.

The AEGL–1 value is then specifically defined as ''the airborne concentration (expressed as ppm (parts per million) or mg/m3 (milligrams per cubic meter)) of a substance above which it is predicted that the general population, including susceptible individuals, could experience notable discomfort, irritation, or certain asymptomatic nonsensory effects. However, the effects are not disabling and are transient and reversible upon cessation of exposure.'' *Id.* at 3. The document also notes that, ''Airborne concentrations below AEGL–1 represent exposure levels that can produce mild and progressively increasing but transient and nondisabling odor, taste, and sensory irritation or certain asymptomatic, nonsensory effects.'' *Id.* Similarly, the document defines AEGL–2 values as ''the airborne concentration (expressed as parts per million or milligrams per cubic meter) of a substance above which it is predicted that the general population, including susceptible individuals, could experience irreversible or other serious, long-lasting adverse health effects or an impaired ability to escape.'' *Id.*

Emergency response planning guideline values are derived for use in emergency response, as described in the American Industrial Hygiene Association's Emergency Response Planning (ERP) Committee document titled, *ERPGS Procedures and Responsibilities* (*https://www.aiha.org/get-involved/AIHAGuideline Foundation/EmergencyResponse PlanningGuidelines/Documents/ERPG%20Committee%20Standard%20 Operating%20Procedures%20%20-%20 March%202014%20Revision%20%28 Updated%2010-2-2014%29.pdf*), which states that, ''Emergency Response Planning Guidelines were developed for emergency planning and are intended as health based guideline concentrations for single exposures to chemicals.''[18] *Id.* at 1. The ERPG–1 value is defined as ''the maximum airborne concentration below which nearly all individuals could be exposed for up to 1 hour without experiencing more than mild, transient health effects or without perceiving a clearly defined, objectionable odor.'' *Id.* at 2. Similarly, the ERPG–2 value is defined as ''the maximum airborne concentration below which nearly all individuals could be exposed for up to 1 hour without experiencing or developing irreversible or other serious adverse health effects or symptoms that could impair an individual's ability to take protective action.'' *Id.* at 1.

As can be seen from the definitions above, the AEGL and ERPG values include the similarly-defined severity levels 1 and 2. For many chemicals, a severity level 1 value AEGL or ERPG has not been developed because the types of effects for these chemicals are not consistent with the AEGL–1/ERPG–1 definitions; in these instances, we compare higher severity level AEGL–2 or ERPG–2 values to our modeled exposure levels to screen for potential acute concerns. When AEGL–1/ERPG–1 values are available, they are used in our acute risk assessments.

Acute REL values for 1-hour exposure durations are typically lower than their corresponding AEGL–1 and ERPG–1 values. Even though their definitions are slightly different, AEGL–1 values are often the same as the corresponding ERPG–1 values, and AEGL–2 values are often equal to ERPG–2 values. Maximum HQ values from our acute screening risk assessments typically result when basing them on the acute REL value for a particular pollutant. In cases where our maximum acute HQ value exceeds 1, we also report the HQ value based on the next highest acute dose-response value (usually the AEGL–1 and/or the ERPG–1 value).

To develop screening estimates of acute exposures in the absence of hourly emissions data, generally we first develop estimates of maximum hourly emissions rates by multiplying the average actual annual hourly emissions rates by a default factor to cover routinely variable emissions. We choose the factor to use partially based on process knowledge and engineering judgment. The factor chosen also reflects a Texas study of short-term volatile organic compound (VOC) emissions variability, which showed that most peak emission events in a heavily-industrialized four-county area (Harris, Galveston, Chambers, and Brazoria Counties, Texas) were less than twice the annual average hourly emissions rate. The highest peak emissions event was 74 times the annual average hourly emissions rate, and the 99th percentile ratio of peak hourly emissions rate to the annual average hourly emissions rate was 9.[19] Considering this analysis, to account for more than 99 percent of the peak hourly emissions, we apply a conservative screening multiplication factor of 10 to the average annual hourly emissions rate in our acute exposure screening assessments as our default approach. However, we use a factor other than 10 if we have information that indicates that a different factor is appropriate for a particular source category. For this source category, median peak-to-mean multipliers ranging from 1.1 to 4.7 were developed for 40 CFR part 63, subpart MM emission process groups based on the routine annual emissions data and peak hourly emissions data obtained from Part II survey data. A further discussion of why these factors were chosen can be found in the memorandum, *Preparation of Residual Risk Modeling Input File for Subpart MM,* available in the docket for this rulemaking.

As part of our acute risk assessment process, for cases where acute HQ values from the screening step were less than or equal to 1 (even under the conservative assumptions of the screening analysis), acute impacts were deemed negligible and no further analysis was performed for these HAPs. See the *Residual Risk Assessment for Pulp Mill Combustion Sources in Support of the December 2016 Risk and Technology Review Proposed Rule* for more details. Ideally, we would prefer to have continuous measurements over time to see how the emissions vary by each hour over an entire year. Having a frequency distribution of hourly emissions rates over a year would allow us to perform a probabilistic analysis to estimate potential threshold exceedances and their frequency of occurrence. Such an evaluation could include a more complete statistical treatment of the key parameters and elements adopted in this screening analysis. Recognizing that this level of data is rarely available, we instead rely on the multiplier approach.

To better characterize the potential health risks associated with estimated acute exposures to HAPs, and in response to a key recommendation from the SAB's peer review of the EPA's RTR risk assessment methodologies,[20] we generally examine a wider range of available acute health metrics (*e.g.,* RELs, AEGL) than we do for our chronic risk assessments. This is in response to

Texas Environmental Research Consortium. *https://www.researchgate.net/publication/237593060_Variable_Industrial_VOC_Emissions_and_their_Impact_on_Ozone_Formation_in_the_Houston_Galveston_Area.*

[20] The SAB peer review of *RTR Risk Assessment Methodologies* is available at *http://yosemite.epa.gov/sab/sabproduct.nsf/4AB3966E263D943A8525771F00668381/$File/EPA-SAB-10-007-unsigned.pdf.*

the SAB's acknowledgement that there are generally more data gaps and inconsistencies in acute reference values than there are in chronic reference values. In some cases, when Reference Value Arrays [21] for HAPs have been developed, we consider additional acute values (*i.e.,* occupational and international values) to provide a more complete risk characterization.

4. How did we conduct the multipathway exposure and risk screening?

The EPA conducted a screening analysis examining the potential for significant human health risks due to exposures via routes other than inhalation (*i.e.,* ingestion). We first determined whether any sources in the source category emitted PB–HAP. The PB–HAP compounds or compound classes are identified for the screening from the EPA's Air Toxics Risk Assessment Library (available at *http://www2.epa.gov/fera/risk-assessment-and-modeling-air-toxics-risk-assessment-reference-library*).

For the 40 CFR part 63, subpart MM source category, we identified emissions of cadmium compounds, lead compounds, mercury compounds, POM, dioxins/furans, and hexachlorobenzene. Because one or more of these PB–HAPs are emitted by at least one facility in the subpart MM source category, we proceeded to the next step of the evaluation. In this step, we determined whether the facility-specific emissions rates of the emitted PB–HAP were large enough to create the potential for significant non-inhalation human health risks under reasonable worst-case conditions. To facilitate this step, we have developed emissions rate screening levels for several PB–HAPs using a hypothetical upper-end screening exposure scenario developed for use in conjunction with the EPA's Total Risk Integrated Methodology Fate, Transport, and Ecological Exposure (TRIM.FaTE) model. The PB–HAPs with emissions rate screening levels are: Lead, cadmium, dioxins/furans, mercury compounds, and POM. We conducted a sensitivity analysis on the screening scenario to ensure that its key design parameters would represent the upper end of the range of possible values, such that it would represent a conservative, but not impossible, scenario. The facility-specific emissions for each PB–HAP were compared to the emission rate screening levels for these PB–HAPs to assess the potential for significant human health risks via non-inhalation pathways. We call this application of the TRIM.FaTE model the Tier 1 TRIM-screen or Tier 1 screen.

For the purpose of developing emission rate screening values for our Tier 1 TRIM-screen, we derived emission levels for these PB–HAPs (other than lead compounds) at which the maximum excess lifetime cancer risk would be 1-in-1 million (*i.e.,* for dioxins/furans and POM) or, for HAPs that cause non-cancer health effects (*i.e.,* cadmium compounds and mercury compounds), the maximum HQ would be 1. If the emissions rate of any PB–HAP included in the Tier 1 screen exceeds the Tier 1 screening emissions level for any facility, we conduct a second screen, which we call the Tier 2 TRIM-screen or Tier 2 screen.

In the Tier 2 screen, the location of each facility that exceeded the Tier 1 emission level is used to refine the assumptions associated with the environmental scenario while maintaining the exposure scenario assumptions. A key assumption that is part of the Tier 1 screen is that a lake is located near the facility; we confirm the existence of lakes near the facility as part of the Tier 2 screen. We then adjust the risk-based Tier 1 screening value for each PB–HAP for each facility based on an understanding of how exposure concentrations estimated for the screening scenario change with meteorology and environmental assumptions. PB–HAP emissions that do not exceed these new Tier 2 screening levels are considered to pose no unacceptable risks. If the PB–HAP emissions for a facility exceed the Tier 2 screening levels and data are available, we may decide to conduct a more refined Tier 3 multipathway assessment. There are several analyses that can be included in a Tier 3 screen depending upon the extent of refinement warranted, including validating that the lake is fishable and considering plume-rise to estimate emissions lost above the mixing layer. If the Tier 3 screen is exceeded, the EPA may further refine the assessment.

In evaluating the potential multipathway risk from emissions of lead compounds, rather than developing a screening emissions rate for them, we compared maximum estimated chronic inhalation exposures with the level of the current National Ambient Air Quality Standard (NAAQS) for lead.[22] Values below the level of the primary (health-based) lead NAAQS were considered to have a low potential for multipathway risk.

For further information on the multipathway analysis approach, see the document titled *Residual Risk Assessment for Pulp Mill Combustion Sources in Support of the December 2016 Risk and Technology Review Proposed Rule*, which is available in the docket for this action.

5. How did we conduct the environmental risk screening assessment?

a. Adverse Environmental Effect

The EPA conducts a screening assessment to examine the potential for adverse environmental effects as required under section 112(f)(2)(A) of the CAA. Section 112(a)(7) of the CAA defines ''adverse environmental effect'' as ''any significant and widespread adverse effect, which may reasonably be anticipated, to wildlife, aquatic life, or other natural resources, including adverse impacts on populations of endangered or threatened species or significant degradation of environmental quality over broad areas.''

b. Environmental HAPs

The EPA focuses on seven HAPs, which we refer to as ''environmental HAPs,'' in its screening analysis: Five PB–HAPs and two acid gases. The five PB–HAPs are cadmium, dioxins/furans, POM, mercury (both inorganic mercury and methyl mercury) and lead compounds. The two acid gases are HCl and HF. The rationale for including these seven HAPs in the environmental risk screening analysis is presented below.

The HAPs that persist and bioaccumulate are of particular environmental concern because they accumulate in the soil, sediment, and water. The PB–HAPs are taken up, through sediment, soil, water, and/or

[21] U.S. EPA. (2009) Chapter 2.9, *Chemical Specific Reference Values for Formaldehyde in Graphical Arrays of Chemical-Specific Health Effect Reference Values for Inhalation Exposures (Final Report).* U.S. Environmental Protection Agency, Washington, DC, EPA/600/R–09/061, 2009, and available online at *http://cfpub.epa.gov/ncea/cfm/recordisplay.cfm?deid=211003.*

[22] In doing so, the EPA notes that the legal standard for a primary NAAQS—that a standard is requisite to protect public health and provide an adequate margin of safety (CAA section 109(b))—differs from the CAA section 112(f) standard (requiring among other things that the standard provide an ''ample margin of safety''). However, the primary lead NAAQS is a reasonable measure of determining risk acceptability (*i.e.,* the first step of the Benzene NESHAP analysis) since it is designed to protect the most susceptible group in the human population—children, including children living near major lead emitting sources. 73 FR 67002/3; 73 FR 67000/3; 73 FR 67005/1. In addition, applying the level of the primary lead NAAQS at the risk acceptability step is conservative, since that primary lead NAAQS reflects an adequate margin of safety.

ingestion of other organisms, by plants or animals (*e.g.,* small fish) at the bottom of the food chain. As larger and larger predators consume these organisms, concentrations of the PB–HAPs in the animal tissues increases as does the potential for adverse effects. The five PB–HAPs we evaluate as part of our screening analysis account for 99.8 percent of all PB–HAP emissions nationally from stationary sources (on a mass basis from the 2005 EPA NEI).

In addition to accounting for almost all of the mass of PB–HAPs emitted, we note that the TRIM.FaTE model that we use to evaluate multipathway risk allows us to estimate concentrations of cadmium compounds, dioxins/furans, POM, and mercury in soil, sediment and water. For lead compounds, we currently do not have the ability to calculate these concentrations using the TRIM.FaTE model. Therefore, to evaluate the potential for adverse environmental effects from lead compounds, we compare the estimated exposures from the source category emissions of lead with the level of the secondary NAAQS for lead.[23] We consider values below the level of the secondary lead NAAQS to be unlikely to cause adverse environmental effects.

Due to their well-documented potential to cause direct damage to terrestrial plants, we include two acid gases, HCl and HF, in the environmental screening analysis. According to the 2005 NEI, HCl and HF account for about 99 percent (on a mass basis) of the total acid gas HAPs emitted by stationary sources in the United States. In addition to the potential to cause direct damage to plants, high concentrations of HF in the air have been linked to fluorosis in livestock. Air concentrations of these HAPs are already calculated as part of the human multipathway exposure and risk screening analysis using the HEM3–AERMOD air dispersion model, and we are able to use the air dispersion modeling results to estimate the potential for an adverse environmental effect.

The EPA acknowledges that other HAPs beyond the seven HAPs discussed above may have the potential to cause adverse environmental effects. Therefore, the EPA may include other relevant HAPs in its environmental risk screening in the future, as modeling science and resources allow. The EPA invites comment on the extent to which other HAPs emitted by the source category may cause adverse environmental effects. Such information should include references to peer-reviewed ecological effects benchmarks that are of sufficient quality for making regulatory decisions, as well as information on the presence of organisms located near facilities within the source category that such benchmarks indicate could be adversely affected.

[23] The Secondary Lead NAAQS is a reasonable measure of determining whether there is an adverse environmental effect since it was established considering ''effects on soils, water, crops, vegetation, man-made materials, animals, wildlife, weather, visibility and climate, damage to and deterioration of property, and hazards to transportation, as well as effects on economic values and on personal comfort and well-being.''

c. Ecological Assessment Endpoints and Benchmarks for PB–HAP

An important consideration in the development of the EPA's screening methodology is the selection of ecological assessment endpoints and benchmarks. Ecological assessment endpoints are defined by the ecological entity (*e.g.,* aquatic communities including fish and plankton) and its attributes (*e.g.,* frequency of mortality). Ecological assessment endpoints can be established for organisms, populations, communities or assemblages, and ecosystems.

For PB–HAPs (other than lead compounds), we evaluated the following community-level ecological assessment endpoints to screen for organisms directly exposed to HAPs in soils, sediment, and water:

- Local terrestrial communities (i.e., soil invertebrates, plants) and populations of small birds and mammals that consume soil invertebrates exposed to PB–HAPs in the surface soil;
- Local benthic (i.e., bottom sediment dwelling insects, amphipods, isopods, and crayfish) communities exposed to PB–HAPs in sediment in nearby water bodies; and
- Local aquatic (water-column) communities (including fish and plankton) exposed to PB–HAP in nearby surface waters.

For PB–HAPs (other than lead compounds), we also evaluated the following population-level ecological assessment endpoint to screen for indirect HAP exposures of top consumers via the bioaccumulation of HAPs in food chains:

- Piscivorous (*i.e.,* fish-eating) wildlife consuming PB–HAP-contaminated fish from nearby water bodies.

For cadmium compounds, dioxins/furans, POM, and mercury, we identified the available ecological benchmarks for each assessment endpoint. An ecological benchmark represents a concentration of HAPs (*e.g.,* 0.77 µg of HAP per liter of water) that has been linked to a particular environmental effect level through scientific study. For PB–HAPs we identified, where possible, ecological benchmarks at the following effect levels:

- Probable effect levels (PEL): Level above which adverse effects are expected to occur frequently;
- Lowest-observed-adverse-effect level (LOAEL): The lowest exposure level tested at which there are biologically significant increases in frequency or severity of adverse effects; and
- No-observed-adverse-effect levels (NOAEL): The highest exposure level tested at which there are no biologically significant increases in the frequency or severity of adverse effect.

We established a hierarchy of preferred benchmark sources to allow selection of benchmarks for each environmental HAP at each ecological assessment endpoint. In general, the EPA sources that are used at a programmatic level (*e.g.,* Office of Water, Superfund Program) were used in the analysis, if available. If unavailable, the EPA benchmarks used in regional programs (*e.g.,* Superfund) were used. If benchmarks were not available at a programmatic or regional level, we used benchmarks developed by other federal agencies (*e.g.,* National Oceanic and Atmospheric Administration (NOAA)) or state agencies.

Benchmarks for all effect levels are not available for all PB–HAPs and assessment endpoints. In cases where multiple effect levels were available for a particular PB–HAP and assessment endpoint, we use all of the available effect levels to help us to determine whether ecological risks exist and, if so, whether the risks could be considered significant and widespread.

d. Ecological Assessment Endpoints and Benchmarks for Acid Gases

The environmental screening analysis also evaluated potential damage and reduced productivity of plants due to direct exposure to acid gases in the air. For acid gases, we evaluated the following ecological assessment endpoint:

- Local terrestrial plant communities with foliage exposed to acidic gaseous HAPs in the air.

The selection of ecological benchmarks for the effects of acid gases on plants followed the same approach as for PB–HAPs (*i.e.,* we examine all of the available chronic benchmarks). For HCl, the EPA identified chronic benchmark concentrations. We note that the benchmark for chronic HCl exposure to plants is greater than the reference concentration for chronic inhalation exposure for human health. This means that where the EPA includes regulatory requirements to prevent an exceedance of the reference concentration for human health, additional analyses for adverse environmental effects of HCl would not be necessary.

For HF, the EPA identified chronic benchmark concentrations for plants and evaluated chronic exposures to plants in the screening analysis. High concentrations of HF in the air have also been linked to fluorosis in livestock. However, the HF concentrations at which fluorosis in livestock occur are higher than those at which plant damage begins. Therefore, the benchmarks for plants are protective of both plants and livestock.

e. Screening Methodology

For the environmental risk screening analysis, the EPA first looked at whether any facilities in the 40 CFR part 63, subpart MM source category emitted any of the seven environmental HAPs. Because we found that one or more of the seven environmental HAPs evaluated are emitted by at least one facility in the source category, we proceeded to the second step of the evaluation.

f. PB–HAP Methodology

For cadmium, mercury, POM, and dioxins/furans, the environmental screening analysis consists of two tiers, while lead compounds are analyzed differently as discussed earlier. In the first tier, we determined whether the maximum facility-specific emission rates of each of the emitted environmental HAPs were large enough to create the potential for adverse environmental effects under reasonable worst-case environmental conditions. These are the same environmental conditions used in the human multipathway exposure and risk screening analysis.

To facilitate this step, TRIM.FaTE was run for each PB–HAP under hypothetical environmental conditions designed to provide conservatively high HAP concentrations. The model was set to maximize runoff from terrestrial parcels into the modeled lake, which in turn, maximized the chemical concentrations in the water, the sediments, and the fish. The resulting media concentrations were then used to back-calculate a screening level emission rate that corresponded to the relevant exposure benchmark concentration value for each assessment endpoint. To assess emissions from a facility, the reported emission rate for each PB–HAP was compared to the screening level emission rate for that PB–HAP for each assessment endpoint. If emissions from a facility do not exceed the Tier 1 screening level, the facility ‘‘passes’’ the screen, and, therefore, is not evaluated further under the screening approach. If emissions from a facility exceed the Tier 1 screening level, we evaluate the facility further in Tier 2.

In Tier 2 of the environmental screening analysis, the emission rate screening levels are adjusted to account for local meteorology and the actual location of lakes in the vicinity of facilities that did not pass the Tier 1 screen. The modeling domain for each facility in the Tier 2 analysis consists of 8 octants. Each octant contains 5 modeled soil concentrations at various distances from the facility (5 soil concentrations × 8 octants = total of 40 soil concentrations per facility) and 1 lake with modeled concentrations for water, sediment and fish tissue. In the Tier 2 environmental risk screening analysis, the 40 soil concentration points are averaged to obtain an average soil concentration for each facility for each PB–HAP. For the water, sediment, and fish tissue concentrations, the highest value for each facility for each pollutant is used. If emission concentrations from a facility do not exceed the Tier 2 screening level, the facility passes the screen, and typically is not evaluated further. If emissions from a facility exceed the Tier 2 screening level, the facility does not pass the screen and, therefore, may have the potential to cause adverse environmental effects. Such facilities are evaluated further to investigate factors such as the magnitude and characteristics of the area of exceedance.

g. Acid Gas Methodology

The environmental screening analysis evaluates the potential phytotoxicity and reduced productivity of plants due to chronic exposure to acid gases. The environmental risk screening methodology for acid gases is a single-tier screen that compares the average off-site ambient air concentration over the modeling domain to ecological benchmarks for each of the acid gases. Because air concentrations are compared directly to the ecological benchmarks, emission-based screening levels are not calculated for acid gases as they are in the ecological risk screening methodology for PB–HAPs.

For purposes of ecological risk screening, the EPA identifies a potential for adverse environmental effects to plant communities from exposure to acid gases when the average concentration of the HAP around a facility exceeds the LOAEL ecological benchmark. In such cases, we further investigate factors such as the magnitude and characteristics of the area of exceedance (*e.g.,* land use of exceedance area, size of exceedance area) to determine if there is an adverse environmental effect. For further information on the environmental screening analysis approach, see the *Residual Risk Assessment for Pulp Mill Combustion Sources in Support of the December 2016 Risk and Technology Review Proposed Rule*, which is available in the docket for this action.

6. How did we conduct facility-wide assessments?

To put the source category risks in context, we typically examine the risks from the entire ‘‘facility,’’ where the facility includes all HAP-emitting operations within a contiguous area and under common control. In other words, we examine the HAP emissions not only from the source category emission points of interest, but also emissions of HAPs from all other emission sources at the facility for which we have data. There are currently 108 major sources subject to the 40 CFR part 63, subpart MM source category which includes chemical recovery combustion sources (*e.g.,* recovery furnace, SDT, lime kiln). Nearly all major sources also have boilers on site. These facilities engage in chemical or mechanical pulping, papermaking, paper coating, landfills, petroleum storage and transfer, and other operations. Therefore, where data were available, we performed a facility-wide risk assessment for these major sources as part of this action. For this source category, we conducted the facility-wide assessment using the data from Part II of the Pulp and Paper Sector ICR.

We analyzed risks due to the inhalation of HAPs that are emitted ‘‘facility-wide’’ for the populations residing within 50 km of each facility, consistent with the methods used for the source category analysis described above. For these facility-wide risk analyses, the modeled source category risks were compared to the facility-wide risks to determine the portion of facility-wide risks that could be attributed to the source category addressed in this proposal. We specifically examined the facility that was associated with the highest estimate of risk and determined the percentage of that risk attributable to the source category of interest. The document titled *Residual Risk Assessment for Pulp Mill Combustion Sources in Support of the December 2016 Risk and Technology Review*

Proposed Rule, available in the docket for this action, provides the methodology and results of the facility-wide analyses, including all facility-wide risks and the percentage of source category contribution to facility-wide risks.

7. How did we consider uncertainties in risk assessment?

In the Benzene NESHAP, the Agency concluded that risk estimation uncertainty should be considered in our decision-making under the ample margin of safety framework. Uncertainty and the potential for bias are inherent in all risk assessments, including those performed for this proposal. Although uncertainty exists, we believe that our approach, which used conservative tools and assumptions, ensures that our decisions are health-protective and environmentally protective. A brief discussion of the uncertainties in the RTR emissions dataset, dispersion modeling, inhalation exposure estimates, and dose-response relationships follows below. Where relevant to the estimated exposures, the lack of short-term dose-response values at different levels of severity should be factored into the risk characterization as potential uncertainties. A more thorough discussion of these uncertainties is included in the document titled *Residual Risk Assessment for Pulp Mill Combustion Sources in Support of the December 2016 Risk and Technology Review Proposed Rule,* which is available in the docket for this action.

a. Uncertainties in the RTR Emissions Dataset

Although the development of the RTR emissions dataset involved quality assurance/quality control processes, various uncertainties exist. Thus, the accuracy of emissions values will vary depending on the source of the data, the degree to which data are incomplete or missing, the degree to which assumptions made to complete the datasets are accurate, errors in emission estimates, and other factors. The emission estimates considered in this analysis generally are annual totals for certain years, and they do not reflect short-term fluctuations during the course of a year or variations from year to year. The estimates of peak hourly emission rates for the acute effects screening assessment were based on an emission adjustment factor applied to the average annual hourly emission rates, which are intended to account for emission fluctuations due to normal facility operations.

b. Uncertainties in Dispersion Modeling

We recognize there is uncertainty in ambient concentration estimates associated with any model, including the EPA's recommended regulatory dispersion model, AERMOD. In using a model to estimate ambient pollutant concentrations, the user chooses certain options to apply. For RTR assessments, we select some model options that have the potential to overestimate ambient air concentrations (*e.g.,* not including plume depletion or pollutant transformation). We select other model options that have the potential to underestimate ambient impacts (*e.g.,* not including building downwash). Other options that we select have the potential to either under- or overestimate ambient levels (*e.g.,* meteorology and receptor locations). On balance, considering the directional nature of the uncertainties commonly present in ambient concentrations estimated by dispersion models, the approach we apply in the RTR assessments should yield unbiased estimates of ambient HAP concentrations.

c. Uncertainties in Inhalation Exposure

The EPA did not include the effects of human mobility on exposures in the assessment. Specifically, short-term mobility and long-term mobility between census blocks in the modeling domain were not considered.[24] The approach of not considering short or long-term population mobility does not bias the estimate of the theoretical MIR (by definition), nor does it affect the estimate of cancer incidence because the total population number remains the same. It does, however, affect the shape of the distribution of individual risks across the affected population, shifting it toward higher estimated individual risks at the upper end and reducing the number of people estimated to be at lower risks, thereby increasing the estimated number of people at specific high risk levels (*e.g.,* 1-in-10 thousand or 100-in-1 million).

In addition, the assessment predicted the chronic exposures at the centroid of each populated census block as surrogates for the exposure concentrations for all people living in that block. Using the census block centroid to predict chronic exposures tends to over-predict exposures for people in the census block who live farther from the facility and under-predict exposures for people in the census block who live closer to the facility. Thus, using the census block centroid to predict chronic exposures may lead to a potential understatement or overstatement of the true maximum impact, but is an unbiased estimate of average risk and incidence. We reduce this uncertainty by analyzing large census blocks near facilities using aerial imagery and adjusting the location of the block centroid to better represent the population in the block, as well as adding additional receptor locations where the block population is not well represented by a single location.

The assessment evaluates the cancer inhalation risks associated with pollutant exposures over a 70-year period, which is the assumed lifetime of an individual. In reality, both the length of time that modeled emission sources at facilities actually operate (*i.e.,* more or less than 70 years) and the domestic growth or decline of the modeled industry (*i.e.,* the increase or decrease in the number or size of domestic facilities) will influence the future risks posed by a given source or source category. Depending on the characteristics of the industry, these factors will, in most cases, result in an overestimate both in individual risk levels and in the total estimated number of cancer cases. However, in the unlikely scenario where a facility maintains, or even increases, its emissions levels over a period of more than 70 years, residents live beyond 70 years at the same location, and the residents spend most of their days at that location, then the cancer inhalation risks could potentially be underestimated. However, annual cancer incidence estimates from exposures to emissions from these sources would not be affected by the length of time an emissions source operates.

