In the FY 2027 IPPS/LTCH PPS proposed rule (91 FR 19528), we stated that Sepsis, or septicemia, is a life-threatening condition that results from the body's dysregulated response to infection and is a leading cause of mortality, hospitalization, and readmission in the United States.[181] It is the most frequent principal diagnosis among non-maternal, non-neonatal inpatients, with over 2.2 million hospitalizations reported in 2018.[182] Of the 1.7 million adults diagnosed with sepsis annually, approximately 20 percent die.[183] [184] [185]

Consistent with section 1886(q)(5)(A) of the Act, which, as noted above, defines an ''applicable condition'' in the Hospital Readmissions Reduction Program, sepsis readmissions are both high volume and high expenditure. Thirty-day average readmission rates for patients with sepsis are estimated to be about 21 percent.[186] Sepsis is also associated with poor health outcomes, such as the development of chronic conditions and functional impairment,[187] as well as higher costs compared to other conditions included in CMS value-based and quality reporting programs.[188] Between 2016 and 2021, the aggregate hospital costs for patients with sepsis aged 65 and older increased from $16.7 billion to $26.3 billion, and the average total cost of sepsis stays for this population increased from $21,700 to $25,000 over this period.[189] Approximately 50 percent of the total hospital costs for sepsis stays in 2020 and 2021 were associated with stays expected to be billed to Medicare.[190] A recent study concluded that the quality reporting and payment-for-performance programs should address these concerns after finding that sepsis readmissions occurred at a rate similar to that of other conditions included in the Hospital Readmissions Reduction Program (for example, heart failure, chronic obstructive pulmonary disease, acute myocardial infarction).[191]

Sepsis readmissions are often preventable, highlighting the need for targeted interventions to reduce sepsis-related mortality and improve post-discharge outcomes including readmissions.[192] Readmission following a sepsis hospitalization may be a result of inadequate treatment of the initial infection, complications of hospital care, or secondary to the many challenges in implementation of care transitions and immediate post-discharge care among a complex patient population.[193] [194] Research has demonstrated that targeted quality improvement initiatives can reduce sepsis readmission rates. One study at a large, academically-affiliated hospital showed that the use of multimodal interventions, such as clinical decision support tools, sepsis response teams, standardized order sets, and data-driven quality tracking, has been associated with a lower rate of infection-related readmissions as well as lower overall readmission rates.[195] Another study of patients with severe sepsis showed that post-discharge strategies, including timely home health visits and outpatient physician follow-up within the first week, reduced all-cause 30-day readmissions.[196] A randomized clinical trial at a multisite facility showed that a multicomponent post-sepsis transition service led by a nurse navigator was associated with a 20 percent reduced risk of 30-day readmission or mortality compared to usual care.[197] These findings highlight the effectiveness of both in-hospital and post-discharge quality improvement efforts in improving outcomes for sepsis patients.

(2) Overview of Measure

In the FY 2027 IPPS/LTCH PPS proposed rule (91 FR 19528 through 19538), we proposed to adopt the Hospital 30-Day, All-Cause, Risk-Standardized Readmission Rate Following Sepsis Hospitalization measure (Sepsis Readmission measure) for the Hospital Readmissions Reduction Program beginning with an applicable period of July 1, 2025, to June 30, 2027, for the FY 2029 program year. The purpose of the Sepsis Readmission measure is to improve patient outcomes by providing patients, physicians, hospitals, and policymakers with important information about hospital-level unplanned readmission rates following hospitalization for sepsis. The Sepsis Readmission measure encourages hospitals to improve patient safety and the quality of care provided across the care continuum by tracking hospital-level rates of sepsis readmission. The measure also promotes adherence to evidence-based practices, including standardized clinical protocols, implementation of targeted post-discharge interventions, and appropriate discharge planning. This measure also gives consumers meaningful insights into the quality of care received by Medicare patients.[198]

The measure aligns with our Meaningful Measures 2.0 priority area of ''Seamless Care Coordination,'' which aims to ensure patients receive timely and coordinated care, reduce the risk of errors, and improve overall patient outcomes.[199] The Sepsis Readmission measure has been specified to include both Medicare Fee-for-Service and Medicare Advantage beneficiaries. Including Medicare Advantage beneficiaries in CMS hospital outcome measures helps ensure that hospital quality is measured consistently across all Medicare beneficiaries.[200] This is also consistent with the program's finalization of a policy in the FY 2026 IPPS/LTCH PPS final rule to integrate Medicare Advantage beneficiaries into the cohorts of the Hospital Readmissions Reduction Program measure set beginning with the FY 2027 program year (90 FR 36923 through 36929).

The Sepsis Readmission measure we proposed addresses a significant performance gap in healthcare quality. Sepsis represents a critical public health challenge, with substantial variation in hospital readmission rates following an index sepsis hospitalization. This variation reflects differences in the quality of initial treatment, discharge planning, and post-discharge care transitions across healthcare facilities. Based on our calculations using data from 2022–2023, the mean 30-day all-cause risk-standardized readmission rate (RSRR) for sepsis using the proposed measure methodology (see section I.b.4 for the proposed Sepsis Readmission measure methodology) for all hospitals with at least 25 eligible discharges for the measure is about 18.09 percent. Among hospitals with at least 25 eligible discharges for the Sepsis Readmission measure, hospitals with a Disproportionate Share Hospital (DSH) patient percentage of at least 65 percent and teaching hospitals with 100 or more residents have the highest mean RSRRs (18.63 percent and 18.62 percent, respectively). Additionally, safety-net hospitals with at least 25 eligible discharges have a slightly higher mean RSRR than non-safety-net hospitals with at least 25 eligible discharges (18.37 percent and 18.02 percent, respectively).

TABLE V.I.-02.: MEAN SEPSIS RSRRS BY HOSPITAL CHARACTERISTIC

	Number of Hospitals with 25 or more sepsis discharges [a]	Mean Sepsis Risk Standardized Readmission Rate (%) [b]
All Hospitals	2,597	18.09
By Geographic Location		
Urban hospitals	2,037	18.14
1-99 beds	376	17.84
100-199 beds	627	18.16
200-299 beds	393	18.32
300-399 beds	270	18.21
400-499 beds	118	18.02
500 or more beds	253	18.23
Rural hospitals	556	17.90
1-49 beds	209	17.74
50-99 beds	180	17.93
100-149 beds	94	18.13
150-199 beds	42	17.99
200 or more beds	31	18.05
By Teaching Status [c]		
No teaching	1,357	17.97
Fewer than 100 residents	941	18.09
100 or more residents	295	18.62
By Ownership Type		
Government	337	18.05
Proprietary	501	18.52
Voluntary	1,755	17.97
By Safety-net Status [d]		
Safety-net hospitals	525	18.37
Non-safety-net hospitals	2,068	18.02
By Disproportionate Share Hospital (DSH) Patient Percentage [e]		
0-24	923	18.07
25-49	1,405	18.01
50-64	154	18.51
65 and over	111	18.63
By Medicare Cost Report (MCR) Percentage [f]		

0-24	1,334	18.09
25-49	1,223	18.09
50-64	35	18.03
65 and over	1	16.76
By Region		
New England	118	18.51
Middle Atlantic	300	18.32
East North Central	422	18.15
West North Central	197	17.75
South Atlantic	465	18.29
East South Central	216	18.02
West South Central	335	18.05
Mountain	188	17.44
Pacific	355	18.02

Source: Measure results based on preliminary Sepsis Readmission measure results that were available using data from January 1, 2022, through December 31, 2023. Preliminary Sepsis Readmission measure results include hospitals that are not eligible to participate in the Hospital Readmissions Reduction Program (such as CAHs) in the estimation of RSRRs. Although data from all subsection (d), Maryland hospitals, and hospitals that are not eligible to participate in the Hospital Readmissions Reduction Program hospitals were used in calculations of each hospital's RSRR, this table does not include results for Maryland hospitals, hospitals that are not eligible to participate in the Hospital Readmissions Reduction Program, and hospitals that are not open as of the October 2025 public reporting open hospital list because these hospitals are not included in the Hospital Readmissions Reduction Program. Data from the FY 2026 IPPS/LTCH PPS proposed rule impact file were used to identify hospital characteristics. The number of hospitals with each characteristic may not sum to the total number of hospitals due to some hospitals having missing characteristic data in the impact file. This table only includes results for hospitals with at least 25 eligible discharges for the sepsis measure, as measure performance cannot be reliably estimated for hospitals with fewer than 25 eligible discharges.

[a] This table only includes results for hospitals with at least 25 eligible discharges for the sepsis measure as measure performance cannot be reliably estimated for hospitals with fewer than 25 eligible discharges.
[b] The RSRR is the ratio of the predicted readmission rate based on the hospital's performance with its patient case mix to the expected readmission rate based on readmission rates at an average hospital with a patient case mix similar to that hospital's, multiplied by the national observed readmission rate.
[c] A hospital is considered a teaching hospital if it has an Indirect Medical Education adjustment factor for Operation PPS greater than zero.

[d] A hospital is considered a safety-net hospital if it is in the top DSH quintile.

[e] DSH patient percentage is the sum of the percentage of Medicare inpatient days attributable to patients eligible for both Medicare Part A and Supplemental Security Income (SSI), and the percentage of total inpatient days attributable to patients eligible for Medicaid but not Medicare Part A.
[f] MCR (Medicare Cost Report) percentage is the percentage of total inpatient stays from Medicare patients.

As discussed in the Background section, research demonstrates that thirty-day hospital readmissions following sepsis hospitalization often stem from ineffective initial treatment, poor discharge planning, and insufficient post-discharge follow-up. Studies have shown that facilities implementing a higher number of evidence-based transitional care processes experience lower readmission rates, indicating substantial opportunity for quality improvement across the healthcare system.

Given that infection (either new or recurrent) is the leading cause of sepsis-related readmission, and that evidence-based interventions such as care coordination, medication reconciliation, patient education, and timely post-discharge follow-up have been proven effective in reducing readmissions, this measure would provide hospitals with actionable feedback to enhance quality across the entire care continuum and reduce preventable readmissions for a population not captured in CMS' other condition- and procedure-specific readmission measures.

(3) Measure Specifications

(a) Numerator

In the FY 2027 IPPS/LTCH PPS proposed rule (91 FR 19531), we stated that the numerator of the measure is defined as Medicare Fee-for-Service or Medicare Advantage beneficiaries aged 65 years and older, who were discharged from the hospital with a principal diagnosis of sepsis (including post-procedural sepsis), who were then readmitted to an acute care hospital for any cause within 30 days. Patients must have been enrolled in Medicare Fee-for-Service or Medicare Advantage during the index admission and for the 12 months prior to the date of admission, discharged alive from a non-federal short-term acute care hospital, and not transferred to another acute care facility. Only an unplanned inpatient admission to a short-term acute care hospital can qualify as a readmission. Planned readmissions, which are generally not a signal of quality of care, are not included in the numerator. For details of the measure methodology, we refer readers to the measure methodology report, available at: *https://qualitynet.cms.gov/inpatient/measures/readmission/methodology.*

(b) Denominator

The measure denominator includes all Medicare Fee-for-Service or Medicare Advantage beneficiaries aged 65 years and older, hospitalized at non-federal short-term acute care hospitals who are discharged alive following a principal hospital discharge diagnosis of sepsis (including post-procedural sepsis), and with a continuous 12-month Medicare enrollment period prior to the index hospitalization.

This measure excludes index admissions for patients who meet additional exclusion criteria, including: (1) admissions during which patients leave the hospital against medical advice (AMA) (excluded because providers may not have the opportunity to deliver full care and prepare the patient for discharge); (2) admissions for patients without at least 30 days post-discharge enrollment in Medicare Fee-for-Service or Medicare Advantage (excluded because the 30-day

readmission outcome cannot be assessed in this group); (3) admissions resulting in patients discharged to hospice (readmission may not be a meaningful outcome for these hospice patients and the discharging hospital is not the most appropriate party to hold accountable for the readmission from hospice for this measure); (4) sepsis admissions captured in the pneumonia readmission measure (to avoid overlap with the pneumonia readmission measure); and (5) sepsis admissions within 30 days of an eligible sepsis index admission (excluded because they are considered readmissions, not index admissions). For more information about the measure specifications, we refer readers to the methodology report, available at: *https://qualitynet.cms.gov/inpatient/measures/readmission/methodology*.

(c) Risk Adjustment

To account for differences in case mix across hospitals, the Sepsis Readmission measure includes risk adjustments for patient factors such as age, comorbid diseases, and indicators of patient frailty. The measure also adjusts for the aggressiveness of the infectious organism (bacteria, virus, or fungus) causing sepsis, a transplant recipient indicator, and clinical markers of severe sepsis. These factors are included in risk adjustment calculations for the measure because they are clinically relevant and are related to the measure outcome. For each patient, risk adjustment variables are obtained from inpatient, outpatient, and physician Medicare administrative claims data (Medicare Fee-for-Service Part A and Part B claims, hospital-submitted Medicare Advantage claims, and Medicare Advantage Organization-submitted encounter data) extending up to 12 months prior to the index hospitalization, and secondary diagnoses documented as present on admission during the index hospitalization. The risk adjustment does not include complications that arise during the course of the index hospitalization because they reflect the quality of care delivered and fall within the causal pathway rather than patient risk.[201] For more information on risk adjustment we refer readers to the methodology report, available at: *https://qualitynet.cms.gov/inpatient/measures/readmission/methodology.*

[201] *https://p4qm.org/measures/5275.*

(4) Calculating Sepsis Risk-Standardized Readmission Rate

In the FY 2027 IPPS/LTCH PPS proposed rule (91 FR 19532), we stated that the Sepsis Readmission measure calculates hospital-level 30-day all-cause risk-standardized readmission rates (RSRR) for sepsis. The sepsis RSRR will be calculated as the ratio of the number of predicted readmissions based on the hospital's performance with its observed case mix to the number of expected readmissions based on the average national level of performance with that hospital's case mix, multiplied by the national observed readmission rate. This is the same measure calculation methodology as the current measures in the Hospital Readmissions Reduction Program. For more detail on how the Sepsis Readmission measure would be used to calculate the 30-day Risk-Standardized Readmission Rate, we refer readers to the methodology report, available at: *https://qualitynet.cms.gov/inpatient/measures/readmission/methodology.*

(5) Calculating the Excess Readmission Ratio

As we proposed in the FY 2027 IPPS/LTCH PPS proposed rule (91 FR 19532), the Sepsis Readmission measure would use the same methodology and statistical modeling approach as the current measures in the Hospital Readmissions Reduction Program. In the FY 2012 IPPS/LTCH PPS final rule (76 FR 51673 through 51676), we finalized the excess readmission ratio pursuant to section 1886(q)(4)(C) of the Act. The ratio is calculated using hierarchical logistic regression. The method adjusts for variation across hospitals in how sick their patients are when admitted to the hospital (and therefore, variation in hospital patients' readmission risk) as well as the variation in the number of patients that a hospital treats to reveal differences in quality. The method produces an adjusted actual (or ''predicted'') number in the numerator and an ''expected'' number in the denominator. The expected calculation is similar to that for logistic regression—it is the sum of all patients' expected probabilities of readmission, given their risk factors and the risk of readmission at an average hospital with a similar patient case mix. For each hospital, the numerator of the ratio used in the consensus-based entity methodology (actual adjusted readmissions) is calculated by estimating the probability of readmission for each patient at that hospital and summing up over all the hospital's patients to get the actual adjusted number of readmissions for that hospital. The ratio compares the total adjusted actual readmissions at the hospital to the number that would be expected if the hospital's patients were treated at an average hospital with similar patients. Hospitals with more adjusted actual readmissions than expected readmissions will have a risk-standardized ratio (excess readmission ratio) greater than one.

For additional detail on the methodology of excess readmission ratio calculations, we refer readers to the FY 2013 IPPS/LTCH PPS final rule (77 FR 53380 through 53381). We also refer readers to section V.I.2.b.(9) of this final rule for a description of how the Sepsis Readmission measure would be incorporated into the Hospital Readmissions Reduction Program payment adjustment beginning with the FY 2029 program year.

(6) Reliability Testing

In the FY 2027 IPPS/LTCH PPS proposed rule (91 FR 19532), we stated that reliability testing was conducted to assess the consistency and stability of the Sepsis Readmission measure in distinguishing hospital performance. The testing methodology evaluated whether observed differences in hospital readmission rates reflect true differences in quality of care rather than random variation.

The reliability analysis employed standard statistical approaches to examine measure performance across hospitals with varying patient volumes. Specifically, we assessed split-half reliability, also called split-sample reliability, to test the internal consistency or stability of the measure. Reliability was estimated both at the measure score and accountable-entity levels.

Reliability testing was assessed using 2 years of data from January 1, 2022, through December 31, 2023. Table V.I.-03 shows split-half reliability results at the measure score level for hospitals with a minimum case of ≥ 2 cases and ≥ 25 cases (the proposed threshold for public reporting), respectively. The results indicate that the measure is sufficiently reliable for distinguishing between high- and low-performing hospitals, consistent with the minimum standard for reliability set forth by the Partnership for Quality Measurement (≥ 0.60).[202]

[202] For more details on reliability guidance, we refer readers to the Reliability Guidance for the Endorsement and Maintenance of Clinical Quality Measures Document available at: *https://p4qm.org/em/resources.*

TABLE V.I.-03.: MEASURE SCORE SPLIT-HALF RELIABILITY (JANUARY 1, 2022 – DECEMBER 31, 2023)

Minimum Case Volume	Number of Hospitals (%)	Number of Patients (%)	Split-half Reliability Score
>=2	4,287 (100)	1,326,427 (100)	0.6
>=25	3,053 (71.2)	1,315,690 (99.2)	0.6

Table V.I.–04 shows the accountable entity-level reliability results for hospitals with a minimum case of ≥ 25 cases (the proposed threshold for public reporting). Hospitals were categorized into volume deciles to assess reliability across different facility sizes and patient populations. Using this method, 69 percent of accountable entities met the split-half reliability estimate threshold of ≥ 0.60. This indicates that the measure is sufficiently reliable for distinguishing between high- and low-performing hospitals.

TABLE V.I.-04.: ACCOUNTABLE ENTITY LEVEL RELIABILITY ESTIMATE (JANUARY 1, 2022 – DECEMBER 31, 2023)

	Overall	Min	Decile 1	Decile 2	Decile 3	Decile 4	Decile 5	Decile 6	Decile 7	Decile 8	Decile 9	Decile 10	Max
Mean Reliability	0.682	0.205	0.254	0.384	0.521	0.642	0.727	0.782	0.826	0.862	0.894	0.932	0.986
Mean Performance Score	18.085	18.107	17.944	17.984	17.939	18.037	18.064	18.155	18.074	18.177	18.264	18.21	20.756
N of Entities	**3,053**	21	312	296	309	305	306	302	308	305	306	304	1
N of Persons / Encounters / Episodes	**1,315,690**	525	10,421	18,064	33,027	53,529	79,658	105,855	142,821	186,672	253,832	431,811	6,769

The Sepsis Readmission measure demonstrates acceptable reliability based on the split-half reliability method, both at the measure score level, and at the entity level. The measure's strong reliability, combined with evidence of substantial performance variation, indicates that it will provide hospitals with actionable, consistent feedback to drive improvements in sepsis care transitions and reduce preventable readmissions.

We also conducted additional analyses to examine coding variability as a source of bias in entity level performance scores; and post-discharge mortality within 30 days of discharge to account for competing risk of mortality in readmission risk. The analyses found no correlation between the hospital level use of sepsis code A41.9 (the most widely used code) and readmission or mortality risk. There was also no correlation between post-discharge mortality and readmission risk at the entity (hospital) level. Post-discharge mortality was stable with increasing duration of time since discharge and up to 30 days. Please refer to the measure methodology report on QualityNet for more detailed information on these analyses, available at: *https://qualitynet.cms.gov/inpatient/measures/readmission/methodology.*

(7) Pre-Rulemaking Process and Measure Endorsement

(a) Recommendation From the Pre-Rulemaking Measure Review (PRMR) Process

In the FY 2027 IPPS/LTCH PPS proposed rule (91 FR 19533), we referred readers to the Partnership for Quality Measurement website for details on the PRMR process, including the voting procedures used to reach consensus on measure recommendations.[203] [204] The PRMR Hospital Committee met on January 12 and 13, 2026, to review measures included by the Secretary on the publicly available ''2025 Measures Under Consideration List,'' including the Hospital 30-Day, All-Cause, Risk-Standardized Readmission Rate Following Sepsis Hospitalization measure (MUC2025–055).[205]

The voting results of the PRMR Hospital Recommendation Group for the proposed Sepsis Readmission measure within the Hospital Readmissions Reduction Program were as follows: 13 (65 percent) of the Recommendation Group members recommended adopting the measure into the Hospital Readmissions Reduction Program; seven (35 percent) of the Recommendation Group members voted not to recommend the measure for adoption.[206] With 65 percent of the votes for recommend, consensus was not reached, but the majority of the Recommendation Group expressed some support for use of the measure in the Hospital Readmissions Reduction Program. Recommendation Group members who voted not to recommend adoption of the measure for the Program provided the following rationales: (1) concerns about adopting the Sepsis Readmission measure directly into the Hospital Readmissions Reduction Program; (2) methodological concerns; and (3) the need for greater consistency in sepsis definitions across measures and payers.

The Recommendation Group expressed concerns about adopting the Sepsis Readmission measure directly into the Hospital Readmissions Reduction Program, given the payment implications and the perception that hospitals may need time to adapt. Several members recommended a staged approach—initial implementation in the Hospital Inpatient Quality Reporting Program for multiple years, followed by later consideration for Hospital Readmissions Reduction Program—so hospitals have adequate time to understand the measure before the measure is tied to payment.

We appreciate these implementation concerns and agree that careful rollout planning is important for any measure proposed for pay-for-performance programs. We agree that hospitals will benefit from understanding their performance on the Sepsis Readmission measure and potential impacts to their payment under the Hospital Readmissions Reduction Program prior to using the measure for payment adjustments. We considered whether to first adopt this measure in the Hospital Inpatient Quality Reporting Program, in

[203] Battelle, Partnership for Quality website. Available at: *https://p4qm.org/.*

[204] In 2025, we updated the PRMR voting process such that committee members will vote to either ''recommend'' or ''do not recommend'' that a measure be added to the intended CMS program(s), thus, removing the ''recommend with conditions'' voting option. The threshold to reach consensus on a given measure continues to be a minimum of 75 percent agreement among members. Committee members can provide considerations for CMS to review prior to implementation.

[206] Battelle. (February 2026). National Consensus Development and Strategic Planning for Health Care Quality Measurement 2025–2026 Pre-Rulemaking Measure Review (PRMR) Recommendation Group Final Meeting Summary: Hospital Committee. *https://p4qm.org/sites/default/files/2026-02/PRMR-Hospital-Recommendation-Group-Meeting-Final-Summary-508.pdf* Accessed February 26, 2026.

order to give hospitals time to become familiar with the measure before adopting it in a penalty program. However, given the significant morbidity and mortality linked to sepsis and the high case volume and cost of hospital readmissions, we proposed to adopt the measure directly into the Hospital Readmissions Reduction Program, but using a phased approach, in an effort to balance implementation concerns against our intention to address this CMS priority in a timely manner. Specifically, we proposed to implement the Sepsis Readmission measure with ''early look'' reports for FY 2028—discussed further in section V.I.2.b.(9)—that would include sepsis readmission rates as well as estimated Hospital Readmissions Reduction Program payment adjustments with the addition of the Sepsis Readmission measure before beginning to use this measure in the FY 2029 payment adjustment. In addition, we stated in the proposed rule that we would continue to evaluate measure performance characteristics (including hospital-level reliability, stability year-over-year, and subgroup impacts such as rural/low-volume hospitals) as part of routine measure maintenance.[207]

Committee members also raised methodological concerns, including the perceived imprecision of claims-based readmission measures and uncertainty about risk adjustment adequacy, particularly for rural hospitals and hospitals facing documentation constraints (for example, non-employed clinicians, limited resources). We acknowledge the committee's view of the limitations and variability in the accuracy of claims-based measures; however, claims-based readmission measures are widely used in CMS programs because they are nationally scalable, consistently available, and minimize provider reporting burden while enabling standardized comparisons across hospitals. For this measure specifically, we conducted analyses to examine variation in the use of sepsis codes across hospitals, stratified by volume of sepsis cases treated, and observed no correlation with 30-day readmission or mortality, indicating that documentation practices are not driving hospital measure performance. We wish to emphasize that the risk adjustment variables were identified through a deliberative and empirical process that resulted in a robust risk adjustment model that includes clinically relevant variables such as severity of sepsis, source of infection, how aggressive the infectious organism is, immunocompromised state of the patient, and organ failure/dysfunction. The risk model demonstrated strong calibration and discrimination in testing including for patients with differing severity of sepsis. For more details on our analysis of measure reliability and the risk adjustment methodology, we refer readers to subsection (6) in this section and to the measure methodology report, available at: *https://qualitynet.cms.gov/inpatient/measures/readmission/methodology.*

Finally, the committee emphasized the need for greater consistency in sepsis definitions across measures and payors, with many urging alignment with Sepsis-3 as the most current international consensus definition.[208] CMS noted that differing definitions can reflect deliberate tradeoffs between sensitivity and specificity; [209] a scan of the literature shows that the most common problems with sepsis diagnoses relate to under-coding by providers due to inconsistent coding practices.[210] The developer noted that the current approach yields excellent model performance and identifies a clinically meaningful at-risk population for readmission. We appreciate the committee's request for clarity and standardization, particularly given reported coding and claims-denial dynamics that may influence whether sepsis is included on a claim. We note that we conducted analyses to examine coding practices as a factor that impacts performance scores and found no evidence to support this relationship. Further, as a part of routine measure maintenance, we conduct ongoing monitoring and evaluation analyses to watch for any unintended consequences.

(b) Measure Endorsement

We refer readers to the Partnership for Quality Measurement website for details on the measure endorsement and maintenance process, including the measure evaluation procedures the Endorsement and Maintenance Committees use to evaluate measures and whether they meet endorsement criteria. The measure was submitted for review in the Fall 2025 cycle. The Cost and Efficiency Recommendation Group reviewed the Hospital-Level, Risk-Standardized 30-day All-Cause Readmission Following Hospitalization for Sepsis (CBE# 5275) on February 6, 2026. The voting results of the Recommendation Group were: 16 members (84 percent) voted to endorse the measure, and 3 members (16 percent) voted not to endorse the measure. With a vote of 84 percent, the measure was endorsed, without conditions.[211]

(8) Payment Reductions

The payment adjustment factor under the Hospital Readmissions Reduction Program is calculated as the greater of 1 minus the ratio of aggregate payments for excess readmissions for the applicable condition to aggregate payments for all discharges or the applicable floor adjustment factor, as defined by Section 1886(q)(3)(A) of the Act. The definition for ''aggregate payments for excess readmissions'' is codified at § 412.152 and the methodology to calculate the payment adjustment factor is codified at § 412.154(c).

In the FY 2027 IPPS/LTCH PPS proposed rule (91 FR 19534), we stated that as a result of the proposal to add sepsis as an applicable condition under the Hospital Readmissions Reduction Program, excess readmissions for sepsis would be included in the calculation of aggregate payments for excess readmissions beginning with the FY 2029 program year. Consistent with the definition codified at § 412.152, aggregate payments for excess readmissions would include the aggregate base operating DRG payments for excess readmissions associated with sepsis, as applicable. Accordingly, the

[207] We conduct an annual reevaluation of measures implemented in its quality reporting and value-based purchasing programs to ensure that they remain valid and reflective of current clinical practice and coding standards. As part of this process, we may update measure cohorts, risk adjustment models, or outcomes, as appropriate. These updates are informed by review of the most recent scientific literature, stakeholder input, empirical analyses, and assessments of coding trends that may indicate shifts in clinical practice or billing patterns.

[209] While there is no one consensus definition of sepsis, Sepsis-2 (based mainly on Systemic Inflammatory Response Syndrome criteria or SIRS) is highly sensitive, often identifying patients before severe deterioration. Sepsis-3 (based primarily on Sequential Organ Failure Assessment or SOFA) is highly specific, meaning it risks missing patients. Based on detailed expert clinical and TEP input, we elected to align the measure with Sepsis-2 definition in order to ensure cases were not missed, but also ensured no overlap with existing condition- and procedure-specific 30-day readmission measures.

Accuracy of International Classification of Diseases, 10th Revision Codes for Identifying Sepsis: A Systematic Review and Meta-Analysis. Crit Care Explor. 2022 Nov 9;4(11):e0788. doi: 10.1097/CCE.0000000000000788. PMID: 36382338; PMCID: PMC9649267.

[211] *https://p4qm.org/sites/default/files/Cost%20and%20Efficiency/material/ContractNo-75FCMC23C0010-Cost-EM-Technical-Report-Fall-2025-508.pdf.*

inclusion of sepsis as an applicable condition would be reflected in the calculation of the payment adjustment factor consistent with the established methodology of the program.

To assess the expected impact on hospital payment adjustments resulting from the proposal to adopt the Sepsis Readmission measure, we estimated hospitals' payment adjustment factors including the Sepsis Readmission measure. Table V.I.–05. shows the estimated total Medicare savings with and without the Sepsis Readmission measure included in the program measure set. Based on our analysis, the estimated average payment reduction per penalized hospital when including the Sepsis Readmission measure increased by approximately $63,500.

TABLE V.I.-05.: ESTIMATED TOTAL MEDICARE SAVINGS OF PROPOSED ADOPTION OF SEPSIS READMISSION MEASURE TO HOSPITAL READMISSIONS REDUCTION PROGRAM MEASURE SET

	Current measure set (without sepsis)	Proposed measure set with sepsis	Difference between proposed and current measure sets	Percentage difference between proposed and current measure sets
Estimated total Medicare savings	$361,347,626	$530,998,964	$169,651,338	47%
Number of penalized hospitals	2,358	2,450	92	4%

Our analysis, as reflected in Table V.I.–05, also assessed the impact of the proposed Sepsis Readmission measure adoption on the number of hospitals that could be penalized under the Hospital Readmissions Reduction Program (that is, they have 25 or more eligible discharges for at least one measure), the number and percentage of penalized hospitals, and penalties as a share of payments overall and by hospital characteristics. The results for the current measure set are equal to those in Table V.I.–02., which show the estimated results for the FY 2027 Hospital Readmissions Reduction Program by hospital characteristic. The second and sixth columns in Table V.I.–06. indicate the total number of hospitals that could be penalized under the Hospital Readmissions Reduction Program. Poorly performing hospitals included in the program may receive a penalty if they are non-Maryland subsection (d) hospitals with 25 or more eligible discharges for at least one measure during the applicable period. The third and seventh columns in the table indicate the total number of non-Maryland hospitals with available data for each characteristic that have an estimated payment adjustment factor less than 1 (that is, penalized hospitals). The fourth and eighth columns in the table indicate the estimated percentage of penalized hospitals among those that could be penalized by hospital characteristic. The fifth and ninth columns in the table estimate the financial impact on hospitals by hospital characteristic, referred to as the penalty as a share of payments. The penalty as a share of payments is calculated as the sum of penalties for all hospitals with that characteristic over the sum of all base operating DRG payments for those hospitals. For example, under the current measure set without sepsis, the penalty as a share of payments for urban hospitals is 0.48 percent, and with the proposed updates, the penalty as a share of payments for urban hospitals is 0.68 percent. This means that total penalties for all urban hospitals are 0.48 percent of total payments for urban hospitals under the current measure set and 0.68 percent with the proposed measure set to add sepsis. Measuring the financial impact on hospitals as a percentage of total base operating DRG payments accounts for differences in the amount of base operating DRG payments for hospitals with the characteristic when comparing the financial impact of the program on different groups of hospitals.

TABLE V.I.-06.: COMPARISON OF PROPOSED SEPSIS READMISSION MEASURE IN HOSPITAL READMISSIONS REDUCTION PROGRAM BY HOSPITAL CHARACTERISTIC

	Current measure set (without Sepsis Readmission measure)				Proposed measure set (with Sepsis Readmission measure)			
Hospital Characteristic	Number of Hospitals Eligible for a Penalty [a]	Number of Penalized Hospitals [b]	Percentage of Hospitals Penalized (%) [c]	Penalty as a Share of Payments (%) [d]	Number of Hospitals Eligible for a Penalty [a]	Number of Penalized Hospitals [b]	Percentage of Hospitals Penalized (%) [c]	Penalty as a Share of Payments (%) [d]
All Hospitals	2,832	2,358	83.26	0.48	2,836	2,450	86.39	0.68
By Geographic Location								
Urban hospitals	2,180	1,876	86.06	0.48	2,183	1,937	88.73	0.68
1-99 beds	511	358	70.06	0.48	514	382	74.32	0.64

Source: Current and proposed measure set results based on preliminary Medicare Advantage and Medicare-Fee-for-Service readmission measure results that were available using data from January 1, 2022, through December 31, 2023. Preliminary Medicare Advantage and Medicare-Fee-for-Service and Sepsis Readmission measure results included hospitals that were not eligible to participate in the Hospital Readmissions Reduction Program (such as CAHs) in the estimation of excess readmission ratios (ERRs). Although data from all subsection (d), Maryland hospitals, and hospitals that were not eligible to participate in the Hospital Readmissions Reduction Program hospitals were used in calculations of each hospital's ERR, this table does not include results for Maryland hospitals, hospitals that are not eligible to participate in the Hospital Readmissions Reduction Program, and hospitals that were not open as of the October 2025 public reporting open hospital list because these hospitals were not included in the Hospital Readmissions Reduction Program. Dual proportions and Fee-for-Service base operating DRG ratios were calculated from July 1, 2021, through June 30, 2023. MedPAR data from October 1, 2022, through September 30, 2023 (FY 2023) were used to calculate the payment adjustment as a proportion of total base operating DRG payments. Data from the FY 2026 IPPS/LTCH PPS proposed rule impact file was used to identify hospital characteristics. The number of hospitals with each characteristic may not sum to the total number of hospitals due to some hospitals having missing characteristic data in the impact file. This table only includes results for hospitals that could be penalized under the program on the basis of having at least 25 eligible discharges for at least one measure. The average share of penalties as a percentage of all base operating DRG payments was calculated as the sum of all Medicare savings for the group of hospitals divided by total base operating DRG payments for all hospitals in that group.

[a] This column is the number of applicable hospitals within the characteristic that could be penalized (that is, they have 25 or more eligible discharges for at least one measure).

[b] This column is the number of applicable hospitals that are penalized (that is, they have 25 or more eligible discharges for at least one measure and an estimated payment adjustment factor less than 1) within the characteristic.

[c] This column is the percentage of applicable hospitals that are penalized among hospitals that could be penalized, by characteristic.

[d] This column is calculated as the sum of all penalties for the group of hospitals with that characteristic divided by total base operating DRG payments for all those hospitals. Measuring the financial impact on hospitals as a percentage of total base operating DRG payments in this way allows for comparisons across hospital characteristics that accounts for differences in the amount of base operating DRG payments for different groups of hospitals. MedPAR data from October 1, 2022, through September 30, 2023 (FY 2023), are used to estimate the total base operating DRG payments.

[e] A hospital is considered a teaching hospital if it has an Indirect Medical Education adjustment factor for Operation PPS greater than zero.

[f] A hospital is considered a safety-net hospital if it is in the top DSH quintile.

[g] DSH patient percentage is the sum of the percentage of Medicare inpatient days attributable to patients eligible for both Medicare Part A and Supplemental Security Income (SSI), and the percentage of total inpatient days attributable to patients eligible for Medicaid but not Medicare Part A.

[h] MCR (Medicare Cost Report) percentage is the percentage of total inpatient stays from Medicare patients.

(9) Data Submission, Early Look, and Public Reporting

In the FY 2027 IPPS/LTCH PPS proposed rule (91 FR 19538), we stated that the Sepsis Readmission measure uses Medicare administrative data (Medicare Fee-for-Service Part A and Part B claims, hospital-submitted Medicare Advantage claims, and Medicare Advantage Organization-submitted encounter data) for Medicare Fee-for-Service and Medicare Advantage beneficiaries hospitalized for sepsis. Because this measure utilizes CMS administrative data, a hospital would not be required to submit additional data for calculating the measure. In the FY 2026 IPPS/LTCH PPS final rule, we finalized our policy to use 2 years of claims data to calculate readmission measures (90 FR 36931 through 36932) in conjunction with the policy to integrate Medicare Advantage beneficiaries into the cohorts of the Hospital Readmissions Reduction Program measure set (90 FR 36923 through 36929) beginning with the FY 2027 program year.

We considered whether to first adopt this measure in the Hospital Inpatient Quality Reporting Program, in order to give hospitals time to become familiar with the measure before adopting it in

a penalty program. However, as discussed in section V.I.2.b.(1) of the FY 2027 IPPS/LTCH PPS proposed rule, given the significant morbidity and mortality linked to sepsis and the high case volume and cost of hospital readmissions, and our intention to address this CMS priority in a timely manner, we proposed to adopt the measure in the Hospital Readmissions Reduction Program without delay, but also to provide hospitals with an ''early look'' of their Sepsis Readmission measure results and estimated Hospital Readmissions Reduction Program payment adjustments with the addition of the Sepsis Readmission measure for the FY 2028 program year, for which the applicable period is from July 1, 2024, to June 30, 2026. As proposed, data used in this early look would not be publicly reported or used for payment adjustment; the early look would provide hospitals with confidential reports of their measure and program results prior to public reporting of the Sepsis Readmission measure beginning with the FY 2029 program year.

We proposed that the Sepsis Readmission measure would be used for payment adjustment beginning with the FY 2029 program year, for which the applicable period is from July 1, 2025, to June 30, 2027. We recognize that the first year of data used to calculate the Sepsis Readmission measure would include patient data from a period of time predating the proposal of the measure. We note that the approach of including that data in public reporting and payment determination is consistent with prior claims-based measure adoptions in the Hospital Readmissions Reduction Program. We reiterate that this measure will not require any additional data from hospitals and that the proposed implementation timeline would support our goal of addressing the health care quality gap in sepsis care in a timely manner. Consistent with the standard of care for patients with sepsis, we expect that hospitals are already providing the types of discharge planning and care coordination services that would be expected to minimize readmissions. Additionally, more than half of the proposed first reporting period would take place after the intended publication date of the FY 2027 IPPS/LTCH PPS proposed rule. This will allow hospitals to make any necessary improvements to their discharge planning and care coordination processes. We refer readers to the FY 2015 IPPS/LTCH PPS final rule for an example of such an instance (79 FR 50033 through 50039). We will continue to publicly report readmission rates by publicly posting the readmission measure results annually for the applicable conditions for each hospital on the Compare tool or successor website(s), currently available at *https://www.medicare.gov/care-compare/*, and on the Provider Data Catalog, available at *https://data.cms.gov/provider-data/,* as codified at § 412.154(f).

We invited public comment on our proposal to adopt the Sepsis Readmission measure as part of the Hospital Readmissions Reduction Program measure set beginning with an early look for the FY 2028 program year (applicable period of July 1, 2024, to June 30, 2026), and use for the FY 2029 program year (applicable period of July 1, 2025, to June 30, 2027) and subsequent years.

Comment: Several commenters supported the adoption of the Sepsis Readmission measure into the Hospital Readmissions Reduction Program for use in the FY 2029 program year and subsequent years, stating that it will improve quality, care coordination, and safety of post-sepsis transitions of care and reduce recurrent infection and complications following sepsis treatment. A commenter supported the inclusion of Medicare Advantage (MA) patients, stating that the inclusion will improve the accuracy of performance comparisons by more fully reflecting patient populations.

Response: We thank commenters for their support. We agree that the Sepsis Readmission measure will support quality of care for patients with sepsis discharging from hospitals.

Comment: A few commenters supported the proposal but had suggestions for future rulemaking. A commenter stated that CMS should align the measure with existing sepsis quality measures to create a coherent set of initiatives. Another commenter requested that CMS incorporate diagnostic-informed clinical decision-making, risk stratification, and care planning as part of future measure refinements.

Response: We thank commenters for their support and will consider these suggestions in future rulemaking.

Comment: Many commenters expressed concern that the proposal to include the Sepsis Readmission measure in the Hospital Readmissions Reduction Program did not allow sufficient time for hospitals to review the methodology, receive feedback, validate performance, and understand how patient complexity is addressed. Commenters were appreciative of the ''early look'' reports, but a few commenters requested that CMS provide at least two full years of an early look, to include providing hospitals with confidential, hospital-specific feedback, before incorporating the measure into Hospital Readmissions Reduction Program for payment purposes. A few commenters noted that hospitals are already halfway through the performance period for which they would be held financially accountable. A commenter recommended delaying implementation of the measure for performance-based accountability until the FY 2031 program year.

Response: We appreciate the commenters' concerns and are finalizing the proposal with modification. Specifically, we will adopt the Sepsis Readmission measure as part of the Hospital Readmissions Reduction Program measure set beginning with early looks for the FY 2028 (applicable period of July 1, 2024 to June 30, 2026) and FY 2029 (applicable period of July 1, 2025 to June 30, 2027) program years. The measure will then be used in the Hospital Readmissions Reduction Program for payment adjustment beginning with the FY 2030 program year (applicable period of July 1, 2026 to June 30, 2028) and subsequent years.

During the ''early look'' periods, data will not be publicly reported or used for payment adjustment; the early look will provide hospitals with confidential reports of their measure and program results prior to public reporting of the Sepsis Readmission measure beginning with the FY 2030 program year. We believe one additional year of confidential reporting prior to impacting hospital payments appropriately balances the need to address an important area of quality measurement with commenters' requests for additional time to understand measure specifications, review performance results, and assess and enact potential improvement opportunities for their hospital operations. The additional year also addresses the concern that we are finalizing this measure during the period that will inform the first early look. During this period, hospitals will have the opportunity to evaluate their performance, familiarize themselves with measure methodology, and better understand how risk adjustment, patient complexity, and attribution are reflected in their results before the measure affects payment.

Comment: Many commenters stated that the measure should be implemented into the Hospital Inpatient Quality Reporting Program for further testing and public reporting before it is used to determine payment penalties.

Response: As we stated in the proposed rule, given the significant

morbidity and mortality linked to sepsis and the high case volume and cost of hospital readmissions, we will adopt the measure directly into the Hospital Readmissions Reduction Program using a phased approach in an effort to balance implementation concerns against our intention to address this CMS priority in a timely manner. To further address commenters' concerns, we are finalizing an additional early look period for the FY 2029 program year before the Sepsis Readmission measure is used for payment adjustments beginning with the FY 2030 program year.

Comment: Another commenter noted that the Partnership for Quality Measurement's Hospital Recommendation Group did not reach consensus and recommended additional monitoring in a non-penalty context before broader program use.

Response: We appreciate the commenter's concern regarding the lack of consensus from the Pre-Rulemaking Measure Review (PRMR) Hospital Recommendation Group. The Cost and Efficiency Recommendation Group reviewed the Hospital-Level, Risk-Standardized 30-day All-Cause Readmission Following Hospitalization for Sepsis (CBE# 5275) on February 6, 2026. Sixteen members (84 percent) voted to endorse the measure, and 3 members (16 percent) voted not to endorse the measure. The measure was therefore endorsed, without conditions. While the PRMR Hospital Recommendation Group did not reach consensus on adoption, a majority supported the measure, and we maintain that this measure addresses a high-priority area.

Comment: Many commenters raised methodological concerns regarding the incorporation of Medicare Advantage (MA) data and the risk-adjustment methodology. Several commenters expressed concern about the inclusion of MA beneficiaries in the measure and stated that CMS did not provide sufficient information on how this change will impact the reliability and validity of the measure. A few commenters suggested that CMS maintain distinct MA and FFS results to preserve established benchmarks and allow evaluation of differences in MA performance. A commenter expressed concern that the Sepsis Readmission measure will rely on MA encounter data rather than paid claims to calculate hospital results and that doing so will affect the integrity of any readmissions data. The commenter recommended that CMS clarify which data elements it intends to use.

Response: As we stated in the proposed rule, the Sepsis Readmission measure has been specified to include both Medicare Fee-for-Service and MA beneficiaries. Including MA beneficiaries in CMS hospital outcome measures helps ensure that hospital quality is measured consistently across all Medicare beneficiaries.[212] We believe combining FFS and MA beneficiaries is appropriate, because hospitals generally provide care to both populations through the same clinical systems and care processes. We note that MA beneficiaries comprise a growing share of Medicare enrollees and that hospitals are responsible for providing high quality care to all their patients, regardless of payer. Hospitals must work closely with insurers, including MA plans, to ensure high quality care for all their patients. By adding the MA cohort to the Hospital Readmissions Reduction Program measures, we would provide a more robust and holistic view of the quality of care provided to all Medicare beneficiaries. In addition, the measure testing included the combined FFS and MA population and demonstrated acceptable reliability and validity. We believe inclusion of MA beneficiaries improves the representativeness of the measure and better reflects the patient populations served by hospitals. Measure development and testing demonstrated that inclusion of MA beneficiaries increases the number of eligible cases available for assessment and supports measure reliability than compared to the FFS-only cohort, particularly for hospitals with lower sepsis volumes. We combined Medicare Advantage Organization (MAO)-submitted encounter data and hospital-submitted MA admission claims because each source captures admissions not fully reflected in the other. MAO-submitted encounter data include admissions absent from hospital-submitted claims, and a smaller share of admissions appear only in hospital-submitted claims. Combining both sources provides a more complete capture of MA admissions than either source alone. The risk-adjustment methodology was developed and validated using these data sources. Internal measure development and testing results showed that, on average, observed readmission rates were similar between FFS- and MA-only patients for most conditions and procedures.[213] To account for any case-mix difference between FFS and MA patients, the risk model includes an indicator for MA versus FFS enrollment. Additionally, calibration plots showed that the model performs well for MA and FFS respectively. We do not believe that the use of MA encounter data compromises the integrity of the measure. Rather, inclusion of these data allows for a more complete assessment of hospital performance across the Medicare population.

With respect to suggestions that we maintain separate MA and FFS results, we note that the purpose of the measure is to assess hospital performance across the Medicare population as a whole. Keeping FFS and MA patients together for purposes of this measure's calculation will keep the hospitals' total volume higher for more reliable measure scores. We will provide data regarding payers for hospitals to review through annual confidential feedback reports and continue to monitor measure performance, including the impact of MA data inclusion, as part of our ongoing measure maintenance activities. In the future, we may consider providing separate MA and FFS measure rates that hospitals could use for internal quality improvement efforts, while maintaining the combined MA and FFS cohort as the official publicly reported statistic.

Finally, we also note that, in the FY 2026 IPPS/LTCH PPS final rule (90 FR 36536, 36927–29), we addressed similar concerns regarding MA data completeness and reliability, explaining that we have evaluated MA data for quality measurement since 2017, recent policies have improved the timeliness, completeness, and accuracy of MA data. Specific examples of the use of MA data across multiple CMS initiatives include hospital-submitted MA claims used for DSH and Graduate Medical Education payment calculations, and MAO-submitted encounter data are used to calculate MA beneficiary risk scores with 100 percent of the risk score using risk-adjustment eligible diagnoses from MA encounter data and FFS claims.

Comment: A few commenters expressed additional recommendations regarding the measure specifications and risk-adjustment. These recommendations included removing clinical markers of severe sepsis, adopting a new sepsis definition for consistency in reporting and care guidelines, and broadening the transplant recipient indicator. They also recommended accounting for other types of immunosuppressed patients and patients who may have planned readmissions. A commenter also suggested that CMS explore machine learning or empiric risk adjustment from the data obtained, including elements

[212] *https://p4qm.org/measures/5275.*

[213] CMS internal analysis.

like access to care that capture whether the patient resides in a rural area and their distance from a hospital. A commenter also requested that CMS clarify how the measure will be adjusted for the aggressiveness of the infectious organism (bacteria, virus, or fungus) causing sepsis. Another commenter recommended further study into reasons that sepsis survivors are so likely to experience readmission within 30 days and identify a more precise target to measure.

Response: We thank the commenters for their recommendations. We agree that appropriate risk adjustment is particularly important for the Sepsis Readmission measure because patients hospitalized with sepsis often have complex clinical profiles and varying baseline risk. As described in the proposed rule, the Sepsis Readmission measure risk-adjusts for patient factors such as age, comorbid diseases, indicators of frailty, clinical markers of severe sepsis, transplant-recipient status, organ failure or dysfunction, source of infection, immunocompromised state, and the aggressiveness of the infectious organism causing sepsis. We selected these factors through a deliberative and empirical process because they are clinically relevant and related to the readmission outcome. As we also noted in the proposed rule, the risk-adjustment model demonstrated strong calibration and discrimination in testing, including among patients with differing severity of sepsis.

We do not agree that clinical markers of severe sepsis should be removed from the risk-adjustment model at this time. These markers help distinguish patients with greater baseline acuity at the time of admission and therefore help ensure that hospitals are compared on outcomes for clinically similar patients. We also recognize commenters' concerns about consistency in sepsis definitions. In the proposed rule, we acknowledged that there is not one universally accepted sepsis definition and we stated that the measure aligns with a Sepsis-2-based approach to avoid missing patients, while also avoiding overlap with existing condition- and procedure-specific 30-day readmission measures. We will continue to monitor evolving clinical standards, coding practices, and measure performance through routine measure maintenance and may consider future refinements if evidence supports doing so.

We appreciate the recommendation to broaden the transplant-recipient indicator to include other immunosuppressed patients. The proposed risk model already includes variables related to immunocompromised state, in addition to a transplant-recipient indicator. We believe this approach appropriately captures clinically important baseline risk using standardized administrative data available for both Medicare Fee-for-Service and MA beneficiaries. We will continue to evaluate whether additional claims-based indicators of immunosuppression would improve model performance without reducing transparency, stability, or comparability across hospitals.

We also clarify that planned readmissions are not counted in the numerator of the measure. As described in the measure specifications, only unplanned inpatient admissions to short-term acute care hospitals qualify as readmissions; planned readmissions, which generally are not signals of poor quality, are excluded from the numerator. This approach is consistent with the Hospital Readmissions Reduction Program's existing methodology for readmission measures.

With respect to machine learning and additional empiric risk-adjustment approaches, we agree that risk models should be informed by empirical data. The current model is empirically derived and uses the same hierarchical logistic regression framework used for other Hospital Readmissions Reduction Program measures, which supports national comparability, interpretability, and consistency. We are open to continued evaluation of alternative modeling approaches, including more advanced empirical methods, but any such approach would need to be transparent, reproducible, clinically interpretable, stable over time, and appropriate for use in a national payment program.

Regarding rural residence, distance from a hospital, and other access-to-care variables, we agree that these factors may affect post-discharge care and readmission risk. However, including such variables in patient-level risk adjustment requires careful consideration because adjustment for access barriers may mask disparities in outcomes or obscure opportunities for improvement in discharge planning, care coordination, and follow-up. As we stated in the proposed rule, we will continue evaluating hospital-level reliability, year-over-year stability, and subgroup impacts, including impacts for rural and low-volume hospitals, as part of routine measure maintenance.

We also clarify how the measure accounts for the aggressiveness of the infectious organism. The measure uses claims-based risk-adjustment variables derived from inpatient, outpatient, and physician Medicare administrative claims data from the 12 months before the index hospitalization and from secondary diagnoses documented as present on admission during the index hospitalization. Organism-related variables, including whether the infection is bacterial, viral, or fungal, are included in the risk-adjustment calculations when available in the claims data. These variables affect the patient's predicted risk of readmission within the hierarchical model; they do not function as exclusions from the measure. Complications that arise during the index hospitalization are not included in risk adjustment because they may reflect the quality of care delivered and fall within the causal pathway rather than baseline patient risk.

Finally, we agree that continued study of post-sepsis readmissions is important. The proposed rule noted that readmissions after sepsis may stem from inadequate treatment of the initial infection, complications of hospital care, challenges in care transitions, and post-discharge care needs. We also cited evidence that care coordination, medication reconciliation, patient education, timely follow-up, home health visits, and multicomponent post-sepsis transition services can reduce readmissions. We believe an all-cause 30-day risk-standardized readmission measure remains appropriate because post-sepsis readmissions are multifactorial and often reflect the quality of both inpatient care and discharge-to-community transitions. We will continue to assess whether future measure refinements, companion measures, or additional analyses could identify more targeted opportunities to improve outcomes for sepsis survivors.

Comment: Many commenters raised methodological concerns about whether the measure is sufficiently valid, citing concerns regarding sample size and reliability. A few commenters expressed concern with the minimum measure reliability and referenced their own minimum measure reliability analysis at 0.205 across more than 3,000 facilities with at least 25 admissions. A commenter noted that this indicated that the measure is not yet stable for payment use, recommending that CMS increase the minimum sample size to produce a higher intraclass correlation coefficient of 0.6 or higher. A commenter suggested that, instead of a national benchmark, CMS consider a standard such as a low threshold percentage or shift to an improvement framework in which hospitals are compared to their own performance—either showing improvement, or in cases

of high performance, maintaining excellence.

Response: With regard to the concerns regarding the measure's reliability and the minimum reliability estimates, we note that reliability testing demonstrated that the measure meets accepted reliability standards. Specifically, among accountable entities with at least 25 eligible discharges, approximately 69 percent achieved a split-half reliability estimate of at least 0.60, a threshold commonly used to distinguish higher- and lower-performing providers. We believe this level of reliability is sufficient for public reporting and payment applications, particularly when considered in conjunction with the increased case volume resulting from inclusion of MA beneficiaries. While we acknowledge that reliability varies across hospitals based on volume and case mix, we think the testing results support adoption of the measure. We note that this measure was endorsed by the Cost and Efficiency Recommendation Group of the Partnership for Quality Measurement, the consensus-based entity for measure review and endorsement, which process includes a rigorous review of reliability testing results. We will continue to monitor reliability and performance stability over time, including among rural and lower-volume hospitals.

Comment: A few commenters expressed concern with the proposed reduction in the Hospital Readmissions Reduction Program performance period from three years to two years as CMS has not provided sufficient evidence that the concerns associated with two-year periods specifically that a two-year period was known to produce volatile results, have been resolved and hospitals will have difficulty determining their impact.

Response: We maintain that with the increased cohort size, a two-year performance period appropriately balances measure reliability with timeliness. A shorter performance period enables hospitals to receive feedback that is reflective of more current clinical performance and improvement efforts while maintaining acceptable reliability. Measure testing demonstrated that reliability remains satisfactory under the proposed approach, particularly with the inclusion of MA beneficiaries. As we discussed in the FY 2026 IPPS/LTCH PPS final rule (90 FR 36931), more timely performance information better supports the goals of the Hospital Readmissions Reduction Program by allowing hospitals to evaluate and respond to performance trends sooner than would be possible under a longer measurement period.

Comment: Several commenters expressed concern with the inclusion of the Sepsis Readmission measure in the Hospital Readmissions Reduction Program because the sepsis diagnosis is broad and includes patients with diverse clinical presentations, making it difficult to apply a uniform definition across all cases. A few commenters expressed concern that the Sepsis Readmission measure proposed for the Hospital Readmissions Reduction Program relies on claims-based sepsis identification methods. These commenters stated that there is a lack of consensus regarding sepsis diagnostic definitions and coding methodologies.

Response: Although sepsis encompasses a clinically heterogeneous population and there continues to be ongoing discussion regarding optimal approaches to sepsis identification, the measure cohort is sufficiently defined and supported by the available evidence. The measure was developed through a rigorous testing and validation process using nationally available Medicare administrative data and established coding methodologies. In the proposed rule we acknowledged that there is not one universally accepted sepsis definition and we stated that the measure aligns with a Sepsis-2-based approach to avoid missing patients, while also avoiding overlap with existing condition- and procedure-specific 30-day readmission measures. The measure appropriately identifies a population of patients hospitalized with sepsis who are at substantial risk for readmission and for whom hospitals can meaningfully influence outcomes through inpatient care, discharge planning, care coordination, and post-discharge transition processes.

We acknowledge that multiple clinical and surveillance frameworks currently exist for identifying sepsis and that differences among those frameworks may result in variation in patient populations. However, we note that claims-based measurement approaches are widely used across CMS quality programs because they are nationally available, consistently reported, broadly applicable across hospitals, and feasible for large-scale implementation. The measure underwent extensive development and testing using Medicare administrative data, and the claims-based approach provides a practical and reliable method for identifying eligible cases and assessing hospital performance.

We further note that we evaluated the relationship between hospital-level sepsis coding practices and measured outcomes and found no meaningful association between coding rates and readmission risk. These analyses support the conclusion that differences in hospital performance are not primarily driven by variation in coding practices, and therefore the measure provides a valid assessment of readmission outcomes among patients hospitalized with sepsis.

Comment: A few commenters urged CMS to delay any sepsis-related readmission measures until there is national alignment regarding sepsis definitions and clearly defined drivers for improvement and to consider aligning future sepsis quality programs to minimize burden for hospitals.

Response: We maintain that the absence of complete uniformity across all sepsis measurement frameworks should not preclude the use of a measure that has undergone rigorous development, testing, and validation and that addresses an important area of patient safety and healthcare quality. Delaying implementation until all sepsis definitions and measurement approaches are fully harmonized could significantly postpone opportunities to improve outcomes for a patient population that experiences substantial morbidity, mortality, and healthcare utilization.

Comment: A commenter recommended that CMS provide additional details regarding the diagnosis codes, exclusion criteria, attribution rules, and clinical rationale for the measure cohort.

Response: The measure underwent extensive testing and validation. Additional analyses found no meaningful association between hospital-level sepsis coding rates and measured readmission or mortality risk, suggesting that coding variation is not driving performance differences. We examined coding variability as a potential source of bias and found low correlation between hospital-level use of sepsis code A41.9 and readmission risk (r ranging from less than 0.001 to 0.07) or mortality risk (r ranging from 0.04 to 0.15) within hospitals with at least 25 eligible cases. We also found low correlation between post-discharge mortality and hospital-level readmission risk ($r = -0.11$). Therefore, the claims-based methodology provides an appropriate and objective basis for identifying eligible cases and assessing hospital performance. We will continue to monitor coding trends, documentation variation, and subgroup impacts through routine measure maintenance.

We note that detailed measure specifications, including cohort

definitions, diagnosis code lists, inclusion and exclusion criteria, attribution methodology, and risk-adjustment approaches, are publicly available through the measure development and rulemaking process. The measure excludes planned readmissions, and in the event of a transfer, the outcome is attributed to the hospital that ultimately discharges the patient to a non-acute care setting. These specifications were developed to ensure that the measure cohort is clinically coherent and that outcomes are appropriately attributed to the accountable hospital. For more information about the measure specifications, we refer readers to the methodology report, available at: *https://qualitynet.cms.gov/inpatient/measures/readmission/methodology.*

Comment: A commenter expressed concern with the change from HCCs to individual ICD–10 codes, stating that the impact of the change is unclear. A commenter noted that there may be modifications to the ICD–10–CM sepsis code set to better align with ICD–11 conventions and recommended that CMS avoid implementing changes to ICD–10–CM at this time.

Response: We note that individual ICD–10 codes are more specific than HCCs. By re-specifying the risk models with individual ICD–10 codes, we improve the performance of the risk adjustment models for our condition specific measures.

We appreciate commenters' observations regarding potential future modifications to ICD–10–CM sepsis coding and the possibility of future alignment with ICD–11 conventions. We recognize that diagnosis coding systems evolve over time to reflect advances in clinical knowledge and classification standards. However, the possibility of future coding revisions does not diminish the validity of the current measure or the appropriateness of the current coding framework for identifying sepsis hospitalizations. We routinely update quality measures to account for coding changes, clinical advances, and evolving evidence. Should future revisions to ICD–10–CM or other coding systems materially affect measure specifications or performance, we would evaluate those changes through the established measure maintenance and rulemaking processes.

Comment: A commenter noted differences between the proposed Sepsis Readmission measure and the emerging digital CDC/NHSN-based framework proposed for the Adult Community-Onset Sepsis Standardized Mortality Ratio measure. Another commenter stated that CMS should align the Hospital Readmissions Reduction Program, Hospital-Acquired Condition Reduction Program, and infection prevention initiatives so that preventable hospital-acquired infections are addressed proactively through targeted improvement incentives rather than indirectly penalized through readmission measures alone.

Response: We acknowledge that the Sepsis Readmission measure and the CDC's Adult Community-Onset Sepsis Standardized Mortality Ratio measure serve different purposes and therefore employ different methodologies. The Adult Community-Onset Sepsis Standardized Mortality Ratio measure is intended as a mortality measure that relies on clinical surveillance methodologies and electronic clinical data, whereas the proposed Sepsis Readmission measure is a claims-based outcome measure designed to assess risk-standardized hospital readmission performance. Differences in data sources, measure objectives, and intended applications may appropriately result in differences in cohort definitions and identification methodologies. CMS will continue to evaluate opportunities for alignment across sepsis-related quality programs where feasible and appropriate while recognizing the distinct purposes served by individual measures. We refer readers to section IX.B.4. of the preamble of this final rule where we describe our request for comment on the CDC's Adult Community-Onset Sepsis Standardized Mortality Ratio measure.

Comment: Several commenters stated that the Sepsis Readmission measure is not appropriately risk adjusted and recommended that CMS incorporate socio-economic risk adjustment at the patient, hospitals, and community levels. Commenters stated that sepsis outcomes depend on factors outside the hospital control, and that the measure will penalize hospitals serving a disproportionate share of medically and socially complex patients.

Response: The Sepsis Readmission measure employs an appropriate risk-adjustment methodology that accounts for patient characteristics associated with the risk of readmission while preserving the measure's ability to identify meaningful differences in hospital performance. The measure was developed and tested using a comprehensive set of clinically relevant variables derived from Medicare administrative claims and encounter data and is intended to adjust for patient medical factors present at the time of admission that are outside the hospital's control. This approach is consistent with longstanding CMS measure-development principles and supports fair comparisons across hospitals.

We acknowledge the important role that social risk factors can play in patient outcomes and recognize that patients with sepsis frequently experience complex medical, behavioral, or social needs that may influence post-discharge recovery. To account for medically and socially complex patients, the 21st Century Cures Act amended section 1886(q) so that the Hospital Readmissions Reduction Program adjusts for social risk by peer grouping based on the hospital proportion of patients with dual eligible status prior to assignment of payment adjustment. Specifically, the peer grouping methodology accounts for differences in hospitals' proportions of beneficiaries that are dually eligible for both Medicare and full Medicaid benefits when calculating payment adjustments. This approach helps address concerns regarding differences in patient populations while preserving the measure's ability to identify potentially avoidable readmissions. We note, however, that the Sepsis Readmission measure is intended to hold all hospitals to the same standards of care quality and accountability. Adjusting for social risk factors could mask systemic differences in care quality between hospitals serving more versus fewer vulnerable patients. Nonetheless, the evidence shows that hospitals in the fourth quartile for the proportion of patients with dual eligibility (that is, hospitals with a relatively larger proportion of patients with dual eligible status) can perform as well as hospitals in the 1st–3rd quartiles (hospitals with relatively fewer patients with dual eligible status).[214] The measure is well calibrated for patients with and without dual eligible status. The specifications of this measure also align with CMS' other 30-day readmission measures in the Hospital Readmissions Reduction Program that also do not adjust for socioeconomic status.

Comment: A commenter recommended that CMS consider stratifying performance assessment and associated payment adjustment across different peer groups, such as academic medical center status and regional areas.

Response: We appreciate the suggestion that CMS stratify performance assessment and associated payment adjustments based on hospital characteristics such as academic medical center status or geographic region. However, the Hospital Readmissions Reduction Program

[214] *https://p4qm.org/measures/5275.*

statute only authorizes peer grouping based on patients' dual eligibility for Medicare and Medicaid; it does not permit stratification by other hospital characteristics for purposes of payment adjustment. We could consider whether additional stratified performance information could be included in hospitals' confidential feedback reports or public reporting in future rulemaking.

Comment: A few commenters suggested that CMS account for patients who may have planned readmissions.

Response: The Sepsis Readmission measure and all of the readmission measures used in this program incorporate the CMS Planned Readmission Algorithm to exclude planned readmissions from outcome calculations. As a result, hospitals are not held accountable for readmissions that are identified as planned according to established CMS methodology. This approach appropriately focuses the measure on unplanned readmissions that may be more reflective of care quality, discharge planning, care coordination, and post-discharge support. For additional details we refer readers to the measure methodology report, available at: *https://qualitynet.cms.gov/inpatient/measures/readmission/methodology.*

Comment: A commenter suggested that CMS should strengthen risk adjustment by incorporating clinical data elements as factors impacting readmissions including complications, inadequate treatment, and care-transition challenges are not fully captured in claims data. Another commenter stated that the methodology must incorporate enough clinical nuance to distinguish between readmissions for novel infections and those resulting from potential failures in the initial sepsis treatment plan.

Response: We agree that clinically detailed information can provide important insights into patient severity and outcomes. In the Hospital Inpatient Quality Reporting Program, the Hybrid Hospital-Wide All-Cause Readmission Measure (HWR) and the Hybrid Hospital-Wide All-Cause Risk Standardized Mortality Measure (HWM) use more than one data source for measure calculation: core clinical data elements (CCDEs), linking variables, and claims data (80 FR 49698). CCDEs are a set of clinical variables derived from electronic health records (EHRs) that can be used to risk adjust hospital outcome measures (80 FR 49699), such as vital signs and laboratory results. Linking variables are administrative data that can be used to link or merge the CCDEs and administrative claims data for measure calculation (80 FR 49703). These measures are designed to enhance risk adjustment of administrative claims-based outcome measures by utilizing patient clinical data captured in EHRs (80 FR 49698). We intend to explore options to add CCDEs for condition and procedure-specific measures such as those in the Hospital Readmissions Reduction Program in the future. In the meantime, the current claims-based methodology is also a robust approach for risk adjustment with strengths, including important advantages, including national feasibility, consistency of reporting, and broad applicability across hospitals. The measure underwent extensive testing and validation using available Medicare data sources, and the current model appropriately balances feasibility, reliability, and clinical relevance.

Comment: A commenter suggested that CMS should address challenges through shared accountability models as sepsis outcomes depend on factors outside hospital control, including skilled nursing facility quality, home health capacity, outpatient access, caregiver support, and medication affordability.

Response: We thank the commenter for their suggestion that CMS address challenges associated with sepsis care through shared accountability models. We appreciate this perspective and recognize that outcomes following sepsis hospitalization may be influenced by care delivered across multiple settings, including post-acute care providers, outpatient clinicians, caregivers, and community resources. Nevertheless, statutory authority limits the Hospital Readmissions Reduction Program to hospitals, and the purpose of the proposed measure is to assess the quality of hospital care and care-transition processes associated with the index hospitalization. We believe hospitals play a critical role in discharge planning, patient education, medication management, coordination of follow-up care, and other activities that influence readmission risk. As such, attribution of the measure to hospitals remains appropriate.

Comment: A few commenters recommended that, in addition to excluding patients from a hospital's performance if they were transferred to another hospital for their sepsis care, the measure should also exclude transfer patients from the accepting hospital's evaluation. The commenters noted that these patients tend to be too sick or too complex for the referring community hospital which may delay timely and effective care. A commenter noted that these patients are often transferred outside of their home area making treatment post discharge more challenging.

Response: With respect to the suggestion that transfer patients should be excluded from the accepting hospital's evaluation, we appreciate commenters' concerns that such patients are often clinically complex and may require care that is beyond the capabilities of the referring hospital. We agree that, in many instances, patients transferred for sepsis care are medically fragile and may require specialized resources, and we recognize that transfers may occur across geographic areas and thereby complicate post-discharge follow-up. At the same time, we do not agree that it would be appropriate to categorically exclude transfer patients from the accepting hospital's measure cohort. The accepting hospital is the entity that furnishes the inpatient care, coordinates the subsequent clinical course, and is often best positioned to influence the quality of the hospital stay, the discharge process, and the transition to the next site of care. Excluding these patients from the receiving hospital's evaluation would remove a meaningful set of cases from the measure and would not reflect the care delivered by the hospital that assumed responsibility for the patient's sepsis treatment. The measure's existing transfer-related exclusions appropriately address attribution concerns while preserving accountability for the hospital that furnishes the indexed inpatient stay.

We are also concerned that categorically excluding transfer patients could mask quality of care differences for this population, potentially disadvantaging patients, including many rural patients, who rely on transfers to access specialized sepsis care. Excluding these cases from measurement could reduce accountability for the care they receive at the accepting hospital. Finally, we note that the measure's risk-adjustment methodology already accounts for clinical complexity, including comorbid conditions, which mitigates concerns that transferred patients' greater severity would unfairly affect an accepting hospital's performance results.

Comment: Another commenter encouraged CMS to explore incorporation of patient-reported outcomes and functional recovery outcomes related to post-sepsis care. A commenter encouraged CMS to direct future development of sepsis measures to evaluate how certain data could be used to identify early deterioration and whether early detection would reduce

sepsis mortality. Another commenter suggested that CMS should focus efforts on identifying underlying causes of the initial sepsis admission and how sepsis hospitalizations can be prevented. A commenter recommended that CMS encourage hospitals to adopt evidence-based prevention strategies for hospital-acquired pneumonia and early sepsis recognition as part of a comprehensive patient safety approach. A commenter stated that CMS should clarify in measure documentation and impact analyses that the Sepsis Readmission measure includes sepsis cases arising from healthcare-associated infections, including hospital-acquired pneumonia, and acknowledge this as an important policy consideration.

Response: We appreciate commenters' suggestions regarding patient-reported outcomes, early deterioration detection, sepsis prevention, and measure documentation. The Sepsis Readmission measure is a readmission outcome measure and is intended to assess hospital performance using nationally available Medicare data. With respect to patient-reported and functional recovery measures, we agree that the concepts are valuable and will take them into consideration for future measure development and potential inclusion in other CMS quality programs. The Hospital Readmissions Reduction Program is statutorily limited to readmission outcome measures, so incorporating patient-reported or functional recovery outcomes directly into the Sepsis Readmission measure would not be appropriate at this time. The Sepsis Readmission measure complements the Severe Sepsis and Septic Shock Management Bundle (SEP–1) measure, which is currently included in the Hospital Value-Based Purchasing Program, by assessing post-discharge outcomes rather than in-hospital detection and treatment. We also note the Sepsis Readmission measure further complements the Sepsis Mortality measure RFI included in section IX.B.4. of this final rule.

We also appreciate that prevention of sepsis and identification of precipitating conditions are important public health and clinical goals. The Sepsis Readmission measure is intended to assess hospital performance after a sepsis hospitalization has occurred, particularly with respect to care transitions and readmissions, and is not intended to replace broader prevention efforts. CMS will continue to consider opportunities to support sepsis prevention through future rulemaking.

Finally, we clarify that the Sepsis Readmission measure includes sepsis cases arising from healthcare-associated infections, including hospital-acquired pneumonia. However, the measure excludes index admissions meeting certain additional exclusion criteria, including sepsis admissions already captured in the Pneumonia Readmission measure, which avoids overlap between the two measures.

Comment: A few commenters noted that CMS did not provide an impact analysis for the proposed Sepsis Readmission measure. A commenter specifically noted that the proposed rule did not provide the impact specifically for rural hospitals.

Response: We refer readers to the Regulatory Impact Analysis in the FY 2027 IPPS/LTCH PPS proposed rule, particularly section I.G.6. of Appendix A for the impact analysis of the measure, including an analysis of rural hospitals.[215] Table I.G.6.–01 in the proposed rule estimated the financial impact on hospitals by hospital characteristic.[216] This table is also reprinted at section I.G.6 of Appendix A of this final rule.

Comment: A few commenters expressed concern with the 30-day readmission timeframe of the Sepsis Readmission measure and suggested that either a 7-day or 14-day readmission measure window would better capture hospital performance and provide a more meaningful target for quality improvements. A commenter expressed concern that it is difficult to determine the timing of the onset of sepsis and thus the 30-day readmission timeframe may be difficult to determine. A commenter stated that hospital-onset sepsis lacks an objectively defined time-zero.

Response: We thank commenters for the suggestions. We maintain that a 30-day timeframe is appropriate for the Sepsis Readmission measure and is consistent with the longstanding approach used across the Hospital Readmissions Reduction Program. A 30-day outcome window captures a broader range of clinically meaningful post-discharge events while allowing sufficient opportunity to evaluate the effectiveness of hospital care, discharge planning, medication management, care coordination, and follow-up arrangements. The 30-day timeframe provides a comprehensive assessment of patient outcomes following hospitalization and supports consistency across Hospital Readmissions Reduction Program measures. We also clarify that the Sepsis Readmission measure is not limited to solely hospital-onset sepsis but rather captures beneficiaries who were discharged from the hospital with a principal diagnosis of sepsis (including post-procedural sepsis).

The validity of the 30-day, all-cause outcome is supported by several pieces of empirical evidence. First, we have shown for other readmission measures that the daily readmission rate does not return to baseline after 30 days after the index admission and is therefore temporally associated with the index admission. Furthermore, readmission risk remains elevated well after 30 days. For example, in one study of more than 40,000 sepsis survivors, 26 percent were readmitted within 30 days and 48 percent within 180 days.[217] A meta-analysis of 56 studies showed readmission rates among sepsis survivors were 21.4 percent at 30 days and 39 percent by 365 days.[218] Second, studies have shown that the reasons for readmission (principal discharge diagnoses) are clinically related to the index admission.[219] The 30-day timeframe has been in use since 2012 and by multiple countries because the first three weeks after discharge are the highest risk period for readmission, and this period provides adequate time for hospitals to implement strategies to avert readmission.

With regard to the concern that the timing of sepsis onset can be difficult to determine and therefore questioned the appropriateness of a 30-day readmission timeframe, we acknowledge that the clinical onset of sepsis may not always be precisely identifiable and that sepsis can represent a heterogeneous condition with varying clinical presentations. However, the Sepsis Readmission measure is anchored to the index hospitalization and discharge date rather than the precise onset of sepsis symptoms. Consistent with other Hospital Readmissions Reduction Program measures, the readmission outcome period begins following discharge from the qualifying hospitalization and assesses unplanned readmissions occurring within 30 days of discharge.

[219] Ackermann, K., Lynch, I., Aryal, N., Westbrook, J., & Li, L. (2025). Hospital readmission after surviving sepsis: A systematic review of readmission reasons and meta-analysis of readmission rates. Journal of critical care, 85, 154925.

Comment: One commenter expressed general concern about the Hospital Readmissions Reduction Program that the literature shows that readmission measures based on administrative claims may be leading to increased mortality.

Response: We appreciate the commenter's concern regarding the Hospital Readmissions Reduction Program. We note that CMS has established complementary mortality measures for the existing conditions and procedures included in the Hospital Readmissions Reduction Program, which provide an additional check on whether readmission rates are being influenced by differences in patient mortality. We note the Sepsis Mortality measure RFI included in section IX.B.4. of this final rule, which would similarly complement the Sepsis Readmission measure. For existing Hospital Readmissions Reduction Program measures, previous study showed that risk-standardized mortality rates and readmission rates were not associated for patients admitted with an acute myocardial infarction or pneumonia and were only weakly associated, within a certain range, for patients admitted with heart failure.

With respect to the Sepsis Readmission measure specifically, we assessed whether post-discharge mortality may be introducing bias into the readmission measure. We examined the timing of post-discharge mortality by day (days 1–30) and week (weeks 1–4) following discharge from an index sepsis hospitalization, and the results showed that the proportion of patients who died following discharge remained relatively stable across the full 30-day post-discharge window, with no notable concentration of deaths in any particular day or week. This means that the risk of bias introduced by a hospital having a high number of deaths immediately post-discharge leading to lower readmission rates among a smaller pool of sepsis survivors was minimal.

Similarly, we examined the relationship between hospital-level post-discharge mortality among patients without a readmission and readmission rates by grouping hospitals into deciles based on their post-discharge mortality rate. The results showed that readmission rates were similarly consistent across hospital mortality decile groups. The correlation between hospital-level post-discharge mortality among patients without a readmission and hospital-level readmission rates was negligible (unweighted Pearson correlation coefficient is 0.005; p = 0.784; 95% CI [−0.032, 0.042] and volume-weighted analyses Pearson correlation coefficient is 0.011; p = 0.578; 95% CI [−0.027, 0.048]). Neither result was statistically significant, indicating minimal difference in readmission rates between hospitals with lower mortality rates among patients that are not readmitted, versus those with higher mortality and no readmissions. Post-discharge mortality is not meaningfully impacting readmissions in a way that would bias Sepsis Readmission measure. Furthermore, we have the RFI available for public comment on a Sepsis Mortality measure included in section IX.B.4. of this final rule, for continued tracking of Sepsis Mortality.

After consideration of the comments received, we are finalizing the proposal with modification. Specifically, we will adopt the Hospital 30-Day, All-Cause, Risk-Standardized Readmission Rate Following Sepsis Hospitalization measure as part of the Hospital Readmissions Reduction Program measure set beginning with an early look for the FY 2028 (applicable period of July 1, 2024 to June 30, 2026) and FY 2029 (applicable period of July 1, 2025 to June 30, 2027) program years. The measure will then be used in the Hospital Readmissions Reduction Program for payment adjustment beginning with the FY 2030 program year (applicable period of July 1, 2026 to June 30, 2028) and subsequent years.

J. Hospital Value-Based Purchasing Program

1. Background

a. Overview

For background on the Hospital Value-Based Purchasing Program, we refer readers to the CMS website at: *https://www.cms.gov/medicare/quality/initiatives/hospital-quality-initiative/hospital-value-based-purchasing.* We also refer readers to our codified requirements for the Hospital Value-Based Purchasing Program at 42 CFR 412.160 through 412.168.

b. FY 2027 Program Year Payment Details

Under section 1886(o)(7)(C)(v) of the Act, the applicable percent for the FY 2027 program year is 2.00 percent. Using the methodology we adopted in the FY 2013 IPPS/LTCH PPS final rule (77 FR 53571 through 53573), we estimate that the total amount available for value-based incentive payments for FY 2027 is approximately $1.9 billion, based on the December 2025 update of the FY 2025 MedPAR file.

As finalized in the FY 2013 IPPS/LTCH PPS final rule (77 FR 53573 through 53576), we will utilize a linear exchange function to translate this estimated amount available into a value-based incentive payment percentage for each hospital, based on its Total Performance Score (TPS). We published proxy value-based incentive payment adjustment factors in Table 16 associated with the FY 2027 IPPS/LTCH PPS proposed rule (which is available via the internet on the CMS website). We note that these proxy adjustment factors will not be used to adjust hospital payments. These proxy value-based incentive payment adjustment factors were calculated using historical baseline and performance periods for the FY 2026 Hospital Value-Based Purchasing Program. These proxy factors were calculated using the March 2026 update to the FY 2025 MedPAR file. The slope of the linear exchange function used to calculate these proxy factors was 3.4489188481, and the estimated amount available for value-based incentive payments to hospitals for FY 2027 is approximately $1.9 billion. We will add Table 16B to display the actual value-based incentive payment adjustment factors, exchange function slope, and estimated amount available for the FY 2027 Hospital Value-Based Purchasing Program. We expect that Table 16B will be posted on the CMS website in the fall of 2026.

2. Hospital Value-Based Purchasing Program Measures

In the FY 2027 IPPS/LTCH PPS proposed rule (91 FR 19568 through 19574), we proposed to adopt substantive measure updates to five condition-specific and procedure-specific mortality measures, in the Clinical Outcomes domain, beginning with the July 1, 2028 through June 30, 2030 performance period for the FY 2032 program year, which we discuss further in section IX.B.2. of the preamble of this final rule. We proposed (91 FR 19568 through 19574) these updates contingent on our adoption of the same modified mortality measures in the Hospital Inpatient Quality Reporting Program beginning with the FY 2028 payment determination, which we discuss further in section IX.B.2. of the preamble of this final rule.

a. Summary of Previously Adopted Quality Measures for the Hospital Value-Based Purchasing Program

We refer readers to the FY 2026 IPPS/LTCH PPS final rule for summaries of the previously adopted measures for the FY 2027 through FY 2031 program years (90 FR 36951). We did not propose any changes to the measure set. Table V.J.1. summarizes the previously adopted

Hospital Value-Based Purchasing Program measure set for the FY 2027 program year.

TABLE V.J.1. SUMMARY OF PREVIOUSLY ADOPTED MEASURES FOR THE FY 2027 PROGRAM YEAR

Measure Short Name	Domain/Measure Name	CBE #
Person and Community Engagement Domain		
HCAHPS*	Hospital Consumer Assessment of Healthcare Providers and Systems (HCAHPS) (including Care Transition and Responsiveness of Hospital Staff dimensions)	0166 (0228)
Safety Domain		
CAUTI	National Healthcare Safety Network (NHSN) Catheter Associated Urinary Tract Infection (CAUTI) Outcome Measure	0138
CLABSI	National Healthcare Safety Network (NHSN) Central Line Associated Bloodstream Infection (CLABSI) Outcome Measure	0139
Colon and Abdominal Hysterectomy SSI	American College of Surgeons Centers for Disease Control and Prevention (ACS-CDC) Harmonized Procedure Specific Surgical Site Infection (SSI) Outcome Measure	0753
MRSA Bacteremia	National Healthcare Safety Network (NHSN) Facility wide Inpatient Hospital onset Methicillin-resistant *Staphylococcus aureus* (MRSA) Bacteremia Outcome Measure	1716
CDI	National Healthcare Safety Network (NHSN) Facility wide Inpatient Hospital onset *Clostridium difficile* Infection (CDI) Outcome Measure	1717
SEP-1	Severe Sepsis and Septic Shock: Management Bundle	0500
Clinical Outcomes Domain		
MORT-30-AMI	Hospital 30-Day, All-Cause, Risk-Standardized Mortality Rate Following Acute Myocardial Infarction (AMI) Hospitalization	0230
MORT-30-HF	Hospital 30-Day, All-Cause, Risk-Standardized Mortality Rate Following Heart Failure (HF) Hospitalization	0229
MORT-30-PN	Hospital 30-Day, All-Cause, Risk-Standardized Mortality Rate Following Pneumonia Hospitalization	0468
MORT-30-COPD	Hospital 30-Day, All-Cause, Risk-Standardized Mortality Rate Following Chronic Obstructive Pulmonary Disease (COPD) Hospitalization	1893
MORT-30-CABG	Hospital 30-Day, All-Cause, Risk-Standardized Mortality Rate Following Coronary Artery Bypass Graft (CABG) Surgery	2558
COMP-HIP-KNEE	Hospital Level Risk-Standardized Complication Rate Following Elective Primary Total Hip Arthroplasty (THA) and/or Total Knee Arthroplasty (TKA)	1550
Efficiency and Cost Reduction Domain		
MSPB	Medicare Spending Per Beneficiary (MSPB) Hospital	2158

*In the FY 2025 IPPS/LTCH PPS final rule, we adopted the updated HCAHPS Survey measure in the Hospital Value-Based Purchasing Program beginning with the FY 2030 program year (89 FR 69508 through 69511). The Care Transition and Responsiveness of Hospital Staff dimensions will be included in the HCAHPS Survey but not scored for FY 2027 through FY 2029, and will not be included in the HCAHPS Survey beginning with FY 2030.

Table V.J.2. summarizes the previously adopted Hospital Value-Based Purchasing Program measures for the FY 2028 through FY 2032 program years.

TABLE V.J.2. SUMMARY OF PREVIOUSLY ADOPTED MEASURES FOR THE FY 2028 THROUGH FY 2032 PROGRAM YEARS

Measure Short Name	Domain/Measure Name	CBE #
Person and Community Engagement Domain		
HCAHPS*	Hospital Consumer Assessment of Healthcare Providers and Systems (HCAHPS) (including Care Transition and Responsiveness of Hospital Staff dimensions)	0166 (0228)
Safety Domain		
CAUTI	National Healthcare Safety Network (NHSN) Catheter Associated Urinary Tract Infection (CAUTI) Outcome Measure	0138
CLABSI	National Healthcare Safety Network (NHSN) Central Line Associated Bloodstream Infection (CLABSI) Outcome Measure	0139
Colon and Abdominal Hysterectomy SSI	American College of Surgeons Centers for Disease Control and Prevention (ACS-CDC) Harmonized Procedure Specific Surgical Site Infection (SSI) Outcome Measure	0753
MRSA Bacteremia	National Healthcare Safety Network (NHSN) Facility wide Inpatient Hospital onset Methicillin-resistant *Staphylococcus aureus* (MRSA) Bacteremia Outcome Measure	1716
CDI	National Healthcare Safety Network (NHSN) Facility wide Inpatient Hospital onset *Clostridium difficile* Infection (CDI) Outcome Measure	1717
SEP-1	Severe Sepsis and Septic Shock: Management Bundle	0500
Clinical Outcomes Domain		
MORT-30-AMI**	Hospital 30-Day, All-Cause, Risk-Standardized Mortality Rate Following Acute Myocardial Infarction (AMI) Hospitalization	0230
MORT-30-HF**	Hospital 30-Day, All-Cause, Risk-Standardized Mortality Rate Following Heart Failure (HF) Hospitalization	0229
MORT-30-PN**	Hospital 30-Day, All-Cause, Risk-Standardized Mortality Rate Following Pneumonia Hospitalization	0468
MORT-30-COPD**	Hospital 30-Day, All-Cause, Risk-Standardized Mortality Rate Following Chronic Obstructive Pulmonary Disease (COPD) Hospitalization	1893
MORT-30-CABG**	Hospital 30-Day, All-Cause, Risk-Standardized Mortality Rate Following Coronary Artery Bypass Graft (CABG) Surgery	2558
COMP-HIP-KNEE***	Hospital Level Risk-Standardized Complication Rate Following Elective Primary Total Hip Arthroplasty (THA) and/or Total Knee Arthroplasty (TKA)	1550
Efficiency and Cost Reduction Domain		
MSPB	Medicare Spending Per Beneficiary (MSPB) Hospital	2158

* In the FY 2025 IPPS/LTCH PPS final rule, we adopted the updated HCAHPS Survey measure in the Hospital Value-Based Purchasing Program beginning with the FY 2030 program (89 FR 69508 through 69511). The Care Transition and Responsiveness of Hospital Staff dimensions will be included in the HCAHPS Survey but not scored for FY 2027 through FY 2029, and will not be included in the HCAHPS survey beginning with FY 2030.

** In this final rule, we are finalizing modifications to the MORT–30–AMI, MORT–30–HF, MORT–30–PN, MORT–30–COPD, and the MORT–30–CABG measures beginning with the FY 2032 program year. We refer readers to section IX.B.2. of the preamble of this final rule for more detailed discussion.

*** In the FY 2026 IPPS/LTCH PPS final rule, we finalized modifications to the COMP-HIP-KNEE measure in the Hospital Value-Based Purchasing Program beginning with the FY 2033 program year (90 FR 36943 through 36948). The updated COMP-HIP-KNEE measure will include Medicare Advantage beneficiaries in the measure cohort and a reduced reporting period from 3 to 2 years beginning with the FY 2033 program year.

3. Baseline and Performance Periods for the FY 2028 Through FY 2032 Program Years

a. Background

We refer readers to the FY 2026 IPPS/LTCH PPS final rule (90 FR 36951 through 36954) for previously adopted baseline and performance periods for the FY 2027 through FY 2031 program years. We also refer readers to the FY 2017 IPPS/LTCH PPS final rule (81 FR 56998) in which we finalized a schedule for all future baseline and performance periods.

b. Summary of Baseline and Performance Periods for the FY 2028 Through FY 2032 Program Years

Tables V.J.3., V.J.4., V.J.5., V.J.6., and V.J.7. summarize the baseline and performance periods that we have previously adopted.

TABLE V.J.3. BASELINE AND PERFORMANCE PERIODS FOR THE FY 2028 PROGRAM YEAR

Measures	Baseline Period	Performance Period
Person and Community Engagement Domain		
HCAHPS	January 1, 2024 – December 31, 2024	January 1, 2026 – December 31, 2026
Clinical Outcomes Domain		
Mortality measures (MORT-30-AMI, MORT-30-HF, MORT-30-COPD, MORT-30-CABG, MORT-30-PN)	July 1, 2018 – June 30, 2021*	July 1, 2023 – June 30, 2026
COMP-HIP-KNEE	April 1, 2018 – March 31, 2021*	April 1, 2023 – March 31, 2026
Safety Domain		
NHSN measures (CAUTI, CLABSI, Colon and Abdominal Hysterectomy SSI, CDI, MRSA Bacteremia)	January 1, 2024 – December 31, 2024	January 1, 2026 – December 31, 2026
SEP-1	January 1, 2024 – December 31, 2024	January 1, 2026 – December 31, 2026
Efficiency and Cost Reduction Domain		
MSPB	January 1, 2024 – December 31, 2024	January 1, 2026 – December 31, 2026

* These baseline periods are impacted by the ECE granted by CMS on March 22, 2020. Qualifying claims will be excluded from the measure calculations for January 1, 2020–March 31, 2020 (Q1 2020) and April 1, 2020–June 30, 2020 (Q2 2020) from the claims-based complication and mortality measures. For more detailed information, we refer readers to the FY 2022 IPPS/LTCH PPS final rule (86 FR 45297 through 45299).

TABLE V.J.4. BASELINE AND PERFORMANCE PERIODS FOR THE FY 2029 PROGRAM YEAR

Measures	Baseline Period	Performance Period
Person and Community Engagement Domain		
HCAHPS	January 1, 2025 – December 31, 2025	January 1, 2027 – December 31, 2027
Clinical Outcomes Domain		
Mortality measures (MORT-30-AMI, MORT-30-HF, MORT-30-COPD, MORT-30-CABG, MORT-30-PN)	July 1, 2019 – June 30, 2022*	July 1, 2024 – June 30, 2027
COMP-HIP-KNEE	April 1, 2019 – March 31, 2022*	April 1, 2024 – March 31, 2027
Safety Domain		
NHSN measures (CAUTI, CLABSI, Colon and Abdominal Hysterectomy SSI, CDI, MRSA Bacteremia)	January 1, 2025 – December 31, 2025	January 1, 2027 – December 31, 2027
SEP-1	January 1, 2025 – December 31, 2025	January 1, 2027 – December 31, 2027
Efficiency and Cost Reduction Domain		
MSPB	January 1, 2025 – December 31, 2025	January 1, 2027 – December 31, 2027

* These baseline periods are impacted by the ECE granted by CMS on March 22, 2020. Qualifying claims will be excluded from the measure calculations for January 1, 2020–March 31, 2020 (Q1 2020) and April 1, 2020–June 30, 2020 (Q2 2020) from the claims-based complication and mortality measures. For more detailed information, we refer readers to the FY 2022 IPPS/LTCH PPS final rule (86 FR 45297 through 45299).

TABLE V.J.5. BASELINE AND PERFORMANCE PERIODS FOR THE FY 2030 PROGRAM YEAR

Measures	Baseline Period	Performance Period
Person and Community Engagement Domain		
HCAHPS	January 1, 2026 – December 31, 2026	January 1, 2028 – December 31, 2028
Clinical Outcomes Domain		
Mortality measures (MORT-30-AMI, MORT-30-HF, MORT-30-COPD, MORT-30-CABG, MORT-30-PN)	July 1, 2020 – June 30, 2023	July 1, 2025 – June 30, 2028
COMP-HIP-KNEE	April 1, 2020 – March 31, 2023*	April 1, 2025 – March 31, 2028
Safety Domain		
NHSN measures (CAUTI, CLABSI, Colon and Abdominal Hysterectomy SSI, CDI, MRSA Bacteremia)	January 1, 2026 – December 31, 2026	January 1, 2028 – December 31, 2028
SEP-1	January 1, 2026 – December 31, 2026	January 1, 2028 – December 31, 2028
Efficiency and Cost Reduction Domain		
MSPB	January 1, 2026 – December 31, 2026	January 1, 2028 – December 31, 2028

* This baseline period is impacted by the ECE granted by CMS on March 22, 2020. Qualifying claims will be excluded from the measure calculation for January 1, 2020–March 31, 2020 (Q1 2020) and April 1, 2020–June 30, 2020 (Q2 2020) from the claims-based complication and mortality measures. For more detailed information, we refer readers to the FY 2022 IPPS/LTCH PPS final rule (86 FR 45297 through 45299).

TABLE V.J.6. BASELINE AND PERFORMANCE PERIODS FOR THE FY 2031 PROGRAM YEAR

Measures	Baseline Period	Performance Period
Person and Community Engagement Domain		
HCAHPS	January 1, 2027 – December 31, 2027	January 1, 2029 – December 31, 2029
Clinical Outcomes Domain		
Mortality measures (MORT-30-AMI, MORT-30-HF, MORT-30-COPD, MORT-30-CABG, MORT-30-PN)	July 1, 2021 – June 30, 2024	July 1, 2026 – June 30, 2029
COMP-HIP-KNEE	April 1, 2021 – March 31, 2024	April 1, 2026 – March 31, 2029
Safety Domain		
NHSN measures (CAUTI, CLABSI, Colon and Abdominal Hysterectomy SSI, CDI, MRSA Bacteremia)	January 1, 2027 – December 31, 2027	January 1, 2029 – December 31, 2029
SEP-1	January 1, 2027 – December 31, 2027	January 1, 2029 – December 31, 2029
Efficiency and Cost Reduction Domain		
MSPB	January 1, 2027 – December 31, 2027	January 1, 2029 – December 31, 2029

TABLE V.J.7. BASELINE AND PERFORMANCE PERIODS FOR THE FY 2032 PROGRAM YEAR

Measures	Baseline Period	Performance Period
Person and Community Engagement Domain		
HCAHPS	January 1, 2028 – December 31, 2028	January 1, 2030 – December 31, 2030
Clinical Outcomes Domain		
Mortality measures (MORT-30-AMI, MORT-30-HF, MORT-30-COPD, MORT-30-CABG, MORT-30-PN)	July 1, 2024 – June 30, 2026*	July 1, 2028 – June 30, 2030
COMP-HIP-KNEE	April 1, 2022 – March 31, 2025	April 1, 2027 – March 31, 2030
Safety Domain		
NHSN measures (CAUTI, CLABSI, Colon and Abdominal Hysterectomy SSI, CDI, MRSA Bacteremia)	January 1, 2028 – December 31, 2028	January 1, 2030 – December 31, 2030
SEP-1	January 1, 2028 – December 31, 2028	January 1, 2030 – December 31, 2030
Efficiency and Cost Reduction Domain		
MSPB	January 1, 2028 – December 31, 2028	January 1, 2030 – December 31, 2030

*In this final rule, we are finalizing modifications to the mortality measures beginning with the FY 2032 program year, including a reduced performance period from 3 to 2 years. We refer readers to section IX.B.2. of the preamble of this final rule for more detailed discussion.

4. Performance Standards for the Hospital Value-Based Purchasing Program

a. Background

We refer readers to the FY 2025 IPPS/LTCH PPS final rule (89 FR 69406 through 69407) for previously established performance standards for the FY 2027 program year. We also refer readers to the FY 2026 IPPS/LTCH PPS final rule (90 FR 36955 through 36957) for the previously established performance standards for the FY 2028 program year.

b. Previously Established and Newly Established Performance Standards for Certain Measures for the FY 2029 Through the FY 2031 Program Years

We have adopted certain measures for the Safety domain, Clinical Outcomes domain, and the Efficiency and Cost Reduction domain for future program years to ensure that we can adopt baseline and performance periods of sufficient length for performance scoring purposes. In the FY 2026 IPPS/LTCH PPS final rule (90 FR 36948 through 36950), we made technical updates to the Clinical Outcomes domain beginning with the FY 2027 program year to include COVID–19 patients in the measure data, and thus established new performance standards for the FY 2029 through the FY 2031 program years for the Clinical Outcomes domain measures (MORT–30–AMI, MORT–30–HF, MORT–30–PN, MORT–30–COPD, MORT–30–CABG, and COMP–HIP–KNEE). In the FY 2026 IPPS/LTCH PPS final rule (90 FR 36954 through 36955), we made technical updates to the Safety domain, such that the five National Healthcare Safety Network Healthcare–Associated Infection measures (CAUTI, CLABSI, CDI, MRSA Bacteremia, and Colon and Abdominal Hysterectomy SSI) would use the CY 2022 data to calculate performance standards for the FY 2029 program year and subsequent years. In the FY 2025 IPPS/LTCH PPS final rule (89 FR 69409 through 69410), we established performance standards for the FY 2029 through the FY 2030 program years for the Efficiency and Cost Reduction domain measure (MSPB Hospital). We note that the performance standards for the MSPB Hospital measure are based on performance period data. Therefore, we are unable to provide numerical equivalents for the standards at this time. The previously established performance standards for the Clinical Outcomes domain and the Efficiency and Cost Reduction domain and newly estimated performance standards for the Safety domain measures are set out in Table V.J.8. for the FY 2029 program year.

TABLE V.J.8. PREVIOUSLY ESTABLISHED AND NEWLY ESTIMATED PERFORMANCE STANDARDS FOR THE FY 2029 PROGRAM YEAR

Measure Short Name	Achievement Threshold	Benchmark
Safety Domain**		
CAUTI*	0.392	0
CLABSI*	0.478	0
CDI*	0.268	0
MRSA Bacteremia*	0.602	0
Colon and Abdominal Hysterectomy SSI*	0.707 0.848	0
SEP-1	0.664479	0.879775
Clinical Outcomes Domain♦		
MORT-30-AMI	0.873295	0.891834
MORT-30-HF	0.87976	0.906894
MORT-30-PN	0.801554	0.842898
MORT-30-COPD	0.905582	0.924775
MORT-30-CABG	0.970801	0.979861
COMP-HIP-KNEE*	0.031509	0.023706
Efficiency and Cost Reduction Domain		
MSPB*	Median Medicare Spending per Beneficiary ratio across all hospitals during the performance period.	Mean of the lowest decile Medicare Spending per Beneficiary ratios across all hospitals during the performance period.

* Lower values represent better performance.

** We note that the numerical values for the performance standards for the HAI and SEP–1 measures in this final rule represent estimates based on CY 2025 data.

♦ Previously established performance standards.

We refer readers to the FY 2025 IPPS/LTCH PPS final rule (89 FR 69507 through 69508) where we finalized the policy to modify the scoring of the HCAHPS Survey for the FY 2027 through FY 2029 program years while updates to the survey are publicly reported under the Hospital Inpatient Quality Reporting Program. Scoring is modified to only score hospitals on the six unchanged Hospital Value-Based Purchasing Program dimensions of the HCAHPS Survey until the updates to the HCAHPS Survey have been publicly reported for 1 year. The six unchanged dimensions of the HCAHPS Survey for the Hospital Value-Based Purchasing Program are as follows:

- ''Communication with Nurses,''
- ''Communication with Doctors,''
- ''Communication about Medicines,''
- ''Discharge Information,''
- ''Cleanliness and Quietness,''
- ''Overall Rating.''

Scoring is modified such that for each of the six unchanged dimensions, Achievement Points (0–10 points) and Improvement Points (0–9 points) will be calculated, the larger of which will be summed across these six dimensions to create a pre-normalized HCAHPS Base Score of 0–60 points (as compared to 0–80 points with the current eight dimensions). The pre-normalized HCAHPS Base Score will then be multiplied by ⅝ (1.3333333) and rounded according to standard rules (values of 0.5 and higher are rounded up, values below 0.5 are rounded down) to create the normalized HCAHPS Base Score. Each of the six unchanged dimensions will be of equal weight, so that, as currently scored, the normalized HCAHPS Base Score will range from 0 to 80 points. HCAHPS Consistency Points will be calculated in the same manner as the current method and will continue to range from 0 to 20 points. Like the Base Score, the Consistency Points Score will consider scores across the six unchanged dimensions of the Person and Community Engagement domain. The final element of the scoring formula, which will remain unchanged from the current formula, will be the sum of the HCAHPS Base Score and the HCAHPS Consistency Points Score for a total score that ranges from 0 to 100 points. The method for calculating the performance standards for the six dimensions will remain unchanged. We refer readers to the Hospital Inpatient Value-Based Purchasing Program final rule (76 FR 26511 through 26512) for our methodology for calculating performance standards. The estimated performance standards for the six unchanged dimensions for the FY 2029 program year are set out in Table V.J.9.

TABLE V.J.9. NEWLY ESTIMATED PERFORMANCE STANDARDS FOR THE FY 2029 PROGRAM YEAR: PERSON AND COMMUNITY ENGAGEMENT DOMAIN

HCAHPS Survey Dimension*[1]	Floor (minimum)	Achievement Threshold (50th percentile)	Benchmark (mean of top decile)
Communication with Nurses	55.34	77.84	86.08
Communication with Doctors	57.45	77.55	85.40
Responsiveness of Hospital Staff**	X	X	X
Communication about Medicines	39.83	59.29	69.67
Hospital Cleanliness & Quietness	36.69	62.90	75.78
Discharge Information	66.71	85.97	91.07
Care Transition**	X	X	X
Overall Rating of Hospital	36.23	68.84	82.39

[1] Includes IPPS hospitals with 100+ completed surveys from patients discharged between January 2025 and December 2025 (2,697 hospitals). Scores have been adjusted for survey mode and patient-mix.

*We note that the numerical values for the performance standards for the HCAHPS Survey in this final rule represent estimates based on the most recently available data. These estimates are based on 01/01/2025–12/31/2025 data.

** In the FY 2025 IPPS/LTCH PPS final rule (89 FR 69507 and 69508), we finalized the policy to only score on the six unchanged dimensions of the original HCAHPS Survey for the FY 2029 program year while the updates to the survey are publicly reported in the Hospital Inpatient Quality Reporting Program for the statutorily required 1 year. Therefore, we are not reporting performance standards for the dimensions that are unscored.

The previously established performance standards for Clinical Outcomes domain and the Efficiency and Cost Reduction domain measures are set out in Table V.J.10. for the FY 2030 program year.

TABLE V.J.10. PREVIOUSLY ESTABLISHED PERFORMANCE STANDARDS FOR THE FY 2030 PROGRAM YEAR

Measure Short Name	Achievement Threshold	Benchmark
Clinical Outcomes Domain		
MORT-30-AMI	0.872557	0.892486
MORT-30-HF	0.87823	0.908997

c. Newly Established Performance Standards for Certain Measures for the FY 2032 Program Year

As discussed previously, we have adopted certain measures for the Clinical Outcomes domain (MORT–30–AMI, MORT–30–HF, MORT–30–PN, MORT–30–COPD, MORT–30–CABG, and COMP–HIP–KNEE) and the Efficiency and Cost Reduction domain (MSPB Hospital) for future program years to ensure that we can adopt baseline and performance periods of sufficient length for performance scoring purposes. In accordance with our methodology for calculating performance standards discussed more fully in the Hospital Inpatient Value-Based Purchasing Program final rule (76 FR 26511 through 26512), which is codified at 42 CFR 412.160, we are establishing the following performance standards for the FY 2032 program year for the Clinical Outcomes domain and the Efficiency and Cost Reduction domain. We note that the performance standards for the MSPB Hospital measure are based on performance period data. Therefore, we are unable to provide numerical equivalents for the standards at this time. The newly established performance standards for these measures are set out in Table V.J.12.

TABLE V.J.12. NEWLY ESTABLISHED PERFORMANCE STANDARDS FOR THE FY 2032 PROGRAM YEAR

Measure Short Name	Achievement Threshold	Benchmark
Clinical Outcomes Domain		
MORT-30-AMI**	0.881686	0.899183
MORT-30-HF**	0.887519	0.915618
MORT-30-PN**	0.846031	0.882679
MORT-30-COPD**	0.911638	0.930897
MORT-30-CABG**	0.976958	0.984987
COMP-HIP-KNEE*	0.039655	0.028874
Efficiency and Cost Reduction Domain		
MSPB*	Median Medicare Spending per Beneficiary ratio across all hospitals during the performance period.	Mean of the lowest decile Medicare Spending per Beneficiary ratios across all hospitals during the performance period.

* Lower values represent better performance.

** In this final rule, we are finalizing modifications to the five mortality measures in the Clinical Outcomes domain beginning with the FY 2032 program year. We note the performance standards for these measures do not yet reflect these finalized modifications, which include Medicare Advantage beneficiaries to the measures' cohorts and a shortened reporting period from 3 to 2 years. We intend to provide updated performance standards for the FY 2032 program year in the FY 2028 IPPS/LTCH PPS proposed rule to reflect these newly finalized modifications. We refer readers to section IX.B.2. of the preamble of this final rule for more detailed discussion.

K. Hospital-Acquired Condition (HAC) Reduction Program

We refer readers to the FY 2014 IPPS/LTCH PPS final rule (78 FR 50707 through 50709) for a general overview of the HAC Reduction Program and a detailed discussion of the statutory basis for the program. We also refer readers to 42 CFR 412.170 through 412.172 for codified HAC Reduction Program requirements. For additional information about the HAC Reduction Program measures and maintenance of technical specifications, we refer readers to the FY 2026 IPPS/LTCH PPS final rule (90 FR 36963 through 36967).

We did not make any proposals or updates for the HAC Reduction Program in the FY 2027 IPPS/LTCH proposed rule (91 FR 19546). We refer readers to section I.G.8. of Appendix A of this final rule for an updated estimate of the proportion of hospitals in the worst performing quartile of the Total HAC Scores for the FY 2027 HAC Reduction Program.

L. Rural Community Hospital Demonstration Program

1. Introduction

The Rural Community Hospital Demonstration was originally authorized by section 410A of the Medicare Prescription Drug, Improvement, and Modernization Act of 2003 (MMA) (Pub. L. 108–173). The demonstration has been extended three times since the original 5-year period mandated by the MMA, each time for an additional 5 years. These extensions were authorized by sections 3123 and 10313 of the Patient Protection and Affordable Care Act (ACA) (Pub. L. 111–148), section 15003 of the 21st Century Cures Act (Pub. L. 114–255) (Cures Act) enacted in 2016, and most recently, by section 128 of the Consolidated Appropriations Act, 2021 (Pub. L. 116–260), which also reauthorized the RCHD for five years. Later in this section we summarize the status of the demonstration program and the current methodologies for implementation and calculating budget neutrality.

2. Background

Section 410A(a) of the MMA required the Secretary to establish a demonstration program to test the feasibility and advisability of establishing rural community hospitals to furnish covered inpatient hospital services to Medicare beneficiaries. The demonstration pays rural community hospitals under a reasonable cost-based methodology for Medicare payment purposes for covered inpatient hospital services furnished to Medicare beneficiaries. A rural community hospital, as defined in section 410A(f)(1), is a hospital that—

- Is located in a rural area (as defined in section 1886(d)(2)(D) of the Act) or is treated as being located in a rural area under section 1886(d)(8)(E) of the Act;
- Has fewer than 51 beds (excluding beds in a distinct part psychiatric or rehabilitation unit) as reported in its most recent cost report;
- Provides 24-hour emergency care services; and
- Is not designated or eligible for designation as a CAH under section 1820 of the Act.

Our policy for implementing the 5-year extension period authorized by the CAA, 2021 follows upon the previous extensions under the ACA and the Cures Act. Section 410A of the MMA initially required a 5-year period of performance. Subsequently, sections 3123 and 10313 of the ACA (Pub. L. 111–148) required the Secretary to conduct the demonstration program for an additional 5-year period, to begin on the date immediately following the last day of the initial 5-year period. In addition, the ACA (Pub. L. 111–148) limited the number of hospitals participating to no more than 30. Section 15003 of the Cures Act (Pub. L. 114–255) required a 10-year extension period in place of the 5-year extension period under the ACA (Pub. L. 111–148), thereby extending the demonstration for another 5 years. Section 128 of CAA, 2021 (Pub. L. 116–260), in turn, revised the statute to indicate a 15-year extension period, instead of the 10-year extension period mandated by the Cures Act (Pub. L. 114–255). The FY 2023 IPPS proposed and final rules (87 FR 28454 through 28458, and 87 FR 49138 through 49142, respectively) describe hospitals entering into and withdrawing from the demonstration with these re-authorizations. As of March 2026, there are 27 hospitals participating in the demonstration.

2. Budget Neutrality

a. Statutory Budget Neutrality Requirement

Section 410A(c)(2) of the MMA (Pub. L. 108–173) requires that, in conducting the demonstration program under this section, the Secretary shall ensure that the aggregate payments made by the Secretary do not exceed the amount that the Secretary would have paid if the demonstration program under this section was not implemented. This requirement is commonly referred to as ''budget neutrality.'' Generally, when we implement a demonstration program on a budget neutral basis, the demonstration program is budget neutral on its own terms; the aggregate payments to the participating hospitals do not exceed the amount that would be paid to those same hospitals in the absence of the demonstration program. We note that the payment methodology for this demonstration, that is, cost-based payments to participating small rural hospitals, made it unlikely that increased Medicare outlays would produce an offsetting reduction to Medicare expenditures elsewhere. Therefore, in the IPPS final rules spanning the period from FY 2005 through FY 2016, we have adjusted the national IPPS rates by an amount sufficient to account for the added costs of this demonstration program, applying budget neutrality across the payment system as a whole rather than merely across the participants in the demonstration program. We applied a different methodology for FY 2017, with the demonstration expected to end prior to the Cures Act extension. As described in the FYs 2005 through 2017 IPPS/LTCH PPS final rules (69 FR 49183; 70 FR 47462; 71 FR 48100; 72 FR 47392; 73 FR 48670; 74 FR 43922, 75 FR 50343, 76 FR 51698, 77 FR 53449, 78 FR 50740, 77 FR 50145; 80 FR 49585; and 81 FR 57034, respectively), we believe that the statutory language of the budget neutrality requirements permits the agency to implement the budget neutrality provision in this manner.

We resumed this methodology of offsetting demonstration costs against the national payment rates in the IPPS final rules from FY 2018 through FY 2026. Please see the FY 2026 IPPS/LTCH PPS final rule for a description of how we applied the budget neutrality requirement for these fiscal years (90 FR 36967 through 36969).

b. General Budget Neutrality Methodology

We have generally incorporated two components into the budget neutrality offset amounts identified in the final IPPS rules in previous years. First, we have estimated the costs of the demonstration for the upcoming fiscal year, generally determined from historical, ''as submitted'' cost reports for the hospitals participating in that year. Updated factors representing nationwide trends in cost and volume increases have been incorporated into these estimates, as specified in the methodology described in the final rule for each fiscal year. Second, as finalized cost reports became available, we determined the amount by which the actual costs of the demonstration for an earlier, given year differed from the

estimated costs for the demonstration set forth in the final IPPS rule for the corresponding fiscal year, and incorporated that amount into the budget neutrality offset amount for the upcoming fiscal year. If the actual costs for the demonstration for the earlier fiscal year exceeded the estimated costs of the demonstration identified in the final rule for that year, this difference was added to the estimated costs of the demonstration for the upcoming fiscal year when determining the budget neutrality adjustment for the upcoming fiscal year. Conversely, if the estimated costs of the demonstration set forth in the final rule for a prior fiscal year exceeded the actual costs of the demonstration for that year, this difference was subtracted from the estimated cost of the demonstration for the upcoming fiscal year when determining the budget neutrality adjustment for the upcoming fiscal year. For historical development and modifications to this methodology, see 81 FR 57034 through 57037.

We note that we have calculated this difference for FYs 2005 through 2020 between the actual costs of the demonstration as determined from finalized cost reports once available, and estimated costs of the demonstration as identified in the applicable IPPS final rules for these years.

c. Budget Neutrality Methodology for the Extension Period Authorized by CAA, 2021

For the most-recently enacted extension period, under the CAA, 2021, we have continued upon the general budget neutrality methodology used in previous years, as described previously in the citations to earlier IPPS final rules.

Under the general methodology used in previous years, we have estimated the costs of the demonstration for the upcoming fiscal year, and proposed to incorporate the estimate into the budget neutrality offset amount to be applied to the national IPPS rates for the upcoming fiscal year. We are conducting this estimate for FY 2027 based on the 30 participating hospitals for cost report periods ending in CY2024. However, due to timing issues with the addition of 11 new hospitals in 2025, we are not yet able to finalize the estimated FY 2027 costs of the demonstration at this time. We anticipate that all of the historical ''as submitted'' cost reports needed to formulate estimated demonstration costs for FY 2027 and FY 2028 will be available in advance of the FY 2028 IPPS/LTCH PPS proposed rule and we will be able to finalize estimated demonstration costs for both FY 2027 and FY 2028.

As noted, in previous years we have also calculated the difference between the actual costs of the demonstration and estimated costs of the demonstration for FYs 2005 through 2020 as determined from finalized cost reports. We intend to continue with this approach and anticipate that we will be able to determine the actual costs for the demonstration for FY 2021 and FY 2022 from finalized cost reports in advance of the FY 2028 IPPS/LTCH PPS proposed rule. Consistent with our methods in previous years these differences will be applied to the estimated costs of the demonstration when determining the FY 2027 and FY 2028 budget neutrality offsets.

As we are not yet able to finalize the FY 2027 estimated costs of the demonstration at this time, we did not propose to apply a budget neutrality offset to the FY 2027 IPPS/LTCH PPS final rule. Rather, we proposed to apply budget neutrality offsets for both FY 2027 and FY 2028 to the national IPPS rates in the FY 2028 IPPS/LTCH PPS proposed rule. We will also incorporate any statutory change that might affect the methodology for determining hospital costs either with or without the demonstration. We invited public comments.

We received a few public comments, most of which were out of scope. However all of the comments we received were supportive of continuing the Rural Community Hospital Demonstration.

Comment: A commenter recommended that CMS allow RCHD hospitals whose 5-year participation agreements have expired or will be expiring under the CAA extension reenter the program until the demonstration's statutory end date of June 30, 2028.

Response: We thank the commenter for their interest and recommendation. In the absence of new authorizing legislation, it is CMS' position that we cannot extend expired participation agreements beyond the statutorily defined 5-year periods under the same reauthorization.

Comment: The parent company for two of the participating hospitals expressed support for the continuation of the Rural Community Hospital Demonstration program, but noted that it does not offer long-term financial stability needed to maintain health care access in rural areas. The commenter requests that the demonstration be made a permanent program. Furthermore, the commenter requests several technical adjustments to the administration of the demonstration that may enhance stability in the payment to the participating hospitals.

Response: We appreciate the comments. We have conducted the demonstration program in accordance with section 410A of the MMA, and there is no authority to make the demonstration a permanent program. With regard to any technical adjustments to the demonstration, we intend to work with the commenter and other rural stakeholders to examine the issues involved.

After consideration of the public comments we received, primarily requesting to extend the demonstration, we are finalizing our policy without modification.

VI. Changes to the IPPS for Capital-Related Costs

A. Overview

Section 1886(g) of the Act requires the Secretary to pay for the capital-related costs of inpatient acute hospital services in accordance with a prospective payment system established by the Secretary. Under the statute, the Secretary has broad authority in establishing and implementing the IPPS for acute care hospital inpatient capital-related costs. We initially implemented the IPPS for capital-related costs in the FY 1992 IPPS final rule (56 FR 43358). In that final rule, we established a 10-year transition period to change the payment methodology for Medicare hospital inpatient capital-related costs from a reasonable cost-based payment methodology to a prospective payment methodology (based fully on the Federal rate).

FY 2001 was the last year of the 10-year transition period that was established to phase in the IPPS for hospital inpatient capital-related costs. For cost reporting periods beginning in FY 2002, capital IPPS payments are based solely on the Federal rate for almost all acute care hospitals (other than hospitals receiving certain exception payments and certain new hospitals). (We refer readers to the FY 2002 IPPS final rule (66 FR 39910 through 39914) for additional information on the methodology used to determine capital IPPS payments to hospitals both during and after the transition period.)

The basic methodology for determining capital prospective payments using the Federal rate is set forth in the regulations at 42 CFR 412.312. For the purpose of calculating capital payments for each discharge, the standard Federal rate is adjusted as follows:

(Standard Federal Rate) × (DRG Weight) × (Geographic Adjustment Factor (GAF) × (COLA for hospitals located in Alaska and Hawaii) × (1 + Capital DSH Adjustment Factor + Capital IME Adjustment Factor, if applicable).

In addition, under § 412.312(c), hospitals also may receive outlier payments under the capital IPPS for extraordinarily high-cost cases that qualify under the thresholds established for each fiscal year.

B. Additional Provisions

1. Exception Payments

The regulations at 42 CFR 412.348 provide for certain exception payments under the capital IPPS. The regular exception payments provided under § 412.348(b) through (e) were available only during the 10-year transition period. For a certain period after the transition period, eligible hospitals may have received additional payments under the special exceptions provisions at § 412.348(g). However, FY 2012 was the final year hospitals could receive special exceptions payments. For additional details regarding these exceptions policies, we refer readers to the FY 2012 IPPS/LTCH PPS final rule (76 FR 51725).

Under § 412.348(f), a hospital may request an additional payment if the hospital incurs unanticipated capital expenditures in excess of $5 million due to extraordinary circumstances beyond the hospital's control. Additional information on the exception payment for extraordinary circumstances in § 412.348(f) can be found in the FY 2005 IPPS final rule (69 FR 49185 and 49186).

2. New Hospitals

Under the capital IPPS, the regulations at 42 CFR 412.300(b) define a new hospital as a hospital that has operated (under previous or current ownership) for less than 2 years and lists examples of hospitals that are not considered new hospitals. In accordance with § 412.304(c)(2), under the capital IPPS, a new hospital is paid 85 percent of its allowable Medicare inpatient hospital capital related costs through its first 2 years of operation, unless the new hospital elects to receive full prospective payment based on 100 percent of the Federal rate. We refer readers to the FY 2012 IPPS/LTCH PPS final rule (76 FR 51725) for additional information on payments to new hospitals under the capital IPPS.

3. Payments for Hospitals Located in Puerto Rico

In the FY 2017 IPPS/LTCH PPS final rule (81 FR 57061), we revised the regulations at 42 CFR 412.374 relating to the calculation of capital IPPS payments to hospitals located in Puerto Rico beginning in FY 2017 to parallel the change in the statutory calculation of operating IPPS payments to hospitals located in Puerto Rico, for discharges occurring on or after January 1, 2016, made by section 601 of the Consolidated Appropriations Act, 2016 (Pub. L. 114–113). Section 601 of Public Law 114–113 increased the applicable Federal percentage of the operating IPPS payment for hospitals located in Puerto Rico from 75 percent to 100 percent and decreased the applicable Puerto Rico percentage of the operating IPPS payments for hospitals located in Puerto Rico from 25 percent to zero percent, applicable to discharges occurring on or after January 1, 2016. As such, under revised § 412.374, for discharges occurring on or after October 1, 2016, capital IPPS payments to hospitals located in Puerto Rico are based on 100 percent of the capital Federal rate.

C. Annual Update for FY 2027

The annual update to the national capital Federal rate, as provided in 42 CFR 412.308(c), for FY 2027 is discussed in section III. of the Addendum to this FY 2027 IPPS/LTCH PPS final rule.

VII. Changes for Hospitals Excluded From the IPPS

A. Rate-of-Increase in Payments to Excluded Hospitals for FY 2027

Certain hospitals excluded from a prospective payment system, including children's hospitals, 11 cancer hospitals, and hospitals located outside the 50 States, the District of Columbia, and Puerto Rico (that is, hospitals located in the U.S. Virgin Islands, Guam, the Northern Mariana Islands, and American Samoa) receive payment for inpatient hospital services they furnish on the basis of reasonable costs, subject to a rate-of-increase ceiling. A per discharge limit (the target amount, as defined in § 413.40(a) of the regulations) is set for each hospital based on the hospital's own cost experience in its base year, and updated annually by a rate-of-increase percentage. For each cost reporting period, the updated target amount is multiplied by total Medicare discharges during that period and applied as an aggregate upper limit (the ceiling as defined in § 413.40(a)) of Medicare reimbursement for total inpatient operating costs for a hospital's cost reporting period. In accordance with § 403.752(a) of the regulations, religious nonmedical health care institutions (RNHCIs) also are subject to the rate-of-increase limits established under § 413.40 of the regulations discussed previously. Furthermore, in accordance with § 412.526(c)(3) of the regulations, extended neoplastic disease care hospitals (formerly classified as ''Subclause II LTCHs'') also are subject to the rate-of-increase limits established under § 413.40 of the regulations discussed previously.

As explained in the FY 2006 IPPS final rule (70 FR 47396 through 47398), beginning with FY 2006, we have used the percentage increase in the IPPS operating market basket to update the target amounts for children's hospitals, the 11 cancer hospitals, and RNHCIs.

Consistent with the regulations at §§ 412.23(g) and 413.40(a)(2)(ii)(A) and (c)(3)(viii), we also have used the percentage increase in the IPPS operating market basket to update target amounts for short-term acute care hospitals located in the U.S. Virgin Islands, Guam, the Northern Mariana Islands, and American Samoa. In the FY 2022 IPPS/LTCH PPS final rule (86 FR 45194 through 45207), we finalized the use of the percentage increase in the 2018-based IPPS operating market basket to update the target amounts for children's hospitals, the 11 cancer hospitals, RNHCIs, and short-term acute care hospitals located in the U.S. Virgin Islands, Guam, the Northern Mariana Islands, and American Samoa for FY 2022 and subsequent fiscal years. As discussed in section IV. of the preamble of the FY 2026 IPPS/LTCH PPS final rule (90 FR 36859 through 36866), we rebased and revised the IPPS operating basket to a 2023 base year. Therefore, we used the percentage increase in the 2023-based IPPS operating market basket to update the target amounts for children's hospitals, the 11 cancer hospitals, RNHCIs, and short-term acute care hospitals located in the U.S. Virgin Islands, Guam, the Northern Mariana Islands, and American Samoa for FY 2026.

For the FY 2027 IPPS/LTCH PPS proposed rule, based on IGI's 2025 fourth quarter forecast, we estimated that the 2023-based IPPS operating market basket percentage increase for FY 2027 was 3.2 percent (that is, the estimate of the market basket rate-of-increase). Based on this estimate, the FY 2027 rate-of-increase percentage that would be applied to the FY 2026 target amounts in order to calculate the FY 2027 target amounts for children's hospitals, the 11 cancer hospitals,

RNHCIs, and short-term acute care hospitals located in the U.S. Virgin Islands, Guam, the Northern Mariana Islands, and American Samoa was 3.2 percent, in accordance with the applicable regulations at 42 CFR 413.40. However, we proposed that if more recent data became available for the FY 2026 IPPS/LTCH PPS final rule, we would use such data, if appropriate, to calculate the final IPPS operating market basket update for FY 2027.

More recent data has become available. Based on IGI's second quarter 2026 forecast, we estimate that the 2023-based IPPS operating market basket percentage increase for FY 2027 is 3.2 percent (that is, the estimate of the market basket rate-of-increase). Accordingly, the FY 2027 rate-of-increase percentage that we will apply to the FY 2026 target amounts in order to calculate the FY 2027 target amounts for children's hospitals, the 11 cancer hospitals, RNHCIs, and short-term acute care hospitals located in the U.S. Virgin Islands, Guam, the Northern Mariana Islands, and American Samoa is 3.2 percent, which is based on IGI's second quarter 2026 forecast.

We received no comments on this proposal and therefore are finalizing this provision without modification. Incorporating more recent data available for this final rule, as we proposed, we are adopting a 3.2 percent update for FY 2027.

In addition, payment for inpatient operating costs for hospitals classified under section 1886(d)(1)(B)(vi) of the Act (which we refer to as ''extended neoplastic disease care hospitals'') for cost reporting periods beginning on or after January 1, 2015, is to be made as described in 42 CFR 412.526(c)(3), and payment for capital costs for these hospitals is to be made as described in 42 CFR 412.526(c)(4), (for additional information on these payment regulations, we refer readers to the FY 2018 IPPS/LTCH PPS final rule (82 FR 38321 through 38322).) Section 412.526(c)(3) provides that the hospital's Medicare allowable net inpatient operating costs for that period are paid on a reasonable cost basis, subject to that hospital's ceiling, as determined under § 412.526(c)(1), for that period. Under § 412.526(c)(1), for each cost reporting period, the ceiling was determined by multiplying the updated target amount, as defined in § 412.526(c)(2), for that period by the number of total Medicare discharges paid during that period. Section 412.526(c)(2)(i) describes the method for determining the target amount for cost reporting periods beginning during FY 2015. Section 412.526(c)(2)(ii) specifies that, for cost reporting periods beginning during fiscal years after FY 2015, the target amount will equal the hospital's target amount for the previous cost reporting period updated by the applicable annual rate-of-increase percentage specified in § 413.40(c)(3) for the subject cost reporting period (79 FR 50197).

For FY 2027, in accordance with §§ 412.22(i) and 412.526(c)(2)(ii) of the regulations, for cost reporting periods beginning during FY 2027, the proposed update to the target amount for extended neoplastic disease care hospitals (that is, hospitals described under § 412.22(i)) is the applicable annual rate-of-increase percentage specified in § 413.40(c)(3), which is estimated to be the proposed percentage increase in the 2023-based IPPS operating market basket (that is, the estimate of the market basket rate-of-increase). Accordingly, the proposed update to an extended neoplastic disease care hospital's target amount for FY 2027 was 3.2 percent, which was based on IGI's fourth quarter 2025 forecast. Furthermore, we proposed that if more recent data became available for the FY 2027 IPPS/LTCH PPS final rule, we would use such data, if appropriate, to calculate the IPPS operating market basket rate of increase for FY 2027.

More recent data has become available. Based on IGI's second quarter 2026 forecast, we estimate that the 2023-based IPPS operating market basket percentage increase for FY 2027 is 3.2 percent (that is, the estimate of the market basket rate-of-increase). Accordingly, the FY 2027 rate-of-increase percentage that we will apply to the FY 2026 target amounts in order to calculate the FY 2027 target amounts for extended neoplastic disease care hospitals is 3.2 percent, which is based on IGI's second quarter 2026 forecast.

We received no comments on this proposal and therefore are finalizing this provision without modification. Incorporating more recent data available for this final rule, as we proposed, we are adopting a 3.2 percent update for FY 2027.

B. Report on Adjustment (Exception) Payments

Section 4419(b) of Public Law 105–33 requires the Secretary to publish annually in the **Federal Register** a report describing the total amount of adjustment payments made to excluded hospitals and hospital units by reason of section 1886(b)(4) of the Act during the previous fiscal year.

The process of requesting, reviewing, and awarding an adjustment payment is likely to occur over a 2-year period or longer. First, generally, an excluded hospital must file its cost report for the fiscal year in accordance with § 413.24(f)(2) of the regulations. The MAC reviews the cost report and issues a notice of provider reimbursement (NPR). Once the hospital receives the NPR, if its operating costs are in excess of the ceiling, the hospital may file a request for an adjustment payment. After the MAC receives the hospital's request in accordance with applicable regulations, the MAC or CMS, depending on the type of adjustment requested, reviews the request and determines if an adjustment payment is warranted. This determination is sometimes not made until more than 180 days after the date the request is filed because there are times when the request applications are incomplete and additional information must be requested in order to have a completed request application. However, in an attempt to provide interested parties with data on the most recent adjustment payments for which we have data, we are publishing data on adjustment payments that were processed by the MAC or CMS during FY–2025.

The table that follows includes the most recent data available from the MACs and CMS on adjustment payments that were adjudicated during FY 2025. As indicated previously, the adjustments made during FY 2025 only pertain to cost reporting periods ending in years prior to FY 2025. Total adjustment payments made to IPPS-excluded hospitals during FY 2025 are $92,696,418. The table depicts for each class of hospitals, in the aggregate, the number of adjustment requests adjudicated, the excess operating costs over the ceiling, and the amount of the adjustment payments.

Class of Hospital	Number	Excess Cost Over Ceiling	Adjustment Payments
Cancer Hospitals	5	$162,316,893	$91,599,402
Children's Hospitals	8	$5,357,347	$1,097,016
Total	13	$167,674,150	$92,696,418

B. Critical Access Hospitals (CAHs)

1. Background

Section 1820 of the Act provides for the establishment of Medicare Rural Hospital Flexibility Programs (MRHFPs), under which individual States may designate certain facilities as critical access hospitals (CAHs). Facilities that are so designated and meet the CAH conditions of participation under 42 CFR part 485, subpart F, will be certified as CAHs by CMS. Regulations governing payments to CAHs for services to Medicare beneficiaries are located in 42 CFR part 413.

2. Frontier Community Health Integration Project Demonstration

a. Introduction

The Frontier Community Health Integration Project Demonstration was originally authorized by section 123 of the Medicare Improvements for Patients and Providers Act of 2008 (Public Law 110–275). The demonstration has been extended by section 129 of the Consolidated Appropriations Act, 2021 (Public Law 116–260) for an additional 5 years. In this final rule, we summarized the status of the demonstration program, and the ongoing methodologies for implementation and budget neutrality for the demonstration extension period.

b. Background and Overview

As discussed in the FY 2026 IPPS/LTCH PPS final rule (90 FR 36971 through 36975), section 123 of the Medicare Improvements for Patients and Providers Act of 2008, as amended by section 3126 of the Affordable Care Act, authorized a demonstration project to allow eligible entities to develop and test new models for the delivery of health care services in eligible counties in order to improve access to and better integrate the delivery of acute care, extended care and other health care services to Medicare beneficiaries. The demonstration was titled ''Demonstration Project on Community Health Integration Models in Certain Rural Counties,'' and commonly known as the Frontier Community Health Integration Project (FCHIP) Demonstration.

The authorizing statute stated the eligibility criteria for entities to be able to participate in the demonstration. An eligible entity, as defined in section 123(d)(1)(B) of Public Law 110–275, as amended, is a Medicare Rural Hospital Flexibility Program (MRHFP) grantee under section 1820(g) of the Act (that is, a CAH); and is located in a State in which at least 65 percent of the counties in the state are counties that have 6 or less residents per square mile.

The authorizing statute stipulated several other requirements for the demonstration. In addition, section 123(g)(1)(B) of Public Law 110–275 required that the demonstration be budget neutral. Specifically, this provision stated that, in conducting the demonstration project, the Secretary shall ensure that the aggregate payments made by the Secretary do not exceed the amount which the Secretary estimates would have been paid if the demonstration project under the section were not implemented. Furthermore, section 123(i) of Public Law 110–275 stated that the Secretary may waive such requirements of titles XVIII and XIX of the Act as may be necessary and appropriate for the purpose of carrying out the demonstration project, thus allowing the waiver of Medicare payment rules encompassed in the demonstration. CMS selected CAHs to participate in four interventions, under which specific waivers of Medicare payment rules would allow for enhanced payment for telehealth, skilled nursing facility/nursing facility beds, ambulance services, and home health services. These waivers were formulated with the goal of increasing access to care with no net increase in costs.

Section 123 of Pub L. 110–275 initially required a 3-year period of performance. The FCHIP Demonstration began on August 1, 2016, and concluded on July 31, 2019 (referred to in this section of the final rule as the ''initial period''). Subsequently, section 129 of the Consolidated Appropriations Act, 2021 (Public Law 116–260) extended the demonstration by 5 years (referred to in this section of the final rule as the ''extension period''). The Secretary is required to conduct the demonstration for an additional 5-year period. CAHs participating in the demonstration project during the extension period began such participation in their cost reporting year that began on or after January 1, 2022.

As described in the FY 2026 IPPS/LTCH PPS final rule (90 FR 36971 through 36975), 10 CAHs were selected for participation in the demonstration initial period. The selected CAHs were located in three states—Montana, Nevada, and North Dakota—and participated in three of the four interventions identified in the FY 2025 IPPS/LTCH PPS final rule. Each CAH was allowed to participate in more than one of the interventions. None of the selected CAHs were participants in the home health intervention, which was the fourth intervention.

In the FY 2022 IPPS/LTCH PPS final rule (86 FR 45323 through 45328), CMS concluded that the initial period of the FCHIP Demonstration (covering the performance period of August 1, 2016, to July 31, 2019) had satisfied the budget neutrality requirement described in section 123(g)(1)(B) of Public Law 110–275. Therefore, CMS did not apply a budget neutrality payment offset policy for the initial period of the demonstration.

Section 129 of Public Law 116–260, stipulates that only the 10 CAHs that participated in the initial period of the FCHIP Demonstration are eligible to participate during the extension period. Among the eligible CAHs, five have elected to participate in the extension period. The selected CAHs are located in two states—Montana and North Dakota—and are implementing three of the four interventions. The eligible CAH participants elected to change the number of interventions and payment waivers they would participate in during the extension period. CMS accepted and approved the CAHs intervention and payment waiver updates. For the extension period, five CAHs are participants in the telehealth intervention, three CAHs are participants in the skilled nursing facility/nursing facility bed intervention, and three CAHs are participants in the ambulance services intervention. As with the initial period, each CAH was allowed to participate in more than one of the interventions

during the extension period. None of the selected CAHs are participants in the home health intervention, which was the fourth intervention.

c. Intervention Payment and Payment Waivers

As described in the FY 2026 IPPS/LTCH PPS final rule (90 FR 36971 through 36975), CMS waived certain Medicare rules for CAHs participating in the demonstration initial period to allow for alternative reasonable cost-based payment methods in the three distinct intervention service areas: telehealth services, ambulance services, and skilled nursing facility/nursing facility (SNF/NF) beds expansion. The payments and payment waiver provisions only apply if the CAH is a participant in the associated intervention. CMS Intervention Payment and Payment Waivers for the demonstration extension period consist of the following:

(1) Telehealth Services Intervention Payments

CMS waives section 1834(m)(2)(B) of the Act, which specifies the facility fee to the originating site for Medicare telehealth services. CMS modifies the facility fee payment specified under section 1834(m)(2)(B) of the Act to make reasonable cost-based reimbursement to the participating CAH where the participating CAH serves as the originating site for a telehealth service furnished to an eligible telehealth individual, as defined in section 1834(m)(4)(B) of the Act. CMS reimburses the participating CAH serving as the originating site at 101 percent of its reasonable costs for overhead, salaries and fringe benefits associated with telehealth services at the participating CAH. CMS does not fund or provide reimbursement to the participating CAH for the purchase of new telehealth equipment.

CMS waives section 1834(m)(2)(A) of the Act, which specifies that the payment for a telehealth service furnished by a distant site practitioner is the same as it would be if the service had been furnished in-person. CMS modifies the payment amount specified for telehealth services under section 1834(m)(2)(A) of the Act to make reasonable cost-based reimbursement to the participating CAH for telehealth services furnished by a physician or practitioner located at distant site that is a participating CAH that is billing for the physician or practitioner professional services. Whether the participating CAH has or has not elected Optional Payment Method II for outpatient services, CMS would pay the participating CAH 101 percent of reasonable costs for telehealth services when a physician or practitioner has reassigned their billing rights to the participating CAH and furnishes telehealth services from the participating CAH as a distant site practitioner. This means that participating CAHs that are billing under the Standard Method on behalf of employees who are physicians or practitioners (as defined in section 1834(m)(4)(D) and (E) of the Act, respectively) would be eligible to bill for distant site telehealth services furnished by these physicians and practitioners. Additionally, CAHs billing under the Optional Method would be reimbursed based on 101 percent of reasonable costs, rather than paid based on the Medicare physician fee schedule, for the distant site telehealth services furnished by physicians and practitioners who have reassigned their billing rights to the CAH. For distant site telehealth services furnished by physicians or practitioners who have not reassigned billing rights to a participating CAH, payment to the distant site physician or practitioner would continue to be made as usual under the Medicare physician fee schedule. Except as described herein, CMS does not waive any other provisions of section 1834(m) of the Act for purposes of the telehealth services intervention payments, including the scope of Medicare telehealth services as established under section 1834(m)(4)(F) of the Act.

(2) Ambulance Services Intervention Payments

CMS waives 42 CFR 413.70(b)(5)(i)(D) and section 1834(l)(8) of the Act, which provides that payment for ambulance services furnished by a CAH, or an entity owned and operated by a CAH, is 101 percent of the reasonable costs of the CAH or the entity in furnishing the ambulance services, but only if the CAH or the entity is the only provider or supplier of ambulance services located within a 35-mile drive of the CAH, excluding ambulance providers or suppliers that are not legally authorized to furnish ambulance services to transport individuals to or from the CAH. The participating CAH would be paid 101 percent of reasonable costs for its ambulance services regardless of whether there is any provider or supplier of ambulance services located within a 35-mile drive of the participating CAH or participating CAH-owned and operated entity. CMS would not make cost-based payment to the participating CAH for any new capital (for example, vehicles) associated with ambulance services. This waiver does not modify any other Medicare rules regarding or affecting the provision of ambulance services.

(3) SNF/NF Beds Expansion Intervention Payments

CMS waives 42 CFR 485.620(a), 42 CFR 485.645(a)(2), and section 1820(c)(2)(B)(iii) of the Act which limit CAHs to maintaining no more than 25 inpatient beds, including beds available for acute inpatient or swing bed services. CMS waives 1820(f) of the Act permitting designating or certifying a facility as a critical access hospital for which the facility at any time is furnishing inpatient beds which exceed more than 25 beds. Under this waiver, if the participating CAH has received swing bed approval from CMS, the participating CAH may maintain up to ten additional beds (for a total of 35 beds) available for acute inpatient or swing bed services; however, the participating CAH may only use these 10 additional beds for nursing facility or skilled nursing facility level of care. CMS would pay the participating CAH 101 percent of reasonable costs for its SNF/NF services furnished in the 10 additional beds.

d. Budget Neutrality

(1) Budget Neutrality Requirement

In the FY 2022 IPPS/LTCH PPS final rule (86 FR 45323 through 45328), we finalized a policy to address the budget neutrality requirement for the demonstration initial period. As explained in the FY 2022 IPPS/LTCH PPS final rule, we based our selection of CAHs for participation in the demonstration with the goal of maintaining the budget neutrality of the demonstration on its own terms, meaning that the demonstration would produce savings from reduced transfers and admissions to other health care providers, offsetting any increase in Medicare payments as a result of the demonstration. However, because of the small size of the demonstration and uncertainty associated with the projected Medicare utilization and costs, the policy we finalized for the demonstration initial period of performance in the FY 2022 IPPS/LTCH PPS final rule provides a contingency plan to ensure that the budget neutrality requirement in section 123 of Public Law 110–275 is met.

In the FY 2023 IPPS/LTCH PPS final rule (87 FR 49144 through 49147), we adopted the same budget neutrality policy contingency plan used during the demonstration initial period to ensure that the budget neutrality requirement in section 123 of Public Law 110 275 is

met during the demonstration extension period. If analysis of claims data for Medicare beneficiaries receiving services at each of the participating CAHs, as well as from other data sources, including cost reports for the participating CAHs, shows that increases in Medicare payments under the demonstration during the 5-year extension period are not sufficiently offset by reductions elsewhere, we would recoup the additional expenditures attributable to the demonstration through a reduction in payments to all CAHs nationwide.

As explained in the FY 2023 IPPS/LTCH PPS final rule, because of the small scale of the demonstration, we indicated that we did not believe it would be feasible to implement budget neutrality for the demonstration extension period by reducing payments to only the participating CAHs. Therefore, in the event that this demonstration extension period is found to result in aggregate payments in excess of the amount that would have been paid if this demonstration extension period were not implemented, CMS policy is to comply with the budget neutrality requirement finalized in the FY 2023 IPPS/LTCH PPS final rule, by reducing payments to all CAHs, not just those participating in the demonstration extension period.

In the FY 2023 IPPS/LTCH PPS final rule (87 FR 49144 through 49147), we stated that we believe it is appropriate to make any payment reductions across all CAHs because the FCHIP Demonstration was specifically designed to test innovations that affect delivery of services by the CAH provider category. We explained our belief that the language of the statutory budget neutrality requirement at section 123(g)(1)(B) of Public Law 110–275 permits the agency to implement the budget neutrality provision in this manner. The statutory language merely refers to ensuring that aggregate payments made by the Secretary do not exceed the amount which the Secretary estimates would have been paid if the demonstration project was not implemented and does not identify the range across which aggregate payments must be held equal.

In the FY 2023 IPPS/LTCH PPS final rule, we finalized a policy that in the event the demonstration extension period is found not to have been budget neutral, any excess costs would be recouped within one fiscal year. We explained our belief that this policy is a more efficient timeframe for the government to conclude the demonstration operational requirements (such as analyzing claims data, cost report data or other data sources) to adjudicate the budget neutrality payment recoupment process due to any excess cost that occurred as result of the demonstration extension period.

(2) FCHIP Budget Neutrality Methodology and Analytical Approach

As explained in the FY 2022 IPPS/LTCH PPS final rule, we finalized a policy to address the demonstration budget neutrality methodology and analytical approach for the initial period of the demonstration. In the FY 2023 IPPS/LTCH PPS final rule, we finalized a policy to adopt the budget neutrality methodology and analytical approach used during the demonstration initial period to ensure budget neutrality for the extension period. The analysis of budget neutrality during the initial period of the demonstration identified both the costs related to providing the intervention services under the FCHIP Demonstration and any potential downstream effects of the intervention-related services, including any savings that may have accrued.

The budget neutrality analytical approach for the demonstration initial period incorporated two major data components: (1) Medicare cost reports; and (2) Medicare administrative claims. As described in the FY 2022 IPPS/LTCH PPS final rule (86 FR 45323 through 45328), CMS computed the cost of the demonstration for each fiscal year of the demonstration initial period using Medicare cost reports for the participating CAHs, and Medicare administrative claims and enrollment data for beneficiaries who received demonstration intervention services.

In addition, in order to capture the full impact of the interventions, CMS developed a statistical modeling, Difference-in-Difference (DiD) regression analysis to estimate demonstration expenditures and compute the impact of expenditures on the intervention services by comparing cost data for the demonstration and non-demonstration groups using Medicare administrative claims across the demonstration period of performance under the initial period of the demonstration. The DiD regression analysis would compare the direct cost and potential downstream effects of intervention services, including any savings that may have accrued, during the baseline and performance period for both the demonstration and comparison groups.

Second, the Medicare administrative claims analysis would be reconciled using data obtained from auditing the participating CAHs' Medicare cost reports. We would estimate the costs of the demonstration using ''as submitted'' cost reports for each hospital's financial fiscal year participation within each of the demonstration extension period performance years. Each CAH has its own Medicare cost report end date applicable to the 5-year period of performance for the demonstration extension period. The cost report is structured to gather costs, revenues and statistical data on the provider's financial fiscal period. As a result, we finalized a policy in the FY 2023 IPPS/LTCH PPS final rule that we would determine the final budget neutrality results for the demonstration extension once complete data is available for each CAH for the demonstration extension period.

e. Policies for Implementing the 5-year Extension and Provisions Authorized by Section 129 of the Consolidated Appropriations Act, 2021 (Pub. L. 116–260)

As stated in the FY 2026 IPPS/LTCH PPS final rule (90 FR 36971 through 36975), our policy for implementing the 5-year extension period for section 129 of Public Law 116–260 follows same budget neutrality methodology and analytical approach as the demonstration initial period methodology. While we expect to use the same methodology that was used to assess the budget neutrality of the FCHIP Demonstration during initial period of the demonstration to assess the financial impact of the demonstration during this extension period, upon receiving data for the extension period, we may update and/or modify the FCHIP budget neutrality methodology and analytical approach to ensure that the full impact of the demonstration is appropriately captured.

f. Total Budget Neutrality Offset Amount for FY 2027

At this time, for the FY 2027 IPPS/LTCH PPS final rule, while this discussion represents our anticipated approach to assessing the financial impact of the demonstration extension period based on upon receiving data for the full demonstration extension period, we may update and/or modify the FCHIP Demonstration budget neutrality methodology and analytical approach to ensure that the full impact of the demonstration is appropriately captured.

Therefore, we did not propose to apply a budget neutrality payment offset to payments to CAHs in FY 2027. This policy would have no impact for any national payment system for FY 2027. We received no comments on this

proposal and therefore are finalizing this provision without modification.

VIII. Changes to the Long-Term Care Hospital Prospective Payment System (LTCH PPS) for FY 2027

A. Background of the LTCH PPS

1. Legislative and Regulatory Authority

Section 123 of the Medicare, Medicaid, and SCHIP (State Children's Health Insurance Program) Balanced Budget Refinement Act of 1999 (BBRA) (Pub. L. 106–113), as amended by section 307(b) of the Medicare, Medicaid, and SCHIP Benefits Improvement and Protection Act of 2000 (BIPA) (Pub. L. 106–554), provides for payment for both the operating and capital-related costs of hospital inpatient stays in long-term care hospitals (LTCHs) under Medicare Part A based on prospectively set rates. The Medicare prospective payment system (PPS) for LTCHs applies to hospitals that are described in section 1886(d)(1)(B)(iv) of the Act, effective for cost reporting periods beginning on or after October 1, 2002.

Section 1886(d)(1)(B)(iv)(I) of the Act originally defined an LTCH as a hospital that has an average inpatient length of stay (as determined by the Secretary) of greater than 25 days.

Section 1886(d)(1)(B)(iv)(II) of the Act also provided an alternative definition of LTCHs (''subclause II'' LTCHs). However, section 15008 of the 21st Century Cures Act (Pub. L. 114–255) amended section 1886 of the Act to exclude former ''subclause II'' LTCHs from being paid under the LTCH PPS and created a new category of IPPS-excluded hospitals, which we refer to as ''extended neoplastic disease care hospitals,'' to be paid as hospitals that were formally classified as ''subclause (II)'' LTCHs (82 FR 38298).

Section 123 of the BBRA requires the PPS for LTCHs to be a ''per discharge'' system with a diagnosis-related group (DRG) based patient classification system that reflects the differences in patient resource use and costs in LTCHs.

Section 307(b)(1) of the BIPA, among other things, mandates that the Secretary shall examine, and may provide for, adjustments to payments under the LTCH PPS, including adjustments to DRG weights, area wage adjustments, geographic reclassification, outliers, updates, and a disproportionate share adjustment.

In the August 30, 2002, **Federal Register** (67 FR 55954), we issued a final rule that implemented the LTCH PPS authorized under the BBRA and BIPA. For the initial implementation of the LTCH PPS (FYs 2003 through 2007), the system used information from LTCH patient records to classify patients into distinct long-term care-diagnosis-related groups (LTCDRGs) based on clinical characteristics and expected resource needs. Beginning in FY 2008, we adopted the Medicare severity-long-term care-diagnosis related groups (MS–LTC–DRGs) as the patient classification system used under the LTCH PPS. Payments are calculated for each MS–LTC–DRG and provisions are made for appropriate payment adjustments. Payment rates under the LTCH PPS are updated annually and published in the **Federal Register**.

The LTCH PPS replaced the reasonable cost-based payment system under the Tax Equity and Fiscal Responsibility Act of 1982 (TEFRA) (Pub. L. 97–248) for payments for inpatient services provided by an LTCH with a cost reporting period beginning on or after October 1, 2002. (The regulations implementing the TEFRA reasonable-cost-based payment provisions are located at 42 CFR part 413.) With the implementation of the PPS for acute care hospitals authorized by the Social Security Amendments of 1983 (Pub. L. 98–21), which added section 1886(d) to the Act, certain hospitals, including LTCHs, were excluded from the PPS for acute care hospitals and paid their reasonable costs for inpatient services subject to a per discharge limitation or target amount under the TEFRA system. For each cost reporting period, a hospital specific ceiling on payments was determined by multiplying the hospital's updated target amount by the number of total current year Medicare discharges. (Generally, in this section of the preamble of this final rule, when we refer to discharges, we describe Medicare discharges.) The August 30, 2002, final rule further details the payment policy under the TEFRA system (67 FR 55954).

In the August 30, 2002, final rule, we provided for a 5-year transition period from payments under the TEFRA system to payments under the LTCH PPS. During this 5-year transition period, an LTCH's total payment under the PPS was based on an increasing percentage of the Federal rate with a corresponding decrease in the percentage of the LTCH PPS payment that is based on reasonable cost concepts, unless an LTCH made a one-time election to be paid based on 100 percent of the Federal rate. Beginning with LTCHs' cost reporting periods beginning on or after October 1, 2006, total LTCH PPS payments are based on 100 percent of the Federal rate.

In addition, in the August 30, 2002, final rule, we presented an in-depth discussion of the LTCH PPS, including the patient classification system, relative weights, payment rates, additional payments, and the budget neutrality requirements mandated by section 123 of the BBRA. The same final rule that established regulations for the LTCH PPS under 42 CFR part 412, subpart O, also contained LTCH provisions related to covered inpatient services, limitation on charges to beneficiaries, medical review requirements, furnishing of inpatient hospital services directly or under arrangement, and reporting and recordkeeping requirements. We refer readers to the August 30, 2002, final rule for a comprehensive discussion of the research and data that supported the establishment of the LTCH PPS (67 FR 55954).

In the FY 2016 IPPS/LTCH PPS final rule (80 FR 49601 through 49623), we implemented the provisions of the Pathway for Sustainable Growth Rate (SGR) Reform Act of 2013 (Pub. L. 113–67), which mandated the application of the ''site neutral'' payment rate under the LTCH PPS for discharges that do not meet the statutory criteria for exclusion beginning in FY 2016. For cost reporting periods beginning on or after October 1, 2015, discharges that do not meet certain statutory criteria for exclusion are paid based on the site neutral payment rate. Discharges that do meet the statutory criteria continue to receive payment based on the LTCH PPS standard Federal payment rate. For more information on the statutory requirements of the Pathway for SGR Reform Act of 2013, we refer readers to the FY 2016 IPPS/LTCH PPS final rule (80 FR 49601 through 49623) and the FY 2017 IPPS/LTCH PPS final rule (81 FR 57068 through 57075).

In the FY 2018 IPPS/LTCH PPS final rule, we implemented several provisions of the 21st Century Cures Act (''the Cures Act'') (Pub. L. 114–255) that affected the LTCH PPS. (For more information on these provisions, we refer readers to (82 FR 38299).)

In the FY 2019 IPPS/LTCH PPS final rule (83 FR 41529), we made conforming changes to our regulations to implement the provisions of section 51005 of the Bipartisan Budget Act of 2018 (Pub. L. 115–123), which extends the transitional blended payment rate for site neutral payment rate cases for an additional 2 years. We refer readers to section VII.C. of the preamble of the FY 2019 IPPS/LTCH PPS final rule for a discussion of our final policy. In addition, in the FY 2019 IPPS/LTCH PPS final rule, we removed the 25-

percent threshold policy under 42 CFR 412.538, which was a payment adjustment that was applied to payments for Medicare patient LTCH discharges when the number of such patients originating from any single referring hospital was in excess of the applicable threshold for given cost reporting period.

In the FY 2020 IPPS/LTCH PPS final rule (84 FR 42439), we further revised our regulations to implement the provisions of the Pathway for SGR Reform Act of 2013 (Pub. L. 113–67) that relate to the payment adjustment for discharges from LTCHs that do not maintain the requisite discharge payment percentage and the process by which such LTCHs may have the payment adjustment discontinued.

2. Criteria for Classification as an LTCH

a. Classification as an LTCH

Under the regulations at § 412.23(e)(1), to qualify to be paid under the LTCH PPS, a hospital must have a provider agreement with Medicare. Furthermore, § 412.23(e)(2)(i), which implements section 1886(d)(1)(B)(iv) of the Act, requires that a hospital have an average Medicare inpatient length of stay of greater than 25 days to be paid under the LTCH PPS. In accordance with section 1206(a)(3) of the Pathway for SGR Reform Act of 2013 (Pub. L. 113–67), as amended by section 15007 of Public Law 114–255, we amended our regulations to specify that Medicare Advantage plans' and site neutral payment rate discharges are excluded from the calculation of the average length of stay for all LTCHs, for discharges occurring in cost reporting period beginning on or after October 1, 2015.

b. Hospitals Excluded From the LTCH PPS

The following hospitals are paid under special payment provisions, as described in § 412.22(c) and, therefore, are not subject to the LTCH PPS rules:

- Veterans Administration hospitals.
- Hospitals that are reimbursed under State cost control systems approved under 42 CFR part 403.
- Hospitals that are reimbursed in accordance with demonstration projects authorized under section 402(a) of the Social Security Amendments of 1967 (Pub. L. 90–248) (42 U.S.C. 1395b–1), section 222(a) of the Social Security Amendments of 1972 (Pub. L. 92–603) (42 U.S.C. 1395b1 (note)) (Statewide-all payer systems, subject to the rate-of increase test at section 1814(b) of the Act), or section 3021 of the Patient Protection and Affordable Care Act (Pub. L. 111–148) (42 U.S.C. 1315a).
- Nonparticipating hospitals furnishing emergency services to Medicare beneficiaries.

3. Limitation on Charges to Beneficiaries

In the August 30, 2002, final rule, we presented an in-depth discussion of beneficiary liability under the LTCH PPS (67 FR 55974 through 55975). This discussion was further clarified in the RY 2005 LTCH PPS final rule (69 FR 25676). In keeping with those discussions, if the Medicare payment to the LTCH is the full LTC–DRG payment amount, consistent with other established hospital prospective payment systems, § 412.507 currently provides that an LTCH may not bill a Medicare beneficiary for more than the deductible and coinsurance amounts as specified under §§ 409.82, 409.83, and 409.87, and for items and services specified under § 489.30(a). However, under the LTCH PPS, Medicare will only pay for services furnished during the days for which the beneficiary has coverage until the short-stay outlier (SSO) threshold is exceeded. If the Medicare payment was for a SSO case (in accordance with § 412.529), and that payment was less than the full LTC–DRG payment amount because the beneficiary had insufficient coverage as a result of the remaining Medicare days, the LTCH also is currently permitted to charge the beneficiary for services delivered on those uncovered days (in accordance with § 412.507). In the FY 2016 IPPS/LTCH PPS final rule (80 FR 49623), we amended our regulations to expressly limit the charges that may be imposed upon beneficiaries whose LTCHs' discharges are paid at the site neutral payment rate under the LTCH PPS. In the FY 2017 IPPS/LTCH PPS final rule (81 FR 57102), we amended the regulations under § 412.507 to clarify our existing policy that blended payments made to an LTCH during its transitional period (that is, an LTCH's payment for discharges occurring in cost reporting periods beginning in FYs 2016 through 2019) are considered to be site neutral payment rate payments.

Comment: We received several comments outside the scope of the proposed rule.

Response: While the comments were outside the scope of this rulemaking, we will consider issues and concerns raised by the commenters for future rulemaking.

B. Medicare Severity Long-Term Care Diagnosis-Related Group (MS–LTC–DRG) Classifications and Relative Weights for FY 2027

1. Background

Section 123 of the BBRA required that the Secretary implement a PPS for LTCHs to replace the cost-based payment system under TEFRA. Section 307(b)(1) of the BIPA modified the requirements of section 123 of the BBRA by requiring that the Secretary examine the feasibility and the impact of basing payment under the LTCH PPS on the use of existing (or refined) hospital DRGs that have been modified to account for different resource use of LTCH patients.

Under both the IPPS and the LTCH PPS, the DRG-based classification system uses information on the claims for inpatient discharges to classify patients into distinct groups (for example, DRGs) based on clinical characteristics and expected resource needs. When the LTCH PPS was implemented for cost reporting periods beginning on or after October 1, 2002, we adopted the same DRG patient classification system utilized at that time under the IPPS. We referred to this patient classification system as the ''long-term care diagnosis-related groups (LTC–DRGs).'' As part of our efforts to better recognize severity of illness among patients, in the FY 2008 IPPS final rule with comment period (72 FR 47130), we adopted the MS–DRGs and the Medicare severity long-term care diagnosis-related groups (MS–LTC–DRGs) under the IPPS and the LTCH PPS, respectively, effective beginning October 1, 2007 (FY 2008). For a full description of the development, implementation, and rationale for the use of the MS–DRGs and MS–LTC–DRGs, we refer readers to the FY 2008 IPPS final rule with comment period (72 FR 47141 through 47175 and 47277 through 47299). (We note that, in that same final rule, we revised the regulations at § 412.503 to specify that for LTCH discharges occurring on or after October 1, 2007, when applying the provisions of 42 CFR part 412, subpart O, applicable to LTCHs for policy descriptions and payment calculations, all references to LTC–DRGs would be considered a reference to MS–LTC–DRGs. For the remainder of this section, we present the discussion in terms of the current MS–LTC–DRG patient classification system unless specifically referring to the previous LTC–DRG patient classification system that was in effect before October 1, 2007.)

Consistent with section 123 of the BBRA, as amended by section 307(b)(1) of the BIPA, and § 412.515 of the regulations, we use information derived from LTCH PPS patient records to classify LTCH discharges into distinct MS–LTC–DRGs based on clinical characteristics and estimated resource needs. As noted previously, we adopted the same DRG patient classification system utilized at that time under the IPPS. The MS–DRG classifications are updated annually, which has resulted in the number of MS–DRGs changing over time. For FY 2027, there will be 768 MS–DRG, and by extension, MS–LTC–DRG, groupings based on the changes, as discussed in section II.C. of the preamble of this final rule.

Although the patient classification system used under both the LTCH PPS and the IPPS are the same, the relative weights are different. The established relative weight methodology and data used under the LTCH PPS result in relative weights under the LTCH PPS that reflect the differences in patient resource use of LTCH patients, consistent with section 123(a)(1) of the BBRA. That is, we assign an appropriate weight to the MS–LTC–DRGs to account for the differences in resource use by patients exhibiting the case complexity and multiple medical problems characteristic of LTCH patients.

2. Patient Classifications Into MS–LTC–DRGs

a. Background

The MS–DRGs (used under the IPPS) and the MS–LTC–DRGs (used under the LTCH PPS) are based on the CMS DRG structure. As noted previously in this section, we refer to the DRGs under the LTCH PPS as MS–LTC–DRGs although they are structurally identical to the MS–DRGs used under the IPPS.

The MS–DRGs are organized into 25 major diagnostic categories (MDCs), most of which are based on a particular organ system of the body; the remainder involve multiple organ systems (such as MDC 22, Burns). Within most MDCs, cases are then divided into surgical DRGs and medical DRGs. Surgical DRGs are assigned based on a surgical hierarchy that orders operating room (O.R.) procedures or groups of O.R. procedures by resource intensity. The GROUPER software program does not recognize all ICD–10–PCS procedure codes as procedures affecting DRG assignment. That is, procedures that are not surgical (for example, EKGs) or are minor surgical procedures (for example, a biopsy of skin and subcutaneous tissue (procedure code 0JBH3ZX)) do not affect the MS–LTC–DRG assignment based on their presence on the claim.

Generally, under the LTCH PPS, a Medicare payment is made at a predetermined specific rate for each discharge that varies based on the MS–LTC–DRG to which a beneficiary's discharge is assigned. Cases are classified into MS–LTC–DRGs for payment based on the following six data elements:

- Principal diagnosis.
- Additional or secondary diagnoses.
- Surgical procedures.
- Age.
- Sex.
- Discharge status of the patient.

Currently, for claims submitted using the version ASC X12 5010 standard, up to 25 diagnosis codes and 25 procedure codes are considered for an MS–DRG assignment. This includes one principal diagnosis and up to 24 secondary diagnoses for severity of illness determinations. (For additional information on the processing of up to 25 diagnosis codes and 25 procedure codes on hospital inpatient claims, we refer readers to section II.G.11.c. of the preamble of the FY 2011 IPPS/LTCH PPS final rule (75 FR 50127).)

Under the HIPAA transactions and code sets regulations at 45 CFR parts 160 and 162, covered entities (45 CFR 160.103) must comply with the adopted transaction standards and operating rules specified in subparts I through S of part 162. Among other requirements, on or after January 1, 2012, covered entities are required to use the ASC X12 Standards for Electronic Data Interchange Technical Report Type 3—Health Care Claim: Institutional (837), May 2006, ASC X12N/005010X223, and Type 1 Errata to Health Care Claim: Institutional (837) ASC X12 Standards for Electronic Data Interchange Technical Report Type 3, October 2007, ASC X12N/005010X233A1 for the health care claims or equivalent encounter information transaction (45 CFR 162.1102(c)).

HIPAA requires covered entities to use the applicable medical data code sets when conducting HIPAA transactions (45 CFR 162.1000). Currently, upon the discharge of the patient, the LTCH must assign appropriate diagnosis and procedure codes from the International Classification of Diseases, 10th Revision, Clinical Modification (ICD–10–CM) for diagnosis coding and the International Classification of Diseases, 10th Revision, Procedure Coding System (ICD–10–PCS) for inpatient hospital procedure coding, both of which were required to be implemented October 1, 2015 (45 CFR 162.1002(c)(2) and (3)). For additional information on the implementation of the ICD–10 coding system, we refer readers to section II.F.1. of the preamble of the FY 2017 IPPS/LTCH PPS final rule (81 FR 56787 through 56790) and section II.E.1. of the preamble of this final rule. Additional coding instructions and examples are published in the AHA's *Coding Clinic for ICD–10–CM/PCS.*

To create the MS–DRGs (and by extension, the MS–LTC–DRGs), base DRGs were subdivided according to the presence of specific secondary diagnoses designated as complications or comorbidities (CCs) into one, two, or three levels of severity, depending on the impact of the CCs on resources used for those cases. Specifically, there are sets of MS–DRGs that are split into 2 or 3 subgroups based on the presence or absence of a CC or a major complication or comorbidity (MCC). We refer readers to section II.D. of the preamble of the FY 2008 IPPS final rule with comment period for a detailed discussion about the creation of MS–DRGs based on severity of illness levels (72 FR 47141 through 47175).

Medicare Administrative Contractors (MACs) enter the clinical and demographic information submitted by LTCHs into their claims processing systems and subject this information to a series of automated screening processes called the Medicare Code Editor (MCE). These screens are designed to identify cases that require further review before assignment into a MS–LTC–DRG can be made. During this process, certain types of cases are selected for further explanation (74 FR 43949).

After screening through the MCE, each claim is classified into the appropriate MS–LTC–DRG by the Medicare LTCH GROUPER software on the basis of diagnosis and procedure codes and other demographic information (age, sex, and discharge status). The GROUPER software used under the LTCH PPS is the same GROUPER software program used under the IPPS. Following the MS–LTC–DRG assignment, the MAC determines the prospective payment amount by using the Medicare PRICER program, which accounts for hospital-specific adjustments. Under the LTCH PPS, we provide an opportunity for LTCHs to review the MS–LTC–DRG assignments made by the MAC and to submit additional information within a specified timeframe as provided in § 412.513(c).

The GROUPER software is used both to classify past cases to measure relative hospital resource consumption to

establish the MS–LTC–DRG relative weights and to classify current cases for purposes of determining payment. The records for all Medicare hospital inpatient discharges are maintained in the MedPAR file. The data in this file are used to evaluate possible MS–DRG and MS–LTC–DRG classification changes and to recalibrate the MS–DRG and MS–LTC–DRG relative weights during our annual update under both the IPPS (§ 412.60(e)) and the LTCH PPS (§ 412.517), respectively.

b. Changes to the MS–LTC–DRGs for FY 2027

As specified by our regulations at § 412.517(a), which require that the MS–LTC–DRG classifications and relative weights be updated annually, and consistent with our historical practice of using the same patient classification system under the LTCH PPS as is used under the IPPS, in this final rule, as we proposed, we are updating the MS–LTC–DRG classifications effective October 1, 2026 through September 30, 2027 (FY 2027), consistent with the changes to specific MS–DRG classifications presented in section II.C. of the preamble of this final rule. Accordingly, the MS–LTC–DRGs for FY 2027 are the same as the MS–DRGs being used under the IPPS for FY 2027. In addition, because the MS–LTC–DRGs for FY 2027 are the same as the MS–DRGs for FY 2027, the other changes that affect MS–DRG (and by extension MS–LTC–DRG) assignments under GROUPER Version 44, as discussed in section II.C. of the preamble of this final rule, including the changes to the MCE software and the ICD–10–CM/PCS coding system, are also applicable under the LTCH PPS for FY 2027.

3. Development of the FY 2027 MS–LTC–DRG Relative Weights

a. General Overview of the MS–LTC–DRG Relative Weights

One of the primary goals for the implementation of the LTCH PPS is to pay each LTCH an appropriate amount for the efficient delivery of medical care to Medicare patients. The system must be able to account adequately for each LTCH's case-mix to ensure both fair distribution of Medicare payments and access to adequate care for those Medicare patients whose care is costlier (67 FR 55984). To accomplish these goals, we have annually adjusted the LTCH PPS standard Federal prospective payment rate by the applicable relative weight in determining payment to LTCHs for each case. Under the LTCH PPS, relative weights for each MS–LTC–DRG are a primary element used to account for the variations in cost per discharge and resource utilization among the payment groups (§ 412.515). To ensure that Medicare patients classified to each MS–LTC–DRG have access to an appropriate level of services and to encourage efficiency, we calculate a relative weight for each MS–LTC–DRG that represents the resources needed by an average inpatient LTCH case in that MS–LTC–DRG. For example, cases in an MS–LTC–DRG with a relative weight of 2 would, on average, cost twice as much to treat as cases in an MS–LTC–DRG with a relative weight of 1.

The established methodology to develop the MS–LTC–DRG relative weights is generally consistent with the methodology established when the LTCH PPS was implemented in the August 30, 2002, LTCH PPS final rule (67 FR 55989 through 55991). However, there have been some modifications of our historical procedures for assigning relative weights in cases of zero volume or nonmonotonicity or both resulting from the adoption of the MS–LTC–DRGs. We also made a modification in conjunction with the implementation of the dual rate LTCH PPS payment structure beginning in FY 2016 to use LTCH claims data from only LTCH PPS standard Federal payment rate cases (or LTCH PPS cases that would have qualified for payment under the LTCH PPS standard Federal payment rate if the dual rate LTCH PPS payment structure had been in effect at the time of the discharge). We also adopted, beginning in FY 2023, a 10-percent cap policy on the reduction in a MS–LTC–DRG's relative weight in a given year. (For details on the modifications to our historical procedures for assigning relative weights in cases of zero volume and nonmonotonicity or both, we refer readers to the FY 2008 IPPS final rule with comment period (72 FR 47289 through 47295) and the FY 2009 IPPS final rule (73 FR 48542 through 48550)). For details on the change in our historical methodology to use LTCH claims data only from LTCH PPS standard Federal payment rate cases (or cases that would have qualified for such payment had the LTCH PPS dual payment rate structure been in effect at the time) to determine the MS–LTC–DRG relative weights, we refer readers to the FY 2016 IPPS/LTCH PPS final rule (80 FR 49614 through 49617). For details on our adoption of the 10-percent cap policy, we refer readers to the FY 2023 IPPS/LTCH PPS final rule (87 FR 49152 through 49154).)

For purposes of determining the MS–LTC–DRG relative weights, under our historical methodology, there are three different categories of MS–LTC–DRGs based on volume of cases within specific MS–LTC–DRGs: (1) MS–LTC–DRGs with at least 25 applicable LTCH cases in the data used to calculate the relative weight, which are each assigned a unique relative weight; (2) low-volume MS–LTC–DRGs (that is, MS–LTC–DRGs that contain between 1 and 24 applicable LTCH cases that are grouped into quintiles (as described later in this section in Step 3 of our methodology) and assigned the relative weight of the quintile); and (3) no-volume MS–LTC–DRGs that are cross-walked to other MS–LTC–DRGs based on the clinical similarities and assigned the relative weight of the cross-walked MS–LTC–DRG (as described later in this section in Step 8 of our methodology). For FY 2027, we are continuing to use applicable LTCH cases to establish the same volume-based categories to calculate the FY 2027 MS–LTC–DRG relative weights.

b. Development of the MS–LTC–DRG Relative Weights for FY 2027

In the FY 2027 IPPS/LTCH PPS proposed rule (91 FR 19556 through 19562), we presented our proposed methodology for determining the MS–LTC–DRG relative weights for FY 2027.

Comment: Some commenters stated that CMS should recalibrate the MS–LTC–DRG structure to improve payment accuracy. Commenters expressed that the dual-rate payment system has reshaped the LTCH industry, resulting in a significant decline in the number of standard Federal payment rate cases and a more clinically acute patient population increasingly concentrated in a narrow set of MS–LTC–DRGs. Commenters argued that the current MS–LTC–DRG structure no longer accurately captures the true cost of treating LTCH patients, as severity varies widely within individual DRGs, and that a rising share of cases now qualifies for outlier payments because of this structural misalignment. Commenters further argued that this structural misalignment is itself a contributing factor to recent rises in the fixed-loss amount. Consistent with comments submitted in prior rulemakings, commenters highlighted standard Federal payment rate cases grouped to MS–LTC–DRGs 189 and 207, which together accounted for over 40 percent of standard Federal payment rate cases in FY 2025 and are not subdivided based on the presence or absence of a complication or comorbidity (CC) or a major complication or comorbidity (MCC). Commenters requested that CMS refine certain high-volume MS–LTC–DRGs by

creating subgroups within these MS–LTC–DRGs based on the presence or absence of CCs and MCCs, which they believe would increase LTCH PPS payment accuracy and thereby reduce the outlier payments made to cases grouped to such MS–LTC–DRGs.

Response: We continue to appreciate commenters' suggestions on possible refinements to certain MS–LTC–DRGs and their thoughts on the impact the MS–LTC–DRG structure may have on LTCH PPS payment accuracy and outlier payments. In the FY 2026 IPPS/LTCH PPS final rule (90 FR 37244), we stated that we had not found evidence that the MS–LTC–DRG structure is a major driver of the recent increases to the fixed-loss amount. While we acknowledge that commenters referenced independent analyses suggesting that the concentration of cases in a small number of MS–LTC–DRGs contributes to increases in the fixed-loss amount, we do not believe that sufficient quantitative evidence has been provided to support the conclusion that the MS–LTC–DRG structure is a major contributor to payment inaccuracy or to the increases in the fixed-loss amount in recent years. (Refer to section V.D. of the Addendum of this final rule for the public comments and responses on the fixed-loss amount.) For these reasons, we are not adopting any of the changes to the MS–LTC–DRGs suggested by commenters in this final rule.

Comment: We received a comment urging CMS to adjust the proposed methodologies for determining the FY 2027 LTCH PPS rates to account for the impact of the COVID–19 pandemic on the underlying ratesetting data. A commenter expressed particular concern about the use of FY 2024 cost report data in the determination of the MS–LTC–DRG relative weights, noting that these data reflect patient acuity and cost trends unlikely to persist in FY 2027.

Response: As discussed in Step 6 of our methodology, the MS–LTC–DRG relative weights are calculated using the hospital-specific relative weights methodology, which relies on charges from historical Medicare LTCH claims data rather than data from historical cost reports. As discussed in Step 1 of our methodology, we proposed to use charge data from the FY 2025 MedPAR file. Therefore, we do not agree that a modification to our methodology for determining the relative weights is warranted.

After consideration of the comments we received, we are finalizing, without modification, our proposed methodology for determining the MS–LTC–DRG relative weights for FY 2027. In the remainder of this section, we present our finalized methodology. We first list and provide a brief description of our steps for determining the FY 2027 MS–LTC–DRG relative weights. Later in this section, we discuss in greater detail each step. We note that, as we did in FY 2026, we used our historical relative weight methodology as described in the FY 2021 IPPS/LTCH PPS final rule (85 FR 58898 through 58907), subject to a ten percent cap as described in the FY 2023 IPPS/LTCH PPS final rule (87 FR 49162).

- *Step 1—Prepare data for MS–LTC–DRG relative weight calculation.* In this step, we select and group the applicable claims data used in the development of the MS–LTC–DRG relative weights.
- *Step 2—Remove cases with a length of stay of 7 days or less.* In this step, we trim the applicable claims data to remove cases with a length of stay of 7 days or less.
- *Step 3—Establish low-volume MS–LTC–DRG quintiles.* In this step, we employ our established quintile methodology for low-volume MS–LTC–DRGs (that is, MS–LTC–DRGs with fewer than 25 cases).
- *Step 4—Remove statistical outliers.* In this step, we trim the applicable claims data to remove statistical outlier cases.
- *Step 5—Adjust charges for the effects of Short Stay Outliers (SSOs).* In this step, we adjust the number of applicable cases in each MS–LTC–DRG (or low-volume quintile) for the effect of SSO cases.
- *Step 6—Calculate the relative weights on an iterative basis using the hospital-specific relative weights methodology.* In this step, we use our established hospital specific relative value (HSRV) methodology, which is an iterative process, to calculate the relative weights.
- *Step 7—Adjust the relative weights to account for nonmonotonically increasing relative weights.* In this step, we make adjustments that ensure that within each base MS–LTC–DRG, the relative weights increase by MS–LTC–DRG severity.
- *Step 8—Determine a relative weight for MS–LTC–DRGs with no applicable LTCH cases.* In this step, we cross-walk each no-volume MS–LTC–DRG to another MS–LTC–DRG for which we calculated a relative weight.
- *Step 9—Budget neutralize the uncapped relative weights.* In this step, to ensure budget neutrality in the annual update to the MS–LTC–DRG classifications and relative weights, we adjust the relative weights by a normalization factor and a budget neutrality factor that ensures estimated aggregate LTCH PPS payments will be unaffected by the updates to the MS–LTC–DRG classifications and relative weights.
- *Step 10—Apply the 10-percent cap to decreases in MS–LTC–DRG relative weights.* In this step we limit the reduction of the relative weight for a MS–LTC–DRG to 10 percent of its prior year value. This 10-percent cap does not apply to zero-volume MS–LTC–DRGs or low-volume MS–LTC–DRGs.
- *Step 11—Budget neutralize the application of the 10-percent cap policy.* In this step, to ensure budget neutrality in the application of the MS–LTC–DRG cap policy, we adjust the relative weights by a budget neutrality factor that ensures estimated aggregate LTCH PPS payments will be unaffected by our application of the cap to the MS–LTC–DRG relative weights.

We next describe each of the 11 steps for calculating the FY 2027 MS–LTC–DRG relative weights in greater detail.

