SUPPLEMENTARY INFORMATION:**Background**

Recovery of endangered or threatened animals and plants to the point where they are again secure, self-sustaining members of their ecosystems is a primary goal of our endangered species program and the Act (16 U.S.C. 1531 *et seq.*). Recovery means improvement of the status of listed species to the point at which listing is no longer appropriate under the criteria set out in section 4(a)(1) of the Act. The Act requires the development of recovery plans for listed species, unless such a plan would not promote the conservation of a particular species.

Species History

Noel's amphipod (*Gammarus desperatus*), Koster's springsnail (*Juturnia kosteri*), Roswell springsnail (*Pyrgulopsis roswellensis*), and Pecos assimineae (*Assimineae pecos*) (four invertebrates) are associated with spring systems in desert-grasslands in southeastern New Mexico and southwestern Texas. In 2005, the four invertebrates were federally listed as endangered throughout their range, including the Roswell Basin aquifer system in southeastern New Mexico and the Toyah and Coyanosa Basins in southwest Texas. All four species are found on Bitter Lake National Wildlife Refuge in southern New Mexico. Pecos assimineae (*Assimineae pecos*) is also located at Diamond Y and East Sandia Spring in west Texas. Critical habitat was designated for the four species in 2011.

Water quantity decreases and associated spring flow declines are the primary threats to the four invertebrate species. Groundwater pumping in the