The exposure estimates used in these analyses assume chronic exposures to ambient (outdoor) levels of pollutants. Because most people spend the majority of their time indoors, actual exposures may not be as high, depending on the characteristics of the pollutants modeled. For many of the HAPs, indoor levels are roughly equivalent to ambient levels, but for very reactive pollutants or larger particles, indoor levels are typically lower. This factor has the potential to result in an overestimate of 25 to 30 percent of exposures.[25]

In addition to the uncertainties highlighted above, there are several factors specific to the acute exposure

[24] Short-term mobility is movement from one micro-environment to another over the course of hours or days. Long-term mobility is movement from one residence to another over the course of a lifetime.

[25] U.S. EPA. *National-Scale Air Toxics Assessment for 1996.* (EPA 453/R–01–003; January 2001; page 85.)

assessment that the EPA conducts as part of the risk review under section 112 of the CAA that should be highlighted. The accuracy of an acute inhalation exposure assessment depends on the simultaneous occurrence of independent factors that may vary greatly, such as hourly emissions rates, meteorology, and the present of humans at the location of the maximum concentration. In the acute screening assessment that we conduct under the RTR program, we assume that peak emissions from the source category and worst-case meteorological conditions co-occur, thus, resulting in maximum ambient concentrations. These two events are unlikely to occur at the same time, making these assumptions conservative. We then include the additional assumption that a person is located at this point during this same time period. For this source category, these assumptions would tend to be worst-case actual exposures, as it is unlikely that a person would be located at the point of maximum exposure during the time when peak emissions and worst-case meteorological conditions occur simultaneously.

d. Uncertainties in Dose-Response Relationships

There are uncertainties inherent in the development of the dose-response values used in our risk assessments for cancer effects from chronic exposures and non-cancer effects from both chronic and acute exposures. Some uncertainties may be considered quantitatively, and others generally are expressed in qualitative terms. We note as a preface to this discussion a point on dose-response uncertainty that is brought out in the EPA's *2005 Cancer Guidelines;* namely, that ''the primary goal of EPA actions is protection of human health; accordingly, as an Agency policy, risk assessment procedures, including default options that are used in the absence of scientific data to the contrary, should be health protective'' (*EPA's 2005 Cancer Guidelines,* pages 1–7). This is the approach followed here as summarized in the next several paragraphs. A complete detailed discussion of uncertainties and variability in dose-response relationships is given in the *Residual Risk Assessment for Pulp Mill Combustion Sources in Support of the December 2016 Risk and Technology Review Proposed Rule,* which is available in the docket for this action.

Cancer URE values used in our risk assessments are those that have been developed to generally provide an upper bound estimate of risk. That is, they represent a ''plausible upper limit to the true value of a quantity'' (although this is usually not a true statistical confidence limit).[26] In some circumstances, the true risk could be as low as zero; however, in other circumstances the risk could be greater.[27] When developing an upper bound estimate of risk and to provide risk values that do not underestimate risk, health-protective default approaches are generally used. To err on the side of ensuring adequate health protection, the EPA typically uses the upper bound estimates rather than lower bound or central tendency estimates in our risk assessments, an approach that may have limitations for other uses (*e.g.,* priority-setting or expected benefits analysis).

Chronic non-cancer RfC and reference dose (RfD) values represent chronic exposure levels that are intended to be health-protective levels. Specifically, these values provide an estimate (with uncertainty spanning perhaps an order of magnitude) of a continuous inhalation exposure (*i.e.,* the RfC) or a daily oral exposure (*i.e.,* the RfD) to the human population (including sensitive subgroups) that is likely to be without an appreciable risk of deleterious effects during a lifetime. To derive values that are intended to be ''without appreciable risk,'' the methodology relies upon an uncertainty factor (UF) approach (U.S. EPA, 1993 and 1994) which considers uncertainty, variability and gaps in the available data. The UFs are applied to derive reference values that are intended to protect against appreciable risk of deleterious effects. The UFs are commonly default values,[28] *e.g.,* factors of 10 or 3, used in the absence of compound-specific data; where data are available, UFs may also be developed using compound-specific information. When data are limited, more assumptions are needed and more UFs are used. Thus, there may be a greater tendency to overestimate risk in the sense that further study might support development of reference values that are higher (*i.e.,* less potent) because fewer default assumptions are needed. However, for some pollutants, it is possible that risks may be underestimated.

While collectively termed ''UF,'' these factors account for a number of different quantitative considerations when using observed animal (usually rodent) or human toxicity data in the development of the RfC. The UFs are intended to account for: (1) variation in susceptibility among the members of the human population (*i.e.,* inter-individual variability); (2) uncertainty in extrapolating from experimental animal data to humans (i.e., interspecies differences); (3) uncertainty in extrapolating from data obtained in a study with less-than-lifetime exposure (i.e., extrapolating from sub-chronic to chronic exposure); (4) uncertainty in extrapolating the observed data to obtain an estimate of the exposure associated with no adverse effects; and (5) uncertainty when the database is incomplete or there are problems with the applicability of available studies.

Many of the UFs used to account for variability and uncertainty in the development of acute reference values are quite similar to those developed for chronic durations, but they more often use individual UF values that may be less than 10. The UFs are applied based on chemical-specific or health effect-specific information (*e.g.,* simple irritation effects do not vary appreciably between human individuals, hence a value of 3 is typically used), or based on the purpose for the reference value (see the following paragraph). The UFs applied in acute reference value derivation include: (1) Heterogeneity among humans; (2) uncertainty in extrapolating from animals to humans; (3) uncertainty in lowest observed adverse effect (exposure) level to no observed adverse effect (exposure) level adjustments; and (4) uncertainty in accounting for an incomplete database on toxic effects of potential concern. Additional adjustments are often applied to account for uncertainty in

[26] IRIS glossary (*https://iaspub.epa.gov/sor_internet/registry/termreg/searchandretrieve/glossariesandkeywordlists/search.do?details=&vocabName=IRIS%20Glossary*).

[27] An exception to this is the URE for benzene, which is considered to cover a range of values, each end of which is considered to be equally plausible, and which is based on maximum likelihood estimates.

[28] According to the NRC report, *Science and Judgment in Risk Assessment* (NRC, 1994) ''[Default] options are generic approaches, based on general scientific knowledge and policy judgment, that are applied to various elements of the risk assessment process when the correct scientific model is unknown or uncertain.'' The 1983 NRC report, *Risk Assessment in the Federal Government: Managing the Process,* defined default option as ''the option chosen on the basis of risk assessment policy that appears to be the best choice in the absence of data to the contrary'' (NRC, 1983a, p. 63). Therefore, default options are not rules that bind the Agency; rather, the Agency may depart from them in evaluating the risks posed by a specific substance when it believes this to be appropriate. In keeping with the EPA's goal of protecting public health and the environment, default assumptions are used to ensure that risk to chemicals is not underestimated (although defaults are not intended to overtly overestimate risk). See U.S. EPA, *An Examination of EPA Risk Assessment Principles and Practices*, EPA/100/B–04/001, 2004 available at: *https://training.fws.gov/resources/course-resources/pesticides/Risk%20Assessment/Risk%20Assessment%20Principles%20and%20Practices.pdf.*

extrapolation from observations at one exposure duration (*e.g.,* 4 hours) to derive an acute reference value at another exposure duration (*e.g.,* 1 hour).

Not all acute reference values are developed for the same purpose, and care must be taken when interpreting the results of an acute assessment of human health effects relative to the reference value or values being exceeded. Where relevant to the estimated exposures, the lack of short-term dose-response values at different levels of severity should be factored into the risk characterization as potential uncertainties.

For a group of compounds that are unspeciated (*e.g.,* glycol ethers), we conservatively use the most protective reference value of an individual compound in that group to estimate risk. Similarly, for an individual compound in a group (*e.g.,* ethylene glycol diethyl ether) that does not have a specified reference value, we also apply the most protective reference value from the other compounds in the group to estimate risk.

e. Uncertainties in the Multipathway Assessment

For each source category, we generally rely on site-specific levels of PB–HAP emissions to determine whether a refined assessment of the impacts from multipathway exposures is necessary. This determination is based on the results of a three-tiered screening analysis that relies on the outputs from models that estimate environmental pollutant concentrations and human exposures for four PB–HAPs. Two important types of uncertainty associated with the use of these models in RTR risk assessments and inherent to any assessment that relies on environmental modeling are model uncertainty and input uncertainty.[29]

Model uncertainty concerns whether the selected models are appropriate for the assessment being conducted and whether they adequately represent the actual processes that might occur for that situation. An example of model uncertainty is the question of whether the model adequately describes the movement of a pollutant through the soil. This type of uncertainty is difficult to quantify. However, based on feedback received from previous EPA SAB reviews and other reviews, we are confident that the models used in the screen are appropriate and state-of-the-art for the multipathway risk assessments conducted in support of RTR.

Input uncertainty is concerned with how accurately the models have been configured and parameterized for the assessment at hand. For Tier 1 of the multipathway screen, we configured the models to avoid underestimating exposure and risk. This was accomplished by selecting upper-end values from nationally-representative datasets for the more influential parameters in the environmental model, including selection and spatial configuration of the area of interest, lake location and size, meteorology, surface water and soil characteristics, and structure of the aquatic food web. We also assume an ingestion exposure scenario and values for human exposure factors that represent reasonable maximum exposures.

In Tier 2 of the multipathway assessment, we refine the model inputs to account for meteorological patterns in the vicinity of the facility versus using upper-end national values, and we identify the actual location of lakes near the facility rather than the default lake location that we apply in Tier 1. By refining the screening approach in Tier 2 to account for local geographical and meteorological data, we decrease the likelihood that concentrations in environmental media are overestimated, thereby increasing the usefulness of the screen. The assumptions and the associated uncertainties regarding the selected ingestion exposure scenario are the same for Tier 1 and Tier 2.

For both Tiers 1 and 2 of the multipathway assessment, our approach to addressing model input uncertainty is generally cautious. We choose model inputs from the upper end of the range of possible values for the influential parameters used in the models, and we assume that the exposed individual exhibits ingestion behavior that would lead to a high total exposure. This approach reduces the likelihood of not identifying high risks for adverse impacts.

Despite the uncertainties, when individual pollutants or facilities do screen out, we are confident that the potential for adverse multipathway impacts on human health is very low. On the other hand, when individual pollutants or facilities do not screen out, it does not mean that multipathway impacts are significant, only that we cannot rule out that possibility and that a refined multipathway analysis for the site might be necessary to obtain a more accurate risk characterization for the source category.

For further information on uncertainties and the Tier 1 and 2 screening methods, refer to the risk document, Appendix 6, *Technical Support Document for TRIM-Based Multipathway Tiered Screening Methodology for RTR.*

f. Uncertainties in the Environmental Risk Screening Assessment

For each source category, we generally rely on site-specific levels of environmental HAP emissions to perform an environmental screening assessment. The environmental screening assessment is based on the outputs from models that estimate environmental HAP concentrations. The same models, specifically the TRIM.FaTE multipathway model and the AERMOD air dispersion model, are used to estimate environmental HAP concentrations for both the human multipathway screening analysis and for the environmental screening analysis. Therefore, both screening assessments have similar modeling uncertainties.

Two important types of uncertainty associated with the use of these models in RTR environmental screening assessments (and inherent to any assessment that relies on environmental modeling) are model uncertainty and input uncertainty.[30]

Model uncertainty concerns whether the selected models are appropriate for the assessment being conducted and whether they adequately represent the movement and accumulation of environmental HAP emissions in the environment. For example, does the model adequately describe the movement of a pollutant through the soil? This type of uncertainty is difficult to quantify. However, based on feedback received from previous EPA SAB reviews and other reviews, we are confident that the models used in the screen are appropriate and state-of-the-art for the environmental risk assessments conducted in support of our RTR analyses.

Input uncertainty is concerned with how accurately the models have been configured and parameterized for the assessment at hand. For Tier 1 of the environmental screen for PB–HAPs, we configured the models to avoid underestimating exposure and risk to reduce the likelihood that the results

[29] In the context of this discussion, the term ''uncertainty'' as it pertains to exposure and risk encompasses both variability in the range of expected inputs and screening results due to existing spatial, temporal, and other factors, as well as uncertainty in being able to accurately estimate the true result.

[30] In the context of this discussion, the term ''uncertainty,'' as it pertains to exposure and risk assessment, encompasses both variability in the range of expected inputs and screening results due to existing spatial, temporal, and other factors, as well as uncertainty in being able to accurately estimate the true result.

indicate the risks are lower than they actually are. This was accomplished by selecting upper-end values from nationally-representative datasets for the more influential parameters in the environmental model, including selection and spatial configuration of the area of interest, the location and size of any bodies of water, meteorology, surface water and soil characteristics, and structure of the aquatic food web. In Tier 1, we used the maximum facility-specific emissions for the PB–HAPs (other than lead compounds, which were evaluated by comparison to the Secondary Lead NAAQS) that were included in the environmental screening assessment and each of the media when comparing to ecological benchmarks. This is consistent with the conservative design of Tier 1 of the screen. In Tier 2 of the environmental screening analysis for PB–HAPs, we refine the model inputs to account for meteorological patterns in the vicinity of the facility versus using upper-end national values, and we identify the locations of water bodies near the facility location. By refining the screening approach in Tier 2 to account for local geographical and meteorological data, we decrease the likelihood that concentrations in environmental media are overestimated, thereby increasing the usefulness of the screen. To better represent widespread impacts, the modeled soil concentrations are averaged in Tier 2 to obtain one average soil concentration value for each facility and for each PB–HAP. For PB–HAP concentrations in water, sediment, and fish tissue, the highest value for each facility for each pollutant is used.

For the environmental screening assessment for acid gases, we employ a single-tiered approach. We use the modeled air concentrations and compare those with ecological benchmarks.

For both Tiers 1 and 2 of the environmental screening assessment, our approach to addressing model input uncertainty is generally cautious. We choose model inputs from the upper end of the range of possible values for the influential parameters used in the models, and we assume that the exposed individual exhibits ingestion behavior that would lead to a high total exposure. This approach reduces the likelihood of not identifying potential risks for adverse environmental impacts.

Uncertainty also exists in the ecological benchmarks for the environmental risk screening analysis. We established a hierarchy of preferred benchmark sources to allow selection of benchmarks for each environmental HAP at each ecological assessment endpoint. In general, EPA benchmarks used at a programmatic level (*e.g.,* Office of Water, Superfund Program) were used if available. If unavailable, we used EPA benchmarks used in regional programs (*e.g.,* Superfund Program). If benchmarks were not available at a programmatic or regional level, we used benchmarks developed by other agencies (*e.g.,* NOAA) or by state agencies.

In all cases (except for lead compounds, which were evaluated through a comparison to the NAAQS), we searched for benchmarks at the following three effect levels, as described in section III.A.5 of this preamble:

1. A no-effect level (*i.e.*, NOAEL).
2. Threshold-effect level (*i.e.*, LOAEL).
3. Probable effect level (*i.e.*, PEL).

For some ecological assessment endpoint/environmental HAP combinations, we could identify benchmarks for all three effect levels, but for most, we could not. In one case, where different agencies derived significantly different numbers to represent a threshold for effect, we included both. In several cases, only a single benchmark was available. In cases where multiple effect levels were available for a particular PB–HAP and assessment endpoint, we used all of the available effect levels to help us to determine whether risk exists and if the risks could be considered significant and widespread.

The EPA evaluates the following seven HAPs in the environmental risk screening assessment: cadmium, dioxins/furans, POM, mercury (both inorganic mercury and methyl mercury), lead compounds, HCl, and HF, where applicable. These seven HAPs represent pollutants that can cause adverse impacts for plants and animals either through direct exposure to HAPs in the air or through exposure to HAPs that is deposited from the air onto soils and surface waters. These seven HAPs also represent those HAPs for which we can conduct a meaningful environmental risk screening assessment. For other HAPs not included in our screening assessment, the model has not been parameterized such that it can be used for that purpose. In some cases, depending on the HAP, we may not have appropriate multipathway models that allow us to predict the concentration of that pollutant. The EPA acknowledges that other HAPs beyond the seven HAPs that we are evaluating may have the potential to cause adverse environmental effects and, therefore, the EPA may evaluate other relevant HAPs in the future, as modeling science and resources allow.

Further information on uncertainties and the Tier 1 and 2 environmental screening methods is provided in Appendix 6 of the document, *Technical Support Document for TRIM-Based Multipathway Tiered Screening Methodology for RTR. Also, see the document titled Residual Risk Assessment for Pulp Mill Combustion Sources in Support of the December 2016 Risk and Technology Review Proposed Rule,* available in the docket for this action.

B. How did we consider the risk results in making decisions for this proposal?

As discussed in section II.A of this preamble, in evaluating and developing standards under CAA section 112(f)(2), we apply a two-step process to address residual risk. In the first step, the EPA determines whether risks are acceptable. This determination ‘‘considers all health information, including risk estimation uncertainty, and includes a presumptive limit on maximum individual lifetime [cancer] risk (MIR) [31] of approximately [1-in-10 thousand] [*i.e.*, 100-in-1 million].’’ 54 FR 38045, September 14, 1989. If risks are unacceptable, the EPA must determine the emissions standards necessary to bring risks to an acceptable level without considering costs. In the second step of the process, the EPA considers whether the emissions standards provide an ample margin of safety ‘‘in consideration of all health information, including the number of persons at risk levels higher than approximately 1-in-1 million, as well as other relevant factors, including costs and economic impacts, technological feasibility, and other factors relevant to each particular decision.’’ *Id.* The EPA must promulgate emission standards necessary to provide an ample margin of safety. After conducting the ample margin of safety analysis, we consider whether a more stringent standard is necessary to prevent, taking into consideration, costs, energy, safety, and other relevant factors, an adverse environmental effect.

In past residual risk actions, the EPA considered a number of human health risk metrics associated with emissions from the categories under review, including the MIR, the number of persons in various risk ranges, cancer incidence, the maximum non-cancer HI and the maximum acute non-cancer hazard. See, *e.g.*, 72 FR 25138, May 3,

[31] Although defined as ‘‘maximum individual risk,’’ MIR refers only to cancer risk. MIR, one metric for assessing cancer risk, is the estimated risk were an individual exposed to the maximum level ofa pollutant for a lifetime.

2007; and 71 FR 42724, July 27, 2006. The EPA considered this health information for both actual and allowable emissions. See, *e.g.*, 75 FR 65068, October 21, 2010; 75 FR 80220, December 21, 2010; 76 FR 29032, May 19, 2011. The EPA also discussed risk estimation uncertainties and considered the uncertainties in the determination of acceptable risk and ample margin of safety in these past actions. The EPA considered this same type of information in support of this action.

The Agency is considering these various measures of health information to inform our determinations of risk acceptability and ample margin of safety under CAA section 112(f). As explained in the Benzene NESHAP, ''the first step judgment on acceptability cannot be reduced to any single factor'' and, thus, ''[t]he Administrator believes that the acceptability of risk under [previous] section 112 is best judged on the basis of a broad set of health risk measures and information.'' 54 FR 38046, September 14, 1989. Similarly, with regard to the ample margin of safety determination, ''the Agency again considers all of the health risk and other health information considered in the first step. Beyond that information, additional factors relating to the appropriate level of control will also be considered, including cost and economic impacts of controls, technological feasibility, uncertainties, and any other relevant factors.'' Id.

The Benzene NESHAP approach provides flexibility regarding factors the EPA may consider in making determinations and how the EPA may weigh those factors for each source category. In responding to comment on our policy under the Benzene NESHAP, the EPA explained that:

> ''[t]he policy chosen by the Administrator permits consideration of multiple measures of health risk. Not only can the MIR figure be considered, but also incidence, the presence of non-cancer health effects, and the uncertainties of the risk estimates. In this way, the effect on the most exposed individuals can be reviewed as well as the impact on the general public. These factors can then be weighed in each individual case. This approach complies with the *Vinyl Chloride* mandate that the Administrator ascertain an acceptable level of risk to the public by employing [her] expertise to assess available data. It also complies with the Congressional intent behind the CAA, which did not exclude the use of any particular measure of public health risk from the EPA's consideration with respect to CAA section 112 regulations, and thereby implicitly permits consideration of any and all measures of health risk which the Administrator, in [her] judgment, believes are appropriate to determining what will 'protect the public health'.''

See 54 FR at 38057, September 14, 1989. Thus, the level of the MIR is only one factor to be weighed in determining acceptability of risks. The Benzene NESHAP explained that ''an MIR of approximately one in 10 thousand should ordinarily be the upper end of the range of acceptability. As risks increase above this benchmark, they become presumptively less acceptable under CAA section 112, and would be weighed with the other health risk measures and information in making an overall judgment on acceptability. Or, the Agency may find, in a particular case, that a risk that includes MIR less than the presumptively acceptable level is unacceptable in the light of other health risk factors.'' *Id.* at 38045. Similarly, with regard to the ample margin of safety analysis, the EPA stated in the Benzene NESHAP that: ''EPA believes the relative weight of the many factors that can be considered in selecting an ample margin of safety can only be determined for each specific source category. This occurs mainly because technological and economic factors (along with the health-related factors) vary from source category to source category.'' *Id.* at 38061. We also consider the uncertainties associated with the various risk analyses, as discussed earlier in this preamble, in our determinations of acceptability and ample margin of safety.

The EPA notes that it has not considered certain health information to date in making residual risk determinations. At this time, we do not attempt to quantify those HAP risks that may be associated with emissions from other facilities that do not include the source categories in question, mobile source emissions, natural source emissions, persistent environmental pollution, or atmospheric transformation in the vicinity of the sources in these categories.

The Agency understands the potential importance of considering an individual's total exposure to HAPs in addition to considering exposure to HAP emissions from the source category and facility. We recognize that such consideration may be particularly important when assessing non-cancer risks, where pollutant-specific exposure health reference levels (e.g., RfCs) are based on the assumption that thresholds exist for adverse health effects. For example, the Agency recognizes that, although exposures attributable to emissions from a source category or facility alone may not indicate the potential for increased risk of adverse non-cancer health effects in a population, the exposures resulting from emissions from the facility in combination with emissions from all of the other sources (e.g., other facilities) to which an individual is exposed may be sufficient to result in increased risk of adverse non-cancer health effects. In May 2010, the SAB advised the EPA ''that RTR assessments will be most useful to decision makers and communities if results are presented in the broader context of aggregate and cumulative risks, including background concentrations and contributions from other sources in the area.'' [32]

In response to the SAB recommendations, the EPA is incorporating cumulative risk analyses into its RTR risk assessments, including those reflected in this proposal. The Agency is: (1) Conducting facility-wide assessments, which include source category emission points as well as other emission points within the facilities; (2) considering sources in the same category whose emissions result in exposures to the same individuals; and (3) for some persistent and bioaccumlative pollutants, analyzing the ingestion route of exposure. In addition, the RTR risk assessments have always considered aggregate cancer risk from all carcinogens and aggregate non-cancer HI from all non-carcinogens affecting the same target organ system.

Although we are interested in placing source category and facility-wide HAP risks in the context of *total* HAP risks from all sources combined in the vicinity of each source, we are concerned about the uncertainties of doing so. Because of the contribution to total HAP risk from emission sources other than those that we have studied in depth during this RTR review, such estimates of total HAP risks would have significantly greater associated uncertainties than the source category or facility-wide estimates. Such aggregate or cumulative assessments would compound those uncertainties, making the assessments too unreliable.

C. How did we perform the technology review?

Our technology review focused on the identification and evaluation of developments in practices, processes, and control technologies that have occurred since the MACT standards were promulgated. Where we identified such developments, in order to inform

[32] The EPA's responses to this and all other key recomendations of the SAB's advisory on RTR risk assessment methodologies (which is available at: *http://yosemite.epa.gov/sab/sabproduct.nsf/4AB3966E263D943A8525771F00668381/$File/EPA-SAB-10-007-unsigned.pdf*) are outlined in a memorandum to this rulemaking docket from David Guinnup titled, *EPA's Actions in Response to the Key Recommendations of the SAB Review of RTR Risk Assessment Methodologies*.

our decision of whether it is "necessary" to revise the emissions standards, we analyzed the technical feasibility of applying these developments and the estimated costs, energy implications, non-air environmental impacts, as well as considering the emission reductions. We also considered the appropriateness of applying controls to new sources versus retrofitting existing sources.

Based on our analyses of the available data and information, we identified potential developments in practices, processes, and control technologies. For this exercise, a "development" was considered to be any of the following that was not considered during the development of the promulgated subpart MM standards that could result in significant additional reductions of regulated HAP emissions:

- Add-on control technology or other equipment not previously identified;
- Improvements in add-on control technology or other equipment;
- Work practices or operational procedures that were not previously identified;
- Process change or pollution prevention alternative that could be broadly applied to further reduce HAP emissions; and
- Improvements in work practices, operational procedures, process changes, or pollution prevention alternatives.

In addition to reviewing the practices, processes, and control technologies that were considered at the time we originally developed the NESHAP, we reviewed a variety of data sources in our investigation of potential practices, processes, or controls to consider. Among the sources we reviewed were the practices, processes and control technologies considered in the NESHAP for various industries that were promulgated since the MACT standards being reviewed in this action. We requested information from facilities regarding developments in practices, processes or control technology through Part III of the Pulp and Paper Sector ICR. The ICR data provided information on the process and emission controls currently in use on chemical recovery combustion sources, and provided emissions data to assess the performance of current emissions controls. We reviewed continuous opacity monitoring data for ESP-controlled recovery furnaces and lime kilns. We also consulted the EPA's RBLC to determine whether it contained any practices, processes or control technologies for the types of processes covered by the 40 CFR part 63, subpart MM source category.[33] We conducted a general search of the Internet for information on control technologies applicable to pulp mill combustion sources. We also reviewed information from other sources, such as state and/or local permitting agency databases.

Each of the evaluations listed above considered and reviewed the technologies suitable to demonstrate compliance with the requirements listed in 40 CFR 63.860 through 63.868 (subpart MM).[34]

IV. Analytical Results and Proposed Decisions

A. What are the results of the risk assessment and analyses?

1. Inhalation Risk Assessment Results

The inhalation risk modeling performed to estimate risks based on actual and allowable emissions relied primarily on emissions data from the ICR. The results of the chronic baseline inhalation cancer risk assessment indicate that, based on estimates of current actual and allowable emissions under 40 CFR part 63, subpart MM, the MIR posed by the MACT source category was 4-in-1 million. The total estimated cancer incidence from the MACT source category based on actual emission levels is 0.01 excess cancer cases per year, or 1 case every 100 years, while the cancer incidence for allowable emissions is 0.02 excess cancer cases per year, or 1 case every 50 years. Air emissions of chromium VI, formaldehyde, and naphthalene contributed 31 percent, 18 percent, and 13 percent, respectively, to this cancer incidence. We estimated approximately 7,600 people to have cancer risks greater than or equal to 1-in-1 million considering actual and allowable emissions from subpart MM sources, refer to Table 3.

TABLE 3—INHALATION RISK ASSESSMENT SUMMARY FOR PULP MILL COMBUSTION SOURCES SOURCE CATEGORY—(SUBPART MM)

	Cancer MIR (in-1 million)		Cancer incidence (cases per year)	Population with risk of 1-in-1 million or more	Population with risk of 10-in-1 million or more	Max chronic noncancer HI (actuals)	Max chronic noncancer HI (allowables)
	Based on actual emissions	Based on allowable emissions					
Source Category	4 (naphthalene, acetaldehyde).	4 (naphthalene, acetaldehyde).	0.01	7,600	0	HI < 1	HI < 1
Whole Facility	20 (arsenic, chromium VI).	....	0.05	440,000	280	HI = 1	HI = 1

We estimated the maximum modeled chronic non-cancer HI (TOSHI) value for the source category based on actual and allowable emissions to be 0.3, with acrolein emissions from lime kilns accounting for 92 percent of the HI.