Step 1—Prepare Data for MS–LTC–DRG Relative Weight Calculation

For the FY 2027 IPPS/LTCH PPS proposed rule (91 FR 19557), we obtained total charges from FY 2025 Medicare LTCH claims data from the December 2025 update of the FY 2025 MedPAR file and used proposed Version 44 of the GROUPER to classify LTCH cases. Consistent with our historical practice, we proposed that if better data become available, we would use those data and the finalized Version 44 of the GROUPER in establishing the FY 2027 MS–LTC–DRG relative weights in the final rule. Accordingly, for this final rule, we are establishing the FY 2027 MS–LTC–DRG relative weights based on updated FY 2025 Medicare LTCH claims data from the March 2026 update of the FY 2025 MedPAR file, which is the best available data at the time of development of this final rule, and the finalized Version 44 of the GROUPER to classify LTCH cases.

To calculate the FY 2027 MS–LTC–DRG relative weights under the dual rate LTCH PPS payment structure, we proposed to continue to use applicable LTCH data, which includes our policy of only using cases that meet the criteria for exclusion from the site neutral payment rate (or would have met the criteria had they been in effect at the time of the discharge) (80 FR 49624). Section 3711(b)(2) of the CARES Act provided a waiver of the application of the site neutral payment rate for LTCH cases admitted during the COVID–19 PHE period. The COVID–19 PHE expired on May 11, 2023. Therefore, nearly all LTCH PPS cases in FY 2025

were subject to the dual rate LTCH PPS payment structure. However, a small number of FY 2025 LTCH PPS cases (those with admission dates on or before May 11, 2023) were subject to the CARES Act waiver and were paid the LTCH PPS standard Federal rate regardless of whether the discharge met the statutory patient criteria. Therefore, for purposes of setting rates for LTCH PPS standard Federal rate cases for FY 2027 (including MS–LTC–DRG relative weights), we proposed to identify FY 2025 cases that meet the statutory patient criteria depending on date of admission as follows. First, we proposed to use LTCH PPS cases in the FY 2025 MedPAR file with an admission date after May 11, 2023, that met the criteria for exclusion from the site neutral payment rate under § 412.522(b) and were paid the LTCH PPS standard Federal rate in FY 2025 (based on the claim payment amount). Second, we proposed to also use LTCH PPS cases in the FY 2025 MedPAR file with an admission date on or before May 11, 2023, that would have met the criteria for exclusion from the site neutral payment rate if the CARES Act waiver had not been in effect. For these cases we relied on our historical process for identifying cases that would have met the criteria for exclusion from the site neutral payment rate rather than how those cases were paid in FY 2025. This process is explained in full detail in the FY 2025 IPPS/LTCH PPS final rule (89 FR 69425).

We did not receive any specific comments on the proposed methodology to identify FY 2025 cases that meet the statutory patient criteria, depending on the date of admission. Therefore, we are finalizing this methodology without modification.

Furthermore, consistent with our historical methodology, we excluded any claims in the resulting data set that were submitted by LTCHs that were all inclusive rate providers and LTCHs that are paid in accordance with demonstration projects authorized under section 402(a) of Public Law 90–248 or section 222(a) of Public Law 92603. In addition, consistent with our historical practice and our policies, we excluded any Medicare Advantage (Part C) claims in the resulting data. Such claims were identified based on the presence of a GHO Paid indicator value of ''1'' in the MedPAR files.

In summary, in general, we identified the claims data used in the development of the FY 2027 MS–LTC–DRG relative weights in this final rule by trimming claims data that were paid the site neutral payment rate or would have been paid the site neutral payment rate had the provisions of the CARES Act not been in effect. We trimmed the claims data of all inclusive rate providers reported in the March 2026 update of the FY 2025 MedPAR file and any Medicare Advantage claims data. There were no data from any LTCHs that are paid in accordance with a demonstration project reported in the March 2026 update of the FY 2025 MedPAR file, but had there been any, we would have trimmed the claims data from those LTCHs as well, in accordance with our established policy.

We used the remaining data (that is, the applicable LTCH data) in the subsequent steps to calculate the MS–LTC–DRG relative weights for FY 2027.

Step 2—Remove Cases With a Length of Stay of 7 Days or Less

The next step in our calculation of the FY 2027 MS–LTC–DRG relative weights is to remove cases with a length of stay of 7 days or less. The MS–LTC–DRG relative weights reflect the average of resources used on representative cases of a specific type. Generally, cases with a length of stay of 7 days or less do not belong in an LTCH because these stays do not fully receive or benefit from treatment that is typical in an LTCH stay, and full resources are often not used in the earlier stages of admission to an LTCH. If we were to include stays of 7 days or less in the computation of the FY 2027 MS–LTC–DRG relative weights, the value of many relative weights would decrease and, therefore, payments would decrease to a level that may no longer be appropriate. We do not believe that it would be appropriate to compromise the integrity of the payment determination for those LTCH cases that actually benefit from and receive a full course of treatment at an LTCH by including data from these very short stays. Therefore, as we proposed, consistent with our existing relative weight methodology, in determining the FY 2027 MS–LTC–DRG relative weights, we removed LTCH cases with a length of stay of 7 days or less from applicable LTCH cases. (For additional information on what is removed in this step of the relative weight methodology, we refer readers to 67 FR 55989 and 74 FR 43959.)

Step 3—Establish Low-Volume MS–LTC–DRG Quintiles

To account for MS–LTC–DRGs with low-volume (that is, with fewer than 25 applicable LTCH cases), consistent with our existing methodology, as we proposed, we are continuing to employ the quintile methodology for low-volume MS–LTC–DRGs, such that we grouped the ''low-volume MS–LTC–DRGs'' (that is, MS–LTC–DRGs that contain between 1 and 24 applicable LTCH cases into one of five categories (quintiles) based on average charges (67 FR 55984 through 55995; 72 FR 47283 through 47288; and 81 FR 25148)).

In this final rule, based on the best available data (that is, the March 2026 update of the FY 2025 MedPAR file), we identified 244 MS–LTC–DRGs that contained between 1 and 24 applicable LTCH cases. This list of MS–LTC–DRGs was then divided into 1 of the 5 low-volume quintiles. We assigned the low-volume MS–LTC–DRGs to specific low-volume quintiles by sorting the low-volume MS–LTC–DRGs in ascending order by average charge in accordance with our established methodology. Based on the data available for this final rule, the number of MS–LTC–DRGs with less than 25 applicable LTCH cases was not evenly divisible by 5. The quintiles each contained at least 48 MS–LTC–DRGs (244/5 = 48 with a remainder of 4). As we proposed, we employed our historical methodology of assigning each remainder low-volume MS–LTC–DRG to the low-volume quintile that contains an MS–LTC–DRG with an average charge closest to that of the remainder low-volume MS–LTC–DRG. In cases where these initial assignments of low-volume MS–LTC–DRGs to quintiles results in nonmonotonicity within a base-DRG, as we proposed, we adjusted the resulting low-volume MS–LTC–DRGs to preserve monotonicity, as discussed in Step 7 of our methodology.

To determine the FY 2027 relative weights for the low-volume MS–LTC–DRGs, consistent with our historical practice, we used the five low-volume quintiles described previously. We determined a relative weight and (geometric) average length of stay for each of the five low-volume quintiles using the methodology described in Step 6 of our methodology. We assigned the same relative weight and average length of stay to each of the low-volume MS–LTC–DRGs that make up an individual low-volume quintile. We note that, as this system is dynamic, it is possible that the number and specific type of MS–LTC–DRGs with a low volume of applicable LTCH cases would vary in the future. Furthermore, we note that we continue to monitor the volume (that is, the number of applicable LTCH cases) in the low-volume quintiles to ensure that our quintile assignments used in determining the MS–LTC–DRG relative weights result in appropriate payment for LTCH cases grouped to low-volume MS–LTC–DRGs and do not result in an unintended financial incentive for LTCHs to inappropriately admit these types of cases.

For this final rule, we are providing the list of the composition of the low volume-quintiles for low-volume MS–LTC–DRGs in a supplemental data file for public use posted via the internet on the CMS website for this final rule at *https://www.cms.gov/Medicare/Medicare-Fee-for-Service-Payment/AcuteInpatientPPS/index.html* to streamline the information made available to the public that is used in the annual development of Table 11.

Step 4—Remove Statistical Outliers

The next step in our calculation of the FY 2027 MS–LTC–DRG relative weights is to remove statistical outlier cases from the LTCH cases with a length of stay of at least 8 days. Consistent with our existing relative weight methodology, as we proposed, we are continuing to define statistical outliers as cases that are outside of 3.0 standard deviations from the mean of the log distribution of both charges per case and the charges per day for each MS–LTC–DRG. These statistical outliers are removed prior to calculating the relative weights because we believe that they may represent aberrations in the data that distort the measure of average resource use. Including those LTCH cases in the calculation of the relative weights could result in an inaccurate relative weight that does not truly reflect relative resource use among those MS–LTC–DRGs. (For additional information on what is removed in this step of the relative weight methodology, we refer readers to 67 FR 55989 and 74 FR 43959.) After removing cases with a length of stay of 7 days or less and statistical outliers, in each set of claims, we were left with applicable LTCH cases that have a length of stay greater than or equal to 8 days. In this final rule, we refer to these cases as ''trimmed applicable LTCH cases.''

Step 5—Adjust Charges for the Effects of Short Stay Outliers (SSOs)

As the next step in the calculation of the FY 2027 MS–LTC–DRG relative weights, consistent with our historical approach, as we proposed, we adjusted each LTCH's charges per discharge for those remaining cases (that is, trimmed applicable LTCH cases) for the effects of SSOs (as defined in § 412.529(a) in conjunction with § 412.503). Specifically, as we proposed, we made this adjustment by counting an SSO case as a fraction of a discharge based on the ratio of the length of stay of the case to the average length of stay of all cases grouped to the MS–LTC–DRG. This has the effect of proportionately reducing the impact of the lower charges for the SSO cases in calculating the average charge for the MS–LTC–DRG. This process produces the same result as if the actual charges per discharge of an SSO case were adjusted to what they would have been had the patient's length of stay been equal to the average length of stay of the MS–LTC–DRG.

Counting SSO cases as full LTCH cases with no adjustment in determining the FY 2027 MS–LTC–DRG relative weights would lower the relative weight for affected MS–LTC–DRGs because the relatively lower charges of the SSO cases would bring down the average charge for all cases within a MS–LTC–DRG. This would result in an ''underpayment'' for non-SSO cases and an ''overpayment'' for SSO cases. Therefore, we are continuing to adjust for SSO cases under § 412.529 in this manner because it would result in more appropriate payments for all LTCH PPS standard Federal payment rate cases. (For additional information on this step of the relative weight methodology, we refer readers to 67 FR 55989 and 74 FR 43959.)

Step 6—Calculate the Relative Weights on an Iterative Basis Using the Hospital-Specific Relative Value Methodology

By nature, LTCHs often specialize in certain areas, such as ventilator-dependent patients. Some case types (MS–LTC–DRGs) may be treated, to a large extent, in hospitals that have, from a perspective of charges, relatively high (or low) charges. This nonrandom distribution of cases with relatively high (or low) charges in specific MS–LTC–DRGs has the potential to inappropriately distort the measure of average charges. To account for the fact that cases may not be randomly distributed across LTCHs, consistent with the methodology we have used since the implementation of the LTCH PPS, in this FY 2027 IPPS/LTCH PPS final rule, as we proposed, we are continuing to use a hospital-specific relative value (HSRV) methodology to calculate the MS–LTC–DRG relative weights for FY 2027. We believe that this method removes this hospital specific source of bias in measuring LTCH average charges (67 FR 55985). Specifically, under this methodology, we reduced the impact of the variation in charges across providers on any particular MS–LTC–DRG relative weight by converting each LTCH's charge for an applicable LTCH case to a relative value based on that LTCH's average charge for such cases.

Under the HSRV methodology, we standardize charges for each LTCH by converting its charges for each applicable LTCH case to hospital specific relative charge values and then adjusting those values for the LTCH's case-mix. The adjustment for case-mix is needed to rescale the hospital-specific relative charge values (which, by definition, average 1.0 for each LTCH). The average relative weight for an LTCH is its case-mix; therefore, it is reasonable to scale each LTCH's average relative charge value by its case-mix. In this way, each LTCH's relative charge value is adjusted by its case-mix to an average that reflects the complexity of the applicable LTCH cases it treats relative to the complexity of the applicable LTCH cases treated by all other LTCHs (the average LTCH PPS case-mix of all applicable LTCH cases across all LTCHs). In other words, by multiplying an LTCH's relative charge values by the LTCH's case-mix index, we account for the fact that the same relative charges are given greater weight at an LTCH with higher average costs than they would at an LTCH with low average costs, which is needed to adjust each LTCH's relative charge value to reflect its case-mix relative to the average case-mix for all LTCHs. By standardizing charges in this manner, we count charges for a Medicare patient at an LTCH with high average charges as less resource-intensive than they would be at an LTCH with low average charges. For example, a $10,000 charge for a case at an LTCH with an average adjusted charge of $17,500 reflects a higher level of relative resource use than a $10,000 charge for a case at an LTCH with the same case-mix, but an average adjusted charge of $35,000. We believe that the adjusted charge of an individual case more accurately reflects actual resource use for an individual LTCH because the variation in charges due to systematic differences in the markup of charges among LTCHs is taken into account.

Consistent with our historical relative weight methodology, as we proposed, we calculated the FY 2027 MS–LTC–DRG relative weights using the HSRV methodology, which is an iterative process. Therefore, in accordance with our established methodology, for FY 2027, we continued to standardize charges for each applicable LTCH case by first dividing the adjusted charge for the case (adjusted for SSOs under § 412.529 as described in Step 5 of our methodology) by the average adjusted charge for all applicable LTCH cases at the LTCH in which the case was treated. The average adjusted charge reflects the average intensity of the health care services delivered by a particular LTCH and the average cost level of that LTCH. The average adjusted charge is then multiplied by the LTCH's case-mix

index to produce an adjusted hospital-specific relative charge value for the case. We used an initial case-mix-index value of 1.0 for each LTCH.

For each MS–LTC–DRG, we calculated the FY 2027 relative weight by dividing the SSO-adjusted average of the hospital-specific relative charge values for applicable LTCH cases for the MS–LTC–DRG (that is, the sum of the hospital-specific relative charge value, as previously stated, divided by the sum of equivalent cases from Step 5 for each MS–LTC–DRG) by the overall SSO-adjusted average hospital-specific relative charge value across all applicable LTCH cases for all LTCHs (that is, the sum of the hospital-specific relative charge value, as previously stated, divided by the sum of equivalent applicable LTCH cases from Step 5 for each MS–LTC–DRG). Using these recalculated MS–LTC–DRG relative weights, each LTCH's average relative weight for all of its SSO adjusted trimmed applicable LTCH cases (that is, it's case-mix) was calculated by dividing the sum of all the LTCH's MS–LTC–DRG relative weights by its total number of SSO-adjusted trimmed applicable LTCH cases. The LTCHs' hospital-specific relative charge values (from previous) are then multiplied by the hospital-specific case-mix indexes. The hospital specific case-mix-adjusted relative charge values are then used to calculate a new set of MS–LTC–DRG relative weights across all LTCHs. This iterative process continued until there was convergence between the relative weights produced at adjacent steps, for example, when the maximum difference was less than 0.0001.

Step 7—Adjust the Relative Weights To Account for Nonmonotonically Increasing Relative Weights.

The MS–DRGs contain base DRGs that have been subdivided into one, two, or three severity of illness levels. Where there are three severity levels, the most severe level has at least one secondary diagnosis code that is referred to as an MCC (that is, major complication or comorbidity). The next lower severity level contains cases with at least one secondary diagnosis code that is a CC (that is, complication or comorbidity). Those cases without an MCC or a CC are referred to as ''without CC/MCC.'' When data do not support the creation of three severity levels, the base MS–DRG is subdivided into either two levels or the base MS–DRG is not subdivided. The two-level subdivisions may consist of the MS–DRG with CC/MCC and the MS–DRG without CC/MCC. Alternatively, the other type of two-level-subdivision may consist of the MS–DRG with MCC and the MS–DRG without MCC.

In those base MS–LTC–DRGs that are split into either two or three severity levels, cases classified into the ''without CC/MCC'' MS–LTC–DRG are expected to have a lower resource use (and lower costs) than the ''with CC/MCC'' MS–LTC–DRG (in the case of a two level split) or both the ''with CC'' and the ''with MCC'' MS–LTC–DRGs (in the case of a three-level-split). That is, theoretically, cases that are more severe typically require greater expenditure of medical care resources and would result in higher average charges. Therefore, in the three severity levels, relative weights should increase by severity, from lowest to highest. If the relative weights decrease as severity increases (that is, if within a base MS–LTC–DRG, an MS–LTC–DRG with CC has a higher relative weight than one with MCC, or the MS–LTC–DRG ''without CC/MCC'' has a higher relative weight than either of the others), they are nonmonotonic. We continue to believe that utilizing nonmonotonic relative weights to adjust Medicare payments would result in inappropriate payments because the payment for the cases in the higher severity level in a base MS–LTC–DRG (which are generally expected to have higher resource use and costs) would be lower than the payment for cases in a lower severity level within the same base MS–LTC–DRG (which are generally expected to have lower resource use and costs). Therefore, in determining the FY 2027 MS–LTC–DRG relative weights, consistent with our historical methodology, as we proposed, we continued to combine MS–LTC–DRG severity levels within a base MS–LTC–DRG for the purpose of computing a relative weight when necessary to ensure that monotonicity is maintained. For a comprehensive description of our existing methodology to adjust for nonmonotonicity, we refer readers to the FY 2010 IPPS/RY 2010 LTCH PPS final rule (74 FR 43964 through 43966). Any adjustments for nonmonotonicity that were made in determining the FY 2027 MS–LTC–DRG relative weights by applying this methodology are denoted in Table 11, which is listed in section VI. of the Addendum to this final rule and is available via the internet on the CMS website.

Step 8—Determine a Relative Weight for MS–LTC–DRGs With No Applicable LTCH Cases

Using the trimmed applicable LTCH cases, consistent with our historical methodology, we identified the MS–LTC–DRGs for which there were no claims in the March 2026 update of the FY 2025 MedPAR file and, therefore, for which no charge data was available for these MS–LTC–DRGs. Because patients with a number of the diagnoses under these MS–LTC–DRGs may be treated at LTCHs, consistent with our historical methodology, we generally assign a relative weight to each of the no-volume MS–LTC–DRGs based on clinical similarity and relative costliness (with the exception of ''transplant'' MS–LTC–DRGs, ''error'' MS–LTC–DRGs, and MS–LTC–DRGs that indicate a principal diagnosis related to a psychiatric diagnosis or rehabilitation (referred to as the ''psychiatric or rehabilitation'' MS–LTC–DRGs), as discussed later in this section of the preamble of this final rule). (For additional information on this step of the relative weight methodology, we refer readers to 67 FR 55991 and 74 FR 43959 through 43960.)

Consistent with our existing methodology, as we proposed, we cross-walked each no-volume MS–LTC–DRG to another MS–LTC–DRG for which we calculated a relative weight (determined in accordance with the methodology as previously described). Then, the ''no-volume'' MS–LTC–DRG is assigned the same relative weight (and average length of stay) of the MS–LTC–DRG to which it was cross-walked (as described in greater detail in this section of the preamble of this final rule).

Of the 768 MS–LTC–DRGs for FY 2027, we identified 415 MS–LTC–DRGs for which there were no trimmed applicable LTCH cases. The 415 MS–LTC–DRGs for which there were no trimmed applicable LTCH cases includes the 11 ''transplant'' MS–LTC–DRGs, the 2 ''error'' MS–LTC–DRGs, and the 15 ''psychiatric or rehabilitation'' MS–LTC–DRGs, which are discussed in this section of this final rule, such that we identified 387 MS–LTC–DRGs that for which, we assigned a relative weight using our existing ''no-volume'' MS–LTC–DRG methodology (that is, $415 - 11 - 2 - 15 = 387$). As we proposed, we assigned relative weights to each of the 387 no-volume MS–LTC–DRGs based on clinical similarity and relative costliness to 1 of the remaining 353 ($768 - 415 = 353$) MS–LTC–DRGs for which we calculated relative weights based on the trimmed applicable LTCH cases in the FY 2025 MedPAR file data using the steps described previously. (For the remainder of this discussion, we refer to the ''cross-walked'' MS–LTC–DRGs as one of the 353 MS–LTC–DRGs to which we cross-walked each of the 387 ''no-volume'' MS–LTC–DRGs.) Then, in general, we assigned the 387 no-volume MS–LTC–DRGs the relative weight of the cross-walked MS–LTC–DRG (when necessary, we made

adjustments to account for nonmonotonicity).

We cross-walked the no-volume MS–LTC–DRG to a MS–LTC–DRG for which we calculated relative weights based on the March 2026 update of the FY 2025 MedPAR file, and to which it is similar clinically in intensity of use of resources and relative costliness as determined by criteria such as care provided during the period of time surrounding surgery, surgical approach (if applicable), length of time of surgical procedure, postoperative care, and length of stay. (For more details on our process for evaluating relative costliness, we refer readers to the FY 2010 IPPS/RY 2010 LTCH PPS final rule (73 FR 48543).) We believe in the rare event that there would be a few LTCH cases grouped to one of the no-volume MS–LTC–DRGs in FY 2027, the relative weights assigned based on the cross-walked MS–LTC–DRGs would result in an appropriate LTCH PPS payment because the crosswalks, which are based on clinical similarity and relative costliness, would be expected to generally require equivalent relative resource use.

Then we assigned the relative weight of the cross-walked MS–LTC–DRG as the relative weight for the no-volume MS–LTC–DRG such that both of these MS–LTC–DRGs (that is, the no-volume MS–LTC–DRG and the cross-walked MS–LTC–DRG) have the same relative weight (and average length of stay) for FY 2027. We note that, if the cross-walked MS–LTC–DRG had 25 applicable LTCH cases or more, its relative weight (calculated using the methodology as previously described in Steps 1 through 4) is assigned to the no-volume MS–LTC–DRG as well. Similarly, if the MS–LTC–DRG to which the no-volume MS–LTC–DRG was cross-walked had 24 or less cases and, therefore, was designated to 1 of the low-volume quintiles for purposes of determining the relative weights, we assigned the relative weight of the applicable low-volume quintile to the no-volume MS–LTC–DRG such that both of these MS–LTC–DRGs (that is, the no-volume MS–LTC–DRG and the cross-walked MS–LTC–DRG) have the same relative weight for FY 2027. (As we noted previously, in the infrequent case where nonmonotonicity involving a no-volume MS–LTC–DRG resulted, additional adjustments are required to maintain monotonically increasing relative weights.)

For this final rule, we are providing the list of the no-volume MS–LTC–DRGs and the MS–LTC–DRGs to which each was cross-walked (that is, the cross-walked MS–LTC–DRGs) for FY 2027 in a supplemental data file for public use posted via the internet on the CMS website for this final rule at *https://www.cms.gov/Medicare/Medicare-Fee-for-Service-Payment/AcuteInpatientPPS/index.html* to streamline the information made available to the public that is used in the annual development of Table 11.

To illustrate this methodology for determining the relative weights for the FY 2027 MS–LTC–DRGs with no applicable LTCH cases, we are providing the following example.

Example: There were no trimmed applicable LTCH cases in the FY 2025 MedPAR file that we are using for this final rule for MS–LTC–DRG 061 (Ischemic stroke, precerebral occlusion or transient ischemia with thrombolytic agent with MCC). We determined that MS–LTC–DRG 064 (Intracranial hemorrhage or cerebral infarction with MCC) is similar clinically and based on resource use to MS–LTC–DRG 061. Therefore, we assigned the same relative weight (and average length of stay) of MS–LTC–DRG 064 of 1.0496 for FY 2027 to MS–LTC–DRG 061 (we refer readers to Table 11, which is listed in section VI. of the Addendum to this final rule and is available via the internet on the CMS website).

Again, we note that, as this system is dynamic, it is entirely possible that the number of MS–LTC–DRGs with no volume would vary in the future. Consistent with our historical practice, as we proposed, we used the best available claims data to identify the trimmed applicable LTCH cases from which we determined the relative weights in the final rule.

For FY 2027, consistent with our historical relative weight methodology, as we proposed, we are establishing a relative weight of 0.0000 for the following transplant MS–LTC–DRGs: Heart Transplant or Implant of Heart Assist System with MCC (MS–LTC–DRG 001); Heart Transplant or Implant of Heart Assist System without MCC (MS–LTC–DRG 002); Liver Transplant with MCC or Intestinal Transplant (MS–LTC–DRG 005); Liver Transplant without MCC (MS–LTC–DRG 006); Lung Transplant (MS–LTC–DRG 007); Simultaneous Pancreas, Islet Cell and Kidney Transplant (MS–LTC–DRG 008); Simultaneous Pancreas, Islet Cell and Kidney Transplant with Hemodialysis (MS–LTC–DRG 019); Pancreas or Islet Cell Transplant (MS–LTC–DRG 010); Kidney Transplant (MS–LTC–DRG 652); Kidney Transplant with Hemodialysis with MCC (MS–LTC–DRG 650), and Kidney Transplant with Hemodialysis without MCC (MS–LTC–DRG 651). This is because Medicare only covers these procedures if they are performed at a hospital that has been certified for the specific procedures by Medicare and presently no LTCH has been so certified. At the present time, we include these 11 transplant MS–LTC–DRGs in the GROUPER program for administrative purposes only. Because we use the same GROUPER program for LTCHs as is used under the IPPS, removing these MS–LTC–DRGs would be administratively burdensome. (For additional information regarding our treatment of transplant MS–LTC–DRGs, we refer readers to the RY 2010 LTCH PPS final rule (74 FR 43964).) In addition, consistent with our historical policy, we are establishing a relative weight of 0.0000 for the 2 ''error'' MS–LTC–DRGs (that is, MS–LTC–DRG 998 (Principal Diagnosis Invalid as Discharge Diagnosis) and MS–LTC–DRG 999 (Ungroupable)) because applicable LTCH cases grouped to these MS–LTC–DRGs cannot be properly assigned to an MS–LTC–DRG according to the grouping logic.

Additionally, we are establishing a relative weight of 0.0000 for the following ''psychiatric or rehabilitation'' MS–LTC–DRGs: MS–LTC–DRG 876 (O.R. Procedures with Principal Diagnosis of Mental Illness); MS–LTC–DRG 880 (Acute Adjustment Reaction & Psychosocial Dysfunction); MS–LTC–DRG 881 (Depressive Neuroses); MS–LTC–DRG 882 (Neuroses Except Depressive); MS–LTC–DRG 883 (Disorders of Personality & Impulse Control); MS–LTC–DRG 884 (Organic Disturbances & Intellectual Disability); MS–LTC–DRG 885 (Psychoses); MS–LTC–DRG 886 (Behavioral & Developmental Disorders); MS–LTC–DRG 887 (Other Mental Disorder Diagnoses); MS–LTC–DRG 894 (Alcohol, Drug Abuse or Dependence, Left AMA); MS–LTC–DRG 895 (Alcohol, Drug Abuse or Dependence with Rehabilitation Therapy); MS–LTC–DRG 896 (Alcohol, Drug Abuse or Dependence without Rehabilitation Therapy with MCC); MS–LTC–DRG 897 (Alcohol, Drug Abuse or Dependence without Rehabilitation Therapy without MCC); MS–LTC–DRG 945 (Rehabilitation with CC/MCC); and MS–LTC–DRG 946 (Rehabilitation without CC/MCC). We are establishing a relative weight of 0.0000 for these 15 ''psychiatric or rehabilitation'' MS–LTC–DRGs because the blended payment rate and temporary exceptions to the site neutral payment rate would not be applicable for any LTCH discharges occurring in FY 2027, and as such payment under the LTCH PPS would be no longer be made in part based on the LTCH PPS standard

Federal payment rate for any discharges assigned to those MS–LTC–DRGs.

Step 9—Budget Neutralize the Uncapped Relative Weights

In accordance with the regulations at § 412.517(b) (in conjunction with § 412.503), the annual update to the MS–LTC–DRG classifications and relative weights is done in a budget neutral manner such that estimated aggregate LTCH PPS payments would be unaffected, that is, would be neither greater than nor less than the estimated aggregate LTCH PPS payments that would have been made without the MS–LTC–DRG classification and relative weight changes. (For a detailed discussion on the establishment of the budget neutrality requirement for the annual update of the MS–LTC–DRG classifications and relative weights, we refer readers to the FY 2008 LTCH PPS final rule (72 FR 26881 and 26882)).

To achieve budget neutrality under the requirement at § 412.517(b), under our established methodology, for each annual update the MS–LTC–DRG relative weights are uniformly adjusted to ensure that estimated aggregate payments under the LTCH PPS would not be affected (that is, decreased or increased). Consistent with that provision, as we proposed, we continued to apply budget neutrality adjustments in determining the FY 2027 MS–LTC–DRG relative weights so that our update of the MS–LTC–DRG classifications and relative weights for FY 2027 are made in a budget neutral manner. For FY 2027, as we proposed, we applied two budget neutrality factors to determine the MS–LTC–DRG relative weights. In this step, we describe the determination of the budget neutrality adjustment that accounts for the update of the MS–LTC–DRG classifications and relative weights prior to the application of the ten-percent cap. In steps 10 and 11, we describe the application of the 10-percent cap policy (step 10) and the determination of the budget neutrality factor that accounts for the application of the 10-percent cap policy (step 11).

In this final rule, to ensure budget neutrality for the update to the MS–LTC–DRG classifications and relative weights prior to the application of the 10-percent cap (that is, uncapped relative weights), under § 412.517(b), we continued to use our established two-step budget neutrality methodology. Therefore, in the first step of our MS–LTC–DRG update budget neutrality methodology, for FY 2027, we calculated and applied a normalization factor to the recalibrated relative weights (the result of Steps 1 through 8 discussed previously) to ensure that estimated payments are not affected by changes in the composition of case types or the changes to the classification system. That is, the normalization adjustment is intended to ensure that the recalibration of the MS–LTC–DRG relative weights (that is, the process itself) neither increases nor decreases the average case-mix index.

To calculate the normalization factor for FY 2027, we used the following three steps: (1.a.) use the applicable LTCH cases from the best available data (that is, LTCH discharges from the FY 2025 MedPAR file) and group them using the FY 2027 GROUPER (that is, Version 44 for FY 2027) and the recalibrated FY 2027 MS–LTC–DRG uncapped relative weights (determined in Steps 1 through 8 discussed previously) to calculate the average case-mix index; (1.b.) group the same applicable LTCH cases (as are used in Step 1.a.) using the FY 2026 GROUPER (Version 43) and FY 2026 MS–LTC–DRG relative weights in Table 11 of the FY 2026 IPPS/LTCH PPS final rule and calculate the average case-mix index; and (1.c.) compute the ratio of these average case-mix indexes by dividing the average case-mix index for FY 2026 (determined in Step 1.b.) by the average case-mix index for FY 2027 (determined in Step 1.a.). As a result, in determining the MS–LTC–DRG relative weights for FY 2027, each recalibrated MS–LTC–DRG uncapped relative weight is multiplied by the normalization factor of 1.27345 (determined in Step 1.c.) in the first step of the budget neutrality methodology, which produces ''normalized relative weights.''

In the second step of our MS–LTC–DRG update budget neutrality methodology, we calculated a budget neutrality adjustment factor consisting of the ratio of estimated aggregate FY 2027 LTCH PPS standard Federal payment rate payments for applicable LTCH cases before reclassification and recalibration to estimated aggregate payments for FY 2027 LTCH PPS standard Federal payment rate payments for applicable LTCH cases after reclassification and recalibration. That is, for this final rule, for FY 2027, we determined the budget neutrality adjustment factor using the following three steps: (2.a.) simulate estimated total FY 2027 LTCH PPS standard Federal payment rate payments for applicable LTCH cases using the uncapped normalized relative weights for FY 2027 and GROUPER Version 44; (2.b.) simulate estimated total FY 2027 LTCH PPS standard Federal payment rate payments for applicable LTCH cases using the FY 2026 GROUPER (Version 43) and the FY 2026 MS–LTC–DRG relative weights in Table 11 of the FY 2026 IPPS/LTCH PPS final rule; and (2.c.) calculate the ratio of these estimated total payments by dividing the value determined in Step 2.b. by the value determined in Step 2.a. In determining the FY 2027 MS–LTC–DRG relative weights, each uncapped normalized relative weight is then multiplied by a budget neutrality factor of 1.0055356 (the value determined in Step 2.c.) in the second step of the budget neutrality methodology.

Step 10—Apply the 10-Percent Cap to Decreases in MS–LTC–DRG Relative Weights

To mitigate the financial impacts of significant year-to-year reductions in MS–LTC–DRGs relative weights, beginning in FY 2023, we adopted a policy that applies a budget neutral 10-percent cap on annual relative weight decreases for MS–LTC–DRGs with at least 25 applicable LTCH cases (§ 412.515(b)). Under this policy, in cases where CMS creates new MS–LTC–DRGs or modifies the MS–LTC–DRGs as part of its annual reclassifications resulting in renumbering of one or more MS–LTC–DRGs, the 10-percent cap does not apply to the relative weight for any new or renumbered MS–LTC–DRGs for the fiscal year. We refer readers to section VIII.B.3.b. of the preamble of the FY 2023 IPPS/LTCH PPS final rule with comment period for a detailed discussion on the adoption of the 10-percent cap policy (87 FR 49152 through 49154).

Applying the 10-percent cap to MS–LTC–DRGs with 25 or more cases results in more predictable and stable MS–LTC–DRG relative weights from year to year, especially for high-volume MS–LTC–DRGs that generally have the largest financial impact on an LTCH's operations. For this final rule, in cases where the relative weight for a MS–LTC–DRG with 25 or more applicable LTCH cases would decrease by more than 10-percent in FY 2027 relative to FY 2026, as we proposed, we limited the reduction to 10-percent. Under this policy, we do not apply the 10 percent cap to the low-volume MS–LTC–DRGs identified in Step 3 or the no-volume MS–LTC–DRGs identified in Step 8.

Therefore, in this step, for each FY 2027 MS–LTC–DRG with 25 or more applicable LTCH cases (excludes low-volume and zero-volume MS–LTC–DRGs) we compared its FY 2027 relative weight (after application of the normalization and budget neutrality factors determined in Step 9), to its FY 2026 MS–LTC–DRG relative weight. For any MS–LTC–DRG where the FY 2027 relative weight would otherwise have

declined more than 10 percent, we established a capped FY 2027 MS–LTC–DRG relative weight that is equal to 90 percent of that MS–LTC–DRG's FY 2026 relative weight (that is, we set the FY 2027 relative weight equal to the FY 2026 weight × 0.90).

In section II.C. of the preamble of this final rule, we discuss our changes to the MS–DRGs, and by extension the MS–LTC–DRGs, for FY 2027. As discussed previously, under our current policy, the 10-percent cap does not apply to the relative weight for any new or renumbered MS–LTC–DRGs. We did not propose any changes to this policy for FY 2027, and as such any new or renumbered MS–LTC–DRGs for FY 2027 were not eligible for the 10-percent cap.

Step 11—Budget Neutralize Application of the 10-Percent Cap Policy

Under the requirement at existing § 412.517(b) that aggregate LTCH PPS payments will be unaffected by annual changes to the MS–LTC–DRG classifications and relative weights, consistent with our established methodology, we continued to apply a budget neutrality adjustment to the MS–LTC–DRG relative weights so that the 10-percent cap on relative weight reductions (step 10) is implemented in a budget neutral manner. Therefore, we determined the budget neutrality adjustment factor for the 10-percent cap on relative weight reductions using the following three steps: (a) simulate estimated total FY 2027 LTCH PPS standard Federal payment rate payments for applicable LTCH cases using the capped relative weights for FY 2027 (determined in Step 10) and GROUPER Version 44; (b) simulate estimated total FY 2027 LTCH PPS standard Federal payment rate payments for applicable LTCH cases using the uncapped relative weights for FY 2027 (determined in Step 9) and GROUPER Version 44; and (c) calculate the ratio of these estimated total payments by dividing the value determined in step (b) by the value determined in step (a). In determining the FY 2027 MS–LTC–DRG relative weights, each capped relative weight is then multiplied by a budget neutrality factor of 0.9978875 (the value determined in step (c)) to achieve the budget neutrality requirement.

Table 11, which is listed in section VI. of the Addendum to this final rule and is available via the internet on the CMS website, lists the MS–LTC–DRGs and their respective relative weights, geometric mean length of stay, and five-sixths of the geometric mean length of stay (used to identify SSO cases under § 412.529(a)) for FY 2027. We also are making available on the website the MS–LTC–DRG relative weights prior to the application of the 10 percent cap on MS–LTC–DRG relative weight reductions and corresponding cap budget neutrality factor.

C. Changes to the LTCH PPS Payment Rates and Other Changes to the LTCH PPS for FY 2027

1. Overview of Development of the LTCH PPS Standard Federal Payment Rates

The basic methodology for determining LTCH PPS standard Federal payment rates is currently set forth at 42 CFR 412.515 through 412.533 and 412.535. In this section, we discuss the factors that we used to update the LTCH PPS standard Federal payment rate for FY 2027, that is, effective for LTCH discharges occurring on or after October 1, 2026, through September 30, 2027. Under the dual rate LTCH PPS payment structure required by statute, beginning with discharges in cost reporting periods beginning in FY 2016, only LTCH discharges that meet the criteria for exclusion from the site neutral payment rate are paid based on the LTCH PPS standard Federal payment rate specified at 42 CFR 412.523. (For additional details on our finalized policies related to the dual rate LTCH PPS payment structure required by statute, we refer readers to the FY 2016 IPPS/LTCH PPS final rule (80 FR 49601 through 49623).)

Prior to the implementation of the dual payment rate system in FY 2016, all LTCH discharges were paid similarly to those now exempt from the site neutral payment rate. That legacy payment rate was called the standard Federal rate. For details on the development of the initial standard Federal rate for FY 2003, we refer readers to the August 30, 2002, LTCH PPS final rule (67 FR 56027 through 56037). For subsequent updates to the standard Federal rate from FYs 2003 through 2015, and LTCH PPS standard Federal payment rate from FY 2016 through present, as implemented under 42 CFR 412.523(c)(3), we refer readers to the FY 2020 IPPS/LTCH PPS final rule (84 FR 42445 through 42446).

In this FY 2027 IPPS/LTCH PPS final rule, we present our policies related to the annual update to the LTCH PPS standard Federal payment rate for FY 2027.

The update to the LTCH PPS standard Federal payment rate for FY 2027 is presented in section V.A. of the Addendum to this final rule. The components of the annual update to the LTCH PPS standard Federal payment rate for FY 2027 are discussed in this section, including the statutory reduction to the annual update for LTCHs that fail to submit quality reporting data for FY 2027 as required by the statute (as discussed in section IX.C.2.c. of the preamble of this final rule). As we proposed, we made an adjustment to the LTCH PPS standard Federal payment rate to account for the estimated effect of the changes to the area wage level for FY 2027 on estimated aggregate LTCH PPS payments, in accordance with 42 CFR 412.523(d)(4) (as discussed in section V.B. of the Addendum to this final rule).

2. FY 2027 LTCH PPS Standard Federal Payment Rate Annual Market Basket Update

a. Overview

Historically, the Medicare program has used a market basket to account for input price increases in the services furnished by providers. The market basket used for the LTCH PPS includes both operating and capital-related costs of LTCHs because the LTCH PPS uses a single payment rate for both operating and capital-related costs. We adopted the 2022-based LTCH market basket for use under the LTCH PPS beginning in FY 2025. For additional details on the historical development of the market basket used under the LTCH PPS, we refer readers to the FY 2013 IPPS/LTCH PPS final rule (77 FR 53467 through 53476), and for a complete discussion of the LTCH market basket and a description of the methodologies used to determine the operating and capital-related portions of the 2022-based LTCH market basket, we refer readers to the FY 2025 IPPS/LTCH PPS final rule (89 FR 69435 through 69455).

Section 3401(c) of the Affordable Care Act provides for certain adjustments to any annual update to the LTCH PPS standard Federal payment rate and refers to the timeframes associated with such adjustments as a ''rate year.'' We note that, because the annual update to the LTCH PPS policies, rates, and factors now occurs on October 1, we adopted the term ''fiscal year'' (FY) rather than ''rate year'' (RY) under the LTCH PPS beginning October 1, 2010, to conform with the standard definition of the Federal fiscal year (October 1 through September 30) used by other PPSs, such as the IPPS (75 FR 50396 through 50397). Although the language of sections 3004(a), 3401(c), 10319, and 1105(b) of the Affordable Care Act refers to years 2010 and thereafter under the LTCH PPS as ''rate year,'' consistent with our change in the terminology used under the LTCH PPS from ''rate year'' to

''fiscal year,'' for purposes of clarity, when discussing the annual update for the LTCH PPS standard Federal payment rate, including the provisions of the Affordable Care Act, we use ''fiscal year'' rather than ''rate year'' for 2011 and subsequent years.

b. Annual Update to the LTCH PPS Standard Federal Payment Rate for FY 2027

As previously noted, we adopted the 2022-based LTCH market basket for use under the LTCH PPS beginning in FY 2025. The 2022-based LTCH market basket is primarily based on the Medicare cost report data submitted by LTCHs and, therefore, specifically reflects the cost structures of LTCHs. For additional details on the development of the 2022-based LTCH market basket, we refer readers to the FY 2025 IPPS/LTCH PPS final rule (89 FR 69435 through 69455). We continue to believe that the 2022-based LTCH market basket appropriately reflects the cost structure of LTCHs for the reasons discussed when we adopted its use in the FY 2025 IPPS/LTCH PPS final rule. Therefore, in this final rule, as we proposed, we used the 2022-based LTCH market basket to update the LTCH PPS standard Federal payment rate for FY 2027.

Section 1886(m)(3)(A) of the Act provides that, beginning in FY 2010, any annual update to the LTCH PPS standard Federal payment rate is reduced by the adjustments specified in clauses (i) and (ii) of subparagraph (A), as applicable. Clause (i) of section 1886(m)(3)(A) of the Act provides for a reduction, for FY 2012 and each subsequent rate year, by ''the productivity adjustment'' described in section 1886(b)(3)(B)(xi)(II) of the Act. Section 1886(b)(3)(B)(xi)(II) of the Act, as added by section 3401(a) of the Affordable Care Act, defines this productivity adjustment as equal to the 10-year moving average of changes in annual economy-wide, private nonfarm business multifactor productivity (as projected by the Secretary for the 10-year period ending with the applicable fiscal year, year, cost reporting period, or other annual period). The U.S. Department of Labor's Bureau of Labor Statistics (BLS) publishes the official measures of productivity for the U.S. economy. The productivity measure referenced in section 1886(b)(3)(B)(xi)(II) is published by BLS as private nonfarm business total factor productivity ((TFP) previously referred to as multifactor productivity).[220] We refer readers to *www.bls.gov/productivity* for the BLS historical published TFP data. A complete description of IGI's TFP projection methodology is available on the CMS website at *https://www.cms.gov/data-research/statistics-trends-and-reports/medicare-program-rates-statistics/market-basket-research-and-information.* Section 1886(m)(3)(A)(ii) of the Act provided for a reduction, for each of FYs 2010 through 2019, by the ''other adjustment'' described in section 1886(m)(4)(F) of the Act.

Section 1886(m)(3)(B) of the Act provides that the application of paragraph (3) may result in the annual update being less than zero for a rate year, and may result in payment rates for a rate year being less than such payment rates for the preceding rate year.

c. Adjustment to the LTCH PPS Standard Federal Payment Rate Under the Long-Term Care Hospital Quality Reporting Program (LTCH QRP)

In accordance with section 1886(m)(5) of the Act, the Secretary established the Long-Term Care Hospital Quality Reporting Program (LTCH QRP). The reduction in the annual update to the LTCH PPS standard Federal payment rate for failure to report quality data under the LTCH QRP for FY 2014 and subsequent fiscal years is codified under 42 CFR 412.523(c)(4). The LTCH QRP, as required for FY 2014 and subsequent fiscal years by section 1886(m)(5)(A)(i) of the Act, requires that a 2.0 percentage points reduction be applied to any update under 42 CFR 412.523(c)(3) for an LTCH that does not submit quality reporting data to the Secretary in accordance with section 1886(m)(5)(C) of the Act with respect to such a year (that is, in the form and manner and at the time specified by the Secretary under the LTCH QRP under 42 CFR 412.523(c)(4)(i)). Section 1886(m)(5)(A)(ii) of the Act provides that the application of the 2.0 percentage points reduction may result in an annual update that is less than 0.0 for a year, and may result in LTCH PPS payment rates for a year being less than such LTCH PPS payment rates for the preceding year. Furthermore, section 1886(m)(5)(B) of the Act specifies that the 2.0 percentage points reduction is applied in a noncumulative manner, such that any reduction made under section 1886(m)(5)(A) of the Act shall apply only with respect to the year involved and shall not be taken into account in computing the LTCH PPS payment amount for a subsequent year. These requirements are codified in the regulations at 42 CFR 412.523(c)(4). (For additional information on the history of the LTCH QRP, including the statutory authority and the selected measures, we refer readers to section X.E. of the preamble of this final rule.)

d. Annual Market Basket Update Under the LTCH PPS for FY 2027

Consistent with our historical practice, we estimate the market basket percentage increase and the productivity adjustment based on IHS Global Inc.'s (IGI's) forecast using the most recent available data. Based on IGI's fourth quarter 2025 forecast, the proposed FY 2027 market basket percentage increase for the LTCH PPS using the 2022-based LTCH market basket was 3.2 percent. The proposed productivity adjustment for FY 2027 based on IGI's fourth quarter 2025 forecast was 0.8 percentage point.

For FY 2027, section 1886(m)(3)(A)(i) of the Act requires that any annual update to the LTCH PPS standard Federal payment rate be reduced by the productivity adjustment, described in section 1886(b)(3)(B)(xi)(II) of the Act. Consistent with the statute, we proposed to reduce the FY 2027 market basket percentage increase by the FY 2027 productivity adjustment. To determine the proposed market basket update for LTCHs for FY 2027 we subtracted the proposed FY 2027 productivity adjustment from the proposed FY 2027 market basket percentage increase. (For additional details on our established methodology for adjusting the market basket percentage increase by the productivity adjustment, we refer readers to the FY 2012 IPPS/LTCH PPS final rule (76 FR 51771).) In addition, for FY 2027, section 1886(m)(5) of the Act requires that, for LTCHs that do not submit quality reporting data as required under the LTCH QRP, any annual update to an LTCH PPS standard Federal payment rate, after application of the adjustments required by section 1886(m)(3) of the Act, shall be further reduced by 2.0 percentage points.

In the FY 2027 IPPS/LTCH PPS proposed rule (91 FR 19564), in accordance with the statute, we proposed to reduce the proposed FY 2027 market basket percentage increase of 3.2 percent (based on IGI's fourth quarter 2025 forecast of the 2022-based LTCH market basket) by the proposed FY 2027 productivity adjustment of 0.8 percentage point (based on IGI's fourth quarter 2025 forecast). Therefore, under the authority of section 123 of the BBRA as amended by section 307(b) of the BIPA, consistent with 42 CFR 412.523(c)(3)(xvii), we proposed to establish an annual market basket

[220] *https://www.bls.gov/productivity/notices/2021/mfp-to-tfp-term-change.htm.*

update to the LTCH PPS standard Federal payment rate for FY 2027 of 2.4 percent (that is, the proposed LTCH PPS market basket percentage increase of 3.2 percent less the proposed productivity adjustment of 0.8 percentage point). For LTCHs that fail to submit quality reporting data under the LTCH QRP, under 42 CFR 412.523(c)(3)(xvii) in conjunction with 42 CFR 412.523(c)(4), we proposed to further reduce the annual update to the LTCH PPS standard Federal payment rate by 2.0 percentage points, in accordance with section 1886(m)(5) of the Act. Accordingly, we proposed to establish an annual update to the LTCH PPS standard Federal payment rate of 0.4 percent (that is, the proposed 2.4 percent LTCH market basket update minus 2.0 percentage points) for FY 2027 for LTCHs that fail to submit quality reporting data as required under the LTCH QRP. Consistent with our historical practice, we proposed in the FY 2027 IPPS/LTCH PPS proposed rule (91 FR 19564) that if more recent data subsequently became available (for example, a more recent estimate of the market basket percentage increase and productivity adjustment), we would use such data, if appropriate, to determine the FY 2027 market basket percentage increase and productivity adjustment in the final rule. We note that, consistent with historical practice, we also proposed to adjust the FY 2027 LTCH PPS standard Federal payment rate by an area wage level budget neutrality factor in accordance with 42 CFR 412.523(d)(4) (as discussed in section V.B.6. of the Addendum to this final rule).

Comment: A few commenters appreciated and supported the proposed rate increase for LTCHs with a commenter stating it will help hospitals meet patient needs and improve access to care. Most commenters expressed concern with the proposed 3.2 percent LTCH market basket increase and whether it adequately supports the operational and clinical demands faced by LTCHs. Commenters stated they believe the proposed payment increase is insufficient considering the current rate of inflation and escalating costs (including labor, drugs, supplies, and equipment) facing LTCHs due to health care workforce shortages and supply chain disruptions.

Commenters provided data and cited recent studies and reports regarding increasing labor costs, state minimum wage requirements, medical supply and pharmaceuticals costs, dialysis costs, total operating costs, administrative costs (including those associated with Medicare Advantage claim denials), impact of tariffs, and hourly rates for contract labor, which the commenters stated highlights the need for additional increases in payments to cover these significant increases in costs. Commenters stated that these increases in costs, combined with the reimbursement pressures on LTCHs, have resulted in a significant decline in the number of LTCHs in operation and the total number of Medicare discharges from LTCHs.

Commenters requested that CMS either modify its methodology used to determine the market basket update, provide for a special increase to the proposed market basket update, or apply a special payment adjustment to account for significantly higher labor and supply costs incurred by LTCHs in recent years and potentially in FY 2027. Another commenter urged CMS to provide a more adequate market basket update in the final rule that reflects actual inflation in the LTCH cost structure and use all available administrative flexibilities to increase the net payment update. A commenter stated that the cumulative impact of inflationary pressure coupled with the proposed Medicare payment increases for FY 2027 will continue to have negative effects on LTCH PPS operating margins.

Response: CMS has historically used a market basket to account for input price increases in the services furnished by fee-for-service providers. Since the inception of the LTCH PPS, the LTCH PPS standard Federal payment rates (with the exception of statutorily mandated updates) have been updated based on a projection of a market basket percentage increase.

The LTCH market basket (as well as other CMS market baskets) is a fixed-weight, Laspeyres type index that measures price changes over time and does not reflect increases in costs associated with changes in the volume or intensity of input goods and services until the index is rebased. As such, the LTCH market basket update reflects the prospective price pressures described by the commenters as increasing during a high inflation period (such as faster wage growth or higher energy prices) but inherently does not reflect other factors that might increase the level of costs, such as the quantity of labor used (which may be associated with intensity of services). However, the impact of changes in quantity or use of services on the market basket cost weights are captured when the market basket is rebased.

We appreciate the commenters' concern regarding inflationary pressure, including labor and supply costs, encountered by LTCHs. We would highlight that the market basket percentage increase is a forecast of the price pressures that LTCHs are expected to face in FY 2027. We also note that when developing its forecast for the various price indexes used in the LTCH market basket, IGI considers industry-specific and overall economic conditions. More specifically for the Employment Cost Index (ECI) for hospital workers, IGI considers overall labor market conditions (including the impact of wage pressures on skill mix) as well as trends in contract labor wages, which both have an impact on wage pressures for workers employed directly by the hospital.

In the FY 2027 IPPS/LTCH proposed rule (91 FR 19564), we proposed a FY 2027 LTCH market basket percentage increase of 3.2 percent. As is our general practice, we also proposed that if more recent data became available, we would use such data, if appropriate, to derive the final FY 2027 LTCH market basket increase for the final rule. For this final rule (as proposed), we are using an updated forecast of the price proxies underlying the market basket that incorporates more recent historical data and reflects a revised outlook regarding the U.S. economy. Based on IGI's second quarter 2026 forecast with historical data through the first quarter of 2026, the projected 2022-based LTCH market basket percentage increase for FY 2027 is 3.2 percent, the same increase as in the proposed rule.

As discussed earlier, we believe the LTCH market basket percentage increase appropriately reflects the input price growth (including compensation price growth) that LTCHs incur in providing medical services. We also believe the LTCH market basket is methodologically sound and uses the best available data for FY 2027. Therefore, we disagree with the commenters that CMS should increase the market basket update or apply a ''special'' payment adjustment to the LTCH PPS rates to account for or offset higher labor and supply costs or unprecedented inflation.

Comment: A commenter expressed concern about the lack of transparency from CMS regarding the LTCH market basket and the use of the IGI data. The commenter referenced CMS' responses in the FY 2025 IPPS/LTCH final rule (89 FR 69450) regarding commenters' concerns about the lack of transparency in the market basket. The commenter stated that in the FY 2027 IPPS/LTCH proposed rule, CMS did not provide greater transparency about the IGI data used for the market basket update that CMS is proposing for FY 2027. The commenter claimed that it is still not

possible to replicate exactly how CMS is arriving at the proposed 3.2 percent market basket update for FY 2027. The commenter requested that CMS provide more transparency in the final rule regarding the IGI data that led to the proposed market basket update.

Response: As discussed in the FY 2025 IPPS/LTCH final rule (89 FR 69450) and the FY 2026 IPPS/LTCH final rule (90 FR 36987), information on the CMS market baskets can be found at the CMS website: *https://www.cms.gov/data-research/statistics-trends-and-reports/medicare-program-rates-statistics/market-basket-research-and-information.* This website provides information including but not limited to how a top-line market basket level is derived from the detailed cost categories, how a four-quarter percent change moving average is calculated, and a link to a spreadsheet containing an example of how the detailed market basket cost weights are calculated for the 2006-based IPPS market basket, which is similar to the approach followed for the LTCH market basket as well as most of the other CMS market baskets. In addition, the latest, publicly available CMS market baskets are available at the CMS website: *https://www.cms.gov/data-research/statistics-trends-and-reports/medicare-program-rates-statistics/market-basket-data.* We note that publicly available market baskets on the CMS website would reflect an updated forecast only after a proposed or final rule is published. Using these spreadsheets, stakeholders are able to replicate the top-line market basket index levels in the historical time period by multiplying the detailed index level for each cost category by the associated cost weight. These products (weight multiplied by index level) can then be summed up to derive the aggregate market basket index level.

In response to the commenter's request for more transparency, in this final rule, we are also providing the projected increase for FY 2027 for some of the aggregated cost categories that underlie the most recent forecast of the FY 2027 LTCH market basket increase (3.2 percent). This detail is consistent with the level of information that is published on the CMS website on a quarterly basis as described above. We note that forecasted FY 2027 prices for Compensation costs, which account for about 62 percent of the market basket are projected to increase 3.2 percent; prices for All Other Products and Services, which account for about 28 percent of the market basket are projected to increase 3.2 percent; and prices for Capital-Related costs, which account for about 8.5 percent of the LTCH market basket are projected to increase 3.5 percent. While the projected market basket increase is calculated using the aggregation of the detailed price forecasts multiplied by their respective cost weights for each of the 26 individual cost categories, we want to provide an estimate of how the broader cost categories are contributing to the overall increase. We reiterate that the price proxy forecasts that underlie the LTCH market basket percentage increase (and all CMS market baskets) are derived from proprietary data produced by IGI. Because these forecasts are proprietary to IGI, CMS cannot make the full underlying data publicly available. CMS uses independent, third-party forecasting services such as IGI specifically to ensure that the market basket projections reflect sound, objective economic analysis. We strive for transparency regarding our methods and regularly respond to questions from stakeholders regarding the market baskets via email at *cmsdnhs@cms.hhs.gov.*

Comment: As in past years, several commenters were concerned about the proposed productivity adjustment of 0.8 percentage point. A commenter again stated that the market basket update is effectively eroded by the 0.8 percentage point productivity cut—a reduction that is especially damaging for hospitals already operating on slim or negative margins. Commenters stated that they believe the productivity adjustment to be flawed, as it assumes the hospital field can mirror productivity gains achieved by private nonfarm businesses that benefit from new technologies, economies of scale, business acumen, managerial skill and changes in production, which they argue is not realistic for the health care industry where labor is the greatest cost. Commenters indicated that LTCHs have little opportunity to gain productivity when salary and benefit pressures grow year over year, and workforce numbers need to keep up with patient demand. Commenters referenced Bureau of Labor Statistics productivity data as well as a CMS Office of the Actuary memorandum that stated hospital total factor productivity (TFP) using two methodologies ranges from 0.2 percent to 0.5 percent and also indicates an assumed future rate of hospital industry productivity growth of 0.4 percent per year.

Several commenters stated they understand that the productivity adjustment is statutorily mandated but suggest CMS use its ''special exceptions and adjustments'' authority to eliminate or reduce the productivity adjustment, or to make an additional, non-budget-neutral rate adjustment to account for flaws in the calculation. A commenter further states that if CMS believes it lacks statutory authority to temporarily suspend the productivity adjustment, then it should use its broad rate setting authority to make other changes that would reduce the impact of the productivity adjustment; such as to apply an offsetting payment adjustment to reduce the productivity adjustment, in whole or in part; or to modify the data used by IGI in a manner that would reduce the amount of the productivity adjustment. A commenter requested CMS work with Congress to reduce the magnitude of the productivity adjustment.

Several commenters expressed concern that the productivity adjustment appears to be applied only when it reduces Medicare payments. They stated that in the one year (FY 2021) where productivity in the non-farm business sector did not improve and measured TFP declined, CMS set the productivity adjustment to 0.0 rather than increasing payments. A commenter stated that while section 1886(b)(3)(B)(xi)(I) of the Act states that ''such percentage increase shall be reduced by the productivity adjustment'' it does not follow that the statute necessarily requires that the productivity adjustment be a subtraction from the otherwise applicable update. The commenter believes that CMS should make this issue subject to public notice and comment rulemaking.

A commenter also requested that CMS provide more transparency about how the productivity adjustment is calculated. A commenter requested CMS conduct and publish a hospital-sector-specific analysis of productivity assumptions and to work with Congress to reassess the continued application of the productivity adjustment in light of ongoing workforce and access challenges.

Response: Section 1886(m)(3)(A)(i) of the Act requires the application of the productivity adjustment. As set forth in section 1886(b)(3)(B)(xi) of the Act, the FY 2027 productivity adjustment is derived based on the 10-year moving average growth in economy-wide private nonfarm business total factor productivity for the period ending in FY 2027. We recognize the concerns of the commenters regarding the appropriateness of the productivity adjustment; however, as we explained in response to similar comments in the FY 2023, FY 2024 FY 2025, and FY 2026 IPPS/LTCH PPS final rules, section 1886(m)(3)(A)(i) of the Act requires the application of the specific productivity adjustment described in section

1886(b)(3)(B)(xi) of the Act. Therefore, we disagree with commenters that CMS should apply a ''special'' payment adjustment to the LTCH PPS rates to offset the productivity adjustment.

In the FY 2026 IPPS/LTCH final rule (90 FR 36988 through 36989), we addressed commenter's concerns regarding transparency and provided information on how the productivity adjustment is calculated using the TFP index levels (historical and projected). In addition, as stated in the FY 2026 IPPS/LTCH final rule, we have always made available on the CMS website the general method for calculating the productivity adjustment. This includes providing a link to the most recent BLS historical TFP data (*http://www.bls.gov/productivity*), which allows interested parties to obtain historical TFP annual index levels for 1987 through 2025. We also provided the IGI projection model (*https://www.cms.gov/research-statistics-data-and-systems/statistics-trends-and-reports/medicareprogramratesstats/downloads/tfp_methodology.pdf*) which is used to derive annual TFP growth rates for 2026 and 2027. The annual index level derived from this method is then interpolated to quarterly levels, and the FY 2027 productivity adjustment is equal to the percent change in the 40-quarter moving average projected level for the period ending September 30, 2027 relative to the 40-quarter moving average projected level for the period ending September 30, 2026. We believe our methodology for the productivity adjustment is consistent with section 1886(b)(3)(B)(xi)(II) of the Act, which states that the productivity adjustment is equal to the 10-year moving average of changes in annual economy-wide private nonfarm business multi-factor productivity (as projected by the Secretary for the 10-year period ending with the applicable fiscal year, year, cost reporting period, or other annual period).

At the time of this final rule, the FY 2027 productivity adjustment reflects BLS historical TFP data through 2025 (released on March 19, 2026) and IGI's forecasted TFP growth for 2026 and 2027. The average annual growth rate of historical TFP published by BLS for 2018 through 2025 is currently 1.0 percent and IGI is projecting average TFP growth of about 0.7 percent for 2026 and 2027 based on IGI's second-quarter 2026 forecast. Combining the historical and projected TFP data over the entire 10-year time period and interpolating into quarterly index levels results in a 10-year moving average growth rate of TFP of 0.9 percent for FY 2027. The productivity adjustment (based on the 10-year period ending with FY 2027) for the FY 2027 IPPS/LTCH final rule is 0.1 percentage point higher than in the FY 2027 IPPS/LTCH proposed rule mainly due to the incorporation of updated BLS historical data.

We acknowledge the commenter's request for CMS to conduct and publish a hospital-sector-specific analysis of productivity assumptions. CMS recently updated its analysis of Hospital Multifactor productivity to reflect data through 2023 and it is available on the CMS website at *https://www.cms.gov/files/document/productivity-memo.pdf.*

In response to commenters' concerns about the productivity adjustment only being applied if it reduces the payment update, we note that the productivity adjustment was established under the Affordable Care Act with a specific policy intent to encourage efficiency improvements in healthcare delivery by linking Medicare payment updates to economy-wide productivity gains. The statutory language in section 1886(m)(3)(A)(i) of the Act requires that the Secretary reduce (not increase) the market basket percentage increase by changes in economy-wide productivity, therefore, only positive productivity adjustments are applied.

Comment: Several commenters again requested that CMS implement a one-time market basket correction to address the cumulative underpayments resulting from forecast errors in the market basket updates from FY 2021 through FY 2025, which they state has resulted in a cumulative underpayment to LTCHs of 5.1 percent, or $130 million per year. These commenters argued that the standard methodology, while appropriate in normal circumstances, failed to capture the extraordinary inflationary environment of the post-pandemic period, resulting in payment rates that have persistently lagged behind actual cost growth. Commenters expressed concern that these forecast errors will be incorporated into the LTCH PPS payment rates indefinitely because all future updates are based on the current year's payment rate.

For these reasons, commenters requested that CMS should use the most recent forecast data to apply a one-time payment adjustment to account for the differences between the FYs 2021 through 2025 market basket updates and the actual market baskets for those years. A commenter claimed that these forecast errors have improperly allowed Medicare to underpay LTCHs for years while they have been incurring significantly higher labor and supply costs in recent years and in FY 2027. A commenter recommended CMS consider adopting a forecast error correction policy for the LTCH PPS beginning with FY 2027, in the event CMS again underestimates hospital inflation in a period of economic uncertainty and instability. A commenter stated that bipartisan Congressional support exists for a retrospective payment adjustment and urged CMS to act accordingly.

Response: In responding to similar comments in the FY 2023, FY 2024, FY 2025 and FY 2026 IPPS/LTCH PPS final rules (87 FR 49165, 88 FR 59136, 89 FR 69434, and 90 FR 36989), we explained that under the law, the LTCH PPS is a per-discharge prospective payment system that uses a market basket percentage increase to set the annual update prospectively. This means that the update relies on a mix of both historical data for part of the period for which the update is calculated and forecasted data for the remainder. (For instance, the 2022-based LTCH market basket growth rate for FY 2027 in this final rule is based on IGI's second quarter 2026 forecast with historical data through the first quarter of 2026.) While there is currently no mechanism to adjust for market basket forecast error in the LTCH PPS payment update, the forecast error for a market basket update is equal to the actual market basket percentage increase for a given year less the forecasted market basket percentage increase. Due to the uncertainty regarding future price trends, forecast errors can be both positive and negative.

We acknowledge the commenter's concern that forecast errors may be permanently embedded in future payment rates given the prospective nature of the LTCH PPS. While the projected LTCH market basket updates for FY 2021 through FY 2025 (the last historical fiscal year) were cumulatively under forecast (actual increases less forecasted increases were positive), this was largely due to unanticipated inflation and labor market pressures as the economy emerged from the COVID–19 PHE. The forecast error of the LTCH market basket has been both positive and negative during past years, and over longer periods of time the cumulative forecast hasn't deviated significantly from the historical measures.

For these reasons, we are not adopting the commenters' requests to implement an adjustment for FY 2027 to account for the difference between the actual and forecasted LTCH market basket updates for FYs 2021 through 2025.

Comment: A commenter expressed concern about the use of the Employment Cost Index (ECI) to measure changes in labor compensation in the market basket. The commenter

stated that the use of the ECI may not be adequately capturing employment and labor cost growth and stated that they continue to stand ready to work with CMS to examine the market basket compensation indices and proxies to improve the accuracy of these measures.

Response: We believe that the ECIs for Wages and Salaries and Benefits for Hospital Workers is accurately reflecting the price change associated with the labor used to provide hospital care in LTCHs. The ECI appropriately does not reflect other factors that might affect the rate of price changes associated with labor costs, such as a shift in the occupations that may occur due to increases in case-mix or shifts in hospital purchasing decisions (for instance, to hire or to use contract labor). We believe that the prices of employed staff and contract labor are influenced by the same factors and should generally grow at similar rates.

After consideration of public comments, we are finalizing the LTCH PPS payment rate update using the most recent forecast of the 2022-based LTCH market basket percentage increase and productivity adjustment. As such, based on IGI's second quarter 2026 forecast, the FY 2027 market basket percentage increase for the LTCH PPS using the 2022-based LTCH market basket is 3.2 percent. The current estimate of the productivity adjustment for FY 2027 based on IGI's second quarter 2026 forecast is 0.9 percentage point. Therefore, under the authority of section 123 of the BBRA as amended by section 307(b) of the BIPA, consistent with 42 CFR 412.523(c)(3)(xvii), we are establishing an annual market basket update to the LTCH PPS standard Federal payment rate for FY 2027 of 2.3 percent (that is, the most recent estimate of the LTCH PPS market basket percentage increase of 3.2 percent less the productivity adjustment of 0.9 percentage point). For LTCHs that fail to submit quality reporting data under the LTCH QRP, under 42 CFR 412.523(c)(3)(xvii) in conjunction with 42 CFR 412.523(c)(4), as we proposed, we are further reducing the annual update to the LTCH PPS standard Federal payment rate by 2.0 percentage points, in accordance with section 1886(m)(5) of the Act. Accordingly, we are establishing an annual update to the LTCH PPS standard Federal payment rate of 0.3 percent (that is, the 2.3 percent LTCH market basket update minus 2.0 percentage points) for FY 2027 for LTCHs that fail to submit quality reporting data as required under the LTCH QRP.

IX. Quality Data Reporting Requirements for Specific Providers

A. Overview

In section IX. of the proposed rule, we sought comments on and proposed changes to the following Medicare quality reporting programs:

- In section IX.B. of the proposed rule, we made the following crosscutting quality program proposals or sought requests for information:

++ Adoption of the Advance Care Planning Electronic Clinical Quality Measure for use in the Hospital Inpatient Quality Reporting Program, PPS-Exempt Cancer Hospital Quality Reporting Program, and Medicare Promoting Interoperability Program for Eligible Hospitals and Critical Access Hospitals (CAHs) (previously known as the Medicare EHR Incentive Program).

++ Adoption and Modifications to Five Mortality Measures in the Hospital Inpatient Quality Reporting and Value-based Purchasing Programs.

++ Measuring Emergency Care Access and Timeliness in the Hospital Inpatient Quality Reporting and Hospital Value-Based Purchasing Programs—Request for Information.

++ Potential Future Use of the Adult Community-Onset Sepsis Standardized Mortality Ratio Measure in the Hospital Inpatient Quality Reporting Program—Request for Information.

- In section IX.C. of the proposed rule, the Hospital Inpatient Quality Reporting Program.
- In section IX.D. of the proposed rule, the PPS-Exempt Cancer Hospital Quality Reporting Program.
- In section IX.E. of the proposed rule, the Long-Term Care Hospital Quality Reporting Program.
- In section IX.F. of the proposed rule, the Medicare Promoting Interoperability Program for Eligible Hospitals and CAHs.

We summarize and respond to public comments related to our proposals and provide final decisions in each of their respective sections.

B. Crosscutting Quality Program Proposals and Requests for Comment

1. Adoption of the Advance Care Planning Electronic Clinical Quality Measure in the Hospital Inpatient Quality Reporting, PPS-Exempt Cancer Hospital Quality Reporting, and Medicare Promoting Interoperability Programs

a. Background

The 1990 Patient Self-Determination Act requires hospitals to inform patients of their rights regarding medical decisions and document the execution of an advance directive in medical records.[221] In the CY 2016 Medicare Physician Fee Schedule final rule (80 FR 70955 through 70959), we authorized Medicare payment to reimburse practitioners for time devoted to advance care planning services under specific procedure codes beginning in CY 2016.[222] Despite this, engagement in advance care planning remains low.[223] [224] Among Medicare Fee-For-Service beneficiaries, the advance care planning procedure codes were billed for less than 6 percent of patients in the three years after their introduction,[225] and about 5 percent of practitioners billed them in 2021.[226]

Many patients assume that their caregivers know their preferences regarding their care, but caregivers incorrectly predict the patients' preferences one-third of the time.[227] Additionally, care preferences may change over time,[228] particularly if there are changes in an individual's health status or circumstances.[229] [230] From the

patient perspective, the benefits of documenting advance care planning can include increased autonomy, reduced unwanted and unnecessary treatments, and reduced length and number of hospitalizations as well as allowing more time with family and loved ones.[231] A study among terminally ill Medicare beneficiaries also found that earlier advance care planning conversations were associated with less intensive care, including lower rates of in-hospital death, hospital admission, intensive care unit (ICU) admission, and emergency department (ED) visits.[232] These findings underscore the need for early, iterative conversations to keep care aligned with evolving patient goals and values, and for families and clinicians to have clear guidance in the event that patients are unable to convey their preferences.[233] [234] Core elements of advance care planning include identifying a trusted health care proxy or surrogate decision-maker, clarifying care priorities for quality of life, and discussing specific treatments and interventions including resuscitation, intubation, ventilation, and ICU admission.[235] Inpatient care teams routinely manage high-stakes decisions and care transitions, making hospitalization an opportune moment to initiate or update advance care planning documentation and ensure updated directives are accessible to clinicians across subsequent care settings.

b. Overview of Measure

The Advance Care Planning electronic clinical quality measure (eCQM) calculates the proportion of adult patients with one or more inpatient hospitalizations during the measurement period who, by the time of hospital discharge for at least one encounter, have an advance care planning document or documentation of an advance care planning discussion resulting in a documented decision in the patient's electronic health record (EHR). This eCQM is intended to promote timely advance care planning by encouraging communication between patients and providers to elicit and document the patient's care preferences and surrogate decision-makers, thereby supporting age-friendly and goal-concordant care. The promotion of patient-centered care and utilization of EHRs to support health information exchange are important priorities across our quality reporting programs. Standardized advance care planning documentation in an EHR furthers these priorities to keep care aligned with patients' stated preferences across the care continuum. The Advance Care Planning eCQM allows for automated extraction of patient-level data directly from the EHR. We refer readers to the Electronic Clinical Quality Improvement (eCQI) Resource Center for detailed eCQM measure specifications and implementation guidance for each reporting period: *https://ecqi.healthit.gov/eh-cah/ecqm-resources.*

c. Measure Calculation

The measure numerator includes all adult patients with one or more inpatient encounters during the measurement period who have an advance care planning document or documentation of an advance care planning discussion resulting in a documented decision in the patient's EHR by the time of hospital discharge during at least one of the inpatient encounters. At this time, the numerator comprises any one of the following: (1) advance care planning document as evidenced by the following types of documents: designated health care agent (health care proxy or medical power of attorney for health care),[236] advance directive (or living will), or a portable medical order (medical order for life sustaining treatment [MOLST] or physician order for life sustaining treatment [POLST] or do not resuscitate [DNR] orders);[237] or (2) documentation that an advance care planning discussion with a documented decision occurred during the measurement period.[238]

To be counted in the numerator, the advance care planning document must be available in the patient's EHR during any hospitalization in the measurement period. The measure does not require a date reflecting the document's origination or when it was last updated; however, we encourage hospitals to support their health care providers in discussing with the patient, or their surrogate, whether the document accurately reflects the patient's current preferences. In order to be counted as an advance care planning discussion leading to a decision, the documentation of the discussion with a decision must have a date in the EHR that occurs during an inpatient encounter in the measurement period. If a patient has multiple inpatient encounters during the measurement period, an advance care planning discussion with a decision occurring in any one of the inpatient encounters during the measurement period is counted toward the numerator.

The denominator includes all patients aged 18 years and older at the start of the measurement period who are discharged from an inpatient hospitalization during the measurement period, which is a 12-month period that would run from January 1 through December 31 of each applicable calendar year.

There are no numerator or denominator exclusions.[239] The

[236] The designated health care agent accounts for the presence of a documented health care proxy or medical power of attorney that is either already established or identified and documented during the inpatient encounter. These forms allow a patient to identify a specific person who can make an advance care planning decision on the patient's behalf. States vary in the hierarchy of advance care planning decision-making by an undesignated proxy, and these state specifics are out of scope for the measure.

[237] Some state organizations may refer to a MOLST or POLST form by other terms such as: medical orders for scope of treatment (MOST), physician orders for scope of treatment (POST), clinical orders for life-sustaining treatment (COLST), or a transportable physician orders for patient preferences (TPOPP).

[238] Documentation that an advance care planning discussion with a documented decision occurring during the measurement period includes a discussion with the patient or the surrogate. This allows discussion with a surrogate in instances where a patient is unable to participate (for example, incapacitated) without requiring prior discussion with the patient.

[239] There are no numerator or denominator exclusions as the eCQM is intended to encourage advance care planning among all adults, recognizing that serious illness or injury can occur at any time, regardless of age or baseline health. The numerator is designed to account for situations where a patient does not have capacity to engage

Continued

Advance Care Planning eCQM is calculated as a proportion by dividing the number of patients who meet the numerator criterion by the total number of eligible patients who meet the denominator criterion.

We note the PCH Quality Reporting program currently uses another measure, Documentation of Goals of Care Discussions Among Cancer Patients measure (88 FR 59222 through 59224), which has some similar aims; however, it only evaluates whether specific oncology patients at a reporting PCH had documentation related to prognosis, treatment, and goals for care. The Advance Care Planning eCQM focuses on documenting condition-agnostic medical instructions and surrogate decision-makers among all adult patients, which are intended to remain applicable across care settings.

Updated data element feasibility has been tested in two EHR systems, and measure score reliability has been tested in 43 hospitals across three health systems.[240] Testing was completed in hospitals representing a mix of urban and rural hospitals, hospital sizes, teaching statuses (for example, teaching vs. non-teaching), and trauma levels. Hospital-level performance rates are summarized in Table IX.B.1. As higher scores indicate better performance, the higher percentiles are hospitals with higher proportions of an advance care planning document or a documented advance care planning conversation with a recorded decision in the EHR.

TABLE IX.B.1. HOSPITAL PERFORMANCE IN MEASURE TESTING FOR THE ADVANCE CARE PLANNING ECQM

Performance Percentile	Measure Proportions
10th	23.2%
50th (Median)	34.7%
90th	60.5%

The wide range and variation of results indicate room for quality improvement and aligns with evidence in the literature that advance care planning remains low. Test results indicated high measure reliability and validity (including agreement between data exported from the EHR and manual review of the patient chart). For detailed information on the measure specifications, please refer to: *https://www.p4qm.org/prmr-measures/muc2025-020.* During the Technical Expert Panel (TEP) convened by the measure developer, interested parties broadly supported the measure's validity and felt it provides meaningful information to make care decisions. For more details on the TEP discussion, we refer readers to the TEP Summary Report available at: *https://mmshub.cms.gov/sites/default/files/CORE-ACP-TEP3SummaryReport-092625.pdf.*

d. Pre-Rulemaking Process and Measure Endorsements

(1) Recommendations From the Pre-Rulemaking Measure Review Process

We refer readers to the Partnership for Quality Measurement for details on the Pre-Rulemaking Measure Review process convened by the consensus-based entity (CBE), including the voting procedures used to reach consensus on measure recommendations.[241] [242] The Pre-Rulemaking Measure Review Hospital Committee, consisting of both the Pre-Rulemaking Measure Review Hospital Recommendation Group (hereafter referred to as the Recommendation Group) and Pre-Rulemaking Measure Review Hospital Advisory Group, met on January 12 and 13, 2026, to review measures included by the Secretary on the publicly available ''2025 Measures Under Consideration List,'' including the Advance Care Planning eCQM.[243] Table IX.B.2. summarizes the voting results for this eCQM in the Hospital Inpatient Quality Reporting, PCH Quality Reporting, and Medicare Promoting Interoperability programs. For all three programs, the Recommendation Group reached consensus to recommend adoption of the Advance Care Planning eCQM within each program.[244]

in, declines, or defers advance care planning by crediting pre-existing advance care planning documents in the EHR and advance care planning discussions with documented decisions occurring during an inpatient encounter (including those conducted with a surrogate when the patient did not have capacity and those where the patient preferred to not name a surrogate or provide an advance care plan).

[240] Partnership for Quality Measurement. Updated Measure Score Level Testing and Importance Results, Downloads, Advance Care Planning. Available at: *https://www.p4qm.org/prmr-measures/muc2025-020.*

[241] Partnership for Quality Measurement. Pre-Rulemaking Measure Review web page. Available at: *https://www.p4qm.org/prmr/about.*

[242] In 2025, the CBE updated the Pre-Rulemaking Measure Review voting process such that Recommendation Group members will vote to either ''recommend'' or ''do not recommend'' that a measure be added to the intended CMS program(s), thus, removing the ''recommend with conditions'' voting option. The threshold to reach consensus on a given measure continues to be a minimum of 75 percent agreement among members.

[243] Centers for Medicare & Medicaid Services. (December 2025). 2025 Measures Under Consideration List. Available at: *https://mmshub.cms.gov/measure-lifecycle/measure-implementation/pre-rulemaking/lists-and-reports/overview.*

[244] Partnership for Quality Measurement. (February 2026). 2025–2026 Pre-Rulemaking Measure Review Recommendation Group Final Meeting Summary: Hospital Committee. Available at *https://p4qm.org/sites/default/files/2026-02/PRMR-Hospital-Recommendation-Group-Meeting-Final-Summary-508.pdf.*

TABLE IX.B.2. PRE-RULEMAKING MEASURE REVIEW HOSPITAL RECOMMENDATION GROUP VOTING RESULTS FOR THE ADVANCE CARE PLANNING ECQM

Program	Voted to Recommend	Voted to Not Recommend	Consensus Reached	Recommendation Decision
Hospital Inpatient Quality Reporting	19 (90%)	2 (10%)	Yes	Recommend
PCH Quality Reporting	20 (95%)	1 (5%)	Yes	Recommend
Medicare Promoting Interoperability	16 (76%)	5 (24%)	Yes	Recommend

Overall, the Pre-Rulemaking Measure Review Hospital Committee largely recognized the importance of advance care planning to improve communication and documentation of patient preferences and to promote patient-centered care. However, it raised concerns that the eCQM does not capture situations when patients decline or defer advance care planning and suggested inclusion of EHR codes that capture these instances. We understand the concerns of patients declining or deferring advance care planning discussions and include EHR codes for these situations. Specifically, hospitals can code for instances where a patient did not name a surrogate or provide an advance care plan; therefore, accommodating the situation where a conversation took place but no plan or proxy was named per the patient's preference.

A few Recommendation Group members who voted to recommend adoption of the Advance Care Planning eCQM recommended adding a length of stay (LOS) requirement to ensure trust between the patient and provider and studying the measure among young adults.

We appreciate the members' recommendations to add a length of stay requirement and to study it among young adults. We considered these recommendations and have determined that revision is not appropriate at this time as the goal of this measure is to establish advance care planning as a normalized, routine part of care regardless of health status and age. For patients facing imminent death as well as those expected to recover quickly, advance care planning is a priority as circumstances can change quickly. However, we will continue to evaluate these topics as additional information, experience, or analysis develops.

A Recommendation Group member who voted not to recommend adoption of the eCQM for the programs stated it would function as a check-the-box exercise rather than meaningful integration of patient preferences into care. This member noted that hospitals already ask whether a DNR order or advance directive is in place and that care teams rarely review these documents or integrate patients' wishes into the care plan. The member stated that advance care planning should primarily occur with a primary care provider or a specialist managing the patient's chronic conditions. We appreciate this feedback, and we wish to emphasize that we consider eliciting and documenting patients' preferences for care and designation of surrogate decision-makers to be a fundamental element of providing high-quality, patient-centered, and goal-concordant care. While the eCQM assesses presence of EHR codes rather than the quality of underlying conversations, this documentation is critical for care teams to reliably locate and use advance care planning information when making clinical decisions. Furthermore, hospitalization is a critical touchpoint to initiate advance care planning or to confirm and update existing information.

Additionally, a few Recommendation Group members who voted not to recommend adoption of the eCQM for the Medicare Promoting Interoperability Program indicated that they supported implementing and evaluating the eCQM in the Hospital Inpatient Quality Reporting Program before considering it for the Medicare Promoting Interoperability Program. Another member stated that the eCQM was not sufficiently defined for use in the Medicare Promoting Interoperability Program but did not provide additional detail regarding this concern in their vote rationale.

As the measure specifications proposed for the Medicare Promoting Interoperability Program are the same as those proposed for the Hospital Inpatient Quality Reporting and PCH Quality Reporting Programs, we believe they are sufficiently defined and appropriate for use across all three programs. The eCQM underwent extensive analysis and measure specifications development required for the endorsement process. Test results indicated high measure reliability and validity (including agreement between data exported from the EHR and manual review of the patient chart).[245] We also plan to maintain alignment of eCQM reporting requirements and the eCQM measure set between the Hospital Inpatient Quality Reporting Program and the Medicare Promoting Interoperability Program. If the eCQM is finalized for one or more programs, we would continue to conduct ongoing monitoring and evaluation analyses to watch for any unintended consequences.

After taking these recommendations and concerns into consideration, we proposed to adopt the Advance Care Planning eCQM in the Hospital Inpatient Quality Reporting Program, PCH Quality Reporting Program, and the Medicare Promoting Interoperability Program (91 FR 19564 through 19568).

(2) Measure Endorsements

We refer readers to the Partnership for Quality Measurement website for details on the measure endorsement and maintenance process, including the measure evaluation procedures the Endorsement and Maintenance Committees use to evaluate measures and whether they meet endorsement criteria. In the FY 2027 IPPS/LTCH PPS proposed rule (91 FR 19564 through 19568), we proposed to adopt this measure into the Hospital Inpatient Quality Reporting Program and the PCH Quality Reporting Program despite the measure not being endorsed by the CBE. Section 1886(b)(3)(B)(viii)(IX)(aa) of the Act requires that each measure specified by the Secretary for use in the Hospital Inpatient Quality Reporting Program be endorsed by the entity with a contract under section 1890(a) of the Act, and section 1866(k)(3)(A) of the Act imposes the same requirement for measures specified for use in the PCH Quality Reporting Program. Sections 1886(b)(3)(B)(viii)(IX)(bb) and

[245] Partnership for Quality Measurement. MERIT Submission Form, Downloads, Advance Care Planning. Available at: *https://www.p4qm.org/prmr-measures/muc2025-020*.

1866(k)(3)(B) of the Act state, however, that in the case of a specified area or medical topic determined appropriate by the Secretary for which a feasible and practical measure has not been endorsed by the entity with a contract under section 1890(a) of the Act, the Secretary may specify a measure that is not so endorsed as long as due consideration is given to measures that have been endorsed or adopted by a consensus organization identified by the Secretary. We reviewed CBE-endorsed measures and were unable to identify any other CBE-endorsed measures on this topic, and, therefore, we stated the exceptions in sections 1886(b)(3)(B)(viii)(IX)(bb) and 1866(k)(3)(B) of the Act apply. Since publication of the proposed rule, we expect the Advance Care Planning eCQM will be submitted in the fall of 2026 for endorsement by the CBE.

e. Data Sources, Submission, and Public Reporting

The proposed Advance Care Planning eCQM is specified in a standard electronic format, utilizing data extracted from EHRs, which would minimize errors due to manual abstraction of data.[246] In addition, by utilizing data in the EHR, it would allow updated directives to potentially be accessible to clinicians across subsequent care settings. The measure is designed to be calculated by a hospital's or PCH's certified health IT using patient-level data and then submitted by the hospital or PCH to CMS.

Testing was performed to confirm the feasibility of the measure and data elements with manual review of EHR data against chart-abstracted data. Testing demonstrated that all critical data elements were reliably and consistently captured in the EHR.[247] Additionally, data element validity testing revealed a high level of agreement between EHR data and chart review (92 percent and above) for all data elements except Advance Directive; however, all fifteen patients with electronically identified ''Advance Directive'' documents that were not present upon chart review (that is, they did not have an advance directive document in their chart) had another advance care planning document in their chart that fulfilled the numerator criteria.[248] Finally, the measure showed high reliability, with a mean of 0.9987 and standard deviation of 0.0012.[249] These results indicate that the measure is reliable and feasible to implement.

In section IX.D.5. of this final rule, we discuss the eCQM reporting and submission requirements in the PCH Quality Reporting Program, under which PCHs would be required to use certified health IT to report and submit eCQMs. PCHs are specialized acute care settings that provide intensive inpatient oncology services. As the measure was successfully tested in a variety of inpatient hospital types and is specified using data elements expected to be available in certified EHR technology, we believe that the high level of feasibility, validity, and reliability observed in a blend of acute care hospitals is reasonably applicable to PCHs despite their specialty focus on cancer patients. Further, we would monitor implementation and measure performance in PCHs and consider refinements if setting-specific issues arise.

In the FY 2027 IPPS/LTCH PPS proposed rule (91 FR 19564 through 19568), we proposed to adopt the Advance Care Planning eCQM as part of the eCQM measure set beginning with the CY 2028 reporting period/FY 2030 payment determination for the Hospital Inpatient Quality Reporting Program and the Medicare Promoting Interoperability Program. A hospital can self-select eCQMs to report from the eCQM measure set to meet the eCQM reporting requirement. We refer readers to sections IX.C.8.c. and IX.F.9., respectively, of this final rule for a discussion of the eCQM form, manner, and timing of data submission and reporting requirements for these two programs. In the FY 2027 IPPS/LTCH PPS proposed rule (91 FR 19564 through 19568), we proposed to adopt the Advance Care Planning eCQM beginning with the CY 2028 reporting period/FY 2030 program year for the PCH Quality Reporting Program. We refer readers to section IX.D.5. of this final rule for a discussion of the eCQM form, manner, and timing of data submission and reporting requirements for the PCH Quality Reporting Program.

We proposed that if adoption of the Advance Care Planning eCQM is finalized, we would publicly report data as soon as it is feasible on CMS websites such as the Compare tool on *Medicare.gov* (*https://www.medicare.gov/care-compare/*) and the CMS Provider Data Catalog or their successor websites after a 30-day preview period.

We invited public comment on our proposal. The following comments and responses are applicable for the Hospital Inpatient Quality Reporting, PCH Quality Reporting, and Medicare Promoting Interoperability Programs unless noted otherwise.

Comment: Many commenters supported adoption of the Advance Care Planning eCQM, emphasizing that it is a foundational element of high-quality care that contributes to improved alignment of care with patient goals and values, reduction in high-cost or unwanted treatments, decreased hospital and ICU stays, enhanced patient and family experience, and more efficient use of health care resources. Commenters stated normalizing earlier and iterative discussions can ensure care continues to align with patients' preferences during serious illness, clinical deterioration, care transitions, and when family or caregivers step in to interpret or carry out these preferences.

Response: We thank commenters for their support and agree that advance care planning is an important component of patient care that is an ongoing conversation to align care with patients' preferences.

Comment: Several commenters supported the inclusion of all patients aged 18 years and older. These commenters stated that this appropriately recognizes that serious illness, unexpected injury, and complex medical decision-making are not limited to older populations and that all adults can benefit from having an advance care plan or designated health care agent.

Response: We thank commenters for their support and agree that advance care planning is relevant to adults across age ranges.

Comment: Several commenters supported the adoption of the Advance Care Planning eCQM because they support efforts to modernize hospital quality reporting programs through adopting additional eCQMs. A few commenters identified advance care planning as a clinically meaningful, patient-centered activity that is appropriate for electronic measurement and efforts to align advance care planning eCQM requirements across CMS quality programs as a positive step toward harmonizing programs, reducing duplicative reporting effort, and supporting consistent clinical

[246] Centers for Medicare & Medicaid Services. (2023). Electronic Clinical Quality Measures (eCQMs) Specification, Testing, Standards, Tools, and Community. Available at: *https://mmshub.cms.gov/sites/default/files/eCQM-Specifications-Testing-Standards-Tools-Community.pdf.*

[247] Partnership for Quality Measurement. Meaningfulness Tab, Advance Care Planning. Available at: *https://www.p4qm.org/prmr-measures/muc2025-020.*

[248] Partnership for Quality Measurement. MERIT Submission Form, Downloads, Advance Care Planning. Available at: *https://www.p4qm.org/prmr-measures/muc2025-020.*

[249] Partnership for Quality Measurement. Meaningfulness Tab, Advance Care Planning. Available at: *https://www.p4qm.org/prmr-measures/muc2025-020.*

documentation practices across inpatient settings.

Response: We thank commenters for their support and agree that CMS' goal is to advance digital quality measurement and prioritize clinically meaningful measures.

Comment: A few commenters emphasized the role that nurses already play in advance care planning, whether it be contacting the appropriate specialist, documenting updated advance directives, connecting patients to relevant at-home health supports for after discharge, ensuring patients are informed of their rights, guaranteeing that patients' decisions are respected, or even engaging in frequent conversations with patients and families.

Response: We thank commenters for their support and agree that the Advance Care Planning eCQM is a clinically meaningful measure involving a team-based approach that benefits patients.

Comment: Several commenters supported the adoption of the Advance Care Planning eCQM while encouraging CMS to clarify that advance care planning is not only about documenting preferences and should help patients and families make informed decisions that are understandable, actionable, and usable across settings. A few commenters stated the measure does not address the quality or appropriateness of the advance care planning discussions, which could inadvertently lead to advance care planning discussions occurring at inappropriate moments or with insufficiently trained clinicians.

Response: We appreciate commenters' support and agree that eliciting and documenting patients' preferences for care and designation of surrogate decision-makers to be a fundamental element of providing high-quality, patient-centered, and goal-concordant care. We encourage hospitals to support their health care providers in discussing with the patient, or their surrogate, whether existing documentation accurately reflects the patient's current advance care planning preferences and to implement the measure consistent with professional standards. This should include ensuring that the staff involved have the appropriate training and support. We note that 70 percent of voting members on the TEP agreed or strongly agreed that the measure could differentiate good from poor quality care.[250]

Comment: Several commenters recommended updating the numerator to include only patients who have documentation of their goals and preferences created or revised during the current admission to ensure that the documentation is representative of the patient's preferences or applicable to their current condition. Commenters elaborated that counting any prior documentation could reduce advance care planning to an administrative exercise rather than an ongoing, goal-concordant process integrated into interdisciplinary care planning. Some commenters suggested requiring structured fields that distinguish between new advance care planning discussions and the confirmation or revision of existing advance care planning documents to enable hospitals to track whether advance care planning is iterative over time rather than a one-time event. A few commenters suggested piloting workflows or AI-enabled platforms to prompt teams to assess whether the plan documented in the patient's chart remains relevant.

Response: We appreciate commenters' recommendations regarding ways the measure could capture the current and iterative nature of advance care planning. However, we do not agree that the numerator should be limited to documentation completed or revised during the current admission, as prior advance care planning may remain applicable and clinically relevant over time. Requiring new or revised documentation for each admission could also create unnecessary burden. Hospitals should establish the appropriate processes to review existing advance care planning documentation with the patient or surrogate to determine whether it remains current and applicable to the patient's care. We leave the determination of the best assessment and documentation tools to each hospital, as they can best evaluate what is appropriate for their population. We also note that the numerator is not limited to documentation and may be satisfied by an advance care planning discussion with a documented decision.

Comment: Several commenters stated that hospitals should be encouraged to ensure that advance care planning conversations are understandable, culturally and linguistically appropriate, and connected to practical next steps, including referrals to financial counseling, case management, and community resources when ongoing care will create foreseeable affordability challenges. A commenter recommended that CMS evaluate whether the measure performs equitably across populations facing financial hardship and other barriers to care.

Response: We agree that hospitals should ensure that advance care planning conversations are understandable, culturally and linguistically appropriate, and connected to relevant next steps. This measure does not prescribe a specific approach to advance care planning conversations, allowing hospitals and clinicians to tailor the discussion in a way that is appropriate for each patient and situation. We acknowledge the commenter's recommendation to evaluate whether the measure performs equitably across patient populations, including those that may experience barriers to care. As part of our measure maintenance process, we will conduct ongoing monitoring and evaluation analyses to evaluate measure performance and watch for any unintended consequences.

Comment: Several commenters stated that, while inpatient care is an important touchpoint, advance care planning should occur across settings, including primary, post-acute, and long-term care, as well as home health and hospice. Several commenters remarked that the measure is not appropriate for the acute inpatient setting because effective conversations depend on trust and established patient-health care provider relationships, which are more commonly developed in outpatient or primary care settings. A few commenters expressed concerns about rushing patient decision-making during a vulnerable time by expecting a patient to reach a well-considered decision during an acute care hospitalization without having adequate time to discuss preferences with family members or their primary care clinician. These commenters recommended that CMS prioritize advance care planning measurement in outpatient settings and, for inpatient care, focus on whether existing documentation of the patient's goals is accessible, reviewed, and communicated across the care team.

Response: We agree with commenters that conversations about advance care planning should be addressed across multiple settings. We note that in the clinician-focused Quality Payment Program within the Merit-based Incentive Payment System (MIPS), there is an Advance Care Plan clinical quality measure available.[251] We also note that not all patients have the same access to primary care; therefore, it is important

[250] Partnership for Quality Measurement. Meaningfulness Tab, Advance Care Planning. Available at: *https://www.p4qm.org/prmr-measures/muc2025-020.*

[251] Centers for Medicare & Medicaid Services. Advance Care Plan Measure Specifications. Available at: *https://qpp.cms.gov/docs/QPP_quality_measure_specifications/CQM-Measures/2026_Measure_047_MIPSCQM.pdf.*

to include this measure in the inpatient setting to make sure patients who do not receive regular primary care have the opportunity to discuss advance care planning. In addition, the high prevalence of patients with acute health status in the inpatient setting supports both confirmation of established advance care plans and advance care planning discussions to support real-time treatment and decision-making.

Comment: Many commenters did not support the adoption of the Advance Care Planning eCQM because they believe the denominator is too broad. Several commenters recommended that the measure is better suited to older adults, suggesting age cutoffs of 50 or 65 years and older, or to higher-risk patients, such as oncology patients, ICU patients, patients with high comorbidity scores, and patients with high readmission risk scores. Several commenters did not support applying the measure broadly across younger populations as it may result in an undue burden for a standalone episode of acute care, require a significant change in workflow, increase documentation when health care provider burnout is high, divert resources from direct patient care, and potentially result in increased anxiety for patients. A few commenters recommended refining inclusion and exclusion criteria to improve feasibility, such as applying minimum length-of-stay thresholds and excluding short-stay, clinically inappropriate encounters, and patients who declined discussion.

Response: We appreciate the suggestion to limit or narrow the denominator. We note that the TEP that was convened as part of the measure development discussed the age range and concluded that the measure was appropriate for all patients 18 years and older because serious illness and loss of decision-making capacity can occur at any age.[252] While we appreciate the comments to refine inclusion and exclusion criteria, we agree with the TEP and believe any patient who must be admitted to an acute care hospital or PCH would benefit from the assignment of a health care proxy or agent, no matter their age, the particular clinical reason for the admission, or the length of stay. We do not intend for the measure to force conversations about end-of-life care for patients who are not ready to have those conversations. To account for this possibility, the measure is designed so that if a patient does not wish to name a health care proxy or make any decisions on their advance care planning, by broaching the conversation with the patient, the hospital may satisfy the numerator.

Regarding comments related to the burden of applying this measure to a broad patient population, we note that data element feasibility testing revealed that data elements specified across numerator categories existed within hospital systems workflows and can already be routinely collected during clinical care with limited or no additional data entry from a clinician or other health care provider, and no EHR interface changes were necessary. For hospitals for which some workflow and EHR adoption are required, we believe the effort is appropriate given the clinical importance of documented advance care plan information to capture patient treatment wishes.

Comment: Many commenters remarked that advance directives are often unavailable at the point of care, particularly in emergent situations or when patients are traveling. Thus, commenters urged CMS to ensure advance care planning documents are accessible across EHR systems and care settings, retrievable in real time, and presented in a manner that supports clinical decision-making. A commenter noted that it is important to send information to advance directive registries or to share it through exchanges such as the Trusted Exchange Framework and Common Agreement (TEFCA).

Response: This measure is intended to promote advance care planning and improve the accessibility of advance care planning documents for clinical use during inpatient encounters. As an eCQM, the Advance Care Planning measure assesses the documentation of a patient's treatment wishes in the patient's medical record and promotes the real time availability of these documents during the delivery of patient care while hospitalized. Advance care planning documents within a patient's EHR, available to all providers within an EHR system, promote data interoperability among providers. However, we acknowledge commenters' concerns that the measure cannot ensure the availability of those records in every situation and at every possible point of care. State and private registries exist to support the availability and exchange of advance directives and other advance care planning forms across the care continuum, and we encourage providers to use these tools to support patients' interests. We may consider ways to encourage broader adoption if it proves necessary.

Comment: Many commenters did not support the adoption of the Advance Care Planning eCQM, stating that the measure testing was insufficient and does not provide adequate information to ensure that the required data can be captured in existing workflows. Several commenters stated that data element validity was only evaluated in one EHR and feasibility was only tested in two EHRs and suggested additional testing across more EHRs and hospitals of varying sizes, locations, and ownership types to ensure that it is reliable, fair, clinically meaningful, and feasible to report. These commenters cited issues including a lack of structured data fields to capture the advance care planning information in some EHRs, codes for advance care planning discussions being inconsistently documented, and some items (such as goals, preferences, and priorities) do not exist as standalone items in structured fields. Without clearly defined data elements or detailed technical specifications, commenters stated that there is a risk of inconsistent interpretation and reporting across hospitals.

Response: We appreciate the commenters' input regarding data element validity and feasibility assessments of this measure across a broader set of EHR vendors and hospitals. We emphasize that eCQMs, like all other measure types, undergo rigorous testing for feasibility, validity, and reliability during the measure development process. Testing to complete the eCQM feasibility scorecard supports that the data required for hospital-level calculation are available in structured fields, are collected through routine workflows, are documented using standard terminology, and are accurate for many of the data elements across tested EHR systems.[253] While some advance care planning information may be captured in unstructured fields within a hospital's EHR, this measure consists of clearly defined data elements and aims to encourage the capture of advance care planning information in structured fields. The use of these defined data fields is important not only for reporting on the Advance Care Planning eCQM, but so that advance care planning documents can be accessed during a patient's inpatient encounter. We recognize that some EHR vendors may need to invest in development,

[252] Yale CORE. Summary of Technical Expert Panel (TEP): Advance Care Planning Measure. Available at: *https://mmshub.cms.gov/sites/default/files/CORE-ACP-TEP3SummaryReport-092625.pdf.*

[253] Partnership for Quality Measurement. Feasibility, Meaningfulness Tab, Advance Care Planning. Available at: *https://www.p4qm.org/prmr-measures/muc2025-020.*

configuration, or workflow standardization to support consistent capture and reporting of these data elements. However, we believe the effort is appropriate given the clinical importance of documented advance care plan information to capture patient treatment wishes.

Comment: Several commenters did not support adoption of this measure because it has not been endorsed by a CBE.

Response: As we detailed in the FY 2027 IPPS/LTCH PPS proposed rule (91 FR 19568), section 1886(b)(3)(B)(viii)(IX)(bb) of the Act states that in the case of a specified area or medical topic determined appropriate by the Secretary for which a feasible and practical measure has not been endorsed by the entity with a contract under section 1890(a) of the Act, the Secretary may specify a measure for use in the Hospital Inpatient Quality Reporting Program that is not so endorsed as long as due consideration is given to measures that have been endorsed or adopted by a consensus organization identified by the Secretary. Section 1866(k)(3)(B) of the Act imposes the same requirement for measures specified for use in the PCH Quality Reporting Program. We reviewed CBE-endorsed measures and were unable to identify any CBE-endorsed measures promoting advance care planning among patients 18 years and older for the inpatient setting. Therefore, the exceptions in sections 1886(b)(3)(B)(viii)(IX)(bb) and 1866(k)(3)(B) of the Act apply and we have determined that it is appropriate to use a measure that is not endorsed by the CBE. Further, we expect the Advance Care Planning eCQM will be submitted in the fall of 2026 for endorsement by the CBE.

Comment: Several commenters remarked that the eCQM should also ensure that an individual's religious or cultural beliefs can be honored that might conflict with providing an advance directive; specifically, the measure should include an exception or guidance allowing the documentation of a discussion to account for those individuals who wish to decline for these types of personal reasons. Several commenters recommended CMS ensure that hospitals are not disadvantaged when patients decline, defer, or approach advance care planning conversations differently because of cultural, religious, emotional, cognitive, or other personal factors. Some commenters stated that hospitals serving lower-income, non-English-speaking, or underserved populations may face steeper implementation challenges.

Response: We appreciate the commenters' concerns, however, the measure numerator accommodates situations where a conversation took place but no advance care plan or proxy was documented. As documenting that a conversation took place satisfies the numerator, hospitals are not disadvantaged for purposes of this quality measure when patients decline, defer, or approach advance care planning conversations differently because of cultural, religious, or other personal factors. Conversations can also be conducted with a surrogate in instances where a patient is unable to participate (for example, the patient is incapacitated) without requiring prior discussion with the patient. The numerator credits pre-existing documentation in the EHR, which would assist clinicians in interpreting and carrying out patient's preferences if a patient is unable or declines to meaningfully engage in a discussion of their preferences.

We remind commenters that the Hospital Inpatient Quality Reporting Program is a pay-for-reporting program. Participants are only subject to a payment adjustment if they do not submit required data on quality measures as specified; their payments are not affected based on their performance on measures. We also remind hospitals that they may initially self-select to report on this eCQM in the Hospital Inpatient Quality Reporting Program; it is not a mandatory eCQM for the CY 2028 reporting period/FY 2030 payment determination. Additionally, the PCH Quality Reporting Program does not impose payment consequences on PCHs.

Comment: A few commenters stated that hospitals' implementation of this measure will also need to comply with individual state requirements, expressing concern that this might disadvantage facilities located in certain regions.

Response: We recognize that state laws differ regarding who may make advance care planning decisions when a patient has not designated a health care proxy or other surrogate. The measure does not make distinctions based on state law and does not supersede or alter state-specific requirements. We expect hospitals to ensure their staff are familiar with applicable state laws and requirements governing advance care planning and surrogate designation so that any advance care planning activities are consistent with state law. Additionally, the variety of options to satisfy the measure numerator supports applicability across states due to both the wide range of included codes and their generality.

Comment: A few commenters advised against broader adoption of the measure as it runs the risk of generating ''survey fatigue'' if patients are asked about advance care planning every time they see a new health care provider or specialist. Commenters recommended that CMS should consider the sites, circumstances, and programs that are most suitable for this measure. A few commenters noted the potential risk of conflicting advance care plan documentation if multiple health care providers create an advance care plan to meet this measure and stated that it will be challenging for clinicians to know which plan is current, with a commenter suggesting that CMS share guidance for addressing multiple plans. Another commenter stated this measure may contribute to note bloat in the EHR, as documentation will likely be copied over repeatedly in the patient's record.

Response: We thank the commenters for sharing these concerns. We note that this measure is an eCQM, not a survey measure like the HCAHPS Survey measure. We acknowledge that in order to meet the measure requirement, hospital staff will need to ask patients questions, and to that end in order to avoid survey fatigue due to repeated questions related to advance care planning, hospitals should have clearly established workflows in which the information is captured or confirmed. Additionally, an encounter would count toward the numerator based on existing advance care planning documentation, regardless of where the documentation originated, provided it is available in the patient's medical record during an inpatient encounter in the measurement period and meets the numerator criteria. Hospitals should establish guidelines to assist their health care providers in identifying the most current and appropriate advance care plan within a patient's chart to address instances of conflicting documentation.

Comment: A commenter recommended clarification on how to capture and document patients with multiple inpatient encounters.

Response: For a patient with multiple inpatient encounters during the measurement period, either (1) an advance care planning document must be available in the patient's EHR during any hospitalization in the measurement period; or (2) an advance care planning discussion with a decision must have occurred in any one of the inpatient encounters during the measurement period. Therefore, if a patient has multiple inpatient encounters in the

measurement period and does not satisfy the numerator criteria on their initial encounter, a subsequent encounter in the same measurement period that does satisfy the numerator criteria would be credited.

Comment: A few commenters did not support the Advance Care Planning eCQM because they stated that some of the practices captured by the measure are duplicative of other reporting requirements, including parts of Medicare's Conditions of Participation (CoP), or aspects of the Age-Friendly Hospital measure, which requires attestation of advance care planning activities. To avoid redundancy, commenters recommend that CMS either remove the advance care planning attestation component from the Age-Friendly Hospital measure or incorporate the Advance Care Planning eCQM into the Age-Friendly Hospital measure.

Response: We agree that generally avoiding duplication is important. We believe commenters were referring to the Medicare CoP for hospitals related to quality assessment and performance improvement programs at 42 CFR 482.21. We disagree that the Advance Care Planning eCQM is redundant to the CoPs and maintain that it is complementary to them. While the CoPs set forth minimum activities related to developing, implementing, and maintaining an effective, ongoing, hospital-wide, data-driven quality assessment and performance improvement program, the Advance Care Planning eCQM requires hospitals to build upon these minimum activities to provide goal concordant care with respect to advance care planning and health care proxies for all adult patients. In addition, the public display requirements of the Hospital Inpatient Quality Reporting, PCH Quality Reporting, and Medicare Promoting Interoperability Programs mean that the results of this measure will be available to patients, consumers, family and caregivers, and other interested parties. This transparency can further incentivize quality improvement.

While there is some overlap between the Age-Friendly Hospital and Advance Care Planning measures, the Age-Friendly Hospital measure assesses hospital commitment to improving care for patients 65 years or older receiving services in the hospital, operating room, or emergency department. The Advance Care Planning eCQM includes all patients 18 years or older with an inpatient encounter during the measurement period, covering a much broader cohort with defined data points focused on the documentation of advance care plans that can be more readily shared through EHRs.

Comment: A few commenters stated that the Advance Care Planning eCQM does not require the creation of new infrastructure so much as it calls for the effective utilization and alignment of capabilities that CMS and ONC have already catalyzed. Commenters remarked that leveraging existing standards and implementation pathways will enable scalable, real-time retrieval of advance care planning information across care settings while minimizing additional burden on providers and technology developers. Specifically, a few commenters recommended aligning with the advance directive data elements already established in the United States Core Data for Interoperability (USCDI) framework, including the Care Experience Preferences and Treatment Intervention Preferences (USCDI v4), the Advance Directive Observation element (USCDI v5), and Portable Medical Orders (USCDI v6) data elements. The Post-Acute Care Interoperability (PACIO) Project's Fast Healthcare Interoperability Resources® (FHIR®) [254] based Advance Healthcare Directive Interoperability Implementation Guide provides the technical specification for structured exchange of these data elements across care settings, including acute-to-post-acute transitions.

Response: We thank commenters for their recommendations. The Advance Care Planning eCQM was originally specified with and currently uses the Quality Data Model (QDM) 5.6 standard which defines clinical patient data and concepts for electronic quality performance measurement.[255] The measure will be specified in FHIR® via the QI–CORE standard for potential future implementation. This FHIR version will align with the suggested USCDI advance directive documentation data elements and the relevant PACIO Project Implementation Guides as the measure transitions from QDM to FHIR. The specific codes utilized in the measure were developed with extensive expert input and are designed to be comprehensive of advance care planning documentation and discussion with decision and will align across the QDM and FHIR versions. We wish to point readers to our request for information on potential FHIR timelines in the CY 2027 Physician Fee Schedule proposed rule (91 FR 44151 through 44154).

Comment: A few commenters suggested CMS should consider whether this measure belongs in the MIPS Value Pathway that addresses primary care or specialty care dealing with chronic illnesses. A commenter noted that this measure expands the measure denominator of the Advance Care Plan measure in MIPS. Another commenter recommended that CMS build on the advance care planning measure by considering additional quality measures related to communication regarding serious illnesses, symptom burden, caregiver experience, and goal-concordant transitions in addition to creating quality mechanisms, such as patient-reported outcome measures. Another commenter recommended alternative measures such as (1) the patient reporting outcome measure ''patients' experience of feeling heard and understood'' used in MIPS; (2) the proportion of patients with a surrogate decision-maker or health care proxy in the EHR; and (3) the proportion of hospital clinical staff who have successfully completed training in advanced communication skills in the context of a serious illness. A commenter encouraged CMS to align the specifications of this measure with the advance care planning measure required by the National Committee for Quality Assurance (NCQA) for Medicare Advantage plan reporting in the Healthcare Effectiveness Data and Information Set (HEDIS) for greater alignment of measures and specifications across systems to reduce regulatory burden and streamline the clinical and administrative workflows of all providers.

Response: We thank commenters for their recommendations and will consider building upon the foundation of this measure in future years. We note that the PCH Quality Reporting Program currently uses the Documentation of Goals of Care Discussions Among Cancer Patients measure, which evaluates whether specific oncology patients at a reporting PCH had documentation related to prognosis, treatment, and goals for care.[256]

Regarding alignment with other measures, such as the Advance Care Plan measure in MIPS or the NCQA's HEDIS Advance Care Planning measure,

[254] FHIR® is the registered trademark of Health Level Seven International (HL7), and its use does not constitute endorsement by HL7.

[255] Centers for Medicare & Medicaid Services, & Office of the National Coordinator for Health Information Technology. (2021, January). Quality Data Model (QDM), version 5.6: For use by measure developers creating measures using Clinical Quality Language (CQL). Available at: *https://ecqi.healthit.gov/sites/default/files/QDM-v5.6-508.pdf.*

[256] CMS QualityNet. Documentation of Goals of Care Discussions Among Cancer Patients Measure. Available at: *https://qualitynet.cms.gov/pch/measures/goals.*

the Advance Care Planning eCQM does not conflict with and expands upon the existing advance care plan measures used in other programs by widening the eligible cohort to include patients aged 18 years and older and by including additional modes of advance care planning documentation in the measure numerator.[257] Having this measure structured as an eCQM allows CMS to monitor performance of advance care planning activities at the hospital level using additional EHR data for an expanded cohort of patients 18 and older.

Comment: A commenter stated that POLST/MOLST forms should only count toward the measure numerator when a Do Not Attempt Resuscitation order is in place. Without this limitation, the commenter stated that the measure could incentivize routine completion of POLST/MOLST forms for all hospitalized adults, which is neither clinically appropriate nor consistent with best practice, as the forms are indicated for people who are at risk of a life-threatening clinical event due to a serious life-limiting medical condition.

Response: We interpret the comment to mean that the commenter does not think that POLST/MOLST forms are clinically appropriate for all hospitalized adults. We do not intend to encourage routine completion of these forms when not consistent with best practice and emphasize that the numerator may be satisfied through multiple pathways and does not require any particular document type for all patients. Rather, the Advance Care Planning eCQM encourages appropriate documentation of the advance care plan that reflects the patient's current situation and preferences.

Comment: A commenter stated that the measure should explicitly exclude in-hospital-only and temporary health care surrogate designations from qualifying as valid surrogate decision-makers, as well as surrogates identified on temporary advance directive forms at admission that are framed as identifying an emergency contact rather than a true surrogate decision-maker, as these designations may allow hospitals to receive credit for the measure without any accountability for effective advance care planning. This commenter noted that identification of a patient's surrogate decision-maker should be performed by an appropriate clinical member of the care team, and this process should include a clear discussion to ensure accurate understanding of the decision-maker's role and responsibilities.

Response: This measure aims to advance person-centered care by ensuring that hospitals provide patients and their caregivers the opportunity to discuss their goals of care and/or capture patients' existing advance care planning decisions. The measure does not require a specific duration of any documented care plan, only the presence of it during the admission. Surrogates identified on temporary advance directive forms at admission that are framed as identifying an emergency contact rather than a true surrogate decision-maker would not satisfy the numerator. It is the expectation, based on the eCQM's specified codes, that a power of attorney or healthcare surrogate are identified, not an emergency contact. We also note that each facility determines who has permission to document the information based on policy and licensure.

Comment: A commenter stated that the proposed measure only credits advance care planning discussions that result in a documented decision and recommended that CMS credit all documented advance care planning discussions. A commenter stated that the measure appears to recognize only patients with an inpatient DNR code status, which may exclude other documented code status decisions that also reflect substantive advance care planning. Another commenter stated the eCQM does not account for patients who do not have an advance care plan but do have a designated health care agent.

Response: The measure numerator includes all adult patients with one or more inpatient encounters during the measurement period who have an advance care planning document or documentation of an advance care planning discussion resulting in a documented decision in the patient's EHR by the time of hospital discharge during at least one of the inpatient encounters. The measure addresses situations where a conversation is documented without a completed plan or named proxy, allowing for situations where a patient would like additional time to consider or to consult with their primary care clinician, specialist, and family members. We clarify that a DNR code status is only one of the several elements available to satisfy the measure criteria, and that the numerator does account for patients who have a designated healthcare agent.

Comment: A few commenters suggested additional numerator components, such as mental health advance directives and CPT codes 99497 and 99498.

Response: We thank commenters for their suggestions. Our TEP concluded that mental health or psychiatric advance directives should not be included in the measure numerator as they do not reflect preferences for end-of-life care.[258] However, we acknowledge the importance of psychiatric advance directives, and note that the Transition Record with Specific Elements Received By Discharged Patients measure in the Inpatient Psychiatric Facility (IPF) Quality Reporting Program [259] includes the requirement for IPFs to indicate in the patient's transition record whether the patient has a documented psychiatric advance directive.

CPT 99497 and 99498 are not included in the final measure specifications because they represent an advance care planning discussion but do not require documentation of the discussion nor any decision that may have followed the discussion. The measure is intended to capture advance care planning discussion with a documented decision as documenting the patient's decision provides this information for care in the hospital and provides direct attestation that a conversation occurred. For example, Code 1124F is included as it represents an advance care planning discussion in which a decision was made not to identify a surrogate decision maker or make an advance care plan.

Comment: A commenter encouraged CMS to engage in broader education regarding the need to develop advance care plans and the importance of sharing their plans with their health care providers and hospitals. The commenter stated that Medicare Advantage plans should be encouraging advance care planning among their membership and that CMS should consider an agency-driven education campaign to impress upon beneficiaries the importance of advance care planning as well as the operational complexities associated with advance care planning discussions, including varying patient decisional capacity, behavioral health conditions, cultural considerations, family involvement, and differences in state law governing advance directives and surrogate decision-making.

[257] Partnership for Quality Measurement. Appropriateness of Scale Tab, Advance Care Planning. Available at: *https://www.p4qm.org/prmr-measures/muc2025-020.*

[258] Yale CORE. Summary of Technical Expert Panel (TEP): Advance Care Planning Measure. Available at: *https://mmshub.cms.gov/sites/default/files/CORE-ACP-TEP3SummaryReport-092625.pdf.*

[259] CMS QualityNet. IPF Specifications Manual v1.4: Transition Record Measure. Available at: *https://qualitynet.cms.gov/files/686bd1fde1b47e03cd8451ae?filename=2c_TranitionRec_v1.4.pdf.*

Response: We appreciate the commenter's suggestion and will consider it as part of our education and outreach during implementation of this measure. We agree that broader communication about the importance of sharing care preferences with health care providers and hospitals would support our goals to normalize advance care planning conversations and promote goal-concordant care. With respect to Medicare Advantage plans encouraging advance care planning conversations, we note that NCQA's Health Plan Ratings for Medicare include a measure, Advance Care Planning, as part of the HEDIS measure set.[260]

Comment: Many commenters stated that hospitals need time to modify EHR templates and workflows, train clinicians and quality staff, and devote additional administrative resources to ensure standardized documentation and accurate reporting. Several commenters suggested that new eCQMs, including the Advance Care Planning eCQM, be delayed to allow EHR vendors and hospitals sufficient lead time to make the necessary changes, especially in consideration of the overall pace and scope of updated eCQM reporting requirements in the Hospital Inpatient Quality Reporting Program.

Response: We carefully consider both the benefits and the burden of adopting new measures and transitioning to eCQMs. The shift toward digital quality measures will ultimately decrease the burden for hospitals because eCQMs use electronic standards, which help reduce the burden of manual abstraction and reporting. We note that hospitals participating in the Hospital Inpatient Quality Reporting Program and the Medicare Promoting Interoperability Program would have the option to self-select whether to report on this measure, which provides flexibility for those hospitals that may need more time for successful implementation. We refer readers to sections IX.C.8.c. and IX.F.9. for more detailed discussion of our modifications to the reporting and submission requirements for eCQMs in the Hospital Inpatient Quality Reporting Program and Medicare Promoting Interoperability Program, respectively.

For implementation guidance, we refer readers to the eCQI Resource Center website, available at: *https://ecqi.healthit.gov,* for more details on the measure specifications and other resources. We acknowledge that many quality measures can require adjustments to existing practices but believe the ultimate benefits to both individual patients and overall health outcomes from promoting advance care planning are worth the effort.

Comment: Commenters supported the transition to digital and FHIR®-based quality measurement in the PCH Quality Reporting Program but were concerned about introducing and operationalizing eCQMs beginning with mandatory reporting with the CY 2028 reporting period/FY 2030 program year. These commenters suggested that CMS delay the implementation of the policy for PCHs or do a phased introduction with an initial voluntary, confidential reporting period.

Response: As these concerns also relate to our proposal to adopt the Malnutrition Care Score eCQM in the PCH Quality Reporting Program, we refer readers to section IX.D.2.a. of this final rule for our responses to concerns specific to implementing eCQMs in the PCH Quality Reporting Program and where we describe our decision to finalize a modification of our proposal for the PCH Quality Reporting Program. Specifically, after consideration of the public comments we received on the proposed timeline for introducing eCQMs in the PCH Quality Reporting Program, we recognize that PCHs and their vendors may need additional time to operationalize eCQM reporting and submission requirements since eCQMs would be an entirely new measure type in the PCH Quality Reporting Program.

Therefore, we are finalizing our proposal to adopt the Advance Care Planning eCQM into the PCH Quality Reporting Program with a modification to provide an initial voluntary reporting period for the CY 2028 reporting period/FY 2030 program year followed by mandatory reporting of a full year's data beginning with the CY 2029 reporting period/FY 2031 program year. For the CY 2028 reporting period/FY 2030 program year voluntary period, PCHs will receive confidential data through the Hospital Quality Reporting System to provide opportunities to identify and address deficiencies before public display. We will then publicly report measure information beginning with the CY 2029 reporting period/FY 2031 program year data as soon as it is feasible on CMS websites such as the Compare tool on *Medicare.gov* and the CMS Provider Data Catalog, or their successor websites, after a 30-day preview period.

After consideration of public comments received, we are finalizing our proposal to adopt the Advance Care Planning eCQM as a self-selected eCQM beginning with the CY 2028 reporting period/FY 2030 payment determination for the Hospital Inpatient Quality Reporting Program and Medicare Promoting Interoperability Program. We refer readers to section IX.F.9. of this final rule for a discussion of finalizing adoption of this eCQM in the Medicare Promoting Interoperability Program.

2. Adoption and Modifications to Five Mortality Measures in the Hospital Inpatient Quality Reporting and Value-Based Purchasing Programs

a. Background

In the CY 2007 OPPS/ASC final rule (71 FR 68205 through 68206), we began adopting condition-specific and procedure-specific mortality measures into the Hospital Inpatient Quality Reporting Program to more fully reflect patient outcomes following hospitalization. Beginning with the FY 2014 program year, we adopted mortality measures into the Hospital Value-Based Purchasing Program, under the Clinical Outcomes domain, specifically:

- Hospital 30-day, All-Cause, Risk-Standardized Mortality Rate Following Acute Myocardial Infarction Hospitalization (MORT–30–AMI) measure (76 FR 26495 through 26511);
- Hospital 30-day, All-Cause, Risk-Standardized Mortality Rate Following Heart Failure Hospitalization (MORT–30–HF) measure (76 FR 26495 through 26511);
- Hospital 30-day, All-Cause, Risk-Standardized Mortality Rate Following Pneumonia Hospitalization (MORT–30–PN) measure (adopted at 76 FR 26495 through 26511; modified at 81 FR 56994 through 56996);
- Hospital 30-day, All-Cause, Risk-Standardized Mortality Rate Following Chronic Obstructive Pulmonary Disease (COPD) Hospitalization (MORT–30–COPD) measure (80 FR 49557 through 49558); and
- Hospital 30-day, All-Cause, Risk-Standardized Mortality Rate Following Coronary Artery Bypass Graft (CABG) Surgery (MORT–30–CABG) measure (81 FR 56996 through 56998).

For more details on these five mortality measures, we refer readers to the condition-specific and the procedure-specific mortality measures updates and specifications reports available at: *https://qualitynet.cms.gov/inpatient/measures/mortality/methodology.*

In the FY 2019 IPPS/LTCH PPS final rule (83 FR 41556 through 41558), after adopting these measures into a pay-for-performance program, the Hospital Value-Based Purchasing Program, we

[260] National Committee for Quality Assurance. NCQA's Health Plan Ratings 2027. Available at: *https://www.ncqa.org/hedis/reports-and-research/ncqas-health-plan-ratings-2027/.*

removed them from the Hospital Inpatient Quality Reporting Program, a pay-for-reporting program, under removal Factor 8, the costs associated with a measure outweigh the benefit of its continued use in the program. We subsequently removed these measures from the Hospital Inpatient Quality Reporting Program, while maintaining them in the Hospital Value-Based Purchasing Program, as a part of our ongoing effort to move the programs forward in the least burdensome manner possible, while maintaining parsimonious sets of quality measures and continuing to incentivize improvement in the quality of care provided to patients. These five mortality measures continue to provide meaningful information for patients on the quality and value of care provided at a hospital and continue to be included in the calculation of incentive payment adjustments for the Hospital Value-Based Purchasing Program. Table IX.B.3. summarizes our previously finalized policies for these five mortality measures in the Hospital Inpatient Quality Reporting and Value-Based Purchasing Programs.

TABLE IX.B.3. SUMMARY OF FIVE MORTALITY MEASURES INITIAL AND FINAL PAYMENT DETERMINATION OR PROGRAM YEARS IN THE HOSPITAL INPATIENT QUALITY REPORTING AND VALUE-BASED PURCHASING PROGRAMS

Measure Name	First Payment Determination in Hospital Inpatient Quality Reporting program	First Program Year in Hospital Value-Based Purchasing Program	Last Payment Determination in Hospital Inpatient Quality Reporting program
MORT–30–AMI	FY 2008 (71 FR 68205 through 68206)	FY 2014 (76 FR 26495 through 26511)	FY 2020 (83 FR 41556 through 41558)
MORT–30–HF	FY 2008 (71 FR 68205 through 68206)	FY 2014 (76 FR 26495 through 26511)	FY 2020 (83 FR 41556 through 41558)
MORT–30–PN	FY 2009 (72 FR 47348 through 47351)	FY 2014 (76 FR 26495 through 26511)	FY 2021 (83 FR 41556 through 41558)
MORT–30–COPD	FY 2016 (78 FR 50792 through 50794)	FY 2021 (80 FR 49557 through 49558)	FY 2021 (83 FR 41556 through 41558)
MORT–30–CABG	FY 2017 (79 FR 50224 through 50227)	FY 2022 (81 FR 56996 through 56998)	FY 2022 (83 FR 41556 through 41558)

In the FY 2027 IPPS/LTCH PPS proposed rule (91 FR 19569), we proposed to adopt the modified versions of the MORT–30–AMI, MORT–30–HF, MORT–30–PN, MORT–30–COPD, and the MORT–30–CABG measures in the Hospital Inpatient Quality Reporting Program beginning with the FY 2028 payment determination. We would also modify these measures in the Hospital Value-Based Purchasing Program and remove them from the Hospital Inpatient Quality Reporting Program beginning with the FY 2032 payment determination. When these five mortality measures were previously adopted into the Hospital Inpatient Quality Reporting Program and Hospital Value-Based Purchasing Programs, they only included Medicare Fee-For-Service beneficiaries in the measure cohorts. Since the initial adoption of these measures, the proportion of Medicare Advantage beneficiaries has increased from 35 percent of the Medicare population to approximately 50 percent.[261] If finalized as proposed, the modified mortality measures (MORT–30–AMI, MORT–30–HF, MORT–30–PN, MORT–30–COPD, and MORT–30–CABG) will have been publicly reported in the Hospital Inpatient Quality Reporting Program for at least 1 year in accordance with the statutory and regulatory requirements of section 1886(o)(2)(C)(i) of the Act and 42 CFR 412.164(b), before adoption into the Hospital Value-Based Purchasing program.

b. Overview of Updates

In the FY 2027 IPPS/LTCH PPS proposed rule (91 FR 19569 through 19570), we proposed two substantive modifications to these five mortality measures: (1) expand the measure inclusion criteria to include Medicare Advantage beneficiaries; and (2) shorten the performance period from 3 to 2 years. Medicare fee-for-service only cohorts now omit a large portion of the Medicare population, and Medicare Advantage inclusion improves representativeness, reliability of measure scores, transparency, and beneficiary decision-making. In addition, inclusion of Medicare Advantage beneficiaries leads to more hospitals receiving results, and increases the chance of identifying meaningful differences in quality for some low-volume hospitals. Based on our analysis that included Medicare Advantage beneficiaries in addition to the Medicare Fee-For-Service measure cohort, we found that the measures could achieve a satisfactory level of reliability with a 2-year reporting period.[262] The mean reliability for each of the modified mortality measures exceeded the CBE-established minimum threshold of 0.6.[263] We therefore proposed to shorten the reporting period from 3 to 2 years for the modified mortality measures. Table IX.B.4. summarizes our reliability estimates for the five modified mortality measures using a 2 year reporting period (CY 2022 and CY 2023) and inclusion of Medicare Advantage beneficiaries:

TABLE IX.B.4. MORTALITY MEASURES RELIABILITY ESTIMATES USING A 2-YEAR REPORTING PERIOD

Measure Title	Mean (SD)	Min-Max	25th Percentile	50th Percentile	75th Percentile
MORT–30–AMI	0.772 (0.009)	0.739-0.788	0.765	0.771	0.779
MORT–30–HF	0.712 (0.009)	0.686-0.730	0.705	0.712	0.719
MORT–30–PN	0.900 (0.065)	0.264-0.911	0.905	0.907	0.909
MORT–30–COPD	0.771 (0.009)	0.729-0.786	0.766	0.771	0.778
MORT–30–CABG	0.726 (0.024)	0.633-0.768	0.715	0.729	0.744

Table IX.B.5. summarizes the proposed new performance periods for the Hospital Inpatient Quality Reporting Program and Hospital Value-Based Purchasing Program, beginning with the FY 2028 payment determination. We refer readers to section V.J.3. for more details on the baseline and performance periods in the Hospital Value-Based Purchasing Program for the FY 2032 program year and subsequent years.

TABLE IX.B.5. SUMMARY OF PROPOSED PERFORMANCE PERIODS FOR FIVE MODIFIED MORTALITY MEASURES IN THE HOSPITAL INPATIENT QUALITY REPORTING AND VALUE-BASED PURCHASING PROGRAMS

Measure Title	Proposed Initial Performance Period and Payment Determination in the Hospital Inpatient Quality Reporting Program		Proposed Final Performance Period and Payment Determination in the Hospital Inpatient Quality Reporting Program		Proposed Initial Performance Period and Program Year in the Hospital Value-Based Purchasing Program	
MORT–30–AMI MORT-30-HF MORT-30-PN MORT-30-COPD MORT-30-CABG	July 1, 2024 – June 30, 2026	FY 2028	July 1, 2027 – June 30, 2029	FY 2031	July 1, 2028 – June 30, 2030	FY 2032

For more details on the measure refinement methodology and results for these measures, we refer readers to the condition-specific and procedure-specific mortality measures updates and specifications reports available at: *https://qualitynet.cms.gov/inpatient/measures/mortality/methodology.*

c. Measure Calculation

The outcomes for the modified mortality measures, MORT–30–AMI, MORT–30–HF, MORT–30–PN, MORT–30–COPD, and MORT–30–CABG, would continue to measure 30-day, all-cause mortality.

The measures are calculated by first determining the ratio of the number of ''predicted'' deaths (the adjusted number of deaths at a specific hospital based on its patient population) to the number of ''expected'' deaths (the number of deaths if an average quality hospital treated the same patients) for each hospital and then multiplies the ratio by the national observed mortality rate. The ratio of predicted to expected deaths is greater than one for a hospital that has more deaths than would be expected for an average hospital with similar cases and less than one if the hospital has fewer deaths than would be expected for an average hospital with similar cases. This allows for a comparison of a particular hospital's performance to an average hospital's performance with the same case mix. This approach is analogous to a ratio of an ''observed'' or ''crude'' rate to an ''expected'' or risk-adjusted rate used in other similar types of statistical analyses.

(1) Numerator

The numerator for this measure is 30-day, all-cause mortality. We define mortality as death from any cause within 30 days of the start of the index admission, including in-hospital death.

(2) Denominator

The cohort includes admissions for patients that meet all of the following inclusion criteria:

- Discharged from the hospital with a principal discharge diagnosis of AMI, HF, COPD, pneumonia, or a qualifying CABG procedure;
- Enrolled in Medicare Fee-For-Service Part A and Part B or Medicare Advantage for the first 12 months prior to the date of admission and enrolled in Part A or Medicare Advantage during the index admission; [264]
- Aged 65 or older; and
- Not transferred from another acute care facility.

If a patient has more than one eligible AMI, HF, COPD, pneumonia, or CABG procedure hospitalization during the reporting period, then we randomly select one admission, or eligible

[264] This requirement is not applicable to Veterans Health Administration (VHA) beneficiaries hospitalized in VHA hospitals, who are eligible for inclusion in the cohort regardless of their Medicare enrollment status. VHA beneficiaries hospitalized in non-VHA hospitals must be concurrently enrolled in Medicare Fee-For-Service Part A or Medicare Advantage at the time of the index admission to be eligible for cohort inclusion.

procedure,[265] per year for inclusion in the measure cohort.[266]

For more information regarding measure specifications, including denominator exclusion criteria, we refer readers to condition-specific and procedure-specific mortality measures methodology reports at: *https://qualitynet.cms.gov/inpatient/measures/mortality/methodology.*

d. Pre-Rulemaking Process and Measure Endorsements

(1) Recommendations From the Pre-Rulemaking Measure Review Process

We refer readers to the Partnership for Quality Measurement for details on the Pre-Rulemaking Measure Review process convened by the CBE, including the voting procedures used to reach consensus on measure recommendations.[267] [268] The Pre-Rulemaking Measure Review Hospital Committee, consisting of both the Pre-Rulemaking Measure Review Hospital Recommendation Group (hereafter referred to as the Recommendation Group) and Pre-Rulemaking Measure Review Hospital Advisory Group, met on January 12 and 13, 2026, to review measures included by the Secretary on the publicly available ''2025 Measures Under Consideration List,'' including the MORT–30–AMI, MORT–30–HF, MORT–30–PN, MORT–30–COPD, and the MORT–30–CABG measures.[269] Table IX.B.6. summarizes the voting results for measure recommendations for these measures in the Hospital Inpatient Quality Reporting and Value-Based Purchasing Programs.

TABLE IX.B.6. PRE-RULEMAKING MEASURE REVIEW HOSPITAL RECOMMENDATION GROUP VOTING RESULTS

Measure	MUC ID	Voted to Recommend	Voted to Not Recommend	Consensus Reached	Recommendation Decision
Hospital Inpatient Quality Reporting Program					
MORT-30-AMI	MUC2025-036	17 (81%)	4 (19%)	Yes	Recommend
MORT-30-HF	MUC2025-037	17 (81%)	4 (19%)	Yes	Recommend
MORT-30-PN	MUC2025-044	16 (80%)	4 (20%)	Yes	Recommend
MORT-30-COPD	MUC2025-040	16 (80%)	4 (20%)	Yes	Recommend
MORT-30-CABG	MUC2025-046	17 (85%)	3 (15%)	Yes	Recommend
Hospital Value-Based Purchasing Program					
MORT-30-AMI	MUC2025-036	16 (76%)	5 (24%)	Yes	Recommend
MORT-30-HF	MUC2025-037	15 (75%)	5 (25%)	Yes	Recommend
MORT-30-PN	MUC2025-044	15 (75%)	5 (25%)	Yes	Recommend
MORT-30-COPD	MUC2025-040	15 (75%)	5 (25%)	Yes	Recommend
MORT-30-CABG	MUC2025-046	15 (71%)	6 (29%)	No	Majority of the Recommendation Group expressed some support.

For the Hospital Inpatient Quality Reporting Program, the Recommendation Group reached consensus and recommended the five modified mortality measures for adoption into the program. For the Hospital Value-Based Purchasing Program, the Recommendation Group reached consensus for four of the five modified mortality measures, the MORT–30–AMI, MORT–30–HF, MORT–30–PN, and MORT–30–COPD measures, and thus, recommended these measures for adoption into the Hospital Value-Based Purchasing Program. The Recommendation Group did not reach consensus to recommend the MORT–30–CABG measure for the Hospital Value-Based Purchasing Program, although the majority of the Recommendation Group did express some support.[270]

The Recommendation Group largely supported the addition of Medicare Advantage beneficiaries to the measures' cohorts and underscored the importance of enhancing transparency and facilitating meaningful comparisons and high-quality care by including this population. The Recommendation

[265] A qualifying isolated CABG surgery is defined as a procedure performed without the following concomitant valve or other major cardiac, vascular, or thoracic procedures: valve procedures; atrial and/or ventricular septal defects; congenital anomalies; other open cardiac procedures; heart transplants; aorta or other non-cardiac arterial bypass procedures; head, neck, intracranial vascular procedures; or other chest and thoracic procedure.

[266] Centers for Medicare & Medicaid Services. (December 2025). 2025 Measures Under Consideration List. Available at: *https://mmshub.cms.gov/measure-lifecycle/measure-implementation/pre-rulemaking/lists-and-reports/overview.*

[267] Partnership for Quality Measurement. Pre-Rulemaking Measure Review web page. Available at: *https://www.p4qm.org/prmr/about.*

[268] We note the Pre-Rulemaking Measure Review voting process was updated in 2025. We refer readers to the corresponding footnote in section IX.B.1.d.(1) of this final rule for more details on the updated Pre-Rulemaking Measure Review voting process.

[269] Centers for Medicare & Medicaid Services. (December 2025). 2025 Measures Under Consideration List. Available at: *https://mmshub.cms.gov/measure-lifecycle/measure-implementation/pre-rulemaking/lists-and-reports/overview.*

[270] Partnership for Quality Measurement. (February 2026). PRMR 2025–2026 Pre-Rulemaking Measure Review Recommendation Group Final Meeting Summary: Hospital Committee. Available at: *https://p4qm.org/sites/default/files/2026-02/PRMR-Hospital-Recommendation-Group-Meeting-Final-Summary-508.pdf.*

Group also generally agreed that shortening the reporting period from 3 to 2 years would lead to more actionable insights. Some members recommended further analysis to ensure the effects of including Medicare Advantage beneficiaries to the measures' cohorts are understood. Some members that did not vote to recommend these measures emphasized the need to understand the impacts of including Medicare Advantage beneficiaries in hospital performance in the Hospital Value-Based Purchasing Program prior to implementation. We appreciate the member's recommendation to ensure the impacts of including Medicare Advantage beneficiaries in the measures' cohorts are understood and we wish to emphasize that, based on our analysis, the variation between the two cohorts did not vary significantly for mortality rates, and the reliability estimate for the modified measures showed satisfactory results.[271] Therefore, the inclusion of Medicare Advantage beneficiaries does not raise concerns regarding potential variation between the Fee-For-Service and Medicare Advantage cohorts for these measures, or unintended consequences on hospital performance. We note that as a part of routine measure maintenance, we conduct ongoing monitoring and evaluation analyses to watch for any unintended consequences. Table IX.B.7. shows the results for observed 30-day mortality rates for the Medicare Fee-For-Service, Medicare Advantage, and combined cohorts, as well as the difference between the Medicare Fee-For-Service and Medicare Advantage cohorts for the proposed modified mortality measures. Further, based on our analysis, we found that the mean reliability estimates for the modified mortality measures, using two years of data (CY 2022 and CY 2023), and the updated cohort, all exceeded the CBE-established minimum threshold of 0.6.[272] We refer readers to Table IX.B.4., in section IX.B.2.b., for a description of our reliability estimates for the modified mortality measures, which includes estimates with the updated cohorts.

TABLE IX.B.7. MORTALITY RATES FOR MEDICARE FEE-FOR-SERVICE, MEDICARE ADVANTAGE FOR PROPOSED MODIFIED MORTALITY MEASURES, CY 2022

Measure Name	Medicare Advantage and Fee-For-Service Combined Cohort	Fee-For-Service Only Cohort	Medicare Advantage Only Cohort	Difference Between Fee-For-Service and Medicare Advantage Cohorts
MORT-30-AMI	12.3%	12.5%	12.1%	0.4%
MORT-30-HF	11.5%	12.2%	10.7%	1.4%
MORT-30-PN	16.8%	17.3%	16.2%	1.1%
MORT-30-COPD	8.9%	9.4%	8.4%	1.0%
MORT-30-CABG	2.8%	2.7%	2.9%	-0.2%

Some Recommendation Group members who recommended adopting the modified mortality measures for the Hospital Inpatient Quality Reporting and Hospital Value-Based Purchasing Programs also provided considerations for strengthening the measures. Many of these recommendations included considerations for improving the risk adjustment model. Specifically, some members recommended adjusting for socioeconomic status in the risk model for all mortality measures. Some members that voted to recommend this measure suggested considering including the cause of death in the risk model to improve accuracy. Other members voted not to recommend these measures for the two programs, citing that additional evaluation of the updated risk model is needed.

Regarding the recommendation to add socioeconomic status factors to the risk adjustment model, we note that our analysis found that including these factors showed minimal impact to measure performance. This analysis also found that including these factors could result in negative impacts to vulnerable populations by lowering the expected mortality for these groups, and we decided to exclude these factors from our risk adjustment model. Regarding the recommendation to include the cause of death to improve the risk model, we thank the Recommendation Group members for this recommendation and will consider this in our routine measure maintenance. Regarding the recommendation for additional evaluation of the updated risk model, we wish to emphasize that we have conducted extensive evaluation and based on our analysis using the updated risk adjustment methodology, the ability of the updated risk adjustment model to account for condition-specific or procedure-specific severity improved significantly. We refer readers to section IX.B.2.f. for a detailed discussion of our updates to our risk adjustment methodology and summary of our analysis comparing the results of the modified measures using the two risk adjustment methodologies.

Recommendation Group members emphasized that the modified measures should be re-submitted for endorsement, prior to implementation as a rationale for not voting to recommend this measure for the Hospital Inpatient Quality Reporting and Hospital Value-Based Purchasing Programs. Other key reasons cited for not recommending these modified mortality measures included recommending a phased implementation approach for the measure modifications, as well as confidential reporting to ensure a clear understanding of measure impacts. Some members expressed concerns about whether small or rural hospitals would be able to meet volume

[271] Partnership for Quality Measurement. (March 2024). 2024 Condition- and Procedure-Specific Mortality/Complication Measures Supplemental Methodology Report. Available at: *https://p4qm.org/prmr-measures/muc2025-036.*

[272] For more details on reliability guidance, we refer readers to the Reliability Guidance for the Endorsement and Maintenance of Clinical Quality Measures Document available at: *https://p4qm.org/em/resources.*

thresholds for these measures with the reduced reporting period.

Regarding members' recommendation to re-submit the modified measures for endorsement, these measures are currently endorsed by the CBE and have been re-submitted for endorsement review with these measure modifications for the Spring 2028 cycle. We note that in the FY 2027 IPPS/LTCH PPS proposed rule, we stated that these measures were next going through CBE endorsement and maintenance review in the Spring 2026 review cycle, which has since been updated to the Spring 2028 review cycle (91 FR 19573). In response to the members that recommended a phased implementation of the measures modifications as well as confidential reports, we note that we intend to provide hospitals with measure performance data with the expanded patient cohort based on data collected while the modified versions of these measures are in use in the Hospital Inpatient Quality Reporting Program via annual confidential hospital-specific reports beginning with the FY 2028 program year, as well as via annual Provider Participation Summary Reports under the Hospital Value-Based Purchasing Program beginning with the FY 2032 program year. Further, we proposed the modified mortality measures take effect for the Hospital Value-Based Purchasing Program beginning with the FY 2032 program year, which will provide time and data to monitor for any unintended consequences. In addition, the FY 2032 Hospital Value-Based Purchasing Program performance standards for this measure would be published at least 60 days prior to the beginning of each applicable performance period as required by section 1886(o)(3)(C) of the Act. Regarding the concern about whether small or rural hospitals would be unduly burdened by the shortening of the reporting period from 3 to 2 years, we wish to note that the decrease in cohort size is largely offset with the addition of Medicare Advantage beneficiaries to measure cohorts; thus, we do not anticipate small or rural hospitals to be unduly burdened by this update.

Specifically for the MORT–30–CABG measure, one member cited the potential for unintended consequences for hospitals to refuse care for patients with complex co-morbidities as their rationale for not recommending this measure for either the Hospital Inpatient Quality Reporting Program or the Hospital Value-Based Purchasing Program. We appreciate the Recommendation Group member's concern about unintended consequences. Based on our analysis with the current risk adjustment methodology, which includes risk adjustment for patient frailty, we do not anticipate hospitals to be unfairly penalized for treating patients who may be more complex. We refer readers to Table IX.B.4., in section IX.B.2.b., and Table IX.B.9., in section IX.B.2.f., for more details on our analysis of measure reliability and the risk adjustment methodology. Further, as a part of routine measure maintenance, we conduct ongoing monitoring and evaluation analyses to watch for any unintended consequences.

After taking these recommendations and concerns into consideration, we proposed to adopt the modified mortality measures in the Hospital Inpatient Quality Reporting Program beginning with the FY 2028 payment determination and subsequently modify the mortality measures in Hospital Value-Based Purchasing Program beginning with the FY 2032 program year (91 FR 19568 through 19574).

(2) Measures Endorsements

We refer readers to the Partnership for Quality Measurement website for details on the measure Endorsement and Maintenance process, including the measure evaluation procedures the Endorsement and Maintenance Committees use to evaluate measures and whether they meet endorsement criteria. Table IX.B.8. summarizes the most recent endorsement status and the next planned Endorsement and Maintenance review for five modified mortality measures:

TABLE IX.B.8. FIVE MORTALITY MEASURES ENDORSEMENT STATUS

Measure Title	CBE#	Most Recent Endorsement	Next Endorsement and Maintenance Review*
MORT–30–AMI	0230	Fall 2020	Spring 2028
MORT–30–HF	0229	Fall 2020	Spring 2028
MORT–30–PN	0468	Fall 2020	Spring 2028
MORT–30–COPD	1893	Fall 2020	Spring 2028
MORT–30–CABG	2558	Fall 2022	Spring 2028

* We note that in the FY 2027 IPPS/LTCH PPS proposed rule, we stated that these measures were next going through CBE endorsement and maintenance review in the Spring 2026 review cycle, which has since been updated to the Spring 2028 review cycle (91 FR 19573).

e. Data Source, Submission, and Public Reporting

These measures would be calculated using administrative data from Medicare Fee-For-Service claims or hospital-submitted Medicare Advantage claims, and Medicare Advantage organization-submitted encounter data. These data are routinely generated by hospitals or Medicare Advantage organizations, and submitted to CMS for all Medicare beneficiaries, which includes Medicare Advantage and Medicare Fee-For-Service beneficiaries. Therefore, a hospital would not be required to report any additional data for this measure. The addition of Medicare Advantage beneficiaries increases cohort size, supports more precise hospital-level estimates, and allows more hospitals, including some lower-volume hospitals, to meet minimum reporting thresholds. Enrollment status would be obtained from the Medicare Enrollment Database which contains beneficiary demographic, benefit/coverage, and vital status information.

The proposed modified mortality measures would be calculated and publicly reported on an annual basis using a rolling 24 months of prior data for the measurement period, consistent with the approach currently used for the MORT–30–STK measure, the COMP–HIP–KNEE measure, and the Thirty-day Risk-Standardized Death Rate Among Surgical Inpatients with Complications measure currently reported in the

Hospital Inpatient Quality Reporting Program (90 FR 36997 through 37002, 90 FR 37002 through 37008, and 89 FR 69545 through 69552). We would then publicly report the measures results on the Compare tool, currently available at: *https://www.medicare.gov/care-compare/,* beginning in July 2027 or as soon as feasible for the Hospital Inpatient Quality Reporting Program, which would enable us to post data for at least 1 year before adopting the modifications into the Hospital Value-Based Purchasing Program, as required by section 1886(o)(2)(C)(i) of the Act. For the Hospital Value-Based Purchasing Program, we also proposed that the performance standards calculation methodology for the modified mortality measures would be the same as that which we currently use for the mortality measures. The performance standards for the modified measures for FY 2032 are not yet available.

We invited public comment on our proposals to adopt five modified mortality measures, MORT–30–AMI, MORT–30–HF, MORT–30–PN, MORT–30–COPD, and the MORT–30–CABG, into the Hospital Inpatient Quality Reporting Program from the FY 2028 payment determination through the FY 2031 payment determination, and subsequently remove these measures from the Hospital Inpatient Quality Reporting Program beginning with the FY 2032 payment determination, as a step towards substantively modifying them in the Hospital Value-Based Purchasing Program. We also invited public comment on our proposal to modify these five mortality measures in the Hospital Value-Based Purchasing Program beginning with the FY 2032 program year, contingent on our adoption of these changes in the Hospital Inpatient Quality Reporting Program.

Comment: Many commenters supported our proposal to adopt five modified mortality measures into the Hospital Inpatient Quality Reporting Program and subsequently modifying them in the Hospital Value-Based Purchasing Program. These commenters agreed that the proposed modifications, specifically expanding the cohorts to include Medicare Advantage beneficiaries and shortening the reporting period to 2 years, would improve the measures' reliability and the accuracy of performance data. Many commenters agreed on the importance of including Medicare Advantage beneficiaries given the growing proportion of this population to the overall Medicare population and that this change would be more representative of hospitals' patient populations and help inform care by creating a more accurate picture of hospital performance. Many commenters supported reducing the reporting period from 3 to 2 years for these measures, stating that this update to the measures would provide more timely quality data and may better support organizational learning and responsiveness to emerging safety concerns.

Response: We thank commenters for their support and agree that these updates to the measures will provide hospitals with more reliable, accurate, and timely performance data. We agree that the inclusion of Medicare Advantage beneficiaries is critical given these beneficiaries make up over half the overall Medicare population.

Comment: Many commenters did not support adopting these measures into the Hospital Inpatient Quality Reporting Program and subsequently modifying them in the Hospital Value-Based Purchasing Program due to concerns about the challenges of data collection and reporting with the proposed addition of Medicare Advantage beneficiaries to the measures' cohorts. Many commenters expressed concerns about Medicare Advantage data reliability, consistency, completeness, and the variation between Medicare Advantage and Medicare Fee-For-Service reporting practices. A commenter stated concerns that hospitals are not subject to shadow claims performance assessment prior to formal inclusion in Hospital Value-Based Purchasing Program. Commenters recommended addressing these data collection challenges by conducting additional analysis before the modified mortality measures are implemented, emphasizing the importance of transparency regarding the inclusion of Medicare Advantage populations to ensure Medicare Advantage data meet the same reliability and completeness standards as Medicare Fee-For-Service data.

Response: We acknowledge commenters' concerns regarding the inclusion of Medicare Advantage beneficiaries and the potential for challenges around data reliability, consistency, and completeness. However, we respectfully disagree that Medicare Advantage data completeness creates a significant concern regarding measure reliability, and recent data suggest improved timeliness, completeness, and accuracy of Medicare Advantage encounter data. We direct readers to the Announcement of Calendar Year 2022 Medicare Advantage Capitation Rates and Part C and Part D Payment Policies,[273] in which CMS described its efforts to improve the completeness and validity of encounter data and its transition to calculating 100 percent of the risk score using diagnoses from encounter data and Fee-For-Service claims.

CMS has been assessing Medicare Advantage data for use in quality measurement since 2017, and recent CMS policies have focused on improving the timeliness, completeness, and accuracy of Medicare Advantage data. Hospital-submitted Medicare Advantage claims data are already used in Disproportionate Share Hospital and Graduate Medical Education payment calculations, and Medicare Advantage organization-submitted encounter data are used to calculate Medicare Advantage beneficiary risk scores.

For the Hybrid Hospital-Wide All-Cause Readmission measure and the Hybrid Hospital-Wide All-Cause Risk-Standardized Mortality measure in the Hospital Inpatient Quality Reporting Program, CMS specifies that, for each Medicare Advantage admission, the measure calculation would use either the hospital-submitted information-only Medicare Advantage claim or the Medicare Advantage organization-submitted encounter data record, depending on which source is available. When Medicare Advantage admission information for a patient is available from both sources, CMS would use the hospital-submitted information-only Medicare Advantage claim because it is more timely and is already linked to the applicable hospital's CMS Certification Number.

More broadly, CMS has found that including Medicare Advantage patient data in measures improves measure reliability, narrows confidence intervals for measure scores, and increases the number of hospitals and beneficiaries included in the measures. Based on internal analyses of Medicare Advantage data submitted to CMS by hospitals and Medicare Advantage organizations for 2017 through 2021, CMS determined that incorporating Medicare Advantage admissions into CMS hospital outcome measures is feasible.

Hospitals and Medicare Advantage organizations submit these data on a schedule that will allow their use in measure calculation. Inpatient Medicare Advantage encounter data in CMS'

[273] Centers for Medicare & Medicaid Services. Advance Notice of Methodological Changes for Calendar Year 2022 for Medicare Advantage Capitation Rates and Part C and Part D Payment Policies (the Advance Notice). Accessed March 5, 2023. Available at: *https://www.cms.gov/files/document/2022-advance-notice-part-i.pdf.*

Integrated Data Repository include National Provider Identifiers that can be matched to hospitals' CMS Certification Numbers, which are currently used to identify hospitals in CMS outcome measures. Based on an analysis to include Medicare Advantage beneficiaries into outcome measures, a high percentage of Medicare Advantage encounter data were submitted within the three-month timeframe needed for hospital measure reporting, and submission timeliness has improved over time, increasing from 90.3 percent in 2018 to 95.2 percent in 2021 for inpatient encounters at acute care and critical access hospitals.[274]

CMS' internal analysis also found a high rate of matching diagnoses between Medicare Advantage organization-submitted Medicare Advantage encounter data and hospital-submitted Medicare Advantage claims. This finding supports the use of either data source for a given admission in measure calculation. As discussed in the FY 2027 IPPS/LTCH PPS proposed rule (91 FR 19568 through 19574), we have studied whether there are key differences between the Medicare Advantage and Medicare Fee-For-Service populations and found that there were not significant differences between the two populations. Further, we found that incorporating Medicare Advantage beneficiaries into measures' cohorts improved the measures' reliability. Using 2 years of data (CY 2022 and CY 2023), we found that the mean reliability estimates all exceeded the CBE established minimum threshold of 0.6, with results ranging from 0.712 for the MORT–30–HF measure to 0.900 for the MORT–30–PN measure. Further, we examined the differences in mortality rates between Medicare Advantage and Medicare Fee-For-Service populations and found the observed mortality rates ranged from −0.2 percent for the MORT–30–CABG measure to 1.4 percent for the MORT–30–HF measure. Because the measures also adjust for Medicare Advantage versus Fee-For-Service enrollment status in the risk model, we concluded these measures do not reflect any meaningful bias due to differing proportions of Medicare Advantage patients across hospitals. We refer readers to sections IX.B.2.b. and IX.B.2.d. for detailed results on these findings.

We agree that transparency is important for both patients and providers, and we provide hospitals with annual confidential feedback reports on their measure performance, as well as making our routine measure evaluation reports publicly available through QualityNet on our website at: *https://qualitynet.cms.gov/,* or on a successor website. We note that our annual measure re-evaluations are conducted to ensure that the risk-standardized mortality model is continually assessed and remains valid, given possible changes in clinical practice and coding standards over time. Modifications made to the measure cohort, risk model, and outcomes are informed by review of the most recent literature related to measure conditions or outcomes, feedback from various stakeholders, empirical analyses, and assessment of coding trends that reveal shifts in clinical practice or billing patterns. For the complete measure methodology report and measure risk adjustment model, we specifically refer readers to QualityNet on our website at: *https://qualitynet.cms.gov/inpatient/measures/mortality/methodology* and the Partnership for Quality Measurement's website at: *https://p4qm.org/prmr-measures.*

Comment: Many commenters did not support modification of the mortality measures in the Hospital Value-Based Purchasing Program due to concerns about how the inclusion of Medicare Advantage data would affect measure performance, hospital scores, or payment adjustments. Several commenters recommended providing data showing performance shifts, specifically in the Hospital Value-Based Purchasing Program, to ensure that the results can be used to drive further improvement in patient care. Several commenters expressed concerns that payment adjustment modeling has not been made publicly available for the Hospital Value-Based Purchasing Program. A commenter recommended that CMS make the results of hospital-specific analyses publicly available before implementing the modified measures in the Hospital Value-Based Purchasing Program to show the impact including Medicare Advantage beneficiaries has on individual hospital scores and payment adjustments across different market types.

Response: We understand commenters' concerns regarding impacts on measure performance, and therefore total program performance, due to potential differences in Medicare Advantage populations and Medicare Advantage plan designs. To evaluate hospital performance with the addition of Medicare Advantage beneficiaries, we examined shifts in risk-standardized mortality rates by quintiles of the proportion of hospital Medicare Advantage admissions and by quintiles of overall hospital volume, comparing the Medicare Fee-For-Service only cohort with the original Hierarchical Condition Categories-based risk model factors and the combined Medicare Advantage and Medicare Fee-For-Service cohort with the reselected ICD–10-based risk model factors. This analysis found that overall, hospitals shifted by no more than one quintile between 71.7 percent (MORT–30–CABG measure) of the time to 79.8 percent (MORT–30–HF measure) of the time.[275] For the complete measure performance results, we specifically refer readers to QualityNet on our website at: *https://qualitynet.cms.gov/inpatient/measures/mortality/methodology.*

Regarding payment adjustment modeling and providing hospital-specific feedback reports, we intend to provide hospitals with measure performance data with the expanded measures' patient cohort based on data collected while the modified mortality measures are in use in the Hospital Inpatient Quality Reporting Program via annual confidential hospital-specific reports beginning with the FY 2028 payment determination, as well as via annual Provider Participation Summary Reports under the Hospital Value-Based Purchasing Program beginning with the FY 2032 program year. As previously discussed, we will make routine measure evaluation reports publicly available through QualityNet on our website at: *https://qualitynet.cms.gov/.* In addition, Hospital Value-Based Purchasing Program performance standards for this measure will be published at least 60 days prior to the beginning of each applicable performance period as required by section 1886(o)(3)(C) of the Act.

Comment: Many commenters stated concerns about the risk of being unfairly penalized for factors outside their control, such as Medicare Advantage plan prior authorization delays, network adequacy limitations, and denials of post-acute services, noting these are observed adverse practices by some Medicare Advantage plans that could negatively impact health outcomes like mortality. Several commenters raised concerns about the potential for increased administrative burden with the addition of Medicare Advantage beneficiaries, noting that the prior authorization process used by Medicare

[274] Kyanko KA, Sahay KM, Wang Y, et al. (2024). Processing and validation of inpatient Medicare Advantage data for use in hospital outcome measures. *Health Serv Res,* 59(6):e14350. Available at: *https://doi.org/10.1111/1475-6773.14350.*

[275] Centers for Medicare & Medicaid Services. 2024 Condition- and Procedure-Specific Mortality/Complication Measures Supplemental Methodology Report. Available at: *https://qualitynet.cms.gov/inpatient/measures/mortality/methodology.*

Advantage plans places a significant administrative burden on both acute care hospitals and post-acute care providers, which requires excessive documentation for medical necessity.

Response: We acknowledge commenters' concerns regarding health plan benefit design differences between Medicare Advantage plans and Medicare Fee-For-Service plans and the impact the potential effect of those differences on patient outcomes. Further, we recognize that Medicare Advantage payment policies are not the same as Medicare Fee-For-Service payment policies, and by design, Medicare Advantage organizations are given more flexibility in benefit and provider reimbursement design. We note that mortality is an adverse outcome irrespective of benefit or payment policies. From the patient perspective, it is important to measure and provide transparency as to mortality rates for all Medicare beneficiaries. Using 2 years of data (CY 2022 and CY 2023), internal analyses showed no statistical difference in the average risk-standardized mortality rates across the condition- and procedure-specific measures for the Medicare Fee-For-Service-only and Medicare Advantage-only beneficiaries. Therefore, CMS does not believe that inclusion of MA beneficiaries in the measure cohort would materially increase hospitals' risk of adverse performance results based on differences between the Medicare FFS and MA populations. Based on the available sample, the measures' do not demonstrate meaningful variation in mortality rates between the Medicare Fee-For-Service and Medicare Advantage cohorts. Accordingly, we believe that combining Medicare Fee-For-Service and Medicare Advantage beneficiaries for purposes of measure calculation is appropriate and will preserve a larger measure cohort, thereby increasing hospital case volume and supporting more precise and reliable hospital-level measure scores.

While we understand that Medicare Advantage beneficiaries are subject to different benefits design and payment approaches than Medicare Fee-For-Service enrollees, we do not agree that these differences mean that improving clinical outcomes are completely beyond the hospital's control. In addition, Medicare Advantage payment amounts, plan denials, and plan-specific payment rules are not used to calculate the mortality measures. We continue to encourage hospitals to work closely with insurers, including Medicare Advantage plans, to coordinate the highest quality care for their patients.

Comment: Many commenters did not support this proposal due to the timing of the proposed changes, citing concerns that the implementation timeline of the methodological re-specifications to the mortality measures was too compressed and did not provide a meaningful transition period. Commenters recommended delaying modifications or taking a phased approach to modifying these measures in the Hospital Value-Based Purchasing Program to ensure that hospitals have had adequate time to evaluate the impacts of the revised methodology before holding them financially accountable. A few commenters recommended delaying implementation of these mortality measures until there is a clearer understanding of the impact of including Medicare Advantage beneficiaries into measure cohorts and confidence that inclusion does not result in any unintended consequences. A commenter expressed concern about the rapid pace of re-specifications to these measures and recommended providing dry-run reports incorporating these changes before implementation in any program to assist hospitals to meaningfully improve outcomes.

Response: We understand commenters' concerns about the impacts of implementing multiple changes to the mortality measures. We note that the current approach to adopt the modified mortality measures into the Hospital Inpatient Quality Reporting Program beginning with the FY 2028 payment determination, per section 1886(o)(2)(C)(i) of the Act, followed by adoption into the Hospital Value-Based Purchasing Program beginning with the FY 2032 program year, is a phased implementation approach. This phased approach allows hospitals to have about 4 years to assess the impact of Medicare Advantage beneficiary inclusion before payment adjustments would take effect.

Comment: Many commenters stated concerns about whether the existing risk adjustment methodologies adequately account for differences in patient complexity, clinical severity, Medicare Advantage-specific coding patterns, and social risk factors across patient populations that may influence patient outcomes and provider performance. A few commenters recommended providing additional analysis and detail on the statistical methods, reliability across hospital types, and safety-net status and case mix before the modified measures are fully incorporated into payment programs.

Response: We note that the updated risk adjustment model accounts for case mix in both Medicare Fee-For-Service and Medicare Advantage cohorts. The clinical variables included in the updated risk adjustment model were selected based on analyses of a combined Medicare Fee-For-Service and Medicare Advantage cohort. This approach ensures that the model captures the key risk factors relevant to the combined population. The model includes an indicator variable for Medicare Fee-For-Service and Medicare Advantage enrollment status, which accounts for any potential differences in risk between these groups. We found that the prevalence of clinical risk factors and their associations with mortality risk were similar across Medicare Fee-For-Service and Medicare Advantage populations. We refer readers to section IX.B.2.f. where we discuss details of technical updates to the mortality measures' risk adjustment methodology.

Comment: A few commenters recommended providing additional analysis and detail showing the results of socioeconomic status factors before the modified measures are fully incorporated into payment programs. A commenter expressed concerns that these measures do not account for social risk factors, which could disproportionately impact facilities serving the most vulnerable patients.

Response: Internal analyses found that the impact of any socioeconomic status factors is small to negligible on model performance and hospital-level results. Given these results, and that all patients deserve the same quality of care regardless of social risk, we do not support risk adjusting for these factors. This analysis also found that including these factors could result in negative impacts to vulnerable populations by lowering the expected mortality rate for these groups, therefore, we excluded these factors from our risk adjustment model.

Comment: A commenter recommended that CMS publish an interim report evaluating the impact across hospitals and commit to annual testing and analysis to monitor changes and recalibrate risk adjustment as needed.

Response: We thank commenters for their recommendation to publish an interim report evaluating the impacts of the measure modifications, but we note we annually publish measure evaluation reports. These evaluations ensure that the risk-standardized mortality models are continually assessed and remain valid, given possible changes in clinical practice and coding standards over time.[276] Modifications made to the

[276] Centers for Medicare & Medicaid Services. 2024 Condition- and Procedure-Specific Mortality/

measure cohort, risk model, and outcomes are informed by review of the most recent literature related to measure conditions or outcomes, feedback from various stakeholders, empirical analyses, and assessment of coding trends that reveal shifts in clinical practice or billing patterns. We make our routine measure evaluation reports publicly available through QualityNet on our website at: *https://qualitynet.cms.gov/.* For the complete measure methodology report and measure risk adjustment model, we specifically refer readers to QualityNet on our website at: *https://qualitynet.cms.gov/inpatient/measures/mortality/methodology.*

Comment: Several commenters raised concerns about the potential for increased administrative burden with the addition of Medicare Advantage beneficiaries, noting that the prior authorization process used by Medicare Advantage plans places a significant administrative burden on both acute care hospitals and post-acute care providers, which requires excessive documentation for medical necessity. A few commenters highlighted concerns that changes to these measures could potentially place disproportionate administrative burdens on rural hospitals with limited staffing and IT resources, emphasizing these burdens may divert critical resources away from patient care. A commenter recommended closely monitoring the impacts of changes to the measures on rural and lower-volume hospitals to ensure that reliability thresholds, case minimums, and reporting approaches do not inadvertently disadvantage these providers.

Response: We would like to clarify that the inclusion of hospital-submitted information-only Medicare Advantage claim or Medicare Advantage organization-submitted encounter data into the mortality measures' cohorts does not require any additional data collection or submission from hospitals. As we discussed in the proposed rule (91 FR 19753 through 19755), the inclusion of Medicare Advantage encounter data in these measures uses readily available claim-level data elements routinely generated and submitted to CMS for Medicare Advantage beneficiaries. Specifically, the Medicare Advantage encounter data used for this measure are submitted by Medicare Advantage organizations to CMS. Similarly, Medicare Fee-For-Service claims are submitted through existing hospital billing processes. As such, the proposed modifications do not impose additional data submission burden on hospitals. We refer readers to sections XII.B.2. and XII.B.4.c. for additional details on our information collection burden estimate for the proposal to adopt the modified mortality measures. In addition, hospitals have been preparing for the addition of Medicare Advantage data to several Hospital Inpatient Quality Reporting Program measures, including the MORT–30–STK measure, the COMP–HIP–KNEE measure, and the Thirty-day Risk-Standardized Death Rate Among Surgical Inpatients with Complications measure currently reported in the Hospital Inpatient Quality Reporting Program (90 FR 36997 through 37002, 90 FR 37002 through 37008, and 89 FR 69545 through 69552).

Comment: A commenter recommended providing technical assistance and funding support targeted to rural providers.

Response: While we will not be providing additional funding support for rural providers, we do note that we have outreach and education information, including detailed information related to the measure specifications, located at: *https://qualitynet.cms.gov/inpatient/iqr.*

Comment: A commenter requested that CMS clarify the use of the data collected under the Hospital Inpatient Quality Reporting Program to inform future Hospital Value-Based Purchasing Program scoring, as well as how hospitals should interpret performance results during this interim phase, noting the transition is not intuitive.

Response: To transition these mortality measures from the Hospital Inpatient Quality Reporting Program to the Hospital Value-Based Purchasing Program, we would first adopt the modified mortality measures into the Hospital Inpatient Quality Reporting Program beginning with the FY 2028 payment determination, per section 1886(o)(2)(C)(i) of the Act, followed by adoption into the Hospital Value-Based Purchasing Program beginning with the FY 2032 program year.

We intend to provide hospitals with measure performance data with the expanded measures' patient cohort based on data collected while the modified mortality measures are in use in the Hospital Inpatient Quality Reporting Program via annual confidential hospital-specific reports beginning with the FY 2028 payment determination, as well as via annual Provider Participation Summary Reports under the Hospital Value-Based Purchasing Program beginning with the FY 2032 program year. We will make routine measure evaluation reports publicly available through QualityNet on our website at: *https://qualitynet.cms.gov/.* We will continue working with hospitals to provide information regarding the effects these changes may have on their publicly reported data under the Hospital Inpatient Quality Reporting Program and potential impacts on their Hospital Value-Based Purchasing Program performance.

Comment: A few commenters recommended providing stratified analyses or supplemental reporting that allows stakeholders to better understand any differences across Medicare Advantage and Medicare Fee-For-Service performance results. A few commenters recommended separate reporting for Medicare Advantage and Medicare Fee-For-Service populations in both public reporting and confidential feedback, citing concerns that combining these populations would obscure meaningful differences. Conversely, a few commenters recommended that these measures should not be publicly reported by plan type, emphasizing that doing so would contradict the intended purpose of measuring hospital quality and outcomes and improve validity and reliability, rather than imply plan-level quality comparisons.

Response: We thank commenters for their recommendation to provide stratified measure results, as well as comments recommending that we do not provide stratified measure results. We considered both options and note that the measures' risk models include an indicator variable for Medicare Fee-For-Service and Medicare Advantage enrollment status, which accounts for any potential differences between these groups. We found that stratifying the models by Medicare Fee-For-Service and Medicare Advantage did not yield meaningful improvements in performance, supporting the decision to model them together with an indicator variable. By keeping Medicare Fee-For-Service and Medicare Advantage patients together for purposes of these measures' calculation and display in public reporting will keep the hospitals' total volume higher for more precise measure scores. We note that while we will publicly report aggregated data, confidential feedback reports to hospitals will include patient-level payer information. We will continue to monitor the measures and evaluate whether future stratifications are warranted in public reporting.

Comment: A commenter supported inclusion of the modified mortality

Complication Measures Supplemental Methodology Report. Available at: *https://qualitynet.cms.gov/inpatient/measures/mortality/methodology.*

measures in the Hospital Inpatient Quality Reporting Program, but expressed concern about modifying them in the Hospital Value-Based Purchasing Program as Medicare Advantage plans may have their own value-based purchasing and alternative payment model arrangements that assess performance for their own enrolled populations, which could potentially lead to counting the same event twice, which could disproportionately impact hospitals serving the most vulnerable patients.

Response: We understand commenters' concerns regarding the potential for the same event being counted by multiple programs and recognize that Medicare Advantage organizations may operate their own quality programs or value-based arrangements. Those arrangements are contracts between a Medicare Advantage organization and its network providers. The modified mortality measures assess hospital-level, condition- or procedure-specific outcomes for Medicare beneficiaries treated at the hospital. Including the same patient outcome in different accountability contexts does not convert the mortality measure into a plan-level quality measure. We remain concerned that omitting Medicare Advantage beneficiaries from the mortality measures does not provide a complete picture of the quality of care provided to Medicare beneficiaries by participating hospitals. We maintain that all patients deserve the same quality of care regardless of payer or status and therefore intend to include all Medicare Advantage beneficiaries in these measures. We intend to monitor for potential differences between the Medicare Advantage and Medicare Fee-For-Service populations on these measures and will watch for any unintended consequences.

Comment: A commenter did not support this proposal for the Hospital Inpatient Quality Reporting Program because the proposed performance period is already underway, expressing concern about the performance period for the measures starting prior to the requirements being finalized in rulemaking and recommending that CMS delay the timeline.

Response: We acknowledge the commenter's concern that finalizing these measures for the Hospital Inpatient Quality Reporting Program beginning with the FY 2028 payment determination would result in public reporting of measure results that include the July 1, 2024 through June 30, 2026 performance period, which will have ended by the time of publication of this final rule. We note the Hospital Inpatient Quality Reporting Program is a pay-for-reporting program and hospital payment is not affected by performance on these measures. As long as hospitals report the required measure data in accordance with the form, manner, and timing policies specified by the Secretary, they would not be subject to a financial penalty under this program. Further, delaying adoption of the modified mortality measures to apply only to future performance periods would unnecessarily delay our efforts to improve transparency regarding hospital performance for the combined Medicare Advantage and Medicare Fee-For-Service populations. We note that, beginning with the FY 2028 payment determination, hospitals will be able to preview their data on these measures in the Hospital Inpatient Quality Reporting Program prior to it being publicly reported via annual confidential hospital-specific reports. Further, the mortality measures would not impact payment adjustments until the FY 2032 program year, when the modified measures would begin to be reported in the Hospital Value-Based Purchasing Program. This phased approach allows hospitals to have about 4 years to assess the impact of Medicare Advantage beneficiary inclusion before being subject to any potential payment adjustments.

Comment: A commenter requested that we clarify that the modifications to these measures are fundamentally re-specified measures with newly calculated benchmarks and performance baselines and not a continuation of the existing measures in the Hospital Value-Based Purchasing Program.

Response: We disagree that these are fundamentally re-specified, but do note that because there are substantive modifications to the measures, we proposed them for adoption in the Hospital Inpatient Quality Reporting Program from the FY 2028 payment determination through the FY 2031 payment determination, prior to implementing the modified measures in the Hospital Value-Based Purchasing Program beginning with the FY 2032 program year, in accordance with statutory requirements. We note the newly calculated benchmarks and performance baselines for the FY 2032 program year for the modified mortality measures will be updated in the FY 2028 proposed rule.

Comment: A commenter did not support adoption of the MORT–30–PN measure into the Hospital Inpatient Quality Reporting Program, citing concerns that the measure minimum reliability achieved with 25 admissions was too low with the shortened 2-year reporting period.

Response: We understand concerns about ensuring measures meet an acceptable level of reliability. We note the measure developer conducted rigorous testing using 2 years of data (CY 2022 and CY 2023) from 3,741 facilities with at least 25 admissions and concluded that the addition of Medicare Advantage beneficiaries to the measure's cohort, in conjunction with the performance period changes, resulted in over 75 percent of hospitals exceeding a 0.6 reliability score, with a mean score of 0.900.[277] When at least 70 percent of hospitals have a reliability above 0.6, the measure is capable of differentiating hospitals' quality of performance, and considered acceptable for use for quality reporting.[278] This demonstrates the proposed measure updates balance a focus of using more recent data with a sufficiently reliable measure score that reflects the quality of care provided by hospitals.

Comment: A few commenters requested that we remove the mortality measures from the Hospital Inpatient Quality Reporting Program after they have been adopted into the Hospital Value-Based Purchasing Program, emphasizing this aligns with the Meaningful Measure framework and de-duplication efforts across quality reporting programs.

Response: As proposed, we would adopt the mortality measures into the Hospital Inpatient Quality Reporting Program for the FY 2028 payment determination through the FY 2031 payment determination, removing them from the program beginning with the FY 2032 payment determination. The mortality measures would be modified in the Hospital Value-Based Purchasing Program beginning with the FY 2032 program year, after meeting statutory requirements to publicly report these measures in the Hospital Inpatient Quality Reporting Program for one year.

Comment: A few commenters recommended ensuring different names for the modified mortality measures in confidential feedback reports and when they are publicly reported to avoid confusion. Commenters also recommended providing additional education about the differences in the

[277] Partnership for Quality Measurement. Hospital 30-Day, All-Cause, Risk-Standardized Mortality Rate (RSMR) Following Pneumonia (PN) Hospitalization, Reliability Tab, under the Meaningfulness Tab. Available at: *https://p4qm.org/prmr-measures/muc2025-044.*

[278] For more details on reliability guidance, we refer readers to the Reliability Guidance for the Endorsement and Maintenance of Clinical Quality Measures Document. Available at: *https://p4qm.org/em/resources.*

quality measures reported across the two programs.

Response: We intend to ensure that the names of modified measures are clearly indicated as such in confidential feedback reports and when publicly reported to avoid any confusion about the two versions of these measures being reported across different programs simultaneously. Technical specifications of the mortality measures are provided on our website under the Measure Methodology Reports section, available at: *https://qualitynet.cms.gov/inpatient/measures/mortality/methodology*. We will continue working with hospitals to ensure that they fully understand any effects these changes may have on their publicly reported data under the Hospital Inpatient Quality Reporting Program and potential impacts on their Hospital Value-Based Purchasing Program performance.

