To invite public review and comment on the draft Polar Bear Plan, we published a notice of availability initiating a 45-day public comment period for the draft Polar Bear Plan on July 6, 2015 (80 FR 38458); we extended that comment period an additional 30 days on August 14, 2015 (80 FR 48908). The final Polar Bear Plan and the associated documents reflect the comments and recommendations the U.S. Fish and Wildlife Service received on that draft.

Polar bears evolved to utilize the Arctic sea ice niche. They are distributed throughout most ice-covered seas of the United States, Canada, the Russian Federation, Norway, and Greenland/Denmark (collectively the Range States), in the Northern Hemisphere and are managed in 19 subpopulations around the Arctic (see Figure 1 of the Polar Bear Plan). The current global polar bear population is estimated to be 22,000 to 31,000.

Ongoing and projected loss of the polar bear’s crucial sea ice habitat threatens the species throughout all of its range. The projected loss of sea ice will diminish productivity, abundance, and availability of ice seals, the polar bear’s primary prey base, and increase energetic requirements of polar bears for movement and obtaining food. It will also affect access to traditional denning areas. In turn, these factors will cause declines in the condition of polar bears from nutritional stress and reduced productivity. The eventual effect of this loss of sea ice is that the polar bear population will decline. The rate and magnitude of decline will vary geographically, based on differences in the rate, timing, and magnitude of impacts. However, within the foreseeable future, the worldwide population will be affected, and the species is likely to become in danger of extinction throughout all of its range (73 FR 28292–28293, May 15, 2008). Global climate change resulting from greenhouse gas emissions is the root cause of the loss of Arctic sea ice.

The Plan

The Polar Bear Plan addresses both the MMPA and the ESA, as they relate to polar bear conservation and recovery; it also reflects the input and values of stakeholders closely connected with polar bears and their habitat, including the State of Alaska, the North Slope Borough, Alaska Native peoples, the Polar Bear Range States, conservation groups, and the oil and gas industry, as well as the general public. All of these sources informed the Polar Bear Plan’s fundamental goals, which focus on conservation of polar bears while recognizing values associated with subsistence take, human safety, and economic activity. The goals will be used to guide management, research, monitoring, and communication into the future. Although the fundamental goals target three geographic scales (rangewide, intermediate (ecoregion), and subpopulation (stock)), specific actions under the Polar Bear Plan pertain primarily to the polar bear subpopulations present in Alaska. The Polar Bear Plan also contains specific recovery criteria, expressed in fundamental, demographic, and threats-based terms, to determine when the polar bear should be considered for delisting under the ESA and the MMPA, as they relate to guide conservation efforts associated with the MMPA.

Conservation and recovery actions are specified in the Polar Bear Plan. The single most important action for the recovery of polar bears is global reduction of atmospheric greenhouse gases, which, if achieved, should result in reduced global climate change, including Arctic warming and sea ice loss. Along with communicating that fact, the Polar Bear Plan identifies a suite of high-profile actions designed to ensure that polar bears remain in sufficient number and diversity so that they are in a position to recover once climate change is addressed. Those actions include the following:

- Limit global atmospheric levels of greenhouse gases to levels appropriate for supporting polar bear recovery and conservation, primarily by reducing greenhouse gas emissions;
- Support international conservation efforts through the Range States relationships;
- Manage human–bear conflicts;
- Collaboratively manage subsistence harvest;
- Protect denning habitat;
- Minimize risks of contamination from spills;
- Conduct strategic monitoring and research.

The full cost of implementing the Polar Bear Plan over the next 5 years is approximately $66,720,000.

Authority: We developed our Polar Bear Plan under the authority of ESA section 4(f), 16 U.S.C. 1533(f), as well as section 115(b) of the MMPA, 16 U.S.C. 1362(b). We publish this notice under ESA section 4(f) (16 U.S.C. 1531 et seq.).

Dated: December 20, 2016.

Gregory Siekaniec,
Regional Director, Alaska Region, U.S. Fish and Wildlife Service.

INTERNATIONAL TRADE COMMISSION
[USITC SE–17–001]
Sunshine Act Meeting

TIME AND DATE: January 18, 2017 at 9:30 a.m.
STATUS: Open to the public.

MATTERS TO BE CONSIDERED:
1. Agendas for future meetings: None
2. Minutes
3. Ratification List
6. Outstanding action jackets: None.

In accordance with Commission policy, subject matter listed above, not disposed of at the scheduled meeting, may be carried over to the agenda of the following meeting.

By order of the Commission.
William R. Bishop,
Supervisory Hearings and Information Officer.
[FR Doc. 2017–00279 Filed 1–5–17; 4:15 pm]
BILLING CODE 7020–02–P

INTERNATIONAL TRADE COMMISSION
[Investigation Nos. 701–TA–565 and 731–TA–1341 (Preliminary)]
Hardwood Plywood From China
Determinations

On the basis of the record developed in the subject investigations, the United States International Trade Commission (“Commission”) determines, pursuant to the Tariff Act of 1930 (“the Act”), that there is a reasonable indication that an industry in the United States is materially injured by reason of imports of hardwood plywood from China, ¹

¹The record is defined in sec. 207.2(f) of the Commission’s Rules of Practice and Procedure (19 CFR 207.2(f)).