2. Acute Risk Results

Our screening analysis for worst-case acute impacts based on actual emissions did not identify impacts associated with any pollutants that exceeded an HQ value of 1 based upon the REL. For the acute risk screening analysis, we calculated acute hourly multipliers based on the median of peak-to-mean ratio for 14 emission process groups ranging from 1.3 to 4.7, with emissions from the semichemical recovery process having the highest hourly peak emissions with a multiplier of 4.7. For more information on how we calculated the acute hourly multipliers, refer to the

risk document, Appendix 1, *Preparation of Residual Risk Modeling Input File for Subpart MM* dated September 30, 2014.

3. Multipathway Risk Screening Results

Results of the worst-case Tier 1 screening analysis identified emissions (based on estimates of actual emissions) exceeding the PB–HAP emission cancer screening rates for dioxin/furans and polycyclic aromatic hydrocarbons (PAH) and the non-cancer screening threshold for mercury. For the compounds and facilities that did not screen out at Tier 1, we conducted a Tier 2 screen. The Tier 2 screen replaces some of the assumptions used in Tier 1 with site-specific data, including the location of fishable lakes and local precipitation, wind direction and speed. The Tier 2 screen continues to rely on high-end assumptions about consumption of local fish and locally grown or raised foods (adult female angler at 99th percentile consumption for fish for the subsistence fisherman scenario and 90th percentile consumption for locally grown or raised foods for the farmer scenario). For facilities for which the Tier 2 screening value(s) indicate a potential health risk to the public, we can conduct a Tier 3 multipathway screen. Tier 3 has three individual stages: (1) Lake assessment to assess fishability and accessibility; (2) plume-rise calculations to estimate the emissions exiting the mixing layer and resulting in no ground-level exposures; (3) TRIMFaTE hourly screening runs using the layout for the farm and/or fish location that best characterizes the facility being modeled. We progress through Tier 3 stages until the facility's screening values indicate that emissions are unlikely to pose health risks to the public, or until all three stages are complete. A Tier 3 screen was required for one facility that exceeded the Tier 2 screen for mercury. It is important to note that, even with the inclusion of some site-specific information in the Tier 2 and 3 analysis, the multipathway screening analysis is still a very conservative, health-protective assessment (i.e., upper-bound consumption of local fish and locally grown and/or raised foods) and in all likelihood yields results that serve as an upper-bound multipathway risk associated with a facility.

While the screening analysis is not designed to produce a quantitative risk result, the factor by which the emissions exceed the threshold serves as a rough gauge of the ''upper-limit'' risks we would expect from a facility. Thus, for example, if a facility emitted a PB–HAP carcinogen at a level 2 times the screening threshold, we can say with a high degree of confidence that the actual maximum cancer risks will be less than 2-in-1 million. Likewise, if a facility emitted a noncancer PB–HAP at a level 2 times the screening threshold, the maximum noncancer hazard would represent an HQ less than 2. The high degree of confidence comes from the fact that the screens are developed using the very conservative (health-protective) assumptions that we describe above.

a. Cancer Risk Screening

Results of the worst-case Tier 1 screening analysis indicate that 85 of the 108 facilities with pulp mill combustion sources exceeded the PB–HAP emission cancer screening rates (based on estimates of actual emissions) for dioxin/furans and PAH. The EPA conducted a Tier 2 cancer screening analysis of the 85 facilities that were found to exceed the Tier 1 screening value. Nineteen of these facilities with subpart MM MACT source category sources emitted dioxin/furans and PAH above a cancer screening value of 1 for the subsistence fisher and farmer scenarios. In the Tier 2 analysis, the individual dioxin/furan congener emissions are all scaled based on their toxicity relative to 2,3,7,8-tetrachlorodibenzo-p-dioxin and are reported as toxic equivalents (TEQs), and all PAH congener emissions are scaled based on their toxicity relative to benzo(a)pyrene and are reported as TEQs. The maximum Tier 2 cancer screening value for the subsistence fisher scenario and the farmer scenario for this source category was equal to 10, which represents a maximum cancer risks that would be less than 10-in-1 million. The EPA did not conduct further cancer screening for this source category and considered this result along with all the risk results as part of determining whether the risks are acceptable (as discussed in section B).

b. Non-Cancer Risk Screening

Results of the worst-case Tier 1 screening analysis indicate that 59 of the 108 plants sources exceeded the Tier 1 non-cancer screen value for mercury. The EPA conducted a Tier 2 chronic non-cancer screening analysis of the 59 facilities, resulting in 9 facilities emitting divalent mercury above the non-cancer screening value of 1 for the subsistence fisher scenario. The highest exceedance of the Tier 2 non-cancer mercury screen value for pulp mill combustion sources under 40 CFR part 63, subpart MM was equal to 5. The risk associated with divalent mercury is based on its ability to transform into the most toxic form of mercury as methyl mercury.

The Tier 2 non-cancer screening analysis for the 9 facilities indicated potential risks greater than or equal to 2 but less than 5 times the non-cancer screening level for the subsistence fisher scenario. More refined screening using Tier 3 was conducted for the 9 facilities flagged in Tier 2. The Tier 3 screen examined the set of lakes from which the fisher might ingest fish (Stage 1). Any lakes that appeared to not be fishable or not publicly accessible were removed from the assessment, and the screening assessment was repeated. After we made the determination that the critical lakes were fishable, we analyzed plume rise data for each of the sites (Stage 2). The results of the Tier 3 screen (Stage 2) showed one facility with a non-cancer screen value of 2.

We conducted the final screening stage of Tier 3 for this single facility utilizing a time-series assessment (Stage 3). In this stage, we conducted a new mercury run using TRIM.FaTE for each relevant lake that represents a risk concern based upon the Tier 3 plume-rise assessment. For these model runs, we started with the screening configuration corresponding to the lake location, but instead of the static meteorology and stack parameters used in previous screening tiers and stages, we used site-specific hourly meteorology and the hourly plume-rise values calculated in the Tier 3 plume-rise assessment. Allowing TRIM.FaTE to model chemical fate and transport with hour-by-hour changes in meteorology and plume rise produces a more accurate estimate of chemical concentrations in media of interest, as compared to the static values used in Tier 2 and the post-processing adjustments made in the Tier 3 plume-rise assessment. If the potential risk (estimated using this Tier 3 time-series approach) associated with a facility's PB–HAP emissions are lower than the screening value, we consider the emissions to pose no significant risk. This Tier 3 screen resulted in lowering the maximum exceedance of the screen value for the highest site from 2 to 1. Further details on the refined multipathway screening analysis are in Appendix 10, Attachment 1 of the risk report, ''Residual Risk Assessment for Pulp Mill Combustion Sources in Support of the December 2016 Risk and Technology Review Proposed Rule''.

4. Environmental Risk Screening Results

As described in section III.A of this document, we conducted an environmental risk screening assessment for the 40 CFR part 63, subpart MM source category for the following seven HAPs: PAH, mercury (methyl mercury and mercuric chloride), cadmium, lead, dioxin/furans, HCl, and HF.

In the Tier 1 screening analysis for PB–HAPs (other than lead, which we evaluated differently), one modeled soil parcel for one facility in the source category exceeded a surface soil—threshold level benchmark (invertebrates) for mercuric chloride by 2. There were no Tier 1 exceedances of any benchmarks for the other pollutants; PAH, cadmium and dioxins/furans. Therefore, we conducted a Tier 2 screen for mercuric chloride only. In the Tier 2 screen for mercuric chloride, none of the individual modeled concentrations for any facility in the source category exceeded any of the ecological benchmarks.

For lead, we did not estimate any exceedances of the secondary lead NAAQS. For HCl and HF, the average modeled concentration around each facility (i.e., the average concentration of all off-site data points in the modeling domain) did not exceed any ecological benchmark. In addition, each individual modeled concentration of HCl and HF (*i.e.,* each off-site data point in the modeling domain) was below the ecological benchmarks for all facilities.

5. Facility-Wide Risk Results

Considering facility-wide emissions at the 108 plants, we estimated the MIR to be 20-in-1 million driven by arsenic and chromium VI emissions, and calculated the chronic non-cancer TOSHI value to be 1 driven by emissions of acrolein (refer to Table 3). The above cancer and non-cancer risks are driven by emissions from the industrial boilers.

We estimated approximately 440,000 people to have cancer risks greater than or equal to 1-in-1 million considering whole facility emissions from 81 of the 108 facilities modeled from the pulp and paper production industry (refer to Table 3). From these 81, 2 facilities have cancer risks greater than or equal to 10-in-1 million (but less than 20-in-1 million) with approximately 300 being exposed at these levels.

6. What demographic groups might benefit from this regulation?

To determine whether or not to conduct a demographics analysis, which is an assessment of risks to individual demographic groups, we look at a combination of factors, including the MIR, non-cancer TOSHI, population around the facilities in the source category, and other relevant factors. For the 40 CFR part 63, subpart MM source category, we examined the potential for any environmental justice (EJ) issues that might be associated with the source category, by performing a demographic analysis of the population close to the facilities. In this analysis, we evaluated the distribution of HAP-related cancer and non-cancer risks from the subpart MM source category across different social, demographic, and economic groups within the populations living near facilities identified as having the highest risks. The methodology and the results of the demographic analyses are included in a technical report, *Risk and Technology Review—Analysis of Socio-Economic Factors For Populations Living Near Pulp Mill Combustion Sources*, available in the docket for this action.

The results of the demographic analysis are summarized in Table 4 below. These results, for various demographic groups, are based on the estimated risks from actual emissions levels for the population living within 50 km of the facilities.

TABLE 4—SUBPART MM SOURCE CATEGORY DEMOGRAPHIC RISK ANALYSIS RESULTS

	Nationwide	Population with cancer risk at or above 1-in-1 million	Population with chronic hazard index above 1
Total Population	312,861,265	7,600	0
Race by Percent			
White	72	67	0
All Other Races	28	33	0
Race by Percent			
White	72	67	0
African American	13	28	0
Native American	1.1	0.4	0
Other and Multiracial	14	5	0
Ethnicity by Percent			
Hispanic	17	3	0
Non-Hispanic	83	97	0
Income by Percent			
Below Poverty Level	14	16	0
Above Poverty Level	86	84	0
Education by Percent			
Over age 25 and without High School Diploma	15	18	0
Over age 25 and with a High School Diploma	85	82	0

The results of the 40 CFR part 63, subpart MM source category demographic analysis indicate that emissions from the source category expose approximately 7,600 people to a cancer risk at or above 1-in-1 million and no one exposed to a chronic non-cancer TOSHI greater than 1. The specific demographic results indicate that the percentage of the population potentially impacted by emissions is greater than its corresponding national percentage for the minority population (33 percent for the source category compared to 28 percent nationwide), the African American population (28 percent for the source category compared to 13 percent nationwide) and for the population over age 25 without a high school diploma (18 percent for the source category compared to 15 percent nationwide). The proximity results (irrespective of risk) indicate that the population percentages for certain demographic categories within 5 km of source category emissions are greater than the corresponding national percentage for those same demographics. The following demographic percentages for populations residing within close proximity to facilities with chemical recovery combustion sources are higher than the corresponding nationwide percentage: African American, ages 65 and up, over age 25 without a high school diploma, and below the poverty level.

The risks due to HAP emissions from this source category are low for all populations (*e.g.*, inhalation cancer risks are less than 4-in-1 million for all populations and non-cancer hazard indices are less than 1). Furthermore, we do not expect this proposal to achieve significant reductions in HAP emissions. Section IV.C of this preamble addresses opportunities as part of the technology review to further reduce HAP emissions. These technologies were found not to be cost-effective. Therefore, we conclude that this proposal will not have disproportionately high and adverse human health or environmental effects on minority or low-income populations because it does not affect the level of protection provided to human health or the environment. However, this proposal, if finalized, will provide additional benefits to these demographic groups by improving the compliance, monitoring, and implementation of the NESHAP.

B. What are our proposed decisions regarding risk acceptability, ample margin of safety, and adverse environmental effects?

1. Risk Acceptability

As noted in section II.A of this preamble, the EPA sets standards under CAA section 112(f)(2) using ''a two-step standard-setting approach, with an analytical first step to determine an 'acceptable risk' that considers all health information, including risk estimation uncertainty, and includes a presumptive limit on MIR of approximately 1-in-10 thousand.'' (54 FR 38045, September 14, 1989).

In this proposal, the EPA estimated risks based on both actual and allowable emissions from pulp mill combustion sources. As discussed above, in determining acceptability, we considered risks based on both actual and allowable emissions. Based on the risk assessment results described above, the EPA is proposing that the risks are acceptable.

The baseline inhalation cancer risk from the source category was 4-in-1-million for the most exposed individual based on actual and allowable emissions. The total estimated incidence of cancer for this source category due to inhalation exposures is 0.02 excess cancer cases per year, or 1 case in 50 years. The Agency estimates that the maximum chronic non-cancer TOSHI from inhalation exposure for this source category has an HI equal to 0.3 based upon both actual and allowable emissions. Lime kilns account for a large portion (92 percent) of the HI.

The multipathway screening analysis, based upon actual emissions, indicates the excess cancer risk from this source category is less than 10-in-1 million based on dioxins/furans and PAH emissions, with PAH emissions accounting for 99 percent of these potential risks from the fisher and the farmer scenarios. There were no facilities within this source category with a multipathway non-cancer screen value greater than 1 for cadmium or mercury. In evaluating the potential for multipathway effects from emissions of lead, we compared modeled maximum annual lead concentrations to the secondary NAAQS for lead (0.15 µg/m3). Results of this analysis estimate that the NAAQS for lead would not be exceeded at any off-site locations.

To put the risks from the source category in context, we also evaluated facility-wide risk. Our facility-wide assessment, based on actual emissions, estimated the MIR to be 20-in-1 million driven by arsenic and chromium VI emissions, and estimated the chronic non-cancer TOSHI value to be 1 driven by emissions of acrolein. We estimated approximately 440,000 people to have cancer risks greater than or equal to 1-in-1 million considering facility-wide emissions from the pulp and paper production industry (see Table 3). The above cancer and non-cancer risks are driven by emissions from industrial boilers, representing 62 percent of the cancer risks and 95 percent of the non-cancer risks. Emissions from the 40 CFR part 63, subpart MM sources represent only 6 percent of the total facility-wide cancer risk of 20-in-1 million.

The screening assessment of worst-case acute inhalation impacts indicates no pollutants exceeding an HQ value of 1 based on the REL, with an estimated worst-case maximum acute HQ of 0.3 for acrolein based on the 1-hour REL.

A review of the uncertainties in the risk assessment identified one additional key consideration, and that is the quality of data associated with the whole-facility emissions. The data provided from the power boilers were collected in 2009 and represent pre-MACT emissions before any controls. The uncertainty introduced by using pre-MACT boiler emissions data may result in an overestimated risk estimate for the whole-facility analysis for both cancer and non-cancer impacts.

Considering all of the available health risk information, we propose that risks from the source category are acceptable.

2. Ample Margin of Safety Analysis

As directed by section 112(f)(2), we conducted an additional analysis to determine whether additional standards are needed to provide an ample margin of safety to protect public health. Under this ample margin of safety analysis, we evaluated the cost and feasibility of available control technologies and other measures that could be applied in this source category to further reduce the risks (or potential risks) due to emissions of HAPs identified in our risk assessment, along with all of the health risks and other health information considered in our determination of risk acceptability.

Although we are proposing that the risks from the subpart MM source category are acceptable, inhalation risk estimates are above 1-in-1 million at the actual and MACT-allowable emission levels for approximately 7,600 individuals in the exposed population. The HAP risk drivers contributing to the inhalation risks in excess of 1-in-1 million include primarily the gaseous organic HAPs acetaldehyde and naphthalene. Additional gaseous organic HAPs contributing to the risk includes benzene, chloroprene, formaldehyde, 2-methylnaphthalene, 7,12-dimethylbenz[a]anthracene, acenaphthene, acenaphthylene, and fluoranthene. More than 80-percent of the mass emissions of these compounds originate from NDCE recovery furnaces, and DCE recovery furnaces (including BLO systems). We considered options for further reducing gaseous organic HAP emissions from NDCE and DCE recovery furnaces. The greatest reduction in gaseous organic HAP emissions that could be achieved for DCE recovery furnaces would result from DCE-to-NDCE furnace conversions or replacements of DCE furnaces with NDCE systems. We estimated furnace emissions to be reduced when a DCE furnace is converted (or replaced with NDCE design). Conversion or replacement of a DCE system with an NDCE system results in removal of the BLO system and elimination of 100 percent of the BLO emissions. For NDCE recovery furnaces with wet ESP systems, conversion of the wet ESP system to a dry system can further reduce gaseous organic HAPs. Section IV.C.1 of this preamble discusses the costs and impacts associated with DCE conversions (or replacements) and wet-to-dry ESP conversions for NDCE recovery furnaces. The overall cost of these options is an estimated $1.4 billion to $3.7 billion in capital cost and $120 million to $440 million in annualized cost. Application of this option would achieve an estimated emission reduction of 2,920 tpy of gaseous organic HAPs (including risk drivers and other gaseous organic HAPs), and the corresponding cost-effectiveness ranges from $45,000 to $153,000 per ton of emissions reduced. The non-air environmental impacts, energy impacts, and secondary air emissions associated with the options described above are discussed in a memorandum in the docket. Due to the low level of current risk and the substantial costs associated with these options, we are proposing that additional emission reductions from the source category are not necessary to provide an ample margin of safety.

3. Adverse Environmental Effects

Based on the results of our environmental risk screening assessment, we propose to conclude that there is not an adverse environmental effect as a result of HAP emissions from the 40 CFR part 63, subpart MM source category.[35] Thus, we are proposing that it is not necessary to set a more stringent standard to prevent an adverse environmental effect.

[35] The environmental screening analysis is documented in *Residual Risk Assessment for Pulp Mill Combustion Sources in Support of the December 2016 Risk and Technology Review Proposed Rule*, in the docket for this action.

C. What are the results and proposed decisions based on our technology review?

1. Kraft and Soda Recovery Furnaces

The ability to recover pulping chemicals is imperative to the kraft and soda process, and is achieved by burning spent pulping liquor (*i.e.*, black liquor) in a recovery furnace. The recovery furnace is easily identified at a pulp mill because it is typically the tallest equipment on site. The purpose of the recovery furnace is to: (1) Recover inorganic pulping chemicals (e.g., sodium sulfide (Na_2S) and sodium hydroxide (NaOH) in kraft mills and NaOH in soda mills); and (2) produce steam. The recovered inorganic pulping chemicals are reused in the process, and the steam is used to generate electricity and for process heating. Prior to being fired in the recovery furnace, black liquor recovered from pulp washing is concentrated using an NDCE or DCE. The NDCE is an indirect, steam-heated black liquor concentrator. The DCE uses the hot combustion gases exiting the furnace to increase the solids content of the black liquor. A BLO system precedes the DCE to reduce malodorous total reduced sulfur (TRS) emissions that can be stripped in the DCE when hot flue gases from the recovery furnace come in contact with the black liquor. The BLO system uses molecular oxygen (O_2) or air to oxidize Na_2S to nonvolatile sodium thiosulfate ($Na_2S_2O_3$) to reduce the potential for stripping. Outputs from recovery furnaces include molten smelt (primarily Na_2S and sodium carbonate (Na_2CO_3)), flue gases, and steam. The smelt exits from the bottom of the furnace into an SDT, where the recovery of kraft pulping chemicals continues. Particulate matter (primarily sodium sulfate (Na_2SO_4) [salt cake] and Na_2CO_3) entrained in the flue gases is also recovered using an ESP, which deposits the collected material into a chemical ash tank or salt cake mix tank for subsequent addition into the concentrated black liquor.

We reviewed ICR data on recovery furnace design and emissions controls for purposes of the technology review. There are currently 148 kraft and soda recovery furnaces in the United States, including 36 existing DCE furnaces, 108 existing NDCE furnaces, and 4 recovery furnaces subject to the new source limits under 40 CFR part 63, subpart MM. The vast majority (96 percent) of recovery furnaces have ESP control, including the 4 NDCE recovery furnaces subject to the new source limits under subpart MM. Three of the DCE furnaces and one of the NDCE furnaces have an ESP followed by a wet scrubber. Two NDCE furnaces have a wet scrubber alone. The one remaining soda recovery furnace is a subpart MM new source with ESP control. As we noted in 2001, when subpart MM was promulgated, we project no new DCE recovery furnaces to be installed in the future, because more energy-efficient NDCE technology is now prevalent.

Recovery furnace ESPs can be further characterized as wet- or dry-bottom ESPs having either a wet or dry PM return system. A wet-bottom ESP uses either oxidized or unoxidized black liquor to collect the PM and carry it to the salt cake mix tank via a wet PM return system. A dry-bottom ESP routes the captured PM to the mix tank via a screw conveyor or drag chain without the use of liquid, typically with a dry PM return system. However, there are some dry-bottom ESPs with a wet PM return system that use black liquor or other process liquids to transport the dry collected PM to the mix tank. Approximately 60 percent of recovery furnaces in the United States (or 90 recovery furnaces) have a dry-bottom ESP with a dry PM return system (including two furnaces with a dry-bottom ESP followed by a scrubber).

Recovery furnace gaseous organic HAP. Subpart MM of 40 CFR part 63 contains a gaseous organic HAP limit of 0.025 lb/ton BLS (measured as methanol) for new recovery furnaces based on use of an NDCE recovery furnace with a dry-bottom ESP and a dry PM return system. Recovery furnace system design impacts gaseous organic HAP emissions. Non-direct contact evaporator recovery furnaces emit less gaseous organic HAPs because there is no contact between the incoming black liquor and hot flue gases in the evaporator and there is no BLO system. Replacement of DCE recovery furnace systems with a new NDCE recovery furnace or conversion of an existing DCE furnace to an NDCE design (referred to as a ''low-odor conversion''), along with removal of the associated BLO system, provides the greatest reduction in gaseous organic HAP emissions. Use of a dry-bottom ESP system with a dry PM return also reduces gaseous organic HAP emissions.

Analysis of ICR data for our technology review revealed that the number of DCE recovery furnaces in the United States continues to decrease as facilities with older DCE furnaces either close or, where feasible, replace aging DCE furnaces or convert them to NDCE systems. When subpart MM was proposed in 1998, 39 percent of recovery furnaces (82 units) were DCE systems. Today, only 36 DCE recovery furnaces remain, which is 24 percent of the recovery furnace population (including 2 DCE recovery furnaces that are only used as backup systems for times when other NDCE furnaces onsite are not operating).

We analyzed the costs and environmental impacts of replacement or conversion of the remaining DCE recovery furnaces as part of our technology review. High capital costs of an estimated $1.3 to $3.7 billion and annualized costs of an estimated $120 to $440 million are associated with recovery furnace installation (or conversion) projects due to the integral nature of the recovery furnace within the pulp mill and the number of upstream and downstream equipment components that must be removed, replaced, or reengineered along with the recovery furnace itself. These costs would be borne by 21 facilities that continue to operate DCE recovery furnaces and are not already projected to replace these systems in the absence of any regulatory action. The cost effectiveness of recovery furnace conversions or replacements is also high, at an estimated $44,000 to $159,000 per ton of gaseous organic HAPs reduced. We estimated a range of costs based on multiple information sources.

We also considered the costs and impacts associated with converting the remaining NDCE recovery furnace wet-bottom ESPs in the industry to dry-bottom ESPs. Capital costs are an estimated $56.1 million for wet-to-dry bottom ESP conversions at 11 mills with NDCE recovery furnaces, with cost effectiveness of $54,000 per ton of gaseous organic HAPs removed.

The total costs of the gaseous organic HAP options we considered are an estimated $1.4 to $3.7 billion in capital cost borne by 32 facilities, to achieve an estimated emission reduction of 2,920 tpy of gaseous organic HAP at a cost effectiveness of $45,000 to $153,000 per ton of gaseous organic HAPs removed. Collateral TRS emission reductions are an estimated 1,250 tpy at a cost effectiveness of $104,000 to $357,000 per ton of TRS reduced. Given the high capital costs and high cost per ton of emissions reduced, we are not proposing additional regulation of recovery furnace gaseous organic HAP emissions as a result of the technology review.

Recovery furnace PM. Under the current 40 CFR part 63, subpart MM, PM is a surrogate for HAP metal emissions. Subpart MM requires existing recovery furnaces to meet a PM emission limit of 0.044 grains per dry standard cubic foot (gr/dscf) at 8 percent O_2 and requires new recovery furnaces to meet a PM limit of 0.015 gr/dscf at 8-percent O_2. We recently analyzed PM emissions test data collected with the 2011 Pulp and Paper Sector ICR for purposes of the Kraft Pulp Mill NSPS review promulgated on April 4, 2014 (79 FR 18952). We reviewed the PM data tabulated for the NSPS review in the context of the existing and new source PM limits for the subpart MM NESHAP technology review. The dataset included more than 200 filterable PM stack tests, including some repeat tests, on nearly all of the recovery furnaces in the United States using a variety of PM emission controls (ESP, ESP and wet scrubber combinations, and wet scrubbers). The PM stack test data revealed little or no distinction between DCE and NDCE recovery furnaces for PM emissions. Nearly all of the recovery furnaces tested met the current existing source limit (0.044 gr/dscf),[36] and several met the new source limit (0.015 gr/dscf), though there was a considerable scatter of emission test results between 0.015 and 0.044 gr/dscf, including variability in test results for the same units tested multiple times. There was also variability in the performance of the different types of ESP or ESP and scrubber systems such that no one type of control system seemed to perform better than another. Based on the data, wet scrubbing of recovery furnace exhaust gases (either alone or in conjunction with an ESP) does not necessarily improve filterable PM removal. After reviewing the recovery furnace PM emissions data, we concluded that the current subpart MM emission limits of 0.044 gr/dscf and 0.015 gr/dscf continue to represent the performance of existing and new recovery furnaces, respectively. The technology review did not reveal any developments in practices, processes, and control technologies for reducing PM emissions from recovery furnaces that have occurred since promulgation of subpart MM. Therefore, we are not proposing any changes to the PM emission limits for purposes of the technology review. As discussed below, we estimated incidental incremental improvements in PM emissions as part of our analysis of the opacity monitoring limit for recovery furnaces.

2. Kraft and Soda Lime Kilns

In kraft and soda pulp mills, the lime kiln is part of the causticizing process in which green liquor from the SDT is converted to white liquor. The function of the lime kiln is to oxidize lime mud (calcium carbonate, $CaCO_3$) to reburned lime (calcium oxide, CaO) in a process known as calcining. Lime kiln air pollution control devices include wet scrubbers, ESPs, or a combination system including an ESP followed by a wet scrubber. The 2011 ICR data indicate that, of 130 lime kilns in the United States, 89 kilns have wet scrubbers, 30 kilns have ESPs, and 11 kilns have ESP-wet scrubber combinations.

Subpart MM, 40 CFR part 63, includes a PM limit of 0.064 gr/dscf at 10-percent O_2 (which is a surrogate limit for HAP metals) for existing lime kilns. For new or reconstructed lime kilns, the subpart MM limit is 0.010 gr/dscf at 10-percent O_2 based on use of a high-efficiency ESP. Subpart MM does not distinguish between fuel types. Lime kilns typically burn natural gas, fuel oil, petroleum coke, or a combination of these fuels. They may also burn noncondensable gases (NCGs) or pulp mill byproducts such as tall oil.