Comment: A commenter requested clarification on whether similar cohort expansions would also apply to other Medicare populations, such as beneficiaries with End-Stage Renal Disease or individuals eligible for Medicare due to long-term disabilities, given the potential for higher clinical complexity, greater comorbidity burden, and elevated baseline mortality risk that could influence observed mortality rates following CABG surgery.

Response: We interpret the comment as a request for clarification regarding whether beneficiaries eligible for Medicare due to end-stage renal disease or long-term disabilities will be included in the measures' cohorts. Beneficiaries with end-stage renal disease can choose either Medicare Fee-For-Service or Medicare Advantage coverage.[279] We note that the measures' patient populations include Medicare Fee-For-Service and Medicare Advantage beneficiaries 65 years and older so beneficiaries with end-stage renal disease under either would be included. For the full measure specifications, including discussion of cohort inclusion and exclusion criteria, we refer readers to: *https://qualitynet.cms.gov/inpatient/measures/mortality/methodology.*

Comment: A few commenters recommended that CMS improve quality measurement to drive mortality reduction in the hospital inpatient setting. A commenter recommended development of measures that recognize the full spectrum of mortality reduction efforts, including clinical assessment, risk stratification, and diagnostic-informed decision-making, including the use of in vitro diagnostics to strengthen quality measurement. A commenter recommended developing metrics or other mechanisms that more directly recognize and reward hospitals that implement targeted plans to improve care for high-risk patient populations.

Response: While we are not updating the measures to include the use of in-vitro diagnostics or incentives for implementing targeted plans for improving care at this time, we encourage hospitals to actively engage in quality improvement efforts that improve care for all patients.

After consideration of the public comments received we are finalizing our proposal as proposed, such that we are finalizing adoption of the five modified mortality measures, MORT–30–AMI, MORT–30–HF, MORT–30–PN, MORT–30–COPD, and MORT–30–CABG, into the Hospital Inpatient Quality Reporting Program from the FY 2028 payment determination through the FY 2031 payment determination, and removing these measures from the Hospital Inpatient Quality Reporting Program beginning with the FY 2032 payment determination, and modifying them in the Hospital Value-Based Purchasing Program beginning with the FY 2032 program year. We refer readers to section IX.B.2.b. for details on the substantive modifications to the five modified mortality measures.

f. Technical Updates

In the FY 2027 IPPS/LTCH PPS proposed rule (91 FR 19574), we also notified the public of technical updates to the risk adjustment methodology for the five modified mortality measures' proposed for adoption in the Hospital Inpatient Quality Reporting Program, beginning with the FY 2028 payment determination, and for modification in the Hospital Value-Based Purchasing Program, beginning with the FY 2032 program year, to use individual International Classification of Diseases (ICD–10) codes instead of hierarchical condition categories (HCC) to improve the measure's risk adjustment methodology. The risk adjustment strategy currently in use involves grouping ICD–10 diagnosis codes from CMS's HCC system into clinically relevant categories (76 FR 26495 through 26511, 80 FR 49557 through 49558, and 81 FR 56994 through 56996). We then evaluate the HCCs for statistical association with the measures' outcomes. To better leverage the data and analytical advances since the measure was initially developed, we created a new approach to use individual ICD–10 codes for risk adjustment. Research has indicated that using individual ICD–10 codes in place of HCCs could significantly improve the model performance of the mortality measures. With this new approach, the ability of the risk adjustment model to account for condition-specific or procedure-specific severity was significantly better. See Table IX.B.9. for a summary of improvements to the risk adjustment models' performance for the five modified mortality measures.[280]

[279] *https://www.medicare.gov/basics/end-stage-renal-disease.*

[280] Partnership for Quality Measurement. (March 2024). 2024 Condition- and Procedure-Specific Mortality/Complication Measures Supplemental Methodology Report. Available at: *https://p4qm.org/prmr-measures/muc2025-036.*

TABLE IX.B.9. RISK ADJUSTMENT MODEL PERFORMANCE COMPARISON USING CALENDAR YEAR 2022 DATA

Measure Title	Fee-For-Service-only cohort with HCC-based Risk Variables		Fee-For-Service and Medicare Advantage cohort with ICD-10-based Risk Variables	
	C-statistic (predictive ability %)	Signal-to-Noise Reliability Median (Q1, Q3)	C-statistic (predictive ability %)	Signal-to-Noise Reliability Median (Q1, Q3)
MORT–30–AMI	0.79 (1.2 – 41.6)	0.51 (0.4, 0.6)	0.86 (1.0 – 63.3)	0.73 (0.6, 0.8)
MORT–30–HF	0.69 (2.5 – 27.3)	0.67 (0.5, 0.8)	0.83 (1.1 – 51.4)	0.9 (0.8, 0.9)
MORT–30–PN	0.73 (2.8 – 41.3)	0.63 (0.5, 0.7)	0.85 (1.2 – 69.2)	0.89 (0.8, 0.9)
MORT–30–COPD	0.74 (1.2 – 26.0)	0.54 (0.5, 0.6)	0.85 (0.7 – 45.9)	0.74 (0.6, 0.8)
MORT–30–CABG	0.79 (0.2 – 11.9)	0.82 (0.8, 0.9)	0.85 (0.4 – 16.2)	0.88 (0.8, 0.9)

We received several comments on this technical update.

Comment: Several commenters supported the notice of the technical updates to the risk adjustment model to transition to ICD–10 codes instead of HCCs. Commenters agreed that updating the risk adjustment methodology will enhance the specificity and clinical relevance of the model. A commenter supported the more granular ICD–10–based modeling, noting that ensuring that mortality measures adequately account for patient complexity is critical, particularly for cardiovascular conditions such as heart failure and for procedures such as CABG that often involve high-risk patients.

Response: We thank commenters for their support and agree the updated risk methodology will enhance specificity and clinical relevance, supporting more granular modeling. We agree that ensuring that these measures adequately account for patient complexity is critical for all patients, especially for high-risk patients.

Comment: A few commenters raised concerns about the abrupt nature of the transition to ICD–10 codes coinciding with the other measure modifications, recommending extensive testing to ensure accuracy and reliability. A commenter shared concerns that updating the risk model to use ICD–10 codes could result in unintended consequences due to variations in coding intensity rather than true patient complexity.

Response: We understand commenters' concerns regarding the change from HCCs to ICD–10 code-based risk models and ensuring that this update results in measures that are accurate and reliable. As discussed in the FY 2027 IPPS/LTCH PPS proposed rule (91 FR 19574), we developed this approach to risk adjustment to better leverage data and analytic advances and found this new approach could significantly improve the model performance and reliability of the mortality measures. For example, the predictive ability of the MORT–30–HF measure improved from 0.69 to 0.83 with the combined Medicare Advantage and Medicare Fee-For-Service and ICD–10-based risk variables, and the MORT–30–AMI measure signal-to-noise reliability improved from 0.51 to 0.73.

We note the measure developers conduct annual measure re-evaluations to ensure the risk-standardized mortality rate model is continually assessed and remains valid, given possible changes in clinical practice and coding standards over time. Modifications made to the measure cohort, risk model, and outcomes are informed by review of the most recent literature related to measure conditions or outcomes, feedback from various stakeholders, empirical analyses, and assessment of coding trends that reveal shifts in clinical practice or billing patterns. We refer readers to Table IX.B.9. for our results. For the complete measure methodology report and measure risk adjustment model, we specifically refer readers to QualityNet on our website at: *https://qualitynet.cms.gov/inpatient/measures/mortality/methodology.* We also refer readers to QualityNet: *https://qualitynet.cms.gov/,* where we make our technical measure specifications reports and measure evaluation reports publicly available.

3. Measuring Emergency Care Access and Timeliness in the Hospital Inpatient Quality Reporting and Hospital Value-Based Purchasing Programs—Request for Information

a. Background

Occupancy and boarding rates in EDs continue to worsen and exceed pre-pandemic levels. ED boarding, defined as holding a patient in the ED after the patient is admitted or placed into observation status at a hospital, is an outcome of misaligned incentives to deploy care delivery resources in a particular way,[281] often resulting in shortages of inpatient beds and staff. ED boarding contributes to ED crowding, leading to safety risks for patients and stressful working conditions for healthcare personnel.[282] [283] [284] A recent report from the Agency for Healthcare Research and Quality (AHRQ) characterized patient ED boarding as a growing public health crisis and engaged interested parties to address the strain on the United States healthcare system.[285]

Recent studies indicate that delays in the timeliness of ED care are associated with patient harm.[286] [287] Long ED wait

[287] Laam L.A., Wary A.A., Strony R.S., Fitzpatrick M.H., & Kraus C.K. (2021). Quantifying the impact of patient boarding on emergency department length of stay: All admitted patients are negatively

times are also one of the most cited reasons for patients leaving an ED without being evaluated by a clinician.[288] Increased ED LOS is also a strong predictor of poor timeliness of care and is significantly impacted by ED boarding. One study of several EDs within a single health system found that for every patient boarded, the median ED LOS for all admitted patients increased by at least 12 minutes.[289] Other evidence indicates that prolonged boarding is concentrated among older adults and is associated with downstream impacts that extend beyond the ED encounter.[290] Furthermore, ED boarding and crowding have been associated with poor patient outcomes, such as increased mortality,[291] delays in needed care,[292] and negative patient and staff experiences.[293] [294] [295] For instance, evidence shows that ED crowding can harm patients with sepsis by delaying administration of lifesaving intravenous (IV) fluids and antibiotics.[296] Additionally, there may be additional operational and financial burdens associated with ED boarding, underscoring its relevance to inpatient capacity management and hospital performance.[297]

Studies have documented a significantly higher likelihood of boarding when hospital occupancy rates exceed 85 percent.[298] [299] These dynamics became more pronounced during the COVID–19 public health emergency, when national hospital occupancy increased by 11 percentage points, while staffed hospital beds declined by roughly 16 percent.[300] Data such as these have supported the argument made by a number of emergency medicine clinicians and researchers that ED efficiency and patient throughput are closely tied to a broad collection of hospital-wide operational processes beyond those just occurring in the ED, including but not limited to inpatient bed management, staffing and procedure scheduling, discharge planning and post-acute care access, and diagnostic and consult turnaround.[301]

In line with this perspective, evidence suggests that hospitals which perform better on metrics related to ED boarding are more likely to adopt cross-departmental initiatives (for example, ED, radiology, laboratory services, hospitalist, surgery, housekeeping, nursing) to alleviate crowding.[302] Hence, hospital administrators, individual departments, and associated staff can collectively participate in a variety of processes and interventions that can contribute to lower levels of boarding in the ED. Actions that make discharges earlier, more predictable, and daily (for example, identifying ''next-day discharges'' during afternoon rounds, using expected date of discharge documented on admission when possible, performing early morning discharge rounds, enabling weekend and holiday discharges, pre-completing discharge paperwork and medication reconciliation) can free beds in preparation of future peaks in ED utilization.[303] [304] ''Smoothing'' the surgical schedule to ensure a steady, predictable demand for inpatient beds throughout the week can eliminate artificial peaks and valleys in bed demand that could otherwise contribute to boarding.[305] Employing real-time monitoring and other predictive capabilities within health information technology systems can also identify new efficiencies in triaging and staffing that can result in better rates of bed turnover.[306] [307] Other examples of interventions that have been considered to address this issue include care transitions, point-of-care testing, observation units, streaming, short-stay units, strengthening triage and ED teams, creating new care zones, use of capacity protocols, and other

administrative or organizational improvements.[308] [309] [310] [311]

Notably, the breadth and variation in these strategies makes it clear that no single intervention will solve the ED boarding crisis, particularly when considering the effectiveness of these actions is likely to vary across patient populations, health status and comorbidities, and case-mix. As such, it is important for throughput and patient flow to be viewed as a shared responsibility within the healthcare delivery system. To that end, quality measures should reflect and promote a culture of accountability.

b. Overview of Measure

The Emergency Care Access & Timeliness eCQM is currently specified for the hospital setting and calculates the proportion of four outcome metrics that quantify access to and timeliness of care in a hospital ED setting against specified thresholds, including: (1) patient wait time—1 hour; (2) whether the patient left the ED without being evaluated; (3) patient boarding time in the ED (as defined by a Decision to Admit (order) to ED departure for admitted patients)—4 hours; and (4) patient ED LOS (time from ED arrival to ED physical departure, as defined by the ED departure timestamp)—8 hours. Measure testing for the Emergency Care Access & Timeliness eCQM was conducted by the measure developer across 32 hospital-based EDs, representing a diverse mix of geographic regions, rurality, hospital size, teaching status, trauma level, and EHR vendors, demonstrating that the measure is reliable, valid, and feasible for all required data elements.[312] Measure testing results showed a wide range in overall scores, and across all strata, indicating variation in performance and implying room for quality improvement.[313]

(1) Numerator

The measure numerator includes any ED encounter in the denominator where the patient experiences any one of the following: (1) the patient waited longer than 1 hour after arrival to the ED to be placed in a treatment room or dedicated treatment area that allows for audiovisual privacy during history-taking and physical examination; (2) the patient left the ED without being evaluated; (3) the patient boarded in the ED for longer than 4 hours; and (4) the patient had an ED LOS of longer than 8 hours.[314] An encounter is considered part of the numerator if it includes any one of the four numerator events, with events not being mutually exclusive and each contributing only once to the numerator. ED encounters with ED observation stays [315] are excluded from components (3) and (4) but are included in the denominator. Patients who have a ''decision to admit'' after an ED observation stay remain excluded from criteria (3) calculations.[316]

These four outcomes were selected based on published literature demonstrating that each numerator component is associated with patient harm, as well as input from clinical experts including ED experts and statistical and methodological experts and a TEP that was convened by the measure developer.[317] A Patient and Family Engagement Work Group provided feedback on experiences with emergency care, noting long wait times to be seen by a provider, long wait times to be transferred, and gaps in the discharge processes.

The numerator thresholds were developed according to evidence and consensus-based clinical guidelines for ED time thresholds, including guidelines developed by The Joint Commission (TJC), the American College of Emergency Physicians (ACEP), and the Emergency Department Benchmarking Alliance as well as input from a TEP, literature reviews, and environmental scans. For example, the 4-hour threshold for numerator component (3), boarding time, was developed according to recommendations from TJC and ACEP.[318] [319] This threshold reflects delays that are influenced by inpatient bed availability, hospital capacity, and admission processes.

(2) Denominator

The measure denominator includes all ED encounters associated with patients of all ages, for all-payers, during a 12-month period of performance. Patients can have multiple encounters during a period of performance, and each encounter is eligible to contribute to the calculation of the measure.[320]

(3) Measure Calculation

The measure score is first calculated at the individual ED level as the proportion of ED encounters where any one of the four outcomes occurred. Raw measure scores are then standardized by ED case volume using z-scores. The z-score, or standard score, indicates how many standard deviations a data point is from the mean of a normal distribution. It is calculated by subtracting the mean from a data point, then dividing the result by the standard deviation. For the Emergency Care Access & Timeliness eCQM, a volume-adjusted z-score shows how an ED's performance compares to the average for similar-volume EDs, addressing differences in patient population in hospital outpatient departments (HOPD) and ensuring fair ''like to like'' comparisons between EDs of similar size. ED volume strata are defined in volume bands of 20,000 ED visits, and each ED is assigned to only one volume stratum. For CMS Certification Numbers (CCNs) with more than one ED, volume-

[316] Specific codes required to calculate the numerator are outlined in the value set data dictionary and eCQM package (Quality Data Model—QDM output). Please refer to the ''Measure Calculation'' Section for information at: *https://p4qm.org/measures/4625e.*

[317] Partnership for Quality Measurement. Emergency Care Capacity and Quality. Available at: *https://p4qm.org/measures/4625e.*

[318] The Joint Commission. (2012). Approved: Standards revisions addressing patient flow through the emergency department. Joint Commission perspectives. *Joint Commission on Accreditation of Healthcare Organizations, 32*(7), 1–5.

[319] American College of Emergency Physicians. (2024). Emergency Department Boarding and Crowding. Available at: *https://www.acep.org/administration/crowding--boarding.*

[320] For proposed measure specifications, we refer readers to the eCQI Resource Center at *https://ecqi.healthit.gov/ecqm/hosp-outpt/2027/cms1244v1,* or the CMS QualityNet Hospital Outpatient Quality Reporting program website at *https://qualitynet.cms.gov/outpatient.*

adjusted z-scores are then combined as a weighted average for that CCN.[321]

The results of the Emergency Care Access & Timeliness eCQM are stratified into four groups, two by age (18 years and older, and under 18 years) and two by mental health diagnoses (with, and without).[322] Testing results during the measure development process indicates that the stratification of results by age and mental health diagnosis, as well as standardization of measure performance scores by volume, was sufficient to account for differences between HOPDs; however, we are seeking feedback on whether additional stratification or risk adjustment would be appropriate if the measure were considered for inclusion in the Hospital Inpatient Quality Reporting and Value-Based Purchasing Programs.

We refer readers to the CY 2026 OPPS/ASC final rule, where the Emergency Care Access & Timeliness eCQM was adopted into the Hospital Outpatient Quality Reporting [323] and Rural Emergency Hospital (REH) Quality Reporting [324] programs (90 FR 53925 through 53934; 90 FR 53945 through 53951). Further information and resources are available at the CMS QualityNet Hospital Outpatient Quality Reporting Program website at *https://qualitynet.cms.gov/outpatient,* which also takes readers to the electronic specifications available at the eCQI Resource Center: *https://ecqi.healthit.gov/ecqm/hosp-outpt/2027/cms1244v1.*

c. Request for Comment on Potential Future Use in the Hospital Inpatient Quality Reporting and the Hospital Value-Based Purchasing Programs

In the FY 2027 IPPS/LTCH PPS proposed rule (91 FR 19577), we sought input on how to best measure care access and timeliness among hospitals participating in its quality reporting and value-based purchasing programs. We recognize that this issue is not specific to one particular setting (that is, inpatient or outpatient), and that a higher-level approach may instead be needed. However, as currently designed, CMS's quality reporting programs are divided to separately monitor inpatient and outpatient settings. If proposed for future rulemaking, we could consider adopting the existing outpatient measure into the Hospital Inpatient Quality Reporting Program as currently specified, or we could make adjustments to tailor it more specifically for inpatient use. Such enhancements could include modifying specific numerator components or the overall denominator to be more applicable for the inpatient setting. However, this more targeted approach to inpatient quality measurement may be at odds with aligning access and timeliness at a systems-level as noted above.

We invited public comment on the potential use of the Emergency Care Access & Timeliness eCQM into the Hospital Inpatient Quality Reporting and Value-Based Purchasing Programs, in addition to the following questions:

- What are some of the key barriers and challenges faced by inpatient providers in supporting process changes that improve bed availability and reduce ED boarding?
- What are the best practices for providers within inpatient departments to actively engage with colleagues in other departments, as well as other settings that impact bed availability (for example, post-acute care facilities)? What barriers do providers face, especially rural providers, in establishing protocols for bi-directional communication?
- Are there any elements of this measure that are not applicable (for example, numerator components, denominator, exclusions, etc.) to inpatient care, or for which an inpatient hospital should not be held accountable, which would warrant removal or modification if the measure is proposed in the Hospital Inpatient Quality Reporting Program?

++ For example, numerator components (1), (2), and (4) of the measure can occur for care provided entirely outside of an inpatient setting. This may lead to concerns that hospital inpatient processes are being evaluated based on the care and outcomes of patients who are not admitted during their stay.

++ On the other hand, as discussed above, ED boarding resulting from processes within the inpatient department impacts the throughput of *all ED patients,* which is reflected in numerator components (1), (2) and (4). Therefore, there are concerns that limiting the inpatient Emergency Care Access & Timeliness eCQM to those admitted or boarded may be insufficient to truly address access and timeliness issues.

- Given the overlap in patient cohort with the measure recently adopted for the Hospital Outpatient Quality Reporting program, do stakeholders have concerns related to duplication of encounters in quality measures? Given the shared responsibility across units within the hospital, is it beneficial for the cohort (or a subset of the cohort) to be tracked across similar measures in both programs?

++ For example, we could consider developing separate measures for each program, where a version for use in inpatient quality reporting tracks access and timeliness amongst patients that were admitted during their stay, while an outpatient quality reporting measure version tracks those not admitted.

- Should CMS consider including this measure in the Hospital Value-Based Purchasing Program? If so, would it be beneficial to keep the current measure specifications as is, particularly as these programs may be better suited to capture broader, system-wide processes?
- Are there any potential unintended consequences CMS should be aware of related to introducing this measure into the Hospital Inpatient Quality Reporting and Value-Based Purchasing Programs?
- Are there other measure development/re-specification ideas or opportunities CMS should consider for how inpatient departments can address ED boarding and better measure patient outcomes, such as harm from delays to inpatient care?

We received public comments on this RFI. The following is a summary of the comments we received:

Comment: Many commenters expressed concerns related to the expansion of the Emergency Care Access and Timeliness eCQM into the Hospital Inpatient Quality Reporting and Value-Based Purchasing Programs. Commenters stated that many of the reasons for prolonged emergency department wait times are outside of a hospital's control, citing availability of inpatient beds, delays in prior authorization, and a shortage of behavioral medicine and post-acute care beds. Many commenters recommended that CMS refine the measure to account for system-level drivers of performance, recognize alternative care delivery models, and incorporate safeguards that align with patient-centered clinical practice. Commenters also stated that time-based metrics may not fully reflect

[321] For proposed measure specifications, we refer readers to the CMS QualityNet Hospital Outpatient Quality Reporting program website at *https://qualitynet.cms.gov/outpatient.*

[322] The principal diagnosis (first listed diagnosis at ED discharge) will be used to define strata inclusion. For this measure's purpose, mental health diagnoses do not include substance use disorder diagnoses. Mental health refers to mental health diagnoses, life stressors and crises, and stress-related physical symptoms.

[323] Available at: *https://www.federalregister.gov/d/2025-20907/p-3744.*

[324] Available at: *https://www.federalregister.gov/d/2025-20907/p-3956.* Notably, the specifications for several components in the REH Quality Reporting program measure differ slightly from the Outpatient Quality Reporting specifications to reflect the fact that REHs do not have inpatient beds. The version of the measure being considered for inpatient reporting matches the Hospital Outpatient Quality Reporting specifications.

the patient safety risks associated with boarding in the emergency department and encouraged CMS to evaluate more clinically meaningful measurement options. Other commenters suggested stratification by patient type to accurately reflect acuity and severity. Another commenter suggested reporting each of the four underlying measures along with the composite performance.

A few commenters expressed concern that the measure needed further technical and conceptual development, noting unclear definitions, a lack of evidence-based guidelines, and a failure to adequately account for differences in case mix and volumes. A few commenters expressed concern that the Emergency Care Access and Timeliness eCQM does not account for variability across different types of facilities, noting that the measure may not capture the challenges faced by different types of hospitals or factors specific to the care provided to different patient demographics, such as pediatric care at children's hospitals, hospitals with specialized patient populations, high-acuity referral centers, safety-net providers, and rural hospitals. A commenter also expressed concern that testing the measure at only 9 sites insufficiently captures the variability in facilities and EHR platforms.

Some commenters supported the inclusion of the Emergency Care Access and Timeliness eCQM in the inpatient reporting programs, stating that factors such as inpatient staffing, bed availability, and scheduling are outside of the control of emergency department staff and continuity of the measure across settings will help address the root causes of boarding. Commenters emphasized that the 4-hour maximum timeframe for patients admitted from the emergency department should remain a strict limit and that time in the emergency department should never exceed 8 hours and stated that it is critical to avoid changes that would weaken accountability if the measure must be modified for adoption in the inpatient settings. A few commenters observed that including this measure in the inpatient quality reporting programs would complement the current Age Friendly Hospital measure.

Many commenters identified many barriers and challenges related to improving bed availability and reducing emergency department boarding, including workforce shortages, behavioral health capacity constraints, inpatient bed occupancy, post-acute care bed availability, challenges in finding placement for medically complex patients, and laborious prior authorization requirements. Commenters noted that hospitals continue to strengthen their ability to undertake cross-disciplinary improvement initiatives and to continue to build the operational analytics and capacity management capabilities necessary for system redesign and stated that CMS should allow hospitals additional time to develop these capabilities. Several commenters emphasized the challenges faced in placing behavioral medicine patients due to significant shortages in inpatient psychiatric facility beds and staff as well as reimbursement and coverage limitations. A few commenters stated that the problems in emergency departments are exacerbated by a shortage of primary care providers and an ongoing loss of insurance coverage, leading many to delay care and use the emergency department as a primary care provider. A commenter explained that prior authorization requirements for advanced medical imaging in urgent care and outpatient settings result in patients presenting to the emergency department for timely care, straining emergency department capacity. A few commenters focused on the additional challenges faced in rural settings such as a lack of round-the-clock specialty care, case management, and social workers as well as a lack of geographically close nursing homes or other post-discharge care settings, making hospital throughput and discharges particularly difficult and time intensive.

Several commenters discussed their best practices for encouraging collaboration and engagement across departments and care settings. Examples included EHR interoperability, automated treatment capacity trackers, triage hospitalists, identification of appropriate alternatives to admission, trained social workers and case managers to help expedite placement and transfer, specialists embedded in the emergency department for consultations, and a clear escalation path for questions and disputes. Commenters stated that the exclusion of behavioral healthcare providers from the financial incentives of the Health Information Technology for Economic and Clinical Health Act resulted in a gap in capabilities, and that this gap negatively impacts the exchange of data and delays the acceptance and transfer of patients.

Commenters stated that multiple elements are not applicable to inpatient care or are factors that the hospital should not be held accountable or penalized for. Some commenters reiterated that the Emergency Care Access and Timeliness eCQM is not suitable for the inpatient environment. Other commenters stated that psychiatric units, patients who left without being seen, and hospice patients should be excluded from the measure. Another commenter suggested that patient volume, hospital classification, and provider access should be considered when evaluating performance on the measure. A commenter suggested that a measure of time from consult order to consult completion be added to the measure, while another commenter suggested that socioeconomic status and social determinants of health should be accounted for. Several commenters voiced concerns with aspects of the measure for inpatient or outpatient settings, specifically the ''dedicated treatment area with audiovisual privacy,'' noting that the concept is unclear and not represented in the structured data elements. A commenter suggested that focusing an inpatient measure on patients with a decision to be admitted would be more appropriate than including all emergency department patients in the denominator.

Many commenters stated that adding the Emergency Care Access and Timeliness eCQM to inpatient quality reporting programs would be duplicative, increase administrative burden, increase the risk of payment adjustments for the same measure, and add complexity. Commenters stated that delays in the emergency department are often driven by factors outside of the control of the hospital and that CMS should invest in infrastructure and community-based services to address these issues. Commenters encouraged CMS to invest in more clinically significant emergency department measures or evaluate whether existing Hospital Outpatient Quality Reporting Program measures can be enhanced to address identified gaps. Many commenters expressed concern with adding the Emergency Care Access and Timeliness eCQM to additional programs before reporting data is available, encouraging CMS to collect sufficient data from the outpatient programs to identify unintended consequences first. Commenters supporting the adoption of the Emergency Care Access and Timeliness eCQM in the inpatient programs stressed the importance of prioritizing alignment across programs and clear guidance regarding the interpretation of results.

Commenters were largely opposed to including the Emergency Care Access and Timeliness eCQM in the Hospital Value-Based Purchasing Program due to the complexity and the influence of

factors outside the control of the hospital such as behavioral health patients awaiting placement, patients who cannot be discharged for lack of post-acute or supportive housing options, and non-deferrable trauma volume. Commenters emphasized that, if the measure must be added to the Hospital Value-Based Purchasing Program, it needs to be evaluated and reported in the Hospital Inpatient Quality Reporting Program for at least two years, and all components have been clearly and consistently defined. Many commenters stated that the measure is inappropriate for the Hospital Value-Based Purchasing Program.

Many commenters expressed concerns regarding unintended consequences of adopting the Emergency Care Access and Timeliness eCQM into the inpatient programs, such as incentivizing hospitals to convert patients to observation status to avoid poor scores. Commenters also expressed concerns that the measure could result in inpatient units being disincentivized to accept direct admissions from other facilities, an increase in provider burnout, less time spent on thorough patient exams, premature disposition or discharge of patients, and an increase in patient diversion. A commenter stated that the measure does not account for modern care delivery models, including triage-based evaluation and waiting room treatment models, and another commenter expressed concerns about variability in documentation and timestamp capture that would impact data accuracy. A commenter cautioned CMS to avoid a pattern of adopting, then sunsetting, key emergency care measures, as this has limited the ability to track boarding trends and weakened enforcement initiatives.

Commenters recommended options to address emergency department boarding, such as phasing in complementary metrics to provide a more complete picture, modifying the emergency services CoP to add a readiness component, creating metrics for Medicare Advantage plans related to the timeliness of prior authorizations, improving access to post-acute care for Medicare Fee-For-Service beneficiaries, and encouraging direct inpatient admissions from outpatient settings. A commenter also suggested analyzing hospitals that do not have the staffing capacity to support their inpatient capacity. Another commenter suggested that CMS prioritize policies impacting the flow of patients to the most appropriate care setting, such as addressing issues with prior authorization, inpatient psychiatric bed availability, and inadequate community resources.

Response: We appreciate all the comments and interest in this topic. While we are not responding to specific comments in response to the RFI in this final rule, we acknowledge that this input is very valuable and will continue to take all concerns, comments, and suggestions into account for future development and consideration of this measure for the Hospital Inpatient Quality Reporting Program and the Hospital Value-Based Purchasing Program.

4. Potential Future Use of the Adult Community-Onset Sepsis Standardized Mortality Ratio Measure in the Hospital Inpatient Quality Reporting Program—Request for Information

a. Background

Sepsis is a life-threatening condition that results from the body's dysregulated response to infection and is a leading cause of mortality, hospitalization, and readmission in the United States.[325] It is the most frequent principal diagnosis among non-maternal, non-neonatal inpatients, with over 2.2 million hospitalizations reported in 2018.[326] Of the 1.7 million adults diagnosed with sepsis annually, approximately 20 percent die.[327] [328] [329] [330]

Accurate tracking of sepsis incidence and outcomes can be challenging due to the lack of a definitive diagnostic test and wide variation in diagnosis and coding practices.[331] There are limitations to using claims data only, for example reporting delays and incomplete data for non-Medicare/Medicaid patients. Increased screening and coding for sepsis have led to more cases being identified, often inflating case counts and lowering reported mortality rates.[332] A measure assessing the community-onset sepsis standardized mortality ratio is essential for producing timely, consistent, and clinically meaningful comparisons across hospitals.[333]

For the past several years, we have been working together with the CDC's National Healthcare Safety Network (NHSN) team to advance CMS's digital strategy through the use of digital quality measures (dQMs).[334] Through this collaboration, we have been exploring leveraging CDC's NHSNLink application programming interface (API) that would allow hospitals to exchange data and report digital quality measures to NHSN in a hands-free, fully automated manner, using the FHIR® standard for exchanging healthcare information electronically between information systems.[335] FHIR is a foundational, standards-based specification developed for secure and scalable electronic health information exchange. Using FHIR, data are represented based on nationally recognized standards across EHR vendors, facilities, and agencies. Through CDC's NHSNLink API, EHR data can be pulled from a facility, making real-time patient-level, risk-adjusted surveillance feasible, while at the same time, it can also provide the data needed to calculate hospital quality measures for CMS quality programs,

thus significantly reducing reporting burden for facilities. This enables different systems, such as EHRs and applications, to exchange information in a consistent, structured, and reusable format. CMS has already integrated the FHIR standard, and signaled the use of FHIR, in some of our interoperability requirements in our quality reporting modernization. CDC has implementation guides that describe the CDC NHSN's approach to digital data and the technical specifications for reporting to NHSN. We refer readers to these resources for additional detail on the electronic reporting of NHSN digital quality measures: *https://hl7.org/fhir/us/nhsn-dqm/* and *https://www.cdc.gov/nhsn/fhirportal/dqm/ig/*. CDC is currently partnering with 19 hospitals and health systems across the United States who are working to pilot, implement, and validate NHSN dQMs. This network of hospitals will be the foundation for advancing new healthcare data exchange approaches like FHIR® and will provide valuable insights and lessons learned for implementing FHIR-based dQMs that can be shared with all United States hospitals as they build their FHIR capabilities.

CMS and CDC are collaborating on the development of several FHIR-based dQMs which may be adopted into CMS hospital quality programs in the coming years. Of these, we have identified the Adult Community-Onset Sepsis Standardized Mortality Ratio measure as a high priority due to high sepsis mortality and morbidity. This measure was reviewed in the 2025 Pre-Rulemaking Measure Review process and is currently being tested as a pilot with NHSN partner hospitals (more information available at: *https://www.cdc.gov/nhsn/nhsncolab/index.html*).[336] These partners are submitting EHR FHIR data to NHSN as well as data from claims.

b. Overview of Measure

The Adult Community-Onset Sepsis Standardized Mortality Ratio measure provides hospitals with a nationally benchmarked metric of community-onset sepsis mortality outcomes, which can be used to measure their progress on improving the care of patients with sepsis. The measure uses data from the EHR in combination with claims data to provide robust risk-adjustment. All data elements are in defined fields in electronic sources and align with United States Core Data for Interoperability (USCDI)[337] and USCDI+ Quality[338] standards.

Empiric validity of the measure was tested by comparing hospital-level adult community-onset sepsis standardized mortality ratios (SMRs) to hospital-level process measures that are typically considered to reflect best practices for sepsis care in the first 3–6 hours (Severe Sepsis and Septic Shock Management Bundle [SEP–1]), Hospital 30-day, All-cause, Risk-Standardized Mortality Rate Following Pneumonia Hospitalization (pneumonia mortality), and the CMS Overall Hospital Star Rating. SMRs correlated with pneumonia mortality ($\rho = 0.27$, $p < 0.001$) and quality star ratings ($\rho = -0.29$, $p = 0.001$). The results support the rationale for the Adult Community-Onset Sepsis Standardized Mortality Ratio measure that encourages hospitals to focus on the full breadth of sepsis care, from presentation through discharge, and foster innovation in identifying additional measures that meaningfully impact sepsis outcomes. The CDC calculated signal-to-noise reliability across 433,065 persons from 265 hospitals and reported a median reliability of 0.921.

(1) Measure Description

The measure assesses the annual risk-adjusted standardized mortality ratio (SMR) of adult inpatients with community-onset sepsis who died during their hospitalization or were discharged to hospice. The SMR is reported annually and is calculated by dividing the number of observed community-onset sepsis deaths by the number of predicted community-onset sepsis deaths.

(2) Numerator

The measure numerator is the number of annually observed adults with community-onset sepsis who died during hospitalization or were discharged to hospice. The following are excluded from the numerator:

- Patients <18 years of age
- Length of hospitalization >120 days
- Patients with prior enrollment in hospice
- Patients that transferred to another acute care hospital

(3) Denominator

The measure denominator is the number of annually predicted adults with community-onset sepsis who died during hospitalization or were discharged to hospice.

(4) Measure Calculation

Hospital-level Standardized Mortality Ratio = (observed adult community-onset sepsis in-hospital mortality & discharge to hospice)/(predicted community-onset sepsis in-hospital mortality & discharge to hospice).

(5) Risk-Adjustment

This measure utilizes a risk-adjustment model incorporating baseline patient characteristics (age, sex), comorbidities, and detailed clinical data (including vital signs, laboratory values, positive blood cultures and COVID–19 tests, body mass index, and infection source per ICD–10 codes).

We refer readers to the NHSN digital Quality Measure Resource Center at *https://www.cdc.gov/nhsn/fhirportal/dqm/ach-dQMs.html* for more details on the measure specifications.

(6) Data Sources

Data are from EHRs that would be submitted via the FHIR-based NHSNLink API and augmented by claims data (specifically, ICD–10 codes) for specific components of the sepsis definition, certain exclusions, and part of the risk adjustment. Hospitals' claims data could be submitted directly to NHSN by uploading .csv files or through a third party vendor on a hospital's behalf and would be similar in process to how facilities currently report claims data for the NHSN Surgical Site Infection measures.

c. Pre-Rulemaking Process and Measure Endorsement

(1) Recommendations From the Pre-Rulemaking Measure Review Process

We refer readers to the Partnership for Quality Measurement for details on the Pre-Rulemaking Measure Review process convened by the CBE, including the voting procedures used to reach consensus on measure recommendations.[339] [340] The Pre Rulemaking Measure Review Hospital Committee, consisting of both the Pre-

[336] Partnership for Quality Measurement. (February 2026). 2025–2026 Pre-Rulemaking Measure Review Recommendation Group Final Meeting Summary: Hospital Committee. Available at: *https://p4qm.org/sites/default/files/2026-02/PRMR-Hospital-Recommendation-Group-Meeting-Final-Summary-508.pdf.*

[337] Office of the National Coordinator for Health IT. United States Core Data for Interoperability (USCDI). Available at: *https://www.healthit.gov/isp/united-states-core-data-interoperability-uscdi.*

[338] Office of the National Coordinator for Health IT. USCDI+. Available at: *https://www.healthit.gov/topic/interoperability/uscdi-plus.*

[339] Partnership for Quality Measurement. Pre-Rulemaking Measure Review web page. Available at: *https://www.p4qm.org/prmr/about.*

[340] We note the Pre-Rulemaking Measure Review voting process was updated in 2025. We refer readers to the corresponding footnote in section IX.B.1.d.(1) of this final rule for more details on the updated Pre-Rulemaking Measure Review voting process.

Rulemaking Measure Review Hospital Recommendation Group (hereafter referred to as the Recommendation Group) and Pre-Rulemaking Measure Review Hospital Advisory Group, met on January 12 and 13, 2026, to review measures included by the Secretary on the publicly available ''2025 Measures Under Consideration List,'' including the Adult Community-Onset Sepsis Standardized Mortality Ratio measure.[341] Table IX.B.10. summarizes the voting results for this measure in the Hospital Inpatient Quality Reporting and Hospital Value-Based Purchasing Programs. The Recommendation Group reached consensus to recommend adoption of the Adult Community-Onset Sepsis Standardized Mortality Ratio measure in the Hospital Inpatient Quality Reporting Program but did not reach consensus on the use of the measure in the Hospital Value-Based Purchasing Program.[342]

TABLE IX.B.10. PRE-RULEMAKING MEASURE REVIEW HOSPITAL RECOMMENDATION GROUP VOTING RESULTS FOR THE ADULT COMMUNITY-ONSET SEPSIS STANDARDIZED MORTALITY RATIO MEASURE

Program	Voted to Recommend	Voted to Not Recommend	Consensus Reached	Recommendation Decision
Hospital Inpatient Quality Reporting Program	17 (81%)	4 (19%)	Yes	Recommend
Hospital Value-Based Purchasing Program	12 (57%)	9 (43%)	No	Majority of the Recommendation Group expressed some support.

(2) Measure Endorsement

We refer readers to the FY 2025 IPPS/LTCH PPS final rule (89 FR 69458 through 69459) for details on the measure endorsement and maintenance process, including the measure evaluation procedures the Endorsement and Maintenance Committees use to evaluate measures and whether they meet endorsement criteria. The Adult Community-Onset Sepsis Standardized Mortality Ratio measure will be submitted in a future cycle for endorsement by the CBE. Section 1886(b)(3)(B)(viii)(IX)(bb) of the Act provides an exception that, in the case of a specified area or medical topic determined appropriate by the Secretary for which a feasible and practical measure has not been endorsed by the entity with a contract under Section 1890(a) of the Act, the Secretary may specify a measure that is not so endorsed as long as due consideration is given to measures that have been endorsed or adopted by a consensus organization identified by the Secretary. We reviewed CBE-endorsed measures and were unable to identify any other CBE-endorsed measures that specifically measure sepsis mortality, therefore we believe the exception in Section 1886(b)(3)(B)(viii)(IX)(bb) of the Act applies.

d. Request for Comment on Potential Future Use in the Hospital Inpatient Quality Reporting Program

We invited public input on the potential use of the Adult Community-Onset Sepsis Standardized Mortality Ratio measure, in addition to the following questions:

Operational Considerations

- How feasible would it be for hospitals, especially those in rural areas, to implement and report on this measure using existing data and workflows? What data, workflow, or resource challenges do you anticipate? What is the single most important change you would recommend, if any?
- Do EHRs receive reconciled claims codes from payers or billing systems? Do EHR data reflect the claims-adjudicated codes or does it remain unchanged after claims are submitted? Are there any time lags or any other considerations for using the claims codes for sepsis surveillance and measure calculation as described above? If EHRs do receive reconciled claims from the billing systems, are they able to be represented in FHIR APIs?
- Do third-party vendors reconcile the claim codes? If so, how do these vendors receive data and submit data, what standards are used, and what is the frequency and cadence of data flow? Please consider third-party vendors such as quality measurement vendors, health information exchanges, aggregators, EHR intermediaries, etc. who may normalize or reconcile claims (ICD–10, CPT, HCPCS) with clinical or FHIR-based data for reporting purposes.
- What are anticipated challenges in mapping EHR data to the specified Sepsis measure FHIR profiles and value sets? Please focus on data elements that may be unstructured (for example, are in narrative form), may be represented in local codes, or exist outside of commonly used documents that map to FHIR profiles (for example, flowsheets and provider orders). We refer readers to the NHSN digital quality measure information available at: *https://hl7.org/fhir/us/nhsn-dqm/* and *https://www.cdc.gov/nhsn/fhirportal/dqm/ig/*.
- Are there any additional anticipated challenges or burden related to: (1) making the required EHR data available in FHIR, (2) accessing and linking claims data needed for exclusions and risk adjustment, or (3) working with vendors or NHSN to implement the dQM specifications referenced above? Please provide details.

Additional Policy Options

- To what extent do you believe this measure allows for fair comparison across hospitals? What adjustments or stratifications, if any, would improve fairness?
- To what extent do you agree this measure meaningfully reflects quality/value of care such that CMS should consider including this measure in a pay-for-performance program, such as

[341] Centers for Medicare & Medicaid Services. (December 2025). 2025 Measures Under Consideration List. Available at: *https://mmshub.cms.gov/measure-lifecycle/measure-implementation/pre-rulemaking/lists-and-reports/overview*.

[342] Partnership for Quality Measurement. (February 2026). 2025–2026 Pre-Rulemaking Measure Review Recommendation Group Final Meeting Summary. Available at: *https://p4qm.org/sites/default/files/2026-02/PRMR-Hospital-Recommendation-Group-Meeting-Final-Summary-508.pdf*.

the Hospital Value-Based Purchasing Program?

• Are there any potential unintended effects of using this measure for payment adjustment (for example, risk variable selection, reduced access to care, documentation burden)? If yes or not sure, please describe.

We received public comments on this RFI. The following is a summary of the comments we received:

Comment: Many commenters expressed support for the transition from process measures to outcome-based measures. Some commenters expressed concern regarding the Adult Community-Onset Sepsis Standardized Mortality Ratio measure, noting that further pilot testing and stakeholder engagement were needed in order to ensure that the pilot organizations represent a meaningful cross-section of hospitals and vendors. Commenters requested that CMS carefully define the sepsis population and consider stratification by severity. Some commenters requested that CMS provide clear technical specifications, as well as further information regarding the methodology used to calculate the standardized mortality ratio, including risk adjustment, patient attribution, and inclusion and exclusion criteria. A commenter expressed concern regarding the overlap between the measure specifications and Food and Drug Administration's guidance for medical devices, in which clinical decision support for sepsis is a Medical Device requiring 510(k) clearance.

Many commenters encouraged CMS to move beyond the current Severe Sepsis and Septic Shock: Management Bundle (SEP–1), stating that it is out of date and no longer reflects best practice or provides meaningful information. Other commenters encouraged CMS to evaluate the appropriateness of sepsis measures in pay-for-performance programs, noting that meaningful improvements in sepsis outcomes will also require greater emphasis on community-based prevention, early recognition, care access, and post-discharge support. A commenter recommended that CMS retire SEP–1 and pursue a smaller, well-tested set of sepsis measures. Other commenters encouraged CMS to explore measures targeting early identification of sepsis, address inaccurate diagnosis of sepsis, address the prevalence of contaminated blood cultures, and recognize the importance of in vitro diagnostics in improving outcomes.

Commenters expressed concerns regarding the measure's feasibility and implementation burden, particularly for rural hospitals, and cautioned against adding a new sepsis measure that could increase burden without improving outcomes. Many commenters noted that there are significant variations across hospitals due to differences in rural access, transfer patterns, patient acuity, limited specialty resources, and baseline mortality risk, stating that current risk adjustment models may not fully capture these nuances. Commenters also noted that factors beyond the control of the inpatient facility have a significant impact on sepsis outcomes, and urged CMS to account for the impact of social determinants of health variables (such as delayed access to care, transportation barriers, health literacy, and limited primary care access) within risk adjustment models as well as risk adjustment based on a clinical illness severity score. Another commenter encouraged CMS to consider the challenges faced by rural hospitals, specifically resource constraints and patients that tend to be older, have less contact with the healthcare system, and are often sicker when they arrive at the hospital. A commenter encouraged CMS to provide hospitals access to mortality data for deaths that occur outside of the hospital by providing information from the Social Security Death Index. Commenters stated that measures should include clinically appropriate exclusions so that reporting does not penalize clinician judgment and individualized care, which may create adverse incentives potentially resulting in harmful, non-individualized care.

Other commenters raised ongoing concerns regarding attribution, reliance on present-on-admission coding, transfer patients, variability in defining community-onset cases, and stated that these considerations impact the ability to compare outcomes across hospitals. A commenter expressed concern that limited interoperability and visibility across EHR platforms placed hospitals in areas with multiple healthcare systems at a disadvantage. Commenters stated that it is important to adjust for risk value selection, the appropriate classification of sepsis, code status on admission, and access to care to improve comparability across hospitals.

Although commenters recognized that the measure criteria reflect a meaningful effort to standardize the capture of data relevant to sepsis events and supported the goal of incentivizing the timely and accurate identification of sepsis, they also expressed concern that the resources to implement, maintain, and monitor this measure would be substantial. Some commenters stated that the current one-time early preview of measure results is not sufficient and suggested that CMS provide a 3-year implementation timeline for reporting new measures with additional post-reporting time to review results and adjust documentation and workflows accordingly.

Some commenters encouraged CMS to pursue CBE endorsement as soon as is feasible and prior to including the measure in a quality reporting program. A commenter recommended that CMS defer to the measure specifications instead of codifying the measure in the rule text, citing complications related to the divergence between the regulatory text and the measure specification as the measure evolves.

Commenters recommended changes to the measure, including: a case minimum that is high enough to ensure a valid reliability score; clear definitions of elements such as sepsis categorization, inclusion and exclusion criteria, and risk adjustment; and the exclusion of transfer patients, hospice patients, and patients who refuse care. Commenters supported approaches that limit reliance on billing codes or claims-based processes, stating that risk-adjustment that relies on claims-adjudicated ICD–10 codes result is not compatible with a time-critical measure, and that there is a great deal of inconsistency in the way that adjudicated claims data are received, stored, and integrated. Several commenters stated that the transition to digital quality measurement using data from the EHR instead of relying on claims-based methods is the right approach. Commenters also expressed concerns that claims-based approaches lend themselves to deceptive coding practices and are more reflective of administrative coding practices than clinical care provided. A commenter stated that fragmentation across settings makes it challenging to meet reporting thresholds, and dependencies such as adjudicated claims feeds add delays and burden. Another commenter noted that the term ''reconciled claims data'' is not defined for the measure and requested clarification, also requesting that CMS avoid using dual submission methodologies for a single measure. A commenter suggested that CMS encourage the use of the Patient Access and Provider Access APIs as a source for adjudicated claims data.

Many commenters expressed concerns about including the Adult Community-Onset Sepsis Standardized Mortality Ratio measure in the Hospital Value-Based Purchasing Program. Commenters were concerned that inadequate consideration of pre-hospital influences would disadvantage hospitals based on the population they serve. Others stated that the lack of a

standardized national definition of sepsis, as well as the presence of SEP–1 in the program, would create unnecessary burden and that the measures do not allow for comparison across systems. A commenter believed that sepsis measures in the Hospital Inpatient Quality Reporting, Hospital Value-Based Purchasing, and Hospital Readmission Reduction Programs would result in hospitals experiencing compound penalties driven by a single patient population. Commenters that did not oppose inclusion of the measure in the Hospital Value-Based Purchasing Program urged CMS to thoroughly test it in the Hospital Inpatient Quality Reporting Program and allow sufficient time for hospitals with smaller EHRs to adapt workflows and reporting systems.

Many commenters expressed concern that using this measure for payment adjustment may result in unintended consequences, such as disincentivizing palliative care and hospice, increasing antimicrobial resistance by incentivizing the use of broad-spectrum antibiotics, and penalizing hospitals that care for the sickest and most medically complex patients.

Many commenters provided feedback regarding additional challenges or burden related to using FHIR for reporting the Adult Community-Onset Sepsis Standardized Mortality Ratio measure. Commenters emphasized the need for: robust pilot testing; demonstrations of feasibility across diverse EHRs, hospitals, and clinical settings; detailed specifications; and confidential feedback reports for multiple reporting periods. Several commenters expressed concerns about the use of unstructured or narrative data, and many commenters stressed that the build, mapping, and workflow challenges inherent in moving to FHIR will be substantial. While some commenters believed that the use of FHIR would eventually be less burdensome than current reporting methods, many commenters stated that small and under-resourced hospitals would be at a disadvantage during the transition due to the increased burden and lack of access to resources. Commenters also expressed concerns about the cost of upgrades and services related to the transition to FHIR. Many commenters stated that CMS needs to provide adequate time for the workflow modifications, infrastructure updates, and reconfigurations that will be necessary to move to FHIR-based reporting. A few commenters suggested a phased, pilot-based implementation pathway.

Several commenters supported the transition to FHIR but encouraged CMS to proceed with caution and consider the challenges with prior interoperability and quality reporting initiatives as well as the hybrid readmission and mortality measures. A commenter stated that additional data endpoints are needed to capture the data required in the measure and recommended a targeted expansion of the USCDI rather than modifications to the measure. Another commenter stated that FHIR mapping must realistically reflect the diverse settings in which a patient is provided care for sepsis, while other commenters expressed concerns regarding the challenges related to interoperability and data exchange. A few commenters encouraged CMS to invest in submission models that utilize FHIR APIs and bulk-data exports, and to evaluate opportunities to provide FHIR-based reporting pathways from the earliest stages of measure adoption and implementation. A few commenters requested further clarification regarding the long-term certification plans and transition strategies for current quality reporting measures, another expressed concerns regarding the lack of alignment between the approaches CMS and the CDC are taking to develop dQMs.

Response: We appreciate all the comments and interest in this topic. While we are not responding to specific comments in response to the RFI in this final rule, we acknowledge that this input is very valuable and will continue to take all concerns, comments, and suggestions into account for future development and consideration of this measure for the Hospital Inpatient Quality Reporting Program and the Hospital Value-Based Purchasing Program.

C. Requirements for and Changes to the Hospital Inpatient Quality Reporting Program

1. Background and History of the Hospital Inpatient Quality Reporting Program

The Hospital Inpatient Quality Reporting Program is a pay-for-reporting program intended to measure the quality of hospital inpatient services, improve the quality of care provided to Medicare beneficiaries, and facilitate public transparency. Section 1886(b)(3)(B)(viii) of the Social Security Act (the Act) states that subsection (d) hospitals participating in the Hospital Inpatient Quality Reporting Program that do not submit data required for measures selected with respect to such a year, in the form and manner required by the Secretary, will incur a 2.0 percentage point reduction to their annual payment update for the applicable fiscal year. We refer readers to our previous final rules for detailed discussions of the history of the Hospital Inpatient Quality Reporting Program, including statutory history, and for the measures we have previously adopted for the Hospital Inpatient Quality Reporting Program measure set.[343] We also refer readers to 42 Code of Federal Regulations (CFR) 412.140 for the Hospital Inpatient Quality Reporting Program regulations. We note that in the FY 2026 IPPS/LTCH PPS proposed rule, we discontinued the practice of retaining all subsections of the preamble every year where there are no proposed changes.

2. Considerations in Expanding and Updating Quality Measures

(a) Background

We refer readers to the FY 2019 IPPS/LTCH PPS final rule (83 FR 41147 through 41148), in which we describe the Meaningful Measures Framework. In 2021, we launched Meaningful Measures 2.0 to promote innovation and modernization of all aspects of quality, addressing a wide variety of settings, interested parties, and measure requirements.[344]

There are statutory requirements that the Secretary of HHS make public certain quality and efficiency measures that the Secretary is considering for adoption through rulemaking under Medicare.[345] To comply with those requirements, the consensus-based entity (CBE), currently Battelle, convenes the Partnership for Quality Measurement, which is comprised of

[343] These rules are: the FY 2010 IPPS/LTCH PPS final rule (74 FR 43860 through 43861); the FY 2011 IPPS/LTCH PPS final rule (75 FR 50180 through 50181); the FY 2012 IPPS/LTCH PPS final rule (76 FR 51605 through 51653); the FY 2013 IPPS/LTCH PPS final rule (77 FR 53503 through 53555); the FY 2014 IPPS/LTCH PPS final rule (78 FR 50775 through 50837); the FY 2015 IPPS/LTCH PPS final rule (79 FR 50217 through 50249); the FY 2016 IPPS/LTCH PPS final rule (80 FR 49660 through 49692); the FY 2017 IPPS/LTCH PPS final rule (81 FR 57148 through 57150); the FY 2018 IPPS/LTCH PPS final rule (82 FR 38326 through 38328 and 82 FR 38348); the FY 2019 IPPS/LTCH PPS final rule (83 FR 41538 through 41609); the FY 2020 IPPS/LTCH PPS final rule (84 FR 42448 through 42509); the FY 2021 IPPS/LTCH PPS final rule (85 FR 58926 through 58959); the FY 2022 IPPS/LTCH PPS final rule (86 FR 45360 through 45426); the FY 2023 IPPS/LTCH PPS final rule (87 FR 49190 through 49310); the FY 2024 IPPS/LTCH PPS final rule (88 FR 59144 through 59203); the FY 2025 IPPS/LTCH PPS final rule (89 FR 69515 through 69577); and the FY 2026 IPPS/LTCH PPS final rule (90 FR 36996 through 37027).

clinicians, patients, measure experts, and health information technology specialists, to participate in the pre-rulemaking process and the measure endorsement process. We refer readers to the Partnership for Quality Measurement website [346] for a more detailed discussion on the updated Pre-Rulemaking Measure Review process, as well as the endorsement and maintenance process.

3. New Measures for the Hospital Inpatient Quality Reporting Program Measure Set

In the FY 2027 IPPS/LTCH PPS proposed rule, we proposed to adopt eight measures into the Hospital Inpatient Quality Reporting Program, three new measures (91 FR 19581 through 19588), and five modified mortality measures (91 FR 19568 through 19574) as a step towards substantively modifying the mortality measures currently used in the Hospital Value-Based Purchasing Program: (1) Excess Days in Acute Care After Hospitalization for Diabetes measure beginning with the July 1, 2025 through June 30, 2027 performance period, associated with the FY 2029 payment determination; (2) Advance Care Planning electronic clinical quality measure (eCQM) beginning with the CY 2028 reporting period/FY 2030 payment determination; (3) Hospital Harm—Postoperative Venous Thromboembolism eCQM beginning with the CY 2028 reporting period/FY 2030 payment determination; (4) Hospital 30-Day, All-Cause, Risk-Standardized Mortality Rate Following Acute Myocardial Infarction Hospitalization measure beginning with the July 1, 2024 through June 30, 2026 performance period, associated with the FY 2028 payment determination; (5) Hospital 30-Day, All-Cause, Risk-Standardized Mortality Rate Following Heart Failure Hospitalization measure beginning with the July 1, 2024 through June 30, 2026 performance period, associated with the FY 2028 payment determination; (6) Hospital 30-Day, All-Cause, Risk-Standardized Mortality Rate Following Pneumonia Hospitalization measure beginning with the July 1, 2024 through June 30, 2026 performance period, associated with the FY 2028 payment determination; (7) Hospital 30-Day, All-Cause, Risk-Standardized Mortality Rate Following Chronic Obstructive Pulmonary Disease Hospitalization measure beginning with the July 1, 2024 through June 30, 2026 performance period, associated with the FY 2028 payment determination; and (8) Hospital 30-Day, All-Cause, Risk-Standardized Mortality Rate Following Coronary Artery Bypass Graft Surgery measure beginning with the July 1, 2024 through June 30, 2026 performance period, associated with the FY 2028 payment determination. We provide more details on the Excess Days in Acute Care After Hospitalization for Diabetes and the Hospital Harm—Postoperative Venous Thromboembolism eCQM in the subsequent sections of the preamble. Details on the Advance Care Planning eCQM measure are in section IX.B.1., and details on the five modified mortality measures are in section IX.B.2.

a. Adoption of the Excess Days in Acute Care After Hospitalization for Diabetes Measure

(1) Background

An estimated one in every three Americans 65 years or older has diabetes.[347] The American Diabetes Association estimated that in 2022, health care expenditures attributable to diabetes for individuals aged 65 years or older in the United States included $67.7 billion for hospital inpatient stays and $7.2 billion for emergency department (ED) visits.[348] Diabetes is one of the most expensive conditions billed to Medicare,[349] with wide variation in inpatient utilization among hospitals.[350] For Medicare beneficiaries, diabetes with complications is a leading Medicare principal discharge diagnosis and among the top five principal diagnoses for 30-day all-cause hospital readmissions.[351] [352] Post-discharge ED visits and observation stays are also common and costly for patients with diabetes,[353] often reflecting gaps in discharge coordination, patient education, medication management, and standardized post-discharge support.[354]

Hospitals can improve diabetes care quality with evidence-based, guideline-driven interventions. The American Diabetes Association recommends multiple key strategies as part of structured discharge planning, including diabetes self-management education, medication reconciliation, and scheduling follow-up appointments before the patient is discharged.[355] A review of interventions aimed at reducing readmissions for patients with type 2 diabetes concluded that diabetes management interventions that start at the index admission are highly effective.[356] Common strategies associated with effective interventions include multidisciplinary input, dedicated care transition teams, certified diabetes educator appointments post-discharge, and hospital-initiated discharge protocol development and implementation, among others.[357] Other recommended interventions include the use of dedicated inpatient diabetes teams and multi-component programs combining education, transition support, and outpatient follow-up.[358] [359] Hospitals

that practice these interventions help to reduce post-discharge acute care utilization and other diabetes-related costs.[360]

There are currently no publicly reported measures of post-discharge care utilization for patients hospitalized for diabetes in the Hospital Inpatient Quality Reporting Program. Given the prevalence, care burden, and cost of diabetes, as well as the availability of effective interventions,[361] we proposed (91 FR 19581 through 19585) to adopt the Excess Days in Acute Care After Hospitalization for Diabetes (Diabetes EDAC) measure into the Hospital Inpatient Quality Reporting Program beginning with the July 1, 2025 to June 30, 2027 performance period, associated with the FY 2029 payment determination. The Diabetes EDAC measure supports the CMS and HHS priority to address chronic illness while aiming to improve disease-specific outcomes, reduce avoidable acute-care utilization, and improve care transitions.[362]

(2) Overview of Measure

The Diabetes EDAC measure is a risk adjusted outcome measure that assesses the number of days a patient spends in acute care within 30 days of discharge from an inpatient hospitalization for a diagnosis of diabetes mellitus with complications. The measure is intended to improve the quality of care transitions provided to patients hospitalized for diabetes by collectively measuring different types of returns to the hospital (ED visits, observation stays, and unplanned readmissions), which are all adverse acute care outcomes that can occur at any time within 30 days of discharge.[363] We tested the proposed Diabetes EDAC measure using the most recent Medicare inpatient hospital discharge data from 4,193 hospitals with at least 25 eligible discharges from January 1, 2022, through December 31, 2023. Hospital-level performance rates are depicted in Table IX.C.1., and demonstrate there is meaningful variation in the distribution of the measure scores.[364] Similarly to the existing EDAC measures in the Hospital Inpatient Quality Reporting Program for patients admitted for pneumonia, heart failure, or acute myocardial infarction, which calculate final risk adjusted measure scores as the difference (''excess'') between a hospital's ''predicted days'' and ''expected days,'' per 100 discharges, lower scores (including negative numbers) indicate better performance. Thus, the lower performance percentiles are better performing hospitals than those in the higher percentiles (for example, the hospitals in the tenth percentile are the best performing hospitals). We note that in Table IX.C.1. negative numbers indicate fewer days than predicted in acute care. The interquartile range is 69.5 excess days in acute care per 100 discharges, and the difference between the 10th and 90th percentiles is 142.8 excess days in acute care per 100 discharges, occurring within 30 days of discharge from an inpatient hospitalization for diabetes.[365] For more details on the risk adjustment model, we refer readers to section IX.C.3.a.

TABLE IX.C.1. HOSPITAL PERFORMANCE IN MEASURE TESTING FOR THE DIABETES EDAC MEASURE

Performance Percentile	Risk-Adjusted Excess Days in Acute Care per 100 Discharges
10th Percentile	-55.1
25th Percentile	-29.5
50th Percentile (median)	1.6
75th Percentile	40.3
90th Percentile	87.7

Further, test results indicated measure reliability that meets accepted standards of reliability for a publicly reported measure.[366] In testing this measure, we observed a significant association with the expected strength and in the expected direction with measures in the same causal pathway, which supports the validity of the Diabetes EDAC measure.[367] The Diabetes EDAC measure was designed with stakeholder feedback from a diverse Technical Expert Panel (TEP).[368] During measure development, the TEP evaluated the measure's face validity and expressed overall support, indicating that the Diabetes EDAC measure is a meaningful indicator of hospital quality.[369]

(3) Measure Calculation

The final risk adjusted Diabetes EDAC measure score is calculated as the difference, or ''excess'' days, between a hospital's ''predicted'' days (that is, the average number of days a patient spent in acute care after adjusting for the risk factors) and ''expected'' days (that is, the average number of risk adjusted days in acute care a patient would have been expected to spend if discharged from an average-performing hospital with the same case mix), per 100 discharges. The measure result is multiplied by 100, such that the final Diabetes EDAC measure score would represent excess days in acute care per 100 discharges and is reported as a rate.

(a) Numerator

The numerator for the proposed Diabetes EDAC measure is defined as the number of days a patient spends in acute care for any cause, within 30 days of discharge from the index hospitalization for diabetes. Days in acute care are defined as time spent in: ED visits without an associated admission, observation stays, and unplanned readmissions.[370] Utilization is measured in days; each ED visit counts as one full day, regardless of duration or whether it spans more than one calendar date. Observation stays are measured in hours and rounded up to the nearest whole day; for example, a 28-hour observation stay counts as two full days. Unplanned readmissions are counted in days based on length of the hospital stay. All eligible encounters occurring within the 30-day period are counted, even if repeated. For example, an unplanned readmission with a length of stay of 7 days and an ED visit without an associated admission, both within 30 days of discharge, would contribute 8 days toward the EDAC numerator. Planned readmissions, such as scheduled follow-up visits, elective surgeries, or chemotherapy, are excluded. Consistent with existing EDAC measures, a planned readmission algorithm identifies admissions typically scheduled within 30 days of discharge.

(b) Denominator

This measure denominator includes index admissions for patients who meet all of the following criteria:

- Principal discharge diagnosis of diabetes;
- Enrolled in Medicare Fee-For-Service or Medicare Advantage for the 12 months prior to the date of admission and during the index admission;
- Aged 65 or over;
- Discharged alive from a non-federal short-term acute care hospital; and
- Not transferred to another acute care facility.

The measure excludes the following index admissions from the measure cohort: (1) hospitalizations without at least 30 days of post-discharge enrollment in Medicare Fee-For-Service or Medicare Advantage; (2) discharged against medical advice; or (3) diabetes admissions within 30 days of discharge from a prior diabetes index admission. These exclusion criteria are similar to those of the existing EDAC measures in the Hospital Inpatient Quality Reporting Program.

(c) Risk-Adjustment

To account for differences in case mix among hospitals, the measure risk adjusts for age, comorbidities, severity of illness, and frailty based on clinical status at the index admission. The measure's risk adjustment includes comorbidities present at admission or within the prior 12 months, excludes complications arising during hospitalization, and accounts for survival times shorter than 30 days post discharge to accurately reflect hospital performance.

(4) Pre-Rulemaking Process and Measure Endorsement

(a) Recommendation From the Pre-Rulemaking Measure Review Process

We refer readers to the Partnership for Quality Measurement for details on the Pre-Rulemaking Measure Review process convened by the CBE, including the voting procedures used to reach consensus on measure recommendations.[371] [372] The Pre-Rulemaking Measure Review Hospital Committee, consisting of both the Pre-Rulemaking Measure Review Hospital Recommendation Group (hereafter referred to as the Recommendation Group) and Pre-Rulemaking Measure Review Hospital Advisory Group, met on January 12 and 13, 2026, to review measures included by the Secretary on the publicly available ''2025 Measures Under Consideration List,'' including the Diabetes EDAC measure (MUC2025–053).[373]

The voting results of the Recommendation Group for the proposed inclusion of the Diabetes EDAC measure in the Hospital Inpatient Quality Reporting Program were: 15 members (68 percent) recommended adopting the measure into the Hospital Inpatient Quality Reporting Program; 7 members (32 percent) voted not to recommend the measure for adoption.[374] With 68 percent of the votes for recommend, consensus was not reached, but the majority of the Recommendation Group expressed some support for use of the measure in the Hospital Inpatient Quality Reporting Program.

Recommendation Group members who voted to recommend the measure for inclusion in the Hospital Inpatient Quality Reporting Program emphasized its importance for patients hospitalized for diabetes. Some Recommendation Group members provided considerations along with their vote to recommend this measure. Considerations included improved discharge planning and shortening the accountability window to a 7-day post-discharge period. Another member recommended adding sociodemographic risk factors to the risk adjustment model. Members also recommended expanding the measure to a hospital-wide approach, rather than a condition-specific approach.

Recommendation Group members who voted not to recommend the measure for inclusion in the Hospital Inpatient Quality Reporting Program provided the following rationales: (1) hospitals have limited control over outpatient access or follow-up care; (2) the 30-day post-discharge period may not be appropriate; (3) the risk adjustment should be evaluated to ensure it is sufficient; (4) the measure should undergo additional testing and have clearer specifications; and (5) the measure should be submitted for endorsement.

Regarding concerns related to hospitals' limited control over

[370] Partnership for Quality Measurement. Excess Days in Acute Care (EDAC) After Hospitalization for Diabetes. Available at: *https://www.p4qm.org/prmr-measures/muc2025-053.*

[371] Partnership for Quality Measurement. Pre-Rulemaking Measure Review web page. Available at: *https://p4qm.org/prmr/about.*

[372] In 2025, the CBE updated the Pre-Rulemaking Measure Review voting process such that Recommendation Group members will vote to either ''recommend'' or ''do not recommend'' that a measure be added to the intended CMS program(s), thus, removing the ''recommend with conditions'' voting option. The threshold to reach consensus on a given measure continues to be a minimum of 75 percent agreement among members. Recommendation Group members can provide considerations for CMS to review prior to implementation.

[373] Centers for Medicare & Medicaid Services. (2025). 2025 Measures Under Consideration List. Available at *https://mmshub.cms.gov/measure-lifecycle/measure-implementation/pre-rulemaking/lists-and-reports.*

[374] Partnership for Quality Measurement. (February 2026). 2025–2026 Pre-Rulemaking Measure Review Recommendations Group Final Meeting Summary: Hospital Committee. Available at: *https://p4qm.org/sites/default/files/2026-02/PRMR-Hospital-Recommendation-Group-Meeting-Final-Summary-508.pdf.*

outpatient access or follow-up care, we wish to emphasize that an effective strategy for improving avoidable post-discharge acute-care utilization is to connect patients to resources as part of discharge planning. For example, one of the key strategies recommended by the American Diabetes Association is scheduling follow-up appointments before the patient is discharged.[375] We consider these types of activities to be an important part of providing high quality care for patients with diabetes and note that a goal of this measure is to incentivize hospitals to ensure these types of activities are standard practices. Through detailed, confidential, hospital-specific reports, hospitals would be provided with data to show where there are opportunities for improvement.

Regarding concerns and considerations related to the post-discharge period for accountability, the measure's 30-day timeframe is consistent with the existing 30-day readmission and EDAC measures in the Hospital Inpatient Quality Reporting Program, which have been endorsed by a CBE and publicly reported. The 30-day timeframe allows for a more complete reflection of the hospital's full discharge plan, including follow-up, care coordination, and self-management education.

Regarding concerns about the sufficiency of the measure's risk adjustment model, measure testing supported the current risk adjustment model. The Diabetes EDAC measure is risk adjusted for clinically relevant factors including patient functional status (frailty indicator), patient-level demographics (age), and patient-level health status and clinical conditions (case-mix adjustment, comorbidities, and severity of illness).[376] The risk adjustment model testing results indicate adequate controls for differences in patient characteristics (case mix), with a c-statistic [377] of 0.68, and 0.70 in the validation sample. The predictive ability [378] ranged from 1.66 percent to 13.23 percent, and 1.22 percent to 14.43 percent in the validation sample.[379] These testing results demonstrate the risk adjustment model effectively differentiates excess days in acute care after hospitalization for diabetes, thus adequately adjusting for differences in patient characteristics.[380] Regarding the recommendation to include sociodemographic risk factors, we tested model performance using dual-eligible status. Overall, the results indicate that the impact of dual-eligible status on measures scores is minimal and did not meaningfully change hospital scores. This informed our decision not to adjust for dual-eligible status in the risk adjustment model.[381]

Regarding concerns about additional testing, a recommendation for clearer specifications, and concerns about lack of endorsement, we note that the measure underwent the same extensive analysis and measure specifications development needed for the endorsement process, and that the measure will be submitted to the CBE for endorsement review for the Spring 2026 review cycle.

Regarding the consideration to expand this measure to a hospital-wide approach, rather than a condition-specific approach, we thank the Recommendation Group for this consideration and will consider it for future measures.

After taking these recommendations and concerns into consideration, we proposed (91 FR 19581 through 19585) to adopt the Diabetes EDAC measure into the Hospital Inpatient Quality Reporting Program beginning with the July 1, 2025 to June 30, 2027 performance period, associated with the FY 2029 payment determination.

(b) Measure Endorsement

We refer readers to the Partnership for Quality Measurement website for details on the measure endorsement and maintenance process, including the measure evaluation procedures the Endorsement and Maintenance Committees use to evaluate measures and whether they meet endorsement criteria. The Diabetes EDAC measure will be submitted to the CBE for endorsement review for the Spring 2026 cycle. Section 1886(b)(3)(B)(viii)(IX)(aa) of the Social Security Act (Act) generally requires that measures specified by the Secretary for use in the Hospital Inpatient Quality Reporting Program be endorsed by the entity with a contract under section 1890(a) of the Act. However, section 1886(b)(3)(B)(viii)(IX)(bb) of the Act states that in the case of a specified area or medical topic determined appropriate by the Secretary for which a feasible and practical measure has not been endorsed by the entity with a contract under section 1890(a) of the Act, the Secretary may specify a measure that is not so endorsed as long as due consideration is given to measures that have been endorsed or adopted by a consensus organization identified by the Secretary. We reviewed CBE-endorsed measures and were unable to identify any CBE-endorsed hospital inpatient measures addressing post-discharge care utilization for patients hospitalized for diabetes. Therefore, the exception in section 1886(b)(3)(B)(viii)(IX)(bb) of the Act applies.

(5) Data Sources, Submission, and Public Reporting

The proposed Diabetes EDAC measure uses claims data from Medicare Fee-For-Service and Medicare Advantage encounter data which are routinely generated by hospitals and Medicare Advantage plans and submitted to CMS. Therefore, hospitals would not be required to report any additional data for this measure. Enrollment status would be obtained from the Medicare Enrollment Database which contains beneficiary demographic, benefit/coverage, and vital status information.

While the existing EDAC measures in the Hospital Inpatient Quality Reporting Program currently use a 3-year performance period, in the FY 2027 IPPS/LTCH PPS proposed rule, we proposed (91 FR 19590 through 19593) to add Medicare Advantage

[375] American Diabetes Association Professional Practice Committee. Recommendation 16.16 (structured discharge plan). Chapter 16. Diabetes Care in the Hospital: Standards of Care in Diabetes—2025. Diabetes Care 2025;48 (Suppl. 1):S321–S334. Available at: *https://doi.org/10.2337/dc25-S016.*

[376] Centers for Medicare & Medicaid Services. (2025). Diabetes EDAC Risk Adjustment and Model Performance Testing. Available at: *https://www.p4qm.org/sites/default/files/2025-12/MUC2025-053.zip.*

[377] The c-statistic is an indicator of the model's discriminant ability or ability to correctly classify those patients who have and have not had a qualifying event within 30 days. Potential values range from 0.5, meaning no better than chance, to 1.0, an indication of perfect prediction. The CBE has determined that for readmission-type measures, a c-statistic of 0.68 is considered an effective model of discriminant ability. We refer readers to the ''Diabetes EDAC Risk Adjustment and Model Performance Testing'' available at: *https://p4qm.org/prmr-measures/muc2025-053* for more details.

[378] Predictive ability measures the ability to distinguish high-risk subjects from low-risk subjects. A model with good predictive ability would see a wide range in observed outcomes between lowest and highest deciles of predicted outcomes. We have calculated the range of mean observed hospital ratios between the lowest and highest deciles of hospital visit probabilities. We refer readers to the ''Diabetes EDAC Risk Adjustment and Model Performance Testing'' available at: *https://p4qm.org/prmr-measures/muc2025-053* for more details.

[379] Centers for Medicare & Medicaid Services. (2025). Diabetes EDAC Risk Adjustment and Model Performance Testing. Available at: *https://www.p4qm.org/sites/default/files/2025-12/MUC2025-053.zip.*

[380] Centers for Medicare & Medicaid Services. (2025). Diabetes EDAC Risk Adjustment and Model Performance Testing. Available at: *https://www.p4qm.org/sites/default/files/2025-12/MUC2025-053.zip.*

[381] Centers for Medicare & Medicaid Services. (2025). Diabetes EDAC Risk Adjustment and Model Performance Testing. Available at: *https://www.p4qm.org/sites/default/files/2025-12/MUC2025-053.zip.*

beneficiaries to the measure cohorts and shorten the performance period to 2 years. To align with these proposed updates, we proposed that the Diabetes EDAC measure would also use a 2-year performance period. For example, for the FY 2029 payment determination, the performance period would comprise of data for index admissions that occurred between July 1, 2025 to June 30, 2027. The measure would be publicly reported through the Compare tool, currently available at: *https://www.medicare.gov/care-compare/,* or successor CMS website, for the first time in July 2028, or as soon as feasible. The measure would be calculated and publicly reported on an annual basis using a rolling 24-months performance period data.

We invited public comment on our proposal to adopt the Diabetes EDAC measure into the Hospital Inpatient Quality Reporting Program beginning with the July 1, 2025 to June 30, 2027 performance period, associated with the FY 2029 payment determination.

Comment: Many commenters supported the adoption of the Diabetes EDAC measure into the Hospital Inpatient Quality Reporting Program, stating that it improves inpatient diabetes management, discharge planning, patient outcomes, adherence to guideline-based care, patient education, and access to diabetes support. Many commenters stated that the measure strengthens care transition planning and effectiveness. A few commenters stated that longitudinal measures better reflect patients' real-world experiences after hospitalization. These commenters stated that this measure broadens healthcare utilization to more than readmissions by including ED visits and observation stays, noting that it identifies opportunities to improve discharge readiness, medication management, and follow-up care. A few commenters stated that the measure increases post-discharge accountability, and a commenter stated this measure would provide meaningful insight into the effectiveness of care transitions, post-acute management, and chronic disease management for longitudinal outcomes.

A few commenters stated that given the prevalence, care burden, and cost of diabetes, as well as the availability of effective interventions, it is appropriate to include a publicly reported measure of post-discharge care utilization for patients hospitalized for diabetes. A few commenters supported adoption of the measure because reducing post-discharge acute care utilization and complications can lower costs.

A few commenters specifically noted a gap in adherence to American Diabetes Association clinical guidelines in hospital settings and expressed the importance of this measure in encouraging a greater focus on highly vulnerable patients and driving the system-wide accountability needed to close that gap. A commenter stated the importance of hospitals connecting patients to resources and follow-up services as part of discharge planning, as the American Diabetes Association recommends. A few commenters appreciated CMS's recognition of diabetes self-management training as an evidence-based, guideline-driven intervention.

A commenter supported adoption of the Diabetes EDAC measure and stated that it could encourage hospitals to improve inpatient diabetes management through innovative care delivery tools and workflows, including evidence-based insulin management support and clinical software platforms that help standardize protocols, reduce hypoglycemia and hyperglycemia events, and minimize clinician burden. The commenter also encouraged CMS to continue engaging providers, health systems, and health care technology developers as the measure evolves to ensure implementation reflects real-world clinical workflows and advances in diabetes technology. A commenter stated that the use of post-discharge acute care utilization measures can help reinforce secondary and tertiary prevention-oriented approaches to chronic disease management and recommended that CMS explore how similar approaches might be applied to other chronic conditions.

Response: We thank the commenters for their support. We agree that adopting the Diabetes EDAC measure into the Hospital Inpatient Quality Reporting Program will help address a gap in publicly reported measures of post-discharge care utilization for patients hospitalized for diabetes. We also agree that the measure will provide important information to inform care delivery, discharge planning, and connection of patients to community resources.

Comment: A commenter recommended implementing the measure in CY 2028 rather than CY 2027 in order to allow for 18 months before implementation of eCQMs.

Response: We note that the Diabetes EDAC measure is not an eCQM; the measure uses Medicare Fee-For-Service claims and Medicare Advantage encounter data that are routinely generated and submitted to CMS, and hospitals would not be required to report additional data for this measure. We would also like to clarify that this measure is proposed for adoption beginning with the July 1, 2025 to June 30, 2027 performance period, associated with the FY 2029 payment determination.

Comment: A commenter recommended CMS report the measure in the aggregate, meaning not stratified by Medicare Fee-For-Service and Medicare Advantage. Another commenter recommended stratifying Medicare Advantage and Medicare Fee-For-Service cohorts in measure reporting.

Response: We acknowledge commenters' recommendations to provide stratified measure results, as well as comments recommending that we do not provide stratified measure results. We considered both options and at this time we will publicly report aggregated data, but note that confidential feedback reports to hospitals will include payer information on a patient level. By keeping Medicare Fee-For-Service and Medicare Advantage patients together for purposes of this measure's calculation and display in public reporting, hospitals' total volume will remain higher for more precise measure scores. We will continue to monitor the measure and evaluate whether future stratifications are warranted in public reporting.

Comment: Many commenters expressed concerns related to the inclusion of Medicare Advantage beneficiaries in EDAC measures.

Response: We note that these concerns were applicable to both the proposed adoption of the Diabetes EDAC measure and the proposal to include Medicare Advantage beneficiaries in our three current EDAC measures. We refer readers to section IX.C.5. of this final rule in which we respond to these concerns for the expanded cohort of current EDAC measures.

Comment: A few commenters stated that EDAC measures are uniquely sensitive to Medicare Advantage encounter data integrity compared to readmission measures, because Medicare Advantage plans report ED and observation encounters inconsistently and through downstream entities.

Response: We note that we have previously conducted analyses assessing the availability, completeness, and comparability of data elements used to define the EDAC outcome. These analyses found that the data elements necessary to identify ED visits and observation stays are available within Medicare Advantage encounter data,

and that Medicare Advantage encounter data latency is comparable to Medicare Fee-For-Service claims for inpatient and outpatient settings. Generally, within 3 months following the close of the measurement period, more than 97 percent of ED and observation claims are available in both data sources. The relative distribution of EDAC outcome components, including inpatient readmissions, ED visits, and observation stays, is comparable between Medicare Advantage encounter data and Medicare Fee-For-Service claims, supporting the use of Medicare Advantage encounter data for reliable EDAC outcome measurement.

Comment: A commenter urged CMS to explore alternative methodologies that can maintain stability and reliability with smaller denominators rather than continuing to depend on Medicare Advantage data to improve the scientific properties of the measure.

Response: We note that inclusion of Medicare Advantage beneficiaries in the measure cohort is not only important for measure reliability, but that it is also important to provide a more complete assessment of care transitions and acute care use following hospitalization. The proportion of Medicare Advantage beneficiaries has increased to over half of the Medicare population and therefore omitting Medicare Advantage beneficiaries leaves a critical gap in assessing quality of care for a large population of Medicare beneficiaries. A primary purpose of including Medicare Advantage beneficiaries in the measure cohort is to assess quality of care for these Medicare beneficiaries.

Comment: A commenter expressed concern that adding Medicare Advantage beneficiaries to penalty programs, such as the Hospital Value-Based Purchasing Program, could lead to double-counting events given that Medicare Advantage plans have their own value-based purchasing arrangements that assess performance for enrolled populations. The commenter encouraged CMS to address the risk of double-counting events should the agency choose to use this measure in a value-based care program in the future.

Response: We understand commenters' concerns regarding the potential for the same event being counted by multiple programs and recognize that Medicare Advantage plans have their own quality program. While we are not adopting the Diabetes EDAC measure into any value-based purchasing programs at this time, we maintain that all patients deserve the same quality of care regardless of payer or status.

Comment: Many commenters recommended delaying adoption of the Diabetes EDAC measure until the measure can be tested to ensure that the risk adjustment model properly accounts for differences in patient characteristics. Some commenters specifically recommended an analysis to ensure that Medicare Advantage data can be used with Medicare Fee-For-Service without an impact on performance.

Response: Measure testing supported the current risk adjustment model and demonstrated adequate controls for differences in patient characteristics (case mix). The Diabetes EDAC model c-statistic is 0.68, indicating good model discrimination. Predictive ability results show a wide range between the lowest decile and highest decile, indicating the ability to distinguish high-risk subjects from low-risk subjects. In addition, higher deciles of the predicted outcomes are associated with higher observed outcomes, indicating good calibration of the model for all admissions, as well as admissions stratified by payer (Medicare Advantage vs. Medicare Fee-For-Service). Interpreted together, our diagnostic results demonstrate the risk adjustment model adequately controls differences in patient characteristics.

Good measure score reliability provides additional support that adding Medicare Advantage admissions will not adversely impact measure performance. For hospitals with at least 25 admissions, the split-half reliability was 0.79, and the minimum entity-level signal-to-noise reliability was 0.668 with a median of 0.904, meeting the CBE reliability threshold of 70 percent of measured entities being greater than or equal to 0.6. For more details on measure testing results we refer readers to *https://qualitynet.cms.gov/inpatient/iqr/proposedmeasures.*

Comment: Many commenters expressed concerns about the risk adjustment approach. A few commenters stated that Pre-Rulemaking Measure Review Hospital Committee members raised concerns regarding whether the risk adjustment was sufficient. A few commenters recommended including demographic and social risk factors in addition to age. These commenters stated that sociodemographic risk adjustments are essential to ensuring that hospitals serving large populations of low-income or uninsured patients are not unfairly penalized.

Response: The Diabetes EDAC measure's risk adjustment approach was based on a rigorous empirical approach that identified variables that are significantly associated with the outcome. The risk adjustment model is intended to adjust for case-mix differences across hospitals by including more than 40 clinically relevant factors such as patient age, comorbidities, severity of illness, and indicators of patient frailty. The risk adjustment model uses comorbidities present at admission or in the 12 months prior to the index admission and excludes complications that arise during hospitalization to support fair comparisons across hospitals.

Measure testing supported the current risk adjustment approach. The model demonstrated adequate controls for differences in patient characteristics, with a c-statistic of 0.68 in the development sample and 0.70 in the validation sample. The predictive ability ranged from 1.66 percent to 13.23 percent in the development sample and 1.22 percent to 14.43 percent in the validation sample. The calibration results also demonstrated good alignment between predicted and observed outcomes, indicating that the model provides accurate probability estimates across the full range of predictions.

We note that we tested dual-eligible status as a surrogate marker for economic disadvantage. Although patients with dual eligibility had higher unadjusted days in acute care than patients without dual eligibility, adding dual-eligible status to the risk model had minimal impact on measure scores. Measure scores calculated with and without dual eligibility were highly correlated at greater than 0.999, and the distribution of measure scores across hospitals grouped by the proportion of patients with dual eligibility largely overlapped. We also found that the risk model is well calibrated for admissions for patients with, and without, the dual eligibility variable. These empiric results did not support adjusting the measure for dual eligibility. We will continue to monitor the measure's performance, including its performance for hospitals serving higher proportions of patients with economic disadvantage, as part of routine measure monitoring and evaluation activities.

Comment: A few commenters expressed concern that smaller hospitals will not be able to meet minimum volume thresholds and therefore would be unable to report the measure. A commenter specifically stated that a 2-year performance period would be difficult for hospitals with smaller diabetes volumes, while another commenter expressed concern that reliability and validity data for the 2-year performance period was not provided. A commenter expressed

concern that small case volumes may limit statistical reliability.

Response: We understand commenters' concern regarding the reliability and validity data for the 2-year performance period. We note that measure testing results for reliability and validity were made publicly available in March 2026. The Diabetes EDAC measure was tested using a 2-year (CY 2022 to 2023) dataset. The final cohort included 370,594 index admissions across 4,193 hospitals.[382] Among hospitals with at least one diabetes index admission, the median hospital volume was 37 admissions over the 2-year testing period. For purposes of public reporting, the measure uses a minimum case threshold of at least 25 admissions to help ensure that publicly reported results are sufficiently reliable. For hospitals meeting this minimum case threshold, split-half reliability was 0.79, and the minimum entity-level signal-to-noise reliability was 0.668 with a median of 0.904, meeting the CBE reliability threshold of 70 percent of measured hospitals with reliability greater than or equal to 0.6. The measure testing also demonstrated evidence supporting validity, including face validity and empiric validity testing. We acknowledge that some smaller-volume hospitals may not meet the minimum case threshold. However, hospitals that do not meet the minimum case threshold would not have measure results publicly reported for this measure but would receive their own results as part of confidential reporting. For the complete measure methodology report, we specifically refer readers to QualityNet on our website at: *https://qualitynet.cms.gov/inpatient/iqr/proposedmeasures* and the Partnership for Quality Measurement's website at: *https://p4qm.org/prmr-measures.*

Comment: A few commenters urged CMS to incorporate enhanced risk adjustment, stratification, or exclusion criteria for patients over age 80 because national guidelines emphasize that diabetes management in adults aged 80 and older should be highly individualized due to the fact that this population is often marked by multimorbidity, frailty, and limited life expectancy with frequent health care utilization.

Response: We agree that diabetes management for older adults may be clinically complex and individualized. The Diabetes EDAC measure risk adjusts for age, comorbidities, severity of illness, and indicators of frailty, which are intended to account for differences in patient clinical complexity across hospitals. We will continue to monitor the measure's performance, including for older adults and other clinically complex patient populations, as part of routine measure monitoring and evaluation activities.

Comment: A few commenters recommended CMS define the measure using only a primary diagnosis of diabetes and exclude cases captured through secondary diagnoses, which may reflect more complex underlying clinical circumstances and reduce the measure's specificity. A few commenters expressed concerns regarding the 30-day measure window and whether it is appropriate for the measure. A commenter stated that it incorporates excess days beyond the reasonable control of a hospital and suggested a shorter 7-day window.

Response: The Diabetes EDAC measure cohort is defined using a principal discharge diagnosis of diabetes. This approach is intended to identify patients hospitalized for diabetes, support a more clinically specific cohort, and avoid overlap with other existing EDAC measure cohorts. Regarding concerns about the 30-day measure window, the 30-day timeframe is consistent with existing 30-day readmission and EDAC measures in the Hospital Inpatient Quality Reporting Program which have been endorsed by a CBE and publicly reported. The 30-day timeframe allows for a more complete reflection of the hospital's discharge plan, including follow-up, care coordination, and self-management education. In addition, data during testing has shown that following an admission for diabetes, post-discharge hospital visits continue beyond 30 days, and do not reach baseline until about 80 days.

Comment: A few commenters requested that CMS clarify the measure specifications, with another commenter expressing concern regarding the lack of clarification outlining what will constitute ''excess days'' as opposed to an appropriate length of stay for diabetic persons in acute care, and upon what criteria that determination will be made. The commenter cautioned that applying a limitation on the length of stay for a patient with diabetes may present challenges for individuals who have chronic and comorbid conditions and stated that limited lengths of stay could lead to further complications that may have been prevented with treatment that was provided within an adequate timeframe.

Response: The measure does not establish a limitation on the appropriate length of an inpatient stay for patients with diabetes. The measure specifically looks at patients returning to acute care settings following discharge from an index admission. The measure calculates ''excess days'' as the difference between a hospital's predicted days and expected days in acute care within 30 days of discharge, per 100 discharges. Days in acute care include ED visits, observation stays, and unplanned readmissions after the index hospitalization. Detailed technical specifications that clarify what constitutes ''excess days'' and the full measure methodology are available in the Diabetes EDAC Measure Methodology Report available at: *https://qualitynet.cms.gov/inpatient/iqr/proposedmeasures.*

Comment: A few commenters stated the need for additional testing, validation, and stakeholder review before this new measure is considered for use in the Hospital Inpatient Quality Reporting Program. A commenter highlighted the TEP members' suggestion for additional refinement and testing to ensure the measure's validity and reliability.

Response: The measure was developed with input from clinical and methodological experts, a Technical Expert Panel, and other stakeholders, and was tested using Medicare Fee-For-Service claims and Medicare Advantage encounter data. Measure testing demonstrated good model performance, strong reliability, and evidence supporting validity. We note that TEP feedback informed the measure specifications and that face validity testing indicated support for the validity of the measure. For the complete measure methodology report, we specifically refer readers to QualityNet on our website at: *https://qualitynet.cms.gov/inpatient/iqr/proposedmeasures,* and to the Partnership for Quality Measurement's website at: *https://p4qm.org/prmr-measures,* for additional measure details.

Comment: Several commenters who did not support the measure raised concerns that the measure outcomes are heavily influenced by factors beyond hospital control, such as access to outpatient care, medication affordability, community resources, caregiver support, and patient adherence. The commenters stated that the measure may not accurately reflect hospital performance and could create unintended consequences.

Response: We wish to emphasize that an important strategy for improving

[382] Centers for Medicare & Medicaid Services. (March 2026). Excess Days in Acute Care (EDAC) After Hospitalization for Diabetes: Measure Methodology Report. Available at: *https://qualitynet.cms.gov/inpatient/iqr/proposedmeasures.*

avoidable post-discharge acute-care utilization is to connect patients to resources as part of discharge planning. Hospitals play an important role in discharge planning, medication reconciliation, patient education, care coordination, and arranging timely follow-up care, including scheduling follow-up appointments before discharge. We consider these types of activities to be an important part of providing high quality care for patients with diabetes and a goal of this measure is to incentivize hospitals to ensure these types of activities are standard practices. Through detailed, confidential, hospital-specific reports, hospitals would be provided with data to show where there are opportunities for improvement.

Comment: A few commenters expressed concerns about potential unintended consequences to patients that may result from measures that include readmissions, noting a study that analyzed Hospital Readmissions Reduction Program measures that showed that the 30-day readmission measures may lead to increased mortality. The study raised several potential concerns around gaming, including the potential to incentivize hospitals to ''game'' the system, using strategies such as delaying admissions beyond day 30, increasing observation stays, or shifting inpatient-type care to emergency departments. A commenter specifically recommended additional analyses to examine the association between reduced readmission rates and patient mortality. A few commenters also suggested examining trends based on adjusted and unadjusted data to better understand clinical decisions and outliers.

Response: We acknowledge commenters' concerns about potential unintended consequences associated with measures that include readmissions, including concerns regarding the relationship between reduced readmissions and mortality. With respect to the concern that readmissions-focused measures may incentivize hospitals to delay admissions beyond day 30, increase observation stays, or shift care to emergency departments, we note that the Diabetes EDAC measure is not limited to readmissions but instead assesses broader post-discharge acute care utilization, including ED visits, observation stays, and unplanned readmissions within 30 days of discharge. Including broader post-discharge acute care utilization is intended to reduce the likelihood that hospitals will shift acute care to non-acute settings or delay care. We reiterate that there are many strategies that a hospital can use to reduce the risk that a patient clinically deteriorates following discharge such that they require further acute care.

We note that the Diabetes EDAC measure, like other EDAC measures, incorporates the proportion of days alive within the 30-day outcome window to account for post-discharge mortality, thereby reducing the risk of assigning better performance to hospitals with higher mortality rates.

We will continue to monitor Diabetes EDAC for potential unintended consequences as part of routine measure monitoring and evaluation activities. With respect to the recommendation to examine trends based on adjusted and unadjusted data, the measure methodology report, available at: *https://qualitynet.cms.gov/inpatient/iqr/proposedmeasures,* includes unadjusted outcome analyses, including observed days in acute care and component outcomes, as well as risk-adjusted measure testing results. Hospitals will also receive confidential hospital-specific reports that provide information on their measure performance to help identify opportunities for improvement.

Comment: A few commenters expressed concern that this measure could disproportionately impact areas with provider shortages, particularly rural areas where travel barriers may affect patients' ability to access post-discharge care despite hospital discharge planning efforts. A commenter urged CMS to evaluate the effects of the measure on rural and safety-net facilities where unique case-mix variables and access limitations may skew performance outcomes.

Response: In areas with provider shortages, it is critical that hospitals help patients identify strategies for managing symptoms and preventing clinical deterioration with an understanding of the barriers patients may face in accessing care. Hospitals play an important role in discharge planning, care coordination, patient education, medication reconciliation, and connecting patients to appropriate follow-up care and resources. We will monitor the measure for potential unintended consequences, including any disproportionate effects on rural and safety-net hospitals or areas with provider shortages, as part of routine measure monitoring and evaluation activities. In studies done with the currently implemented EDAC measures, there was no consistent association between safety net status and EDAC performance.[383]

Comment: Several commenters who did not support the measure adoption expressed concern that the Diabetes EDAC measure may not be sufficiently attributable to inpatient hospital care. A commenter stated that, compared with existing EDAC measures, the Diabetes EDAC measure may be more challenging because patients hospitalized for diabetes often have complex comorbidities, a range of complications, and care needs involving multiple specialists. A commenter expressed concern regarding the reliability of diagnosis coding for diabetes and the feasibility of accurately capturing the full range of acute care encounters for patients with diabetes.

Response: We acknowledge that patients with diabetes may have complex comorbidities, complications, and care across inpatient and outpatient settings. This further emphasizes the importance of assessing outcomes and improving quality of care for this patient population. Additionally, this measure is risk-adjusted for clinically relevant factors for patients hospitalized for diabetes. We also note that the Diabetes EDAC measure is intended to assess hospital-level variation in post-discharge acute care utilization following hospitalization for diabetes, rather than all aspects of diabetes management. Regarding concerns about the reliability of diagnosis coding for diabetes and feasibility of capturing the full range of acute care encounters for patients with diabetes, we note that the measure cohort is defined using a principal discharge diagnosis of diabetes. This approach identifies patients hospitalized for diabetes, supports a more clinically specific cohort, and helps avoid overlap with other existing EDAC measure cohorts. In addition, research has shown that coding for diabetes is highly stable.[384] Regarding the feasibility of capturing the full range of acute care encounters for patients with diabetes, the Diabetes EDAC measure uses the same approach as the existing CBE-endorsed EDAC

[383] Horwitz LI, Wang Y, Altaf FK, Wang C, Lin Z, Liu S, Grady J, Bernheim SM, Desai NR, Venkatesh AK, Herrin J. (2018). Hospital Characteristics Associated With Post-discharge Hospital Readmission, Observation, and Emergency Department Utilization. *Med Care, 56(4), 281–289.* Available at: *https://pmc.ncbi.nlm.nih.gov/articles/PMC6170884/.*

[384] Pan J, Lee S, Cheligeer C, Li B, Wu G, Eastwood CA, Xu Y, Quan H. (2025). Assessing the validity of ICD–10 administrative data in coding comorbidities. *BMJ Health Care Inform,* 32(1), e101381. Available at: *https://pmc.ncbi.nlm.nih.gov/articles/PMC12083369/.*

measures to identify post-discharge hospital utilization.

Comment: A few commenters stated that many of the factors influencing long-term outcomes occur outside the inpatient setting and that successful diabetes management often depends on outpatient medication management, patient education, access to supplies, and ongoing clinical follow-up. The commenters further expressed concern that the typical inpatient hospital stay only provides hospitals with a limited ability to influence factors that drive diabetes-related readmissions. A commenter stated that diabetes management is better aligned with the function of a primary care provider than hospitals, and another commenter suggested the measure may be better suited for an Accountable Care Organization-type environment due to the dependency on outpatient resources and post-discharge follow-up.

Response: We recognize that diabetes care extends beyond the inpatient stay. However, hospitals play an important role in discharge planning, medication reconciliation, patient education, care coordination, and connecting patients to appropriate follow-up care and resources. Standards for hospital care for patients with diabetes, including care at the peri-discharge period, are well established. The American Diabetes Association Professional Practice Committee has established recommendations to reduce readmissions for patients hospitalized for diabetes that include clear guidance for hospitals to transition patients from the hospital to an ambulatory setting to reduce future readmissions. The Diabetes EDAC measure is intended to assess hospital-level outcomes 30 days post-discharge following an inpatient hospitalization for diabetes, rather than long-term outcomes, and it is appropriate to evaluate hospitals on their patients' outcomes following discharge within the 30 days post-discharge timeframe. Analyses submitted for CBE endorsement review show that in Medicare patients the most common reason, as captured by principal discharge diagnosis, for a diabetes hospitalization after discharge is a diabetes-specific complication, suggesting that better management of diabetes in the peri-discharge period can reduce excess post-discharge acute care utilization.[385]

Comment: A commenter urged CMS to consider alternate programs for the measure's implementation, stating this hospital-level measure is not targeted towards the conditions and complications typically associated with hospitalization for diabetes, including coma, diabetic ketoacidosis, diabetic foot ulcer, and hyperosmolar hyperglycemic state. Another commenter recommended that CMS consider a more targeted post-procedural EDAC measure that is more directly attributable to inpatient care and more actionable for hospitals. A commenter recommended adopting a diabetes-related readmission measure rather than an EDAC measure due to general challenges of EDAC measures, including capturing observation stays and ED visits that may occur at another facility.

Response: We note that the Diabetes EDAC measure assesses hospital-level outcomes following an inpatient hospitalization for diabetes, focusing on acute care utilization after discharge. The measure cohort is defined using a principal diagnosis of diabetes with complications (AHRQ CCS50 codes), which is intended to identify hospitalizations where diabetes is the primary reason for admission, and includes hospitalization for diabetes, including coma, diabetic ketoacidosis, diabetic foot ulcer, and hyperosmolar hyperglycemic state, among other complications. We refer readers to Table 1 (Diabetes EDAC Cohort Inclusion) of the Diabetes EDAC Data Dictionary available at: *https://p4qm.org/sites/default/files/2026-04/5575-1.13a-Diabetes-EDAC-Data-Dictionary-Spring2026.xlsx.*

Hospitals play an important role in supporting safe care transitions at discharge. Supplementary analyses demonstrated that the most frequent principal discharge diagnoses associated with unplanned readmission after an index hospitalization for diabetes were diabetes mellitus with complications, septicemia (except in labor), and complications of surgical procedures or medical care, all of which indicate relatedness to the index hospitalization.[386] We note that the measure outcome approach provides broader information than a readmission-only measure by capturing ED visits and observation stays in addition to unplanned readmissions. We will monitor implementation of the measure and consider these recommendations in future rulemaking as we continue developing quality measures related to chronic conditions.

Comment: A commenter stated there is limited information regarding how this measure aligns with existing diabetes-related quality initiatives. The commenter recommended CMS provide information regarding the measure in the context of other diabetes-related quality measures and initiatives before finalizing the proposal. A commenter stated that hospitals already participate in outpatient diabetes quality measures.

Response: We note that the Diabetes EDAC measure is intended to address a specific gap in the Hospital Inpatient Quality Reporting Program, as there are currently no publicly reported measures of post-discharge care utilization for patients hospitalized for diabetes. The Diabetes EDAC measure is distinct from outpatient diabetes quality measures because it assesses hospital-level post-discharge acute care utilization following an inpatient hospitalization for diabetes. Additionally, variation across hospitals in Diabetes EDAC measure scores during measure testing identified an important quality gap.

Comment: A commenter stated that this measure overlaps conceptually with existing readmissions measures, as both assess 30-day post-discharge utilization with the EDAC measure capturing broader sets of encounters, including ED visits and observation stays. The commenter noted this overlap can create challenges in prioritization and performance improvement efforts, as hospitals must track and respond to multiple closely related outcome measures that reflect similar aspects of care transitions, and asked whether it has been evaluated for overlap or redundancy with existing measures.

Response: We note the Diabetes EDAC measure does not duplicate existing measures; specifically, there is no existing Diabetes readmission measure in our portfolio of quality reporting and value-based purchasing programs. The Diabetes EDAC measure is defined using a principal discharge diagnosis of diabetes, which supports a more clinically specific cohort, avoiding overlap with other existing EDAC measure cohorts. While EDAC and readmission measures both assess 30-day post-discharge utilization, the Diabetes EDAC measure captures a broader set of acute care use, including ED visits, observation stays, and unplanned readmissions.

Comment: A commenter asserted that there is a lack of clearly defined, scalable inpatient-only interventions or care bundles with strong and validated evidence that demonstrates a sustained

[385] Partnership for Quality Measurement. (2026, May). Excess days in acute care (EDAC) after hospitalization for diabetes. Available at: *https://p4qm.org/measures/5575.*

[386] Partnership for Quality Measurement. (May 2026). Excess days in acute care (EDAC) after hospitalization for diabetes. Available at: *https://p4qm.org/measures/5575.*

reduction in excess days in acute care following hospitalization for diabetes.

Response: Regarding available interventions, we recognize that no single inpatient-only intervention will address all factors affecting post-discharge acute care utilization for patients with diabetes. Outcome measures, such as Diabetes EDAC, combined with confidential hospital-specific reports, help hospitals identify specific areas of improvement for their patient population. Furthermore, there are evidence-based interventions and guideline-directed standards that have been shown to reduce post-discharge acute care use, including high-quality care transitions through diabetes self-management education, medication reconciliation, scheduling follow-up appointments before discharge, multidisciplinary input, dedicated care transition teams, certified diabetes educator appointments post-discharge, and hospital-initiated discharge protocols.

Comment: A few commenters recommended that CMS carefully balance the agency's quality measurement priorities with the substantial operational, financial, and technological burdens measure reporting places on hospitals. A commenter urged CMS to ensure new reporting requirements remain feasible for hospitals of all sizes, and provide adequate flexibility, technical assistance, and implementation timeframes, particularly for rural and resource-constrained facilities. A commenter recognized the value of expanding outcome-based measurement but noted that adding a Diabetes EDAC measure creates additional burden for hospitals by increasing the number of publicly reported performance metrics tied to post-discharge outcomes.

Response: We agree that reporting requirements should be feasible and should avoid unnecessary burden, particularly for rural, smaller, and resource-constrained hospitals. We note that the Diabetes EDAC measure uses Medicare Fee-For-Service claims and Medicare Advantage encounter data that are routinely generated and submitted to CMS. Therefore, hospitals would not be required to report any additional data for this measure. We understand that there may be some burden for hospitals to review publicly reported data to ensure accuracy and completeness, however, the use of measures generated using data already submitted to CMS should minimize this burden while providing high-value information about outcomes associated with a common clinical condition. We will continue to consider burden and feasibility as we monitor implementation of the measure.

Comment: A few commenters urged CMS to delay adoption of the measure into the Hospital Inpatient Quality Reporting Program until CBE endorsement review is completed to provide additional insight on measure performance. A commenter recommended that CMS continue to refine and evaluate the measure before it is included in the Hospital Inpatient Quality Reporting Program with respect to validity and reliability testing. A few commenters urged CMS to allow hospitals to assess performance impact, develop internal monitoring tools, and engage in meaningful quality improvement before the measure is implemented.

Response: Although the Diabetes EDAC measure will be submitted to the CBE for endorsement review for the Spring 2026 cycle, we note that the Diabetes EDAC measure is closely aligned with the existing EDAC measures in the Hospital Inpatient Quality Reporting Program, which have been CBE-endorsed and publicly reported. Further, we note section 1886(b)(3)(B)(viii)(IX)(bb) of the Act states that in the case of a specified area or medical topic determined appropriate by the Secretary for which a feasible and practical measure has not been endorsed by the entity with a contract under section 1890(a) of the Act, the Secretary may specify a measure that is not so endorsed as long as due consideration is given to measures that have been endorsed or adopted by a consensus organization identified by the Secretary. We reviewed CBE-endorsed measures and were unable to identify any CBE-endorsed hospital inpatient measures addressing post-discharge care utilization for patients hospitalized for diabetes. Therefore, the exception in section 1886(b)(3)(B)(viii)(IX)(bb) of the Act applies.

The Diabetes EDAC measure underwent extensive analysis and specification development needed for the endorsement process. The measure testing supported the measure's performance, including reliability, validity, and meaningful variation in hospital scores. We refer readers to the Diabetes EDAC Methodology Report available at: *https://qualitynet.cms.gov/inpatient/iqr/proposedmeasures* for further details on measure testing. We note that hospitals will receive confidential hospital-specific reports to help identify opportunities for improvement.

After consideration of the public comments we received, we are finalizing adoption of the Diabetes EDAC measure as proposed beginning with the July 1, 2025 to June 30, 2027 performance period, associated with the FY 2029 payment determination.

b. Adoption of the Hospital Harm—Postoperative Venous Thromboembolism Electronic Clinical Quality Measure

(1) Background

Postoperative venous thromboembolism (VTE) includes both deep vein thrombosis (DVT), a thrombus (that is, blood clot) in the deep veins, most often in the legs, and pulmonary embolism (PE), when a thrombus travels through the venous circulation and the right side of the heart, and lodges in the lungs. VTE is considered to be a leading cause of preventable death following surgery, with as many as 70 percent of cases considered to be preventable.[387] Non-fatal postoperative VTE can lead to adverse health consequences, including chronic thromboembolic pulmonary hypertension, a potentially fatal condition. Long term complications, such as pain and swelling in the affected limb, occur among one third to one half of people who have had a DVT and one third of VTE patients will experience a recurrence of the DVT within 10 years.[388] The AHRQ Healthcare Cost and Utilization Project (HCUP) State Inpatient Database from 2020, 2021, and 2022 showed that 50,017 perioperative PE's or DVT's occurred in 15,387,213 discharges, which is a rate of 3.25 per 1,000 discharges.[389] Each postoperative VTE event generates an estimated $17,367 in additional costs,[390] suggesting a 3-year cost of $868,645,239 for the postoperative VTE events identified in the HCUP data. An analysis of 1,112,014 hospitalizations between 2013 and 2021 found a more than three times higher risk of readmission and a 63 percent

higher risk of death for patients acquiring a hospital-associated VTE.[391]

There are established therapies that can reduce the risk of a VTE, but failure or delay in prescribing appropriate VTE prophylaxis can result in a higher risk of postoperative VTE. For example, one study found that delays or interruptions in thromboprophylaxis were associated with two to three times higher risk of VTE.[392] Hospital care processes can reduce the risk of hospital-acquired VTE through integration of evidence-based guidelines into hospital protocols and use of VTE-risk assessment and physician alerts to improve use of VTE prophylaxis.[393] Another report found evidence that combining hospital interventions, such as mechanical and pharmacological prophylaxis, can reduce the incidence of DVT among patients undergoing surgery or admitted with trauma.[394] This volume of preventable safety events shows that there are opportunities to reduce the rate of postoperative VTEs.

Preventing VTE and associated complications after hospitalization and incentivizing appropriate administration of VTE prophylaxis have been, and continue to be, important goals of the Hospital Inpatient Quality Reporting Program since the early days of the program. The current measure set contains two VTE eCQMs, Venous Thromboembolism Prophylaxis (VTE–1) eCQM and Intensive Care Unit Venous Thromboembolism Prophylaxis (VTE–2) eCQM, which were adopted as measures that hospitals could self-select beginning with the CY 2014 reporting period (78 FR 50807 through 50810). Replacing these two process measures with a single comprehensive outcome measure can reduce burden while continuing to address this consequential health care issue affecting postoperative patient outcomes.

We proposed to adopt the Hospital Harm—Postoperative Venous Thromboembolism (hereafter referred to as Hospital Harm—Postoperative VTE) eCQM (91 FR 19585 through 19588) beginning with the CY 2028 reporting period/FY 2030 payment determination. We refer readers to section IX.C.4.a. for our proposal to remove the VTE–1 and VTE–2 eCQMs contingent upon the adoption of the Hospital Harm—Postoperative VTE eCQM.

(2) Overview of Measure

The Hospital Harm—Postoperative VTE eCQM is a risk-adjusted outcome measure that assesses the proportion of inpatient hospitalizations for patients age 18 and older who have at least one surgical procedure performed inside the operating room during the admission, and who suffer the harm of a postoperative VTE during hospitalization or within 30 days after the first surgical procedure. The intent of the measure is to improve patient safety by incentivizing hospitals to implement processes to reduce the occurrence of postoperative VTE. Accurately monitoring the rate at which postoperative VTE occurs will allow hospitals to improve quality and reduce VTE harm rates.

(3) Measure Calculation

This outcome measure reports the proportion of inpatient hospitalizations for patients aged 18 years and older with a postoperative VTE within 30 days of the first surgical procedure.[395] This measure is calculated using a risk adjusted measure score, which reflects the performance of a hospital treating its patients relative to the average hospital treating patients with the same characteristics. This is calculated by:

- Dividing the number of inpatient hospitalizations in the numerator by the number of inpatient admissions in the denominator to determine the observed rate;
- Using the risk adjustment model to determine the hospital's expected VTE event rate based on the hospital's case mix; and
- Dividing the observed rate by the expected rate.

(a) Numerator

The numerator is the number of inpatient hospitalizations for adult patients who had a surgical procedure performed in the operating room during the hospitalization and experienced a VTE within 30 days of the surgical procedure. Postoperative VTE cases can be identified for inclusion in the numerator in multiple ways. For example, documentation in the medical record of a diagnosis of VTE that was not present when the patient was admitted to the hospital for an inpatient stay that included surgery would qualify the admission for the numerator. Alternatively, an inpatient admission in which a patient had surgery and subsequently had a diagnostic imaging procedure performed followed by an order for anticoagulation therapy would also qualify for the numerator. A postoperative VTE that occurs during a subsequent hospital stay within 30 days of the surgical procedure would count toward the numerator if there is documentation of a diagnosis of VTE and anticoagulation therapy ordered or prescribed during that hospital stay. We refer readers to the Partnership for Quality Measurement website (*https://p4qm.org/prmr-measures/muc2025-067*) for more details on the measure specifications, including more details on how a postoperative VTE is determined.

(b) Denominator

The denominator is the number of adult patients who had a surgical procedure performed in the operating room during an inpatient hospitalization. The cohort includes inpatient hospitalizations for patients aged 18 and older where a surgical procedure was performed inside the operating room during the encounter. The cohort excludes inpatient encounters for:

- Patients with an obstetric-related diagnosis;
- A VTE diagnosis present on admission;
- Acute brain or spinal injury or hemorrhage present on admission;
- Extracorporeal membrane oxygenation during the inpatient encounter;
- A thrombectomy procedure before or on the same day as the first surgical procedure;
- Intracranial or spinal surgery where the patient was discharged less than five days after the end of the surgery; and
- Inpatient encounters with a duration of stay less than 2 days.

(c) Risk Adjustment

The risk adjustment model accounts for factors that affect risk of VTE, specifically age, sex, and eight clinical factors (bleeding disorders, cancer, catheter insertion, history of VTE, obesity, respiratory operations, stroke, and vascular surgeries). The risk adjustment model was developed using two consecutive years (CY 2022 through 2023) of electronic health record (EHR) data from a commercially available EHR database.[396] Testing of the risk adjustment model demonstrated the ability to discriminate between high-risk and low-risk postoperative VTE events. The risk adjustment model has been developed to ensure that hospitals that care for patients at higher risk of postoperative VTE are evaluated fairly.[397]

The sample to evaluate the risk adjustment model included 100,911 hospitalizations from 34 hospitals in six states during 2022 and 2023. Hospital-level characteristics were not available because the data uses anonymized hospital identifications. Hospitals included in the sample had hospitalizations ranging in number from 56 to 6,746 annually.[398] The risk adjusted performance scores ranged from 0.21 percent in Decile 1 to 4.21 percent in Decile 10, with a median score of 0.78 percent.[399] The difference between the best and worst performing facilities suggests there is room for improvement among facilities. In addition, the median performance score of 0.78 percent exceeds the rate of 0.35 percent found in the AHRQ HCUP State Inpatient Database.[400] The testing results using 2 years of data (CY 2022 through 2023) indicated strong measure reliability, with signal-to-noise reliability scores ranging from 0.9998 to 0.9999, and therefore this measure demonstrates high reliability using 2 years of data.[401] Data element validity testing was conducted with two hospitals and results from this testing showed strong agreement between EHR data and patient chart-abstracted data for nearly all data elements and moderate to excellent sensitivity and specificity results for classifying patients into the denominator and numerator. There was moderate to low sensitivity for classifying patients as denominator exclusions, but these findings were likely driven by specific limitations of the hospitals involved in testing rather than indicative of broader validity limitations.

(4) Pre-Rulemaking Process and Measure Endorsements

(a) Recommendations From the Pre-Rulemaking Measure Review Process

We refer readers to the Partnership for Quality Measurement website for details on the Pre-Rulemaking Measure Review process convened by the CBE, including the voting procedures used to reach consensus on measure recommendations.[402] [403] The Pre-Rulemaking Measure Review Hospital Committee, consisting of both the Pre-Rulemaking Measure Review Hospital Recommendation Group (hereafter referred to as the Recommendation Group) and Pre-Rulemaking Measure Review Hospital Advisory Group, met on January 12 and 13, 2026, to review measures included by the Secretary on the publicly available ''2025 Measures Under Consideration List,'' including the Hospital Harm—Postoperative VTE measure.[404]

The voting results of the Recommendation Group for the proposed adoption of the Hospital Harm—Postoperative VTE measure in the Hospital Inpatient Quality Reporting Program were: 7 members (35 percent) recommended adopting the measure into the Hospital Inpatient Quality Reporting Program, and 13 members (65 percent) voted not to recommend the measure for adoption.[405] With 65 percent of the votes not to recommend, consensus was not reached, with the majority of the Recommendation Group expressing some concern about use of the measure in the Hospital Inpatient Quality Reporting Program.

Some Recommendation Group members who voted to support adoption of the Hospital Harm—Postoperative VTE measure in the Hospital Inpatient Quality Reporting Program provided several considerations with their vote. These considerations were concerns regarding the proposed 30-day window, concern that the timeline for adoption is unclear, and a recommendation to test the measure in additional EHR systems.

Recommendation Group members who voted not to recommend provided the following rationales: (1) concerns regarding the proposed 30-day timeframe; (2) concerns regarding potential overlap with the PSI 12 measure; (3) concerns regarding potential unintended consequences; (4) recommendations for methodological refinements; (5) concerns regarding technical implementation within EHR systems; (6) lack of clarity regarding the measure's ability to meaningfully advance quality; and (7) concerns that the measure has not been endorsed by the CBE. We address each of these concerns in detail in the following paragraphs.

Regarding concerns that the timeline for adoption is unclear, we note that we proposed to adopt the Hospital Harm—Postoperative VTE measure beginning with the CY 2028 reporting period/FY 2030 payment determination as an option for self-selection. That is, participating hospitals may select the Hospital Harm—Postoperative VTE measure as one of the three self-selected eCQMs to be reported in addition to three mandatory eCQMs. We refer readers to Table IX.C.5 for the full list of eCQMs available for self-selection. In addition, in the FY 2027 IPPS/LTCH PPS proposed rule (91 FR 19600 through 19604), we proposed that Hospital Harm eCQMs would become mandatory after two years of being an option for self-selection. If that policy is finalized, the Hospital Harm—Postoperative VTE measure would become mandatory beginning with the CY 2030 reporting period/FY 2032 payment determination.

[405] Partnership for Quality Measurement. (February 2026). 2025–2026 Pre-Rulemaking Measure Review Recommendation Group Final Meeting Summary: Hospital Committees. Available at: *https://p4qm.org/sites/default/files/2026-02/PRMR-Hospital-Recommendation-Group-Meeting-Final-Summary-508.pdf.*

Regarding the recommendation to test the measure in additional EHR systems, we used test sites collectively using four EHR systems (specifically, Epic, Allscripts, Cerner, and Meditech) which represent the majority of EHR systems in the United States.[406] We refer readers to section IX.C.3.b.(3)(c) for details on measure testing, including measure reliability and validity. If this eCQM is finalized for adoption into the Hospital Inpatient Quality Reporting Program, we note that as a part of routine measure maintenance we conduct ongoing monitoring and evaluation of our measures to identify potential unintended consequences.

With respect to the 30-day timeframe, we note that 30 days post-discharge is a common window for assessing adverse events stemming from a hospital admission. The Hospital Inpatient Quality Reporting Program includes several measures that cover the 30-day period post discharge, such as the Thirty-day Risk-Standardized Death Rate among Surgical Inpatients with Complications Measure and the Hybrid Hospital-Wide All-Cause Readmission Measure. With respect to using a 30-day timeframe for capturing postoperative VTE events, evidence shows that roughly one third of VTEs occur between postoperative day 14 and the end of the fourth week after surgery.[407]

We understand the concern regarding potential overlap with PSI 12, which is a claims-based measure of perioperative PE and DVT rate included in the Patient Safety and Adverse Events Composite (PSI 90 composite), and only captures care provided for Medicare beneficiaries. The Hospital Harm—Postoperative VTE measure is an all-payer eCQM, and therefore captures care provided for all patients rather than Medicare patients only. For this reason, we believe this measure has the potential to serve as a replacement for the claims-based PSI 12 measure in the future.

With respect to concerns about unintended consequences, including overtreatment and unnecessary use of anticoagulation therapies, we note that as a part of routine measure maintenance we conduct ongoing monitoring and evaluation of our measures to identify potential unintended consequences. Furthermore, we may consider adopting a measure focused on overuse of anticoagulation medication in future measure development and rulemaking.

Members of the Recommendation Group who suggested methodological refinements specifically recommended including clearer diagnostic criteria for VTE. The measure specifies that a stay must have documentation of both an imaging procedure to diagnose the VTE and initiation of anticoagulant therapy within 24 hours of the imaging procedure. The measure further requires that the anticoagulant therapy be delivered at a dose appropriate for therapeutic treatment of VTE, as opposed to a lower dose appropriate for VTE prophylaxis or maintenance therapy for atrial fibrillation. In concert, the three numerator requirements—(a) documentation of a diagnostic imaging procedure, (b) administration of anticoagulant therapy within 24 hours of the imaging procedure, and (c) for the anticoagulant to be provided at a dose consistent with VTE treatment—would minimize the chance for misclassification. We refer readers to the Electronic Clinical Quality Improvement (eCQI) Resource Center (*https://ecqi.healthit.gov/ecqm/hosp-inpt/2028/cms1061v1*) for more details on the measure specifications, including more details on how a postoperative VTE is determined.

Members of the Recommendation Group who had concerns regarding technical implementation in EHRs were concerned that hospitals in systems with a single enterprise-wide EHR may appear to perform worse on the measure because post-discharge VTE events are more likely to be captured. We note that this measure relies on capturing data regarding an imaging procedure to diagnose the VTE and initiation of anticoagulant therapy within 24 hours of the imaging procedure within the same EHR system in which the qualifying surgery was documented, which may cause systems with multiple EHRs to appear to perform better on this measure because they capture fewer post-discharge VTE events. However, given that many numerator-qualifying VTE events occur during the initial hospitalization, and approximately 75 percent of patients with post-surgical complications return to their discharging hospital,[408] [409] we expect that the vast majority of data on postoperative VTEs would be available within the reporting hospital's EHR.

With respect to questions about how the Hospital Harm—Postoperative VTE measure advances quality, adopting a measure that evaluates the frequency of postoperative VTEs incentivizes hospitals to evaluate their current procedures and implement quality improvement initiatives to reduce the occurrences of this preventable condition.

With respect to concerns raised by Recommendation Group members that the measure had not been endorsed by the CBE, the Hospital Harm—Postoperative VTE measure was submitted to the CBE for the Fall 2025 endorsement cycle. We note that the CBE had not yet met to review the Hospital Harm—Postoperative VTE measure for endorsement at the time of the Recommendation Group review, but it subsequently did so and endorsed the measure with conditions. We refer readers to section IX.C.3.b.(4)(b) of this final rule for a further discussion of the results of the CBE's endorsement decision.

After taking these recommendations and concerns into consideration, we proposed to adopt the Hospital Harm—Postoperative VTE measure in the Hospital Inpatient Quality Reporting Program beginning with the FY 2030 payment determination (91 FR 19585 through 19588).

(b) Measure Endorsement

We refer readers to the Partnership for Quality Measurement website for details on the measure endorsement and maintenance process, including the measure evaluation procedures the Endorsement and Maintenance Committees use to evaluate measures and whether they meet endorsement criteria. The Hospital Harm—Postoperative VTE eCQM was submitted for review in the Fall 2025 cycle. The Management of Acute and Chronic Conditions Recommendation Group reviewed the Hospital Harm—Postoperative VTE eCQM (CBE# 5325e) on February 4, 2026. The voting results of the Recommendation Group were: 2

Available at: *http://dx.doi.org/10.1016/S0140-6736(15)60087-3*.

members (11 percent) voted to endorse the measure; 15 members (79 percent) voted to endorse the measure with conditions; and 2 members (11 percent) voted not to endorse the measure. With more than 75 percent of members voting to endorse the measure or endorse the measure with conditions, the Recommendation Group reached consensus to endorse the measure with conditions.[410] The condition is that by the next measure maintenance review (5 years) the developer will have explored other risk factors that may impact post-discharge VTE (for example, social determinants of health). In connection with this condition, we will continue to monitor and evaluate the risk adjustment methodology to determine if changes are needed.

(5) Data Source, Submission, and Public Reporting

The Hospital Harm—Postoperative VTE eCQM uses data collected through hospitals' EHRs. The measure is designed to be calculated by the hospitals' certified health IT using the patient-level data and then submitted by hospitals to CMS. All data elements necessary to calculate the measure, including the numerator and denominator as well as to apply the risk adjustment model, are defined within value sets available in the Value Set Authority Center.[411] Testing was performed to confirm the feasibility of the measure, data elements, and validity of the numerator, using clinical adjudicators who validated the EHR data compared with medical chart-abstracted data. Testing in six hospitals using three EHR systems demonstrated that all critical data elements can be reliably and consistently captured, and measure implementation is feasible.

We refer readers to section IX.C.8.c. of this final rule for discussion of previously finalized eCQM reporting and submission policies, and our modifications to establish mandatory reporting of all Hospital Harm eCQMs after an initial period of voluntary reporting in the program. Additionally, we refer readers to section IX.F.9. of this final rule for discussion of a similar policy to adopt this measure in the Medicare Promoting Interoperability Program.

We invited public comment on our proposal to adopt the Hospital Harm—Postoperative VTE eCQM beginning with the CY 2028 reporting period/FY 2030 payment determination.

Comment: Many commenters supported adoption of the Hospital Harm—Postoperative VTE eCQM. Some commenters supported this measure because it is an eCQM, stating that eCQMs improve the timeliness of quality data. Some commenters stated VTE is an important healthcare topic and that adding an outcome measure to the portfolio of measures addressing VTE will improve the ability to evaluate hospitals for the effectiveness of care, not just the processes.

Response: We thank these commenters for their support and agree that the outcome measure will help evaluate the effectiveness of care.

Comment: A few commenters supported adoption of the Hospital Harm—Postoperative VTE eCQM and stated that this measure is a critical step towards a process measure of structured VTE risk assessment. These commenters stated that this would both address VTE prevention and concerns about anticoagulant overuse.

Response: We thank the commenters for their support of the Hospital Harm—Postoperative VTE eCQM and their recommendation to consider a process measure of structured VTE risk assessment.

Comment: Many commenters expressed concern that the measure was not recommended by the Recommendation Group and recommended that CMS address the Recommendation Group's concerns and return the measure to the Pre-Rulemaking Measure Review process and resubmitted to the Measures Under Consideration List.

Response: We understand commenters' concern that the Recommendation Group did not vote to recommend this measure for adoption into the Hospital Inpatient Quality Reporting Program. Members who voted not to recommend this measure raised the following concerns about the Hospital Harm—Postoperative VTE eCQM: (1) concerns regarding the proposed 30-day timeframe; (2) concerns regarding potential overlap with the PSI 12 measure; (3) concerns regarding potential unintended consequences; (4) recommendations for methodological refinements; (5) concerns regarding technical implementation within EHR systems; (6) concerns regarding a lack of clarity on the measure's ability to meaningfully advance quality; and (7) concerns that the measure has not been endorsed by the CBE. We addressed each of these topics in the FY 2027 IPPS/LTCH PPS proposed rule (91 FR 19587 through 19588) and address them further in the subsequent comments and responses. Regarding the recommendation that we return the measure to the Measures Under Consideration List, because we have addressed each of the Recommendation Group's concerns without updates to the measure specifications, it is not necessary to return the measure to the Pre-Rulemaking Measure Review process. Doing so would delay adoption of this outcome measure that addresses an important patient safety topic.

Comment: Some commenters expressed concern regarding the 30-day post discharge attribution period. These commenters stated that many factors outside of a hospital's control, including patient adherence, post-acute care transitions, social risk factors, and outpatient follow-up, can contribute to post-discharge VTE.

Response: We would like to clarify that the measurement period includes the 30 days following the first surgical procedure, rather than ''30 days post-discharge,'' which may include some post-discharge period, but is not dependent on the date of discharge. We understand commenters' concern that post discharge outcomes are influenced by many factors, including factors outside of the hospital's control. We note that while hospitals cannot directly control elements such as patient adherence and outpatient follow-up, a hospital's responsibility is to provide education and support to help patients and their caregivers understand the importance of adhering to medical recommendations and to help prepare patients for outpatient follow-up.

Comment: A few commenters stated that there is a lack of evidence to support the 30 days as a timeframe for associating VTE events with a surgical procedure. A commenter stated that CMS had not provided evidence that a VTE which occurs after discharge is associated with the care received during the inpatient stay.

Response: We selected 30 days post-surgery because this is a period of high-risk for post-surgical VTEs. Evidence shows that roughly one third of VTEs following surgery can occur between postoperative day 14 and the end of the fourth week after surgery.[412] Because of

[410] Partnership for Quality Measurement. (April 2026). Fall 2025 Cycle Endorsement and Maintenance (E&M) Technical Report: Management of Acute Events and Chronic Conditions. Available at: *https://p4qm.org/document/6096.*

[411] To access the value sets for the measure, please visit the Value Set Authority Center, sponsored by the National Library of Medicine, at *https://vsac.nlm.nih.gov/.*

[412] Singh, T., Lavikainen, L.I., Halme, A.L.E., Aaltonen, R., Agarwal, A. Blanker, M.H., Bolsunovskyi, K., Cartwright, R., García-Perdomo, H., Gutschon, R., Lee, Y., Pourjamal, N., Vernooij, R.W.M., Violette, P.D., Haukka, J., Guyatt, G.H., & Tikkinen, K.A.O. (2023). Timing of symptomatic

Continued

the high incidence of VTEs in this period, we encourage hospitals to ensure patient education and access to appropriate VTE prophylaxis prior to discharge. This care coordination and preparation for safe discharge is an important part of inpatient care. There are established therapies that can reduce the risk of a VTE, but failure to prescribe or a delay in prescribing appropriate VTE prophylaxis can result in a higher risk of postoperative VTE. For example, one study found that delays or interruptions in thromboprophylaxis were associated with two to three times the risk of VTE compared to patients who did not experience a delay.[413] Hospital care processes can reduce the risk of hospital-acquired VTE through the integration of evidence-based guidelines into hospital protocols and the use of VTE-risk assessment and physician alerts to improve the use of VTE prophylaxis.[414] While VTE events post-discharge are not completely within a hospital's control, the timeliness of interventions taken prior to and post-surgery coupled with the role of patient education and discharge planning during the stay serve a significant role in preventing these events.

Comment: A commenter recommended mitigating the concern that VTE incidence post-discharge is outside the control of the hospital by stratifying publicly reported data for in-hospital versus post-discharge events.

Response: We thank the commenter for the recommendation to stratify publicly reported data for in-hospital versus post-discharge events. As part of our routine measure monitoring, we will consider whether trends in measure performance warrant stratifying the publicly reported data.

Comment: A few commenters stated that there is potential overlap between the Hospital Harm—Postoperative VTE eCQM and PSI 12, which is a claims-based measure of perioperative PE and DVT rate included in the PSI 90 composite. A commenter supported adoption of the Hospital Harm—Postoperative VTE eCQM, stating that this alignment reduces administrative burden for hospitals. Several commenters recommended transitioning from PSI measures to eCQMs, stating that eCQMs provide more accurate information. Some commenters specifically requested that CMS provide a plan to replace PSI 12 with the Hospital Harm—Postoperative VTE eCQM. A commenter also requested that CMS establish a plan to replace all components of the PSI 90 composite with eCQMs.

Response: We thank the commenter for the support of adopting the Hospital Harm—Postoperative VTE eCQM to align with PSI 12. We agree that there is some overlap between PSI 12 and the Hospital Harm—Postoperative VTE eCQM. We note that the Hospital Harm—Postoperative VTE eCQM is an all-payer eCQM, and therefore captures care provided for all patients whereas PSI–12 only captures data related to Medicare patients. Therefore, we believe that this measure has the potential to serve as a replacement for the claims-based PSI 12 measure in the future. However, as part of the PSI 90 composite, all hospitals are required to report the PSI 12 measure, and currently the Hospital Harm—Postoperative VTE eCQM is only available for self-selection. As we gain experience with collecting Hospital Harm eCQM data, we will consider replacing some or all components of the PSI 90 composite with these measures.

Comment: Some commenters recommended that CMS monitor for unintended consequences such as inappropriate use of anticoagulants and identify strategies to ensure that these potential unintended consequences are mitigated. Another commenter recommended additional testing for potential unintended consequences, such as delayed surgery or limits to appropriate anesthesia.

Response: We thank commenters for their recommendations. As a part of our routine monitoring and evaluation, we will watch for any unintended consequences from the adoption of the Hospital Harm—Postoperative VTE eCQM. We note that we conduct annual measure re-evaluations to confirm that the measures are performing as intended. We update the specifications and post technical release notes annually on the eCQI Resource Center, available at: *https://ecqi.healthit.gov/ecqm/hosp-inpt/2028/cms1061v1.*

Comment: A few commenters stated that the Hospital Harm—Postoperative VTE eCQM does not include clear diagnostic criteria for VTE.

Response: Postoperative VTE cases can be identified for inclusion in the numerator in multiple ways. For example, documentation in the medical record of a diagnosis of VTE that was not present when the patient was admitted to the hospital for an inpatient stay that included surgery would qualify the admission for the numerator. Alternatively, an inpatient admission in which a patient had surgery and subsequently had a diagnostic imaging procedure performed followed by an order for anticoagulation therapy would also qualify for the numerator. A postoperative VTE that occurs during a subsequent hospital stay within 30 days of the surgical procedure would count toward the numerator if there is documentation of a diagnosis of VTE and anticoagulation therapy ordered or prescribed during that hospital stay. We refer readers to the Partnership for Quality Measurement website (*https://p4qm.org/measures/5325e*) for more details on the measure specifications, including more details on how a postoperative VTE is determined. We note that the Measure Calculation page within the Measure Specs tab includes a data dictionary that provides details regarding determination of imaging studies, use of anticoagulation therapies, and diagnosis codes for VTEs.

Comment: A commenter recommended refining the Hospital Harm—Postoperative VTE eCQM prior to inclusion in the Hospital Inpatient Quality Reporting Program. Commenters specifically recommended reviewing the measure for additional clinically appropriate exclusions (such as pending surgery).

Response: This measure evaluates inpatient encounters where at least one surgical procedure was performed in the operating room, with surgery being a defining component of the measure population rather than a condition warranting exclusion. The measure evaluates VTE events in relation to the index surgical encounter, which may trigger postoperative hypercoagulability and increase VTE risk for several weeks. We recognize that patients may undergo planned or subsequent procedures, however the measure does not evaluate planned, pending, or subsequent surgeries outside of the index surgical encounter within the 30-day timeframe. We note that the measure team conducted a comprehensive environmental scan that assessed perioperative VTE in the inpatient setting, convened a series of TEP meetings, and obtained public feedback to develop the exclusion list for the measure.

Comment: A few commenters recommended that CMS continue to evaluate risk factors, including social

venous thromboembolism after surgery: meta-analysis, *BJS, 110*(5), 553–561. Available at: *https://doi.org/10.1093/bjs/znad035.*

Call to action to prevent venous thromboembolism in hospitalized patients: A policy statement from the American Heart Association. *Circulation, 141*(24). Available at: *https://doi.org/10.1161/cir.0000000000000769.*

[414] Geerts, W. (2009). Prevention of venous thromboembolism: a key patient safety priority. Journal of Thrombosis and Haemostasis, 7, 1–8. Available at: *https://www.sciencedirect.com/science/article/pii/S1538783622174040.*

risk factors, that affect post-discharge VTE outcomes. A few commenters stated that the risk-adjustment model may not fully account for patient complexity and recommended that CMS continue refining the risk-adjustment methodology to ensure fair comparisons across hospitals. A commenter recommended that CMS ensure that measures distinguish outcomes within a hospital's control versus those driven by other factors.

Response: We understand commenters' concerns that factors outside of a hospital's control may affect the patient's risk for VTE. We note that the measure developer developed a conceptual model based on input from a literature review, established risk indices, clinical experts, and our TEP. This conceptual model, which is posted as part of the risk adjustment methodology report on the eCQI Resource Center, was then empirically tested using patient level data.[415] This rigorous process, which was informed by multiple clinical experts and validated scoring indices, yielded a robust risk adjustment model. However, we acknowledge that there may be opportunities to identify additional risk factors that may influence postsurgical VTE incidence. When the CBE endorsed the Hospital Harm—Postoperative VTE eCQM, they included the condition that by the next measure maintenance review (5 years) the developer will have explored other risk factors that may impact post-discharge VTE (for example, social determinants of health). In connection with this condition, we will continue to monitor and evaluate the risk adjustment methodology to determine if changes are needed.

Comment: Some commenters expressed concern that the data element validity testing was limited to two vendor systems.

Response: We understand commenters' concern regarding data element validity testing. The testing in which we calculated the percent agreement for critical data elements using chart abstracted data to calculate percent agreement was limited to two systems, which represent over 58 percent of the United States hospital EHR market.[416] [417] We note that we collaborated with 15 hospitals, which were not limited to these two vendor systems, to complete the eCQM feasibility scorecard, which assesses whether the data required for hospital-level calculation are available in structured fields, are collected through routine workflows, are documented using standard terminology, and are accurate.[418] Both of these tests demonstrated that these data elements were feasible and valid. The testing was consistent with the requirement for eCQM testing in the Measures Management System Blueprint, which requires evidence of testing with at least two different electronic health records.[419]

Comment: A few commenters expressed concern regarding whether an eCQM can accurately and completely capture post-discharge VTEs. These commenters stated that VTEs may not be completely captured in EHR data if the VTE is recorded in another hospital or health system's EHR. Some commenters requested that CMS provide additional details regarding the workflow for collecting data subsequent to discharge. A few commenters expressed concern that because QRDA I files are specific to hospitals, VTE events may not be counted if patients seek post-discharge care at other facilities. A few commenters recommended that CMS specify this as a claims-based measure to improve data completeness. Another commenter recommended that CMS wait until the measure is available as a dQM (that is, available to report using the Fast Healthcare Interoperability Resources® (FHIR®) standard) and adopt it at that time.[420] Some commenters expressed concern regarding variability in data capture across EHR systems. A few commenters expressed concern that the measure may not be feasible to implement at hospitals without advanced technology.

Response: We note that this measure relies on capturing data regarding an imaging procedure to diagnose the VTE and initiation of anticoagulant therapy within 24 hours of the imaging procedure within the same EHR system in which the qualifying surgery was documented. We understand commenters' concerns that this may lead to some VTE events not being captured within the EHR data. However, given that many numerator-qualifying VTE events occur during the initial hospitalization, and approximately 75 percent of patients with post-surgical complications return to hospital where the surgery was performed,[421] [422] we expect that the vast majority of data on postoperative VTEs would be available within the reporting hospital's EHR. Furthermore, we worked with multiple hospitals to ensure that the data required for hospital-level calculation are available in structured fields, are collected through routine workflows, are documented using standard terminology, and are accurate.

Comment: A commenter stated that QRDA files are specific to quarters and requested that CMS clarify how the measure will be calculated if the hospitalization and VTE event are in different quarters.

Response: VTE events would be assessed within 30 days from the end of the first surgical procedure of the index hospitalization. Hospitals reporting this measure would be required to include all relevant data within a given QRDA submission, even if that data occurs during a prior quarter. For example, if a patient has a denominator-eligible surgical inpatient encounter within Q1 and a subsequent inpatient encounter in Q2 with a VTE event that meets numerator criteria, the hospital would need to submit data on both inpatient encounters as part of the Q2 QRDA data submission. We will provide hospitals with resources to support compliance with this requirement through vehicles such as Expert-to-Expert webinars.

Comment: A few commenters recommended that CMS limit the measure to admissions with a discharge date on or before November 30. These commenters stated that this would ensure the entire measurement period falls within the calendar year, which the commenters stated would provide hospitals more time to capture post-discharge events, validate data, and complete data submission.

Response: We understand commenters' concern that including VTE events that occur up to 30 days after the first surgery will require hospitals to consider data past the end of the calendar year. The measure has been specified and tested to include surgeries occurring throughout the year, therefore we are not considering revising the measure to exclude surgeries during the last 30 days of the year. We note that for eCQMs the submission deadline is March 1. For VTE events that occur up to 30 days after December 31, this will leave hospitals at least one month after the end of the 30 day lookback period to retrieve data from their EHRs for submission to CMS. However, we will continue to assess these considerations and seek feedback from stakeholders and implementers as part of ongoing measure evaluation and maintenance activities.

Comment: A commenter expressed concern that the Hospital Harm—Postoperative VTE eCQM has not been endorsed by the CBE.

Response: The Hospital Harm—Postoperative VTE eCQM was endorsed with conditions in the Fall 2025 cycle. The Management of Acute and Chronic Conditions Recommendation Group reviewed the Hospital Harm—Postoperative VTE eCQM (CBE# 5325e) on February 4, 2026. The voting results of the Recommendation Group were: 2 members (11 percent) voted to endorse the measure; 15 members (79 percent) voted to endorse the measure with conditions; and 2 members (11 percent) voted not to endorse the measure. With more than 75 percent of members voting to endorse the measure or endorse the measure with conditions, the Recommendation Group reached consensus to endorse the measure with conditions. The condition is that by the next measure maintenance review (5 years) the developer will have explored other risk factors that may impact post-discharge VTE (for example, social determinants of health). In connection with this condition, we will continue to monitor and evaluate the risk adjustment methodology to determine if changes are needed.

Comment: A few commenters recommended that CMS delay adoption of the Hospital Harm—Postoperative VTE eCQM to allow hospitals additional time to coordinate with vendors, establish workflows, train staff and monitor measure performance. A few commenters stated that adopting multiple eCQMs across the inpatient and outpatient quality reporting programs leads to operational burden and delays in clinician engagement. A commenter requested that CMS establish a timeline for adopting the Hospital Harm—Postoperative VTE eCQM.

Response: We carefully consider the benefit of adopting new measures in relation to any burden on hospitals. The program's shift toward digital measures will ultimately decrease the burden for hospitals because eCQMs use electronic standards, which helps reduce the burden of manual abstraction and reporting for measured entities. We note that we proposed to adopt the Hospital Harm—Postoperative VTE eCQM as one of the measures that hospitals can self-select for reporting beginning with the CY 2028 reporting period. Following the finalization of this rule, hospitals would have 15 months until the beginning of the CY 2028 reporting period. Furthermore, hospitals that need additional time to prepare to report the Hospital Harm—Postoperative VTE eCQM would have an additional two years of self-selected reporting prior to mandatory reporting of this measure. We refer readers to section IX.C.8. of this final rule for additional information regarding mandatory reporting of the Hospital Harm—Postoperative VTE eCQM.

Comment: A few commenters recommended that CMS provide hospital-specific data files, technical documentation, and implementation guidance early enough that hospitals can prepare for measure reporting. A commenter recommended that CMS ensure that this guidance recognizes the team-based nature of VTE prevention, avoids undue administrative burden, and ensures hospital-level outcomes are not attributed to individual clinicians.

Response: Information about the Hospital Harm—Postoperative VTE eCQM is currently available on the Partnership for Quality Measurement website (*https://p4qm.org/measures/5325e*) and on the Value Set Authority Center, sponsored by the National Library of Medicine (*https://vsac.nlm.nih.gov*). Technical information is available on the eCQI Resource Center (*https://ecqi.healthit.gov/ecqm/hosp-inpt/2028/cms1061v1*). We agree with the commenter that VTE prevention is team based and note that this measure is calculated at the hospital level and does not attribute outcomes to individual clinicians. We have developed this measure to minimize administrative burden associated with information collection.

Comment: Several commenters recommended that CMS engage interested parties in ongoing implementation, maintenance, and quality improvement efforts for this measure.

Response: We appreciate commenters' interest in implementation, maintenance, and quality improvement efforts for this measure. To ensure transparency and engagement throughout the measure development process, a TEP provided direction and input from interested parties to the measure developer in every phase of the measure development process. The measure developer incorporated feedback from TEP upon their review of the measure testing results. We also submitted this measure through the Pre-Rulemaking Measure Review process for input from a multistakeholder group of clinicians, patients, and other interested parties.

Comment: A few commenters expressed concern regarding the Hospital Harm—Postoperative VTE eCQM's potential effects on rural and safety net providers. A commenter recommended that CMS evaluate the effects, including assessing whether unique case-mix variables or access limitations may skew performance outcomes or safety-net providers. Another commenter recommended that CMS provide hardship exceptions to rural, safety-net, and resource constrained providers.

Response: We understand commenters' concerns regarding potential effects on rural and safety-net providers. Because the measure is risk adjusted based on clinical and demographic factors that have been demonstrated to affect VTE risk, the measure accounts for hospitals that treat a disproportionate number of clinically complex or high-risk patients. We additionally note that the hospitals would initially have the option to self-select whether to report this eCQM to meet the eCQM reporting requirement for the Hospital Inpatient Quality Reporting Program, providing flexibility for those hospitals, including rural or safety net hospitals, that may need more time to prepare to report this measure.

After consideration of the public comments we received, we are finalizing the Hospital Harm—Postoperative VTE eCQM as proposed beginning with the CY 2028 reporting period/FY 2030 payment determination. We refer readers to section IX.F.9. of this final rule where we are finalizing the same eCQM for the Medicare Promoting Interoperability Program.

4. Removals in the Hospital Inpatient Quality Reporting Program Measure Set

In the FY 2027 IPPS/LTCH PPS proposed rule (91 FR 19588 through 19590), we proposed to remove three

measures from the Hospital Inpatient Quality Reporting Program beginning with the CY 2028 reporting period/FY 2030 payment determination: (1) Venous Thromboembolism Prophylaxis eCQM; (2) Intensive Care Unit Venous Thromboembolism Prophylaxis eCQM; and (3) Discharged on Antithrombotic Therapy eCQM. We provide more details on each of these proposals in the subsequent sections.

a. Removal of Two Venous Thromboembolism Electronic Clinical Quality Measures

We refer readers to the FY 2014 IPPS/LTCH PPS final rule where we adopted the Venous Thromboembolism Prophylaxis (VTE–1) and Intensive Care Unit Venous Thromboembolism Prophylaxis (VTE–2) eCQMs beginning with the CY 2014 reporting period/FY 2016 payment determination (78 FR 50807 through 50810). These measures were originally adopted as chart-abstracted measures and were later specified as eCQMs, which we adopted as optional measures for hospitals to self-select. In the FY 2027 IPPS/LTCH PPS proposed rule (91 FR 19588 through 19589), we proposed to remove the VTE–1 and VTE–2 eCQMs from the Hospital Inpatient Quality Reporting Program, beginning with the CY 2028 reporting period/FY 2030 payment determination, under our measure removal factor 5, the availability of a measure that is more strongly associated with desired patient outcomes for the particular topic, as described at 42 CFR 412.140(g)(3)(i)(E), if the proposed Hospital Harm—Postoperative VTE eCQM is adopted.[423] The VTE–1 eCQM assesses the proportion of patients admitted to the hospital who received VTE prophylaxis or have documentation of why no VTE prophylaxis was given between the day of hospital admission to the day after admission or surgery end date. The VTE–2 eCQM measures the proportion of patients admitted or transferred to the intensive care unit (ICU) who received VTE prophylaxis or have documentation of why no VTE prophylaxis was given between the day of admission or transfer to the ICU to the day after admission or surgery end date.

Patient safety topics such as appropriate VTE prophylaxis continue to be high priority topics for quality measurement in the hospital inpatient setting. Since introducing the VTE–1 and VTE–2 eCQMs into the Hospital Inpatient Quality Reporting Program over a decade ago, we have developed an outcome-focused VTE eCQM, Hospital Harm—Postoperative VTE eCQM, as proposed for adoption in the FY 2027 IPPS/LTCH PPS proposed rule (91 FR 19585 through 19588) beginning with the FY 2030 payment determination. The Hospital Harm—Postoperative VTE eCQM is an outcome measure that builds upon the existing process measures and evaluates the incidence of postoperative VTE events, assessing the success of the VTE prophylaxis strategies measured by the VTE–1 and VTE–2 eCQMs, and thus is more strongly associated with desired patient outcomes for this particular topic. It also aligns with our efforts to reduce burden and refine the Hospital Inpatient Quality Reporting Program's measure set by replacing two process measures with a single outcome measure. In addition, the VTE–1 and VTE–2 eCQMs were retired from The Joint Commission's ORYX® requirements effective CY 2026.[424] [425] We note that the proposed removal of the VTE–1 and VTE–2 eCQMs is contingent upon our finalizing the proposal to adopt the Hospital Harm—Postoperative VTE eCQM as discussed in section IX.C.3.b. of this final rule.

We note that we also proposed to remove the VTE–1 and VTE–2 eCQMs in the Medicare Promoting Interoperability Program beginning with the CY 2028 reporting period. For more information, we refer readers to section IX.F.9. of this final rule.

We invited public comment on our proposal to remove the VTE–1 and VTE–2 eCQMs beginning with the CY 2028 reporting period/FY 2030 payment determination.

Comment: Many commenters supported removal of the VTE–1 and VTE–2 eCQMs. Several commenters stated that the transition to the Hospital Harm—Postoperative VTE eCQM would reduce burden while focusing on patient outcomes. Several commenters stated that VTE–1 and VTE–2 should be removed regardless of whether the adoption of the Hospital Harm—Postoperative VTE eCQM is finalized.

Response: We thank the commenters for their support. We agree that transitioning to the Hospital Harm—Postoperative VTE eCQM would improve focus on patient outcomes and reduce administrative burden. We refer readers to section IX.C.3.b. of this final rule where we are finalizing our proposal to adopt the Hospital Harm—Postoperative VTE eCQM.

Comment: A few commenters supported removal of the VTE–1 and VTE–2 eCQMs but stated that it is important that publicly reported data consistently maintains information related to VTEs to ensure continued focus on this topic.

Response: We understand commenters' concerns regarding continual reporting of information related to VTEs. We refer readers to section IX.C.3.b. of this final rule in which we are including the Hospital Harm—Postoperative VTE eCQM as a measure available for hospitals to self-select beginning with the CY 2028 reporting period/FY 2030 payment determination. This aligns with the proposal to remove the VTE–1 and VTE–2 eCQMs from the measures available for hospitals to self-select beginning with the CY 2028 reporting period/FY 2030 payment determination so that there will continually be a measure related to VTEs available for hospitals to self-select for reporting. We further refer readers to section IX.C.8.c. of this final rule in which we are establishing a policy under which reporting Hospital Harm eCQMs becomes mandatory following 2 years of self-selected reporting. We note that under that policy data regarding the Hospital Harm—Postoperative VTE eCQM will be available for all participating hospitals beginning with the CY 2030 reporting period/FY 2032 payment determination.

Comment: Many commenters stated that retaining VTE–1 and VTE–2 would continue to provide clinical value. Many commenters stated that pairing the VTE–1 and VTE–2 process measures with the newly proposed VTE related outcome measure would provide a more complete clinical picture which could help hospitals understand systemic failures which lead to VTEs. A few commenters stated that retaining these process measures would continue to provide valuable information and facilitate longitudinal analysis. A commenter stated that VTE–1 and VTE–2 include a broader patient population than the Hospital Harm Postoperative VTE eCQM because these measures include non-surgical patients.

[423] We refer readers to the FY 2019 IPPS/LTCH PPS final rule (83 FR 41540 through 41544) for a summary of the Hospital Inpatient Quality Reporting Program's removal factors. Removal factors are codified at 42 CFR 412.140(g)(2) and (3).

[424] The Joint Commission. (Oct. 2025). 2026 ORYX Performance Measurement Reporting Requirements. Available at: *https://jointcommission-ddsp.atlassian.net/wiki/spaces/DCS/pages/1030619137/2026+ORYX+Performance+Measurement+Reporting+Requirements.*

[425] The ORYX initiative integrates performance measurement data into The Joint Commission's standards-based survey and accreditation process to support hospitals in their quality improvement efforts through the continuous monitoring and evaluation. For more details on The Joint Commission's accreditation, we refer readers to: *https://www.jointcommission.org/en-us/accreditation/performance-measurement.*

Response: We understand commenters' concerns that outcomes data alone does not allow analysis of potential systemic failures that led to specific outcomes and that these process measures could continue to provide valuable clinical information. We encourage hospitals seeking to improve performance on outcome-related measures to analyze processes and workflows, such as appropriate and timely VTE prophylaxis, that contribute to adverse patient outcomes. We note that this analysis would likely include all patients with VTE risk, regardless of whether the patient had a planned surgical procedure, and therefore while the Hospital Harm—Postoperative VTE eCQM does not include non-surgical patients, efforts to improve performance on this measure would impact all patients at risk of VTEs. While we understand the importance of longitudinal analysis, we note that such analysis of measures on which hospitals can self-select to report, such as VTE–1 and VTE–2, may be impacted by an inconsistent set of reporting hospitals over time. We note that one of the goals of the Hospital Inpatient Quality Reporting Program is to move forward in the least burdensome manner possible, while maintaining a parsimonious set of the most meaningful quality measures and continuing to incentivize improvement in the quality of care provided to patients. Replacing these two process measures with one outcome measure is an effective way to accomplish this goal. Our priority is a focus on measurable clinical outcomes such as the prevalence of postoperative VTEs as measured by the Hospital Harm—Postoperative VTE eCQM.

Comment: A few commenters stated that performance on the proposed Hospital Harm—Postoperative VTE eCQM is outside of a hospital's control and recommended retaining VTE–1 and VTE–2 until further refinements are made to the Hospital Harm—Postoperative VTE eCQM.

Response: We refer readers to section IX.C.3.b. of this final rule in which we discuss the adoption of the Hospital Harm—Postoperative VTE eCQM. In that section of this final rule, we discuss the risk adjustment of the Hospital Harm—Postoperative VTE eCQM and strategies that hospitals can take to reduce postoperative VTE incidence. Given the importance of VTE as a clinical outcome and the strategies available to hospitals to reduce the risk of VTE, further refinements to the Hospital Harm—Postoperative VTE eCQM are not necessary and it is appropriate to adopt this outcome eCQM while removing the associated process measures from the Hospital Inpatient Quality Reporting Program measure set.

Comment: Several commenters expressed concern that the number of eCQMs available for self-selection is becoming too small. A few of these commenters stated that transitioning to other self-selected eCQMs would require time for hospitals to build, validate, and adjust workflows to meet the requirements of newly selected eCQMs. A commenter stated that most of the operational burden associated with an eCQM is in configuring data capture, mapping value sets, and aligning workflows with the measure logic. This commenter stated that removing these eCQMs would not reduce burden for hospitals, which may continue to monitor performance on these measures to support quality improvement efforts.

Response: We recognize that the number of eCQMs available for self-selection would be reduced by the removal of these eCQMs and the transition of other eCQMs to mandatory reporting. We also understand commenters' concerns that the operational burden of eCQM reporting is largely associated with system configuration and workflow updates. However, it is important to continue to evolve the Hospital Inpatient Quality Reporting Program's measure set to address the most meaningful quality measures and continue to incentivize improvement in the quality of care provided to patients. By replacing process measures with an outcome measure we can ensure that the Hospital Inpatient Quality Reporting Program's measure set advances to improve patient safety and outcomes.

After consideration of the public comments we received, we are finalizing our proposal to remove the VTE–1 and VTE–2 eCQMs beginning with the FY 2030 payment determination. We refer readers to section IX.F.9. of this final rule where we are finalizing removal of these same eCQMs for the Medicare Promoting Interoperability Program.

b. Removal of the Discharged on Antithrombotic Therapy Electronic Clinical Quality Measure Beginning With the FY 2030 Payment Determination

We refer readers to the FY 2014 IPPS/LTCH PPS final rule where we adopted the Discharged on Antithrombotic Therapy (STK–02) eCQM into the Hospital Inpatient Quality Reporting Program eCQM measure set for self-selected reporting beginning with the CY 2014 reporting period (78 FR 50807 through 50810).[426] This measure was originally adopted as a chart-abstracted measure and was later specified as an eCQM, which we adopted as an option for hospitals to self-select (76 FR 51633 through 51634 and 78 FR 50807 through 50810).[427] The STK–02 eCQM assesses the proportion of patients hospitalized with ischemic stroke who are prescribed or continue antithrombotic therapy at the time of hospital discharge. In the FY 2027 IPPS/LTCH PPS proposed rule (91 FR 19589 through 19590), we proposed to remove the STK–02 eCQM from the Hospital Inpatient Quality Reporting Program, beginning with the CY 2028 reporting period/FY 2030 payment determination under measure removal factor 1, measure performance among hospitals is so high and unvarying that meaningful distinctions and improvements in performance can no longer be made, as described at 42 CFR 412.140(g)(3)(i)(A).[428]

Over four of the most recent reporting periods, hospital performance has been so high and unvarying that it meets our criteria for ''topped out'' under measure removal factor 1 (83 FR 41540 through 41544), that is, statistically indistinguishable performance at the 75th and 90th percentiles, and truncated coefficient of variation ≤0.10, see Table IX.C.2. Since the STK–02 eCQM is a self-selected eCQM, meaning that not all hospitals are required to report it, we considered that the topped out status may not reflect national performance. However, the number of hospitals reporting on this measure has remained consistently high, with approximately two-thirds of the Hospital Inpatient Quality Reporting Program-eligible hospitals reporting since FY 2023. We therefore believe that the measure results represent most hospitals' performance on this measure. Further, the CBE recently selected this measure for review for potential removal from the Hospital Inpatient Quality Reporting Program as part of the Measure Set Review process and ultimately recommended its discontinuation due to minimal variation and stable median performance across hospitals.[429] The

[426] Partnership for Quality Measurement. STK–02: Discharged on Antithrombotic Therapy. Available at: *https://p4qm.org/measures/0435e.*

[427] For more details on STK–02 specifications, we refer readers to the eCQI Resource Center available at: (*https://ecqi.healthit.gov/eh-cah*).

[428] We refer readers to the FY 2019 IPPS/LTCH PPS final rule (83 FR 41540 through 41544) for a summary of the Hospital Inpatient Quality Reporting Program's removal factors. Removal factors are codified at 42 CFR 412.140(g)(2) and (3) (88 FR 59144).

[429] Partnership for Quality Measurement (2025). 2025 Measure Set Review Draft Meeting Summary.

STK–02 eCQM was also retired from The Joint Commission's ORYX® requirements effective CY 2026.[430] [431]

TABLE IX.C.2.: STK-02 DATA FROM REPORTING HOSPITALS Q1 2020 THROUGH Q4 2024

Payment Determination	Performance Period	Mean	75th Percentile	90th Percentile	Truncated COV
FY 2023	Q1 2021- Q4 2021	91.66	100.00	100.00	0.055
FY 2024	Q1 2022- Q4 2022	92.26	99.00	100.00	0.045
FY 2025	Q1 2023- Q4 2023	92.71	99.00	100.00	0.038
FY 2026	Q1 2024- Q4 2024	93.13	99.00	100.00	0.034

Stroke has been and remains a priority topic for quality measurement in the hospital inpatient setting for over a decade due to its high prevalence and substantial impact on quality of life, disability, and death (76 FR 51633 through 51634).[432] We explained in the proposed rule that if the STK–02 eCQM measure is removed from the Hospital Inpatient Quality Reporting Program, we would continue to address quality of care for stroke patients through the use of other clinical outcome measures. These measures include the Hospital 30-Day, All-Cause, Risk Standardized Mortality Rate Following Acute Ischemic Stroke (MORT–30–STK) measure, which assesses the hospital-level, risk-standardized mortality rate after hospital admission for acute ischemic stroke (78 FR 50798 through 50802, most recently modified at 90 FR 36997 through 37001) as well as the remaining two eCQMs that are a part of the stroke measure set, including the Anticoagulation Therapy for Atrial Fibrillation (STK–03) eCQM and the Antithrombotic Therapy by the End of Hospital Day Two (STK–05) eCQM (76 FR 51633 through 51634, 78 FR 50807 through 50810).

We note that we also proposed to remove the STK–02 eCQM in the Medicare Promoting Interoperability Program beginning with the CY 2028 reporting period. For more information, we refer readers to section IX.F.9. of this final rule.

We invited public comment on our proposal to remove the STK–02 eCQM beginning with the CY 2028 reporting period/FY 2030 payment determination.

Comment: Many commenters supported our proposal to remove the STK–02 eCQM from the Hospital Inpatient Quality Reporting Program because the measure no longer provides information that is actionable or useful given the lack of meaningful differentiation in hospital performance. Several commenters supported removal of this measure and agreed that removing lower-value or topped-out measures reduces reporting burden, allowing hospitals to focus clinical and health IT resources on newer digital measures, interoperability requirements, and reporting capabilities. A few commenters supported our continued transition toward outcome-focused eCQMs that focus on patient harm, provide greater clinical value, and reduce unnecessary administrative burden.

Response: We thank commenters for their support and agree that removing this measure will allow hospitals to focus on eCQMs that provide greater clinical value.

Comment: A commenter supported the removal of this measure and recommended developing a replacement outcome measure that would close a longstanding gap in stroke quality reporting.

Response: We agree with the commenter that outcomes for stroke patients are an important topic in the inpatient setting and will continue to evaluate additional measures related to stroke care for the inpatient quality measurement sets.

Comment: Several commenters did not support removing the STK–02 eCQM because it significantly reduces flexibility in meeting eCQM reporting requirements and recommended maintaining this measure as an option for hospitals to self-select. A few commenters stated concerns about removing this measure because it is an established, stable measure that hospitals have invested significant financial, operational, and information technology resources to successfully implement. A few commenters recommended delaying the removal of STK–02 until hospitals have adequate time to build, validate, and adjust workflows to ensure a smooth and reliable transition to meet the requirements of the other self-selected measures that would take their place.

Response: We recognize that the number of eCQMs available for self-selection would be reduced by the removal of the STK–02 eCQM and the transition of other eCQMs to mandatory reporting. We also understand commenters' concerns that the operational burden of eCQM reporting is largely associated with system configuration and workflow updates. We reiterate that over four of the most recent reporting periods, hospital performance on this measure has been so high and unvarying that this measure meets our criteria for ''topped out'' under removal factor 1 (83 FR 41540 through 41544), that is, performance is statistically indistinguishable at the 75th and 90th percentiles, and truncated coefficient of variation ≤0.10. Therefore, this measure no longer provides meaningful comparative information. By removing measures that meet our criteria for ''topped out'' we can ensure that the Hospital Inpatient Quality Reporting Program's measure set continues to address the most meaningful quality measures. While removing this eCQM would limit the available eCQMs for self-selection, we anticipate that the measure set would continue to evolve in future rulemaking,

[431] The ORYX initiative integrates performance measurement data into The Joint Commission's standards-based survey and accreditation process to support hospitals in their quality improvement efforts through the continuous monitoring and evaluation. For more details on The Joint Commission's accreditation, we refer readers to: *https://www.jointcommission.org/en-us/accreditation/performance-measurement.*

[432] Department of Health and Human Services. Heart Disease and Stroke. Available at: *https://odphp.health.gov/healthypeople/objectives-and-data/browse-objectives/heart-disease-and-stroke.*

providing additional self-selection options for hospitals.

Comment: A few commenters stated concerns that removal of this measure could result in a reduction in provider performance for stroke patient outcomes. Commenters stated that this measure remains a valuable tool for clinicians and patients and recommended continuing to monitor performance to confirm that removal does not result in unintended consequences, suggesting monitoring for at least 2 years following removal to assess any changes in prescribing rates. A commenter recommended ensuring that this aspect of care remains addressed through other measures within the Hospital Inpatient Quality Reporting Program.

Response: We acknowledge commenters' concerns about removing the STK–02 eCQM from the Hospital Inpatient Quality Reporting Program. We reiterate that the CBE recently recommended the removal of the STK–02 eCQM due to minimal variation and stable median performance across hospitals.[433] Given the lack of meaningful variation in measure performance, improvements in performance can no longer be made, and thus removing this measure under removal factor 1 will allow hospitals to focus resources on eCQMs with room for further performance improvement. While we are not maintaining the STK–02 eCQM as a part of the measure set in the Hospital Inpatient Quality Reporting Program, we encourage hospitals who may still find this measure valuable to maintain this measure as a part of their own quality improvement efforts.

After consideration of the public comments we received, we are finalizing our proposal to remove the STK–02 eCQM beginning with the FY 2030 payment determination. We refer readers to section IX.F.9. of this final rule where we are finalizing removal of this same eCQM for the Medicare Promoting Interoperability Program.

5. Modifications to Current Measures in the Hospital Inpatient Quality Reporting Program Measure Set

In the FY 2027 IPPS/LTCH PPS proposed rule (91 FR 19590 through 19594), we proposed modifications to three measures that are currently in the Hospital Inpatient Quality Reporting Program measure set beginning with the July 1, 2024 through June 30, 2026 performance period, associated with the FY 2028 payment determination: (1) Excess Days in Acute Care after Hospitalization for Acute Myocardial Infarction measure; (2) Excess Days in Acute Care after Hospitalization for Heart Failure measure; and (3) Excess Days in Acute Care after Hospitalization for Pneumonia measure.

a. Modifications to Three Excess Days in Acute Care Measures

(1) Background

In the FY 2016 IPPS/LTCH PPS final rule (80 FR 49660 through 49690), we began including excess days in acute care quality measures in the Hospital Inpatient Quality Reporting Program to capture the quality of care transitions provided to discharged patients. The previously finalized EDAC measures are summarized:

- Excess Days in Acute Care after Hospitalization for Acute Myocardial Infarction (AMI EDAC) measure (adopted at 80 FR 49680 through 49690; modified at 87 FR 49269 through 49272).
- Excess Days in Acute Care after Hospitalization for Heart Failure (Heart Failure EDAC) measure (adopted at 80 FR 49682 through 49690).
- Excess Days in Acute Care after Hospitalization for Pneumonia (Pneumonia EDAC) (adopted at 81 FR 57142 through 57148).

For more details on these EDAC measures, we refer readers to the EDAC measures updates and specifications reports available at: *https://qualitynet.cms.gov/inpatient/measures/edac.*

Since adoption into the Hospital Inpatient Quality Reporting Program, these EDAC measures have contributed to our assessment of care coordination and patient outcomes, providing a broader view of quality of care than can be captured by individual process-of-care measures. Safely transitioning patients from hospital to home requires a complex series of tasks which would be cumbersome to capture individually as process measures: timely and effective communication between providers, prevention of and response to complications, patient education about post-discharge care and self-management, timely follow-up, and more.[434] [435] Suboptimal transitions contribute to a variety of adverse events post-discharge that result in patients returning to the hospital.[436] When these EDAC measures were adopted into the Hospital Inpatient Quality Reporting Program measure set, they only included Medicare Fee-For-Service beneficiaries in the measure cohorts. Since the initial adoption of these measures, the proportion of Medicare Advantage beneficiaries has increased from 35 percent of the Medicare population to over 50 percent.[437] Omitting Medicare Advantage beneficiaries from quality reporting leaves a critical gap in assessing acute events, care transitions, and avoidable acute utilization among a large population of Medicare beneficiaries. Capturing care transition outcomes for all Medicare beneficiaries for these acute conditions continues to be a high priority for CMS. We note that returns to the ED, observation stays, or unplanned readmissions are disruptive to patients and caregivers, costly to the healthcare system, and put patients at additional risk of hospital-acquired infections and complications.[438] Therefore, in the FY 2027 IPPS/LTCH PPS proposed rule (91 FR 19590 through 19594), we proposed to adopt modifications to the AMI, Heart Failure, and Pneumonia EDAC measures beginning with the July 1, 2024 through June 30, 2026 performance period, which is associated with the FY 2028 payment determination. We also refer readers to section IX.C.3.a. of this FY 2027 IPPS/LTCH PPS final rule where we proposed to add the Diabetes EDAC measure into the Hospital Inpatient Quality Reporting Program.

(2) Overview of Proposed Updates to Measures

We proposed (91 FR 19590 through 19594) to modify the AMI, Heart Failure, and Pneumonia EDAC measures with two substantive updates: (1) expand the measure inclusion criteria to include Medicare Advantage

[433] Partnership for Quality Measurement (2025). 2025 Measure Set Review Draft Meeting Summary. Available at: *https://p4qm.org/sites/default/files/2025-11/Del-4-11-2025-MSR-Recommendation-Group-Meeting-Final-Summary-508.pdf.*

[438] CMS QualityNet. Excess Days in Acute Care (EDAC) Measures Overview. Available at: *https://qualitynet.cms.gov/inpatient/measures/edac.*

beneficiaries; and (2) shorten the performance period from 3 years to 2 years. Inclusion of Medicare Advantage beneficiaries expands quality measurement of care coordination outcomes across all Medicare beneficiaries, enhances the reliability of the measure scores, leads to more hospitals receiving results, and increases the chance of identifying meaningful differences in quality for some low-volume hospitals. Based on our analysis that included Medicare Advantage beneficiaries in addition to the Medicare Fee-For-Service measure cohort, we found that the measures could achieve a satisfactory level of reliability with a 2-year reporting period. Table IX.C.3. summarizes the reliability scores for the three modified EDAC measures for the CY 2022 through CY 2023 reporting period with the inclusion of Medicare Advantage beneficiaries:[439]

TABLE IX.C.3. EDAC MEASURES RELIABILITY ESTIMATES USING A 2-YEAR REPORTING PERIOD

Measure	Mean (SD)	Range	25th Percentile	50th Percentile	75th Percentile
AMI EDAC	0.922 (0.049)	0.786-0.992	0.897	0.935	0.960
Heart Failure EDAC	0.863 (0.128)	0.542-0.996	0.793	0.92	0.962
Pneumonia EDAC	0.873 (0.109)	0.593-0.996	0.806	0.920	0.960

The mean reliability for each of the EDAC measures exceeds the CBE-established minimum of 0.6.[440] We therefore proposed to shorten the reporting period from 3 to 2 years for the modified EDAC measures in order to provide hospitals, consumers, and other members of the public with more recent measure information.

These measures capture the quality of care transitions provided to discharged patients hospitalized with AMI, heart failure, or pneumonia by collectively measuring different types of returns to the hospital (ED visit, observation stay, or readmission), which are all adverse acute care outcomes that can occur post-discharge. With the increase in Medicare Advantage beneficiaries to over half of all Medicare beneficiaries, these modifications would better reflect overall patient care coordination among a broader population of patients, improving measure reliability. Shortening the reporting period would allow measure results to reflect more recent hospital performance and provide more actionable insights for quality improvement.

(3) Measure Calculation

The modified AMI, Heart Failure, and Pneumonia EDAC measures would continue to assess the number of days the patient spends in acute care within 30 days post-discharge from an inpatient hospitalization with a principal diagnosis of AMI, heart failure, or pneumonia. The measures adjust for factors including patient age, comorbid diseases, and indicators of patient frailty.[441] The hospital-level 30-day all-cause EDAC for each measure is a risk adjusted calculation using a random-effects binomial model which calculates the difference, or excess days, between a hospital's predicted days (the average number of days a patient spent in acute care after adjusting for the risk factors) and expected days (the average number of risk adjusted days in acute care a patient would have been expected to spend if discharged from an average-performing hospital with the same case mix) per 100 discharges. Unplanned readmissions are defined using the planned readmission algorithm.[442]

(a) Numerator

The numerator of the measure is a count of the number of days the patient spends in acute care within 30 days of discharge from an eligible index hospitalization for AMI, heart failure, or pneumonia. We define days in acute care as days spent in an ED, an observation stay, or admitted as an unplanned readmission for any cause to a short-term acute care hospital, within 30 days from the date of discharge from the index hospitalization. ED visits are counted as one whole day, regardless of how many hours the patient spends in the ED or whether the ED visit crosses more than one calendar date. Observation stays are counted by hours and rounded up to the nearest whole day.[443]

(b) Denominator

To be included in the measure cohort, patients must meet the following inclusion criteria:

- Have a principal discharge diagnosis of AMI, heart failure, or pneumonia;
- Enrolled in Medicare Fee-For-Service Part A and Part B or Medicare Advantage for 12-months prior to the date of admission and enrolled in Part A or Medicare Advantage during the index admission;[444]
- Aged 65 or older;
- Discharged alive from a non-federal short-term acute care hospital or Veterans Health Administration hospital; and
- Not transferred to another acute care facility.

For more detailed measure specifications, including denominator exclusions for each condition, we refer readers to the EDAC measure methodology reports available at: *https://qualitynet.cms.gov/inpatient/measures/edac/methodology.*

(4) Pre-Rulemaking Process and Measure Endorsement

(a) Recommendations From the Pre-Rulemaking Measure Review Process

We refer readers to the Partnership for Quality Measurement website for details on the Pre-Rulemaking Measure Review process convened by the CBE, including

[439] 2024 Excess Days in Acute Care Measures Updates and Specifications Report. Available at: *https://www.p4qm.org/prmr-measures/muc2025-030.*

[440] For more details on reliability guidance, we refer readers to the Reliability Guidance for the Endorsement and Maintenance of Clinical Quality Measures Document. Available at: *https://p4qm.org/em/resources.*

[441] QualityNet. Excess Days in Acute Care Measures Methodology. Available at: *https://qualitynet.cms.gov/inpatient/measures/edac/methodology.*

[442] Details regarding the planned readmission algorithm can be found in a zip file on the CMS Measure Methodology site, available at: *https://www.cms.gov/medicare/quality/initiatives/hospital-quality-initiative/measure-methodology.*

[443] QualityNet. Excess Days in Acute Care Measures Methodology. Available at: *https://qualitynet.cms.gov/inpatient/measures/edac/methodology.*

[444] This requirement is not applicable to Veterans Health Administration (VHA) beneficiaries hospitalized in VHA hospitals, who are eligible for inclusion in the cohort regardless of their Medicare enrollment status. VHA beneficiaries hospitalized in non-VHA hospitals must be concurrently enrolled in Medicare Fee-For-Service Part A or Medicare Advantage at the time of the index admission to be eligible for cohort inclusion.

the voting procedures used to reach consensus on measure recommendations.[445] [446] The Pre-Rulemaking Measure Review Hospital Committee, consisting of both the Pre-Rulemaking Measure Review Hospital Recommendation Group (hereafter referred to as the Recommendation Group) and the Pre-Rulemaking Measure Review Hospital Advisory Group, met on January 12 and 13, 2026, to review measures included by the Secretary on the publicly available ''2025 Measures Under Consideration List,'' including the AMI EDAC (MUC2025–030), Heart Failure EDAC (MUC2025–031), and Pneumonia EDAC (MUC2025–039) measures.[447]

The voting results of the Recommendation Group for the proposed modifications to the AMI EDAC measure were: 18 members (86 percent) recommended adopting the measure into the Hospital Inpatient Quality Reporting Program; three members (14 percent) voted not to recommend the measure for adoption. The voting results for the proposed modifications to the Heart Failure EDAC measure were: 19 members (90 percent) recommended adopting the measure into the Hospital Inpatient Quality Reporting Program; two members (10 percent) voted not to recommend the measure for adoption. The voting results for the proposed modifications to the Pneumonia EDAC measure were: 19 members (90 percent) recommended adopting the measure into the Hospital Inpatient Quality Reporting Program; two members (10 percent) voted not to recommend the measure for adoption. Thus, the Recommendation Group reached consensus agreement to recommend the AMI EDAC, Heart Failure EDAC, and Pneumonia EDAC measures for use in the Hospital Inpatient Quality Reporting Program.[448]

Overall, the Recommendation Group supported the addition of Medicare Advantage beneficiaries and the reduction of the performance period from 3 years to 2 years, noting these changes improved the comprehensiveness and timeliness of reporting. The Recommendation Group members who recommended these measures suggested adding risk adjustment factors for medically underserved and rural areas, where limited access to post-acute services may affect readmissions beyond a hospital's control. Recommendation Group members who voted not to recommend adoption of the measure for the program provided the following rationales: (1) concerns that the 30-day post-discharge window may not be appropriate; and (2) concerns regarding AMI EDAC measure's complexity, diagnosis set, and the risk adjustment approach.