The EPA recently reviewed PM stack test data from more than 250 filterable PM stack tests (including several repeat tests) on 110 lime kilns in the United States for purposes of the Kraft Pulp Mill NSPS review. The EPA interpreted this same dataset in the context of conducting the technology review of the subpart MM PM limits for lime kilns. The tests included lime kilns with scrubbers, ESPs and ESP-wet scrubber combination controls. Most of the scrubber-controlled kilns achieved the subpart MM existing source limit (0.064 gr/dscf at 10-percent O_2) with the exception of kilns that participate in the PM bubble compliance alternative. The data suggested that scrubber-controlled kilns would not be expected to meet the subpart MM new source limit of 0.010 gr/dscf at 10-percent O_2. The EPA found that ESP and ESP-wet scrubber controls typically reduce PM to lower levels than wet scrubbers alone. The ESP-wet scrubber systems did not necessarily perform better on filterable PM than the ESPs alone. Several existing ESP and ESP-wet scrubber controlled kilns consistently met the 0.064 gr/dscf existing source limit, and often met the new source limit of 0.010 gr/dscf at 10-percent O_2. The EPA observed test results between the existing and new source limit for existing sources with ESP and ESP-wet scrubber systems. Our review of the PM emissions test data for lime kilns suggests that the subpart MM limits for lime kilns are appropriate. For purposes of the subpart MM technology review, the EPA has identified no practices, processes, or controls for PM emissions from lime kilns beyond those

[36] Exceptions included a few stack tests that were repeated, or recovery furnaces that participate in the PM bubble compliance option under 40 CFR part 63, subpart MM.

identified when subpart MM was developed. Therefore, the EPA is not proposing any changes to the existing PM limits of 0.064 gr/dscf at 10-percent O_2 for existing lime kilns and 0.010 gr/dscf at 10-percent O_2 for new and reconstructed lime kilns.

3. Recovery Furnace and Lime Kiln Monitoring

This subsection discusses our review of the opacity and ESP monitoring provisions for recovery furnaces and lime kilns with ESPs or combined ESP and wet scrubber systems.

Continuous opacity monitoring. Subpart MM of 40 CFR part 63 requires continuous monitoring of opacity to demonstrate ongoing compliance with the PM concentration limits for ESP-controlled recovery furnaces and lime kilns. The current PM opacity limits under subpart MM are 35-percent opacity for existing recovery furnaces and 20-percent opacity for existing lime kilns, new lime kilns, and new recovery furnaces. Subpart MM contains an opacity monitoring allowance for existing sources where 6 percent of the 6-minute opacity averages during a quarter (excluding periods of SSM and periods when the facility is not operating) may exceed the 35-percent recovery furnace or 20-percent lime kiln opacity limit without being considered a violation. Subpart MM currently contains a corrective action threshold of 10 consecutive 6-minute averages above 20-percent opacity for new and existing recovery furnaces and lime kilns.

The EPA reviewed recovery furnace and lime kiln continuous opacity monitoring system (COMS) data for purposes of the technology review to evaluate the current 40 CFR part 63, subpart MM opacity limits and 6-percent monitoring allowance. The EPA performed a similar review of the COMS data for the subpart BBa NSPS review promulgated April 4, 2014 (79 FR 18952). The EPA's analysis of the recovery furnace COMS data for subpart MM is included in a memorandum in the docket.[37] Our conclusions from reviewing the opacity data in the context of subpart MM are consistent with the conclusions reached for the 2014 NSPS review.

The COMS data for 135 recovery furnaces show that the majority of existing recovery furnaces, regardless of design (DCE or NDCE), and with most controls, are meeting a 20-percent opacity limit based on a 6-minute average, with fewer than 2 percent of averaging periods exceeding 20-percent opacity, including periods of startup and shutdown. The EPA also reviewed state permits and found many recovery furnaces with permit limits of 20-percent opacity. Therefore, the EPA concludes that this information is evidence that there has been a development in existing recovery furnace operating practices that supports reducing the existing source opacity limit from 35-percent to 20-percent and revising the monitoring allowance for the 20-percent opacity limit from 6 percent to a 2-percent monitoring allowance as part of the 40 CFR part 63, subpart MM technology review process.

The COMS data for 28 ESP-controlled lime kilns show that all of the existing lime kilns are meeting the 20-percent opacity limit based on a 6-minute average, with nearly all performing at a 1-percent monitoring allowance, including periods of startup and shutdown. The EPA considers this information as evidence that there has been a development in existing lime kiln operating practices and that this development supports revising the monitoring allowance from 6 percent to a 1-percent monitoring allowance for opacity as part of the 40 CFR part 63, subpart MM technology review process.

Subpart MM of 40 CFR part 63 currently requires that the opacity allowance be calculated based on the percent of the operating time in a quarter in which excess emissions are recorded. The Agency is proposing to change the reporting requirement frequency, as discussed in section IV.D.4, and, therefore, analyzed both quarterly and semiannual averaging periods when reviewing the proposed monitoring allowance discussed above.

The EPA considered the impacts of various opacity monitoring options as part of the technology review. The opacity regulatory options considered for kraft and soda recovery furnaces were:

Baseline Option 1: 35-percent opacity (existing) or 20-percent opacity (new), 20-percent corrective action level, 6-percent monitoring allowance, quarterly reporting.

Option 2: 35-percent opacity, 20-percent corrective action level, 2-percent monitoring allowance, semiannual reporting.

Option 3: 20-percent opacity, 6-percent monitoring allowance, quarterly reporting.

Option 4: 20-percent opacity, 2-percent monitoring allowance, semiannual reporting.

Option 5: 20-percent opacity, 2-percent monitoring allowance, quarterly reporting.

The opacity regulatory options considered for kraft and soda ESP-controlled lime kilns were:

Baseline Option 1: 20-percent opacity and corrective action level with 6-percent allowance, quarterly reporting.

Option 2: 20-percent opacity with a 1-percent monitoring allowance, semiannual reporting.

Option 3: 20-percent opacity with a 1-percent monitoring allowance, quarterly reporting.

For purposes of estimating costs and impacts of the regulatory options, we assumed that recovery furnaces and ESP-controlled lime kilns that did not meet the regulatory options in our COMS analysis would require ESP maintenance and testing to improve opacity performance, or an ESP upgrade. The EPA also reviewed PM performance levels (based on PM stack test data) for emission units not meeting the opacity limits under consideration in at least one reporting period. If the PM performance level achieved met the PM performance expected from an upgraded ESP (0.015 gr/dscf at 8-percent O_2 for recovery furnaces or 0.010 gr/dscf at 10-percent O_2 for lime kilns), then we assumed that the ESP would only require improved annual maintenance and testing to achieve the opacity options. Otherwise, we assumed that units would require an ESP upgrade to meet the opacity options.

Although we are not proposing any changes to the PM metal HAP limits as part of the technology review, ESP upgrades to meet a tighter opacity monitoring limit would have the effect of reducing PM emissions. We estimated recovery furnace upgrade costs for adding two parallel fields to an existing ESP resulting in a PM performance level of 0.015 gr/dscf at 8-percent O_2. For lime kilns, we estimated costs based on adding one field to the existing ESP to achieve a PM performance level of 0.01 gr/dscf at 10-percent O_2. For each emission unit expected to require an ESP upgrade, we estimated the potential reduction in PM emissions by subtracting the PM limit expected to be achieved by the upgraded ESP from the lower of the current PM permit limit or the actual PM performance level for the emission unit.

The EPA's full analysis of the cost and impacts associated with the regulatory options for opacity (including energy and secondary air impacts) is presented

[37] See memorandum titled, *Review of the Continuous Opacity Monitoring Data from the Pulp and Paper ICR Responses for Subpart MM Sources*, in the docket.

in a memorandum in the docket.[38] Table 5 summarizes the number of impacted facilities, estimated cost, PM reductions, and cost effectiveness of the opacity regulatory options.

TABLE 5—COSTS AND IMPACTS OF OPACITY REGULATORY OPTIONS

Option	Number of mills impacted	2015$ Capital costs, $million	2015$ Annualized costs, $million/yr	Incremental HAP reduction, tpy	Cost effectiveness $/ton PM[1]
Recovery Furnaces Opacity Monitoring Limit Options					
Baseline Option 1: No change. 35% opacity, 20% corrective action level (CAL), 6% monitoring allowance (MA), quarterly (Q) reporting.	0	0	0	0	NA
Option 2: 35% opacity, 20% CAL, 2% MA, semiannual (SA) reporting.	1	0	0.087	0	NA
Option 3: 20% opacity, 6% MA, Q reporting	7	27	5.4	188 (PM), 85 ($PM_{2.5}$)	28,400
Option 4: 20% opacity, 2% MA, SA reporting	12	42	8.7	235 (PM), 112 ($PM_{2.5}$)	36,800
Option 5: 20% opacity, 2% MA, Q reporting	19	74	15	364 (PM), 170 ($PM_{2.5}$)	41,000
Lime Kiln Opacity Monitoring Limit Options					
Option 1: No change. 20% opacity, 6% MA, Q reporting.	0	0	0	0	NA
Option 2: 20% opacity, 1% MA, SA reporting	2	0	0.068	0	NA
Option 3: 20% opacity, 1% MA, Q reporting	Same as option 2				

[1] HAP metals comprise less than 0.5-percent of the PM emissions (0.03-percent for recovery furnaces or 0.48-percent for lime kilns). Thus, the cost effectiveness specifically for HAP metals is orders of magnitude greater than that shown for PM (>$5.5 million per ton HAP metals).

After considering the costs and impacts of the regulatory options for opacity, we are proposing recovery furnace option 4 and lime kiln option 2 for opacity monitoring. These options are representative of the actual performance of 40 CFR part 63, subpart MM emission units based on our analysis of the COMS data, and also align closely with the opacity limits, monitoring allowances, and semiannual reporting requirements established for new sources through the 2014 NSPS review. The EPA is proposing to reduce the opacity limit for existing recovery furnaces from 35-percent to 20-percent opacity. Lowering the recovery furnace opacity limit to 20 percent eliminates the need for the 20-percent corrective action level. Specifying a 20-percent corrective action level is redundant where the opacity limit is already set at 20-percent; therefore, we are proposing to eliminate the subpart MM corrective action level in 40 CFR 63.864(k)(1)(i) by reserving this section. We are proposing a monitoring allowance of 2-percent for existing and new recovery furnaces. We are proposing to retain the 20-percent opacity limit and are proposing a monitoring allowance of 1 percent for opacity monitoring for lime kilns. We are also proposing to reduce the reporting frequency from quarterly to semiannually, as discussed in section IV.D.4 of this preamble. The proposed semiannual averaging period would be used for calculating the opacity monitoring allowance, providing flexibility for startup and shutdown periods. The cost effectiveness of recovery furnace option 4, $36,800 per ton PM, is within the range of other recent EPA regulations. There is no cost effectiveness value for lime kiln option 2 because no incremental HAP reductions were estimated. In addition to proposing the revisions described above, the EPA is requesting comment on all of the options presented in Table 5.

ESP parameter monitoring. The EPA is proposing to add an ESP parameter monitoring requirement for recovery furnaces and lime kilns equipped with ESPs. The purpose of this is to provide another indicator of ESP performance and enable affected sources to show continuous compliance with the HAP metal standards (surrogate PM emission limit) at all times, including periods when the opacity monitoring allowance is used. The EPA is proposing that these sources monitor the secondary voltage and secondary current (or, alternatively, total secondary power) of each ESP collection field. These ESP parameter monitoring requirements are in addition to opacity monitoring for recovery furnaces equipped with ESPs alone. The EPA is proposing that these ESP parameters be monitored, recorded every successive 15 minutes, and averaged over the same semiannual period as the opacity monitoring allowance. The semiannual average of the ESP parameters must remain above the minimum limits established during the PM performance test (*i.e.*, above the minimum secondary current and secondary voltage or above minimum total secondary power).

The EPA estimates that the nationwide costs associated with adding the proposed ESP parameter monitoring requirements would be $5.7 million capital and $1.4 million annualized costs for ESP parameter monitors. All mills with ESP-controlled recovery furnaces and lime kilns are estimated to be impacted.

Monitoring of ESPs followed by wet scrubbers. Because moisture in wet stacks interferes with opacity readings, opacity is not a suitable monitoring requirement for recovery furnaces or lime kilns with wet scrubber stacks. The EPA is therefore proposing to require ESP and wet scrubber parameter monitoring for emission units equipped with an ESP followed by a wet scrubber. The ESP parameters to be monitored are

[38] See memorandum titled, *Costs/Impacts of the Subpart MM Residual Risk and Technology Review*, in the docket.

secondary voltage and secondary current (or, alternatively, total secondary power), and the wet scrubber parameters are pressure drop and scrubber liquid flow rate. The EPA is proposing that ESP and wet scrubber parameters be recorded at least once every successive 15-minute period and reduced to 3-hour averages. The EPA estimates no incremental costs to be associated specifically with the proposed monitoring requirements for combined ESP-wet scrubber systems because the ESP parameter monitoring costs estimated above include ESPs in combined control systems, and wet scrubber parameter monitoring is already required under 40 CFR part 63, subpart MM.

4. Kraft and Soda Smelt Dissolving Tanks

Smelt dissolving tanks are covered vessels located below the recovery furnace to collect molten smelt, one of the main products from the combustion of black liquor. Smelt is comprised predominantly of Na_2S and Na_2CO_3 and is formed in the bottom of the recovery furnace. The smelt is continuously discharged through water-cooled smelt spouts into the SDT where it is mixed with weak wash water from the pulp mill recausticizing area to form green liquor, an aqueous solution of Na_2CO_3 and Na_2S. The green liquor is subsequently transferred to the recausticizing area for reprocessing into pulping liquor (*i.e.*, white liquor). In the soda pulping process, the molten smelt and green liquor is predominantly Na_2CO_3 because soda pulping is a non-sulfur process. Based on the 2011 Pulp and Paper Sector ICR data, there are 161 kraft and soda SDTs in the United States. Nearly all of the SDTs have wet scrubbers that control the particulate emissions, including HAP metals, from this process. A small number of SDTs use mist eliminators as the only means of emissions control. Some new sources were designed to vent emissions through the recovery furnace as an alternative to using wet scrubber control alone, but also have a wet scrubber for backup periods when venting to the recovery furnace is not feasible.

SDT PM. The current 40 CFR part 63, subpart MM PM emission limit (which is a surrogate for HAP metals) for existing SDTs is 0.20 lb/ton BLS. The subpart MM PM limit for new and reconstructed sources with initial startup in 2001 or later is 0.12 lb/ton BLS based on the use of a high-efficiency wet scrubber.

The EPA analyzed SDT PM stack test data collected with the 2011 Pulp and Paper Sector ICR for the NSPS review promulgated on April 4, 2014 (79 FR 18952). We reviewed this same dataset in the context of subpart MM for purposes of the 40 CFR part 63, subpart MM technology review. The stack test data show that nearly all SDTs have achieved the subpart MM existing source limit of 0.20 lb/ton BLS (with the exception of a few SDTs with mist eliminators and SDTs included in the PM bubble compliance option under subpart MM). There were many existing scrubber-controlled SDTs with emissions between the new source limit of 0.12 lb/ton BLS and the existing source limit of 0.20 lb/ton BLS. The practice of routing SDT emissions through the recovery furnace has an unquantified effect on PM emissions because no emission test data are available to differentiate SDT emissions from the recovery furnace emissions in these systems. The EPA has identified no practices, processes, or controls for SDTs beyond those identified at the time of subpart MM development, nor any incremental improvements in the ability of wet scrubbers to reduce PM. Therefore, the EPA is not proposing any changes to the current existing and new source PM limits in subpart MM for kraft and soda mill SDTs. The EPA has identified no regulatory options for SDTs for further consideration under the subpart MM technology review.

SDT parameter monitoring. Subpart MM specifies monitoring of scrubber liquid flow rate and pressure drop for SDTs equipped with wet scrubbers. Facilities may have difficulty meeting the minimum pressure drop requirement during startup and shutdown, as expected due to the reduced (and changing) volumetric flow of stack gases during startup and shutdown. The EPA is proposing to consider only scrubber liquid flow rate during these periods (*i.e.*, excess emissions would include any 3-hour period when BLS are fired that the scrubber flow rate does not meet the minimum parameter limits set in the initial performance test). This is discussed further in section IV.D.1.

Based on previous alternative monitoring requests for SDTs, the EPA is also proposing to allow operators to use SDT scrubber fan amperage as an alternative to pressure drop measurement for SDT dynamic scrubbers operating at ambient pressure or for low-energy entrainment scrubbers on SDTs where the fan speed does not vary.

5. Sulfite Combustion Units

When subpart MM was proposed in 1998, there were 15 sulfite pulp mills. Today there are only three sulfite mills, including one using the magnesium-based sulfite process and two mills using the ammonia (NH3)-based sulfite process. The EPA projects no new sulfite mills to come online in the United States in the next 5 years. Based on a review of permits and ICR data that the EPA has collected for these three sulfite mills, we determined that there are a total of eight sulfite combustion units currently operating in the United States.

Sulfite combustion unit PM. Subpart MM of 40 CFR part 63 requires existing sulfite combustion units to meet a PM emission limit of 0.040 gr/dscf at 8-percent O_2, based on the use of a fiber-bed demister system. Subpart MM requires new sulfite combustion units to meet a PM limit of 0.020 gr/dscf at 8-percent O_2, based on the combined use of a wet scrubber and fiber-bed demister system.[39] The PM emission limits are a surrogate for HAP metals.

For the 40 CFR part 63 subpart MM technology review, the EPA reviewed ICR data on sulfite processes and controls, title V permit limits, and PM stack test data for the three sulfite pulp mills currently operating in the United States. Each sulfite mill has a unique configuration of sulfite combustion units and corresponding site-specific limits. Two facilities with sulfite combustion units subject to a PM permit limit of 0.04 gr/dscf achieved this limit based on actual measurement data submitted (with the exception of one test above the limit that was superseded by a more recent test). Another facility (Cosmo Specialty Fibers in Cosmopolis, Washington) has a site-specific PM permit limit of 0.10 gr/dscf for its chemical recovery combustion units, and instead reduces PM emissions from the hog fuel dryer at the plant site. The chemical recovery combustion units (which have a combined stack) have achieved average PM emissions of 0.054 gr/dscf. The hog fuel dryer is permitted at 10 pounds per hour (lb/hr) of PM and has achieved PM emissions of 1.2 and 1.5 lb/hr in two tests. The EPA's technology review found no developments in practices, processes, or controls since the promulgation of subpart MM for PM emissions from sulfite combustion units. The EPA is proposing to retain the 0.040 and 0.020 gr/dscf at 8-percent O_2 PM limits for existing and new sulfite combustion units. The EPA has identified no

[39] Although any control system could be used to meet the emission limits for sulfite combustion units, the existing source limit is consistent with the performance of a fiber-bed demister system and the new source limit is consistent with the performance of a wet scrubber with a fiber-bed demister.

regulatory options for sulfite combustion units for further consideration under the subpart MM technology review.

Sulfite combustion unit parameter monitoring. Subpart MM of 40 CFR part 63 specifies monitoring of scrubber liquid flow rate and pressure drop for sulfite combustion units equipped with wet scrubbers. Facilities may have difficulty meeting the minimum pressure drop requirement during startup and shutdown, as expected due to the reduced (and changing) volumetric flow of stack gases during startup and shutdown. The EPA is proposing to consider only scrubber liquid flow rate during startup and shutdown periods (*i.e.*, excess emissions would include any 3-hour period when spent pulping liquor is fired that the scrubber flow rate does not meet the minimum parameter limits set in the initial performance test). The EPA is proposing no changes for parameter monitoring of the fiber-bed demister system, which is addressed under the alternative monitoring provisions of subpart MM.

6. Semichemical Combustion Units

When 40 CFR part 63, subpart MM, was originally proposed in 1998, there were 14 semichemical combustion units at 14 stand-alone semichemical pulp mills. Today, there are seven semichemical combustion units at seven mills in the United States, at six of which combustion units and mills are operating.[40] Semichemical combustion unit design types include: Fluidized-bed reactor (two units, one operating), recovery furnace (four units), and rotary liquor kiln (one unit).

Semichemical combustion unit total hydrocarbon (THC). The current 40 CFR part 63, subpart MM standards require existing and new semichemical combustion units to reduce total gaseous organic HAP emissions (measured as THC) by 90 percent or meet a total gaseous organic HAP emission limit (measured as THC) of 2.97 lb/ton of BLS fired.

For the 40 CFR part 63, subpart MM RTR, the EPA reviewed ICR data on processes and control configurations, title V permit limits, and THC stack test data for the stand-alone semichemical pulp mills currently operating in the United States. The review of permit limits indicated that all semichemical combustion units are subject to the 2.97 lb/ton BLS THC limit specified in subpart MM for existing and new units. Performance of the different semichemical combustion units varies considerably for THC. While most units achieve the 2.97 lb/ton BLS THC limit, at least one unit relied on the 90-percent reduction compliance option included in subpart MM to address variability. The EPA has identified no regulatory options for semichemical combustion units for purposes of the subpart MM RTR, given that no practices, processes, or controls beyond those considered during the original rule development have emerged.

Semichemical combustion unit parameter monitoring. Subpart MM of 40 CFR part 63 requires semichemical combustion units using RTOs to measure and record RTO operating temperature to demonstrate compliance with the standard for gaseous organic HAP (measured as THC). As noted previously, no practices, processes, or controls beyond those considered during the original rule development have emerged. Consequently, the EPA is proposing no changes for the current parameter monitoring requirements.

D. What other actions are we proposing?

In addition to the proposed actions described above, we are proposing additional revisions. We are proposing revisions to the SSM provisions of the MACT rule in order to ensure that they are consistent with the court decision in *Sierra Club* v. *EPA*, 551 F.3d 1019 (D.C. Cir. 2008), which vacated two provisions that exempted sources from the requirement to comply with otherwise applicable CAA section 112(d) emission standards during periods of SSM. We also are proposing various other changes, including 5-year periodic emissions testing for selected process equipment, semiannual electronic reporting for all excess emissions reports, electronic submittal of compliance reports (which include performance test reports), incorporation by reference, and various technical and editorial changes. Our analyses and proposed changes related to these issues are discussed in sections IV.D.1 through 6 of this preamble.

1. Startup, Shutdown, and Malfunction

In its 2008 decision in *Sierra Club* v. *EPA*, 551 F.3d 1019 (D.C. Cir. 2008), the United States Court of Appeals for the District of Columbia Circuit vacated portions of two provisions in the EPA's CAA section 112 regulations governing the emissions of HAPs during periods of SSM. Specifically, the Court vacated the SSM exemption contained in 40 CFR 63.6(f)(1) and 40 CFR 63.6(h)(1), holding that under section 302(k) of the CAA, emissions standards or limitations must be continuous in nature and that the SSM exemption violates the CAA's requirement that some CAA section 112 standards apply continuously.

We are proposing the elimination of the SSM exemption in this rule. Consistent with *Sierra Club* v. *EPA*, we are proposing standards in this rule that apply at all times. We are also proposing several revisions to Table 1 (the General Provisions Applicability Table) as is explained in more detail below. For example, we are proposing to eliminate the incorporation of the General Provisions' requirement that the source develop an SSM plan. We also are proposing to eliminate and revise certain recordkeeping and reporting requirements related to the SSM exemption as further described below.

The EPA has attempted to ensure that the provisions we are proposing to eliminate are inappropriate, unnecessary, or redundant in the absence of the SSM exemption. We are specifically seeking comment on whether we have successfully done so.

Periods of startup and shutdown. In reviewing the standards in this rule, the EPA has taken into account startup and shutdown periods and, for the reasons explained below, is not proposing alternate standards for those periods.

Subpart MM of 40 CFR part 63 requires continuous opacity monitoring to indicate ongoing compliance with the PM emission limits. In developing proposed standards for subpart MM, the EPA reviewed numerous continuous opacity monitoring datasets that included periods of startup and shutdown, and concluded that the affected units will be able to comply with the proposed standards at all times. The proposed subpart MM also requires RTO operating temperature and ESP and wet scrubber parameter monitoring. Parameter limits apply at all times, including during startup and shutdown. The proposed subpart MM requires RTO operating temperature and wet scrubber and ESP operating parameters to be recorded at least once every 15 minutes. Subpart MM specifies corrective action levels in 40 CFR 63.864(k)(1) and violation levels in 40 CFR 63.864(k)(2) which would be reported as excess emissions under 40 CFR 63.867(c). For RTO temperature, subpart MM requires corrective action when any 1-hour temperature falls below the average temperature established during the performance test. Subpart MM considers any 3-hour RTO temperature that falls below the average established during the performance test to be a violation. Subpart MM requires the ESP and scrubber parameters to be averaged over a 3-hour block, except for ESPs with COMS, which would have

[40] One additional stand-alone semichemical pump mill ceased operation in late 2015.

ESP parameters averaged semiannually. The corrective action level for wet scrubber and ESP operating parameters (when opacity is not also measured) is triggered when any 3-hour average is outside of the limit established during the performance test. A violation would occur when six or more of the 3-hour average parameter values within a 6-month period are outside of the limits established during the performance test. Violations based on opacity would be considered over a semiannual period. For new or existing kraft or soda recovery furnaces, a violation would occur when any opacity is greater than 20 percent for 2 percent or more of the operating time when spent liquor is fired within a semiannual period. For new or existing lime kilns, a violation would occur when any opacity is greater than 20 percent for 1 percent or more of the operating time when lime mud is fired in a semiannual period. A violation would also occur when the recovery furnace or lime kiln ESP secondary voltage and secondary current (or total secondary power) averaged over the semiannual period are below the minimum operating limits established during the performance test, with the exception of secondary current (or total secondary power) during periods of startup and shutdown.

To address the need for ESPs to warm to a specified temperature (typically above 200 °F) before full power is applied to the transformer-rectifier set, the EPA is proposing to define excess emissions (*i.e.*, the corrective action and violation levels) as opacity and ESP parameter measurements below the minimum requirements during times when BLS or lime mud is fired (as applicable), based on several responses to the ICR indicating that mills with ESP minimum temperature requirements bring the ESP online before introducing BLS or lime mud into the recovery furnace or lime kiln, respectively. The EPA is also proposing language that would allow affected units to use wet scrubber liquid flow rate to demonstrate compliance during periods of startup and shutdown because pressure drop is difficult to achieve during these periods.

Periods of malfunction. Periods of startup, normal operations, and shutdown are all predictable and routine aspects of a source's operations. Malfunctions, in contrast, are neither predictable nor routine. Instead they are, by definition, sudden, infrequent, and not reasonably preventable failures of emissions control, process or monitoring equipment. (40 CFR 63.2) (Definition of malfunction). The EPA interprets CAA section 112 as not requiring emissions that occur during periods of malfunction to be factored into development of CAA section 112 standards. Under CAA section 112, emissions standards for new sources must be no less stringent than the level ''achieved'' by the best controlled similar source and for existing sources generally must be no less stringent than the average emission limitation ''achieved'' by the best performing 12 percent of sources in the category. There is nothing in CAA section 112 that directs the Agency to consider malfunctions in determining the level ''achieved'' by the best performing sources when setting emission standards. As the District of Columbia Circuit Court has recognized, the phrase ''average emissions limitation achieved by the best performing 12 percent of'' sources ''says nothing about how the performance of the best units is to be calculated.'' *Nat'l Ass'n of Clean Water Agencies* v. *EPA*, 734 F.3d 1115, 1141 (D.C. Cir. 2013). While the EPA accounts for variability in setting emissions standards, nothing in CAA section 112 requires the Agency to consider malfunctions as part of that analysis. A malfunction should not be treated in the same manner as the type of variation in performance that occurs during routine operations of a source. A malfunction is a failure of the source to perform in a ''normal or usual manner'' and no statutory language compels the EPA to consider such events in setting section CAA 112 standards.