Regarding the suggestion to add additional risk adjustment factors, in alignment with other readmission measures, we do not adjust the EDAC measures for rurality or medically underserved populations. We note that Critical Access Hospitals (CAHs), which serve higher proportions of rural and medically underserved populations, are not required to report to the Hospital Inpatient Quality Reporting Program.[449] We also note that EDAC measures are risk-standardized for patient demographics and comorbidities, which helps account for varying health complexities. Further, we would continue to provide hospitals with patient-level information to help inform quality improvement efforts that can be targeted to specific patient populations. We would continue to monitor the measures' performance as part of our routine monitoring and evaluation efforts to identify potential unintended consequences.

We note that the 30-day timeframe is consistent with the existing measure specifications that have been endorsed by a CBE and publicly reported. In addition, the EDAC measures were originally designed to complement condition specific 30-day readmission measures for the same conditions and therefore the 30-day outcome window is aligned. The 30-day timeframe allows for a more complete reflection of the hospital's discharge plan which includes follow-up, care coordination, and patient self-management education.

Regarding the AMI EDAC measure specifically, Recommendation Group members expressed concerns regarding its complexity and relatively narrow diagnosis set, noting a preference for other metrics to assess AMI care. While statistically complex, the AMI EDAC risk-model was determined by the CBE to indicate an effective model discrimination for a readmission-type measure with a c-statistic[450] of 0.68, and predictive ability[451] of 1.4 percent to 10.1 percent. Further, the measure developer considered threats to validity during measure development and testing of a risk adjustment model. The measure is risk adjusted for patient functional status (frailty indicator), patient-level demographics (age), and patient-level health status and clinical conditions (case-mix adjustment, comorbidities, and severity of illness). The results of model discrimination testing and calibration using the c-statistic and examining predictive ability suggest that the model effectively differentiates excess days in acute care after hospitalization for acute myocardial infarction levels and adequately adjusts for differences in patient characteristics.[452]

Recommendation Group members highlighted potential shortcomings in the current risk adjustment approach for the AMI EDAC measure, particularly the comorbidity adjustment for non-ST-segment elevation myocardial infarction (NSTEMI) cases. The measure developer used an empirical approach for the selection of risk variables included in adjustments for hospital-level case mix. The index and history (pre-index) codes were selected based on their prevalence and the index and pre-index variables were combined based on their correlation with each other and their associations with the outcome. For AMI EDAC, ST-segment elevation myocardial infarction (STEMI) involving the right and left coronary arteries occurring in

[445] Partnership for Quality Measurement. Pre-Rulemaking Measure Review web page. Available at: *https://p4qm.org/prmr/about.*

[446] We note the Pre-Rulemaking Measure Review voting process was updated in 2025. We refer readers to the corresponding footnote in section IX.C.3.a.(4)(a) of this final rule for details on the updated Pre-Rulemaking Measure Review voting process.

[447] Centers for Medicare & Medicaid Services. (2025). 2025 Measures Under Consideration List. Available at: *https://mmshub.cms.gov/measure-lifecycle/measure-implementation/pre-rulemaking/lists-and-reports/overview.*

[448] Partnership for Quality Measurement. (February 2026). 2025–2026 Pre-Rulemaking Measure Review Recommendations Report. Available at: *https://p4qm.org/prmr/news-events.*

[449] CMS. Critical Access Hospitals. Available at: *https://www.cms.gov/medicare/health-safety-standards/certification-compliance/critical-access-hospitals.*

[450] The c-statistic is an indicator of the model's discriminant ability or ability to correctly classify those patients who have and have not had a qualifying event within 30 days. Potential values range from 0.5, meaning no better than chance, to 1.0, an indication of perfect prediction. The CBE has determined that for readmission-type measures, a c-statistic of 0.68 is considered an effective model of discriminant ability. We refer readers to the ''2024 Excess Days in Acute Care Measures Updates and Specifications Report,'' available at: *https://www.p4qm.org/prmr-measures/muc2025-030* for more details.

[451] Predictive ability measures the ability to distinguish high-risk subjects from low-risk subjects. A model with good predictive ability would see a wide range in observed outcomes between lowest and highest deciles of predicted outcomes. We have calculated the range of mean observed hospital ratios between the lowest and highest deciles of hospital visit probabilities. We refer readers to the ''2024 Excess Days in Acute Care Measures Updates and Specifications Report,'' available at: *https://www.p4qm.org/prmr-measures/muc2025-030* for more details.

[452] PQM. 2025 Pre-Rulemaking Measure Review Preliminary Assessment: AMI EDAC. Available at: *https://www.p4qm.org/sites/default/files/2025-12/MUC2025-030-PA.pdf.*

the 12 months prior to the index admission were identified as risk adjustment variables, while NSTEMI was not identified. Clinically, STEMI presents a more severe form of myocardial infarction for which aggressive interventions are required in a short period of time. Additionally, we wish to emphasize we have conducted extensive evaluation of the proposed updated risk adjustment methodology and the updated risk methodology shows significant improvements from the previous model. We refer readers to Table IX.C.4., in section IX.C.5.a.(6), for more details on the technical updates to the risk adjustment methodology for the three modified EDAC measures.

After taking these recommendations and concerns into consideration, we proposed (91 FR 19590 through 19594) to modify the three EDAC measures in the Hospital Inpatient Quality Reporting Program beginning with the FY 2028 payment determination.

(b) Measure Endorsements

We refer readers to the Partnership for Quality Measurement website for details on the measure endorsement and maintenance process, including the measure evaluation procedures the Endorsement and Maintenance Committees use to evaluate measures and whether they meet endorsement criteria. The Heart Failure EDAC (CBE #2880) and Pneumonia EDAC (CBE #2882) measures were last endorsed in the Spring 2021 CBE review cycle and are planned for maintenance review in the Fall 2027 cycle.[453] [454] The updated AMI EDAC (CBE #2881) measure, which included the addition of Medicare Advantage beneficiaries, was most recently submitted to the CBE's Endorsement and Maintenance Cost and Efficiency Committee in the Spring 2025 review cycle. The Endorsement and Maintenance Cost and Efficiency Committee voted to endorse the AMI EDAC measure with conditions. The condition imposed was for the measure developer to empirically explore the differences with outpatient visits and post-hospitalizations for Medicare Advantage beneficiaries compared to Fee-For-Service beneficiaries when the measure returns in five years for maintenance endorsement in the Spring 2030 cycle.[455] [456]

(5) Data Source, Submission, and Public Reporting

The modified EDAC measures would be calculated using administrative data from Medicare Fee-For-Service claims or Medicare Advantage encounters, or both. This data is routinely generated by hospitals and submitted to CMS for all Medicare beneficiaries, which includes Medicare Advantage and Medicare Fee-For-Service beneficiaries. Therefore, a hospital would not be required to report any additional data for this measure. Enrollment status would be obtained from the Medicare Enrollment Database which contains beneficiary demographic, benefit/coverage, and vital status information. The proposed modified EDAC measures would be calculated and publicly reported on an annual basis using 24 months of prior data for the measurement period. We would then publicly report the measures' results on the Compare tool, currently available at: *https://www.medicare.gov/care-compare/,* or successor CMS website.

We invited public comment on our proposal to modify the AMI, Heart Failure, and Pneumonia EDAC measures to include Medicare Advantage patients in the measure cohort and reduce the performance period from 3 years to 2 years, beginning with the July 1, 2024 through June 30, 2026 performance period, associated with the FY 2028 payment determination.

Comment: Many commenters supported the modifications to the AMI, Heart Failure, and Pneumonia EDAC measures. Many commenters stated that including Medicare Advantage beneficiaries in the measures' cohorts will fill a significant gap in data, providing a more complete picture of quality of care for a large portion of Medicare beneficiaries, which will improve patients' and families' ability to make fully informed decisions about where to seek care. Several commenters supported the shortening of the performance period from 3 to 2 years because it provides more recent data and supports organizational learning, quality improvement, and responsiveness to emerging safety concerns. A commenter stated that the shorter performance period would reduce burden. A commenter supported technical updates to existing measures stating that this would improve aligned quality measurement across programs, reduce fragmentation, and promote more actionable, patient-centered quality reporting.

Response: We thank commenters for their support of the proposed modifications to the AMI, Heart Failure, and Pneumonia EDAC measures. We agree that including Medicare Advantage beneficiaries will provide a more complete assessment of hospital performance across the Medicare population. We also agree that shortening the performance period from 3 to 2 years will provide more recent and actionable information. We appreciate commenters' support for the EDAC measures and for the technical updates to the risk adjustment methodology.

Comment: A few commenters stated that a combination of multiple modifications could create volatile and unreliable performance scores, which would drive penalty exposure without improving the quality of care delivered to patients. A commenter specifically stated that shortening the performance period could increase year-to-year volatility.

Response: As discussed in the FY 2027 IPPS/LTCH PPS proposed rule (91 FR 19590 through 19594), we analyzed the modified EDAC measures with Medicare Advantage beneficiaries included in the measures' cohorts and found that the measures achieved satisfactory reliability using a 2-year reporting period. The inclusion of Medicare Advantage beneficiaries both increases measure cohort size and improves reliability, while the shortened performance period allows measure results to reflect more recent hospital performance. This approach balances the need for reliable measure results with the goal of providing more timely and actionable information for quality improvement. We refer readers to section IX.C.5.a.(2) for detailed measure testing reliability results. We also refer readers to the Excess Days in Acute Care Methodology Reports available at: *https://qualitynet.cms.gov/inpatient/measures/edac/methodology* for further details on the measure testing methodology. We also recognize the importance of ensuring that measure results are stable, meaningful, and useful for quality improvement. We will continue monitoring the performance of the EDAC measures, including reliability, validity, and year-to-year variation, as part of routine monitoring and evaluation.

Comment: Many commenters expressed concern that including Medicare Advantage beneficiaries in the cohorts for the EDAC measures would

[456] Battelle. (November 2025). Draft Spring 2025 Cycle Endorsement and Maintenance Technical Report: Cost and Efficiency. Available at: *https://p4qm.org/sites/default/files/Cost%20and%20Efficiency/material/Cost-Efficiency-Spring-2025-Technical-Report.pdf.*

affect comparability and reliability due to concerns about the completeness and consistency of Medicare Advantage encounter data. Several commenters recommended delaying the inclusion of Medicare Advantage beneficiaries until further testing and analyses can be done to ensure Medicare Advantage encounter data is accurate and comparable.

Response: We understand commenters' concerns regarding the inclusion of Medicare Advantage beneficiaries and the potential for challenges around data reliability, comparability, and completeness. As discussed in the FY 2027 IPPS/LTCH PPS proposed rule (91 FR 19590 through 19593), we have studied whether there are key differences between the Medicare Advantage and Medicare Fee-For-Service populations and found that there were not significant differences between the two populations. We also note that the risk adjustment models are aligned with the existing readmission measures, and include a Medicare Advantage indicator to account for differences between Medicare Advantage and Medicare Fee-For-Service beneficiaries and adjust for the prevalence of comorbidities in the Medicare Advantage cohort, especially among the pre-index variables that were derived from services in the outpatient setting (for example, physician visits). We note the inclusion of Medicare Advantage beneficiaries has several important benefits for the reliability of these EDAC measures. The increased size of the measures' cohorts leads to more hospitals reaching the minimum threshold for reporting and receiving results, thereby increasing the opportunity to identify meaningful differences in quality for some low-volume hospitals. Further, we found that incorporating Medicare Advantage beneficiaries into the measures' cohorts improved the measures' reliability. Using 2 years of data (CY 2022 to CY 2023), we found that the mean reliability estimates all exceeded the CBE established minimum threshold of 0.6, with results showing 0.922, 0.863, and 0.873, for the AMI EDAC measure, Heart Failure EDAC measure, and Pneumonia EDAC measure, respectively. Therefore, we concluded inclusion of Medicare Advantage beneficiaries into these measures' cohorts does not raise concerns about data comparability between the two populations across hospitals.

We have previously assessed the availability, completeness, and comparability of data elements used to define the EDAC outcome. These analyses found that the data elements necessary to identify ED visits and observation stays are available within Medicare Advantage encounter data, and that Medicare Advantage encounter data latency is comparable to Medicare Fee-For-Service claims for inpatient and outpatient settings. Generally, within 3 months following the close of the measurement period, more than 97 percent of ED and observation claims are available in both data sources. The relative distribution of EDAC outcome components, including inpatient readmissions, ED visits, and observation stays, is comparable between Medicare Advantage encounter data and Medicare Fee-For-Service claims, supporting the use of Medicare Advantage encounter data for reliable EDAC outcome measurement.[457]

We note that with over half of the Medicare population now receiving benefits through the Medicare Advantage program, continuing to include this population into quality measures in the Hospital Inpatient Quality Reporting Program supports quality improvement goals of high-quality, safe care for all Medicare beneficiaries and patients. We refer readers to section IX.C.5.a.(2) for detailed results on these findings. We also refer readers to the Excess Days in Acute Care Methodology Reports available at: *https://qualitynet.cms.gov/inpatient/measures/edac/methodology* for additional details on the measure testing results including the observed days of post-discharge events per 100 discharges for the EDAC measures.

Comment: Several commenters stated that utilization trends for patients with Medicare Advantage are affected by plan benefit structures, payment delays, inappropriate denials, prior authorization requirements, coding methodologies, accuracy of encounter data, care management protocols, post-acute network limitations, and differences in patient populations. A few commenters stated that these effects on utilization trends may mean that hospitals would be subject to unfair comparisons based on the markets they serve rather than on the quality of care. A few commenters stated that regional differences in Medicare Advantage penetration levels could disproportionately impact certain hospitals in areas with higher Medicare Advantage enrollment. A commenter urged CMS to ensure that the measures distinguish between factors within a hospital's control and those driven by patient, community, payer, or broader healthcare system factors.

Response: We acknowledge that some post-discharge utilization may be influenced by factors beyond a hospital's direct control including factors related to Medicare Advantage plans. Further, we recognize that Medicare Advantage payment policies are not the same as Medicare Fee-For-Service payment policies, and by design, Medicare Advantage organizations are given more flexibility in benefit and provider reimbursement design. We note that from a patient's perspective, unplanned readmissions, ED visits, and observation stays are adverse events irrespective of benefit or payment policies. It is important to measure and provide transparency on the quality of transitions in care provided to discharged patients by collectively measuring these events for all Medicare beneficiaries. These measures are intended to provide a more complete reflection of the hospital's discharge planning, including follow-up, care coordination, and patient self-management education, which are important for all patients regardless of payer. While we understand that Medicare Advantage beneficiaries are subject to different benefits design and payment approaches than Medicare Fee-For-Service enrollees, we do not agree that these differences mean that their clinical outcomes are beyond the hospital's control. We continue to encourage hospitals to work closely with insurers, including Medicare Advantage plans, to coordinate the highest quality care for their patients.

With respect to the concern that hospitals in areas with higher Medicare Advantage enrollment may be disproportionately affected, we note that the risk adjustment model includes a Medicare Advantage indicator to account for potential differences between Medicare Advantage and Medicare Fee-For-Service beneficiaries. For more details on measure testing results, we refer to *https://qualitynet.cms.gov/inpatient/measures/edac/methodology.*

Comment: A few commenters expressed concern that existing risk adjustment methodologies may not sufficiently account for differences between Medicare Advantage and traditional Medicare populations. A few commenters recommended risk adjustment for social risk, outpatient access, post-acute and specialty care availability, safety net status, rurality, and coding variation.

Response: The EDAC measures are risk adjusted for clinically relevant

[457] Centers for Medicare & Medicaid Services. (April 2025). 2025 Condition-Specific Excess Days in Acute Care Measures Updates and Specifications Report. Available at: *https://qualitynet.cms.gov/inpatient/measures/edac/methodology.*

factors including age, comorbidities, case mix, severity of illness, and frailty. Measure testing supported the current risk adjustment model and demonstrated adequate controls for differences in patient characteristics (case mix), with a c-statistic of approximately 0.68, 0.64, and 0.67 for the AMI EDAC, Heart Failure EDAC, and Pneumonia EDAC measures, respectively. Additionally, CMS is making technical updates to the risk adjustment methodology to use individual International Classification of Diseases, Tenth Revision (ICD–10) codes rather than Hierarchical Condition Categories (HCC) categories to improve the measures' risk adjustment methodology. We refer readers to section IX.C.5.a.(6) for more details on our updates to the measures' risk methodology. We will continue to monitor measure performance, including whether future refinements to the risk adjustment methodology are warranted.

Comment: A few commenters expressed concern that the integration of Medicare Advantage data would impose disproportionate administrative burden on rural hospitals because they have limited staffing and IT resources, limited leverage with Medicare Advantage plans, and smaller patient populations which increases sensitivity to inaccurate Medicare Advantage data and variations in plan behavior. A few commenters also recommended that CMS continue monitoring for measure reliability and unintended consequences, particularly for hospitals serving medically and socially complex populations and for low-volume hospitals.

Response: We would like to clarify that the inclusion of Medicare Advantage encounter data into the EDAC measures' cohorts does not require any additional data collection or submission from hospitals. As we discussed in the proposed rule (91 FR 19593), the inclusion of Medicare Advantage encounter data in these measures uses readily available claim-level data elements routinely generated and submitted to CMS for Medicare Advantage. Specifically, the Medicare Advantage encounter data used for this measure are submitted by Medicare Advantage organizations to CMS. Similarly, Medicare Fee-For-Service claims are submitted through existing hospital billing processes. As such, the proposed modifications do not impose additional data submission burden on hospitals. We refer readers to section XII.B.4. for additional details on our information collection burden estimate for the proposal to adopt the modified EDAC measures.

Comment: A few commenters recommended that CMS stratify outcomes by payer to help identify disparities, provide visibility into Medicare Advantage and Fee-For-Service variations, and highlight emerging unintended consequences or differential patterns of preventable harm. Several commenters recommended that CMS provide hospital-specific impact analyses to allow hospitals to evaluate impacts before implementing these updates. However, a few commenters recommended that CMS not stratify outcomes by payer because the measures are designed to assess hospital quality and outcomes, rather than plan performance.

Response: We thank commenters for their recommendation to provide stratified measure results by payer to help identify disparities. We note that the measures' risk models include an indicator variable for Medicare Fee-For-Service and Medicare Advantage enrollment status, which accounts for any potential differences between these groups. We found that stratifying the risk models for the corresponding readmission measures on which these measures were based by Medicare Fee-For-Service and Medicare Advantage did not yield meaningful improvements in performance, supporting the decision to model them together with an indicator variable. Keeping Medicare Fee-For-Service and Medicare Advantage beneficiaries together for purposes of this measure's calculation will keep the hospitals' total volume higher for more precise measure scores. Any potential public reporting of stratified measure data would be proposed through future notice-and-comment rulemaking. We also note that confidential hospital-specific reports will be made available to hospitals to assess measure performance.

Comment: Several commenters urged CMS to delay the inclusion of Medicare Advantage beneficiaries until further testing and analyses can be done to ensure Medicare Advantage encounter data is accurate and comparable and can more accurately account for differences in coverage, utilization management, and data reporting. A few commenters specifically stated that when evaluating the AMI EDAC measure for endorsement, the CBE applied the condition that the developer empirically explore the differences in outpatient visits and post-hospitalization utilization for Medicare Advantage patients compared to Medicare Fee-For-Service patients prior to the next endorsement review in 5 years. These commenters stated that the CBE will likely apply the same condition to the heart failure EDAC and pneumonia EDAC measures when they undergo maintenance endorsement review in fall 2027.

Response: We note the inclusion of Medicare Advantage beneficiaries has several important benefits for the reliability of these EDAC measures. The increased size of the measures' cohorts leads to more hospitals reaching the minimum threshold for reporting and receiving results, thereby increasing the opportunity to identify meaningful differences in quality for some low-volume hospitals. As discussed in the FY 2027 IPPS/LTCH PPS proposed rule (91 FR 19568 through 19574), we have studied whether there are key differences between the Medicare Advantage and Medicare Fee-For-Service populations and found that there were not significant differences between the two populations. We intend to provide hospitals with confidential hospital-specific reports on their measure performance and will continue to evaluate differences between Medicare Advantage and Medicare Fee-For-Service beneficiaries through routine measure monitoring and future measure maintenance activities consistent with the condition provided by the CBE as part of the AMI EDAC measure endorsement.

Comment: A commenter requested clarification on whether the measures are intended to capture all post-discharge utilization or only preventable utilization.

Response: The EDAC measures compare the number of days patients are predicted to spend in acute care, specifically in unplanned hospital readmissions, observation stays, and ED visits, after discharge from a hospital compared to the days expected based on their degree of illness. The measures use a risk adjustment methodology to determine the predicted post-discharge utilization. As planned inpatient readmissions are not included in the EDAC measure outcome, the measure outcome does more readily capture preventable post-discharge acute care utilization.

Comment: A few commenters expressed concern that the EDAC measures are not easily replicable using available data sources.

Response: The EDAC measures contain data that are not easily replicated because it is a measure of post-discharge outcomes and relies on claims-based data compiled from multiple healthcare settings. However, post-discharge outcomes are important

indicators of quality because they reflect the effectiveness of discharge planning, care coordination, and follow-up care and provide information that is meaningful to patients and their families when making care decisions. We note that hospital-specific reports will include patient-level information about their measure results, which may help hospitals understand their performance and identify opportunities for improvement.

Comment: Another commenter recommended evaluating whether counting each ED visit as a full day may overstate acute-care utilization, particularly for brief or low-intensity encounters.

Response: We acknowledge that ED visits vary in duration and clinical intensity. Counting each ED visit as a full day supports a standardized calculation across hospitals. Modifying the weight of ED and observation stay days helps with the production, implementation, and ongoing reevaluation of the EDAC measures and improves the performance of the statistical model. Additionally, feedback from stakeholders suggests that although the average ED treat and discharge stay is about four hours, patients often spend an entire day from the time it takes to get to the ED, the wait time in the ED for treatment, treatment in the ED, and any trips for medication or supplies after their ED visit.

Comment: A few commenters recommended that CMS delay the proposals by 1 year, use a phased approach, or conduct a dry run prior to incorporation into the Hospital Inpatient Quality Reporting Program. These commenters stated that this additional time would allow hospitals to assess potential impact and allow CMS to complete additional reliability and social risk factor testing. A commenter stated that under the proposed implementation timeline the performance period will be completed by the time the rule is finalized, leaving hospitals no opportunity to understand, operationalize, or improve performance under the new specifications.

Response: We understand commenters' concerns about the impacts of implementing multiple changes to the EDAC measures. We note that hospitals have been preparing for the addition of Medicare Advantage data to several Hospital Inpatient Quality Reporting Program measures, including the MORT–30–STK measure, the COMP–HIP–KNEE measure, and the Thirty-day Risk-Standardized Death Rate Among Surgical Inpatients with Complications measure currently reported in the Hospital Inpatient Quality Reporting Program (90 FR 36997 through 37002, 90 FR 37002 through 37008, and 89 FR 69545 through 69552). Additionally, the inclusion of Medicare Advantage encounter data into the EDAC measures' cohorts does not require any additional data collection or submission from hospitals and uses readily available claim-level data elements routinely generated and submitted to CMS by Medicare Advantage organizations. While we are not delaying our proposal to modify these measures, beginning with the FY 2028 payment determination, hospitals will be able to preview their data on this measure in the Hospital Inpatient Quality Reporting Program prior to it being publicly reported. We also note that since the Hospital Inpatient Quality Reporting Program is a pay-for-reporting program, hospitals' performance on the EDAC measures will not affect payment. As long as hospitals report the required measure data in accordance with the form, manner, and timing policies specified by the Secretary, they are not subject to a financial penalty under this program.

Regarding concerns about the risk adjustment model accounting for social risk, the risk model has been updated to account for the case mix in both Medicare Fee-For-Service and Medicare Advantage. The clinical variables included in the risk adjustment model were selected based on an analysis of a combined Medicare Fee-For-Service and Medicare Advantage cohort. This approach ensures that the model captures the key risk factors relevant to the combined population. The models include an indicator variable for Medicare Fee-For-Service and Medicare Advantage enrollment status, which accounts for any potential differences in risk between these groups. We found that the prevalence of clinical risk factors and their associations with excess days spent in acute care were similar across Medicare Fee-For-Service and Medicare Advantage populations.

Lastly, we note the measure developers conduct annual measure re-evaluations to ensure the risk adjustment model is continually assessed and remains valid, given possible changes in clinical practice and coding standards over time. Modifications made to the measure cohort, risk model, and outcomes are informed by review of the most recent literature related to measure conditions or outcomes, feedback from various stakeholders, empirical analyses, and assessment of coding trends that reveal shifts in clinical practice or billing patterns. For the complete measure methodology report and measure risk adjustment model, we specifically refer readers to QualityNet on our website at: *https://qualitynet.cms.gov/inpatient/measures/edac/methodology*. We also refer readers to QualityNet: *https://qualitynet.cms.gov/,* where we make our technical measure specifications reports and measure evaluation reports publicly available.

After consideration of the public comments we received, we are finalizing our proposal to modify the AMI, Heart Failure, and Pneumonia EDAC measures beginning with the July 1, 2024 through June 30, 2026 performance period, associated with the FY 2028 payment determination.

(6) Technical Updates

In the FY 2027 IPPS/LTCH PPS proposed rule (91 FR 19593), we also notified the public of technical updates to the three EDAC measures' risk adjustment methodology in the Hospital Inpatient Quality Reporting Program, beginning with the FY 2028 payment determination, to use individual ICD–10 codes to improve the measure's risk adjustment methodology. The risk adjustment strategy currently in use involves grouping ICD–10 diagnosis codes from the CMS HCC system into clinically relevant categories.[458] We recently notified hospitals of the same technical update to our risk adjustment model to use individual ICD–10 codes instead of HCCs for two measures—MORT–30–STK and COMP–HIP–KNEE—in the Hospital Inpatient Quality Reporting Program to better leverage the data and analytical advances since these measures were initially developed (90 FR 36997 through 37008). With this new approach, the ability of the risk adjustment model to account for condition-specific risk improved. See Table IX.C.4. for a summary of improvements to the risk adjustment model performance for the three modified EDAC measures in the Hospital Inpatient Quality Reporting Program.[459] [460]

[458] QualityNet. 2025 Condition-Specific Excess Days in Acute Care Measures Updates and Specifications Report: AMI, HF, and Pneumonia. Available at: *https://qualitynet.cms.gov/inpatient/measures/edac/methodology*.

[459] 2024 Excess Days in Acute Care Measures Updates and Specifications Report. Available at: *https://www.p4qm.org/prmr-measures/muc2025-030*.

TABLE IX.C.4. EDAC MEASURES RISK ADJUSTMENT MODEL PERFORMANCE COMPARISON

Measure Title	Fee-For-Service-only cohort with HCC-based Risk Variables (July 1, 2022 through June 30, 2023) C-Statistic (predictive ability)	Fee-For-Service and Medicare Advantage cohort with ICD-10-based Risk Variables (January 1, 2022 through December 30, 2023) C-Statistic (predictive ability)
AMI EDAC	0.60 (85 - 123)	0.68 (59 - 261)
Heart Failure EDAC	0.59 (133 - 172)	0.64 (89 - 361)
Pneumonia EDAC	0.61 (106 - 152)	0.67 (59 - 338)

Note: The predictive ability is the range of mean observed days in acute care per 100 discharges between the lowest and highest predicted deciles.

We received a few comments on this technical update.

Comment: A few commenters supported the update to the risk adjustment methodology to use ICD–10 codes, noting it will improve alignment with contemporary clinical practice and provide a more comprehensive evaluation of hospital performance. A commenter noted it will produce more actionable risk estimates and improve validity of performance comparisons.

Response: We thank the commenters for their support and agree this update to the risk adjustment model will improve alignment with current clinical practices and result in improved validity of the measures' performance.

6. Summary of Previously Finalized and Newly Finalized Hospital Inpatient Quality Reporting Program Measures

This table IX.C.5. summarizes the previously finalized and newly finalized Hospital Inpatient Quality Reporting Program measures for the FY 2028 to FY 2031 payment determinations, which removes the STK–02, VTE–1, and VTE–2 eCQMs discussed in section IX.C.4. of this final rule; modifies three EDAC measures as discussed in section IX.C.5. of this final rule; adds the Diabetes EDAC measure and the Hospital Harm—Postoperative VTE eCQM as discussed in section IX.C.3. in this final rule; and adds the Advance Care Planning eCQM and five modified mortality measures as discussed in sections IX.B.1. and IX.B.2. of this final rule:

TABLE IX.C.5. HOSPITAL INPATIENT QUALITY REPORTING PROGRAM MEASURE SET BY DATA COLLECTION METHOD AND PAYMENT DETERMINATION (PD)

Measure Name	CBE Number	FY 2028 PD	FY 2029 PD	FY 2030 PD	FY 2031 PD
Patient Experience of Care Survey Measures					
Hospital Consumer Assessment of Healthcare Providers and Systems Survey (including Care Transition Measure)	0166 (0228)	✓	✓	✓	✓
Chart-Abstracted Clinical Process of Care Measures

Advance Care Planning*******	N/A			Self-Selected	✓*

✓Measure is mandatory for the specified payment determination year.

* Measure is a self-selected eCQM for the specified payment determination year. Hospitals are required to self-select three eCQMs, in addition to all mandatory eCQMs, to submit for the specified payment determination year.

** In this final rule, we are finalizing adoption of the MORT-30-AMI, MORT-30-HF, MORT-30-PN, MORT-30-COPD, and MORT-30-CABG for the FY 2028 payment determination through the FY 2031 payment determination. We refer readers to section IX.B.2. of this final rule for more detailed discussion.

*** In this final rule, we are finalizing modifications to the AMI EDAC, HF EDAC, and PN EDAC measures beginning with the FY 2028 payment determination. We refer readers to section IX.C.5. of this final rule for more detailed discussion.

**** In this final rule, we are finalizing adoption beginning with FY 2029 payment determination.

***** In this final rule, we are finalizing removal beginning with the FY 2030 payment determination.

****** In this final rule, we are finalizing modification from self-selected to mandatory reporting beginning with the FY 2030 payment determination.

******* In this final rule, we are finalizing adoption beginning with the FY 2030 payment determination. We refer readers to section IX.C.8.c. of this final rule for more detailed discussion of our modifications to the reporting and submission requirements for eCQMs. Under this modification, the Hospital Harm—Postoperative VTE eCQM will begin mandatory reporting after two years of self-selection beginning with the FY 2032 payment determination.

7. Future Considerations

We seek to develop a comprehensive set of quality measures to be widely available for informed decision-making and quality and cost improvements in the hospital inpatient setting. We have identified potential future measures that are focused on topics that are of importance to interested parties, but that are not currently included in the Hospital Inpatient Quality Reporting Program's measure set. We refer readers to section IX.B.3. for our request for comment on ''Measuring Emergency Care Access and Timeliness in Hospital Inpatient Quality Reporting and Value-Based Purchasing Programs—Request for Information'' and section IX.B.4. for our request for comment on ''Potential Future Use of the Adult Community-Onset Sepsis Standardized Mortality

Ratio Measure in the Hospital Inpatient Quality Reporting Program—Request for Information.''

We are also soliciting comments on our anticipated approach to potential scoring methodologies for the next phase of our Birthing-Friendly Hospital designation. We will consider feedback we receive as we determine how best to further develop and refine the Hospital Inpatient Quality Reporting Program's measure set and to advance other quality improvement efforts that address important patient safety and health care quality topics.

a. Birthing-Friendly Hospital Designation Modification To Expand Designation Criteria—Request for Information

In this request for information (RFI), we sought public input on potential modifications to the Birthing-Friendly Hospital Designation which was adopted in the FY 2023 IPPS/LTCH PPS final rule (87 FR 49284 through 49290). In the FY 2023 IPPS/LTCH PPS final rule, we noted our intent to expand the Birthing-Friendly Hospital Designation with a more robust set of metrics in future years, and we intended for those additional metrics to potentially be derived from maternal care quality measures from the Hospital Inpatient Quality Reporting Program. This RFI aims to gather broad public input on: (1) the inclusion of the Cesarean Birth eCQM and the Severe Obstetric Complications eCQM in the criteria for awarding the Birthing-Friendly Hospital Designation; and (2) a modified scoring methodology developed for the expanded Birthing-Friendly Hospital Designation.

(1) Background

The Birthing-Friendly Hospital Designation (hereinafter referred to as ''the Designation''), was created to identify hospitals that demonstrate the delivery of high-quality maternal care and a commitment to improving maternal health outcomes (87 FR 49284 through 49290). Despite the highest rate of spending on maternity care, maternal morbidity and mortality rates in the United States are high compared to other high-income countries. Every year in the United States, approximately 700 women die of complications related to pregnancy and childbirth, and over 25,000 women experience severe complications of pregnancy (severe maternal morbidity).[461] [462] Approximately one-third of all pregnancy-related deaths occur at the time of delivery and immediately postpartum, with nearly 20 percent occurring between one and six days postpartum.[463] Yet, three out of five pregnancy-related deaths are considered preventable.[464]

We believe the Designation is an important way to advance maternal care quality for patients and families and represents our sustained commitment to improving health outcomes. Interested parties expressed support for the Designation as a meaningful step to promote transparency and improve maternal health outcomes. When we proposed the Designation in the FY 2023 IPPS/LTCH PPS proposed rule, many commenters recommended using additional data to determine which hospitals would receive the Designation, including data from the Cesarean Birth and Severe Obstetric Complications eCQMs, rather than just the Maternal Morbidity Structural measure data (87 FR 49284 through 49290).

The Designation was created to be a consumer-friendly, publicly reported display signaling a hospital's commitment to improving maternal health. Hospitals that are awarded the Designation receive a Birthing-Friendly icon on the Compare tool on *Medicare.gov*. The Designation was first displayed on the Compare tool in Fall 2023 using CY 2022 data. Geocoded information of Birthing-Friendly hospitals and health systems is available at: *https://data.cms.gov/provider-data/birthing-friendly-hospitals-and-health-systems.*

(2) Current Birthing-Friendly Hospital Designation Methodology

Currently, the Designation is comprised of the Maternal Morbidity Structural measure adopted in the FY 2022 IPPS/LTCH PPS final rule (86 FR 45361 through 45365). The Maternal Morbidity Structural measure is an attestation-based measure which includes one attestation, currently specified as a two-part question, that captures whether hospitals are: (1) currently participating in a structured state or national Perinatal Quality Improvement (QI) Collaborative; and (2) implementing patient safety practices or bundles as part of these QI initiatives.[465] In reporting this measure, hospitals answer ''yes,'' ''no,'' or ''not applicable (our hospital does not provide inpatient labor/delivery care)''.[466] The Designation is given to hospitals that report ''yes'' for the Maternal Morbidity Structural measure. The current version of the Maternal Morbidity Structural measure specifications is available at: *https://qualitynet.cms.gov/inpatient/iqr/measures#tab2.* We note in section IX.C.8.d.(1) of this final rule where we are updating the reporting requirements of the Maternal Morbidity Structural measure beginning with the CY 2026 reporting period/FY 2028 payment determination.

(3) Potential Modifications to the Birthing-Friendly Hospital Designation

Potential modifications to the Designation would include incorporating hospital performance on two additional maternal care quality outcome measures: (1) the Cesarean Birth eCQM and (2) the Severe Obstetric Complications eCQM. These two eCQMs aim to reduce the occurrence of cesarean deliveries and maternal complications, thereby improving maternal health outcomes and quality of life. Incorporating guidance from a TEP, we developed a potential new scoring methodology for the Designation that aggregates these two measures into a composite score to meaningfully summarize hospital maternal health performance and to determine hospital performance on the Designation.

(a) Expanding the Birthing-Friendly Hospital Designation To Include the Cesarean Birth and the Severe Obstetric Complications Electronic Clinical Quality Measures

The Cesarean Birth eCQM is an outcome measure that assesses the proportion of cesarean deliveries to

[465] Centers for Medicare & Medicaid Services. Cross-Cutting Initiative: CMS Maternity Care Action Plan. 2022. Available at: *https://www.cms.gov/files/document/cms-maternity-care-action-plan.pdf.*

[466] To report on this measure, hospitals will respond to a two-part question: ''Does your hospital or health system participate in a Statewide and/or National Perinatal Quality Improvement Collaborative Program aimed at improving maternal outcomes during inpatient labor, delivery and postpartum care, and has it implemented patient safety practices or bundles related to maternal morbidity to address complications, including, but not limited to, hemorrhage, severe hypertension/preeclampsia or sepsis?'' Further details on this measure can be found in the FY 2022 IPPS/LTCH PPS final rule at 86 FR 45361 through 45365.

nulliparous women (women giving birth for the first time) who delivered at 37 weeks' gestation or later with a live singleton baby (a single baby) in a vertex position (head-down). The hospital-level score is calculated as a proportion, for which a lower proportion is better; however, since cesarean delivery is a warranted emergency intervention in certain situations, scores are not expected, nor desired, to approach zero. For further details on the measure methodology, we refer readers to the methodology report available at: *https://manual.jointcommission.org/releases/TJC2023B/MIF0167.html.* The measure became mandatory for all hospitals participating in the Hospital Inpatient Quality Reporting and Medicare Promoting Interoperability Programs beginning with the CY 2024 reporting period (87 FR 49298 through 49302, and 87 FR 49361 through 49364).

The Severe Obstetric Complications eCQM is a risk-standardized measure that assesses severe maternal morbidity events and mortality during delivery hospitalizations for patients greater than or equal to 8 years and less than 65 years of age delivering stillborn or a live birth at greater than or equal to 20 weeks' gestation. The measure evaluates two outcomes: (1) any severe obstetric complications (as specified), and (2) severe obstetric complications excluding encounters for which blood transfusion was the only numerator event. For both outcomes, the hospital-level score is reported as a rate per 10,000 delivery hospitalizations, for which a lower score is better. For further details on the measure methodology, we refer readers to the methodology report available at: *https://ecqi.healthit.gov/sites/default/files/SevereObstetricComplications%20eCQM_Methodology%20Report%20-%20Dec%202022.pdf.* The measure became mandatory for all hospitals participating in the Hospital Inpatient Quality Reporting and Medicare Promoting Interoperability Programs beginning with the CY 2024 reporting period (87 FR 49298 through 49302; 87 FR 49361 through 49364).

(b) Potential New Scoring Methodology

Following careful assessment of various scoring approaches, we determined the composite score approach with k-means clustering to be a strong approach for calculating hospital Designation scores. The composite score approach with k-means clustering enables a tiered approach to award the Designation, thus allowing for a range of hospital performance while still recognizing high-performing hospitals. In addition, this approach allows for differential weighting, enabling more outcome related measures to have a stronger influence on the overall performance scores. This approach is similar to that used in the Overall Hospital Quality Star Rating methodology (85 FR 86193 through 86236).[467]

To be eligible for the expanded Designation, hospitals would have to attest positively to the Maternal Morbidity Structural measure and report on both maternal outcome measures (Cesarean Birth and Severe Obstetric Complications eCQMs). Positive attestation to the Maternal Morbidity Structural measure would be required for Designation eligibility and would serve as a prerequisite to obtaining the Designation. Once hospital eligibility is determined, the methodology for aggregating hospital scores for the two maternal outcome measures into a composite and scoring for the Designation would include a series of steps. First, the direction of measure scores is changed so that a higher score indicates better performance for all the measures. Second, measure scores that do not follow a normal distribution are normalized by applying a log transformation, and then the data are standardized using Z-scores[468] to enable aggregation on a common scale. Third, measure scores are multiplied by assigned weights. The Cesarean Birth eCQM is assigned a 45 percent weight. The two outcomes for the Severe Obstetric Complications eCQM are assigned weights that sum to 55 percent: 18 percent for any severe obstetric complications, and 37 percent for severe obstetric complications excluding encounters for which blood transfusion was the only numerator event. The higher weighting of the Severe Obstetric Complications eCQM was selected because it prioritizes the occurrence of severe obstetric complications and elevates attention to reducing maternal morbidity. Furthermore, the differential weighting among the two Severe Obstetric Complications eCQM outcomes was selected to prioritize the outcome excluding blood transfusion-only encounters, as these encounters may represent lesser severity than the other specified obstetric complications. Fourth, weighted measure scores are aggregated to generate the composite score for each hospital. Fifth, hospitals are grouped into four peer groups based on the delivery volume for that hospital during the performance period (less than or equal to 500 deliveries, 501 to 1000 deliveries, 1001 to 2000 deliveries, and greater than 2000 deliveries). Peer grouping by hospital delivery volume supports comparison of hospitals with obstetric units of similar scale. Sixth, a statistical clustering algorithm (k-means clustering) is applied within each peer group to assign hospitals with similar composite scores to one of three clusters representing levels of maternal care quality. For details of this potential future modified measure methodology for scoring an expanded Designation, we refer readers to the draft methodology report, available at: *https://qualitynet.cms.gov/inpatient/iqr/proposedmeasures.*

(c) Awarding the Birthing-Friendly Hospital Designation

For the current Birthing-Friendly Hospital Designation, hospitals receive the Designation for positively attesting to the Maternal Morbidity Structural measure. The potential new scoring methodology described previously would introduce a tiered approach to awarding the Designation by performance relative to other hospitals on multiple maternal quality measures, and shifts away from a binary approach that only identifies hospitals as ''Birthing-Friendly'' or, by default, as ''non-Birthing-Friendly.'' The potential new approach considers the range in maternal care performance among labor and delivery hospitals and allows for recognition of the highest-performing hospitals. As positive attestation to the Maternal Morbidity Structural measure would serve as a prerequisite to receiving the Designation, hospitals currently awarded the Designation could maintain ''Birthing-Friendly'' status.

Within delivery volume peer groups, hospitals would be assigned to one of three clusters based on composite score, where cluster three consists of hospitals with the highest level of performance (highest composite scores) and cluster one consists of hospitals with the lowest level of performance (lowest composite scores). Each cluster would be represented by a corresponding number of Birthing-Friendly icons (similar to a star rating) such that hospitals in cluster one would be identified with one Birthing-Friendly icon (identifying the lowest performing hospitals), hospitals in cluster two would be identified with two Birthing-Friendly icons, and hospitals in cluster three would be

[467] Available at: *https://data.cms.gov/provider-data/topics/hospitals/overall-hospital-quality-star-rating/.*

[468] Z-score standardization is a commonly used approach that translates hospital results into a common scale, indicating how each hospital's performance compares with the overall average. This approach helps reduce the impact of extreme values and differences in scoring methods, while supporting fair and consistent comparisons across hospitals.

identified with three Birthing-Friendly icons (identifying the top performing hospitals).

The use of peer grouping by hospital delivery volume to award the Designation allows for comparison of like hospitals, grouping facilities with obstetric units of similar scale. Other variables for peer grouping the Designation were considered, with particular attention to using Maternal Levels of Care in anticipation that hospitals providing different levels of care vary in patient case mix. The Maternal Levels of Care, a classification system developed by the American College of Obstetricians and Gynecologists and Society for Maternal-Fetal Medicine to support risk-appropriate maternal care delivery, is used to classify hospitals providing labor and delivery services from ''Basic Care'' (Level I) for women with low to moderate-risk pregnancies to ''Regional Perinatal Health Care Centers'' (Level IV) for women inclusive of those at low-risk to the highest-risk pregnancies.[469] However, there is currently no reliable and comprehensive source of publicly reported data on Maternal Levels of Care for all hospitals providing labor and delivery services. In this RFI, we seek further input on peer grouping considerations.

In preliminary testing of the modified Designation scoring methodology, 2,548 hospitals that reported at least one of the maternal measures for CY 2024 were identified (excluding hospitals that responded ''not applicable (our hospital does not provide inpatient labor/delivery care)'' to the Maternal Morbidity Structural measure). Among these, 1,976 hospitals were determined to have reported on all three measures and had 25 or more delivery hospitalizations during the measurement period, to align with the public reporting threshold for the maternal outcome measures. Of these hospitals, 1,920 (97.1 percent) hospitals attested positively to the Maternal Morbidity Structural measure and were included in testing of the modified Designation scoring methodology. Preliminary results indicate variation in mean composite scores for the Designation clusters across delivery volume categories (peer groups), most distinctly for the top delivery volume category (hospitals with greater than 2000 deliveries) that had a lower mean composite score within each cluster as compared to the mean composite scores of those clusters in lower delivery volume categories (see Table IX.C.6.).

TABLE IX.C.6. MEAN BIRTHING-FRIENDLY HOSPITAL DESIGNATION COMPOSITE SCORE PER CLUSTER FOR EACH DELIVERY VOLUME CATEGORY (PEER GROUP), CY 2024 TESTING DATA (N = 1920 HOSPITALS)

Delivery Volume Categories	Cluster 1 (Lowest Performing)	Cluster 2	Cluster 3 (Highest Performing)
≤ 500	-0.75	0.09	0.81
501 – 1,000	-0.66	0.13	0.85
1,001 – 2,000	-0.78	0.03	0.71
> 2,000	-0.94	-0.21	0.59

Preliminary testing results for awarding Birthing-Friendly Hospital Designation icons indicate similar distributions across delivery volume categories (peer groups) for hospitals to receive one, two, and three Birthing-Friendly icons representing lowest to highest Birthing-Friendly hospital performance (see Table IX.C.7.).

TABLE IX.C.7. DISTRIBUTION OF BIRTHING-FRIENDLY HOSPITAL DESIGNATION FOR EACH DELIVERY VOLUME CATEGORY (PEER GROUP), CY 2024 TESTING DATA (N = 1920 HOSPITALS)

Peer Groups (Delivery Volume Categories)	Cluster 1 (Lowest Performing)	Cluster 2	Cluster 3 (Highest Performing)
≤ 500	24%	44%	32%
501 – 1,000	27%	43%	30%
1,001 – 2,000	26%	45%	29%
> 2,000	28%	46%	26%

The measure developer received feedback during winter 2025 from a TEP, including patients, patient advocates, technical experts, and clinicians, supporting the expansion of criteria for the Designation and the potential new scoring methodology.[470]

(4) Solicitation of Public Comments

We sought feedback on potential modifications to the current Birthing-

[469] Available at: *https://www.acog.org/programs/lomc.*

[470] Yale CORE. (March 2026). Summary of Technical Expert Panel (TEP): Development of Birthing Friendly Hospital Designation (BFHD). Available at: *https://mmshub.cms.gov/sites/default/files/Del4-3BFHDSummaryTEPEvaluation-March2026.pdf.*

Friendly Hospital Designation. We requested input from interested parties on the following potential modifications: (1) expanding the Designation to include two maternal care quality outcome measures: Cesarean Birth eCQM and Severe Obstetric Complications eCQM; (2) the outlined scoring methodology noted previously including use of peer grouping; and (3) the accompanying tiered approach to awarding Birthing-Friendly Hospital Designation icons. Specifically, we requested feedback on the following topics:

- Do you have feedback on the potential new scoring methodology outlined in this RFI for the Designation?
- With respect to the potential new scoring methodology, do you have any special considerations for small, rural, or safety net hospitals?
- Differential measure score weighting:

++ Do you have feedback on the higher weighting of the Severe Obstetric Complications eCQM (combined scores) at 55 percent compared to weighting of the Cesarean Birth eCQM at 45 percent?

++ Do you have feedback on the differential weighting of the two Severe Obstetric Complications eCQM outcomes (any severe obstetric complication equals 18 percent, severe obstetric complications excluding encounters for which blood transfusion was the only numerator event equals 37 percent)?

- Do you have feedback on a tiered approach to awarding the Designation for identifying levels of quality/performance?
- Approaches for peer grouping:

++ Do you have feedback on using delivery volume as a peer grouping variable?

++ Would the category ''less than or equal to 500 deliveries'' represent an appropriate peer grouping for hospitals with low birth volumes, such as those in rural areas?

++ Should there be a minimum number of births required in the peer grouping, such as ''25–500 deliveries'' instead of ''less than or equal to 500 deliveries''?

++ Are there any other variables that would be appropriate for peer grouping? And if so, please provide information on data sources.

- Public reporting of the Designation results:

++ Do you have feedback on the presentation of the Designation on the Compare tool? Specifically, do you agree with using one to three Birthing-Friendly icons to represent summarized hospital performance?

++ Is the Designation easily interpreted by patients and consumers? Do you have suggestions on the messaging of the Designation on the Compare tool on *Medicare.gov?*

With these questions, we sought public input on potential modifications to the Birthing-Friendly Hospital Designation described previously, for consideration in future rulemaking.

We received public comments on these topics. The following is a summary of the comments we received:

Comment: Many commenters supported updating the Birthing-Friendly Hospital Designation because of the significant impact that the quality of obstetric care has on patients and their families. A few commenters stated that the potential updates to the Birthing-Friendly Hospital Designation would align with the Joint Commission's Outcomes-Driven Certification in Perinatal Care and stated that alignment would limit provider confusion. A commenter recommended that CMS publish updates to the Birthing-Friendly Hospital Designation, including methodology, weighting, peer grouping, and information about the public display framework through notice and comment rulemaking.

Some commenters expressed concern about the appropriateness of the available measures and did not support developing a scoring or tiering system using these measures. Some of these commenters recommended waiting until hospitals have more experience reporting and receiving feedback on these measures prior to including them in the Birthing-Friendly Hospital Designation. A commenter expressed concern that this Designation may be used to adjust hospital payments, which the commenter stated could reduce access to obstetric care.

Many commenters supported inclusion of the Cesarean Birth eCQM in the Birthing-Friendly Hospital Designation. However, many commenters expressed concerns about the Cesarean Birth eCQM. Some commenters stated that it is important to recognize that there are times when a cesarean birth is medically necessary and therefore it is not appropriate to target a zero percent score on this measure. A few commenters further stated that without a target rate of cesarean births, it will be difficult for hospitals and the public to meaningfully interpret data reported for the Cesarean Birth eCQM. A few commenters stated that this is a utilization measure that does not appropriately distinguish between medically necessary and elective cesarean births. These commenters requested that CMS provide evidence that this measure is indicative of clinical quality before incorporating it into any public facing designation. Many commenters expressed concern regarding the measure's lack of sufficient risk adjustment. These commenters recommended risk-adjusting for patient mix including age, comorbidity, payer, and clinical risk factors. However, several commenters expressed concern that clinical risk factors are sometimes documented in narrative history or scanned records.

Many commenters supported inclusion of the Severe Obstetric Complications eCQM. Some commenters recommended updates to the Severe Obstetric Complications eCQM prior to incorporation into a modified Birthing-Friendly Hospital Designation. Commenters specifically recommended incorporating risk adjustment for social and clinical risk factors, including for the most medically complex patients. A few commenters expressed concern that there have been shifts in complication rates and there is a lack of a stable national benchmark. A few commenters expressed concern about including this measure in the methodology for the Birthing-Friendly Hospital Designation because this measure tracks rare events and therefore most hospitals may not have enough cases to report.

Some commenters recommended other quality measures or quality measure concepts for inclusion in the scoring for the Birthing-Friendly Hospital Designation. The recommended measures and measure concepts are:

- Unexpected Complications in Term Newborns (PC–06)
- Elective Delivery (PC–01)
- HCAHPS, specifically the upcoming Inpatient Maternal Health Care Survey
- Timely Treatment of Severe Hypertension (ePC–08)
- Measures topics identified by the Core Quality Measures Collaborative Workgroup:
  - ++ Postpartum depression and follow-up
  - ++ Delivery types
  - ++ Unexpected complications
  - ++ Infant immunization
- Whether hospitals have adopted continuous, real-time hemodynamic monitoring capabilities
- Access to midwives
- Hemorrhage readiness and response
- Sepsis recognition
- Postpartum follow-up
- PRO–PMs
- Secure data interoperability

- Measures that reflect and address disparities in maternal health outcomes
- Quality of anesthesia care
- A measure that includes all medically unnecessary C-sections

Several commenters supported updating the scoring for the Birthing-Friendly Hospital Designation to avoid a binary scoring structure. However, several commenters expressed concern regarding the potential scoring framework described in the proposed rule. Some of these commenters specifically expressed concern regarding k-means clustering and some stated that a clustering approach may be difficult for patients to interpret and hospitals to use for quality improvement. A few commenters stated that the combined effects of k-means clustering and peer grouping could lead hospitals with higher performance to receive worse scores, or the reverse. A few commenters recommended using a z-score based methodology to improve reproducibility and ease of interpretation. A few commenters expressed concern that the scoring methodology described in the proposed rule could allow hospitals that perform poorly on the Cesarean Birth or Severe Obstetric Complications eCQMs to receive a Birthing-Friendly Hospital Designation icon. These commenters supported a scoring methodology that requires hospitals to have a positive attestation to the Maternal Morbidity structural measure or to meet a certain threshold on the two outcomes eCQMs to receive any Birthing-Friendly Hospital Designation icons. Another commenter recommended requiring a minimum Overall Star Rating score to qualify for the Birthing-Friendly Hospital Designation. A commenter recommended establishing absolute criteria to qualify for the Birthing-Friendly Hospital Designation rather than comparing hospitals to one another.

Many commenters recommended that CMS ensure any updates to the Birthing-Friendly Hospital Designation are fair for hospitals caring for medically and socially complex, rural, underserved, and historically marginalized patients. A few commenters expressed concern that establishing different methodologies based on hospital type or size may create a two-tiered standard for safety. A commenter expressed concern that updating the scoring methodology for the Birthing-Friendly Hospital Designation could strain maternal quality analytics and data systems, which could disproportionately affect safety net providers. Some commenters stated that including outcome measures could lead to a misrepresentation of the care provided at small or rural facilities.

Many commenters supported the higher weighting of the Severe Obstetric Complications eCQM because of the importance of focusing on preventable maternal morbidity. A few commenters supported weighting the Severe Obstetric Complications eCQM at 55 percent and the Cesarean Birth eCQM at 45 percent, stating that this approach has face validity because the Severe Obstetric Complications eCQM comprises two outcomes. A commenter recommended either assigning the two measures equal weight or assigning the Cesarean Birth eCQM 55 percent and the Severe Obstetric Complications eCQM 45 percent of the score because the Cesarean Birth eCQM is more established. A commenter recommended using harm-based weighting analogous to the method used in the AHRQ PSI 90 composite measure.

A few commenters supported two outcomes of the Severe Obstetric Complications eCQM that distinguish inclusion and exclusion of blood transfusion-only outcomes. A few commenters supported the tiered approach as described in the proposed rule. A few commenters recommended ensuring that the tiered approach would remain relatively stable to reduce potential confusion associated with year-to-year volatility. A few commenters stated three tiers would not provide sufficient granularity to meaningfully distinguish the quality of performance. A commenter recommended testing reliability across hospital types and delivery volumes prior to adopting any tiered designation framework.

Many commenters supported peer grouping and establishing minimum case volumes. Several commenters supported including delivery volume as a peer grouping variable. A few commenters suggested including more than two peer grouping variables to better represent hospitals' differences. A few commenters supported a minimum case volume to identify hospitals that do not regularly provide labor and delivery services. Several other commenters stated that a minimum case volume may signal that quality of care is not important at hospitals that treat small volumes of labor and delivery patients. A few commenters provided additional variables for peer grouping. Commenters specifically suggested hospital type (that is, rural, urban, critical access, or safety net), NICU level, or ACOG Maternal Level of Care.

Many commenters provided feedback on public reporting of the Birthing-Friendly Hospital Designation using one to three Birthing-Friendly icons. A few commenters stated that the use of one to three icons may be confusing and recommended providing education and outreach to show that receiving one icon does not indicate unsafe or low-quality care. A few commenters recommended aligning with Overall Hospital Star Ratings (for example by having an overall star rating and a maternal health star rating) to improve clarity when compared to introducing icons with different meanings.

Many commenters stated that the Birthing-Friendly Hospital Designation as described in the proposed rule may be hard for patients and their families to understand. Some of these commenters recommended that CMS engage with patients, families, and communities to ensure the Birthing-Friendly Hospital Designation is helpful and not overly complex. Several commenters recommended providing public-facing materials on the data used to calculate the results to improve public awareness and confidence. A few commenters recommended that CMS ensure that it is clear to patients and families how the Birthing-Friendly Hospital Designation can be interpreted in the context of Overall Star Ratings (for example, how to interpret a hospital that has a low Overall Star Rating but receives the Birthing-Friendly Hospital Designation). A few commenters stated that composite scores are not meaningful to consumers because they do not accurately reflect differences in quality of care. A commenter expressed concern that the Birthing-Friendly Hospital Designation may not be useful for most patients due to limited choice about where to receive labor and delivery services. A commenter stated that the Birthing-Friendly Hospital Designation is only helpful to patients and their families if it is regularly updated and noted that there are hospitals that no longer offer labor and delivery services that are still included as Birthing-Friendly hospitals on the Care Compare site.

Response: We appreciate all the comments and interest in this topic. While we are not responding to specific comments in response to the RFI in this final rule, we believe that this input is very valuable and will continue to take all concerns, comments, and suggestions into account for future development of the Birthing-Friendly Hospital Designation.

8. Updates to the Form, Manner, and Timing of Quality Data Submission

In the FY 2027 IPPS/LTCH PPS proposed rule (91 FR 19600 through 19605), we proposed changes to our

reporting and submission requirements for eCQMs and structural measures, as later discussed in this final rule.

We did not propose any changes to the following requirements: procedural requirements; data submission requirements for chart-abstracted measures; data submission and reporting requirements for hybrid measures; sampling and case thresholds for chart-abstracted measures; HCAHPS Survey administration and submission requirements; data submission and reporting requirements for CDC National Healthcare Safety Network measures; and data submission and reporting requirements for Patient-Reported Outcome-Based Performance Measures. Accordingly, these requirements were not repeated in the Form, Manner, and Timing of Quality Data Submission section. We refer readers to the QualityNet website at: *https://qualitynet.cms.gov/inpatient/iqr* (or other successor CMS designated websites) for more details on the Hospital Inpatient Quality Reporting Program data submission and procedural requirements.

a. Background

Section 1886(b)(3)(B)(viii)(I) and (b)(3)(B)(viii)(II) of the Act state that the applicable percentage increase for FY 2015 and each subsequent year shall be reduced by one-quarter of such applicable percentage increase (determined without regard to sections 1886(b)(3)(B)(ix), (xi), or (xii) of the Act) for any subsection (d) hospital that does not submit data required to be submitted on measures specified by the Secretary in a form and manner and at a time specified by the Secretary. To successfully participate in the Hospital Inpatient Quality Reporting Program, hospitals must meet specific procedural, data collection, submission, and validation requirements.

b. Maintenance of Technical Specifications for Quality Measures

Section 412.140(c)(1) of title 42 of the CFR generally requires that a subsection (d) hospital participating in the Hospital Inpatient Quality Reporting Program must submit to CMS data on measures selected under section 1886(b)(3)(B)(viii) of the Act in a form and manner, and at a time, specified by CMS. The data submission requirements, specifications manual, measure methodology reports, and submission deadlines are posted on the QualityNet website at: *https://qualitynet.cms.gov* (or other successor CMS designated websites).

The CMS Annual Update for the Hospital Quality Reporting (HQR) Programs (Annual Update) contains the technical specifications for eCQMs. The updated measure specifications applicable to a reporting period are contained in the Annual Update issued in the year prior to the reporting period. For example, for the CY 2026 reporting period/FY 2028 payment determination, hospitals are collecting and will submit eCQM data using the May 2025 Annual Update and any applicable addenda. The Annual Update and implementation guidance documents are available on the eCQI Resource Center website at: *https://ecqi.healthit.gov/.*

Hospitals must register and submit quality data as described at 42 CFR 412.140(a).

c. Data Submission and Reporting Requirements for Electronic Clinical Quality Measures

(1) Background

Beginning with the CY 2016 reporting period, we began requiring hospitals to report on eCQMs with the goal of progressively increasing the number of eCQMs a hospital is required to report while also being responsive to concerns about timing, readiness, and burden associated with the increased number of measures (80 FR 49693 through 49698 and 81 FR 57150 through 57157). Over time we have gradually increased the number of eCQMs that we require hospitals to report over the course of several years to allow hospitals and their vendors time to gain experience with reporting eCQMs, while providing flexibility by retaining an element of choice in allowing a hospital to self-select some eCQMs (84 FR 42503 through 42505, 85 FR 58932 through 58939, 86 FR 45417 through 45418, 87 FR 49298 through 49302, and 89 FR 69568 through 69573). In the FY 2025 IPPS/LTCH PPS final rule, we finalized a further increase in the number of mandatory eCQMs focused on improving patient safety (89 FR 69568 through 69573). Table IX.C.8. summarizes our current eCQM reporting and submission policies:

TABLE IX.C.8. PREVIOUSLY FINALIZED ECQM REPORTING AND SUBMISSION REQUIREMENTS FOR THE CY 2026 REPORTING PERIOD/FY 2028 PAYMENT DETERMINATION AND SUBSEQUENT YEARS

Reporting Period/ Payment Determination	Total Number of eCQMs Reported	eCQMs Selected by CMS to be Reported	eCQMs for Self-selection (must report 3)
CY 2026/ FY 2028	Eight	• Safe Use of Opioids—Concurrent Prescribing • Cesarean Birth • Severe Obstetric Complications • Hospital Harm—Severe Hyperglycemia • Hospital Harm—Severe Hypoglycemia	• Discharged on Antithrombotic Therapy • Anticoagulation Therapy for Atrial Fibrillation/Flutter • Antithrombotic Therapy by the End of Hospital Day Two • Excessive Radiation Dose or Inadequate Image Quality for Diagnostic CT in Adults • Venous Thromboembolism Prophylaxis • Intensive Care Unit Venous Thromboembolism Prophylaxis • Malnutrition Care Score • Hospital Harm—Opioid-Related Adverse Events • Hospital Harm—Pressure Injury • Hospital Harm—Acute Kidney Injury • Hospital Harm—Falls with Injury • Hospital Harm—Postoperative Respiratory Failure
CY 2027/ FY 2029	Nine	• Safe Use of Opioids—Concurrent Prescribing • Cesarean Birth • Severe Obstetric Complications • Hospital Harm—Severe Hyperglycemia • Hospital Harm—Severe Hypoglycemia • Hospital Harm—Opioid-Related Adverse Events	• Discharged on Antithrombotic Therapy • Anticoagulation Therapy for Atrial Fibrillation/Flutter • Antithrombotic Therapy by the End of Hospital Day Two • Excessive Radiation Dose or Inadequate Image Quality for Diagnostic CT in Adults • Venous Thromboembolism Prophylaxis • Intensive Care Unit Venous Thromboembolism Prophylaxis • Malnutrition Care Score • Hospital Harm—Pressure Injury • Hospital Harm—Acute Kidney Injury • Hospital Harm—Falls with Injury • Hospital Harm—Postoperative Respiratory Failure
CY 2028/ FY 2030 (and for subsequent years)	Eleven	• Safe Use of Opioids—Concurrent Prescribing • Cesarean Birth • Severe Obstetric Complications • Hospital Harm—Severe Hyperglycemia • Hospital Harm—Severe Hypoglycemia • Hospital Harm—Opioid-Related Adverse Events • Hospital Harm—Pressure Injury • Hospital Harm—Acute Kidney Injury	• Discharged on Antithrombotic Therapy • Anticoagulation Therapy for Atrial Fibrillation/Flutter • Antithrombotic Therapy by the End of Hospital Day Two • Excessive Radiation Dose or Inadequate Image Quality for Diagnostic CT in Adults • Venous Thromboembolism Prophylaxis • Intensive Care Unit Venous Thromboembolism Prophylaxis • Malnutrition Care Score • Hospital Harm—Falls with Injury • Hospital Harm—Postoperative Respiratory Failure

We refer readers to the QualityNet website for additional information on current and previous reporting and submission requirements for eCQMs at: *https://qualitynet.cms.gov/inpatient/measures/ecqm.*

(2) Mandatory Reporting of the Malnutrition Care Score Electronic Clinical Quality Measure

The Malnutrition Care Score eCQM was initially adopted in the FY 2023 IPPS/LTCH PPS final rule into the Hospital Inpatient Quality Reporting Program measure set from which a hospital could self-select beginning with the CY 2024 reporting period/FY 2026 payment determination (87 FR 49239 through 49246). In the FY 2025 IPPS/LTCH PPS final rule, we modified the measure to include patients 18 years old and older in the measure cohort, beginning with the CY 2026 reporting period/FY 2028 payment determination (89 FR 69557 through 69560). In the FY 2026 IPPS/LTCH PPS final rule, we summarized input we received through the public comment process in response to our RFI on measure concepts of well-being and nutrition for future years in the Hospital Inpatient Quality Reporting Program and other quality measure programs; many commenters supported the utilization of the Malnutrition Care Score eCQM, noting it plays a critical role in identifying and addressing nutritional concerns in the hospital inpatient setting, and some commenters specifically supported making the Malnutrition Care Score eCQM mandatory (90 FR 36996 through 36997).

In consideration of these public comments and in alignment with the administration's priority focus on well-being and nutrition, in the FY 2027 IPPS/LTCH PPS proposed rule (91 FR

19600 through 19604), we proposed mandatory reporting of the Malnutrition Care Score eCQM beginning with the CY 2028 reporting period/FY 2030 payment determination. This proposal also aligns with our ongoing strategy to transition to a fully digital quality measurement landscape that promotes interoperability, reduces reporting burden, and increases the value of reporting quality measure data (90 FR 36990 through 36996). We explained in the proposed rule that if this proposal is finalized, hospitals would have an opportunity to continue to self-select this eCQM for the CY 2026 and CY 2027 reporting periods before mandatory reporting for all hospitals would begin with the CY 2028 reporting period/FY 2030 payment determination.

(3) Mandatory Reporting of the Hospital Harm Electronic Clinical Quality Measures

We previously implemented a stepwise approach to increase the number of required eCQMs in response to public comments noting the burden and resources necessary to implement new eCQMs (89 FR 69568 through 69573). This approach balances the need to prioritize more comprehensive reporting on important safety and preventable harm metrics with the need to provide hospitals and health IT vendors with time to implement new eCQMs.

Currently, in the Hospital Inpatient Quality Reporting Program, we have adopted seven eCQMs aimed at addressing different types of and various aspects of preventable hospital harms: Hospital Harm—Severe Hyperglycemia; Hospital Harm—Severe Hypoglycemia; Hospital Harm—Opioid-Related Adverse Events; Hospital Harm—Pressure Injury; Hospital Harm—Acute Kidney Injury; Hospital Harm—Falls with Injury; and Hospital Harm—Postoperative Respiratory Failure. On average, less than 10 percent of hospitals self-select to report on a given eCQM in the first year it is available, and we assume a hospital tends to self-select a given eCQM because it will perform better on that eCQM compared to other eCQMs available to self-select. Because hospital harms remain a significant source of morbidity, mortality, and cost, and because of the importance of publicly reporting these metrics to promote patient safety, we proposed to build on the stepwise approach for increasing the number of required eCQMs by modifying the eCQM reporting and submission requirements for Hospital Harm eCQMs. Specifically, in the FY 2027 IPPS/LTCH PPS proposed rule (91 FR 19602 through 19604), we proposed that beginning with the CY 2028 reporting period/FY 2030 payment determination, Hospital Harm eCQMs that have not yet been finalized for mandatory reporting would become mandatory in the third year of reporting.

Under this proposal, the Hospital Harm—Falls with Injury eCQM and the Hospital Harm—Postoperative Respiratory Failure eCQM would begin mandatory reporting in CY 2028 reporting period/FY 2030 payment determination. In the FY 2027 IPPS/LTCH PPS proposed rule (91 FR 19585 through 19588), we also proposed that the Hospital Harm—Postoperative VTE eCQM, finalized for adoption in section IX.C.3.b. of this final rule, would become mandatory to report beginning with the CY 2030 reporting period/FY 2032 payment determination, after being available for 2 years of self-selected reporting. Furthermore, in the FY 2027 IPPS/LTCH PPS proposed rule (91 FR 19600 through 19604 and 91 FR 19652 through 19654), we proposed that in subsequent years, newly adopted Hospital Harm eCQMs would become mandatory eCQMs for reporting after 2 years of self-selected reporting in the Hospital Inpatient Quality Reporting Program and the Medicare Promoting Interoperability Program. We did not propose changes to our previously finalized policy that progressively increases the number of mandatory eCQMs a hospital must report for the CY 2026 reporting period/FY 2028 payment determination or the CY 2027 reporting period/FY 2029 payment determination (89 FR 69568 through 69573).

TABLE IX.C.9. PROPOSED HOSPITAL HARM ECQM REPORTING AND SUBMISSION REQUIREMENTS FOR THE CY 2028 REPORTING PERIOD/FY 2030 PAYMENT DETERMINATION AND FOR SUBSEQUENT YEARS

Reporting Period/ Payment Determination	Hospital Harm eCQMs Required to be Reported
CY 2028/FY 2030	• Hospital Harm—Severe Hyperglycemia • Hospital Harm—Severe Hypoglycemia • Hospital Harm—Opioid-Related Adverse Events • Hospital Harm—Pressure Injury • Hospital Harm—Acute Kidney Injury • Hospital Harm—Falls with Injury* • Hospital Harm—Postoperative Respiratory Failure*
CY 2029/FY 2031	• Hospital Harm—Severe Hyperglycemia • Hospital Harm—Severe Hypoglycemia • Hospital Harm—Opioid-Related Adverse Events • Hospital Harm—Pressure Injury • Hospital Harm—Acute Kidney Injury • Hospital Harm—Falls with Injury* • Hospital Harm—Postoperative Respiratory Failure*
CY 2030/FY 2032 (and for subsequent years)	• Hospital Harm—Severe Hyperglycemia • Hospital Harm—Severe Hypoglycemia • Hospital Harm—Opioid-Related Adverse Events • Hospital Harm—Pressure Injury • Hospital Harm—Acute Kidney Injury • Hospital Harm—Falls with Injury* • Hospital Harm—Postoperative Respiratory Failure* • Hospital Harm—Postoperative Venous Thromboembolism**

* Proposed modification in the FY 2027 IPPS/LTCH PPS proposed rule (91 FR 19600 through 19604), from self-selected to mandatory reporting beginning with the FY 2030 payment determination.

** Proposed for adoption in the FY 2027 IPPS/LTCH PPS proposed rule (91 FR 19652 through 19654), as a self-selected eCQM beginning with the FY 2030 payment determination. Under this proposal the Hospital Harm—Postoperative VTE eCQM would become mandatory after 2 years of self-selected reporting beginning with the FY 2032 payment determination.

This proposal would advance the transition to a fully digital quality measure set, standardize safety data collection, and improve patient safety by having all hospitals report these measures. By the CY 2028 reporting period/FY 2030 payment determination, hospitals will have had 12 years of progressive experience reporting eCQMs. We believe hospitals have built a strong foundation of eCQM reporting through this phased ramp-up to accommodate newly adopted Hospital Harm eCQMs into the mandatory measure set for the Hospital Inpatient Quality Reporting Program and the Medicare Promoting Interoperability Program after 2 years of self-selected reporting. By making the Hospital Harm eCQMs mandatory after 2 years of self-selected reporting, we ensure that we would receive a robust national dataset for measures on these important topics, and these measures could serve as potential replacements for claims-based measures, such as those reported within the PSI 90 composite.

(4) Summary of Proposed Changes to the eCQM Reporting and Submission Requirements

We refer readers to section IX.C.6. of this final rule for the full list of eCQMs by payment determination year in the Hospital Inpatient Quality Reporting Program. If a hospital does not have patients that meet the denominator criteria for any of the eCQMs included in this proposal, the hospital would submit a zero denominator declaration. The submission of a zero denominator declaration allows a hospital to meet the reporting requirements for a particular eCQM. We refer readers to the FY 2015 IPPS/LTCH PPS final rule (79 FR 50256 through 50259), the FY 2016 IPPS/LTCH PPS final rule (80 FR 49705 through 49708), and the FY 2017 IPPS/LTCH PPS final rule (81 FR 57169 and 57170) for our previously adopted eCQM file format requirements. A QRDA Category I file with patients meeting the initial patient population of the applicable measures, a zero denominator declaration, or a case threshold exemption all count toward a successful submission for eCQMs for the Hospital Inpatient Quality Reporting Program (82 FR 38387). The following Table IX.C.10. summarizes our proposed policies:

TABLE IX.C.10. PROPOSED ECQM REPORTING AND SUBMISSION REQUIREMENTS FOR THE CY 2028 REPORTING PERIOD/FY 2030 PAYMENT DETERMINATION AND FOR SUBSEQUENT YEARS

Reporting Period/ Payment Determination	Total Number of eCQMs Reported	eCQMs Selected by CMS to be Reported	eCQMs for Self-selection (must report 3)
CY 2028/ FY 2030	Fourteen	• Safe Use of Opioids—Concurrent Prescribing • Cesarean Birth • Severe Obstetric Complications • Malnutrition Care Score* • Hospital Harm—Severe Hyperglycemia • Hospital Harm—Severe Hypoglycemia • Hospital Harm—Opioid-Related Adverse Events • Hospital Harm—Pressure Injury • Hospital Harm—Acute Kidney Injury • Hospital Harm—Falls with Injury* • Hospital Harm—Postoperative Respiratory Failure*	• Anticoagulation Therapy for Atrial Fibrillation/Flutter • Antithrombotic Therapy by the End of Hospital Day Two • Excessive Radiation Dose or Inadequate Image Quality for Diagnostic CT in Adults • Advance Care Planning** • Hospital Harm—Postoperative Venous Thromboembolism***
CY 2029/ FY 2031	Fourteen	• Safe Use of Opioids—Concurrent Prescribing • Cesarean Birth • Severe Obstetric Complications • Malnutrition Care Score* • Hospital Harm—Severe Hyperglycemia • Hospital Harm—Severe Hypoglycemia • Hospital Harm—Opioid-Related Adverse Events • Hospital Harm—Pressure Injury • Hospital Harm—Acute Kidney Injury • Hospital Harm—Falls with Injury* • Hospital Harm—Postoperative Respiratory Failure*	• Anticoagulation Therapy for Atrial Fibrillation/Flutter • Antithrombotic Therapy by the End of Hospital Day Two • Excessive Radiation Dose or Inadequate Image Quality for Diagnostic CT in Adults • Advance Care Planning** • Hospital Harm—Postoperative Venous Thromboembolism***
CY 2030/ FY 2032 (and subsequent years)	Fifteen	• Safe Use of Opioids—Concurrent Prescribing • Cesarean Birth • Severe Obstetric Complications • Malnutrition Care Score* • Hospital Harm—Severe Hyperglycemia • Hospital Harm—Severe Hypoglycemia • Hospital Harm—Opioid-Related Adverse Events • Hospital Harm—Pressure Injury • Hospital Harm—Acute Kidney Injury • Hospital Harm—Falls with Injury* • Hospital Harm—Postoperative Respiratory Failure* • Hospital Harm—Postoperative Venous Thromboembolism***	• Anticoagulation Therapy for Atrial Fibrillation/Flutter • Antithrombotic Therapy by the End of Hospital Day Two • Excessive Radiation Dose or Inadequate Image Quality for Diagnostic CT in Adults • Advance Care Planning**

* Proposed modification in the FY 2027 IPPS/LTCH PPS proposed rule (91 FR 19600 through 19604), from self-selected to mandatory reporting beginning with the FY 2030 payment determination.
** Proposed for adoption in the FY 2027 IPPS/LTCH PPS proposed rule (91 FR 19564 through 19568), as a self-selected eCQM beginning with the FY 2030 payment determination.
*** Proposed for adoption in the FY 2027 IPPS/LTCH PPS proposed rule (91 FR 19585 through 19588), as a self-selected eCQM beginning with the FY 2030 payment determination. If this proposal and our proposal to modify the eCQM reporting requirements for Hospital Harm eCQMs are finalized, the Hospital Harm—Postoperative VTE eCQM would become mandatory after 2 years of self-selected reporting beginning with the FY 2032 payment determination.

We invited public comment on our proposals to require hospitals to report on the Malnutrition Care Score eCQM and on all current and future Hospital Harm eCQMs after 2 years of self-selected reporting beginning with the CY 2028 reporting period/FY 2030 payment determination. We refer readers to section IX.F.9. of this final rule, in which we proposed the same reporting and submission requirements for eCQMs under the Medicare Promoting Interoperability Program for eligible hospitals and CAHs.

Comment: Many commenters supported modifying eCQM reporting and submission requirements stating that this is a reasonable step in moving towards the goal to transition all quality measure reporting to digital quality measures (dQMs), which would in turn provide more real-time actionable data. These commenters recommended that CMS announce a timeline for introducing voluntary FHIR®-based dQM reporting.

Response: We thank the commenters for their support. We agree that these modifications to eCQM reporting and submission requirements are a fundamental step towards dQM transition. We note that in the FY 2022 IPPS/LTCH PPS final rule, we discussed our goal of moving to digital quality measurement for all CMS quality reporting and value-based purchasing programs (86 FR 45342). In the FY 2023 IPPS/LTCH PPS final rule, we further described our goals to transition to dQMs, which include: reducing burden of reporting; leveraging digital measures for advanced analytics to define, measure, and predict key quality issues; and employing quality measures that support development of a learning health system (87 FR 49181 through 49188). We also wish to highlight that our previously described vision for future dQMs would leverage interoperability standards to decrease mapping burden and align standards for quality measurement with interoperability standards used in other healthcare exchange methods (87 FR 49181 through 49188). We also wish to point readers to our request for information on potential FHIR® timelines in the CY 2027 Physician Fee Schedule (PFS) proposed rule (91 FR 44151 through 44154) as well as section X.E. of the preamble of this final rule where we discuss the updated standards and versions of the prior authorization FHIR® Implementation Guides.

Comment: Many commenters specifically supported transitioning the Malnutrition Care Score eCQM to mandatory reporting, noting nutrition care is a low-cost but high-impact intervention with positive implications for patient health, including improved care coordination, timely intervention, and patient satisfaction. Commenters noted that addressing malnutrition can improve patient outcomes and reduce readmissions, shorten lengths of stay, reduce complications, decrease functional decline, and lower risk of mortality. A few commenters appreciated that this measure may help close the gap between identification of and intervention for malnutrition as it is often underdiagnosed and undertreated. A commenter noted that this measure

aligns with broader federal priorities related to patient-centered care and nutrition. A few commenters noted that adopting the Malnutrition Care Score eCQM aligns with the screening and intervention for frailty and malnutrition risk component of Age-Friendly Hospital measure in the Hospital Inpatient Quality Reporting Program. Commenters encouraged CMS to continue building upon this important work by advancing additional nutrition quality measures, such as in post-acute care settings and pay-for-performance programs, to support effective care transitions upon discharge and broader implementation of evidence-based nutrition care nationwide.

Response: We thank the commenters for their support. We agree that these modifications to eCQM reporting and submission requirements to include the Malnutrition Care Score eCQM would increase the available information about malnutrition screening and therefore support increasing nutrition care which has the potential to have significant impacts on patient well-being. We agree that mandatory reporting of the Malnutrition Care Score eCQM aligns with broader HHS and CMS nutrition policies and initiatives. The January 2026 HHS fact sheet emphasizes prevention, nutrient-dense foods, and improved nutrition across federal health programs.[471]

Comment: A few commenters specifically supported the proposed implementation timeline of making Hospital Harm eCQMs mandatory because preventable harm events are among the most meaningful outcomes measures as they reflect failures that patients directly experience through injury, suffering, prolonged recovery, disability, loss of trust, and in some cases death. A few commenters supported the idea of replacing PSI 90 composite with Hospital Harm eCQMs since eCQMs provide more accurate information. A commenter encouraged CMS to formally adopt a strategy to replace all components of the PSI 90 composite with eCQMs in the near future. A few commenters encouraged CMS to maintain advancement of a continuously learning safety infrastructure to not only measure harm retrospectively but also to help health systems identify risk, recognize deterioration, strengthen communication, and prevent avoidable harm before patients are injured.

Response: We thank the commenters for their support. We agree that these modifications to Hospital Harm eCQMs reporting requirements would increase public reporting on quality and safety since they are all-payer; thus, empowering individuals to make informed decisions about their healthcare. The PSI 90 composite is a claims-based composite measure comprised of 10 patient safety indicators. We believe that the Hospital Harm eCQMs have the potential to serve as replacements for components of the PSI 90 composite, and we will consider commenters' input for future rulemaking to replace some or all components of the PSI 90 composite with these eCQMs.

Comment: Many commenters stated that the pace and scale of mandatory eCQM implementation does not leave enough time for realistic implementation of measures. A few commenters stated that EHR vendors can take several years to implement changes because of the time required to complete upgrades and programming. Many commenters recommended adopting a more phased approach to implement the new requirements to allow additional time for staff training, education, rollout, and at least a full calendar year to validate, monitor, and improve performance before mandatory reporting begins. A commenter recommended allowing more time for hospitals and EHR vendors to focus on eCQM optimization as they currently exist before adding new eCQMs which would increase administrative burden.

Response: We acknowledge commenters' concerns about the proposed timeline and the resources required for vendors to implement new eCQMs, including EHR mapping, vendor workflow updates, staff training, and ongoing monitoring to ensure accurate data is submitted. We recognize that these requirements may be particularly challenging for small and rural hospitals, including CAHs, and the proposed timeline has a short lead time to correct any issues that arise during reporting. We note that we are revising the eCQM Annual Update addendum process to expedite fixing issues in the eCQM logic as they are identified to improve vendors' ability to implement new eCQMs. Additionally, this proposal establishes a predictable timeline by providing hospitals with 2 years of self-selected reporting before a Hospital Harm eCQM becomes mandatory; thus, hospitals have advance notice and can plan accordingly. We will be monitoring for additional challenges that may warrant future attention.

Comment: Some commenters recommended offering voluntary incentivized FHIR®-based dQM reporting as an alternative to mandatory eCQM reporting. These commenters stated that increased eCQM mandates may limit hospital participation in the expected voluntary period of FHIR-based dQM reporting. A commenter recommended that CMS consider whether the proposed increase of mandatory eCQM reporting could be structured to allow FHIR-based submission as an alternative compliance pathway alongside QRDA-based eCQM submission, and to prioritize development of FHIR-native specifications for future Hospital Harm measures rather than converting Quality Data Model based specifications as the default.

Response: We thank commenters for their recommendations regarding FHIR-based dQM reporting. We understand the concern that hospitals that are updating their processes and technology to report additional eCQMs may not participate in voluntary FHIR-based dQM reporting. We will consider this input as we develop policies related to future FHIR-based dQM reporting. Because of the importance of the clinical topics addressed by the Malnutrition Care Score eCQM and the Hospital Harm eCQMs, we are prioritizing adopting mandatory reporting of these measures as we work to develop FHIR specifications. We also wish to point readers to our request for information on potential FHIR timelines in the CY 2027 PFS proposed rule (91 FR 44151 through 44154) as well as section X.E. of this final rule where we discuss the updated standards and versions of the prior authorization FHIR Implementation Guides.

Comment: Many commenters stated concerns about limited health IT resources available, particularly for small teams, stating that health IT staff in hospitals is often very limited. Commenters expressed concern that the volume of changes being implemented introduces a significant administrative burden for small and rural hospitals, including critical access hospitals (CAHs), and hospitals caring for patients who are medically complex. A few commenters noted that many hospitals, particularly small and rural hospitals, chose not to self-select Hospital Harm eCQMs as they did not have sufficient volume to report these measures. These commenters requested that CMS provide adequate guidance on minimum volumes for reporting, as well as clear language to interpret publicly reported data when minimum volumes cannot be met.

[471] Department of Health and Human Services. (2026). Fact Sheet: Trump Administration Resets U.S. Nutrition Policy, Puts Real Food Back at the Center of Health. Available at: *https://www.hhs.gov/press-room/fact-sheet-historic-reset-federal-nutrition-policy.html.*

Response: We understand concerns regarding the impact on hospitals with limited health IT resources available. We acknowledge that making additional eCQMs mandatory affects burden; however, the benefits of ensuring that all hospitals report on these critical patient safety topics outweighs that increase in burden. We understand that some hospitals do not have sufficient volume to report certain measures, including Hospital Harm eCQMs. Hospitals which document that they do not meet minimum volumes will not be penalized for not reporting these measures. We refer readers to the Quality Reporting Center for resources for the Inpatient Quality Reporting Program, including public reporting information at *https://www.qualityreportingcenter.com/en/inpatient-quality-reporting-programs/.*

Comment: Many commenters noted that hospitals have experienced a significant increase in requirements over a short period of time, noting this requires significant investments in time and staff resources. Many commenters expressed concerns that the proposal nearly doubles the number of required eCQMs. Commenters recommended various alternatives, such as extending the voluntary submission period to 3 years or assessing mandatory reporting readiness for each measure and continuing to propose mandatory reporting on a measure-by-measure basis through rulemaking rather than establishing a set policy for mandatory reporting of Hospital Harm eCQMs automatically after 2 years of voluntary reporting.

Response: A longstanding goal of the Hospital Inpatient Quality Reporting Program has been to simplify and streamline reporting through electronic reporting which improves the ability to align and harmonize measures across programs (78 FR 50807). As part of this established goal, we are increasing the number of eCQMs that we require. We understand that this requires investment in time and resources; however, we believe delaying implementation would delay our efforts to improve transparency regarding hospital performance on important safety topics. Additionally, through creating a set policy rather than an individual measure approach, we are establishing a predictable timeline by providing hospitals with 2 years of self-selected reporting before a Hospital Harm eCQM becomes mandatory; thus, hospitals have advance notice and can plan accordingly.

Comment: A few commenters requested CMS clarify its strategy for eCQM requirements, specifically recommending that CMS establish a cap for the number of mandatory eCQMs.

Response: We note that one of the goals of the Hospital Inpatient Quality Reporting Program is to move forward in the least burdensome manner possible, while maintaining a parsimonious set of the most meaningful quality measures and continuing to incentivize improvement in the quality of care provided to patients. We carefully evaluate each measure that we propose to adopt for the Hospital Inpatient Quality Reporting Program to ensure that its benefits outweigh the associated burden. We also assess the cumulative burden of requirements across the program and may remove a measure when its costs outweigh the benefits of its continued use. We will continue to evaluate this balance on a case-by-case basis for the Hospital Inpatient Quality Reporting Program measure set.

Comment: Several commenters were concerned that the number of eCQMs available for self-selected eCQMs decreases too significantly as the Malnutrition Care Score and Hospital Harm eCQMs become mandatory, reducing flexibility and creating a near-mandatory reporting structure. A few commenters emphasized that self-selection is important for hospitals to report measures that are more meaningful, applicable, and representative of their specific patient populations, clinical services, and quality improvement priorities. Other commenters suggested eliminating the self-selection requirement to decrease the strain on health IT, labor, financial, and clinical resources needed to maintain those measures. Commenters stated that such efforts could be diverted to the increasing number of mandatory eCQMs. A commenter recommended that CMS change the number of self-selected eCQMs from three to two. Another recommended CMS maintain a broader portfolio of non-Hospital Harm eCQMs before implementing this proposal.

Response: We understand that increasing the number of mandatory eCQMs affects burden and reduces the list of eCQMs that hospitals can self-select. We note that the number of measures available for self-selection would be five for the CY 2028 and CY 2029 reporting periods, which allows hospitals to choose the most meaningful measures for their patient populations and quality improvement efforts. While the number of measures available for self-selection would be four beginning with the CY 2030 reporting period, the measure set may continue to evolve in future rulemaking, providing additional self-selection options for hospitals. We continually monitor and evaluate the measures and requirements of the Hospital Inpatient Quality Reporting Program, and if, in our monitoring and evaluation, we determine that the burden of maintaining a set of measures for self-selected reporting outweighs the benefit of providing this flexibility to hospitals, we will evaluate alternative approaches to our eCQM policies. We thank the commenters for recommending these alternative approaches.

Comment: A commenter requested that CMS consider aligning the deadline for validation and submission with the Merit-based Incentive Payment System (MIPS) deadline to grant hospitals additional time to report.

Response: The MIPS reporting deadline is established for CY payments to clinicians. Because hospitals are paid under the IPPS, which is a FY payment system, it is appropriate for the Hospital Inpatient Quality Reporting Program to maintain earlier reporting deadlines to prepare for payment updates that occur one calendar quarter earlier than payments made under the PFS.

Comment: A few commenters stated concerns about using Hospital Harm eCQMs in programs that directly impact reimbursement or Overall Hospital Quality Star Ratings before they have been adequately adopted, validated, and stabilized. A few commenters requested CMS limit frequent measure specifications changes, demonstrate measure stability, and consider a transition period with neutral scoring before introducing these measures in programs that impact reimbursement or public reporting. A commenter highlighted these challenges, especially for hospitals subject to state reporting requirements that rely on year-over-year eCQM outcomes. Another commenter expressed concerns that as Hospital Harm eCQMs are adopted across pay-for-reporting programs, pay-for-performance programs, and alternative payment models, hospitals are increasingly evaluated multiple times on the same underlying measures, placing substantial reliance on a relatively small set of quality measures.

Response: We thank the commenters and acknowledge their concerns about transitioning measures into programs that impact reimbursement and with public reporting that can impact Overall Hospital Quality Star Ratings or state reporting programs. We also acknowledge the request for measure stability before measures transition to performance-based programs and public reporting. By making the Hospital Harm eCQMs mandatory after 2 years of self-

selected reporting, we ensure that we will receive a robust national dataset for measures on these important topics. At this time, these eCQMs have not been proposed for adoption into a pay-for-performance program. However, as we adopt measures from the Hospital Inpatient Quality Reporting Program into pay-for-performance programs (such as the Hospital-Acquired Condition Reduction Program), we generally remove them from the Hospital Inpatient Quality Reporting Program, so we are not evaluating hospitals on the same underlying measures.

We understand commenters' concerns regarding public reporting of data on measures. To address this concern, we will publicly report data for Hospital Harm eCQMs on the more research-focused Provider Data Catalog for the first year of mandatory reporting before moving them to the consumer-focused Care Compare site, including Star Ratings, beginning with the second year of mandatory reporting. By keeping the proposed timeline, but not publicly reporting on Care Compare for an additional year after these measures become mandatory, we are able to meet our goal of advancing robust patient safety data reported, address data issues sooner, and be responsive to concerns from hospitals about potentially inaccurate data being public facing.

Comment: Several commenters expressed concerns that the timeline for mandatory reporting for the Malnutrition Care Score may be premature given ongoing data integrity concerns, measure complexity, and workflow challenges. A few commenters stated these concerns are particularly significant for hospitals without advanced EHR systems. Several commenters urged CMS to consider staffing constraints, particularly limited dietician and nutritionist resources and recommended risk adjustments for rural and resource limited hospitals. A commenter noted that for shorter lengths of stay, patients may be discharged prior to completion of a full nutrition assessment. A commenter stated that the measure promotes documentation rather than clinical improvement because outcomes are not observable during the hospital stay. A commenter recommended an evaluation of what additional resources are necessary to support successful implementation of the Malnutrition Care Score eCQM and that CMS monitor for any unintended consequences of transitioning the measure to mandatory reporting. A commenter requested a 1-year delay in mandatory reporting of the Malnutrition Care Score eCQM to allow hospitals more time to implement and validate the measure.

Response: We note that this measure uses data that is designed to be calculated by the hospital's certified health IT using data captured in structured fields, thereby reducing reporting burden and complexity. We acknowledge commenters' concerns about the availability of staff, particularly in rural hospitals, and note the measure observations can be completed at any point during the inpatient encounter, which allows flexibility for facilities that do not have a dietician on staff at all hours, and applies to patients with a length of stay equal to or greater than 24 hours. The Malnutrition Care Score eCQM measure was endorsed with conditions in the Spring 2024 review cycle, with a condition for the measure steward to review implementation data to examine whether the measure is associated with improved nutritional status or related clinical endpoints when the measure returns for maintenance review in the Spring 2029 cycle.[472] [473] The measure developer is working to collect and review hospital implementation data to assess the clinical outcomes associated with the measure by its next review cycle in Spring 2029. Because improved nutrition care has the potential to have significant impacts on patient well-being, it is appropriate to require reporting on the Malnutrition Care Score eCQM at this time. We will continue to conduct ongoing monitoring and analyses to watch for any unintended consequences of the expanded reporting for the Malnutrition Care Score eCQM.

Comment: Many commenters stated that Hospital Harm eCQMs are particularly complex to construct and validate, typically taking multiple iterations to establish EHR feasibility to ensure accurate reporting. A commenter stated the Hospital Harm—Postoperative VTE eCQM specifically has not been robustly tested enough yet for inclusion as a mandatory measure.

Response: We understand commenters' concerns regarding the complexity of reporting the Hospital Harm eCQMs. We note that these eCQMs address important patient safety topics, and therefore the benefits of reporting these data outweigh the burden of updating EHR systems. We refer readers to section IX.C.3.b.(5) of this final rule in which we discuss the testing that the Hospital Harm—Postoperative VTE eCQM underwent as part of the development and endorsement process.

After consideration of the public comments we received, we are finalizing our proposal to update the reporting requirements for the Malnutrition Care Score eCQM to begin mandatory reporting with the CY 2028 reporting period/FY 2030 payment determination. We refer readers to section IX.F.9. of the preamble of this final rule for a discussion of updating reporting requirements for this measure in the Medicare Promoting Interoperability Program.

We are finalizing our proposal to modify reporting requirements for the Hospital Harm eCQMs with modification. We are finalizing the proposed timeline to begin mandatory reporting after two years of self-selected reporting starting with the CY 2028 reporting period/FY 2030 payment determination with a modification to publicly report data on the more research-focused Provider Data Catalog for the first year of mandatory reporting before moving it to the consumer-focused Care Compare site, including Star Ratings, beginning with the second year of mandatory reporting. We refer readers to section IX.F.9. of the preamble of this final rule for a discussion of updating reporting requirements for Hospital Harm eCQMs in the Medicare Promoting Interoperability Program.

d. Data Submission and Reporting Requirements for Structural Measures

We refer readers to the FY 2012 IPPS/LTCH PPS final rule (76 FR 51643 and 51644) and the FY 2013 IPPS/LTCH PPS final rule (77 FR 53538 and 53539) for details on the data submission requirements for structural measures. In the FY 2027 IPPS/LTCH PPS proposed rule (91 FR 19604 through 19605), we proposed an update to the reporting and submission requirements for the Maternal Morbidity Structural measure beginning with the FY 2028 payment determination.

(1) Update to Maternal Morbidity Structural Measure Reporting

In the FY 2022 IPPS/LTCH PPS final rule (86 FR 45361 through 45365), we adopted the Maternal Morbidity Structural measure beginning with the FY 2023 payment determination. In this attestation-based measure, hospitals answer the following two-part question:

[472] Partnership for Quality Measurement. Malnutrition Care Score. *Available at: https://p4qm.org/measures/3592e.*

[473] Partnership for Quality Measurement. Spring 2024 Cycle Endorsement and Maintenance Technical Report Initial Recognition and Management. *Available at: https://p4qm.org/sites/default/files/Initial%20Recognition%20and%20Management/material/EM-Spring-2024-IRM-Final-Project-Report.pdf.*

Does your hospital or health system participate in a Statewide and/or National Perinatal Quality Improvement Collaborative Program aimed at improving maternal outcomes during inpatient labor, delivery and postpartum care, and has it implemented patient safety practices or bundles related to maternal morbidity to address complications, including, but not limited to, hemorrhage, severe hypertension/preeclampsia or sepsis?[474] The answer choices are ''yes'', ''no'', or ''not applicable'' (for hospitals that do not provide inpatient labor/delivery care).

To improve the completeness and usefulness of the data collected, in the FY 2027 IPPS/LTCH PPS proposed rule (91 FR 19604 through 19605), we proposed updating the reporting requirements. Specifically, if a hospital answers ''yes'' to the measure as currently specified, the hospital would also need to report the name of the perinatal quality improvement collaborative program. In the HQR System, if a hospital selects ''yes'' in response to the measure, the hospital would also be prompted to report a response to the following: ''Which Statewide and/or National Perinatal Quality Improvement Collaborative Program does the hospital participate in?'' This change is intended to enhance our understanding of current practices and support targeted quality improvement efforts. This update to the reporting requirements of the measure would not impact measure performance, as the criteria for attesting ''yes'' to the measure remain the same. However, we would not consider a hospital which attested ''yes'' to the measure but did not provide the name of the perinatal quality improvement collaborative program in which they participate to have successfully reported all requirements for this measure. Therefore, such a hospital would be subject to a payment penalty. To report on this measure, hospitals would continue using the CMS-approved web-based collection tool available within the HQR System once annually, as they currently do to report for this and other Hospital Inpatient Quality Reporting Program structural measures (87 FR 49304 through 49305).

We invited public comment on our proposed update to the reporting requirements for the Maternal Morbidity Structural measure beginning with the CY 2026 reporting period/FY 2028 payment determination.

Comment: Many commenters supported our proposal to update the Maternal Morbidity Structural measure to include a sub-question for a hospital to report the name of the Statewide or national Perinatal Quality Improvement Collaborative, if a hospital answers ''yes'' to the measure. Commenters agreed this would improve completeness, transparency, and usefulness of publicly reported information, strengthening accountability for maternal safety initiatives. Commenters also recommended we continue to evolve maternal health quality reporting. A commenter supported our proposal and recommended considering the limitations that smaller, rural, and safety-net hospitals may face in accessing established collaborative networks.

Response: We thank the commenters for their support and agree it is important to continue evolving maternal health initiatives and consider this a priority topic in our quality reporting efforts in the Hospital Inpatient Quality Reporting Program. We refer readers to section IX.C.7.a.(3) of this final rule where we discuss potential scoring methodologies for the next phase of the Birthing-Friendly Hospital Designation as a part of our efforts to continue evolving maternal quality reporting. We note that the CDC maintains a list of statewide quality collaboratives at: *https://www.cdc.gov/maternal-infant-health/pqc/state-pqcs.html.* We understand the commenter's concern that smaller, rural, and safety-net hospitals may face challenges in accessing collaborative networks. However, we note that even if participation in a Statewide Perinatal Quality Improvement Collaborative is not accessible, there are a number of national Perinatal Quality Improvement Collaboratives available. Therefore, we do not anticipate hospitals being unable to access them, even if a hospital has low patient volume.

Comment: A few commenters expressed concerns that stating the name of the Perinatal Quality Improvement Collaborative would not drive clinical improvement or advance the underlying goal of the facility engaging in these initiatives. These commenters stated that hospitals should not be subject to a payment reduction for not providing the name of the perinatal collaborative initiative. A commenter expressed concern that adding descriptive reporting to this structural measure would not reflect the depth or effectiveness of its implementation, would add unnecessary burden, and would not inform consumers about quality of care provided. A commenter had concerns about the impact of this update to the Maternal Morbidity Structural measure on other state improvement reporting efforts and recommended ensuring more stability in the measure specifications given the downstream implications.

Response: Requesting hospitals to provide the name of the collaborative they are affiliated with would provide consumers and hospitals with an additional level of detail about hospitals' participation in a perinatal quality collaborative. This in turn would improve accountability and transparency of hospitals' current practices and quality improvement efforts toward addressing an important health issue like maternal morbidity. Regarding concerns about additional burden, as discussed in section XII.B.4.f. of the FY 2027 IPPS/LTCH PPS proposed rule (91 FR 19755), we estimated that the currently approved burden of five minutes is adequate for hospitals to both attest to the current two-part question and answer the additional sub-question, and therefore do not anticipate any additional burden on hospitals. We acknowledge commenter concerns about potential impacts on state reporting requirements and will monitor for unintended consequences as a part of our routine monitoring and evaluation of the Hospital Inpatient Quality Reporting Program measure set.

Comment: A few commenters made recommendations to further strengthen the Maternal Morbidity Structural measure's ability to distinguish between nominal affiliation and meaningful engagement in quality improvement activities. A few commenters recommended defining and evaluating levels of hospital engagement with the perinatal quality improvement collaborative program they are affiliated with, to consider leveraging existing perinatal quality collaborative engagement frameworks, and to incorporate an attestation to indicate the level of engagement a hospital participates in. A commenter recommended we include another prompt requesting information on what patient safety practices or bundles related to maternal morbidity are being implemented at hospitals, noting this would result in better understanding of how hospitals are utilizing certain types of patient safety bundles or activities across the country. A commenter recommending ensuring the submission process remains streamlined and

[474] CMS. QualityNet. IQR Measures—Web-Based Data Collection. Attestation Guide for the Maternal Morbidity Structural Measure. Available at: *https://qualitynet.cms.gov/inpatient/iqr/measures#tab2.*

clinically validated, avoiding excessive documentation burdens.

Response: We thank commenters for their recommendations and will consider this feedback as we continue to develop the measure in the future. While we are not updating the measure to define or evaluate a specific level of engagement or participation with a perinatal quality collaborative at this time, we encourage hospitals to meaningfully engage with the perinatal quality collaborative they are affiliated with to address this important topic and improve maternal safety.

After consideration of the public comments we received, we are finalizing our proposal to update the reporting requirements for the Maternal Morbidity Structural measure beginning with the CY 2026 reporting period/FY 2028 payment determination.

D. PPS-Exempt Cancer Hospital Quality Reporting Program

1. Background and History of the PPS-Exempt Cancer Hospital (PCH) Quality Reporting Program

The PPS-Exempt Cancer Hospital (PCH) Quality Reporting Program, authorized by section 1866(k) of the Act, applies to hospitals described in section 1886(d)(1)(B)(v) of the Act (referred to as ''PPS-Exempt Cancer Hospitals'' or ''PCHs''). We refer readers to the FY 2013 IPPS/LTCH PPS final rule (77 FR 53555 through 53567) for a general overview of the PCH Quality Reporting Program. We also refer readers to 42 CFR 412.24 for codified PCH Quality Reporting Program requirements.

2. New Measures for the PCH Quality Reporting Program Measure Set

In the FY 2027 IPPS/LTCH PPS proposed rule (91 FR 19605), we proposed to adopt two new measures into the PCH Quality Reporting Program: (1) Advance Care Planning electronic clinical quality measure (eCQM) for a full year of reporting beginning with the CY 2028 reporting period/FY 2030 program year; and (2) Malnutrition Care Score eCQM for a full year of reporting beginning with the CY 2028 reporting period/FY 2030 program year. We provide more details on the proposed adoption of the Malnutrition Care Score eCQM in section IX.D.2.a. of this final rule, while details on the proposed adoption of the Advance Care Planning eCQM measure appear in section IX.B.1. of this final rule.

a. Adoption of the Malnutrition Care Score Electronic Clinical Quality Measure

(1) Background

Malnutrition is a common and high-risk condition characterized by unbalanced nutrition, encompassing both undernutrition and overnutrition.[475] Undernutrition occurs when an individual has insufficient calories, protein, or other nutrients from inadequate intake, impaired absorption, increased metabolic demands, or increased nutrient losses. Overnutrition includes a surplus of calories, which increases risk for obesity, type 2 diabetes, heart attacks, strokes, and other chronic conditions.[476] Malnutrition can be more prevalent among hospitalized patients with cancer and is associated with increased health care costs and adverse clinical outcomes, including increased length of hospital stays, complications and readmission rates, and all-cause mortality risk.[477] Up to an estimated 80 percent of cancer patients experience malnutrition, with prevalence varying based on cancer stage, type, treatment route, and the patient's age.[478] Adult cancer patients at risk of malnutrition have a 70 percent higher risk for all-cause mortality and a 49 percent higher risk for chemotherapy-related complications compared to patients with no malnutrition risk.[479] Furthermore, the side effects of cancer treatments, such as chemotherapy and radiation therapy, can impair nutritional intake due to nausea, vomiting, early satiety, and taste changes.[480] These effects underscore the need for nutrition screening throughout cancer treatment to maintain patient health, minimize nutrition-related side effects, and ultimately ensure the ability to keep a patient on an effective treatment schedule.

PCHs have an opportunity to identify malnutrition early in the patient admission process and to address it efficiently and effectively with interventions individualized to the patient's cancer treatment plan that could optimize outcomes, including reduced complications and lengths of stay.[481] However, gaps and inconsistencies exist in nutrition care practices in the inpatient setting,[482] and malnutrition remains poorly recognized, mostly due to a lack of awareness and inadequate coordination between healthcare providers.[483] The implementation of malnutrition care including: (1) malnutrition risk screening; (2) nutrition assessment following detection of malnutrition risk; (3) malnutrition diagnosis; and (4) nutrition care plans for patients identified as malnourished improves the identification and treatment of malnourished patients.[484] Providing inpatient nutritional support saves an estimated $2,818 per patient over 6 months, largely due to fewer infections and shorter hospital stays.[485]

(2) Overview of Measure

The Malnutrition Care Score eCQM assesses the percentage of adults aged

[485] Schuetz P, Sulo S, Walzer S, Vollmer L, Brunton C, Kaegi-Braun N, Stanga Z, Mueller B, Gomes F. (2021). Cost savings associated with nutritional support in medical inpatients: an economic model based on data from a systematic review of randomised trials. *BMJ Open, 11*(7), e046402. *https://doi.org/10.1136/bmjopen-2020-046402.*

18 years and older at the start of the eligible encounter, with a length of stay equal to or greater than 24 hours, who received optimal malnutrition care appropriate to the specific patient's level of malnutrition risk and severity. Best practices related to the prevention and care of malnutrition recommend that for each eligible encounter, adult inpatients are: (1) screened for malnutrition risk or for a dietitian referral order to be placed; (2) assessed by a registered dietitian (RD) or registered dietitian nutritionist (RDN) to confirm findings of malnutrition risk, and if identified with a ''moderate'' or ''severe'' malnutrition status in the current performed nutrition assessment; (3) receive a ''moderate'' or ''severe'' malnutrition diagnosis by a physician or eligible clinician as defined by CMS; and (4) have a current nutrition care plan performed by an RD/RDN.[486] [487]

To improve clinical outcomes for patients and reduce health care costs, we adopted the Malnutrition Care Score eCQM (previously known as the Global Malnutrition Composite Score eCQM) into the Hospital Inpatient Quality Reporting and Medicare Promoting Interoperability Programs as one of the eCQMs that hospitals can select to report beginning with the CY 2024 reporting period (87 FR 49239 through 49246 and 87 FR 49361 through 49365, respectively). In the FY 2025 IPPS/LTCH PPS final rule, we modified the measure to include patients 18 years old and older in the measure cohort (89 FR 69557 through 69560 and 89 FR 69621 through 69623). In this rule, we also proposed mandatory reporting of the Malnutrition Care Score eCQM in the Hospital Inpatient Quality Reporting and Medicare Promoting Interoperability Programs beginning with the CY 2028 reporting period/FY 2030 payment determination. We refer interested readers to sections IX.C.8.c.(2). and IX.F.9.c. of this final rule for further discussion of this measure in the Hospital Inpatient Quality Reporting and Medicare Promoting Interoperability Programs, respectively.

(3) Measure Calculation

The Malnutrition Care Score eCQM consists of four components, which are scored separately: (1) screening for malnutrition risk at admission; (2) completing a nutrition assessment for patients who screened for risk of malnutrition; (3) appropriate documentation of malnutrition diagnosis in the patient's medical record if a malnutrition risk of ''moderate'' or ''severe'' was indicated by the assessment findings; and (4) development of a nutrition care plan for malnourished patients including the recommended treatment plan. The malnutrition components are specified for use in electronic health records (EHRs). The Malnutrition Care Score eCQM numerator is comprised of four components that are individually scored at the encounter level for patients 18 years of age and older who are admitted to a PCH. Each eligible component is given a value of 0 if not documented, or 1 if documented, and then all values are summed to total the numerator. The measure denominator is the total eligible occurrences of the four components for patients aged 18 years and older who are admitted to a PCH. The only denominator exclusion for this measure population is patients whose length of stay is less than 24 hours. Details on the cohort for each component are specified in Table IX.D.1.

TABLE IX.D.1.: MALNUTRITION CARE SCORE ECQM COMPONENT COHORT DESCRIPTIONS

Component	Numerator	Denominator
Completion of a Malnutrition Screening	Patients in the denominator who have a malnutrition screening documented in the medical record	Patients age 18 years and older at time of admission who are admitted to a PCH
Completion of a Nutrition Assessment for Patients Identified as At-Risk for Malnutrition	Patients in the denominator who have a nutrition assessment documented in the medical record	Patients age 18 years and older at time of admission who are admitted to a PCH and were identified as at-risk for malnutrition upon completing a malnutrition screening
Appropriate Documentation of a Malnutrition Diagnosis	Patients in the denominator with a diagnosis of malnutrition documented in the medical record	Patients age 18 years and older at time of admission who are admitted to a PCH with findings of malnutrition upon completing a nutrition assessment
Nutrition Care Plan for Patients Identified as Malnourished after a Completed Nutrition Assessment	Patients in the denominator who have a nutrition care plan documented in the medical record	Patients age 18 years and older at time of admission who are admitted to a PCH with findings of malnutrition upon completing a nutrition assessment.

The score for each eligible encounter is calculated by dividing the numerator by the denominator. Results range from 0 to 100 percent, with higher percentages indicating better performance. The measure specifications for the Malnutrition Care Score eCQM can be found on the Electronic Clinical Quality Improvement (eCQI) Resource Center website, available at: *https://ecqi.healthit.gov/ecqm/hosp-inpt/2028/cms0986v6.*

(4) Pre-Rulemaking Process and Measure Endorsement

(a) Recommendations From the Pre-Rulemaking Measure Review Process

We refer readers to the Partnership for Quality Measurement website for details on the Pre-Rulemaking Measure Review process convened by the consensus-

[486] Malnutrition Quality Improvement Initiative. (2024). MQii Toolkit. *Available at: https://malnutritionquality.org/mqii-toolkit/#case_malnutrition_care_hospital.*

[487] Silver HJ, Pratt KJ, Bruno M, Lynch J, Mitchell K, McCauley SM. (2018). Effectiveness of the Malnutrition Quality Improvement Initiative on Practitioner Malnutrition Knowledge and Screening, Diagnosis, and Timeliness of Malnutrition-Related Care Provided to Older Adults Admitted to a Tertiary Care Facility: A Pilot Study. *Journal of the Academy of Nutrition and Dietetics,118*(1):101–109. *https://doi.org/10.1016/j.jand.2017.08.111.*

based entity (CBE), including the voting procedures used to reach consensus on measure recommendations.[488] [489] The Pre-Rulemaking Measure Review Hospital Committee, consisting of both the Pre-Rulemaking Measure Review Hospital Recommendation Group (hereafter referred to as the Recommendation Group) and Pre-Rulemaking Measure Review Hospital Advisory Group, met on January 12 and 13, 2026, to review measures included by the Secretary on the publicly available ''2025 Measures Under Consideration List,'' including the Malnutrition Care Score eCQM (MUC2025–065).[490]

The voting results of the Recommendation Group for the proposed inclusion of the Malnutrition Care Score eCQM in the PCH Quality Reporting Program were: 19 members (95 percent) recommended adopting the measure into the PCH Quality Reporting Program, and one member (5 percent) voted not to recommend the measure for adoption.[491] With 95 percent of the votes for recommend, the Recommendation Group reached consensus agreement to recommend the Malnutrition Care Score eCQM for use in the PCH Quality Reporting Program.

The Pre-Rulemaking Measure Review Hospital Committee overall agreed that this measure is particularly relevant for cancer patients, who often experience malnutrition. The Recommendation Group member who voted not to recommend the measure expressed concerns that (1) rural hospitals often lack sufficient registered dietitian staffing, even with telemedicine, and (2) whether documenting screening leads to meaningful improvements in post-discharge outcomes.

In response to the Recommendation Group member's first concern about rural hospitals, the hospitals participating in the PCH Quality Reporting Program consist of 11 total PCHs. All PCHs are affiliated with large academic medical centers, research institutions, or standalone premier cancer centers.[492] As there are no PCHs currently designated as rural hospitals or considered to be low-resource hospitals, this concern is not relevant to our proposal to adopt the Malnutrition Care Score eCQM into the PCH Quality Reporting Program.

Regarding the Recommendation Group member's second concern about meaningful improvements, the Malnutrition Care Score eCQM measure was endorsed in the Spring 2024 review cycle with a condition for the measure steward to review implementation data to examine whether the measure is associated with improved nutritional status or related clinical endpoints when the measure returns for maintenance review in the Spring 2029 cycle.[493] [494] The measure developer is working to collect and review hospital implementation data to assess the clinical outcomes associated with the measure by its next review cycle in Spring 2029, and we will continue to evaluate the measure as more data is received.

We thank the committee for their recommendations and concerns. After taking them into consideration, we proposed to adopt the Malnutrition Care Score eCQM in the PCH Quality Reporting Program beginning with the CY 2028 reporting period/FY 2030 program year (91 FR 19605 through 19608).

(b) Measure Endorsement

We refer readers to the Partnership for Quality Measurement website for details on the measure endorsement and maintenance process, including the measure evaluation procedures the Endorsement and Maintenance Committees use to evaluate measures and whether they meet endorsement criteria. The Malnutrition Care Score eCQM was recently reviewed by the Endorsement and Maintenance Initial Recognition and Management Committee as part of measure maintenance in the Spring 2024 review cycle. The Endorsement and Maintenance committee voted to endorse with conditions. The condition was for the measure steward to review implementation data (including the recently expanded cohort of patients 18 years and older) to examine whether the measure is associated with improved nutritional status or related clinical endpoint when the measure returns for maintenance review in the Spring 2029 cycle.[495] [496] We are working with the measure steward to collect and review hospital implementation data to assess the clinical outcomes associated with the Malnutrition Care Score eCQM.

(5) Data Sources, Submission, and Reporting

The Malnutrition Care Score eCQM uses data collected through a hospital's EHR. The measure is designed to be calculated by certified health information technology (IT) using the patient-level data and then submitted by the PCH to CMS. Table IX.D.2. outlines the data specification(s) and data sources for each of the four components.

[488] Partnership for Quality Measurement. Pre-Rulemaking Measure Review web page. *Available at: https://p4qm.org/prmr/about.*

[489] In 2025, the CBE updated the Pre-Rulemaking Measure Review voting process such that committee members will vote to either ''recommend'' or ''do not recommend'' that a measure be added to the intended CMS program(s), thus removing the ''recommend with conditions'' voting option. The threshold to reach consensus on a given measure continues to be a minimum of 75 percent agreement among members. Committee members can provide considerations for CMS to review prior to implementation.

TABLE IX.D.2.: MALNUTRITION CARE SCORE ECQM COMPONENTS AND DATA SOURCES

Component	Description	Data Sources
Completion of a Malnutrition Screening	Patients age 18 years and older who were screened for malnutrition	- Inpatient Admission Time - Inpatient Discharge Time - Birthdate - Completed Malnutrition Screening - Completed Malnutrition Screening Time Stamp
Completion of a Nutrition Assessment for Patients Identified as At-Risk for Malnutrition	Patients age 18 years and older identified as at-risk for malnutrition based on a malnutrition screening who have a nutrition assessment documented in the medical record	- Inpatient Admission Time - Inpatient Discharge Time - Birthdate - Completed Malnutrition Screening - Malnutrition Screening Result - Completed Nutrition Assessment - Completed Nutrition Assessment Time Stamp
Appropriate Documentation of a Malnutrition Diagnosis	Patients age 18 years and older and found to be malnourished based on a completed nutrition assessment who have documentation of a malnutrition diagnosis	- Inpatient Admission Time - Inpatient Discharge Time - Birthdate - Completed Nutrition Assessment - Nutrition Assessment Result - Malnutrition Diagnosis
Nutrition Care Plan for Patients Identified as Malnourished after a Completed Nutrition Assessment	Patients age 18 years and older and found to be malnourished based on a completed nutrition assessment who have a documented nutrition care plan in the medical record	- Inpatient Admission Time - Inpatient Discharge Time - Birthdate - Completed Nutrition Assessment - Nutrition Assessment Result - Documented Nutrition Care Plan

In the FY 2027 IPPS/LTCH PPS proposed rule (91 FR 19605 through 19608), we proposed to adopt the Malnutrition Care Score eCQM in the PCH Quality Reporting Program beginning with the CY 2028 reporting period/FY 2030 program year. We refer readers to section IX.D.5.b. of this final rule for a discussion of form, manner, and timing of data submission and reporting requirements for eCQMs in the PCH Quality Reporting Program.

Section 1866(k)(4) of the Act requires the Secretary to make quality measure information available to the public after PCHs have the opportunity to review their data. We proposed that if adoption of the Malnutrition Care Score eCQM is finalized, we would publicly report data as soon as it is feasible on CMS websites such as the Compare tool on *Medicare.gov* (*https://www.medicare.gov/care-compare/*) and the CMS Provider Data Catalog or their successor websites after a 30-day preview period.

We invited public comment on our proposal to adopt the Malnutrition Care Score eCQM into the PCH Quality Reporting Program beginning with the CY 2028 reporting period/FY 2030 program year.

Comment: Many commenters supported the proposal to adopt the Malnutrition Care Score eCQM because nutrition care is a low-cost but high-impact intervention with positive implications for patient care, including improved care coordination, timely intervention, and patient satisfaction. Commenters noted that addressing malnutrition can improve patient outcomes and reduce readmissions, length of stay, complications, and mortality. A few commenters stated that this measure may help close the gap between identification of malnutrition and actual malnutrition care provision. A commenter noted that this measure aligns with broader federal priorities related to patient-centered care and nutrition. Another commenter encouraged CMS to continue building upon this important work by advancing additional nutrition quality measures and supporting broader implementation of evidence-based nutrition care nationwide.

Response: We thank the commenters for their support. We agree that addressing nutrition is important and may consider future measure development and quality reporting activities to strengthen nutrition care across the healthcare continuum. We agree that adopting the Malnutrition Care Score eCQM aligns with broader HHS and CMS nutrition policies and initiatives. The January 2026 HHS fact sheet emphasizes prevention, nutrient-dense foods, and improved nutrition across federal health programs.[497]

Comment: Many commenters highlighted the importance of malnutrition care specifically for cancer patients, noting that malnutrition can affect a patient's ability to withstand cancer treatments and can negatively affect health outcomes. Several commenters noted the high prevalence, but underdiagnosis, of malnutrition among cancer patients. A few commenters stated that requiring the measure for PCHs would strengthen inpatient nutrition care and promote coordinated nutrition care across ambulatory and outpatient settings where many cancer patients continue to receive care. These commenters encouraged CMS to incentivize effective care transitions upon discharge and sustainable patient access to outpatient services, so nutrition diagnoses and care plans are communicated and carried out in post-acute care settings. A commenter noted that the Pre-Rulemaking Measure Review Recommendation Group overwhelmingly supported the inclusion of the Malnutrition Care Score eCQM in the PCH Quality Reporting Program.

Response: We thank the commenters for their support. We agree with commenters and the Recommendation Group that this measure would be an important addition to the PCH Quality Reporting Program as it facilitates improved care coordination and outcomes for cancer patients through timely screening and intervention for malnutrition.

[497] Department of Health and Human Services. (2026). Fact Sheet: Trump Administration Resets U.S. Nutrition Policy, Puts Real Food Back at the Center of Health. Available at: *https://www.hhs.gov/press-room/fact-sheet-historic-reset-federal-nutrition-policy.html.*

Comment: Several commenters stated concerns about implementing and operationalizing eCQMs in the PCH Quality Reporting Program beginning with the CY 2028 reporting period/FY 2030 program year as proposed. These commenters suggested that CMS delay implementation of the policy to allow sufficient time for infrastructure development, vendor alignment, workflow implementation, and data validation. Some commenters recommended an initial voluntary reporting period of up to two years or a phased approach similar to eCQM implementation policies in other CMS quality reporting programs, such as the Hospital Inpatient Quality Reporting Program, to appropriately reflect the level of effort required to ensure successful adoption and high-quality data. A few commenters questioned CMS' proposal to publicly report the eCQMs immediately following the first required reporting period, stating that the standard data preview process would not provide sufficient opportunity to validate data accuracy or ensure consistent interpretation of measure specifications prior to public display, which could misrepresent hospital performance.

A few commenters stated that the Malnutrition Care Score eCQM introduces additional complexity due to its multidisciplinary nature. They stated that successfully implementing the measure requires coordination and staff availability across clinical teams, including physicians, dietitians, and nursing staff, in addition to the efforts to initiate eCQM reporting, and stated that all of this cannot be completed within the proposed timeframe. A commenter encouraged CMS to evaluate the additional resources that are necessary to support successful implementation of the Malnutrition Care Score eCQM and monitor for any unintended consequences of the measure's required reporting, given the measure's documentation demands and workforce constraints, including the availability of nutritionists and dietitians.

Response: We appreciate the commenters' concerns about implementation of the eCQMs. We note that the measure uses data collected through hospitals' EHRs and is designed to be calculated by the hospital's certified health IT, thereby reducing reporting burden and complexity. However, we recognize that PCHs and their vendors may need additional time to operationalize eCQM reporting and submission requirements since eCQMs would be an entirely new measure type in the PCH Quality Reporting Program. We understand that additional time would help ensure the accuracy and reliability of publicly reported data and would promote implementation of more effective workflows between clinical teams seeking strong performance on both this quality measure and, more generally, the introduction of eCQMs to the PCH Quality Reporting Program. Therefore, we are finalizing our proposal with a modification; specifically, we are finalizing adoption of this measure with voluntary reporting in the PCH Quality Reporting Program for the CY 2028 reporting period/FY 2030 program year followed by mandatory reporting beginning with the CY 2029 reporting period/FY 2031 program year.

For the CY 2028 reporting period/FY 2030 program year voluntary period, PCHs will receive confidential data through the Hospital Quality Reporting System to provide opportunities to identify and address deficiencies before public display. We will then publicly report measure information beginning with the CY 2029 reporting period/FY 2031 program year data as soon as it is feasible on CMS websites such as the Compare tool on *Medicare.gov* (*https://www.medicare.gov/care-compare/*) and the CMS Provider Data Catalog or their successor websites after a 30-day preview period.

For implementation guidance, we refer readers to the measure specifications, implementation guide, and other resources, which can be found on the eCQI Resource Center website, available at: *https://ecqi.healthit.gov.* We acknowledge that many quality measures can require adjustments to existing practices but believe the ultimate benefits to both individual patients and overall health outcomes from promoting better nutrition are worth the effort. We will continue to conduct ongoing monitoring and analyses for any unintended consequences.

After consideration of the public comments we received, we are finalizing our proposal to adopt the Malnutrition Care Score eCQM into the PCH Quality Reporting Program with a modification to start with voluntary reporting for the CY 2028 reporting period/FY 2030 program year followed by mandatory reporting of a full year's data beginning with the CY 2029 reporting period/FY 2031 program year.

3. Removal in the PCH Quality Reporting Program Measure Set

a. Removal of the COVID–19 Vaccination Coverage Among Healthcare Personnel Measure

We refer readers to the FY 2022 IPPS/LTCH PPS final rule where we adopted the COVID–19 Vaccination Coverage among Healthcare Personnel (HCP) measure (hereafter referred to as HCP COVID–19 Vaccination measure) into the PCH Quality Reporting Program (86 FR 45428 through 45434) and the FY 2024 IPPS/LTCH PPS final rule where we modified the HCP COVID–19 Vaccination measure to account for updated COVID–19 vaccine guidance (88 FR 59137 through 59144). The HCP COVID–19 Vaccination measure requires PCHs to report the COVID–19 vaccination status of HCP through the Centers for Disease Control and Prevention (CDC) National Healthcare Safety Network (NHSN). PCHs must collect current vaccination status for all employees, licensed independent practitioners, adult trainees, students, and volunteers, as well as certain contract personnel one week out of each month and report these data on a quarterly basis (88 FR 59140).

In the FY 2027 IPPS/LTCH PPS proposed rule (91 FR 19608 through 19609), we proposed to remove the HCP COVID–19 Vaccination measure beginning with the CY 2026 reporting period/FY 2028 program year under removal factor 2, a measure does not align with current clinical guidelines or practice (§ 412.24(d)(3)(i)(B)). When we originally adopted this measure, the United States was in the midst of a Public Health Emergency (PHE) with millions of COVID–19 cases and over 550,000 COVID–19 deaths (86 FR 45428). In March 2021, when this measure was being proposed, the United States was averaging over 5,000 deaths per week. In April 2023, the last full month of the PHE, the weekly number of deaths due to COVID–19 averaged around 1,300.[498] While preventing the spread of COVID–19 remains a public health goal, the PHE ended on May 11, 2023,[499] and the COVID–19 death rate has continued to decrease. At the time we were drafting the proposed rule, weekly deaths attributed to COVID–19 ranged from 188 to 488 during the 6-

[498] Centers for Disease Control and Prevention. Provisional COVID–19 Deaths, by Week, in The United States, Reported to CDC. *Available at: https://covid.cdc.gov/covid-data-tracker/#trends_weeklydeaths_select_00.*

[499] End of the Federal COVID–19 Public Health Emergency (PHE) Declaration via *https://archive.cdc.gov/www_cdc_gov/coronavirus/2019-ncov/your-health/end-of-phe.html.*

month period from the week ending August 2, 2025, through the week ending January 31, 2026.[500] Since the proposed rule was published, this figure has continued to decline; from the week ending April 4, 2026, through the week ending June 20, 2026, weekly deaths attributed to COVID–19 ranged from 16 to 172.[501]

With the end of the PHE and decrease in COVID–19 deaths, we believed the continued costs and burden to providers of reporting on this measure outweighed the benefit of continued information collection on the HCP COVID–19 Vaccination in several settings. We have already removed this measure from the Hospital Inpatient Quality Reporting Program (90 FR 37010 through 37012), the Inpatient Psychiatric Facility Quality Reporting Program (90 FR 37657 through 37658), the Inpatient Rehabilitation Facility Quality Reporting Program (90 FR 37701 through 37702), the Ambulatory Surgical Center Quality Reporting Program (90 FR 53917 through 53919), and the Hospital Outpatient Quality Reporting Program (90 FR 53917 through 53919).

Since the end of the PHE, the CDC's clinical recommendations for COVID–19 vaccination have changed. In December 2020, the CDC's Advisory Committee on Immunization Practices (ACIP) recommended that HCP should receive a complete vaccination course.[502] At the time the HCP COVID–19 Vaccination measure was adopted in August 2021, vaccination was a critical part of the nation's strategy to effectively counter the spread of COVID–19 in an effort to restore societal functioning.[503] There were well-defined parameters for receiving the COVID–19 vaccination intended to capture routine, catch-up, and risk-based immunization recommendations.

However, these parameters no longer apply, due to evolving circumstances. At the time the proposed rule was published, the latest CDC COVID–19 vaccination recommendations for the 2025–2026 season were based on shared clinical decision-making (also known as individual-based decision-making).[504] For shared clinical decision-making, there is not a default decision to vaccinate for a defined population.[505] Given that there is no single default recommendation to vaccinate a defined population, both receipt and nonreceipt of vaccination may be consistent with the application of shared clinical decision-making. This differs from the guidance in place when this measure was finalized.

On this basis, we proposed to remove the measure from the PCH Quality Reporting Program under removal Factor 2, a measure does not align with current clinical guidelines or practice, in the FY 2027 IPPS/LTCH PPS proposed rule (91 FR 19608 through 19609). We refer readers to section IX.E.3. of this final rule for a similar proposal to remove the HCP COVID–19 Vaccination measure in the LTCH Quality Reporting Program.

If finalized, PCHs would not be required to report CY 2026 HCP COVID–19 Vaccination measure data for purposes of the FY 2028 program year. Any CY 2026 HCP COVID–19 vaccination data received by CMS would not be used for PCH Quality Reporting Program public reporting.

We invited public comment on our proposal to remove the COVID–19 Vaccination Coverage among Healthcare Personnel measure from the PCH Quality Reporting Program beginning with the CY 2026 reporting period/FY 2028 program year.

Comment: A few commenters supported the proposed removal because they believe the HCP COVID–19 Vaccination measure no longer aligns with current clinical guidance and practice following the end of the COVID–19 PHE. These commenters stated that changing definitions of vaccination status, the transition to an endemic phase of COVID–19, and the shift towards shared clinical decision-making have reduced the measure's utility and relevance as a quality measure in the PCH setting. These commenters further stated that these changes mean the measure no longer aligns with current clinical guidelines or practice.

A few commenters supported the proposal because they believed the burden associated with collecting and reporting measure data outweighs its current value. Commenters stated that continued reporting requires staff time and resources while providing limited benefit in the current clinical environment. Some commenters also supported removal of the measure and associated reporting requirements because doing so would reduce administrative burden associated with collecting and reporting COVID–19 vaccination data.

Response: We thank the commenters for their support, and we understand that the clinical guidance has changed since the measure was first adopted and that there is confusion over the current recommendations and their applicability to HCP. When the current measure was adopted, guidance recommended routine vaccination to remain ''up to date,'' which was then revised for the 2025–2026 COVID–19 vaccination schedule based on shared clinical decision-making, also known as individual-based decision-making.[506] Unlike routine vaccination, shared clinical decision-making does not establish a standard recommendation or schedule for vaccination. Instead, the decision is made on an individual basis and may consider the available evidence, the individual's characteristics and preferences, and the health care provider's clinical judgment. Under this framework, both receipt and non-receipt of vaccination may be consistent and appropriate with current clinical guidance.[507] As a result, the measure no longer reliably reflects vaccination prevalence among HCP. Therefore, we believe removal of the measure under removal Factor 2 is appropriate. In addition, we agree with commenters about the burden reduction associated with removal of this measure and refer interested readers to sections XII.B.5.c. and XII.B.5.d. of this final rule for details on our Information Collection Burden Estimates for the removal of this measure from the PCH Quality Reporting Program.

[507] Centers for Disease Control and Prevention. ACIP Shared Clinical Decision-Making Recommendations. *Available at: https://www.cdc.gov/acip/vaccine-recommendations/shared-clinical-decision-making.html.*

Comment: A few commenters opposed the proposal and stated that COVID–19 vaccination remains an important strategy for protecting cancer patients as they are highly immunocompromised and remain particularly vulnerable to increased risk of severe COVID–19 outcomes. Some commenters stated that continued visibility into HCP vaccination coverage remains important to encourage vaccine uptake, support infection prevention efforts, and protect vulnerable patients and HCP. A few commenters therefore recommended retaining the measure or exploring alternative approaches.

A few commenters opposed the proposal because they believed continued reporting of COVID–19 vaccination rates among HCP would promote transparency and accountability and expressed concern that removing the measure would reduce transparency and weaken accountability for infection prevention efforts.

Response: We acknowledge commenters' concerns regarding the increased risk for severe COVID–19 outcomes among PCH patient populations and views that continued public reporting of HCP vaccination rates may promote accountability, transparency, vaccination uptake, infection prevention efforts, and workforce protection. We also agree that preventing the spread of COVID–19 and protecting vulnerable patients remain important goals. However, we proposed removal of the measure under removal Factor 2 because the measure no longer aligns with current clinical guidelines and practice, not as a reflection of the effectiveness or importance of COVID–19 vaccination.

As stated previously, when the current measure was adopted, guidance recommended routine vaccination to remain ''up to date,'' which was then revised for the 2025–2026 COVID–19 vaccination schedule based on shared clinical decision-making.[508] Unlike routine vaccination, shared clinical decision-making does not establish a standard recommendation or schedule for vaccination. Instead, the decision is made on an individual basis and may consider the available evidence, the individual's characteristics and preferences, and the health care provider's clinical judgment. As a result, the measure is no longer reflects the prevalence of COVID–19 vaccination among HCP, as an HCP may be considered in compliance with vaccine recommendations without receiving an updated COVID–19 vaccination.

Comment: A commenter questioned whether alignment with other CMS quality reporting programs is an appropriate basis for removing the measure from the PCH Quality Reporting Program. The commenter stated that the unique characteristics of PCH patient populations warrant continued measurement of healthcare personnel vaccination coverage and suggested that alignment with other quality reporting programs should not outweigh clinical considerations specific to PCH settings.

Response: We acknowledge the commenter's concern that alignment with other CMS quality reporting programs should not, by itself, justify removal of the measure. Our decision to finalize removal of this measure is based on removal Factor 2 and our determination that the measure no longer aligns with current clinical guidelines and practice.

After consideration of the comments received, we are finalizing the removal of the COVID–19 Vaccination Coverage Among HCP measure from the PCH Quality Reporting Program beginning with the CY 2026 reporting period/FY 2028 program year as proposed.

4. Summary of Previously Finalized and Newly Finalized PCH Quality Reporting Program Measures

Table IX.D.3. summarizes the previously established and newly finalized PCH Quality Reporting Program measure set for the FY 2028 to FY 2031 program years, which removes the COVID–19 Vaccination Coverage among HCP measure as discussed in section IX.D.3.a. of this final rule, adds the Advance Care Planning eCQM as discussed in section IX.B.1. of this final rule, and adds the Malnutrition Care Score eCQM as discussed in section IX.D.2.a. of this final rule.

[508] Centers for Disease Control and Prevention. Staying Up to Date with COVID–19 Vaccines. *Available at: https://www.cdc.gov/covid/vaccines/stay-up-to-date.html.*

TABLE IX.D.3.: PCH QUALITY REPORTING PROGRAM MEASURE SET BY PROGRAM YEAR (PY)

Measure Name	CBE Number	FY 2028 PY	FY 2029 PY	FY 2030 PY	FY 2031 PY
NHSN Safety and Healthcare-Associated Infection (HAI) Measures					
NHSN Catheter-associated Urinary Tract Infection (CAUTI) Outcome Measure	0138	✓	✓	✓	✓
NHSN Central line-associated Bloodstream Infection (CLABSI) Outcome Measure	0139	✓	✓	✓	✓
Influenza Vaccination Coverage Among Healthcare Personnel (HCP)	0431	✓	✓	✓	✓
COVID–19 Vaccination Coverage among HCP*	N/A				
American College of Surgeons – Centers for Disease Control and Prevention (ACS-CDC) Harmonized Procedure Specific Surgical Site Infection (SSI) Outcome Measure (currently includes SSIs following Colon Surgery and Abdominal Hysterectomy Surgery)	0753	✓	✓	✓	✓
NHSN Facility-wide Inpatient Hospital-onset Methicillin-resistant *Staphylococcus aureus* (MRSA) Bacteremia Outcome Measure	1716	✓	✓	✓	✓
NHSN Facility-wide Inpatient Hospital-onset *Clostridium difficile* Infection (CDI) Outcome Measure	1717	✓	✓	✓	✓
Patient Safety Structural Measure	N/A	✓	✓	✓	✓
Claims-Based End-of-Life Measures					
Proportion of Patients Who Died from Cancer - Receiving Chemotherapy in the Last 14 Days of Life	0210	✓	✓	✓	✓
Proportion of Patients Who Died from Cancer - Not Admitted to Hospice	0215	✓	✓	✓	✓
Proportion of Patients Who Died from Cancer - Admitted to the ICU in the Last 30 Days of Life	0213	✓	✓	✓	✓
Proportion of Patients Who Died from Cancer - Admitted to Hospice for Less Than Three Days	0216	✓	✓	✓	✓
Patient Engagement/Experience of Care Measures					
Hospital Consumer Assessment of Healthcare Providers and Systems (HCAHPS) Survey	0166	✓	✓	✓	✓
Documentation of Goals of Care Discussions Among Cancer Patients	N/A	✓	✓	✓	✓
Claims-Based Outcome Measures					
Admissions and Emergency Department (ED) Visits for Patients Receiving Outpatient Chemotherapy	N/A	✓	✓	✓	✓
30-Day Unplanned Readmissions for Cancer Patients	3188	✓	✓	✓	✓

Electronic Clinical Quality Measures					
Advance Care Planning eCQM**	N/A			Voluntary	✓
Malnutrition Care Score eCQM**	3592e			Voluntary	✓

✓Measure required for the specified program year

*Finalized for removal in this final rule beginning with the CY 2026 reporting period/FY 2028 program year.

**Finalized for adoption in this final rule beginning with voluntary reporting for the CY 2028 reporting period/FY 2030 program year followed by mandatory reporting beginning with the CY 2029 reporting period/FY 2031 program year.

We refer readers to the CMS QualityNet website at *https://qualitynet.cms.gov/pch* for additional information on the reporting periods and submission deadlines for each measure previously finalized in the PCH Quality Reporting Program.

5. Updates to the Form, Manner, and Timing of Quality Data Submission

In the FY 2027 IPPS/LTCH PPS proposed rule (91 FR 19610 through 19612), we proposed to update program policies for introducing eCQMs into the PCH Quality Reporting Program by establishing eCQM data submission and reporting requirements, which would apply to the proposed Advance Care Planning eCQM and Malnutrition Care Score eCQM.

a. Maintenance of Technical Specifications for Quality Measures

Section 412.24(c) of title 42 of the Code of Federal Regulations generally requires that a PCH participating in the PCH Quality Reporting Program must submit to CMS data on measures selected under section 1833(k)(3) of the Act in a form and manner, and at a time, specified by CMS. The data submission requirements, specifications manual, measure methodology reports, and submission deadlines are posted on the QualityNet website at: *https://qualitynet.cms.gov* (or other successor CMS designated websites).

In alignment with the Hospital Inpatient Quality Reporting Program, we proposed that the technical specifications for eCQMs for the PCH Quality Reporting Program would be contained in the CMS Annual Update for the Hospital Quality Reporting Programs (Annual Update). The Annual Update and implementation guidance documents are available on the eCQI Resource Center website at: *https://ecqi.healthit.gov/*. For eCQMs, we would generally update the measure specifications on an annual basis through the Annual Update process which includes code updates, logic

corrections, alignment with current clinical guidelines, and additional guidance for PCHs and EHR vendors to collect and submit data on eCQMs from EHRs. In addition, we would generally update related eCQM implementation guidance on an annual basis. In the FY 2027 IPPS/LTCH PPS proposed rule (91 FR 19610 through 19611), we proposed that PCHs would be required to use the eCQM electronic measure specifications and implementation guidance for the applicable reporting period available on the eCQI Resource Center website at: *https://ecqi.healthit.gov/* or another website as designated by CMS.

We invited public comments on this proposal.

We did not receive public comments on this proposal; therefore, we are finalizing the policy for maintaining technical specifications for eCQMs as proposed.

b. Data Submission and Reporting Requirements for Electronic Clinical Quality Measures for the PCH Quality Reporting Program

(1) Background

Collection and reporting of data through health IT streamlines quality reporting through automated electronic extraction and reporting. Certified health IT assists facilities in a variety of ways, such as by improving coordination of care with referring providers or labs,[509] using eCQMs to improve quality and safety, and advancing a vision to eventually transition to a fully digital quality measure set.[510] We acknowledge the initial investment that the implementation of eCQMs may require for PCHs, but we expect that this investment will deliver long-term burden reduction along with more accurate and timely access to quality information to inform patient care.

We intend to transition to a fully digital quality measure (dQM) landscape, first by transitioning eCQMs to Health Level 7® Fast Healthcare Interoperability Resources® (FHIR®)-based eCQMs, to promote interoperability and increase the value of quality measure data.[511] [512] While we continue to transition our quality measurement infrastructure to dQMs, we are advancing interim improvements by expanding the use of eCQMs in our quality reporting programs. This approach will promote meaningful progress in electronic quality measurement while supporting deliberate, phased conversion to FHIR and dQMs over time. We refer readers to our most recent requests for information on the transition to digital quality measurement (90 FR 36990 through 36996) and on potential FHIR® timelines in the CY 2027 Physician Fee Schedule proposed rule (91 FR 44151 through 44154) for more information.

We refer readers to sections IX.B.1. and IX.D.2.a. of this final rule, where we finalize the adoption of the Advance Care Planning eCQM and the Malnutrition Care Score eCQM, respectively, into the PCH Quality Reporting Program measure set beginning with voluntary reporting for the CY 2028 reporting period/FY 2030 program year followed by a full year of mandatory reporting for the CY 2029 reporting period/FY 2031 program year. The Advance Care Planning eCQM and the Malnutrition Care Score eCQM are the first eCQMs in the PCH Quality Reporting Program, although CMS began providing hospitals with the opportunity to voluntarily submit eCQM data in CY 2013 before required reporting in the Hospital Inpatient Quality Reporting and Medicare Promoting Interoperability Programs in CY 2016. Additionally, eCQMs are used in the Hospital Outpatient Quality Reporting Program, Rural Emergency Hospital (REH) Quality Reporting Program, Merit-Based Incentive Payment System for clinicians, and certain CMS Innovation Center models.

Introducing eCQM reporting in the PCH Quality Reporting Program involves establishing related policies and requirements, including eCQM certification requirements, data standards and formats, submission methods, and other program-specific requirements. In the following sections, we proposed eCQM submission and reporting requirements for the PCH Quality Reporting Program that align with these other programs.

(2) eCQM Reporting and Data Submission Requirements

(a) Certification Requirements for eCQM Reporting

In the FY 2025 IPPS/LTCH PPS final rule (89 FR 69569) and the CY 2025 OPPS/ASC final rule (89 FR 94418 through 94420), we summarized our requirements with respect to using technology meeting the Office of the National Coordinator for Health Information Technology's (ONC) health IT certification criteria for reporting eCQMs in the Hospital Inpatient Quality Reporting Program and the Hospital Outpatient Quality Reporting Program, respectively. In the FY 2027 IPPS/LTCH PPS proposed rule (91 FR 19611), we proposed to adopt similar eCQM certification requirements in the PCH Quality Reporting Program, and to codify them by adding a new paragraph (g) ''Requirements for submission of electronic clinical quality measures (eCQMs) under the PCHQR Program'' to 42 CFR 412.24.

Under this approach, we proposed to codify at § 412.24(g)(1) the requirement for PCHs to utilize health IT certified to the ONC Health IT Certification Program certification criteria, as adopted and updated at 45 CFR 170.315(c), which cover the elements necessary for eCQM reporting under the PCH Quality Reporting Program.

We also proposed to codify at 42 CFR 412.24(g)(2) the requirement that PCHs use the certified health IT described in paragraph (g)(1) to calculate, export, and submit results for the eCQMs available to report under the PCHQR Program. Additionally, we proposed to codify at § 412.24(g)(3) the requirement that PCHs use the eCQM electronic measure specifications for the applicable reporting period available on the eCQI Resource Center website at: *https://ecqi.healthit.gov/* or another website as designated by CMS. Further, consistent with the other programs, we proposed that health IT would not need to be recertified each time the eCQMs' specifications are updated to a more recent version. Under this proposal, this requirement would apply beginning with the CY 2028 reporting period/FY 2030 program year and for subsequent years. Any substantive changes to modernize electronic submission methods would be proposed in future rulemaking.

(b) File Format for eCQM Reporting

When EHRs and health IT systems capture data in standardized formats, the information is represented and interpreted consistently, enabling automated computation without manual interpretation. As described in the FY 2016 IPPS/LTCH PPS final rule (80 FR 49701), these standards are referred to as content exchange standards because the standards detail how data should be represented and the relationships between data elements. This allows the

[509] Office of the National Coordinator for Health IT (May 2024). Interoperable Exchange of Patient Health Information Among U.S. Hospitals: 2023. *Available at: https://www.healthit.gov/data/data-briefs/interoperable-exchange-patient-health-information-among-us-hospitals-2023.*

[510] Centers for Medicare & Medicaid Services. Electronic Clinical Quality Improvement (eCQI) Resource Center. *Available at: https://ecqi.healthit.gov/.*

[511] For more information on dQMs, visit: *https://ecqi.healthit.gov/dqm/about-dqms.*

[512] FHIR® is the registered trademark of Health Level Seven International (HL7), and its use does not constitute endorsement by HL7.

data to be exchanged across EHRs and health IT systems while retaining their meaning. At this time, the Quality Reporting Document Architecture (QRDA) standard is the standard file format used for eCQM submission in CMS quality programs that rely on QRDA-based eCQM reporting. The QRDA standard provides a document format and standard structure to electronically report quality measure data, promotes consistent representation of the data, and enables calculation of eCQM measure results.

To utilize the same file format requirements currently applied in the Hospital Inpatient Quality Reporting Program (85 FR 58940), the Hospital Outpatient Quality Reporting Program (86 FR 63869), the REH Quality Reporting Program (90 FR 53954), and the Medicare Promoting Interoperability Program (80 FR 49706), in the FY 2027 IPPS/LTCH PPS proposed rule (91 FR 19611 through 19612), we proposed comparable file format requirements for the PCH Quality Reporting Program beginning with the CY 2028 reporting period/FY 2030 program year. Specifically, we proposed that a PCH: (1) must submit eCQM data via the QRDA Category I (QRDA I) file format; [513] (2) may use third parties to submit QRDA I files on their behalf; [514] and (3) may either use abstraction or pull the data from non-certified sources in order to then input these data into certified health IT for capture and reporting in the QRDA I file format. We stated under this proposal, we expect QRDA I files to reflect data for one patient per file per quarter with five key elements necessary to identify the file: (1) CCN; (2) CMS Program Name; (3) EHR Patient ID; (4) Reporting period specified in the Reporting Parameters Section; and (5) EHR Submitter ID. For technical guidance in implementing these standards for quality reporting, we referred readers to the QRDA Implementation Guides available at: *https://ecqi.healthit.gov/qrda/versions.*

PCHs could meet the eCQM reporting requirements by submitting data via QRDA I files, submitting a zero-denominator declaration, or submitting a case threshold exemption. In the FY 2027 IPPS/LTCH PPS proposed rule (91 FR 19611 through 19612), we discussed the zero-denominator declaration and case threshold exemptions in the subsequent sections. We also refer readers to section IX.D.5.a. of this final rule where we outline the maintenance of technical specifications including those for eCQMs.

(c) Zero Denominator Declarations

We understand there may be situations in which a PCH does not have data to report on a particular eCQM. Therefore, we proposed that if the PCH's health IT is certified to an eCQM but the PCH does not have patients that meet the denominator criteria of that eCQM, the PCH would submit a zero in the denominator for that eCQM (91 FR 19612). Submission of a zero in the denominator for such an eCQM would qualify as a successful submission for that eCQM.

(d) Case Threshold Exemptions

We understand that in some cases, a PCH may not meet the case threshold of discharges for a particular eCQM to reliably calculate performance on the measure. In the FY 2027 IPPS/LTCH PPS proposed rule (91 FR 19612), we proposed to align with the case threshold exemption policy from the Medicare Promoting Interoperability Program (77 FR 54080), the Hospital Inpatient Quality Reporting Program (79 FR 50323 and 50324), the Hospital Outpatient Quality Reporting Program (86 FR 63869), and the REH Quality Reporting Program (90 FR 53954). As stated for the Hospital Inpatient Quality Reporting Program, the case threshold exemption means that for each quality measure where the minimum number of patients that meet the patient population denominator criteria for the relevant reporting period is not met, a hospital could declare a ''case threshold exemption.'' We proposed a PCH using certified health IT would be exempt from reporting on that eCQM if the PCH has 5 or fewer applicable inpatient encounters or discharges per quarter or 20 or fewer applicable inpatient encounters or discharges per year (Medicare and non-Medicare combined), with applicability defined by specifications for each eCQM's denominator population. Case threshold exemptions would be entered on the Denominator Declaration screen within CMS' Hospital Quality Reporting System available during the submission period. The exemption would not have to be used, and a PCH could report those individual cases if they elect to do so. However, the measure rate would not be publicly reported if below the case threshold. We proposed to adopt the case threshold exemption for the PCH Quality Reporting Program beginning with the CY 2028 reporting period/FY 2030 program year.

(3) Submission Deadlines for eCQM Data

In the FY 2017 IPPS/LTCH PPS final rule (81 FR 57171 through 57172), the Hospital Inpatient Quality Reporting Program aligned its eCQM submission deadline with that of the Medicare Promoting Interoperability Program. The eCQM submission deadline we have established for those two programs is by the end of 2 months following the close of the calendar year reporting period.

To align with these existing programs, in the FY 2027 IPPS/LTCH PPS proposed rule (91 FR 19612), we proposed to require eCQM data submission for the PCH Quality Reporting Program by the end of 2 months following the close of the calendar year for the CY 2028 reporting period/FY 2030 program year and for subsequent years. We believe that by aligning with these existing programs' deadlines we can minimize burden and simplify understanding of the data reporting requirements. For example, although we are modifying our proposal to make the first year of eCQM reporting in the CY 2028 reporting period/FY 2030 program year voluntary for PCHs, a PCH participating in the one-year voluntary reporting period would be required to submit eCQM data to CMS by February 28, 2029, which is the end of 2 months following the close of the calendar year (December 31, 2028). For the CY 2029 reporting period/FY 2031 program year, when mandatory reporting begins, PCHs would be required to submit eCQM data to CMS by February 28, 2030. If this date falls on a weekend or Federal holiday, the submission deadline would be moved to the next business day under established reporting practices.

We invited public comments on these eCQM submission and reporting proposals.

Comment: A few commenters supported CMS' goals of transitioning quality reporting programs, including the PCH Quality Reporting Program, to digital quality measures and aligning requirements across programs if such measures are clinically meaningful, technically feasible, adequately tested, and implemented with appropriate pacing and support. A commenter noted that improved interoperability, digitization, and standardization of health information are essential to advancing optimal care. Another commenter remarked that CMS' proposed requirements focus on a single certification criterion for health IT, which reduces the burden for hospitals

[513] QRDA I is an individual patient-level quality report that contains quality data for one patient for one or more eCQMs. QRDA creates a standard method to report quality measure results in a structured, consistent format and can be used to exchange eCQM data between systems.

[514] The PCH remains responsible for ensuring the data submitted by a third party is true, accurate, and complete.

and avoids having to use solutions and vendors that are certified to other criteria, which may be redundant or unnecessary for participating hospitals.

Response: We thank commenters for their support. We recognize that aligned certification criteria, technical support, and sufficient lead time to establish reporting infrastructure are necessary for PCHs to begin reporting on eCQMs and ultimately reduce burden. As noted in sections IX.B.1 and IX.D.2.a. of this final rule, where we respectively adopt the Advance Care Planning and Malnutrition Care Score eCQMs, we are providing a one-year voluntary reporting period for CY 2028 before mandatory reporting begins with the CY 2029 reporting period/FY 2031 program year. This voluntary period will provide additional time for PCHs to transition to reporting eCQMs while adopting meaningful new measures and modernizing the quality reporting programs over time.

Comment: Commenters requested that CMS provide ample time for the transition to eCQMs and FHIR-based dQMs to ensure hospitals have the technical support to meet these reporting requirements. A commenter stated that introducing eCQMs to the PCH Quality Reporting Program while the broader hospital quality reporting community is moving towards FHIR® is concerning. This commenter recommended that PCHs could transition directly to a FHIR-native framework as they do not carry the legacy QRDA investment and eCQM reporting infrastructure that makes the transition to FHIR costly in other settings.

Response: While we continue to transition our quality measurement infrastructure towards FHIR-based dQMs, we are advancing interim improvements by expanding the use of digital reporting, such as eCQMs, in the quality reporting programs. A focused eCQM approach allows facilities to begin capturing clinically meaningful measures now while laying the groundwork for a future transition to FHIR-based reporting. We also wish to point readers to our request for information on potential FHIR® timelines in the CY 2027 Physician Fee Schedule proposed rule (91 FR 44151 through 44154).

After consideration of the public comments we received, we are finalizing the proposals related to the certification requirements for eCQM reporting, file format for EHR data, zero denominator declarations, case threshold exemptions, and submission deadlines as proposed.

c. Review and Corrections Period for eCQM Data Submitted to the PCH Quality Reporting Program

In alignment with the Hospital Outpatient Quality Reporting Program (86 FR 63870), in the FY 2027 IPPS/LTCH PPS proposed rule (91 FR 19612), we proposed a review and corrections period for eCQM data which would run concurrently with the data submission period. The review and corrections period is from the time the submission period opens to the submission deadline. In the Hospital Quality Reporting System, providers can submit QRDA Category I test and production data files and can correct QRDA Category I test and production data files before production data are submitted for final reporting. We encourage early testing and the use of pre-submission testing tools to reduce errors and inaccurate data submissions in eCQM reporting. The Hospital Quality Reporting System does not allow data to be submitted or corrected after the annual deadline. We refer readers to the Hospital Quality Reporting System website (available at: *https://hqr.cms.gov/hqrng/support*), the eCQI Resource Center (available at: *https://ecqi.healthit.gov/*), and the CMS QualityNet website (*https://qualitynet.cms.gov/pch/public-reporting*) for more resources on eCQM reporting, submission deadlines, and program notifications for the PCH Quality Reporting Program.

We invited public comments on our proposal.

We did not receive public comments on this proposal; therefore, we are finalizing the review and corrections period for eCQM data as proposed.

E. Changes to the Long-Term Care Hospital Quality Reporting Program (LTCH QRP)

1. Background and Statutory Authority

The Long-Term Care Hospital Quality Reporting Program (LTCH QRP) is authorized by section 1886(m)(5) of the Act, and it applies to all hospitals certified by Medicare as long-term care hospitals (LTCHs). Section 1886(m)(5)(C) of the Act requires LTCHs to submit to the Secretary data on quality measures specified under section 1886(m)(5)(D) in a form and manner, and at a time, specified by the Secretary. In addition, section 1886(m)(5)(F) of the Act requires LTCHs to submit data on quality measures under section 1899B(c)(1) of the Act, resource use or other measures under section 1899B(d)(1) of the Act, and standardized patient assessment data required under section 1899B(b)(1) of the Act. LTCHs must submit the data required under section 1886(m)(5)(F) of the Act in the form and manner, and at the time, specified by the Secretary. Section 1886(m)(5)(A) of the Act requires the Secretary to reduce by 2 percentage points the annual update to the LTCH PPS standard Federal rate for discharges for an LTCH during a fiscal year if the LTCH has not submitted data to the Secretary in accordance with the LTCH QRP requirements specified for that fiscal year. Section 1890A of the Act requires that the Secretary establish and follow a pre-rulemaking process, in coordination with the consensus-based entity (CBE) with a contract under section 1890(a) of the Act, to solicit input from certain groups regarding the selection of quality and efficiency measures for the LTCH QRP. We have codified our program requirements in our regulations at 42 CFR 412.560.

In this final rule, we finalize the removal of two measures, specifically the COVID–19 Vaccination Coverage Among Healthcare Personnel (HCP) measure and the COVID–19 Vaccine: Percent of Patients/Residents Who Are Up to Date measure, beginning with the FY 2028 LTCH QRP as described in sections IX.E.3. and IX.E.4. of this final rule. In section IX.E.6.b, of this final rule, we also finalize our proposal to revise the LTCH QRP Data Submission Deadlines beginning with the FY 2029 LTCH QRP. We also provide a summary of public comments received on our Request for Information (RFI) on future measure concepts for the LTCH QRP in section IX.E.5 of this final rule.

2. General Considerations Used for the Selection of Measures for the LTCH QRP—Quality Measures Currently Adopted for the LTCH QRP

For a detailed discussion of the considerations we use for the selection of LTCH QRP quality, resource use, and other measures, we refer readers to the FY 2016 Inpatient Prospective Payment System (IPPS)/LTCH PPS final rule (*80 FR 49728*). The LTCH QRP currently has 18 adopted measures, which are set out in Table IX.E.–01. We did not propose to adopt any new measures for the LTCH QRP.

For a discussion of the factors we use to evaluate whether a measure should be removed from the LTCH QRP, we refer readers to the FY 2019 IPPS/LTCH PPS final rule (*83 FR 41624* through *41634*) and to the regulations at § 412.560(b)(3).

TABLE IX.E.-01: QUALITY MEASURES CURRENTLY ADOPTED FOR THE LTCH QRP

Short Name	Measure Name & Data Source
LTCH CARE Data Set	
Pressure Ulcer/Injury	Changes in Skin Integrity Post-Acute Care: Pressure Ulcer/Injury
Application of Falls	Application of Percent of Residents Experiencing One or More Falls with Major Injury (Long Stay)
Change in Mobility	Functional Outcome Measure: Change in Mobility Among Long-Term Care Hospital (LTCH) Patients requiring ventilator support
DRR	Drug Regimen Review Conducted with Follow-Up for Identified Issues–Post Acute Care (PAC) Long-Term Care Hospital (LTCH) Quality Reporting Program (QRP)
Compliance with SBT	Compliance with Spontaneous Breathing Trial (SBT) by Day 2 of the LTCH Stay
Ventilator Liberation	Ventilator Liberation Rate
TOH-Provider	Transfer of Health Information to the Provider Post-Acute Care (PAC)
TOH-Patient	Transfer of Health Information to the Patient Post-Acute Care (PAC)
DC Function	Discharge Function Score
Patient/Resident COVID-19 Vaccine	COVID-19 Vaccine: Percent of Patients/Residents Who Are Up to Date
National Healthcare Safety Network (NHSN)	
CAUTI	National Healthcare Safety Network (NHSN) Catheter-Associated Urinary Tract Infection (CAUTI) Outcome Measure
CLABSI	National Healthcare Safety Network (NHSN) Central-Line associated Bloodstream Infection (CLABSI) Outcome Measure
CDI	National Healthcare Safety Network (NHSN) Facility-wide Inpatient Hospital-onset *Clostridium difficile* Infection (CDI) Outcome Measure
HCP Influenza Vaccine	Influenza Vaccination Coverage among Healthcare Personnel (HCP)
HCP COVID-19 Vaccine	COVID-19 Vaccination Coverage among Healthcare Personnel (HCP)
Claims-Based	
MSPB LTCH	Medicare Spending Per Beneficiary (MSPB)–Post Acute Care (PAC) Long-Term Care Hospital (LTCH) Quality Reporting Program (QRP)
DTC	Discharge to Community– Post Acute Care (PAC) Long-Term Care Hospital (LTCH) Quality Reporting Program (QRP)
PPR	Potentially Preventable 30-Day Post-Discharge Readmission Measure for Long-Term Care Hospital (LTCH) Quality Reporting Program (QRP)

3. Removal of the COVID–19 Vaccination Coverage Among Healthcare Personnel (HCP) Measure Beginning With the FY 2028 LTCH QRP

We refer readers to the FY 2022 IPPS/LTCH PPS final rule where we adopted the COVID–19 Vaccination Coverage among HCP measure (HCP COVID–19 Vaccine measure) into the LTCH QRP (*86 FR 45438* through *45446*) and the FY 2024 LTCH PPS final rule where we modified the HCP COVID–19 Vaccine measure to account for updated COVID–19 vaccine guidance (*88 FR 59138* through *59144*). The HCP COVID–19 Vaccine measure requires LTCHs to report the COVID–19 vaccination status of HCP through the National Healthcare Safety Network (NHSN). LTCHs must collect current vaccination status for all employees, licensed independent practitioners, adult trainees, students, and volunteers, as well as certain contract personnel one week out of each month and report these data on a quarterly basis (*88 FR 59139*).

We proposed to remove the HCP COVID–19 Vaccine measure beginning with the FY 2028 LTCH QRP under measure removal factor 3: a measure does not align with current clinical guidelines or practice (§ 412.560(b)(3)(iii)). When we originally adopted this measure, the United States was in the midst of a Public Health Emergency (PHE) with millions of COVID–19 cases and over 550,000 COVID–19 deaths (*88 FR 59138* and *59139*). In March 2021, when this measure was being proposed, the United States was averaging over 5,000 deaths per week. In April 2023, the last full month of the PHE, the weekly number of deaths due to COVID–19 averaged around 1,300.[515] While preventing the spread of COVID–19 remains a public health goal, the PHE ended on May 11, 2023,[516] and the COVID–19 death rate has continued to decrease. At the time of the proposed rule, weekly number of deaths attributed to COVID–19 during the 6-month period from the weeks ending 8/2/25 through 1/31/26 ranged from 188 to 488.[517] Since the publication of the proposed rule more recent data show that the weekly number of deaths attributed to COVID–19 ranged from 16 to 172 during the period from the week ending in 4/4/26 through the week ending in 6/20/26.[518]

With the end of the PHE and decrease in COVID–19 deaths, we believed the continued costs and burden to LTCHs of reporting on this measure outweighed the benefit of continued information collection on the HCP COVID–19 Vaccine measure in several settings. We have already removed this measure from the Hospital Inpatient Quality Reporting Program (*90 FR 37010* through *37012*), the Inpatient Psychiatric Facility Quality Reporting Program (*90 FR 37657* through *37658*), the Ambulatory Surgical Center Quality Reporting (*90 FR 53917* through *53919*), the Hospital

[516] *https://www.hhs.gov/coronavirus/covid-19-public-health-emergency/index.html.*

[517] Provisional COVID–19 Mortality Surveillance *https://www.cdc.gov/nchs/nvss/vsrr/covid19/.*

[518] Provisional COVID–19 Mortality Surveillance *https://www.cdc.gov/nchs/nvss/vsrr/covid19/.*

Outpatient Quality Reporting Programs (*90 FR 53917* through *53919*), and the Inpatient Rehabilitation Facility Quality Reporting Program (IRF QRP) (*90 FR 37700* through *37702*).

Since the end of the PHE, the CDC's clinical recommendations for COVID–19 vaccination have changed. In December 2020, the CDC's Advisory Committee on Immunization Practices (ACIP) recommended that HCP should receive a complete vaccination course.[519] At the time the HCP COVID–19 Vaccine measure was adopted in August 2021, vaccination was a critical part of the nation's strategy to effectively counter the spread of COVID–19 in an effort to restore societal functioning.[520] There were well-defined parameters for receiving the COVID–19 vaccination intended to capture routine, catch-up, and risk-based immunization recommendations.

However, these parameters no longer apply, due to evolving circumstances. The latest CDC COVID–19 vaccination recommendations for the 2025–2026 vaccine schedule recommendations, at the time of the proposed rule, were based on shared clinical decision-making (also known as individual-based decision-making).[521] For shared clinical decision-making, there is not a default decision to vaccinate for a defined population.[522] Given that there is no single default recommendation to vaccinate a defined population, both receipt and nonreceipt of vaccination may be consistent with the application of shared clinical decision-making. This differs from the guidance in place when this measure was finalized.

On this basis, we proposed to remove the measure from the LTCH QRP under removal factor 3, a measure does not align with current clinical guidelines or practice.

We proposed that LTCHs would not be required to report CY 2026 HCP COVID–19 Vaccine measure data for purposes of the FY 2028 payment determination (that is, LTCHs that do not report CY 2026 HCP COVID–19 vaccine measure data will not be penalized for FY 2028 annual payment update under the LTCH QRP). Any CY 2026 HCP COVID–19 vaccine data received by CMS will not be used for LTCH QRP compliance or public reporting.

We invited public comment on our proposal to remove the COVID–19 Vaccination Coverage among Healthcare Personnel measure from the LTCH QRP beginning with the FY 2028 LTCH QRP.

Comment: Several commenters supported CMS's proposal to remove the COVID–19 Vaccination Coverage among Healthcare Personnel (HCP) measure from the LTCH QRP and recommended that CMS finalize removal of the measure. Many commenters who supported removal of the measure expressed views similar to those submitted regarding the COVID–19 Vaccine: Percent of Patients/Residents Who Are Up to Date measure, which we describe in section IX.E.4 of this final rule. Several commenters stated that the measure no longer aligns with current clinical guidelines and practice following the end of the COVID–19 PHE.

Some of these commenters stated that declining COVID–19 severity and mortality, evolving vaccination recommendations, changing definitions of vaccination status, the transition to an endemic phase of COVID–19, and the shift toward shared clinical decision-making reflected in recent federal guidance have reduced the measure's utility and relevance as a standardized quality measure. These commenters further stated that these changes mean the measure no longer aligns with current clinical guidelines or practice. Commenters also supported the proposal because they believed the burden associated with collecting, tracking, and reporting HCP COVID–19 vaccination data outweighs the value of continued data collection in the current environment. Commenters noted ongoing staffing shortages, workforce challenges, and increasing operational costs and stated that resources devoted to reporting could be redirected toward patient care and other infection prevention activities.

Other commenters supported the proposal because removal of the measure would align the LTCH QRP with other CMS quality reporting programs that have already removed similar COVID–19 vaccination measures. Commenters stated that alignment with other CMS quality reporting programs would promote consistency across quality reporting programs and reduce unnecessary reporting requirements.

Several commenters emphasized that their support for removing the measure should not be interpreted as reduced support for vaccination, infection prevention activities, or public health surveillance efforts. These commenters continued to support vaccination of healthcare personnel and patients, ongoing infection prevention practices, and the maintenance of appropriate infectious disease surveillance infrastructure.

Response: We thank the commenters for their support, and we understand that the clinical guidance has changed since the measure was first adopted and that there is confusion over the current recommendations and their applicability to HCP. When the current measure was adopted, guidance recommended routine vaccination to remain ''up to date,'' which was then revised for the 2025–2026 COVID–19 vaccination schedule based on shared clinical decision-making, also known as individual-based decision-making.[523]

Unlike routine catch-up, and risk-based recommendations, individual-based decision-making does not establish a default recommendation to vaccinate. Instead, the decision is made on an individual basis and may consider the available evidence, the individual's characteristics and preferences, the health care provider's clinical judgment, and the characteristics of the vaccine. Under this framework, both receipt and nonreceipt of vaccination may be consistent with current clinical guidance.[524] We acknowledge commenters' comments about support for vaccination, infection prevention activities, or public health surveillance efforts. We acknowledge commenters' concerns regarding the burden associated with collecting and reporting data for the measure and recognize that removal of the measure will reduce reporting burden for LTCHs. However, our decision is based on our determination that the measure no longer aligns with current clinical guidelines and practice. We note that LTCHs remain subject to the infection prevention and control and antibiotic stewardship program requirements at § 482.42. Finalizing removal of this measure does not alter LTCH responsibilities under these requirements.

---

[524] ACIP Shared Clinical Decision-Making Recommendations. *https://www.cdc.gov/acip/vaccine-recommendations/shared-clinical-decision-making.html.*

Comment: A few commenters opposed the proposal to remove the COVID–19 Vaccination Coverage among Healthcare Personnel (HCP) measure from the LTCH QRP and recommended that CMS retain the measure. Some of these commenters stated that LTCHs serve medically complex patients with prolonged lengths of stay, serious underlying illnesses, immunocompromising conditions, and other characteristics that place them at increased risk of severe COVID–19 outcomes. These commenters stated that continued visibility into HCP vaccination coverage remains important for infection prevention, outbreak mitigation, patient safety, and protection of vulnerable LTCH patients. Commenters suggested that removing the measure could reduce CMS's ability to monitor and encourage protection of these high-risk populations.

Response: We acknowledge commenters' concerns regarding the unique characteristics of LTCH patient populations and agree that LTCHs serve medically complex patients, including patients with prolonged lengths of stay, serious underlying illnesses, immunocompromising conditions, and other factors that may place them at increased risk of severe COVID–19 outcomes. We also agree that preventing the spread of COVID–19 and protecting vulnerable patients remain important goals. However, CMS proposed removal of the measure under measure removal factor 3 because the measure no longer aligns with current clinical guidelines and practice. As discussed in the proposed rule, CDC recommendations for the 2025–2026 vaccination recommendations were based on shared clinical decision-making at the time of publication, meaning there is no longer a single default recommendation to vaccinate a defined population.[525] Under this framework, both receipt and nonreceipt of vaccination may be consistent with current clinical guidance. As a result, the measure is less useful for interpreting HCP vaccination status because an HCP may be considered up to date under this guidance without receiving an updated COVID–19 vaccine. Because the measure was adopted in a different clinical environment characterized by broadly applicable vaccination recommendations, we continue to believe that the measure no longer aligns with current clinical guidelines and practice. Removal of the measure from the LTCH QRP does not preclude LTCHs from establishing their own policies and practices related to COVID–19 vaccination or from continuing to monitor vaccination status consistent with current clinical guidance. Rather, the measure will no longer be required for purposes of the LTCH QRP. We acknowledge commenters' concerns that removing the measure could reduce CMS's ability to monitor high-risk populations. However, CMS continues to monitor quality and safety trends affecting LTCH patients, and we continue to believe that the measure no longer aligns with current clinical guidelines and practice.

Comment: Several commenters stated that HCP vaccination remains an important infection prevention strategy that helps protect patients, healthcare personnel, and visitors from COVID–19 and other vaccine-preventable diseases. Several commenters stated that healthcare personnel vaccination helps reduce disease transmission, supports patient safety efforts, and may reduce workforce absenteeism. Some commenters further stated that continued measurement and public reporting of vaccination rates promote accountability, transparency, and ongoing vaccination efforts among healthcare personnel. These commenters suggested that removing the measure could reduce attention to vaccination efforts and diminish incentives for maintaining high vaccination coverage among healthcare personnel.

Response: We acknowledge commenters' views that continued measurement and public reporting of HCP vaccination rates may promote accountability, transparency, vaccination uptake, infection prevention efforts, and workforce protection. While we recognize these potential benefits, we believe that the measure conflicts with current clinical guidance. We also acknowledge commenters' concerns that removal of the measure could reduce attention to vaccination efforts. The purpose of this proposal is not to assess the value of vaccination or infection prevention activities, but rather to evaluate whether the measure continues to be appropriate for inclusion in the LTCH QRP. As previously stated, when this measure was adopted in the LTCH QRP, COVID–19 vaccination recommendations provided specific clinical guidelines for assessing whether individuals were up to date with vaccination; in light of evolving clinical guidance, the measure no longer provides clear information on whether HCP have been vaccinated and is no longer is appropriate for inclusion in LTCH QRP.

Comment: Several commenters questioned whether alignment with other CMS quality reporting programs is an appropriate basis for removing the measure from the LTCH QRP. These commenters stated that the unique characteristics of LTCH patient populations warrant continued measurement of healthcare personnel vaccination coverage and suggested that alignment with other quality reporting programs should not outweigh clinical considerations specific to LTCH settings.

Response: We acknowledge commenters' concerns and agree that alignment with other CMS quality reporting programs should not, by itself, justify removal of the measure. While we note that similar COVID–19 vaccination measures have been removed from other CMS quality reporting programs, our decision to finalize removal of this measure is based on measure removal factor 3 that the measure no longer aligns with current clinical guidelines and practice.

After consideration of the public comments we received, we are finalizing our proposal to remove the COVID–19 Vaccination Coverage Among Healthcare Personnel (HCP) Measure beginning with the FY 2028 LTCH QRP without modification.

4. Removal of the COVID–19 Vaccine: Percent of Patients/Residents Who Are Up to Date Measure Beginning With the FY 2028 LTCH QRP

We refer readers to the FY 2024 IPPS/LTCH PPS final rule (*88 FR 59243* through *59250*), where we finalized the COVID–19 Vaccine: Percent of Patients/Residents Who Are Up to Date (Patient/Resident COVID–19 Vaccine) measure for the FY 2026 LTCH QRP. The measure is an assessment-based process measure that reports the percent of stays in which patients in an LTCH are up to date on their COVID–19 vaccinations per the CDC's latest guidance. In the FY 2026 LTCH PPS final rule (*90 FR 37033* through *90 FR 37034*), we finalized a modification to the reporting requirements for this measure to exclude patients who expired in the LTCH beginning with the FY 2028 LTCH QRP.

We proposed to remove the Patient/Resident COVID–19 Vaccine measure from the LTCH QRP beginning with the FY 2028 LTCH QRP under removal factor 3: a measure does not align with current clinical guidelines or practice (§ 412.560(b)(3)(iii)).

When we originally adopted the Patient/Resident COVID–19 Vaccine

[525] ACIP Shared Clinical Decision-Making Recommendations | ACIP | CDC *https://www.cdc.gov/acip/vaccine-recommendations/shared-clinical-decision-making.html.*

measure, COVID–19 continued to be a major challenge for LTCHs, with older adults at a significantly higher risk of mortality, severe disease, and death following infection (*88 FR 59243* and *59244*). In August 2023, when this measure was adopted, CDC COVID–19 vaccination guidance emphasized population-level vaccination expectations for older adults and other high-risk groups, and the evidence base focused on demonstrating broad protective benefit at the population level, as described in the FY 2024 IPPS/LTCH PPS final rule (*88 FR 59244*). CDC data at that time showed that, among adults aged 50 years and older, individuals who had received a primary vaccination series and booster dose experienced significantly lower risks of COVID–19-related hospitalization and death compared to those who were unvaccinated, and that additional booster doses, including bivalent booster formulations, further reduced the risk of severe outcomes, including hospitalization and death, in the context of emerging variants (*88 FR 59244*). These data supported an infection prevention framework under which being ''up to date'' with COVID–19 vaccination was treated as a broadly applicable expectation for high-risk populations and therefore appropriate for monitoring through a facility-level quality measure.

At the time the Patient/Resident COVID–19 Vaccine measure was adopted, it was intended to capture routine, catch-up, and risk-based immunization recommendations. Due to evolving circumstances, the latest CDC COVID–19 vaccination recommendations for the 2025–2026 vaccination recommendations were based on shared clinical decision-making (also known as individual-based decision-making).[526] For shared clinical decision-making, there is not a default decision to vaccinate for a defined population.[527] Given that there is no single default recommendation to vaccinate a defined population, both vaccination and non-vaccination may be consistent with application of shared clinical decision-making. This differs from the guidance in place when this measure was finalized.

When there were more narrow parameters for receiving the COVID–19 vaccination, the Patient/Resident COVID–19 Vaccine measure promoted consumer transparency and choice by giving consumers clear information on the number of patients in an LTCH who were vaccinated. However, these parameters no longer apply in light of current CDC clinical guidance that recommends shared clinical decision-making for COVID–19 vaccination decisions. As a result, both vaccination and non-vaccination may reflect an ''up to date'' status using the guidance of shared clinical decision-making, and the Patient/Resident COVID–19 Vaccine measure may no longer provide information on the prevalence of COVID–19 vaccination in the LTCH setting. On this basis, we proposed to remove the measure from the LTCH QRP under removal factor 3: a measure does not align with current clinical guidelines or practice.

Removing this measure will bring LTCH in to alignment with other post-acute care settings since we have already removed this measure from the Home Health Quality Reporting Program (HH QRP) (*90 FR 55416* through *55418*) and the Inpatient Rehabilitation Facility Quality Reporting Program (IRF QRP) (*90 FR 37702* through *37704*).