Further, accounting for malfunctions in setting emission standards would be difficult, if not impossible, given the myriad of different types of malfunctions that can occur across all sources in the category and given the difficulties associated with predicting or accounting for the frequency, degree, and duration of various malfunctions that might occur. As such, the performance of units that are malfunctioning is not ''reasonably'' foreseeable. See, *e.g.*, *Sierra Club* v. *EPA*, 167 F.3d 658, 662 (D.C. Cir. 1999) (''The EPA typically has wide latitude in determining the extent of data-gathering necessary to solve a problem. We generally defer to an agency's decision to proceed on the basis of imperfect scientific information, rather than to 'invest the resources to conduct the perfect study.' '') See also, *Weyerhaeuser* v. *Costle,* 590 F.2d 1011, 1058 (D.C. Cir. 1978) (''In the nature of things, no general limit, individual permit, or even any upset provision can anticipate all upset situations. After a certain point, the transgression of regulatory limits caused by 'uncontrollable acts of third parties,' such as strikes, sabotage, operator intoxication or insanity, and a variety of other eventualities, must be a matter for the administrative exercise of case-by-case enforcement discretion, not for specification in advance by regulation.''). In addition, emissions during a malfunction event can be significantly higher than emissions at any other time of source operation. For example, if an air pollution control device with 99-percent removal goes off-line as a result of a malfunction (as might happen if, for example, the bags in a baghouse catch fire) and the emission unit is a steady state type unit that would take days to shut down, the source would go from 99-percent control to zero control until the control device was repaired. The source's emissions during the malfunction would be 100 times higher than during normal operations. As such, the emissions over a 4-day malfunction period would exceed the annual emissions of the source during normal operations. As this example illustrates, accounting for malfunctions could lead to standards that are not reflective of (and significantly less stringent than) levels that are achieved by a well-performing non-malfunctioning source. It is reasonable to interpret CAA section 112 to avoid such a result. The EPA's approach to malfunctions is consistent with CAA section 112 and is a reasonable interpretation of the statute.

In the event that a source fails to comply with the applicable CAA section 112(d) standards as a result of a malfunction event, the EPA would determine an appropriate response based on, among other things, the good faith efforts of the source to minimize emissions during malfunction periods, including preventative and corrective actions, as well as root cause analyses to ascertain and rectify excess emissions. The EPA would also consider whether the source's failure to comply with the CAA section 112(d) standard was, in fact, sudden, infrequent, not reasonably preventable, and was not instead caused in part by poor maintenance or careless operation. 40 CFR 63.2 (definition of malfunction).

If the EPA determines in a particular case that an enforcement action against a source for violation of an emission standard is warranted, the source can raise any and all defenses in that enforcement action and the Federal District Court will determine what, if any, relief is appropriate. The same is true for citizen enforcement actions. Similarly, the presiding officer in an administrative proceeding can consider any defense raised and determine whether administrative penalties are appropriate.

In summary, the EPA interpretation of the CAA and, in particular, CAA section 112 is reasonable and encourages practices that will avoid malfunctions. Administrative and judicial procedures for addressing exceedances of the standards fully recognize that violations may occur despite good faith efforts to comply and can accommodate those situations.

a. General Duty

We are proposing to revise the General Provisions table (Table 1) entry for 40 CFR 63.6(e) by re-designating it as 40 CFR 63.6(e)(1)(i) and changing the ''yes'' in column 3 to a ''no.'' Section 63.6(e)(1)(i) describes the general duty to minimize emissions. Some of the language in that section is no longer necessary or appropriate in light of the elimination of the SSM exemption. We are proposing instead to add general duty regulatory text at 40 CFR 63.860(d) that reflects the general duty to minimize emissions while eliminating the reference to periods covered by an SSM exemption. The current language in 40 CFR 63.6(e)(1)(i) characterizes what the general duty entails during periods of SSM. With the elimination of the SSM exemption, there is no need to differentiate between normal operations and SSM events in describing the general duty. Therefore, the language the EPA is proposing for 40 CFR 63.860(d) does not include that language from 40 CFR 63.6(e)(1).

We are also proposing to revise the General Provisions table (Table 1) to add an entry for 40 CFR 63.6(e)(1)(ii) and include a ''no'' in column 3. Section 63.6(e)(1)(ii) imposes requirements that are not necessary with the elimination of the SSM exemption or are redundant with the general duty requirement being added at 40 CFR 63.860(d).

b. SSM Plan

We are proposing to revise the General Provisions table (Table 1) to add an entry for 40 CFR 63.6(e)(3) and include a ''no'' in column 3. Generally, the paragraphs under 40 CFR 63.6(e)(3) require development of an SSM plan and specify SSM recordkeeping and reporting requirements related to the SSM plan. As noted, the EPA is proposing to remove the SSM exemptions. Therefore, affected units will be subject to an emission standard during such events. The applicability of a standard during such events will ensure that sources have ample incentive to plan for and achieve compliance and, thus, the SSM plan requirements are no longer necessary.

c. Compliance With Standards

We are proposing to revise the General Provisions table (Table 1) entries for 40 CFR 63.6(f) and (h) by re-designating these sections as 40 CFR 63.6(f)(1) and (h)(1) and including a ''no'' in column 3. The current language of 40 CFR 63.6(f)(1) and (h)(1) exempts sources from non-opacity and opacity standards during periods of SSM. As discussed above, the court in *Sierra Club* vacated the exemptions contained in this provision and held that the CAA requires that some CAA section 112 standard apply continuously. Consistent with *Sierra Club*, the EPA is proposing to revise standards in this rule to apply at all times.

d. Performance Testing

We are proposing to revise the General Provisions table (Table 1) entry for 40 CFR 63.7(e) by re-designating it as 40 CFR 63.7(e)(1) and including a ''no'' in column 3. Section 63.7(e)(1) describes performance testing requirements. The EPA is instead proposing to add a performance testing requirement at 40 CFR 63.865. The proposed performance testing provisions require testing under representative operating conditions, excluding periods of startup and shutdown. As in 40 CFR 63.7(e)(1), performance tests conducted under this subpart should not be conducted during malfunctions because conditions during malfunctions are often not representative of normal operating conditions. The EPA is proposing to add language that requires the owner or operator to record the process information that is necessary to document operating conditions during the test and include in such record an explanation to support that such conditions represent normal operation. Section 63.7(e) requires that the owner or operator make available to the Administrator such records ''as may be necessary to determine the condition of the performance test'' available to the Administrator upon request, but does not specifically require the information to be recorded. The regulatory text the EPA is proposing to add to this provision builds on that requirement and makes explicit the requirement to record the information.

e. Monitoring

We are proposing to revise the General Provisions table (Table 1) by re-designating 40 CFR 63.8(c) as 40 CFR 63.8(c)(1), adding entries for 40 CFR 63.8(c)(1)(i) through (iii) and including ''no'' in column 3 for paragraphs (i) and (iii). The cross-references to the general duty and SSM plan requirements in those subparagraphs are not necessary in light of other requirements of 40 CFR 63.8 that require good air pollution control practices (40 CFR 63.8(c)(1)) and that set out the requirements of a quality control program for monitoring equipment (40 CFR 63.8(d)).

We are also proposing to revise the General Provisions table (Table 1) by adding an entry for 40 CFR 63.8(d)(3) and including a ''no'' in column 3. The final sentence in 40 CFR 63.8(d)(3) refers to the General Provisions' SSM plan requirement which is no longer applicable. The EPA is proposing to add to the rule at 40 CFR 63.864(f) text that is identical to 40 CFR 63.8(d)(3) except that the final sentence is replaced with the following sentence: ''The program of corrective action should be included in the plan required under 40 CFR 63.8(d)(2).''

f. Recordkeeping

We are proposing to revise the General Provisions table (Table 1) by adding an entry for 40 CFR 63.10(b)(2)(i) and including a ''no'' in column 3. Section 63.10(b)(2)(i) describes the recordkeeping requirements during startup and shutdown. These recording provisions are no longer necessary because the EPA is proposing that recordkeeping and reporting applicable to normal operations will apply to startup and shutdown. Special provisions applicable to startup and shutdown, such as a startup and shutdown plan, have been removed from the rule (with exceptions discussed below) thereby reducing the need for additional recordkeeping for startup and shutdown periods.

Records of startup and shutdown periods are proposed to be required under 40 CFR 63.866(c)(8) to help characterize minor exceptions to reporting. The EPA is proposing no reporting of wet scrubber pressure drop or ESP secondary current (or total secondary power) during periods of startup and shutdown because it is not feasible to meet operating limits established under normal operation for these parameters during startup and shutdown. Instead, the EPA is proposing that wet scrubber liquid flow rate (or fan amperage) and ESP secondary voltage be monitored during startup and shutdown.

We are also proposing to revise the General Provisions table (Table 1) by adding an entry for 40 CFR 63.10(b)(2)(ii) and including a ''no'' in column 3. Section 63.10(b)(2)(ii) describes the recordkeeping requirements during a malfunction. The EPA is proposing to add such requirements to 40 CFR 63.866(d). The regulatory text we are proposing to add differs from the General Provisions it is replacing in that the General Provisions requires the creation and retention of a record of the occurrence and duration of each malfunction of process, air pollution control, and monitoring equipment. The EPA is proposing that this requirement apply to any failure to meet an applicable standard and is requiring that the source record the date, time, and duration of the failure rather than the ''occurrence.'' The EPA is also proposing to add to 40 CFR 63.866(d) a requirement that sources keep records that include a list of the affected source or equipment and actions taken to minimize emissions, an estimate of the quantity of each regulated pollutant emitted over the emission limit for which the source failed to meet the standard, and a description of the method used to estimate the emissions. Examples of such methods would include product-loss calculations, mass balance calculations, measurements when available, or engineering judgment based on known process parameters. The EPA is proposing to require that sources keep records of this information to ensure that there is adequate information to allow the EPA to determine the severity of any failure to meet a standard, and to provide data that may document how the source met the general duty to minimize emissions when the source has failed to meet an applicable standard.

We are also proposing to revise the General Provisions table (Table 1) by adding an entry for 40 CFR 63.10(b)(2)(iv) and (v) and including a ''no'' in column 3. When applicable, the provision requires sources to record actions taken during SSM events when actions were inconsistent with their SSM plan. The requirement is no longer appropriate because SSM plans will no longer be required. The requirement previously applicable under 40 CFR 63.10(b)(2)(iv)(B) to record actions to minimize emissions and record corrective actions is now applicable by reference to 40 CFR 63.866(d).

We are also proposing to revise the General Provisions table (Table 1) by adding an entry for 40 CFR 63.10(c)(15) and including a ''no'' in column 3. The EPA is proposing that 40 CFR 63.10(c)(15) no longer apply. When applicable, the provision allows an owner or operator to use the affected source's SSM plan or records kept to satisfy the recordkeeping requirements of the SSM plan, specified in 40 CFR 63.6(e), to also satisfy the requirements of 40 CFR 63.10(c)(10) through (12). The EPA is proposing to eliminate this requirement because SSM plans would no longer be required, and, therefore, 40 CFR 63.10(c)(15) no longer serves any useful purpose for affected units.

g. Reporting

We are proposing to revise the General Provisions table (Table 1) entry for 40 CFR 63.10(d)(5) by re-designating it as 40 CFR 63.10(d)(5)(i) and changing the ''yes'' in column 3 to a ''no.'' Section 63.10(d)(5)(i) describes the periodic reporting requirements for startups, shutdowns, and malfunctions. To replace the General Provisions reporting requirement, the EPA is proposing to add reporting requirements to 40 CFR 63.867(c). The replacement language differs from the General Provisions requirement in that it eliminates periodic SSM reports as a stand-alone report. We are proposing language that requires sources that fail to meet an applicable standard at any time to report the information concerning such events in the semiannual report to be required under the proposed rule. We are proposing that the report must contain the number, date, time, duration, and the cause of such events (including unknown cause, if applicable), a list of the affected source or equipment, an estimate of the quantity of each regulated pollutant emitted over any emission limit, and a description of the method used to estimate the emissions.

Examples of such methods would include product-loss calculations, mass balance calculations, measurements when available, or engineering judgment based on known process parameters. The EPA is proposing this requirement to ensure that there is adequate information to determine compliance, to allow the EPA to determine the severity of the failure to meet an applicable standard, and to provide data that may document how the source met the general duty to minimize emissions during a failure to meet an applicable standard.

We will no longer require owners or operators to determine whether actions taken to correct a malfunction are consistent with an SSM plan, because plans would no longer be required. The proposed amendments, therefore, eliminate the cross reference to 40 CFR 63.10(d)(5)(i) that contains the description of the previously required SSM report format and submittal schedule from this section. These specifications are no longer necessary because the events will be reported in otherwise required reports with similar format and submittal requirements.

We are also proposing to revise the General Provisions table (Table 1) to add an entry for 40 CFR 63.10(d)(5)(ii) and include a ''no'' in column 3. Section 63.10(d)(5)(ii) describes an immediate report for startups, shutdown, and malfunctions when a source failed to meet an applicable standard, but did not follow the SSM plan. We will no longer require owners and operators to report when actions taken during a startup, shutdown, or malfunction were not consistent with an SSM plan, because plans would no longer be required.

2. 5-Year Periodic Emissions Testing

As part of an ongoing effort to improve compliance with various federal air emission regulations, the EPA reviewed the testing and monitoring requirements of 40 CFR part 63, subpart MM and is proposing the following change. The EPA is proposing to require facilities complying with the standards for chemical recovery combustion sources at kraft, soda, sulfite, and stand-alone semichemical pulp mills to conduct periodic air emissions performance testing, with the first of the periodic performance tests to be conducted within 3 years of the effective date of the revised standards and thereafter before the facilities renew their 40 CFR part 70 operating permits, but no longer than 5 years following the previous performance test. Periodic performance tests are already required by permitting authorities for some facilities. Further, the EPA believes that requiring periodic performance tests will help to ensure that control systems are properly maintained over time, thereby reducing the potential for acute emissions episodes. This proposal would require periodic air emissions testing for filterable PM once every 5 years for existing and new kraft and soda recovery furnaces, SDTs, and lime kilns and sulfite combustion units. In addition, this proposal would require air emissions testing for methanol once every 5 years for new kraft and soda recovery furnaces. This proposal would also require periodic air emissions testing for THC for existing and new semichemical combustion units.

3. Continuous Parameter Monitoring System (CPMS) Operating Limits

We are proposing to specify procedures for establishing operating limits based on data recorded by CPMS. The 40 CFR part 63, subpart MM emission standards are comprised of numerical emission limits, with compliance demonstrated through periodic performance tests, and operating limits such as opacity limits or continuously monitored parameter limits used to demonstrate ongoing compliance in between performance tests. Currently, the subpart MM regulatory text refers extensively to operating parameter ranges and is not as specific as more recent NESHAPs in specifying how operating limits are to be determined. Therefore, we are proposing language to clarify the procedures for establishing parameter limits.

As noted previously, we are proposing ESP parameter monitoring requirements for recovery furnaces and lime kilns with ESPs or combined ESP and wet scrubber controls. This proposal would require ESP parameters be recorded at least once every successive 15-minute period, and the recorded readings be reduced to semiannual averages for ESPs (i.e., where opacity monitoring requirements also apply) or 3-hour averages for ESPs followed by a wet scrubber. Similarly, this proposal would require wet scrubber parameters, including pressure drop across the scrubber (or fan amperage for certain SDT scrubbers) and scrubbing liquid flow rate, be recorded at least every 15-minutes and reduced to 3-hour averages. This proposal would require RTO temperature be recorded every 15 minutes and reduced to a 1-hour average for purposes of assessing when corrective action is required under 40 CFR 63.864(k)(1), and reduced to a 3-hour average under 40 CFR 63.864(k)(2) for purposes of assessing violations.

We are proposing that the ESP and wet scrubber operating limits be established as the average of the parameter values associated with each performance test run. For example, the proposal would require the recorded readings during each test run be averaged to arrive at the parameter value associated with three test runs, and the three values be averaged to arrive at the operating limit. The proposal would require these revised procedures be used beginning with the first periodic performance test proposed to be required under 40 CFR 63.865. Wet scrubbers and ESPs have minimum operating limits, such that the EPA would consider 3-hour average values below the minimum operating limit to be a monitoring exceedance to be reported under 40 CFR 63.867(c). Also, in the spirit of ensuring continuous compliance, we are proposing to eliminate the language in 40 CFR 63.864(k)(3) that allowed no more than one non-opacity monitoring exceedance to be attributed to any 24-hour period.

4. Reporting Frequency

Subpart MM of 40 CFR part 63 currently requires owners and operators of subpart MM facilities to submit quarterly excess emissions reports for monitoring exceedances and periods of noncompliance and semiannual reports when no excess emissions have occurred during the reporting period. These excess emission reports are typically submitted as a hard copy to the delegated authority, and reports in this form usually are not readily available for the EPA and public to analyze. The Agency is proposing that semiannual electronic reporting would provide ample data to assess a facility's performance with regard to the emission standards in subpart MM. The EPA is proposing that all excess emissions reports be submitted on a semiannual basis, to conform to the semiannual reporting frequency employed by the electronic reporting system discussed in the following section. The EPA requests comment on maintaining quarterly reporting for reports of monitoring exceedances and periods of noncompliance.

5. Electronic Reporting

The EPA is proposing that owners and operators of 40 CFR part 63, subpart MM facilities submit electronic copies of compliance reports, which include performance test reports, semiannual reports, and notifications, through the EPA's Central Data Exchange (CDX) using the Compliance and Emissions Data Reporting Interface (CEDRI). Specifically, we are proposing that owners and operators submit performance test reports through the Electronic Reporting Tool (ERT) and submit notifications and semiannual reports through CEDRI. The EPA believes that the electronic submittal of the reports addressed in this proposed rulemaking will increase the usefulness of the data contained in those reports, is in keeping with current trends in data availability, will further assist in the protection of public health and the environment, and will ultimately result in less burden on the regulated community. Under current requirements, paper reports are often stored in filing cabinets or boxes, which make the reports more difficult to obtain and use for data analysis and sharing. Electronic storage of such reports would make data more accessible for review, analyses, and sharing. Electronic reporting can also eliminate paper-based, manual processes, thereby saving time and resources, simplifying data entry, eliminating redundancies, minimizing data reporting errors and providing data quickly and accurately to the affected facilities, air agencies, the EPA, and the public.

In 2011, in response to Executive Order 13563, the EPA developed a plan [41] to periodically review its regulations to determine if they should be modified, streamlined, expanded, or repealed in an effort to make regulations more effective and less burdensome. The plan includes replacing outdated paper reporting with electronic reporting. In keeping with this plan and the White House's Digital Government Strategy,[42] in 2013 the EPA issued an agency-wide policy specifying that new regulations will require reports to be electronic to the maximum extent possible. By requiring electronic submission of specified reports in this proposed rule, the EPA is taking steps to implement this policy.

The EPA Web site that stores the submitted electronic data, WebFIRE, will be easily accessible to everyone and will provide a user-friendly interface that any stakeholder could access. By making data readily available, electronic reporting increases the amount of data that can be used for many purposes. One example is the development of emissions factors. An emissions factor is a representative value that attempts to relate the quantity of a pollutant released to the atmosphere with an activity associated with the release of that pollutant (e.g., kilograms of particulate emitted per megagram of coal burned). Such factors facilitate the estimation of emissions from various sources of air pollution and are an important tool in developing emissions inventories, which in turn are the basis for numerous efforts, including trends analysis, regional, and local scale air quality modeling, regulatory impact assessments, and human exposure modeling. Emissions factors are also widely used in regulatory applicability determinations and in permitting decisions.

The EPA has received feedback from stakeholders asserting that many of the EPA's emissions factors are outdated or not representative of a particular industry emission source. While the EPA believes that the emissions factors are suitable for their intended purpose, we recognize that the quality of emissions factors varies based on the extent and quality of underlying data. We also recognize that emissions profiles on different pieces of equipment can change over time due to

[41] *Improving Our Regulations: Final Plan for Periodic Retrospective Reviews of Existing Regulations,* August 2011. Available at *https://www.epa.gov/sites/roduction/files/2015-09-/documents/eparetroreviewplan-aug2011_0.pdf.*

[42] *Digital Government: Buildiing a 21st Century Platform to Better Serve the American People,* May 2012. Available at *http://www.whitehouse.gov/sites/default/files/omb/egov/digital-government/digital-government-strategy/pdf.*

a number of factors (fuel changes, equipment improvements, industry work practices), and it is important for emissions factors to be updated to keep up with these changes. The EPA is currently pursuing emissions factor development improvements that include procedures to incorporate the source test data that we are proposing be submitted electronically. By requiring the electronic submission of the reports identified in this proposed action, the EPA would be able to access and use the submitted data to update emissions factors more quickly and efficiently, creating factors that are characteristic of what is currently representative of the relevant industry sector. Likewise, an increase in the number of test reports used to develop the emissions factors will provide more confidence that the factor is of higher quality and representative of the whole industry sector.

Additionally, by making the records, data and reports addressed in this proposed rulemaking readily available, the EPA, the regulated community and the public will benefit when the EPA conducts periodic reviews of its rules. As a result of having performance test reports and air emission reports readily accessible, our ability to carry out comprehensive reviews will be increased and achieved within a shorter period of time. These data will provide useful information on control efficiencies being achieved and maintained in practice within a source category and across source categories for regulated sources and pollutants. These reports can also be used to inform the technology-review process by providing information on improvements to add-on control technology and new control technology.

Under an electronic reporting system, the EPA's Office of Air Quality Planning and Standards (OAQPS) would have air emissions and performance test data in hand; OAQPS would not have to collect these data from the EPA Regional offices or from delegated authorities or industry sources in cases where these reports are not submitted to the EPA Regional offices. Thus, we anticipate fewer or less substantial ICRs in conjunction with prospective CAA-required technology and risk-based reviews may be needed. We expect this to result in a decrease in time spent by industry to respond to data collection requests. We also expect the ICRs to contain less extensive stack testing provisions, as we will already have stack test data electronically. Reduced testing requirements would be a cost savings to industry. The EPA should also be able to conduct these required reviews more quickly, as OAQPS will not have to include the ICR collection time in the process or spend time collecting reports from the EPA Regional Offices. While the regulated community may benefit from a reduced burden of ICRs, the general public benefits from the Agency's ability to provide these required reviews more quickly, resulting in increased public health and environmental protection.

Electronic reporting could minimize submission of unnecessary or duplicative reports in cases where facilities report to multiple government agencies and the agencies opt to rely on the EPA's electronic reporting system to view report submissions. Where delegated authorities continue to require a paper copy of these reports and will accept a hard copy of the electronic report, facilities will have the option to print paper copies of the electronic reporting forms to submit to the delegated authorities, and, thus, minimize the time spent reporting to multiple agencies. Additionally, maintenance and storage costs associated with retaining paper records could likewise be minimized by replacing those records with electronic records of electronically submitted data and reports.

Delegated authorities could benefit from more streamlined and automated review of the electronically submitted data. For example, because the performance test data would be readily-available in a standard electronic format, delegated authorities would be able to review reports and data electronically rather than having to conduct a review of the reports and data manually. Having reports and associated data in electronic format will facilitate review through the use of software ''search'' options, as well as the downloading and analyzing of data in spreadsheet format. Additionally, delegated authorities would benefit from the reported data being accessible to them through the EPA's electronic reporting system wherever and whenever they want or need access (as long as they have access to the Internet). The ability to access and review air emission report information electronically will assist delegated authorities to more quickly and accurately determine compliance with the applicable regulations, potentially allowing a faster response to violations which could minimize harmful air emissions. This benefits both delegated authorities and the general public.

The proposed electronic reporting of data is consistent with electronic data trends (*e.g.,* electronic banking and income tax filing). Electronic reporting of environmental data is already common practice in many media offices at the EPA. The changes being proposed in this rulemaking are needed to continue the EPA's transition to electronic reporting.

As noted above, we are proposing that 40 CFR part 63, subpart MM performance test reports be submitted through the EPA's ERT. All of the test methods listed under subpart MM are currently supported by the ERT, with the exception of Method 308 in 40 CFR part 63, appendix A. The proposal would require that performance test results collected using test methods that are not supported by the ERT as listed on the EPA's ERT Web site at the time of the test be submitted in portable document format (PDF) using the attachment module of the ERT.

In addition to electronically reporting the results of performance tests, we are proposing the requirement to electronically submit notifications and the semiannual excess emissions report and/or summary report required in 40 CFR 63.867. The proposal would require the owner or operator use the appropriate electronic form or spreadsheet template in CEDRI for the subpart or an alternate electronic file format consistent with the form's extensible markup language (XML) schema. If neither the reporting form nor the spreadsheet template specific to the subpart are available at the time that the report is due, the owner or operator would upload an electronic copy of the report in CEDRI. The owner or operator would begin submitting reports electronically using the reporting form or spreadsheet template with the next report that is due, once the electronic form or template has been available for at least 90 days. The EPA is currently working to develop the forms and a spreadsheet template for subpart MM. We are specifically taking comment on the content, layout, and overall design of the forms and spreadsheet template, which are discussed in a memorandum in the docket titled *Electronic Reporting for Subpart MM Excess Emission Reports.*

As part of this review, we have specified in 40 CFR 63.867 the reporting requirements from the 40 CFR part 63 General Provisions for the excess emissions and summary reports. We believe that specifying the General Provision reporting requirements for the proposed semiannual reports in 40 CFR part 63, subpart MM, will help eliminate confusion as to which report is submitted (*e.g.*, full excess emissions report or summary report) and the content of the required report. Based on the criteria specified in the General Provisions, subpart MM requires a full excess emissions report under any of the following three conditions: (1) The total duration of monitoring exceedances is one percent or more of the total reporting period operating time, or (2) the total continuous monitoring system (CMS) downtime is five percent or more of the total reporting period operating time, or (3) any violations according to 40 CFR 63.864(k)(2) occurred. Subpart MM requires only an abbreviated summary report when none of the three conditions apply for the semiannual reporting period.

As stated in 40 CFR 63.867(a), the proposal also requires that notifications be reported electronically though CEDRI. Currently, there are no templates for notifications in CEDRI for this subpart. Therefore, the owner or operator must submit their notifications in PDF. Examples of such notifications include (but are not limited to) the following: Initial notifications, notifications of compliance status, notifications of a performance test, notifications of CMS performance evaluation, and notifications of opacity and visible emissions observations.

6. Incorporation by Reference Under 1 CFR part 51

The EPA is proposing regulatory text that includes incorporation by reference (IBR). In accordance with requirements of 1 CFR 51.5, the EPA is proposing to incorporate by reference the following document described in the amendments to 40 CFR 63.14:

- EPA–454/R–98–015, Office of Air Quality Planning and Standards (OAQPS), Fabric Filter Bag Leak Detection Guidance, September 1997, IBR approved for 40 CFR 63.864(e).

This document provides guidance on the use of triboelectric monitors as fabric filter bag leak detectors. The document includes fabric filter and monitoring system descriptions; guidance on monitor selection, installation, setup, adjustment, and operation; and quality assurance procedures. The EPA has made, and will continue to make, this document generally available electronically through *http://www.regulations.gov* and/or in hard copy at the appropriate EPA office (see the **ADDRESSES** section of this preamble for more information). In addition, this document is available on the EPA Technical Air Pollution Resources Emission Measurement Center Web page (*https://www.epa.gov/emc*) under Continuous Emission Monitoring.

7. Technical and Editorial Changes

The following lists additional changes that address technical and editorial corrections:

- Made revisions throughout 40 CFR part 63, subpart MM, to clarify the location in 40 CFR part 60 of applicable EPA test methods;
- Made revisions throughout 40 CFR part 63, subpart MM, to update the facility name for Cosmo Specialty Fibers;
- Revised the definitions section in 40 CFR 63.861 to:
  - Remove the definition for ''black liquor gasification'' and remove reference to black liquor gasification in the definitions for ''kraft recovery furnace,'' ''recovery furnace,'' ''semichemical combustion unit,'' and ''soda recovery furnace'';
  - Remove the SSM exemption from the definition for ''modification'';
  - Clarify that the definition for ''particulate matter'' refers to filterable PM;
  - Removed reference to use of one-half of the method detection limit for non-detect Method 29 measurements within the definition of ''hazardous air pollutant (HAP) metals'' because the full detection limit in emission measurements is now typically used for compliance determination in NESHAPs, with the limited exception of TEQ determination for dioxins and furans; and
  - Remove the definition for ''startup'' that pertains to the former black liquor gasification system at Georgia-Pacific's facility in Big Island, Virginia.
- Corrected misspelling in 40 CFR 63.862(c).
- Revised multiple sections (40 CFR 63.863, 63.866, and 63.867) to remove reference to the former smelters and former black liquor gasification system at Georgia-Pacific's facility in Big Island, Virginia.
- Revised the monitoring requirements section in 40 CFR 63.864 to:
  - Add reference to Performance Specification 1 (PS–1) in COMS monitoring provisions;
  - Add IBR for bag leak detection systems;
  - Specify written procedures for CMS recording frequency and reducing data into averages; and
  - Clarify ongoing compliance provisions to address startup and shutdown periods when certain parameters cannot be met.
- Revised the performance test requirements section in 40 CFR 63.865 to specify the conditions for conducting performance tests and to revise the ambient O_2 concentration in Equations 7 and 8 from 21 percent to 20.9 percent to bring 40 CFR part 63, subpart MM, in line with the rest of the NESHAPs.
- Revised the recordkeeping requirements section in 40 CFR 63.866 to include the requirement to record information on failures to meet the applicable standard.
- Revised the terminology in the delegation of authority section in 40 CFR 63.868 to match the definitions in 40 CFR 63.90.
- Revised the General Provisions applicability table (Table 1 to subpart MM of part 63) to align with those sections of the General Provisions that have been amended or reserved over time.

E. What compliance dates are we proposing?

The compliance date for the revisions we are proposing here is 1 year after the date of publication of the final rule in the **Federal Register**, with the exception of the following: (1) Facilities must conduct the first of the 5-year periodic performance tests within 3 years of the effective date of the standards (that is, the date 3 years after the date of publication of the final rule in the **Federal Register**), and must conduct the subsequent periodic performance tests before renewing the facility's 40 CFR part 70 operating permit, but no longer than 5 years following the previous performance test; and (2) facilities must submit performance test data through the ERT within 60 days after the date of completing each performance test.

V. Summary of Cost, Environmental, and Economic Impacts

A. What are the affected sources?

There are currently 108 major source pulp and paper mills operating in the United States that conduct chemical recovery combustion operations, including 97 kraft pulp mills, 1 soda pulp mill, 3 sulfite pulp mills, and 7 stand-alone semichemical pulp mills. The 40 CFR part 63, subpart MM, affected source regulated at kraft or soda pulp mills is each existing chemical recovery system, defined as all existing DCE and NDCE recovery furnaces, SDTs, and lime kilns. The DCE recovery furnace system is defined as the DCE recovery furnace and any BLO system, if present, at the pulp mill. New affected sources at kraft or soda pulp mills include each new NDCE or DCE recovery furnace and associated SDT, and each new lime kiln. Subpart MM affected sources also include each new or existing chemical recovery combustion unit located at a sulfite pulp mill or at a stand-alone semichemical pulp mill.

B. What are the air quality impacts?

At the current level of control, emissions of HAPs (HAP metals, acid gases, and gaseous organic HAP) are approximately 11,600 tpy. Current emissions of PM (a surrogate pollutant for HAP metals) and TRS (emitted by the same mechanism as gaseous organic HAP) are approximately 23,200 tpy and 3,600 tpy, respectively.

The proposed amendments will require an estimated 108 mills to conduct periodic testing for their chemical recovery combustion operations, 96 mills equipped with ESP controls to meet more stringent opacity limits and monitoring allowances and conduct ESP parameter monitoring, and all 108 major sources with equipment subject to the 40 CFR part 63, subpart MM standards to operate without the SSM exemption. The EPA estimates that the proposed changes to the opacity limits and monitoring allowances will reduce PM emissions by approximately 235 tpy and $PM_{2.5}$ emissions by approximately 112 tpy. We were unable to quantify the specific emissions reductions associated with periodic emissions testing or eliminating the SSM exemption, and we expect no emissions reductions with ESP parameter monitoring. However, periodic testing will tend to reduce emissions by providing incentive for facilities to maintain their control systems and make periodic adjustments to ensure peak performance. Eliminating the SSM exemption will reduce emissions by requiring facilities to meet the applicable standard during SSM periods.

Indirect or secondary air emissions impacts are impacts that would result from the increased electricity usage associated with the operation of control devices (i.e., increased secondary emissions of criteria pollutants from power plants). Energy impacts consist of the electricity and steam needed to operate control devices and other equipment that would be required under this proposed rule. The EPA estimates that the proposed changes to the opacity limits and monitoring allowances will result in energy impacts of 106,000 million British thermal units per year and criteria pollutant emissions of 29 tpy (which includes PM, carbon monoxide, nitrogen oxides, and sulfur dioxide). The EPA expects no secondary air emissions impacts or energy impacts from the other proposed requirements.

Section IV.C of this preamble presents estimates of the air quality impacts associated with the regulatory options that were not selected for inclusion in this proposed rule. For further information, see the memorandum titled, Costs/Impacts of the *Subpart MM Residual Risk and Technology Review*, in the docket for this action.

C. What are the cost impacts?

Subpart MM of 40 CFR part 63 mills will incur costs to meet more stringent opacity limits and monitoring allowances, conduct periodic testing, and perform new ESP parameter monitoring. Costs associated with elimination of the startup and shutdown exemption were estimated as part of the reporting and recordkeeping costs and include time for re-evaluating previously developed SSM record systems. The EPA estimates the nationwide capital costs associated with the new testing and monitoring requirements to be $48 million. The EPA estimates the total nationwide annualized costs associated with these new requirements to be $13 million per year. Section IV.C of this preamble presents cost estimates associated with the regulatory options that were not selected for inclusion in this rule. For further information, see the memorandum titled *Costs/Impacts of the Subpart MM Residual Risk and Technology Review,* in the docket for this action.

D. What are the economic impacts?

The economic impact analysis is designed to inform decision makers about the potential economic consequences of a regulatory action. For the current proposal, the EPA performed a partial-equilibrium analysis of national pulp and paper product markets to estimate potential paper product market and consumer and producer welfare impacts of the proposed regulatory options.

Across proposed regulatory options, the EPA estimates market-level changes in the paper and paperboard markets to be insignificant. For the proposed option, the EPA predicts national-level weighted average paper and paperboard prices to increase about 0.01 percent, but predicts total quantities to decrease less than 0.01 percent.

In addition, the EPA performed a screening analysis for impacts on small businesses by comparing estimated annualized engineering compliance costs at the firm-level to firm sales. The screening analysis found that the ratio of compliance cost to firm revenue falls below 1-percent for the three small companies likely to be affected by the proposal. For small firms, the minimum and maximum cost-to-sales ratios are less than 1 percent.

More information and details of this analysis is provided in the technical document titled *Economic Impact Analysis for Proposed Revisions to the National Emissions Standards for Hazardous Air Pollutants, Subpart MM, for the Pulp and Paper Industry*, which is available in the docket for this proposed rule (Docket ID No. EPA–HQ–OAR–2014–0741).

E. What are the benefits?

The EPA estimates the proposed changes to the opacity limits and monitoring allowances at the 16 impacted mills will reduce PM emissions by approximately 235 tpy and $PM_{2.5}$ emissions by approximately 112 tpy. Because these proposed amendments are not considered economically significant, as defined by Executive Order 12866, we did not monetize the benefits of reducing these emissions. This does not mean that there are no benefits associated with the reduction in metal HAPs from this rule. We expect that these avoided emissions will reduce health effects associated with exposure to air pollution, and we provide below a qualitative description of benefits associated with reducing $PM_{2.5}$. In addition, we anticipate the specific control technologies associated with these proposed amendments will result in minor disbenefits from additional energy consumption.

Directly emitted particles are precursors to secondary formation of $PM_{2.5}$. Controls installed to reduce HAP emissions would also reduce ambient concentrations of $PM_{2.5}$. Reducing exposure to $PM_{2.5}$ is associated with significant human health benefits, including avoiding mortality and morbidity from cardiovascular and respiratory illnesses. Researchers have associated $PM_{2.5}$ exposure with adverse health effects in numerous toxicological, clinical, and epidemiological studies (U.S. EPA, 2009).[43] When adequate data and resources are available and a regulatory impact analysis is required, the EPA generally quantifies several health effects associated with exposure to $PM_{2.5}$ (*e.g.*, U.S. EPA, 2012).[44] These

[43] U.S. Environmental Protection agency (U.S. EPA). 2009. *Integrated Science Assessment for Particulate Matter (Final Report).* EPA–600–R–08–139F. National Center for Environmental Assessment—RTP Division. Available on the Internet at *https://cfpub.epa.gov/ncea/risk/recordisplay.cfm?deid=216546.*

[44] U.S. Environmental Protection Agency (U.S. EPA). 2012. *Regulatory Impact Analysis for the Final Revisions to the National Ambient Air Quality Standards for Particulate Matter.* Office of Air and Radiation, Research Triange Park, NC. Available on the Internet at *https://www3.epa.gov/thn/ecas/regdata/RIAs/finalria.pdf* and *https://www3.epa.gov/ttnecas1/regdata/RIAs/PMRIACombinedFile_Bookmarked.pdf.*

health effects include premature mortality for adults and infants, cardiovascular morbidities such as heart attacks, hospital admissions, and respiratory morbidities such as asthma attacks, acute bronchitis, hospital and emergency department visits, work loss days, restricted activity days, and respiratory symptoms. The scientific literature also suggests that exposure to $PM_{2.5}$ is associated with adverse effects on birth weight, pre-term births, pulmonary function, and other cardiovascular and respiratory effects (U.S. EPA, 2009), but the EPA has not quantified these impacts in its benefits analyses.

VI. Request for Comments

We solicit comments on all aspects of this proposed action. In addition to general comments on this proposed action, we are also interested in additional data that may improve the risk assessments and other analyses. We are specifically interested in receiving any improvements to the data used in the site-specific emissions profiles used for risk modeling. Such data should include supporting documentation in sufficient detail to allow characterization of the quality and representativeness of the data or information. Section VII of this preamble provides more information on submitting data.

VII. Submitting Data Corrections

The site-specific emissions profiles used in the source category risk and demographic analyses and instructions are available for download on the RTR Web site at: *http://www3.epa.gov/ttn/atw/rrisk/rtrpg.html.* The data files include detailed information for each HAP emissions release point for the facilities in the source category.

If you believe that the data are not representative or are inaccurate, please identify the data in question, provide your reason for concern, and provide any ''improved'' data that you have, if available. When you submit data, we request that you provide documentation of the basis for the revised values to support your suggested changes. To submit comments on the data downloaded from the RTR Web site, complete the following steps:

1. Within this downloaded file, enter suggested revisions to the data fields appropriate for that information.

2. Fill in the commenter information fields for each suggested revision (*i.e.*, commenter name, commenter organization, commenter email address, commenter phone number, and revision comments).

3. Gather documentation for any suggested emissions revisions (*e.g.*, performance test reports, material balance calculations, etc.).

4. Send the entire downloaded file with suggested revisions in Microsoft® Access format and all accompanying documentation to Docket ID No. EPA–HQ–OAR–2014–0741 (through one of the methods described in the **ADDRESSES** section of this preamble).

5. If you are providing comments on a single facility or multiple facilities, you need only submit one file for all facilities. The file should contain all suggested changes for all sources at that facility. We request that all data revision comments be submitted in the form of updated Microsoft® Excel files that are generated by the Microsoft® Access file. These files are provided on the RTR Web site at: *http://www3.epa.gov/ttn/atw/rrisk/rtrpg.html.*

VIII. Statutory and Executive Order Reviews

Additional information about these statutes and Executive Orders can be found at *http://www.epa.gov/laws-regulations/laws-and-executive-orders.*

A. Executive Order 12866: Regulatory Planning and Review and Executive Order 13563: Improving Regulation and Regulatory Review

This action is not a significant regulatory action and was therefore not submitted to OMB for review.

B. Paperwork Reduction Act (PRA)

The information collection activities in this proposed rule have been submitted for approval to OMB under the PRA. The ICR document that the EPA prepared has been assigned EPA ICR number 1805.08. You can find a copy of the ICR in the docket for this rule, and it is briefly summarized here.

The information collection requirements are not enforceable until OMB approves them. The information requirements are based on notification, recordkeeping, and reporting requirements in the NESHAP General Provisions (40 CFR part 63, subpart A), which are essential in determining compliance and mandatory for all operators subject to national emissions standards. These recordkeeping and reporting requirements are specifically authorized by CAA section 114 (42 U.S.C. 7414). All information submitted to the EPA pursuant to the recordkeeping and reporting requirements for which a claim of confidentiality is made is safeguarded according to Agency policies set forth in 40 CFR part 2, subpart B.

We are proposing changes to the paperwork requirements for 40 CFR part 63, subpart MM, in the form of eliminating the SSM reporting and SSM plan requirements, adding periodic emissions testing for selected process equipment, revising opacity monitoring provisions, adding parameter monitoring for ESPs, changing the frequency of all excess emissions reports to semiannual, and requiring electronic submittal of all compliance reports (including performance test reports).

Respondents/affected entities: Respondents include chemical pulp mills operating equipment subject to 40 CFR part 63, subpart MM.

Respondent's obligation to respond: Mandatory (authorized by section 114 of the CAA).

Estimated number of respondents: 108.

Frequency of response: The frequency of responses varies depending on the burden item. Responses include initial notifications, reports of periodic performance tests, and semiannual compliance reports.

Total estimated burden: The annual recordkeeping and reporting burden for this information collection, averaged over the first 3 years of this ICR, is estimated to total 139,600 labor hours per year. Burden is defined at 5 CFR 1320.3(b).

Total estimated cost: $17.7 million per year, including $14.4 million per year in labor costs and $3.29 million per year in annualized capital and operation and maintenance costs.

An agency may not conduct or sponsor, and a person is not required to respond to, a collection of information unless it displays a currently valid OMB control number. The OMB control numbers for the EPA's regulations in 40 CFR are listed in 40 CFR part 9.

Submit your comments on the Agency's need for this information, the accuracy of the provided burden estimates, and any suggested methods for minimizing respondent burden, to the EPA using the docket identified at the beginning of this rule. You may also send your ICR-related comments to OMB's Office of Information and Regulatory Affairs via email to *OIRA_submission@omb.eop.gov*, Attention: Desk Officer for the EPA. Since OMB is required to make a decision concerning the ICR between 30 and 60 days after receipt, OMB must receive comments no later than January 30, 2017. The EPA will respond to any ICR-related comments in the final rule.

C. Regulatory Flexibility Act (RFA)

I certify that this action will not have a significant economic impact on a substantial number of small entities under the RFA. In making this determination, the impact of concern is any significant adverse economic impact on small entities. An agency may certify that a rule will not have a significant economic impact on a substantial number of small entities if the rule relieves regulatory burden, has no net burden or otherwise has a positive economic effect on the small entities subject to the rule. The EPA estimates that all affected small entities will have annualized costs of less than 1 percent of their sales. We have, therefore, concluded that this action will have no net regulatory burden for all directly regulated small entities. For more information on the small entity impacts associated with this proposed rule, please refer to the Economic Impact and Small Business Analyses in the public docket.

D. Unfunded Mandates Reform Act (UMRA)

This action does not contain an unfunded mandate of $100 million or more as described in UMRA, 2 U.S.C. 1531–1538, and does not significantly or uniquely affect small governments. The action imposes no enforceable duty on any state, local, or tribal governments or the private sector.

E. Executive Order 13132: Federalism

This action does not have federalism implications. It will not have substantial direct effects on the states, on the relationship between the national government and the states, or on the distribution of power and responsibilities among the various levels of government.

F. Executive Order 13175: Consultation and Coordination With Indian Tribal Governments

This action does not have tribal implications as specified in Executive Order 13175. It will not have substantial direct effects on tribal governments, on the relationship between the federal government and Indian tribes, or on the distribution of power and responsibilities between the federal government and Indian tribes, as specified in Executive Order 13175. This rule imposes requirements on owners and operators of kraft, soda, sulfite, and stand-alone semichemical pulp mills and not tribal governments. The EPA does not know of any pulp mills owned or operated by Indian tribal governments, or located within tribal lands. However, if there are any, the effect of this rule on communities of tribal governments would not be unique or disproportionate to the effect on other communities. Thus, Executive Order 13175 does not apply to this action.

G. Executive Order 13045: Protection of Children From Environmental Health Risks and Safety Risks

This action is not subject to Executive Order 13045 because it is not economically significant as defined in Executive Order 12866, and because the EPA does not believe the environmental health or safety risks addressed by this action present a disproportionate risk to children. This action's health and risk assessments are contained in sections III and IV of this preamble and further documented in the risk report, titled *Residual Risk Assessment for Pulp Mill Combustion Sources in Support of the December 2016 Risk and Technology Review Proposed Rule*, in the docket for this action.

H. Executive Order 13211: Actions Concerning Regulations That Significantly Affect Energy Supply, Distribution, or Use

This action is not subject to Executive Order 13211, because it is not a significant regulatory action under Executive Order 12866.

I. National Technology Transfer and Advancement Act (NTTAA) and 1 CFR part 51

This action involves technical standards. While the EPA identified ASTM D6784–02 (Reapproved 2008), ''Standard Test Method for Elemental, Oxidized, Particle-Bound and Total Mercury Gas Generated from Coal-Fired Stationary Sources (Ontario Hydro Method)'' as being potentially applicable, the Agency does not propose to use it. The use of this voluntary consensus standard would be impractical because this standard is only acceptable as an alternative to the portion of Method 29 for mercury, and mercury is not regulated under 40 CFR part 63, subpart MM.

J. Executive Order 12898: Federal Actions To Address Environmental Justice in Minority Populations and Low-Income Populations

The EPA believes that this action will not have potential disproportionately high and adverse human health or environmental effects on minority populations, low-income populations, and/or indigenous peoples, as specified in Executive Order 12898 (59 FR 7629, February 16, 1994). The documentation for this decision is contained in section IV.B of this preamble and the technical report titled *Risk and Technology Review—Analysis of Socio-Economic Factors for Populations Living Near Pulp Mill Combustion Sources*, which is located in the public docket for this action.

We examined the potential for any EJ issues that might be associated with the source category, by performing a demographic analysis of the population close to the facilities. In this analysis, we evaluated the distribution of HAP-related cancer and non-cancer risks from the 40 CFR part 63, subpart MM source category across different social, demographic, and economic groups within the populations living near facilities identified as having the highest risks. The methodology and the results of the demographic analyses are included in a technical report, *Risk and Technology Review—Analysis of Socio-Economic Factors for Populations Living Near Pulp Mill Combustion Sources*, available in the docket for this action.

The results of the 40 CFR part 63, subpart MM source category demographic analysis indicate that emissions from the source category expose approximately 7,600 people to a cancer risk at or above 1-in-1 million and no one exposed to a chronic non-cancer TOSHI greater than 1. The specific demographic results indicate that the percentage of the population potentially impacted by emissions is greater than its corresponding national percentage for the minority population (33 percent for the source category compared to 28 percent nationwide), the African American population (28 percent for the source category compared to 13 percent nationwide) and for the population over age 25 without a high school diploma (18 percent for the source category compared to 15 percent nationwide). The proximity results (irrespective of risk) indicate that the population percentages for certain demographic categories within 5 km of source category emissions are greater than the corresponding national percentage for those same demographics. The following demographic percentages for populations residing within close proximity to facilities with pulp mill combustion sources are higher than the corresponding nationwide percentage: African American, ages 65 and up, over age 25 without a high school diploma, and below the poverty level.

The risks due to HAP emissions from this source category are low for all populations (*e.g.*, inhalation cancer risks are less than 4-in-1 million for all populations and non-cancer hazard indices are less than 1). Furthermore, we do not expect this proposal to achieve significant reductions in HAP emissions. Therefore, we conclude that this proposal will not have disproportionately high and adverse human health or environmental effects on minority or low-income populations because it does not affect the level of protection provided to human health or the environment. However, this proposal, if finalized, will provide additional benefits to these demographic groups by improving the compliance, monitoring, and implementation of the NESHAP.

List of Subjects in 40 CFR Part 63

Environmental protection, Administrative practice and procedure, Air pollution control, Hazardous substances, Incorporation by reference, Intergovernmental relations, Pulp and paper mills, Reporting and recordkeeping requirements.

Dated: December 13, 2016.

Gina McCarthy,

Administrator.

For the reasons set out in the preamble, title 40, chapter I, part 63 of the Code of Federal Regulations is proposed to be amended as follows:

PART 63—[AMENDED]

■ 1. The authority citation for part 63 continues to read as follows:

Authority: 42 U.S.C. 7401 et seq.

Subpart A—[Amended]

■ 2. Section 63.14 is amended by revising paragraph (m)(3) to read as follows:

§ 63.14 Incorporations by reference.

* * * * *

(m) * * *

(3) EPA–454/R–98–015, Office of Air Quality Planning and Standards (OAQPS), Fabric Filter Bag Leak Detection Guidance, September 1997, IBR approved for §§ 63.548(e), 63.864(e), 63.7525(j), 63.8450(e), 63.8600(e), and 63.11224(f).

Subpart MM—[Amended]

■ 3. Section 63.860 is amended by revising paragraphs (b)(5) and (7) and adding paragraph (d) to read as follows:

§ 63.860 Applicability and designation of affected source.

* * * * *

(b) * * *

(5) Each new or existing sulfite combustion unit located at a sulfite pulp mill, except such existing units at Cosmo Specialty Fibers' Cosmopolis, Washington facility (Emission Unit no. AP–10).

* * * * *

(7) The requirements of the alternative standard in § 63.862(d) apply to the hog fuel dryer at Cosmo Specialty Fibers' Cosmopolis, Washington facility (Emission Unit no. HD–14).

* * * * *

(d) At all times, the owner or operator must operate and maintain any affected source, including associated air pollution control equipment and monitoring equipment, in a manner consistent with safety and good air pollution control practices for minimizing emissions. The general duty to minimize emissions does not require the owner or operator to make any further efforts to reduce emissions if levels required by the applicable standard have been achieved. Determination of whether a source is operating in compliance with operation and maintenance requirements will be based on information available to the Administrator which may include, but is not limited to, monitoring results, review of operation and maintenance procedures, review of operation and maintenance records, and inspection of the source.

■ 4. Section 63.861 is amended by:

■ a. Removing the definitions for ''Black liquor gasification'' and ''Startup'';

■ b. Revising the definitions for ''Hazardous air pollutants (HAP) metals,'' ''Hog fuel dryer,'' ''Kraft recovery furnace,'' ''Modification,'' ''Particulate matter (PM),'' ''Recovery furnace,'' ''Semichemical combustion unit,'' ''Soda recovery furnace,'' and ''Total hydrocarbons (THC).''

The revisions read as follows:

§ 63.861 Definitions.

* * * * *

Hazardous air pollutants (HAP) metals means the sum of all emissions of antimony, arsenic, beryllium, cadmium, chromium, cobalt, lead, manganese, mercury, nickel, and selenium as measured by EPA Method 29 (40 CFR part 60, appendix A–8).

Hog fuel dryer means the equipment that combusts fine particles of wood waste (hog fuel) in a fluidized bed and directs the heated exhaust stream to a rotary dryer containing wet hog fuel to be dried prior to combustion in the hog fuel boiler at Cosmo Specialty Fibers' Cosmopolis, Washington facility. The hog fuel dryer at Cosmo Specialty Fibers' Cosmopolis, Washington facility is Emission Unit no. HD–14.

* * * * *

Kraft recovery furnace means a recovery furnace that is used to burn black liquor produced by the kraft pulping process, as well as any recovery furnace that burns black liquor produced from both the kraft and semichemical pulping processes, and includes the direct contact evaporator, if applicable.

* * * * *

Modification means, for the purposes of § 63.862(a)(1)(ii)(E)(1), any physical change (excluding any routine part replacement or maintenance) or operational change that is made to the air pollution control device that could result in an increase in PM emissions.

* * * * *

Particulate matter (PM) means total filterable particulate matter as measured by EPA Method 5 (40 CFR part 60, appendix A–3), EPA Method 17 (§ 63.865(b)(1)) (40 CFR part 60, appendix A–6), or EPA Method 29 (40 CFR part 60, appendix A–8).

* * * * *

Recovery furnace means an enclosed combustion device where concentrated black liquor produced by the kraft or soda pulping process is burned to recover pulping chemicals and produce steam.

* * * * *

Semichemical combustion unit means any equipment used to combust or pyrolyze black liquor at stand-alone semichemical pulp mills for the purpose of chemical recovery.

* * * * *

Soda recovery furnace means a recovery furnace used to burn black liquor produced by the soda pulping process and includes the direct contact evaporator, if applicable.

* * * * *

Total hydrocarbons (THC) means the sum of organic compounds measured as carbon using EPA Method 25A (40 CFR part 60, appendix A–7).

■ 5. Section 63.862 is amended by revising paragraphs (c)(1) and (d) to read as follows:

§ 63.862 Standards.

* * * * *

(c) *Standards for gaseous organic HAP.* (1) The owner or operator of any new recovery furnace at a kraft or soda pulp mill must ensure that the concentration or gaseous organic HAP, as measured by methanol, discharged to the atmosphere is no greater than 0.012 kg/Mg (0.025 lb/ton) of black liquor solids fired.

* * * * *

(d) *Alternative standard.* As an alternative to meeting the requirements of paragraph (a)(2) of this section, the owner or operator of the existing hog fuel dryer at Cosmo Specialty Fibers' Cosmopolis, Washington facility (Emission Unit no. HD–14) must ensure that the mass of PM in the exhaust gases discharged to the atmosphere from the hog fuel dryer is less than or equal to 4.535 kilograms per hour (kg/hr) (10.0 pounds per hour (lb/hr)).

■ 6. Section 63.863 is amended by revising paragraph (c) to read as follows:

§ 63.863 Compliance dates.

* * * * *

(c) The owner or operator of an existing or new affected source or process unit must comply with the revised requirements published on [insert date of publication of final rule in the **Federal Register**] no later than [insert date 1 year after date of publication of final rule in the **Federal Register**], with the exception of the following:

(1) The first of the 5-year periodic performance tests must be conducted within 3 years of the effective date of the revised standards, by [insert date 3 years after date of publication of final rule in the **Federal Register**], and thereafter before renewing the facility's 40 CFR part 70 operating permit, but no longer than 5 years following the previous performance test; and

(2) The date to submit performance test data through the ERT is within 60 days after the date of completing each performance test.

■ 7. Section 63.864 is revised to read as follows:

§ 63.864 Monitoring requirements.

(a)–(c) [Reserved]

(d) *Continuous opacity monitoring system (COMS).* The owner or operator of each affected kraft or soda recovery furnace or lime kiln equipped with an ESP must install, calibrate, maintain, and operate a COMS in accordance with Performance Specification 1 (PS–1) in appendix B to 40 CFR part 60 and the provisions in §§ 63.6(h) and 63.8 and paragraphs (d)(1) through (5) of this section.

(1)–(2) [Reserved]

(3) As specified in § 63.8(c)(4)(i), each COMS must complete a minimum of one cycle of sampling and analyzing for each successive 10-second period and one cycle of data recording for each successive 6-minute period.

(4) As specified in § 63.8(g)(2), each 6-minute COMS data average must be calculated as the average of 36 or more data points, equally spaced over each 6-minute period.

(5) As specified in § 63.8(g)(4), each 6-minute COMS data average should be rounded to the nearest 1-percent opacity.

(e) *Continuous parameter monitoring system (CPMS).* For each CPMS required in this section, the owner or operator of each affected source or process unit must meet the requirements in paragraphs (e)(1) through (14) of this section.