We proposed that beginning with patients discharged on or after October 1, 2026, LTCHs would no longer be required to collect and submit the Patient/Resident COVID–19 Vaccine measure data to CMS. We also proposed to remove the Patient's COVID–19 vaccination is up to date data element (O0350) from the LTCH Continuity Assessment Record and Evaluation (CARE) Data Set (LCDS) as of October 1, 2028, since it is not technically feasible to remove this data element earlier. However, this data element will become voluntary and LTCHs will not be required to collect and submit Patient/Resident COVID–19 Vaccine data beginning with patients discharged on or after October 1, 2026 (FY2028 LTCH QRP, payment determination year).

We invited public comment on our proposal to remove the COVID–19 Vaccine: Percent of Patients/Residents Who Are Up to Date measure from the LTCH QRP beginning with the FY 2028 LTCH QRP.

Comment: Several commenters supported CMS's proposal to remove the COVID–19 Vaccine: Percent of Patients/Residents Who Are Up to Date measure from the LTCH QRP and recommended that CMS finalize removal of the measure. Many commenters who supported removal of the measure expressed views similar to those submitted regarding the COVID–19 Vaccination Coverage among Healthcare Personnel measure. Some commenters stated that the measure no longer aligns with current clinical guidelines and practice following the end of the COVID–19 PHE. Commenters stated that declining COVID–19 severity and mortality, evolving vaccination recommendations, the end of the COVID–19 PHE, and changes in the clinical environment have reduced the measure's utility and relevance as a standardized quality measure. Some commenters further stated that these changes mean the measure no longer represents a meaningful indicator of LTCH quality or quality performance.

Several commenters also stated that the burden associated with collecting, tracking, and reporting patient COVID–19 vaccination data outweighs the value of continued data collection in the current environment. Commenters stated that LTCHs continue to face staffing shortages, workforce challenges, and increasing operational costs and suggested that resources devoted to reporting could be redirected toward patient care and other infection prevention activities.

Several commenters further stated that removing the measure would align the LTCH QRP with other CMS quality reporting programs that have already removed similar COVID–19 vaccination measures. These commenters stated that such alignment would promote consistency across CMS quality reporting programs and reduce unnecessary reporting requirements.

Several commenters also emphasized that their support for removing the measure should not be interpreted as reduced support for vaccination, infection prevention activities, or public health surveillance efforts and continued to support vaccination of patients and healthcare personnel, infection prevention practices, and surveillance infrastructure.

Response: We thank the commenters for their support, and we understand that the clinical guidance has changed since the measure was first adopted and that there is confusion over the current recommendations and their applicability to Patients. When the current measure was adopted, guidance recommended routine vaccination to remain ''up to date,'' which was then revised for the 2025–2026 COVID–19 vaccination schedule based on shared clinical decision-making, also known as individual-based decision-making.[528] At the time of publication of the proposed rule, the definition of ''up to date'' with respect to 2025–2026 COVID–19 vaccination was based on shared

[526] 2025–2026 COVID–19 Vaccination Guidance 2025–2026 COVID–19 Vaccination Guidance | Covid | CDC.

[528] Centers for Disease Control and Prevention. Staying Up to Date with COVID–19 Vaccines. *Available at: https://www.cdc.gov/covid/vaccines/stay-up-to-date.html.*

clinical decision-making, also known as individual-based decision-making.[529] Unlike routine catch-up, and risk-based recommendations, individual-based decision-making does not establish a default recommendation to vaccinate. Instead, the decision is made on an individual basis and may consider the available evidence, the individual's characteristics and preferences, the health care provider's clinical judgment, and the characteristics of the vaccine. Under this framework, both receipt and nonreceipt of vaccination may be consistent with current clinical guidance.[530] As discussed in the proposed rule, we continue to believe the measure no longer aligns with current clinical guidelines under measure removal factor 3.

We acknowledge commenters' observations regarding the burden associated with collecting, tracking, and reporting patient COVID–19 vaccination data, as well as commenters' support for aligning the LTCH QRP with other CMS quality reporting programs that have removed similar COVID–19 vaccination measures. While we considered these factors, our decision is based on our determination that the measure no longer aligns with current clinical guidelines and practice.

We also acknowledge commenters' continued support for vaccination, infection prevention activities, and public health surveillance efforts. We note that LTCHs remain subject to the infection prevention and control and antibiotic stewardship program requirements at § 482.42. Finalizing removal of this measure does not alter LTCH responsibilities under these requirements.

Comment: Several commenters opposed CMS's proposal to remove the COVID–19 Vaccine: Percent of Patients/Residents Who Are Up to Date measure from the LTCH QRP and recommended that CMS retain the measure. Several commenters stated that LTCHs serve medically complex, medically fragile, and high-risk patient populations that remain vulnerable to severe COVID–19 outcomes, including serious illness, hospitalization, and death. These commenters stated that vaccination remains an important tool for protecting LTCH patients and suggested that continued measurement of patient vaccination status remains important for protecting vulnerable populations and supporting infection prevention efforts.

Response: We acknowledge commenters' concerns regarding the vulnerability of LTCH patient populations and agree that LTCHs serve medically complex patients, including older adults and patients with serious underlying illnesses increasing their risk of severe COVID–19 outcomes. However, the basis for this proposal is not a determination that COVID–19 is no longer clinically important or that vaccination is no longer beneficial. Rather, we proposed removal of the measure under measure removal factor 3 because the measure no longer aligns with current clinical guidelines and practice. We note that LTCHs may continue to monitor COVID–19 vaccination practices within their facilities and support vaccination decisions consistent with current clinical guidance and shared clinical decision-making.

Comment: A few commenters disagreed with CMS's determination that the measure no longer aligns with current clinical guidelines and practice. These commenters stated that current vaccination recommendations continue to support vaccination for populations commonly served in LTCH settings and suggested that the measure remains consistent with current clinical guidance. A commenter opposed removing the measure and cited ongoing changes to the CDC guidelines as a reason to retain this measure.

Some commenters further stated that changes in vaccination recommendations and the use of shared clinical decision-making do not diminish the value of measuring and reporting patient vaccination status. These commenters suggested that the measure continues to provide meaningful information regarding patient vaccination coverage and questioned whether shared clinical decision-making supports removal of the measure.

Response: We acknowledge commenters' views regarding current COVID–19 vaccination recommendations and their concerns that vaccination may continue to be recommended or appropriate for many patients commonly served in LTCH settings. We also acknowledge commenters' references to recent revisions to the CDC's COVID–19 vaccine recommendations. However, our proposal was based on the overall framework of current COVID–19 vaccination recommendations and the extent to which the measure continues to align with current clinical guidelines and practice. When we originally proposed this measure (*88 FR 59243* through *59250*), it was intended to capture routine, catch-up, and risk-based immunization recommendations. As discussed in the proposed rule, current COVID–19 vaccination recommendations are based on shared clinical decision-making, meaning there is no longer a single default recommendation to vaccinate a defined population. Under this framework, both receipt and nonreceipt of vaccination may be consistent with current clinical guidance.

We also acknowledge commenters' views that changes in vaccination recommendations and the use of shared clinical decision-making do not diminish the value of measuring and reporting patient vaccination status. However, because the measure assesses whether patients are ''up to date'' with COVID–19 vaccination, the evolving recommendation framework may create uncertainty in interpreting the measure for standardized quality reporting purposes. Because current clinical guidance specifies vaccination decisions are based on individual clinical circumstances and shared clinical decision-making rather than a broadly applicable recommendation for a defined population, the measure no longer aligns with current clinical guidelines and practice.[531]

Comment: Several commenters stated that the measure supports accountability, monitoring, and ongoing vaccination efforts and suggested that continued measurement of patient vaccination status remains important for encouraging vaccination uptake and maintaining attention to COVID–19 prevention efforts.

Response: We acknowledge commenters' views that continued measurement of patient vaccination status may support monitoring, accountability, and ongoing vaccination efforts. However, the purpose of this proposal is not to assess the value of vaccination or infection prevention activities generally, but rather to evaluate whether the measure continues to meet the criteria for inclusion in the LTCH QRP. For the reasons discussed in the proposed rule, including that public reporting of the measure may no longer provide information on the prevalence of COVID–19 vaccination in the LTCH setting (*91 FR 19614 and 19615*), the measure no longer aligns with current clinical guidelines and practice.

After consideration of the public comments we received, we are finalizing this proposal without modification.

5. LTCH QRP Measure Concepts Under Consideration for Future Years—Request for Information (RFI)

In the FY 2024 IPPS/LTCH PPS proposed rule (*88 FR 27150* through *27153*), we included a request for information (RFI) on a set of principles for selecting and prioritizing LTCH QRP measures, identifying measurement gaps and suitable measures for filling these gaps. We refer readers to the FY 2024 IPPS/LTCH PPS final rule (*88 FR 59250* and *59251*) for a summary of the public comments we received in response to the RFI.

We sought input on the importance, relevance, appropriateness, and applicability of the quality measure concept of advanced care planning for future years in the LTCH QRP. Advance care planning is a continuous process that supports people in understanding and communicating their goals, values, and preferences regarding future medical decisions.[532] The Patient Self Determination Act of 1990[533] supports this process by requiring healthcare facilities to inform patients of their rights regarding medical decisions, including advance directives and end of life care.[534] In post-acute care (PAC) settings, where patients recover from acute illness, injury, or major procedures, their needs and goals may evolve as their condition changes. Factors such as clinical stability, functional status, therapy tolerance, cognition function, prognosis, and personal preferences can all shift during recovery. Regular reassessment and transparent communication are essential to maintaining person-centered care, while advance care planning facilitates shared decision-making by documenting patient preferences and ensuring goal-concordant care throughout care transitions.[535]

As we review new measure concepts, we will prioritize evidence-based outcome measures that promote person-centered care practices.

The following is a summary of the public comments received on the RFI regarding the relevant aspects of advanced care planning and measures appropriate for the LTCH setting, along with our responses.

Comments: We received several comments in support of this measure concept in the LTCH QRP. A commenter appreciated that it would allow patients to have a bigger role in making medical decisions. A commenter supported the measure concept but recommended that CMS not implement a ''check box'' process measure.

CMS received several comments with recommendations for advance care planning measure specification and development. A commenter encouraged CMS to consider the role of health care agents and surrogate medical decision-makers in measure development. A few commenters recommended reporting the measure via the LCDS instead of extracting it from EHR. Other commenters stated that the measure should comply with individual state requirements and include an exception or guidance for religious or cultural refusal of these discussions. A few commenters suggested pilot testing of a potential measure in the LTCH setting. A commenter recommended that a measure should be accessible across care settings and should measure not only the presence of documentation but integration of the discussions into care workflows. A commenter recommended that the measure information be shared with advance directive registries.

A few commenters had concerns about the measure in the LTCH setting due to the clinical instability of many patients. A commenter stated that LTCH patients on medical ventilation or with cognitive impairments may be unable to participate in the advance care planning process. Another commenter did not believe that LTCHs are the appropriate accountable entity for this measure and had concerns about patient stigma associated with these discussions.

Comment: In addition to comments received on the measure concept of advance care planning, we also received comments on other future measure concepts, including patient reported outcome measures, patient-specific goal attainment, successful care transitions, and sepsis.

Response: We thank all the commenters for responding to this RFI. While we are not responding to specific comments in response to the RFI in this final rule, we will take this feedback into consideration for our future measure development efforts for the LTCH QRP.

6. Form, Manner, and Timing of Data Submission Under the LTCH QRP

a. Background

We refer readers to the regulatory text at § 412.560(b) for information regarding the current policies for reporting specified data for the LTCH QRP.

b. Revision of LTCH QRP Data Submission Deadlines Beginning With the FY 2029 LTCH QRP

(1) Background

Sections 1886(m)(5)(E), 1899B(f) and 1899B(g) of the Act require CMS to provide feedback to LTCHs and to publicly report their performance on quality and other measures specified under the LTCH QRP. More specifically, section 1899B(f)(1) of the Act requires the Secretary to provide confidential feedback reports to LTCHs on their performance on the quality, resource use, and other measures specified for the LTCH QRP. Section 1899B(f)(2) of the Act provides that, to the extent feasible, the Secretary must make these confidential feedback reports available not less frequently than on a quarterly basis, except in the case of measures reported on an annual basis, in which case the confidential feedback reports may be made available annually. Additionally, sections 1886(m)(5) and 1899B(g)(1) of the Act require the Secretary to provide for the public reporting of each LTCH's performance on the measures specified for the LTCH QRP by establishing procedures for making the performance data available to the public. Sections 1886(m)(5)(E) and 1899B(g)(2) of the Act specifically require that such procedures must ensure that LTCHs can review the data and other information before it is made public.

For LCDS assessment-based measures, in the FY 2013 IPPS/LTCH PPS final rule (*77 FR 53636* and *53637*), we finalized submission deadlines for LTCHs to submit data quarterly for each of the finalized measures in the FY 2013 rule, requiring LTCHs to submit data collected during each quarter for the FY 2015 payment determination approximately 4.5 months (135 days) after the end of the quarter. We also finalized in the FY 2013 rule that LTCHs would have a shorter data submission timeframe for each of the measures for the FY 2016 payment determination. Specifically, for each quarter in which data was collected for the FY 2016 payment determination, we finalized submission deadlines that were approximately 45 days after the

[533] Public Law 101–508, sections 4206, 4751.

[534] *https://www.congress.gov/bill/101st-congress/house-bill/5835.*

[535] McMahan RD, Tellez I, Sudore RL. Deconstructing the Complexities of Advance Care Planning Outcomes: What Do We Know and Where Do We Go? A Scoping Review. J Am Geriatr Soc. 2021 Jan;69(1):234–244. doi: 10.1111/jgs.16801. Epub 2020 Sep 7. PMID: 32894787; PMCID: PMC7856112.

end of each quarter (*77 FR 53636* and *53637*). However, in the FY 2016 IPPS/LTCH PPS final rule (*80 FR 49749* through *49751*), we finalized a requirement that LTCHs submit data within 4.5 months of the end of each calendar quarter, beginning with the FY 2017 LTCH QRP, unless otherwise specified for a measure. We proposed and finalized this modification to the LTCH QRP data submission deadlines to align with the Inpatient Rehabilitation Facility Quality Reporting Program (IRF QRP) and Hospital Inpatient Quality Reporting (IQR) Program (*80 FR 49749* through *49751*).

We also finalized data submission deadlines for LTCH QRP measures that are submitted via the Centers for Disease Control and Prevention's (CDC) National Healthcare Safety Network (NHSN). In the FY 2014 IPPS/LTCH PPS final rule (*78 FR 50882*), we finalized that for the NHSN Catheter Associated Urinary Tract Infection (CAUTI), the NHSN Central Line-Associated Bloodstream Infection (CLABSI) and the Facility-wide Inpatient Hospital-onset Clostridium difficile Infection (CDI) Outcome Measures, each facility's data must be entered into NHSN no later than 45 days after the end of the reporting quarter. However, in the FY 2016 IPPS/LTCH PPS final rule (*80 FR 49749* through *49751*), we finalized a requirement that LTCHs submit data within 4.5 months of the end of each calendar quarter for these measures. We also finalized that the data collection period for the Influenza Vaccination Coverage among Healthcare Personnel (HCP) measure would be October 1 through March 31, with a data submission deadline of May 15th for each influenza season (*78 FR 50882* and *50883*). In the FY 2024 IPPS/LTCH PPS final rule (*88 FR 59138*), we finalized that the COVID–19 Vaccination Coverage among HCP measure would be reported to the CDC through the NHSN at least 1 week per month, with the CDC reporting data to CMS quarterly and allowing for corrections in the NHSN application in alignment with CMS data submission deadlines.

Public reporting of data collected under quality programs, such as the LTCH QRP, is designed to provide consumers and their families with the most current information to empower them to make quality-informed decisions about where to receive their care. We have identified that the time between when data on measures is submitted to us and when those data are publicly reported (approximately nine months) may be too long to provide the most accurate and up to date information for the public. For example, through technical expert panels (TEPs), we have received feedback from patient caregiver advocates that the aged data used in publicly reported quality measures diminishes their value to consumers.

Currently, the largest contributing factor to the nine-month lag between the end of the data collection period and when measures are publicly reported is the 4.5-month timeframe for data submission. Reducing the data submission timeframe from 4.5 months to 45 days could reduce this lag by up to three months, resulting in more timely public reporting of data for consumers and increasing the value of publicly reported data. Additionally, this timeframe provides LTCHs with more recent data in support of their quality improvement activities.

In the FY 2026 IPPS/LTCH PPS proposed rule, we included a request for information (RFI) on reducing the data submission deadline from 4.5 months to 45 days (*90 FR 18353*). We refer readers to the FY 2026 IPPS/LTCH PPS final rule (*90 FR 37042*) for a full summary of the public comments received.

(2) Proposal To Revise the LTCH QRP Assessment Data Submission Deadline

Beginning with the FY 2029 LTCH QRP, we proposed that LTCHs must complete their data submissions and make corrections to their assessment data where necessary no later than the 15th day of the second month after the end of the calendar quarter. However, if the 15th day of the second month falls on a Friday, weekend, or Federal holiday, the submission date is delayed until 11:59 p.m. EST on the next business day. Specifically, we proposed that LTCHs would follow the deadlines presented in Table IX.E.02 for the FY 2029 LTCH QRP. We also proposed that similar calendar year data submission deadlines would apply to future years' payment determinations.

TABLE IX.E.-02: DATA COLLECTION TIMEFRAME AND DATA SUBMISSION DEADLINES FOR LCDS DATA AFFECTING THE FY 2029 PAYMENT DETERMINATION

Calendar Year (CY) Quarter	Data Collection Timeframe	Final Data Submission Deadlines for FY 2029 Payment Determination*
CY 2027 Quarter 1	January 1–March 31, 2027	May 17, 2027
CY 2027 Quarter 2	April 1–June 30, 2027	August 16, 2027
CY 2027 Quarter 3	July 1–September 30, 2027	November 15, 2027
CY 2027 Quarter 4	October 1–December 31, 2027	February 15, 2028

* Data submission deadlines will follow a similar quarterly schedule for subsequent CYs.

We believe that requiring LTCHs to submit LCDS assessment data by the 15th day of the second month after the end of the calendar quarter is reasonable. We conducted an analysis on the potential impact of reducing the timeframe by determining how many assessments are currently being submitted by this deadline, which is approximately within 45 days of the end of the quarter. Using 2024 data, we identified that 98.36 percent of all LCDS assessments were submitted to CMS within a 45-day timeframe. Of the remaining 1.64 percent submitted beyond 45 days, 0.08 percent were submitted after the current 4.5-month data submission deadline and would not be further impacted by a change in the data submission deadline. Therefore, only 1.56 percent of LCDS assessments would be impacted by changing the data submission deadline from 4.5 months to require data submission by the 15th day of the second month after the end of the calendar quarter.

(3) Proposal To Revise the CDC NHSN Data Submission Deadlines

Beginning with the FY 2029 LTCH QRP, we proposed that LTCHs must complete their data submissions and make corrections to their CDC NHSN data where necessary no later than the 15th day of the second month after the end of the calendar quarter. However, if the 15th day of the second month falls

on a Friday, weekend, or Federal holiday, the date is delayed until 11:59 p.m. EST on the next business day. Specifically, we proposed that LTCHs would follow the deadlines presented in Table IX.E.03 for the FY 2029 LTCH QRP. We also proposed that similar calendar year data submission deadlines would apply to future years' payment determinations.

TABLE IX.E.-03: DATA COLLECTION TIMEFRAME AND DATA SUBMISSION DEADLINES FOR CDC NHSN LTCH QRP MEASURES AFFECTING THE FY 2029 PAYMENT DETERMINATION

Measure	Data Collection Timeframe	Final Data Submission Deadlines for FY 2029 Payment Determination*
CAUTI	January 1–March 31, 2027	May 17, 2027
	April 1–June 30, 2027	August 16, 2027
CLABSI	July 1–September 30, 2027	November 15, 2027
CDI **COVID-19 Vaccination Coverage among HCP****	October 1–December 31, 2027	February 15, 2028
Influenza Vaccination Coverage among HCP	October 1, 2027—March 31, 2028	May 15, 2028

* Data submission deadlines will follow a similar quarterly schedule for subsequent CYs.

** In section IX.E.3 of this final rule, we finalized our proposal to remove this measure effective with the FY2028 LTCH QRP.

We believe that requiring LTCHs to submit CDC NHSN assessment data by the 15th day of the second month after the end of the calendar quarter is reasonable. We note that there would be no change in the data submission deadline for the Influenza Vaccination Coverage among HCP measure, as the previously finalized data submission date is May 15th for each influenza season. We conducted an analysis on the potential impact of reducing the timeframe by determining how many LTCHs are currently reporting data by this deadline, which is approximately within 45 days of the end of the quarter. Using FY 2025 data, we identified that 88 percent of all LTCHs submitted CDC NHSN data within a 45-day timeframe.

On these bases, we believed revising the LTCH QRP data submission deadline for LCDS and CDC NHSN data to require LTCHs to submit CDC NHSN data by the 15th day of the second month after the end of the calendar quarter would improve the timeliness of public reporting by three months, which is beneficial to both consumers and LTCHs, with no change in burden to LTCHs.

We invited comment on this proposal to require LTCHs to submit LCDS assessment data and CDC NHSN data by the 15th day of the second month after the end of the calendar quarter beginning with the FY 2029 LTCH QRP. A summary of the comments received, along with our responses, is below.

Comment: A commenter supported the proposal, stating that it would reduce the time from reporting to public display and allow healthcare consumers to make educated decisions about where to receive care.

Response: We thank the commenter for their support and agree that this proposal would give patients and consumers more timely access to quality data.

Comment: A few commenters supported the proposal but recommended a clearer deadline, such as requiring submission on the last business day of the month, instead of the 15th day of the month. A commenter recommended extending the submission deadline to the last day of the second month after the end of the quarter and not adjusting for weekends and Federal holidays. Another commenter recommended providing 90 days after the end of the quarter.

Response: We appreciate the recommendations for alternative data submission deadlines. While we appreciate the commenters' recommendations to require submission on the last business day of the month instead of the 15th day of the month, we disagree that the proposed deadline of the 15th day of the month is unclear for providers. This format for the data submission deadline is similar to the format that has been in place for the LTCH QRP, since the current deadline of 4.5 months (or approximately 135 days) falls on or around the 15th of a given month. Also, to assist providers, CMS publishes the data submission deadlines for each program year on our website, at *https://www.cms.gov/medicare/quality/long-term-care-hospital/ltch-quality-reporting-data-submission-deadlines.*

With regard to the comment recommending a deadline that will not shift due to weekends or Federal holidays, we wish to clarify that this is not a new requirement, as our current policy already shifts the deadline for weekends and Federal holidays. We have previously heard from interested parties that flexibility around these dates is appreciated, since administrative and support staff may not be in the LTCH on those days to submit data. We also note that providers can submit the data at any time during the data submission timeframe. They do not need to alter their workflows if the deadline is moved due to a weekend or Federal holiday, if they wish to submit data earlier.

We disagree with the recommendations to adopt an alternate deadline, such as two months or 90 days after the end of the quarter, as the public reporting would fall into the same quarterly refresh that it is in currently. For example, for Q1 CY 2027, data submitted on May 17, 2027 under the proposed 45-day deadline could be published in the September 2027 Care Compare refresh on *Medicare.gov*. However, using the commenters' suggested 90-day deadline, Q1 CY 2027 data would be submitted around June 29, 2027. Adopting a two month deadline, Q1 CY 2027 data would be submitted around May 31, 2027. After allotting time for measure calculation and the 30-day provider preview period, data submitted under either of these recommended deadlines would not be published until the December 2027 Care Compare refresh on *Medicare.gov*. This

is the same 9-month lag that exists under our current data submission deadline. A longer time frame for data submission would not allow us to reach our goal of providing more timely data to consumers and LTCHs.

Comment: A commenter expressed concerns about operational challenges for LTCHs, given current clinical and administrative workflows. This commenter was concerned that the proposal would increase administrative burden and risk data inaccuracies. A few commenters were concerned that small or rural LTCHs with limited capacity and LTCHs with staffing challenges would struggle to meet shortened deadlines.

Response: We appreciate the commenters' concerns about operational and staffing challenges, especially for small or rural LTCHs. However, we are not adding any new reporting requirements to the LTCH QRP and do not believe that the proposal adds burden by changing the data submission deadline; rather, it shifts the existing workflow from 4.5 months after each quarterly data collection period to the 15th day of the second month after the end of the calendar quarter. Regarding concerns about the risk of data inaccuracies, we believe that the effective date of January 1, 2027 provides LTCHs sufficient time to address operational or staffing changes that may be required, which will allow LTCHs to confirm data accuracy prior to submission in accordance with the updated deadline. CMS does not expect that shortening the data submission timeframe would impact the accuracy of the data LTCHs submit to CMS. Historically, LTCHs have infrequently requested to modify their data submissions for the purposes of the QRP. We continue to believe that this proposed deadline modification will benefit LTCHs by allowing them to have access to more timely data for quality improvement efforts.

Comment: We received comments providing recommendations for the implementation of this policy. A few commenters recommended that CMS provide targeted outreach and assistance to LTCHs in advance of the deadlines. A few commenters suggested that CMS continue to maintain and remind LTCHs of their options for extraordinary circumstances exceptions.

Response: We appreciate commenters' input and recommendations for implementation of this proposal. We note that we currently conduct outreach by providing reminder updates for upcoming data submission deadlines as well as targeted outreach to individual LTCHs about upcoming data submission deadlines. We also provide guidance and technical manuals, data submission deadline documents, and training resources. CMS also intends to make timely updates to our outreach processes, manuals, data submission deadline documents and training resources. Regarding technical assistance and support, we list resources and several help desks on our website: *https://www.cms.gov/medicare/quality/long-term-care-hospital/ltch-quality-reporting-help.*

Regarding commenters' request to remind LTCHs about extraordinary circumstances exceptions options, CMS has an established process, described at § 412.560(c), which allows LTCHs the opportunity to request an exception or extension from the program's reporting requirements in the event they are unable to submit quality data due to extraordinary circumstances beyond their control. LTCHs affected by an extraordinary circumstance may request an exception and extension using instructions provided on our website: *https://www.cms.gov/medicare/quality/long-term-care-hospital/ltch-quality-reporting-reconsideration-and-exception-extension.*

Comment: Several commenters were opposed to the proposal, stating that it would result in additional administrative burden for LTCHs. Many of these commenters were concerned that the proposal would result in more penalties for LTCHs. A few commenters stated that a longer submission period would be beneficial in the case of a change in ownership. A commenter stated that emergency discharges or acute hospital transfers should be removed from the reporting requirements.

Response: We appreciate the commenters' concerns about administrative burden. However, we are not adding any new reporting requirements to the LTCH QRP, but instead propose shifting the time frame for this existing work, and therefore do not believe that the proposed revised data submission deadline adds burden. With regard to concerns about increased penalties for LTCHs, CMS did not propose the addition of any new or increased penalties for not meeting the proposed data submission deadline. We interpret that the commenter is referring to the requirement that LTCHs must submit required LTCH QRP data to avoid receiving a 2 percentage point reduction to the annual payment update. By proposing to implement this policy beginning in January 2027, we are giving LTCHs enough time to make any updates to IT systems and workflow operations to accommodate this change and submit data by the proposed deadline to avoid a penalty.

Regarding the request to give special consideration for change in ownership, CMS has not historically provided extended deadlines for this circumstance. CMS does not believe a change in ownership would cause an LTCH to not be able to successfully submit quality data in a timely manner as the change in ownership is a well-established process.

Regarding emergency discharges, or acute hospital transfers, we disagree that they should be removed from reporting requirements, including the proposed data submission deadline. In such cases, LTCHs would complete the unplanned discharge assessment, which requires LTCH to submit fewer data elements to CMS when a patient is having an emergency. This is an established process which reduces burden, allowing LTCHs to focus on patient care. LTCHs are required to submit admission and discharge assessments on all patients admitted to their hospital, regardless of length of stay. At the time of the emergency discharge or transfer, the LTCH may be in the process of completing or may have already completed some items of the unplanned discharge assessment, and exempting these data from reporting requirements could remove valuable information about the quality of care being provided in the LTCH from the LTCH QRP.

Comment: A few commenters were opposed to the proposal, stating that LTCHs need additional time to verify that NHSN reporting is complete and accurate and to address NHSN system problems that can delay reporting and verification.

Response: We acknowledge the commenters' concerns about having adequate time to verify that NHSN reporting is complete and accurate. However, as described in the proposed rule (91 FR 19617), our analysis showed that 88 percent of all LTCHs submitted CDC NHSN data within a 45-day timeframe, which suggests that the proposed deadline is feasible for LTCHs. The NHSN website also provides extensive training and support materials for LTCHs, available at: *https://www.cdc.gov/nhsn/cms/ltach.html.* CDC NHSN also provides a help desk that can assist with any concerns about NHSN reporting and system issues at *nhsn@cdc.gov.*

Comment: A few commenters were opposed to the proposal and recommended that the data submission period should be no less than 90 days after the end of the quarter, stating that it is impossible to collect and report all assessment information for certain

cases. Another commenter recommended a gradual transition or additional flexibility, such as an extended correction window or an extended deadline for the submission of newer measures.

Response: We disagree with the recommendations to adopt an alternate deadline, such as 90 days after the end of the quarter, because that would not allow us to close the nine-month lag between the end of the data collection period and when measures are publicly reported. A longer time frame for data submission would not allow us to reach our goal of providing more timely data to consumers and LTCHs. CMS does not expect that shortening the data submission timeframe would impact the accuracy of the data LTCHs submit to CMS. CMS expects that all data submitted for the purposes of the QRP from an LTCH is correct and the need for modifications is an infrequent occurrence. Regarding the concern that it is not possible to collect all information for certain LTCH patients, CMS reminds LTCHs that they must meet the minimum data completion threshold of no less than 85 percent of the LCDS assessments having 100 percent completion of the required data elements. This provides a buffer, allowing LTCHs flexibility in those rare cases where it is not possible to collect all quality data and submit it to CMS.

Comment: We received additional comments that were outside the scope of the proposal. Specifically, we received a comment regarding expanding the exception or extension policy to include changes of ownership.

Response: While we did not propose any changes to the exception or extension policy, we thank the commenters for bringing this issue to our attention and will take these comments into consideration for potential policy refinements.

After consideration of the public comments we received, we are finalizing our proposal to require LTCHs to submit LCDS assessment data and CDC NHSN data by the 15th day of the second month after the end of the calendar quarter beginning with the FY 2029 LTCH QRP.

7. Policies Regarding Public Display of Measure Data for the LTCH QRP

a. Background

For a more detailed discussion about our policies regarding public display of LTCH QRP measure data and procedures for the opportunity to review and correct data and information, we refer readers to the FY 2017 IPPS/LTCH PPS final rule (*81 FR 57231* through *57236*).

b. Proposal To End the Public Display of COVID–19 Vaccination Coverage Among Healthcare Personnel (HCP) Measure.

In the FY 2022 IPPS/LTCH PPS final rule (*86 FR 45438* through *45446*), we finalized our proposal to publicly report the COVID–19 Vaccination Coverage among Healthcare Personnel (HCP COVID–19 Vaccine) measure beginning with the September 2022 Care Compare refresh on *Medicare.gov.* In section IX.E.3. of this final rule, we proposed to remove the HCP COVID–19 Vaccine) measure beginning with the FY 2028 LTCH QRP. If finalized as proposed, an LTCHs HCP COVID–19 measure data would be publicly reported for the last time with the September 2026 Care Compare refresh on *Medicare.gov*, based on data from Q4 of 2025. Thereafter, we would no longer display an LTCHs' HCP COVID–19 Vaccine measure data on the Care Compare tool at *Medicare.gov*.

We invited comment on our proposal to end public display of the HCP COVID–19 Vaccine measure data after the September 2026 Care Compare refresh on the Care Compare tool at *Medicare.gov.*

We received no comments on this proposal and therefore are finalizing this provision without modification.

c. Proposal To End the Public Display of the COVID–19 Vaccine: Percent of Patients/Residents Who Are Up to Date Measure

In the FY 2024 IPPS/LTCH PPS final rule (*88 FR 59243* through *59250*), we finalized our proposal to begin publicly displaying data for the Patient/Resident COVID–19 measure beginning with the September 2025 Care Compare refresh. In section IX.E.4. of this final rule, we proposed to remove the Patient/Resident COVID–19 Measure beginning with the FY 2028 LTCH QRP. However, if this proposal is finalized, the reporting of data for the Patient's COVID–19 vaccination is up to date data element would be voluntary effective October 1, 2026, through September 30, 2027. If finalized as proposed, we proposed that the Patient/Resident COVID–19 Vaccine measure data would be publicly reported for the last time with the September 2026 Care Compare refresh on *Medicare.gov*, based on data from Q4 of 2025.

We invited public comment on our proposal to end the public display of Patient/Resident COVID–19 Vaccine measure data after the September 2026 Care Compare refresh on *Medicare.gov.*

Comment: A few commenters opposed CMS's proposal to discontinue public reporting of the COVID–19 Vaccine: Percent of Patients/Residents Who Are Up to Date measure and recommended that CMS continue publicly reporting the measure. Commenters stated that public reporting promotes transparency, accountability, and informed decision-making for patients, residents, families, and caregivers. Commenters further stated that publicly reporting patient COVID–19 vaccination rates provides important information regarding protection of vulnerable populations, supports public health surveillance and vaccination efforts, and encourages facilities to maintain focus on COVID–19 prevention activities. Some of these commenters suggested that removing the measure from Care Compare would reduce visibility into patient vaccination rates and limit information available to patients, caregivers, and families when evaluating LTCHs.

Response: We acknowledge commenters' views that public reporting may promote transparency, accountability, public health surveillance, and informed decision-making for patients, residents, families, and caregivers. We also acknowledge commenters' concerns that discontinuing public reporting of the measure may reduce visibility into patient COVID–19 vaccination rates. Because CMS is finalizing the removal of the COVID–19 Vaccine: Percent of Patients/Residents Who Are Up to Date measure from the LTCH QRP as we continue to believe the measure no longer aligns with current clinical guidelines and practice, we also are finalizing our proposal to discontinue public reporting of the measure. Consistent with past practices, all previously reported and archived Patient/Resident COVID–19 vaccine measure data will remain on the Care Compare tool at *Medicare.gov* for the purposes of transparency and accountability.

After consideration of the public comments we received, we are finalizing this provision without modification.

F. Changes to the Medicare Promoting Interoperability Program

1. Statutory Authority for the Medicare Promoting Interoperability Program for Eligible Hospitals and Critical Access Hospitals (CAHs)

Sections 1886(b)(3)(B)(ix) and 1814(l)(4) of the Act (as amended by the Health Information Technology for Economic and Clinical Health Act, Title

XII of Division A and Title IV of Division B of the American Recovery and Reinvestment Act of 2009 [ARRA], Pub. L. 111–5) authorize downward payment adjustments under Medicare, beginning with FY 2015 for eligible hospitals and CAHs that do not successfully demonstrate meaningful use of certified electronic health record technology (CEHRT) for the applicable electronic health record (EHR) reporting periods. Section 602 of Title VI, Division O of the Consolidated Appropriations Act, 2016 (Pub. L. 114–113) added subsection (d) hospitals in Puerto Rico as eligible hospitals under the Medicare Electronic Health Record (EHR) Incentive Program (now known as the Medicare Promoting Interoperability Program) and extended the participation timeline for these hospitals such that downward payment adjustments were authorized beginning in FY 2022 for subsection (d) Puerto Rico hospitals that do not successfully demonstrate meaningful use of CEHRT for the applicable EHR reporting periods.

2. Office of the National Coordinator for Health Information Technology (ONC) Health Information Technology (Health IT) Certification Program Updates Relevant To the Medicare Promoting Interoperability Program

a. Background

In the Health Data, Technology, and Interoperability: ASTP/ONC Deregulatory Actions to Unleash Prosperity proposed rule (90 FR 60970) (HTI–5 proposed rule), which appeared in the **Federal Register** on December 29, 2025, ONC[536] proposed a wide-ranging set of updates to the ONC Health IT Certification Program. The HTI–5 proposed rule focuses on deregulatory actions in 45 CFR part 170 (Health Information Technology Standards, Implementation Specifications, and Certification Criteria and Certification Programs for Health Information Technology) and 45 CFR part 171 (Information Blocking). The HTI–5 proposed rule seeks to reduce burden, offer flexibility to developers and health care providers, and support innovation through the removal and revision of certain certification criteria and regulatory provisions. The following summarizes proposals in the HTI–5 proposed rule that are relevant to eligible hospitals and CAHs participating in the Medicare Promoting Interoperability Program.

In the HTI–5 proposed rule, ONC identified 34 certification criteria for removal and 7 certification criteria for revision. ONC stated that removing or revising these criteria would reduce burden and costs for health IT developers and clinicians, partly due to the decreased necessity to maintain ongoing conformance with certification requirements (90 FR 60973).

In the FY 2027 Inpatient Prospective Payment System (IPPS)/Long-Term Care Hospital Prospective Payment System (LTCH PPS) proposed rule (91 FR 19619) and this final rule, we summarized in Table IX.F.–01 the potential impact on Medicare Promoting Interoperability Program participants of the proposed certification criteria removals and revisions. Table IX.F.–01 describes how criteria that are the subject of HTI–5 proposals are incorporated into the definition of CEHRT in 42 CFR 495.4. In addition to the health IT certification criteria specified in the CEHRT definition in 42 CFR 495.4, the definition includes EHR technology certified under the ONC Health IT Certification Program that meets the Base EHR definition at 45 CFR 170.102 and technology certified to the criteria necessary to be a meaningful EHR user under the Medicare Promoting Interoperability Program. The criteria necessary to be a meaningful EHR user include criteria that are necessary to report on applicable objectives and measures under the Medicare Promoting Interoperability Program.

Several of the changes outlined in the HTI–5 proposed rule are described in further detail within this FY 2027 IPPS/LTCH PPS final rule. For more information, please see ''Updates to the Definition of Certified Electronic Health Record Technology in the Medicare Promoting Interoperability Program'' in section IX.F.2.b of this final rule and ''Removal of the Support Electronic Referral Loops by Sending Health Information and Support Electronic Referral Loops by Receiving and Reconciling Health Information Measures'' in section IX.F.4 of this final rule.

[536] ASTP/ONC is now referred to as ONC, pursuant to a notice published in the **Federal Register** on April 1, 2026 (91 FR 16204). Although at the time of specific references noted herein ONC was either referenced as ASTP/ONC or as ONC, for clarity all references in this document are now noted as ONC.

TABLE IX.F.-01. HTI-5 PROPOSED REMOVALS OR REVISIONS OF CERTIFICATION CRITERIA REFERENCED IN CEHRT DEFINITION FOR THE MEDICARE PROMOTING INTEROPERABILITY PROGRAM

ONC Health IT Certification Criteria as defined in the following sections of Title 45 CFR 170.315	Remove/Revise	Timing	Relevance to the CEHRT Definition for the Medicare Promoting Interoperability Program
Patient Demographics and Observations - (a)(5)	Revise	Effective date of HTI-5 final rule.	Specified in Base EHR definition.
Implantable Device List - (a)(14)	Remove	Effective date of HTI-5 final rule.	Specified in Base EHR definition.
Decision Support Interventions - (b)(11)	Revise	Effective date of HTI-5 final rule.	Specified in Base EHR definition.
Direct Project - (h)(1)	Remove	Effective date of HTI-5 final rule.	Specified in Base EHR definition.
Direct Project, Edge Protocol, and XDR/XDM - (h)(2)	Remove	Effective date of HTI-5 final rule.	Specified in Base EHR definition.
Family Health History - (a)(12)	Remove	Effective January 1, 2027.	Specified in CEHRT definition.
Patient Health Information Capture - (e)(3)	Remove	Effective January 1, 2027.	Specified in CEHRT definition.
Automated Numerator Recording - (g)(1)	Remove	Effective January 1, 2027.	Specified in CEHRT definition.
Automated Measure Calculation - (g)(2)	Remove	Effective January 1, 2027.	Specified in CEHRT definition.
Transitions of Care - (b)(1)	Revise	Effective January 1, 2027.	Specified criterion for the Support Electronic Referral Loops by Sending Health Information, Support Electronic Referral Loops by Receiving and Reconciling Health Information, HIE Bi-Directional Exchange, and Enabling Exchange Under TEFCA measures.
Clinical Information Reconciliation and Incorporation - (b)(2)	Remove	Effective January 1, 2027.	Specified criterion for the Support Electronic Referral Loops by Receiving and Reconciling Health Information measure.
View, Download, and Transmit to 3rd Party - (e)(1)	Revise	Effective date of HTI-5 final rule.	Specified criterion for the Provide Patients Access measure.
Transmission to public health agencies - Electronic Case Reporting - (f)(5)	Revise	Effective date of HTI-5 final rule.	Specified criterion for the Electronic Case Reporting measure.
Transmission to public health agencies - Antimicrobial Use and Resistance Reporting - (f)(6)	Revise	Effective date of HTI-5 final rule.	Specified criterion for the Antimicrobial Use Surveillance and Antimicrobial Resistance Surveillance measures.
Transmission to public health agencies - Health Care Surveys - (f)(7)	Remove	Effective January 1, 2027.	Specified criterion for the Public Health Registry measure.
Application access — patient selection - (g)(7)	Remove	Effective January 1, 2027.	Specified criterion for the Provide Patients Access and HIE Bi-Directional Exchange measures.
Application Access – All Data Request - (g)(9)	Remove	Effective January 1, 2027.	Specified criterion for the Provide Patients Access and HIE Bi-Directional Exchange measures.

We stated in the proposed rule that proposed changes in the HTI–5 proposed rule would affect certification criteria referenced in the definition of CEHRT in 42 CFR 495.4 that apply to the Medicare Promoting Interoperability Program in several ways. First, several ONC proposals affect the ONC Health IT Certification Program certification criteria included within the Base EHR definition at 45 CFR 170.102, which is incorporated into the CEHRT definition at 42 CFR 495.4. Removal of these criteria from the ONC Health IT Certification Program and the Base EHR definition would therefore remove the requirement that an eligible hospital or CAH must use CEHRT that includes this functionality. ONC proposed to remove from the Base EHR definition the certification criteria at: 45 CFR 170.315(a)(14)—''implantable device list'' (90 FR 60983), 45 CFR 170.315(h)(1)—''transport methods and other protocols—direct project'' (90 FR 60998), and 45 CFR 170.315(h)(2)—''transport methods and other protocols—Direct Project, Edge Protocol, and XDR/XDM'' (90 FR 60999). ONC also proposed to revise the following criteria referenced in the Base EHR definition: 45 CFR 170.315(a)(5)—''patient demographics and observations'' (90 FR 60981 through 60982) and 45 CFR 170.315(b)(11)—''decision support interventions'' (90 FR 60986 through 60987).

ONC proposed to remove four certification criteria specified in the text

of the CEHRT definition at 42 CFR 495.4. including: 45 CFR 170.315(a)(12)—''family health history'', 45 CFR 170.315(e)(3)—''patient health information capture'', 45 CFR 170.315(g)(1)—''automated numerator recording'', and 45 CFR 170.315(g)(2)—''automated measure calculation'' (90 FR 60982, 60991, 60994, and 60995). We further discuss these criteria in section IX.F.2.b of this final rule.

ONC proposed to remove or revise other certification criteria that directly support certain Medicare Promoting Interoperability Program measures. For example, four certification criteria were identified as supporting the Provide Patients Electronic Access to Their Health Information measure: 45 CFR 170.315(e)(1), 45 CFR 170.315(g)(7), 45 CFR 170.315(g)(9), and 45 CFR 170.315(g)(10). Of these four criteria, three are impacted by the HTI–5 proposals. ONC proposed to revise 45 CFR 170.315(e)(1) (90 FR 60990 through 60991), and to remove 45 CFR 170.315(g)(7) and 45 CFR 170.315(g)(9) (90 FR 60998). If ONC finalizes these proposals, only the remaining criteria identified for the Provide Patients Electronic Access to Their Health Information measure (the revised 45 CFR 170.315(e)(1) and unaltered 45 CFR 170.315(g)(10)) would be necessary for eligible hospitals and CAHs to report the measure. Table IX.F.–07 in section IX.F.8 of the proposed rule (91 FR 19650) and this final rule contain a complete list of the Medicare Promoting Interoperability Program objectives and measures and their relevant ONC Health IT certification criteria, including the impact to individual certification criteria if the HTI–5 proposals are finalized.

Regarding the Public Health Registry Reporting measure, ONC proposed to remove the only certification criterion (45 CFR 170.315(f)(7)—''transmission to public health agencies—health care surveys'') (90 FR 60994) that supports the measure. We stated in the proposed rule that if the removal of the criterion is finalized, there would be no specific certification criteria identified for this measure. An eligible hospital or CAH would be able to use any available data exchange standard specified in 45 CFR part 170 subpart B to meet the measure. For example, the transmission could be in the form of a Consolidated Clinical Document Architecture (C-CDA) per 45 CFR 170.205(a)(4), or Quality Reporting Document Architecture (QRDA) per 45 CFR 170.205(h)(2).

Regarding the Electronic Case Reporting measure, ONC proposed to revise the criterion at 45 CFR 170.315(f)(5)—''transmission to public health agencies—electronic case reporting,'' (90 FR 60992 through 60993) identified as supporting this measure. Regarding the Antimicrobial Use Surveillance and Antimicrobial Resistance Surveillance measures, ONC proposed to revise the criterion at 45 CFR 170.315(f)(6)—''transmission to public health agencies—antimicrobial use and resistance reporting,'' (90 FR 60993) identified as supporting these measures. These ONC proposals aim to update the certification criteria to focus on functional, rather than standards-based, requirements. While ONC's proposed updates, if finalized, would revise the requirements for health IT products certified to these criteria, eligible hospitals and CAHs would continue to need to use health IT certified to these criteria to report the Electronic Case Reporting, Antimicrobial Use Surveillance, and Antimicrobial Resistance Surveillance measures.

We noted in the proposed rule that ONC proposed removing certain certification criteria such as 45 CFR 170.315(g)(3)—''safety-enhanced design'' and 45 CFR 170.315(g)(4)—''quality management system,'' (90 FR 60995 through 60997) and a series of criteria related to privacy and security functionality in 45 CFR 170.315(d)(1)–(13) (90 FR 60989 through 60990), which are included in the Health IT Module certification requirements at 45 CFR 170.550. These criteria represent capabilities found in certified health IT products used by eligible hospitals and CAHs. We noted that the proposed removal of these criteria from the ONC Health IT Certification Program would not affect an eligible hospital's or CAH's obligations to ensure the privacy and security of patients' electronic health information under the Health Insurance Portability and Accountability Act of 1996 and other applicable laws.

b. Updates to the Definition of Certified Electronic Health Record Technology in the Medicare Promoting Interoperability Program

For CY 2019 and subsequent years, the definition of CEHRT for the Medicare Promoting Interoperability Program at 42 CFR 495.4 requires the use of EHR technology certified under the ONC Health IT Certification Program that meets the 2015 Edition Base EHR definition or subsequent Base EHR definition (as defined at 45 CFR 170.102) and has been certified to specified ONC health IT certification criteria, as adopted and updated in 45 CFR 170.315. In paragraph (2)(i), the definition further specifies that EHR technology must be certified to criteria for ''family health history'' (45 CFR 170.315(a)(12)) and ''patient health information capture'' (45 CFR 170.315(e)(3)). In paragraph (2)(ii), the definition specifies that EHR technology must be certified to ONC health IT certification criteria that are necessary to be a meaningful EHR user. Paragraph (2)(ii)(A) includes the applicable measure calculation certification criteria at 45 CFR 170.315(g)(1) or (2) for all certification criteria that support an objective with a percentage-based measure.

In the FY 2027 IPPS/LTCH PPS proposed rule (91 FR 19620 through 19621), we proposed to revise the definition of CEHRT at 42 CFR 495.4 for the Medicare Promoting Interoperability Program so the definition would be consistent with certain proposed modifications to ONC health IT certification criteria in the HTI–5 proposed rule. Specifically, we proposed to remove references to the following certification criteria effective January 1, 2027:

- ''family health history''—45 CFR 170.315(a)(12)
- ''patient health information capture''—45 CFR 170.315(e)(3)
- ''automated numerator recording''—45 CFR 170.315(g)(1)
- ''automated measure calculation''—45 CFR 170.315(g)(2)

We stated that effective January 1, 2027, these criteria would no longer be included in the CEHRT definition and that the revised definition in 42 CFR 495.4 would be, in relevant part, as follows:

''*Certified electronic health record technology (CEHRT)* [.ensp;. .]

(2) For 2019 and subsequent years, EHR technology (which could include multiple technologies) certified under the ONC Health IT Certification Program that meets the 2015 Edition Base EHR definition, or subsequent Base EHR definition (as defined at 45 CFR 170.102) and has been certified to the ONC health IT certification criteria, as adopted and updated in 45 CFR 170.315—

(i) For 2019 through 2026, at 45 CFR 170.315(a)(12) (family health history) and 45 CFR 170.315(e)(3) (patient health information capture); and

(ii) Necessary to be a Meaningful EHR User (as defined in this section), including the following:

(A) For 2019 through 2026, the applicable measure calculation certification criterion at 45 CFR 170.315(g)(1) or (2) for all certification criteria that support a meaningful use objective with a percentage-based measure.

(B) Clinical quality measure certification criteria that support the calculation and reporting of clinical quality measures at 45 CFR 170.315(c)(2) and (c)(3)(i) and (ii) and can be electronically accepted by CMS.''

We noted that while this change is consistent with the approach in the HTI–5 proposed rule (90 FR 60970), we did not believe that ONC must finalize its proposed revisions for us to finalize the changes outlined in this section for our regulatory definition of CEHRT in the Medicare Promoting Interoperability Program.

We stated that the longstanding presence of the criteria for ''family health history'' at 45 CFR 170.315(a)(12) and ''patient health information capture'' at 45 CFR 170.315(e)(3) in the ONC Health IT Certification Program and their incorporation into Medicare Promoting Interoperability Program requirements means that the functionality reflected in these criteria is fully embedded in certified health IT and is widely available and used by eligible hospitals and CAHs. ONC anticipated that health IT developers would continue to retain these capabilities in their Health IT Modules despite the absence of certification criteria for these functionalities (90 FR 60991 and 90 FR 60982). We noted in the proposed rule that these criteria are not identified as supporting any specific measures within the Medicare Promoting Interoperability Program.

We also noted that with respect to the certification criteria needed for measure calculation (''automated numerator recording'' and ''automated measure calculation'' certification criteria in 45 CFR 170.315(g)(1) and 45 CFR 170.315(g)(2)), health IT developers seeking to support customers participating in the Medicare Promoting Interoperability Program would need to continue to support reporting of numerators and denominators for certain Medicare Promoting Interoperability Program measures, including the Electronic Prescribing measure and Providing Patients Access to Their Health Information measure. We stated that removing the requirements for certification at 45 CFR 170.315(g)(1) and 45 CFR 170.315(g)(2), and removing references to those criteria in the definition of CEHRT at 42 CFR 495.4, would reduce administrative burden for health IT developers when testing and certifying this functionality without impacting reporting requirements for the Medicare Promoting Interoperability Program.

In summary, we proposed to revise the definition of CEHRT for the Medicare Promoting Interoperability Program at 42 CFR 495.4. Specifically, we proposed to remove the certification criteria for ''family health history'' (45 CFR 170.315(a)(12)), ''patient health information capture'' (45 CFR 170.315(e)(3)), ''automated numerator recording'' (45 CFR 170.315(g)(1)), and ''automated measure calculation'' (45 CFR 170.315(g)(2)) effective January 1, 2027 in alignment with the proposed timing to remove such criteria from the Code of Federal Regulations in the HTI–5 proposed rule.

We invited public comment on these proposals.

Comment: Many commenters supported our proposal to modify the CEHRT definition. Several commenters stated that CMS should align with the proposed changes in the HTI–5 proposed rule. A few commenters noted that the health IT functionalities are already mature, broadly implemented, and embedded in certified health IT products and workflows.

Response: We thank commenters for their support. We will continue to work closely with ONC to ensure program alignment where possible. We agree with commenters that many health IT functionalities proposed for removal or revision in the HTI–5 proposed rule are already broadly implemented.

Comment: Several commenters did not support our proposal to modify the CEHRT definition. A few commenters stated that CMS should wait until ONC finalizes the HTI–5 proposed rule to support consistency and predictability in compliance across HHS programs. A commenter stated that the CY 2027 timeline for modification of the CEHRT definition is not tenable because it does not provide sufficient time for implementation.

Response: As we noted in the FY 2027 IPPS/LTCH PPS proposed rule (91 FR 19621), these proposed changes are consistent with the timelines outlined in the HTI–5 proposed rule (90 FR 60970). We do not believe that ONC must finalize its proposed removals and revisions for us to finalize the changes outlined in this section to our regulatory definition of CEHRT for the Medicare Promoting Interoperability Program. Doing so also increases clarity for eligible hospitals and CAHs that may otherwise need to refer to a CEHRT definition that includes references to removed criteria, should ONC finalize its proposed removals and revisions. Regarding concerns that eligible hospitals and CAHs will not be provided a sufficient amount of time for implementation, we remind readers that our proposed revisions to the definition of CEHRT have the effect of removing, rather than adding, requirements with respect to the CEHRT definition. We therefore do not expect any new implementation requirements to arise from these proposed removals. To the extent that criteria are removed from the ONC Health IT Certification Program, ONC and CMS have stated that the underlying functionality will continue to exist unless health IT developers update their products to remove the functionality.

Comment: A few commenters stated that CMS should not remove the ''family health history'' and ''patient health information capture'' certification criteria from the CEHRT definition because there is no guarantee that these functionalities will continue to be offered within health IT products. The commenters instead recommended that CMS and ONC retain these criteria in their respective regulations.

Response: We thank commenters for their feedback. The longstanding presence of the ''family health history'' criterion at 45 CFR 170.315(a)(12) and ''patient health information capture'' criterion at 45 CFR 170.315(e)(3) in the ONC Health IT Certification Program and their incorporation into Medicare Promoting Interoperability Program requirements means that the functionality reflected in these criteria is already fully embedded in certified health IT and is widely available and used by eligible hospitals and CAHs. We firmly believe that removing the family health history certification criterion will have minimal impact on data consistency because many developers of certified health IT will continue to conform to the Systematized Nomenclature of Medicine—Clinical Terms® (SNOMED CT) US Edition standard and the functionality to code family health history with this standard will likely remain in certified health IT adopted by hospitals and physicians (90 FR 60982). Moreover, updates to the United States Core Data for Interoperability (USCDI) in USCDI v6 demonstrate ONC's commitment to the exchange of family health history information using the SNOMED CT US Edition standard.[537] We note that while USCDI v6 has not been adopted in regulation at this time, it may be considered for adoption in future rulemaking. Of note, USCDI v6 has been approved by the National Coordinator for use under the Standards Version Advancement Process (SVAP), which means health IT developers may

[537] *See https://isp.healthit.gov/united-states-core-data-interoperability-uscdi#uscdi-v6.*

voluntarily incorporate this standard into Certified Health IT Modules.[538]

Regarding the patient health information capture criterion, the capabilities described in the criterion are widely implemented and used in health IT at this time and we firmly believe these capabilities will remain in health IT products even if the corresponding criterion is removed. ONC has also noted that removing the criterion from the Certification Program could spur greater development and innovation in this area (90 FR 60991). There are other certification criteria that support patient engagement, such as the ''view, download, and transmit to 3rd party'' and ''standardized API for patient and population services'' certification criteria (90 FR 60991). ONC has seen developers integrate the functionality in the patient health information capture certification criterion as part of other patient engagement features, such as patient portals.

Accordingly, there are multiple avenues to fully implement and broadly support family health history data and the patient health information capture through standards without the need to retain references to these certification criteria in the CEHRT definition. Not only will we continue to identify opportunities to work with industry to improve data quality, but we will also continue to monitor and analyze approaches by health IT developers for real world implementation. Although these criteria are not identified as supporting any specific measures within the Medicare Promoting Interoperability Program, we will monitor these CEHRT changes and welcome comments and feedback if eligible hospitals and CAHs find their experience to be to the contrary.

Comment: A few commenters did not support the proposal to remove the references in the CEHRT definition to the certification criteria for ''automated numerator recording'' at 45 CFR 170.315(g)(1) and ''automated measure calculation'' at 45 CFR 170.315(g)(2) from the CEHRT definition. A commenter stated that removal of these criteria without a clearly defined plan for measure calculation may introduce inconsistency, data errors, and increased audit risk for eligible hospitals and CAHs. The commenter requested that CMS coordinate closely with ONC to develop standardized calculation guidance, updated specifications, and a cohesive transition strategy so that eligible hospitals and CAHs are not adversely impacted by divergent reporting methodologies once certification testing is removed. Another commenter stated that these functions remain essential for accurate Medicare Promoting Interoperability Program reporting, quality assurance, and future performance-based measures, and that the proposal is inconsistent because it acknowledges that these capabilities are still necessary for program participation. The commenter expressed concern that eliminating references to these certification criteria while retaining reporting obligations could increase calculation errors, undermine accountability, expose eligible hospitals and CAHs to inaccurate scores and, subsequently, downward payment adjustments.

Response: We thank the commenters for their feedback. Health IT developers seeking to support customers participating in the Medicare Promoting Interoperability Program will still need to support reporting of numerators and denominators for certain Medicare Promoting Interoperability Program measures, including the Electronic Prescribing measure and Providing Patients Access to Their Health Information measure. However, ONC has stated that removing the certification criteria at 45 CFR 170.315(g)(1) and 45 CFR 170.315(g)(2) would reduce administrative burden for health IT developers associated with testing and certifying this functionality without impacting reporting requirements for the Medicare Promoting Interoperability Program, and we therefore disagree with the concerns that commenters expressed. We appreciate commenters' concerns about calculation errors and accountability, but we note that our proposed revisions to the CEHRT definition do not and should not affect current functionality in this regard, and we have proposed no changes in measures with numerator and denominator calculations that would prompt configuration changes. Therefore, we recommend that eligible hospitals and CAHs work closely with their vendors to ensure that current functionality is retained. We also note that eligible hospitals and CAHs already have a responsibility to ensure the accuracy of their reported values and that merely using EHR technology that was certified to particular ONC certification criteria was never entirely sufficient because of the risk of local configuration errors.

We also note that health IT developers now have had more time and experience with CMS programs than when we first added references to § 170.315(g)(1) and § 170.315(g)(2) to the definition of CEHRT beginning with the EHR reporting period in CY 2019. We believe that health IT developers will continue to ensure that patients or actions included in a measure's numerator are recorded in a fashion that supports accurate calculation to meet CMS requirements without needing to certify their health IT products to § 170.315(g)(1) or § 170.315(g)(2). Eligible clinicians, eligible hospitals, and CAHs, may currently use a separate, non-certified system to calculate numerators and denominators and to generate reports on the measures.[539] We will continue to work closely with ONC to ensure consistency in specifications and accuracy in reporting methodologies, and we intend to include details in this respect in future measure specification documents.[540]

Comment: A few commenters recommended that CMS establish a monitoring mechanism to streamline health IT vendor software management for the changes related to numerator recording and measure calculation, stating that removing these certification requirements shifts accountability to internal data analytics and clinical informatics teams. A few commenters stated that reducing developer burden should not inadvertently penalize or burden organizations while they adjust to this technology no longer being certified by ONC. Another commenter expressed concern that excessive CEHRT deregulation could undermine standardization, interoperability, and affect other health care programs, and therefore recommended careful review of stakeholder feedback before finalizing the changes. A commenter expressed support for CMS's and ONC's efforts to align health IT regulations, reduce burden, and improve the timely, reliable exchange of data across health care programs, however they also expressed concern that reducing CEHRT requirements could create unintended consequences, including shifting validation and compliance burdens from vendors to organizations, increasing patient safety and interoperability risks, and reducing product standardization. This commenter noted that although the targeted certification criteria may not

[540] For the CY 2025 CMS Specifications Manual for the Medicare Promoting Interoperability Program, see: *https://www.cms.gov/files/document/cms-specifications-manual-ehr-period-cy-2025.pdf.* Specification manuals are provided yearly in advance of the relevant EHR reporting period calendar year.

directly support Medicare Promoting Interoperability Program measures, changes may still affect other programs and clinical workflows. A commenter recommended CMS provide guidance for any CEHRT definition changes, ensure that health IT vendors have sufficient time to update certified products, and protect eligible hospitals and CAHs from penalties where compliance depends on vendor readiness.

Response: We appreciate the suggestion to establish a monitoring mechanism for the changes related to numerator recording and measure calculation. We will continue to collaborate with ONC to identify opportunities for technical support that will facilitate the transition away from ONC certification of this functionality. Regarding commenters' concerns that these CEHRT definition changes may shift burden to eligible hospitals and CAHs, undermine standardization and interoperability, and impact other health care programs, we note that removal of criteria from the CEHRT definition has the effect of decreasing eligible hospitals' and CAHs' program obligations with respect to their CEHRT and that both ONC and CMS expect the underlying functionality will continue to exist within EHR systems. We therefore do not expect significant changes to eligible hospitals and CAHs from this proposal to modify the CEHRT definition. We expect that health IT developers will continue to ensure that patients or actions included in a measure calculation are recorded in a fashion that will meet CMS requirements without needing to certify their health IT products to § 170.315(g)(1) or (g)(2). We will continue to work closely with ONC to align health IT regulations where applicable, reduce administrative burden when feasible, incentivize the reliable exchange of data, and minimize any unintentional consequences of these changes. We also recognize commenters' concerns that changes to certification requirements could affect internal validation processes used by eligible hospitals, CAHs, and health systems for other CMS programs, but we still view this change as a net decrease in compliance obligations rather than an increase, and we will seek to harmonize changes across CMS programs where appropriate. We intend to monitor implementation experiences and questions related to numerator and denominator calculation, and we will provide additional sub-regulatory guidance to support consistent implementation. We will continue coordinating with ONC to help ensure that any changes to CEHRT-related requirements are clearly communicated in a manner that supports readiness among health IT developers, eligible hospitals, and CAHs.

Comment: A few commenters recommended removing the certification criteria because they do not directly support Medicare Promoting Interoperability measures, but only if CMS and ONC establish ongoing monitoring of health IT vendor retention of these functions and implement a mechanism to reinstate the requirements if necessary. A few commenters expressed concern that health IT vendors may discontinue or reduce support for clinically important capabilities or monetize necessary numerator and denominator calculation functions.

Response: We thank the commenters for their support and recommendations. We note that ONC expects that health IT developers will continue to retain these capabilities in their Health IT Modules despite the absence of certification criteria (90 FR 60991 and 90 FR 60982) as the functionality is already fully embedded in certified health IT and is widely available and used by eligible hospitals and CAHs. We understand commenters' concerns regarding the potential for health IT vendors to monetize or reduce support for these important capabilities and encourage eligible hospitals and CAHs to consider these capabilities when reviewing their EHR technology purchase options with health IT vendors and during contract negotiations. We note that if the main effect of the policy is to decrease the certification and testing burden of health IT developers, the removal of the references to these criteria in the CEHRT definition alone should not cause health IT developers to have to make changes to their products or otherwise expend development resources. Nevertheless, we agree that ongoing monitoring of the effects of removal of these criteria is necessary, and we will continue to work with ONC to do so.

Comment: A commenter recommended that CMS ensure this proposal would not shift new operational, compliance, or validation burdens onto eligible hospitals and CAHs, particularly rural hospitals and other low-resourced organizations, noting that removing certification criteria does not eliminate the need for underlying functions such as security controls, audit capabilities, reporting tools, accessibility features, and data integrity protections.

Response: We thank the commenter for their recommendation. We recognize the potential challenges that may be faced by smaller and under-resourced eligible hospitals and CAHs and are committed to continuing to receive feedback and explore ways to offer support where possible. We will continue to work closely with ONC to ensure consistency, flexibility, and stability of our policies, and to closely monitor for any unintended consequences to eligible hospitals and CAHs participating in the Medicare Promoting Interoperability Program.

Comment: A commenter requested clarification on our proposal, asking if CMS intends for the functional, clinically useful data elements in these criteria to be retained or removed. The commenter recommended that CMS publish a detailed list of the data elements collected for these criteria and indicate whether each is captured elsewhere in the EHR to determine if removing these certification criteria would create clinical gaps in documentation causing unforeseen operational or clinical impacts.

Response: We thank the commenter for this suggestion. We note that clinically useful data elements that support the Medicare Promoting Interoperability Program would still be retained in the CEHRT definition as many of the criteria of the Base EHR definition continue to require these data elements. We do not intend for any data elements to be removed. As for the request for a detailed list of data elements, we discussed in a prior comment how certified health IT will continue to conform to the SNOMED CT US Edition standard and the functionality to code family health history with this standard will likely remain in certified health IT adopted by hospitals and physicians (90 FR 60982). The ''patient health information capture'' criterion does not define any specific data elements. Finally, the ''automated numerator recording'' (45 CFR 170.315(g)(1)), and ''automated measure calculation'' (45 CFR 170.315(g)(2)) criteria do not have specific data element requirements but rather relate to functionality for measures derived from care delivery.

After consideration of the public comments we received, we are finalizing our proposal to revise the definition of CEHRT for the Medicare Promoting Interoperability Program at 42 CFR 495.4 to the following:

''*Certified electronic health record technology (CEHRT)* [. . .]

(2) For 2019 and subsequent years, EHR technology (which could include multiple technologies) certified under the ONC Health IT Certification Program that meets the 2015 Edition Base EHR

definition, or subsequent Base EHR definition (as defined at 45 CFR 170.102) and has been certified to the ONC health IT certification criteria, as adopted and updated in 45 CFR 170.315—

(i) For 2019 through 2026, at 45 CFR 170.315(a)(12) (family health history) and 45 CFR 170.315(e)(3) (patient health information capture); and

(ii) Necessary to be a Meaningful EHR User (as defined in this section), including the following:

(A) For 2019 through 2026, the applicable measure calculation certification criterion at 45 CFR 170.315(g)(1) or (2) for all certification criteria that support a meaningful use objective with a percentage-based measure.

(B) Clinical quality measure certification criteria that support the calculation and reporting of clinical quality measures at 45 CFR 170.315(c)(2) and (c)(3)(i) and (ii) and can be electronically accepted by CMS.''

3. Removal of ONC Direct Review and ONC-Authorized Certification Body (ACB) Surveillance Attestations

a. Background

In the Medicare Program, Merit-Based Incentive Payment System (MIPS) and Alternative Payment Model (APM) Incentive Under the Physician Fee Schedule, and Criteria for Physician-Focused Payment Models final rule with comment period, which appeared in the **Federal Register** on November 4, 2016 (hereafter the ''CY 2017 Quality Payment Program final rule'') (81 FR 77027), we adopted two attestations for the Medicare Promoting Interoperability Program (then called the Medicare EHR Incentive Program) related to supporting eligible hospitals and CAHs with the performance of CEHRT. The two attestations were adopted at 42 CFR 495.40(b)(2)(i)(I)(*1*) and (*2*), as follows:

- ONC Direct Review attestation: Eligible hospitals and CAHs must affirm cooperation with ONC Direct Review of their CEHRT by: (1) acknowledging the requirement to cooperate in good faith with ONC direct review of their health information technology certified under the ONC Health IT Certification Program if a request to assist in ONC direct review is received; and (2) if requested, cooperate in good faith with ONC direct review of their health information technology certified under the ONC Health IT Certification Program.[541]
- ONC–ACB Surveillance attestation: Eligible hospitals and CAHs may also attest that they engaged in supporting health care providers with the performance of CEHRT activities by attesting that they: (1) acknowledge the option to cooperate in good faith with ONC–ACB surveillance of their health information technology certified under the ONC Health IT Certification Program if a request to assist in ONC–ACB surveillance is received; and (2) if requested, cooperated in good faith with ONC–ACB surveillance of their health information technology certified under the ONC Health IT Certification Program.[542]

The ONC Direct Review attestation has been a required element of the Medicare Promoting Interoperability Program; submitting a ''Yes'' response fulfills the requirements of the attestation. Submitting a ''No'' response would subject an eligible hospital or CAH to a downward payment adjustment for not meeting minimum program requirements. The ONC–ACB Surveillance attestation has been optional: a ''Yes'' response on the attestation, a ''No'' response on the attestation, or non-response are all acceptable answers. Both attestations have been reported through a manual attestation (''Yes'' or ''No'') process via the CMS Hospital Quality Reporting (HQR) system.

b. Removal of the ONC Direct Review and ONC–ACB Surveillance Attestations Beginning With the EHR Reporting Period in CY 2026

In the FY 2027 IPPS/LTCH PPS proposed rule (91 FR 19621 through 19622), we proposed to remove the required ONC Direct Review attestation and the optional ONC–ACB Surveillance attestation from the Medicare Promoting Interoperability Program beginning with the EHR reporting period in CY 2026 and make conforming changes at 42 CFR 495.40(b)(2)(i)(I). We proposed for these changes to be effective with the data submission period beginning January 1, 2027, because neither attestation requires any specific action to occur within the 180-day EHR reporting period. We stated that the removal of these measures advances our focus on high-value, outcome-oriented measures. We stated that while we continue to support the ONC direct review process and ONC–ACB surveillance, we also recognized the need to reduce administrative burdens in our measure and attestation set when feasible.

We continue to recognize the importance of ONC direct review and ONC–ACB surveillance activities and believe these mechanisms are important for mitigating issues with health IT products that may pose serious risks to public health or safety and continue to cooperate with ONC in supporting the ONC Health IT Certification Program. As stated in the CY 2017 Quality Payment Program final rule (81 FR 77020), efforts to strengthen surveillance and direct review of certified health IT are critical to the success of HHS programs and initiatives that require the use of certified health IT to improve health care quality and the efficient delivery of care. We stated in the proposed rule we did not anticipate that the commitment from ONC and the ONC–ACBs toward such goals will change.

When we initially finalized these attestations in November 2016 in the CY 2017 Quality Payment Program final rule, we believed that the attestations would complement and strengthen ONC's ability to perform surveillance and direct review activities. In October 2015, ONC finalized the 2015 Edition Health Information Technology (Health IT) Certification Criteria, 2015 Edition Base Electronic Health Record (EHR) Definition, and ONC Health IT Certification Program Modifications final rule, which added requirements that ONC–ACBs conduct more frequent and more rigorous surveillance of certified technology and capabilities ''in the field'' (80 FR 62707). In October 2016, ONC published the ONC Health IT Certification Program: Enhanced Oversight and Accountability final rule, which established regulatory processes to facilitate ONC's direct review and evaluation of the performance of certified health IT in certain circumstances (81 FR 72406). In the CY 2017 Quality Payment Program final rule, we determined that surveillance and direct review activities provided greater assurance to health care providers that their certified EHR technology would perform in a manner that meets their expectations, but that this surveillance and direct review would not be effective unless health care providers cooperated with these activities, including by granting access to and assisting ONC–ACBs and ONC to observe the performance of production systems (81 FR 77020).

While these activities remain important, we stated in the proposed rule we no longer believe that the requirement for eligible hospitals and CAHs to attest ''yes'' to the ONC Direct Review attestation is necessary to demonstrate the meaningful use of CEHRT. Since 2016, the ONC direct review process has become known to eligible hospitals and CAHs, and the value of participation has become

[541] 42 CFR 495.40(b)(2)(i)(I)(*1*).

[542] 42 CFR 495.40(b)(2)(i)(I)(*2*).

evident without dependence on an annual attestation. Likewise, we stated that the ONC–ACB Surveillance attestation, which is optional for attestation, is no longer necessary to collect because eligible hospitals and CAHs have been made aware of their ability to participate in ONB–ACB surveillance if asked. We stated that the burden of the attestations, even the minimal burden of the voluntary ONC–ACB Surveillance attestation, now outweighs their value. Removing these measures aligns with our goals of reducing administrative burden while simultaneously focusing on high-value, outcome-oriented measures. Specifically, removal of these attestations from the Medicare Promoting Interoperability Program represents an opportunity to reduce the number of discrete manual steps and reporting fields required for successful program participation without diminishing the integrity or central goals of the program. Although we proposed removing the attestations, we strongly encouraged eligible hospitals and CAHs to continue participating in these oversight processes.

We proposed the removal of the ONC Direct Review and ONC–ACB Surveillance attestations beginning with the EHR reporting period in CY 2026 to reduce burden as quickly as feasible. Since eligible hospitals and CAHs would not be reporting on these attestations until the data submission period opens on January 1, 2027, we determined that it would be feasible for eligible hospitals and CAHs to implement this change sooner. Therefore, eligible hospitals and CAHs would not have to report on these attestations by the March 1, 2027, submission deadline and there would be no effect on their FY 2028 payment determination or FY 2026 cost reimbursement, respectively.

We invited public comment on this proposal.

Comment: Several commenters supported our proposal to remove the ONC Direct Review Attestation and the ONC–ACB Surveillance Attestation from the Medicare Promoting Interoperability Program, stating that the removal of these measures would reduce unnecessary reporting and administrative burden while streamlining program requirements. A commenter stated they support this proposal because they oppose reporting that adds little value while increasing burden. A commenter noted that they intend to continue participating in these oversight processes when assistance is requested by ONC or an ONC–ACB. A commenter stated that these measures have a limited impact on daily hospital operations and do not meaningfully enhance quality or oversight. Another commenter noted that these changes show that many hospitals have achieved a baseline level of interoperability and now rely on EHR capabilities as embedded infrastructure rather than discrete compliance activities, and that reducing duplicative attestations allows organizations to focus their resources on meaningful use of interoperable data rather than procedural validation. A commenter expressed support for the proposal, specifically stating that the removal of these measures also benefits smaller developers and the hospitals they serve because it prevents the diversion of limited resources away from improving patient care.

Response: We thank commenters for their support. We agree that the removal of these attestations aligns with our goals of reducing administrative burden while simultaneously focusing on high-value, outcome-oriented measures.

Comment: A few commenters that supported our proposal offered recommendations for consideration. A few commenters recommended that CMS clarify that hospitals remain encouraged but not required to participate with ONC or an ONC–ACB if they are contacted, so not to underscore the ongoing importance of surveillance activities. A commenter noted that the ONC Direct Review and ONC–ACB Surveillance processes are robust, comprehensive, and necessary safeguards to monitor developers' adherence to requirements, mitigate issues with health IT products, and provide assurances to health care providers that their CEHRT is functioning as intended. This commenter recommended that CMS continue to support ONC in upholding and strengthening direct reviews and surveillance activities.

Response: We thank commenters for their feedback. We reiterate that although we proposed to remove these attestations, we strongly encourage eligible hospitals and CAHs to continue participating in these activities when requested. We agree with commenters that surveillance and direct review activities are an important and helpful part of an overall process to monitor whether CEHRT and certified health IT Modules perform in an expected manner. We also agree that removing these measures will reduce administrative burden. We will continue to work with ONC to support direct review and surveillance activities.

Comment: A few commenters expressed appreciation for the efforts to reduce unnecessary administrative burden, acknowledging that the ONC Direct Review and ONC–ACB Surveillance attestations are not direct measures of patient outcomes. The commenters also expressed concern that removing mechanisms that may reinforce institutional awareness of and cooperation with health IT oversight activities may contribute to delayed diagnosis, interoperability failures, missed abnormal results, medication errors, communication breakdowns, and other patient safety risks. The commenters recommended CMS and ONC continue to maintain strong oversight, transparency, and organizational accountability regarding certified health IT performance and safety.

Response: We thank the commenters for their feedback. We strongly encourage eligible hospitals and CAHs to continue participating in oversight processes when assistance is requested by ONC or an ONC–ACB. We will continue to work with ONC to strengthen direct review and surveillance activities.

After consideration of the public comments we received, we are finalizing our proposal to remove the ONC Direct Review attestation and the ONC–ACB Surveillance attestation from the Medicare Promoting Interoperability Program beginning with the EHR reporting period in CY 2026 and make conforming changes at 42 CFR 495.40(b)(2)(i)(I). Although we are finalizing the removal of these attestations, we strongly encourage eligible hospitals and CAHs to continue participating in these oversight processes when assistance is requested by ONC or an ONC–ACB.

4. Removal of the Support Electronic Referral Loops by Sending Health Information and Support Electronic Referral Loops by Receiving and Reconciling Health Information Measures

a. Background on the Health Information Exchange Objective

The Health Information Exchange objective and its associated measures encourage and leverage the interoperability of electronic health information on a broader scale and promote health IT-based care coordination. The Health Information Exchange objective includes five measures: Support Electronic Referral Loops by Sending Health Information, Support Electronic Referral Loops by Receiving and Reconciling Health Information, Health Information Exchange (HIE) Bi-Directional Exchange, Enabling Exchange Under the

Trusted Exchange Framework and Common Agreement (TEFCA), and Electronic Prior Authorization. For background on this objective and its associated measures, we refer readers to the FY 2019 IPPS/LTCH PPS final rule (83 FR 41656 through 41661), the FY 2020 IPPS/LTCH PPS final rule (84 FR 42596 through 42597), the FY 2021 IPPS/LTCH PPS final rule (85 FR 58969), the FY 2022 IPPS/LTCH PPS final rule (86 FR 45465 through 45470), the FY 2023 IPPS/LTCH PPS final rule (87 FR 49327 through 49334), and the 2024 Interoperability and Prior Authorization final rule (89 FR 8926).

The Support Electronic Referral Loops by Sending Health Information measure requires that, for at least one transition of care or referral, the eligible hospital or CAH that transitions or refers its patient to another setting of care or health care provider: (1) creates a summary of care record using CEHRT; and (2) electronically exchanges the summary of care record.

- *Numerator:* Number of transitions of care and referrals in the denominator where a summary of care record was created using CEHRT and exchanged electronically.
- *Denominator:* Number of transitions of care and referrals during the EHR reporting period for which the eligible hospital or CAH inpatient or emergency department (Place of Service [POS] 21 or 23) was the transitioning or referring health care provider.

The Support Electronic Referral Loops by Receiving and Reconciling Health Information measure requires, for at least one electronic summary of care record received using CEHRT for patient encounters during the EHR reporting period for which an eligible hospital or CAH was the receiving party of a transition of care or referral, or for patient encounters during the EHR reporting period in which the eligible hospital or CAH has never before encountered the patient, the eligible hospital or CAH conducts clinical information reconciliation for medication, medication allergy, and current problem list using CEHRT.

- *Numerator:* The number of electronic summary of care records in the denominator for which clinical information reconciliation is completed using CEHRT for the following three clinical information sets: (1) Medication—Review of the patient's medication, including the name, dosage, frequency, and route of each medication; (2) Medication allergy—Review of the patient's known medication allergies; and (3) Current Problem List—Review of the patient's current and active diagnoses.
- *Denominator:* Number of electronic summary of care records received using CEHRT for patient encounters during the EHR reporting period for which an eligible hospital or CAH was the reconciling party of a transition of care or referral, and for patient encounters during the EHR reporting period in which the eligible hospital or CAH has not previously encountered the patient.

An eligible hospital or CAH has been required to satisfy the Health Information Exchange objective by using one of three reporting options: Option 1 (report on the Support Electronic Referral Loops by Sending Health Information measure AND the Support Electronic Referral Loops by Receiving and Reconciling Health Information measure), Option 2 (report on the HIE Bi-Directional Exchange measure), or Option 3 (report on the Enabling Exchange Under TEFCA measure) (87 FR 49334). The Support Electronic Referral Loops by Sending Health Information measure and the Support Electronic Referral Loops by Receiving and Reconciling Health Information measure are each worth 15 points within the Health Information Exchange objective, and an eligible hospital or CAH may receive a maximum of 30 points by reporting on both measures. Eligible hospitals and CAHs must also attest ''Yes'' on the Electronic Prior Authorization measure beginning with the EHR reporting period in CY 2027 to meet all requirements for the Health Information Exchange objective (89 FR 8926 through 8927).[543]

Two ONC health IT certification criteria in 45 CFR 170.315 have supported the Support Electronic Referral Loops by Sending Health Information measure and the Support Electronic Referral Loops by Receiving and Reconciling Health Information measure. In the ''Medicare and Medicaid Programs; Electronic Health Record Incentive Program-Stage 3 and Modifications to Meaningful Use in 2015 Through 2017'' final rule, we finalized that eligible hospitals and CAHs must use the ''transitions of care'' certification criterion at 45 CFR 170.315(b)(1) for the measure (80 FR 62882) that we subsequently renamed as the Support Electronic Referral Loops by Sending Health Information measure (83 FR 41658). In the FY 2019 IPPS/LTCH PPS final rule, for the Support Electronic Referral Loops by Receiving and Reconciling Health Information measure, we finalized that eligible hospitals and CAHs must utilize both the ''transitions of care'' certification criterion at 45 CFR 170.315(b)(1) and the ''clinical information reconciliation and incorporation'' certification criterion at 45 CFR 170.315(b)(2) (83 FR 41661). These certification criteria, based upon the C–CDA standard, enable eligible hospitals and CAHs to complete the actions described in the measures around sending, receiving, and reconciling summary of care records.

In the HTI–5 proposed rule (90 FR 60984 through 60985), ONC proposed multiple updates to the ONC health IT certification criteria that facilitate reporting the Support Electronic Referral Loops by Sending Health Information and Support Electronic Referral Loops by Receiving and Reconciling Health Information measures. Notably, ONC proposed to reduce the scope of the ''transitions of care'' certification criterion at 45 CFR 170.315(b)(1) to focus its requirements on enabling the receipt of a C–CDA document to position the criterion for a future evolution to receipt of Fast Healthcare Interoperability Resources® (FHIR)-formatted data. ONC also proposed to remove the ''clinical information reconciliation and incorporation'' certification criterion at 45 CFR 170.315(b)(2) based on its review of industry adoption of the criterion. ONC's review found that the capabilities of the criterion are widely implemented and used in health IT and thus are not likely to go away as a supported capability by developers of certified health IT based solely on removal of the criterion from the ONC Health IT Certification Program. For more details regarding these ONC proposals, please see the HTI–5 proposed rule at 90 FR 60984.

b. Removal of the Support Electronic Referral Loops by Sending Health Information and Support Electronic Referral Loops by Receiving and Reconciling Health Information Measures

In the FY 2027 IPPS/LTCH PPS proposed rule (91 FR 19622 through 19625), we proposed to remove the Support Electronic Referral Loops by Sending Health Information and Support Electronic Referral Loops by Receiving and Reconciling Health Information measures beginning with the EHR reporting period in CY 2028. We stated that removing these measures would streamline reporting and reduce the complexity of multiple measure reporting options for the Health Information Exchange objective, while focusing program performance on measures that assess the adoption of

[543] In section IX.F.5 of this final rule, we are finalizing several updates to the Electronic Prior Authorization measure and associated reporting requirements.

newer health information technologies and more comprehensive methods of information-sharing. We proposed that beginning with the EHR reporting period in CY 2028, eligible hospitals and CAHs would fulfill requirements in the Health Information Exchange objective by attesting ''Yes'' to either the HIE Bi-Directional Exchange measure or the Enabling Exchange Under TEFCA measure, as well as attesting ''Yes'' or claiming an Exclusion on the Electronic Prior Authorization measure.[544]

The Support Electronic Referral Loops by Sending Health Information and Support Electronic Referral Loops by Receiving and Reconciling Health Information measures have been measures of meaningful use since Stage 2 of the EHR Incentive Program, the precursor to the Medicare Promoting Interoperability Program (77 FR 54044). Since their initial adoption, these measures have supported widespread adoption of functionality in EHRs for supporting the exchange of summary care records using the C–CDA standard. Use of this functionality as advanced by the current measures and their predecessors has served as a key driver for the adoption and use of exchange capabilities across the health care landscape for over a decade.

With this baseline of functionality broadly available to eligible hospitals and CAHs, we began to explore additional measures that foster the availability of longitudinal care records for patients and facilitate enhanced care coordination across settings by adding the Health Information Exchange (HIE) Bi-Directional Exchange measure and, later, the Enabling Exchange Under TEFCA measure (86 FR 45470 and 87 FR 49334, respectively). We stated we are further advancing this work by proposing to remove the prior measures and transitioning eligible hospitals and CAHs to focus on broader-scale interoperability approaches by prioritizing pathways that leverage Health Information Exchanges and Qualified Health Information Networks (QHINs) under TEFCA.

We described this transition as consistent with trends already underway in the program. Since the HIE Bi-Directional Exchange and Enabling Exchange Under TEFCA measures were adopted in the program, we have seen increased reporting of these measures to meet the Health Information Exchange objective. For the EHR reporting period in CY 2024, which was the most recent program data available, 68.8 percent of reporting eligible hospitals and CAHs reported on the HIE Bi-Directional Exchange measure and 4.6 percent of reporting facilities reported on the Enabling Exchange Under TEFCA measure, while only 26.6 percent of reporting eligible hospitals and CAHs reported on the Support Electronic Referral Loops by Sending Health Information and Support Electronic Referral Loops by Receiving and Reconciling Health Information measures. CAHs were disproportionately represented among the facilities that reported the Support Electronic Referral Loops by Sending Health Information and Support Electronic Referral Loops by Receiving and Reconciling Health Information measures, with 33.1 percent of CAHs compared to 23.9 percent of eligible hospitals reporting the measures.

However, we stated this statistic also showed that a majority of eligible hospitals and CAHs have been able to successfully report either the HIE Bi-Directional Exchange measure or the Enabling Exchange Under TEFCA measure. We stated that these measures of participation in network-based exchange are more comprehensive indicators of meaningful health information exchange than the Support Electronic Referral Loops by Sending Health Information and Support Electronic Referral Loops by Receiving and Reconciling Health Information measures. For example, exchanging information through an HIE or entity participating in TEFCA supports on-demand patient health information exchange to any location in an entire network of participants rather than the submission of a summary of care document to a single specified recipient. We stated that removing the Support Electronic Referral Loops by Sending Health Information and Support Electronic Referral Loops by Receiving and Reconciling Health Information measures, although impacting the eligible hospitals and CAHs that report on those measures, would benefit patients by assessing regional and national network-based longitudinal health information exchange among these eligible hospitals and CAHs rather than assessing the transmission of patient information to a single location at a single point in time. We also stated that all eligible hospitals, including small, rural hospitals, and CAHs benefit from increased access to patient health information for the patients they treat through increased participation in health information exchanges or TEFCA. Removal of these measures would also streamline reporting and reduce program complexity by decreasing the overall number of measures in the program. We welcomed comments with respect to whether there are additional barriers beyond what we have mentioned that small hospitals, rural hospitals, or CAHs may encounter to successfully report either the HIE Bi-Directional Exchange measure or Enabling Exchange Under TEFCA measure.

Finally, we also stated in the proposed rule that the removal of the Support Electronic Referral Loops by Sending Health Information and Support Electronic Referral Loops by Receiving and Reconciling Health Information measures, which are C–CDA-based measures, would encourage eligible hospitals and CAHs to further explore new exchange modalities that move away from document-centric standards and point-to-point exchange. We stated the Support Electronic Referral Loops by Sending Health Information and Support Electronic Referral Loops by Receiving and Reconciling Health Information measures focus on the exchange of summary of care records using the C–CDA standard, but industry trends toward increased FHIR adoption have enabled easier scalability to support real-time data exchange and access to more discrete data elements when compared to the document-centric CDA standard.[545] We have sought to improve the use of electronic health records over time, and one such aspect of doing so is fostering eligible hospitals' and CAHs' use of emerging data exchange standards that may improve upon those that were adopted in prior years.

We noted that the proposed removal of these measures does not imply that the underlying exchange activities targeted by the Health Information Exchange objective are fully and effectively implemented at this time, including among eligible hospitals and CAHs. We stated that we are considering evaluating performance-based measures under the Health Information Exchange objective for future rulemaking. Specifically, we plan to continue to evaluate future potential changes to the current HIE Bi-Directional Exchange and Enabling Exchange Under TEFCA measures to transition from attestation-based to performance-based measures to drive further improvement around ongoing gaps in health information exchange among eligible hospitals and CAHs. We

[544] In section IX.F.5 of this final rule, we are finalizing several updates to the Electronic Prior Authorization measure and associated reporting requirements.

[545] *https://healthit.gov/data/data-briefs/hospital-use-of-apis-to-enable-data-sharing-between-ehrs-and-third-party-technology/.*

also noted that we expect the use of C–CDA-based exchange to continue to serve as an ongoing capability for health information exchange even though we have determined that the Medicare Promoting Interoperability Program would no longer need a measure of its adoption and use. While the removal of these measures from the Medicare Promoting Interoperability Program seeks to encourage the use of new technology approaches that improve the function of electronic health records over time, we acknowledged the impact and value of these exchange methods.

We proposed removing the Support Electronic Referral Loops by Sending Health Information and Support Electronic Referral Loops by Receiving and Reconciling Health Information measures beginning with the EHR reporting period in CY 2028, rather than in an earlier reporting period, to provide the 26.6 percent of eligible hospitals and CAHs currently reporting on these measures sufficient time to prepare for reporting on the HIE Bi-Directional Exchange measure or the Enabling Exchange Under TEFCA measure. We reasoned that making these measure removals effective in the EHR reporting period in CY 2028 would allow those eligible hospitals and CAHs time to plan, procure, configure, and validate new workflows for participation with an entity facilitating health information exchange, whether through the HIE Bi-Directional Exchange or the Enabling Exchange Under TEFCA measures. This additional lead time would support a safe and reliable transition, while eligible hospitals and CAHs that wish to transition earlier and report on HIE Bi-Directional Exchange or Enabling Exchange Under TEFCA measures, if they are not already doing so, would be able to do so for the EHR reporting period in CY 2026 or CY 2027 if they so choose. Although eligible hospitals and CAHs may incur additional costs as a result of joining a Health Information Exchange or a QHIN under TEFCA to report either of the measures, we stated that these benefits outweigh the costs considering the value of broad health information exchange networks to patient care [546] and the fact that such networks are more valuable to each participant as more and more participants are present in the network.[547]

We proposed that following the removal of these measures, eligible hospitals and CAHs would be required to satisfy the Health Information Exchange objective by reporting the HIE Bi-Directional Exchange measure or reporting the Enabling Exchange Under TEFCA measure. We proposed to maintain the same scoring policy for these two measure options; attesting ''Yes'' to either the HIE Bi-Directional Exchange or Enabling Exchange Under TEFCA measure would result in a maximum score of 30 points. Additionally, eligible hospitals would be required to meet the Electronic Prior Authorization measure requirement in the Health Information Exchange objective, which we discuss in section IX.F.5 of this final rule.

We invited public comment on these proposals.

Comment: Many commenters supported CMS's proposal to remove the Support Electronic Referral Loops by Sending Health Information and Support Electronic Referral Loops by Receiving and Reconciling Health Information measures beginning with the EHR reporting period in CY 2028 because they believe the measures are outdated, duplicative of or less useful than newer network-based exchange options, and no longer meaningfully differentiate performance among eligible hospitals and CAHs with established interoperability capabilities. Commenters stated that removing these measures would streamline reporting, reduce burden and program complexity, align the Medicare Promoting Interoperability Program with more modern health information exchange approaches, and allow eligible hospitals and CAHs to focus on broader-scale interoperability through the HIE Bi-Directional Exchange and Enabling Exchange Under TEFCA measures.

Response: We appreciate the commenters' support. We agree that removing the Support Electronic Referral Loops by Sending Health Information and Support Electronic Referral Loops by Receiving and Reconciling Health Information measures will streamline reporting under the Health Information Exchange objective and better align the Medicare Promoting Interoperability Program with broader, network-based exchange approaches. We also agree that the HIE Bi-Directional Exchange and Enabling Exchange Under TEFCA measures provide a broader and more robust assessment of health information exchange than measures focused on sending and receiving summary of care documents for individual referrals.

Comment: A few commenters supported the proposal but recommended that CMS provide additional implementation support during the transition, flexibility, hardship exceptions, or transitional policies for eligible hospitals and CAHs that do not currently have established HIE or TEFCA relationships, particularly small, rural, critical access, low-resourced, underserved, and inner-city hospitals. Commenters recommended clear reporting guidance, sufficient transition time, targeted financial or technical assistance, and outreach to small and rural hospital leaders and health IT developers, and sub-regulatory guidance so that affected hospitals can move to the HIE Bi-Directional Exchange or Enabling Exchange Under TEFCA measures without compliance gaps or disruption to information exchange during care transitions.

Response: We thank the commenters for their support and recommendations that we offer technical assistance, implementation support, flexibility, hardship exceptions, and transitional policies. We recognize that some eligible hospitals and CAHs, including small, rural, or otherwise under-resourced hospitals may need additional time and support to plan, procure, configure, and validate workflows for participation in the HIE Bi-Directional Exchange or Enabling Exchange Under TEFCA measures. We note that the current C–CDA exchange functionality underlying the removed measures would not disappear with the measure removal and should not disrupt information exchange. We agree that transition considerations should be balanced with the program goal of moving toward broader-scale exchange, and we are finalizing this proposal to allow ample transition time for affected eligible hospitals and CAHs. We note that significant hardship exceptions up to a statutory limit of five years (section 1886(b)(3)(B)(ix)(II) of the Act) are available and can be requested in the case of extreme and uncontrollable circumstances (codified at 42 CFR 412.64(d)(4)(ii)(B)), but not solely due to inability to successfully attest to a measure due to circumstances within one's control. We decline to provide additional incentives beyond the payment adjustment already present within the program because the program's statutory period of incentive payments is completed and no such mechanism now exists.

Comment: Several commenters recommended that CMS provide

[546] Menachemi N, Rahurkar S, Harle CA, Vest JR. The benefits of health information exchange: an updated systematic review. Journal of the American Medical Informatics Association. 2018 Sep;25(9):1259–65.

[547] Yaraghi N, Du AY, Sharman R, Gopal RD, Ramesh R. Network effects in health information exchange growth. ACM Transactions on Management Information Systems (TMIS). 2013 Apr 1;4(1):1–26.

additional time before removing the Support Electronic Referral Loops by Sending Health Information and Support Electronic Referral Loops by Receiving and Reconciling Health Information measures, stating that the proposed timeline of removal for the EHR reporting period in CY 2028 may not provide sufficient time for eligible hospitals and CAHs to transition successfully. Commenters expressed concern that some eligible hospitals and CAHs may face barriers related to readiness, vendor implementation timelines, costs, staffing constraints, and technical onboarding.

Response: We thank commenters for their feedback regarding the proposed timeline. We recognize commenters' concerns that some eligible hospitals and CAHs may need additional time to transition to other available Health Information Exchange reporting options. Therefore, after considering commenter feedback and the possibility that some eligible hospitals and CAHs may need additional time, we are finalizing the removal of the Support Electronic Referral Loops by Sending Health Information and Support Electronic Referral Loops by Receiving and Reconciling Health Information measures beginning with the EHR reporting period in CY 2029, rather than beginning with the EHR reporting period in CY 2028, as proposed.

Comment: A few commenters supported CMS's continued emphasis on the HIE Bi-Directional Exchange and Enabling Exchange Under TEFCA measures but recommended continued investment in TEFCA infrastructure and governance. A few commenters recommended that CMS and ONC ensure TEFCA supports practical use cases such as admission, discharge, and transfer (ADT) notifications, transitions of care for long-term and post-acute care, and pharmacy interoperability. Commenters also recommended that CMS consider stronger data protection and monitoring of QHINs so vendors cannot obtain patient data under the banner of care coordination without an appropriate clinical relationship.

Response: We thank the commenters for their support and recommendations regarding continued development of TEFCA infrastructure and governance. We agree that trust, privacy, security, and practical use cases are important components of the continued development of a nationwide health information exchange. We thank commenters for their suggestions regarding the continued development of use cases within TEFCA and will share those with ONC. We will also continue coordinating with ONC as TEFCA implementation advances. We also acknowledge the commenters' recommendations regarding stronger data protection and monitoring of QHINs and participants and note that additional information on applicable TEFCA requirements, including the Common Agreement and Standard Operating Procedures, is available in the TEFCA Resource Library at *https://rce.sequoiaproject.org/tefca-and-rce-resources/*. We will continue to work with ONC and monitor TEFCA implementation to support appropriate health information exchange consistent with applicable privacy and security requirements and any other legal requirements.

Comment: A commenter supported reducing unnecessary administrative burden where appropriate but emphasized that continuity of information exchange during care transitions remains foundational to patient safety.

Response: We thank the commenter for their support and agree that continuity of health information exchange during care transitions remains foundational to patient safety. Removing the Support Electronic Referral Loops by Sending Health Information and Support Electronic Referral Loops by Receiving and Reconciling Health Information measures does not diminish the importance of health information exchange during care transitions. Rather, the two remaining measures under the Health Information Exchange objective will continue to support timely and broad access to patient information across networks, including during care transitions. We also expect that the health IT functionality to directly exchange health information via C–CDA will continue to be available for use by hospitals as needed.

Comment: A few commenters did not support CMS's proposal to remove the Support Electronic Referral Loops by Sending Health Information and Support Electronic Referral Loops by Receiving and Reconciling Health Information measures beginning with the EHR reporting period in CY 2028, or did not support the removal timeline as proposed, because they stated eligible hospitals, CAHs, and health IT vendors would need additional time to develop, deploy, procure, configure, validate, and operationalize capabilities needed to successfully attest to the HIE Bi-Directional Exchange or Enabling Exchange Under TEFCA measures. Commenters expressed concern that removal would disproportionately affect rural hospitals, CAHs, and other low-resourced health care providers that may still depend on C–CDA-based workflows and may face barriers such as direct HIE or QHIN participation costs, uneven regional HIE availability, EHR vendor limitations or integration costs, limited health IT staff and workforce capacity, lack of technical assistance, and operational disruption. Commenters recommended that CMS delay removal, retain the measures as a reporting option during transition, assess and document readiness for the remaining HIE reporting pathways, clarify requirements and transaction volume expectations, and publish targeted technical assistance and measure specification guidance before finalizing or implementing removal.

Response: We appreciate the commenters' concerns regarding operational readiness, health IT vendor configuration, workflow transition, rural hospital and CAH barriers, and the timing of removal. We continue to believe that removing the Support Electronic Referral Loops by Sending Health Information and Support Electronic Referral Loops by Receiving and Reconciling Health Information measures is appropriate because these measures are less comprehensive indicators of meaningful health information exchange than participation in broader network-based exchange as reflected in the HIE Bi-Directional Exchange or Enabling Exchange Under TEFCA measures, and because removal would reduce the complexity of multiple Health Information Exchange objective reporting options. We clarify that, even with the removal of these measures, we anticipate hospitals and CAHs will continue exchanging health information using C–CDA as appropriate, including for exchange with HIEs and entities participating in TEFCA under the HIE Bi-Directional Exchange or Enabling Exchange Under TEFCA measures. We recognize that some eligible hospitals and CAHs may face resource, health IT vendor, workforce, cost, and regional infrastructure constraints when transitioning to the remaining reporting options, and that these barriers may be particularly acute for eligible hospitals and CAHs with limited health IT staffing resources or exchange options. However, these associated costs also come with the significant benefit of wider network-based availability of patient electronic health information. We also recognize that uneven regional availability of HIE infrastructure may affect eligible hospitals' and CAHs' ability to participate in health information exchange. We continue to support flexible pathways for health

information exchange, including participation through state-designated HIEs, other bi-directional exchange networks, and TEFCA-enabled approaches, as available and appropriate. Therefore, after considering commenter feedback, we are finalizing our proposal with modification to delay the removal of these measures, effective beginning with the EHR reporting period in CY 2029. We agree that eligible hospitals and CAHs need to understand the requirements for the remaining Health Information Exchange objective reporting options, including what is needed for successful reporting. We will continue to coordinate with ONC and consider commenters' recommendations regarding readiness, regional availability, transition costs, measure specification guidance, clarification of reporting expectations and transaction volume, and targeted technical assistance materials, as appropriate.

Comment: A few commenters did not support removing the Support Electronic Referral Loops by Sending Health Information and Support Electronic Referral Loops by Receiving and Reconciling Health Information measures because they stated C–CDA-based exchange remains widely used and continues to provide an important interoperability floor for eligible hospitals and CAHs that have not fully adopted alternative exchange pathways, such as FHIR-based exchange or TEFCA. Commenters stated that C–CDA-supported functionality is still prevalent, is often used by under-resourced eligible hospitals, CAHs, and health information professionals, and helps ensure that patient information can travel where needed. Commenters expressed concern that removing these measures, especially alongside related proposed ONC certification changes, could signal movement away from existing technologies, jeopardize nationwide interoperability, and create additional vendor or implementation burden before alternative HIE pathways are sufficiently established and broadly available.

Response: We appreciate the commenters' concerns regarding the continued use of C–CDA-based exchange and the importance of maintaining an interoperability baseline. We acknowledge the value of C–CDA-based exchange and expect that it may continue to serve as an ongoing capability for health information exchange, including for eligible hospitals and CAHs that have not fully adopted network-based exchange pathways. Removing the Support Electronic Referral Loops measures does not prohibit eligible hospitals and CAHs from continuing to use C–CDA-based exchange where it remains clinically or operationally appropriate, nor does it reflect a view that existing exchange technologies no longer have value. For example, C–CDA-based exchange remains identified as a capability to support the other HIE measures through the criterion at 45 CFR 170.315(b)(1), which ONC proposed to revise, not remove. Therefore, we do not anticipate negative impacts to nationwide interoperability by the removal of these two measures. At the same time, we continue to believe that the Medicare Promoting Interoperability Program should focus the Health Information Exchange objective on broader, network-based exchange approaches, which better demonstrate more comprehensive health information exchange capabilities. In response to concerns about burden on eligible hospitals and CAHs and readiness of the alternative HIE pathways, we note that we are delaying by one year the requirement to select either the HIE Bi-Directional Exchange or Enabling Exchange Under TEFCA measures (beginning with the EHR reporting period in CY 2029). This delay provides an additional year beyond our proposal to choose the best option and further develop the HIE pathways reflected in the two measures.

Comment: A few commenters expressed concern that removing the Support Electronic Referral Loops by Sending Health Information and Support Electronic Referral Loops by Receiving and Reconciling Health Information measures could weaken the Medicare Promoting Interoperability Program's emphasis on referral reconciliation, incorporation of clinically relevant information into care workflows, and closed-loop interdisciplinary care coordination during transitions of care. Commenters stated that continuity of care is foundational to patient safety, improved outcomes, and lower costs, and that interoperability failures and communication gaps can contribute to preventable harm across transitions of care. Commenters encouraged CMS to continue to focus on continuity of care and care coordination, and to remain focused on outcome measures and process measures that identify opportunities for improvement in patient safety and care transitions. A commenter stated that participation in a broader exchange network does not necessarily ensure that information is effectively exchanged, reconciled, or incorporated, and recommended that CMS continue prioritizing interoperability approaches that support meaningful referral communication, reconciliation of clinical information, and longitudinal care coordination across settings.

Response: We agree that the exchange and use of clinically relevant information during transitions of care remains important. Removing these measures from the Medicare Promoting Interoperability Program does not diminish the importance of these activities. Rather, the HIE Bi-Directional Exchange and Enabling Exchange Under TEFCA measures support broader access to longitudinal patient information across exchange networks and care settings, and that information can support referral communication, reconciliation of clinical information, incorporation of relevant information into care workflows, and care coordination across health care providers. Although removal of the Support Electronic Referral Loops by Receiving and Reconciling Health Information measure does represent a decreased emphasis on this particular aspect of health information exchange, we believe that the HIE Bi-Directional Exchange and Enabling Exchange Under TEFCA measures are more comprehensive measures of health information exchange and that the program's goals are advanced more fully by requiring one of those measures rather than retaining the Support Electronic Referral Loops by Receiving and Reconciling Health Information measure as an option. We may consider future refinements to the Health Information Exchange objective, as necessary, if we find additional opportunities to promote the meaningful use of health information technology to support patient safety and care transitions.

Comment: A few commenters recommended that CMS establish exclusions or hardship pathways before removing the Support Electronic Referral Loops by Sending Health Information and Support Electronic Referral Loops by Receiving and Reconciling Health Information measures for eligible hospitals and CAHs that cannot successfully participate in the activities necessary to report the HIE Bi-Directional Exchange or Enabling Exchange Under TEFCA measures due to circumstances outside the eligible hospital's or CAH's control. Commenters requested accommodations for situations in which network capability is unavailable, a hospital is migrating to a new exchange environment, newly acquired facilities are integrating into a different exchange environment, HIE or QHIN coverage is

insufficient, or documented barriers that prevent successful participation despite reasonable efforts. Commenters also recommended that CMS clarify the documentation hospitals should retain to support an exclusion or hardship request.

Response: We appreciate the commenters' recommendations regarding exclusions, hardship pathways, and suggested documentation to keep on site. We did not propose exclusions for the HIE Bi-Directional Exchange or Enabling Exchange Under TEFCA measures, but we recognize that some eligible hospitals and CAHs may encounter circumstances outside their control, including network availability, regional exchange coverage, or third-party readiness issues. The hardship exception process remains available for eligible hospitals and CAHs up to a statutory limit of five years of granted hardships. We note that failing to successfully attest to a measure may not qualify for a hardship exception. We agree that transition concerns should be addressed while maintaining the policy goal of moving the Health Information Exchange objective toward broader network-based exchange. We will continue to consider these operational issues and provide additional guidance and educational tools as feasible. If needed and appropriate, we may also revisit issues through future rulemaking if necessary.

Comment: A few commenters recommended that CMS preserve flexibility in how eligible hospitals and CAHs satisfy the Health Information Exchange objective as CMS removes the Support Electronic Referral Loops by Sending Health Information and Support Electronic Referral Loops by Receiving and Reconciling Health Information measures. Commenters recommended that CMS continue recognizing state-designated HIE networks that support bi-directional exchange, avoid requiring hospitals to use a single exchange framework before the full care continuum is ready, and proceed cautiously before making TEFCA the sole pathway for meeting the Health Information Exchange objective. Commenters also recommended that CMS ensure concerns related to TEFCA participant vetting, data privacy, and security are addressed before further movement toward TEFCA-based reporting.

Response: We appreciate the commenters' recommendations regarding flexibility in satisfying the Health Information Exchange objective. We agree that eligible hospitals and CAHs operate in varied exchange environments and that it is appropriate for the Medicare Promoting Interoperability Program to recognize more than one network exchange-based pathway for satisfying the Health Information Exchange objective at this time. TEFCA is one of two pathways (one of two separate measures) for meeting this program objective; eligible hospitals and CAHs may satisfy the objective by reporting either the HIE Bi-Directional Exchange measure or the Enabling Exchange Under TEFCA measure. We confirm that state-designated HIEs that meet the attributes described in the measure are acceptable for meeting the HIE measure, and hospitals may also meet the measure through participation in other bi-directional exchange networks that meet these attributes. We agree that trust, privacy, and security are important considerations for nationwide exchange, and we note that TEFCA QHINs have security frameworks associated with their use.

Comment: A few commenters recommended that CMS continue to monitor the effect of removing the Support Electronic Referral Loops by Sending Health Information and Support Electronic Referral Loops by Receiving and Reconciling Health Information measures on continuity of information exchange during care transitions and on care coordination among hospitals, specialists, primary care physicians, post-acute health care providers, and other clinical settings.

Response: We appreciate the commenters' recommendations and agree that continuity of health information exchange during care transitions is foundational to patient safety, care coordination, and improved outcomes. We stated that removing the Support Electronic Referral Loops measures will not diminish the importance of these activities. Instead, we believe that HIE Bi-Directional Exchange and Enabling Exchange Under TEFCA support broader access to longitudinal patient information and more comprehensive exchange across care settings. We will continue to monitor the effects of these reporting changes on information exchange during care transitions and care coordination across eligible hospitals, CAHs, and health care providers and may consider future refinements to the Health Information Exchange objective, as necessary and appropriate.

Comment: A commenter recommended that, when CMS removes measures, CMS provide stakeholder messaging to reinforce that underlying operational expectations for health information exchange remain unchanged, including the need to update, send, and reconcile clinical information. The commenter also stated that CMS should not transition prematurely to receipt of FHIR-formatted data until FHIR is standard across health care, because some health care providers that receive discharge data from hospitals, such as nursing facilities and physical therapy groups, may not have electronic medical records with FHIR-formatted data capabilities.

Response: We appreciate the commenter's recommendations regarding stakeholder messaging and readiness for FHIR-formatted data. We agree that removal of duplicative or less comprehensive measures should not be understood to mean that the underlying operational need for health information exchange during care transitions has changed, including the need to update, send, receive, and reconcile clinical information, as appropriate. Removal of the Support Electronic Referral Loops by Sending Health Information and Support Electronic Referral Loops by Receiving and Reconciling Health Information measures should not impact the ability of eligible hospitals, CAHs, and their exchange partners to continue to engage in C–CDA-based exchange where it remains clinically or operationally appropriate. Most HIEs and TEFCA QHINs themselves continue to support C–CDA exchange as a primary form of data exchange, and although some now also support FHIR-based exchange, there is no defined timeline for a complete transition away from C–CDA. We are actively evaluating readiness for a future FHIR transition for particular use cases, as we discussed most recently in a Request for Information on a FHIR transition timeline for the reporting of CQMs in the Medicare and Medicaid Programs; CY 2027 Payment Policies under the Physician Fee Schedule and Other Changes to Part B Payment and Coverage Policies; Medicare Shared Savings Program Requirements; and Medicare Prescription Drug Inflation Rebate Program proposed rule (CY 2027 PFS proposed rule) (91 FR 44152 through 44154).

After consideration of the public comments we received, we are finalizing our proposal with the following modification: we are removing the Support Electronic Referral Loops by Sending Health Information and Support Electronic Referral Loops by Receiving and Reconciling Health Information measures beginning with the EHR reporting period in CY 2029, rather than beginning with the EHR reporting period in CY 2028 as proposed. After considering commenters' feedback, we

have determined that an additional year of planning is appropriate before these measures are removed.

5. Updates to the Electronic Prior Authorization Measure

a. Background

In the 2024 CMS Interoperability and Prior Authorization final rule (89 FR 8909 through 8927), we adopted the Electronic Prior Authorization measure under the Health Information Exchange objective in the Medicare Promoting Interoperability Program. We finalized that eligible hospitals and CAHs would be required to attest to the Electronic Prior Authorization measure beginning with the EHR reporting period in CY 2027 (89 FR 8910). We explained that for purposes of the Electronic Prior Authorization measure, a prior authorization request must be made using a Prior Authorization Application Programming Interface (API) using data from CEHRT to attest ''Yes'' to the measure, unless the eligible hospital or CAH claims an applicable exclusion. We finalized the following text for the measure description (89 FR 8916):

For at least one hospital discharge and medical item or service (excluding drugs) ordered during the EHR reporting period, the prior authorization is requested electronically via a Prior Authorization API using data from CEHRT.

• *Exclusions: Any eligible hospital or CAH that—*

++ *Does not order any medical items or services (excluding drugs) requiring prior authorization during the EHR reporting period.*

++ *Only orders medical items or services (excluding drugs) requiring prior authorization from a payer that does not offer an API that meets CMS's specified Prior Authorization API requirements during the applicable EHR reporting period.*

We finalized that only a ''Yes'' attestation, or claiming an applicable exclusion, fulfills the requirements of the measure. Additionally, we finalized that the measure will not be scored (that is, not assigned points for a ''Yes'' attestation) for the EHR reporting period in CY 2027 and a ''No'' attestation will result in the eligible hospital or CAH not meeting the measure. If an eligible hospital or CAH does not meet the measure, they would not meet minimum program requirements and be subject to a downward payment adjustment (89 FR 8911).

The 2024 CMS Interoperability and Prior Authorization final rule also finalized that Medicare Advantage plans, state Medicaid Fee-for-service (FFS) programs, state Children's Health Insurance Program (CHIP) FFS programs, Medicaid managed care plans, CHIP managed care entities, and Qualified Health Plans (QHP) issuers on the federally facilitated exchanges (collectively referred to as ''impacted payers'') must implement and maintain a Prior Authorization API beginning in CY 2027 (by January 1, 2027 for MA organizations and state Medicaid and CHIP FFS programs; by the first rating period beginning on or after January 1, 2027 for Medicaid managed care plans and CHIP managed care entities; and for plan years beginning on or after January 1, 2027 for individual market QHP issuers on the FFEs) (89 FR 8759 through 8760). In that rule we also recommended, rather than required, specific FHIR Implementation Guides (IGs) to support the APIs (89 FR 8937).

In the Health Data, Technology, and Interoperability: Electronic Prescribing, Real-Time Prescription Benefit and Electronic Prior Authorization final rule (HTI–4 final rule), which was published as part of the FY 2026 IPPS/LTCH PPS final rule (90 FR 37164 through 37182), ONC finalized three ONC health IT certification criteria for electronic prior authorization:

• ''Provider prior authorization API—coverage requirements discovery'' in 45 CFR 170.315(g)(31);

• ''Provider prior authorization API—documentation templates and rules'' in 45 CFR 170.315(g)(32); and

• ''Provider prior authorization API—prior authorization support'' in 45 CFR 170.315(g)(33).

These certification criteria are based on three IGs developed by the Health Level Seven® (HL7) Da Vinci project, which ONC adopted in the HTI–4 final rule [548] at 45 CFR 170.215(j)(1), (2), and (3):

• HL7 FHIR Da Vinci—Coverage Requirements Discovery (CRD) IG;

• HL7 FHIR Da Vinci—Documentation Templates and Rules (DTR) IG; and

• HL7 FHIR Da Vinci—Prior Authorization Support (PAS) IG.

Together, these certification criteria can enable electronic prior authorizations for health care providers. We refer readers to the HTI–4 final rule (90 FR 37162 through 37175) for a more detailed discussion of ONC's finalized certification criteria at 45 CFR 170.315(g)(31) through (33) and section XI.B.4.b (90 FR 36541 through 36542) of the same rule for a summary of all the finalized ONC policies.

We also recently released the ''Medicare and Medicaid Programs; Patient Protection and Affordable Care Act; Interoperability Standards and Prior Authorization for Drugs for Medicare Advantage Organizations, Medicaid Managed Care Plans, State Medicaid Agencies, Children's Health Insurance Program (CHIP) Agencies and CHIP Managed Care Entities, and Issuers of Qualified Health Plans on the Federally-Facilitated Exchanges'' proposed rule (2026 CMS Interoperability Standards and Prior Authorization for Drugs proposed rule). Among other policies, in the 2026 CMS Interoperability and Prior Authorization for Drugs proposed rule, we proposed to require impacted payers to implement and maintain Prior Authorization APIs that conform to the CRD, DTR, and PAS IGs adopted by ONC on behalf of the Secretary at 45 CFR 170.215(j)(1), (2), and (3) (91 FR 19908). We proposed an October 1, 2027 compliance date for impacted payers to conform to the proposed standards and IGs (impacted payers must still implement Prior Authorization APIs beginning in CY 2027) (91 FR 19908). Finally, in the 2026 CMS Interoperability Standards and Prior Authorization for Drugs proposed rule, ONC proposed to adopt updated versions of the CRD, DTR, and PAS IGs (91 FR 20002). In section X.E. of this final rule, ONC is finalizing the proposals to adopt updated versions of the health IT certification criteria at 45 CFR 170.315(g)(31), (32), and (33) so health IT developers implementing the functionality can utilize the latest versions of these specifications.

The proposals in the 2026 CMS Interoperability Standards and Prior Authorization for Drugs proposed rule for impacted payers to implement and maintain the Prior Authorization APIs using the CRD, DTR, and PAS IGs, along with the provisions ONC finalized in the HTI–4 final rule to adopt the CRD, DTR, and PAS IGs and establish electronic prior authorization certification criteria for health IT developers, collectively support the Electronic Prior Authorization measure for eligible hospitals and CAHs and advance interoperability by applying consistent standards across HHS programs. For more information, please see the 2026 CMS Interoperability Standards and Prior Authorization for Drugs proposed rule and the HTI–4 final rule for the three health IT certification criteria to support electronic prior authorization at 45 CFR 170.315(g)(31), (32), and (33) (90 FR 37169 and 91 FR 20002).

[548] In the 2026 CMS Interoperability Standards and Prior Authorization for Drugs proposed rule, ONC proposed updated versions of these implementation guides. Section X.E. of this final rule includes finalization of these proposals.

b. Modification of the Electronic Prior Authorization Measure Beginning With the EHR Reporting Period in CY 2027

In the FY 2027 IPPS/LTCH PPS proposed rule (91 FR 19625 through 19629), we proposed several changes to the Electronic Prior Authorization measure, reflected in the following modified text for the measure description:

For at least one medical item or service (excluding drugs) ordered during a hospital encounter that occurs within the EHR reporting period, the prior authorization is requested electronically through a Prior Authorization API using CEHRT.

As reflected in the text, we proposed to modify the measure description by revising the phrase ''using data from CEHRT'' to ''using CEHRT.'' In section IX.F.5.c of this final rule, we clarify the requirement to use health IT certified to specific certification criteria included in the definition of CEHRT for this measure. When we adopted the Electronic Prior Authorization measure, we did not identify specific ONC health IT certification criteria required to complete the actions specified in the measure (89 FR 8910 through 8915). We stated that gathering structured data from CEHRT would be achievable without additional certification criteria specific to the measure (89 FR 8925), which had not been proposed or finalized at the time we issued the 2024 CMS Interoperability and Prior Authorization final rule. The proposed update to the measure language to state that a prior authorization must be requested electronically ''using CEHRT'' is consistent with the availability of certified Health IT Modules that must be used to complete the action specified in the Electronic Prior Authorization measure.

We also proposed to change the word ''discharge'' to ''encounter'' to more clearly delineate that a prior authorization request may occur at any time during the hospital encounter, rather than be associated temporally with the discharge, about which some stakeholders had expressed confusion regarding the measure. We did not propose any modifications to the exclusion criteria previously finalized for the Electronic Prior Authorization measure (89 FR 8916). Nor did we propose any exclusions for the Electronic Prior Authorization measure for the EHR reporting period in CY 2027, as exclusions are unnecessary for optional measures, consistent with our proposal to make the Electronic Prior Authorization measure a bonus measure for the EHR reporting period in CY 2027.

We invited public comment on this proposal.

Comment: Several commenters supported CMS's proposed updates to the Electronic Prior Authorization measure text. Commenters specifically supported revising the measure language from ''hospital discharge'' to ''hospital encounter,'' stating that the change better reflects the intent of the measure and likely prior authorization workflows within eligible hospitals and CAHs. A few commenters also supported requiring the use of CEHRT for the measure, rather than ''data from CEHRT,'' and aligning the measure's technical requirements with ONC's electronic prior authorization certification criteria. These commenters stated that using consistent certification standards would support broader adoption, improve interoperability, and help streamline prior authorization workflows.

Response: We thank commenters for their support. We agree that revising the measure language from ''hospital discharge'' to ''hospital encounter'' better reflects the expectation that prior authorization activities may occur at any time during a patient's hospitalization. We also agree that the use of CEHRT and alignment with ONC health IT certification criteria will help establish a consistent technical foundation for the measure, support broader adoption of standards-based electronic prior authorization, and improve interoperability across eligible hospitals, CAHs, and payers.

Comment: Regarding the proposal to modify the measure to require the use of CEHRT, a few commenters appreciated the flexibility regarding the ability to utilize different combinations of certified Health IT Modules to meet the measure because they viewed it as a practical way to encourage real adoption of electronic prior authorization without making eligible hospitals or CAHs responsible for workflows or technical dependencies that may not yet be fully mature.

Response: We appreciate commenters' support for allowing eligible hospitals and CAHs to use a combination of functionality found in one or more of the ONC health IT certification criteria at 45 CFR 170.315(g)(31), (32), and (33) to meet measure requirements and agree this provides practical flexibility at this time while these functionalities continue to be integrated into EHRs. For instance, we expect that many health IT developers may choose to initially focus on development and deployment of health IT certified to the ''provider prior authorization API—coverage requirements discovery'' criterion in 45 CFR 170.315(g)(31). Under the measure we are finalizing through this final rule, eligible hospitals and CAHs could use health IT certified to this criterion to complete a prior authorization request and satisfy the measure.

Although we are finalizing the proposals for the EHR reporting periods in CY 2027 and 2028 in this final rule, we are very strongly considering advancing the use of available certified health IT in rulemaking in the FY 2028 IPPS/LTCH PPS proposed rule by proposing to require the use of functionality found in each of the three ONC health IT certification criteria at 45 CFR 170.315(g)(31), (32), and (33) beginning with the CY 2028 EHR reporting period. This would be in alignment with the proposed CY 2028 performance period/2030 MIPS payment year requirements for the Electronic Prior Authorization measure for MIPS eligible clinicians in the CY 2027 PFS proposed rule (91 FR 44176 through 44182).

Comment: Several commenters opposed changing the measure language from ''using data from CEHRT'' to ''using CEHRT.'' Commenters stated that hospitals often rely on multiple systems, including EHRs, revenue cycle systems, payer portals, clearinghouses, HIEs, intermediaries, and other tools to facilitate a prior authorization request, and that a narrow ''using CEHRT'' requirement could limit practical software implementation options, increase burden, and force duplicative connections across systems. Commenters recommended that CMS retain the current ''using data from CEHRT'' language and clarify that hospitals may use standards-based intermediaries or other interoperable solutions to support electronic prior authorization workflows, provided that relevant data from CEHRT are used and privacy, security, and auditability requirements are met. Commenters also noted that adopting new FHIR IGs, conforming to ONC certification criteria, building and testing interfaces, and aligning with payer implementation timelines may require substantial lead time and would impact eligible hospitals' and CAHs' ability to fulfill the measure.

Response: We appreciate commenters' concerns regarding the proposed change from ''using data from CEHRT'' to ''using CEHRT.'' We recognize that electronic prior authorization workflows may involve multiple systems and entities, including EHRs, revenue cycle systems, payer systems, clearinghouses, intermediaries, HIEs, and other technology solutions. Our intent is not to prohibit the use of standards-based

intermediaries or other interoperable tools that support the electronic prior authorization workflow. Rather, the measure is intended to ensure that eligible hospitals and CAHs conduct the measure action using standards-based health IT functionality certified to ONC's electronic prior authorization certification criteria. We note that eligible hospitals and CAHs may use any combination of Health IT Modules to fulfill the measure action. Moreover, nothing in our proposal prohibits intermediaries from supporting electronic prior authorization exchange in other ways separate from the capabilities reflected in the electronic prior authorization certification criteria. As discussed in section IX.F.5.d, we are finalizing our proposal to make the measure a bonus measure for the EHR reporting period in CY 2027, which will help to address commenters' concerns regarding additional flexibility for initial implementation lead time, interface testing, and payer readiness.

Comment: A commenter did not support the proposed updates to the Electronic Prior Authorization measure description because they wanted several clarifications regarding its requirements. The commenter noted that electronic prior authorizations are often initiated during inpatient stays for post-discharge services, creating ambiguity about which services would be captured and how orders and authorizations would be attributed across eligible hospitals, CAHs, clinics, and health systems. The commenter requested clear numerator and denominator definitions and stated that it would be difficult for eligible hospitals and CAHs to operationalize and demonstrate compliance with the measure without them. The commenter also urged CMS to ensure that payers share responsibility for meeting technology standards, warning that hospitals could otherwise face increased vendor and payer-specific costs without improved efficiency. The commenter recommended that CMS clarify its intent, provide detailed use cases, and consider retaining the ''discharge'' measure text rather than changing to ''encounter.''

Response: We agree that electronic prior authorization workflows may vary depending on the service and care setting. We proposed the change from ''hospital discharge'' to ''hospital encounter'' because electronic prior authorization activities may occur at any time during an encounter and are not always tied solely to the discharge event. Discharge is still an eligible moment within the hospital encounter to request a prior authorization. We will provide educational and guidance resources, as appropriate and feasible, to clarify implementation details. We disagree with the commenter that the measure is not feasible absent a numerator/denominator format because attestation-based measures are typically less complicated to implement and report as an initial measure. However, we agree that clarity is important regarding which actions constitute a successful prior authorization request for purposes of attestation, as discussed in the following comment response. We agree that a numerator/denominator measure could be a meaningful next step in the program to monitor the progress of electronic prior authorization. In response to the commenter urging CMS to ensure that payers share responsibility for meeting technology standards, as proposed in the 2026 CMS Interoperability Standards and Prior Authorization for Drugs proposed rule (91 FR 19908), payers impacted by that regulation would need to use the same standards required for health IT certification criteria beginning on October 1, 2027.

Comment: A few commenters requested clarification on what constitutes a successful prior authorization request for purposes of attestation, including whether a request should count as successful when a payer responds that no prior authorization is required and whether the same treatment should apply for drug prior authorization requests. A commenter asked CMS to clarify whether a request is satisfied when a request is made and a response is received, or only when additional information is subsequently submitted to the payer. Another commenter recommended that CMS should permit fulfillment of the measure by using CEHRT to conduct a check for whether an item or service requires prior authorization for only CY 2027, after which time only a full prior authorization request should count to satisfy the measure.

Response: We appreciate commenters' requests for clarification regarding what constitutes a successful electronic prior authorization action for purposes of the measure. At this time, prior authorization for drugs covered under a medical benefit is not within the scope of this measure, nor prior authorization for drugs covered under a prescription benefit. In addition, any medical item or service that does not require prior authorization by the payer is not within the scope of the measure. In other words, it is necessary for the measure that the need for prior authorization for the medical item or service has been established. For example, if an eligible hospital or CAH submits a query through the Prior Authorization API as to whether prior authorization is needed for a particular medical item or service, and the payer response is that prior authorization is not needed, then this scenario is not within the scope of the measure. While an important step, we disagree that the measure in CY 2027 should be limited to the action of querying whether a prior authorization is needed or not for a medical item or service.

Further, to successfully meet measure requirements, where the measure description requires that ''a prior authorization is requested electronically through a Prior Authorization API,'' an eligible hospital or CAH must first query a Prior Authorization API to request the prior authorization. According to the Da Vinci IGs, the eligible hospital or CAH that queries a payer's Prior Authorization API will receive a response to the prior authorization request such as: *covered = not-covered* (*i.e.,* no coverage or possibility of coverage); *pa-needed = no-auth* (*i.e.,* service is covered and does not require prior authorization); *pa-needed = satisfied* (*i.e.,* prior authorization required, conditions evaluated, and authorization can be bypassed); *conditional* (*i.e.,* the payer cannot yet determine coverage, prior authorization, or documentation requirements); and *pa-needed = auth-needed* (*i.e.,* a prior authorization request is required, so the workflow can proceed through DTR and PAS until it is ultimately complete, having been approved or denied). To attest ''Yes'' for the measure in CY 2027, a request made using CEHRT by an eligible hospital or CAH must result in a satisfied, approved, or denied request.

For CY 2027, based on the complexity of the medical item or service and the payer's particular documentation requirements for the prior authorization request, the prior authorization request may be fulfilled using one or more of the certification criteria at 45 CFR 170.315(g)(31)–(33). For CY 2028 and beyond, as we noted above, we are very strongly considering returning to rulemaking in the FY 2028 IPPS/LTCH PPS proposed rule in order to align our requirements with the CY 2028 requirements proposed for MIPS eligible clinicians in the CY 2027 PFS proposed rule. Specifically, in the CY 2027 PFS proposed rule (91 FR 44178), there is a proposal to require the use of functionality when submitting a prior authorization request that is based on a complete prior authorization workflow, as reflected in the combined use of all three ONC health IT certification criteria at 45 CFR 170.315(g)(31), (32), and (33)

for the CY 2028 performance period/2030 MIPS payment year.

Comment: A commenter did not support this proposal and instead recommended that CMS should preserve flexibility for hospitals to receive credit when electronic prior authorization transactions use data from CEHRT, rather than conditioning successful participation on certification or API-version requirements that may not yet be fully testable or broadly available. A commenter expressed concern with the timeline of the requirement, noting that eligible hospitals, CAHs, and payers are currently investing in version 2.1 implementation and that CRD 2.2 test tools were released in early June 2026, and stated that 12 to 18 months are needed for development, certification, and deployment. The commenter stated that most eligible hospitals and CAHs would not be using version 2.2 until late 2027 or 2028, so the use of certified Health IT Modules within CEHRT would not be achievable for many eligible hospitals and CAHs. The commenter recommended CMS revert to the previous language for 2027, requiring that electronic prior authorization transactions use data from a certified EHR, rather than requiring use of a certified API specifically, noting that this approach would maintain momentum on electronic prior authorization implementation by allowing hospitals actively conducting electronic prior authorization transactions on version 2.1 to earn bonus points while the industry works toward adopting version 2.2.

Response: We recognize that some eligible hospitals and CAHs may face barriers to deploying technology certified to certification criteria at 45 CFR 170.315(g)(31)–(33), which will require use of version 2.2 of the Da Vinci IGs. We took this into consideration when developing our proposal to modify the Electronic Prior Authorization measure as an optional bonus measure for the EHR reporting period in CY 2027. Finalizing the measure as an optional measure for the EHR reporting period in CY 2027 allows eligible hospitals and CAHs to explore electronic prior authorization transactions using version 2.2 of the Da Vinci IGs in 2027 without imposing immediate requirements that could create challenges for entities that have not yet deployed CEHRT, which will be required to use version 2.2 of the Da Vinci IGs as part of ONC Health IT Certification Program requirements.

For more information about the standards required for health IT developers certifying Health IT Modules to the electronic prior authorization criteria in 45 CFR 170.315(g)(31)–(33), see section X.E. of this final rule, in which ONC has adopted version 2.2.1 of the CRD and PAS IGs, and version 2.2.0 of the DTR IG and finalized to replace previously adopted versions upon the effective date of the final rule. The effect of the policies ONC has finalized in section X.E. is that these versions of the IGs will be the only versions health IT developers may use to meet the electronic prior authorization certification criteria as of the effective date of this final rule.

Comment: A few commenters recommended that CMS include drugs as counting toward the Electronic Prior Authorization measure and align any such changes with CMS's payer Prior Authorization API requirements for drugs, stating that drugs administered during hospital stays, including certain cancer therapies typically administered in outpatient settings, could benefit from improved electronic prior authorization timeliness.

Response: We appreciate commenters' recommendations regarding drugs. We recognize that prior authorization for drugs, including drugs administered during hospital stays or in connection with cancer care, may affect timely access to care. At this time, prior authorization for drugs covered under a medical benefit are not within the scope of this measure, nor prior authorization for drugs covered under a prescription benefit. We will take these recommendations into consideration for future rulemaking. We also note that for the MIPS Promoting Interoperability performance category in the CY 2027 PFS proposed rule, we are proposing to adopt a new measure, Electronic Prior Authorization for Prescription Drugs, beginning with the CY 2028 performance period/2030 MIPS payment year (91 FR 44174).

Comment: A commenter requested that CMS allow EHR products used for the Electronic Prior Authorization measure to achieve certification by the last day of the applicable EHR reporting period, consistent with CMS's prior practice. The commenter stated that this flexibility is important for newly proposed measures because technology may be deployed during the performance period while certification remains pending.

Response: We appreciate the commenter's request regarding certification timing. We recognize that new measures may require development, testing, deployment, and certification activities during the EHR reporting period. We confirm that we continue to allow health IT vendors to certify their products by the last day of the relevant EHR reporting period and this practice would still fulfill CMS's expectations with respect to use of CEHRT.

Comment: A commenter recommended that CMS provide additional incentives for eligible hospitals and CAHs and clear interoperability requirements for EHR vendors to ensure that eligible hospitals and CAHs can consistently use and benefit from future electronic prior authorization infrastructure.

Response: We agree that successful implementation depends on alignment among eligible hospitals, CAHs, health IT developers, and payers. However, we did not propose, and therefore are not establishing, additional incentives for this measure beyond the Medicare Promoting Interoperability Program policies finalized in this rule. Interoperability requirements for health IT developers are directly addressed through the voluntary ONC Health IT Certification Program.

Comment: A commenter stated that CMS had not specified how hospitals and CAHs would document, for audit purposes, which certified Health IT Modules were used to satisfy the Electronic Prior Authorization measure, creating implementation uncertainty for hospitals, health IT developers, physicians, and hospital staff. The commenter warned that new or unclear documentation requirements could shift additional administrative burden onto the same personnel expected to use the certified technology, undermining the measure's burden reduction goals. The commenter recommended that CMS and ONC rely on existing Certified Health IT Product List information and standard CEHRT documentation rather than creating new electronic prior authorization record keeping requirements, and that CMS issue sub-regulatory guidance before the effective date. The commenter also recommended that ONC regularly publish information on certified Health IT Module availability and deployment so stakeholders can determine whether the technology environment is ready for the measure's implementation timeline.

Response: We agree that documentation requirements should support program integrity without creating unnecessary recordkeeping burden. As with other measures under the program, eligible hospitals and CAHs should indicate the certified health IT that they used to complete the measures and objectives of the Medicare Promoting Interoperability Program as part of the CMS EHR Certification ID submitted to meet program

requirements. Eligible hospitals and CAHs that report on the Electronic Prior Authorization measure for the EHR reporting period in CY 2027 should include Health IT Modules certified to one or more of the electronic prior authorization criteria in 45 CFR 170.315(g)(31)–(33) that they used to complete the measure as part of their CMS EHR Certification ID. We also intend to continue coordinating with ONC regarding transparency into certified Health IT Module availability so that CMS can monitor progress around deployment of these capabilities.

Comment: A commenter recommended that CMS consider the operational impact of future electronic prior authorization requirements on rural eligible hospitals and CAHs. The commenter stated that many rural hospitals face interoperability and infrastructure barriers outside their control and that imposing additional requirements around interoperability, reporting, or electronic performance before ensuring consistent payer standardization and functionality could disproportionately burden rural hospitals with limited staffing, financial resources, and health IT infrastructure.

Response: We appreciate the concerns regarding rural eligible hospitals and CAHs and recognize that rural hospitals may face resource, staffing, infrastructure, connectivity, and interoperability challenges that affect the implementation of electronic prior authorization. We believe the phased approach for the Electronic Prior Authorization measure, including making the measure optional for the initial year as discussed in section IX.F.5.d of this final rule, helps mitigate burden while allowing eligible hospitals, CAHs, and health IT vendors additional time to prepare. We will continue to monitor implementation experience and consider whether additional guidance, flexibility, or future policy refinements are needed for eligible hospitals and CAHs. We also note our previously stated belief (89 FR 8862) that making the prior authorization process electronic will reduce the time and burden associated with manual prior authorization processes, allowing providers to devote more time to direct patient care, and that this adoption of electronic prior authorization ultimately will reduce provider burnout.

Comment: A commenter recommended that CMS require the ''using CEHRT'' standard as the sole compliance path, with the standard anchored to the finalized versions of the Coverage Requirements Discovery, Documentation Templates and Rules, and Prior Authorization Support IGs.

Response: We thank the commenter for the recommendation, which is in line with the policy being finalized. Our proposal was designed to allow eligible hospitals and CAHs to leverage various certified health IT capabilities, ensuring they can choose the solutions that best fit their operational needs. We remain committed to supporting adaptable approaches that promote participation while minimizing burden for the EHR reporting period in CY 2027, and we will continue to adapt our policies as necessary as hospitals' electronic prior authorization capabilities mature. We note that we are very strongly considering returning to rulemaking in the FY 2028 IPPS/LTCH PPS proposed rule in order to align our requirements to match the proposed requirements for MIPS eligible clinicians in the CY 2027 PFS proposed rule, which proposes to require the use of functionality found in each of the three ONC health IT certification criteria at 45 CFR 170.315(g)(31), (32), and (33) for CY 2028.

After consideration of the public comments we received, we are finalizing our proposal to modify the text in the measure description to the following:

For at least one medical item or service (excluding drugs) ordered during a hospital encounter that occurs within the EHR reporting period, the prior authorization is requested electronically through a Prior Authorization API using CEHRT.

We also note that in addition to our finalization of the proposals in this final rule, we are very strongly considering further modifying the Electronic Prior Authorization measure in the FY 2028 IPPS/LTCH PPS proposed rule to propose aligning our requirements with the proposed modifications for MIPS eligible clinicians in the CY 2027 PFS proposed rule, if finalized. This would include a proposal to revise the measure to focus on submitting a prior authorization request based on a complete prior authorization workflow as reflected in the combined use of the functionality found in each of the three ONC health IT certification criteria at 45 CFR 170.315(g)(31), (32), and (33) for CY 2028 (91 FR 44178).

c. Health IT Certification Criteria To Support the Electronic Prior Authorization Measure

In the FY 2027 IPPS/LTCH PPS proposed rule (91 FR 19626), we discussed specifying the use of health IT certified to these certification criteria as required for the Electronic Prior Authorization measure in light of our proposal that an electronic prior authorization must be requested using CEHRT to satisfy the Electronic Prior Authorization measure as well as the finalization of health IT certification criteria in 45 CFR 170.315(g)(31), (32), and (33) in the HTI–4 final rule. We affirm the same approach in this final rule now that we are finalizing those proposals. Use of certified health IT to support electronic prior authorization transactions included in the measure would ensure that eligible hospitals and CAHs have standards-based capabilities within their health IT systems to interact with Prior Authorization APIs established by impacted payers and successfully complete the measure.

As discussed above, the three certification criteria are based on the HL7 Da Vinci CRD, DTR, and PAS IGs, and address different parts of the electronic prior authorization workflow. The ''provider prior authorization API—coverage requirements discovery'' in 45 CFR 170.315(g)(31) enables a health care provider to request information from payers about coverage requirements. Where further information is needed to support a prior authorization request, the ''provider prior authorization API—documentation templates and rules'' criterion in 45 CFR 170.315(g)(32) provides a mechanism for clinicians and other EHR users to navigate and quickly assemble the information needed to support a prior authorization request according to a payer's requirements. Finally, the ''provider prior authorization API—prior authorization support'' in 45 CFR 170.315(g)(33) enables submission of prior authorization requests from health IT systems as well as checking the status of a previously submitted request. By finalizing each component of the workflow as a separate certification criterion, ONC sought to support a more dynamic health IT marketplace in which a health IT developer could develop Health IT Modules demonstrating conformance to all three IGs or focus on a specific element or elements (90 FR 37169).

Different prior authorization scenarios that allow an eligible hospital or CAH to successfully attest to the Electronic Prior Authorization measure may require the functionality of one, or more than one, Health IT Modules certified to the criteria in 45 CFR 170.315(g)(31), (32), and (33). For instance, an eligible hospital or CAH could successfully report on the measure using CEHRT that only includes a Health IT Module certified to the ''provider prior authorization API—coverage requirements discovery'' criterion in 45 CFR 170.315(g)(31). Consider a

hypothetical scenario in which a Medicare Advantage (MA) enrollee has stable coronary artery disease and new exertional dyspnea (feeling shortness of breath during physical exertion). The beneficiary's cardiologist, working in an eligible hospital or CAH, wants to order an outpatient transthoracic echocardiogram (TTE) to assess left ventricular function and valvular disease. When the cardiologist places an order for a TTE in the EHR, a Health IT Module certified to the ''provider prior authorization API—coverage requirements discovery'' criterion (45 CFR 170.315(g)(31)) automatically sends a real-time query to the beneficiary's MA plan endpoint to determine whether prior authorization is required for the requested service (the TTE) and, if so, what documentation is needed. The MA plan returns a CRD response (via CDS Hooks ''card'' [549]) indicating that prior authorization is necessary and has been approved under the beneficiary's plan benefits and network status, including information such as the prior authorization number and assumed billing codes.

In this hypothetical scenario, the prior authorization request is satisfied using only the capabilities represented with the ''provider prior authorization API—coverage requirements discovery'' certification criterion (45 CFR 170.315(g)(31)). The health care provider submitted a query for prior authorization, the payer responded that prior authorization was required, the prior authorization was approved, and the health care provider received a response indicating this approval from the payer using the payer's API. In this case, the receipt of an approval indicates that the health care provider effectively submitted a request for prior authorization, consistent with the requirements of the Electronic Prior Authorization measure.

However, in other scenarios, the initial prior authorization query from a health care provider to a payer could result in a response indicating the need for additional information before a determination as to whether prior authorization is approved or denied can be provided, based on the coverage requirements identified. Additional certified Health IT Modules supporting additional elements of the electronic prior authorization workflow would then need to be used to submit the prior authorization request after collecting the necessary documentation.

[549] A CDS Hooks card is a user-facing, real-time alert or suggestion returned by a Clinical Decision Support (CDS) service to an EHR in response to a specific clinical event. See *https://cds-hooks.org/* for additional information.

Consider another hypothetical scenario where an MA enrollee has been diagnosed with metastatic colorectal cancer. The beneficiary's oncologist, working in an eligible hospital or CAH, has ordered a PET–CT scan and immunotherapy infusion. In this scenario, the oncologist places the order for a PET–CT scan and immunotherapy infusion in the EHR, which is certified to the ''provider prior authorization API—coverage requirements discovery'' criterion (45 CFR 170.315(g)(31)) and automatically queries the beneficiary's MA plan's FHIR API. The EHR receives a response via CDS Hooks card indicating that prior authorization is required for both services and describes coverage criteria and documentation needs. Because the EHR is also certified to 45 CFR 170.315(g)(32), the certified health IT enables the oncologist to complete prior authorization following the DTR IG. An embedded SMART on FHIR app fetches the payer's specific documentation template and rules for oncology prior authorizations. For the PET–CT, the payer's documentation rules ask for the cancer staging information and previous imaging results; for immunotherapy, the payer's documentation rules require the patient's biomarker (for example, PD–L1 expression) status, prior treatment history, and recent lab results. Much of this information can be auto populated because the embedded DTR app uses Clinical Quality Language (CQL) logic and FHIR queries to pull the beneficiary's latest CT scan report and lab results from their medical record, and it confirms her cancer diagnosis and stage from the problem list. The oncologist answers a few additional questions (such as confirming the beneficiary has no contraindications and that a required biomarker test was positive) within the embedded DTR app. By the end of this step, the EHR has compiled all necessary supporting documentation for the prior authorization, ensuring the request will be complete.

Next, the oncologist's office submits the prior authorization request electronically using the capabilities under the ''provider prior authorization API-prior authorization support'' criterion (45 CFR 170.315(g)(33)) to bundle the request and documentation and send it to the MA plan's prior authorization endpoint. This bundle is transmitted via a FHIR RESTful interaction to the payer, as defined by the PAS IG. The EHR's certified Health IT Module ensures the request conforms to the required FHIR structure and sends it securely. Because all required information was provided up front and matched the plan's coverage criteria, the MA plan's system could potentially automatically adjudicate and approve the requests in near real-time. If that happened, the oncologist could now schedule the beneficiary's therapy without delay, confident that the services are covered.

Both scenarios described result in a prior authorization request that successfully satisfies the action required by the proposed Electronic Prior Authorization measure and therefore would allow the eligible hospital or CAH to successfully report the measure. However, each example utilized different combinations of Health IT Modules certified to electronic prior authorization certification criteria in 45 CFR 170.315(g)(31), (32), and (33). In the first scenario, the health care provider used a Health IT Module certified to the ''provider prior authorization API—coverage requirements discovery'' criterion (45 CFR 170.315(g)(31)) to complete actions necessary for the eligible hospital or CAH to successfully attest ''Yes'' to the measure. In the second scenario, the health care provider used Health IT Modules certified to all three of the electronic prior authorization certification criteria to complete all actions for the eligible hospital or CAH to successfully attest ''Yes'' to the measure.

Consistent with these hypothetical examples, we note that an eligible hospital or CAH would be able to successfully attest to the measure using only those certified Health IT Modules necessary for the eligible hospital or CAH to complete the measure. Eligible hospitals and CAHs would not be required to adopt additional electronic prior authorization certified Health IT Modules if they are not needed for the purposes of successfully reporting the measure. We expect that the ability to utilize different combinations of certified Health IT Modules to meet the measure will afford eligible hospitals, CAHs, and health IT developers flexibility in how they deploy, adopt, and use different aspects of certified health IT functionality for electronic prior authorization. We note that we are very strongly considering returning to rulemaking in the FY 2028 IPPS/LTCH PPS proposed rule in order to align our requirements to match the proposed requirements for MIPS eligible clinicians in the CY 2027 PFS proposed rule, which proposes to revise the measure to focus on submitting a prior authorization request based on a complete prior authorization workflow as reflected in the combined use of all three ONC health IT certification criteria

at 45 CFR 170.315(g)(31), (32), and (33) for CY 2028 (91 FR 44178).

d. Finalization of the Electronic Prior Authorization Measure as a Bonus Measure for the EHR Reporting Period in CY 2027

In the FY 2027 IPPS/LTCH PPS proposed rule (91 FR 19627 through 19628), we proposed to modify our previously finalized requirement that an eligible hospital or CAH must report the Electronic Prior Authorization measure to be considered a meaningful EHR user for the EHR reporting period in CY 2027 (89 FR 8911). We stated that, for multiple reasons, eligible hospitals and CAHs may need additional time and flexibility before requiring the Electronic Prior Authorization measure. First, we stated that we recognized that eligible hospitals, CAHs, and health IT developers will need additional time for procurement, integration, and testing to operationalize standards-based electronic prior authorization capabilities that support the Electronic Prior Authorization measure. Second, we stated that stakeholders have indicated that achieving widespread implementation and routine use of these capabilities in CY 2027 may be challenging, particularly for small, rural, and otherwise under-resourced eligible hospitals and CAHs. Third, we stated that we expected additional implementation complexity for eligible hospitals, CAHs, and their vendors due to proposed changes in Prior Authorization API standards requirements that would occur in CY 2027. For these reasons, we stated that we believed that a year of optional reporting will both incentivize adoption of CEHRT through bonus points and offer flexibility to those hospitals and CAHs that could benefit from additional time to test, implement, and deploy CEHRT functionality necessary to support electronic prior authorization.

Therefore, we proposed to make the Electronic Prior Authorization measure, with the proposed measure updates, optional and eligible for 10 bonus points for eligible hospitals and CAHs that attest ''Yes'' to the measure for the EHR reporting period in CY 2027. We stated that allocating 10 bonus points is an appropriate and effective incentive to promote the adoption and use of certified technology for requesting electronic prior authorizations among eligible hospitals and CAHs. An eligible hospital or CAH attesting ''No'' will not earn any bonus points, but attesting ''No'' will also not result in the eligible hospital or CAH failing to meet the measure, and, therefore, failing to meet minimum program requirements and not being considered a meaningful EHR user for the EHR reporting period in CY 2027. This proposal was a modification to the policy we adopted for this measure in the 2024 CMS Interoperability and Prior Authorization final rule (89 FR 8911). We stated that optional reporting for the first year is particularly important for small, rural, or otherwise under-resourced eligible hospitals and CAHs navigating new measure requirements while minimizing and balancing burden.

Exclusions would not be available for the Electronic Prior Authorization measure for the EHR reporting period in CY 2027, as exclusions are unnecessary for optional measures. Only those eligible hospitals and CAHs that attest ''Yes'' to the measure would receive the 10 bonus points. Given the time eligible hospitals and CAHs have had to become familiar with the Electronic Prior Authorization measure since the 2024 Interoperability and Prior Authorization final rule, we believe making this an optional bonus measure solely for the EHR reporting period in CY 2027 would provide eligible hospitals and CAHs enough time to adopt and begin utilizing the certified health IT necessary to successfully report the Electronic Prior Authorization measure.

We invited public comment on these proposals.

Comment: Many commenters supported the proposal stating that, given the limitations of EHR vendors' current software functionality and the complexity of implementation, additional time is needed to implement the required APIs and IGs to enable prior authorization workflows. Several commenters described it as an appropriate phased approach for eligible hospitals, CAHs, and vendors to implement and test the prior authorization APIs, modify workflows, update policies, train staff, and troubleshoot technical and operational challenges to ensure successful functionality prior to required reporting of the measure. A few commenters agreed that one year of reporting as a bonus measure is sufficient time to test the Prior Authorization APIs, modify workflows as needed, update policies, train staff, and address technical and operational challenges to ensure successful functionality of systems prior to required reporting of the Electronic Prior Authorization measure. A commenter also noted that electronic prior authorization will result in more efficient care while maintaining appropriate controls to prevent fraud. Another commenter supported the proposal stating that current health IT certification criteria support different parts of the electronic prior authorization process separately, including discovery of coverage requirements, and that depending on the service, payer, and clinical scenario, hospitals may need different combinations of certified Health IT Modules to complete a full electronic prior authorization workflow.

Response: We thank commenters for their support. We agree that the additional time prior to this measure becoming required provides eligible hospitals and CAHs the flexibility and stability they may need to develop and update their systems and coordinate with their EHR vendors as necessary. We agree that one year of reporting as a bonus measure is sufficient time to test the Prior Authorization APIs, modify workflows as needed, update policies, train staff, and address technical and operational challenges to ensure successful functionality of systems prior to required reporting of the Electronic Prior Authorization measure.

Comment: A few commenters supported the proposal due to concerns about the disproportionate burden the measure may impose on small, rural, or under-resourced hospitals, and stated these entities would benefit from the additional time to manage the complexities of implementation. A commenter stated that small hospitals have unique challenges to electronic prior authorization implementation such as managing staffing shortages, new transitions from manual to electronic workflows, limited payer coordination, and inadequate technical resources to drive these changes. The commenter expressed appreciation for the proposal, noting that it will support meaningful adoption of the measure while reducing the burden on small facilities. Another commenter expressed concern with the impact on smaller facilities, citing that smaller hospitals, rural hospitals, CAHs, and independent organizations may not have the same health IT vendor relationships, payer connectivity, or technical infrastructure that is available to larger health systems.

Response: We thank commenters for their support. One reason we proposed the Electronic Prior Authorization measure as a bonus measure for the EHR reporting period in CY 2027 rather than a required measure is because requiring the measure may have otherwise caused undue hardship for small, rural, or under-resourced eligible hospitals and CAHs. We agree that the additional time provides eligible small, rural and under-resourced hospitals and CAHs the additional flexibility they may need to develop and update their systems and

coordinate with their EHR vendors given the unique challenges they may face in implementing electronic prior authorization workflows.

Comment: Several commenters who supported the proposal offered recommendations for consideration. A commenter recommended CMS continue evaluating implementation timelines, specifically payer readiness and alignment with ONC-certified Health IT Module availability. The commenter noted, for example, that current payer implementation timelines for the Da Vinci version 2.2 standards may result in eligible hospitals and CAHs having limited reporting periods in the initial implementation year and create operational challenges during the transition. A few commenters recommended that CMS continue to keep the Electronic Prior Authorization measure as a bonus measure through the EHR reporting period in CY 2028. A commenter recommended CMS delay mandatory reporting until CY 2029 or later to allow hospitals adequate time for configuration, testing, and training, and recommended CMS focus on medical services initially and not expand the measure to include other categories, such as drugs. Another commenter recommended that CMS explicitly limit the Electronic Prior Authorization measure bonus reporting period to only the EHR reporting period in CY 2027 and clearly state that this is an optional, incentive-based approach that will not be extended beyond that year. The commenter noted that explicitly stating that the bonus period is time-limited reinforces CMS's expectation that electronic prior authorization will become a standard, required capability rather than a permanently optional measure, and that this would further support operational planning, promote timely adoption of certified technology, and maintain the credibility of the electronic prior authorization measure. A commenter recommended CMS keep its requirements consistent across CMS programs and ONC certification criteria so that developers can build once and deploy across settings rather than maintain duplicative implementations. Another commenter expressed concern that engagement with electronic modalities is heavily reliant on the payers and health IT vendors' capacities to implement these provisions, and they recommended CMS avoid adopting mandatory measures where the activity being evaluated is novel. The commenter also recommended that CMS continue to provide flexibility during implementation and closely monitor payer readiness and technology adoption across the industry before finalizing mandatory reporting requirements, noting that successful electronic prior authorization depends not only on eligible hospital and CAH capabilities, but also on the readiness of health plans, technology vendors, and other industry partners to support these transactions in a consistent and reliable manner.

Response: We thank commenters for their support and recommendations. We note we proposed that the Electronic Prior Authorization measure would be a bonus measure for only the CY 2027 EHR reporting period. Continuing to improve the interoperability of health information exchange by enabling eligible hospitals and CAHs to have more reliable data and provide timely, efficient care are key goals of the Medicare Promoting Interoperability Program. We will continue to monitor technological advancements and strive to maintain the consistency, flexibility, and stability of our policies, and note that one year of reporting as an optional bonus measure provides sufficient time for eligible hospitals and CAHs to successfully deploy and test EHR upgrades by working with vendors, and to address any current challenges to electronic prior authorization implementation. Regarding commenters' feedback about keeping requirements consistent across CMS programs and ONC certification criteria, we reiterate that we will continue to work closely with ONC to evaluate implementation timelines, payer readiness, and alignment with ONC certification criteria availability.

Comment: A commenter recommended that CMS adopt the same optional bonus measure timeline for MIPS-eligible clinicians in CY 2027, citing that alignment across programs would reduce implementation burden for vendors supporting both hospital and ambulatory settings and minimize confusion for clinicians who practice across care settings.

Response: We thank the commenter for their feedback. We plan to continue to work within CMS to evaluate measure implementation timelines and cross-program alignment to streamline requirements where possible. We note in the CY 2027 PFS proposed rule (91 FR 44177), we made a similar proposal that the Electronic Prior Authorization measure would be a bonus measure for only the CY 2027 performance period/2029 MIPS payment year for the MIPS Promoting Interoperability performance category. We note that we are very strongly considering returning to rulemaking in the FY 2028 IPPS/LTCH PPS proposed rule in order to align our requirements to match the proposed requirements for MIPS eligible clinicians in the CY 2027 PFS proposed rule, which proposes to revise the measure to focus on submitting a prior authorization request based on a complete prior authorization workflow as reflected in the combined use of all three ONC health IT certification criteria at 45 CFR 170.315(g)(31), (32), and (33) for CY 2028 (91 FR 44178).

Comment: A commenter stated that the 2024 CMS Interoperability and Prior Authorization final rule allows up to seven calendar days for standard requests, which in the commenter's experience, is too slow for inpatient and other time-sensitive care. The commenter recommended CMS require payer responses within 72 hours for standard requests and within 24 hours for emergent or expedited requests, noting that FHIR-based APIs and automated adjudication make these timelines feasible. The commenter expressed that if payers can use automation to deny requests quickly, they can also use it to approve them quickly, and that patients should not bear the consequences of payer inefficiency.

Response: We thank the commenter for the recommendation. We did not propose to modify the decision timeframes for impacted payers, as this rulemaking concerns eligible hospitals and CAHs participating in the Medicare Promoting Interoperability Program and does not include proposals for impacted payers.

Comment: A few commenters supported the proposal and stated that it would help ease administrative burden. A commenter supported the proposal, noting that it would reduce implementation burden and improve the likelihood of the long-term success of electronic prior authorization as eligible hospitals, CAHs, payers, and health IT vendors move toward standardized electronic prior authorization workflows.

Response: We thank commenters for their support. We agree that the additional time to ensure proper implementation of electronic prior authorization workflows will reduce burden by providing flexibility to those eligible hospitals and CAHs that could benefit from additional time to test, implement, and deploy CEHRT functionality necessary to support electronic prior authorization.

Comment: A few commenters did not support this proposal. A commenter recommended keeping mandatory reporting of the measure for the EHR reporting period in CY 2027 and

including it as a scored measure in the Medicare Promoting Interoperability Program, noting the importance of advancing the adoption of electronic prior authorization because it would drive improvements in reducing cost through more efficient and timely health care, lower administrative burden, and help prevent unsafe, low-value care. The commenter stated that the measure should be mandatory because a voluntary measure will not be a meaningful incentive to eligible hospitals and CAHs.

Response: While we understand the importance of providing timely incentives to drive the adoption of electronic prior authorization, one year of optional reporting of the measure would not delay or impede the progress eligible hospitals and CAHs have made in implementation of electronic prior authorization workflows. We proposed the Electronic Prior Authorization measure would be a bonus measure for only the EHR reporting period in CY 2027 to both incentivize adoption of CEHRT through bonus points and offer flexibility to those hospitals and CAHs that could benefit from additional time to test, implement, and deploy CEHRT functionality necessary to support electronic prior authorization. Finalizing the measure as an optional measure for the EHR reporting period in CY 2027 allows eligible hospitals and CAHs to explore electronic prior authorization transactions using version 2.2 of the Da Vinci IGs underlying the certification criteria in 2027 without imposing immediate requirements that could create challenges for entities that have not yet deployed CEHRT, which will be required to use version 2.2 of the Da Vinci IGs as part of ONC Health IT Certification Program requirements.

For more information about the standards required for health IT developers certifying Health IT Modules to the electronic prior authorization criteria in 45 CFR 170.315(g)(31)–(33), see section X.E. of this final rule, in which ONC has adopted version 2.2.1 of the CRD and PAS IGs, and version 2.2.0 of the DTR IG. The effect of the policies ONC has finalized in section X.E. is that these versions of the IGs will be the only versions health IT developers may use to meet the electronic prior authorization certification criteria as of the effective date of this final rule.

Comment: A few commenters did not support the proposal for other reasons. A commenter opposed required reporting in CY 2028 because they stated it would impose a new certification-based compliance requirement too quickly despite limited certified module deployment and evolving IGs. The commenter recommended a more gradual transition with alternative compliance pathways. A commenter opposed the proposal, stating they do not support adding new required measures under the Medicare Promoting Interoperability Program. The commenter suggested electronic prior authorization tools should reduce burden and gain adoption voluntarily if they are functional, reliable, and well-integrated into clinical workflows, rather than through additional reporting requirements.

Response: We appreciate commenters' concerns. We recognize that electronic prior authorization implementation depends on certified technology availability, standards implementation, and workflow integration, and that some eligible hospitals and CAHs may need time to adopt the applicable functionality. We continue to believe, however, that use of CEHRT is appropriate for this measure because it aligns with ONC's electronic prior authorization certification criteria and promotes consistent, standards-based implementation across health care providers, health IT developers, and payers. We also believe that including the measure in the Medicare Promoting Interoperability Program will advance broader adoption of electronic prior authorization in a manner consistent with the program's goals of improving interoperability and assessing meaningful use of CEHRT.

Comment: A few commenters provided recommendations regarding the proposal. A commenter stated that adoption challenges vary significantly across clinical settings and service lines, and that certain specialties such as oncology and other complex care environments may encounter unique operational and workflow challenges as electronic prior authorization processes are integrated into existing clinical and revenue cycle systems. The commenter also expressed concern that implementation of electronic prior authorization remains dependent on a complex ecosystem of payers, intermediaries, health IT developers, and third-party platforms, and that eligible hospitals and CAHs often navigate varying payer requirements, health IT vendor relationships, and transaction pathways, which can create additional administrative complexity and costs. Another commenter expressed concern that while standards-based APIs represent an important step toward greater consistency, eligible hospitals and CAHs continue to encounter fragmented implementation approaches that may require separate technical integrations or operational processes depending on the payer and technology platform involved and may also require additional investments.

Response: We acknowledge the commenters' concerns and recognize that eligible hospitals, CAHs, and health IT developers need additional time for procurement, integration, and testing to operationalize standards-based electronic prior authorization capabilities that support the Electronic Prior Authorization measure, and that implementation in certain care settings is more complex. Achieving widespread implementation and routine use of these capabilities during the EHR reporting period in CY 2027 may be challenging, and that is why we proposed one year of optional reporting for this measure. There may be additional implementation complexity for eligible hospitals, CAHs, and their health IT vendors due to the proposed changes in Prior Authorization API standards requirements in the 2026 CMS Interoperability Standards and Prior Authorization for Drugs proposed rule that would occur in CY 2027 (91 FR 19908), and this is another reason we proposed one year of optional reporting. This one year of optional reporting will both incentivize adoption of CEHRT through bonus points and offer flexibility to those eligible hospitals and CAHs that could benefit from additional time to test, implement, and deploy CEHRT functionality necessary to support electronic prior authorization.

Comment: A commenter expressed concern that successfully reporting the bonus measure for the EHR reporting period in CY 2027 would be limited by the ability of health IT vendors to certify their Health IT Modules on time. The commenter recommended that, if CMS finalizes its proposal to make the measure a bonus measure for the EHR reporting period in CY 2027, CMS should consider permitting Health IT Module certification to be in place by the end of the reporting period instead of the beginning of the reporting period, given implementation challenges.

Response: We acknowledge that some eligible hospitals and CAHs may face barriers to advancing their electronic prior authorization workflows based on limitations in health IT vendor readiness. We took this into consideration in developing the proposed timeline of the measure, and this is one reason we proposed that the Electronic Prior Authorization measure would be an optional bonus measure and would not negatively impact scoring for eligible hospitals and CAHs that do not participate for the EHR reporting period in CY 2027. We confirm that we intend to continue to

allow certification of the relevant Health IT Modules and functionality to occur by the end of the applicable EHR reporting period rather than requiring that certification be in place beforehand.

After consideration of the public comments we received, we are finalizing our proposal to make the Electronic Prior Authorization measure, with the proposed measure updates, optional and eligible for 10 bonus points for eligible hospitals and CAHs that attest ''Yes'' to the measure for the EHR reporting period in CY 2027.

e. Required Reporting of the Electronic Prior Authorization Measure Beginning With the EHR Reporting Period in CY 2028

When we adopted the Electronic Prior Authorization measure in the 2024 CMS Interoperability and Prior Authorization final rule (89 FR 8909 through 8927), we finalized that eligible hospitals and CAHs would be required to attest to the Electronic Prior Authorization measure beginning with the EHR reporting period in CY 2027 (89 FR 8910) and that only a ''Yes'' attestation, or claiming an applicable exclusion, would fulfill the requirements of the measure. Additionally, we finalized that although the measure would not be scored (that is, not assigned points for a ''Yes'' attestation) for the EHR reporting period in CY 2027, a ''No'' attestation would result in the eligible hospital or CAH not meeting the measure. The eligible hospital or CAH would therefore not meet minimum program requirements and not be considered a meaningful EHR user for the relevant EHR reporting period and be subject to a downward payment adjustment (89 FR 8911).

As discussed in section IX.F.5.d, we are finalizing our proposal to make the Electronic Prior Authorization measure optional for the EHR reporting period in CY 2027. In the FY 2027 IPPS/LTCH PPS proposed rule (91 FR 19628), we also proposed that, should we finalize that proposal, eligible hospitals and CAHs would be required to attest ''Yes'' to the updated Electronic Prior Authorization measure beginning with the EHR reporting period in CY 2028. Consistent with the revised text we proposed for the measure, we also proposed in the FY 2027 IPPS/LTCH PPS proposed rule (91 FR 19628 through 19629) that an eligible hospital or CAH must request a prior authorization electronically using CEHRT to send a request through a payer's Prior Authorization API for at least one medical item or service (excluding drugs) ordered during a hospital encounter that occurs within the EHR reporting period to attest ''Yes'' to the measure, or else the eligible hospital or CAH must claim an applicable exclusion. Only a ''Yes'' attestation or claiming an applicable exclusion would fulfill the requirements of the measure. A ''No'' response would result in the eligible hospital or CAH not meeting measure requirements. We proposed that if an eligible hospital or CAH does not meet the measure requirements, it would not meet minimum program requirements nor be considered a meaningful EHR user for an EHR reporting period, and, therefore, the hospital would be subject to a downward payment adjustment. This proposed change mirrors the response requirements we adopted when we first adopted the measure but applies them to the EHR reporting period in CY 2028. We proposed this modification to provide eligible hospitals and CAHs additional time to prepare to successfully report the measure, consistent with making the measure an optional bonus measure for the EHR reporting period in CY 2027.

We proposed that the measure exclusions originally adopted in the 2024 Interoperability and Prior Authorization final rule (89 FR 8916 through 8923) would be available to eligible hospitals and CAHs for the EHR reporting period in CY 2028 and subsequent years. The available exclusions would be: (1) an eligible hospital or CAH did not order any medical item or service (excluding drugs) requiring prior authorization during the EHR reporting period; or (2) the eligible hospital or CAH only ordered medical items or services (excluding drugs) requiring prior authorization from a payer that does not offer an API that meets CMS's specified Prior Authorization API requirements during the applicable EHR reporting period.

When we adopted the Electronic Prior Authorization measure in the 2024 Interoperability and Prior Authorization final rule (89 FR 8909 through 8927), we finalized that eligible hospitals and CAHs would report the measure as an unscored attestation for only the EHR reporting period in CY 2027 (89 FR 8910), but we did not specify its scoring methodology for subsequent years because we determined that it would be more appropriate to determine the measure's scoring structure closer in time to its effective date. In the FY 2027 IPPS/LTCH PPS proposed rule (91 FR 19629), we proposed that the Electronic Prior Authorization measure would remain unscored for the EHR reporting period in CY 2028 and subsequent years, which would allow time for eligible hospitals and CAHs to adjust to the new electronic prior authorization workflow using Prior Authorization APIs without undue focus on scoring implications in the Medicare Promoting Interoperability Program. We stated that we believe that the Electronic Prior Authorization measure will retain its importance as an aspect of health information exchange.

We invited public comment on this proposal.

Comment: Several commenters supported the proposal because it would allow additional time to properly implement the new measure. Across these comments, there was broad support for making the Electronic Prior Authorization measure a bonus measure in CY 2027 and requiring it beginning in CY 2028, with commenters describing that timeline as a pragmatic, phased approach that better matches the operational and technical realities of implementation. Several commenters expressed that the added time is needed for implementation, testing, validation, integration, and workflow redesign before the measure becomes mandatory. A few commenters pointed to the clinical and technical complexity of electronic prior authorization workflows, including dependencies on EHR vendors, certified technology, and payer readiness. A few commenters stated current EHR functionality and broader market readiness are not yet sufficient to support the measure as intended, making a delayed or phased rollout more workable. A few commenters supported the phased approach because it would allow eligible hospitals, CAHs, and developers to adopt the electronic prior authorization workflow more gradually and meaningfully. A few commenters also supported the proposal because of the longer-term benefits of standardized electronic prior authorization, including reduced administrative burden, faster approvals, and improved patient access to care.

A few commenters expressed general support for the proposal to phase in the Electronic Prior Authorization measure and delay making the measure a required measure, including making reporting initially optional before transitioning to a required measure. One such commenter commended CMS' continued efforts to advance interoperability and promote more standardized electronic prior authorization processes across the health care system. Another commenter stated continued progress on data interoperability would benefit patients, eligible hospitals, CAHs, and care outcomes. A commenter stated that movement to facilitate electronic prior

authorization could reduce turnaround times for approvals, improve timely access to care, and maintain appropriate safeguards against fraud.

Response: We thank commenters for their support. We agree that making the Electronic Prior Authorization measure a bonus measure for the EHR reporting period in CY 2027 and a required measure beginning with the EHR reporting period in CY 2028 provides an appropriate phased approach for implementation. We recognize that successful electronic prior authorization workflows require coordination among eligible hospitals, CAHs, health IT developers, and payers, as well as time for development, certification, testing, integration, validation, and workflow redesign. We also agree that continued progress toward standardized electronic prior authorization can reduce administrative burden, provide more timely prior authorization decisions, improve patient access to care, and foster greater interoperability across the health care system.

Comment: Several commenters did not support the proposal as written. Several commenters said the measure should remain optional for longer, with some recommending optional reporting through the EHR reporting period in CY 2028 and delaying mandatory reporting until the EHR reporting period in CY 2029 or later. A few commenters generally cited the need for additional time to test, implement, configure, train, and operationalize electronic prior authorization workflows; significant technical build requirements, workflow redesign, and staff training needs; continued dependence on vendor readiness, payer participation, and external partner alignment. A few commenters stated concerns that FHIR standards, APIs, and IGs are still maturing and may not yet be sufficiently tested across real-world settings. A few commenters cited competing IT priorities across multiple regulatory programs and their view that eligible hospital and CAH compliance should not depend on payer API readiness or uneven standards-based functionality across markets.

Several commenters also recommended CMS avoid making the measure a required measure until the broader ecosystem (including payers, vendors, and standards) is ready and workflows can be implemented reliably. A few commenters recommended conditioning making the measure a required measure on demonstrated payer and health IT vendor readiness, avoiding penalties for failed transactions or incomplete payer participation, and providing clearer guidance on measure specifications, exclusions, and acceptable workflows, including how the measure would apply in different hospital electronic prior authorization scenarios.

Response: We appreciate commenters' concerns regarding the timing and readiness of the health IT functionality to support the Electronic Prior Authorization measure. We recognize that implementation will require technical build, testing, configuration, staff training, workflow redesign, and coordination with health IT developers, payers, and other external partners. We also acknowledge commenters' concerns regarding standards maturity, payer API readiness, and variation in implementation across markets. However, we believe that finalizing the measure as an optional bonus measure for the EHR reporting period in CY 2027 before making the measure a required measure beginning with the EHR reporting period in CY 2028 provides a reasonable and balanced transition period. This approach gives eligible hospitals, CAHs, developers, payers, and other partners time to gain implementation experience while continuing to advance standardized electronic prior authorization. We note that we have proposed in the 2026 CMS Interoperability Standards and Prior Authorization for Drugs proposed rule (91 FR 19908) that payers impacted by that regulation would need to use the same standards required for health IT certification criteria beginning on October 1, 2027. We also note the importance of wide, cross-sector efforts to improve prior authorization that depend on participation from eligible hospitals and CAHs in addition to payers and health IT developers.[550]

Comment: A commenter recommended that CMS ensure that electronic prior authorization requirements are supported by mature, fully tested IGs before requirements for eligible hospitals and CAHs become mandatory. The commenter suggested IGs should be validated through real-world testing across multiple payer and EHR environments, health care provider types, and shared service settings before eligible hospitals and CAHS are held accountable. The commenter also cautioned that, without that testing, rural and low-resourced hospitals, including CAHs, could face inconsistent workflows, manual workarounds, operational disruption, duplicative effort, and compliance risk due to infrastructure gaps outside their control.

Response: We appreciate the commenter's recommendation and recognize the importance of mature, tested IGs and standards-based workflows for successful electronic prior authorization implementation. We refer readers to section X.E. of this final rule for additional discussion about the IG versions included in certification. We also agree that implementation depends on appropriate testing among health IT developers, payers, health care providers, and other partners, and that rural and low-resourced hospitals, including CAHs, may face additional challenges related to infrastructure, staffing, shared services, and payer connectivity. We believe the phased implementation approach, under which the measure would be an optional measure for the EHR reporting period in CY 2027 before becoming a required measure for the EHR reporting period in 2028, will provide adequate additional time for testing, standards adoption, and operational readiness. We will continue to monitor eligible hospitals' and CAHs' implementation experience and coordinate with ONC and other CMS components as standards, IGs, and payer-facing requirements continue to mature.

Comment: Many commenters supported CMS' goal of advancing electronic prior authorization, but recommended pairing implementation with clearer operational guidance, stronger payer accountability, and timelines that reflect the current readiness of payers, health IT vendors, and health IT infrastructure. Several commenters expressed that expectations for eligible hospitals and CAHs should be aligned with the readiness of payer APIs, health IT vendors, certification tools, staffing, and technical infrastructure. These commenters emphasized that inconsistent or immature payer and health IT vendor capabilities could force eligible hospitals and CAHs into duplicative manual workflows and undermine the intended burden reduction of electronic prior authorization.

A few commenters requested clearer operational guidance on how the measure would work in practice. Suggestions included allowing prior authorization at any point during an encounter rather than only at discharge, clarifying qualifying workflows and eligible services, defining exclusions with numeric thresholds, and explaining whether all three certified electronic prior authorization functions must be available throughout the reporting period. A few commenters

[550] For more information, see: *https://www.cms.gov/newsroom/press-releases/cms-announces-early-adopters-advance-solutions-electronic-prior-authorization-accelerating-momentum.*

recommended CMS preserve flexibility and avoid moving faster than standards, testing tools, certification, and implementation support allow. These commenters supported phased adoption, continued stakeholder engagement, technical assistance, and timelines that reflect the reality of evolving IGs and vendor readiness.

Response: We agree that electronic prior authorization is most effective when health care providers, payers, health IT vendors, eligible hospitals, CAHs, and standards-based capabilities are aligned. The Electronic Prior Authorization measure is intended to encourage eligible hospitals and CAHs to adopt standards-based workflows using CEHRT. Under the measure finalized in this rule, eligible hospitals and CAHs are not required to have all three certified electronic prior authorization functions available during the EHR reporting period. However, we are very strongly considering proposing in next year's rulemaking to align this aspect of the measure with similar proposals under the MIPS Promoting Interoperability performance category for CY 2028. We will consider commenters' requests for additional guidance on qualifying workflows, eligible services, exclusions, timing during the encounter, and certified functionality as we develop additional resources and sub-regulatory guidance. We also recognize concerns regarding rural and under-resourced health care providers, health IT vendor readiness, payer API implementation, and evolving IGs. We believe the phased approach, including making the Electronic Prior Authorization measure an optional measure for the EHR reporting period in CY 2027 before the measure becomes a required measure beginning in the EHR reporting period in CY 2028, provides additional time for implementation, testing, and workflow redesign.

Comment: Several commenters suggested the measure would only reduce burden if payers are also held accountable for timely, meaningful decisions. These commenters recommended CMS require faster payer turnaround times, address large gaps between initial denials and appeal overturns, curb ''deny first, appeal later'' practices, and consider the patient care consequences of delayed prior authorizations. A few commenters suggested that electronic prior authorization should be paired with broader efforts to reduce the overall volume of prior authorization requirements. These commenters called for more deliberate and limited use of electronic prior authorization, consideration of exemptions or gold-carding, and reassessment of which services truly warrant prior authorization.

Response: Broader payer obligations, prior authorization timeframes, considerations regarding more limited use of electronic prior authorization, exemptions, gold-carding, and assessment of which services warrant prior authorization, and related process requirements are being addressed through multi-pronged HHS efforts, including CMS and ONC policies and rulemaking, as applicable. However, comments regarding these topics are outside the scope of this proposal. In addition to our rulemaking efforts in this respect, we note additional CMS efforts to advance solutions for electronic prior authorization. These efforts include promoting API-enabled data exchange for prior authorization using FHIR-based standards as well as defined timeframes for prior authorization decisions.[551]

Comment: A commenter suggested that making the measure mandatory but unscored would create a mismatch between implementation cost, financial risk, and program incentives. This commenter recommended awarding eligible hospitals and CAHs points once the measure becomes mandatory, so hospitals are not asked to invest heavily while facing downside payment risks. A commenter recommended that CMS expand the measure to include drugs, consistent with the 2026 CMS Interoperability Standards and Prior Authorization for Drugs proposed rule.

Response: We do not believe that there is a mismatch between implementation cost, financial risk, and program incentives and having the measure be unscored. Whether we assign points or not to the measure, all eligible hospitals and CAHs are required to attest ''Yes'' to the updated Electronic Prior Authorization measure or claim an exclusion to avoid a downward payment adjustment. Therefore, the unscored measure retains sufficient incentive to reflect the implementation cost and financial risk.

After consideration of the public comments we received, we are finalizing our proposal that eligible hospitals and CAHs would be required to attest ''Yes'' to the updated Electronic Prior Authorization measure or claim an exclusion beginning with the EHR reporting period in CY 2028 in order to be a meaningful EHR user and that the measure will be unscored. We note that we are very strongly considering returning to rulemaking in the FY 2028 IPPS/LTCH PPS proposed rule in order to align our requirements to match the proposed requirements for MIPS eligible clinicians in the CY 2027 PFS proposed rule, which proposes to revise the measure to focus on submitting a prior authorization request based on a complete prior authorization workflow as reflected in the combined use of all three ONC health IT certification criteria at 45 CFR 170.315(g)(31), (32), and (33) for CY 2028 (91 FR 44178).

f. Request for Information on Future Potential Performance-Based Measure of Electronic Prior Authorization

While we believe the current measure requirement of achieving ''at least one'' electronic prior authorization is appropriate for the initial inclusion of the measure in the Medicare Promoting Interoperability Program, we do not expect this minimal requirement to fully increase electronic prior authorization usage over time. Therefore, in the FY 2027 IPPS/LTCH PPS proposed rule (91 FR 19629), we sought comments on potential future updates we could make to this measure to incentivize eligible hospitals and CAHs to use electronic prior authorization for a more substantial set of the electronic prior authorization requests that they submit over the course of an EHR reporting period. Consistent with statutory requirements in section 1886(n)(3)(A)(ii) of the Act, we envision that expanding the scope of the measure in future rulemaking would lead to increased interoperable exchange of data that would not only decrease administrative burden but could improve the quality of health by reducing the time needed for a patient to get access to necessary medical services and items. Reducing delays in the exchange of data and as a result providing patients care more efficiently, drives better care coordination, which is a key objective of meaningful use. Additionally, because electronic prior authorization requires data sharing, this advances interoperability, which is a primary focus of meaningful use.

We also intend to drive consistent adoption of certified health IT capabilities supporting the complete electronic prior authorization workflow over time, by requiring eligible hospitals and CAHs to address a wider array of prior authorization requests that require more complex interactions with payers. The public input we received will contribute to future considerations for potentially updating the Electronic Prior Authorization measure in a manner that helps achieve HHS's goals of promoting

meaningful use of certified EHR technology, electronic exchange of health information, and submission of clinical quality measures.

We invited comments on how we can further strengthen the Electronic Prior Authorization measure in a manner that incentivizes progress while minimizing burden on eligible hospitals and CAHs. We also sought comment on barriers and challenges small, rural, or otherwise under-resourced eligible hospitals and CAHs might face reporting a performance-based electronic prior authorization measure.

Commenters generally supported CMS' goal of advancing electronic prior authorization and recognized its potential to reduce administrative burden, improve transparency, speed access to care, and support interoperability, but many urged CMS to proceed cautiously before adopting any future performance-based measure. Commenters recommended that CMS use a phased approach, including sequential implementation of coverage requirements discovery, documentation templates and rules, and prior authorization support, and avoid performance thresholds until payer APIs, EHR functionality, IGs, certification tools, and health care provider workflows are mature and tested. Many commenters emphasized that performance measurement would depend heavily on factors outside hospital control, including payer readiness, vendor capabilities, API reliability, service-line coverage, and inconsistent payer requirements, and recommended payer accountability, shared or bi-directional performance measures, public reporting of payer responsiveness, and protections against penalizing health care providers for payer-side failures.

Commenters also requested clearer measure specifications regarding attribution, numerator and denominator construction, qualifying workflows, payer errors, exclusions, and whether checking if prior authorization is required should count as a meaningful electronic action. Several commenters cautioned that rural, small, CAH, and under-resourced hospitals could face disproportionate costs and workflow disruption, and recommended flexibility, hardship exemptions, technical assistance, and phased timelines.

We appreciate all the comments and interest in this topic. While we are not responding to specific comments in response to the RFI in this final rule, we believe that this input is very valuable and will continue to take all concerns, comments, and suggestions into account for future development and consideration of this measure for the Medicare Promoting Interoperability Program. We thank commenters for their responses and will take them into consideration for future rulemaking.

6. Adoption of the Unique Device Identifiers for Implantable Medical Devices Measure in the Public Health and Clinical Data Exchange Objective

a. Background

Under section 519(f) of the Federal Food, Drug, and Cosmetic Act (the FD&C Act) (21 U.S.C. 360i(f)), the Food and Drug Administration (FDA) issued regulations establishing a unique device identification system [552] for medical devices (78 FR 58786).[553] The Unique Device Identifier (UDI) is a standard identifier that adequately identifies a medical device from manufacturing through distribution to patient use. The UDI is composed of the Device Identifier (UDI–DI), which identifies the specific version or model of a device and the labeler of that device, and the Production Identifier(s) (UDI–PI), which contain production information about a device such as lot or batch number, serial number, expiration and manufacturing dates, and distinct identification code for human cellular or tissue-based products regulated as devices.[554] The FDA UDI system requires device labelers to include UDIs on device labels and packages in both human readable form and machine-readable form such that it can be read by a bar code scanner or other similar technology,[555] and submit device identification information to FDA's Global Unique Device Identification Database (GUDID), which is accessible from two public portals, AccessGUDID[556] and OpenFDA.[557]

FDA designed the UDI system to serve multiple public health objectives by enabling rapid and accurate device identification throughout distribution and use (78 FR 58786). UDIs can reduce medical errors by allowing health care providers to positively identify devices and access key attributes through GUDID rather than consulting multiple and potentially inconsistent sources, thus eliminating confusion that can lead to inappropriate device use. The UDI system also allows for accurate identification of devices associated with adverse events, enabling manufacturers and FDA to more rapidly aggregate and analyze related reports, isolate underlying problems, and develop appropriate solutions for safety issues. Routine inclusion of UDIs as discrete data elements in EHRs and registries would enable accurate identification of devices used during patient care delivery, facilitate rapid notification and follow-up care during recalls, and improve care coordination across health care providers. Additionally, discrete documentation of UDI strengthens real-world data sources for use across the device lifecycle, which will improve the FDA's ability to conduct post-market surveillance and outcomes-based research.[558] UDIs also enable more efficient and effective inventory and supply chain management, providing the foundation for a global, secure distribution chain, helping to address counterfeiting and diversion while supporting preparedness for medical emergencies.

While the foundation for the UDI system is established with UDI being present on device labels and data available in GUDID, the health care system has yet to achieve broad adoption of UDI documentation. Fully realizing the benefits of the UDI system depends on UDIs being integrated into data sources throughout the health care system, including the supply chain, EHRs, medical device registries, and claims.[559] [560] Multiple barriers and challenges to UDI adoption have been noted,[561] including lack of knowledge across the health care system about the benefits and return on investment for UDI implementation, and lack of regulatory and policy mandates.

However, capabilities to capture UDI in the EHR have been widely adopted by eligible hospitals and CAHs. In the ONC Health IT Certification Program, the ''implantable device list'' certification criterion at 45 CFR 170.315(a)(14) requires Health IT Modules certified to the criterion to record and allow a user to access a list of UDIs associated with a patient's implantable devices. This certification

criterion is currently included in the Base EHR definition and has been widely implemented in health IT products, with 341 Health IT Modules identified as certified to the criterion. Other certification criteria also support the use of UDI. Under the ''standardized API for patient and population services'' criterion in 45 CFR 170.315(g)(10), which is also included in the Base EHR definition, a certified Health IT Module must be able to make UDI information for a patient's implantable device(s) available using a standards-based API according to the HL7 FHIR US Core IG, the STU 6.1.0 FHIR IG. Additionally, the criteria at 45 CFR 170.315(b)(1)—''transitions of care'' and 45 CFR 170.315(b)(2)—''clinical information reconciliation and incorporation,'' which have long been required for measures in the Health Information Exchange Objective, support the ability for health care providers to receive, send, and reconcile documents that contain UDI information.

The wide use of products certified to these criteria indicates that eligible hospitals and CAHs have the ability to store and exchange UDIs if UDIs have been recorded through documentation.[562] Published evidence via health system case studies show that capturing UDI using barcode scanning at the point of care is operationally feasible.[563] [564] In cardiac catheterization lab implementation studies, barcode scanning was successfully integrated into routine workflows to link UDIs with clinical records.[565] Frontline nursing evaluations in surgical services report that implant barcode scanning is workable in practice.[566] Together, these studies demonstrate that structured UDIs captured in EHRs using barcode technology can be implemented without substantial workflow disruption.

b. Adoption of the Unique Device Identifiers for Implantable Devices Measure Beginning With the EHR Reporting Period in CY 2027

As we stated in the FY 2027 IPPS/LTCH PPS proposed rule (91 FR 19630), the routine, electronic capture and discrete storage of UDIs for implantable medical devices directly advances the Secretary's core responsibility, articulated in the statutory authority for the Medicare Promoting Interoperability Program, to improve the use of electronic health records and health care quality over time. Such electronic capture and discrete storage of UDIs would advance the safety of health care, an essential element of health care quality. Broader use of UDIs is similarly aligned with the meaningful use of CEHRT through the Medicare Promoting Interoperability Program. A primary aspect of the meaningful use of CEHRT is whether valuable data are captured at the point of care and available for subsequent exchange and use by health care providers. For example, in the ''Medicare and Medicaid Programs; Electronic Health Record Incentive Program'' final rule (75 FR 44328), the precursor program to the Medicare Promoting Interoperability Program, we implemented multiple data capture-related measures such as ''Record Smoking Status'' and ''Maintain Active Medication List'' because, as we noted, the availability of pertinent clinical data is important to the meaningful use of CEHRT. We stated that integrating a UDI-focused measure into the Medicare Promoting Interoperability Program would foster consistent workflows for capturing device data as discrete EHR elements and strengthen the ability of eligible hospitals, CAHs, beneficiaries, and public health agencies to use interoperable health information to improve outcomes, manage risk, and respond rapidly to device-related safety concerns. We also noted that multiple studies and pilots have discussed the ease of UDI capture at the point of care through bar code scanning, storage in the EHR, and transmission to the health plan through claims.[567] [568]

Therefore, in the FY 2027 IPPS/LTCH PPS proposed rule (91 FR 19630 through 19632) we proposed to adopt the Unique Device Identifiers for Implantable Medical Devices measure under the Public Health and Clinical Data Exchange objective. We stated that this measure would further public health surveillance benefits that would arise from capturing the UDI for implanted medical devices.

Measure Description: The eligible hospital or CAH uses CEHRT during the EHR reporting period to electronically capture and store, as one or more discrete data elements within the patient's electronic health record, the complete Unique Device Identifier (UDI), which includes the device identifier and, when present on the device label, the production identifier, for each implantable medical device subject to UDI requirements used for patient care delivery.

Reporting Requirements: ''Yes'' or ''No'' attestation.

Exclusion: The eligible hospital or CAH implanted five or fewer medical devices subject to UDI requirements during the calendar year of the applicable EHR reporting period.

We proposed to require eligible hospitals and CAHs to attest to this measure beginning with the EHR reporting period in CY 2027. We proposed that eligible hospitals and CAHs would be required to attest ''Yes'' or ''No'' to meet measure requirements or claim an applicable exclusion. Failure to attest ''Yes'' or ''No'' or claim an applicable exclusion would result in the eligible hospital or CAH being subject to a downward payment adjustment for not meeting minimum program requirements. We proposed that no points will be assigned to this measure; rather, it would be one of seven measures required to satisfy the Public Health and Clinical Data Exchange objective. We proposed to allow both ''Yes'' and ''No'' responses, which would allow eligible hospitals and CAHs to become familiar with UDI and highlight its importance while avoiding undue burden. We also noted that the measure only applies to implantable medical devices subject to UDI requirements under 21 CFR 801.20(a) and 21 CFR part 830, subpart E, which represents most implantable medical devices. We noted that under certain circumstances,[569] some devices, such as investigational devices, devices for research use only, and custom devices, are excepted from UDI requirements and are therefore not included in this measure. In the proposed rule, we also stated that we intend to propose modifications to this measure in future rulemaking to further promote the appropriate capture of UDIs within the EHR. We proposed one exclusion for the UDIs for Implantable Medical Devices measure and invited comments on any additional exclusions that should be considered in the future.

As discussed in the FY 2027 IPPS/LTCH PPS proposed rule (91 FR 19631), there are numerous ONC health IT certification criteria that reference UDI,

[569] 21 CFR 801.30.

including the ''implantable device list'' certification criterion in 45 CFR 170.315(a)(14), which would be required to support the measure. However, we noted that ONC proposed to remove this criterion in the HTI–5 proposed rule (90 FR 60983), and that if ONC finalizes removal of this criterion, it would no longer be required to support the measure. Separate from this dedicated certification criterion, UDI is a named data element within USCDI Version 3 as the ''Unique Device Identifier(s) for a patient's implantable device(s)'' and therefore is a supported element within the HL7 FHIR US Core IG STU 6.1.0 IG, which Health IT Modules certified to the certification criterion at 45 CFR 170.315(g)(10) must be capable of using to respond to requests for patient data. We identified the criterion at 45 CFR 170.315(g)(10) as required to support fulfillment of the measure, which is also part of the Base EHR definition in 45 CFR 170.102 and already incorporated into the definition of CEHRT at 42 CFR 495.4. We welcomed comments as to whether other certification criteria should be considered to support this measure.

We invited public comment on these proposals, to include the feasibility of the timeline, additional exclusions, and any additional certification criteria that we should consider for this measure in future rulemaking.

Comment: Many commenters supported our proposal to adopt the Unique Device Identifiers for Implantable Medical Devices measure, noting that recording UDI in EHRs would improve post-market surveillance and care coordination, reduce patient safety risks, and enable faster, more accurate public health responses. Several commenters noted that allowing for ''Yes'' and ''No'' attestation is reasonable for preparing eligible hospitals and CAHs for future modifications to the UDI measure.

Response: We thank the commenters for their support, and we agree that standardized UDI capture in EHRs would improve post-market surveillance, reduce patient safety risks, and enable faster, more accurate public health responses.

Comment: A few commenters generally supported the proposed UDI measure but requested clarification regarding the scope of the implantable device requirements, including what devices qualify and whether they apply only to the health care provider inserting the device or also to devices implanted by another health care provider.

Response: We intend this measure to apply to medical devices implanted by the eligible hospital or CAH during the EHR reporting period that are subject to FDA's UDI requirements under 21 CFR 801.20(a) and 21 CFR part 830, subpart E. We note that devices excepted under the general exceptions from UDI requirements at 21 CFR 801.30 would also be excepted from this measure.

Comment: Several commenters asked that CMS clarify whether eligible hospitals and CAHs may use CEHRT alone or in combination with integrated non-CEHRT systems to capture, validate, reconcile, exchange, and transmit complete, structured UDI data into the EHR. Commenters stated that this approach that allows use of integrated non-CEHRT systems would better align with clinical and operational workflows, reduce burden, and improve data quality. A commenter also recommended that CMS require electronic capture rather than manual entry of UDIs within the measure.

Response: We note that activities other than ''capture'' and ''store'' are outside the scope of this measure and therefore approaches to these and other activities related to integrating UDI data into the EHR and exchange of that information are not subject to the requirements of this measure. We also wish to clarify that the measure's requirement that an eligible hospital or CAH must use CEHRT to electronically capture complete UDI information is intended to refer to the ultimate capture and storage of this information, and that intermediate steps or systems used outside of CEHRT to capture this information are permissible as long as the complete UDI is ultimately captured and stored in CEHRT.

Comment: Several commenters supported the proposal but made recommendations regarding its details. A few commenters recommended CMS allow sufficient implementation time before CMS considers shifting to a required ''Yes'' attestation or a performance-based metric. A few commenters recommended that CMS define the scope of ''implantable medical devices'' and provide documented exception categories for circumstances such as UDI-exempt devices, emergencies, damaged or unavailable labels/barcodes, items pending manual validation, and implants outside the hospital's operational control. Another commenter recommended that CMS treat eligible hospitals and CAHs as compliant if they can collect and share either the UDI–DI or UDI–PI as discrete data, rather than requiring a complete UDI–DI plus UDI–PI string. Another commenter recommended that CMS encourage eligible hospitals and CAHs to include UDI data in discharge summaries and patient portals to empower patients with information about their implanted devices. A commenter asked for guidance regarding surgical implants that are too small to be directly marked with a UDI and whose linkage to a full UDI may have been lost at a manufacturer's distribution center before its use at the point of care.

Response: CMS intends to allow sufficient implementation time should we add additional requirements to the measure in future rulemaking. As discussed earlier, documented exception categories include UDI-exempt devices and implants not performed at the eligible hospital or CAH. We clarify that ''each implantable device'' and ''implantable medical devices'' refer to medical devices that were implanted in a procedure performed during the EHR reporting period at that eligible hospital or CAH and that are subject to UDI requirements. The measure assesses compliance at the facility level, and the facility's responsibility to store UDIs within CEHRT extends to all eligible implantable devices implanted during the EHR reporting period in order for the eligible hospital or CAH to attest ''Yes'' to the measure. An eligible hospital or CAH could claim an exclusion if it implanted five or fewer medical devices subject to UDI requirements during the calendar year of the applicable EHR reporting period. For the purposes of the measure, CMS would interpret an eligible hospital's or CAH's responsibility as extending to all implantable devices with a valid UDI at the time the eligible hospital or CAH receives that device. That is, if a UDI is not available to the eligible hospital or CAH at the time of receipt of the implantable device, then the implantable device would not count for measure assessment purposes. The full value of the UDI system depends on recording and storage of both the UDI–DI and the UDI–PI, so we decline to allow only one of these data elements to meet the measure requirement for UDI at this time. Similarly, although we agree that inclusion of UDI data in discharge summaries and patient portals is in keeping with the goals of the UDI system, we decline to require such actions in the current version of the measure. We encourage eligible hospitals, CAHs, and health IT developers to adopt functionality that benefits Medicare beneficiaries and health care providers. We emphasize that we intend the measure to foster the comprehensive availability of implantable device UDIs within CEHRT.

Comment: A few commenters supported CMS' proposed adoption of the UDIs for Implantable Medical Devices measure but opposed any future requirement to report UDIs on claims, asserting that claims are designed for billing rather than granular device traceability and such a requirement would impose administrative and operational burden.

Response: We will take the commenters' suggestions into consideration for future rulemaking. The current measure does not require incorporation of UDI information into claims.

Comment: A commenter supported finalizing the proposed UDI measure but recommended that CMS reiterate that the primary purpose of the measure and capture of this information is to support the clinical and public health purposes of UDI data rather than encouraging device-specific pricing decisions without appropriate clinical context.

Response: We agree with the commenter that the purpose of this measure is to support the clinical and public health purposes of UDI data.

Comment: Several commenters did not support our proposal to adopt the measure and recommended that CMS delay implementation of required reporting and provide a multi-year transition period before requiring full participation or moving toward performance-based measurement. Commenters stated that eligible hospitals, CAHs, and health systems would need additional time to configure EHRs and related systems, revise workflows, train staff, test processes, validate data, resolve supply chain and inventory-system gaps. Commenters also stated that CMS would need to establish clear definitions and implementation guidance. Commenters noted that current capture of UDI often relies on manual documentation rather than barcode scanning, and that many device barcodes may not be represented in internal systems or may not populate into CEHRT without substantial operational and technical work. Commenters urged CMS to make the measure optional or voluntary for CY 2027, with some recommending a delay of at least three years or until 2028, to avoid penalizing hospitals for implementation barriers outside their control and to allow more consistent, accurate, and interoperable UDI capture.

Response: We proposed that the UDIs for Implantable Medical Devices measure would be an attestation-based measure where either a ''Yes'' or ''No'' response would count as fulfillment of the requirements of the measure. Therefore, we disagree that eligible hospitals and CAHs need more time to implement the measure. The number of eligible hospitals and CAHs that report ''No'' for the measure also gives us valuable information on the overall adoption of UDI storage within CEHRT and the readiness of eligible hospitals and CAHs in this respect. Because the number of eligible hospitals and CAHs attesting ''No'' to the measure gives CMS valuable information, we also decline to make the measure an optional measure for the EHR reporting period in CY 2027. We also note that recording and display of UDI data is already supported within certified health IT as a part of the ''implantable device list'' ONC health IT certification criterion at 45 CFR 170.315(a)(14), and that this criterion has been included in CEHRT as part of the Base EHR definition for a significant period of time. However, we agree that eligible hospitals and CAHs should be given implementation time before we consider any changes to make it a performance-based measure, which this period as an attestation measure would provide.

Comment: A few commenters did not support the proposal and stated that the proposed UDI capture measure would create implementation expectations without sufficient financial or operational support for hospitals and health systems. Many commenters noted that effective UDI adoption may require significant investments in system integration, workflow redesign, governance, and coordination across EHRs, supply chain systems, administrative transactions, and other operational platforms. These commenters recommended that CMS consider additional support, such as financial incentives or other implementation assistance, to promote adoption.

Response: We appreciate commenters' concerns regarding implementation burden and timing. We note that eligible hospitals and CAHs already have obligations to capture UDI information for implantable devices at 21 CFR 821.30 and that the proposed measure only assesses whether that information is stored in CEHRT as structured data. We also note that we proposed that eligible hospitals and CAHs could attest either ''Yes'' or ''No'' to meet the measure requirement; we did not propose to require a ''Yes'' response. An eligible hospital or CAH that attests ''No'' would still be considered to have successfully reported the measure for program purposes. We do not intend for the measure to penalize hospitals that are not yet routinely capturing UDI in CEHRT, but rather we intend to establish a baseline for future policy development and continued progress toward improved device traceability, patient safety, and interoperability. Accordingly, a separate incentive is not necessary for this initial measure, which is designed to establish baseline information and support continued progress toward improved device traceability, patient safety, and interoperability without penalizing eligible hospitals and CAHs that have not yet implemented this capability.

Comment: A few commenters did not support our proposal to adopt the measure because they wanted CMS to clarify the measure description requiring eligible hospitals and CAHs to use CEHRT to electronically capture UDI information, stating that the phrase could be interpreted as requiring barcode scanning and direct capture within CEHRT even though many hospitals currently use inventory management, procedural documentation, or other non-CEHRT systems that transmit UDI data to their EHRs. Commenters recommended that CMS revise the measure description language to allow hospitals and CAHs to use CEHRT alone or in combination with interoperable non-CEHRT systems, including inventory management, procedural documentation, and point-of-use systems, to capture and transmit complete UDI data to CEHRT.

Response: We appreciate commenters' request for clarification regarding permissible methods for electronically capturing UDI information. We clarify that the measure does not preclude the use of non-CEHRT systems that transmit UDI data to the EHR. Eligible hospitals and CAHs may use barcode scanning, other automated identification and data capture technologies, or separate systems to transmit UDI information provided that the UDI is captured and stored as structured, discrete data in the eligible hospital or CAH's EHR consistent with the measure requirements.

Comment: A commenter did not support the proposal and recommended that CMS broaden compliance for the UDI measure to include non-CEHRT data platforms in addition to CEHRT. The commenter stated that UDI data often originates in supply chain, inventory, logistics, and other operational systems before being linked to clinical information, and that limiting compliance to CEHRT could create data silos and reduce the value of UDI-enabled interoperability.

Response: While we acknowledge that eligible hospitals and CAHs may use a variety of operational, supply chain, inventory, procedural, or other systems to support UDI capture, validation, and

internal workflows, we decline to broaden the measure as suggested. The Medicare Promoting Interoperability Program is focused on the use of CEHRT to support interoperable health information exchange; therefore we intend the measure to assess whether UDI information is stored in CEHRT as structured, discrete data. Accordingly, for purposes of this measure, we are maintaining the focus on CEHRT rather than expanding compliance to include non-CEHRT systems.

Comment: A commenter opposed adoption of the proposed measure because the commenter viewed the attestation measure as a first step toward future requirements to include device identifiers on claims. The commenter stated that requiring UDI information on claims would be duplicative of clinical data capture, impose unnecessary administrative burden on health care providers, create technical challenges because multiple UDIs may be associated with a single product model or implantable device system, and risk payment delays or inefficient claims processing. The commenter further stated that claims systems are not designed for this level of device detail and that claims-derived DI data may be incomplete, difficult to query, and unreliable for post-market surveillance or research.

Response: We appreciate the commenter's concerns regarding possible future uses of UDI data. We clarify that this measure does not establish any requirements regarding the inclusion of UDIs on claims. The measure is limited to whether an eligible hospital or CAH uses CEHRT to electronically capture and store UDI information for implantable medical devices as structured data. The purpose of this measure is to support improved device documentation, interoperability, patient safety, recall management, and related clinical and public health uses.

Comment: A commenter did not support our proposal to adopt the measure within the Public Health and Clinical Data Exchange objective, stating that UDI capture is primarily a patient safety and device traceability function and does not align with the objective's focus on exchange with public health agencies and registries. The commenter stated that adding a required UDI measure would increase burden within an already complex objective. The commenter recommended that CMS clarify permissible capture methods, required UDI data elements, the level at which compliance would be assessed, audit documentation requirements, and whether workflow constraints or external system limitations could support an exclusion or hardship request.

Response: We appreciate the commenter's concerns. Although we agree that patient safety is an important aspect of UDI use, we believe this measure is appropriately situated within the Public Health and Clinical Data Exchange objective because structured UDI capture in CEHRT supports interoperable exchange of device information for patient safety, recall management, care coordination, post-market surveillance, and other public health and clinical data uses. Because we did not propose to assign points to the measure, require eligible hospitals and CAHs to attest ''Yes'' to the measure, or impose a performance threshold, we stated and continue to believe that the measure provides an appropriate initial step while giving eligible hospitals and CAHs additional time to continue building UDI capture capabilities. As for permissible data capture methods, we noted earlier in this section that we are not precluding the use of non-CEHRT systems that transmit UDI data to the EHR. Eligible hospitals and CAHs may use barcode scanning, other automated identification and data capture technologies, or separate systems to transmit UDI information provided that the UDI is captured and stored as structured, discrete data in the patient's EHR consistent with the measure requirements. We will provide additional guidance, including additional information on permissible electronic capture methods, data elements, documentation, and applicable exclusions in program measure specification manuals that we provide on a yearly basis on the CMS QualityNet website.

Comment: Several commenters recommended that CMS delay mandatory implementation or phase in additional requirements in the measure over multiple years. Commenters stated that eligible hospitals and CAHs would need substantial time to assess system capabilities, redesign workflows, configure EHR and related systems, integrate supply chain and procedural platforms, train staff, test processes, and validate data. Commenters recommended that CMS begin with voluntary or attestation-based reporting, avoid immediate performance-based scoring or penalties, and provide sufficient transition time before requiring full participation. Some commenters also urged CMS to avoid penalizing hospitals for missing or incomplete data resulting from vendor limitations, manufacturer data gaps, or infrastructure constraints outside the hospital's control.

Response: We appreciate commenters' recommendations regarding future expansion of the measure. We will take commenters' recommendations regarding broader device scope, additional care settings, expanded data elements, and future uses of UDI data into consideration for future rulemaking.

Comment: Several commenters requested that CMS clarify that the proposed UDI measure is limited to clinical documentation and interoperability purposes and does not establish or signal a requirement to report UDI or device identifier information on Medicare claims or cost reports. Commenters stated that hospital claims, HIPAA transaction sets, NUBC revenue codes, and Medicare cost reporting rules serve billing and payment functions and should remain distinct from FDA's UDI framework. Commenters expressed concern that claims-based UDI reporting would duplicate EHR or registry documentation, increase administrative burden, create technical and payment-processing challenges, and produce data that may be incomplete or unreliable for surveillance. Commenters also requested that CMS confirm that FDA's definition of ''implantable device'' for UDI purposes does not alter or supersede the HIPAA transaction set definitions, NUBC revenue code assignments, or CMS cost reporting instructions that govern hospital billing and cost reporting.

Response: We confirm that the proposed UDI measure does not establish a requirement to report UDI or device identifier information on Medicare claims or cost reports. The measure does not modify HIPAA transaction set requirements, NUBC revenue code assignments, Medicare claims reporting requirements, or Medicare cost reporting instructions.

Comment: A few commenters recommended that CMS treat the proposed implantable-device UDI measure as an initial step toward a broader UDI framework that would extend beyond implantable devices and apply across medical devices subject to the UDI rule in additional care settings. Commenters stated that complete UDI data should be captured, interpreted, validated, stored, and used in structured and discrete form to support patient care and safety, recall management, patient access, analytics, exchange, longitudinal surveillance, facility operations, and supply chain security. Commenters recommended that CMS signal this broader future direction

while phasing in detailed data elements over time, including raw UDI, capture method, device identifier, production identifiers when present, GUDID-derived attributes, patient and encounter context, capture source, and validation status.

Response: We appreciate commenters' recommendations regarding the potential future development of a broader UDI framework. We will take commenters' recommendations into consideration for future rulemaking.

Comment: A commenter stated concern with ONC's proposal to remove the implantable device list ONC health IT certification criterion at 45 CFR 170.315(a)(14) and how it would impact performance on the measure. The commenter stated that the criterion enables UDI to link to core device attributes in AccessGUDID, including brand name, model or version, company name, and MRI safety information, thereby supporting patient access to meaningful device information and improving patient safety. The commenter asserted that maintaining the implantable device list criterion would help ensure referential integrity and improve GUDID data quality over time.

Response: We appreciate the commenter's concern regarding ONC's proposal to remove the implantable device list certification criterion at 45 CFR 170.315(a)(14) and the potential effect on UDI-related functionality. We agree that linking UDI information to device attributes, including information available through AccessGUDID, can support patient access to meaningful device information, patient safety, and data quality. However, if ONC finalizes this proposal, we believe that health IT functionality related to UDI access, storage, and exchange would continue to be maintained because other ONC certification criteria continue to reference or support exchange of UDI for implantable devices, including the standardized API for patient and population services criterion at 45 CFR 170.315(g)(10).

We also note that removal of the specific implantable device list criterion would not preclude health IT developers from continuing to support AccessGUDID lookup, device attribute display, validation, or related functionality. We will continue to coordinate with ONC and monitor implementation to ensure that eligible hospitals and CAHs have appropriate certified health IT capabilities to support UDI capture and exchange.

After consideration of the public comments we received, we are finalizing our proposal to adopt the Unique Device Identifiers for Implantable Medical Devices measure beginning with the EHR reporting period in CY 2027. Eligible hospitals and CAHs will be required to attest ''Yes'', ''No'', or claim an applicable exclusion to fulfill the measure requirements. If an eligible hospital or CAH does not meet the minimum requirements, it will be subject to a downward payment adjustment.

c. Future Direction of the Unique Device Identifiers for Implantable Devices Measure and Additional Options for Utilizing UDI

As we finalize adoption of the measure, we also intend to consider future modifications to this measure and invited public comment on a series of questions about the future direction of the measure (91 FR 19631).

Commenters generally supported the long-term goal of expanded UDI capture and use, but recommended that CMS proceed gradually before adopting performance-based requirements. Commenters suggested possible future measures based on the percentage of implant procedures, encounters, selected procedure codes, or covered devices for which complete UDI data are captured and stored as structured data, but many stated that performance-based measurement would be premature until hospitals have reliable workflows, clear numerator and denominator definitions, and better integration among EHR, supply chain, procedural, and inventory systems. Commenters identified non-sterile, tray-based, small, consigned, multi-component, and unpackaged devices as especially difficult to capture, and recommended phased implementation, exceptions, and collaboration with manufacturers and vendors to improve labeling, validation, and data quality. Commenters also supported future UDI exchange through certified health IT, FHIR APIs, registries, discharge summaries, after-visit summaries, and patient portals, and encouraged CMS to consider future uses for recall management, patient follow-up, real-world evidence, quality measurement, and expansion to additional procedural settings when infrastructure is ready.

We appreciate all the comments and interest in this topic. While we are not responding to specific comments in response to the RFI in this final rule, we believe that this input is very valuable and will continue to take all concerns, comments, and suggestions into account for future development and consideration of this measure for the Medicare Promoting Interoperability Program. We thank commenters for their responses and will take them into consideration for future rulemaking.

7. Overview of Scoring Methodology

In the FY 2019 IPPS/LTCH PPS final rule (83 FR 41636), we adopted a performance-based scoring methodology for eligible hospitals and CAHs reporting to the Medicare Promoting Interoperability Program beginning with the EHR reporting period in CY 2019. This methodology included a minimum scoring threshold that eligible hospitals and CAHs must meet in addition to the requirement to report on the objectives and measures of meaningful use under 42 CFR 495.24. In the FY 2025 IPPS/LTCH PPS final rule (89 FR 68986), we finalized a proposal to increase the performance-based scoring threshold to 70 points for the EHR reporting period in CY 2025 and to 80 points beginning with the EHR reporting period in CY 2026.

As shown in Table IX.F.–02., for the EHR reporting period in CY 2027, the points associated with the required measures sum to 100 points, and reporting on one or more of the optional bonus measures (including 10 bonus points for reporting on the Electronic Prior Authorization measure for the EHR reporting period in CY 2027), offers up to an additional 15 bonus points. The scores for each of the required measures and bonus measures are added together to calculate a total score of up to 115 possible points for each eligible hospital or CAH. We refer readers to Table IX.F.–02. in this final rule, which reflects the objectives, measures, maximum points available, and whether a measure is required or optional for the EHR reporting period in CY 2027 based on our previously adopted policies and the proposals finalized in this final rule.

As shown in Table IX.F.–03., for the EHR reporting period in CY 2028, the points associated with the required measures sum to 100 points. For the EHR reporting period in CY 2028, the Electronic Prior Authorization measure is being finalized as a required measure thereby eliminating the 10 bonus points offered for the EHR reporting period in CY 2027, and 5 bonus points remain available under the Public Health and Clinical Data Exchange objective. The scores for each of the required measures and bonus measures are added together to calculate a total score of up to 105 possible points for each eligible hospital or CAH.

BILLING CODE 4169–69–P

TABLE IX.F.-02.: PERFORMANCE-BASED SCORING METHODOLOGY FOR EHR REPORTING PERIOD IN CY 2027

Objective	Measure	Maximum Points	Required/Optional
Electronic Prescribing (e-Prescribing)	e-Prescribing	10 points	Required
	Query of Prescription Drug Monitoring Program (PDMP)	10 points	Required
Health Information Exchange	Support Electronic Referral Loops by Sending Health Information	15 points	Required (eligible hospitals and CAHs must choose one of the three reporting options)
	-AND-		
	Support Electronic Referral Loops by Receiving and Reconciling Health Information	15 points	
	-OR-		
	HIE Bi-Directional Exchange	30 points	
	-OR-		
	Enabling Exchange Under TEFCA	30 points	
	Electronic Prior Authorization*	10 points (*bonus*)	Optional
Provider to Patient Exchange	Provide Patients Electronic Access to Their Health Information	25 points	Required
Public Health and Clinical Data Exchange	Report the following seven measures: • Syndromic Surveillance Reporting • Immunization Registry Reporting • Electronic Case Reporting • Electronic Laboratory Reporting • Antimicrobial Use Surveillance • Antimicrobial Resistance Surveillance • Unique Device Identifier**	25 points	Required
	Report one of the following measures: • Public Health Registry Reporting • Clinical Data Registry Reporting • Public Health Reporting using TEFCA	5 points (*bonus*)	Optional

Notes: The Security Risk Analysis measure, SAFER Guides measure, and Information Blocking attestation required by section 106(b)(2)(B) of the Medicare Access and CHIP Reauthorization Act of 2015 are required but will not be scored. Reporting electronic clinical quality measures (eCQMs) is required but will not be scored. Eligible hospitals and CAHs must also submit their level of active engagement for measures under the Public Health and Clinical Data Exchange objective. Participants may spend only one EHR reporting period at Option 1: Pre-production and Validation level per measure and must progress to Option 2: Validated Data Production level for the following EHR reporting period. See the FY 2023 IPPS/LTCH PPS final rule (87 FR 49337) for more details about active engagement. In section IX.F.3 of this final rule, we are finalizing removal of the ONC Direct Review and ONC-ACB Surveillance attestations for the EHR reporting period in CY 2026 and subsequent years.

* In section IX.F.5.d of this final rule, we are finalizing that the Electronic Prior Authorization measure be an optional bonus measure for CY 2027 EHR reporting period.

** In section IX.F.6 of this final rule, we are finalizing our proposal to adopt the Unique Device Identifier measure beginning with the EHR reporting period in CY 2027.

TABLE IX.F.-03. : PERFORMANCE-BASED SCORING METHODOLOGY FOR EHR REPORTING PERIOD IN CY 2028

Objective	Measure	Maximum Points	Required/Optional
Electronic Prescribing (e-Prescribing)	e-Prescribing	10 points	Required
	Query of Prescription Drug Monitoring Program (PDMP)	10 points	Required
Health Information Exchange	Support Electronic Referral Loops by Sending Health Information*	15 points	Required (eligible hospitals and CAHs must choose one of the three reporting options)*
	-AND-		
	Support Electronic Referral Loops by Receiving and Reconciling Health Information*	15 points	
	-OR-		
	HIE Bi-Directional Exchange	30 points	
	-OR-		
	Enabling Exchange Under TEFCA	30 points	
	Electronic Prior Authorization**	Unscored	Required
Provider to Patient Exchange	Provide Patients Electronic Access to Their Health Information	25 points	Required
Public Health and Clinical Data Exchange	Report the following seven measures: • Syndromic Surveillance Reporting • Immunization Registry Reporting • Electronic Case Reporting • Electronic Laboratory Reporting • Antimicrobial Use Surveillance • Antimicrobial Resistance Surveillance • Unique Device Identifier***	25 points	Required
	Report one of the following measures: • Public Health Registry Reporting • Clinical Data Registry Reporting • Public Health Reporting using TEFCA	5 points (*bonus*)	Optional

Notes: The Security Risk Analysis measure, SAFER Guides measure, and Information Blocking attestation required by section 106(b)(2)(B) of the Medicare Access and CHIP Reauthorization Act of 2015 are required but will not be scored. Reporting electronic clinical quality measures (eCQMs) is required but will not be scored. Eligible hospitals and CAHs must also submit their level of active engagement for measures under the Public Health and Clinical Data Exchange objective. Participants may spend only one EHR reporting period at Option 1: Pre-production and Validation level per measure and must progress to Option 2: Validated Data Production level for the following EHR reporting period. See the FY 2023 IPPS/LTCH PPS final rule (87 FR 49337) for more details about active engagement. In section IX.F.3 of this final rule, we are finalizing removal of the ONC Direct Review and ONC-ACB Surveillance attestations for the EHR reporting period in CY 2026 and subsequent years.

*In section IX.F.4 of this final rule, the Support Electronic Referral Loops by Sending Health Information and Support Electronic Referral Loops by Receiving and Reconciling Health Information measures will be removed for the EHR reporting period in CY 2029 and subsequent years. Eligible hospitals and CAHs must choose one of the two reporting options beginning with the EHR reporting period in CY 2029.

** In section IX.F.5 of this final rule, we are finalizing our proposal to make the Electronic Prior Authorization optional in the CY 2027 EHR reporting period and required, but unscored, starting with the EHR reporting period in CY 2028.

*** In section IX.F.6 of this final rule, we are finalizing our proposal to adopt the Unique Device Identifier measure beginning with the EHR reporting period in CY 2027.

BILLING CODE 4169–69–C

The maximum number of points available for each measure described in Tables IX.F.–02. and IX.F.–03. does not include the points that would be redistributed in the event an exclusion is claimed for a given measure. We are not making any changes to our policy for point redistribution in the event an exclusion is claimed. We refer readers to Table IX.F.–04. in this final rule, which shows point redistribution among the objectives and measures for the EHR reporting period in CY 2027 in the event an eligible hospital or CAH claims an exclusion. Similarly, Table IX.F.–05. shows the redistribution for the EHR reporting periods in CY 2028 and subsequent years.

We note that we adopted and codified a measure suppression policy for the Medicare Promoting Interoperability Program beginning with the EHR reporting period in CY 2026 at § 495.24(f)(3) in the Medicare and Medicaid Programs; CY 2026 Payment Policies Under the Physician Fee Schedule and Other Changes to Part B Payment and Coverage Policies; Medicare Shared Savings Program Requirements; and Medicare Prescription Drug Inflation Rebate Program final rule (CY 2026 PFS final rule) (90 FR 49881). Specifically, we codified that if certain circumstances occur that impact our assessment of the performance of eligible hospitals and CAHs on a measure selected for the Medicare Promoting Interoperability Program, we have the sole discretion to suppress the affected measure by excluding it from our assessment of performance. In this case, we would allocate the maximum points available or provide full credit for the affected measure if the eligible hospital or CAH reports the affected measure, or we would exclude the affected measure from the determination of a meaningful EHR user if the affected measure is not scored. For more information, see the CY 2026 PFS final rule at 90 FR 49881.

BILLING CODE 4169–69–P

TABLE IX.F.-04. : EXCLUSION REDISTRIBUTION FOR THE EHR REPORTING PERIOD IN CY 2027

Objective	Measure	Redistribution if Exclusion is Claimed
e-Prescribing	e-Prescribing	10 points to Health Information Exchange objective
	Query of PDMP	10 points to e-Prescribing measure
Health Information Exchange	Support Electronic Referral Loops by Sending Health Information*	No exclusion
	-AND-	
	Support Electronic Referral Loops by Receiving and Reconciling Health Information*	No exclusion
	-OR-	
	HIE Bi-Directional Exchange	No exclusion
	-OR-	
	Enabling Exchange Under TEFCA	No exclusion
	Electronic Prior Authorization (Optional)	No exclusion
Provider to Patient Exchange	Provide Patients Electronic Access to Their Health Information	No exclusion
Public Health and Clinical Data Exchange	Report the following seven measures: ● Syndromic Surveillance Reporting ● Immunization Registry Reporting ● Electronic Case Reporting ● Electronic Laboratory Reporting ● AU Surveillance ● AR Surveillance ● Unique Device Identifier***	If an exclusion is claimed for each of the seven measures, 25 points are redistributed to the Provide Patients Electronic Access to their Health Information measure

* In section IX.F.4 of this final rule, we are finalizing our proposal to remove the Support Electronic Referral Loops by Sending Health Information and Support Electronic Referral Loops by Receiving and Reconciling Health Information measures beginning with the EHR reporting period in CY 2029 and for subsequent years.
** In section IX.F.5 of this final rule, we are finalizing our proposal to make the Electronic Prior Authorization optional in the CY 2027 EHR reporting period.
*** In section IX.F.6 of this final rule, we are finalizing our proposal to adopt the Unique Device Identifier measure beginning with the EHR reporting period in CY 2027.

TABLE IX.F.-05. : EXCLUSION REDISTRIBUTION FOR THE EHR REPORTING PERIOD IN CY 2028

Objective	Measure	Redistribution if Exclusion is Claimed
e-Prescribing	e-Prescribing	10 points to Health Information Exchange objective
	Query of PDMP	10 points to e-Prescribing measure
Health Information Exchange*	Support Electronic Referral Loops by Sending Health Information*	No exclusion
	-AND-	
	Support Electronic Referral Loops by Receiving and Reconciling Health Information*	No exclusion
	-OR-	
	HIE Bi-Directional Exchange	No exclusion
	-OR-	
	Enabling Exchange Under TEFCA	No exclusion
	Electronic Prior Authorization**	No redistribution for exclusion**
Provider to Patient Exchange	Provide Patients Electronic Access to Their Health Information	No exclusion
Public Health and Clinical Data Exchange	Report the following seven measures: ● Syndromic Surveillance Reporting ● Immunization Registry Reporting ● Electronic Case Reporting ● Electronic Laboratory Reporting ● AU Surveillance ● AR Surveillance ● Unique Device Identifier***	If an exclusion is claimed for each of the seven measures, 25 points are redistributed to the Provide Patients Electronic Access to their Health Information measure

* In section IX.F.4 of this final rule, the Support Electronic Referral Loops by Sending Health Information and Support Electronic Referral Loops by Receiving and Reconciling Health Information measures will be removed for the EHR reporting period in CY 2029 and subsequent years.

** In section IX.F.5 of this final rule, we are finalizing our proposal to make the Electronic Prior Authorization required but unscored starting with the EHR reporting period in CY 2028.

*** In section IX.F.6 of this final rule, we are finalizing our proposal to adopt the Unique Device Identifier measure beginning with the EHR reporting period in CY 2027.

BILLING CODE 4169–69–C

8. Overview of Objectives and Measures

Table IX.F.–06. lists objectives and measures for the Medicare Promoting Interoperability Program for the EHR reporting period in CY 2027 and reflects the policies finalized in this final rule as well as finalized changes that would go into effect for the EHR reporting period beginning with CY 2028. For measures that have differing information between the EHR reporting period in CY 2027 and the EHR reporting period in CY 2028 and subsequent years, the applicable year will be noted in the measure column. Table IX.F.–07. lists the ONC health IT certification criteria required to meet specific objectives and measures.

TABLE IX.F.-06.: OBJECTIVES AND MEASURES FOR THE MEDICARE PROMOTING INTEROPERABILITY PROGRAM FOR THE EHR REPORTING PERIODS IN CY 2027, CY 2028 AND SUBSEQUENT YEARS

Objective	Measure	Numerator	Denominator	Exclusion	Calculation considerations related to counting unique patients or actions
e-Prescribing	e-Prescribing: For at least one hospital discharge, medication orders for permissible prescriptions (for new and changed prescriptions) are transmitted electronically using CEHRT.	The number of prescriptions in the denominator generated and transmitted electronically.	The number of new or changed prescriptions written for drugs requiring a prescription in order to be dispensed, other than controlled substances for patients discharged during the EHR reporting period.	Any eligible hospital or CAH that does not have an internal pharmacy that can accept electronic prescriptions, and there are no pharmacies that accept electronic prescriptions within 10 miles at the start of their EHR reporting period.	Measure may be calculated by reviewing only actions for patients whose records are maintained using CEHRT for which sufficient data were entered in the CEHRT to allow the record to be saved and not rejected due to incomplete data.
e-Prescribing	Query of PDMP: For at least one Schedule II opioid or Schedule III or IV drug electronically prescribed using CEHRT during the EHR reporting period, the eligible hospital or CAH uses CEHRT to conduct a query of a PDMP for prescription drug history.	N/A (measure is Y/N)	N/A (measure is Y/N)	(1) Any eligible hospital or CAH that does not have an internal pharmacy that can accept electronic prescriptions for controlled substances that include Schedule II, III and IV drugs and is not located within 10 miles of any pharmacy that accepts electronic prescriptions for controlled substances at the start of their EHR reporting period. (2) Any eligible hospital or CAH that could not report on this measure in accordance with applicable law.	N/A (measure is Y/N)
Health Information Exchange	Electronic Prior Authorization (EHR Reporting Period in CY 2027 *only*):* For at least one medical item or service (excluding drugs) ordered during a hospital encounter that occurs within the EHR reporting period, the prior authorization is requested electronically through a Prior Authorization API using CEHRT.	N/A (measure is Y/N)	N/A (measure is Y/N)	None*	N/A (measure is Y/N)

Health Information Exchange	Electronic Prior Authorization (EHR Reporting Period in CY 2028 and Subsequent Years):** For at least one medical item or service (excluding drugs) ordered during a hospital encounter that occurs within the EHR reporting period, the prior authorization is requested electronically through a Prior Authorization API using CEHRT.	N/A (measure is Y/N)	N/A (measure is Y/N)	Any eligible hospital or CAH that: (1) Does not order any medical items or services (excluding drugs) requiring prior authorization during the EHR reporting period; or (2) Only orders medical items or services (excluding drugs) requiring prior authorization from a payer that does not offer an API that meets the Prior Authorization API requirements during the applicable EHR reporting period.*	N/A (measure is Y/N)
Health Information Exchange	Support Electronic Referral Loops by Sending Health Information:** For at least one transition of care or referral, the eligible hospital or CAH that transitions or refers its patient to another setting of care or provider of care: (1) Creates a summary of care record using CEHRT; and (2) Electronically exchanges the summary of care record.	Number of transitions of care and referrals in the denominator where a summary of care record was created using CEHRT and exchanged electronically.**	Number of transitions of care and referrals during the EHR reporting period for which the eligible hospital or CAH inpatient or emergency department (Place of Service [POS] 21 or 23) was the transitioning or referring provider.**	None**	Measure may be calculated by reviewing only actions for patients whose records are maintained using CEHRT for which sufficient data were entered in the CEHRT to allow the record to be saved and not rejected due to incomplete data.**

Health Information Exchange	Support Electronic Referral Loops by Receiving and Reconciling Health Information:** For at least one electronic summary of care record received using CEHRT for patient encounters during the EHR reporting period for which an eligible hospital or CAH was the receiving party of a transition of care or referral, or for patient encounters during the EHR reporting period in which the eligible hospital or CAH has never before encountered the patient, the eligible hospital or CAH conducts clinical information reconciliation for medication, medication allergy, and current problem list using CEHRT.	Number of electronic summary of care records in the denominator for which clinical information reconciliation is completed using CEHRT for the following three clinical information sets: (1) Medication – Review of the patient's medication, including the name, dosage, frequency, and route of each medication; (2) Medication Allergy – Review of the patient's known medication allergies; and (3) Current Problem List – Review of the patient's current and active diagnoses.**	Number of electronic summary of care records received using CEHRT for patient encounters during the EHR reporting period for which an eligible hospital or CAH was the reconciling party of a transition of care or referral, and for patient encounters during the EHR reporting period in which the eligible hospital or CAH has never before encountered the patient.**	None**	Measure may be calculated by reviewing only actions for patients whose records are maintained using CEHRT for which sufficient data were entered in the CEHRT to allow the record to be saved and not rejected due to incomplete data.**

Health Information Exchange	HIE Bi-Directional Exchange The eligible hospital or CAH must attest to the following: (1) Participating in a Health Information Exchange system (HIE) in order to enable secure, bi-directional exchange of information to occur for all unique patients discharged from the eligible hospital or CAH inpatient or emergency department (POS 21 or 23), and all unique patient records stored or maintained in the EHR for these departments, during the EHR reporting period in accordance with applicable law and policy. (2) Participating in an HIE that is capable of exchanging information across a broad network of unaffiliated exchange partners including those using disparate EHRs, and not engaging in exclusionary behavior when determining exchange partners. (3) Using the functions of CEHRT to support bi-directional exchange with an HIE.	N/A (measure is Y/N)	N/A (measure is Y/N)	None	N/A (measure is Y/N)

Health Information Exchange	Enabling Exchange Under TEFCA The eligible hospital or CAH must attest to the following: (1) Participating as a signatory to a Framework Agreement (as that term is defined by the Common Agreement for Nationwide Health Information Interoperability as published in the **Federal Register** and on ONC's website) in good standing (that is, not suspended) and enabling secure, bi-directional exchange of information to occur, in production, for all unique patients discharged from the eligible hospital or CAH inpatient or emergency department (POS 21 or 23), and all unique patient records stored or maintained in the EHR for these departments, during the EHR reporting period in accordance with applicable law and policy. (2) Using the functions of CEHRT to support bi-directional exchange of patient information, in production, under this Framework Agreement.	N/A (measure is Y/N)	N/A (measure is Y/N)	None	N/A (measure is Y/N)

Provider to Patient Exchange	Provide Patients Electronic Access to Their Health Information: For at least one unique patient discharged from the eligible hospital or CAH inpatient or emergency department (POS 21 or 23): (1) the patient (or patient-authorized representative) is provided timely access to view online, download, and transmit their health information; and (2) the eligible hospital or CAH ensures the patient's health information is available for the patient (or patient-authorized representative) to access using any application of their choice that is configured to meet the technical specifications of the application programming interface (API) in the eligible hospital's or CAH's CEHRT.	The number of patients in the denominator (or patient authorized representatives) who are provided timely access to health information to view online, download and transmit to a third party and to access using an application of their choice that is configured to meet the technical specifications of the API in the eligible hospital's or CAH's CEHRT.	The number of unique patients discharged from an eligible hospital or CAH inpatient or emergency department (POS 21 or 23) during the EHR reporting period.	None	Measure must be calculated by reviewing all patient records, not just those maintained using CEHRT.

Public Health and Clinical Data Exchange	Immunization Registry Reporting: The eligible hospital or CAH is in active engagement with a PHA to submit immunization data and receive immunization forecasts and histories from the public health immunization registry or immunization information system (IIS).	N/A (measure is Y/N)	N/A (measure is Y/N)	Any eligible hospital or CAH meeting one or more of the following criteria may be excluded from the immunization registry reporting measure if the eligible hospital or CAH: (1) Does not administer any immunizations to any of the populations for which data are collected by its jurisdiction's immunization registry or IIS during the EHR reporting period; (2) Operates in a jurisdiction for which no immunization registry or IIS is capable of accepting the specific standards required to meet the CEHRT definition at the start of the EHR reporting period; or (3) Operates in a jurisdiction where no immunization registry or IIS has declared readiness to receive immunization data as of 6 months prior to the start of the EHR reporting period.	N/A (measure is Y/N)

Public Health and Clinical Data Exchange	Syndromic Surveillance Reporting: The eligible hospital or CAH is in active engagement with a PHA to submit syndromic surveillance data from an emergency department (POS 23).	N/A (measure is Y/N)	N/A (measure is Y/N)	Any eligible hospital or CAH meeting one or more of the following criteria may be excluded from the syndromic surveillance reporting measure if the eligible hospital or CAH: (1) Does not have an emergency department; (2) Operates in a jurisdiction for which no PHA is capable of receiving electronic syndromic surveillance data from eligible hospitals or CAHs in the specific standards required to meet the CEHRT definition at the start of the EHR reporting period; or (3) Operates in a jurisdiction where no PHA has declared readiness to receive syndromic surveillance data from eligible hospitals or CAHs as of 6 months prior to the start of the EHR reporting period.	N/A (measure is Y/N)
Public Health and Clinical Data Exchange	Electronic Case Reporting: The eligible hospital or CAH is in active engagement with a PHA to submit case reporting of reportable conditions.	N/A (measure is Y/N)	N/A (measure is Y/N)	Any eligible hospital or CAH meeting one or more of the following criteria may be excluded from the case reporting measure if the eligible hospital or CAH: (1) Does not treat or diagnose any reportable diseases for which data are collected by its jurisdiction's reportable disease system during the EHR reporting period; (2) Operates in a jurisdiction for which no PHA is capable of receiving electronic case reporting data in the specific standards required to meet the CEHRT definition at the start of the EHR reporting period; or (3) Operates in a jurisdiction where no PHA has declared readiness to receive electronic case reporting data as of 6 months prior to the start of the EHR reporting period.	N/A (measure is Y/N)

Public Health and Clinical Data Exchange	Electronic Laboratory Reporting: The eligible hospital or CAH is in active engagement with a PHA to submit Electronic Laboratory Reporting results.	N/A (measure is Y/N)	N/A (measure is Y/N)	Any eligible hospital or CAH meeting one or more of the following criteria may be excluded from the Electronic Laboratory Reporting measure if the eligible hospital or CAH: (1) Does not perform or order laboratory tests that are reportable in its jurisdiction during the EHR reporting period; (2) Operates in a jurisdiction for which no PHA is capable of accepting the specific Electronic Laboratory Reporting standards required to meet the CEHRT definition at the start of the EHR reporting period; or (3) Operates in a jurisdiction where no PHA has declared readiness to receive Electronic Laboratory Reporting results from an eligible hospital or CAH as of 6 months prior to the start of the EHR reporting period.	N/A (measure is Y/N)
Public Health and Clinical Data Exchange	Antimicrobial Use Surveillance: The eligible hospital or CAH is in active engagement with CDC's National Health Safety Network (NHSN) to submit Antimicrobial Use data for the EHR reporting period and receives a report from NHSN indicating its successful submission of Antimicrobial Use data for the EHR reporting period.	N/A (measure is Y/N)	N/A (measure is Y/N)	Any eligible hospital or CAH may be excluded from the measure if the eligible hospital or CAH: (1) Does not have any patients in any patient care location for which data are collected by NHSN during the EHR reporting period; (2) Does not have electronic medication administration record (eMAR)/barcode medication administration (BCMA) electronic records or an admission, discharge, transfer (ADT) system during the EHR reporting period; or (3) Does not have a data source containing the minimal discrete data elements that are required for reporting.	N/A (measure is Y/N)
Public Health and Clinical Data Exchange	Antimicrobial Resistance Surveillance: The eligible hospital or CAH is in active engagement with	N/A (measure is Y/N)	N/A (measure is Y/N)	Any eligible hospital or CAH may be excluded from the measure if the eligible hospital or CAH: (1) Does not have any patients in any patient care location for	N/A (measure is Y/N)

	CDC's NHSN to submit Antimicrobial Resistance data for the EHR reporting period and receives a report from NHSN indicating its successful submission of Antimicrobial Resistance data for the EHR reporting period.			which data are collected by NHSN during the EHR reporting period; (2) Does not have a laboratory information system (LIS) or ADT system during the EHR reporting period; or (3) Does not have a data source containing the minimal discrete data elements that are required for reporting.	
Public Health and Clinical Data Exchange	Public Health Registry Reporting: The eligible hospital or CAH is in active engagement with a PHA to submit data to public health registries.	N/A (measure is Y/N)	N/A (measure is Y/N)	None	N/A (measure is Y/N)
Public Health and Clinical Data Exchange	Clinical Data Registry Reporting: The eligible hospital or CAH is in active engagement to submit data to a clinical data registry.	N/A (measure is Y/N)	N/A (measure is Y/N)	None	N/A (measure is Y/N)
Public Health and Clinical Data Exchange	Public Health Reporting Using TEFCA: The eligible hospital or CAH (1) Participates as a signatory to a Framework Agreement (as that term is defined by the Common Agreement for Nationwide Health Information Interoperability as published in the **Federal Register** and on ONC's website); (2) is not suspended; (3) submits health information using TEFCA to a PHA consistent with one or more of the measures under the Public Health and Clinical Data Exchange objective; (4) is in active engagement Option 2 (validated data production) with a PHA to transfer	N/A (measure is Y/N)	N/A (measure is Y/N)	None	N/A (measure is Y/N)

	health information for one or more of the measures under the Public Health and Clinical Data Exchange objective; and (5) uses the functions of CEHRT to exchange data with the PHA.				
Public Health and Clinical Data Exchange	Unique Device Identifier:* The eligible hospital or CAH uses CEHRT during the EHR reporting period to electronically capture and store, as one or more discrete data elements within the patient's electronic health record, the complete Unique Device Identifier (UDI), which includes the device identifier and, when present on the device label, the production identifier, for each implantable medical device subject to UDI requirements used for patient care delivery.	N/A (measure is Y/N)	N/A (measure is Y/N)	The eligible hospital or CAH implanted five or fewer medical devices subject to UDI requirements during the calendar year of the applicable EHR reporting period.	N/A (measure is Y/N)
Protect Patient Health Information	Security Risk Analysis: First, conduct or review a security risk analysis and second, conduct security risk management activities, in accordance with the requirements under 45 CFR 164.308(a)(1)(ii)(A) and (B). Security risk analysis and management activities include addressing the security of data created or maintained by CEHRT (to include encryption), in accordance with 45 CFR 164.312(a)(2)(iv) and 45 CFR	N/A (measure is Y/N)	N/A (measure is Y/N)	None	N/A (measure is Y/N)

	164.306(d)(3). The encryption implementation specified at 45 CFR 164.312(a)(2)(iv) must be implemented if it is reasonable and appropriate; if encryption is not reasonable and appropriate, then the eligible hospital or CAH would adopt an equivalent alternative measure if it is reasonable and appropriate to do so. Actions included in the security risk analysis measure may occur any time during the calendar year in which the EHR reporting period occurs.				
Protect Patient Health Inormation	Safety Assurance Factors for EHR Resilience (SAFER) Guides Conduct an annual self-assessment using all eight of the 2025 SAFER Guides at any point during the calendar year in which the EHR reporting period occurs, beginning with the EHR reporting period in CY 2026 and subsequent years.	N/A (measure is Y/N)	N/A (measure is Y/N)	None	N/A (measure is Y/N)

* Signifies a policy finalized in this FY 2027 IPPS/LTCH PPS final rule that applies to the EHR reporting period in CY 2027.

** We have finalized a policy in this FY 2027 IPPS/LTCH PPS final rule to remove this measure in the EHR reporting period in CY 2029 and subsequent years.

TABLE IX.F.-07. : MEDICARE PROMOTING INTEROPERABILITY PROGRAM OBJECTIVES AND MEASURES AND ONC HEALTH IT CERTIFICATION CRITERIA

Objective	Measure	ONC Health IT Certification Criteria as defined in the following sections of Title 45 CFR	ONC Health IT Certification Criteria Changes If HTI-5 Proposals Are Finalized as Proposed
e-Prescribing	e-Prescribing	170.315(b)(3) e-Prescribing	No change
	Query of PDMP	170.315(b)(3) e-Prescribing	No change
Health Information Exchange	Support Electronic Referral Loops by Sending Health Information*	170.315(b)(1) Transitions of care	Revised
	Support Electronic Referral Loops by Receiving and Reconciling Health Information*	170.315(b)(1) Transitions of care	Revised
		170.315(b)(2) Clinical information reconciliation and incorporation	Removed
Health Information Exchange (alternative)	HIE Bi-Directional Exchange	Examples of certified health IT capabilities to support the actions of this measure may include but are not limited to technology certified to the following criteria:	

		170.315(b)(1) Transitions of care	Revised
		170.315(b)(2) Clinical information reconciliation and incorporation	Removed
		170.315(g)(7) Application access — patient selection	Removed
		170.315(g)(9) Application access — all data request	Removed
		170.315(g)(10) Application access — standardized API for patient and population services	No change
Health Information Exchange (alternative)	Enabling Exchange Under TEFCA	Examples of certified health IT capabilities to support the actions of this measure may include but are not limited to technology certified to the following criteria:	
		170.315(b)(1) Transitions of care	Revised
		170.315(g)(7) Application access — patient selection	Removed
		170.315(g)(9) Application access — all data request	Removed
		170.315(g)(10) Application access — standardized API for patient and population services	No change
Health Information Exchange	Electronic Prior Authorization*	Certified health IT capabilities that may support the actions of this measure	
		170.315(g)(31) Provider prior authorization API — coverage requirements discovery*	No change
		170.315(g)(32) Provider prior authorization API — documentation templates and rules*	No change
		170.315(g)(33) Provider prior authorization API — prior authorization support*	No change
Provider to Patient Exchange	Provide patients electronic access to their health information	170.315(e)(1) View, download, and transmit to 3rd party	Revised
		170.315(g)(7) Application access — patient selection	Removed
		170.315(g)(9) Application access — all data request	Removed
		170.315(g)(10) Application access — standardized API for patient and population services	No change
Public Health and Clinical Data Exchange	Immunization registry reporting	170.315(f)(1) Transmission to immunization registries	No change
	Syndromic surveillance reporting	170.315(f)(2) Transmission to public health agencies — syndromic surveillance	No change

	Electronic case reporting	170.315(f)(5) Transmission to public health agencies — electronic case reporting	Revised
	Public health registry reporting	170.315(f)(7) Transmission to public health agencies — health care surveys.	Removed
	Clinical data registry reporting	No ONC health IT certification criteria at this time.	No change
	Public health reporting using TEFCA	Examples of certified health IT capabilities to support the actions of this measure may include but are not limited to technology certified to the following criteria:	
		170.315(f)(3) Transmission to public health agencies — reportable laboratory tests and value/results	No change
		170.315(f)(5) Transmission to public health agencies — electronic case reporting	Revised
	Electronic laboratory reporting	170.315(f)(3) Transmission to public health agencies — reportable laboratory tests and value/results	No change
	Antimicrobial Use Surveillance	170.315(f)(6) Transmission to public health agencies — antimicrobial use and resistance reporting	Revised
	Antimicrobial Resistance Surveillance	170.315(f)(6) Transmission to public health agencies — antimicrobial use and resistance reporting	Revised
	Unique Device Identifier*	170.315(a)(14) Implantable device list	Removed
		170.315(g)(10) Application access — standardized API for patient and population services	No change
Electronic Clinical Quality measures (eCQMs)	eCQMs for eligible hospitals and CAHs	170.315(c)(1)	No change
		170.315(c)(2)	No change
		170.315(c)(3)(i) and (ii)	No change
Protect Patient Health Information	Security Risk Analysis	No ONC health IT certification criteria at this time.	No change
	SAFER Guides	No ONC health IT certification criteria at this time.	No change

*Signifies a measure with a policy finalized in this FY 2027 IPPS/LTCH PPS final rule.

BILLING CODE 4169–69–C

9. Clinical Quality Measurement for Eligible Hospitals and CAHs Participating in the Medicare Promoting Interoperability Program

a. Background on Clinical Quality Measurement for Eligible Hospitals and CAHs

Under sections 1814(l)(3)(A) and 1886(n)(3)(A) of the Act and the definition of ''meaningful EHR user'' under 42 CFR 495.4, eligible hospitals and CAHs must report on clinical quality measures (also referred to as electronic clinical quality measures, or eCQMs) selected by CMS using CEHRT as part of the Medicare Promoting Interoperability Program.

As we stated in the FY 2018 IPPS/LTCH PPS final rule (82 FR 38479), we intend to continue to align the eCQM reporting requirements and eCQM measure set for the Medicare Promoting Interoperability Program with similar requirements under the Hospital Inpatient Quality Reporting Program, to the extent feasible. Section 1886(n)(3)(B)(i)(I) of the Act requires the Secretary to provide preference for the selection of clinical quality measures that are also used in the Hospital Inpatient Quality Reporting Program or endorsed by the entity with a contract with the Secretary under section 1890(a) of the Act (referred to in this rule as the consensus-based entity (CBE)). Furthermore, aligning eCQM reporting requirements between the Medicare Promoting Interoperability Program and the Hospital Inpatient Quality Reporting Program allows for improved coordination, burden reduction, and the promotion of quality care.

b. Adoption and Removal of eCQMs

In the FY 2027 IPPS/LTCH PPS proposed rule (91 FR 19652), as discussed in section IX.B.1., section IX.C.3., section IX.C.4., and section IX.C.8.c. of the preamble of the proposed rule, and in alignment with the Hospital Inpatient Quality Reporting Program, we proposed to adopt and remove the same eCQMs for the Medicare Promoting Interoperability Program beginning with the CY 2028 reporting period. Specifically, we proposed to adopt the following two eCQMs in the Medicare Promoting Interoperability Program eCQM measure set from which eligible hospitals and CAHs could self-select to report, beginning with the CY 2028 reporting period: (1) Hospital Harm—Postoperative Venous Thromboembolism (VTE); and (2) Advance Care Planning. Additionally, we proposed to remove the following three eCQMs from the Medicare Promoting Interoperability Program eCQM measure set, beginning with the CY 2028 reporting period: (1) Discharged on Antithrombotic Therapy eCQM; (2) VTE Prophylaxis eCQM; and (3) Intensive Care Unit VTE Prophylaxis eCQM.

We invited public comment on these proposals.

The comment summaries and responses in this section are specific to the Medicare Promoting Interoperability Program. For more complete summaries of the comments we received on these measure proposals, we refer readers to the Hospital Inpatient Quality Reporting Program discussion in section IX.C.8.c. of this final rule where we discuss the comments we received regarding both programs and our responses.

Comment: A few commenters supported CMS's proposals to align eCQM adoption and removal across the Medicare Promoting Interoperability Program and the Hospital Inpatient Quality Reporting Program, including removing eCQMs that they believed had become clinically dated, because they believed the proposals would promote consistency across hospital quality reporting programs, reduce duplicative reporting, simplify hospital workflows, maintain consistent measure specifications and submission requirements, and support meaningful quality improvement.

Response: We appreciate the commenters' support. We agree that aligning the eCQM reporting requirements and eCQM measure set for the Medicare Promoting Interoperability Program with similar requirements under the Hospital Inpatient Quality Reporting Program, to the extent feasible, allows for improved coordination, burden reduction, and the promotion of quality care. We also agree that maintaining a consistent measure set across programs supports clearer expectations for eligible hospitals and CAHs.

After consideration of the public comments we received, we are finalizing our proposals to adopt the Hospital Harm—Postoperative VTE and Advance Care Planning eCQMs and to remove the three VTE-related eCQMs beginning with the CY 2028 reporting period.

c. Modification of the eCQM Reporting and Submission Requirements

As we stated in the FY 2027 IPPS/LTCH PPS proposed rule (91 FR 19652), consistent with our goal to align the eCQM reporting periods and criteria in the Medicare Promoting Interoperability Program with the Hospital Inpatient Quality Reporting Program, eligible hospitals and CAHs are currently required to annually report data for each required eCQM and three self-selected eCQMs for the CY 2026 reporting period and subsequent years (85 FR 58975 through 58976, 86 FR 45496, 87 FR 49365 through 49367, and 89 FR 69623 through 69624). We did not propose changes to our previously finalized policy that progressively increases the number of mandatory eCQMs a hospital must report for the CY 2026 reporting period or the CY 2027 reporting period (89 FR 69623 through 69624). In alignment with the Hospital Inpatient Quality Reporting Program, we did propose changes to the reporting and submission requirements for eCQMs for the Medicare Promoting Interoperability Program beginning with the CY 2028 reporting period. Specifically, in the FY 2027 IPPS/LTCH PPS proposed rule (91 FR 19652 through 19654), we proposed to modify the eCQM reporting and submission requirements for the Hospital Harm eCQMs such that beginning with the CY 2028 reporting period these eCQMs would become mandatory for reporting after 2 years of self-selected reporting. Under the proposed changes, for example, the Hospital Harm—Falls with Injury eCQM and the Hospital Harm—Postoperative Respiratory Failure eCQM would become mandatory for reporting beginning with the CY 2028 reporting period. Consistent with the proposed approach for the Hospital Harm eCQMs (that is, two years of self-selected reporting followed by mandatory reporting in the third year), the proposed Hospital Harm—Postoperative VTE eCQM would be available for self-selected reporting for the CY 2028 and CY 2029 reporting periods and would become mandatory for reporting beginning with the CY 2030 reporting period. We refer readers to section IX.C.8.c. of the preamble of the FY 2027 IPPS/LTCH PPS proposed rule and section IX.C.8.c. of this final rule for more detailed discussion in the Hospital Inpatient Quality Reporting Program.

Further, we proposed to require mandatory reporting of the Malnutrition Care Score eCQM beginning with the CY 2028 reporting period. The Hospital Harm—Falls with Injury eCQM, the Hospital Harm—Postoperative Respiratory Failure eCQM, and the Malnutrition Care Score eCQM would continue to be available as self-selected measures for the CY 2027 reporting period. These proposed changes are intended to further incentivize improvements in patient safety and nutrition care. We refer readers to

section IX.C.8.c. of the preamble of the FY 2027 IPPS/LTCH PPS proposed rule and section IX.C.8.c. of this final rule for more detailed discussion in the Hospital Inpatient Quality Reporting Program about our rationale.

We invited public comment on the proposals to modify reporting and submission requirements for eCQMs beginning with the CY 2028 reporting period.

We did not receive any comments specific to the Medicare Promoting Interoperability Program and refer readers to the Hospital Inpatient Quality Reporting Program discussion in section IX.C.8.c. of this final rule where we discuss the comments we received regarding both programs and our responses. We are finalizing our proposal to modify eCQM reporting, submission, and public reporting requirements with modification, beginning with the CY 2028 reporting period. Specifically, we are finalizing the proposed timeline under which Hospital Harm eCQMs will become mandatory after 2 years of self-selected reporting, with a modification to publicly report data on the more research-focused Provider Data Catalog for the first year of mandatory reporting before moving it to the consumer-focused Care Compare site, including Star Ratings, beginning with the second year of mandatory reporting. These measures will not be publicly reported during the 2-year self-selection period. This policy will apply to all Hospital Harm eCQMs adopted under the program, including any such measures adopted in future rulemaking. We are also finalizing mandatory reporting for the Hospital Harm—Falls with Injury eCQM, the Hospital Harm—Postoperative Respiratory Failure eCQM, and the Malnutrition Care Score eCQM.

We also refer readers to the Request for Information on FHIR-based digital quality measurement in the CY 2027 PFS proposed rule (91 FR 44152 through 44154), in which we are seeking comment on a phased timeline, key milestones, and implementation considerations for transitioning to FHIR-based digital quality reporting in the Quality Payment Program and other CMS clinician and hospital quality programs, including the Medicare Promoting Interoperability Program.

d. Summary of Previously Finalized and Newly Finalized eCQMs Available for Eligible Hospitals and CAHs to Report Under the Medicare Promoting Interoperability Program

Table IX.F.–8 summarizes our finalized policies to modify reporting and submission requirements for eCQMs beginning with the CY 2028 reporting period.

BILLING CODE 4169–69–P

TABLE IX.F.-08. SUMMARY OF ECQM REPORTING AND SUBMISSION REQUIREMENTS

Reporting Period	Total Number of eCQMs Reported	eCQMs Required to be Reported	eCQMs for Self-selection (must report 3)
CY 2028	Fourteen	• Safe Use of Opioids—Concurrent Prescribing • Cesarean Birth • Severe Obstetric Complications • Malnutrition Care Score* • Hospital Harm—Severe Hyperglycemia • Hospital Harm—Severe Hypoglycemia • Hospital Harm—Opioid-Related Adverse Events • Hospital Harm—Pressure Injury • Hospital Harm—Acute Kidney Injury • Hospital Harm—Falls with Injury* • Hospital Harm—Postoperative Respiratory Failure*	• Anticoagulation Therapy for Atrial Fibrillation/Flutter • Antithrombotic Therapy by the End of Hospital Day Two • Excessive Radiation Dose or Inadequate Image Quality for Diagnostic CT in Adults • Advance Care Planning** • Hospital Harm—Postoperative Venous Thromboembolism***
CY 2029	Fourteen	• Safe Use of Opioids—Concurrent Prescribing • Cesarean Birth • Severe Obstetric Complications • Malnutrition Care Score* • Hospital Harm—Severe Hyperglycemia • Hospital Harm—Severe Hypoglycemia • Hospital Harm—Opioid-Related Adverse Events • Hospital Harm—Pressure Injury • Hospital Harm—Acute Kidney Injury • Hospital Harm—Falls with Injury* • Hospital Harm—Postoperative Respiratory Failure*	• Anticoagulation Therapy for Atrial Fibrillation/Flutter • Antithrombotic Therapy by the End of Hospital Day Two • Excessive Radiation Dose or Inadequate Image Quality for Diagnostic CT in Adults • Advance Care Planning** • Hospital Harm—Postoperative Venous Thromboembolism***
CY 2030 and subsequent years	Fifteen	• Safe Use of Opioids—Concurrent Prescribing • Cesarean Birth • Severe Obstetric Complications • Malnutrition Care Score* • Hospital Harm—Severe Hyperglycemia • Hospital Harm—Severe Hypoglycemia • Hospital Harm—Opioid-Related Adverse Events • Hospital Harm—Pressure Injury • Hospital Harm—Acute Kidney Injury • Hospital Harm—Falls with Injury* • Hospital Harm—Postoperative Respiratory Failure* • Hospital Harm—Postoperative Venous Thromboembolism***	• Anticoagulation Therapy for Atrial Fibrillation/Flutter • Antithrombotic Therapy by the End of Hospital Day Two • Excessive Radiation Dose or Inadequate Image Quality for Diagnostic CT in Adults • Advance Care Planning**

* Finalized from self-selected to mandatory reporting beginning with the CY 2028 reporting period.
** Finalized for adoption as a self-selected eCQM beginning with the CY 2028 reporting period.
*** Finalized for adoption as a self-selected eCQM for two years beginning with the CY 2028 reporting period. The measure will become mandatory beginning with the CY 2030 reporting period after two years of self-selected reporting.

BILLING CODE 4169–69–C

Table IX.F.–9 summarizes the previously finalized and newly finalized eCQMs available for eligible hospitals and CAHs to report under the Medicare Promoting Interoperability Program for the specified reporting periods, including whether the measure is mandatory or self-selected as further discussed in section IX.C.8.c. regarding finalized changes to this latter policy.

BILLING CODE 4169–69–P

TABLE IX.F.-09: PREVIOUSLY FINALIZED AND NEWLY FINALIZED PROMOTING INTEROPERABILITY PROGRAM MEASURE SET BY DATA COLLECTION METHOD AND REPORTING PERIOD

Measure Name	CBE Number	CY 2026	CY 2027	CY 2028	CY 2029	CY 2030
Discharged on Antithrombotic Therapy**	0435e	*	*	Removal	Removal	Removal

Severe Obstetric Complications	3687e	✓	✓	✓	✓	✓
Malnutrition Care Score***	3592e	*	*	Mandatory Reporting	Mandatory Reporting	Mandatory Reporting
Excessive Radiation Dose or Inadequate Image Quality for Diagnostic Computed Tomography (CT) in Adults (Hospital Level – Inpatient)	3663e	*	*	*	*	*
Advance Care Planning****	N/A			Self-Selected Reporting	Self-Selected Reporting	Self-Selected Reporting

✓Measure is mandatory for the specified reporting period.

* Measure is a self-selected eCQM for the specified reporting period. Hospitals are required to self-select three eCQMs, in addition to all mandatory eCQMs, to submit for the specified reporting period.

** Removal finalized in this final rule beginning with the CY 2028 reporting period.

*** Finalized in this final rule from self-selected to mandatory reporting beginning with the CY 2028 reporting period and subsequent years.

**** Adopted in this final rule beginning with the CY 2028 reporting period. We refer readers to section IX.C.8.c. for our finalized policy to modify reporting and submission requirements for the Hospital Harm eCQMs; under this finalized policy the Hospital Harm—Postoperative VTE eCQM would become mandatory after two years of self-selected reporting beginning with the CY 2030 reporting period.

BILLING CODE 4169–69–C

X. Other Provisions Included in This Final Rule

A. Changes to the Transforming Episode Accountability Model (TEAM)

1. Background

a. Purpose

TEAM is a 5-year mandatory alternative payment model tested by the CMS Innovation Center that began on January 1, 2026, and will end on December 31, 2030. TEAM tests whether an episode-based pricing methodology linked with quality measure performance for select acute care hospitals reduces Medicare program expenditures while preserving or improving the quality of care for Medicare beneficiaries who initiate certain episode categories. Specifically, TEAM tests five surgical episode categories: Coronary Artery Bypass Graft Surgery (CABG), Lower Extremity Joint Replacement (LEJR), Major Bowel Procedure, Surgical Hip/Femur Fracture Treatment (SHFFT), and Spinal Fusion.

As discussed in greater detail in section X.A.1.b. of the preamble of this final rule, TEAM was established through notice and comment rulemaking. As a mandatory model, new

policies or policy modifications require notice and comment rulemaking. In the proposed rule, we sought to make updates to TEAM that include the following modifications:

- Adding new Medicare Severity Diagnosis Related Groups (MS–DRGs) to the spinal fusion episode category.
- Adjusting episode attribution.
- Adjusting the measurement performance periods for certain quality measures.
- Adjusting the construction of the CQS baseline period.
- Capturing Ambulatory Payment Classification (APC) and MS–DRG changes in preliminary target prices.
- Adjusting the construction of the prospective normalization factor.

We also solicited public comment on two Requests for Information (RFI) in the following policy areas:

- Ambulatory Surgical Center (ASC) Episodes.
- Hospital with Physician Ownership (POH).

The policies in this final rule reflect our commitment to ensuring TEAM's incentives help to drive beneficiary quality of care improvements and reductions in Medicare spending.

b. Statutory Authority and Background

Under the authority of section 1115A of the Act, through notice-and-comment rulemaking, the CMS Innovation Center established TEAM in the FY 2025 IPPS/LTCH PPS final rule that appeared in the August 28, 2024, **Federal Register** (89 FR 69626 through 69879). The intent of TEAM is to improve beneficiary care through financial accountability for episode categories that begin with one of the following procedures: CABG, LEJR, major bowel procedure, SHFFT, and spinal fusion. TEAM tests whether financial accountability for these episode categories reduces Medicare expenditures while preserving or enhancing the quality of care for Medicare beneficiaries.

Under Original Medicare, Medicare makes separate payments to providers and suppliers for the items and services furnished to a beneficiary over the course of an episode of care. Because providers and suppliers are paid for each individual item or service delivered, providers may not be incentivized to invest in quality improvement and care coordination activities. As a result, care may be fragmented, unnecessary, or duplicative. By holding hospitals accountable for all items and services provided during an episode, providers would be better incentivized to coordinate patient care, avoid duplicative or unnecessary services, and improve the beneficiary care experience during care transitions.

Under TEAM, all acute care hospitals, with limited exceptions, located within the Core Based Statistical Areas (CBSAs) that CMS selected for model implementation are required to participate in TEAM. CMS allowed a one-time opportunity for hospitals that participated until the last day of the last performance period in the Bundled Payments for Care Improvement Advanced (BPCI Advanced) Model or the last day of the last performance year of the Comprehensive Care for Joint Replacement (CJR) Model, that are not located in a mandatory CBSA selected for TEAM participation, to voluntarily opt into TEAM. TEAM includes a 1-year glide path opportunity that allows TEAM participants to ease into full financial risk as well as three different participation tracks to accommodate different levels of financial risk and reward. Track 1 is an upside only risk track available for all TEAM participants in the first performance year and available to safety net hospitals for the first 3 performance years. Track 2 is a two-sided risk track that has lower financial risk and reward, relative to Track 3, and will be available to select TEAM participants in performance years 2 through 5.[570] Track 3 is a two-sided risk track that has higher financial risk and reward, relative to Track 2, and is available to all TEAM participants in performance years 1 through 5.

Episodes include non-excluded Medicare Parts A and B items and services and begin with an anchor hospitalization or anchor procedure and will end 30 days after hospital discharge. TEAM participants continue to bill Medicare FFS as usual for items and services delivered to beneficiaries in an episode but will receive preliminary target prices for episodes prior to each performance year. Target prices are based on 3 years of baseline data, prospectively trended forward to the relevant performance year, and calculated at the level of Medicare Severity Diagnosis Related Group/Healthcare Common Procedure Coding System (MS–DRG/HCPCS) episode type and region. Target prices also include a discount factor and risk-adjustment. Participants will receive reconciliation (final) target prices that will incorporate a capped retrospective trend factor adjustment and a capped normalization factor.

Performance in the model will be assessed by comparing TEAM participants' actual Medicare FFS spending during a performance year to their reconciliation target price as well as by assessing performance on selected quality measures. TEAM participants may earn a payment from CMS, subject to a quality performance adjustment, if their spending is below the reconciliation target price. TEAM participants may owe CMS a repayment amount, subject to a quality performance adjustment, if their spending was above the reconciliation target price.

2. TEAM Provisions of This Final Rule

a. Episodes

(1) Background

As indicated in the FY 2025 IPPS/LTCH PPS final rule, an episode has two significant dimensions: (1) a clinical dimension that describes which clinical conditions and associated services are included in the episode; and (2) a time dimension that describes the beginning and end of the episode, its length, and when the episode may be cancelled prior to the end of the episode (89 FR 69710). Under TEAM, episodes begin when a beneficiary is admitted for an anchor hospitalization or an anchor procedure identified by specific Medicare Severity Diagnosis Related Groups (MS–DRGs) or Healthcare Common Procedure Coding System (HCPCS) codes, identified in 42 CFR 512.525(d). TEAM episodes include all spending for Medicare Parts A and B items and services during the anchor hospitalization or anchor procedure and a 30-day post-discharge period, as described in 42 CFR 512.525(e), with limited exclusions as outlined in 42 CFR 512.525(f). An episode may be cancelled if the beneficiary (1) does not meet the beneficiary inclusion criteria, as outlined in 42 CFR 512.535; (2) dies during the anchor hospitalization or anchor procedure; or (3) the episode qualifies for the extreme and uncontrollable circumstances policy, as described in 42 CFR 512.537(b)(3).

TEAM tests five episode categories, identified in Table X.A.–01, that represent high-expenditure, high-volume care delivered to Medicare beneficiaries. These episode categories also generally have a greater proportion of spending in the post-acute period relative to the anchor hospitalization or procedure, that present a greater opportunity to improve care transitions for beneficiaries and reduce

[570] TEAM participants eligible for Track 2 include safety net hospitals, rural hospitals, Medicare dependent hospitals, Sole Community Hospitals, and Essential Access Community Hospitals, all defined at § 512.505.

unnecessary hospitalizations and emergency care.

TABLE X.A.-01: EPISODE CATEGORIES AND CORRESPONDING CODES THAT INITIATE AN ANCHOR HOSPITALIZATION OR ANCHOR PROCEDURE

Episode Category	Anchor Hospitalization Trigger Code (MS-DRG)	Anchor Procedure Trigger (HCPCS)
Coronary Artery Bypass Graft	231, 232, 233, 234, 235, or 236	Not Applicable
Lower Extremity Joint Replacement	469, 470, 521, or 522	27447, 27130, or 27702
Major Bowel Procedure	329, 330, or 331	Not Applicable
Surgical Hip Femur Fracture Treatment	480, 481, or 482	Not Applicable
Spinal Fusion	402, 426, 427, 428, 429, 430, 447, 448, 450, 451, 471, 472, or 473	22551, 22554, 22612, 22630, or 22633

(2) Changes to Spinal Fusion Episode Category

Generally, CMS assesses MS–DRG classification changes on an annual basis with the fiscal year IPPS rulemaking cycle. These changes may result in the addition, modification, or deletion of MS–DRGs. Since inpatient episodes in TEAM rely on MS–DRG codes to identify when an anchor hospitalization is initiated, any changes to the MS–DRGs included in TEAM may affect episode volume and ultimately the number of beneficiaries included in the model. As described in section II.C of the preamble of this final rule, there are final policies to change certain MS–DRGs that affect the spinal fusion episode category in TEAM. Specifically, three new MS–DRGs are being finalized to better classify beneficiary acuity and resource utilization for a subset of spinal fusion procedures. As indicated in the proposed rule, if these new MS–DRGs were finalized, we would make conforming changes in TEAM, therefore we proposed at § 512.525(d)(4)(i) that starting on October 1, 2026, MS–DRGs 523, 524, and 525 would be added to the spinal fusion episode category that would initiate a spinal fusion anchor hospitalization. We also proposed at § 512.505 to update the spinal fusion definition to include these three new MS–DRGs. This means the other spinal fusion MS–DRGs remain unchanged and would initiate a spinal fusion anchor hospitalization starting on January 1, 2026. We believed it was important to include these new MS–DRGs in TEAM so that hospitals can continue to have sufficient spinal fusion episode volume to pursue efficiencies in care delivery, spread financial risk, and increase the potential to maximize beneficiaries access to value-based care. Further, we indicated in the proposed rule that not including these new MS–DRGs may reduce the scale and create evaluation challenges for the spinal fusion episode category. Lastly, we also believed it was important to capture proposed MS–DRG updates in TEAM to reflect current coding standards, ensuring consistency with IPPS policies.

We considered in the proposed rule, but did not propose, not to update the MS–DRGs in TEAM for the spinal fusion episode category. This would mean that only the spinal fusion MS–DRGs that remain unchanged would initiate a spinal fusion anchor hospitalization in TEAM. While this approach would minimize change during the model test, episode volume would remain a concern. Additionally, we noted in the proposed rule that we believed not updating the spinal fusion MS–DRGs was not a feasible long-term approach because not updating the spinal fusion MS–DRGs is not responsive to Medicare policy changes and prohibits beneficiaries from accessing the benefits of the model.

We sought comment on our proposals at § 512.505 to update the spinal fusion definition and at § 512.525(d)(4)(i) to add MS–DRGs 523, 524, and 525 to the spinal fusion episode category.

The following is a summary of the public comments received on the proposed policy for updating the spinal fusion definition to add MS–DRGs 523, 524, and 525 to the spinal fusion episode category, and our responses to these comments:

Comment: A few commenters supported the inclusion of MS–DRGs 523, 524, and 525 in the TEAM spinal fusion episode category starting October 1, 2026, noting that this would ensure alignment with underlying coding structure changes, preserve adequate volume for the spinal fusion episode category, and capture more complex cases in the model. A commenter also highlighted that excluding these MS–DRGs from TEAM would create a financial disincentive for participants to utilize innovative spine technology and subsequently limit access for Medicare beneficiaries.

Response: We thank the commenters for their support of including MS–DRGs 523, 524, and 525 in the TEAM spinal fusion episode category. We agree that the inclusion of these MS–DRGs aligns with current coding standards and ensures participants have sufficient episode volume for the spinal fusion category.

Comment: A few commenters supported the inclusion of MS–DRGs 523, 524, and 525 in the TEAM spinal fusion episode category, but expressed their concerns and suggestions regarding the implementation of this change. A commenter recommended the inclusion of additional risk adjusters for the spinal fusion episode category, such as functional and disability status, to ensure that participants that perform these complex procedures are not disadvantaged. A couple commenters also suggested that CMS delay the implementation of the new MS–DRGs to the start of PY2, to avoid adding codes during the performance year, or to PY3, to allow participants time to adapt to the revised episode definitions and associated methodologies. A commenter also requested additional technical assistance materials to help participants prepare for this update, such as scaling factor implications and mappings for impacted codes. Lastly, a commenter recommended that CMS monitor whether the inclusion of MS–DRGs 523, 524, and 525 results in any unintended consequences, such as variation in target prices or benchmark prices.

Response: We appreciate the concerns that commenters shared regarding CMS's proposal to include MS–DRGs 523, 524, and 525 in TEAM starting October 1, 2026. We believe the risk adjustment model for the spinal fusion episode category finalized in the FY2026 IPPS/LTCH PPS final rule sufficiently captures hospital- and beneficiary-level risk. We will continue to analyze and monitor our risk adjustment model and consider changes through future notice and comment rulemaking. We understand stakeholder concerns about incorporating new trigger MS–DRGs during the performance year and requests to postpone the implementation of this change. However, we believe that implementing all MS–DRG-related changes in accordance with the standard fiscal year update cadence

ensures alignment with the most current IPPS policies. We also acknowledge the request for technical assistance materials to support participants. CMS intends to continue providing learning resources to educate participants on key changes to the model, minimize burden and optimize participants' opportunities for success in the model. Finally, we will continue to monitor for any unintended consequences of this change on participants and beneficiaries.

Comment: Some commenters opposed the inclusion of MS–DRGs 523, 524, and 525 in the TEAM spinal fusion episode category. A few commenters noted that many of the procedures that are included in MS–DRGs 523, 524, and 525 are not currently TEAM-eligible procedures, and the inclusion of these procedures would represent an expansion of the spinal fusion episode category with no clear evidence that these changes are necessary. A commenter urged CMS to provide data regarding the spending patterns and expected financial impacts of these newly included MS–DRGs. In addition, a commenter cited that this would create significant administrative burden for participants, including modifications to EHR workflows, episode identification logic, and operational processes. A commenter urged CMS to refrain from mid-model expansions to TEAM's MS–DRG scope, stating that any such change should be made to future model iterations instead. Another commenter encouraged CMS to allow sufficient time for evaluation of the initial MS–DRGs before considering additional episode expansions. A commenter raised concerns that the new MS–DRGs do not have sufficient historic data for reliable target price calibration, meaningful risk adjustment, or accurate benchmarking of episode expenditure, and could expose participants to inappropriate risk and limit beneficiary access to these procedures. They recommended CMS delay implementation until there is sufficient historical claim data under the new MS–DRG structure.

Response: We thank commenters for sharing their concerns. We disagree that there is no clear rationale behind the inclusion of MS–DRGs 523, 524, and 525 in TEAM since many of the underlying procedure codes that were reassigned to these MS–DRGs are currently included in the spinal fusion episode category. Moreover, implementing updates to TEAM-eligible MS–DRGs in tandem with the standard fiscal year MS–DRG update cadence ensures alignment with the most current IPPS policies and ensures TEAM participants continue to have sufficient spinal fusion episode volume.

We acknowledge concerns about the administrative burden the additional MS–DRGs may put on TEAM participants. CMS intends to provide technical assistance materials to TEAM participants to inform them about the new MS–DRGs and relevant procedures to help mitigate this burden. CMS intends to continue to provide learning resources to educate participants on key changes to the model, minimize burden and optimize participants' opportunities for success in the model. Additionally, we believe the advantages of including these MS–DRGs, such as spreading financial risk and increasing the potential to maximize beneficiary access to value-based care, outweigh the administrative challenges.

We thank the commenters for their suggestions to delay the addition of new MS–DRGs. However, we believe that it is important to make conforming and timely changes in TEAM so as not to reduce the scale of the model or create evaluation challenges for the spinal fusion category, and to ensure alignment with annual MS–DRG updates in IPPS. That being said, CMS intends to continue monitoring the impact of these additional MS–DRGs over the course of the model.

Regarding concerns on insufficient historical data, we believe the TEAM target price construction methodology sufficiently addresses changes and updates to MS–DRG classifications. As finalized in the FY2026 IPPS/LTCH PPS Final Rule, CMS already accounts for changes in MS–DRG definitions through the three-step mapping approach. We believe this will mitigate risks related to insufficient historical claims data for MS–DRG 523, 524, and 525.

Comment: A couple commenters also stated that MS–DRGs 523, 524, and 525 encapsulate highly complex procedures that are not appropriate for TEAM. A commenter noted that these MS–DRGs group together spinal fusions of more than two levels and eight or more levels fused and argued that a single target price for the MS–DRG is not appropriate, given the potential variation in procedure complexity. Furthermore, the commenter highlighted that spending variation for these procedures cannot always be explained by differences in patient case-mix, and as such, excluding these procedures from TEAM is favorable. Another commenter noted that these procedures often have unexpected complications that make these MS–DRGs difficult for participants to proactively identify for TEAM inclusion. The commenter further noted these MS–DRGs included procedures that are often staged, and such cases would be captured as a readmission in TEAM, posing financial risk for participants. In addition, the commenter noted that these procedures are often disproportionately completed at tertiary referral centers and neuroscience programs, and these high acuity centers could be financially penalized for treating these patients. Finally, the commenter recommended that all staged procedures are excluded from TEAM.

Response: We acknowledge that MS–DRGs 523, 524, and 525 include complex procedures which require accurate target pricing but disagree that these are not appropriate for TEAM. Excluding specific MS–DRGs that are associated with existing TEAM episode categories can reduce the number of patients covered by value-based care arrangements and may even create new opportunities for gaming by providers. We believe that the inclusion of these MS–DRGs increases the potential to maximize beneficiaries' access to value-based care and encourages improvements in quality and cost-efficiency without creating distorted financial incentives. As previously stated, we believe our risk adjustment and target price methodology sufficiently account for hospital and beneficiary characteristics as well as variation in spending across MS–DRGs and procedure types. We will continue to monitor how the introduction of these new MS–DRGs impact participants and if updates to the risk-adjustment model for spinal fusion episodes are necessary to propose in future rule making.

We also understand that hospitals may not know the assigned MS–DRG of a beneficiary at the time of discharge. We urge TEAM participants to proactively track underlying diagnosis and procedure codes to identify potential TEAM triggers and undertake care coordination for all potential TEAM beneficiaries. We acknowledge the comment related to staged procedures and the need to account for planned subsequent admissions during the 30-day discharge period. We believe that undertaking a second spinal fusion procedure within a 30-day episode period will be infrequent within TEAM, assuming the need for pre-operative medical optimization, including recovery from prior procedures and management of underlying conditions. We will continue to monitor the frequency and circumstances of such occurrences for future consideration.

Additionally, we want to clarify that TEAM participant clinical episodes are identified based on the CMS

Certification Number (CCN) on the triggering inpatient or outpatient claim with a TEAM qualifying MS–DRG or HCPCS code. If a TEAM participant hospital has tertiary referral centers or other specialty centers that bill under the same CCN as the participant hospital, all procedures triggered at these other facilities can be included in TEAM.

After consideration of the public comments, we are finalizing without modification the proposal at § 512.525(d)(4)(i) to add MS–DRGs 523, 524, and 525 to the spinal fusion episode category.

(3) Changes to Episode Attribution

In section X.C. of the preamble of this final rule, the Comprehensive Care for Joint Replacement Expanded (CJR–X) Model is being finalized as an expanded phase II model test under Section 1115A(c) of the Act. Similar to TEAM, CJR–X will be a mandatory episode-based payment model for acute care hospitals with a focus on Lower Extremity Joint Replacement (LEJR) episodes. Both TEAM and CJR–X test LEJR episodes, however TEAM tests a 30-day post-discharge period episode length while CJR–X will test a 90-day post-discharge period episode length. We stated in the proposed rule that given the model similarities and our desire to assess differences in outcomes between these two episode durations, the CJR–X model proposed to exclude TEAM participants from participating in CJR–X, as described in section X.C.2.b.(2)(i) of the preamble of this final rule. We also stated in the proposed rule that while this exclusion would prevent a TEAM participant from being a CJR–X participant, it does not address instances where a beneficiary is in a CJR–X episode and receives care at a TEAM participant during the CJR–X 90-day post-discharge period. Therefore, we proposed at § 512.537(b)(4) that if a beneficiary in a CJR–X episode has a procedure performed at a TEAM hospital that would initiate a TEAM episode during the CJR–X 90-day post-discharge period, then that procedure would not initiate a TEAM episode or be attributed to the TEAM participant and the spending from that procedure would be included in the CJR–X episode. We noted in the proposed rule that while this instance would result in the TEAM participant not being attributed the episode, the procedure and its associated spending would be included in TEAM target price construction, which relies on average episode spending and average trends across all MS–DRG/HCPCS region combinations. As noted in section X.C.2.(h)(2) of the preamble of this final rule, we considered TEAM precedence in this situation and dropping the CJR–X episode to initiate a TEAM episode to support episode volume in TEAM, but we believed it was important to hold the hospital where the anchor hospitalization or anchor procedure took place accountable for spending and care coordination throughout the episode, especially given the investments that hospitals employ to manage a beneficiary's care. We also believed this policy would avoid duplicative calculations for the same procedure in a model that is similar in overall design.

We sought comment on our proposals at § 512.537(b)(4) to not attribute an episode to a TEAM participant if the beneficiary is in a CJR–X episode and has a procedure performed at a TEAM participant that would initiate an episode during the CJR–X 90-day post-discharge period.

The following is a summary of the public comments received on the proposed policy to not attribute an episode to a TEAM participant if the beneficiary is in a CJR–X episode and has a procedure performed at a TEAM participant that would initiate an episode during the CJR–X 90-day post-discharge period, and our responses to these comments:

Comment: Many commenters supported the proposed episode attribution policy. Some commenters appreciated the clear episode attribution rules, noting that they are essential for avoiding duplicative accountability, confusion among participants and beneficiaries, and reconciliation complexity. A commenter also supported excluding CJR–X episodes from TEAM performance reconciliation while including the associated spending in TEAM target prices to ensure accurate benchmarking.

Response: We thank commenters for their support. We agree that clear attribution rules for CJR–X and TEAM are crucial for participants.

Comment: Some commenters requested CMS continue to provide data and guidance on how TEAM participants can identify beneficiaries impacted by this overlap policy. A commenter suggested that CMS monitor this policy to ensure it adequately prevents episode overlap.

Response: We appreciate the commenters' suggestions. CMS will explore potential resources, including technical assistance materials, to aid participants in identifying beneficiaries that are impacted by the episode attribution policy. CMS intends to also monitor the frequency and impact of the TEAM and CJR–X episode attribution policy.

Comment: A commenter requested that CMMI specify which episode applies when a second procedure occurs at a TEAM hospital or when CJR–X and TEAM episode windows overlap.

Response: We thank the commenter for their request. If a beneficiary has an initial procedure at a CJR–X participant hospital and a subsequent TEAM-eligible procedure within the CJR–X 90-day post-discharge window at a TEAM-participant hospital, the subsequent procedure would be attributed to the CJR–X participant episode and would not initiate a TEAM episode. In this scenario, the subsequent procedure and its associated spending would still be captured in TEAM target price construction to ensure average episode spending, benchmarking, and trends are accurately captured, but it would not be attributed to a TEAM participant.

Comment: A commenter raised concerns that the concurrent implementation of CJR–X and TEAM requires health systems to manage similar patients under different financial and episode structures (including the distinct post-discharge period windows) and recommended aligning key design elements, such as attribution, to reduce complexity and burden.

Response: We appreciate the concerns raised by this commenter. Although the models are similar, CJR–X's 90-day post-discharge window and TEAM's 30-day post-discharge window are intentionally distinct to identify differences in outcomes between these two episode durations. We also believe the proposed episode attribution policy will avoid duplicative, complex calculations.

After consideration of the public comments, we are finalizing without modification the proposal at § 512.537(b)(4) to not attribute an episode to a TEAM participant if the beneficiary is in a CJR–X episode and has a procedure performed at a TEAM participant that would initiate an episode during the CJR–X 90-day post-discharge period.

b. Quality Measures

(1) Background

As discussed in the FY25 and FY26 IPPS/LTCH PPS final rule (89 FR 68986 and 90 FR 36536), Medicare payment policy continues to move away from fee-for-service (FFS) payments that are not linked to quality of care. As previously noted in the prior rules, through the Medicare Modernization Act and the Affordable Care Act, we have implemented specific IPPS programs

like the Hospital Inpatient Quality Reporting (IQR) Program (section 1886(b)(3)(B)(viii) of the Act), the Hospital Outpatient Quality Reporting (OQR) Program (section 1833(t)(17)(C) of the Act), the Hospital Value-Based Purchasing (VBP) Program (subsection (o) of section 1886), the Hospital-Acquired Condition (HAC) Reduction Program (subsection (q) of section 1886), and the Hospital Readmissions Reduction Program (subsection (p) of section 1886), where payment may reflect the quality of care delivered to Medicare beneficiaries or be impacted by the reporting of quality measures.

TEAM quality measures focus on care coordination, patient safety, and patient-reported outcomes (PROs), which are areas critical to patients undergoing acute procedures. To streamline reporting in this mandatory model, we align quality measures in TEAM with those used in existing CMS models and reporting programs wherever feasible. TEAM participants will not submit separate quality data to CMS for TEAM. Instead, CMS will utilize data already reported through established CMS quality reporting programs, eliminating duplicate reporting requirements. TEAM's finalized set of quality measures are used to calculate the Composite Quality Score (CQS). The CQS will be combined with the TEAM participants' reconciliation amount during the reconciliation process to tie quality performance to payment. We proposed and finalized seven quality measures due to their: (1) alignment with the goals of TEAM; (2) hospitals' familiarity with the measures due to their use in other CMS hospital quality programs, including the Hospital IQR, OQR and HAC Reduction Programs; and (3) alignment to CMS priorities, including the CMS National Quality Strategy, which has goals that support safety, outcomes, and engagement. We believe these quality measures reflect these goals and accurately measure hospitals' level of achievement on such goals.

The measures are—

- For all TEAM inpatient episodes in PY1—PY5: Hybrid Hospital-Wide All-Cause Readmission (Hybrid HWR) Measure with Claims and Electronic Health Record Data (CMIT ID #356), claims-only for PY1 and full hybrid for PY2—PY5;
- For all TEAM inpatient episodes in PY1: CMS Patient Safety and Adverse Events Composite (CMS PSI–90) (CMIT ID #135);
- For all TEAM inpatient LEJR episodes in PY1—PY5: Hospital-Level Total Hip and/or Total Knee Arthroplasty (THA/TKA) Patient-Reported Outcome-Based Performance Measure (PRO–PM) (CMIT ID #1618);
- For all TEAM inpatient episodes in PY2—PY5: Hospital Harm—Falls with Injury (CMIT ID #1518);
- For all TEAM inpatient episodes in PY2—PY5: Hospital Harm—Postoperative Respiratory Failure (CMIT ID #1788);
- For all TEAM inpatient episodes in PY2—PY5: Thirty-day Risk—Standardized Death Rate among Surgical Inpatients with Complications (ISCMR) (CMIT ID #134); and
- For all TEAM outpatient LEJR and Spinal Fusion episodes in PY3—PY5: Information Transfer Patient Reported Outcome-Based Performance Measure (Information Transfer PRO–PM) (CMIT ID #1797).

We believe the TEAM quality measure set provides CMS with sufficient measures to monitor quality and to calculate scoring on quality performance. As stated in the FY25 and FY26 IPPS/LTCH PPS final rules (89 FR 68986 and 90 FR 36536), we may adjust the measure set in future performance years via rulemaking if we determine those adjustments to be appropriate at the time.

(2) Measurement Performance Periods for Certain Quality Measures

As stated previously, TEAM aims to, whenever possible, align with existing reporting requirements so as not to introduce additional burden to participants. In the FY25 IPPS/LTCH PPS final rule (89 FR 68986), we finalized the Hospital Harm—Falls with Injury, Hospital Harm—Postoperative Respiratory Failure, and Thirty-day Risk-Standardized Death Rate among Surgical Inpatients with Complications (ISCMR) and stated these measures would align with the hospital reporting programs. At that time, we stated our intent to align these measures with the performance periods used in the Hospital IQR Program. However, we did not propose or finalize the specific measurement performance periods for these measures within TEAM.

In this final rule, we are establishing measurement performance periods for these three quality measures. In the proposed rule for Hospital Harm—Falls with Injury and Hospital Harm—Postoperative Respiratory Failure, we proposed alignment with the Hospital IQR Program's calendar year reporting requirements, utilizing a one-year measurement performance period. For ISCMR, we proposed alignment with the Hospital IQR Program's 2-year rolling measurement performance period. Table X.A–02 displays the proposed measurement performance periods for these specific quality measures in TEAM. We believed these measurement performance periods were consistent with other CMS quality reporting programs and therefore would help minimize TEAM participant confusion.

TABLE X.A.-02: FINALIZED QUALITY MEASUREMENT PERFORMANCE PERIODS

	TEAM PERFORMANCE YEAR (PY) QUALITY MEASUREMENT PERFORMANCE PERIOD			
Quality Measure	**PY2 Performance Period**	**PY3 Performance Period**	**PY4 Performance Period**	**PY5 Performance Period**
Hospital Harm—Falls with Injury (CMIT ID #1518)	January 1, 2027 – December 31, 2027	January 1, 2028 – December 31, 2028	January 1, 2029 – December 31, 2029	January 1, 2030 – December 31, 2030
Hospital Harm—Postoperative Respiratory Failure (CMIT ID #1788)	January 1, 2027 – December 31, 2027	January 1, 2028 – December 31, 2028	January 1, 2029 – December 31, 2029	January 1, 2030 – December 31, 2030
Thirty-day Risk—Standardized Death Rate among Surgical Inpatients with Complications (ISCMR) (CMIT ID #134)	July 1, 2024 – June 30, 2026	July 1, 2025 – June 30, 2027	July 1, 2026 – June 30, 2028	July 1, 2027 – June 30, 2029

We sought comment on the proposed measurement performance period timeframes for TEAM performance years 2 through 5 for the Hospital Harm—Falls with Injury and Hospital Harm—Postoperative Respiratory Failure, and ISCMR quality measures.

The following is a summary of the public comments received on the proposed measure performance period timeframes for these three measures, and our responses to these comments:

Comment: A commenter expressed concerns that changing measurement performance periods in the middle of a TEAM performance year would make it difficult for participants to identify stable targets and plan quality improvement efforts. The commenter recommended that CMS release an annual calendar specifying which measures applied to each performance year and detailing any updates to performance periods.

Response: We appreciate the commenter's concern regarding participants' ability to identify stable targets and plan quality improvement efforts under TEAM. While we finalized these measures in the FY 2025 IPPS/LTCH PPS final rule and stated that we intended to align these measures with the measurement performance periods used in the Hospital IQR Program, we did not propose or finalize specific measurement performance periods for these measures within TEAM in that rule. This is the first instance we have proposed measurement performance periods for these measures. Given that the proposed measurement performance periods for the Hospital Harm measures do not begin until January 1, 2027, and these measures are not applicable until Performance Year 2, we believe that participants will have adequate time to identify targets and plan quality improvement efforts for these measures. While the proposed ISCMR measurement performance period begins on July 1, 2024, proposing a measurement performance period that begins after the release of this final rule, the earliest of which would be July 1, 2027–June 30, 2029, would not be feasible given the timelines of the TEAM reconciliation process. We thank the commenter for their suggestion to release an annual calendar providing more details on the quality measures used in TEAM and will take this suggestion into consideration.

Comment: A commenter requested that CMS push back the measurement performance periods for the Hospital Harm—Falls with Injury and Hospital Harm—Postoperative Respiratory Failure eCQMs, as these measures are not currently mandatory to report under the Hospital IQR Program and will not be available to report under the Hospital IQR Program until FY 2028 payment determination, noting that hospitals need more time to prepare their systems for new measures. Another commenter expressed concern that having measurement performance periods for these measures prior to mandatory reporting, when the measures are ''untested'' will place additional burden on TEAM participants and contradict CMS' proposal to allow 2 years of self-selected reporting for new Hospital Harm eCQMs before making them mandatory.

Response: We thank the commenters for sharing their concerns. However, we disagree that hospitals have not had adequate time to prepare for the inclusion of the Hospital Harm measures in TEAM, or that this proposal would add administrative burden for TEAM participants. Hospitals have had the ability to choose the Hospital Harm—Falls with Injury and Hospital Harm—Postoperative Respiratory Failure measures as one of their three self-selected eCQMs beginning with the CY 2026 reporting period, which corresponds to FY 2028 payment determination. In the FY 2026 IPPS/LTCH PPS final rule, we finalized that TEAM participants that have no or an incomplete raw quality measure score for a given quality measure would receive a scaled quality score of 50 for that measure. Accordingly, any hospitals that choose not to report the Hospital Harm measures as one of their self-selected eCQMs in CY 2027 will receive a scaled score of 50 for those measures in performance year 2. While these measures will begin mandatory reporting under the Hospital IQR Program in CY 2028 as finalized in section IX.C.8.c.(3), there is no TEAM-specific mandate that hospitals report these measures, and any hospitals that have no or an incomplete raw quality measure score for these measures will receive a scaled score of 50. Because there is no TEAM specific mandate to report these measures in any years of the model, and because hospitals had 2 years of voluntary reporting for the Hospital Harm measures under the Hospital IQR Program, we do not believe that this proposal contradicts our policy of allowing 2 years of self-selected reporting for new Hospital Harm eCQMs before making them mandatory.

After consideration of the public comments, we are finalizing without modification the proposal to apply measurement performance period timeframes, as specified in Table X.A.-02, to TEAM performance years 2 through 5 for the Hospital Harm—Falls with Injury and Hospital Harm—Postoperative Respiratory Failure, and ISCMR quality measures.

(3) Changes to TEAM CQS Baseline Period Methodology

In the FY25 IPPS/LTCH PPS final rule (89 FR 68986), we established fixed CQS baselines for calculating CQS performance that would remain constant throughout the model's duration, using calendar year (January–December) CQS baseline periods for all quality measures. The CQS baselines are national distributions of quality measure scores against which TEAM participants are ranked. After evaluating this approach and considering alignment with existing CMS hospital quality reporting programs, we proposed two changes to the CQS baseline methodology: (1) establishing a sliding historical CQS baseline methodology and (2) aligning CQS baseline periods with the CMS hospital reporting program timeframes for specific measures that are currently not aligned. We proposed at § 512.547(a)(1) through (3) replacing the current fixed CQS baseline approach with a sliding historical CQS baseline methodology for all quality measures except the CMS PSI–90 measure which applies only in TEAM PY1 and therefore does not require advancement of baseline periods beyond that performance year. We stated that the proposal to change to a sliding historical CQS baseline would be effective beginning with TEAM PY1. Under this proposed approach, CQS baselines would be calculated using a rolling window of historical performance data that updates annually, rather than remaining fixed throughout the model's tenure. We noted in the proposed rule that this approach would allow CQS baselines to evolve with improvements in care delivery, providing a responsive quality assessment framework.

Considering the proposed shift from fixed to sliding historical CQS baselines, we also proposed at § 512.547(a)(1)–(3) to update the baseline periods from a calendar year to a July to June period for the Hybrid HWR, CMS PSI–90, THA/TKA PRO–PM, and the ISCMR measures, Specifically, we proposed to align the CQS baseline periods with the hospital program required measurement periods of July–June timeframe rather than the previously finalized calendar year (January–December) periods. This proposed alignment is consistent with the Hospital IQR and HAC programs requirement of July–June measurement periods. Aligning TEAM CQS baseline periods with these established timeframes ensures consistency and reduces confusion. We noted in the proposed rule that this proposal would not affect the Hospital Harm—Falls with

Injury and Hospital Harm—Postoperative Respiratory Failure or the Information Transfer PRO–PM, which will continue to use calendar year CQS baseline periods as originally finalized, consistent with their respective hospital reporting program requirements. These measures maintain calendar year CQS baseline periods because their respective hospital reporting program requirements utilize calendar year measurement periods, ensuring consistency between TEAM CQS baselines and the established reporting infrastructure for these specific measures. Additionally, we also stated in the proposed rule that aligning the CQS baseline periods with existing hospital measure timeframes ensures that the necessary data are available and validated according to established timelines. Using the same measurement periods for the existing hospital reporting and TEAM CQS baselines periods leverages this existing data infrastructure and ensures timely availability of baseline data for CQS calculations.

We believed it was important to implement this alignment beginning in TEAM PY1 and to apply it consistently throughout the duration of the model. Beginning this alignment in TEAM PY1 avoids introducing a mid-model change in CQS baseline period timeframes that could create confusion and complicate longitudinal performance assessment. We stated it also ensures that TEAM participants' quality performance is evaluated under a single, transparent methodological framework for the entire duration of the model. In addition, because certain TEAM PY1 measures are not calculated on a calendar-year basis within their respective hospital reporting programs, it would be operationally challenging to re-specify and recalculate these measures solely for TEAM. Aligning TEAM CQS baseline periods with the Hospital IQR and HAC Reduction Program timeframes from the start of the model leverages validated data already calculated for existing programs and minimizes TEAM participant confusion.

We also considered in the proposed rule an alternative approach under which the transition from fixed CQS baselines to the sliding historical CQS baseline methodology would begin in TEAM PY2 rather than TEAM PY1. Under this alternative, TEAM PY1 would continue to use the fixed CQS baseline methodology finalized in the FY25 IPPS/LTCH PPS final rule, and the sliding historical CQS baseline methodology (including the July through June baseline period alignment described previously) would begin with TEAM PY2 and apply for the remainder of the model. Under this alternative, all CQS baseline periods and methodologies finalized in the FY25 IPPS/LTCH PPS final rule would apply unchanged for TEAM PY1, and the July through June baseline alignment and sliding historical methodology would first apply to TEAM PY2 measurement and CQS calculations. We considered this alternative because beginning the transition in TEAM PY2 could reduce operational and participant risk associated with implementing a baseline methodology change at model launch. Specifically, this risk refers to the potential for operational disruptions, such as insufficient time for participants to adapt systems and processes to the new methodology, as well as the possibility that participants may not have adequate time to understand, prepare for, and respond to changes in how their quality performance is assessed beginning in TEAM PY1. However, beginning in TEAM PY2 would introduce a mid-model change in baseline methodology, which could create participant confusion and complicate longitudinal performance assessment across performance years. We sought comment on whether beginning the transition to the sliding historical CQS baseline methodology in TEAM PY2, rather than TEAM PY1, would be preferable.

We also recognized in the proposed rule that updating to the proposed CQS baseline periods beginning in TEAM PY1 meant that different months of performance may be reflected in the CQS baseline compared to a calendar-year approach. For example, if a hospital's performance improved during the latter half of calendar year (CY) 2025, those improvements would be included under the proposed July through June CQS baseline period rather than excluded based solely on a calendar-year cutoff. While this proposed change in baseline timeframe could result in differences in PY1 CQS scoring compared to a CY CQS baseline, improved performance captured within the aligned reporting timeframe would be incorporated as the proposed sliding historical CQS baseline updates in subsequent performance years. We stated in the proposed rule that under the proposed approach, the Hybrid HWR measure would use the same CQS baseline period (July 1, 2025, through June 30, 2026) for TEAM PY2 and PY3. This was necessary under the proposed sliding historical approach due to the measure transitioning from claims-only methodology in TEAM PY1 to hybrid methodology beginning in TEAM PY2 and TEAM PY3, intending to serve as the initial reference point for the sliding historical CQS baseline methodology before advancing annually in PY4 and PY5. However, we are not finalizing the proposed sliding historical CQS baseline methodology. Under the concurrent rolling CQS baseline methodology finalized in this rule, the Hybrid HWR CQS baseline period advances each performance year in alignment with the applicable measurement period, as reflected in Table X.A.-03. TEAM PY1 will use a claims-only CQS baseline (July 1, 2024, through June 30, 2025), and beginning in TEAM PY2, the hybrid CQS baseline advances annually in alignment with the applicable measurement period for each performance year, as reflected in Table X.A.-03.

We believed that adopting sliding historical baselines for CQS measurement offered several advantages over the current fixed baseline approach. Specifically, a sliding historical CQS baseline methodology would enable TEAM to capture and reflect evolving trends in quality performance over time. As quality improvement initiatives advance, this baseline approach would ensure that performance benchmarks remain relevant and responsive to these changes. This approach also acknowledged that quality performance is dynamic, requiring evolving baselines to reflect current care standards. Additionally, for the Hospital Harm—Falls with Injury and Hospital Harm—Postoperative Respiratory Failure, which are self-selected voluntary reporting measures in the Hospital IQR Program, the proposed sliding historical CQS baseline approach ensures that baselines remain representative of the current reporting population over time. Further, it would ensure performance expectations continue to challenge TEAM participants to improve, rather than meet static targets. We acknowledged in the proposed rule that, similar to the concurrent CQS baseline approach discussed later in this section, the sliding historical CQS baseline methodology also presented challenges in tracking long-term progress from the start of the model because the baseline updates annually. However, we believed the proposed sliding historical CQS baseline approach mitigates this concern by using historical data rather than contemporaneous data, in most instances, providing greater stability and predictability while still maintaining relevant performance benchmarks. The proposed sliding historical CQS baseline methodology

would align with the target price baseline approach used in TEAM, which rolls forward annually, creating a more coherent performance assessment framework for participating hospitals. We indicated this alignment would eliminate the disconnect where cost performance is evaluated against recent benchmarks while quality performance is measured against a static historical reference point, making it easier for TEAM participants to understand the relationship between quality and cost metrics. The parallel baseline structures would enable hospitals to develop improvement strategies that address both quality and cost objectives simultaneously.

We proposed implementing the sliding historical CQS baseline methodology beginning with TEAM PY1. We believe beginning implementation of this methodology change in TEAM PY1 is appropriate for several reasons. We stated in the proposed rule that TEAM PY1 CQS calculations and reconciliation would not occur until Fall 2027. This would allow the implementation of this methodology before the calculations occur. Also, all TEAM participants were able to select Track 1 for TEAM PY1 and participants who did not actively select a track were assigned to Track 1 by default. Track 1 does not involve downside financial risk during TEAM PY1. Additionally, the proposed changes aligned CQS baseline timeframes with existing hospital reporting program requirement timeframes, meaning hospitals are already collecting and validating data during these timeframes for reporting purposes. Additionally, implementing the proposed sliding historical CQS baseline approach beginning in TEAM PY1 ensured consistent CQS baseline methodology throughout the model's duration and avoids mid-model transitions that could create confusion or complicate performance tracking. This proposed approach, starting in TEAM PY 1, would provide participants with clarity and predictability regarding how their quality performance will be assessed throughout all performance years. We stated in the proposed rule that this consistency supports participants' ability to develop and implement long-term quality improvement strategies that align with both TEAM goals and existing hospital quality reporting requirements.

We also considered in the proposed rule, but did not propose, the implementation of a rolling concurrent CQS baselines for quality measures throughout all TEAM performance years. Under a rolling concurrent CQS baseline methodology, the CQS baseline for a given TEAM performance year would be identical to the applicable TEAM measurement period for that year. In other words, the national distribution of measure performance scores against which TEAM participants are ranked would be derived from contemporaneous performance-year data.

This concurrent baseline methodology would require quality performance benchmarks to be recalculated annually using contemporaneous data. For each performance year, the national distribution of measure performance, including risk-adjusted scores, expected-value parameters, and national averages specified in the measure methodology, would be recalibrated based on that same performance year's data before CQS scoring is finalized.

We stated in the proposed rule that while the proposed sliding historical CQS baseline approach also recalculates benchmarks annually, it uses historical data, in most instances, rather than contemporaneous data. In this context, the reference to ''in most instances'' reflects that, under the proposed sliding historical approach, the CQS baseline for a given TEAM performance year would generally be based on a completed historical measurement period that precedes the applicable performance year. For certain measures and performance years, however, the same CQS baseline period may apply to more than one performance year or may rely on the first available validated measure reporting period to ensure methodological consistency and the use of complete, validated data.

We indicated in the proposed rule that a concurrent CQS baseline approach offers several advantages, such as capturing real-time performance, encouraging continuous quality improvement, and addressing concerns about outdated benchmarks. In addition, since concurrent CQS baselines compare quality measure scores to baseline scores from the same year, the measure scores and baseline scores are calculated using the same methodology. This methodological alignment is particularly relevant for TEAM quality measures that incorporate expected values with formulas that are recalibrated annually and rely on national averages of hospitals' performance in that year.

However, under a concurrent CQS baseline, improvement would always be assessed relative to a moving CQS baseline. We stated in the proposed rule that a concurrent CQS baseline, like a sliding historical CQS baseline, would introduce uncertainty for participants because final CQS baseline calculations, including risk adjustment coefficients and national averages used in mapping raw measure scores, would not be available in advance of the applicable performance year. Because the national distribution would be constructed from the same performance-year data, participants would not know the final percentile thresholds or scaling parameters until after the measurement period concludes and national data are finalized.

We recognized in the proposed rule that similar timing limitations apply under the sliding historical CQS baseline approach, given the lag between baseline construction and finalization of national performance data. We recognized that several limitations apply to both the concurrent and proposed sliding historical CQS baseline approaches. However, because the proposed sliding historical CQS baseline relies on completed historical data, in most instances, rather than contemporaneous data, it may provide comparatively greater stability relative to a fully concurrent CQS baseline approach. Although we did not propose a concurrent CQS baseline methodology, we considered this approach and we sought comment on its potential implementation. Additionally, we considered whether such an approach, if adopted, should begin in TEAM PY1 or TEAM PY2, and we sought comment on those timing options. We noted in the proposed rule that beginning in TEAM PY1 would avoid a mid-model change in CQS baseline methodology and would allow quality performance to be assessed under a single methodological framework for the duration of the model. Beginning in TEAM PY2 could reduce implementation risk at model launch by providing additional time for participants to operationalize the methodology and prepare for changes in quality performance assessment. We sought comment on whether a concurrent CQS baseline methodology would be preferable to the proposed sliding historical CQS baseline methodology and, if so, whether implementation should begin in TEAM PY1 or TEAM PY2.

We also considered in the proposed rule, but did not propose, an alternative approach that would maintain a fixed historical CQS baseline methodology while changing the CQS baseline periods from calendar year to July through June timeframes for the Hybrid HWR, CMS PSI–90, THA/TKA PRO–PM, and the ISCMR measures. Under this alternative fixed CQS baseline approach with updated timeframes, the

Hybrid HWR CQS baseline would be established concurrently with the measurement performance period for TEAM PY1 and would be July 1, 2024, through June 30, 2025, using claims only data and would be updated once more for TEAM PY2 and would be July 1, 2025, through June 30, 2026, using hybrid data to account for the measure's transition from claims-only to hybrid methodology, after which it would remain fixed for TEAM PY3 through PY5. The CMS PSI–90 measure, which is only used in TEAM PY1, would have a CQS baseline period of July 1, 2023, through June 30, 2025, concurrent with its TEAM PY1 measurement period. The THA/TKA PRO–PM would have a concurrent CQS baseline and measurement period for TEAM PY1 of July 1, 2024, through June 30, 2025, which would then remain fixed throughout TEAM PY2 through PY5. Similarly, the ISCMR measure CQS baseline would be July 1, 2023, through June 30, 2025, and remain fixed for TEAM PY2 through PY5. The Hospital Harm—Falls with Injury and Hospital Harm—Postoperative Respiratory Failure CQS baselines would remain calendar year 2026 (January 1, 2026–December 31, 2026) for TEAM PY2 through PY5 and the Information Transfer PRO–PM CQS baseline would remain calendar year 2027 (January 1, 2027–December 31, 2027) for TEAM PY3 through PY5.

We stated in the proposed rule that the fixed historical CQS baseline approach has several benefits. It offers stable targets that provide greater certainty for participants, as performance benchmarks are known in advance whenever possible. This approach facilitates tracking of long-term quality improvement goals from the start of the model and eliminates the need for annual CQS baseline recalculations, reducing administrative complexity compared to sliding historical CQS baselines. However, we determined that the fixed historical CQS baseline approach presents significant disadvantages. The fixed CQS baselines can become outdated and less reflective of current performance conditions over time. Fixed CQS baselines may also reduce incentives for continuous improvement once participants meet initial targets. Additionally, data anomalies, such as missing or incomplete data from the CQS baseline period, cannot be adjusted under a fixed CQS baseline approach, which could result in inequitable performance assessments throughout the model's duration. We noted in the proposed rule that these limitations led us to propose the sliding historical CQS baseline methodology instead, which we believed better supports ongoing quality improvement and maintains relevant performance benchmarks throughout the model.

We sought comment on our proposal at § 512.547(a)(1) through (5) for the proposed changes to the CQS baseline methodology in TEAM to include the transition from fixed CQS baseline periods to sliding historical CQS baseline periods and the change from calendar year to July to June timeframe for the Hybrid HWR, CMS PSI–90, THA/TKA PRO–PM, and ISCMR measures. We also sought comment on whether beginning the transition to the sliding historical CQS baseline methodology in TEAM PY2, rather than TEAM PY1, would be preferable. We also sought comment on whether either a fixed historical CQS baseline methodology or a concurrent CQS baseline methodology, each incorporating the updated July through June timeframes for applicable measures as described previously, would be preferable to the proposed sliding historical CQS baseline methodology. With respect to the concurrent CQS baseline methodology specifically, we sought comment on whether, if adopted, implementation should begin in TEAM PY1 or TEAM PY2.

The following is a summary of the public comments received on the proposed changes to the TEAM CQS baseline period, and our responses to these comments:

Comment: Many commenters supported the proposal to update the CQS baseline periods from a calendar year to a July to June period for the Hybrid HWR, CMS PSI–90, THA/TKA PRO–PM, and the ISCMR measures. Some of these commenters noted that doing so would reduce administrative burden on participants and reduce confusion.

Response: We thank the commenters for their support. We agree that this proposal will reduce administrative burden and confusion for TEAM participants.

Comment: Some commenters supported the proposal to adopt sliding historical CQS baseline periods. One of the commenters stated that an advantage of the sliding historical CQS baseline period methodology was that it would hold hospitals accountable to more up-to-date standards of quality, as opposed to a static baseline, which could become outdated. They expressed support for rewarding continuous improvement as the benchmark moves forward with new evidence-based practices in perioperative care. Another commenter stated that the proposal would better synchronize quality measurement with TEAM's target price methodology where the baseline period is updated on a rolling basis for each PY.

Response: We thank the commenters for their support. We agree that measuring hospitals against a more up-to-date standard of quality and alignment with TEAM's target price methodology are both advantages of utilizing a sliding historic CQS baseline period as compared to a fixed CQS baseline period. These advantages are also present in a concurrent CQS baseline period. While the concurrent CQS baseline period methodology aligns slightly less with the target price framework than the sliding historic CQS baseline methodology, the concurrent CQS baseline period methodology holds participants accountable to the most up-to-date standard of quality and current practices of any of the methodologies.

Comment: A few commenters opposed the proposal to transition to sliding historic CQS baseline periods, preferring a fixed CQS baseline period. A commenter stated that a sliding baseline period would punish hospitals who achieved high quality scores in the early years of the model. It would incentivize hospitals to manage their quality improvement efforts in a way that avoids raising future benchmarks. A few commenters stated that a fixed CQS baseline period would provide a stronger incentive to improve quality, making it easier for hospitals to set actionable targets. A commenter requested that CMS use a fixed CQS baseline period that ends before the start of the first performance period for each measure.

Response: We thank the commenters for sharing their concerns. We disagree that a sliding CQS baseline period would incentivize hospitals to manage their quality improvements to avoid raising benchmarks. The CQS baseline period is constructed using a large cohort of hospitals including both TEAM participants and IPPS/OPPS-eligible hospitals not participating in TEAM. TEAM hospitals are not measured exclusively against their own past performance, but rather against this large cohort, of which their own performance comprises only one data point. Therefore, any efforts by a hospital to manage quality improvement to avoid increasing their benchmark would have a negligible effect on the CQS baseline period benchmarks the hospital was measured against and could negatively impact their performance compared to this benchmark. Under a concurrent CQS baseline period methodology, a

hospital's quality score in previous performance periods will have no impact on the CQS baseline period benchmarks they are measured against.

While we acknowledge that a fixed CQS baseline period may make it easier for hospitals to set actionable targets for quality improvement under TEAM within the context of the CQS, we disagree that the incentive to improve quality is stronger under a fixed CQS baseline period. We believe that the incentive to improve quality is strongest under a concurrent CQS baseline period, as this methodology holds participants accountable to the most up-to-date standard of quality. We are concerned that, under a fixed CQS baseline period methodology, participants who achieve a scaled score that they deem acceptable on a measure will have no incentive to improve on this score in future performance years.

Comment: A couple of commenters expressed concerns that a sliding CQS baseline period would be subject to year-to-year data variability. One of the commenters added that this risk was exacerbated by the fact that many TEAM quality measures are low-volume and episodic, making them more susceptible to year-to-year variations driven by small sample size, and added that the sliding CQS baseline period could penalize regression to the mean. One of the commenters also expressed concerns that under a sliding CQS baseline period, changing benchmarks could reflect measure maturity.

Response: We thank the commenters for sharing their concerns. Regarding the point that a sliding baseline period would be subject to year-to-year data variability, we anticipate that the cohort of hospitals used to construct the CQS baseline will be large enough to generate reasonably stable percentiles once participants have established data reporting processes. Concerns about low-volume and episodic measures impacting individual hospital's raw measure scores, or about hospital performance on a given measure regressing to the mean, would remain the same regardless of the CQS baseline period methodology.

One of the benefits of a sliding or concurrent CQS baseline period is that, unlike a fixed CQS baseline period, any anomalies in the baseline data, for example missing data caused by immature reporting infrastructure, would not carry through for the duration of the model.

Another benefit of utilizing a concurrent baseline methodology is that it ensures apples-to-apples comparisons for measures that are recalibrated or have methodological changes between years. For example, many of the TEAM quality measures are formulated as observed (or predicted) outcome divided by expected outcome multiplied by a national average of that outcome, with the coefficients and national average being recalibrated annually, which confounds comparisons of raw measure scores across time.

Regarding the concern that a sliding baseline period would reflect measure maturation, while we agree with the commenter that changes in the CQS baseline period scores under a sliding or concurrent CQS baseline period will reflect improvements in measure performance as the model progresses, we believe that this is a benefit of the proposal. We do not believe that measuring participants against static targets that reflect outdated quality standards sufficiently incentivizes quality improvement.

Comment: A few commenters expressed concerns that the use of a sliding CQS baseline period would reduce the transparency and predictability of the targets that participants are measured against. A few commenters stated that a sliding CQS baseline would negatively impact hospital's ability to manage quality improvement, such as setting internal quality improvement targets, tracking improvement over time, or engaging clinicians.

Response: We appreciate the commenters' concerns about maintaining transparent and predictable benchmarks in the model. We agree that the stability of targets provided under a fixed CQS baseline period is an advantage over the sliding historic and concurrent CQS baseline periods and considered this carefully when weighing the merits of these methodologies. Ultimately, we decided that the advantages of a concurrent baseline, which we believe provides the strongest incentive for continuing quality improvement, outweighed this disadvantage. Regarding hospital's ability to manage quality improvement, while we recognize that both a concurrent CQS baseline period and a sliding historic CQS baseline period will prevent hospitals from receiving the percentiles that map raw measure scores to scaled scores prior to each performance year, hospitals can still track improvements in their raw measures scores over time. While it may be more difficult to set target scaled scores for quality improvement efforts under a concurrent CQS baseline methodology, we believe that these efforts, which will reflect the most up-to-date standards of care, will be more impactful than those based on historic targets. We believe that the potential lack of incentive to improve quality later in the model under a fixed CQS baseline methodology represents a larger risk to quality of care under the model.

Comment: A commenter expressed concerns that the proposed sliding baseline period, in conjunction with the use of new quality measures that hospitals have had little time to understand, operationalize, or benchmark against, would introduce risk that was disconnected from quality performance. The Information Transfer PRO–PM measure, which begins voluntarily reporting under the Hospital OQR Program in CY 2026, was cited as an example.

Response: We thank the commenter for their feedback. While we understand the commenter's concerns about participants' ability to properly prepare for quality measures, we disagree that participants will have insufficient time to familiarize themselves with the quality measures utilized in the CQS before they are included in TEAM. Specifically, TEAM participants' scores on the Information Transfer PRO–PM measure will not contribute to their CQS until the CY 2028 reporting period, meaning that they will have one year of mandatory reporting under the Hospital OQR Program to prepare for the measure's inclusion. We also disagree that the risk associated with utilizing new measures in conjunction with a sliding or concurrent CQS baseline period would be disconnected from quality performance. We acknowledge that concurrent CQS baseline periods likely assess TEAM participants against more challenging benchmarks but believe that this is directly tied to evaluating quality performance against the current standard of care, as opposed to outdated static targets. Similarly, all of the measures added to the model, such as the Information Transfer PRO–PM, were added to better capture quality of care.

Comment: A commenter supported the use of a concurrent CQS baseline period as opposed to a sliding historic CQS baseline period, noting that doing so would provide hospitals with more consistent targets. The commenter added that a sliding historic CQS baseline period would introduce compounding variables that would make financial forecasting more difficult.

Response: We thank the commenter for their feedback. We believe that, under a historic sliding CQS baseline period, the potential for differences in measure methodologies between the

CQS baseline period and the corresponding measurement performance period could complicate financial forecasting, and agree that this issue would not be present under a concurrent CQS baseline period.

Comment: A commenter opposed a concurrent CQS baseline period. The commenter stated that, while they favored a fixed CQS baseline period, a historic sliding CQS baseline period was preferrable to a concurrent CQS baseline period, as the former better mitigated the issue of not accounting for improvement in measure scores as the model progressed.

Response: We thank the commenter for their feedback. We agree with the commenter that benchmarks under the concurrent CQS baseline period methodology would best reflect up-to-date standards of quality performance, but disagree that this is a disadvantage of the methodology. As discussed previously, we see this ability to reflect the most current standards of quality as a significant advantage of the concurrent CQS baseline period methodology. After consideration of comments received, and weighing the advantages and disadvantages of the fixed CQS baseline period, sliding historical baseline period, and concurrent CQS baseline period methodologies, we believe that the concurrent CQS baseline period methodology provides the strongest incentive for participants to continue to improve their quality of care throughout the duration of the model. Therefore, we are finalizing a concurrent CQS baseline period methodology

Comment: A few commenters recommended that, if CMS were to implement a sliding CQS baseline period, its implementation should be delayed, with a couple of commenters supporting delaying implementation until PY 2 or PY 3. A few of these commenters added that changing the methodology mid performance year would not give participants enough time to respond to the change and flagged that hospitals needed more time to become familiar with TEAM measures and establish stable performance.

Response: We thank the commenters for their recommendation and understand the desire to have more time to prepare for changes to the model. Regarding the recommendation to delay implementing changes to the CQS baseline periods until PY 2, while the proposal to update the CQS baseline periods from a calendar year to a July to June period for the Hybrid HWR, CMS PSI–90, THA/TKA PRO–PM, and the ISCMR measures would impact the PY 1 CQS baseline periods, implementing concurrent CQS baseline periods would not impact PY 1 outside of this alignment because PY 1 already leverages concurrent baselines. Accordingly, there would be no difference between implementing a concurrent CQS baseline period beginning in PY 1 or beginning in PY 2. Therefore, we do not view this policy, which affects PY 2 and beyond, as a mid-performance year change. Regarding the recommendation to delay implementation until PY 3, we believe that implementing the change in PY 1 would allow for consistency throughout the duration of the model. If we were to implement a concurrent CQS baseline period beginning in PY 3, hospitals would be measured against a concurrent baseline period for PY 1, then a historic baseline for PY 2, before going back to a concurrent baseline from PY 3 onwards. We believe that this would cause more confusion for participants than simply utilizing concurrent CQS baselines for the duration of the model.

Comment: A commenter suggested that CMS implement changes to the CQS baseline periods more gradually and consider a hybrid approach, with fixed CQS baselines at the start of the model and protections to limit year-to-year changes in the CQS baseline benchmarks. The commenter also suggested CMS could evaluate the statistical merit of sliding baselines individually for each measure.

Response: We thank the commenter for their feedback. While we appreciate the desire to provide further stability in benchmarks and time for participants to prepare for model changes, we feel that a hybrid approach with protections to limit year-to-year changes in the CQS baseline benchmarks would overly complicate the model. We believe that it would be preferable to assess quality framework under a single methodological framework for the duration of the model.

Comment: A commenter expressed concerns that CMS was changing parameters of TEAM after hospitals had made operational commitments. They recommended that CMS only modify model parameters under extraordinary circumstances. The commenter added that, should CMS proceed with modifying the CQS baseline period methodology, they should provide more transparency into CQS baseline calculations prior to each performance year.

Response: We acknowledge the commenter's concern. We understand participant desire to limit modifications to the model. While we recognize that the proposal to update the CQS baseline periods from a calendar year to a July to June period for the Hybrid HWR, CMS PSI–90, THA/TKA PRO–PM, and the ISCMR measures will impact PY 1, we believe that this change will ultimately reduce burden for participants. Given that the concurrent baseline methodology, as discussed previously, would not impact PY 1, we do not believe that this policy will have a significant impact on hospital's prior operational commitments. We appreciate the suggestion to provide more transparency into baseline calculations prior to each performance year and will take it into consideration as we design future resources.

TABLE X.A.-03: FINALIZED CONCURRENT MEASUREMENT PERIODS & CQS BASELINE PERIODS

Quality Measure	PY1 Measurement Period & CQS Baseline Period	PY2 Measurement Period & CQS Baseline Period	PY3 Measurement Period & CQS Baseline Period	PY4 Measurement Period & CQS Baseline Period	PY5 Measurement Period & CQS Baseline Period
Hybrid Hospital-Wide All-Cause Readmission (Hybrid HWR) Measure with Claims and Electronic Health Record Data (CMIT ID #356)	July 1, 2024, through June 30, 2025 (claims-only)	July 1, 2025, through June 30, 2026 (hybrid)	July 1, 2026, through June 30, 2027 (hybrid)	July 1, 2027, through June 30, 2028 (hybrid)	July 1, 2028, through June 30, 2029 (hybrid)
CMS Patient Safety and Adverse Events Composite (CMS PSI-90) (CMIT ID #135)	July 1, 2023, through June 30, 2025	N/A	N/A	N/A	N/A
Hospital-Level Total Hip and/or Total Knee Arthroplasty (THA/TKA) Patient-Reported Outcome-Based Performance Measure (PRO-PM) (CMIT ID #1618)	July 1, 2024, through June 30, 2025	July 1, 2025, through June 30, 2026	July 1, 2026, through June 30, 2027	July 1, 2027, through June 30, 2028	July 1, 2028, through June 30, 2029
Hospital Harm—Falls with Injury (CMIT ID #1518)	N/A	January 1, 2027, through December 31, 2027	January 1, 2028, through December 31, 2028	January 1, 2029, through December 31, 2029	January 1, 2030, through December 31, 2030
Hospital Harm—Postoperative Respiratory Failure (CMIT ID #1788)	N/A	January 1, 2027, through December 31, 2027	January 1, 2028, through December 31, 2028	January 1, 2029, through December 31, 2029	January 1, 2030, through December 31, 2030
Thirty-day Risk—Standardized Death Rate among Surgical Inpatients with Complications (ISCMR) (CMIT ID #134)	N/A	July 1, 2024, through June 30, 2026	July 1, 2025, through June 30, 2027	July 1, 2026, through June 30, 2028	July 1, 2027, through June 30, 2029
Information Transfer Patient Reported Outcome-Based Performance Measure (Information Transfer PRO-PM) (CMIT ID #1797)	N/A	N/A	January 1, 2028, through December 31, 2028	January 1, 2029, through December 31, 2029	January 1, 2030, through December 31, 2030

After consideration of the public comments, we are finalizing with modification the proposal at § 512.547(a)(1) through (5) to change the CQS baseline methodology in TEAM to using a concurrent CQS baseline period starting in PY 1. Specifically, we are finalizing a concurrent CQS baseline period methodology rather than the proposed sliding historical CQS baseline methodology, effective beginning with TEAM PY1. Under this approach, the CQS baseline for a given TEAM performance year is identical to the applicable measurement period for that year. We are also finalizing without modification to change from calendar year to July to June timeframe for the Hybrid HWR, CMS PSI–90, THA/TKA PRO–PM, and ISCMR measures.

c. Pricing Methodology

(1) Background

As finalized in the FY 2025 IPPS/LTCH PPS final rule (89 FR 68986), TEAM participants will be provided with target prices for each MS–DRG/HCPCS episode type. These target prices will be calculated using 3 years of rolling baseline episode spending, trended forward with 2 additional historical years to the performance year, at the level of MS–DRG/HCPCS episode type and region, with updates to be made using the performance year data during the reconciliation process. The regions are defined as the nine U.S. census divisions and the MS–DRG/HCPCS episode type is based on the episode categories that will be tested in the model: Coronary Artery Bypass Graft (CABG), Lower Extremity Joint Replacement (LEJR), Major Bowel Procedure, Surgical Hip Femur Fracture Treatment (SHFFT), and Spinal Fusion.

Episode spending will be capped at the 99th percentile for each of the 29 MSDRG/HCPCS episode types and 9 regions, and the benchmark price will be calculated as the average capped and standardized spending in the most recent baseline year dollars for each MS–DRG/HCPCS episode type in each region, resulting in 261 benchmark prices. Benchmark prices will be calculated using all hospitals in a region, regardless of TEAM participation status. CMS will apply a prospective trend factor and a discount factor to benchmark prices. During reconciliation, these preliminary target prices will be modified by updating the trend (subject to a cap) and normalization factor (subject to a cap) and by adjusting for each participant's realized performance year case mix.

Risk adjustment factors will be calculated and made available to TEAM participants prior to the start of each performance year, so TEAM participants will be able to use them to estimate their episode-level target prices. Risk adjusters finalized in the FY 2025 IPPS/LTCH PPS final rule and FY 2026 IPPS/LTCH PPS final rule include age group, Hierarchical Condition Category (HCC) count, and beneficiary economic risk, as well as episode category-specific HCC adjusters and hospital-level adjusters including a hospital bed size factor and a safety net hospital factor. The risk adjustment factors will be calculated at the MS–DRG/HCPCS level using a weighted linear regression where episodes are weighted differentially based on whether they belong to year 1, 2, or 3 of the baseline periods. As finalized in the FY 2025 IPPS/LTCH PPS final rule (89 FR 68986), episodes from baseline year 1 will be weighted at 17 percent, baseline year 2 at 33 percent, and baseline year 3 at 50 percent. The risk adjustment factors will be fixed and applied to performance year episodes at reconciliation based on the realized case mix of the TEAM Participant in the performance year.

After risk adjusting for the performance year case-mix, CMS will normalize the target prices to ensure that the average of the total risk-adjusted preliminary target price does not exceed the average of the total non-risk adjusted preliminary target price. The final normalization factor will be calculated as the mean of the benchmark price for each MS–DRG/HCPCS episode type and region divided by the mean of the risk-adjusted benchmark price for the same MS–DRG/HCPCS episode type and region. As finalized in the FY 2025 IPPS/LTCH PPS final rule (89 FR 68986) it will be capped should this ratio exceed ±5 percent of the prospective normalization factor. The final target prices will include a retrospective trend factor, which will be capped at being within 3 percent of the prospective trend, as finalized in the FY 2025 IPPS/LTCH PPS final rule (89 FR 68986). The retrospective trend factor will be calculated as the average capped performance year episode spending at the MS–DRG/HCPCS episode type and region level divided by the capped average baseline episode spending in the most recent baseline year dollars at the MS–DRG/HCPCS episode type and region level (that is, national mean benchmark price).

The reconciliation (final) target price will be calculated as the product of the capped mean baseline episode spending in the most recent baseline year dollars, the discount factor, the risk adjustment multiplier using the performance year case-mix, the capped final normalization factor, and the capped retrospective trend factor.

TEAM participants will have the opportunity to achieve a reconciliation payment amount, after accounting for quality performance, if their performance year spending is below the reconciliation target price, or they may owe a repayment amount if their spending is above the reconciliation target price.

(2) Ambulatory Payment Classification (APC) and Medicare Severity Diagnosis Related Groups (MS–DRG) Update Factors

(a) Background

TEAM relies on the Medicare Severity Diagnosis Related Group (MS–DRG) and Healthcare Common Procedure Coding System (HCPCS) codes to identify procedures to initiate an anchor hospitalization or anchor procedure. MS–DRG and HCPCS codes, and more specifically the assignment of HCPCS codes to Ambulatory Payment Classifications (APCs), may be modified because of changes in treatment patterns, technology, and any other factors that may change the relative use of hospital and provider resources. Typically, CMS proposes and finalizes coding changes, as applicable, through established annual payment rules. MS–DRG changes are generally aligned with the fiscal year (FY) in the IPPS/LTCH proposed and final rules, while HCPCS and APC changes generally align with the calendar year (CY) in the Outpatient Prospective Payment System (OPPS)/Ambulatory Surgical Center (ASC) proposed and final rules.

Because TEAM uses 3 years of rolling baseline episode spending, with 2 additional historical trend years, to construct target prices for a given performance year, changes in the MS–DRG or HCPCS–APC mappings and weights after the baseline period and either prior to or during the performance year may result in target prices that do not appropriately reflect episode spending in the performance year. Additionally, any new code established prior to or during the performance year that did not exist in the baseline period would not have a target price. In the FY 2026 IPPS/LTCH PPS final rule (90 FR 36536), we finalized the definition of a scaling factor at § 512.505 and methodology at § 512.540(a)(2)(i) through (iii) to account for changes to MS–DRGs and HCPCS between the baseline period and the performance year using a three-step mapping and scaling approach. The scaling factor, calculated as the ratio of MS–DRG or APC weight in the performance year to that in the baseline year, accounts for relative weight changes for MS–DRGs in the inpatient setting and APCs for HCPCS in the outpatient setting. However, this approach does not address changes that may arise after preliminary target prices are released to TEAM participants.

In the FY 2025 IPPS/LTCH PPS final rule (89 FR 68986), we established that preliminary target prices would be constructed only once per performance year and shared with TEAM participants prior to each performance year, which covers a calendar year timeframe. Therefore, due to the availability of data and timing of when target prices are released to TEAM participants, target prices are constructed using the previous calendar year HCPCS–APC mappings and weights (that is, the year prior to the performance year) and only the first three quarters of the current fiscal year's MS–DRG definitions and weights. TEAM target prices do not account for any MS–DRG definition or weight changes that are implemented in the last quarter of the performance year because fiscal years span October 1 to September 30. For example, performance year 1 (January 1, 2026–December 31, 2026) preliminary target prices are constructed using calendar year 2025 (January 1, 2025–December 31, 2025) HCPCS–APC mappings and weights and fiscal year 2026 (October 1, 2025–September 30, 2026) MS–DRG definitions and weights. HCPCS–APC mappings and weight changes in the CY OPPS/ASC and MS–DRG definition or weight changes in the FY IPPS/LTCH final rules would alter observed and scaled spending in the baseline period. Further, MS–DRG definition or weight changes may shift which code would initiate an anchor hospitalization and subsequently change the composition of inpatient episodes. As a result, benchmark and target prices would not reflect changes between calendar years (for instance, if HCPCS codes are reassigned to different APC weights during a performance year) or between fiscal years (for instance, MS–DRG definition changes between the first and second fiscal years of a performance year). At reconciliation, these changes may not be sufficiently accounted for by the retrospective trend factor which is capped at ±3 percent. Additionally, there may not be benchmark prices or other target price components available for episodes with anchor hospitalization end dates in the second fiscal year. To avoid these inconsistencies we proposed, as

discussed in section X.A.2.c.(2).(b). and (c). of this final rule, the application of APC and MS–DRG update factors in final target price calculations beginning in performance year 1, to ensure the final target price and reconciliation amounts align with payment rates and weights that are applied during each performance year.

(b) APC Update Factor

We proposed to update the Definitions at § 512.505 and the pricing methodology at § 512.540(b)(7) to add an APC update factor to the calculation of the prospective trend factor and at § 512.545(f)(1) to the retrospective trend factor. We proposed to define the APC update factor at § 512.505 as the component applied to the prospective trend factor to ensure that the APC weights corresponding to the performance year are incorporated into the final target price calculations. The APC update factor, as set forth in 512.540(b)(7), would be calculated at the MS–DRG/HCPCS episode type and region level as the ratio of the benchmark prices calculated with APC weights corresponding to the calendar year of the performance year (CY 2026 for performance year 1) to the preliminary benchmark prices calculated with the APC weights corresponding to the calendar year prior to the performance year (CY 2025 for performance year 1). The APC update factor would be calculated after the CY OPPS/ASC final rule is published each year and would be shared with TEAM participants to ensure that all information that is used to calculate final target prices is available. The APC update factor would be applied as a multiplier to the prospective trend factor, creating an updated prospective trend factor, which will be applied during final target price calculations. Specifically, we proposed to update § 512.545(f)(1) such that the retrospective trend factor is capped relative to the updated prospective trend factor to ensure that final target prices are aligned with performance year payment rates and weights.

We stated in the proposed rule that we believed this would be a straightforward approach to account for calendar year changes in APC weights by directly applying the corresponding changes to the prospective trend factor, without creating and distributing multiple preliminary target prices. For example, TEAM participants would only need to multiply the APC update factor to the prospective trend factor as compared to receiving a new preliminary target price with other updated pricing components. We noted in the proposed rule that if the APC relative weights decrease between calendar years, the application of the APC update factor may result in a decrease in benchmark prices. Additionally, risk adjustment coefficients are not updated and may not reflect changes between calendar years. Internal analysis assessed the impact of using outdated APC weights on TEAM benchmark prices, comparing the average scaled and winsorized spending in the most recent baseline year at the MS–DRG/HCPCS episode type and region level using CY 2025 and CY 2026 APC weights. Findings from this internal analysis indicated that episodes with APC assignment changes between calendar years 2025 and 2026 had significant percent differences in APC weights between years (49 percent). Additionally, the percent differences in average scaled and winsorized spending for TEAM initiating episodes with changed APC assignments between calendar years 2025 and 2026 were large, ranging from 33 percent to 40 percent, and the percent difference between baseline benchmark prices ranged from 2 percent to 8 percent.

We stated in the proposed rule that though we anticipated only minor adjustments to APC weights during the calendar year, internal analyses indicated that benchmark prices and therefore the final target price calculations at reconciliation would not account for code reassignments that significantly change relative APC weights. We considered but did not propose applying the APC update factor beginning in performance year 2. As detailed later in this section, APC update factors would be shared in advance of final target price calculations and would improve target price accuracy, aligning reconciliation amounts with payment rates and weights applied during the performance year. Given this, we proposed adjusting the prospective trend factor methodology at § 512.540(b)(7) and the retrospective trend factor methodology at § 512.545(f)(1) to account for changes in relative APC weights between calendar years in the TEAM performance year.

The following is a summary of the public comments received on the proposed policy to include an APC update factor to the prospective trend factor, and our responses to these comments:

Comment: Many commenters expressed support for the APC update factor proposal. Some of these commenters stated the application of the APC update factor should help ensure target prices more accurately reflect APC weight changes between calendar years. A few of these commenters expressing support also noted that ensuring target prices reflect performance year APC weights is essential to reduce the risk of under- or over-estimating target prices and support consistency and predictability for TEAM participants. A couple commenters expressed appreciation for CMS' consideration of complex timelines across annual payment rules and efforts to address timing inconsistencies between preliminary target price construction and annual CY OPPS/ASC payment system updates.

Response: We thank the commenters for sharing their support for the APC update factor proposal. We agree that the APC update factor should help ensure target price accuracy and predictability. We also believe the APC update factor will help address timing inconsistencies between calculation of preliminary target prices and the CY OPPS/ASC payment system updates.

Comment: A commenter expressed support for providing the APC update factor to participants during the performance year after the CY OPPS/ASC final rule is published, noting it should improve participants' ability to manage a known target.

Response: We thank the commenter for their support.

Comment: A couple commenters encouraged CMS to provide clear and timely visibility and communication into any updates associated with OPPS/ASC changes prior to the start of the applicable performance year, noting that this will help participants better anticipate how payment system updates are reflected in target prices and support more effective care and budget planning. A commenter suggested CMS maintain transparency regarding the APC update factor methodology by addressing any changes through IPPS/LTCH rulemaking prior to the start of the performance year in which the methodology change would be applied.

Response: We thank the commenters for their suggestions. We appreciate commenters' suggestions and recognize that providing participants with timely visibility into payment system updates is critical for effective care delivery and budget planning. CMS is committed to maintaining transparency in our payment methodologies and communications. To support planning and operational readiness, CMS believes it is important to provide participants with preliminary target prices ahead of each performance year as it allows participants to make informed operational decisions, allocate

resources, and plan for the upcoming year with greater certainty.

However, due to the timing of the rulemaking cycle, the OPPS/ASC final rules are typically released just before the start of the applicable TEAM performance year. Since preliminary target prices are also shared with TEAM participants prior to the start of the performance year, it is not feasible to incorporate the relevant OPPS/ASC changes applicable to the target prices during the preliminary target price release itself. As stated in the proposed rule, CMS will calculate the APC update factor after the CY OPPS/ASC final rule is published and share the APC update factor with TEAM participants in advance of final target price calculations. We believe that this will ensure that TEAM participants receive the most accurate and up-to-date information before the final target prices are set. Additionally, CMS intends to release updated methodology specifications that include the APC update factor methodology and application.

Comment: A couple commenters recommended assessing the impact of the APC update factor over time, ensuring the multiplier appropriately reflects evolving clinical and payment environments without introducing unintended variability in target prices. These commenters noted stable and transparent methodologies are critical in maintaining provider engagement and allowing hospitals to effectively plan and manage episode-based care.

Response: We thank the commenters for their recommendation. We agree that maintaining stable and transparent pricing methodology is critical for TEAM participants' engagement and planning. CMS intends to monitor the impacts of the APC update factor, as well as other methodological refinements, to ensure the factor enhances target price accuracy.

Comment: A couple commenters suggested that if the APC update factor is applied starting in PY1, it should only be applied in cases where it results in favorable adjustments for TEAM participants. These commenters noted that since PY1 has already started, and hospitals have already made operational and financial decisions based on the original PY1 methodology, participants should not be held accountable for any retroactive changes that increase repayment obligations to CMS or otherwise worsen their financial position.

Response: We thank the commenters for their suggestions. We acknowledge that PY1 has already started, and the proposed policy would result in a methodology change mid-performance year. However, as noted previously, APC update factors will be shared in advance of final target price calculations and would improve target price accuracy and align reconciliation amounts with APC payment weights applied during the performance year. While we acknowledge that the APC update factor may result in downward adjustments in target prices if the APC relative weights decrease between calendar years, and that not having the APC update factor information released until late in PY1 makes it difficult for participants to make timely operational or performance-based adjustments, CMS believes there are important mitigating factors. Specifically, the IP–OP blended price methodology helps absorb smaller downward adjustments in APC weight changes, reducing the effect on target prices. Moreover, most participants have selected Track 1 for PY1, where there is no downside risk. As a result, the potential negative impacts of downward adjustments due to APC update factors are further mitigated for participants in PY1.

Comment: A commenter requested CMS to consider publishing the updated target price methodology with examples at a minimum of 90 days prior to the beginning of each performance year.

Response: We thank the commenter for their request. Due to the timing of the rulemaking cycle, the OPPS/ASC final rules are typically released just before the start of the applicable TEAM performance year. Since preliminary target prices are also shared with TEAM participants prior to the start of the performance year, it is not feasible to incorporate the relevant OPPS/ASC changes applicable to the target prices during the preliminary target price release itself. CMS intends to publish updated methodology specifications prior to each performance year so participants are well-informed about the methodology and any changes before the performance year begins. As stated in the proposed rule, CMS will calculate the APC update factor after the CY OPPS/ASC final rule is published and share the APC update factor with TEAM participants in advance of final target price calculations. We believe that this will ensure that TEAM participants receive the most accurate and up-to-date information before the final target prices are set.

After consideration of the public comments, we are finalizing without modification the proposal at § 512.505 to add an APC update factor definition and without modification the proposal at § 512.540(b)(7) and § 512.545(f)(1) to add an APC update factor to the calculation of the prospective trend factor.

(c) MS–DRG Update Factor

To account for changes in MS–DRG mapping and weights between the first and second fiscal years in a TEAM performance year, we proposed updates to the Definitions at § 512.505 and the pricing methodology at § 512.540, § 512.545, and § 512.550 to adjust the target price and reconciliation amount accordingly. Specifically, we proposed updating methodology at § 512.540(b)(7) to add a MS–DRG update factor to the calculation of the prospective trend factor for episodes with anchor end dates in the fourth quarter of the performance year. We proposed to define the MS–DRG update factor at § 512.505 as the component applied to the prospective trend factor for episodes with anchor hospitalization or anchor procedure end dates in the fourth quarter of the performance year to account for changes in MS–DRG definitions and weights between the first and second fiscal years in the performance year. We stated in the proposed rule that the MS–DRG update factor would be calculated at the MS–DRG/HCPCS episode type and region level as the ratio of benchmark prices calculated with the second fiscal year inputs (FY 27 MS–DRG definitions and weights for performance year 1) to preliminary benchmark prices calculated with the first fiscal year inputs (FY 26 MS–DRG definitions and weights for performance year 1). The MS–DRG update factor would be calculated after the FY IPPS/LTCH final rule is published each year and would be shared with TEAM participants as a multiplier to the prospective trend factor to ensure that all information that is used to calculate final target prices is available.

We stated in the proposed rule that when TEAM initiating MS–DRGs change between the first and second fiscal years in a performance year, the reconciliation target price for episodes with anchor end dates in the fourth quarter of the performance year would be calculated using MS–DRG mappings and weights from both fiscal years. We proposed at § 512.550(c), that initiating MS–DRGs with anchor end dates in the second fiscal year of a performance year would be mapped and assigned a first fiscal year MS–DRG. We proposed to update the methodology at § 512.545 to specify the fiscal year MS–DRG(s) of each reconciliation target price component for episodes with anchor end dates in the fourth quarter of the performance year. Components derived from baseline data, such as the

benchmark price and the risk adjustment coefficients, would be calculated using MS–DRG mappings and weights from the assigned first fiscal year in a performance year (as described in § 512.545(a) through (d)). The final normalization factor, described at § 512.545(e) would be calculated specific to the assigned first and second fiscal year MS–DRG and region combination, and cannot exceed ±5 percent of the prospective normalization factor, as specified at 512.540(b)(6), for the assigned first FY MS–DRG. For instance, if two TEAM initiating MS–DRGs are mapped to one MS–DRG in the second fiscal year, the normalization factor would be calculated using the benchmark price and risk adjustment coefficients of the assigned first fiscal year MS–DRG applied to the realized case mix of the second fiscal year MS–DRG. The retrospective trend factor described at § 512.545(f) would be calculated with performance year spending specific to the second fiscal year MS–DRG mapping combination, and cannot exceed ±3 percent of the updated prospective trend factor. The updated prospective trend factor would be the product of the prospective trend factor and the corresponding APC update factor and MS–DRG update factor. We proposed at § 512.505 to define the updated prospective trend factor as the multiplier incorporated into the preliminary target price to estimate changes in spending patterns between the baseline period and the corresponding calendar year and fiscal year in the performance year. See Table X.A–05 for summary of target price components and applicable fiscal year MS–DRGs.

TABLE X.A.-05: SUMMARY OF APPLICABLE FISCAL YEAR MS-DRG FOR EACH TARGET PRICE COMPONENT IN A PERFORMANCE YEAR

Episodes with Anchor End Dates in:	Benchmark Price	Risk Adjuster Coefficients	Risk Adjuster Multiplier	Prospective Normalization Factor	Final Normalization Factor	Prospective Trend Factor	Retrospective Trend Factor
Quarters 1-3	FY 1	FY1	FY1	FY1	FY1	FY1 *	FY1
Quarter 4	FY1	FY1	PY (FY1; FY2)***	FY1	PY (FY1; FY2)***	FY1 **	PY (FY1; FY2)***

* APC-UF as described previously would be applied to the prospective trend factor to generate the updated prospective trend factor in the calculation of target prices.

** APC-UF and DRG-UF as described previously would be applied to the prospective trend factor to generate the updated prospective trend factor in the calculation of target prices.

*** Refers to the assigned first and second fiscal year MS-DRG mapping combinations as proposed at § 512.550(c).

Further, for performance years in which diagnosis or procedure codes are mapped to different TEAM initiating MS–DRGs between the first and second fiscal years, we proposed updating methodology at § 512.550(c) to add a step to assign a first fiscal year MS–DRG to episodes with anchor end dates in the fourth quarter. We noted in the proposed rule that based on logic described in the IPPS/LTCH final rules, CMS would identify and map diagnosis and procedure codes from TEAM initiating MS–DRGs in the second fiscal year MS–DRGs to the first fiscal year MS–DRGs. Episodes with anchor end dates in the fourth quarter of the performance year based on the second fiscal year MS–DRG would continue to initiate, and the reconciliation target price assigned to the episode would be specific to the assigned first and second fiscal year MS–DRG mapping combination for each hospital. CMS would sum the values for each second FY MS–DRG/HCPCS episode type and, ultimately, across all MS–DRG/HCPCS episode types to determine the reconciliation amount.

As previously noted, some MS–DRG definition changes may result in preliminary benchmark prices and target price components not being available. See Table X.A–06 for a summary of the possible MS–DRG mapping scenarios between the first and second fiscal year of a TEAM performance year. For example, a non-TEAM MS–DRG, meaning a MS–DRG that does not initiate a TEAM anchor hospitalization, in the first fiscal year is mapped to a TEAM MS–DRG, meaning a MS–DRG that initiates a TEAM anchor hospitalization, in the second fiscal year of a performance year (scenario 4). We stated in the proposed rule that in this situation, we would not be able to produce a final target price for the episode, as preliminary benchmark prices and target price components would not be available for the non-TEAM MS–DRG based on the first fiscal year inputs. Therefore, we proposed that TEAM participants would not be accountable for episodes with anchor end dates in the fourth quarter of the performance year that are initiated by anchor hospitalizations that would have been assigned a non-TEAM MS–DRGs in the first three quarters of the performance year.

TABLE X.A.-06: SUMMARY OF MS-DRG MAPPING SCENARIOS BETWEEN FISCAL YEARS OF A PERFORMANCE YEAR

Scenario	Fiscal Year 1 MS-DRG	Fiscal Year 2 MS-DRG	TEAM Participant Episode Accountability under the Proposed Approach
1. No MS-DRG mapping changes	TEAM MS-DRG AAA	TEAM MS-DRG AAA	Accountable for episodes in both fiscal years.
2. Mapping changes result in a TEAM MS-DRG mapped to a different TEAM MS-DRG	TEAM MS-DRG AAA	TEAM MS-DRG BBB	Accountable for episodes in both fiscal years
3. Mapping changes result in a TEAM MS-DRG mapped to a Non-TEAM MS-DRG	TEAM MS-DRG AAA	Non-TEAM MS-DRG CCC	Accountable for episodes in fiscal year 1 but not fiscal year 2
4. Mapping changes result in a Non-TEAM MS-DRG mapped to a TEAM MS-DRG	Non-TEAM MS-DRG CCC	TEAM MS-DRG BBB	Not accountable for episodes in either fiscal year.

We believed adding the MS–DRG update factor to the calculation of prospective trend factors for episodes with anchor end dates in the fourth quarter of the performance year is an effective way to account for fiscal year changes in MS–DRG definitions and weights without reissuing preliminary target prices and reduces TEAM

participant burden by not having to manage multiple preliminary target prices within a given performance year. We acknowledged that, depending on the magnitude of changes between the fiscal years in the performance year, some target prices may lack precision or may not be available. Specifically, the risk adjustment coefficients are not updated and will be more reflective of the first fiscal year case mix. We noted in the proposed rule that internal analysis used fiscal years 2024 and 2025 inputs to assess the impact of MS–DRG mapping and weight changes between fiscal years on TEAM benchmark prices. This assessment demonstrated that conducting reconciliation calculations using target prices solely based on FY 2024 inputs, without accounting for FY 2025 MS–DRG mappings and weight changes, may penalize participants. Specifically, five spinal fusion MS–DRGs were deleted in FY 2024 and mapped to 10 new spinal fusion MS–DRGs in FY 2025. As a result, 72 percent of final TEAM spinal fusion episodes were without available FY 2024 benchmark prices, and differences in scaled inpatient stay costs ranged from -56 percent to 71 percent.

As previously noted, the APC and MS–DRG update factors would be calculated after the CY OPPS/ASC and the FY IPPS/LTCH final rules are published and would be shared with TEAM participants to ensure that all information that is used to calculate final target prices is available. Table X.A–07 provides an example operational timeline of APC and MS–DRG update factor availability. We noted in the proposed rule that the operational timeline is subject to change contingent on finalization and publication of the CY OPPS/ASC and FY IPPS/LTCH rules.

TABLE X.A.-07: EXAMPLE OPERATIONAL TIMELINE OF APC UPDATE FACTOR AND MS-DRG UPDATE FACTOR AVAILABILITY

Performance Year	Preliminary Target Prices	APC Update Factor	MS-DRG Update Factor
1	4th quarter of 2025	4th quarter of 2026	4th quarter of 2026
2	4th quarter of 2026	1st quarter of 2027	4th quarter of 2027
3	4th quarter of 2027	1st quarter of 2028	4th quarter of 2028
4	4th quarter of 2028	1st quarter of 2029	4th quarter of 2029
5	4th quarter of 2029	1st quarter of 2030	4th quarter of 2030

We considered in the proposed rule but did not propose to update and deliver preliminary target prices to TEAM participants for each calendar and fiscal year final rule. We believed managing three different preliminary target prices in a given performance year will increase participant burden and pricing methodology complexity. We also considered, but did not propose, to backwards map and descale spending for episodes with anchor end dates in the fourth quarter of the performance year. A descaling factor, the ratio of MS–DRG relative weight in the first fiscal year to the MS–DRG relative weight in the second fiscal year, would be applied to episode spending. The descaled episode costs would be applied to the numerator of the retrospective trend factor as well as directly to the final target price through a factor, which would be calculated as the difference between the average episode cost and the average descaled episode cost, divided by the preliminary target price plus one. Episodes with anchor end dates in the fourth quarter of the performance year would be triggered based on the mapped first fiscal year MS–DRG and reconciled using original episode costs before descaling. We indicated in the proposed rule that although this approach could improve target price accuracy, we believed it would introduce additional complexity, increasing the risk of confusion and challenges in implementation. We considered but did not propose applying the update factors beginning in performance year 2. We believed this would negatively impact participants in performance year 1, resulting in misalignment between target prices, reconciliation amounts, and payment rates and weights applied during the performance year. However, we sought comment on this alternative considered. Lastly, we also considered but did not propose removing the ±3 percent capping of the retrospective trend factor adjustment. Applying a full retrospective trend factor to reconciliation target prices, rather than capping at ±3 percent would account for actual performance year spending and would incorporate APC or MS–DRG mapping and weight changes not captured in preliminary target prices. However, we recognized that removing the ±3 percent cap may introduce target price instability making it more difficult for TEAM participants to predict reconciliation target prices and assess spending performance in the model.

We sought comment on our proposal at § 512.505 to add definitions of the APC update factor, MS–DRG update factor, and updated prospective trend factor. We also sought comment on our proposal at § 512.540(b)(7) to add APC and MS–DRG update factors in the calculation of the prospective trend factor to account for changes in HCPCS–APC and MS–DRG mappings and weights during a TEAM performance year. We also sought comment on our proposals for performance years in which diagnosis or procedure codes are mapped to different TEAM triggering MS–DRGs between the first and second fiscal years. At § 512.545 to specify the FY MS–DRG(s) that each reconciliation target price component reflects for episodes with anchor end dates in the fourth quarter of the performance year. At § 512.550(c) to add a step to assign a first FY MS–DRG to performance year episodes with anchor end dates in the fourth quarter and modify the calculations to the assigned first and second fiscal year MS–DRG/HCPCS episode type.

The following is a summary of the public comments received on the proposed policy to include an MS–DRG update factor to the prospective trend factor, and our responses to these comments:

Comment: Many commenters expressed support for the MS–DRG update factor proposal. Some of these commenters stated the application of the MS–DRG update factor should help ensure target prices more accurately reflect MS–DRG mapping and weight changes between fiscal years. A few of these commenters expressing support also noted that ensuring target prices reflect performance year MS–DRG definitions and weights is essential to maintain alignment between clinical practice, reimbursement, and episode accountability, reduce the risk of under- or over-estimating target prices, and support consistency and predictability

for TEAM participants. A couple commenters expressed appreciation for CMS' consideration of complex timelines across annual payment rules and efforts to address timing inconsistencies between preliminary target price construction and annual FY IPPS/LTCH payment system updates.

Response: We thank the commenters for sharing their support for the MS–DRG update factor proposal. We agree that the MS–DRG update factor should help ensure target price accuracy, predictability, and alignment between clinical practice, reimbursement, and episode accountability. We also believe the MS–DRG update factor will help address timing inconsistencies between preliminary target price construction and the FY IPPS/LTCH payment system updates for the second fiscal year in a performance year.

Comment: A commenter expressed support for providing the MS–DRG update factor to participants during the performance year after the FY IPPS/LTCH final rule is published, noting it should improve participants' ability to manage a known target.

Response: We thank the commenter for their support.

Comment: A couple commenters encouraged CMS to provide clear and timely visibility and communication into any updates associated with IPPS/LTCH changes prior to the start of the applicable performance year, noting that this will help participants better anticipate how payment system updates are reflected in target prices and support more effective care and budget planning. A commenter suggested CMS maintain transparency regarding the MS–DRG update factor methodology by addressing any changes through IPPS/LTCH rulemaking prior to the start of the performance year in which the methodology change would be applied.

Response: We thank the commenters for their suggestions. We agree that timely visibility and communication on relevant IPPS/LTCH changes will help TEAM participants better anticipate how these changes will be reflected in final target prices. Any finalized MS–DRG definition or weight changes will be available in the FY IPPS/LTCH final rules, regardless of whether they are mentioned specifically in the TEAM Provisions section. In order to calculate the MS–DRG update factor, CMS must wait until the FY IPPS/LTCH final rule for the second fiscal year in a performance year is published. As such, we note that it will not be feasible to share the MS–DRG update factor, or relevant IPPS/LTCH changes, prior to the start of the applicable performance year. As stated in the proposed rule, CMS will calculate the MS–DRG update factor after the FY IPPS/LTCH final rule for the second fiscal year is published and share the MS–DRG update factor with TEAM participants in advance of final target price calculations. We believe that this will ensure all information that is used to calculate final target prices is available to TEAM participants. Additionally, CMS intends to release materials on relevant changes for the MS–DRG update factor as soon as feasible, such as MS–DRG mapping specifications, so participants are well-informed about the applicable changes to TEAM.

Comment: A couple commenters recommended assessing the impact of the MS–DRG update factor over time, ensuring the multiplier appropriately reflects evolving clinical and payment environments without introducing unintended variability in target prices. These commenters noted stable and transparent methodologies are critical in maintaining provider engagement and allowing hospitals to effectively plan and manage episode-based care.

Response: We thank the commenters for their recommendation. We agree that maintaining stable and transparent pricing methodology is critical for TEAM participants' engagement and planning. CMS intends to monitor the impacts of the MS–DRG update factor, as well as other methodological refinements, to ensure the factor enhances target price accuracy.

Comment: A couple of commenters suggested that if the MS–DRG update factor is applied starting in PY1, it should only be applied in cases where it results in favorable adjustments for TEAM participants. These commenters noted that since PY1 has already started, and hospitals have already made operational and financial decisions based on the original PY1 methodology, participants should not be held accountable for any retroactive changes that increase repayment obligations to CMS or otherwise worsen their financial position.