(1) For any kraft or soda recovery furnace or lime kiln using an ESP emission control device, the owner or operator must use the continuous parameter monitoring devices specified in paragraphs (e)(1)(i) and (ii) of this section to determine and record parameters at least once every successive 15-minute period.

(i) A monitoring device for the continuous measurement of the secondary voltage of each ESP collection field.

(ii) A monitoring device for the continuous measurement of the secondary current of each ESP collection field.

(iii) Total secondary power may be calculated as the product of the secondary voltage and secondary current measurements for each ESP collection field and used to demonstrate compliance as an alternative to the secondary voltage and secondary current measurements.

(2) For any kraft or soda recovery furnace or lime kiln using an ESP followed by a wet scrubber, the owner or operator must use the continuous parameter monitoring devices specified in paragraphs (e)(1) and (10) of this section. The opacity monitoring system specified in paragraph (d) of this section is not required for combination ESP/wet scrubber control device systems.

(3)–(9) [Reserved]

(10) The owner or operator of each affected kraft or soda recovery furnace, kraft or soda lime kiln, sulfite combustion unit, or kraft or soda smelt dissolving tank equipped with a wet scrubber must install, calibrate, maintain, and operate a CPMS that can be used to determine and record the pressure drop across the scrubber and the scrubbing liquid flow rate at least once every successive 15-minute period using the procedures in § 63.8(c), as well as the procedures in paragraphs (e)(10)(i) and (ii) of this section:

(i) A monitoring device used for the continuous measurement of the pressure drop of the gas stream across the scrubber must be certified by the manufacturer to be accurate to within a gage pressure of ±500 pascals (±2 inches of water gage pressure); and

(ii) A monitoring device used for continuous measurement of the scrubbing liquid flow rate must be certified by the manufacturer to be accurate within ±5 percent of the design scrubbing liquid flow rate.

(iii) As an alternative to pressure drop measurement under paragraph (e)(3)(i) of this section, a monitoring device for measurement of fan amperage may be used for smelt dissolving tank dynamic scrubbers that operate at ambient pressure or for low-energy entrainment scrubbers where the fan speed does not vary.

(11) The owner or operator of each affected semichemical combustion unit equipped with an RTO must install, calibrate, maintain, and operate a CPMS that can be used to determine and record the operating temperature of the RTO at least once every successive 15-minute period using the procedures in § 63.8(c). The monitor must compute and record the operating temperature at the point of incineration of effluent gases that are emitted using a temperature monitor accurate to within ±1 percent of the temperature being measured.

(12) The owner or operator of the affected hog fuel dryer at Cosmo Specialty Fibers' Cosmopolis, Washington facility (Emission Unit no. HD–14) must meet the requirements in paragraphs (e)(12)(i) through (xi) of this section for each bag leak detection system.

(i) The owner or operator must install, calibrate, maintain, and operate each triboelectric bag leak detection system according to EPA–454/R–98–015, ''Fabric Filter Bag Leak Detection Guidance'' (incorporated by reference—see § 63.14). This document is available from the U.S. Environmental Protection Agency (U.S. EPA); Office of Air Quality Planning and Standards; Emissions, Monitoring and Analysis Division; Emission Measurement Center, MD–D205–02, Research Triangle Park, NC 27711. This document is also available on the EPA Technical Air Pollution Resources Emission Measurement Center Web page under Continuous Emission Monitoring. The owner or operator must install, calibrate, maintain, and operate other types of bag leak detection systems in a manner consistent with the manufacturer's written specifications and recommendations.

(ii) The bag leak detection system must be certified by the manufacturer to be capable of detecting PM emissions at concentrations of 10 milligrams per actual cubic meter (0.0044 grains per actual cubic foot) or less.

(iii) The bag leak detection system sensor must provide an output of relative PM loadings.

(iv) The bag leak detection system must be equipped with a device to continuously record the output signal from the sensor.

(v) The bag leak detection system must be equipped with an audible alarm system that will sound automatically when an increase in relative PM emissions over a preset level is detected. The alarm must be located where it is easily heard by plant operating personnel.

(vi) For positive pressure fabric filter systems, a bag leak detector must be installed in each baghouse compartment or cell.

(vii) For negative pressure or induced air fabric filters, the bag leak detector must be installed downstream of the fabric filter.

(viii) Where multiple detectors are required, the system's instrumentation and alarm may be shared among detectors.

(ix) The baseline output must be established by adjusting the range and the averaging period of the device and establishing the alarm set points and the alarm delay time according to section 5.0 of the ''Fabric Filter Bag Leak Detection Guidance'' (incorporated by reference—see § 63.14).

(x) Following initial adjustment of the system, the sensitivity or range, averaging period, alarm set points, or alarm delay time may not be adjusted except as detailed in the site-specific monitoring plan. In no case may the sensitivity be increased by more than 100 percent or decreased more than 50 percent over a 365-day period unless such adjustment follows a complete fabric filter inspection which demonstrates that the fabric filter is in good operating condition, as defined in section 5.2 of the ''Fabric Filter Bag Leak Detection Guidance,'' (incorporated by reference—see § 63.14). Record each adjustment.

(xi) The owner or operator must record the results of each inspection, calibration, and validation check.

(13) The owner or operator of each affected source or process unit that uses an ESP, wet scrubber, RTO, or fabric filter may monitor alternative control device operating parameters subject to prior written approval by the Administrator. The request for approval must also include the manner in which the parameter operating limit is to be set.

(14) The owner or operator of each affected source or process unit that uses an air pollution control system other than an ESP, wet scrubber, RTO, or fabric filter must provide to the Administrator an alternative monitoring request that includes the site-specific monitoring plan described in paragraph (a) of this section, a description of the control device, test results verifying the performance of the control device, the appropriate operating parameters that will be monitored, how the operating limit is to be set, and the frequency of measuring and recording to establish continuous compliance with the standards. The alternative monitoring request is subject to the Administrator's approval. The owner or operator of the affected source or process unit must install, calibrate, operate, and maintain the monitor(s) in accordance with the alternative monitoring request approved by the Administrator. The owner or operator must include in the information submitted to the Administrator proposed performance specifications and quality assurance procedures for the monitors. The Administrator may request further information and will approve acceptable test methods and procedures. The owner or operator must monitor the parameters as approved by the Administrator using the methods and procedures in the alternative monitoring request.

(f) *Data quality assurance.* The owner or operator shall keep CMS data quality assurance procedures consistent with the requirements in § 63.8(d)(1) and (2) on record for the life of the affected source or until the affected source is no longer subject to the provisions of this part, to be made available for inspection, upon request, by the Administrator. If the performance evaluation plan in § 63.8(d)(2) is revised, the owner or operator shall keep previous (*i.e.,* superseded) versions of the performance evaluation plan on record to be made available for inspection, upon request, by the Administrator, for a period of 5 years after each revision to the plan. The program of corrective action should be included in the plan required under § 63.8(d)(2).

(g) *Gaseous organic HAP.* The owner or operator of each affected source or process unit complying with the gaseous organic HAP standard of § 63.862(c)(1) through the use of an NDCE recovery furnace equipped with a dry ESP system is not required to conduct any continuous monitoring to demonstrate compliance with the gaseous organic HAP standard.

(h) *Monitoring data.* As specified in § 63.8(g)(5), monitoring data recorded during periods of unavoidable CMS breakdowns, out-of-control periods, repairs, maintenance periods, calibration checks, and zero (low-level) and high level adjustments must not be included in any data average computed under this part.

(i) [Reserved]

(j) *Determination of operating limits.* (1) During the initial or periodic performance test required in § 63.865, the owner or operator of any affected source or process unit must establish operating limits for the monitoring parameters in paragraphs (e)(1) and (2) and (e)(10) through (14) of this section, as appropriate; or

(2) The owner or operator may base operating limits on values recorded during previous performance tests or conduct additional performance tests for the specific purpose of establishing operating limits, provided that test data used to establish the operating limits are or have been obtained using the test methods required in this subpart. The owner or operator of the affected source or process unit must certify that all control techniques and processes have not been modified subsequent to the testing upon which the data used to establish the operating parameter limits were obtained.

(3) The owner or operator of an affected source or process unit may establish expanded or replacement operating limits for the monitoring parameters listed in paragraphs (e)(1) and (2) and (e)(10) through (14) of this section and established in paragraph (j)(1) or (2) of this section during subsequent performance tests using the test methods in § 63.865.

(4) The owner or operator of the affected source or process unit must continuously monitor each parameter and determine the arithmetic average value of each parameter during each performance test. Multiple performance tests may be conducted to establish a range of parameter values.

(5) New, expanded, or replacement operating limits for the monitoring parameter values listed in paragraphs (e)(1) and (2) and (e)(10) through (14) of this section should be determined as described in paragraphs (j)(5)(i) through (iii) below.

(i) The owner or operator of an affected source or process unit that uses a wet scrubber must set a minimum scrubber pressure drop operating limit as the average of the pressure drop values associated with each test run.

(A) For a smelt dissolving tank dynamic wet scrubber operating at ambient pressure or for low-energy entrainment scrubbers where fan speed does not vary, the minimum fan amperage operating limit must be set as the average of the fan amperage values associated with each test run.

(B) [Reserved]

(ii) The owner operator of an affected source equipped with an ESP must set the minimum operating secondary current and secondary voltage as the average of the values associated with each test run.

(iii) The owner operator of an affected source equipped with an RTO must set the minimum operating temperature of the RTO as the average of the values associated with each test run.

(6) [Reserved]

(k) *On-going compliance provisions.* (1) Following the compliance date, owners or operators of all affected sources or process units are required to implement corrective action if the monitoring exceedances in paragraphs (k)(1)(ii) through (vii) of this section occur during times when spent pulping liquor or lime mud is fired (as applicable). Corrective action can include completion of transient startup and shutdown conditions as expediently as possible.

(i) [Reserved]

(ii) For a new or existing kraft or soda recovery furnace, kraft or soda smelt dissolving tank, kraft or soda lime kiln, or sulfite combustion unit equipped with a wet scrubber, when any 3-hour average parameter value is below the minimum operating limit established in paragraph (j) of this section, with the exception of pressure drop during periods of startup and shutdown.

(iii) For a new or existing kraft or soda recovery furnace or lime kiln equipped with an ESP followed by a wet scrubber, when:

(A) Any 3-hour average scrubber parameter value is below the minimum operating limit established in paragraph (j) of this section, with the exception of pressure drop during periods of startup and shutdown; and

(B) Any 3-hour average ESP secondary voltage and secondary current (or total secondary power) values are below the minimum operating limits established during performance testing, with the exception of secondary current (or total secondary power) during periods of startup and shutdown.

(iv) For a new or existing semichemical combustion unit equipped with an RTO, when any 1-hour average temperature falls below the minimum temperature operating limit established in paragraph (j) of this section.

(v) For the hog fuel dryer at Cosmo Specialty Fibers' Cosmopolis, Washington facility (Emission Unit no. HD–14), when the bag leak detection system alarm sounds.

(vi) For an affected source or process unit equipped with an ESP, wet scrubber, RTO, or fabric filter and monitoring alternative operating parameters established in paragraph (e)(13) of this section, when any 3-hour average value does not meet the operating limit established in paragraph (j) of this section.

(vii) For an affected source or process unit equipped with an alternative air pollution control system and monitoring operating parameters approved by the Administrator as established in paragraph (e)(14) of this section, when any 3-hour average value does not meet the operating limit established in paragraph (j) of this section.

(2) Following the compliance date, owners or operators of all affected sources or process units are in violation of the standards of § 63.862 if the monitoring exceedances in paragraphs (k)(2)(i) through (ix) of this section occur during times when spent pulping liquor or lime mud is fired (as applicable):

(i) For a new or existing kraft or soda recovery furnace equipped with an ESP, when opacity is greater than 20 percent for 2 percent or more of the operating time within any semiannual period;

(ii) For a new or existing kraft or soda lime kiln equipped with an ESP, when opacity is greater than 20 percent for 1 percent or more of the operating time within any semiannual period;

(iii) For a new or existing kraft or soda recovery furnace or lime kiln equipped with an ESP, when the ESP secondary voltage and secondary current (or total secondary power) averaged over the semiannual period are below the minimum operating limits established during the performance test, with the exception of secondary current (or total secondary power) during periods of startup and shutdown;

(iv) For a new or existing kraft or soda recovery furnace, kraft or soda smelt dissolving tank, kraft or soda lime kiln, or sulfite combustion unit equipped with a wet scrubber, when six or more 3-hour average parameter values within any 6-month reporting period are below the minimum operating limits established in paragraph (j) of this section, with the exception of pressure drop during periods of startup and shutdown;

(v) For a new or existing kraft or soda recovery furnace or lime kiln equipped with an ESP followed by a wet scrubber, when:

(A) Six or more 3-hour average scrubber parameter values within any 6-month reporting period are outside the range of values established in paragraph (j) of this section, with the exception of pressure drop during periods of startup and shutdown; and

(B) Six or more 3-hour average ESP secondary voltage and secondary current (or total secondary power) values within any 6-month reporting period are below the minimum operating limits established during performance testing, with the exception of secondary current (or total secondary power) during periods of startup and shutdown;

(vi) For a new or existing semichemical combustion unit equipped with an RTO, when any 3-hour average temperature falls below the temperature established in paragraph (j) of this section;

(vii) For the hog fuel dryer at Cosmo Specialty Fibers' Cosmopolis, Washington facility (Emission Unit no. HD–14), when corrective action is not initiated within 1 hour of a bag leak detection system alarm and the alarm is engaged for more than 5 percent of the total operating time in a 6-month block reporting period. In calculating the operating time fraction, if inspection of the fabric filter demonstrates that no corrective action is required, no alarm time is counted; if corrective action is required, each alarm is counted as a minimum of 1 hour; if corrective action is not initiated within 1 hour, the alarm time is counted as the actual amount of time taken to initiate corrective action;

(viii) For an affected source or process unit equipped with an ESP, wet scrubber, RTO, or fabric filter and monitoring alternative operating parameters established in paragraph (e)(13) of this section, when six or more 3-hour average values within any 6-month reporting period do not meet the operating limits established in paragraph (j) of this section; and

(ix) For an affected source or process unit equipped with an alternative air pollution control system and monitoring operating parameters approved by the Administrator as established in paragraph (e)(14) of this section, when six or more 3-hour average values within any 6-month reporting period do not meet the operating limits established in paragraph (j) of this section.

(3) [Reserved]

■ 8. Section 63.865 is amended by revising the introductory text and paragraphs (b)(1) through (5), (c)(1), and (d)introductory text to read as follows:

§ 63.865 Performance test requirements and test methods.

The owner or operator of each affected source or process unit subject to the requirements of this subpart is required to conduct an initial performance test and periodic performance tests using the test methods and procedures listed in § 63.7 and paragraph (b) of this section. The owner or operator must conduct the first of the periodic performance tests within 3 years of the effective date of the revised standards and thereafter before renewing their 40 CFR part 70 operating permit but at intervals no longer than 5 years following the previous performance test. Performance tests shall be conducted under such conditions as the Administrator specifies to the owner or operator based on representative performance of the affected source for the period being tested. Representative conditions exclude periods of startup and shutdown. The owner or operator may not conduct performance tests during periods of malfunction. The owner or operator must record the process information that is necessary to document operating conditions during the test and include in such record an explanation to support that such conditions represent normal operation. Upon request, the owner or operator shall make available to the Administrator such records as may be necessary to determine the conditions of performance tests.

* * * * *

(b) * * *

(1) For purposes of determining the concentration or mass of PM emitted from each kraft or soda recovery furnace, sulfite combustion unit, smelt dissolving tank, lime kiln, or the hog fuel dryer at Cosmo Specialty Fibers' Cosmopolis, Washington facility (Emission Unit no. HD–14), Method 5 in appendix A–3 of 40 CFR part 60 or Method 29 in appendix A–8 of 40 CFR part 60 must be used, except that Method 17 in appendix A–6 of 40 CFR part 60 may be used in lieu of Method 5 or Method 29 if a constant value of 0.009 g/dscm (0.004 gr/dscf) is added to the results of Method 17, and the stack temperature is no greater than 205 °C (400 °F). For Methods 5, 29, and 17, the sampling time and sample volume for each run must be at least 60 minutes and 0.90 dscm (31.8 dscf), and water must be used as the cleanup solvent instead of acetone in the sample recovery procedure.

(2) For sources complying with § 63.862(a) or (b), the PM concentration must be corrected to the appropriate oxygen concentration using Equation 7 of this section as follows:

$$C_{corr} = C_{meas} \times (20.9-X)/(20.9-Y) \qquad \text{(Eq. 7)}$$

Where:

C_{corr} = the measured concentration corrected for oxygen, g/dscm (gr/dscf);

C_{meas} = the measured concentration uncorrected for oxygen, g/dscm (gr/dscf);

X = the corrected volumetric oxygen concentration (8 percent for kraft or soda recovery furnaces and sulfite combustion units and 10 percent for kraft or soda lime kilns); and

Y = the measured average volumetric oxygen concentration.

(3) Method 3A or 3B in appendix A–2 of 40 CFR part 60 must be used to determine the oxygen concentration. The voluntary consensus standard ANSI/ASME PTC 19.10–1981—Part 10 (incorporated by reference—see § 63.14) may be used as an alternative to using Method 3B. The gas sample must be taken at the same time and at the same traverse points as the particulate sample.

(4) For purposes of complying with of § 63.862(a)(1)(ii)(A), the volumetric gas flow rate must be corrected to the appropriate oxygen concentration using Equation 8 of this section as follows:

$$Q_{corr} = Q_{meas} \times (20.9-Y)/(20.9-X) \qquad \text{(Eq. 8)}$$

Where:

Q_{corr} = the measured volumetric gas flow rate corrected for oxygen, dscm/min (dscf/min).

Q_{meas} = the measured volumetric gas flow rate uncorrected for oxygen, dscm/min (dscf/min).

Y = the measured average volumetric oxygen concentration.

X = the corrected volumetric oxygen concentration (8 percent for kraft or soda recovery furnaces and 10 percent for kraft or soda lime kilns).

(5)(i) For purposes of selecting sampling port location and number of traverse points, Method 1 or 1A in appendix A–1 of 40 CFR part 60 must be used;

(ii) For purposes of determining stack gas velocity and volumetric flow rate, Method 2, 2A, 2C, 2D, or 2F in appendix A–1 of 40 CFR part 60 or Method 2G in appendix A–2 of 40 CFR part 60 must be used;

(iii) For purposes of conducting gas analysis, Method 3, 3A, or 3B in appendix A–2 of 40 CFR part 60 must be used. The voluntary consensus standard ANSI/ASME PTC 19.10–1981—Part 10 (incorporated by reference—see § 63.14) may be used as an alternative to using Method 3B; and

(iv) For purposes of determining moisture content of stack gas, Method 4 in appendix A–3 of 40 CFR part 60 must be used.

* * * * *

(c) * * *

(1) The owner or operator complying through the use of an NDCE recovery furnace equipped with a dry ESP system is required to conduct periodic performance testing using Method 308 in appendix A of this part, as well as the methods listed in paragraphs (b)(5)(i) through (iv) of this section to demonstrate compliance with the gaseous organic HAP standard. The requirements and equations in paragraph (b)(2) of this section must be met and utilized, respectively.

* * * * *

(d) The owner or operator seeking to determine compliance with the gaseous organic HAP standards in § 63.862(c)(2) for semichemical combustion units must use Method 25A in appendix A–7 of 40 CFR part 60, as well as the methods listed in paragraphs (b)(5)(i) through (iv) of this section. The sampling time for each Method 25A run must be at least 60 minutes. The calibration gas for each Method 25A run must be propane.

* * * * *

■ 9. Section 63.866 is revised to read as follows:

§ 63.866 Recordkeeping requirements.

(a) [Reserved]

(b) The owner or operator of an affected source or process unit must maintain records of any occurrence when corrective action is required under § 63.864(k)(1), and when a violation is noted under § 63.864(k)(2). Record the time corrective action was initiated and completed, and the corrective action taken.

(c) In addition to the general records required by § 63.10(b)(2)(iii) and (vi) through (xiv), the owner or operator must maintain records of the information in paragraphs (c)(1) through (8) of this section:

(1) Records of black liquor solids firing rates in units of Mg/d or ton/d for

all recovery furnaces and semichemical combustion units;

(2) Records of CaO production rates in units of Mg/d or ton/d for all lime kilns;

(3) Records of parameter monitoring data required under § 63.864, including any period when the operating parameter levels were inconsistent with the levels established during the performance test;

(4) Records and documentation of supporting calculations for compliance determinations made under § 63.865(a) through (d);

(5) Records of parameter operating limits established for each affected source or process unit;

(6) Records certifying that an NDCE recovery furnace equipped with a dry ESP system is used to comply with the gaseous organic HAP standard in § 63.862(c)(1);

(7) For the bag leak detection system on the hog fuel dryer fabric filter at Cosmo Specialty Fibers' Cosmopolis, Washington facility (Emission Unit no. HD–14), records of each alarm, the time of the alarm, the time corrective action was initiated and completed, and a brief description of the cause of the alarm and the corrective action taken; and

(8) Records of the date, time, and duration of each startup and/or shutdown period, recording the periods when the affected source was subject to the standard applicable to startup and shutdown.

(d)(1) In the event that an affected unit fails to meet an applicable standard, including any emission limit or operating limit, record the number of failures. For each failure record the date, start time, and duration of each failure along with a brief explanation of the cause.

(2) For each failure to meet an applicable standard, record and retain a list of the affected sources or equipment, an estimate of the quantity of each regulated pollutant emitted over any emission limit and a description of the method used to estimate the emissions.

(3) Record actions taken to minimize emissions in accordance with § 63.860(d) and any corrective actions taken to return the affected unit to its normal or usual manner of operation.

■ 10. Section 63.867 is revised to read as follows:

§ 63.867 Reporting requirements.

(a) *Notifications.* (1) The owner or operator of any affected source or process unit must submit the applicable notifications from subpart A of this part, as specified in Table 1 of this subpart.

(2) [Reserved]

(3) In addition to the requirements in subpart A of this part, the owner or operator of the hog fuel dryer at Cosmo Specialty Fibers' Cosmopolis, Washington, facility (Emission Unit no. HD–14) must include analysis and supporting documentation demonstrating conformance with EPA guidance and specifications for bag leak detection systems in § 63.864(e)(12) in the Notification of Compliance Status.

(b) *Additional reporting requirements for HAP metals standards.* (1) Any owner or operator of a group of process units in a chemical recovery system at a mill complying with the PM emissions limits in § 63.862(a)(1)(ii) must submit the PM emissions limits determined in § 63.865(a) for each affected kraft or soda recovery furnace, smelt dissolving tank, and lime kiln to the Administrator for approval. The emissions limits must be submitted as part of the notification of compliance status required under subpart A of this part.

(2) Any owner or operator of a group of process units in a chemical recovery system at a mill complying with the PM emissions limits in § 63.862(a)(1)(ii) must submit the calculations and supporting documentation used in § 63.865(a)(1) and (2) to the Administrator as part of the notification of compliance status required under subpart A of this part.

(3) After the Administrator has approved the emissions limits for any process unit, the owner or operator of a process unit must notify the Administrator before any of the actions in paragraphs (b)(3)(i) through (iv) of this section are taken:

(i) The air pollution control system for any process unit is modified or replaced;

(ii) Any kraft or soda recovery furnace, smelt dissolving tank, or lime kiln in a chemical recovery system at a kraft or soda pulp mill complying with the PM emissions limits in § 63.862(a)(1)(ii) is shut down for more than 60 consecutive days;

(iii) A continuous monitoring parameter or the value or range of values of a continuous monitoring parameter for any process unit is changed; or

(iv) The black liquor solids firing rate for any kraft or soda recovery furnace during any 24-hour averaging period is increased by more than 10 percent above the level measured during the most recent performance test.

(4) An owner or operator of a group of process units in a chemical recovery system at a mill complying with the PM emissions limits in § 63.862(a)(1)(ii) and seeking to perform the actions in paragraph (b)(3)(i) or (ii) of this section must recalculate the overall PM emissions limit for the group of process units and resubmit the documentation required in paragraph (b)(2) of this section to the Administrator. All modified PM emissions limits are subject to approval by the Administrator.

(c) *Excess emissions report.* The owner or operator must submit semiannual excess emissions reports containing the information specified in paragraphs (c)(1) through (5) of this section. The owner or operator must submit semiannual excess emission reports following the procedure specified in paragraph (d)(2) of this section.

(1) If the total duration of excess emissions or process control system parameter exceedances for the reporting period is less than 1-percent of the total reporting period operating time, and CMS downtime is less than 5-percent of the total reporting period operating time, only the summary report is required to be submitted in accordance with § 63.10(e)(3)(vii). This report will be titled ''Summary Report—Gaseous and Opacity Excess Emissions and Continuous Monitoring System Performance'' in accordance with § 63.10(e)(3)(vi) and must contain the information required in § 63.10(e)(3), as specified in paragraphs (c)(1)(i) through (x) of this section. When no exceedances of parameters have occurred, the owner or operator must submit the summary report stating that no excess emissions occurred during the reporting period. In addition to a statement verifying that no excess emissions occurred during the reporting period, this report must contain the information required in § 63.10(e)(3) only as specified in paragraphs (c)(1)(i) through (x) of this section. The summary report must be submitted following the procedure specified in paragraph (d)(2) of this section.

(i) The company name and address and name of the affected facility.

(ii) Beginning and ending dates of the reporting period.

(iii) An identification of each process unit with the corresponding air pollution control device, being included in the semiannual report, including the pollutants monitored at each process unit, and the total operating time for each process unit.

(iv) An identification of the applicable emission limits, operating parameter limits, and averaging times.

(v) An identification of the monitoring equipment used for each process unit and the corresponding model number.

(vi) Date of the last CMS certification or audit.

(vii) An emission data summary, including the total duration of excess emissions (recorded in minutes for opacity and hours for gases), the duration of excess emissions expressed as a percent of operating time, and reason for the excess emissions (*e.g.,* startup/shutdown, control equipment problems, other known reasons, or other unknown reasons).

(viii) A CMS performance summary, including the total duration of CMS downtime, the duration of downtime expressed as a percent of operating time, and reason for the downtime (e.g., monitoring equipment malfunction, non-monitoring equipment malfunction, quality assurance, quality control calibrations, other known causes, or other unknown causes).

(ix) A description of changes to CMS, processes, or controls since last reporting period.

(x) A certification by a certifying official of truth, accuracy and completeness. This will state that, based on information and belief formed after reasonable inquiry, the statements and information in the document are true, accurate, and complete.

(2) [Reserved]

(3) If measured parameters meet any of the conditions specified in § 63.864(k)(1) or (2), the owner or operator of the affected source must submit a semiannual report describing the excess emissions that occurred. If the total duration of monitoring exceedances for the reporting period is 1-percent or greater of the total reporting period operating time, or the total CMS downtime for the reporting period is 5-percent or greater of the total reporting period operating time, or any violations according to § 63.864(k)(2) occurred, information from both the summary report and the excess emissions and continuous monitoring system performance report must be submitted. This report will be titled ''Excess Emissions and Continuous Monitoring System Performance Report'' and must contain the information specified in paragraphs (c)(1)(i) through (x) of this section, in addition to the information required in § 63.10(c)(5) through (14), as specified in paragraphs (c)(3)(i) through (vi) of this section. Reporting monitoring exceedances does not constitute a violation of the applicable standard unless the criteria in § 63.864(k)(2) are reached.

(i) An identification of the date and time identifying each period during which the CMS was inoperative except for zero (low-level) and high-level checks.

(ii) An identification of the date and time identifying each period during which the CMS was out of control, as defined in § 63.8(c)(7).

(iii) The specific identification of each period of excess emissions and parameter monitoring exceedances as described in paragraphs (c)(3)(iii)(A) through (C) of this section.