Response: We thank the commenters for their suggestions. We acknowledge that PY1 has already started, and the proposed policy would result in a methodology change mid-performance year. We note that the proposed changes related to the MS–DRG update factor only apply to and affect the final quarter of PY1 and the availability of the PY1 MS–DRG update factor is contingent upon the finalization of proposed MS–DRG changes for FY2027 and the publication of the FY2027 IPPS/LTCH final rule. Additionally, we acknowledge that the MS–DRG update factor may result in downward adjustments to target prices. However, given that these changes impact only the last quarter of the performance year and most participants are in Track 1, where there is no downside risk during PY1 reconciliation. As such, we believe the potential negative impacts of any downward adjustments in target prices due to the MS–DRG update factor in PY1 will be mitigated.

Comment: A commenter requested CMS to consider publishing the updated target price methodology with examples at a minimum of 90 days prior to the beginning of each performance year.

Response: We thank the commenter for their request. As previously noted, CMS must wait until the FY IPPS/LTCH final rule for the second fiscal year in a performance year is published to calculate the MS–DRG update factor. As such, it will not be feasible to share the MS–DRG update factor, or relevant IPPS/LTCH changes, prior to the start of the applicable performance year. CMS will calculate the MS–DRG update factor after the FY IPPS/LTCH final rule for the second fiscal year is published and share the MS–DRG update factor with TEAM participants in advance of final target price calculations. CMS intends to publish updated methodology specifications prior to each performance year so participants are well-informed about the methodology and any changes before the performance year begins.

After consideration of the public comments, we are finalizing without modification the proposals at § 512.505 to add definitions for MS–DRG update factor and updated prospective and at § 512.540(b)(7) to add MS–DRG update factors in the calculation of the prospective trend factor. We are also finalizing without modification the proposals at § 512.545 to specify the FY MS–DRG(s) that each reconciliation target price component reflects for episodes with anchor end dates in the fourth quarter of the performance year. Lastly, we're finalizing without modification the proposals at § 512.550(c) to add a step to assign a first fiscal year MS–DRG to performance year episodes with anchor end dates in the fourth quarter and modify the calculations to the assigned first and second fiscal year MS–DRG/HCPCS episode type.

(3) Prospective Normalization Factor Construction

In the FY 2025 IPPS/LTCH PPS final rule (89 FR 68986) that established TEAM, a normalization factor was included in the calculation of preliminary and reconciliation target prices to ensure that the average

benchmark price after risk adjustment does not exceed the average benchmark price prior to risk adjustment. The FY26 IPPS/LTCH PPS final rule (90 FR 36536) revised the language at § 512.505 to clarify that the prospective normalization factor will be calculated using the benchmark prices rather than using preliminary target prices. Additionally, the FY26 IPPS/LTCH PPS final rule modified §§ 512.540(b)(6) and 512.545(e)(1)(i) to calculate the prospective and final normalization factors at the MS–DRG/HCPCS episode type and region level rather than at national level.

For each MS–DRG/HCPCS episode type and region combination, the normalization factor is calculated as the average benchmark price divided by the average risk-adjusted benchmark price. The risk-adjusted benchmark price is the product of the benchmark price and a risk adjustment multiplier, which accounts for variation in spending due to hospital and beneficiary characteristics. The risk adjustment multiplier, as defined in current policy at § 512.540(b)(6)(i), is calculated by applying risk adjustment coefficients to the most recent baseline year episodes. Since the baseline period, as defined in § 512.505 and further addressed in § 512.540(b)(2), is a rolling three-year period, the most recent baseline year for a given performance year would always be baseline year 3. The construction of the normalization factor relying on the most recent baseline year was designed to maintain simplicity while using the most recent data available. However, we stated in the proposed rule that we have concerns that only using the most recent baseline year may not accurately reflect all the episodes used to calculate the benchmark price. Nor does using only the most recent baseline year consistently recenter the risk adjusted benchmark prices back to the average of the total non-risk adjusted benchmark price.

To improve predictive accuracy, better represent all episodes used in benchmark price construction, and recenter the risk adjusted benchmark price to the average of the total non-risk adjusted benchmark price, we proposed that starting with performance year 2 to update the definition at § 512.540(b)(6) to calculate the prospective normalization factor at the MS–DRG/HCPCS episode type and region level based on the applicable episodes in the baseline period. We proposed to update § 512.540(b)(6)(i) to apply the risk adjustment coefficients to all applicable baseline year episodes, rather than restricting application to the most recent baseline year episodes, in the calculation of the risk adjustment multiplier. We indicated in the proposed rule that this should improve the accuracy of the multiplier and help to smooth short-term fluctuations, if any, in the most recent baseline year. An internal analysis compared the observed and expected average hospital-level spending for each MS–DRG/HCPCS episode type and region using clinical episodes with start dates on or after January 1, 2022, and anchor end dates on or before December 31, 2024. Findings demonstrated that the multipliers and normalization factors constructed with all the baseline episodes improved predictive accuracy compared to those constructed using only the most recent baseline year episodes. We noted the difference between the MS–DRG/HCPCS episode type and region-level normalization factors calculated using only the most recent baseline year episodes and the normalization factors calculated using all baseline year episodes ranged from −0.03 to 0.02 (−3.46 percent to 2.56 percent). While this difference was small, we believed using all baseline episodes to construct the normalization factor is a more sound mathematical approach and will recenter average expected spending around average observed spending.

We considered in the proposed rule, but did not propose to calculate the normalization factor using an additional 2 years of data prior to the baseline period, similar to the trend factor construction. However, this would not recenter the risk adjusted benchmark prices and would not improve predictive accuracy.

We sought comment on our proposal at § 512.540(b)(6) and (b)(6)(i) to calculate the risk adjustment multiplier and normalization factor using the baseline period clinical episodes starting with performance year 2.

The following is a summary of the public comments received on the proposed policy to update the calculation of the risk adjustment multiplier and normalization factor starting with performance year 2, and our responses to these comments:

Comment: Some commenters supported, and a commenter did not oppose, the proposed update to the prospective normalization factor construction. A few of the commenters agreed that the proposed methodology update would improve the predictive accuracy of the prospective normalization factor. A couple commenters appreciated that the proposed update would improve target price accuracy without adding undue volatility. A couple other commenters further expressed that the proposed methodology would more effectively capture a hospital's episode and patient case mix variations.

Response: We thank the commenters for their support for the proposal to calculate the risk adjustment multiplier and normalization factor using all baseline period clinical episodes starting with performance year 2. We agree with the commenters that using all three baseline years' data in calculating the risk adjustment multiplier and prospective normalization factor would improve accuracy without adding undue volatility and more effectively capture a hospital's episode and patient case mix variation.

Comment: A commenter recommended that any revisions to target price methodologies applied to performance year 1 should be implemented prior to the start of the performance year or should otherwise only result in favorable adjustments for participants. The commenter further suggested that participants should not be held accountable for any retroactive changes that increase their repayment amount to CMS or otherwise result in negative financial impacts.

Response: We appreciate the recommendation and acknowledge that performance year 1 commenced before the methodology update to the construction of the prospective normalization factor was proposed. However, the methodology update will be applied beginning in performance year 2. CMS intends to publish updated target price specifications ahead of the start of that performance year, to ensure that participants are well-informed of the applicable performance year's methodology and any changes that apply.

After consideration of the public comments, we are finalizing without modification the proposals at § 512.540(b)(6) and (b)(6)(i) to calculate the risk adjustment multiplier and normalization factor using the baseline period clinical episodes starting with performance year 2.

d. Ambulatory Surgical Center (ASC) Episodes Request for Information

We received many thoughtful and wide-ranging comments in response to the Ambulatory Surgical Center (ASC) Episodes RFI and we thank the commenters for responding. Due to the breadth of topics covered in the ASC Episodes RFI and public comments, as well as the variety of viewpoints expressed in response to this RFI, we are not responding to specific comments submitted. However, we appreciate the valuable input on the parameters under

which ASCs could be incorporated into TEAM, including the degree to which the addition of ASCs would necessitate a separate model test. We are conducting an in-depth review of the comments received, and this may help to inform potential future rulemaking proposals.

e. Hospital with Physician Ownership Request for Information

We stated in the proposed rule that the CMS Innovation Center is considering initiating a voluntary opt-in period to allow hospitals with physician ownership (POHs) located in core-based statistical areas (CBSAs) not selected for Transforming Episode Accountability Model (TEAM) inclusion to participate in TEAM. A POH is any hospital in which a physician, or an immediate family member of a physician, has an ownership or investment interest in the hospital. An ownership or investment interest may be through equity, debt, or other means, and includes an interest in an entity that holds an ownership or investment interest in the hospital.[571] It is estimated that more than 240 hospitals are owned and operated by physicians.[572]

Section 1877 of the the Act (42 U.S.C. 1395nn), also known as the physician self-referral law (and commonly referred to as the ''Stark'' law):

- Prohibits a physician from making referrals for certain designated health services payable by Medicare to an entity with which he or she (or an immediate family member) has a financial relationship, unless the requirements of an applicable exception are satisfied; and
- Prohibits the entity from filing claims with Medicare (or billing another individual, entity, or third-party payor) for any improperly referred designated health services.

A financial relationship may be an ownership or investment interest in the entity or a compensation arrangement with the entity. The statute establishes a number of specific exceptions and grants the Secretary the authority to create regulatory exceptions for financial relationships that do not pose a risk of program or patient abuse.

Section 1877(d) of the Act sets forth exceptions related to ownership or investment interests held by a physician (or an immediate family member of a physician) in an entity that furnishes designated health services. Section 1877(d)(2) of the Act provides an exception for ownership or investment interests in rural providers (the ''rural provider exception''). To use the rural provider exception, an entity must furnish substantially all of the designated health services that it furnishes to residents of a rural area (as defined in section 1886(d)(2) of the Act). To satisfy the requirements of the rural provider exception, the designated health services must be furnished in a rural area and, in the case where the entity is a hospital, the hospital must meet the requirements of section 1877(i)(1) of the Act no later than September 23, 2011. Section 1877(d)(3) of the Act provides an exception for ownership or investment interests in a hospital located outside of Puerto Rico (the ''whole hospital exception''). To satisfy the requirements of the whole hospital exception, the referring physician must be authorized to perform services at the hospital, the ownership or investment interest must be in the hospital itself (and not merely in a subdivision of the hospital), and the hospital must meet the requirements of section 1877(i)(1) of the Act no later than September 23, 2011. These exceptions are codified in our regulations at § 411.356(c)(1) and (3), respectively.

Section 6001(a) of the Affordable Care Act effectively eliminated the exceptions for physician ownership or investment in hospitals, although hospitals with physician ownership or investment and a Medicare provider agreement on December 31, 2010, are grandfathered and able to continue using the rural provider exception, if applicable, and the whole hospital exception.

Section 6001(a)(3) of the Affordable Care Act amended the rural provider exception and the whole hospital exception to provide that a hospital with physician ownership or investment may not increase the number of operating rooms, procedure rooms, and beds beyond that for which the hospital was licensed on March 23, 2010 (or, in the case of a hospital that did not have a Medicare provider agreement in effect as of this date, but did have a provider agreement in effect on December 31, 2010, the effective date of such provider agreement). However, the Secretary may grant an exception from the prohibition on facility expansion.

In the proposed rule, we referenced section 1877 of the Act (the Act) (42 U.S.C. 1395nn) and section 6001(a)(3) of the Affordable Care Act that limit the expansion of POHs to avoid the underlying concerns of the physician self-referral law, including but not limited to overutilization, patient steering, cherry-picking, and lemon-dropping. We also noted that there is some evidence that suggests that POHs may help control costs, maintain or improve patient outcomes, and prevent hospital consolidation.[573] [574] [575]

We sought public comment in the Request for Information on voluntary opt-in of POHs to participate in TEAM. The following is a summary of public comments received:

Comment: The vast majority of commenters supported allowing hospitals with physician ownership to voluntarily opt in to participate in TEAM. These commenters urged CMS to create a broad opt-in opportunity, and not limit eligibility based on geography, grandfathered status, rural or urban location, or whether the POH is outside a selected mandatory TEAM CBSA.

Some commenters suggested generally that POH participation would be consistent with patient-centered care, physician independence, and value-based care. They stated that physicians who directly care for patients should be able to own, lead, or control care-delivery settings, rather than being required to work as employees of large hospital systems, insurers, private equity entities, or administrator-led organizations. Some commenters asserted that physician-led governance would better align hospital operations with clinical judgment, patient welfare, care coordination, staffing, transitions, and episode-based care redesign. Many commenters stated that POHs could improve quality, patient experience, and continuity of care while reducing costs, waste, and administrative burden. They described POHs as efficient, transparent, less bureaucratic, and more accountable to physicians and patients. Some commenters also asserted that POH participation could increase competition, reduce consolidation pressures, expand patient choice, and provide an alternative to large vertically integrated health systems.

Some commenters also supported POH participation as a way to expand access and respond to community needs, including in rural, underserved, or consolidated markets where patients may face long wait times, service shortages, hospital closures, or limited access to specialty procedures, cancer care, GI services, obstetric care, or emergency surgical care. Some commenters requested that CMS evaluate POHs as a distinct category and separately assess their performance on cost, quality, utilization, patient experience, episode outcomes, and care coordination so TEAM could generate clearer evidence about physician-led delivery models.

[571] 42 CFR 411.351 and 411.254(b).

[572] Physician-Led Healthcare for America. (2026). *Physician-Led Hospitals. https://physiciansled.com/physician-led-hospitals-2/*

Response: We thank the commenters for their support of a voluntary opt-in opportunity for POHs to participate in TEAM. We agree with commenters that allowing additional POHs to participate in TEAM can support the goals of the model by expanding the number of hospitals participating in episode-based accountability, increasing the number of Medicare beneficiaries who may receive care under value-based care arrangements, and supporting continued investment in care redesign, care coordination, and improved transitions of care. We also agree that POHs may have staff, clinical focus, and the physician-led governance structures that could contribute to TEAM's test of whether episode-based payment can reduce Medicare expenditures while preserving or improving quality of care.

We recognize commenters' views that POHs may be well positioned to align operational decisions with clinical judgment and patient needs. TEAM is intended to test accountability for selected surgical episodes, and POHs that furnish services included in TEAM episodes may be able to implement care redesign strategies, engage treating physicians, coordinate post-discharge care, and manage avoidable spending in ways that are consistent with the model's goals. We believe that allowing additional POHs to participate could provide an opportunity for these hospitals to demonstrate whether and how physician-led care delivery structures perform under the same episode-based payment, quality, and reconciliation framework that applies to other TEAM participants.

We also agree with commenters that POH participation through a voluntary opt-in may increase beneficiary access to providers participating in value-based care. We believe that permitting additional eligible POHs to participate in TEAM may allow additional beneficiaries to receive care in settings that are accountable for episode cost and quality. This is consistent with CMS's interest in expanding value-based care opportunities while maintaining model integrity and beneficiary protections.

We also agree with commenters that POH participation may generate useful evidence about physician-led delivery models. This may include reviewing POH performance on cost, quality, patient experience, care coordination, episode outcomes, readmissions, post-acute care use, beneficiary mix, and other measures relevant to model performance and program integrity.

We also agree that competition and patient choice are important considerations. TEAM does not require a beneficiary to receive care from a particular hospital, and participating hospitals must continue to comply with applicable beneficiary protections and Medicare requirements. Allowing additional POHs outside of mandatory TEAM CBSAs to participate may give beneficiaries and referring providers additional options among hospitals that are accountable for episode quality and cost. We believe this may be especially relevant in markets where commenters stated that consolidation, service gaps, or limited access may reduce patient options.

While we appreciate commenters' assertions that POHs may be efficient, transparent, less bureaucratic, and accountable to physicians and patients, we are not relying on these assertions for the final policy. If POHs participating in TEAM can improve care coordination, reduce avoidable spending, maintain or improve quality, and support positive beneficiary outcomes, those results may be observable through model monitoring and evaluation.

After consideration of the public comments we received, we intend to propose in future rulemaking a policy to allow POHs not located in mandatory CBSAs to participate in TEAM. With POH concentration in the clinical areas that TEAM is designed to improve, we believe participation of additional POH will further test whether financial accountability for all costs of care for an episode will incentivize care coordination, improve patient care transition, and reduce unnecessary readmissions.

Comment: Many commenters emphasized that many POHs are specialty-focused facilities, including orthopedic, spine, surgical, cardiac, oncology, gastroenterology, or other physician-led settings relevant to TEAM episodes. Commenters indicated that they believe physician-led specialty hospitals can coordinate perioperative care, manage episodes across the full course of treatment, reduce variation, and deliver high-volume surgical expertise. Several commenters connected POHs to TEAM's surgical episode categories and stated that excluding specialty-focused POHs would leave out facilities that may be well positioned to succeed under bundled or episode-based accountability.

Response: We appreciate commenters highlighting the role of specialty-focused POHs in surgical care and how they may be relevant to the episode categories tested in TEAM. We agree that physician-led specialty hospitals may have experience in orthopedic, spine, cardiac, and other surgical service lines that are relevant to TEAM's episode-based design. We also agree that having specialty-focused experience may help some hospitals standardize care pathways, engage clinicians, manage post-acute transitions, and identify opportunities to reduce unnecessary spending while preserving or improving quality. These considerations support allowing eligible POHs a pathway into TEAM and specifically testing whether POHs are able to reduce Medicare spending while improving or maintaining quality of care in TEAM episodes. However, we must also ensure that specialty-focused POHs do not inappropriately steer beneficiaries, avoid higher-risk patients, or limit access in a way that would undermine the model or beneficiary protections. For these reasons, we agree that specialty-focused POHs can bring relevant expertise to TEAM, but we intend to consider accountability, quality, and compliance requirements in conjunction with POH participation in future rulemaking.

Comment: Some commenters supported or did not oppose consideration of POH participation but stressed that CMS should proceed with caution. Commenters discussed concerns related to appropriate utilization, patient selection, program integrity safeguards, and beneficiary choice. Some commenters supported a broad opt-in as allowed by statute, while others cautioned that POH participation through a voluntary opt-in could raise equity, evaluation, or compliance issues if POHs were treated more favorably than mandatory acute care hospital participants.

Response: We agree that any POH participation through a voluntary opt-in policy should include appropriate guardrails. In future rulemaking, we intend to address beneficiary protections, monitoring requirements, and the potential for remedial action in the event of noncompliance. We also agree that preserving beneficiary protections and maintaining model integrity are important considerations in determining whether and how additional POHs should be allowed to participate in TEAM.

We also agree that beneficiary choice must be protected. TEAM does not permit participating hospitals to restrict where beneficiaries receive care, require beneficiaries to use particular providers or suppliers, or deny medically necessary covered services. CMS will consider whether to require that newly participating POHs include the same beneficiary protections as other TEAM participants, including requirements

related to beneficiary notification, access to medically necessary care, and continued Medicare coverage and choice protections.

We also agree that appropriate utilization and patient selection would be important issues to monitor. TEAM episodes are initiated based on model episode criteria, not based on a hospital's ability to select individual beneficiaries for inclusion or exclusion after the fact. However, we recognize that commenters raised concerns about whether POHs could alter referral patterns, service mix, or case mix in ways that may affect model performance. Along with the POH participation policy, we intend to propose policies requiring POHs to participate in monitoring activities as specified by CMS. Monitoring POH performance may include the use of available claims, utilization, quality, episode, and reconciliation data to identify patterns that may indicate inappropriate behavior, including unusual changes in case mix, episode volume, beneficiary characteristics, referral patterns, admission source, emergency department use, transfer patterns, readmissions, post-acute care utilization, outlier spending, or quality outcomes. We note that TEAM policies allow for remedial action, as permitted under § 512.592, or TEAM participant termination, as permitted under § 512.596, to mitigate concerns identified through monitoring.

We agree with commenters that POH participation through a voluntary opt-in should not undermine model evaluation. We recognize that a voluntary opt-in opportunity can introduce self-selection concerns, including the possibility that hospitals that opt in voluntarily may differ from mandatory participants. Additionally, we appreciate concerns that participation of POHs that opt in could be more favorable than mandatory participation. We will consider these concerns in future rulemaking and may align the terms of POH participation with existing TEAM participation where possible and appropriate.

Comment: Some commenters opposed POH participation through a voluntary opt-in or urged CMS to limit it because of concerns about selective patient mix, negotiating leverage, profits for physician owners, and program integrity. Commenters stated that POHs can be selective in the patients they treat and the case mix they maintain and raised concerns about cherry-picking, lemon-dropping, steering, and differences between POHs and other acute care hospitals. These commenters generally believed that allowing POH participation through a voluntary opt-in could create inequities for mandatory participants and could distort TEAM's cost, quality, and evaluation results. A commenter strongly objected to allowing any new subset of hospitals, including POHs, to voluntarily opt in to participate in TEAM if CMS finalized CJR–X. This commenter believed that creating a POH-only opt-in would produce an uneven playing field, compromise TEAM and CJR–X evaluation integrity, and effectively give only POHs a path to opt out of CJR–X. Another commenter strongly opposed a voluntary opt-in period for POHs, stating that longstanding concerns about self-referral, overutilization, patient steering, cherry-picking healthier and better-insured patients, and limited emergency-service capacity still apply. The commenter stated that POHs tend to treat younger, less complex, and wealthier patients; provide fewer emergency services; report on fewer Medicare quality measures; and could destabilize full-service community and rural hospitals by siphoning profitable patients while leaving more complex and vulnerable patients to other hospitals. The commenter also stated that allowing only POHs to voluntarily opt into TEAM would create self-selection bias, destabilize target prices, threaten access for dual-eligible, low-income subsidy, rural, and underserved beneficiaries, and unfairly favor POHs over full-service hospitals. The commenter cited a study that found that POHs treat younger, less complex, and wealthier patients; are five times more likely to receive CMS' maximum readmission penalty; provide fewer emergency services and rely on community hospitals for critical care. The study also found that POHs report on fewer Medicare quality measures, raising concerns about transparency and accountability. They also cited another study that found that if a new POH opens in the same market as a full-service rural hospital, the full-service hospital's margins decrease significantly as the POH siphons off healthier and commercially insured patients, risking access to 24/7 care and community jobs.

Response: We thank the commenters for raising concerns about program integrity, beneficiary access, patient selection, model evaluation, and the interaction between POH that voluntarily opt in to TEAM and other CMS models. We take these concerns seriously. However, we believe that the design of the model and program integrity safeguards could mitigate the potential harms identified by the commenters.

As previously noted, we intend to propose a policy for additional POH participation in TEAM in future rulemaking. We believe that POHs may be able to contribute to TEAM's goals of improving care coordination and supporting care redesign. TEAM is designed to test whether financial accountability for selected surgical episodes can reduce Medicare expenditures while preserving or improving quality. TEAM participation provides an opportunity for POHs to operate under a value-based model, implement care redesign activities, coordinate care across an episode, and be accountable for cost and quality performance. Allowing additional POHs to participate will allow CMS to monitor whether POHs can succeed under the model without creating a distinct set of operational advantages over other TEAM participants.

We recognize the concerns that limited-service hospitals could raise issues related to overutilization, patient steering, cherry-picking, lemon-dropping, conflicts of interest, and impacts on full-service hospitals. We take these concerns seriously and intend to consider these issues when proposing POH participation and monitoring policies in future rulemaking.

We acknowledge commenters' concerns that voluntary opt-in may introduce self-selection into the model. We noted this concern in the proposed rule, including the potential cost and evaluation implications of voluntary opt-in and the risk that voluntary opt-in may affect model evaluation if not appropriately bounded. However, we do not agree that these concerns require rejecting POH participation through a voluntary opt-in altogether.

We also disagree that POH voluntary opt-in will, by itself, compromise beneficiary protections or permit inappropriate cherry-picking, lemon-dropping, or steering. TEAM does not give participants authority to deny medically necessary care, restrict beneficiary choice, alter Medicare coverage rules, or select beneficiaries for episode inclusion based on expected profitability. TEAM episodes are initiated based on specified clinical episode triggers, as identified by a MS–DRG or HCPCS code, along with beneficiary inclusion criteria, and not initiated based on a hospital's discretionary selection of individual beneficiaries.

We recognize that commenters are concerned that POHs may have different patient mix, service-line focus, emergency-care capacity, or referral patterns than other acute care hospitals. We intend to take these concerns into

account when considering and proposing monitoring policies in conjunction with POH participation in future rulemaking.

We also acknowledge participants' concerns that POH participation through a voluntary opt-in could destabilize target prices or distort TEAM's cost and quality results. We intend to propose a POH policy that considers these concerns in future rulemaking.

We recognize commenters' concerns that a targeted opt-in opportunity would be inequitable, and we intend to consider equity concerns when proposing POH participation policies in future rulemaking. We also do not agree that allowing POHs to opt in to TEAM voluntarily would give them a special exemption from CJR–X because at the end of TEAM, all TEAM participants, inclusive of POHs, would participate in CJR–X.

We acknowledge commenters' concerns about physician financial incentives and conflicts of interest and intend to consider these concerns in future rulemaking.

We also recognize concerns that POHs may focus on profitable service lines and may not furnish the same range of emergency or complex services as full-service community hospitals. We do not agree that these concerns justify excluding otherwise eligible POHs from participation in TEAM. TEAM is itself an episode-based model focused on specified surgical episodes, and all TEAM participants are accountable within the scope of the model's episode categories and payment rules. However, we intend to take service delivery concerns into consideration when proposing POH participation policies in future rulemaking.

We also recognize commenters' concerns that POH participation through a voluntary opt-in may harm rural or underserved communities. We intend to consider these concerns when proposing policies for POH participation and associated monitoring in future rulemaking.

Comment: Some commenters generally supported POH participation in TEAM but stated that a voluntary opt-in opportunity for POHs would not be meaningful without fraud and abuse waivers issued under the Innovation Center's authority. Many commenters urged CMS to revisit and substantially modernize broader federal restrictions on POHs, including the physician self-referral law, Affordable Care Act, and section 6001 limits on POH ownership, expansion, operating rooms, procedure rooms, beds, and facility capacity. Commenters believed that existing restrictions limit physician-led competition, protect incumbent hospital systems, create a double standard compared with large health systems, insurers, and other vertically integrated entities, and prevent POHs from responding to population growth, surgical demand, specialty-service shortages, and beneficiary access needs. Other commenters opposed issuing any fraud and abuse waivers for POHs voluntarily opting in to the model. They believed waivers of section 1877(d) and (i) of the Act would exceed CMS's testing and waiver authority under section 1115A(b) and (d)(1) of the Act. The same commenters also believed the resulting limited-service hospitals would compound the very problems that Congress sought to directly address when enacting the express limitations on new and expanded POHs in section 1877 of the Act.

Response: We appreciate the perspectives shared regarding federal regulations governing hospitals with physician ownership. We note that CMS does not have authority to amend, modify or repeal any statutory provisions. For this model and consistent with the authority under section 1115A(d)(1) of the Act, the Secretary may consider issuing waivers of certain fraud and abuse provisions in sections 1128A, 1128B, and 1877 of the Act as may be necessary solely for purposes of testing models described in section 1115A(b) of the Act. No fraud or abuse waivers are being issued in this final rule. Any potential exercise of this statutory waiver authority will be addressed in separately issued documentation. Any such waiver would apply solely to TEAM and could differ in scope or design from waivers granted for other programs or models. Thus, notwithstanding any provision of this final rule, TEAM participants must comply with all applicable laws and regulations, except as explicitly provided in any such separately documented waiver that may be issued pursuant to section 1115A(d)(1) of the Act specifically for TEAM.

After consideration of the public comments we received, we intend to propose in future rulemaking a policy for POH participation in TEAM. We believe additional participation of POHs in TEAM will promote greater choice and competition.

B. Revision to Provider-Based Location Criteria Regulations Applicable to Off-Campus Facilities or Organizations (§ 413.65)

1. Background

Section 1861(u) of the Act lists the types of facilities that are regarded as providers of services but does not use or define the term ''provider-based''. Since the beginning of the Medicare program, however, some providers, referred to as *main providers,* have functioned as a single entity while owning and operating multiple subordinate facilities that were treated as part of the main provider for Medicare purposes (as related to, for instance, payment; certification; coverage; and/or billing). With this treatment, compared to being treated as a freestanding facility, provider-based facilities might experience a number of advantages, including most notably, increased payments from Medicare. Therefore, we have maintained that having clear criteria for treating a facility as provider-based, as opposed to operating as a freestanding facility, is important because failure to properly distinguish between the two risks inaccurate program payments, which can result in provider overpayments and increased beneficiary coinsurance liability, with no commensurate benefit to the Medicare program or its beneficiaries.

Program Memorandum A–967, published on August 27, 1996, provided instructions for specific entity types from previously published documents consolidated into a general instruction for the designation of provider-based status for all facilities or organizations. That Program Memorandum was subsequently reissued, without substantive change, as Program Memoranda A–98–15 and A99–24 and, in October 1999, was manualized by the Provider Reimbursement Manual, Part I, Transmittal 411 (adding new section 2446), and the State Operations Manual, Transmittal 11 (replacing previous section 2003 and adding new section 2004). The Medicare rules regarding provider-based status of facilities and organizations are set forth at 42 CFR 413.65 and have been revised and updated on numerous occasions since initial issuance on April 7, 2000 (65 FR 18504). We note that implementation of the April 7, 2000 regulations was delayed for many providers by Public Law 106–554 in the Medicare, Medicaid, and SCHIP Benefits Improvement and Protection Act of 2000 (BIPA), which further amended the criteria for determining provider-based status, as implemented in a final rule

published in the **Federal Register** on November 30, 2001 (66 FR 59909).

Since the initial creation and implementation of the provider-based rules, CMS included requirements that the facility or organization seeking provider-based status and the main provider either be located on the same ''campus,'' as defined in regulations,[577] or, amongst other criteria, demonstrate they serve the same patient population. In the initial versions of the provider-based rules, the requirements regarding servicing the same patient population included a requirement that the facility or organization seeking provider-based status be in the ''immediate vicinity'' of the main provider's campus. The precise distance for an ''immediate vicinity'' determination was not defined in rulemaking, though the limit was generally understood to not exceed 35 road miles from the main facility, consistent with prior guidance. In response to a commenter in the final rule with comment period published in the **Federal Register** on April 7, 2000 (65 FR 18516), CMS concurred that establishing more precise criteria was required and finalized alternative methods to determine whether a provider-based facility or organization could demonstrate that it serves the same patient population as the main provider, even if it did not meet the ''immediate vicinity'' criterion. As revised, this ''same patient population'' test required hospitals to annually demonstrate a geographic overlap in service area through comparisons of patients' home zip code data from the main provider and the facility or organization seeking provider-based status.

Section 404(b) of BIPA further amended the immediate vicinity criterion by stating that the facility or organization must be located within a 35-mile radius of the potential main provider. The legislation also required the facility or organization to satisfy the regulatory criteria previously finalized by CMS at § 413.65(d)(7), and redesignated in 2003 as § 413.65(e)(3)(iii), which required a facility or organization to demonstrate it serves the same patient population as the potential main provider (the ''75 percent'' tests). And to encourage delivery of care to uninsured, low-income individuals, BIPA added alternative qualification criteria for certain hospitals with a disproportionate share adjustment greater than 11.75 percent.

In the FY 2001 IPPS/LTCH PPS final rule (65 FR 18517 through 18518), commenters requested that the requirement to serve the same patient population be modified to exclude off-campus inpatient facilities of hospitals because these facilities provide similar types of service as the main provider but serve patient populations from different geographic areas. We responded by stating that CMS recognizes there may be some cases in which a main hospital and another facility or organization seeking provider-based status may meet most or all other determining criteria in the regulations yet not qualify under the same patient population tests. We disagreed that this result should lead us to abandon the same patient population test, however, and pushed back on the commenter's assumption that because the program memorandum and proposed rule were issued in response to situations primarily involving outpatient facilities, they can apply only to such facilities. In that rule, we expressed specific concerns regarding payment implications for certain potential arrangements that we believed warranted application of the provider-based rules to both outpatient and inpatient locations. Specifically, we stated that the establishment of off-campus facilities excluded from the inpatient PPS could lead to payment abuses, such as circumvention of certain payment caps. We further addressed more general requests to exempt off-campus inpatient facilities from provider-based rules in the FY 2003 IPPS/LTCH PPS final rule (67 FR 50081 through 500082), reaffirming our position that provider-based rules should apply to both inpatient and outpatient facilities and organizations.

2. Proposed Revision to the ''Same Patient Population'' Location Criteria

To satisfy the location criterion set forth at § 413.65(e)(3)(iii), the regulation requires the facility or organization demonstrate that it serves the ''same patient population'' as the main provider by submitting records showing that, during the immediately preceding 12-month period, and for each subsequent 12-month period, that either: at least 75 percent of the patients served by the facility or organization reside in the same zip code areas as at least 75 percent of the patients served by the main provider (§ 413.65(e)(3)(iii)(A)); or at least 75 percent of the patients served by the facility or organization who required the type of care furnished by the main provider received that care from that provider (§ 413.65(e)(3)(iii)(B)). The provision at § 413.65(e)(3)(iv) provides a temporary test for newly established facilities that would not yet have 12 months of data to evaluate. We continue to believe that hospitals operating off-campus inpatient sites, such as a remote location or satellite facility, must meet one of the location requirements set forth in § 413.65(e)(3). However, upon further evaluation, we have concerns that aspects of the 75 percent tests do indeed pose an issue regarding facilities that furnish inpatient services.

Within the text of § 413.65(e)(3)(iii)(B), an example is provided to illustrate that to meet the requirement a hospital must demonstrate that at least 75 percent of the patients of a rural health clinic (RHC) seeking provider-based status received inpatient hospital services from the main provider hospital. This example describes a *referral* relationship between the main provider and the off-campus facility. That is, in certain geographic areas, where obtaining more acute follow-up care may require longer travel times, this provision provides an exception to a distance-based criterion for establishing the boundaries for a ''same patient population'' service area. We believe this example was meant to reinforce CMS' intention that this provision could be applied to exceptionally isolated outpatient facilities where additional services are routinely received by patients at more distant acute care facilities. Distinguishably, if a hospital chooses to operate two distinct inpatient locations more than 35 miles apart, we do not believe the hospital should be able to document that they serve the same patient population via the referral-based 75 percent test. Further, for PPS hospitals, inpatient services are generally paid based on the geographic location of the inpatient facility. Therefore, we do not believe that obtaining provider-based status for a remote location facility would have significant financial implications. By contrast, however, we are concerned that allowing this referral-based exception for inpatient facilities, certain specialty and PPS-excluded hospitals could obtain significant payment advantages for inpatient services provided at considerable distances from the main provider. We are aware that hospitals may, on occasion, transfer, or schedule additional follow-up for patients between related inpatient facilities. Even so, we believe these cases are likely limited to exceptional circumstances and not adequately demonstrative of whether one facility provides services to the same patient population as another.

For these reasons, we proposed to limit the application of § 413.65(e)(3)(iii)(B) to outpatient

[577] *See* 42 CFR 413.65(a)(2).

departments only. When a patient that ''required the type of care furnished by the main provider'' is referenced, it was contemplated that the encounter(s) at the proposed provider-based location would deliver outpatient services rather than inpatient services. We believe that this proposed revision maintains the original intent of the policy by permitting a proposed provider-based outpatient practice location to exceed the 35-mile radius in circumstances where inpatient services are not readily available in the area. And it eliminates the aforementioned potential for arguably unwarranted payment advantages by certain hospitals. Accordingly, we proposed to revise § 413.65(e)(3)(iii)(B) to specify that at least 75 percent of the patients served by an outpatient facility or organization who required the type of care furnished by the main provider received that care from that provider. An inpatient facility or organization, by contrast, would be excluded from utilizing this test to meet the location requirement altogether. Further, we proposed the addition of clarifying language at § 413.65(e)(3)(iii)(A) to make explicit that provision may still be utilized by either an inpatient or outpatient facility or organization.

We sought comment on this proposal.

Comment: Commenters argued that CMS's proposal contradicts the agency's own longstanding policy and would risk significant potential harm to patient access—particularly in rural and underserved communities.

Commenters stated that provider-based status allows off-campus locations to operate as integral parts of the hospital, expanding access to rural and underserved patients and improving access for the most medically complex patients. Commenters cited general trends in the industry to operate more remote specialty inpatient locations that would routinely refer patients to a large, better equipped tertiary hospital for additional treatment. Multiple commenters stated CMS's own prior policy that explicitly applied the referral-based test to both inpatient and outpatient provider-based facilities and requested CMS withdraw the proposal entirely or, at minimum, provide an exception provision for existing provider-based facilities. A commenter also questioned whether the proposal is necessary, given that CMS stated it would have a negligible financial impact on hospitals.

Response: We appreciate the input provided by the commenters. We note that while multiple commenters expressed concerns regarding potential negative impacts to hospitals, no commenter provided a specific example of an existing facility that would be negatively affected by this proposal. We acknowledge that this proposal is making a limited modification to longstanding CMS policy that applied provider-based regulations to both inpatient and outpatient facilities. While this policy has been in place for over 20 years, CMS has reviewed few provider-based attestations that utilized either of the 75 percent tests and, based on a search of records, could locate no case that relied on this specific referral test. We believe a hospital would likely seek CMS guidance or approval before presuming to qualify for the 75 percent test exceptions to the 35-mile proximity requirement, particularly before acquiring or constructing an inpatient facility. We do not believe it is appropriate to provide an exception, as requested by commenters, for existing off-campus remote locations because we do not believe that to the extent these facilities are receiving higher payments than would otherwise be justified by the geographic area where those facilities are located, or higher payments than other facilities, if any, that are located in that geographic area are receiving, that those higher payments are justified or equitable.

Additionally, as described above, we typically would not expect provider-based status to produce higher payment for inpatient facilities, as most payment systems base payment on the geographic location of the inpatient facility, whether it is enrolled separately or operated as a provider-based remote location. For example, remote locations of IPPS hospitals that are located in a different payment area than its main provider hospital are indicated with a ''B'' or ''C'' in the third position of the hospital's CCN in Table 2 in the addendum to this final rule, and have a wage index applied based on the remote location's geographic location. As stated in the proposed rule, however, we have become aware of potential scenarios where payments to IPPS-excluded hospitals could be increased by obtaining provider-based status for remote locations. Therefore, while we believe the impact on current hospital facilities is negligible, we find it is necessary to modify the provider-based rules to refine which facilities would be eligible for the referral-based 75 percent test.

Regarding commenters' concerns regarding potential negative impacts on providing integrated care in rural and underserved communities, we note that the referral arrangements they cited are currently allowable under Medicare policy, and provider-based status is not a requirement. Hospital systems routinely operate a variety of hospital and non-hospital facilities and can coordinate care and make necessary referrals between separately enrolled hospitals under current payment systems, facilitating the provision of more advanced or specialty services when medically necessary. The provider-based regulations define what may be considered an integrated part of an individual hospital, and do not restrict new service locations from enrolling with the program and receiving payments in accordance with the applicable payment system. While certain potential administrative efficiencies may be gained by obtaining provider-based status, we do not believe this alone is sufficient justification to provide broad exceptions to the provider-based location requirements.

Comment: One commenter argued that CMS's proposal lacks statutory authority, stating that, in BIPA Section 404(b), Congress ''adopted the 75 percent referral test as written'' and that, based on the commenter's read of § 413.65, Congress ''codified the application to both inpatient and outpatient locations'' such that any change would be contrary to Congressional intent.

Response: We disagree with commenters that BIPA precludes CMS from making any refinements to the 75 percent tests. Furthermore, CMS is maintaining the 75 percent tests and only updating our regulations to address scenarios that likely were not contemplated at the time of BIPA's passage, namely attempts by IPPS-excluded hospitals to increase Medicare payments by obtaining provider-based status for remote locations even if those remote locations are hospitals in other geographically urban areas in proximity to IPPS hospitals. We also note that off-campus inpatient locations will remain eligible to meet the requirements at 413.65(e)(3)(iii)(A).

After consideration of the public comments we received, we are finalizing the policy to exclude inpatient locations from 413.65(e)(3)(iii)(B), as proposed.

C. Expansion of the Comprehensive Joint Replacement (CJR) Model

1. Overview of Expansion of the Comprehensive Care for Joint Replacement (CJR) Model

a. Introduction

CJR was a Phase I mandatory alternative payment model tested by the Center for Medicare and Medicaid Innovation (Innovation Center) between April 1, 2016, and December 31, 2024,

in all eligible acute care hospitals within selected Metropolitan Statistical Areas (MSAs). Based on evaluation results indicating the model successfully reduced spending without reducing quality of care and the Secretary determining that the model has met the requirements for expansion, as described in section X.C.1.c. of this final rule, we proposed to expand CJR to all eligible acute care hospitals nationwide. The CJR model expansion, referred to as the Comprehensive Care for Joint Replacement Expanded (CJR–X) Model, presents an opportunity to further improve the quality of care for lower extremity joint replacements (LEJRs) furnished to Medicare beneficiaries nationwide by incentivizing hospitals, physicians, and post-acute care providers to work together to improve the quality and coordination of care from the initial hospitalization or procedure through recovery. As stated in the proposed rule, and finalized in this final rule, all eligible acute care hospitals would be required to participate in the CJR–X Model. We note that we proposed that CJR–X would start on October 1, 2027, but in response to comments, we are finalizing a model start date of January 1, 2028, as discussed in section X.C.2.a. of this final rule.

In order to distinguish our discussion of policies for CJR–X from our discussion of the initial CJR Model test, we will refer to the latter as ''the CJR Model''. Additionally, we noted that the CJR Model was initially designed to end on December 31, 2020, but was extended with modifications to the methodology, as described in section X.C.1.b. of this final rule. As a result, some of the policies we discuss in this final rule will have been applicable only prior to the extension while others will have been applicable only during the extension period (for example, the extension period broadened the definition of episodes to include outpatient episodes and modified the target price methodology). To distinguish the timeframe in which these particular policies applied, we will henceforth use the term ''original CJR Model'' for the former and ''CJR Extension'' for the latter. For specific policies that were consistent across both the original and extension periods, or discussion of the CJR Model test as a whole, we will continue to use the term ''the CJR Model.'' To distinguish the performance years in the CJR Model as defined at § 510.2 from our definition of performance years (PYs) in CJR–X at § 512.605, we will refer to the former as ''CJR Model PYs.''

b. Background

The Innovation Center implemented the CJR Model under the authority of section 1115A of the Act, through notice-and-comment rulemaking. The Innovation Center issued a final rule titled ''Medicare Program; Comprehensive Care for Joint Replacement Payment Model for Acute Care Hospitals Furnishing Lower Extremity Joint Replacement Services'' (referred to as the ''2015 CJR final rule''), which appeared in the November 24, 2015, **Federal Register** (80 FR 73274). The first CJR Model performance period began April 1, 2016. The goal of the CJR Model was to support better and more efficient care for beneficiaries undergoing the most common inpatient surgeries for beneficiaries: hip and knee replacements (also called lower extremity joint replacements or LEJR). Using the randomized selection methodology finalized in the 2015 CJR final rule, we selected 67 MSAs and initially required the approximately 800 acute care hospitals located in those MSAs to participate in the model through December 31, 2020. The selection of mandatory MSAs was reduced to 34 of the original 67 in later performance years of the model to focus on highest average spending MSAs to allow us to evaluate the effects of the CJR Model across a wide range of providers, including some that might not otherwise participate in the model (82 FR 57073).

The CJR Model tested quality and spending accountability for an episode of care associated with hip and knee replacements to encourage hospitals, physicians, and post-acute care providers to work together to improve the quality and coordination of care from the initial hospitalization through recovery. Specifically, the CJR Model was a retrospective bundled payment model where CMS provided participant hospitals with a target price for each CJR episode type (based on the MS–DRG assigned to the hospitalization and the presence or absence of a hip fracture in the original CJR Model and the MS–DRG or HCPCS code assigned to the hospitalization or procedure in the CJR Extension), prior to the start of each CJR Model PY. All providers and suppliers furnishing LEJR episodes of care to patients throughout the year were paid under existing Medicare payment systems. The target price included a discount that served as Medicare's portion of reduced expenditures from the LEJR episode, and initially incorporated a blend of historical, hospital-specific spending and regional spending for LEJR episodes, with the regional component of the blend increasing over time and eventually being 100 percent regional for PYs 4 through 8. Following the end of a CJR Model PY, actual total spending for a hospital's episodes was compared to the target price for those episodes. Depending on the participant hospital's quality and episode spending performance, the hospital could receive an additional payment from Medicare if spending was less than the target price or be required to repay Medicare for a portion of the episode spending that exceeded the target price.

In the January 2017 final rule (82 FR 180) and the December 2017 final rule (82 FR 57066), CMS implemented revisions to the CJR Model, including creating an Advanced APM track within the model and finalizing technical refinements and clarifications for certain payments, reconciliation and quality provisions. Additionally, in the December 2017 final rule, CMS offered rural and low-volume hospitals selected for participation in the CJR Model, as well as those hospitals located in 33 of the 67 MSAs, a one-time option to choose whether to continue their participation in the model until the initial CJR Model end date of December 31, 2020. All other participating hospitals in the remaining 34 MSAs continued to be mandatory participants (henceforth referred to as ''mandatory hospitals'').

While initial evaluation results for the first and second year of the CJR Model indicated that the model was having a positive impact on lowering episode costs when CJR participant hospitals were compared to non-CJR hospitals (with no negative impacts on quality of care), changes in program payment policy and national care delivery patterns had occurred since the CJR Model began.[578] [579] Specifically, knee replacements (total knee arthroplasty, or TKA) had been removed from the Inpatient Only (IPO) List as of January 1, 2018. Hip replacements (total hip arthroplasty, or THA) were subsequently removed from the IPO List as of January 1, 2020. These policy changes meant that TKA and THA procedures would be paid by Medicare when performed in the outpatient setting (meaning in a hospital outpatient department, or HOPD). However, the definition of an episode in the original

[578] Comprehensive Care for Joint Replacement Model—First Annual Report (*https://www.cms.gov/files/document/cjr-firstannrptpdf.pdf*).

[579] Comprehensive Care for Joint Replacement Model—Second Annual Report (*https://www.cms.gov/files/document/cjr-secondannrptpdf.pdf*).

CJR Model included only those TKA and THA procedures performed in the inpatient setting. Additionally, changes in national care delivery patterns meant that hospitals nationwide (including those not participating in the CJR Model) were reducing spending on LEJR episodes, but the model's original prospective target price methodology did not sufficiently account for these nationwide trends. As a result, target prices were artificially inflated, leading to concerns about the ability of the model to demonstrate savings over time.

In order to update the original CJR Model to address those changes to policy and care delivery patterns and improve the model's ability to demonstrate savings, CMS issued a proposed rule titled ''Medicare Program: Comprehensive Care for Joint Replacement Model Three-Year Extension and Changes to Episode Definition and Pricing'' (referred to as the ''2020 CJR 3-Year Extension proposed rule''), which appeared in the February 24, 2020 **Federal Register** (85 FR 10516). This rule proposed to extend the CJR Model for an additional three CJR Model PYs with modifications that included adding outpatient TKAs and THAs to the episode definition, adjusting the target price methodology and risk adjustment, and simplifying the reconciliation process.

Shortly before the 2020 CJR 3-Year Extension proposed rule was published, on January 31, 2020, Secretary of Health and Human Services Alex M. Azar II determined that a public health emergency (PHE) existed and had existed nationwide since January 27, 2020 due to confirmed cases of the 2019 Novel Coronavirus (2019-nCoV, hereafter referred to as ''COVID–19'').[580] In April 2020, in response to the COVID–19 PHE, CMS issued the April 2020 Interim Final Rule with Comment Period (IFC) (85 FR 19230), which addressed the impact of the COVID–19 PHE on participant hospitals. CMS delayed the proposed extension and modification of the original CJR Model and instead extended CJR Model PY5 through March 31, 2021, to minimize disruption to CJR Model participants as they dealt with the challenges of the COVID–19 PHE. CMS also adjusted the CJR Model's extreme and uncontrollable circumstances policy (originally designed to provide a time-limited period of financial protection to hospitals in the case of natural disasters such as hurricanes, floods, and wildfires) to apply to all CJR episodes during the COVID–19 PHE. This updated policy effectively waived downside risk for all CJR episodes during the COVID–19 PHE.

Subsequently, CMS issued the November 2020 interim final rule with comment period (IFC) (85 FR 71142), which implemented several changes to the CJR Model. Among them, CMS made a technical change to include MS–DRGs 521 and 522 in the CJR episode definition to ensure that the model continued to include the same inpatient LEJR procedures, despite the introduction in FY 2020 of new MS–DRGs to describe those procedures. CMS also finalized a more targeted application of the extreme and uncontrollable circumstances policy to episodes with a COVID–19 diagnosis. This change increased the likelihood of model savings while providing participants with financial protection against COVID–19 episodes after the COVID–19 PHE ended.

Evaluation results from the first four years of the CJR Model indicated that mandatory hospitals generated $72 million in savings to Medicare while maintaining quality, although the savings were not statistically significant. But in PY 5, reconciliation payments substantially increased, generating $95.4M in statistically significant Medicare losses, due to adjustments made to the model during the COVID–19 PHE. CMS implemented these temporary adjustments, which effectively waived downside risk for all CJR episodes, in order to minimize any financial burden associated with model participation given the financial challenges and uncertainties hospitals faced early in the COVID–19 PHE. These adjustments resulted in reconciliation payments being triple what they were in previous years, which reversed the savings trajectory and resulted in statistically significant losses to Medicare for mandatory hospitals. The losses in CJR Model PY 5 were large enough to offset total estimated savings prior to the PHE.[581]

In order to return the model to a savings trajectory, CMS published the final rule titled ''Medicare Program: Comprehensive Care for Joint Replacement Model Three-Year Extension and Changes to Episode Definition and Pricing; Medicare and Medicaid Programs; Policies and Regulatory Revisions in Response to the COVID–19 Public Health Emergency'' in the May 3, 2021 **Federal Register** (86 FR 23496) (referred to in this final rule as the ''2021 CJR 3-Year Extension final rule''). The 2021 CJR 3-Year Extension final rule finalized the extension and modification of the original CJR Model that CMS had proposed in the 2020 CJR 3-Year Extension proposed rule. This rule extended the length of the model through December 31, 2024, by adding an additional 3 CJR Model PYs. Also, CMS finalized revisions to certain aspects of the CJR Model including the episode definition (which was modified to include outpatient episodes), the target price calculation, the reconciliation process, the beneficiary notice requirements, and the appeals process. In addition, for PYs 6 through 8, the 50 percent cap on gainsharing payments, distribution payments, and downstream distribution payments for certain recipients was eliminated.

By 2024, CMS continued to believe the CJR Model could demonstrate savings after extending the model with modifications to account for policy and practice pattern changes. However, assessing the impact of these modifications on the potential for certification and expansion of the CJR Model would require additional time to collect and analyze evaluation data. Although preliminary evaluation results for CJR Model PY6 suggested that the modifications would result in Medicare savings, preliminary evaluation results for the full 3-year CJR Extension would not be available until late 2025. In the meantime, CMS sought to continue the care transformation efforts that we had promoted through both the CJR and Bundled Payments for Care Improvement Advanced (BPCI Advanced) Models. To achieve this goal, CMS finalized the Transforming Episode Accountability Model (TEAM) in the FY 2025 IPPS/LTCH PPS final rule, which appeared in the August 28, 2024, **Federal Register** (89 FR 68986). TEAM is a mandatory episode-based payment model for selected acute care hospitals that includes five surgical episodes, including LEJR. As we noted in the FY 2025 IPPS/LTCH PPS final rule (89 FR 69631), TEAM is based on: (1) lessons learned from testing the Bundled Payments for Care Improvement (BPCI) initiative, the BPCI Advanced Model, and the CJR Model; and (2) comments received from the ''Request for Information; Episode-Based Payment Model'' (88 FR 45872) published in the **Federal Register** on July 18, 2023. The first TEAM performance year began on January 1, 2026.

The LEJR episode and payment methodology currently being tested in

[580] Administration for Strategic Preparedness & Response: Determination That A Public Health Emergency Exists (*https://aspr.hhs.gov/legal/PHE/Pages/2019-nCoV.aspx*).

[581] Comprehensive Care for Joint Replacement Model—Fifth Annual Report (*https://www.cms.gov/priorities/innovation/data-and-reports/2023/cjr-py5-annual-report*).

TEAM are similar to the CJR Model in many ways, but there are a few key differences between the models. For example, TEAM episodes include the 30-day period after the discharge date (for inpatient procedures) or procedure date (for outpatient procedures), rather than the 90-day post-acute period included in the CJR Model. TEAM incorporates a more comprehensive set of risk adjustment factors into episode target prices as compared to the CJR Extension. TEAM also includes provisions for safety net hospitals (as defined at § 512.505) and hospitals with a low volume of episodes during the applicable baseline period to protect those hospitals from disproportionate financial risk. As stated previously, each element of TEAM that differs from either original CJR Model or the CJR Extension was included based on evaluation findings from the CJR and BPCI Advanced Models or stakeholder feedback, including responses to the July 2023 ''Request for Information; Episode-Based Payment Model''.

The final CJR Model PY ended on December 31, 2024, and the first TEAM performance year began on January 1, 2026. In the interim period between the end of the CJR Model and the beginning of TEAM, final evaluation results for the CJR Model PYs 6 and 7 and preliminary evaluation results for CJR Model PY 8 became available, due to the time required after a given CJR Model PY to allow for claims run out, the reconciliation process, and data analysis. Evaluation results for CJR Model PYs 6 through 8 indicated that the modifications in the CJR Extension, along with the more targeted application of the extreme and uncontrollable circumstances policy to COVID–19 episodes, had succeeded in returning the CJR Model to a positive savings trajectory. The seventh annual evaluation report found that the CJR Model had produced $112.7 million in net savings to Medicare across CJR Model PYs 6 and 7 while maintaining quality of care.[582]

Given the success of the CJR Model in achieving savings for Medicare across CJR Model PYs 6 through 8 while maintaining quality of care resulting from the CJR Extension policy modifications, CMS proposed to expand the CJR Model to all eligible acute care hospitals nationwide. For hospitals currently participating in TEAM, which includes an LEJR episode, CMS proposed that those TEAM participant hospitals would be exempt from CJR–X until the end of the TEAM model test. We proposed minor modifications in CJR–X that will align with some of the policies we implemented in TEAM because we believe these changes represent improvements to the CJR Model methodology, as we discussed in the FY 2025 IPPS/LTCH PPS final rule (89 FR 69631) and will discuss in further detail in the following sections of this final rule. We proposed to codify CJR–X policies at §§ 512.600 through 512.695, as discussed in more detail in the sections that follow.

c. Requirements for Expansion of the CJR Model

Section 1115A(c) of the Act provides the Secretary with the authority to expand (including implementation on a nationwide basis), through rulemaking, the duration and the scope of a model that is being tested under section 1115A(b) of the Act if the following findings are made, taking into account the evaluation of the model under section 1115A(b)(4) of the Act: (1) the Secretary determines that such expansion is expected to reduce spending without reducing quality of care or improve the quality of patient care without increasing spending; (2) the CMS Chief Actuary certifies that such expansion would reduce (or would not result in any increase in) net program spending; and (3) the Secretary determines that the expansion would not deny or limit the coverage or provision of benefits.

- *Reduced Spending while Maintaining Quality of Care:* As observed in the Seventh Annual Evaluation Report, the CJR Model achieved savings to Medicare of $112.7 million across PY 6 and 7 while maintaining quality of care as measured by emergency department (ED) visits, unplanned readmission rates, mortality rates, and LEJR complication rates.[583] Based on these findings, the Secretary determined that expansion of the CJR Model would reduce spending while maintaining quality of care.
- *Impact on Medicare Spending:* The CMS Chief Actuary has certified that expansion of the CJR Model would produce Medicare savings if expanded to all eligible acute care hospitals nationwide.
- *No Alteration in Coverage or Provision of Benefits:* The CJR Model did not make any changes to coverage or provision of benefits for beneficiaries. Therefore, the Secretary has determined that expansion of the CJR Model would not deny or limit the coverage or provision of Medicare benefits for beneficiaries.

Consistent with our statutory authority, we proposed to continue to test and evaluate the CJR Model as CJR–X. We note that CJR–X would not be considered a Phase I model, as described under section 1115A(b) of the Act, but rather it would be a Phase II model under section 1115A(c) of the Act. As a nationally expanded Phase II model, we would continue to assess whether the expanded implementation of CJR–X is either continuing to reduce Medicare spending without reducing quality of care or improving the quality of patient care without increasing spending. We note that we may modify CJR–X as appropriate through future notice and comment rulemaking.

The following is a summary of general comments about CJR–X, and our responses to these comments:

Comment: A few commenters supported CJR–X implementation. Many commenters specifically supported the refinements made to CJR–X, including the low volume hospital policy, more robust risk adjustment methodology, and increased financial protections for safety net hospitals.

Response: We thank the commenters for their support.

Comment: Some commenters asserted that CJR–X would exceed the Innovation Center's statutory authority, and it would not be a lawful expansion of the CJR Model. A commenter stated that CMS' CJR–X proposal would be unlawful for at least three reasons: (1) it exceeds the Innovation Center authority; (2) it raises serious constitutional concerns, including separation of powers; and (3) it includes unauthorized waivers. Another commenter believed CJR–X is ineligible for expansion under section 1115A(c) because CJR is not a model that is being tested and CJR–X includes untested elements and changes beyond a mere expansion in duration and scope. Instead of proceeding to a Phase II expansion, any version of CJR–X must first be tested and evaluated as a Phase I model under subsection (b). They continued to state that CJR–X is an overreach of agency authority that contradicts the statutory mandate of section 1115A and raises concerns about impermissible delegation of lawmaking authority to the executive branch and unjust compensation for services provided to Medicare beneficiaries.

Response: We acknowledge the commenters' concerns. However, we do not agree that CJR–X exceeds the Innovation Center's authority, is ineligible for expansion, or is an overreach of agency authority. Section

[582] Comprehensive Care for Joint Replacement Model—Seventh Annual Report (*https://www.cms.gov/priorities/innovation/data-and-reports/2025/cjr-py7-annual-report*).

[583] Ibid.

1115A of the Act provides the Innovation Center with broad authority to test innovative payment and service delivery models to reduce program expenditures while preserving or enhancing the quality of care furnished to Medicare, Medicaid, and CHIP beneficiaries. Additionally, under section 1115A(c) of the Act, taking into account the evaluation of a Phase I model test, the Secretary may, through rulemaking, expand (including implementation on a nationwide basis) the duration and scope of a model if certain criteria are met. We believe that CJR–X has met the requisite statutory criteria in 1115A(c) for expansion to a Phase II model test, and the Chief Actuary of CMS has certified that such expansion would reduce (or would not result in any increase in) net program spending under Medicare.

Comment: A commenter urged CMS to test CJR–X regionally rather than nationally.

Response: We thank the commenter for the suggestion. We do not believe a regional test would be appropriate for CJR–X because CJR–X represents the next step in the progression of testing LEJR episode-based payment, building directly from the CJR Model. The CJR Model was tested regionally, using selected metropolitan statistical areas. That regional test provided CMS with experience implementing mandatory LEJR episode accountability across a range of hospitals and geographic locations. Because CJR–X is predicated on the regional CJR Model test, we believe national implementation is the appropriate next step.

We also believe that national expansion would advance a more consistent approach to LEJR episode-based care coordination, quality accountability, and spending accountability across eligible hospitals. A regional approach could continue to produce variation between hospitals subject to LEJR episode accountability and hospitals not subject to the model, while a national approach would support broader standardization of LEJR episode management and reduce opportunities for geographic differences in model participation to affect care patterns or evaluation of the expanded model.

Comment: Many commenters recommended CMS not finalize CJR–X. A few commenters cited concerns of the potential impact it would have on beneficiaries' access to care and providers' success in the model. A commenter urged CMS to reconsider CJR–X and instead look to sources of Medicare spending other than joint replacements to garner meaningful savings and quality improvements. Another commenter cited their concerns with operational and financial impacts associated with broader mandatory bundled payment models, particularly as hospitals continue balancing quality reporting, interoperability investments, and adoption of new technologies across service lines.

Response: We recognize that there are many areas of Medicare spending that may present opportunities to improve quality and reduce expenditures, and we agree that continued innovation across a broad range of clinical conditions and payment models is important to advancing value-based care. We also note that CJR–X is only one component of the Innovation Center's broader portfolio of models and initiatives. CMS continues to test and implement models addressing other sources of Medicare spending and other clinical conditions through a variety of accountable care, specialty care, population-based, and episode-based payment approaches. We continue to believe that LEJR episodes are an appropriate area for model expansion under CJR–X as this builds upon the evidence generated through nearly a decade of experience with the CJR Model. LEJR episodes are high-volume procedures with well-defined clinical pathways, opportunities for care coordination across providers and settings, and a substantial evidence base demonstrating that episode-based payment approaches can improve efficiency while maintaining quality outcomes.

CJR–X includes safeguards and model features intended to address potential effects on beneficiaries and providers. For beneficiaries, CJR–X would not change Medicare coverage, eligibility, or benefits, and CJR–X participants would remain subject to applicable beneficiary protections, including requirements related to freedom of choice, access to medically necessary care, and monitoring for potential stinting or inappropriate changes in care. For providers, CJR–X includes financial risk protections, including stop-loss limits for all hospitals and lower stop-loss limits for certain categories of hospitals, to place a threshold on repayment responsibility while preserving incentives for care redesign and coordination.

Comment: Some commenters recommended that CMS provide up-front investments or implementation support to help essential hospitals and other resource-constrained hospitals participate successfully in CJR–X. Commenters suggested funding for staff such as nurse navigators, analytics capabilities, or care coordination infrastructure. Commenters stated that hospitals serving vulnerable populations may lack the capital needed to make early investments required for successful episode management. Commenters believed that upfront resources could help hospitals build care redesign capacity before bearing financial accountability.

Response: We appreciate the commenters' recommendation that CMS provide upfront investments or implementation funding to support hospitals with limited financial resources, including hospitals serving vulnerable populations. We believe that such an approach would introduce operational and financial complexities, including determining appropriate payment amounts, identifying eligible recipients, establishing permissible uses of funds, monitoring compliance, and addressing situations in which CJR–X participants subsequently fail to meet model requirements or do not achieve performance improvements. In addition, providing upfront funding would create challenges regarding the recovery of funds if a CJR–X participant were unable to successfully implement care redesign activities or if CMS later determined that the CJR–X participant was not entitled to retain all or a portion of the upfront payment. We believe recovering such payments could require additional administrative processes and could create uncertainty for both CMS and CJR–X participants.

We also note that, unlike models that rely on prospective infrastructure payments, CJR–X allows participants that successfully improve quality and reduce episode spending to retain savings through reconciliation payments. We believe this approach better aligns financial incentives with actual performance and care redesign results rather than providing funding in advance of demonstrated improvements in quality or efficiency.

Comment: Many commenters recommended that CMS provide additional implementation runway or a phased rollout before mandatory CJR–X accountability begins. Commenters stated that organizations need time to redesign workflows, build analytics infrastructure, establish post-acute partnerships, educate clinicians, and evaluate financial exposure. Commenters believed that compressed implementation could reduce readiness and divert resources from other strategic priorities. Some commenters recommended that CMS adopt a longer glide path before applying full downside risk under CJR–X, with a few commenters suggesting a 3-yearglide

path. Other commenters recommended different phased approaches such as a phased in discount factor, a phased in geographic expansion, and a phased in mandatory approach. A commenter suggested a one-year stop gain only performance period for any hospital without prior experience in a CMS-administered episode-based payment model. Another commenter recommended an informational only approach for the first year before introducing risk in the second performance year.

Response: We value commenters' recommendations to help CJR–X participants ease into participation and it was a motivating factor when deciding to finalize a 3-month delay to the model start, as discussed in section X.C.2.a of this final rule. However, we do not believe additional phased implementation approaches such as a multi-year glide path before downside accountability, phased geographic expansion, phased mandatory participation, or a phased-in discount factor are necessary for CJR–X. We believe these approaches would introduce additional complexity into model operations and delay the realization of potential improvements in care coordination and episode efficiency. We are also concerned that extended transition periods or informational-only phases could weaken incentives for CJR–X participants to establish and implement care redesign activities early in the model. Further, phased geographic or participation approaches could limit the consistency and comparability of model results across participants and reduce the ability to assess model performance at scale. We believe that maintaining a consistent accountability framework from the outset, while providing sufficient preparation time and targeted risk protections, better supports both participant readiness and the integrity of the model design.

In addition, we do not believe further reductions in accountability are necessary given the other protections finalized in this rule. We are finalizing a lower discount factor compared to the CJR Model discussed in section X.C.2.f.(3)(g) of this final rule, as well as improvements to risk adjustment discussed in section X.C.2.f.(4) of this final rule, a low-volume hospital policy discussed in section X.C.2.f.(3)(h) of this final rule, and stop-loss limits for all hospitals, with lower limits for certain hospitals, that reduce potential repayment exposure, as discussed in section X.C.2.f.(5)(g) of this final rule. We believe these policies directly address commenters' concerns regarding financial risk and participant readiness while preserving incentives for care redesign and efficient episode management. For these reasons, in combination with the January 1, 2028, start date, we believe there are sufficient protections that provide an appropriate balance between participant readiness and financial accountability.

We also note that CJR–X will not begin until January 1, 2028, and that participants will effectively have a pre-implementation year during calendar year 2027. During this period, CJR–X participants will have the opportunity engage physicians and post-acute care providers, establish governance and accountability structures, and develop episode management processes before model accountability begins. In addition, pursuant to an executed CJR–X data sharing agreement, CJR–X participants will receive baseline data and other model information that may be used to better understand historical performance and identify opportunities for care redesign and operational improvement. We believe calendar year 2027 will provide CJR–X participants with a meaningful opportunity to prepare for participation and gain familiarity with model requirements before being subject to financial accountability.

Comment: Many commenters recommended that CMS strengthen protections for rural, safety-net, Medicare-dependent, small rural hospitals, sole community hospitals, essential access, and other vulnerable hospitals. Commenters stated that these hospitals often operate with limited margins, limited capital, fewer post-acute resources, and less experience with bundled payment infrastructure. Some commenters indicated that immediate downside risk and regional target pricing could disproportionately affect hospitals serving medically underserved or rural communities. Commenters suggested excluding these hospitals from the model or providing exemptions from downside risk, reducing their discount factor, longer transition periods, or other safeguards until CMS has more information on how these hospitals perform under CJR–X and related models. Commenters linked these concerns to beneficiary access, financial stability, and the ability of vulnerable hospitals to invest in care redesign. Another commenter stated that given the lack of historical experience, CMS needs to collect more information through TEAM and CJR–X showing how sole community hospitals and Medicare-dependent hospitals perform under episode-based payment arrangements, including the impact on patient access and quality of care outside of metropolitan statistical areas before requiring participation. A commenter stated safety net hospitals fared poorly under the original CJR model and that on average, safety-net hospitals in the CJR Model performed worse financially than non-safety net hospitals and that safety net hospitals were substantially more likely than non-safety net hospitals to owe repayments to Medicare.

Response: We appreciate the commenters' recommendations regarding protections for rural hospitals, safety-net hospitals, Medicare-dependent, small rural hospitals, sole community hospitals, essential access community hospitals, and other hospitals that may face unique operational and financial challenges. We also acknowledge the CJR Model evaluation findings that demonstrated that safety net hospitals were overrepresented among hospitals with the highest per-episode repayments to Medicare.[584] We believe it is important to provide appropriate safeguards for hospitals that may face greater challenges under CJR–X and draw from lessons learned under the CJR Model. For this reason, we are finalizing several policies designed to improve pricing accuracy and limit financial exposure for hospitals that may have lower episode volumes, serve more complex patient populations, or are more financially vulnerable. These policies include improvements to the risk adjustment methodology intended to better account for differences in patient characteristics and episode complexity, a low-volume hospital policy that recognizes the additional variation associated with smaller episode volumes, and lower stop-loss limits that reduce potential repayment exposure, as discussed in sections X.C.2.f.(4), X.C.2.f.(3)(h), and X.C.2.f.(5)(g) of this final rule.

Improved risk adjustment helps ensure that target prices more accurately reflect differences in beneficiary characteristics and clinical complexity rather than holding hospitals accountable for factors outside of their control. This is particularly important for hospitals that serve medically underserved populations or beneficiaries with greater health and social needs, as more accurate risk adjustment can reduce the likelihood that target prices systematically

[584] Comprehensive Care for Joint Replacement Model—Safety Net Hospital Experience in Bundled Payment Model Report: *https://www.cms.gov/priorities/innovation/data-and-reports/2025/cjr-safety-net-hospital-exp-rpt.*

understate expected episode spending for these populations.

We also recognize that hospitals with lower episode volumes may experience greater year-to-year variation in spending and quality outcomes due to a relatively small number of episodes. A small number of unusually complex cases, complications, or high-cost episodes can have a proportionally larger effect on performance for low volume hospitals than for hospitals with hundreds of episodes. We believe the low volume hospital policy helps address this concern by recognizing the uncertainty associated with smaller episode counts and reducing the likelihood that financial outcomes are driven by random variation rather than underlying performance.

In addition, safety net hospitals, rural hospitals, Medicare-dependent hospitals, and sole community hospitals all receive lower stop-loss limits. Lower stop-loss limits provide important financial protection by capping the amount that a CJR–X participant may owe CMS in a given performance year. We believe these limits are particularly meaningful for hospitals with limited operating margins, fewer financial reserves, or less ability to absorb unexpected financial losses. By limiting repayment exposure, the stop-loss policy allows hospitals to participate in the model and pursue care redesign activities while reducing the risk that model participation could result in repayment obligations that are disproportionate to their size or financial capacity.

Taken together, we believe these policies improve pricing accuracy, reduce exposure to random variation, and limit financial risk while maintaining incentives for quality improvement and efficient episode management. Rather than exempting certain hospitals from accountability altogether, we believe these targeted protections better address the specific challenges identified by commenters while preserving the model's ability to encourage care coordination, evaluate performance across diverse hospital types, and test whether episode-based payment can improve quality and reduce Medicare spending in a broad range of communities.

With respect to discount factor reductions, we believe the existing protections through reduced stop-loss limits, rather than a reduced discount factor is the most appropriate mechanism for addressing vulnerable hospital concerns. The purpose of the discount factor is to represent Medicare's share of expected savings generated through improvements in care coordination, quality, and efficiency. We believe CJR–X participants should generally be subject to a consistent accountability framework that maintains a clear relationship between episode spending performance, quality performance, and Medicare savings. Reducing discount factors for broad categories of hospitals could weaken those incentives and reduce the model's ability to generate savings while maintaining consistency across participants.

We do not believe that exempting these hospitals from downside risk or delaying downside accountability beyond the start of the model is necessary or appropriate. We believe that accountability for both quality and spending from the outset of participation creates appropriate incentives for care coordination, discharge planning, post-acute care management, and other care redesign activities that are central to the goals of the model. Further, we believe that exempting broad categories of hospitals from downside accountability could reduce incentives for care redesign and limit the model's ability to evaluate whether episode-based payment can improve quality and reduce spending across a diverse range of hospitals and communities. Rather than exempting these hospitals from accountability, we believe it is more appropriate to provide targeted protections through risk adjustment improvements, low-volume policies, stop-loss protections, and additional implementation time while maintaining a consistent accountability framework across participants.

Lastly, we do not agree that these hospitals should be excluded from CJR–X until additional experience is collected. Including sole community hospitals and Medicare-dependent, small rural hospitals in CJR–X, subject to the model's applicable policies and protections, will allow CMS to better understand how these hospitals perform under LEJR episode-based payment arrangements in real-world settings. Excluding these hospitals from the model would limit CMS' ability to evaluate episode-based care coordination, quality, spending, patient access, and post-acute care patterns in the communities they serve. We also believe that participation by these hospitals can help inform more targeted policies and support over time. Monitoring and evaluation of CJR–X will allow CMS to assess whether certain hospitals, including sole community hospitals and Medicare-dependent, small rural hospitals, experience distinct operational challenges or access, quality, or financial impacts under the model. That information can help CMS identify whether additional guidance, technical assistance, model refinements, or other targeted policies may be warranted.

Comment: Some commenters stated that the proposed model structure did not adequately capture or emphasize downstream nonphysician services, including therapy services needed to support recovery and prevent secondary complications. A commenter stated that hospital should not be rewarded for reducing costs if savings are achieved by limiting post-acute care. Another commenter stated that patients should be able to pick which provider works best for them based on quality of care and provider location. Another commenter stated that it is best for patients to receive post-surgical care in their home community when possible and removing barriers to services locally helps maintain the fiscal health of rural providers.

Response: We agree that CJR–X should not limit access to care or restrict beneficiaries from seeking care from their preferred providers. As outlined in § 512.120, CJR–X participants must not restrict beneficiaries' ability to choose to receive care from any provider or supplier and also must make medically necessary covered services available to beneficiaries, including post-acute care services. Further, CJR–X includes the Telehealth and 3-Day SNF Rule waivers, discussed in section X.C.2.j of this final rule, that support CJR–X participants providing care closer to the beneficiary's home. Therefore, CJR–X does not dictate where beneficiaries receive care and provides flexibilities to help beneficiaries to receive care closer to home. However, if a beneficiary does elect to seek care from a CJR–X participant, they would not be able to opt-out of the model.

CJR–X participants are also held accountable for the quality of care provided to CJR–X beneficiaries. As discussed in section X.C.2.e of this final rule, CJR–X participants are assessed on five quality measures and performance on those measures is tied financial performance. While reductions in post-acute care services may help reduce Medicare expenditures, the CJR–X participant may not be eligible for a reconciliation payment if they performed poorly on quality.

We also recognize the role of downstream providers, including nonphysician services, in supporting beneficiary recovery. A CJR–X episode strives to be total-cost-of-care with limited exclusions, as discussed in section X.C.2.d.(3)(c) of this final rule, therefore many nonphysician services

are included in the episode. Given this inclusion, we believe it's important for CJR–X participants to have the ability to partner with these entities to help improve beneficiary outcomes and reduce Medicare expenditures. We are finalizing the ability for CJR–X participant to have sharing arrangements with CJR–X collaborators, as discussed in section X.C.2.i.(3) of this final rule, which would permit nonphysician entities, such as nonphysician practitioners, therapists in private practice, comprehensive outpatient rehabilitation facilities, providers or suppliers of outpatient therapy services, therapy group practices, and other entities to be CJR–X collaborators and support care redesign.

Comment: A commenter noted that, as Medicare Advantage (MA) enrollment increases, models such as CJR–X that apply only to Original Medicare will continue to cover a decreasing share of beneficiaries. While the commenter recognized that CMS and the Innovation Center face limitations in incorporating MA into payment models, they encouraged CMS to consider the implications of continued MA growth as it develops and evaluates future Innovation Center models.

Response: We appreciate the commenter's concern about the impact of increasing MA enrollment on models that only include Original Medicare beneficiaries. CMS recognizes that Medicare Advantage enrollment has continued to grow and that, although the rate of growth has slowed in recent years, MA now accounts for more than half of eligible Medicare beneficiaries. CMS will continue to consider how Medicare enrollment patterns, including the continued growth of MA, affect the reach, design, data availability, and evaluation of future Innovation Center models.

Comment: A commenter requested that CMS provide greater transparency about the composition of savings in the CJR Model, given that we cite these savings as part of our justification for model expansion. They request information including the number and mix of participating hospitals, distribution of savings and losses across participants, and whether the model improved or only maintained quality. They state their belief that the CJR Model did not demonstrate quality improvement and therefore may not have achieved its intended goal.

Response: We refer the commenter to the published evaluation reports of the CJR Model, including the Seventh Annual Report (*https://www.cms.gov/priorities/innovation/data-and-reports/2025/cjr-py7-annual-report*), which contain the information requested by the commenter. We note that we expect to publish the final evaluation report of the CJR Model in the fall of 2026. We confirm based on those evaluation results that the CJR Model maintained quality on claims-based and patient-reported outcomes while saving money for Medicare. As we noted earlier in this section of this final rule, the Innovation Center aims to test models that either reduce spending while maintaining quality of care or improve the quality of patient care without increasing spending. We note the finding in the Seventh Annual Report that the quality of LEJR care nationwide has improved since the beginning of the CJR Model, and CJR participants kept pace with those quality improvements while saving money, though they did not show significant increases in quality beyond non-CJR hospitals. However, saving money while maintaining quality aligns with Innovation Center model goals and, along with the CMS Chief Actuary's certification of expected savings and the Secretary's determination that expansion would not deny or limit coverage or benefits, fulfills CMS's statutory requirements for model expansion.

Comment: A few commenters offered recommendations related to how CMS should evaluate the CJR–X Model, share evaluation findings, and use those findings to refine the model. A commenter suggested that a phased or regionally stratified approach to implementation would allow CMS to build on prior CJR findings while addressing key evidence gaps, including impacts on access to care, referral patterns, risk modeling, and financial sustainability across different hospital types. They recommended that CMS conduct and publish evaluations of early implementation impacts, including access, patient selection, and financial impacts across hospital types and participation phases. They requested that CMS commit to an ongoing process to evaluate and incorporate findings into model refinement while working toward nationwide expansion. They also encouraged CMS to incorporate insights from the ongoing TEAM as part of the evaluation of CJR–X to inform future episode-based payment policy design.

Another commenter highlighted the importance of continuing to evaluate the impact of CJR–X on safety net hospitals. They stated their appreciation that CMS has acknowledged the need for additional protections for safety net hospitals in CJR–X, based on the challenges identified in CMS's evaluation of the CJR Model, but they expressed their concern that the proposed remedies would fall short of mitigating these challenges. They recommended that CMS conduct a formal evaluation to reassess how the model is affecting safety net hospitals and pause the model if it continues to find evidence of disproportionate harm to essential hospitals.

Response: We appreciate the commenters' concerns about continuing to monitor the impact of CJR–X on a range of outcomes including patient access to care, financial sustainability, and differential impacts on different categories of hospitals, including safety net hospitals. While we disagree with the suggestion of a phased or regionally stratified approach for reasons discussed above in this section of this final rule, we acknowledge the need for continued evaluation of the model's impacts and the application of lessons learned to refine the model as needed through notice and comment rulemaking. While nationwide expansion does not allow for a randomized control evaluation design as in the CJR Model, we plan to monitor hospitals' performance and look for evidence of disproportionate repayment impacts on subgroups of hospitals including safety net hospitals, rural hospitals, low volume hospitals, Sole Community Hospitals, and Medicare Dependent, small rural Hospitals. We will monitor year-over-year trends in outcomes including total episode spending, the percentage of hospitals that earn reconciliation payments and owe repayments, and improvement or maintenance of quality measures. We plan to post reports of these outcomes on a regular basis on the CJR–X website. We will work with the TEAM evaluation contractor to compare outcomes in 30-day TEAM LEJR episodes with 90-day CJR–X LEJR episodes. We note that we have made changes in CJR–X as a result of CJR evaluation findings that indicated the need for additional protections for certain types of vulnerable hospitals. We will evaluate the impact of those changes, if any.

Comment: A commenter stated that the pace and scale of the proposed model may limit the ability of organizations to test and stabilize care redesign strategies.

Response: We acknowledge the commenter's concern; however, we do not believe the proposed pace and scale of CJR–X would prevent organizations from iterating on care redesign strategies. As a nationally expanded model, CJR–X is intended to move LEJR episode-based care further toward a

standardized approach to care coordination, quality accountability, and episode spending accountability across eligible hospitals. We do not view care redesign as a one-time activity that must be fully completed before accountability begins. In ordinary clinical and operational practice, hospitals routinely assess outcomes, update care pathways, refine discharge planning, strengthen post-acute care coordination, and revise internal processes over time. The CJR–X framework would support that type of continued refinement while applying a consistent national episode-based payment methodology for LEJR episodes.

Comment: Many commenters expressed concern that CJR–X would hold hospitals financially accountable for spending that hospitals do not fully control. A commenter stated in the past, such models have not been mandatory and were successful at least partially because they included only hospitals ready and able to make such models successful. Another commenter recommended CMS adjust accountability methodologies to reflect the limited control hospitals have over post-acute utilization, particularly in non-employed physician models. Another commenter stated that hospitals do not have full control over services delivered by independent or post-acute care providers, or over beneficiary choice of post-acute providers, creating a misalignment between financial accountability and operational control.

Response: We acknowledge commenters' concerns and recognize that hospitals may not control beneficiary choice of post-acute care providers and that some hospitals may have less direct authority over physicians or post-acute care partners. We know voluntary models have produced important evidence and have shown that participating hospitals and other providers can improve care coordination and reduce episode spending. However, voluntary models are affected by self-selection and attrition which can limit the model's ability to generate broad-based, generalizable results and sustain savings across the Medicare program. We believe mandatory participation is important to advancing CJR–X as a nationally expanded model and as a step toward standardizing LEJR episode-based care coordination, quality accountability, and spending accountability.

We do not believe that hospitals must control every item or service furnished during an episode for episode-based accountability to be appropriate. CJR–X is predicated on the CJR Model, which tested mandatory LEJR episode-based accountability and demonstrated that hospitals can reduce episode spending while maintaining quality. Although hospitals may not control every item or service furnished during an episode, hospitals are well positioned to influence key aspects of LEJR episode performance, including discharge planning, care coordination, collaboration with physicians and post-acute care providers, beneficiary and caregiver education, internal care pathways, and processes that affect transitions of care, avoidable complications, readmissions, and post-acute recovery.

We also recognize that beneficiary freedom of choice remains an important protection under CJR–X. The model does not require beneficiaries to receive post-acute care from a particular provider or facility, and hospitals may not restrict beneficiaries' choice of Medicare-participating providers or suppliers. Instead, CJR–X relies on hospitals, treating clinicians, beneficiaries, and caregivers working together to identify clinically appropriate post-acute care arrangements that meet the beneficiary's needs and preferences. Hospitals may influence care through education, coordination, discharge planning, and collaboration, but CJR–X does not eliminate beneficiary choice or require hospitals to control independent providers.

We further acknowledge that hospitals operate under different structures, including non-employed physician models. CJR–X is designed to support care coordination across different organizational arrangements, including through collaboration with physicians, post-acute care providers, and other entities involved in LEJR episodes. The model's design recognizes that an episode of care is delivered across multiple settings, while encouraging hospitals to strengthen relationships, share information, and coordinate care with providers and suppliers that affect LEJR outcomes.

Comment: Some commenters suggested CMS include more accountability and monitoring to help address the post-acute care challenges. A few commenters expressed concerns over their view that CJR–X incentives may drive patients away from medically necessary inpatient rehabilitation facility (IRF) and long-term care hospital use. A commenter stated that essential hospitals serve patient populations with limited access to skilled nursing facilities and inpatient rehabilitation facilities and CMS should consider ways to better monitor post-acute care access barriers and provide technical assistance or modify the model if necessary. Another commenter believed CJR–X could drive blanket reductions in post-acute care utilization without adequate consideration of individual patient need and recommended the model include meaningful guardrails to ensure patients can continue to access appropriate levels of post-acute care. Another commenter encouraged CMS to monitor care patterns under CJR–X, including changes in site-of-care and post-acute utilization. They believed that while ongoing evolution in care delivery may be appropriate, treatment decisions should remain grounded in clinical appropriateness and patient-specific considerations. Another commenter was concerned about a potential impact on patient access to medically necessary IRF care, and that patients would be diverted to skilled nursing facilities (SNFs) or other settings due to their lower cost. They continued to state that the type and intensity of services provided by IRFs are distinctly not provided in SNFs and claimed that CJR–X would cause substitutions in the type of care received by beneficiaries. They further stated that recent oversight reports about major nursing home operators highlight inherent risks and patient safety concerns that could arise if patients are diverted to this setting.

Response: We recognize that post-acute care availability may vary across communities and that hospitals serving historically underserved populations are no exception. We agree that monitoring beneficiary access to post-acute care, post-acute care utilization, and site-of-care patterns is important under CJR–X. As noted in section X.C.2.m of this final rule, we intend to monitor CJR–X, including beneficiary access and safety. We reiterate that CJR–X does not require beneficiaries to receive post-acute care in any particular setting nor does it permit clinically inappropriate substitution of one post-acute care setting for another based on cost. CJR–X would not change Medicare coverage, eligibility, or benefits, and beneficiaries would retain freedom of choice to receive care from any Medicare-participating provider or supplier.

We acknowledge that some hospitals, including essential hospitals, may serve communities where beneficiaries face preexisting barriers to accessing post-acute care, including limited availability of skilled nursing facility or inpatient rehabilitation facility services. We also recognize that some beneficiaries undergoing lower-extremity joint

replacement procedures may have clinical, functional, or social needs that make access to an appropriate level of post-acute care especially important. For example, beneficiaries with multiple chronic conditions, mobility limitations, limited caregiver support, or a higher risk of complications or readmissions may need more intensive rehabilitation or other post-acute services to support recovery and functional independence.

However, we do not believe CJR–X would create those access limitations. Where a beneficiary's clinical condition supports the need for IRF care, LTCH care, SNF care, home health services, outpatient therapy, or another covered post-acute care service, treatment and discharge planning decisions should remain grounded in medical necessity, clinical appropriateness, and the beneficiary's individual circumstances.

We also recognize that changes in post-acute care use can be an important indicator of whether the model is operating as intended. Under CJR–X, hospitals may work to improve discharge planning, care transitions, and post-acute care coordination, and changes in post-acute utilization may reflect appropriate care redesign. However, reductions or shifts in post-acute care use must not result from stinting on medically necessary care, inappropriate steering, or barriers to clinically appropriate services. For that reason, monitoring post-acute care utilization, site-of-care changes, beneficiary access, quality of care, readmissions, complications, and other indicators of beneficiary safety will be important to CMS' oversight of CJR–X.

Consistent with standard discharge planning and care coordination practices, we expect hospitals, treating clinicians, beneficiaries, and caregivers to work together to identify clinically appropriate post-acute care options that meet the beneficiary's needs and preferences. Treatment decisions should remain grounded in clinical appropriateness and patient-specific considerations, including the beneficiary's functional status, medical needs, home support, caregiver availability, provider availability, and preferences. CJR–X does not authorize a CJR–X participant to force a CJR–X beneficiary into a lower-cost post-acute care setting when a different covered setting is medically necessary and clinically appropriate.

We also take seriously concerns about beneficiary safety in post-acute care settings, including concerns about potential adverse outcomes if beneficiaries are discharged to settings that are not equipped to meet their clinical and rehabilitation needs. As noted earlier, CMS' monitoring of CJR–X may include review of post-acute care utilization, patterns, and other indicators that could suggest inappropriate reductions in care or unsafe shifts in site of care.

We will continue to monitor CJR–X implementation, including beneficiary access to post-acute care, post-acute care utilization, site-of-care patterns, quality of care, and potential unintended consequences. If monitoring or evaluation identifies access barriers, inappropriate changes in post-acute care use, or other issues that warrant action, CMS may consider additional technical assistance or operational guidance. We may also consider this in future notice and comment rulemaking.

Comment: A commenter supported CMS's continued engagement with stakeholders as the CJR–X is implemented and suggested that mid-model changes should be minimized to the extent possible to provide stability and predictability for participating hospitals. Another commenter urged CMS to evaluate and work with stakeholders on the design and development of additional episodic payment options, particularly for surgical procedures.

Response: We recognize that participating hospitals need sufficient certainty regarding model policies to plan effectively, invest in care redesign, and manage LEJR episodes over time. At the same time, we believe CJR–X should remain responsive to beneficiary needs and to changes in clinical practice, care pathways, and health care delivery. Care for LEJR beneficiaries continues to evolve, including changes in surgical practice, discharge planning, post-acute care use, care coordination tools, quality measurement, and provider workflows. We believe it is important for CJR–X to retain the ability to respond to such developments where appropriate, so that the model continues to reflect how providers currently practice and how beneficiaries receive care.

With respect to commenters' suggestions of other surgical procedures, we are open to stakeholder feedback that may be appropriate to consider for future episodic payment models or payment options. We also note that TEAM is testing four surgical episode categories in addition to the LEJR episode category. Experience from TEAM may help inform CMS' broader understanding of surgical episode-based care, including how care redesign operates across different surgical procedures. We may consider lessons from TEAM, as well as feedback received through this and future rulemaking processes, as well.

Comment: A few commenters recommended expanding the episode to include upstream services to broaden the scope of the episode and strengthen the model's connection to longitudinal care. A commenter urged CMS to collaborate with stakeholders to design and test a longitudinal payment model that moves care upstream and directly addresses procedural appropriateness. Another commenter requested CMS to articulate how the model's episode structure can serve as building blocks for broader longitudinal accountability. Another commenter recommended that CMS should explicitly recognize and encourage the use of evidence based pre-surgical testing and diagnostic strategies as core components of episode optimization and quality assessment. A commenter recommended expanding the episode to include therapy interventions within the weeks prior to (and in connection with) the anchor surgery.

Response: We acknowledge that CJR–X is not designed to directly determine procedural appropriateness before an LEJR procedure occurs or to establish longitudinal accountability for care before and after multiple episodes or over an extended period of time. We believe it's important for episode-based payment models to have clear episode time periods and triggers and extending the episode to start before the anchor hospitalization or anchor procedure can make defining the episode challenging. Further, starting the episode before the anchor hospitalization or anchor procedure can make it difficult to avoid including unrelated items and is more likely to encompass costs that vary widely among beneficiaries, which would make the episode more difficult to price appropriately.

However, we agree that evidence-based pre-surgical evaluation, diagnostic strategies, shared decision-making, and care planning can be important to appropriate surgical care and successful episode outcomes. experience. For those reasons, we encourage providers to use clinically appropriate, evidence-based pre-surgical evaluation and diagnostic practices as part of patient-centered care, consistent with applicable Medicare coverage and payment rules.

Episode-based models can serve as important building blocks for broader accountability by encouraging providers to coordinate across settings, strengthen relationships with clinicians and post-acute care providers, and manage care beyond the inpatient stay. These capabilities may inform future

approaches to longitudinal accountability, including approaches that consider care pathways before a procedure occurs. We also believe the CJR–X overlap policy, as discussed in section X.C.2.h of this final rule, supports broader accountability by allowing CJR–X to operate alongside longitudinal or total-cost-of-care models, such as ACO models. When a beneficiary is included in both a longitudinal model and a CJR–X episode, the models can provide complementary forms of accountability. The longitudinal model participant may remain accountable for the beneficiary's broader care over time, including care before a surgical episode, while the CJR–X participant hospital is accountable for the quality and spending associated with the LEJR episode when surgery occurs. This overlap approach can help preserve upstream care-management incentives while maintaining focused accountability for the surgical episode and post-acute recovery period once an LEJR procedure is performed.

With respect to the request to design and test a longitudinal payment model that moves care upstream, we are open to stakeholder feedback on future model concepts. To the extent we propose a future model, we would provide opportunities for public input consistent with applicable rulemaking or model-development processes.

Comment: A commenter expressed significant concern and opposition to the expansion of the CJR model and stated that value-based models must align accountability with areas of influence and the CJR–X Model does not achieve this balance for community hospitals.

Response: We disagree that CJR–X may hold community hospitals accountable for aspects of care outside the hospital's influence. We believe CJR–X appropriately aligns accountability with areas that all hospitals can influence. Hospitals furnish the anchor procedure or anchor hospitalization, conduct discharge planning, communicate with treating clinicians, arrange or recommend post-acute care options, educate beneficiaries and caregivers, and can work with physicians, post-acute care providers, and other providers to improve care transitions and reduce avoidable complications, readmissions, and unnecessary utilization. While hospitals do not control every service furnished during an episode, they are well positioned to influence care coordination and care redesign across the episode.

We recognize that community hospitals vary in size, resources, episode volume, patient mix, local post-acute care capacity, and ability to absorb financial risk. For that reason, CJR–X includes policies intended to limit excessive financial exposure and support participation for hospitals that may face greater operational or financial constraints. These include a low volume hospital policy, as discussed in section X.C.2.f.(3)(h) of this final rule, and lower stop-loss limits for certain categories of hospitals, including safety net hospitals, rural hospitals, Medicare-dependent, small rural hospitals, and sole community hospitals, as discussed in section X.C.2.f.(5)(g) of this final rule. We believe these policies help address concerns that some community hospitals may have less capacity to absorb downside risk while preserving incentives to coordinate care, improve quality, and manage LEJR episode spending.

Comment: A commenter recommended that CMS, in coordination with the HHS Office of Inspector General, examine the scope of existing patient choice and discharge planning requirements as applied to CJR–X participants and provide clear regulatory guidance on the extent to which CJR–X participants may direct beneficiaries to higher performing post-acute care providers consistent with quality goals and clinical appropriateness. Without such guidance or appropriately scoped flexibility, hospital accountability for post-discharge and post-episode spending will be significantly mismatched with hospital authority to shape the care pathway.

Response: We agree that hospitals should be able to support beneficiaries and caregivers with information that helps them make informed post-acute care decisions, including information related to quality, care coordination, and clinical appropriateness. We indicated, as discussed in section X.C.2.c.(1) of this final rule, that CJR–X participants may recommend preferred providers to CJR–X beneficiaries, provided those recommendations are made within the constraints of current law. CJR–X participants may identify or recommend providers or suppliers that the hospital believes may support high-quality care transitions and appropriate post-acute care, including providers with whom the hospital has established care coordination relationships. However, CJR–X participants may not limit CJR–X beneficiaries to a preferred or recommended provider list.

We emphasize that CJR–X would not change Medicare beneficiary freedom of choice, Medicare coverage, or discharge planning requirements. Beneficiaries would retain the right to obtain care from any Medicare-participating provider or supplier, and CJR–X participants may not require beneficiaries to use a particular post-acute care provider, physician, or other provider or supplier as a condition of receiving care or participating in the model. Recommendations must be presented in a manner consistent with all applicable laws and regulations, including applicable requirements relating to patient choice and discharge planning, as well as applicable fraud and abuse laws.

We recognize the commenter's concern that hospitals are accountable for post-discharge episode spending while beneficiaries retain freedom of choice and post-acute care providers may operate independently. CMS continues to believe that hospitals can meaningfully influence LEJR episode outcomes through discharge planning, beneficiary and caregiver education, care coordination, information sharing, and collaboration with physicians and post-acute care providers, without restricting beneficiary choice. The ability to recommend preferred or high-performing providers, within the constraints of current law, supports care coordination and quality goals while preserving beneficiary protections.

We will continue to consider whether additional sub-regulatory guidance, operational materials, or beneficiary-facing resources would be useful to clarify how CJR–X participants may provide information about post-acute care options while complying with existing patient choice and discharge planning requirements.

Comment: A commenter encouraged CMS to focus on targeted refinements that enhance operational feasibility and provider sustainability. They stated such refinements will be essential to ensure that CJR–X achieves its intended goals while preserving access to high-quality care across diverse hospital settings. Another commenter stated the success of mandatory models is highly dependent on whether program design provides a realistic opportunity for providers to succeed across diverse market contexts.

Response: We believe the CJR–X design provides an opportunity for CJR–X participants to succeed by including targeted policies intended to support operational feasibility across diverse hospital settings. These policies include defined episode and participant criteria, a target price methodology that uses regional spending data, quality-based reconciliation, stop-loss protections,

monitoring and beneficiary protections, and opportunities for hospitals to coordinate with physicians, post-acute care providers, and other collaborators. We also include additional protections for hospitals that may face greater operational or financial constraints, including lower stop-loss limits for certain hospital categories and policies addressing low-volume hospitals.

We believe a nationally expanded model should be designed to operate across the range of eligible hospitals while incorporating safeguards and targeted policies that help participants manage accountability. CJR–X is a continuation of the CJR Model, which demonstrated that hospitals can improve LEJR episode efficiency while maintaining quality. At the same time, we will continue to consider monitoring data, evaluation findings, operational experience, and stakeholder feedback to determine whether refinements are needed to support implementation, protect beneficiary access, and preserve incentives for high-quality care.

Comment: A commenter recommended CMS view CJR–X as a long-term partnership with providers to improve patient outcomes, care coordination, and system efficiency.

Response: We recognize the importance that providers and suppliers bring to value-based care models. We will continue to engage CJR–X participants and other interested parties to support the model goals of improving quality of care and reducing Medicare spending.

Comment: A commenter did not support making CJR–X mandatory, particularly given the ongoing shift of joint replacement procedures to ambulatory surgical centers (ASCs). They stated that as more routine cases migrate to outpatient settings, hospitals are increasingly left caring for patients with greater medical and social complexity, which can significantly affect performance under a mandatory bundled payment model.

Response: We acknowledge the commenter's concern that the site of service for joint replacement procedures continues to evolve and that hospitals may treat beneficiaries with greater medical, functional, or social complexity as more routine cases shift to ambulatory surgical centers and other outpatient settings. However, we do not agree that these concerns warrant making CJR–X voluntary. CJR–X is predicated on the CJR Model, which tested mandatory LEJR episode-based accountability and demonstrated reduced Medicare spending while maintaining quality. We believe mandatory participation remains important to generating broad-based, generalizable results and supporting a consistent national approach to LEJR episode-based care coordination, quality accountability, and spending accountability.

We also believe that the CJR–X target price methodology is designed to remain responsive to changes in the population of beneficiaries receiving LEJR procedures in hospital settings. Because the baseline period rolls forward annually, target prices would reflect more recent episode spending and patient mix for beneficiaries receiving LEJR procedures in the inpatient hospital or hospital outpatient department setting. To the extent routine cases continue to shift to ASCs and hospitals treat a comparatively more acute or complex mix of beneficiaries, that changing case mix and associated spending would generally be reflected in future target prices. We believe this rolling baseline approach helps maintain alignment between target prices and current hospital LEJR practice patterns.

We will continue to monitor changes in joint replacement site of service, patient complexity, quality of care, beneficiary access, utilization, and episode spending under CJR–X. Monitoring and evaluation will help CMS assess whether the model is operating as intended across diverse hospital settings and whether future refinements may be appropriate to ensure that CJR–X remains responsive to evolving practice patterns and beneficiary needs.

Comment: Some commenters expressed concerns with CJR–X participant burden implementing the model. A commenter believed that CJR–X would create significant financial challenges and an unfunded workforce burden to manage 90-day episodes of care across a continuum that hospitals do not fully control. Another commenter stated that CJR–X Model introduces significant operational and financial uncertainty for academic medical centers. They stated the expansion increases both the scope and the accountability associated with bundled payments, including broader episode definitions, more aggressive cost benchmarks, and greater emphasis on post-acute care performance. While these goals align with care coordination efforts, they do not fully account for the clinical and social complexity of patients treated at institutions such as ours. Another commenter encouraged CMS to streamline requirements wherever possible.

Response: We disagree that CJR–X would result in unfunded workforce burden or result in greater burden for certain hospitals like academic medical centers. CJR–X does not require hospitals to hire additional staff. CJR–X holds hospitals accountable for LEJR episode quality and spending, but the model does not prescribe a specific staffing model or require CJR–X participants to create new positions to manage episodes. Hospitals retain flexibility to determine how best to organize care coordination, discharge planning, quality improvement, and post-acute care communication based on their existing resources, patient population, market conditions, and operational structure.

We also note that hospitals already have obligations under the Medicare hospital conditions of participation related to appropriate discharge planning, as described in 42 CFR 482.43. CJR–X builds on hospitals' existing role in planning for safe transitions from the hospital to the next care setting. CJR–X encourages hospitals to strengthen care coordination, communicate with treating clinicians and post-acute care providers, educate beneficiaries and caregivers, and support clinically appropriate transitions of care.

Further, CJR–X will not alter the way CJR–X participants bill Medicare. We believe that there will be no additional burden for CJR–X participants related to billing practices, even in cases where CMS waives certain policies for purposes of CJR–X (for example, the telehealth waivers discussed in section X.C.2j of this final rule). We do recognize the time and effort to establish financial arrangements, which may vary based on a CJR–X participant's experience and capabilities partnering with entities and setting up the terms and conditions of such partnerships. However, CJR–X participants are not required to engage in financial arrangements for the model. Additionally, we believe CJR–X will not be adding to quality measure reporting burden because we are using quality measures that CJR–X participants will already be reporting. However, we recognize there may be some CJR–X participants required to submit a financial arrangements list or clinician engagement list, as discussed in section X.C.2.i.(3) of this final rule, for which we've noted the associated estimate of burden in section I.G.12 of Appendix A of this final rule.

Lastly, we appreciate the commenter's recommendation that CMS streamline requirements wherever possible. We are committed to considering opportunities to reduce unnecessary administrative burden and improve operational clarity,

while maintaining the safeguards, beneficiary protections, and program accountability needed to implement and evaluate CJR–X effectively. We will continue to assess whether any requirements can be simplified, aligned with existing Medicare processes, or clarified through implementation guidance without undermining the goals of the model or the protections.

Comment: A commenter stated that CJR–X is at odds with the Rural Health Transformation Program (RHTP) because tertiary care facilities will be left with the difficult choice to divert post-surgical care away from CAHs or face financial performance penalties under the CJR–X.

Response: We agree that beneficiaries in rural communities should continue to have access to medically necessary, high-quality care, including post-surgical and post-acute care when clinically appropriate. We do not believe CJR–X discourages hospitals from referring beneficiaries to CAHs or other rural providers when those providers are clinically appropriate for the beneficiary's needs. CJR–X would not require a beneficiary to receive post-acute or follow-up care from any particular provider or facility, nor would it permit CJR–X participants to restrict beneficiary choice in a manner inconsistent with current Medicare requirements. CJR–X beneficiaries retain freedom of choice to receive care from Medicare-participating providers and suppliers, including rural providers, as applicable. Additionally, we note that CMS would use standardized payment amounts to calculate target prices and episode spending in CJR–X.

We also do not believe that CJR–X is at odds with efforts to support rural access to care. CJR–X is intended to improve care coordination, quality, and efficiency for LEJR episodes, including during the 90-day post-discharge period. For beneficiaries who return to rural communities after surgery, appropriate coordination with rural providers, including CAHs and other local providers, may be important to supporting recovery and avoiding unnecessary complications, emergency department visits, or readmissions. The model's incentives are intended to encourage clinically appropriate care coordination, not to divert care away from rural providers solely for financial reasons.

We also note that the SNF 3-day rule waiver, as discussed in section X.C.2.j.(4) of this final rule, is designed to support appropriate post-acute care access and care transitions. Under the waiver, CJR–X participants may discharge eligible beneficiaries to certain qualifying skilled nursing facilities or hospitals with swing bed arrangements, including Critical Access Hospitals, without a prior 3-day inpatient hospital stay, provided the applicable waiver conditions are met. Including Critical Access Hospitals in this waiver helps support access to post-acute care for beneficiaries in rural communities by allowing clinically appropriate discharge options closer to where beneficiaries live.

We recognize that tertiary care facilities may care for beneficiaries who live in rural areas and may need to coordinate with rural hospitals, Critical Access Hospitals, post-acute care providers, and other providers after discharge. We expect CJR–X participants to consider beneficiary needs, clinical appropriateness, provider availability, and beneficiary preferences when planning post-surgical care. CJR–X does not eliminate or reduce existing discharge planning obligations, beneficiary protections, or Medicare coverage of medically necessary services.

CJR–X also includes policies intended to support hospitals that may face greater rural or resource-related challenges, including lower stop-loss limits for certain hospital categories, such as rural hospitals, Medicare dependent hospitals, sole community hospitals, and safety net hospitals, as applicable. CMS will monitor CJR–X for effects on beneficiary access, quality of care, utilization, post-acute care patterns, and potential unintended consequences, including whether the model affects access to care for beneficiaries in rural communities or referrals to rural providers. If monitoring, evaluation, or stakeholder feedback identifies access concerns, CMS may consider whether additional guidance, technical assistance, or future policy refinements are warranted.

Comment: A few commenters requested CMS monitor the impact of post-acute care availability for CJR–X participants and make appropriate design changes to mitigate the impact of post-acute care shortages.

Response: We do not expect CJR–X will result in adverse results such as decrease in availability of services or disruption of patient care. In contrast, CMS believes that CJR–X may have the opposite effects. The financial incentives in the model are designed to incentivize innovative care delivery methods that focus on improving care and reducing Medicare spending. We believe CJR–X may spur partnerships between CJR–X participants and post-acute care providers, such as skilled nursing facilities and home health agencies, to share financial risk and collaborate on care redesign strategies. We recognize that partnerships with post-acute care providers could be a crucial driver of episode spending and quality, given that many beneficiaries in CJR–X may receive post-acute care services after discharge from the hospital. We believe the opportunities to find savings in post-acute care could be a motivator for these partnerships to help address some of the challenges with vacancies and capacities. Evaluation findings suggest episode-based payment model participants tend to find efficiencies in the post-acute care space such as reducing the length of stay in institutional post-acute care.[585] Reductions in the length of stay may free up institutional post-acute care beds, thereby allowing beneficiaries to not remain in the acute care setting unnecessarily. We also believe that model incentives could be a catalyst to financially support additional staffing needs through the sharing of reconciliation payment amounts established by financial arrangements between the CJR–X participant and post-acute care provider. We emphasize the importance of beneficiary quality and access to care in CJR–X and we will monitor the impact of the model, as described in section X.C.2.m of this final rule.

We also acknowledge that post-acute care can vary across different communities, regions, and states and may take into consideration policies, waivers, or pricing methodology adjustments that may address these variances. We may take this into consideration in future notice and comment rulemaking.

Comment: A commenter recommended CMS develop safeguards to ensure that hospitals are not penalized for spending variation that is unrelated to the quality or efficiency of the care they provide.

Response: We recognize that episode spending may be affected by sources of variation that may not directly reflect the quality or efficiency of a hospital's care. CJR–X includes safeguards intended to address these concerns. The pricing methodology, as discussed in section X.C.2.f of this final rule, includes policies designed to improve predictability and account for variation across hospitals and beneficiary populations, including regional target pricing, risk adjustment, trend and normalization policies, and stop-loss

[585] Comprehensive Care for Joint Replacement Model—Seventh Annual Report: *https://www.cms.gov/priorities/innovation/data-and-reports/2025/cjr-py7-annual-report.*

limits that cap repayment responsibility. Regional target prices help mitigate the effect of individual hospital-level variability by basing prices on broader regional episode spending experience rather than solely on a hospital's own historical episode spending. The high-cost outlier cap also limits the extent to which unusually expensive episodes affect episode spending calculations, helping reduce the influence of extreme cases that may not reflect typical hospital performance. In addition, the retrospective trend factor is capped to limit the difference between the prospective trend factor used in preliminary target prices and the retrospective trend factor applied at reconciliation. This cap helps maintain predictability and reduces the extent to which target prices may shift based on performance-year spending trends that participants could not fully anticipate.

Comment: Some commenters encouraged CMS to explore broader accountability mechanisms that more appropriately distribute risk among all parties contributing to patient outcomes, including physicians, implant manufacturers, and post-acute care providers.

Response: We appreciate commenters' recommendation to consider broader accountability mechanisms that recognize the role of multiple parties in LEJR episode outcomes. While we agree that hospitals are not the sole contributors in episodic care, we maintain the belief that hospitals are the most appropriate entity to place accountability. Hospitals furnish the anchor hospitalization or anchor procedure, manage discharge planning, coordinate transitions of care, and are generally positioned to engage physicians, and post-acute care providers involved in post-discharge recovery.

We recognize that episode outcomes depend on collaboration across the care continuum. For that reason, CJR–X includes policies that allow CJR–X to enter into financial arrangements and care redesign relationships with certain entities, subject to applicable requirements and safeguards, as discussed in section X.C.2.i of this final rule. These arrangements can help align incentives among hospitals, physicians, post-acute care providers, and other entities that contribute to LEJR episode quality and spending, while maintaining hospital accountability as the central model participant.

We are not permitting CJR–X participants to establish financial arrangements with all entities, such as implant manufacturers at this time. Doing so would implicate additional program integrity and beneficiary protection considerations. However, we agree that stakeholder feedback on broader accountability structures may be useful for future model design, including approaches that consider how best to align incentives among entities that contribute to patient outcomes.

Comment: Some commenters encouraged CMS to provide additional operational guidance, data-sharing support, implementation flexibility, and subregulatory compliance guidance prior to the model's start. CMS could consider providing additional technical assistance, implementation resources, and timely performance data to help providers adapt to CJR–X participation on a national scale. Another commenter recommended CMS consider providing additional technical assistance, implementation resources, and timely performance data to help providers adapt to CJR–X participation on a national scale.

Response: We value commenters' recommendations and we intend to provide learning and implementation support for CJR–X participants before the model begins. We anticipate engaging CJR–X participants before the model start date and sharing resources to help participants prepare for implementation. We also anticipate sharing technical specifications and data before the model begins, including information needed to understand model methodology, episode attribution, target prices, quality measures, reconciliation, and other operational requirements. Further, we will continue to make updated model resources publicly available, including the CJR–X Model-specific web page, frequently asked questions, fact sheets, and other implementation materials.

We welcome feedback on additional ways to educate and assist CJR–X participants and their care partners in care redesign, knowledge sharing, and model implementation.

Comment: Many commenters recommended that CJR–X emphasize patient-centered care. These comments included requests for individualized discharge planning, caregiver training services, appropriate post-acute care access, and monitoring of care patterns so that cost incentives do not override clinical needs. Other commenters requested CMS include specific providers in care decisions, such as occupational therapists during discharge planning, and acknowledging physiatrist's role in medically complex patients. A commenter encouraged CMS to take on a holistic view regarding the specific episode categories because bundled payment models run the risk of viewing a patient solely as their condition rather than through the whole person lens.

Response: We appreciate commenters' recommendations and agree that LEJR episode care should remain patient-centered, clinically appropriate, and responsive to each beneficiary's individual needs. CJR–X is intended to improve coordination, quality, and efficiency for LEJR episodes, but the model does not override clinical judgment, beneficiary choice, Medicare coverage rules, or the need for individualized care planning. We also note that CJR–X includes quality measures focused on patient experience and patient reported outcomes, as discussed in section X.C.2.e.(3) of this final rule.

Discharge planning and post-acute care decisions should be based on the beneficiary's medical condition, functional status, rehabilitation needs, home environment, caregiver availability, preferences, and other patient-specific circumstances. CJR–X does not require beneficiaries to receive post-acute care from any particular provider or facility, and beneficiaries retain freedom of choice to receive care from Medicare-participating providers and suppliers. Hospitals, treating clinicians, beneficiaries, and caregivers should work together to identify clinically appropriate care plans and post-acute care arrangements that support safe recovery.

We also recognize the important role of rehabilitation professionals, including occupational therapists, physical therapists, physiatrists, and other clinicians, in supporting recovery for LEJR beneficiaries. CJR–X does not prescribe a single discharge planning team or require that specific provider types participate in every care decision, because beneficiaries' needs vary and hospitals use different clinical staffing models. However, CMS expects CJR–X participants to involve appropriate clinical expertise, consistent with applicable Medicare requirements and the beneficiary's needs, when developing discharge plans, arranging rehabilitation services, coordinating post-acute care, and addressing medically complex cases.

We also agree that caregiver involvement and caregiver education can be important components of safe transitions and recovery after LEJR procedures. When caregivers are involved in a beneficiary's care, hospitals and other providers should consider the caregiver's role in supporting recovery, medication management, mobility, activities of daily living, transportation, follow-up

care, and the beneficiary's ability to safely remain in the intended care setting.

We agree that CJR–X beneficiaries should be treated holistically, not solely as episode categories. The CJR–X episode structure provides a framework for accountability for LEJR-related quality and spending, but it does not replace individualized clinical assessment or the need to consider comorbidities, functional limitations, social needs, caregiver support, and beneficiary preferences. We believe CJR–X can support whole-person care by encouraging hospitals to coordinate across settings and providers to support each beneficiary's recovery.

Comment: A commenter had concerns that CJR–X reconciliation and quality structure—among the only direct ways that physical therapists are discretely considered in the model—are skewed heavily toward large or multi-site outpatient physical therapy practices. They believe it is because the ability to evidence a practice's contribution to success is a prerequisite for gainsharing and it requires significant investment in both systems and personnel and simply is not realistic for most small or even mid-size practices.

Response: We recognize that physical therapists and other rehabilitation professionals play an important role in successful recovery for LEJR beneficiaries. We recognize that outpatient therapy practices vary in size, administrative capacity, data infrastructure, and ability to participate in formal care redesign or financial arrangements. CJR–X does not require outpatient physical therapy practices to participate in gainsharing or other financial arrangements, and it does not require CJR–X participants to enter into arrangements only with large or multi-site therapy practices. CJR–X participants retain flexibility to collaborate with providers and suppliers that support clinically appropriate, high-quality recovery for beneficiaries, including small and mid-size therapy practices, consistent with applicable model requirements and current law. We believe that safeguards for financial arrangements are necessary to ensure that any gainsharing payments or other distributions are tied to legitimate care redesign activities, quality improvement, or episode performance, and are not used in a manner that could compromise beneficiary choice, program integrity, or medically necessary care. These requirements are intended to protect beneficiaries and the Medicare program while permitting participant hospitals to align incentives with care partners that contribute to LEJR episode outcomes. Further, we do not believe that these safeguards are intended to favor large or multi-site outpatient therapy practices. Rather, they establish accountability requirements for any entity receiving financial distributions under the model. Hospitals may work with therapy practices of different sizes and structures, and beneficiaries retain freedom of choice to receive covered therapy services from Medicare-participating providers and suppliers. Decisions about rehabilitation services should remain based on clinical appropriateness, beneficiary needs and preferences, functional status, home environment, caregiver support, and provider availability.

Comment: Some commenters recommended that CJR–X include stronger mechanisms for physician and specialist engagement in episode management. A commenter recommended that CJR–X participant hospitals be required to establish a steering committee that includes physicians who perform joint replacement surgery at the hospital. Other commenters recommended that episodes triggered by surgical procedures be attributed to the operating surgeon, expressed concern about attribution conflicts across multiple CMS models, and stated that CJR–X may not hold surgeons equally accountable for episode costs even though surgeons influence patient selection, surgical care, and post-acute care decisions. A commenter recommended that CMS develop mechanisms to track and report specialist engagement in episode-based payment models so that specialist contributions to outcomes and resource use are reflected in performance measurement.

Response: We appreciate commenters' recommendations regarding physician and specialist engagement in CJR–X and agree they are critical partners in caring for CJR–X beneficiaries. Although physicians and other clinicians contribute to episode outcomes, we continue to believe that hospitals are best positioned to organize episode-level care coordination across the surgical setting, discharge transition, and recovery period. We strongly encourage CJR–X participants to engage surgeons and other relevant clinicians in episode management, care redesign, quality improvement, and post-acute care coordination. Hospitals may choose to establish physician-led or multidisciplinary committees, clinical workgroups, or other governance structures that support successful implementation of CJR–X. However, we do not believe in making specific organizational structures a CJR–X requirement. Hospitals vary in size, organizational structure, physician alignment, governance processes, and existing care redesign infrastructure. Requiring a uniform steering committee structure could create unnecessary administrative burden and may not reflect the most effective approach for every hospital.

We also do not believe that CJR–X episodes should be attributed to the operating surgeon rather than the participant hospital. CJR–X builds on the CJR Model's hospital-based episode accountability structure and changing that may jeopardize the ability for CJR–X expansion. We note that CJR–X includes financial arrangements that allow CJR–X participants to align incentives with certain collaborators, including physicians and physician group practices, subject to model requirements and safeguards. These arrangements can support physician engagement while maintaining hospital accountability as the central model participant. We believe this approach provides flexibility for hospitals to engage surgeons and other specialists without requiring a complex, multi-attribution model or a prescribed governance structure for all participants.

We will continue to consider whether data, monitoring, evaluation, or future model design can better capture the role of specialists in episode outcomes and resource use. However, we are not adding a separate specialist engagement reporting requirement at this time to avoid reporting burden. We will continue to consider ways of increasing specialist engagement in CJR–X.

Comment: A commenter recommended that CMS ensure CJR–X does not undermine statutory requirements for appropriate pain medication prescribing, which they said included statutory requirements for temporary separate payments for certain non-opioid treatment for pain relief under the OPPS and ASC payment system.

Response: We recognize that pain management is an important component of recovery following LEJR procedures. CJR–X is not intended to influence providers to avoid medically necessary or clinically appropriate pain management services or therapies. The model would not change Medicare coverage, eligibility, or benefits for beneficiaries, and it would not alter the ability of clinicians to prescribe or furnish pain management therapies that are medically appropriate for a beneficiary.

Further, CJR–X Model will not undermine statutory requirements under Section 4135 of Consolidated Appropriations Act (CAA), 2023 which amended section 1833(t)(16) and section 1833(i) of the Act, also known as the NO PAIN Act, because the temporary additional payments for certain non-opioid treatments for pain relief are authorized in hospital outpatient departments (HOPDs) and ambulatory surgical centers (ASCs)on or after January 1, 2025 and before January 1, 2028. The CJR–X Model has a start date of January 1, 2028 such that there would be no overlap.

We will continue to consider whether and how drugs, biologicals, devices, or other treatments subject to separate statutory payment requirements, may affect episode spending, prescribing behavior, and beneficiary access under CJR–X. CMS may consider these issues in future monitoring, evaluation, or rulemaking, as appropriate.

Comment: A commenter recommended that CMS include incentives to encourage adoption of evidence-based testing protocols, including rapid molecular testing for pathogens associated with surgical complications.

Response: We appreciate the recommendation and agree that clinically appropriate testing and diagnostic strategies may help identify beneficiary-specific risks, inform perioperative planning, support infection prevention efforts, and improve outcomes for some beneficiaries. However, we are not establishing a separate CJR–X incentive or requirement for any specific testing protocol or diagnostic technology at this time. Testing needs may vary based on beneficiary-specific risk factors, clinical presentation, local practice patterns, provider judgment, and applicable evidence-based guidelines, and we believe providers should retain clinical flexibility to determine when particular pre-surgical or perioperative testing is appropriate.

Comment: A commenter believes CJR–X will be a race to the bottom and CMS recognizing the ''ratchet effect'' is not akin to CMS fixing the ''ratchet effect,'' which refers to the idea that target prices will continually decrease over time as hospitals decrease their spending in response to the model.

Response: We recognize that if target prices are based only on a hospital's own historical performance, repeated use of improved performance to set future prices could create a ratchet effect by continually lowering benchmarks for hospitals that reduce spending. We believe the CJR–X target price methodology helps mitigate, though not eliminate, this concern by using regional prices rather than relying solely on a participant hospital's own historical spending. Regional pricing assesses episode spending across a broader group of hospitals within the applicable region, rather than basing each hospital's target price only on its own prior performance. This approach helps reduce the extent to which an individual hospital's own care redesign success or spending reductions are immediately incorporated into that same hospital's future target prices. We believe this broader regional benchmark promotes more stable and comparable pricing while maintaining incentives for hospitals to improve LEJR episode efficiency and quality.

We also note that CJR–X includes additional pricing and reconciliation safeguards intended to improve predictability and reduce the effect of unusual spending variation. These include trend and normalization policies, high-cost outlier caps, quality-based reconciliation, and stop-loss limits that cap repayment responsibility. The retrospective trend factor cap limits the difference between the prospective trend factor used in preliminary target prices and the retrospective trend factor applied at reconciliation, which helps reduce the extent to which target prices shift based on performance-year spending trends that participants could not fully anticipate.

We will continue to monitor CJR–X participant performance in relation to spending trends and assess whether the target price methodology creates realistic opportunities for hospitals to achieve savings while providing high-quality beneficiary care.

Comment: A commenter was concerned that the CJR–X Model continues to be built on the FFS framework, with providers largely continuing to bill Medicare on a FFS basis followed by an annual retrospective reconciliation some months after the conclusion of the performance year. This structure creates significant lags between when care is delivered and when performance is recognized. We encourage CMS to explore mechanisms that more closely tie value into the initial payment structure.

Response: We are considering ways to move away from relying solely on a fee-for-service framework and the traditional approach of retrospective reconciliation, including approaches that could bring financial incentives closer to the time care is delivered or closer to when a CJR–X participant receives payment. We agree that payment approaches that more directly incorporate value into the initial payment structure may, in some circumstances, strengthen incentives for timely care redesign, quality improvement, and episode management.

At the same time, the CJR–X reconciliation methodology builds on the tested CJR Model structure and provides a clear framework for assessing LEJR episode spending and quality across the 90-day episode. Retrospective reconciliation allows CMS to account for actual episode spending and quality performance after the episode and performance year are complete. We believe this approach remains appropriate for CJR–X while CMS continues to evaluate potential future approaches to value-based payment.

Comment: A commenter recommended that CMS should consider how technologies that improve visibility into patient condition, support care coordination, and assist with earlier clinical intervention may contribute to reduced complications, lower readmissions, and improved episode performance across the continuum of care. They also stated that CMS should also ensure that payment and quality policies appropriately support technologies that facilitate safe discharge planning, care coordination, and transitions across care settings.

Response: We are not requiring or endorsing any specific technology, vendor, platform, or tool under CJR–X. Hospitals vary in their resources, workflows, patient populations, care partners, and local market conditions, and we believe CJR–X participants should retain flexibility to determine which technologies or operational tools best support their care redesign activities and beneficiary needs. A technology-neutral approach allows hospitals to adopt or continue using tools that are appropriate for their circumstances without creating a uniform technology mandate or disadvantaging participants that use different approaches. However, we support the use of technology to help CJR–X participants improve care for beneficiaries. For example, tools that help identify changes in patient condition, facilitate timely follow-up, support care teams in coordinating with post-acute care providers, or help beneficiaries understand recovery instructions may contribute to improved episode performance when used appropriately.

Comment: A comment stated that they believe that target-price models that lack sufficient guardrails inappropriately incentivize hospitals to make discharge decisions based on short-term cost

concerns—rather than patients' individual clinical needs, functional recovery, and long-term outcomes.

Response: We agree that care redesign under CJR–X must not result in stinting on medically necessary care, inappropriate steering, or discharge decisions that are inconsistent with a beneficiary's clinical circumstances. CJR–X is designed to align financial incentives with high-quality, clinically appropriate care, rather than reductions in utilization alone. Under CJR–X, participants would not be rewarded for reducing spending alone. The payment methodology incorporates quality performance into reconciliation through the composite quality score, as discussed in section X.C.2.f.(5)(e) of this final rule, which would affect the CJR–X participant's financial performance under the model. For example, poor quality performance would result in a CJR–X participant not being eligible for a reduced discount factor or a reconciliation payment, while stronger quality performance could allow a CJR–X participant to receive more favorable reconciliation outcome. As a result, CJR–X participants would have a financial incentive to make discharge planning and post-acute care decisions that support quality of care, functional recovery, and beneficiary-specific clinical needs.

In addition, poor quality care may lead to avoidable spending during the episode, including spending associated with complications, hospital visits, readmissions, or other additional services. Those avoidable costs would increase episode spending and could adversely affect a CJR–X participant's reconciliation performance under CJR–X. Accordingly, the model's financial incentives are designed to encourage CJR–X participants to coordinate care, support appropriate recovery, and avoid preventable complications, rather than to make discharge decisions based solely on short-term reductions in post-acute care use.

We will monitor CJR–X implementation, including whether changes in discharge patterns or post-acute care use raise concerns about beneficiary access, safety, quality, or outcomes.

Comment: A commenter suggested for CMS to move beyond approaches that focus solely on discrete episodes of care and consider incorporating population health strategies aimed at reducing inequities in access to appropriate and timely services.

Response: We appreciate the commenter's recommendation. While CJR–X focuses on LEJR episodes, which represent high-volume procedures with significant opportunities to improve care coordination and reduce Medicare spending while maintaining quality, the model is intended to complement broader population-based care initiatives rather than operate independently. As discussed in section X.C.2.h of this final rule, CJR–X would permit beneficiary and provider overlap with certain population-based models and would allow savings generated under both models to be retained by the respective participants. We believe this approach supports coordinated care by allowing CJR–X participants to focus on improving the quality, coordination, and efficiency of care surrounding the LEJR episode while enabling beneficiaries who are aligned to an ACO or other total cost of care model to transition to ongoing, longitudinal care beyond the episode. We believe this will promote collaboration across complementary value-based payment models while avoiding unnecessary complexity and preserving the integrity of each model.

Comment: A commenter was concerned that the ''target rates'' for CJR–X participants hospitals assume a level of access to a range of services that does not always exist. They believe it would unfairly penalize the hospital performing the procedure but could also prevent patients from receiving care in the most appropriate and often cost-effective available clinical setting within the episode of care

Response: We disagree that the CJR–X target pricing methodology assumes that every hospital has the same access to the same range of services or is intended to penalize hospitals for factors outside their control. We believe the CJR–X target pricing methodology helps account for regional variation in care patterns and beneficiary characteristics. As described in section X.C.2.f of this final rule, CJR–X target prices are based on regional episode spending for the applicable MS–DRG or HCPCS episode type, rather than a single national price. To the extent hospitals in a region have different patterns of access to post-acute care or other episode services, those regional spending patterns would be reflected in the regional data used to construct target prices. CJR–X target prices also incorporate beneficiary-level risk adjustment, including factors related to age, CJR HCC count, and dual eligibility, so that episodes involving older, more medically complex, or socioeconomically disadvantaged beneficiaries may receive corresponding adjustments to the target price.

2. Provisions of the Proposed Comprehensive Care for Joint Replacement Expanded (CJR–X) Model

a. Scope of Proposed Model

We proposed that CJR–X would begin on October 1, 2027. Under this proposal, CJR–X performance years would align with fiscal years (FYs). In contrast, the CJR Model aligned with calendar years (CYs). While we considered proposing a January 1, 2028 start date to align with CY and be consistent with the CJR Model, we stated our belief that changing to FY is more appropriate given that the IPPS is aligned to an FY cycle, and we anticipate potential future policy changes to CJR–X would be proposed in the IPPS rulemaking cycle. Therefore, we proposed that the first PY of CJR–X would run from October 1, 2027 through September 30, 2028, and the proceeding performance years would follow the same cadence.

We also considered a later start date to allow additional time for CJR–X participants to prepare for the model. However, we believe it beneficial to limit the amount of time between the final CJR Model PY and the continuation of the model test as CJR–X. In addition, the proposed start date provides more lead time for participants than the CJR Model did when finalized in November 2015. Despite the CJR Model beginning when hospitals had less experience with episode-based payment models, participants were able to successfully implement the model for the first performance year in April 2016. With the October 1, 2027 start date, hospitals would have more than 1 year to prepare for CJR–X participation. We also anticipate that many hospitals will have prior experience with LEJR episodes given that the Innovation Center has tested episode-based payment models for over a decade and Medicare Advantage organizations and commercial insurers often include episode-based contracts for high-volume procedures.

The CJR Model was a mandatory model for acute care hospitals within certain selected MSAs. However, for CJR–X, we proposed that all eligible acute care hospitals nationwide would be required to participate, as described in section X.C.1.b. of this final rule. As we stated in section X.C.1.c. of this final rule, the CJR Model has met the requirements for expansion as a nationwide model by reducing spending and maintaining quality of care among mandatory hospitals, and the CMS Chief Actuary has certified its nationwide expansion as a mandatory model.

We sought comment on our proposal at § 512.605 to define ''performance

year'' as aligning with FYs and our proposal at § 512.630(a) to begin the model on October 1, 2027. We also sought comment on alternative start dates.

The following is a summary of the public comments received on our performance year and model start date proposals, and our responses to these comments:

Comment: Numerous commenters recommended that CMS delay the proposed October 1, 2027 CJR–X start date. Commenters stated that the proposed timeline would not provide enough lead time for hospitals to prepare for mandatory nationwide participation and two-sided financial accountability. Commenters cited the need to build analytics infrastructure, hire or train care management staff, engage physicians, develop post-acute partnerships, and understand model methodology. Some commenters recommended that CMS delay implementation of CJR–X altogether. Commenters stated that CMS should address stakeholder concerns, methodological questions, or operational issues before the model begins. Commenters believed that additional time would allow hospitals and partners to prepare for workflow, data, and care coordination changes. Some commenters recommended that implementation not proceed until key issues are resolved. A commenter cited other CMS models that allowed more time for hospitals to prepare for mandated implementation, including the two years to prepare for mandated for Inpatient Quality Reporting (IQR) of Patient- Reported Outcomes (PRO) and three years to prepare for mandated Outpatient Quality Reporting (OQR) PRO. A few commenters urged CMS to hold off on implementing a potential expanded CJR model at least until after the initial performance years for TEAM have been completed or postponing implementation of the CJR–X until several key design elements can be verified through TEAM. Another commenter stated that CMS has not afforded TEAM the ability to illustrate results prior to mandating CJR–X.

Response: We appreciate the commenters' recommendations regarding the timing of CJR–X implementation. We recognize that mandatory participation in a nationwide episode-based payment model requires substantial preparation and that hospitals may need time to develop operational, clinical, financial, and data infrastructure to support successful participation.

After considering the public comments, we are persuaded that CJR–X participants would benefit from additional implementation time before the start of mandatory participation in CJR–X. Commenters described the operational work necessary to prepare for model participation, including developing care management capabilities, enhancing data and analytics infrastructure, engaging physicians and post-acute care providers, and establishing episode management processes. We agree that additional preparation time will support participant readiness and facilitate more effective implementation of the model.

At the same time, we continue to believe that lower extremity joint replacement is an appropriate area for model expansion given the extensive experience generated through prior episode-based payment initiatives. Accordingly, rather than delaying the Phase II model indefinitely, we believe a targeted three-month implementation delay appropriately balances commenters' readiness concerns with the benefits of continuing care transformation efforts in this clinical area.

Therefore, we are finalizing at § 512.630(a) to begin the Phase II model on January 1, 2028 rather than the proposed October 1, 2027 start date. We are also finalizing at § 512.605 that performance years will be based on the calendar year rather than the fiscal year. We believe these modifications provide CJR–X participants with meaningful additional time to prepare while creating a more predictable framework for annual planning, budgeting, performance monitoring, and operational implementation.

The revised implementation timeline will allow hospitals and their partners additional time to strengthen governance and accountability structures, assess reporting capabilities, and implement operational changes necessary to support successful participation. We believe this additional preparation period will be particularly valuable for organizations with less experience in episode-based payment models or those continuing to build care coordination and episode management infrastructure.

However, we do not believe that delaying implementation beyond January 1, 2028 or postponing CJR–X until all stakeholder concerns are resolved is necessary. We believe approximately 17 months between publication of the final rule and the January 1, 2028 model start date provides participants sufficient time to prepare for model implementation. During this period, CMS will produce resources to support CJR–X understand model requirements and methodologies and CJR–X participants will have the opportunity to review baseline performance data and establish care redesign processes. In addition, lower extremity joint replacement is among the most common and clinically standardized procedures in Medicare and has been the focus of extensive care redesign efforts through the CJR Model, BPCI Advanced, Medicare Advantage arrangements, and commercial bundled payment initiatives. As a result, many hospitals, physicians, and post-acute care providers have already developed experience with care coordination, discharge planning, utilization management, and episode-based approaches that are directly relevant to CJR–X.

We recognize that CMS has provided longer implementation periods for other certain quality reporting initiatives, including requirements related to patient-reported outcome measures. However, we do not believe those initiatives are directly comparable to CJR–X. The implementation activities associated with establishing new patient-reported outcome reporting requirements differ from those associated with an episode-based payment model focused on lower extremity joint replacement. While PRO reporting initiatives often require the development of new data collection processes, survey administration workflows, vendor relationships, and reporting infrastructure, CJR–X builds upon a clinical episode that has been the subject of extensive care redesign and episode-based payment efforts for many years.

Lastly, we do not believe it is necessary to delay CJR–X implementation pending further experience with TEAM. TEAM is a separate episode-based payment model that will have two full years of testing prior to CJR–X and three full years where both models are tested simultaneously. We believe this provides a unique opportunity to test TEAM in different scenarios while generating evidence to compare a 30-day episode to a 90-day episode. Additionally, CJR–X is being implemented as an expansion of the Comprehensive Care for Joint Replacement (CJR) Model under section 1115A(c) of the Act. As a result, CJR–X is grounded primarily in the experience, evaluation findings, and tested design elements of the CJR Model rather than in future findings from TEAM. We believe the evidence supporting expansion of the CJR Model provides a sufficient basis for moving forward with CJR–X without waiting for

additional years of experience under TEAM. We also note that the CJR–X implementation timeline provides a meaningful opportunity for CMS to gain operational experience from TEAM before CJR–X begins. TEAM began on January 1, 2026, and CJR–X will begin on January 1, 2028, providing TEAM two full years of implementation before CJR–X begins.

Comment: Some commenters recommended that CMS align CJR–X performance and reporting periods with the calendar year. Commenters stated that calendar-year alignment would simplify data management, abstraction workflows, validation processes, cross-program analytics, resource allocation, and budgeting. Commenters noted that overlapping or conflicting timelines across programs increase the risk of data errors and administrative burden. Some commenters also cited alignment with the Outpatient Prospective Payment System (OPPS), TEAM performance years, and other reporting programs. A few commenters recommended standardized calendar-year periods wherever feasible.

Response: After considering the public comments, we agree that aligning CJR–X performance years with the calendar year will simplify model administration and CJR–X participant operations. Therefore, in conjunction with finalizing a January 1, 2028 model start date rather than the proposed October 1, 2027 start date, we are also finalizing at § 512.605 to define ''performance year'' that align with the calendar year rather than the fiscal year. Under this approach, each performance year will run from January 1 through December 31.

We believe calendar-year performance periods will provide several advantages for CJR–X participants. Aligning performance years with a single annual reporting cycle may simplify financial forecasting, performance monitoring, and operational planning activities. We also believe calendar-year performance periods create a more intuitive framework for CJR–X participants to monitor episode performance and evaluate year-over-year trends. In addition, as a growing share of lower extremity joint replacement procedures are furnished in outpatient settings, calendar-year alignment may simplify CJR–X participants' efforts to monitor performance across inpatient and outpatient episodes within a single calendar year performance year.

We also note that calendar-year alignment will better align CJR–X with TEAM performance years and certain other CMS reporting and payment initiatives. While we recognize that complete alignment across all CMS programs and initiatives is not always possible given differing statutory, regulatory, and operational requirements, we agree that reducing unnecessary differences in performance periods where feasible may help reduce administrative burden and improve operational efficiency for participants. Further, consistent performance periods across initiatives may support the sharing of operational lessons learned across episode-based payment initiatives. Common performance periods may also improve the comparability of operational and performance information across episode-based payment initiatives and facilitate the identification of successful care redesign strategies.

Finally, we believe the combination of a January 1, 2028 start date and calendar-year performance years provides participants with a clearer and more predictable implementation timeline while supporting participant readiness. Together, these modifications provide additional preparation time before model accountability begins and establish a performance year structure that is easier for participants to administer and integrate into existing planning and reporting processes.

Comment: Numerous commenters recommended that CMS make the first CJR–X performance year upside-only or waive downside risk during the first year. Commenters stated that PY1 upside-only risk would allow hospitals to gain experience with target prices, data, episode management, post-acute coordination, and reconciliation methods before being subject to repayment obligations. Commenters compared this approach to prior episode-based models and stated that it would be especially important for hospitals without prior bundled payment experience. They believed that a one-year transition would reduce immediate financial strain while preserving incentives to identify savings opportunities and improve care processes.

Response: We recognize the commenters' concerns regarding participant readiness, particularly for hospitals without prior experience in bundled payment models, and we agree that participants need sufficient time to understand all the requirements and methodologies associated with model participation. However, we do not believe that an upside-only first performance year is necessary or appropriate for CJR–X. As a result of public comments regarding implementation readiness, we are finalizing a January 1, 2028 model start date rather than the proposed October 1, 2027 start date and are aligning performance years with the calendar year. We believe this additional three-months, resulting in a 17-month implementation period, provides CJR–X participants meaningful additional time to prepare for model participation, establish governance structures, engage physicians and post-acute care providers, develop care management workflows, evaluate historical performance, and implement operational processes necessary to manage episodes effectively before financial accountability begins.

We also note that lower extremity joint replacement is among the most common and well-established episode categories in Medicare and has been the focus of episode-based payment initiatives for nearly a decade. During that time, hospitals, physicians, post-acute care providers, and other stakeholders have gained substantial experience with episode management, care coordination, discharge planning, post-acute care optimization, and performance monitoring related to LEJR episodes. Further, CJR Model evaluation data has demonstrated that non-participating hospitals also reduced LEJR episode spending over the years and suggests market-wide adoption of care efficiency practices.[586] We believe the widespread attention given to LEJR episodes through the CJR Model and similar initiatives has contributed to the development of standardized care pathways, established best practices, and operational capabilities that are broadly available across the health care system, including among organizations that did not directly participate in prior bundled payment models.

We further believe that downside risk plays an important role in encouraging CJR–X participants to establish care redesign processes, monitor utilization, and coordinate care across providers and settings from the outset of model participation. While upside-only risk participation may reduce financial exposure during the first year, it may also reduce incentives for CJR–X participants to implement operational changes necessary to improve efficiency and manage episode spending. We believe CJR–X participants are best positioned to begin developing these capabilities prior to the start of the model, particularly given the additional implementation time provided through January 1, 2028.

[586] Comprehensive Care for Joint Replacement Model—Fifth Annual Report: *https://www.cms.gov/priorities/innovation/data-and-reports/2023/cjr-py5-annual-report.*

Comment: A commenter recommended that CMS coordinate CJR–X implementation with FY 2027 IPPS MS–DRG restructuring. The commenter stated that target prices and baseline episode definitions should be stable, transparent, and not subject to disruptive midcourse changes. The commenter believed that beginning CJR–X before hospitals understand the effects of coding and grouping changes could undermine pricing predictability and participant planning. The commenter requested that CMS time implementation to avoid instability in episode definitions, baseline construction, and target-price calculations.

Response: We note that CMS routinely updates Medicare payment policies through an annual rulemaking process, including changes to MS–DRG classifications, relative weights, coding policies, grouper logic, HCPCS codes, and other payment system parameters. These annual updates are a longstanding feature of the Medicare payment environment and are intended to ensure that payment methodologies appropriately reflect current clinical practice, coding, resource use, and health care delivery. As a result, hospitals regularly adapt to these updates as part of their normal operational and financial planning activities.

We further note that CJR–X is designed with the expectation that annual payment system updates will continue to occur throughout the model. For this reason, we are finalizing our proposed policy, as discussed in section X.C.2.f.(5)(d), under which reconciliation target price construction will account for applicable MS–DRG and HCPCS coding changes so that target prices reflect the most current payment methodologies and rates available. We believe incorporating these updates into target price construction improves pricing accuracy and helps ensure that reconciliation target prices remain reflective of current episode spending patterns rather than historical payment structures that may no longer align with current Medicare payment policy.

In addition, in response to public comments regarding participant readiness, we are finalizing a January 1, 2028 start date for CJR–X rather than the proposed October 1, 2027 start date and are aligning performance years with the calendar year. We believe this additional implementation period provides participants with additional time to understand and operationalize any finalized FY 2027 IPPS payment policy changes before the start of model accountability. The revised implementation timeline also provides participants with additional time to evaluate baseline performance, assess operational impacts, and prepare internal systems and processes for participation in CJR–X.

Comment: Some commenters stated that CMS did not identify a fixed end date for CJR–X. Commenters expressed concern that hospitals could remain subject to mandatory financial accountability indefinitely, including hospitals that perform poorly or face persistent structural challenges. Commenters stated that the absence of a defined endpoint or formal evaluation milestone could reduce transparency and predictability. Some commenters recommended that CMS implement CJR–X as a time-limited demonstration or establish clear milestones for continued operation, modification, or termination. Commenters requested greater clarity regarding the duration of CJR–X and how CMS would assess ongoing model performance. A commenter stated that CMS has not included an end date for the CJR–X Model and this would mean a poorly performing hospital could lose reimbursement on every eligible LEJR patient in perpetuity, especially since CMS has not included a floor after which penalties stop. Another commenter believed that Innovation Center authority is limited to models of defined duration, and the proposal to implement CJR–X without any end date and with only the prospect of unilateral termination is unlawful. They believed all models under section 1115A(b) and (c) must have a defined duration (that is, a completion date).

Response: CJR–X is a national expansion of the CJR Model under section 1115A(c) of the Act, rather than a new time-limited Phase I model test. As discussed in section X.C.1.c of this final rule, section 1115A(c) authorizes the Secretary, through rulemaking, to expand the duration and scope of a model, including nationwide implementation, when the statutory expansion criteria are met.

We disagree with the commenters' views that section 1115A requires every model to have a fixed completion date. We also disagree that CJR–X would be unlawful because it would not include a fixed end date. The absence of a fixed completion date does not mean CJR–X would operate without accountability or without a mechanism for modification or termination. Rather, CJR–X would be subject to the standard provisions, including monitoring and evaluation, as discussed in section X.C.2.m of this final rule. CMS will continue to assess whether expanded implementation is reducing Medicare spending without reducing quality of care or improving quality without increasing spending.

We recognize commenters' concerns regarding transparency, predictability, and the possibility that hospitals could remain subject to mandatory financial accountability for an extended period. We believe CJR–X provides transparency through the policies established in regulation and continued monitoring and evaluation.

We disagree with the commenter's statement that CJR–X would allow hospitals to lose reimbursement on every eligible LEJR patient without a floor. Under the reconciliation methodology, CJR–X would include stop-loss and stop-gain limits on the total amount a CJR–X participant could owe CMS as a repayment or receive from CMS as a reconciliation payment, as discussed in section X.C.2.f.(5)(g). These limits ensure that CJR–X participants would not be subject to an unmanageable level of risk and would not be incentivized to stint on care to achieve savings. Most CJR–X participants will be subject to a 20 percent stop-loss and stop-gain limit; however, safety net hospitals, rural hospitals, Medicare-dependent, small rural hospitals, and sole community hospitals are subject to a 5 percent stop-loss.

Comment: A couple of commenters recommended alignment of CJR–X performance years with TEAM performance years to ensure hospitals currently in TEAM would have an immediate transition to CJR–X upon the conclusion of TEAM, rather than a 9-month holding period to transition to CJR–X on October 1, 2031.

Response: We agree that aligning CJR–X performance years with calendar years would better support continuity for hospitals transitioning from TEAM to CJR–X. We also agree that such a gap could create unnecessary operational discontinuity for hospitals that have already been managing LEJR episodes under TEAM. While a seamless transition was not a driving factor, we are finalizing our proposal with modification such that the CJR–X performance year aligns with calendar years, which would permit TEAM participants that become CJR–X participants after TEAM ends to begin CJR–X participation on January 1, 2031.

After consideration of the public comments, we are finalizing with modification the proposals at § 512.605 to define ''performance year'' to mean a calendar year, the ''model start date'' to mean January 1, 2028. We are also finalizing with modification our

proposal at § 512.630(a) to begin the model on January 1, 2028.

b. Participants

(1) Background

The CJR Model incentivized coordination between hospitals, clinicians, and post-acute care providers (that is, home health agencies (HHAs), skilled nursing facilities (SNFs), inpatient rehabilitation facilities (IRFs), and long-term care hospitals (LTCHs), as defined at section 1899B(a)(2) of the Act) to improve outcomes and reduce spending for beneficiaries undergoing an LEJR procedure. The model required participation by most acute care hospitals in selected geographical areas, unless they met certain exceptions. Based on the CJR Model evaluations, participant hospitals were able to decrease spending while maintaining quality. Therefore, we believe expanding the CJR Model nationally to all eligible hospitals will increase its impact.

(2) CJR–X Participant Definition

Consistent with the CJR Model, we proposed that hospitals would be the model participants in CJR–X. Because it is the hospital that furnishes the surgical procedure, we believe it is most straightforward and appropriate for the hospital to be the model participant. Hospital staff already manage discharge needs and placement recommendations as part of post-procedural or post-discharge care for beneficiaries. In addition, hospitals are more likely than other providers or suppliers to have access to the resources to appropriately manage and coordinate care throughout the episode and have an adequate volume of episodes to warrant investment in more robust care coordination. For the purposes of CJR–X, the term ''hospital'' means a hospital as defined in section 1886(d)(1)(B) of the Act, which includes only acute care hospitals and excludes certain specialty hospitals, such as psychiatric and cancer hospitals. Although the CJR Model was confined to certain geographic areas, we proposed at § 512.610(a) that CJR–X participation would be mandatory for all acute care hospitals nationwide, provided they meet the ''CJR–X participant'' definition.

We proposed to define a ''CJR–X participant'' as an acute care hospital located in any of the 50 United States, District of Columbia, or U.S. Territories that initiates LEJR episodes and is paid under both the IPPS and OPPS, unless it meets an exception described in section X.C.2.b.(2)(a) of this final rule. We believe that only including acute care hospitals that bill for services under both the IPPS and OPPS is necessary to avoid potential challenges related to constructing target prices for episodes that initiate in either the inpatient or outpatient department of a hospital but are not paid under the IPPS or OPPS, respectively. Specifically, this policy would exclude Indian Health Service (IHS) and Tribal hospitals from CJR–X participation as they are paid under the IPPS but not the OPPS, as described in § 419.20 of this chapter. Similarly, hospitals participating in the Rural Community Hospital Demonstration, Critical Access Hospitals, and Rural Emergency Hospitals would also be excepted because they are not paid under IPPS.

Further, we proposed at § 512.610(a)(2) that CJR–X participants will remain CJR–X participants, unless they no longer meet the definition of CJR–X participant, CMS terminates CJR–X, or the CJR–X participant receives notice of termination from CJR–X in accordance with § 512.165.

We considered but did not propose including Ambulatory Surgery Centers (ASCs) as CJR–X participants. Including ASCs would present a significant departure from the CJR Model test.

We sought comment on our proposal at § 512.605 to define ''hospital'' as defined in section 1886(d)(1)(B) of the Act and ''CJR–X participant'' as a hospital located in any of the 50 States, District of Columbia, or U.S. Territories that initiates LEJR episodes and is paid under both the IPPS and OPPS. We also sought comment on our proposals at § 512.610(a) that CJR–X participation would be mandatory for all eligible acute care hospitals nationwide and that CJR–X participants will remain CJR–X participants, unless they no longer meet the definition of CJR–X participant, CMS terminates CJR–X, or the CJR–X participant receives notice of termination from CJR–X in accordance with § 512.165.

The following is a summary of the public comments received.

Comment: A commenter supported the proposal to define ''hospital'' for purposes of CJR–X by reference to section 1886(d)(1)(B) of the Act, which excludes certain specialty hospitals, such as psychiatric and cancer hospitals.

Response: We appreciate the commenter's support for excluding specialty hospitals.

Comment: Some commenters supported CMS' proposed ''CJR–X participant'' definition and the exclusion of Critical Access Hospitals and other acute care hospitals that do not bill for services under both the IPPS and OPPS. Commenters generally agreed that these exclusions were appropriate for CJR–X participant eligibility. A commenter stated that CJR–X may incentivize hospitals to better coordinate with post-acute care providers.

Response: We appreciate the commenters' support of our proposal to exclude certain hospitals from the ''CJR–X participant'' definition and related exclusions. As previously discussed in this section of the final rule, we proposed that a CJR–X participant must be paid under both the IPPS and OPPS. This policy is to account for the inclusion of both inpatient and outpatient episodes and the challenges that including hospitals not paid under both payment systems would create in constructing target prices. This approach will exclude, among others, IHS and Tribal hospitals paid under IPPS but not OPPS, hospitals participating in the Rural Community Hospital Demonstration, Critical Access Hospitals, and Rural Emergency Hospitals that are not paid under IPPS. We maintain that these exclusions will provide a workable and consistent pricing methodology for inpatient and outpatient LEJR episodes. We note that to be a CJR–X participant, we proposed that a hospital must be paid under both the IPPS and OPPS. That is, a hospital must not be excluded from either of those payment systems. Hospitals are not required to receive payment through both payment systems in a given performance year to be a CJR–X participant. Therefore, to be more precise, we are updating the wording of the ''CJR–X participant'' definition to reflect IPPS and OPPS payment eligibility rather than actual payment.

Comment: Some commenters recommended that CMS permit physician group practices (PGPs), physician-owned hospitals (POHs), and others that have participated in bundled payment models and other APMs to manage or initiate episodes in CJR–X, as convening or collaborative participants. A few commenters stated that orthopedic PGPs are a natural fit for CJR–X because of their experience in bundled payment models and their role in clinical decision-making for LEJR procedures. A commenter stated that, specifically for hip and knee replacements, orthopedic PGPs generated savings for Medicare and quality improvements for patients. They recommended that CMS give operating surgeons and physician groups the ability to oversee the bundle, including collecting payments and accepting two-sided risk across the spectrum of care.

Commenters stated that PGPs and POHs have demonstrated success in BPCI, BPCI Advanced, and CJR by improving outcomes, increasing care efficiency, and reducing Medicare costs. Another commenter stated that more must be done to recognize and favor the physician's role as the individual responsible for clinical care.

Response: We appreciate commenters' recommendations to include physicians and physician-led organizations in CJR–X. We recognize that physicians, including orthopedic surgeons, play an important role in clinical care, selection of surgical setting, beneficiary engagement, and episode performance. We also acknowledge the contribution of PGPs in BPCI Advanced and other voluntary models and do not doubt that many PGPs would be equally successful participants in CJR–X. We recognize that many PGPs would have the necessary infrastructure and episode volume to drive care redesign activities and coordinate care throughout the 90-day episode. However, as previously stated in this section of the final rule, CMS proposed to define a CJR–X participant as an acute care hospital that is paid under both the IPPS and OPPS to avoid challenges related to constructing target prices for episodes that initiate in either the inpatient or outpatient setting. Because physicians are paid under the Physician Fee Schedule, target price construction would be subject to additional challenges.

Finally, commenters recommended including PGPs as voluntary participants, although CJR–X is being finalized as a mandatory model. However, we did not propose to make PGPs model participants or episode initiators. Nevertheless, physicians, PGPs, and other providers and suppliers may participate through CJR–X collaborator arrangements, including sharing arrangements and distribution arrangements, subject to model requirements and applicable fraud and abuse safeguards, as described in section X.C.2.i. of this final rule.

Comment: A few commenters urged CMS to allow ASCs to be voluntary participants, as they are optimized for elective total joint replacements. They stated surgeons are able to shift appropriate procedures to these lower-cost settings, while maintaining or improving quality outcomes. Other commenters disagreed stating that including ASCs would enable surgeons who own ASCs to draw preferred patients away from hospitals, leaving only the more challenging and costly patients to receive hospital treatment.

Response: We thank commenters for these suggestions. We considered but did not propose including ASCs as participants in the CJR–X Model. However, we do recognize that the role of ASCs in episode-based payment models continues to evolve. Accordingly, we issued a request for information regarding the potential inclusion of ASCs in TEAM in section X.A.2.d. of the proposed rule. Information received through that request, together with evidence generated through TEAM implementation and subsequent evaluation reports, may provide additional insight into the feasibility and implications of including ASCs as accountable participants in episode-based payment models.

Comment: Many commenters supported mandatory participation for eligible acute care hospitals in CJR–X. Commenters stated that a mandatory model could reduce selection bias and produce more reliable evidence than a voluntary model. They suggested that mandatory participation could broaden accountability for LEJR episodes, support care coordination, and advance value-based care. Some commenters viewed mandatory participation as an opportunity to create a stronger glidepath toward accountable care and specialist accountability.

Response: We appreciate commenters' support for mandatory participation for eligible acute care hospitals in CJR–X. We agree that mandatory participation is an important feature of CJR–X because it will broaden accountability for LEJR episodes and support a more robust assessment of the model's impact across eligible acute care hospitals. Accordingly, CJR–X participation will be mandatory for acute care hospitals that meet the CJR–X participant definition, subject to the proposed participant exceptions, including TEAM participants and Maryland hospitals.

Comment: Many commenters did not support mandatory participation and recommended that CMS make CJR–X voluntary. Commenters stated that a mandatory model would impose substantial administrative, operational, and compliance costs on hospitals. A commenter also raised concerns about data analysis, care redesign, and financial risk management costs related to model implementation. Many commenters suggested that hospitals differ significantly in size, resources, infrastructure, local markets, patient populations, and post-acute care access, and that a mandatory nationwide model may not account for those differences. Some commenters stated that hospitals with limited prior bundled payment experience may need time to build infrastructure and partnerships before assuming downside risk.

Other commenters recommended opt-in participation, broader exemptions, or hospital discretion to determine whether the model is feasible for their communities. Many commenters recommended that CMS provide voluntary or phased participation for specific hospitals, such as rural, safety net, smaller, sole community, and Medicare-dependent, small rural hospitals. A commenter recommended that CMS incorporate tiered participation tracks, including an option for safety net providers to participate without downside risk. Commenters stated that these hospitals often operate with thinner margins, fewer staff, lower episode volumes, and fewer resources for analytics and care redesign. They expressed concern that even limited downside risk could be difficult for financially-fragile hospitals to absorb. Commenters suggested that mandatory participation could worsen access challenges in communities that rely on these hospitals.

Response: We appreciate commenters' requests for additional flexibilities for certain hospitals. Although we believe that many hospitals have prior experience with LEJR episodes or episode-based payment models, we recognize that readiness may vary across hospitals. Therefore, as discussed in section X.C.2.a of this final rule, we are finalizing a start date of January 1, 2028 to increase the preparation time for hospitals that do not already have processes in place to meet the model requirements. We note that the CJR Model was implemented with significantly less lead time and hospital participants were able to successfully meet the model requirements. We continue to believe that CJR–X participants will have ample time and capacity to prepare for CJR–X, particularly with a later start date. In addition, we will be providing educational guidance and implementation support prior to the model start. We encourage readers to visit the CJR–X website at *https://www.cms.gov/priorities/innovation/innovation-models/cjr-x* for model updates. For reasons discussed in the proposed rule, we are not considering voluntary participation at this time.

Comment: Some commenters stated that integrated health systems may have some hospitals participating in TEAM and other hospitals participating in CJR–X. These commenters stated that this could require the same health system to manage different LEJR episode lengths, attribution rules, workflows,

and model requirements across facilities. A commenter stated that requiring health systems to participate in multiple mandatory episode-based payment models simultaneously, including TEAM and CJR–X, creates significant operational and clinical confusion. They stated that under the proposed framework, health systems would be required to manage patients across distinct bundles with different attribution rules, episode durations, post-acute responsibility, and financial risk structures.

Response: We are implementing CJR–X based on the previous test and belief that it is appropriate for the majority of acute care hospitals. We also continue to test new Innovation Center payment models, such as TEAM, and iterate upon previous policies based on ongoing model evaluations and stakeholder feedback. We recognize that many hospitals are part of larger health systems and may operate differently than other hospitals within that system depending on patient population, available services, location, or other factors. However, health systems regularly manage and successfully implement various programs with different payment policies and rules in a subset of their hospitals. For instance, it is not uncommon for specialty-designated hospitals, such as cancer hospitals, to be part of a larger health system. Therefore, we do not believe that ownership of several hospitals should preclude a systems' participation in applicable CMS' programs and policies.

Final response: After consideration of the public comments we received, we are finalizing without modification our proposal at § 512.605 to define ''hospital'' as defined in section 1886(d)(1)(B) of the Act. We are finalizing with modification the ''CJR–X participant'' definition at § 512.605 to be a hospital located in any of the 50 States, District of Columbia, or U.S. Territories that initiates LEJR episodes and is eligible to be paid under both the IPPS and OPPS. We are also finalizing without modification our proposal at § 512.610(a)(1) that CJR–X participation is mandatory for any hospital that meets the CJR–X participant definition. We did not receive comment on our proposal at § 512.610(a)(2) that CJR–X participants will remain CJR–X participants, unless they no longer meet the definition of CJR–X participant, CMS terminates CJR–X, or the CJR–X participant receives notice of termination from CJR–X in accordance with § 512.165. However, we realized we introduced a technical error by including the reference to § 512.165, which relates to notices of termination provided to model participants only in the event of the termination of the model test in its entirety. To provide clarification on when a model participant may receive a notice of termination, outside of the termination of CJR–X, and to avoid including duplicative provisions in § 512.610(a)(2), we have inserted a separate provision addressing the notice of termination at § 512.610(c), which is discussed in section X.C.2.m. of this final rule. Accordingly, we are finalizing with modification our proposal at § 512.610(a)(2) that CJR–X participants will remain CJR–X participants, unless they no longer meet the definition of CJR–X participant, CMS terminates the CJR–X participant in accordance with § 512.610(c), or CMS terminates CJR–X in accordance with § 512.165. As we did in the CJR model, we expect to post a list of the CJR–X participants on the CJR–X website for the 2028 performance year/2030 payment year by the end of 2026. We anticipate this list would be updated on a quarterly cadence, to account for hospital mergers, closures, or other instances that would result in a hospital being added or removed from CJR–X participation.

(a) CJR–X Participant Exclusions

We proposed at § 512.610(b)(1) to exclude hospitals that are TEAM participants. Although LEJR episodes in TEAM are similar to LEJR episodes in CJR–X, there are a few key differences. Most notably, TEAM tests 30-day episodes, while CJR–X would continue testing the 90-day episodes that demonstrated savings in the CJR Model. Excluding TEAM participants from CJR–X would allow us to compare the impacts of 30- and 90-day episodes on savings and quality of care while maintaining a consistent methodology across all five TEAM episodes. Moreover, we believe that subjecting TEAM participants to CJR–X rules for LEJR episodes and TEAM rules for the remaining four TEAM episodes would create confusion for providers and deviate from a consistent testing methodology.

We note that the TEAM exclusion applies to both mandatory and voluntary TEAM participants, as voluntary TEAM participants must remain in the model until its conclusion per § 512.510(a). We also note that this exclusion would expire at the conclusion of the TEAM test or if at any point a TEAM participant no longer meets the TEAM participant definition, at which point TEAM participants that meet CJR–X participant definition at § 512.605 would become CJR–X participants. In addition, while it is too early to make assumptions about the model test, should TEAM be expanded in the future, we would evaluate whether to continue LEJR in either TEAM or CJR–X, as we do not envision LEJR episodes being expanded in both concurrently.

We proposed at § 512.610(b)(2) to exclude acute care hospitals in the State of Maryland because of its unique rate-setting authority, as described in section X.C.2.f.(3)(a) of this final rule. We do not believe that the regional pricing methodology used in CJR–X would accurately reflect episode spending for Maryland hospitals. We acknowledge that the State of Maryland is participating in the Achieving Healthcare Efficiency through Accountable Design (AHEAD) model, with which CJR–X would allow concurrent participation. Further, we are aware that Maryland's rate setting authority is in transition and will conclude at the end of 2027. As stated in the proposed rule, we may consider, through future notice and comment rulemaking, modifications to our finalized policy to exclude Maryland from CJR–X and our finalized policy to permit concurrent participation with the AHEAD model.

We sought comment on our proposals at § 512.610(b) to exclude TEAM participants and Maryland hospitals from CJR–X. The following is a summary of the public comments received.

Comment: Many commenters supported CMS' proposal to exclude hospitals participating in TEAM from CJR–X during their TEAM participation. Commenters stated that this exclusion would avoid duplicative episode accountability, beneficiary confusion, reporting burden, and reconciliation complexity for overlapping LEJR episodes. Some commenters also supported CMS' proposed attribution approach under which TEAM generally supersedes CJR–X for TEAM hospitals, except where a TEAM-qualifying procedure occurs during an existing CJR–X episode and is included in the CJR–X episode instead. Commenters asked CMS to continue coordinating TEAM and CJR–X overlap policies and to provide clear examples in subregulatory guidance.

Response: We appreciate commenters' support for excluding TEAM participants from CJR–X during the TEAM test period. We believe avoiding duplicative episode accountability will reduce beneficiary confusion and provider burden. Under the CJR–X proposal, hospitals participating in TEAM would be exempt from CJR–X

until the end of the TEAM model test. We also proposed episode cancellation and precedence rules for beneficiaries whose care could otherwise overlap across TEAM and CJR–X, as discussed in section X.C.2.d.(3) of this final rule. These policies are intended to avoid duplicative calculations for the same procedure, preserve clear accountability for the anchoring provider, and reduce model-overlap complexity for participants and beneficiaries. In addition, excluding TEAM participants preserves the ability to evaluate the models' differences. To help participants prepare for implementation, clear guidance regarding model policies will be maintained on the CJR–X website at *https://www.cms.gov/priorities/innovation/innovation-models/cjr-x.*

Comment: Many commenters raised concerns regarding transitioning TEAM hospitals into CJR–X in future years. A few commenters stated that late-entering hospitals would be disadvantaged compared to hospitals that had participated in CJR–X from the beginning. They requested clarity on how we would ensure equitable benchmarking and target price setting across cohorts entering at different times and whether historical TEAM performance would be incorporated into CJR–X benchmarking. Commenters stated that TEAM hospitals will have invested in TEAM-specific care redesign, data systems, quality reporting, care coordination, and workflows, and that immediate transition into CJR–X could create administrative burden and structural disadvantage. Some commenters urged CMS to allow TEAM hospitals to voluntarily elect whether to participate in CJR–X after TEAM ends. Because TEAM hospitals may already have implemented LEJR care redesign and achieved efficiencies under TEAM, they should be allowed to choose whether CJR–X participation is appropriate after TEAM ends. Some commenters requested phase-in options for health systems with hospitals in both TEAM and CJR–X. Commenters requested that CMS publish a clear transition framework before the end of the TEAM test.

Response: We appreciate commenters' concerns regarding the proposed transition of TEAM hospitals into CJR–X after TEAM ends or when a hospital no longer meets the TEAM participant definition. We recognize that hospitals may make model-specific investments and may have questions about operational readiness and treatment of prior TEAM experience. However, we believe that any TEAM care redesign activities will continue to benefit and be applicable to care pathways under CJR–X. Accordingly, we will strive to align CJR–X and TEAM policies wherever possible to effectuate as smooth a transition as possible when TEAM concludes.

We continue to believe it is reasonable that hospitals participating in a geographically- and time-limited model, such as TEAM, would become subject to the participation requirements applicable under a mandatory national model, such as CJR–X, once they no longer qualify for a particular participant exclusion. As discussed in the proposed rule, voluntary participation by hospitals that meet the ''CJR–X participant'' definition, is not supported by experience with the original CJR Model.

Our goal is to test multiple value-based methodologies and adopt the most beneficial and effective policies, even if that means iterating on previously implemented CJR–X Model design. Therefore, we recognize that the design of either model could change over time, including policies related to participation, benchmarking, financial methodology, or model duration. As implementation experience accumulates, there may be additional approaches that better facilitate transitions between the models than those currently contemplated. While we continue to believe that defaulting TEAM hospitals to the participation requirements applicable under CJR–X is appropriate under the models as currently designed, we remain open to considering alternative transition approaches in the future should experience, evaluation results, or future policy considerations warrant them. We also intend to provide appropriate operational guidance to support hospitals in advance of any future transition. Any future modifications to the relationship between TEAM and CJR–X, including transition policies or participation options following the conclusion of TEAM, would be proposed through future notice and comment rulemaking, as appropriate.

Comment: Some commenters supported CMS' proposal to exclude Maryland hospitals from CJR–X. Commenters stated that Maryland's rate-setting authority provides a basis for excluding those hospitals from the model. They supported CMS' recognition that Maryland hospitals are subject to a distinct payment environment. A commenter recommended that CMS consider excluding hospitals in AHEAD states from CJR–X. The commenter stated that hospitals preparing for an AHEAD global budget payment methodology may need to focus on that transition. The commenter suggested that overlap between CJR–X and hospital global budgets could create operational or payment complexity.

Response: We appreciate commenters' support for the proposed exclusion of Maryland hospitals from CJR–X. We proposed this exclusion because Maryland's unique rate-setting authority would make the proposed CJR–X regional pricing methodology unsuitable for accurately reflecting episode spending for Maryland hospitals. We acknowledge that Maryland is participating in AHEAD and that Maryland's rate-setting authority is in transition. As stated in the proposed rule, we may consider, through future notice and comment rulemaking, modifications to our finalized policy to exclude Maryland from CJR–X and our finalized policy to permit concurrent participation with the AHEAD model.

Comment: Many commenters recommended additional participant exceptions. Many commenters recommended that CMS exclude rural, low-volume, or otherwise resource-constrained hospitals. A commenter stated many hospitals will have had limited direct experience with bundled payment models. Many commenters stated that hospitals with limited episode volume and infrastructure capability would have difficulty with mandatory CJR–X participation. A commenter asked that CMS test CJR–X with rural and smaller hospitals on a more limited scale. Another commenter stated that hospitals with fewer than 100 lower extremity joint replacements per performance year should not be subject to mandatory CJR–X participation. Several commenters stated that rural hospitals are already experiencing financial pressure, including Medicare payment rates below the cost of care, Medicare Advantage losses, Medicaid payment reductions, and limited staffing and resources. The commenters expressed concern that mandatory downside risk under CJR–X could further strain financially fragile rural hospitals and could contribute to hospital closures or reduced access to care in the communities they serve. A commenter stated that sole community hospitals are the sole source of care for Medicare beneficiaries in large rural areas and are currently facing numerous financial challenges. Some commenters recommended that CMS create an exception or flexibility process based on post-acute care access, community resources, or local market constraints. Commenters stated that hospitals that

face major deficits in post-acute care access or other community should not be penalized when patient needs and community resources make care in a particular setting appropriate. Commenters recommended exceptions, hardship processes, or flexibility where local resources limit a hospital's ability to manage the episode. Commenters stated that reduced stop-loss limits may not be sufficient protection for hospitals with small or negative margins and recommended categorical exclusions, hardship exemptions, modified participation, delayed participation, or optional participation for these hospitals.

Response: We appreciate concerns regarding potential burden and financial impact of mandatory downside risk for rural hospitals, sole community hospitals, Medicare-dependent, small rural hospitals, and low volume hospitals. We disagree that additional hospitals that perform more than 31 episodes in the baseline period should be excluded from the model. Many low volume hospitals were able to successfully implement and perform well in the CJR Model.

To reduce burden, we are finalizing policies which eliminate CJR–X specific quality reporting and are relying on data submitted to other hospital quality reporting programs. In addition, we are finalizing the model in the FY 2027 IPPS to give CJR–X participants additional time to prepare for implementation. We found that low-volume status and performance were correlative, but volume was not a necessarily causative factor of poor performance. However, if the hospital also provided care to a high-proportion of dual-eligible beneficiaries, there was a greater risk of poor performance. In light of this, we considered the combination of those factors when determining the payment methodology for CJR–X. We are finalizing as proposed a low-volume threshold of 31 episodes for reconciliation, as discussed in section X.C.2.f.(3)(h) of this final rule, and a hospital-level safety net risk-adjuster for hospitals with a higher proportion of dual-eligible beneficiaries, discussed in section X.C.2.f.(4) of this final rule. To clarify, hospitals that meet the CJR–X participant definition will be participants and the low-volume threshold is not a criterion of that definition. However, we will exclude from reconciliation CJR–X participants that don't meet the low-volume threshold.

We recognize the importance of rural access considerations in designing a national episode-based payment model and that some hospitals may have fewer resources than others. We also recognize that post-acute care access, community resources, and local market constraints may affect how hospitals manage LEJR episodes. However, quality outcomes for rural beneficiaries are affected by cost variation, care transitions, and post-acute care patterns and including these hospitals will help us to understand how the model works for hospitals with different resources, patient populations, and post-acute care access. In addition, including rural hospitals with lower volume or fewer post-acute options enables us to monitor these issues directly rather than assuming the model effects in rural communities.

Nevertheless, given these challenges, we have included policies that help to protect rural hospitals from significant financial loss. For example, we are finalizing as proposed a lower stop-loss limit for rural hospitals to minimize extreme losses in repayment amounts, as discussed in section X.C.2.f.(5)(g) of this final rule. Since some hospitals, including many rural hospitals, may have low LEJR volume, we are also finalizing the proposal to exclude low volume hospitals from reconciliation, as discussed in section X.C.2.f.(3)(h) of this final rule. The low volume hospital policy effectively eliminates upside and downside risk so that low volume CJR–X participants are not disadvantaged by their limited capacity to distribute financial risk or implement efficient operational processes.

We will monitor rural hospital experience, including effects on quality, beneficiary access, and operational burden, and may take this into consideration in future notice and comment rulemaking.

After consideration of the public comments we received, we are finalizing without modification our proposal at § 512.610(b) to exclude TEAM participants and Maryland hospitals from CJR–X.

c. Beneficiary Population

We proposed at § 512.620(a) that the beneficiaries whose care would be included in CJR–X would include those who meet the following beneficiary inclusion criteria at the time of their anchor procedure or anchor hospitalization:

- Is enrolled in Medicare Part A and Part B;
- Has Medicare as their primary payer;
- Is not eligible for Medicare on the basis of end-stage renal disease, as described at § 406.13;
- Is not enrolled in any managed care plan (for example, Medicare Advantage, Health Care Prepayment Plans, cost-based health maintenance organizations);
- Is not covered under a United Mine Workers of America health plan, which provides health care benefits for retired mine workers; and
- Is in an episode, as defined at § 512.605.

We believe this is the most appropriate Medicare population to include in CJR–X because it aligns with the CJR Model population tested. Excluding beneficiaries enrolled in managed care or covered by payment systems other than the IPPS and OPPS ensures that CMS has complete and consistent claims data across the full episode of care, including inpatient, outpatient, physician, and post-acute services, which is essential for setting target prices, calculating episode spending, and assessing quality performance. In addition, excluding beneficiaries with Medicare eligibility based on end-stage renal disease and those with other primary payers helps reduce clinical and financial heterogeneity that could compromise comparability across episodes and participant hospitals. Together, these eligibility criteria ensure that CJR–X hospitals are held accountable only for episodes for which Medicare has primary payment responsibility and complete data visibility.

We recognize that a CJR–X episode could be initiated for a beneficiary who ceases to meet the beneficiary inclusion criteria at some point during the episode. In this case, we proposed at § 512.620(b) that we would cancel the episode. We sought comment on the proposed beneficiary inclusion criteria and the proposal to cancel episodes if a beneficiary no longer meets that criteria at § 512.620.

The following is a summary of the public comments received on our proposed beneficiary inclusion criteria and the proposal to cancel episodes if a beneficiary no longer meets those criteria.

Comment: Several commenters requested that CMS clarify and explicitly require that beneficiaries meet the inclusion criteria throughout both the clinical episode period and the 180-day lookback period used for risk adjustment. Specifically, they asked that Medicare explicitly codify the regulation to include the continuous enrollment in Medicare Part A and Part B, as primary payer and exclude managed care enrollment, for the entirety of the 180-days prior to the procedure. Since risk adjustment relies on HCC diagnoses, prior post-acute care use, and economic risk captured during the 180-day period preceding the

procedure, without continuous enrollment, risk adjustment may be incomplete or inaccurate. The commenters urged CMS to refine eligibility for concordance with the proposed risk adjustment policy.

Response: We appreciate the comments and are happy to clarify that the beneficiary inclusion criteria would require continuous enrollment in Medicare Part A and B for the 180 days prior to the episode start date. In addition, we are finalizing updated language for the beneficiary inclusion criteria to reflect the 180-day lookback period.

Comment: A commenter stated it is not obvious to hospitals and providers whether patients are enrolled in Medicare as a result of end-stage renal disease (ESRD). They asked CMS to provide additional information for which patients are excluded due to their enrollment in Medicare's ESRD benefit.

Response: We appreciate the commenter's concern. CJR–X participants may request and receive beneficiary-identifiable claims data during the performance year which can help CJR–X participants identify those beneficiaries that are initiating episodes in the model and which beneficiaries may be excluded due to not meeting the inclusion criteria. Our data sharing provisions are further discussed in section X.C.2.k.(2) of this final rule.

Comment: A commenter urged CMS to prioritize and work toward including Medicare Advantage (MA) enrollees in the CJR–X beneficiary population because more than half of Medicare beneficiaries are enrolled in a Part C plan. They stated excluding MA enrollees who receive total joint replacements means the agency is not capturing relevant data on the costs and outcomes for more than 50% of these high-cost surgical interventions.

Response: We appreciate the commenter's concerns. To reduce participant burden, CJR–X is relying solely on the quality data submitted to the existing hospital quality reporting programs. Although the measure specifications are out of scope for this model, we do note that the Medicare Advantage program is itself a value-based program. As such, Medicare Advantage has its own cost reporting and quality requirements which aid in capturing data on the costs and outcomes of enrollees.

After consideration of the public comments we received, we are finalizing with modification the proposed beneficiary inclusion criteria at § 512.620(a) as follows:

''An individual is a CJR–X beneficiary if, based on a 180-day lookback period that ends on the day prior to an anchor procedure or anchor hospitalization, the individual—

(1) Is enrolled in Medicare Parts A and B;

(2) Has Medicare as their primary payer;

(3) Is not eligible for Medicare on the basis of having end stage renal disease, as described at § 406.13 of this chapter;

(4) Is not enrolled in any managed care plan (for example, Medicare Advantage, health care prepayment plans, or cost-based health maintenance organizations);

(5) Is not covered under a United Mine Workers of America health care plan; and

(6) Is in an episode.''

(1) Beneficiary Notification

We proposed CJR–X because we believe it offers an opportunity to improve quality of care. We believe that the policies of the model would make care more easily accessible to consumers when and where they need it and increase beneficiary engagement and choice. For example, we proposed certain waivers which would offer CJR–X participants additional flexibilities with respect to furnishing telehealth services and care in SNFs, as discussed in section X.C.2.j. of this final rule. In the proposed rule, we noted that these same opportunities could also be used to try to steer beneficiaries into lower cost services without an appropriate emphasis on maintaining or increasing quality given the incentives to reduce Medicare spending in the model.