(A) For opacity:

(*1*) The total number of 6-minute averages in the reporting period (excluding process unit downtime).

(*2*) The number of 6-minute averages in the reporting period removed due to invalid readings.

(*3*) The number of 6-minute averages in the reporting period that exceeded the 20-percent opacity limit.

(*4*) The percent of 6-minute averages in the reporting period that exceed the 20-percent opacity limit.

(*5*) An identification of each exceedance by start time, date, and cause of exceedance (including startup/shutdown, control equipment problems, other known reasons, or other unknown reasons).

(B) For ESP operating parameters:

(*1*) The type of operating parameters monitored for compliance (total secondary power, or secondary voltage and secondary current).

(*2*) The operating limits established during the performance test.

(*3*) For systems only controlled with an ESP, the operating parameters averaged over the semiannual reporting period.

(*4*) For combined ESP and wet scrubber control systems, the number of 3-hour ESP and wet scrubber parameter averages below the minimum operating limit established during the performance test.

(*5*) An identification of each exceedance by start time, date, and cause of exceedance (including startup/shutdown, control equipment problems, other known reasons, or other unknown reasons).

(C) For wet scrubber operating parameters:

(*1*) The operating limits established during the performance test for scrubbing liquid flow rate and pressure drop across the scrubber (or fan amperage if used for smelt dissolving tank scrubbers).

(*2*) The number of 3-hour wet scrubber parameter averages below the minimum operating limit established during the performance test, if applicable.

(*3*) An identification of each exceedance by start time, date, and cause of exceedance (including startup/shutdown, control equipment problems, other known reasons, or other unknown reasons).

(D) For RTO operating temperature:

(*1*) The operating limit established during the performance test.

(*2*) The number of 1-hour and 3-hour temperature averages below the minimum operating limit established during the performance test.

(*3*) An identification of each exceedance by start time, date, and cause of exceedance including startup/shutdown, control equipment problems, other known reasons, or other unknown reasons).

(iv) The nature and cause of any malfunction (if known).

(v) The corrective action taken or preventative measures adopted.

(vi) The nature of repairs and adjustments to the CMS that was inoperative or out of control.

(4) If a source fails to meet an applicable standard, report such events in the semiannual excess emissions report. Report the number of failures to meet an applicable standard. For each instance, report the date, time and duration of each failure. For each failure the report must include a list of the affected sources or equipment, an estimate of the quantity of each regulated pollutant emitted over any emission limit, and a description of the method used to estimate the emissions.

(5) The owner or operator of an affected source or process unit subject to the requirements of this subpart and subpart S of this part may combine excess emissions and/or summary reports for the mill.

(d) *Electronic reporting.* (1) Within 60 days after the date of completing each performance test (as defined in § 63.2) required by this subpart, the owner or operator must submit the results of the performance test following the procedure specified in either paragraph (d)(1)(i) or (ii) of this section.

(i) For data collected using test methods supported by the EPA's Electronic Reporting Tool (ERT) as listed on the EPA's ERT Web site (*https://www.epa.gov/electronic-reporting-air-emissions/electronic-reporting-tool-ert*) at the time of the test, the owner or operator must submit the results of the performance test to the EPA via the Compliance and Emissions Data Reporting Interface (CEDRI). (CEDRI can be accessed through the EPA's Central Data Exchange (CDX) (*https://cdx.epa.gov/*).) Performance test data must be submitted in a file format generated through the use of the EPA's ERT or an alternate electronic file format consistent with the extensible markup language (XML) schema listed on the EPA's ERT Web site. If the owner or operator claims that some of the performance test information being submitted is confidential business information (CBI), the owner or operator must submit a complete file generated through the use of the EPA's ERT or an alternate electronic file consistent with the XML schema listed on the EPA's ERT Web site, including information claimed to be CBI, on a compact disc, flash drive, or other commonly used electronic storage media to the EPA. The electronic media must be clearly marked as CBI and mailed to U.S. EPA/OAPQS/CORE CBI Office, Attention: Group Leader, Measurement Policy Group, MD C404–02, 4930 Old Page Rd., Durham, NC 27703. The same ERT or alternate file with the CBI omitted must be submitted to the EPA via the EPA's CDX as described earlier in this paragraph (d)(1)(i).

(ii) For data collected using test methods that are not supported by the EPA's ERT as listed on the EPA's ERT Web site at the time of the test, the owner or operator must attach an electronic copy of the complete performance test report containing the methods not included in the ERT in the attachment module of the ERT in portable document format (PDF) and submit the results of the performance test to the EPA via CEDRI.

(2) The owner or operator must submit notification and semiannual reports to the EPA via the CEDRI. (CEDRI can be accessed through the EPA's CDX (*https://cdx.epa.gov*).) The owner or operator must use the appropriate electronic report in CEDRI for this subpart or an alternative electronic file format consistent with the XML schema listed on the CEDRI Web site (*https://www.epa.gov/electronic-reporting-air-emissions/compliance-and-emissions-data-reporting-interface-cedri*). If neither the reporting form nor the spreadsheet template specific to this subpart are available in CEDRI at the time that the report is due, you must upload an electronic copy of the report in CEDRI. Once the form or spreadsheet template has been available in CEDRI for at least 90 calendar days, you must begin submitting all subsequent reports via CEDRI using the form or spreadsheet template. The reports must be submitted by the deadlines specified in this subpart, regardless of the method in which the reports are submitted.

■ 11. Section 63.868 is amended by revising paragraphs (b)(2) through (4) to read as follows:

§ 63.868 Delegation of authority.

* * * * *

(b) * * *

(2) Approval of a major change to test method under § 63.7(e)(2)(ii) and (f) and as defined in § 63.90.

(3) Approval of a major change to monitoring under § 63.8(f) and as defined in § 63.90.

(4) Approval of a major change to recordkeeping/reporting under § 63.10(f) and as defined in § 63.90.

■ 12. Table 1 to subpart MM of part 63 is revised to read as follows:

TABLE 1 TO SUBPART MM OF PART 63—GENERAL PROVISIONS APPLICABILITY TO SUBPART MM

General provisions reference	Summary of requirements	Applies to subpart MM	Explanation
63.1(a)(1)	General applicability of the General Provisions.	Yes	Additional terms defined in § 63.861; when overlap between subparts A and MM of this part, subpart MM takes precedence.
63.1(a)(2)–(14)	General applicability of the General Provisions.	Yes.	
63.1(b)(1)	Initial applicability determination	No	Subpart MM specifies the applicability in § 63.860.
63.1(b)(2)	Title V operating permit—see 40 CFR part 70	Yes	All major affected sources are required to obtain a title V permit.
63.1(b)(3)	Record of the applicability determination	No	All affected sources are subject to subpart MM according to the applicability definition of subpart MM.
63.1(c)(1)	Applicability of subpart A of this part after a relevant standard has been set.	Yes	Subpart MM clarifies the applicability of each paragraph of subpart A of this part to sources subject to subpart MM.
63.1(c)(2)	Title V permit requirement	Yes	All major affected sources are required to obtain a title V permit. There are no area sources in the pulp and paper mill source category.
63.1(c)(3)	[Reserved]	No.	
63.1(c)(4)	Requirements for existing source that obtains an extension of compliance.	Yes.	
63.1(c)(5)	Notification requirements for an area source that increases HAP emissions to major source levels.	Yes.	
63.1(d)	[Reserved]	No.	
63.1(e)	Applicability of permit program before a relevant standard has been set.	Yes.	
63.2	Definitions	Yes	Additional terms defined in § 63.861; when overlap between subparts A and MM of this part occurs, subpart MM takes precedence.
63.3	Units and abbreviations	Yes.	
63.4	Prohibited activities and circumvention	Yes.	
63.5(a)	Construction and reconstruction—applicability	Yes.	
63.5(b)(1)	Upon construction, relevant standards for new sources.	Yes.	
63.5(b)(2)	[Reserved]	No.	
63.5(b)(3)	New construction/reconstruction	Yes.	
63.5(b)(4)	Construction/reconstruction notification	Yes.	
63.5(b)(5)	Construction/reconstruction compliance	Yes.	
63.5(b)(6)	Equipment addition or process change	Yes.	

TABLE 1 TO SUBPART MM OF PART 63—GENERAL PROVISIONS APPLICABILITY TO SUBPART MM—Continued

General provisions reference	Summary of requirements	Applies to subpart MM	Explanation
63.5(c)	[Reserved]	No.	
63.5(d)	Application for approval of construction/reconstruction.	Yes.	
63.5(e)	Construction/reconstruction approval	Yes.	
63.5(f)	Construction/reconstruction approval based on prior State preconstruction review.	Yes.	
63.6(a)(1)	Compliance with standards and maintenance requirements—applicability.	Yes.	
63.6(a)(2)	Requirements for area source that increases emissions to become major.	Yes.	
63.6(b)	Compliance dates for new and reconstructed sources.	Yes.	
63.6(c)	Compliance dates for existing sources	Yes, except for sources granted extensions under § 63.863(c).	Subpart MM specifically stipulates the compliance schedule for existing sources.
63.6(d)	[Reserved]	No.	
63.6(e)(1)(i)	General duty to minimize emissions	No	See § 63.860(d) for general duty requirement.
63.6(e)(1)(ii)	Requirement to correct malfunctions ASAP	No.	
63.6(e)(1)(iii)	Operation and maintenance requirements enforceable independent of emissions limitations.	Yes.	
63.6(e)(2)	[Reserved]	No.	
63.6(e)(3)	Startup, shutdown, and malfunction plan (SSMP).	No.	
63.6(f)(1)	Compliance with nonopacity emissions standards except during SSM.	No.	
63.6(f)(2)–(3)	Methods for determining compliance with nonopacity emissions standards.	Yes.	
63.6(g)	Compliance with alternative nonopacity emissions standards.	Yes.	
63.6(h)(1)	Compliance with opacity and visible emissions (VE) standards except during SSM.	No.	
63.6(h)(2)–(9)	Compliance with opacity and VE standards	Yes	Subpart MM does not contain any opacity or VE standards; however, § 63.864 specifies opacity monitoring requirements.
63.6(i)	Extension of compliance with emission standards.	Yes.	
63.6(j)	Exemption from compliance with emissions standards.	Yes.	
63.7(a)(1)	Performance testing requirements—applicability.	Yes.	
63.7(a)(2)	Performance test dates	Yes.	
63.7(a)(3)	Performance test requests by Administrator under CAA section 114.	Yes.	
63.7(a)(4)	Notification of delay in performance testing due to force majeure.	Yes.	
63.7(b)(1)	Notification of performance test	Yes.	
63.7(b)(2)	Notification of delay in conducting a scheduled performance test.	Yes.	
63.7(c)	Quality assurance program	Yes.	
63.7(d)	Performance testing facilities	Yes.	
63.7(e)(1)	Conduct of performance tests	No	See § 63.865.
63.7(e)(2)–(3)	Conduct of performance tests	Yes.	
63.7(e)(4)	Testing under section 114	Yes.	
63.7(f)	Use of an alternative test method	Yes.	
63.7(g)	Data analysis, recordkeeping, and reporting	Yes.	
63.7(h)	Waiver of performance tests	Yes	§ 63.865(c)(1) specifies the only exemption from performance testing allowed under subpart MM.
63.8(a)(1)	Monitoring requirements—applicability	Yes	See § 63.864.
63.8(a)(2)	Performance Specifications	Yes.	
63.8(a)(3)	[Reserved]	No.	
63.8(a)(4)	Monitoring with flares	No	The use of flares to meet the standards in subpart MM is not anticipated.
63.8(b)(1)	Conduct of monitoring	Yes	See § 63.864.
63.8(b)(2)–(3)	Specific requirements for installing and reporting on monitoring systems.	Yes.	
63.8(c)(1)	Operation and maintenance of CMS	Yes	See § 63.864.
63.8(c)(1)(i)	General duty to minimize emissions and CMS operation.	No.	

TABLE 1 TO SUBPART MM OF PART 63—GENERAL PROVISIONS APPLICABILITY TO SUBPART MM—Continued

General provisions reference	Summary of requirements	Applies to subpart MM	Explanation
63.8(c)(1)(ii)	Reporting requirements for SSM when action not described in SSMP.	Yes.	
63.8(c)(1)(iii)	Requirement to develop SSM plan for CMS	No.	
63.8(c)(2)–(3)	Monitoring system installation	Yes.	
63.8(c)(4)	CMS requirements	Yes.	
63.8(c)(5)	Continuous opacity monitoring system (COMS) minimum procedures.	Yes.	
63.8(c)(6)	Zero and high level calibration check requirements.	Yes.	
63.8(c)(7)–(8)	Out-of-control periods	Yes.	
63.8(d)(1)–(2)	CMS quality control program	Yes	See § 63.864.
63.8(d)(3)	Written procedures for CMS	No	See § 63.864(f).
63.8(e)(1)	Performance evaluation of CMS	Yes.	
63.8(e)(2)	Notification of performance evaluation	Yes.	
63.8(e)(3)	Submission of site-specific performance evaluation test plan.	Yes.	
63.8(e)(4)	Conduct of performance evaluation and performance evaluation dates.	Yes.	
63.8(e)(5)	Reporting performance evaluation results	Yes.	
63.8(f)	Use of an alternative monitoring method	Yes.	
63.8(g)	Reduction of monitoring data	Yes.	
63.9(a)	Notification requirements—applicability and general information.	Yes.	
63.9(b)	Initial notifications	Yes.	
63.9(c)	Request for extension of compliance	Yes.	
63.9(d)	Notification that source subject to special compliance requirements.	Yes.	
63.9(e)	Notification of performance test	Yes.	
63.9(f)	Notification of opacity and VE observations	Yes	Subpart MM does not contain any opacity or VE standards; however, § 63.864 specifies opacity monitoring requirements.
63.9(g)(1)	Additional notification requirements for sources with CMS.	Yes.	
63.9(g)(2)	Notification of compliance with opacity emissions standard.	Yes	Subpart MM does not contain any opacity or VE emissions standards; however, § 63.864 specifies opacity monitoring requirements.
63.9(g)(3)	Notification that criterion to continue use of alternative to relative accuracy testing has been exceeded.	Yes.	
63.9(h)	Notification of compliance status	Yes.	
63.9(i)	Adjustment to time periods or postmark deadlines for submittal and review of required communications.	Yes.	
63.9(j)	Change in information already provided	Yes.	
63.10(a)	Recordkeeping requirements—applicability and general information.	Yes	See § 63.866.
63.10(b)(1)	Records retention	Yes.	
63.10(b)(2)(i)	Recordkeeping of occurrence and duration of startups and shutdowns.	No	See § 63.866(c)(8) for recordkeeping of the date, time, and duration of each startup and/or shutdown period.
63.10(b)(2)(ii)	Recordkeeping of failures to meet a standard	No	See § 63.866(d) for recordkeeping of (1) date, time and duration; (2) listing of affected source or equipment, and an estimate of the quantity of each regulated pollutant emitted over the standard; and (3) actions to minimize emissions and correct the failure.
63.10(b)(2)(iii)	Maintenance records	Yes.	
63.10(b)(2)(iv)–(v)	Actions taken to minimize emissions during SSM.	No.	
63.10(b)(2)(vi)	Recordkeeping for CMS malfunctions	Yes.	
63.10(b)(2)(vii)-(xiv)	Other CMS requirements	Yes.	
63.10(b)(3)	Records retention for sources not subject to relevant standard.	Yes	Applicability requirements are given in § 63.860.
63.10(c)(1)–(14)	Additional recordkeeping requirements for sources with CMS..	Yes.	
63.10(c)(15)	Use of SSM plan	No.	
63.10(d)(1)	General reporting requirements	Yes.	
63.10(d)(2)	Reporting results of performance tests	Yes.	

TABLE 1 TO SUBPART MM OF PART 63—GENERAL PROVISIONS APPLICABILITY TO SUBPART MM—Continued

General provisions reference	Summary of requirements	Applies to subpart MM	Explanation
63.10(d)(3)	Reporting results of opacity or VE observations.	Yes	Subpart MM does not include any opacity or VE standards; however, § 63.864 specifies opacity monitoring requirements.
63.10(d)(4)	Progress reports	Yes.	
63.10(d)(5)(i)	Periodic startup, shutdown, and malfunction reports.	No	See § 63.867(c)(3) for malfunction reporting requirements.
63.10(d)(5)(ii)	Immediate startup, shutdown, and malfunction reports.	No	See § 63.867(c)(3) for malfunction reporting requirements.
63.10(e)	Additional reporting requirements for sources with CMS.	Yes.	
63.10(f)	Waiver of recordkeeping and reporting requirements.	Yes.	
63.11	Control device requirements for flares	No	The use of flares to meet the standards in subpart MM is not anticipated.
63.12	State authority and delegations	Yes.	
63.13	Addresses of State air pollution control agencies and EPA Regional Offices.	Yes.	
63.14	Incorporations by reference	Yes.	
63.15	Availability of information and confidentiality	Yes.	
63.16	Requirements for Performance Track member facilities.	Yes.

Part VI

The President

Executive Order 13756—Adjustments of Certain Rates of Pay

Federal Register
Vol. 81, No. 251
Friday, December 30, 2016

Presidential Documents

Title 3—

The President

Executive Order 13756 of December 27, 2016

Adjustments of Certain Rates of Pay

By the authority vested in me as President by the Constitution and the laws of the United States of America, it is hereby ordered as follows:

Section 1. *Statutory Pay Systems.* The rates of basic pay or salaries of the statutory pay systems (as defined in 5 U.S.C. 5302(1)), as adjusted under 5 U.S.C. 5303, are set forth on the schedules attached hereto and made a part hereof:

(a) The General Schedule (5 U.S.C. 5332(a)) at Schedule 1;

(b) The Foreign Service Schedule (22 U.S.C. 3963) at Schedule 2; and

(c) The schedules for the Veterans Health Administration of the Department of Veterans Affairs (38 U.S.C. 7306, 7404; section 301(a) of Public Law 102–40) at Schedule 3.

Sec. 2. *Senior Executive Service.* The ranges of rates of basic pay for senior executives in the Senior Executive Service, as established pursuant to 5 U.S.C. 5382, are set forth on Schedule 4 attached hereto and made a part hereof.

Sec. 3. *Certain Executive, Legislative, and Judicial Salaries.* The rates of basic pay or salaries for the following offices and positions are set forth on the schedules attached hereto and made a part hereof:

(a) The Executive Schedule (5 U.S.C. 5312–5318) at Schedule 5;

(b) The Vice President (3 U.S.C. 104) and the Congress (2 U.S.C. 4501) at Schedule 6; and

(c) Justices and judges (28 U.S.C. 5, 44(d), 135, 252, and 461(a)) at Schedule 7.

Sec. 4. *Uniformed Services.* The rates of monthly basic pay (37 U.S.C. 203(a)) for members of the uniformed services, as adjusted under section 601 of the National Defense Authorization Act for Fiscal Year 2017, [S. 2943, 114th Cong. (2016)], as signed by the President on December 23, 2016, and the rate of monthly cadet or midshipman pay (37 U.S.C. 203(c)) are set forth on Schedule 8 attached hereto and made a part hereof.

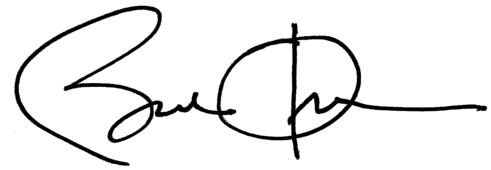
Sec. 5. *Locality-Based Comparability Payments.* (a) Pursuant to section 5304 of title 5, United States Code, and my authority to implement an alternative level of comparability payments under section 5304a of title 5, United States Code, locality-based comparability payments shall be paid in accordance with Schedule 9 attached hereto and made a part hereof.

(b) The Director of the Office of Personnel Management shall take such actions as may be necessary to implement these payments and to publish appropriate notice of such payments in the *Federal Register*.

Sec. 6. *Administrative Law Judges.* Pursuant to section 5372 of title 5, United States Code, the rates of basic pay for administrative law judges are set forth on Schedule 10 attached hereto and made a part hereof.

Sec. 7. *Effective Dates.* Schedule 8 is effective January 1, 2017. The other schedules contained herein are effective on the first day of the first applicable pay period beginning on or after January 1, 2017.

Sec. 8. *Prior Order Superseded.* Executive Order 13715 of December 18, 2015, is superseded as of the effective dates specified in section 7 of this order.



THE WHITE HOUSE,
December 27, 2016.

Billing code 3295–F7–P

SCHEDULE 3--VETERANS HEALTH ADMINISTRATION SCHEDULES
DEPARTMENT OF VETERANS AFFAIRS

(Effective on the first day of the first applicable pay period beginning on or after January 1, 2017)

Schedule for the Office of the Under Secretary for Health
(38 U.S.C. 7306)*
(Only applies to incumbents who are not physicians or dentists)

	Minimum	Maximum
Assistant Under Secretaries for Health		$163,665**
Service Directors	$121,588	$151,005
Director, National Center for Preventive Health	103,672	151,005

Physician and Dentist Base and Longevity Schedule***

Physician Grade	$101,967	$149,553
Dentist Grade	101,967	149,553

Clinical Podiatrist, Chiropractor, and Optometrist Schedule

Chief Grade	$103,672	$134,776
Senior Grade	88,136	114,578
Intermediate Grade	74,584	96,958
Full Grade	62,722	81,541
Associate Grade	52,329	68,025

Physician Assistant and Expanded-Function Dental Auxiliary Schedule****

Director Grade	$103,672	$134,776
Assistant Director Grade	88,136	114,578
Chief Grade	74,584	96,958
Senior Grade	62,722	81,541
Intermediate Grade	52,329	68,025
Full Grade	43,251	56,229
Associate Grade	37,219	48,388
Junior Grade	31,819	41,368

* This schedule does not apply to the Deputy Under Secretary for Health, the Associate Deputy Under Secretary for Health, Assistant Under Secretaries for Health who are physicians or dentists, Medical Directors, the Assistant Under Secretary for Nursing Programs, or the Director of Nursing Services.

** Pursuant to 38 U.S.C. 7404(d), the rate of basic pay payable to these employees is limited to the rate for level V of the Executive Schedule, which is $151,700.

*** Pursuant to section 3 of Public Law 108-445 and 38 U.S.C. 7431, Veterans Health Administration physicians and dentists may also be paid market pay and performance pay.

**** Pursuant to section 301(a) of Public Law 102-40, these positions are paid according to the Nurse Schedule in 38 U.S.C. 4107(b), as in effect on August 14, 1990, with subsequent adjustments.

SCHEDULE 4--SENIOR EXECUTIVE SERVICE

(Effective on the first day of the first applicable pay period beginning on or after January 1, 2017)

	Minimum	Maximum
Agencies with a Certified SES Performance Appraisal System	$124,406	$187,000
Agencies without a Certified SES Performance Appraisal System	$124,406	$172,100

SCHEDULE 5--EXECUTIVE SCHEDULE

(Effective on the first day of the first applicable pay period beginning on or after January 1, 2017)

Level I	$207,800
Level II	187,000
Level III	172,100
Level IV	161,900
Level V	151,700

SCHEDULE 6--VICE PRESIDENT AND MEMBERS OF CONGRESS

(Effective on the first day of the first applicable pay period beginning on or after January 1, 2017)

Vice President	$240,100
Senators	174,000
Members of the House of Representatives	174,000
Delegates to the House of Representatives	174,000
Resident Commissioner from Puerto Rico	174,000
President pro tempore of the Senate	193,400
Majority leader and minority leader of the Senate	193,400
Majority leader and minority leader of the House of Representatives	193,400
Speaker of the House of Representatives	223,500

SCHEDULE 7--JUDICIAL SALARIES

(Effective on the first day of the first applicable pay period beginning on or after January 1, 2017)

Chief Justice of the United States	$263,300

* Basic pay is limited to the rate of basic pay for level II of the Executive Schedule in effect during calendar year 2017, which is $15,583.20 per month for officers at pay grades O-7 through O-10. This includes officers serving as Chairman or Vice Chairman of the Joint Chiefs of Staff, Chief of Staff of the Army, Chief of Naval Operations, Chief of Staff of the Air Force, Commandant of the Marine Corps, Commandant of the Coast Guard, Chief of the National Guard Bureau, or commander of a unified or specified combatant command (as defined in 10 U.S.C. 161(c)).

** Basic pay is limited to the rate of basic pay for level V of the Executive Schedule in effect during calendar year 2017, which is $12,641.70 per month, for officers at pay grades O-6 and below.

*** Does not apply to commissioned officers who have been credited with over 4 years of active duty service as an enlisted member or warrant officer.

**** Reservists with at least 1,460 points as an enlisted member, a warrant officer, or a warrant officer and an enlisted member which are creditable toward reserve retirement also qualify for these rates.

** Applies to personnel who have served 4 months or more on active duty.

*** Applies to personnel who have served less than 4 months on active duty.

SCHEDULE 8--PAY OF THE UNIFORMED SERVICES (PAGE 5)

Part II--RATE OF MONTHLY CADET OR MIDSHIPMAN PAY

The rate of monthly cadet or midshipman pay authorized by 37 U.S.C. 203(c) is $1,062.30.

Note: As a result of the enactment of sections 602–604 of Public Law 105–85, the National Defense Authorization Act for Fiscal Year 1998, the Secretary of Defense now has the authority to adjust the rates of basic allowances for subsistence and housing. Therefore, these allowances are no longer adjusted by the President in conjunction with the adjustment of basic pay for members of the uniformed services. Accordingly, the tables of allowances included in previous orders are not included here.

The United States Government Manual	**741–6000**
Other Services	
Electronic and on-line services (voice)	**741–6020**
Privacy Act Compilation	**741–6050**
Public Laws Update Service (numbers, dates, etc.)	**741–6043**

ELECTRONIC RESEARCH

World Wide Web

Full text of the daily Federal Register, CFR and other publications is located at: **www.fdsys.gov.**

Federal Register information and research tools, including Public Inspection List, indexes, and Code of Federal Regulations are located at: **www.ofr.gov.**

E-mail

FEDREGTOC (Daily Federal Register Table of Contents Electronic Mailing List) is an open e-mail service that provides subscribers with a digital form of the Federal Register Table of Contents. The digital form of the Federal Register Table of Contents includes HTML and PDF links to the full text of each document.

To join or leave, go to **https://public.govdelivery.com/accounts/USGPOOFR/subscriber/new**, enter your email address, then follow the instructions to join, leave, or manage your subscription.

PENS (Public Law Electronic Notification Service) is an e-mail service that notifies subscribers of recently enacted laws.

To subscribe, go to **http://listserv.gsa.gov/archives/publaws-l.html** and select *Join or leave the list (or change settings);* then follow the instructions.

FEDREGTOC and **PENS** are mailing lists only. We cannot respond to specific inquiries.

Reference questions. Send questions and comments about the Federal Register system to: **fedreg.info@nara.gov**

The Federal Register staff cannot interpret specific documents or regulations.

CFR Checklist. Effective January 1, 2009, the CFR Checklist no longer appears in the Federal Register. This information can be found online at **http://bookstore.gpo.gov/.**

FEDERAL REGISTER PAGES AND DATE, DECEMBER

CFR PARTS AFFECTED DURING DECEMBER

At the end of each month the Office of the Federal Register publishes separately a List of CFR Sections Affected (LSA), which lists parts and sections affected by documents published since the revision date of each title.

LIST OF PUBLIC LAWS

Note: No public bills which have become law were received by the Office of the Federal Register for inclusion in today's **List of Public Laws**.

Last List December 22, 2016

Public Laws Electronic Notification Service (PENS)

PENS is a free electronic mail notification service of newly enacted public laws. To subscribe, go to *http://listserv.gsa.gov/archives/publaws-l.html*

Note: This service is strictly for E-mail notification of new laws. The text of laws is not available through this service. **PENS** cannot respond to specific inquiries sent to this address.