We stated that existing Medicare provisions would be effective in protecting beneficiary freedom of choice and access to appropriate care under CJR–X. Further, since CJR–X would be expanded nationally, diverting care to hospitals not in the model would be less of an issue given CJR–X's broad scale. Because we proposed mandatory hospital participation, individual beneficiaries would not be able to opt out of CJR–X when they receive care from a CJR–X participant. Moreover, allowing beneficiaries to opt out would be inconsistent with other Medicare policies. For example, we do not allow beneficiaries to opt out of a payment system, such as the IPPS, but we do not believe that to be a critical factor in upholding beneficiary choice if other safeguards are in place. Specifically, we do not believe this would be an issue for CJR–X, given that this model does not increase beneficiary cost-sharing. However, CJR–X beneficiaries are not precluded from seeking care from providers or suppliers who do not participate in CJR–X. We stated in the proposed rule that full notification and disclosure of the payment model and its possible implications would be critical for CJR–X beneficiary understanding and protection and important to create safeguards for CJR–X beneficiaries to ensure that care recommendations are based on clinical needs and not inappropriate cost savings. It is also important for CJR–X beneficiaries to know that they can raise any concerns with their clinicians, 1–800–MEDICARE, or their local Quality Improvement Organizations (QIOs).

We stated that the CJR–X Model will neither limit a CJR–X beneficiary's ability to choose providers nor limit Medicare's coverage of items and services available to the CJR–X beneficiary. CJR–X beneficiaries may continue to choose any Medicare participating provider, or any provider who has opted out of Medicare, with the same costs, copayments, and responsibilities as they have with other Medicare services. As discussed in section X.C.2.(m) of this final rule, CJR–X participants will be subject to the standard provisions at §§ 512.100 through 190, including the beneficiary protections noted in § 512.120 that cover beneficiary freedom of choice, availability of services, and descriptive model materials and activities.

Further, the model will allow CJR–X participants to enter into CJR–X sharing arrangements with certain providers, as proposed in section X.C.2.i.(4) of this final rule, and these preferred providers may be recommended to CJR–X beneficiaries as long as those recommendations are made within the constraints of current law. However, CJR–X participants may not limit CJR–X beneficiaries to a preferred or recommended providers list.

This model does not create any restriction of beneficiary freedom to choose providers, including surgeons, hospitals, post-acute care or any other providers or suppliers. Moreover, we anticipate that care pathway redesign that occurs in response to the model will increase coordination of care, improve the quality of care, and decrease cost for all patients, not just Medicare beneficiaries. As it would be unlikely that providers would treat individuals differently based on health care insurance, we anticipate care delivery impacts to promote consistent treatment of all beneficiaries.

We proposed at § 512.622(a)(1) that every CJR–X participant must provide written notification to each CJR–X beneficiary of his or her inclusion in the CJR–X Model. We stated that appropriate beneficiary notification should explain the model, advise

patients of both their clinical needs and their care delivery choices, and should clearly identify any CJR–X collaborator, as defined at § 512.605. That is, we proposed that the CJR–X participant would be required to disclose any providers, suppliers, or other entities with which the CJR–X participant holds a sharing arrangement as a ''financial partner of the hospital for the purposes of participation in CJR–X.''

We stated that the notification would enhance CJR–X beneficiaries' understanding of their care and is an important safeguard for ensuring CJR–X beneficiaries receive all medically necessary services. We also highlighted it as an important clinical opportunity to better engage CJR–X beneficiaries in shared decision-making and understanding competing benefits, even as they are presented with cost-saving recommendations. Therefore, we proposed at § 512.622(a)(4) that the CJR–X beneficiary notification must:

- Explain the CJR–X Model and how it might be expected to affect the CJR–X beneficiary's care;
- Inform CJR–X beneficiaries that they retain freedom of choice to choose providers, suppliers, and services;
- Explain how the CJR–X beneficiary can access care records and claims data through an available patient portal and through sharing access to care-givers to their Blue Button® electronic health information;
- Explain that CJR–X participants may receive beneficiary-identifiable claims data;
- Advise CJR–X beneficiaries that all standard Medicare beneficiary protections remain in place, including the ability to report concerns of substandard care to QIOs and 1–800–MEDICARE; and
- Provide a list of the CJR–X collaborators with which the CJR–X participant has a sharing arrangement.

We recognized that an exhaustive list of CJR–X collaborators may lengthen the beneficiary notification, unnecessarily. Therefore, we stated this requirement may be fulfilled by the CJR–X participant including in the detailed notification a publicly available web address where CJR–X beneficiaries may access the CJR–X collaborators list.

After carefully considering the appropriate timing and circumstances for the necessary CJR–X beneficiary notification, we proposed at § 512.622(a)(2) that CJR–X participants must provide the CJR–X beneficiary notification prior to discharge from either the anchor hospitalization or the anchor procedure for a Medicare beneficiary who would be included under the model. The purpose of the proposed policy was to ensure that all CJR–X beneficiaries received the beneficiary notification materials, and that they received such materials as early as possible but no later than discharge from the hospital or hospital outpatient department. We stated that the proposal would increase the likelihood that patients would become engaged and seek to understand CJR–X and its potential impact on their care, particularly in the post-discharge period.

We also considered whether to require CJR–X participants to provide this information at the point of admission, as hospitals provide other information concerning patient rights and responsibilities at that time. However, we recognized that, due to a CJR–X beneficiary 's condition, it may not be feasible to provide notification at such time. We invited comments on ways in which the timing and source of beneficiary notification could best serve the needs of CJR–X beneficiaries without creating unnecessary administrative work.

In addition, we proposed at § 512.622(b) that CJR–X participants would have to require every CJR–X collaborator to provide written notice to applicable CJR–X beneficiaries describing the existence of a sharing arrangement with the CJR–X participant and the basic quality and payment incentives under the model. We proposed that the notice be provided no later than the time at which the beneficiary first receives an item or service from the CJR–X collaborator during an episode. We recognized that due to the patient's condition, it may not be feasible to provide notification at such time, in which case the notification must be provided to the beneficiary or his or her representative as soon as is reasonably practicable. We stated that if the beneficiary notification policy was finalized, CMS would post a CJR–X collaborator template for use by CJR–X participants on the CJR–X website.

We considered, but did not propose, requiring the CJR–X beneficiary notifications only during the years that both CJR–X and TEAM are implemented. Under such a policy, after TEAM ended, we would no longer have required CJR–X beneficiary notifications since all hospitals nationwide, barring any excluded hospitals from CJR–X, would be held accountable for LEJR episodes. We also considered, but did not propose, not requiring the CJR–X beneficiary notifications. We acknowledged other CMS initiatives, such as the Hospital Value Based Purchasing Program or the Expanded Home Health Value-Based Purchasing Model, do not require entities participating in those initiatives to provide beneficiary notifications. We recognized a model that is expanded nationally, such as CJR–X, would become standard practice for hospitals to manage beneficiaries in a LEJR episode of care. Therefore, the beneficiaries' experience or treatment options should not materially change between participating hospitals, nor should beneficiaries' or out-of-pocket costs, freedom of choice, or access to care differ. Further, we recognized that beneficiaries already receive a significant amount of information on discharge from the hospital or hospital outpatient department and a beneficiary notification may go unnoticed or be redundant. We stated that we believed the CJR–X participant would already be communicating to the CJR–X beneficiary the hospital's responsibility to manage the CJR–X beneficiary during the episode, including in the 90-day post-discharge period. Thus, we stated that the administrative burden of notification may outweigh its value.

We invited public comment on our proposed requirements for notification to CJR–X beneficiaries at § 512.622. We also sought comment on our consideration to not require CJR–X beneficiary notifications. The following is a summary of the public comments received on the proposed CJR–X notification requirements.

Comment: Many commenters opposed or recommended narrowing the proposed CJR–X beneficiary notification requirements. Commenters stated that requiring hospitals and collaborators to provide CJR–X-specific written notices would create unnecessary administrative burden, duplicate existing patient education and discharge communications, and provide little practical value to beneficiaries because CJR–X is mandatory and beneficiaries cannot opt out. A commenter stated that such notification is difficult to implement consistently across high-volume inpatient and outpatient surgical settings. Several commenters stated the notices could confuse or alarm beneficiaries even though model participation would not change cost-sharing or standard Medicare rights. A commenter suggested limiting notices to those with a direct care, financial impact, or actionable implication for the patient.

Response: We appreciate commenters' concerns about the administrative burden that may be associated with providing CJR–X Model information to beneficiaries. However, the Innovation Center has employed a similar

requirement for other mandatory models and model participants have successfully operationalized similar beneficiary notifications. We also acknowledge CMS' goal of eliminating unnecessary burden when possible and appropriate. While we do not wish to further confuse or overwhelm beneficiaries, we believe it necessary that beneficiaries are aware of the model, how it would or would not impact their care, and their continued beneficiary rights, including their freedom of choice to choose providers, suppliers, and services. The notification also provides beneficiaries with important information relating to their claims data.

Comment: Many commenters who opposed the hospital-level notice requirement did not oppose beneficiary education altogether. Instead, many commenters suggested CMS-led communication would be more consistent, less duplicative, and less burdensome than requiring each hospital and collaborator to maintain and distribute model-specific notices. Many commenters suggested vehicles such as the Medicare & You Handbook, an annual blanket notification, or a broad beneficiary communication campaign. Other commentors suggested CMS provide standardized templates and protocols if the requirement is finalized.

Response: We appreciate the recommendation for a CMS-directed beneficiary notification. As a Phase II model test, we are still distinct from the Medicare program. As such, including information in the Medicare & You Handbook would not be appropriate. However, as was done for the CJR Model, we plan to provide templates for the beneficiary notifications, which will be posted to the CJR–X website prior to the model start date.

Comment: A commenter stated that some episodes will not be coded as an LEJR MS–DRG until after the patient is discharged, so the patient would not get the notification before they leave the hospital. Another commenter strongly recommended that any notification be delivered during pre-operative conversations and/or patient joint education and that CMS permit electronic delivery. They stated that earlier disclosure allows beneficiaries freedom of choice to seek a provider who is not in the CJR–X Model and receiving the information after the service defeats this purpose.

Response: We believe there is sufficient time to identify CJR–X beneficiaries once the decision is made to furnish a joint replacement procedure, enabling CJR–X participants to provide CJR–X beneficiaries with the beneficiary notification prior to discharge. The notifications may be provided prior to or at any point during admission to reduce administrative and clinical burden on the discharging team. We also recognize that it may be easier for some CJR–X participants to provide the information as part of pre-operative planning, while, for others, more operationally feasible as part of discharge planning. Moreover, we agree that providing any information that may impact beneficiary choice or their recovery is preferable during the pre-operative period. We believe hospitals will have sufficient opportunity to provide notification prior to discharge, as the need will be known at the time of the LEJR procedure, despite any delay in coding the MS–DRG.

Comment: Some commenters support beneficiary notification requirements as a safeguard for transparency, beneficiary choice, and patient understanding. These commenters stated their belief that CJR–X financial incentives could encourage hospitals to steer beneficiaries toward lower-cost settings that may not align with patient wishes or treating clinician judgment. They stated that written notice could help beneficiaries understand their care options, their inclusion in the model, and their freedom to choose providers. A commenter urged CMS to inform beneficiaries about the CJR–X Model as it will be a mandatory, nationwide program. Another commenter stated that alignment with the content required for the TEAM model would decrease administrative burden. Another commenter stated CMS should at minimum require documentation of the beneficiary's post-acute care preference, the clinical basis for the discharge plan, and any reason the beneficiary's preferred setting was not selected.

Response: We thank commenters for providing their support of the beneficiary notification requirement. We agree that the CJR–X participants must not limit a beneficiary's access to care and must continue to make treatment decisions in the best interest of the beneficiary. We also expect that hospitals discuss with beneficiaries the clinical basis for discharge plans and reasons why a beneficiary's preferred setting may not be selected. However, we are not requiring further documentation for CJR–X participants. CJR–X participants may document beneficiary preferences, the clinical basis for the discharge plan, and related discussions in the beneficiary's electronic health record or other medical record documentation.

We agree that transparency remains necessary for beneficiary choice and engagement and continue to recognize the importance of disclosing financial relationships between participant hospitals and the service providers to whom they refer patients.

After consideration of the public comments we received, we are finalizing the beneficiary notification requirements for CJR–X at §§ 512.622(a), 512.622(b), and 512.622(d) as proposed.

However, we remain committed to reducing the administrative burden associated with the beneficiary notification policy and will consider updates to this policy through future notice and comment rulemaking, provided the change would not fundamentally alter beneficiary protections.

d. Episode

(1) Background

A key design feature of episode-based payment models is the definition of the episodes included in the model. The episode definition has two significant dimensions—(1) a clinical dimension that describes which clinical conditions and associated services are included in the episode; and (2) a time dimension that describes the beginning and end of the episode, its length, and when the episode may be cancelled prior to the end of the episode.

In testing payment models, we recognize the importance of there being clear potential for participating hospitals to successfully drive care improvements by streamlining care pathways and transitions between clinical settings. We aim to design models with episodes that are clinically similar, for which episode spending is more predictable. We also note that episodes with a greater proportion of spending in the post-acute period relative to the anchor hospitalization or anchor procedure offer greater opportunity for improved care transitions for beneficiaries to reduce unnecessary hospitalizations and emergency care.

Given the promising findings for LEJR in the CJR Model and BPCI Advanced, we believe there is value in an expansion of the CJR Model test through CJR–X, particularly given the high volume of LEJR procedures among the Medicare population. Based on 2021 Medicare claims data, LEJR episodes were the highest volume, highest cost of the BPCI Advanced surgical episode categories. There were 204,160 episodes with a total cost of $5.01 billion, with more than 40 percent of spending occurring in the post-acute period.

Moreover, based on the CJR Model evaluation, LEJR episodes continue to offer opportunities for improvement.

(2) Clinical Dimension of Episode

(a) Episode Definition (LEJR)

We proposed to define ''episode'' to mean all Medicare Part A and B items and services described in § 512.625(b) (and excluding the items and services described in § 512.625(c)) that are furnished to a beneficiary described in § 512.620 during the time period that begins on the date of the beneficiary's admission to an anchor hospitalization or the date of the anchor procedure, as described at § 512.625(a), and ends on the 90th day following the date of discharge from the anchor hospitalization or anchor procedure, with the date of discharge or date of the anchor procedure itself being counted as the first day in the 90-day post-discharge period, as described at § 512.630.

As discussed in section X.C.2.d.(3) of this final rule, in the case that an anchor hospitalization for the same episode type occurs within 3 days of an anchor procedure (that is, an outpatient procedure is later converted to an inpatient admission), the anchor procedure episode is not initiated, and the episode start date for the anchor hospitalization is the same as the outpatient procedure. This episode definition aligns with the CJR Model and TEAM, at § 510.2 and § 512.505, respectively, providing consistency across Innovation Center models. In addition, this policy aligns with Medicare's 3-day payment guidelines that require hospitals to bundle the technical component of outpatient services with the inpatient claim if they are related to the same condition and occur in the 3 days preceding inpatient admission, in compliance with section 1886 of the Act.

We proposed at § 512.605 to define ''anchor hospitalization'' as the initial hospital stay upon admission for a lower extremity joint replacement included in CJR–X, as described in § 512.625(a), for which the institutional claim is billed through the inpatient prospective payment system (IPPS). Anchor hospitalization also includes an inpatient hospital admission within 3 days after an outpatient Total Knee Arthroplasty (TKA) or Total Hip Arthroplasty (THA). We also proposed at § 512.605 to define ''anchor procedure'' as a TKA or THA procedure related to an episode, as described in § 512.625(a), included in CJR–X that is permitted and paid for by Medicare when performed in a hospital outpatient department (HOPD) and billed through the Hospital Outpatient Prospective Payment System (OPPS), except when the beneficiary is admitted to an inpatient hospital stay within 3 days after the TKA or THA.

We sought comment on our proposed ''episode'' definition at § 512.605. The following is a summary of the public comments received.

Comment: Some commenters supported the proposed CJR–X episode definition and maintaining a focused and clinically appropriate LEJR episode category. Commenters supported including inpatient and outpatient procedures in the model to reflect evolving care delivery patterns, but cautioned that it introduces complexity in achieving site-neutral payments. In addition, patient variability across care settings may significantly influence outcomes and episode costs. Another commenter stated that rigid episode definitions could misalign incentives if they do not reflect current practice patterns.

Response: We appreciate the support for the proposed CJR–X episode definition and acknowledge concerns about shifts between inpatient and outpatient settings. The proposed definition aligns with the CJR Model and TEAM to provide consistency across Innovation Center models. CMS will monitor for unwarranted shifts in setting, site-of-service variation, and other unintended effects as part of the CJR–X evaluation activities.

As stated in the proposed rule, if an outpatient procedure is later converted to an inpatient admission, we would not consider the outpatient procedure to be the episode initiator. Rather, we would consider the anchor hospitalization to be the initiator. This would only occur if the inpatient admission occurs at the same CJR–X participant as the outpatient procedure. This is further discussed in section X.C.2.d.(3)(a) of this final rule and at § 512.630(c).

After consideration of the public comments we received, we are finalizing with modification our proposed ''episode'' definition at § 512.605 as all Medicare Part A and B items and services described in § 512.625(b) (and excluding the items and services described in § 512.625(c)) that are furnished to a CJR–X beneficiary during the time period that begins on the date of the beneficiary's admission to an anchor hospitalization or the date of the anchor procedure, as described at § 512.630(c), and ends on the 90th day following the date of discharge from the anchor hospitalization or anchor procedure, as described at § 512.630(d).

We also recognize that the ''anchor hospitalization'' and ''anchor procedure'' definitions include unnecessary cross-references and policy. Therefore, we are removing extraneous text from the finalized definitions. We are finalizing with modification the ''anchor hospitalization'' definition at § 512.605 as the initial hospital stay upon admission for a lower extremity joint replacement for which the institutional claim is billed through the inpatient prospective payment system (IPPS). We are finalizing with modification the ''anchor procedure'' definition at § 512.605 as a TKA or THA procedure that is permitted and paid for by Medicare when performed in a hospital outpatient department (HOPD) and billed through the Hospital Outpatient Prospective Payment System (OPPS).

(b) Episode Identification (MS–DRG/HCPCS)

We believe that a straightforward approach for identifying CJR–X episodes is important for the care redesign that is required for model success. As was done in the CJR Model, hospitals participating in CJR–X will be able to identify episodes through the MS–DRG of the anchor hospitalization or by the Healthcare Common Procedure Coding System (HCPCS) codes for hospital outpatient procedures, allowing active coordination of beneficiary care during and after the anchor procedure or anchor hospitalization. We believe identifying LEJR episodes with MS–DRGs or HCPCS codes is a reasonable approach especially given LEJR is a procedural episode, making CJR–X beneficiary identification easier at the time of hospital inpatient or hospital outpatient department admission. This approach offers operational simplicity for providers and CMS and is consistent with the approach taken by BPCI Advanced and the CJR Model to identify beneficiaries whose care is included in those episodes. We note that there may be times an episode initiating code, such as an included MS–DRG, changes after the CRJ–X beneficiary is discharged. For example, the inpatient LEJR procedure generally determines the ultimate MS–DRG assignment for the hospitalization. However, depending on the beneficiary's principal and secondary diagnoses and other procedures received during the inpatient stay, the final MS–DRG assigned to the inpatient stay may not be the LEJR procedure, in which case the episode would not be picked up for

CJR–X.[587] In those instances, CJR–X participants could rely on data shared by CMS, in accordance with a CJR–X data sharing agreement and attestation, to confirm episode attribution, as described in section X.C.2.k. of this final rule.

We proposed to identify LEJR episodes by certain MS–DRGs and HCPCS codes included on claims. Specifically, IPPS discharges under MS–DRG 469, 470, 521, or 522; and OPPS claims for HCPCS codes 27130 or 27447, would trigger LEJR episodes in CJR–X. This approach offers operational simplicity for both providers and CMS and is consistent with the approach taken by previous models to identify episodes.

We sought comment on our proposal at § 512.625(a) to identify LEJR episodes with MS–DRGs and HCPCS in CJR–X. The following is a summary of the public comments received.

Comment: Several commenters supported identifying CJR–X episodes by the proposed codes, that is MS–DRGs 469, 470, 521, and 522 and CPT codes 27447 and 27130. A few commenters agreed with CMS's decision to focus the model on selected DRGs and not require participants to manage an entire orthopedic service-line, as was done in BPCI Advanced. A commenter supported excluding procedures that had not previously been tested under CJR, including CPT code 27446 (unicompartmental, or partial, knee replacement).

Response: We appreciate commenters' support for defining CJR–X episodes using the proposed MS–DRGs and CPT codes, which maintains the model's focused LEJR episode scope and excludes procedures not previously tested under CJR.

Comment: A commenter stated that the codes for identifying CJR–X episodes would not capture surgical complexity, such as differences between routine TKA and complex conversion cases involving prior fractures, retained hardware, multiple incisions, or contractures. The commenter stated that treating these cases as comparable episodes could discourage hospitals and surgeons from operating on beneficiaries who need complex reconstructions and create access concerns. Another commenter stated that more complicated admissions, specifically those that would fall under MS–DRGs 469 and 521, present significant coding and documentation challenges, especially regarding hard-to-code social risk factors that strongly condition post-discharge outcomes like hospital readmissions. Another commenter stated CMS should clearly and broadly define trauma to differentiate between a patient who needs a hip replacement to repair a fracture and a patient who is having an elective hip replacement.

Response: We proposed MS–DRG/HCPCS-based episode identification because it would be straightforward, operationally simple, and consistent with prior episode-based payment models for LEJR. While we acknowledge that MS–DRG/HCPCS episode triggers may not distinguish between routine and more complex joint replacement procedures, we believe variation within a particular code would be captured in the baseline spending used to produce target prices.

After consideration of the public comments we received, we are finalizing without modification our proposal at § 512.625(a) to identify LEJR episodes with MS–DRGs and HCPCS codes.

(3) Scope of Episode

We proposed that, consistent with the CJR Model, LEJR episodes in CJR–X would include inpatient hip, knee, and ankle replacement procedures paid through the IPPS under select MS–DRGs and hospital outpatient hip and knee replacement procedures billed under select HCPCS codes through the OPPS. We proposed to exclude from CJR–X ankle replacements performed in the outpatient setting. Total ankle arthroplasty (TAA) was on the IPO list until 2021 and, therefore, was not included in BPCI Advanced or the CJR Model. Although we did consider including outpatient TAAs in CJR–X, to do so at this time would represent too great a departure from the CJR Model to meet the limits of OACT certification. However, we are currently testing outpatient TAAs, as identified by HCPCS code 27702, in TEAM. If we consider adding outpatient TAAs to CJR–X at some point in the future based on TEAM evaluations, we would propose that change through notice and comment rulemaking.

We sought comment on the MS–DRG and HCPCS codes proposed for inclusion in CJR–X at § 512.625(a) and our proposal to exclude outpatient TAA from the LEJR episode category. The following is a summary of the public comments received.

Comment: A commenter supported the proposal to exclude outpatient total ankle arthroplasty in CJR–X. The commenter agreed that adding the procedure would represent a significant change from the prior CJR Model test. Another commenter stated that inpatient total ankle arthroplasty volume is relatively low and that inpatient TAA cases tended to be more complex and higher risk. The commenter stated that expanding a low-volume, higher-acuity procedure into a nationwide mandatory episode model without adequate data could create benchmarking instability and financial volatility and recommended that CMS assess publicly available volume data before advancing any expansion.

Response: We appreciate commenters' support for excluding outpatient total ankle arthroplasty from the CJR–X episode definition and acknowledge concerns that including TAA procedures could create benchmarking instability and financial volatility. However, this policy maintains the LEJR episode scope that was previously tested under the CJR Model. We did not see inherent issues with including these procedures in the CJR Model, but will monitor these procedures for untoward effects in CJR–X.

Comment: Some commenters raised concerns about including fracture-related THA cases in CJR–X. Commenters stated that hip fracture cases involve elderly, medically complex, and vulnerable beneficiaries whose outcomes, post-acute needs, and long-term disability risks differ from primary arthroplasty populations. They stated that patients with hip fractures are more likely to have complications or readmissions. They also stated that because these procedures are not elective, patients cannot be optimized prior to surgery and hospitals have minimal opportunity conduct presurgical interventions. Specifically, the care pathway redesign strategies that drive cost reduction in elective lower extremity joint replacement episodes, including presurgical patient optimization, scheduled rehabilitation pathways and predictable discharge planning, are not available for fracture patients. Moreover, a patient presenting with an acute hip fracture has a fundamentally different risk profile and post-acute trajectory than an elective joint replacement patient. Commenters stated that including these cases could affect access to clinically appropriate care and treatment decisions.

Response: We acknowledge commenters' concerns regarding hip fracture episodes in CJR–X. We understand that the clinical complexity of beneficiaries discharged under different DRGs or CPT codes is varied. We also recognize that presurgical

[587] Medical Severity Diagnosis Related Groups (MS–DRGs): Definitions Manual. Version 33.0A. 3M Health Information Systems. (October 1, 2015). *https://www.cms.gov/Medicare/Medicare-Fee-for-Service-Payment/AcuteInpatientPPS/FY2016-IPPS-Final-Rule-Home-Page-Items/FY2016-IPPS-Final-Rule-Data-Files.html.*

optimization is not always possible. However, as benchmarking and risk adjustment are applied at the episode-level, the baseline spending for fractures would reflect patient complexity, higher costs, and distinct post-acute care needs associated with fracture-related THA episodes.

Comment: Some commenters questioned the rationale for testing LEJR episodes under TEAM and CJR–X at the same time. Commenters stated that doing so could create methodological inconsistencies and operational confusion. A commenter recommended removing LEJR episodes from TEAM and consolidating LEJR episodes under CJR–X. Other commenters supported excluding TEAM participants from CJR–X specifically to enable a clean comparison of the episode designs.

Response: We recognize commenters' concerns that testing LEJR episodes under both TEAM and CJR–X could create operational confusion or methodological inconsistencies if the same hospitals were subject to both sets of model rules. For that reason, CMS proposed to exclude TEAM participants from CJR–X while TEAM is being tested. As discussed in the proposed rule, TEAM and CJR–X test different LEJR episode designs. Most notably, TEAM tests a 30-day LEJR episode, while CJR–X will continue testing the CJR Model's 90-day episode. Maintaining LEJR in TEAM allows CMS to preserve TEAM's consistent methodology across its five surgical episode categories, while CJR–X allows CMS to continue testing the 90-day episode nationally, rather than only 34 MSAs.

We agree with commenters who supported the proposed exclusion of TEAM participants from CJR–X because it offers greater simplicity and reduced burden. It also allows CMS to compare the effects of different episode durations and other episode designs on Medicare spending and quality. We do not believe it would be appropriate to remove LEJR from TEAM and consolidate all LEJR episodes under CJR–X, because doing so would eliminate the opportunity to evaluate the TEAM episode design. We also note that we will continue to monitor and evaluate TEAM and CJR–X and will consider changes to this policy should data signal alternatives are warranted.

After consideration of the public comments we received, we are finalizing without modification the proposed MS–DRG and HCPCS codes at § 512.625(a) to trigger CJR–X episodes.

(a) Episode Initiation

We proposed that, if a beneficiary meets the beneficiary inclusion criteria at § 512.620, an LEJR episode would begin when a beneficiary is admitted for an anchor hospitalization for one of the following MS–DRGs or an anchor procedure indicated by one of the following HCPCS codes on an outpatient claim (specifically, a hospital's institutional claim for an included outpatient procedure billed through the OPPS):

MS–DRGs and HCPCS–

- 469 (Major joint replacement or reattachment of lower extremity with major complications or comorbidities (MCC))
- 470 (Major joint replacement or reattachment of lower extremity without MCC)
- 521 (Hip replacement with principal diagnosis of hip fracture with MCC)
- 522 (Hip replacement with principal diagnosis of hip fracture without MCC)
- 27447 (Total knee arthroplasty)
- 27130 (Total hip arthroplasty)

We proposed that the episode start date would be the day of the anchor procedure for outpatient procedures and the date of admission for an inpatient hospitalization. However, if an anchor hospitalization is initiated on the same day as or within 3 days of an outpatient LEJR procedure, we proposed to begin the episode on the date of the outpatient procedure rather than the date of the inpatient admission.

We recognize there could potentially be episodes initiated as a result of a beneficiary being transferred from one CJR–X participant hospital to another. In this case, and in alignment with the CJR Model and TEAM, these would be viewed as two separate hospitalizations. Specifically, if the initial inpatient admission is for an MS–DRG in CJR–X, then a transfer to another hospital would not initiate a new anchor hospitalization, rather it would be included in the LEJR episode initiated from the first hospitalization. However, if a beneficiary is admitted to a hospital for an MS–DRG not included in CJR–X and subsequently transferred to another CJR–X hospital, from which they are discharged under an MS–DRG that is included in CJR–X, the second hospitalization would initiate the LEJR episode at the second CJR–X hospital.

We sought comment on our proposal at § 512.630(c) for initiating CJR–X episodes. The following is a summary of the public comments received.

Comment: A few commenters supported using the anchor hospitalization admission date or anchor procedure date to define when an episode begins.

Response: We appreciate commenters' support of this policy.

Comment: A commenter supported alignment with the CJR transfer policy and agreed that linking the transfer admission to the initial hospitalization is appropriate. However, they did recommend that CMS cancel the episode if the discharge MS–DRG from the receiving hospital is not a CJR–X episode trigger. Another commenter requested further clarification of episode attribution when a beneficiary receives an outpatient LEJR procedure at a CJR–X hospital and is then transferred to another CJR–X hospital and admitted for care related to the procedure.

Response: We thank commenters for their support of the policy to continue a CJR–X episode if a beneficiary is transferred to another hospital. As discussed in the proposed rule, once a CJR–X episode is initiated, it will continue for 90-days unless it is canceled in accordance with § 512.630(e). Therefore, the initial CJR–X episode would continue, the transfer to the receiving hospital would be considered a readmission, and the spending for the readmission at the transfer hospital would be attributed to the initial CJR–X episode. The policy is the same for an outpatient procedure that results in an admission to another CJR–X participant.

As we stated in the proposed rule, we will begin an episode on the date of the outpatient procedure if an anchor hospitalization is initiated on the same day as or within 3 days of an outpatient LEJR procedure. Under the CJR Model, there were occasions when anchor hospitalizations for LEJR procedures did not have a corresponding claim for the surgeon. This occurred when a beneficiary underwent an outpatient procedure and was later admitted to the hospital. As an administrative fix for not having a surgeon's claim for the procedure linked to the admission, we did a 3-day lookback to determine when the episode began. We proposed a similar policy for CJR–X. As we stated in the proposed rule, this policy applies to an outpatient procedure that is later converted to an inpatient admission. This policy is distinguishable from and unrelated to the transfer policy, as the admission must be at the same CJR–X participant and for the same episode type. Therefore, we are clarifying the language of the proposed policy to state that it only applies if an anchor hospitalization occurs at the same hospital an anchor procedure and for the same episode type.

After consideration of the public comments we received, we are finalizing without modification the proposal at § 512.630(c) that an episode is initiated by a beneficiary's admission

to a CJR–X participant for an anchor hospitalization that is paid under a MS–DRG specified in § 512.625(a) or an anchor procedure billed under a HCPCS code specified in § 512.625(a) and that the episode start date would be the day of the anchor procedure for outpatient procedures and the date of admission for an inpatient hospitalization. We are finalizing § 512.630(c)(2) with modification to state if an anchor hospitalization is initiated on the same day as or within 3 days of an outpatient procedure for the same episode type at the same CJR–X participant, the episode start date will be that of the outpatient procedure rather than the admission date, and an anchor procedure will not be initiated.

(b) Items and Services Included in the Episode

Like previous episode-based payment models, CJR–X would incentivize comprehensive, coordinated, patient-centered care through inclusive episodes. We proposed to include in the episode all items and services paid under Medicare Part A and Part B during the performance year, unless such items and services fall under an exclusion described in section X.C.2.d.(3)(c) of this final rule.

We proposed to include all Part A services furnished during the 90-day post-discharge period of the episode, other than certain excluded hospital readmissions; to ensure the episode is comprehensive in nature. In particular, we believe that claims for services with diagnosis codes that are directly related to LEJR episodes or the quality and safety of care furnished during the episode (for example, surgical would infection) should be included in an episode. Thus, we proposed at § 512.625(b) that items and services for episodes would include all items and services paid under Medicare Part A and Part B, subject to the exclusions at § 512.625(c). For example, the following is a non-exhaustive list of services included in episodes:

- Physicians' services.
- Inpatient hospital services, including services paid through IPPS operating and capital payments.
- Inpatient psychiatric facility (IPF) services.
- Long-Term Care Hospital (LTCH) services.
- Inpatient Rehabilitation Facility (IRF) services.
- Skilled Nursing Facility (SNF) services.
- Home Health Agency (HHA) services.
- Hospital outpatient services.
- Outpatient therapy services.
- Clinical laboratory services.
- Durable medical equipment.
- Part B drugs and biologics except for those excluded under § 512.625(c).
- Hospice services.
- Part B professional claims dated in the 3 days prior to an anchor hospitalization if a claim for the surgical procedure is not detected as part of the hospitalization because the procedure was performed by the participant on an outpatient basis but the patient was subsequently admitted as an inpatient.

These items and services are similar to those included in the CJR Model and reflect the full range of Medicare-covered services that would be furnished to a CJR–X beneficiary during an episode. As joint replacement episodes frequently involve services across multiple providers and settings, we believe excluding these services would fragment financial accountability and undermine the model's ability to promote care coordination and cost containment. Moreover, including these services aligns incentives for hospitals to manage transitions of care, post-acute utilization, and complication-related services.

We sought comment on the items and services we did propose to include in CJR–X at § 512.625(b). The following is a summary of the public comments received.

Comment: A commenter supported the proposed broad accountability structure for Medicare Part A and Part B spending during the recovery period, subject to specified exclusions, because it could encourage coordinated recovery management.

Response: We appreciate the commenter's support for a broad episode accountability structure. We proposed to include most Medicare Part A and Part B items and services furnished during the episode, subject to specified exclusions, because LEJR episodes often involve care across multiple providers and settings. We believe this approach will support comprehensive, coordinated, patient-centered care and reduce fragmentation during the recovery period.

Comment: Some commenters urged CMS to provide additional clarity on which services would be included in a CJR–X episode. Commenters recommended that CMS include only services clinically related to the LEJR procedure. Another commenter asked for clarification on whether emergency department visits or hospital admissions during a CJR–X episode would be included in the episode or if they would initiate a new episode. Another commenter stated that CMS should consider only specific MS–DRGs when considering whether a readmission is attributed to the episode, as many readmissions from post-acute care facilities and providers are well outside the direct control of the CJR–X participant.

Response: We acknowledge requests for additional clarity regarding the items and services included in a CJR–X episode. We proposed a broad episode definition that would include all Medicare Part A and Part B items and services furnished during the episode, unless the item or service is among the exclusions in section X.C.2.d.(3)(b) of this final rule. We elected to adopt this broad policy because joint replacement episodes frequently involve care across multiple providers and settings and because excluding services could fragment accountability. We will maintain the exclusions lists on the CJR–X website at *https://www.cms.gov/priorities/innovation/innovation-models/cjr-x.*

Comment: Some commenters stated that unintentional inclusion of trauma-related or other unrelated high-cost services could distort target prices, dilute episode accountability, and undermine the model's ability to reward efficiency in joint replacement care. Commenters requested that CMS clarify guardrails so that unrelated costs do not inflate benchmarks or create financial volatility for participants. A commenter stated that including high cost therapy, such as IVIG for primary immunodeficiency, CIDP, or other chronic conditions in episode spending could create inappropriate financial pressure on hospitals to manage, defer, or substitute necessary unrelated therapy. Another commenter stated that by including post-acute care delivered in a critical access hospital, CMS is unfairly comparing the episode costs of rural populations against those of urban populations. Specifically, CAH swing beds and outpatient services are paid higher rates than those paid under SNF and PFS payment systems.

Response: We appreciate commenters' concerns about the potential inclusion of trauma-related, chronic-condition-related, rural post-acute care, or other high-cost services in episode spending. We recognize that commenters are concerned that such spending could introduce volatility, dilute accountability, or create inappropriate incentives regarding services that are clinically necessary but not directly related to the LEJR procedure. However, we have generally included all Medicare Part A and Part B spending during the episode because a central purpose of the model is to test whether hospitals can

improve coordination, quality, and efficiency across the full episode of care.

Nevertheless, we believe the model includes safeguards to help address these concerns. Where we have determined that an exclusion is appropriate, those services are added to the exclusions list and removed from spending calculations. With respect to high-cost services that are not on the exclusions lists, including services associated with trauma, chronic conditions, IVIG therapy, or post-acute outpatient care in rural settings, we note that the target price methodology is based on historical spending for comparable episodes. As a result, high-cost services that occur in the performance year are not considered only on one side of the calculation; comparable outlier costs are also present in the historical baseline and are therefore reflected in the benchmark used to establish target prices. This helps mitigate the concern that participants would be measured against benchmarks that do not account for historical episode spending variation.

For these reasons, we believe the proposed episode and pricing methodology appropriately balances episode accountability with protections against undue volatility, including by reflecting historical outlier costs in the benchmark. We will continue to monitor episode spending patterns, including high-cost services and rural post-acute care utilization, as part of model oversight and will revisit the exclusions lists when warranted.

Comment: A commenter recommended expanding the episode to include pre-operative therapy as related to surgical preparation and recovery planning furnished in the weeks before the anchor surgery. Another commenter encouraged CMS to consider coverage of other services in the bundle that would enable care at home, including custodial care and other activities of daily living support, caregiver training codes, and virtual care services such as telehealth, remote physiologic monitoring, or remote therapeutic monitoring.

Response: We appreciate the recommendation to include certain pre-operative therapy interventions connected to the anchor surgery. However, two of the benefits of CJR–X and other episode-based payment models are clear, easily identifiable triggers for initiating episodes and concrete rules for defining what is included in the episode. We believe that retroactively identifying therapy services delivered before a triggering event as prehabilitation or optimization in preparation of an upcoming surgery, rather than a continuation of previous conservative treatment, would not be consistently achievable on a large scale.

We appreciate the value of home-based care and note that virtual care services, such as telehealth, remote physiologic monitoring, or remote therapeutic monitoring, are included items and services in CJR–X. However, expanding Medicare coverage of items and services not currently authorized, such as custodial care, is out of scope for this rulemaking. Should Medicare expand Part B coverage to additional services supporting home-based care, such services would be included in CJR–X episodes, unless the services fall under the episode exclusions.

After consideration of the public comments we received, we are finalizing without modification the proposal at § 512.625(b) to include in a CJR–X episode all items and services paid under Medicare Part A and Part B, subject to the exclusions at § 512.625(c).

(c) Excluded Items and Services

We proposed to exclude from episodes certain Part A and B items and services that are clinically unrelated to an LEJR procedure. The exclusions would be applicable to episodes included during the baseline period, the three-year historical period used to construct target prices, as described in section X.C.2.f.(3)(a) of this final rule, and episodes initiated during a performance year. We proposed to use these exclusions based on several years of experience with them and their suitability for LEJR episodes. The rationale for the exclusions is consistent with the CJR Model (80 FR 73303) and TEAM (89 FR 69722) but differ slightly from both.

We proposed to exclude from episodes all Part A and B items and services for hospital admissions and readmissions, for both the baseline period and performance years, for specific categories of diagnoses, such as oncology, trauma medical admissions, organ transplant, and ventricular shunts determined by MS–DRGs, as well as all of the following excluded Major Diagnostic Categories (MDC):[588]

- MDC 02 (Diseases and Disorders of the Eye)
- MDC 14 (Pregnancy, Childbirth, and Puerperium)
- MDC 15 (Newborns)
- MDC 25 (Human Immunodeficiency Virus)

We proposed to exclude from episodes IPPS new technology add-on payments for drugs, technologies, and services identified by value code 77 on IPPS hospital claims for episodes in the baseline period and performance years.[589] New technology add-on payments are made separately and in addition to the MS–DRG payment under the IPPS for specific new drugs, technologies, and services that substantially improve the diagnosis or treatment of Medicare beneficiaries and would be inadequately paid under the MS–DRG system. We believe this exclusion would reduce the potential for CJR–X to diminish beneficiaries' access to new technologies or burden hospitals with concern about the payments for these new drugs, technologies, or services counting toward CJR–X participants' actual episode spending. Additionally, new drugs, technologies, or services approved for the add-on payments vary unpredictably over time in their application to specific clinical conditions. In addition, maintaining this exclusion from CJR–X episodes would align with the CJR Model (80 FR 73303 through 73304 and 73315).

We also proposed to exclude from episodes OPPS transitional pass-through payments for medical devices as identified through OPPS status indicator H for episodes in the baseline period and performance years. Through the established OPPS review process, we have determined that these technologies have a substantial cost but also lead to substantial clinical improvement for Medicare beneficiaries. This is consistent with the CJR Model final exclusions policy (80 FR 73308 and 73315).

We proposed to exclude hemophilia clotting factors (§ 412.115), identified through HCPCS code, diagnosis code, and revenue center on IPPS claims for episodes in the baseline period and performance years. In contrast to other drugs and biologics that are administered during an inpatient hospitalization and paid through the MS–DRG, hemophilia clotting factors are paid separately by Medicare in recognition of clotting factors being costly, yet essential, to care for certain beneficiaries. Because we do not believe that there are any spending efficiencies to be gained by including hemophilia clotting factors, we proposed to exclude these high-cost drugs from episodes initiated during the baseline period and performance year.

[588] MDCs are formed by dividing all possible principal diagnoses (from ICD–10–CM) into 25 mutually exclusive diagnosis areas. The diagnoses in each MDC correspond to a single organ system or etiology and in general are associated with a particular medical specialty.

[589] This exclusion is applied during the payment standardization process.

We also proposed to exclude from episodes certain Part B payments for high-cost drugs and biologics, low-volume drugs, and blood clotting factors for hemophilia patients billed on outpatient, carrier, and durable medical equipment claims for episodes in the baseline period and initiated in the performance years.[590] These high-cost items are essential to appropriate care of certain beneficiaries and we do not believe including them in the episode would improve any spending or quality of care efficiencies. Specifically, the list would include all of the following:

- For episodes included during the baseline period—

++ Drug/biologic HCPCS codes that are billed in fewer than 31 episodes in total across all episodes in CJR–X during the baseline period;

++ Drug/biologic HCPCS codes that are billed in at least 31 episodes in the baseline period, and have a mean allowed cost of greater than $25,000 per episode in the baseline period; and

++ HCPCS codes corresponding to clotting factors for hemophilia patients, identified in the quarterly average sales price file for certain Medicare Part B drugs and biologics as HCPCS codes with clotting factor = 1, HCPCS codes for new hemophilia clotting factors not in the baseline period, and other HCPCS codes identified as hemophilia.[591]

- For episodes initiated during a performance year, in addition to those listed in the previous bullet, Part B payments for high-cost drugs and biologics, low-volume drugs, and blood clotting factors for hemophilia billed on outpatient, carrier, and durable medical equipment (DME) claims, including, but not limited to—

++ Drug/biologic HCPCS codes that were not included in the baseline period, and appear in 10 or fewer episodes in the performance year;

++ Drug/biologic HCPCS codes that were not included in the baseline period, appear in more than 10 episodes in the performance year, have a mean cost of greater than $25,000 per episode in the performance year;

++ Drug/biologic HCPCS codes that were not included in the baseline period, appear in more than 10 episodes in the performance year, have a mean cost of $25,000 or less per episode in the performance year, and correspond to a drug/biologic that appears in the baseline period list but was assigned a new HCPCS code between the baseline period and performance year; and

++ HCPCS codes for new hemophilia clotting factors not in the baseline period.

Complete lists of excluded MS–DRGs for readmissions and excluded HCPCS codes for Part B services furnished during episodes after beneficiary discharge from an anchor hospitalization will be posted on the CMS CJR–X web page within the Innovation Center website at *https://innovation.cms.gov.* The methodology to identify excluded items and services would apply to all performance years of the model, and lists would be shared with CJR–X participants on the CJR–X web page around the time preliminary target prices are released. Lists would be updated after the performance year concludes to account for the performance year exclusions proposed in the previous paragraph. We proposed that revisions to the exclusion lists, such as adding MS–DRGs not covered by oncology, trauma medical admissions, organ transplant, and ventricular shunts, would be initiated through notice and comment rulemaking to allow for public input.

We sought comment on the proposed excluded services, the lists of excluded services, and the process for updating the lists of excluded services at §§ 512.625(c), (d), and (e). The following is a summary of the public comments received.

Comment: A commenter supported the exclusion of certain categories of unrelated services, including specified oncology, trauma, transplant, ventricular shunt, and related major diagnostic categories. Another commenter agreed with excluding trauma-related and other unrelated high-cost services, as their inclusion could distort target prices, dilute episode accountability, and undermine the model's ability to reward efficiency in joint replacement care. Another commenter requested more information on what is considered a ''trauma medical'' exclusion.

Response: We thank commenters for their support of an episode exclusion policy. We also recognize that the ''trauma medical'' terminology may cause confusion. In aligning with the CJR Model, we adopted similar episode exclusions, including the ''trauma medical'' exclusion at § 510.200(d)(4)(i)(B). However, we believe this language to be an artifact of MS–DRG and ICD coding changes that have occurred, particularly since the CJR exclusions lists included both medical and surgical trauma MS–DRGs. Therefore, we are updating the language to encompass all trauma admissions that would be considered unrelated to the episode.

Comment: Some commenters requested that CMS publish the complete excluded-service lists, with rationale for each exclusion, and operational processes for identifying and removing unrelated services from episode spending. A commenter also asked CMS to publish the methodology for determining readmission exclusions and establish a participant petition process by which CJR–X participants can request additional exclusions based on clinical evidence.

Response: CJR–X excludes certain items and services that are clinically unrelated to the LEJR procedure, or that are high-cost, low-volume, separately paid, or unpredictable in ways that would not create meaningful opportunities for care redesign or spending efficiency. For example, CJR–X excludes hemophilia clotting factors and certain hospital readmissions, such as a readmission for oncology, given their high cost and not being clinically related to the LEJR procedure. Additionally, CJR–X excludes new technology add-on payments and transitional pass-thru payments because these are temporary payments that we do not want to discourage adoption of.

Further, CJR–X aims to limit the items and services excluded from an episode in an effort for episode spending to be close to total-cost-of care. Given this principle, we are continuing a similar exclusion framework used in the CJR Model and other episode-based payment models for CJR–X. We believe the list of exclusions, which was developed through a collaborative effort between CMS and external stakeholders and informed by several years of experience testing episode-based payment models, appropriately captures the items and services that may be unrelated to the episode. We believe this approach would hold CJR–X participants accountable for services they can reasonably influence during the episode while avoiding accountability for unrelated or atypical services that do not reflect the quality or efficiency of LEJR care.

The lists of exclusions will be maintained on the CJR–X website at *https://www.cms.gov/priorities/innovation/innovation-models/cjr-x.* We intend to publicly post the CJR–X exclusions list closer to the time when CMS constructs preliminary target prices. We cannot publish the complete CJR–X exclusions list at this time because certain items and services on the exclusions list are based on how frequently they appear during the

[590] To determine if a drug HCPCS meets the cost or volume thresholds for exclusion, the episodes are pooled across all episode categories.

[591] *https://www.cms.gov/medicare/payment/all-fee-service-providers/medicare-part-b-drug-average-sales-price/asp-pricing-files.*

baseline period. For performance year 1, the baseline period is CY 2024 through CY 2026, and CY 2026 has not yet concluded. Therefore, the complete baseline-period claims experience needs to finish with sufficient claims runout before we can publish the full exclusions list for CJR–X.

Comment: Some commenters recommended that CMS consider additional exclusions to address variable clinical characteristics and resource needs. A commenter requested that CMS reconsider exclusions, carve-outs, or separate benchmarking approaches for clearly atypical or highly complex episodes. Another commenter stated that non-elective and emergent episodes have materially different clinical characteristics and resource requirements than elective joint replacement procedures. Another commenter recommended excluding joint revision procedures or placing them in a separate category because revision cases may have greater clinical complexity, higher complication risk, and more variable costs than primary joint replacements. Another commenter stated CMS should carve out episodes with periprosthetic joint infections from the standard episode. They stated that hospitals should be held accountable for infections that present up to 12 months after the surgery and that the current episode construction would miss these complications.

Response: We recognize that LEJR episodes can vary in clinical complexity, complication risk, and resource use. The proposed CJR–X methodology is intended to account for this variation through the episode definition, separate MS–DRG episode types, risk adjustment, and outlier protections, rather than by excluding broad categories of clinically complex cases from the model. CJR–X episodes would be initiated using specified MS–DRGs and HCPCS codes, including separate inpatient episode types that reflect major complications or comorbidities and hip fractures. We also proposed risk adjustment and normalization to account for beneficiary-level factors that affect episode spending, as discussed in section X.C.2.f.(4) of this final rule.

We disagree that excluding all non-elective, emergent, or otherwise complex episodes would be appropriate for CJR–X. We believe excluding broad categories of higher-complexity episodes could reduce the comprehensiveness of the model, weaken accountability for care coordination, and create operational complexity in identifying which cases should or should not be included. The model is designed to test accountability for the full LEJR episode of care, including post-acute care, transitions of care, and complications that may arise following the anchor hospitalization or procedure, while excluding certain clinically unrelated items and services where appropriate. That said, we do note that CJR–X episode identification does not include revision joint replacement DRGs.

We also note that the pricing methodology includes protections for unusually high-cost episodes, through a high-cost outlier cap to both baseline episode spending and performance year episode spending, as discussed in section X.C.2.f.(5)(g) of this final rule. In addition, outlier costs are not considered only in the performance year; comparable high-cost episodes are also present in the historical baseline and are reflected in the benchmark. This approach helps prevent high-cost outlier spending from artificially inflating benchmarks while also limiting participant responsibility for catastrophic episode spending that hospitals could not reasonably have been expected to prevent.

We acknowledge the commenter's concern that prosthetic joint infections may arise after the proposed CJR–X episode ends. However, extending accountability to 12 months for a specific complication category would represent a substantial departure from the CJR Model and proposed CJR–X Model. Moreover, the retrospective identification of episodes with delayed or late infections would add significant operational complexity to pricing, reconciliation, quality measurement, and overlap policies. However, we will continue to monitor complications associated with LEJR episodes and episode spending patterns for clearly atypical and highly complex cases as part of model oversight. Should we consider additional model refinements, they will be proposed through future notice-and-comment rulemaking if warranted.

Comment: A couple of commenters recommended excluding critical care transport including by air ambulance. A few commenters recommended excluding patients that are discharged to hospice. A commenter recommended excluding patients leaving against medical advice.

Response: We acknowledge these requests but disagree that these services warrant exclusions. These services reflect discharge dispositions that would be reflected in the baseline spending when determining target prices and would, therefore, not artificially penalize participants.

Comment: Some commenters requested additional exclusions for services that are not clinically related to the LEJR episode. Several commenters were concerned that unrelated services, including trauma-related costs, chronic dialysis services, and high-cost chronic maintenance therapies would be attributed to the CJR–X episode despite no clinical relationship to the joint replacement or recovery. Another commenter requested exclusions for substance use disorder treatment, including inpatient psychiatric facility services, chronic conditions, such as auto-immune disorders, and previously existing wounds or pressure ulcers. A commenter stated such services should be excluded from episode spending calculations to avoid penalizing hospitals that serve medically complex patient populations. Another commenter recommended broader protections for unrelated spending because a 90-day episode could still capture unrelated post-acute utilization.

Several commenters recommended CMS exclude Part B payments for drugs and biologicals that are for diagnoses unrelated to the anchor procedure or hospitalization, whether the patient was receiving them prior to the anchor or started during the post-discharge period. Several commenters recommended excluding all infusion services. Another commenter recommended that CMS explicitly exclude all items related to oncology and cancer-related treatment cases, as these treatments lack Medicare savings potential. The commenter stated that excluding oncology treatments will help ensure that performance measurements and financial accountability remain fair and clinically appropriate. Another commenter recommended an exclusion for Fracture Liaison Services (FLS) for osteoporotic patients, which they stated are widely underutilized despite their demonstrated value in reducing secondary fractures. They stated uptake of these services would be further disincentivized as they would be largely absent from the historical spending data used in setting target prices for LEJR episodes. The commenter asked that CMS work with stakeholders to develop flexibilities or a pathway that encourages FLS adoption and actively monitor hospitals to ensure that FLS uptake is not discouraged or delayed due to financial pressures imposed by the CJR–X Model.

Response: We acknowledge commenters' concerns that certain services furnished during the episode may be unrelated to the joint replacement and could affect episode spending for hospitals treating

medically complex beneficiaries. CJR–X episodes will include all Medicare Part A and Part B items and services furnished during the episode, subject to specified exclusions for clinically unrelated services, including certain readmissions and high-cost Part B drugs and biologicals. The lists of exclusions will be maintained on the CJR–X website at *https://www.cms.gov/priorities/innovation/innovation-models/cjr-x.* We proposed this inclusive approach because broad exclusions could fragment accountability for care coordination, post-acute care, and complication management. We also recognize commenters' requests for additional exclusions for other services they view as unrelated to LEJR care, and may take these recommendations under consideration should we draft future rulemaking.

Comment: Several commenters urged CMS to adopt cost exclusions for the IceMan device and other non-opioid pain management treatments. Commenters stated the Non-Opioid Policy for Pain Relief (NO PAIN) Act provides for temporary additional payments for certain non-opioid treatment for pain relief under the Medicare hospital OPPS and ASC Payment System. They stated that, similar to other transitional pass-through payments, CJR–X should exclude the cost of these medical devices from the episode to ensure beneficiary access to these critical therapies.

Response: We support efforts to improve access to alternative pain control options that reduce the need for opioid treatment. We also appreciate the recommendation to exclude non-opioid therapies from the episode. Section 4135 of the Consolidated Appropriations Act, (CAA), 2023, also known as the NO PAIN Act, which amended section 1833(t)(16) and section 1833(i) of the Act, provides temporary additional payments for certain non-opioid treatments for pain relief which are authorized in the HOPDs and ASCs on or after January 1, 2025 and before January 1, 2028. Because we are finalizing a January 1, 2028 start date for CJR–X, we don't anticipate any policy overlap or need for an additional exclusion.

After consideration of the public comments we received, we are finalizing with modification the proposal at § 512.625(c) to exclude from CJR–X episodes certain Part A and B items and services that are clinically unrelated to an LEJR procedure or essential to appropriate care of certain beneficiaries. Specifically, we are updating § 512.625(c)(1)(i)(B) to say ''Trauma unrelated to the CJR–X episode'' rather than the proposed ''Trauma medical.'' We are also finalizing, without modification, the proposal at § 512.625(d) to post the lists of excluded services on the CJR–X website and the process at § 512.625(e) for updating the lists of excluded services.

(d) Episode Duration

We proposed that episodes would cover the surgical procedure and a subsequent period that is marked by significant post-acute care needs, potential complications of surgery, and short-term, intense management of chronic conditions that may be destabilized by a joint replacement. We believe that hospitals have substantial ability to influence the quality and efficiency of care that Medicare beneficiaries receive over the weeks and months following a procedure. For this reason, the CJR Model utilized a 90-day post-discharge episode duration. It is during this period that beneficiaries are provided the most intensive care for their recovery, including physical therapy and interventions to prevent complications. Notably, the professional payments to the surgeon under the Physician Fee Schedule for the procedures included in LEJR are also paid as a global payment covering a 90-day period.

The 90-day episode tested under the CJR Model demonstrated savings while maintaining quality, although some stakeholders have stated a shorter episode length would be more appropriate. Specifically, shorter episodes exhibit less spending variability due to medical events outside the intended scope of the model and conditions unrelated to the joint replacement become more prevalent in the later stage of an episode. In addition, longer episodes increase the potential for ACO overlap (where a beneficiary aligned or assigned to an ACO has an episode included in CJR–X). In the TEAM final rule (89 FR 69727), we agreed that a 30-day episode could position the specialist as the principal provider near the anchor event with a hand-off back to the primary care provider for longitudinal care management and we believe that ACOs are better equipped to address the population health needs of Medicare beneficiaries. For these reasons, the Innovation Center is currently testing a 30-day episode duration in TEAM. Through future evaluations and direct comparison between TEAM and CJR–X, we can determine the optimal episode length to balance spending reductions and outcomes.

Based on the rationale noted earlier, we proposed to end episodes 90 days after discharge from the anchor hospitalization or anchor procedure and that day 1 of the 90-day post-acute portion of the episode is the date of the anchor procedure or the date of discharge from an anchor hospitalization. To the extent that a Medicare payment for services included in an episode spans a period of care that extends beyond the episode duration, we proposed that these payments would be prorated so that only the portion attributable to care during the fixed duration of the episode is attributed to the episode spending.

We sought comment on our proposal at § 512.630(d) to maintain a 90-day post-discharge episode length. The following is a summary of the public comments received.

Comment: Many commenters recommended that CMS shorten the proposed CJR–X episode from 90 days to 30 days. They stated that hospitals have the greatest ability to influence surgical recovery, discharge planning, early complications, and readmissions during the first month after discharge. Commenters expressed concern that a longer episode window may hold hospitals accountable for unrelated medical events, chronic conditions, and less controllable factors, such as social risk. Several commenters also stated that a 30-day window would align CJR–X with TEAM and other Medicare programs and reduce operational burden, financial exposure, and potential access concerns. A commenter stated that holding hospitals responsible for the costs of care for every comorbid condition in 90 days will result in rationing and poorer outcomes for patients. Another commenter stated that patients will need to delay care for other issues and visits with other providers for 90 days after the procedure.

Response: We acknowledge commenters' concerns that a 90-day episode may capture spending later in the recovery period that commenters view as less controllable by the hospital. In fact, we believe the longer episode is beneficial as it will capture later complications and increased management needs for chronic conditions that are directly linked to the care delivered during the early days of the episode. A shorter episode would not capture these complications. We also remind readers that care delivered for chronic comorbid conditions is captured in the risk adjustment and baseline spending used in constructing target prices and participants would not

be penalized for delivering such care to beneficiaries.

We continue to believe hospitals have substantial ability to influence the quality and efficiency of care furnished during the later stages of the post-acute period through discharge planning, care coordination, physical therapy, and post-acute care management. The CJR Model evaluation demonstrated that 90-day episodes were successful for providing adequate incentives to engage hospitals in care redesign and greater engagement with beneficiaries and post-acute care providers. The 90-day duration maintains continuity with the tested CJR approach and allows us to compare results with TEAM, which tests a shorter episode duration.

Importantly, we are not ruling out the effectiveness of a 30-day episode and are testing TEAM for that very reason. We purposely designed TEAM to differ from the CJR Model, and by extension CJR–X, so that it could be adequately evaluated. We aligned with TEAM for many of the risk adjustment and other policies, but total alignment would undermine the TEAM test. Testing CJR–X and TEAM concurrently will provide a unique opportunity to understanding episode length and identify whether a certain length may be more effective at reducing complications, improving outcomes, and lowering spending. However, we believe it is important to adopt the same episode length that was tested in the CJR Model for CJR–X at this time.

Finally, we do not believe patients will delay care as that was not the case for the CJR Model or BPCI–A, both of which used 90-day episodes. Moreover, we have post-episode spending safeguards in place to ensure this does not happen, as discussed in section X.C.2.f. (5)(h) of this final rule. After consideration of the public comments we received, we are finalizing without modification the proposal at § 512.630(d) to utilize a 90-day post-discharge episode length.

(e) Episode Termination

Similar to the CJR Model, we proposed that, once an episode begins, the episode would continue until the end of the episode as described in section X.C.2.d.(3)(d) of this final rule, unless the episode is cancelled for certain reasons.

First, an episode would be canceled if the beneficiary ceases to meet any of the general beneficiary inclusion criteria described in section X.C.2.c. of this final rule. When a beneficiary's status changes during the episode, the episode target price would still reflect full payment for the episode. However, we would not have full Medicare episode payment data for the beneficiary to reconcile against the target price. Therefore, the episode would be canceled.

Second, in the case that a beneficiary has a subsequent inpatient admission for an episode on the same day as or within 3 days of an outpatient LEJR procedure, the outpatient episode would not initiate an anchor procedure and the outpatient procedure would instead initiate an anchor hospitalization. That is, the anchor hospitalization start date will be that of the outpatient procedure. We proposed this policy because we believe that an inpatient episode should take precedence over an outpatient procedure performed on the same day, given the likelihood of higher spend associated with the inpatient episode and potential for higher clinical acuity.

Third, we proposed to cancel the episode if a beneficiary dies at any point during the CJR–X episode. As discussed in the EPM proposed rule (81 FR 50841), we consider mortality to be a harmful beneficiary outcome that should be targeted for improvement through care redesign. We also believe holding participants responsible for episodes during which a beneficiary dies could encourage participants to actively reduce beneficiaries' risk of death. However, we acknowledge that the likelihood that a death that is unrelated to an LEJR procedure occurs is increased the further out from the anchor procedure or anchor hospitalization. Therefore, we believe that holding participants responsible for death during a 90-day episode would create too much uncertainty and variability for participants.

We note that TEAM only cancels episodes if death occurs during the anchor hospitalization or anchor procedure, but not if the death occurs in the post-discharge period (89 FR 69730). As we discussed in the CJR final rule (80 FR 73318), there would be limited incentive for efficiency that could be expected when death occurs during the anchor hospitalization itself. We considered aligning the CJR–X policy with TEAM but believe while this policy is appropriate for a 30-day episode where the cause of death during the post-discharge period is more likely to be related to the index procedure, it is inappropriate for than in a 90-day episode. Therefore, we did not propose for CJR–X to only cancel episodes for a death that occurs during the anchor hospitalization or anchor procedure. Rather, we would cancel any episode during which a death occurs during the anchor hospitalization, anchor procedure, or post-discharge period.

Finally, we proposed that episodes subject to extreme and uncontrollable circumstances (EUC) would be canceled, meaning that the services associated with the episode would continue to be paid through Original Medicare, but the episode would not be reconciled against a target price. We proposed to base the CJR–X EUC definition on the definition finalized in the CJR 2018 final rule (83 FR 26604), which was designed to address the extreme and uncontrollable costs associated with natural disasters such as hurricanes, flooding, and wildfires. Specifically, we proposed that the EUC policy would apply to CJR–X participants with a CCN address located in a county where both: (1) a major disaster has been declared under the Stafford Act; and (2) section 1135 waivers have been issued. We believe that it is appropriate for our EUC policy to apply only in the narrow circumstance of a major disaster, which is catastrophic in nature and tends to have significant impacts on infrastructure, rather than the broader grounds for which an emergency could be declared.

We considered alternative approaches to EUC policy that would allow mandated participants to meet the model's objectives when one or more campuses of a hospital system is in a disaster area but would fail to meet the requirements set forth here. Specifically, we recognize that some hospital systems span across regions or state lines and a location that is not identified by the ''CCN address'' could be in a disaster area. Therefore, we considered alternative methods of identifying CJR–X participants at an individual level using NPI, TIN, or a combination of CCN and another identifier. However, we proposed to continue using CCN address until and unless an alternative is determined to be appropriate. We also stated that any potential change to the identification method used for the EUC policy would first be proposed through notice and comment rulemaking.

Separately, we acknowledge that stakeholders have requested that emergency flexibilities be extended to cybersecurity attacks. We also realize that the difficulties such a scenario would cause for CJR–X participants would extend well beyond this model. Therefore, we would consider conforming to any future CMS policy that addresses emergent cybersecurity issues, as needed, through future notice and comment rulemaking.

We acknowledge this EUC policy deviates from how the CJR Model

addressed the COVID–19 PHE which fell under a major disaster declaration. During the PHE, the CJR Model effectively waived downside risk, which resulted in substantial losses to Medicare. We believe canceling the episode, rather than waiving downside risk, is a better long-term policy to avoid significant risk to the government, while maintaining flexibility for the CJR–X participant. In regard to determining the start date of episodes to which the EUC would apply, we believe that episodes initiated during an emergency period or in the 30 days before the start date of an emergency period (as defined in section 1135(g) of the Act) should reasonably capture those beneficiaries whose high episode costs could be attributed to extreme and uncontrollable circumstances.

We also proposed canceling a CJR–X episode if the beneficiary is in in the 30-day post-discharge period following a TEAM anchor hospitalization or anchor procedure (that is, for an episode at a non-CJR–X hospital). Further discussion of this proposal is discussed in section X.C.2.h.(2) of this final rule.

In summary, we proposed that the following circumstances would cancel an episode:

- The beneficiary no longer meets the criteria for inclusion.
- The beneficiary dies during the episode.
- The CJR–X participant is subject to the EUC policy.
- The beneficiary is in a TEAM episode and has a LEJR procedure at a CJR–X participant during the 30-day post-discharge period after a TEAM anchor hospitalization or anchor procedure.

When an episode is canceled, we proposed that the services furnished to beneficiaries prior to and following the episode cancellation would continue to be paid by Medicare as usual but there would be no episode spending calculation that would be reconciled against the target price (see section X.C.2.f.(5) of this final rule). As discussed in section X.C.2.j. of this final rule, waivers of program rules applicable to beneficiaries in episodes would apply to the care of beneficiaries who are in episodes at the time the waiver is used to bill for a service that is furnished, even if the episode is later canceled.

We sought comment on our proposal at § 512.630(e) to cancel episodes once they have begun but prior to the end of the 90-day post-discharge period under certain conditions. The following is a summary of the public comments received.

Comment: Many commenters asked that CMS clarify how CJR–X would handle overlapping or subsequent LEJR episodes during an active 90-day episode. Commenters described situations involving staged bilateral procedures, a second joint replacement, or overlap between CJR–X and TEAM episodes. Many commenters recommended that CMS follow prior CJR Model policy by canceling or ending the first episode when a subsequent qualifying procedure begins a new episode. Commenters stated that clear precedence rules are necessary for attribution, reconciliation, quality measurement, beneficiary notices, and operational administration.

Response: CMS appreciates requests for clear rules for subsequent and overlapping LEJR episodes. We proposed that once an episode is initiated, all Medicare Part A and B services, with some exceptions, would be included in the episode until the episode ends 90-days post-discharge, or until the episode is canceled in accordance with § 512.630(e).

We acknowledge the need for a policy that addresses a subsequent CJR–X LEJR procedure during the course of an CJR–X LEJR episode. We recognize that it is common for a beneficiary to receive a joint replacement and then undergo a second joint replacement during the 90-day post-discharge period and our intention is to maintain the CJR Model policy without modification. In the CJR Model, if a beneficiary was readmitted for another LEJR procedure during a CJR episode, such as occurs for a staged contralateral procedure, we stated our belief that it would not be appropriate to include both episodes in the model with overlapping time periods. Therefore, we canceled the first LEJR episode and allowed the subsequent LEJR procedure to initiate a new episode, superseding the first.

We recognize that TEAM does not have a policy to cancel one of the episodes when two episodes overlap and there may be instances when a beneficiary may have a subsequent admission for a second TEAM LEJR episode during the 30-day discharge period. Our belief is that such occurrences will be infrequent within TEAM's shorter 30-day episode, assuming the need for beneficiaries to be medically optimized before undergoing a second procedure. However, with a 90-day CJR–X episode, we believe a second LEJR procedure during the post-discharge period will be a more frequent occurrence and it may be more appropriate to cancel the first LEJR episode, consistent with original CJR policy. While we are not finalizing a policy for a second LEJR episode at this time, we may address these situations in future rulemaking.

With respect to episode overlap between CJR–X and TEAM, we proposed to allow the first episode initiated to continue and not initiate a subsequent episode. That is, we proposed to cancel a CJR–X episode that is initiated for a beneficiary that is already in the 30-day post-discharge period of a TEAM episode and allow the spending for the procedure at the CJR–X hospital to be included in the TEAM episode. We note that the overlap policy would apply to any TEAM episode category and is not limited to LEJR episodes. The CJR–X overlap policy is discussed in greater detail in section X.C.2.h.(2) of this final rule. Similarly, as discussed in section X.A.2.a.(3) of this final rule, if a beneficiary is in a CJR–X episode and has a subsequent procedure during the 90-day post-discharge period, the procedure would not initiate a TEAM episode and any spending from that procedure would be included in the CJR–X episode.

Comment: A couple of commenters appreciated the inclusion of an EUC policy. A few commenters requested that CMS also include a cybersecurity-related EUC flexibility. A commenter stated that the prevalence and sophistication of security risks is increasing with the advent of AI and the attacks are both disruptive and take considerable time to remedy.

Response: We appreciate support for the EUC policy. The COVID–19 PHE was an unprecedented situation and policy choices made during that time warranted changes for future situations. We acknowledge that the CJR EUC policy only covered major disasters, although other circumstances, such as cyberattacks, could be equally disruptive to hospital operations. We stated in the proposed rule that such disruptions would likely extend beyond the CJR–X and indicated our intention to conform to CMS policy that would expand the EUC to other instances outside of the control of the CJR–X participant. We stated we would consider changing the policy to address emergent cybersecurity issues, as needed, through future notice and comment rulemaking. However, in light of comments received we are finalizing the addition of cyberattacks to the EUC policy. Similar to policies for the Quality Payment Program at § 414.1380(c)(2)(i)(C), the MSSP, and the Ambulatory Specialty Model at § 512.780(a) to allow CMS to determine, based on information known to the Agency prior to the beginning of the relevant reconciliation calculation for

the performance year in which the cyberattack occurred, that data for a CJR–X participant are inaccurate, unusable, or otherwise compromised due to circumstances outside of the control of the CJR–X participant and its agents, including third-party intermediaries.

Comment: A commenter proposed that CJR–X episodes be canceled if a beneficiary receives any services at a swing bed, outpatient CAH or Rural Health Clinic during the 90-day episode.

Response: We acknowledge the commenter's recommendation, but do not believe that CJR–X episodes should be canceled solely because a beneficiary receives services from a swing bed, outpatient CAH, or Rural Health Clinic during the 90-day episode; excluding such episodes could remove clinically appropriate rural care from episode accountability and reduce the model's ability to evaluate LEJR care across the full post-discharge period.

After consideration of the public comments we received, we are finalizing with modification the proposal at § 512.630(e) to cancel episodes and not perform an episode spending calculation for reconciliation against the target price if the beneficiary no longer meets the criteria for inclusion at § 512.620; the beneficiary dies during the episode; the CJR–X participant is subject to the EUC policy, including due to a cyberattack; or the beneficiary is in a TEAM episode and has a LEJR procedure at a CJR–X participant during the 30-day post-discharge period after a TEAM anchor hospitalization or anchor procedure.

e. Quality Measures and Scoring

(1) Background

The Medicare Modernization Act of 2003, the Affordable Care Act of 2010, and the Tax Relief and Healthcare Act of 2006 led to the implementation of several hospital quality reporting programs where payment reflects the quality of care delivered to Medicare beneficiaries. The CJR Model also tied quality to payment. We believe that future episode-based payment models, including CJR–X, should continue to link quality and payment to ensure ongoing incentives to improve patient outcomes and lower health care spending. This is particularly important in an expanded model where some CJR–X participants will be new to episode-based payment models.

The CJR Model relied on data already reported to the Hospital Inpatient Quality Reporting (IQR) Program (section 1886(b)(3)(B)(viii) of the Act) to assess quality without additional reporting burden for CJR participants. Measures used in the CJR Model included a joint replacement-specific measure and a general patient experience survey of the hospital stay. Specifically, the CJR Model utilized the Hospital-level Risk-Standardized Complication Rate (RSCR) following elective primary Total Hip Arthroplasty (THA) and/or Total Knee Arthroplasty (TKA) and the Hospital Consumer Assessment of Healthcare Providers and Systems (HCAHPS) Survey measure, further discussed in Section X.C.2.e.(3) of this final rule. In addition to the two HIQR measures, the CJR Model offered participants an opportunity to receive additional points towards their quality score for voluntarily submitting THA/TKA patient-reported outcomes (PROs) and limited risk variable data following eligible elective primary THA/TKA procedures.

(2) Selection of Quality Measures

We expect CJR–X will incentivize hospitals to engage in care redesign activities to reduce post-surgical complications and hospital readmissions and enhance patient experience and outcomes for Medicare beneficiaries undergoing joint replacement surgery. Moreover, achieving savings while continuing to ensure high-quality care for Medicare beneficiaries will require close collaboration among hospitals, physicians, post-acute care providers, and other clinicians.

The quality measures we proposed for CJR–X are a natural outgrowth of the CJR Model and maintain focus on patient safety, patient experience, and health outcomes for beneficiaries undergoing hip and knee arthroplasty. The proposed measures sustain ongoing efforts to improve quality and health outcomes across a beneficiary's care journey and incentivize hospitals to better align and coordinate care across various programs and care settings. We believe the measures used for CJR (80 FR 73465 through 73507) remain appropriate for assessing care and proposed to continue utilizing those measures for inpatient LEJR episodes in CJR–X. However, we proposed two notable variations from the CJR Model measures, which are discussed in detail in section X.C.2.e.(3) of this final rule.

First, we proposed to weight the THA/TKA PROs more heavily by forgoing voluntary PRO submission and relying on the required data submitted through the quality reporting programs. CMS is committed to increased use of PROs, whenever possible, as these measures provide valuable insights into the patient's perspective of care received. PROs assessing health status as a result of care are a critical type of outcome needed for health care quality assessment. The use of PRO measures (PROMs), standardized instruments that query patients' self-assessments of their health, provide a direct way to capture patients' experience of care and the results of that care. PROMs can assess multiple health domains, including physical health, emotional well-being, and social functioning by measuring outcomes relevant to each domain, such as symptoms, functional status, and mental status. As a result, they provide rich information on how care affects multiple dimensions of patients' well-being.

Broadly, patient-reported data includes PROs and electronic PROs (ePROs), which is the electronic capture of this data; PROMs, which reflect how the PRO data is reported (for example, a survey or questionnaire); and patient-reported outcome-based performance measures (PRO–PMs), which are reliable and valid quality measures of aggregated PRO data reported through a PROM and potentially used for performance assessment. In support of this goal, the HIQR now includes a THA/TKA PRO–PM, which was developed using the PRO data voluntarily submitted under the original CJR Model. Therefore, CJR–X would use THA/TKA PRO–PM data submitted to the HIQR for the purpose of scoring model performance.

Second, CJR–X would adopt two additional measures to account for the high percentage of hospital outpatient LEJRs procedures. Outpatient same-day surgery has become commonplace in the United States. Nearly 70 percent of all THA and TKA surgeries are now performed in the outpatient setting. By the end of the CJR Model, outpatient procedures accounted for nearly three in four THA and TKA episodes. For this reason, we believe it necessary to supplement the previous measure set to include metrics which capture complications and patient experience related to outpatient surgery. Therefore, we proposed to use additional quality measures that are currently reported under the Hospital Outpatient Quality Reporting (HOQR) Program (section 1833(t)(17)(C) of the Act).

The proposed measures would be used to determine hospital quality of care in the form of a composite quality score (CQS), as described in section X.C.2.e.(5) of this final rule. As observed in the 7th annual evaluation of the CJR model, the proportion of hospitals achieving ''Good'' or ''Excellent'' quality ratings has increased over the course of

the CJR Model.[592] However, there is continued opportunity for quality improvement. Similar to the CJR Model, the CQS would be used to adjust the discount factor, as described in section X.C.2.f.(3)(g) of this final rule, that is applied to the CJR–X participants' reconciliation target price, as specified in section X.C.2.f.(5)(e) of this final rule, during the reconciliation process to tie quality performance to payment.

The measures we proposed are as follows:

- Hospital-level Risk-Standardized Complication Rate (RSCR) following elective primary Total Hip Arthroplasty (THA) and/or Total Knee Arthroplasty (TKA)
- Hospital Visits Within 7 days of Hospital Outpatient Department (HOPD) Surgery
- Hospital Consumer Assessment of Healthcare Providers and Systems Survey (HCAHPS)
- Outpatient and Ambulatory Surgery Consumer Assessment of Healthcare Providers and Systems Survey (OAS CAHPS)
- Hospital-Level Total Hip and/or Knee Arthroplasty (THA/TKA) Patient Reported Outcome (PRO)-Based Performance Measure

We believe the CJR–X proposed measure set would provide CMS with sufficient information to monitor quality performance related to care provided to beneficiaries undergoing a hip or knee replacement and for the purposes of model evaluation. However, should we determine the need to adjust the measure set in future performance years, we would propose any changes through notice and comment rulemaking.

We sought comment on additional measures that should be considered for CJR–X. The following is a summary of the public comments received.

Comment: Some commenters supported CMS's proposed direction for CJR–X quality measurement, including consistency with CJR and alignment with TEAM and existing CMS quality programs. Some commenters recommended that CMS better align CJR–X quality performance measurement with TEAM and other Medicare quality reporting programs, such as IQR, OQR, ASCQR, HVBP. Other commenters stated that consistency across measure specifications and baseline periods can improve methodological coherence and reduce duplicative administrative burden. They appreciated CMS's effort to align quality measurement in value-based care models with broader quality reporting programs. The comments generally favored maintaining alignment rather than creating a separate quality measurement system for CJR–X. Another commenter appreciated alignment but had concerns about the limited differentiation and duplicative nature of the proposed quality measures, which largely overlap with existing programs.

Response: We appreciate commenters' support for aligning CJR–X quality measurement with existing CMS programs and prior CJR experience. We proposed the CJR–X quality framework to maintain accountability using measures that are applicable to LEJR episodes and aligned with existing reporting programs. We recognize concerns about overlapping measures, but this is a product of meeting our goal to reduce duplicative reporting requirements and support national comparability across hospitals. We believe that maintaining continuity with prior CJR policies where appropriate can support participants' understanding of model requirements while allowing targeted improvements in CJR–X.

Comment: Some commenters stated that using different measures for LEJR populations in CJR–X and TEAM could lead to confusion about how CMS defines quality. They stated that this creates unnecessary complexity, reduces clarity for multidisciplinary teams, and undermines coordination among stakeholders working to improve outcomes. Commenters stated the growing complexity of program requirements has created substantial operational burden for providers that may undermine efforts to modernize measurement through electronic clinical quality measures (eCQMs). Many commenters supported using the Information Transfer measure to better align CJR–X with TEAM and create a more balanced inpatient and outpatient framework.

Response: We recognize that coordinating quality measures between CJR–X and TEAM LEJR episodes is preferable, whenever possible. However, model alignment must be balanced with the need for measures that are particularly meaningful for CJR–X. By necessity, TEAM uses measures that are able to be reasonably applied to all five of its episode categories, not just LEJR episodes. In addition, TEAM, as a Phase I test, has greater flexibility to employ measures that have not yet generated performance data through implementation, such as the Information Transfer Patient-Reported Outcome-based Performance Measure. Although we considered using the Information Transfer Measure, it will not become mandatory under the HIQR until CY 2027 and there is currently insufficient historical data to reasonably estimate CJR–X participant performance on the measure. As discussed in section X.C.2.e.(3)(d) this final rule, the CMS Actuary requires such data to estimate model performance as a condition of certification. Therefore, we were unable to propose the Information Transfer measure at this time. However, we did indicate in the proposed rule that we will consider stakeholder feedback on the quality measure set and may make adjustments as data availability and implementation experience mature.

Comment: Some commenters recommended that CMS use quality measures that are directly attributable to LEJR episodes and the care redesign activities evaluated under CJR–X. A commenter stated that other measures would fall outside the scope of metrics that should be considered in determining total joint arthroplasty quality. Commenters believed that more episode-specific measures would give CMS, hospitals, and beneficiaries a clearer picture of the care furnished during joint replacement episodes. Another commenter stated some of the measures are not fully within provider control during a 90-day episode that spans multiple care settings. Some commenters suggested CMS delay the model until reliable, valid, and equitable quality measures can be developed to specifically measure care associated with lower extremity joint replacements.

Response: We agree that CJR–X quality measurement should be closely connected to the episode population and care redesign goals wherever possible. For this reason, we selected lower extremity joint replacement-specific outcome and PRO measures. Both the THA/TKA complications measure and THA/TKA PRO–PM are directly and solely related to LEJR episodes. In addition, CAHPS measures reflect patient experience for inpatient and outpatient care settings, which is relevant to all hospital care, including care provided during LEJR episodes. While the Hospital Visits within 7 days of HOPD Surgery measure is not limited to LEJR procedures, it captures common complications that may arise following outpatient THA and TKA procedures. Moreover, the complications specified in the measure largely crosswalk to the inpatient THA/TKA complications measure. We believe this measure set appropriately captures episode-specific accountability and patient experience and is relative to the care associated

[592] *Comprehensive Care for Joint Replacement Model—Seventh Annual Report, December 3, 2025. https://www.cms.gov/priorities/innovation/innovation-models/cjr.*

with joint replacement procedures. However, we will consider stakeholder feedback on the quality measure set and may make additional adjustments prior to the model start date.

Comment: Some commenters stated that broad hospital-wide measures may be influenced by unrelated service lines, patient populations, or system-level conditions and, therefore, may not accurately reflect joint replacement quality. Several commenters suggested that CJR–X should target complications, outcomes, and patient experience associated with LEJR rather than relying on general facility performance.

Response: We thank commenters for feedback regarding assessment of quality for outpatient LEJR episodes in the absence of a fully-implemented LEJR-specific HOQR measure. As stated in the proposed rule, although the vast majority of LEJR episodes are now outpatient, the HOQR doesn't include a THA/TKA complications measure and outpatient THA/TKA PROs are currently only being reported on a voluntary basis. Until such time as the reporting for LEJR-specific measures is mandatory under the HOQR, including such measures as a CJR–X requirement would create additional administrative burden for model participants. We also note that the CMS Chief Actuary requires sufficient performance data to estimate CJR–X participant performance on the measures before we are unable to adopt them in CJR–X. Therefore, the options available to us are to (1) assess participants only for inpatient episodes, using the HIQR measures; or (2) assess participants at the facility level, by generalizing inpatient THA/TKA Complications and PRO–PMs to encompass all LEJR regardless of setting. We believe the first option would unfairly minimize the work that CJR–X participants put into administering and reporting pre- and post-operative PRO surveys, particularly for those voluntarily reporting the outpatient PROs in anticipation of the mandatory start in CY 2028. The second option avoids additional burden, while allowing overall facility quality to serve as a proxy for outpatient LEJR-specific quality. Because the measure assesses the same CJR–X participant, we disagree that it will inaccurately reflect HOPD quality. Moreover, HOPD and inpatient procedures often utilize the same operating rooms, anesthesia teams, post-operative care units, and perioperative staff.

Comment: Some commenters suggested using a wider range of quality measures to support the delivery of high-quality, safe, patient-centered care. A commenter encouraged CMS to ensure that quality metrics remain sufficiently robust to discourage stinting on medically-necessary services. Many commenters recommended that CMS add a cross-setting care coordination measure, such as documented structured electronic care plan transfer to a skilled nursing facility or home health agency, the Information Transfer Patient-Reported Outcome-based Performance Measure (OP–46), or a patient-centered home time outcome measure. They stated that LEJR episode success often depends on transitions after discharge and that CJR–X should better reflect care coordination across the 90-day post-discharge period. Another commenter supported measures of patient experience, patient and workforce safety and reliability, clinical quality, and caregiver engagement that are evidence-based, targeted, and meaningful to patients and caregivers.

Response: We appreciate commenters' recommendations to adopt a broader set of quality measures, including those that guard against incentives to stint on medically-necessary services and place greater emphasis on care coordination throughout the full length of the episode. In selecting measures for CJR–X, we sought to balance comprehensiveness with feasibility, reliability, alignment with existing CMS quality reporting programs, and participant reporting burden. We believe the proposed quality domains—complications, patient experience, and patient-reported outcomes—provide a balanced framework for assessing whether participants are improving efficiency while maintaining or improving quality. In addition, CJR–X includes post-discharge flexibilities, such as home visits and telehealth waivers, to support safe recovery and care management during the episode.

We agree that LEJR episode performance often depends on whether beneficiaries receive clear discharge instructions, timely communication among providers, appropriate post-acute care, and support during the 90-day recovery period and believe the patient experience measures adequately address communication, discharge information, and care coordination. We also agree that utilizing PROs and aligning with TEAM are preferable and did both, whenever possible. For this reason, we considered using the Information Transfer Patient-Reported Outcome-Based Performance Measure. However, there is insufficient historical data to reasonably estimate CJR–X participant performance on the measure. Therefore, we proposed to use OAS CAHPS to assess outpatient episode quality performance until adequate data are available. We may consider the Information Transfer measure for future use in CJR–X as measure specifications, data availability, and implementation experience mature.

Comment: Some commenters recommended that CMS monitor long-term outcomes, readmissions, mortality, infections, or functional recovery beyond the CJR–X 90-day episode. Commenters stated that some outcomes important to LEJR quality, including non-elective joint replacement outcomes and functional recovery, may extend beyond the episode period. They suggested that CMS collect post-episode patient data up to one year after surgery. Commenters believed longer-term monitoring could provide insight into recovery, downstream utilization, and care quality. Another commenter requested that CMS adopt a quality measure for tracking prosthetic joint infections with a longer performance window, as delayed and late presenting infections are not currently captured in the 90-day measure.

Response: We appreciate commenters' recommendations regarding longer-term outcome monitoring. We proposed a 90-day CJR–X episode duration consistent with the CJR Model and the period during which beneficiaries often receive the most intensive post-acute care. We recognize that certain outcomes, including readmissions, infections, mortality, and functional recovery, may be informative beyond the 90-day episode. However, extending accountability or required reporting beyond the proposed episode would impact attribution, clinical relevance, data availability, burden, and the relationship between longer-term outcomes and hospital episode management. Therefore, we don't believe extending quality monitoring for CJR–X specifically, would maintain operational feasibility for national implementation at this time.

Comment: Some commenters raised concerns about relying on survey-based patient experience measures for CJR–X. Commenters stated that survey response rates are low, survey fatigue is persistent, and facility-wide surveys may not represent Medicare beneficiaries undergoing LEJR procedures. A commenter stated that CAHPS surveys do not stratify by MS–DRG or outpatient procedure code and, therefore, cannot be applied directly to LEJR episodes. A commenter questioned the relevance and applicability of CAHPS given the significant time lag between the admission or procedure and survey completion and its subsequent use for determining CJR–X

performance. Other commenters stated that patient satisfaction or all-payer facility experience scores are not precise proxies for clinical quality or LEJR episode experience. Several commenters recommended minimizing the relative importance of CAHPS survey measures and instead focus on outcomes-based and PRO-based clinical outcome measures.

Response: We appreciate commenters' concerns about using survey-based patient experience measures in CJR–X and agree that patient experience measures should not serve as the sole proxy for clinical quality. For that reason, we proposed a composite quality score that balances patient experience with outcomes-based and PRO measures, including complication measures and the THA/TKA PRO–PM. The proposed methodology weights clinical outcomes most heavily while still recognizing that communication, discharge planning, care coordination, and recovery information are important to LEJR episode quality.

We recognize that HCAHPS and OAS CAHPS are facility-level measures and are not stratified by MS–DRG or outpatient procedure code. However, these measures are standardized, validated, and already reported through existing CMS quality programs. Using these surveys allows us to assess patient experience without creating new CJR–X-specific survey burden. Therefore, we disagree that survey-based measures should be removed from the CJR–X quality methodology, as they are the only method by which we are able to incorporate patient voice into performance assessment. Removing them would reduce accountability for beneficiary communication and care transitions.

Moreover, we do not believe it necessary to limit potential to improve care and efficiencies beyond a particular episode-based payment model. For example, previous model tests have inspired many of the care coordination activities that have become standard practice for hospitals, such as pre-surgical patient education and post-discharge outreach, and there is demonstrated benefit to such spill-over effects.

Comment: Several commenters felt the measure set placed too much emphasis on measures that are not yet fully established or reliable. A couple of commenters stated many of the measures considered are challenged by the current case minimums and patient acuity changes with procedures shifting to outpatient and ASC settings. Commenters recommended the measure set be revised to address reliability, data collection burden, and survey response rate concerns before being used for accountability. Another commenter raised the issue of using highly technical metrics in the CJR–X measure set.

Response: We appreciate commenters' concerns about the inclusion of measures that are new to the Medicare quality reporting programs. We recognize some of these measures are still voluntary or in the first year of reporting and we are still gathering data on provider performance. Therefore, we will continue to evaluate the reliability of the measures to ensure they remain appropriate for inclusion in CJR–X when the model begins in CY 2028. We selected the measures because of their applicability to LEJR episodes and to avoid creating additional reporting burden for participants, as these are measures already required under the HIQR and/or HOQR. However, should CMS determine that providers are not able to meet the case minimums or the measures are not providing sufficiently reliable data, we will certainly consider alternatives.

Comment: A commenter recommended that CMS monitor for unintended consequences associated with the proposed CJR–X quality measures. The commenter stated that the quality performance aspects of CJR–X should fairly and appropriately reflect relevant care. The commenter expressed conceptual concerns because several measures may be used for the first time as part of a pay-for-performance model. Another commenter stated that, as designed, the model effectively creates overlapping penalties by mandating a second pay for performance penalty using similar data already used to calculate payment structures for LEJR procedures.

Response: We appreciate the recommendation to monitor for unintended consequences. We recognize that applying measures in a payment accountability context can raise fairness, reliability, and behavioral incentive concerns, particularly when measures are newly incorporated into a model's financial methodology. We proposed to monitor the effects of CJR–X on model participants and beneficiaries to ensure the model does not create adverse incentives. Monitoring activities may include evaluating measure performance, participant behavior, and beneficiary outcomes. We will also take into account participant and stakeholder feedback to assess whether future refinements are warranted through notice-and-comment rulemaking.

Comment: Some commenters urged CMS to ensure measures are appropriately adjusted for patient complexity and socioeconomic factors outside the direct control of providers. Some commenters were concerned that hospitals with a higher percentage of low-income patients or at higher social risk will do worse on quality measures. They stated that those hospitals struggled in CJR and CJR–X should take steps to adequately account for these populations. A few commenters encouraged CMS to evaluate whether patient experience measures accurately reflect the quality of the full episode of care rather than isolated inpatient encounters.

Response: We appreciate concerns about social risk, patient complexity, and fair quality measurement. In the proposed rule, we proposed payment methodology features, including risk adjustment and policies for safety net and low-volume hospitals, to address differences in hospital and beneficiary characteristics in the model's financial accountability framework. We recognize that social risk and clinical complexity may affect quality performance and we will continue to assess the measures to ensure reliability and fairness. We note that CMS quality reporting programs generally rely on the tested specifications and applicable risk-adjustment approach established in development and throughout the maintenance of each measure.

Comment: Many commenters recommended that CMS consider additional measures for inclusion in the CJR–X quality measure set. Some commenters recommended that CMS include functional status, functional recovery, therapy utilization, or Section GG data in the CJR–X quality framework. Commenters stated that functional outcomes are important to understanding whether LEJR beneficiaries recover mobility and self-care ability after surgery. A commenter recommended that CMS utilize a more reliable and more objective measure to evaluate functional recovery where performance represents all episodes based upon standardized data collection that is performed by licensed professionals such as therapists. They suggested that standardized functional data collected across post-acute care settings, including Section GG information, could help CMS assess patient recovery and therapy needs. A commenter suggested measures of timeliness and quality of rehabilitative care to better capture patient recovery in the post-acute period of an episode. Another commenter suggested that CMS use existing validated measures, such as 30-day readmissions following primary THA/TKA. Other commenters

recommended that CMS collect and analyze therapy utilization and patient outcome data to better understand the services CJR–X beneficiaries need to achieve the best outcomes. Some commenters recommended including a surgical site infections (SSI) measure, such as the measure used in the MIPS Clinical Quality Program for Surgical Site Infections (Quality #357), to encourage improved care of closed surgical incisions while lowering costs. Another commenter stated that CMS should consider future quality and safety measures that better recognize timely identification and intervention for postoperative deterioration, particularly during the high-risk period immediately following discharge. Another commenter recommended adopting an ankle-specific patient-reported outcome measure, such as the Foot and Ankle Outcome Score (FAOS), which is conceptually similar to the HOOS and KOOS instruments used for hip and knee episodes.

Response: We thank commenters for their suggestions of other quality measures CMS should consider for the CJR–X quality measure set. In developing the CJR–X quality measure set, we prioritized measures that CJR–X participants already report through existing CMS quality reporting programs. This approach is intended to minimize additional reporting burden while still allowing CMS to assess important dimensions of quality for LEJR episodes. Accordingly, we are finalizing as proposed to use measures reported through established CMS quality reporting programs, including measures related to complications, patient experience, and patient-reported outcomes, to calculate the composite quality score in CJR–X.

We also believe it is important to maintain a focused quality measure set when calculating the composite quality score. The composite quality score methodology is intended to allow performance on each required quality measure to be meaningfully valued in the model's pay-for-performance methodology, while combining multiple complementary measures into a single assessment of hospital performance across the episode of care. Adding numerous additional measures could reduce the relative weight and interpretability of each individual measure within the composite score and make it more difficult for CJR–X participants and CMS to assess meaningful quality improvement across the measure domains.

We recognize commenters' interest in additional measures that directly assess functional recovery, therapy needs, and post-acute rehabilitation outcomes. We agree that recovery of mobility, self-care, and function after LEJR procedures is an important aspect of episode quality. We note that the THA/TKA complications measure includes both wound and periprosthetic joint infections and the THA/TKA PRO–PM is a functional outcomes measure that captures patient-reported pain and functional status following THA/TKA, so the measures assess distinct and complementary dimensions of quality relevant to LEJR episodes.

We also recognize commenters' recommendations regarding therapy utilization, rehabilitative care, surgical site infections, postoperative deterioration, and readmissions. We believe the CJR–X quality measure set reflects the appropriate quality domains while balancing the value of additional quality information against the burden of requiring new data collection from CJR–X participants. However, we will take these quality measure recommendations into consideration. Any changes to the CJR–X quality measure set would first be proposed through notice and comment rulemaking.

(3) Quality Measures

(a) Hospital-Level Risk-Standardized Complication Rate (RSCR) Following Elective Primary Total Hip Arthroplasty (THA) and/or Total Knee Arthroplasty (TKA) (CMIT ID #350)

THA and TKA are commonly performed procedures that improve quality of life for the Medicare population and are generally considered safe. However, as discussed in the 2015 CJR final rule (80 FR 73473 through 73477), post-operative complications related to these procedures do exist. The hospital-level risk-standardized complication rate (RSCR) following elective primary THA and/or TKA, also referred to as the THA/TKA Complications measure, was finalized for use in the CJR Model to measure a hospital's rate of mortality, myocardial infarction, pneumonia, sepsis, pulmonary embolism, bleeding, infection, and mechanical failure following inpatient surgery.[593] [594]

The goal of this measure is to improve patient outcomes by providing patients, physicians, hospitals, and policy makers with information about complication rates following inpatient primary elective THA and/or TKA at a given hospital. Measurement of patient outcomes allows for a broad view of quality of care that encompasses more than what can be captured by individual process-of-care measures. Complex and critical aspects of care, such as communication between providers, prevention of and response to complications, patient safety, and coordinated transitions to the outpatient environment, all contribute to patient outcomes but are difficult to measure by individual process measures. The goal of outcomes measurement is to risk-adjust for patient conditions at the time of hospital admission and then evaluate patient outcomes. The measure was developed to identify institutions whose performance is better or worse than would be expected based on their patient case-mix, promote quality improvement, and better inform consumers about care quality.

The THA/TKA Complications measure captures the most common complications following inpatient THA and TKA. The outcome (complication) is defined as any one of the specified complications (not already present on admission) that occurs from the date of admission to 90 days following admission. Complications are counted in the measure only if they occur during the index hospital admission or during a readmission. The complication outcome is a dichotomous (yes/no) outcome. If a patient experiences one or more of these complications in the applicable time period, the complication outcome for that patient is counted in the measure as a ''yes'': acute myocardial infarction (AMI), pneumonia or other acute respiratory complication, or sepsis/septicemia/shock during the index admission or within seven days of the start of the index admission; surgical site bleeding or other surgical site complication, pulmonary embolism, or death during the index admission or within 30 days of the start of the index admission; mechanical complication or periprosthetic joint infection/wound infection or other wound complication during the index admission or within 90 days of the start of the index admission.[595]

[593] ''Primary'' refers to an initial joint replacement. The measure does not assess revision joint replacement procedures.

[594] Hospital-Level, Risk-Standardized Complication Rate (RSCR) Following Elective Primary Total Hip Arthroplasty (THA) and/or Total Knee Arthroplasty (TKA), Centers for Medicare & Medicaid Services Measures Inventory Tool, CMIT Measure ID 350. *https://cmit.cms.gov/cmit/#/FamilyView?familyId=350.*

[595] Exception: Subsequent inpatient admissions with a principal diagnosis code of COVID–19 (U07.1) or with a secondary diagnosis code of COVID–19 coded as present on admission on the claim within the seven/30-day time frames are not eligible for use by the measure (and are excluded) in determining whether AMI, pneumonia or other

Continued

In the 2015 CJR final rule (80 FR 73473 through 73477), we described our reasoning for adopting the THA/TKA Complications measure. We shared historical information about the development of the measure, its implementation in CMS programs, and its public display. Our rationale for its continued use is unchanged. Given the clinical alignment with the LEJR episode and its use in the CJR Model, the measure is well established and minimizes complexity since it is familiar to hospitals. Further, the measure reflects the full episode of care, and, given it is risk-standardized, reduces the incentive to avoid higher-risk patients. We believe this measure is beneficially actionable, at both the hospital and care team level, to influence performance through preoperative optimization, standardizing perioperative protocols, and incorporating post-acute care coordination and early complication management.

Therefore, we proposed at § 512.635(a)(1) to use hospital-level RSCR following elective inpatient primary THA and/or TKA (CMIT ID #350) to assess episode quality performance starting in PY1 of CJR–X. We sought comment on the inclusion of this measure in the CJR–X measure set. The following is a summary of the public comments received.

Comment: Some commenters supported adopting the Hospital-Level Risk Standardized Complication Rate (RSCR) following elective primary Total Hip Arthroplasty (THA) or Total Knee Arthroplasty (TKA) as part of the CJR–X quality measure set. A commenter stated that the long-established quality measure is well-suited to track the quality of LEJR procedures.

Response: We agree and thank the commenters for their support.

Comment: Some commenters urged CMS to reconsider use of the THA/TKA complications measure because inpatient LEJR volume has declined, the measure may be topped out or produce insufficient-volume results, and it may not meaningfully distinguish performance under CJR–X. A couple of commenters stated that the shift of LEJR procedures to the outpatient setting has reduced inpatient volume at many hospitals, resulting in a growing number of hospitals unable to meet case volumes, thereby reducing the measure's usefulness for distinguishing performance or driving improvement. Some commenters stated that the THA/TKA complications measure should be revised before use. A commenter stated that hospitals with robust coding practices and resources may capture more ''Present on Admission'' comorbidities and, therefore, perform better through administrative superiority rather than clinical excellence. A couple of commenters stated that the risk adjustment methodology does not account for social factors that contribute to complication rates such as income, level of home support, access to outpatient follow-up care, or affect a patient's ability to recover successfully at home. A commenter suggested that CMS align the measure's risk adjustment with the methodology adopted for CJR–X pricing to account for social factors that materially.

Response: We disagree that the THA/TKA complications measure is topped-out or no longer useful, particularly when applied to an episode-based payment methodology. Many of the hospitals that will be CJR–X participants will be new to CMMI models and we believe there is continued benefit to emphasizing LEJR outcomes on performance. We note that the complications included in the measure only if they occur during the index hospital admission or during a readmission and we do not believe that the significant conditions included in the measure (for example, acute myocardial infarction, acute respiratory illness, sepsis, surgical site bleeding or infection, or death) would be overlooked during coding diagnoses on admission. Finally, we acknowledge the concerns about risk adjustment, coding, and reliability. However, the THA/TKA complications measure is risk-standardized and is intended to compare hospital performance while accounting for patient case mix.

Comment: A commenter recommended adapting the THA/TKA complications measure to account for outpatient total joint arthroplasty rather than relying on a less joint-specific outpatient measure.

Response: We appreciate the commenter's recommendation to adapt the Hospital-level RSCR following elective primary THA and/or TKA measure for outpatient total joint arthroplasty. We included this measure because it is well established, clinically aligned with LEJR episodes, familiar to hospitals, risk-standardized, and actionable through perioperative and post-acute care coordination efforts. Since this measure is designed to assess elective inpatient primary THA/TKA complications, we included the Hospital Visits within 7 days of HOPD Surgery measure as an outpatient proxy to assess complications for outpatient episodes. While not clinically specific to THA/TKA procedures, it does capture events associated with postoperative safety and care coordination, including emergency department visits, observation stays, and unplanned inpatient admissions shortly after discharge. We also included the measure because it can be reported through existing Hospital Outpatient Quality Reporting Program processes without additional CJR–X-specific data submission.

We also note that adapting or re-specifying an existing complications measure to include outpatient THA/TKA would require additional measure development, testing, and validation to ensure that the measure accurately captures the intended clinical outcomes, is reliable across care settings, and is appropriate for use in CJR–X. That process would take significant time, require separate reporting or data collection specifications, and would likely not be completed in time for implementation at the start of CJR–X. We may consider whether a more joint-specific outpatient complications measure could strengthen the CJR–X quality measure set in future rulemaking, particularly as outpatient THA/TKA data and measure experience mature.

After consideration of the public comments we received, we are finalizing without modification the proposal at § 512.635(a)(1) to include the hospital-level RSCR following elective inpatient primary THA and/or TKA (CMIT ID #350) in the CJR–X quality measure set.

(b) Hospital Visits Within 7 days of Hospital Outpatient Department (HOPD) Surgery (CMIT ID #344, OP–36)

There are well-described and potentially preventable adverse events that occur after outpatient surgery, such as uncontrolled pain, urinary retention, infection, bleeding, and venous thromboembolism, which can result in unexpected hospital visits. Similarly, non-clinical patient considerations, such as lack of transport home upon discharge and delayed start of surgery, are primary causes of unanticipated yet preventable hospital admissions following same-day surgery.

National estimates of hospital visit rates following surgery vary from 0.5 to 9.0 percent based on the type of surgery, outcome measured (admissions alone or admissions and emergency department

acute respiratory complication, sepsis/septicemia/shock, or pulmonary embolism occurred. The code list used to define the ''Mechanical Complication'' outcome includes 26 codes that reflect fractures of the pelvis, femur, tibia or fibula, or other bone following insertion of an orthopedic implant as well as periprosthetic fractures around the internal prosthetic joint.

visits), and timeframe for measurement after surgery. Additionally, these rates may vary among HOPDs, suggesting variation in surgical and discharge care quality. Therefore, using a quality measure of hospital visits following outpatient same-day surgery can improve transparency, inform patients and providers, and foster quality improvement.[596]

The Hospital Visits within 7 days of Hospital Outpatient Department (HOPD) Surgery measure assesses quality of care following surgery or cystoscopy performed in the hospital outpatient setting for Medicare beneficiaries. The measure outcome is any of the following hospital visits: (1) an inpatient admission directly after the surgery; or (2) an unplanned hospital visit (inpatient admission, observation stay, or emergency department visit) occurring after discharge or within 7 days of the surgery. The measure score is a ratio of the predicted to expected number of post-surgical hospital visits among the HOPD's patients. The denominator is the expected number of hospital visits given the HOPD's case mix and surgical procedure mix. The numerator is the number of hospital visits predicted for the HOPD's patients accounting for its observed rate, the number of surgeries performed at the HOPD, the case mix, and the surgical procedure mix. A score of less than one indicates the HOPD's patients were estimated as having fewer post-surgical visits than expected compared to HOPDs with similar surgical procedures and patients. A ratio of greater than one indicates the HOPD's patients were estimated as having more visits than expected.

Although it is not specific to outpatient LEJRs, we believe the Hospital Visits within 7 Days of HOPD Surgery measure is an appropriate quality measure for inclusion in CJR–X Model because it captures early, unplanned hospital utilization following outpatient surgical procedures, including elective THA and TKA. It assesses complications similar to several of those included in the THA/TKA Complications measure and, for that reason, is a good complement to the original CJR inpatient measure. As joint replacement care is primarily furnished in outpatient settings, we believe this measure would help ensure that quality accountability under CJR–X reflects current clinical practice across care settings. The measure assesses early post-operative safety and care coordination by identifying emergency department visits, observation stays, and unplanned inpatient admissions shortly after discharge—events that are often associated with potentially preventable complications or gaps in discharge planning and post-operative support. We believe performance on this measure is actionable for hospitals and clinicians and complements the existing CJR–X inpatient complications measure in supporting the model's goals of improving quality, enhancing patient safety, and reducing avoidable episode spending.

We proposed at § 512.635(a)(2) to use the Hospital Visits within 7 days of HOPD Surgery (CMIT ID #344, OP–36) measure to assess outpatient episode quality performance starting in PY1 of CJR–X. We sought comment on the inclusion of this measure in the CJR–X measure set. The following is a summary of the public comments received.

Comment: A couple of commenters supported including the Hospital Visits within 7 Days of HOPD Surgery measure in the CJR–X quality measure set.

Response: We thank the commenters for their support.

Comment: Some commenters did not believe the Hospital Visits within 7 days of HOPD Surgery measure would fairly and appropriately reflect quality performance relevant to CJR–X. The commenter stated that the measure is minimally suitable given that it tracks exceedingly rare events. Several commenters said the measure uses an overly broad denominator that includes all outpatient surgeries rather than joint replacements, so that the weight of the measure would be disproportionate to actual performance on LEJR procedures.

Response: We recognize that the Hospital Visits within 7 days of HOPD Surgery measure may not fully reflect quality performance specific to LEJR episodes under CJR–X. However, we are not aware of another outpatient measure currently being reported by hospitals to CMS that would capture complications related to THA and TKA procedures. We believe the Hospital Visits within 7 days of HOPD Surgery measure is the most appropriate, available measure to assess outpatient episodes because the complications specified in the measure largely crosswalk to the inpatient THA/TKA complications measure, including unplanned hospital visits shortly after outpatient procedures, observation stays, and unplanned inpatient admissions, as well as emergency department visits. We also believe this measure would provide information about short-term postoperative outcomes and care coordination for the outpatient episodes included in CJR–X.

We may consider whether a more joint-specific outpatient complications measure would be appropriate for CJR–X in future rulemaking as outpatient THA/TKA data and measure experience continue to develop.

After consideration of the public comments we received, we are finalizing without modification the proposal at § 512.635(a)(2) to include the Hospital Visits within 7 days of HOPD Surgery (CMIT ID #344, OP–36) measure in the CJR–X quality measure set.

(c) Hospital Consumer Assessment of Healthcare Providers and Systems (HCAHPS) (CMIT ID #338)

The Hospital Consumer Assessment of Healthcare Providers and Systems Survey (HCAHPS) is a national, standardized, publicly-reported survey instrument and data collection methodology for measuring patients' perceptions of their hospital experience.[597] Since 2008, HCAHPS has allowed valid comparisons to be made across hospitals locally, regionally, and nationally. Three broad goals have shaped HCAHPS. First, the standardized survey and implementation protocol produce data that allow objective and meaningful comparisons of hospitals on topics that are important to consumers. Second, public reporting of HCAHPS results creates new incentives for hospitals to improve quality of care. Third, public reporting enhances accountability in health care by increasing transparency. With these goals in mind, CMS and the HCAHPS Project Team have taken substantial steps to assure that the survey is credible, practical and actionable.

HCAHPS is a 32-item survey instrument that produces 11 publicly reported measures: 7 multi-item measures (communication with doctors, communication with nurses, restfulness of hospital environment, care coordination, responsiveness of hospital staff, communication about medicines, and discharge information); and 4 single-item measures (cleanliness of the hospital environment, information about symptoms, overall rating of the hospital, and recommendation of hospital). The FY 2025 IPPS/LTCH PPS final rule describes HCAHPS survey measure updates starting with January 2025 discharges.

[596] National Coverage Analysis (NCA) Decision Memo CAG–00157R4. *https://www.cms.gov/medicare-coverage-database/view/ncacal-decision-memo.aspx?proposed=N&NCAId=288.*

[597] Hospital Consumer Assessment of Healthcare Providers and Systems Survey (HCAHPS), Centers for Medicare & Medicaid Services Measures Inventory Tool, CMIT Measure ID 338. *https://cmit.cms.gov/cmit/#/FamilyView?familyId=338.*

The HCAHPS Survey asks recently discharged patients about aspects of their hospital experience that they are uniquely suited to address. The core of the survey contains 20 items that ask how often or whether patients experienced a critical aspect of hospital care, rather than whether they were satisfied with their care and two global questions about rating and recommending the hospital. Also included in the survey are three screener items that direct patients to relevant questions, five items to adjust for the mix of patients across hospitals, and two items that support Congressionally-mandated reports. Hospitals may include additional questions after the core HCAHPS items. HCAHPS is administered to a random sample of adult inpatients between 2 to 42 days after discharge. Patients admitted in the medical, surgical, and maternity care service lines are eligible for the survey; HCAHPS is not restricted to Medicare beneficiaries. Hospitals may use an approved survey vendor or collect their own HCAHPS data if approved by CMS to do so. HCAHPS can be implemented in six survey modes: mail, telephone, mail with telephone follow-up, web with mail follow-up, web with telephone follow-up, or web with mail and telephone follow-up, each of which requires multiple attempts to contact patients. Hospitals must survey patients throughout each month of the year. IPPS hospitals must achieve at least 300 completed surveys over four calendar quarters.[598]

We believe the HCAHPS survey (CMIT ID #338) is an appropriate quality measure for inclusion in CJR–X because it relies on patient-reported experiences of hospital care, including communication with providers, responsiveness of staff, and discharge information, which are critical to successful joint replacement episodes. We believe patient experience is particularly relevant in the context of episode-based payment models, as effective communication and care transitions are closely associated with adherence to post-acute care plans, rehabilitation participation, and reduced risk of avoidable utilization. Because HCAHPS is a standardized, nationally-validated survey, it allows for consistent comparison of hospital performance. Moreover, the current use of this measure in the HIQR removes the need for CJR–X to introduce additional reporting burden. Including this measure would help ensure that incentives under CJR–X continue to support patient-centered care and balance cost containment with accountability for quality and beneficiary experience.

For the reasons specified previously, we proposed at § 512.635(a)(3) to use the HCAHPS (CMIT ID #338) survey to assess inpatient episode quality performance starting in PY1 of CJR–X. We sought comment on the inclusion of this measure in the CJR–X measure set. The following is a summary of the public comments received.

Comment: A few commenters raised concerns that HCAHPS changes, low response rates, or lack of recent Consensus-Based Entity review could affect reliability and validity. A commenter stated that fracture patients, who are more likely to be discharged to SNFs, are excluded from HCAHP surveys. Commenters stated that HCAHPS depend heavily on patient participation to generate performance data, but response rates are critically low at just above 30 percent. Commenters stated that CMS needs time to address these structural problems before tying the measure to financial consequences.

Response: We acknowledge commenters' concerns. However, the HCAHPS was used in the original CJR Model and reflects overall patient experience for inpatient care settings which is relevant to care provided during LEJR episodes. We believe this measure appropriately captures patient experience and is relative to the care associated with joint replacement procedures. However, we will consider whether additional validation or transition considerations are needed when determining the CJR–X composite quality score.

Comment: Many commenters stated that HCAHPS or other broad patient experience measures may not capture meaningful LEJR-specific quality, may be influenced by broader patient populations, or may not be fully within provider control during the episode. Commenters expressed concern that extrapolating limited HCAHP data to broader populations creates questions of validity of calculating upside and downside risk payments. Commenters suggested CMS drop the care experience measures and redistribute the weighting to outcome metrics capturing rates of infection, readmissions, complications, and revisions.

Response: We disagree that the patient experience domain should be removed and continue to believe it is appropriate to include measures, such as HCAHPS, in the CJR–X quality methodology. These measures capture dimensions of care that are central to recovery from LEJR procedures, including communication, discharge planning, care coordination, and how well patients understand and experience care transitions. These domains are directly relevant to a 90-day episode in which successful recovery depends on coordination across the hospital, physician, and post-acute care settings. Clinical outcome measures are important and receive substantial weight in the CJR–X quality methodology, but they do not fully capture whether beneficiaries received coordinated, understandable, patient-centered care during an episode.

Consistent with the CJR Model's ''quality first'' approach, we believe incorporating HCAHPS-based patient experience into the composite quality score reflects our view that quality in an episode-based model should be multidimensional and not limited to avoidable complications alone. Removing patient experience measures would narrow the quality assessment and could weaken incentives for hospitals to focus on communication, discharge readiness, and care transitions that affect beneficiary recovery.

Comment: A commenter stated that the influence of the HCAHPS survey will be compounded because it is also used to evaluate performance in the Hospital Value-based Purchasing program.

Response: We do not believe the inclusion of HCAHPS in CJR–X would inappropriately compound the measure's influence because the programs use HCAHPS for different purposes and within different payment methodologies.

In CJR–X, HCAHPS would be one component of the composite quality score, which is used to determine the CJR–X participant's eligibility for reconciliation payments and the applicable quality adjustment to repayment responsibility. By contrast, the Hospital Value-Based Purchasing Program uses HCAHPS as part of a separate quality pay-for-performance program that applies its own scoring methodology and payment adjustment rules. In addition, the use of HCAHPS in CJR–X would not change how HCAHPS is scored or applied in the Hospital Value-Based Purchasing Program. The same underlying patient experience measure may therefore inform more than one CMS program without duplicating the same payment adjustment or measuring the same performance construct in the same way.

[598] For full details, see the current HCAHPS Quality Assurance Guidelines, V.19.0, under the Quality Assurance button on the official HCAHPS On-Line website at *https://www.hcahpsonline.org/en/quality-assurance/*.

We also believe that using existing, nationally-implemented measures, such as HCAHPS promotes consistency across CMS quality programs and initiatives. In addition, it benefits CJR–X participants by reducing burden because it relies on established quality reporting infrastructure and processes. Including HCAHPS in CJR–X allows the model to account for patient experience with hospital care without creating a new CJR–X-specific inpatient patient experience survey or reporting requirement.

Comment: Several commenters asked for clarification on which version of the HCAHPS would be used, as CMS is currently transitioning to the updated version. A commenter requested more detail on how HCAHPS would be scored for CJR–X, including the survey version, measure point estimate, sub-measures or composites, calculation method, and national distribution used for percentile assignment.

Response: CMS acknowledges the request for more detail on HCAHPS scoring. CMS began administering the updated HCAHPS in the HIQR for discharges beginning January 1, 2025. Because we are finalizing a January 1, 2028 start date for CJR–X, the HCAHPS performance period for PY 1 of CJR–X will be January 1, 2028–December 31, 2028. Therefore, all surveys for discharges under the HIQR, and by extension CJR–X, will be the updated version.

Comment: A couple of commenters supported including the HCAHPS survey in the measure set.

Response: We thank the commenters for their support.

Comment: A commenter stated that compact performance percentiles for patient experience measures could make meaningful improvement difficult to distinguish and could limit participants' ability to affect their composite quality score.

Response: We believe the scoring approach remains appropriate for the HCAHPS measure because the patient experience percentiles are generally commensurate with the percentiles used for the HCAHPS measure under the CJR Model. This continuity supports use of a familiar quality-scoring framework and is consistent with CMS' prior experience incorporating patient experience into the CJR Model quality methodology.

We also do not intend for any single patient experience measure to determine overall quality performance under CJR–X. Patient experience measures would be one component of the broader composite quality score, together with other measures relevant to LEJR episodes. Including patient experience measures in this broader quality score will allow us to account for beneficiary experience while limiting the effect of compact percentile distributions on the overall CJR–X quality methodology.

We will monitor the distribution and performance of patient experience measures used in the CJR–X quality methodology and may consider refinements through future rulemaking if measure performance does not adequately distinguish quality differences among participants.

After consideration of the public comments we received, we are finalizing without modification the proposal at § 512.635(a)(3) to include the HCAHPS (CMIT ID #338) survey in the CJR–X quality measure set.

(d) Outpatient and Ambulatory Surgery Consumer Assessment of Healthcare Providers and Systems Survey (OAS CAHPS) (CMIT ID #162)

The OAS CAHPS is the complement to the HCAHPS used for inpatient episodes. The OAS CAHPS survey collects feedback on patients' experiences and care in Medicare-certified HOPDs and ASCs.[599] Though the surveyed population is all adults rather than solely Medicare beneficiaries, it still provides relevant information about the quality of care provided at a particular facility. The survey assesses key domains such as communication with providers, information provided before and after surgery, pain management, and care coordination, all of which are critical to safe recovery and successful post-operative outcomes. It includes questions about patients' experiences with their preparation for the surgery or procedure, check-in processes, cleanliness of the facility, communications with the facility staff, discharge from the facility, and preparation for recovering at home. The survey also includes questions about whether patients received information about what to do if they had possible side-effects during their recovery.[600] Outcomes are proportions of patients in HOPDs or ASCs that responded ''Yes'' to survey questions.

We believe the OAS CAHPS survey is an appropriate quality measure for inclusion in CJR–X because it captures beneficiaries' experiences with care in outpatient surgery settings, which are the primary setting for elective total hip and total knee arthroplasty. The inclusion of this measure would ensure that patient experience accountability is measured under CJR–X, regardless of setting. OAS CAHPS is a standardized, nationally developed instrument that allows for consistent comparison of performance and its inclusion supports CJR–X's goals of promoting patient-centered care, care coordination, and high-quality outcomes across the episode.

We considered but did not propose the Patient Understanding of Key Information Related to Recovery After a Facility-Based Outpatient Procedure or Surgery PRO–PM (OP–46), rather than the OAS CAHPS for outpatient LEJR episodes.[601] The measure, also referred to as the Information Transfer PRO–PM, aims to assess the level of clear, personalized recovery information provided to patients who had surgery or a procedure at an HOPD. It reports the average score of a patient's ratings on a three-domain, 9-item survey to evaluate the clarity of the clinical information patients are given before, during, and after an outpatient surgery or procedure. While reporting to the HOQR is voluntary for procedures in CY 2026 (CY 2028 payment determination), the Information Transfer PRO–PM will be mandatory beginning with the CY 2027 reporting period (CY 2029 payment determination).[602]

This measure was considered because it is used in TEAM and, as we have previously stated, we attempted, where feasible, to align CJR–X policies with TEAM to ensure a more reliable and valid comparison between the two models. Moreover, for reasons previously discussed, we strive to use PROs wherever possible to ensure patient voice is appropriately reflected in assessing quality of care. However, as a new measure, there is insufficient data available to reasonably estimate how CJR–X participants might perform on the Information Transfer PRO–PM.

[599] Centers for Medicare & Medicaid Services. (December 1, 2023). 2023 Measures Under Consideration (MUC) List. Available at: *https://mmshub.cms.gov/sites/default/files/2023-MUC-List.xlsxhttps://mmshub.cms.gov/sites/default/files/2023-MUC-List.xlsx.*

[601] Patient Understanding of Key Information Related to Recovery After a Facility-Based Outpatient Procedure or Surgery, Patient Reported Outcome-Based Performance Measure (PRO–PM), Version 1.0 Methodology Report, April 2024. *https://www.cms.gov/files/document/patient-understanding-key-information-related-recovery-after-facility-based-outpatient-procedure-or.pdf.*

[602] Hospital Outpatient Quality Reporting (OQR) Program Measures. *https://qualitynet.cms.gov/2outpatient/oqr/measures.*

Because the CMS Chief Actuary requires a high level of certainty for estimating participant performance in order to certify a model for expansion, we were limited to established measures with sufficient historical data available for analysis. Until adequate data for the Information Transfer PRO–PM is available (which could potentially be attained through TEAM evaluations), we will use the OAS CAHPS measure. Should we proposed to utilize the Information Transfer PRO–PM in the future, we would propose such a change through notice and comment rulemaking.

Therefore, we proposed at § 512.635(a)(4) to use the OAS CAHPS (CMIT #162, OP–46) to assess outpatient episode quality performance starting in PY1 of CJR–X. We sought comment on the inclusion of this measure in the CJR–X measure set. The following is a summary of the public comments received.

Comment: Some commenters supported including OAS CAHPS in the CJR–X quality measure set. A commenter appreciated CMS' effort to include outpatient measures in CJR–X, particularly given the continued migration of lower acuity joint replacement cases to outpatient settings.

Response: We appreciate the support for the inclusion of the OAS CAHPS. As LEJR procedures have largely shifted to outpatient settings, we believe it is a good complement to the inpatient measures.

Comment: A few commenters stated that broad patient experience measures, including the OAS CAHPS may not capture meaningful LEJR-specific quality. A commenter questioned whether the volume distribution of procedures underlying a facility's OAS CAHPS score is sufficiently weighted toward LEJR to make the score a meaningful proxy for LEJR episode quality. Another commenter requested that CMS provide insight into how it can ensure that the measure will fairly and appropriately reflect LEJR care. Another commenter stated the survey responses may not be fully within provider control during a 90-day episode that spans multiple care settings. Another commenter expressed concern that patient participation is necessary to generate performance data. A commenter stated that meaningful performance improvement is difficult to achieve because performance percentiles are often tightly compacted.

Response: We acknowledge commenters' concerns that OAS CAHPS is a broad outpatient surgical patient experience measure and is not LEJR-specific. Because of the large number of CJR–X outpatient THA/TKA procedures being performed, we believe it is necessary to include a patient experience measure relevant to outpatient surgical care. We note that the CJR Model quality measure set did not include a measure that assessed patient experience for outpatient episodes. Given the importance of assessing quality performance and the increasing proportion of outpatient sites of care for these procedures, we believe it is prudent to include a measure that captures patient experience in outpatient surgical care. Although OAS CAHPS is not LEJR-specific, it provides an available and established tool for incorporating outpatient patient experience into the CJR–X quality methodology.

While patient experience remains an important dimension of quality for CJR–X, the OAS CAHPS would not be the sole determinant of quality performance; rather, it would be one component of the composite quality score, together with other measures related to inpatient and outpatient LEJR episode quality. This broader scoring approach helps account for patient experience while limiting the effect of any single measure on a participant's overall quality score.

With respect to concerns that performance percentiles for patient experience measures may be compact, we believe the current approach remains reasonable because the patient experience percentiles used for CJR–X are generally commensurate with the percentiles used for the HCAHPS measure under the CJR Model. This continuity supports use of a familiar scoring framework and is consistent with prior experience incorporating patient experience into the CJR quality methodology.

We recognize that patient involvement is essential for survey-based performance data. Therefore, we avoided creating new surveys or reporting processes that might overwhelm patients or CJR–X participants. We will continue to monitor the performance, distribution, and usefulness of patient experience measures in the CJR–X quality methodology and may consider future refinements through notice and comment rulemaking.

Comment: Some commenters stated that the proposed use of the OAS CAHPS places too much emphasis on a measure that is not yet fully standardized or been submitted for Consensus-Based Entity review. They stated that, therefore, hospitals, patients and policymakers have no independent assurance of its appropriateness, either generally or for use in CJR–X. A commenter stated that fewer than 1 percent of facilities administering the survey by mail with phone follow-up achieve response rates above 36 percent, representing a fundamental challenge to the representativeness and validity of the underlying data. Commenters asked CMS to provide evidence of the survey's reliability before it requires survey administration.

Response: We value commenters feedback on their concerns with the OAS CAHPS. As a measure that assesses patient experience in outpatient settings, we believe its inclusion in CJR–X is appropriate, especially as more THA/TKA procedures are performed in outpatient settings. Therefore, it would be an oversight to rely so heavily on inpatient quality measures when outpatient episode volume far exceeds inpatient volume. Because CJR–X holds CJR–X participants accountable for the quality of care throughout the LEJR episode, we believe it is important to include a measure that reflects the beneficiary's experience of care, including communication, preparation for discharge and recovery, and coordination of outpatient surgical care.

We also believe that relying on an established patient experience measure may provide a broader and more patient-centered assessment of quality than a narrowly focused process measure. While process measures can play an important role in quality measurement, they may not fully capture the aspects of outpatient surgical care that beneficiaries are best positioned to assess. Including a patient experience measure in the CJR–X composite quality score helps ensure that the model evaluates not only whether certain care processes occurred, but also whether beneficiaries experienced care in a manner consistent with high-quality, coordinated, patient-centered care.

We are also mindful of CJR–X participant burden. We included OAS CAHPS because it aligns with existing CMS quality reporting infrastructure. We also believe that including OAS CAHPS in a nationally expanded model may support broader use of the measure and promote greater standardization in outpatient surgical patient experience reporting. Increased use of the measure could provide CMS, hospitals, patients, and other stakeholders with more opportunity to evaluate OAS CAHPS performance across outpatient surgical settings.

As previously noted, we recognize that survey-based measures depend on patient participation and that response rates may affect representativeness. We

also recognize commenters' concern that a broad outpatient surgical survey may not fully capture LEJR-specific quality. For these reasons, OAS CAHPS would not be the sole determinant of a CJR–X participant's quality performance under CJR–X. It would be one component of the broader composite quality score, together with other measures related to inpatient and outpatient LEJR episode quality.

We will continue to consider the reliability, validity, response rates, and usefulness of OAS CAHPS for CJR–X as additional experience with the measure becomes available. We may also consider refinements to the CJR–X quality measure set through future rulemaking if the measure does not adequately support assessment of outpatient patient experience for CJR–X episodes.

Comment: Some commenters stated that the use of the OAS CAHPS in CJR–X is premature in a pay-for-performance context. A commenter noted that CJR–X would represent the first time OAS CAHPS is used to directly determine payment consequences based on performance. A couple of commenters requested that CMS implement the measure as pay-for-reporting during year one of CJR–X. A commenter stated that the measure was only made mandatory for hospital outpatient departments beginning January 1, 2025, meaning hospitals will have limited experience with this measure at the time CJR–X performance years begin. Another commenter requested that CMS delay use of OAS CAHPS in quality scoring until hospitals have completed at least two full years of mandatory reporting experience.

Response: We acknowledge commenters' concerns that hospitals may have limited mandatory reporting experience with the OAS CAHPS measure before the start of CJR–X. However, the OAS CAHPS is already used in a pay-for-reporting context under existing CMS quality reporting infrastructure. Using OAS CAHPS in the CJR–X quality methodology would build on that existing reporting framework and would place greater emphasis on patient experience as a component of quality in an episode-based payment model since CJR–X is a pay-for-performance approach. We believe this is appropriate because patient experience is an important part of the quality of care hospitals provide for outpatient surgical episodes.

We recognize that OAS CAHPS is newer in mandatory reporting. However, because mandatory reporting for OAS CAHPS began on January 1, 2025, hospitals will have had three years of reporting experience prior to the launch of CJR–X on January 1, 2028, as finalized in section X.C.2.a of this final rule. We also note that given the updated model start date, we have made conforming edits to the quality measure performance periods, in section X.C.2.e.(3)(4)(a) of this final rule. The updated quality measure performance period for the OAS CAHPS is January 1, 2028–December 31, 2028, which follows three years of mandatory reporting. We believe three years of mandatory reporting will provide hospitals with sufficient experience collecting and reporting the measure before its use in CJR–X.

We will continue to consider hospitals' reporting experience with OAS CAHPS, the measure's reliability and usefulness, and whether any phase-in or scoring refinements are necessary through future rulemaking as additional experience with the measure becomes available.

After consideration of the public comments we received, we are finalizing without modification the proposal at § 512.635(a)(4) to include the OAS CAHPS (CMIT #162, OP–46) survey in the CJR–X quality measure set.

(e) Hospital-Level Total Hip and/or Total Knee Arthroplasty (THA/TKA) Patient-Reported Outcome-Based Performance Measure (PRO–PM) (CMIT ID #1618)

Administrative claims-based THA/TKA Complications and hospital readmission measures have been publicly reported since 2013. However, these measures do not capture the reasons for which patients undergo elective THA and TKA (for example, Will quality of life be improved after undergoing the procedure?). Therefore, a quality measure based on PRO data provides both patients and providers with a unique and critical perspective on care.

As the goal of the procedures is to improve quality of life, THA and TKA are ideal candidates for assessing PROs. The original CJR model included voluntary reporting of PRO data. In order to meet the CJR Model requirements for successful submission of PRO data, hospitals had to submit the Veterans RAND 12 Item Health Survey (VR–12) or Patient-Reported Outcomes Measurement Information System (PROMIS) Global-10 generic PRO survey; and the (HOOS Jr.)/(KOOS Jr.) or HOOS/KOOS subscales PRO survey for patients undergoing eligible elective primary THA/TKA procedures.

Using the data collected from CJR participants, CMS developed the THA/TKA PRO–PM (CMIT ID #1618) to assess the quality of care delivered to Medicare beneficiaries undergoing elective THA or TKA.[603] As described in the FY 2023 IPPS/LTCH PPS Final rule (87 FR 48780), the THA/TKA PRO–PM became a mandatory requirement for hospitals included in the Hospital IQR Program beginning July 1, 2025. Therefore, voluntary PRO submission is no longer a relevant incentive. Rather, inclusion of the PRO–PM in the HIQR provides an opportunity for CJR–X to access this data without additional burden to CJR–X participants.

The Hospital-Level THA/TKA PRO–PM measure is an appropriate quality measure for inclusion in CJR–X because it directly assesses improvements in patients' pain, physical function, and health-related quality of life following elective joint replacement. Unlike utilization- or complication-based measures, this measure captures outcomes that matter most to beneficiaries. The measure evaluates change in patient-reported outcomes from before surgery to after recovery, which provides a meaningful assessment of episode-level effectiveness and complements existing CJR–X quality measures. In addition, because the measure is risk-adjusted and allows for fair comparison across hospitals, it would support accountability while minimizing incentives to avoid higher-risk patients. Including this measure would strengthen alignment between the CJR–X financial incentives and patient-centered care and support the model's goals of improving quality, value, and beneficiary experience throughout the episode of care.

As stated, THA/TKA PRO–PM reporting is currently only mandatory in the HIQR. However, we believe the inpatient measure provides an overall reflection of hospital performance related to LEJR care and can appropriately be used to infer quality of care for outpatient episodes even in the absence of outpatient-specific PRO collection. Therefore, we do not propose to require PRO submission for outpatient CJR–X episodes but will use the inpatient THA/TK PRO–PM to assess quality of care for all LEJR episodes, regardless of setting.

We note that voluntary THA/TKA PRO reporting to the HOQR (OP–42) has already begun for procedures performed in CY 2025 and will be mandatory for procedures performed in CY 2028 (2031

[603] Patient-Reported Outcomes Following Elective Primary Total Hip and/or Total Knee Arthroplasty: Hospital-Level Performance Measure, Centers for Medicare & Medicaid Services Measures Inventory Tool, CMIT Measure ID 1618. *https://cmit.cms.gov/cmit/#/FamilyView?familyId=1618.*

payment determination).[604] CJR–X may rely on data from the HOQR when it becomes available, but only after proposing such a change through CJR–X notice and comment rulemaking.

Therefore, we proposed at § 512.635(a)(5) to use the Hospital-Level THA/TKA PRO–PM (CMIT ID #1618) to assess inpatient and outpatient LEJR episode quality performance starting in PY1 of CJR–X. We sought comment on the inclusion of this measure in the CJR–X measure set and alternatives to our proposal to apply the PRO–PM to outpatient episodes. The following is a summary of the public comments received.

Comment: Some commenters supported including the THA/TKA PRO–PM in CJR–X. A commenter stated it is appropriate for CJR–X because it directly assesses improvements in patients' pain, physical function, and health-related quality of life following elective joint replacement. Another commenter recommended CMS continue developing patient-reported outcome measures as part of quality assessment. Another commenter stated that PRO measures have the potential to meaningfully inform clinical decision-making and improve patient outcomes. Another commenter stated that THA/TKA PRO–PM represents the type of patient-centered outcome data that could bridge acute episode accountability and longitudinal chronic care management and asked CMS to describe how these measures could be linked to other models, such as ACCESS and CARA arrangements within LEAD, to enable specialists and/or ACCESS participants to track functional status longitudinally for the same patient population.

Response: We thank commenters and agree that the measure is appropriate for CJR–X.

Comment: Many commenters stated that PROs should be implemented in a manner that is both realistic and achievable to ensure their long-term effectiveness and to avoid unintended burden on participating providers. They further stated that, at this time, the operational burden and resource intensity of administering and reporting the PROs will exceed the capabilities of many hospitals. Many commenters stated the operational realities present substantial barriers for hospitals and health systems. A commenter urged CMS to address website issues which frequently result in uploading rejections. They stated that the data elements required for reporting and the timelines for data collection are incredibly complex and require painstaking review of data formatting. Some commenters stated that hospitals in rural and medically-underserved settings do not employ their surgeons, and post-discharge follow-up is conducted with the surgeons, limiting hospitals access to PROs and control over survey administration. Commenters cautioned that the CJR Model demonstrated that even highly engaged and clinically sophisticated organizations struggled to successfully report this measure. They stated that administering PROs diverts resources both pre- and post-operatively from patient care, as it requires significant clinical and quality staff time for patient outreach, tracking, and data entry. Further, post-operative PRO collection at 90–365 days requires long-term tracking outside standard workflows, reliance on third-party tools or manual processes that increase duplication and risk of error. Many commenters asked CMS to provide flexibility, technical support, or refinements. A commenter expected that there will be limited consistency and completeness in the early years of implementation until systems can build sustainable workflows. The commenter requested that CMS align PRO requirements across programs and allow flexibility in the initial performance years.

Response: We acknowledge commenters' concerns that PRO collection and reporting creates operational burden. However, we note that the HIQR reporting requirement for the Hospital-Level THA/TKA PRO–PM is outside the scope of this model. As hospitals must already report the measure to the HIQR, CJR–X will not create additional burden. We also note that there are several differences between the CJR Model PRO reporting experience and the PRO–PM requirements. First, the CJR Model PRO submissions were voluntary, so it is difficult to estimate how many hospitals would have successfully reported PROs under mandatory conditions. Second, the CJR Model instituted increasing minimum reporting thresholds over the course of the model, beginning at 50% in PY 1 and ending at 90% in PY 8. However, in PY 1, 67% of CJR hospitals successfully met the 50% threshold, which is the same threshold currently in use for the PRO–PM under the HIQR.

We acknowledge that collecting both pre-operative and post-operative PRO data may require hospitals to develop or refine workflows for patient outreach, tracking, data submission, and coordination with surgeons and other providers involved in post-discharge care. We also recognize commenters' concerns that hospitals in rural or medically underserved areas, or hospitals that do not employ their orthopedic surgeons, may face additional challenges obtaining PRO data after discharge. These operational considerations are important, and we will consider whether technical assistance, clarification of specifications, or additional implementation flexibility is needed to support feasible reporting.

We continue to believe that including the Hospital-Level THA/TKA PRO–PM in CJR–X is important because it provides a patient-centered measure of surgical recovery and functional improvement that cannot be fully assessed through administrative data alone. We will continue to consider ways to reduce unnecessary burden, improve reporting reliability, and support hospitals in collecting meaningful PRO data for LEJR episodes.

Comment: Many commenters urged CMS to delay mandatory performance-based use of the THA/TKA PRO–PM. Commenters requested that CMS keep the measure voluntary to allow time for participants to establish reporting processes and for CMS to assess response rates, and feasibility. Many commenters asked that CMS make the measure ''pay-for-reporting'' only for the first few years of the model. A commenter requested that CMS not begin ''pay-for-performance'' until the FY2030 Hospital IQR payment determination period. Other commenters suggested offering bonus points for voluntary reporting, as was done in the CJR Model, or removing the PRO–PM.

Response: We thank the commenters for their recommendations and acknowledge concerns about using the THA/TKA PRO–PM in CJR–X for assessing performance.

We note that the THA/TKA PRO–PM is currently in use in a pay-for-reporting context under the HIQR. Using the measure in CJR–X under a pay-for-performance approach would build on that existing reporting framework and strengthen the importance of PROs in evaluating the quality of care hospitals provide. We believe this is appropriate because CJR–X would link financial accountability to both cost and quality for LEJR episodes, and patient outcomes are an important part of assessing the quality and value of care delivered during those episodes.

We further believe that including the THA/TKA PRO–PM in a national episode-based payment model may increase the incentive to report and

[604] Patient-Reported Outcome Performance Measures Overview, CMS QualityNet. *https://qualitynet.cms.gov/outpatient/measures/PRO-PM.*

support broader, more consistent use of PRO data for LEJR care. Increased use of the measure could provide more experience evaluating PRO–PM performance across hospitals and support more reliable reporting practices over time.

We believe that delaying performance-based use of the Hospital-Level THA/TKA PRO–PM for several years could slow progress toward incorporating patient-centered outcomes into value-based care for LEJR episodes. At the same time, we recognize the importance of implementing the measure in a manner that is operationally feasible, reliable, and fair to participating hospitals. We will continue to consider hospitals' reporting experience, data completeness, response rates, and operational feasibility as the THA/TKA PRO–PM is implemented in CJR–X.

Comment: Many commenters suggested making refinements to measure specifications before implementation and taking a measured approach to allow for further evaluation of measure reliability. A commenter stated that the small sample sizes at low-volume hospitals increase variability, limit meaningful comparisons, and require substantial administrative effort with limited value. Other commenters strongly recommend that CMS establish a minimum sample size threshold for the THA/TKA PRO–PM, as a single patient could materially affect results. Another commenter did not believe that comparing participants with lower response rates to others with 90–100% of patients responding was a meaningful incentive. Another commenter urged CMS to implement social risk adjustment methodologies to ensure outcome benchmarks are appropriately adjusted for patient demographics and baseline function before linking them to payment.

Response: We acknowledge commenters' concerns about measure reliability and the lack of social factors in the THA/TKA PRO–PM measure risk adjustment methodology. However, as previously discussed, CJR–X is relying on data that is mandatorily submitted to the HIQR and changes to the measure are out of scope for this model.

We also note that re-specifying an existing measure is not simply an operational change. Additional testing and validation would be needed to assess whether proposed refinements improve fairness and reliability without introducing unintended bias, reducing comparability, or undermining the measure's ability to evaluate outcomes. That process would take significant time. However, we will continue to assess the response rates, sample sizes, and reliability of the HIQR measure as it matures and may consider future refinements to the THA/TKA PRO–PM specifications as appropriate.

Comment: Many commenters recommended lowering the case minimums for the measure. The commenters stated the measure disproportionately affects rural, safety-net, and low-volume facilities because it lacks feasible case minimums. Many commenters noted that completion rates are impacted by factors beyond provider control, including digital literacy, access issues, language barriers, and limited patient awareness. Commenters also urged CMS to account for the population-level factors that drive collection gaps at essential hospitals independent of care quality. Another commenter suggested CMS restore improvement-based quality scoring to allow hospitals to demonstrate meaningful progress in PRO–PM collection and performance over time. Several recommended setting the case minimums at 25 for larger, urban hospitals and 10 for small and/or rural hospitals. Commenters also recommended patient-exclusion criteria or the ability to report patient refusals to capture the volume of patients who decline to participate or are in hospice. A commenter stated their post-op response rates are 28% lower, on average, compared to the pre-op response rates. Other commenters recommended a data-collection framework with an evidence-based response rate less than 50% for low-volume and rural settings and clinically realistic data-collection timelines that align with everyday clinical workflows.

Response: We believe the 25-case minimum is reasonable because it is commensurate with case minimums used for other CMS quality measures. A case minimum helps ensure that measure results are based on enough observations to support more reliable performance assessment and to reduce the effect that a very small number of patient responses may have on a hospital's quality score. We recognize, however, that case minimums must balance reliability with the need to allow participating hospitals, including low-volume and rural hospitals, to be fairly assessed for quality performance in the model.

We also note that the 50 percent minimum reporting threshold currently in use for the PRO–PM under the HIQR corresponds to the reporting threshold in the first CJR performance year. Although submission was voluntary, 67 percent of CJR participants who submitted PROs in PY 1 were successful. We do recognize that hospital reporting under mandatory conditions may differ, but we anticipate that the mandatory requirement would increase engagement among model participants.

Nevertheless, we will continue to monitor the effects of including the measure in CJR–X and may take these recommendations into consideration in the future. *Comment:* We received a few comments about the measure cohort. A commenter requested that CMS limit the cohort to Medicare as primary payor only. They stated that it is nearly impossible, at the time of survey enrollment, to know whether Medicare is the secondary or tertiary payer, resulting in the enrollment of many more patients than will qualify just to avoid a penalty. Another commenter stated that because this is difficult to determine, the measure should not include only those for whom Medicare is the primary payer. Another commenter urged CMS to expand the THA/TKA PRO–PM cohort to include Medicare Advantage beneficiaries, as a FFS-only restriction captures only a minority of joint replacement volume, producing small, non-representative denominators.

Response: We proposed to use the same Hospital-Level THA/TKA PRO–PM measure specifications used in the HIQR to maintain consistency and alignment across CMS programs. We do note that the Medicare Advantage program is itself a value-based program with its own quality requirements which aid in capturing data on the outcomes of enrollees.

At this time, we believe that using the HIQR specifications will support standardization, comparability, and alignment across CMS quality measurement efforts. We will continue to consider whether future refinements to the THA/TKA PRO–PM cohort are warranted as we evaluate measure reliability, feasibility, and representativeness across hospitals.

After consideration of the public comments we received, we are finalizing without modification the proposal at § 512.635(a)(5) to include the Hospital-Level THA/TKA PRO–PM (CMIT ID #1618) in the CJR–X quality measure set.

(4) Quality Measure Reporting

(a) Display of Quality Measures and Performance Periods

We stated in the proposed rule that we believe that the display of measure results is an important way to educate the public on hospital performance and increase the transparency of the model.

We proposed at § 512.635(f) to display quality measure results on the publicly available CMS website in a form and manner consistent with other publicly reported measures. CMS would share each CJR–X participants' quality metrics with the hospital prior to display on the CMS website. The timeframe for when CJR–X participants would receive data on our proposed measures aligns with the Care Compare schedule that can be found here: *https://data.cms.gov/provider-data/topics/hospitals/measures-and-current-data-collection-periods.* We noted that all measures under the statutory hospital quality programs have a 30-day preview period prior to results being posted on the Care Compare web page. CJR–X participant measure scores would be delivered to CJR–X participants confidentially. We proposed to publicly report PY 1 measure scores in calendar year 2029 and we would continue to publicly report scores every performance year with an approximate 1-year lag. We believed this approximate 1-year lag period would be a sufficient amount of time to ensure accuracy of the measures data.

We also recognized in the proposed rule that measure performance periods would not align perfectly with performance years based on availability of data needed to assess quality performance in CJR–X. We proposed the following measure performance periods, summarized in Table X.C.–01. While only 5 performance years are displayed in the table, we proposed that the measure performance periods would continue at the same cadence each performance year. We stated in the proposed rule that where possible, these proposed measure performance periods align with existing CMS quality reporting program measure performance periods to minimize CJR–X participant confusion. We also acknowledged in the proposed rule that the measure performance periods do not exactly line up with the performance years used in CJR–X. While this creates some disparity between measure performance periods and model performance years, we believed this approach is the least burdensome to CJR–X participants because it does not require them to report on these measures separately for CJR–X. Additionally, we stated in the proposed rule that this approach is similar to how some measures were captured in the original CJR model as well as TEAM.

TABLE X.C-01: SUMMARY OF PROPOSED QUALITY MEASURE PERFORMANCE PERIODS BY YEAR IN CJR-X

Quality Measure	CJR-X Performance Year (PY)				
	PY1	PY2	PY3	PY4	PY5
Hospital-Level RSCR Following Elective Primary THA and/or TKA (CMIT ID #350)	April 1, 2026- March 31, 2028	April 1, 2027-March 31, 2029	April 1, 2028-March 31, 2030	April 1, 2029-March 31, 2031	April 1, 2030-March 31, 2032
Hospital Visits within 7 days of HOPD Surgery (CMIT ID #344, OP-36)	January 1, 2027-December 31, 2027	January 1, 2028-December 31, 2028	January 1, 2029-December 31, 2029	January 1, 2030-December 31, 2030	January 1, 2031-December 31, 2031
HCAHPS Survey (CMIT ID #338)	January 1, 2027-December 31, 2027	January 1, 2028-December 31, 2028	January 1, 2029-December 31, 2029	January 1, 2030-December 31, 2030	January 1, 2031-December 31, 2031
OAS CAHPS Survey (CMIT ID #162)	January 1, 2027-December 31, 2027	January 1, 2028-December 31, 2028	January 1, 2029-December 31, 2029	January 1, 2030-December 31, 2030	January 1, 2031-December 31, 2031
Hospital-Level THA/TKA PRO-PM (CMIT ID #1618)	July 1, 2026-June 30, 2027	July 1, 2027-June 30, 2028	July 1, 2028-June 30, 2029	July 1, 2029-June 30, 2030	July 1, 2030-June 30, 2031

We sought comment on our proposals at § 512.635(e) on how quality measures in CJR–X would be displayed and the quality measure performance periods.

The following is a summary of the public comments received on our proposals to display quality measure performance and align quality measure performance with existing CMS quality reporting programs, and our responses to these comments:

Comment: A commenter supported the timing and display of measures being publicly reported.

Response: We thank the commenter for their support.

Comment: A commenter objected to the measure performance periods because some of the measure performance periods will begin before CJR–X implementation and asked CMS to revise the timing.

Response: We recognize the commenter's concern that CJR–X participants may be assessed using quality data from periods before the model starts. This approach is consistent with the CJR Model and we continue to believe is appropriate at this time because the CJR–X quality methodology relies on established CMS quality measures and existing reporting timelines. Using available measure performance periods supports timely calculation of the CQS and avoids creating new CJR–X-specific reporting timelines that could increase burden and reduce consistency with other CMS quality reporting programs. Therefore, when we are performing reconciliation calculation, we will be using quality measure data that are the most currently available and aligns with measure data available through the Hospital Inpatient Quality Reporting Program and Hospital Outpatient Quality Reporting Program. We believe that aligning the measure performance periods with measure periods used in CMS quality reporting programs will reduce the potential for confusion and ensures that CJR–X uses the most currently available measure results for calculating participant hospital reconciliation payment determinations.

We also believe that using existing quality reporting periods promotes transparency and comparability across participant hospitals. These measures reflect ongoing hospital quality performance and are already part of hospitals' quality reporting obligations, rather than new requirements created solely for CJR–X. Delaying the use of quality measure data until only post-implementation periods are available could delay reconciliation calculations and disbursement or collection of reconciliation payment or repayment amounts.

We do note that the model start date has shifted by three months, as described in section X.C.2.a of this final rule, which means CJR–X performance years run on the calendar year and reconciliation calculations would be pushed back three months as well. Given this timing change, we are making conforming changes to the measure performance periods in this final rule. TABLE X.C–02 summarizes the finalized quality measure

performance periods by performance year in CJR–X.

TABLE X.C-02: SUMMARY OF QUALITY MEASURE PERFORMANCE PERIODS BY YEAR IN CJR-X

Quality Measure	CJR-X Performance Year (PY)				
	PY1 (1/1/28-12/31/28)	PY2 (1/1/29-12/31/29)	PY3 (1/1/30-12/31/30)	PY4 (1/1/31-12/31/31)	PY5 (1/1/32-12/31/32)
Hospital-Level RSCR Following Elective Primary THA and/or TKA (CMIT ID #350)	April 1, 2027-March 31, 2029	April 1, 2028-March 31, 2030	April 1, 2029-March 31, 2031	April 1, 2030- March 31, 2032	April 1, 2031-March 31, 2033
Hospital Visits within 7 days of HOPD Surgery (CMIT ID #344, OP-36)	January 1, 2028-December 31, 2028	January 1, 2029-December 31, 2029	January 1, 2030-December 31, 2030	January 1, 2031-December 31, 2031	January 1, 2032-December 31, 2032
HCAHPS Survey (CMIT ID #338)	January 1, 2028-December 31, 2028	January 1, 2029-December 31, 2029	January 1, 2030-December 31, 2030	January 1, 2031-December 31, 2031	January 1, 2032-December 31, 2032
OAS CAHPS Survey (CMIT ID #162)	January 1, 2028-December 31, 2028	January 1, 2029-December 31, 2029	January 1, 2030-December 31, 2030	January 1, 2031-December 31, 2031	January 1, 2032-December 31, 2032
Hospital-Level THA/TKA PRO-PM (CMIT ID #1618)	July 1, 2027-June 30, 2028	July 1, 2028-June 30, 2029	July 1, 2029-June 30, 2030	July 1, 2030-June 30, 2031	July 1, 2031-June 30, 2032

Additionally, we see the value of aligning measure performance periods and model performance years and will monitor the timing and use of quality data under CJR–X and may consider refinements to measure performance periods in future notice and comment rulemaking.

Comment: A commenter recommended shortening the lag between measure performance and CQS calculation at reconciliation so that within performance year improvements are reflected in the reconciliation amount for the year in which they occur, using hybrid claims plus eCQM data already submitted under Hospital Inpatient Quality Reporting Program.

Response: We are using quality measure data from the Hospital Inpatient Quality Reporting Program, and we aim to use the most currently available data such that measure performance periods may overlap as much as possible with a performance year. Shortening the lag substantially could create operational and methodological challenges. Specifically, we would need to ensure that the measure data were sufficiently complete, risk adjusted where applicable, validated, and available for all participant hospitals on a consistent timeline. Using incomplete or preliminary data could reduce reliability, create inequities across hospitals, and increase the risk that reconciliation amounts are based on unstable or non-comparable quality results.

We may monitor the relationship between measure performance periods and reconciliation timing.

After consideration of the public comments, we are finalizing without modification the proposal at § 512.635(e) on how quality measures in CJR–X would be displayed. We are also finalizing with modification the quality measure performance periods used to assess quality performance. The modification accounts for the updated model start date and performance years now aligned with calendar years.

(b) Data Submission Criteria

As discussed in the proposed rule, we believe it is important to be transparent and to outline the form, manner, and timing of quality measure data submission so that accurate measure results are provided to hospitals, and that timely and accurate calculation of measure results are consistently produced to determine reconciliation payment amounts and repayment amounts. We proposed that data submission for the Hospital-Level RSCR Following Elective Primary THA and/or TKA (CMIT ID #350), the HCAHPS survey (CMIT ID #338), and the Hospital-Level THA/TKA PRO–PM (CMIT #1618) would be accomplished through existing Hospital Inpatient Quality Reporting Program processes. Since these measures are reported to the Hospital IQR or other CMS quality reporting programs, CJR–X participants would not need to submit additional data for CJR–X.

For measures in the outpatient setting, we proposed that data submission for the Hospital Visits within 7 days of HOPD Surgery (CMIT ID #344, OP–36) and the OAS CAHPS (CMIT #162) survey be accomplished through the existing Hospital Outpatient Quality Reporting Program. Therefore, CJR–X participants would not need to submit additional data for CJR–X.

The following is a summary of the public comments received on our proposals to collect quality measure data from existing CMS quality reporting programs, and our responses to these comments:

Comment: Some commenters supported CMS' effort to minimize the reporting burden for hospitals by

selecting a parsimonious set of measures that hospitals already report to other CMS quality programs.

Response: We thank the commenter for this support.

Comment: Some commenters urged CMS to rely on existing data sources wherever possible, and suggested CMS continue to ensure alignment with the Hospital Inpatient Quality Reporting Program and Hospital Outpatient Quality Reporting Programs. Another commenter suggested that CMS consider the potential data collection burden of the Hospital-Level THA/TKA PRO–PM and ways to leverage technology to minimize reporting burden.

Response: We agree that minimizing reporting burden is an important consideration in designing and implementing the CJR–X quality methodology. We believe CJR–X reflects this goal because the CQS relies on measures and reporting processes already used in existing CMS quality reporting programs, rather than creating a separate CJR–X-specific quality reporting framework. This approach supports consistency across CMS programs, reduces duplicative reporting, and allows participant hospitals to focus on quality improvement rather than new administrative requirements.

We also acknowledge commenters' concerns about the potential data collection burden associated with the Hospital-Level THA/TKA PRO–PM. We continue to believe in the value of including this measure because patient-reported outcomes provide important information about pain, function, and recovery that is not fully captured through claims-based or patient experience measures. At the same time, we recognize that collecting PRO–PM data requires patient engagement, follow-up workflows, and reporting infrastructure.

We will continue to be mindful of reporting burden as CJR–X is implemented and may consider opportunities to leverage existing processes, technology, and alignment with broader CMS quality reporting efforts. We may monitor participant experience with PRO–PM data collection.

Comment: A commenter stated that implementation of CJR–X will require significant investments in quality reporting.

Response: We disagree because CJR–X is relying on quality measures that hospitals must already report to CMS in existing CMS quality reporting programs. Absent CJR–X, hospitals must report on the five quality measure in the Hospital Inpatient Quality Reporting Program and Hospital Outpatient Quality Reporting program. As a result, CJR–X does not require hospitals to make significant investments in quality reporting beyond what they already have allocated. We believe this approach is the best way to incorporate quality into reconciliation while minimizing new administrative burden, because it uses familiar reporting channels without creating duplicative submissions for CJR–X.

Comment: A commenter suggested that registry reporting could reduce administrative burden for hospitals new to value-based care, support quality and safety improvement, improve patient outcomes, and strengthen measurement. The commenter also noted that a registry could share facility-level metrics or support integration of registry-based metrics into the CQS, and that a registry's benchmarking functionality could help CMS refine the model over time.

Response: We thank the commenter for the suggestion and willingness to partner with CMS to support hospital reporting efforts. At this time, we believe the CJR–X quality methodology is the most appropriate approach because it relies on measures that are already reported through existing CMS quality reporting programs. We note that not every hospital may have access or resources to work with quality registry and we want to ensure hospital reporting can be applied consistently across participant hospitals. We recognize the value of a registry, especially in supporting hospitals that are new to value-based care that may not have experience with reporting quality measures or clinical data elements. We also recognize reporting flexibility may be important to meet the needs of CJR–X participants. We may consider incorporating registry reporting but also acknowledge it would require CMS to assess the availability, completeness, standardization, validation, and feasibility of registry data. Any such changes would be considered through future notice and comment rulemaking.

Comment: A commenter recommended that CMS require hospitals to report infections to the American Joint Replacement Registry and make aggregate product-line infection rates publicly available.

Response: We agree that surgical infections are important patient safety and quality concerns for LEJR beneficiaries, and that information about infection rates can support quality improvement efforts. However, we are not requiring CJR–X participants to report infections to a registry or to publicly report aggregate product-line infection rates as part of CJR–X at this time. We recognize that registries may provide valuable information for clinical quality improvement, including information related to joint replacement outcomes, complications, implants, and infection-related concerns. In addition to burden concerns, we would need to consider, among other issues, whether such reporting would be feasible for all CJR–X participants, whether the data would be standardized and sufficiently comparable, how product-line infection rates would be attributed and risk adjusted, how public reporting would protect beneficiary privacy, and how any new requirement would interact with existing hospital quality reporting and infection surveillance requirements.

We will continue to monitor quality of care and will continue to consider stakeholder feedback, registry data opportunities, measure-development work, monitoring results, and evaluation findings when assessing whether additional infection-related reporting or quality measures would be appropriate for CJR–X or future LEJR payment initiatives.

After consideration of the public comments, we are finalizing without modification the proposal to collect quality measure data from existing CMS quality reporting programs.

(5) Composite Quality Score (CQS)

(a) Overview

We stated in the proposed rule that we believe that CJR–X provides another mechanism for CJR–X participants to improve quality of care, while also achieving cost efficiency. Incentivizing high-value care through episode payments for LEJR is a primary objective of the model. Therefore, incorporating quality performance into the episode payment structure is an essential component of CJR–X, just as it was for the CJR Model (80 FR 73370) and for TEAM (89 FR 69774). We believe it is important for CJR–X to link the financial reward opportunity with performance in the quality of care for Medicare beneficiaries in a LEJR episode.

As discussed in section X.C.2.f. of this final rule, which outlines the pricing methodologies for CJR–X, we discuss the approach for setting a target price for LEJR episodes. We stated in the proposed rule that we would apply the CJR–X participant's discount factor, based on the participant's quality performance for the performance year, to calculate the reconciliation target price for LEJR episodes. We refer to section X.C.2.f.(5)(e). of this final rule for further discussion of the relationship between a CJR–X participant's quality

performance and the discount factor. A CJR–X reconciliation target price would represent expected spending on all related Part A and Part B items and services furnished during a LEJR episodes and would incorporate the CJR–X participant's discount factor for the performance year. CJR–X participants that achieve actual FFS spending below the reconciliation target price for a given performance year may be eligible for a reconciliation payment from CMS, subject to the proposed stop-gain limit policy as discussed in section X.C.2.f.(5)(g). of this final rule. CJR–X participants that achieve actual FFS spending that exceed the reconciliation target price for a given performance year would be required to pay CMS a repayment amount, subject to the stop-loss limit policy as discussed in section X.C.2.f.(5)(g). of this final rule.

We proposed a composite quality score methodology for linking quality and payment in CJR–X that is similar to, but not the same, as the methodology that was finalized for the CJR Model (80 FR 73363 through 73381). We proposed to define the ''composite quality score'' at § 512.605 as a score computed for each CJR–X participant to summarize the CJR–X participant's level of quality performance on specified quality measures as described in § 512.635. We indicated in the proposed rule that notably different is the inclusion of outpatient quality measures in CJR–X and thus the assessment of these measures in the composite quality score. The CJR–X composite quality score methodology would allow performance on each required quality measure to be meaningfully valued in the CJR–X's pay-for-performance methodology, incentivizing and rewarding cost savings in relation to the quality of episode care provided by the CJR–X participant.

We stated that although performance on each measure would be valued in the CJR–X composite quality score methodology, it is the CJR–X participant's overall quality performance under the CJR–X that would be considered in the pay-for-performance approach, rather than performance on each quality measure individually determining the financial opportunity under CJR–X. We noted in the proposed rule that the composite score methodology also provides a framework for incorporating additional measures of meaningful outcomes in the future. Finally, we stated that while we believe that high performance on all of the quality measures represents goals of clinical care that should be achievable by all CJR–X participants that heighten their focus on these measures, we appreciated that many CJR–X participants would have room for significant improvement in their current measure performance. The composite score methodology would provide the potential for financial reward for CJR–X participants that reach ''good'' or ''excellent'' quality performance, thus incentivizing their continued efforts to improve the quality and efficiency of LEJR episodes.

(b) Determining Quality Measure Performance

In the proposed rule we believed that assessing measure performance by comparing CJR–X participants against a national distribution for the proposed CJR–X measures would be the most appropriate way to incorporate quality performance into CJR–X. Moreover, we believed that hospitals nationally are currently working to improve their performance on quality measures on an ongoing basis as some of these measures are included in other CMS programs such as the Hospital Inpatient Quality Reporting and Hospital Value-Based Purchasing Programs. Therefore, we expected that CJR–X participants would have a heightened focus on performance on these measures as a result of the financial incentives resulting from the CJR–X payment methodology.

Thus, at the time of reconciliation for a performance year, we proposed at § 512.635(c) to assign each CJR–X participant's measure point estimate from the measure performance period, as discussed in section X.C.2.e.(5)(d). of this final rule, to a performance percentile based on the national distribution of measure results for hospitals that are eligible for payment under the IPPS reporting the measure, as discussed in section X.C.2.e.(5)(d). of this final rule, that meets the minimum patient case or survey count. We indicated in the proposed rule that this proposal applies to the Hospital-Level RSCR Following Elective Primary THA and/or TKA (CMIT ID #350); the Hospital Visits within 7 days of HOPD Surgery (CMIT ID #344, OP–36); the HCAHPS Survey (CMIT ID #338); the OAS CAHPS Survey (CMIT #162); and the Hospital-Level THA/TKA PRO–PM (CMIT #1618). The measure-specific parameters for minimum case/survey count that would apply to developing the national distributions are displayed in Table X.C–03.

TABLE X.C-03: MINIMUM REQUIREMENTS FOR USE IN NATIONAL DISTRIBUTION

Measure Requirements for use in national distribution
Hospital-Level RSCR Following Elective Primary THA and/or TKA (CMIT ID #350) At least 25 patient cases in the measure performance period.
Hospital Visits within 7 days of HOPD Surgery (CMIT ID #344, OP-36) At least 25 patient cases in the measure performance period.
HCAHPS Survey (CMIT ID #338) At least 100 completed surveys in the measure performance period.
OAS CAHPS Survey (CMIT ID #162) At least 100 completed surveys in the measure performance period.
Hospital-Level THA/TKA PRO-PM (CMIT ID #1618) At least 25 patient cases in the measure performance period.

We proposed at § 512.635(d) to assign any CJR–X participant without a reportable value for the measure, new hospitals that are identified as CJR–X participants, or CJR–X participants where CMS has suppressed the measure value due to an error in the data used to calculate the measure to the 50th performance percentile of the measure

result, so as not to disadvantage a CJR–X participant based on its lack of applicable cases because that CJR–X participant may in actuality provide high quality care. We noted in the proposed rule that we believe that relative measures of quality performance are most appropriate for CJR–X as hospitals continue to make progress nationally on improving patient outcomes and experience. This approach is also consistent with the CJR Model.

We sought comment on our proposals at §§ 512.635(c) and (d) to determine quality measure performance based on assigning the CJR–X participant's measure point estimate to a measure performance percentile based on the national distribution of measure results from hospitals eligible for payment under the IPPS.

The following is a summary of the public comments received on our proposal to determine quality measure performance, and our responses to these comments:

Comment: A commenter was concerned that the minimum cases needed for a quality score may not align with the model's low-volume threshold, creating uncertainty for hospitals with enough episodes to participate but too few cases for stable quality scores.

Response: We thank the commenter for raising concerns that the minimum case thresholds needed to calculate quality measure results may not always align with the CJR–X low-volume threshold for participation. We recognize that this could create uncertainty for hospitals that have enough episodes to participate in the model but too few cases for one or more quality measures to generate stable or reportable results.

We believe the current approach remains appropriate because the low volume hospital threshold and the quality measure case minimums serve different purposes. The low volume hospital threshold is used to determine whether a hospital has sufficient CJR–X episode volume to bear financial risk and have their episodes included in reconciliation, while quality measure case minimums are used to ensure that reported quality results are reliable and consistent with the specifications for the applicable measures. Aligning these thresholds exactly could either exclude hospitals that are otherwise appropriate for participation or require CMS to rely on quality results that may not be sufficiently stable for payment purposes. Therefore, we do not believe it is appropriate to align both the minimum patient case threshold and low volume hospital threshold. However, we will monitor how the quality methodology applies to low volume hospitals, including whether hospitals have sufficient measure data to support stable composite quality scores.

Comment: Some commenters said the Hospital-Level RSCR Following Elective Primary THA/TKA measure's case minimum of 25 cases was insufficient and recommended increasing it so the measure would meet a minimum reliability threshold appropriate for accountability.

Response: We appreciate the commenter's recommendation regarding minimum case thresholds for nationally benchmarked quality measures. The minimum case thresholds in CJR–X are predicated from the CJR Model and align with thresholds used in CMS quality reporting programs. Using these established thresholds supports alignment with the Hospital Inpatient Quality Reporting Program and Hospital Outpatient Quality Reporting Program and allows CMS to apply a consistent, transparent approach across CJR–X participants and avoids creating a separate CJR–X-only measurement system that could increase burden and reduce comparability. We recognize the commenters' concerns about reliability for accountability purposes and may consider whether additional analysis of case minimums is warranted.

Comment: A commenter stated that the 50% threshold is too high for hospitals without a reportable value and was not tested in a variety of US hospitals before implementation.

Response: We thank the commenter for raising concerns about the policy to calculate the measure to the 50th performance percentile when there may be insufficient data for a reportable value, in particular for the patient experience and patient reported outcome measures. We recognize the commenter's concern that response rates may be low for some hospitals and that low response rates could make it difficult for hospitals to obtain stable or representative patient experience data during the initial years of CJR–X.

We agree that quality measures used for payment purposes should be reliable, feasible, and based on sufficient data to support meaningful comparisons across participants. However, we believe the current approach, which mimics the CJR Model, is appropriate at this time because the patient experience measures included in the CQS are established measures used in existing CMS quality reporting programs. Using these measures allows CMS to incorporate patient experience into the model through standardized survey instruments and existing reporting infrastructure, rather than creating new CJR–X-specific reporting requirements that could result in additional reporting burden.

We also believe it is important to maintain the 50 percent threshold because the purpose of the threshold is to not disadvantage a CJR–X participant based on its lack of applicable data or cases because that CJR–X participant may in actuality provide high quality care. Lowering the threshold too substantially could unfairly disadvantage hospitals.

We acknowledge that survey response rates and implementation experience may vary across hospitals, particularly during early model years and for outpatient episodes. We may monitor response rates, measure reliability, data completeness, and the effect of the application of the 50th percentile on CQS calculation and payment adjustments.

Comment: A commenter requested CMS to describe the time period and data sources that will be used to construct the national distribution for OAS CAHPS, and confirm that the distribution reflects a stable, consistently reported version of the measure.

Response: We will be using the OAS CAHPS data available through the Hospital Outpatient Quality Reporting Program where hospitals currently report this measure. We note that the CJR–X Model has shifted the model start date to January 1, 2028, as discussed in section X.C.2.a of this final rule, and therefore we have made conforming changes to measure performance periods, including the measure performance period for the OAS CAHPS, as discussed in section X.C.2.e.(4)(a) of this final rule. For example, for performance year 1, we will be using a January 1, 2028–December 31, 2028 OAS CAHPS measure performance period which is the same time period as the performance year. Given our reliance on using the Hospital Outpatient Quality Reporting Program infrastructure to construct the applicable national distribution for the OAS CAHPS measure, we believe this produces consistent and standardized survey data that supports construction of the national distribution.

We may also monitor OAS CAHPS data availability, stability, and reporting consistency in connection with the quality scoring methodology.

Comment: A commenter suggested CMS should publish minimum data completeness thresholds, provide hospital-level PROM benchmarking dashboards with national and peer-

group comparisons no less than quarterly, standardize the PROM instruments and EHR-extractable specifications to reduce administrative burden, particularly for low-volume participants.

Response: We thank the commenter for their recommendation. We agree that patient-reported outcome measures are most useful when participants have timely feedback, meaningful benchmarks, and efficient data collection processes. We also recognize that participant-facing data can help hospitals use PROM results not only for payment methodology purposes, but also for care redesign, patient engagement, and quality improvement. We anticipate sharing data with CJR–X participants to support quality improvement during the model. We will take the commenter's recommendations into consideration as we develop participant-facing reports, including whether and how to provide information on PROM performance, data completeness, benchmarking, and comparisons to relevant peer and national groupings.

Comment: Some commenters stated concerns over scoring participants relative to each other, rather than against a clear, external performance standard. They indicated that a methodology that relies on forced distribution risks penalizing hospitals that are delivering high-quality care or demonstrating meaningful year-over-year improvement, simply because they fall into a lower decile compared to peers. They believed this approach undermines the intent of CJR–X to encourage continuous improvement.

Response: We recognize commenters' concern that a percentile-based methodology could result in hospitals receiving fewer quality points even when they are furnishing high-quality care or improving over time, if their performance remains in a lower decile compared to other hospitals. However, we believe the national distribution-based scoring approach is appropriate at this time because it provides a standardized, transparent, and comparable method for assessing quality performance across participant hospitals. Scoring participants against the national distribution allows CMS to compare quality performance using a common benchmark, rather than creating hospital-specific standards that could vary based on each hospital's starting point.

We also note that because CJR–X is a national model, identifying a separate external performance standard that is broadly representative, current, and applicable across the range of CJR–X participants would be challenging. Any national hospital benchmark for the relevant measures would likely include many hospitals participating in CJR–X, and excluding those hospitals could make the benchmark less representative of current national performance. For that reason, CMS believes that using the national distribution for the applicable measures provides a transparent and administrable reference point that supports comparability across participants while preserving a common quality standard.

We also do not believe the methodology undermines continuous improvement. The decile-based point structure rewards higher performance with additional quality points and creates an ongoing incentive for hospitals to improve their performance relative to national benchmarks. While year-over-year improvement is important, we believe reconciliation payment eligibility and discount factor reductions should remain tied to whether a participant's overall quality performance meets the model's quality expectations, not solely to whether the participant improved from its own baseline. A methodology based only on improvement could allow hospitals to receive quality-based financial benefits even where their overall quality performance remains below standard.

We will monitor participant quality performance, including whether the percentile-based methodology appropriately captures meaningful quality improvement over time.

Comment: A commenter requested CMS clarify how the HCAHPS and OAS CAHPS measure point estimates will be derived given neither measure is a single measure, but rather a larger measure that encompasses many measures. Further they want to know whether the scoring approach uses top-box proportions (percent of patients responding ''definitely yes''), a combined positive proportion, or some other calculation.

Response: We acknowledge the need for clarification regarding how a single measure point estimate is derived for the HCAHPS and OAS CAHPS survey measures for purposes of assigning quality performance percentiles under CJR–X.

For the HCAHPS, we intend to align with the scoring approach used in the CJR model. Under that approach, CMS summarized performance on the HCAHPS Survey measure using a HCAHPS Linear Mean Roll-up (HLMR) score. The HLMR summarizes performance across the publicly reported HCAHPS measures, excluding Pain Management, by averaging the linear mean scores for the HCAHPS measures, with a weight of 1.0 for each composite measure and a weight of 0.5 for each single-item measure. CMS then used that HLMR value as the HCAHPS measure value for assigning the CJR participant hospital to a performance percentile based on the national distribution of hospitals meeting the applicable survey-count threshold.

Therefore, consistent with the CJR methodology, we would derive the HCAHPS point estimate for CJR–X from the applicable HCAHPS linear mean scores, rather than treating each HCAHPS component as a separate CJR–X quality measure. We would assign each CJR–X participant's measure point estimate to a performance percentile based on the national distribution of measure results for hospitals that meet the applicable minimum survey count.

For OAS CAHPS, we also recognize that the survey includes multiple patient-experience domains. We view the OAS CAHPS as the outpatient complement to HCAHPS and will use it to assess outpatient episode quality performance. We intend to apply a parallel approach for CJR–X scoring: the OAS CAHPS measure point estimate would be derived as a single patient-experience measure value using the applicable OAS CAHPS publicly reported measure results, and that single value would then be assigned to a performance percentile for purposes of the CJR–X composite quality score. This approach is consistent with the CJR model's use of a single rolled-up HCAHPS value for patient experience and with the CJR–X proposal to score HCAHPS and OAS CAHPS as patient-experience measures within the composite quality score, rather than as separate component measures.

We anticipate providing additional resources to help CJR–X participants understand the calculation of measure point estimates and the construction of the composite quality score.

Comment: A commenter stated that the use of OAS CAHPS in a pay-for-performance context represents a significant expansion of this measure's role, and the proposed rule does not appear to address whether OAS CAHPS has the distributional properties necessary to support reliable percentile-based payment scoring.

Response: We appreciate the commenter's concern about the OAS CAHPS measure generally being used in pay-for-reporting contexts. We acknowledge that OAS CAHPS has generally been used in pay-for-reporting programs, where the emphasis has been on promoting standardized measurement and public reporting of

patient experience. We believe that a pay-for-performance approach is appropriate for CJR–X because the model is intended not only to measure quality, but also to encourage participants to improve quality while reducing Medicare expenditures for lower extremity joint replacement episodes. As more LEJR procedures are performed in hospital outpatient departments, it is important that the model incentivize CJR–X participants to deliver a high-quality patient experience in addition to achieving favorable clinical outcomes and efficient resource use. Including OAS CAHPS as a performance measure advances this objective by creating an incentive for participants to improve patients' experiences with outpatient surgical care, including communication, care coordination, and preparation for recovery, rather than solely report these experiences.

We recognize the commenter's concern regarding the distribution of OAS CAHPS scores and whether the measure provides sufficient differentiation to support percentile-based scoring. However, we do not believe that the appropriateness of including a patient experience measure in CJR–X depends on maximizing variation across CJR–X participants. Patient experience measures, including CAHPS surveys more broadly, are designed to assess aspects of care that are important to beneficiaries and are not captured by clinical outcome or cost measures. As providers improve performance over time, it is not unexpected that scores on patient experience measures may become concentrated at the upper end of the distribution. We do not view this, by itself, as evidence that the measure is unsuitable for inclusion in a value-based payment model.

Moreover, we believe that a percentile-based methodology remains an appropriate approach for CJR–X because it recognizes relative performance among CJR–X participants and maintains incentives for continuous quality improvement as national performance evolves. The purpose of the composite quality score is to distinguish performance across CJR–X participants using multiple complementary dimensions of quality, of which patient experience is one. OAS CAHPS contributes to a broader assessment of quality alongside clinical outcome measures, rather than serving as the sole determinant of CJR–X participants' quality performance or reconciliation payments.

At the same time, we acknowledge that CJR–X represents the first application of OAS CAHPS in a Medicare pay-for-performance model. Accordingly, we intend to closely monitor CJR–X participant performance on this measure throughout the model, including the distribution of scores, measure reliability, and movement across performance percentiles over time. We may evaluate whether the measure and scoring methodology appropriately differentiate CJR–X participant performance and support the objectives of the model.

Comment: A commenter stated that the Discharge and Recovery composite in the OAS CAHPS captures care coordination and post-discharge preparation, which CMS itself identifies as central to successful joint replacement episodes, making it the OAS CAHPS domain most clinically aligned with CJR–X goals. They further stated that its recent reinstatement to public reporting is therefore a welcome development in this context. They asked CMS to describe the basis for that reinstatement and to address what the data collected during the suppression period suggests about the composite's current reliability and readiness for use in a payment context. They also wanted to know if this composite was not publicly reported for the period that would form the baseline national distribution for CJR–X, there may be a discontinuity in the historical data underlying that distribution. Lastly, they also requested CMS clarify whether the Discharge and Recovery composite will be included in the OAS CAHPS ''measure point estimate'' used for CJR–X scoring, and if so, whether the national distribution will be constructed from a period when this composite was fully operational, suppressed, or transitional.

Response: We appreciate the commenter's support for the OAS CAHPS Survey and the request for additional information regarding the Preparation for Discharge and Recovery composite. We recognize the commenter's interest in its prior public reporting status and subsequent return to public reporting. The current OAS CAHPS measure specifications, including the Preparation for Discharge and Recovery composite, reflect the survey as it is presently specified and publicly reported by CMS, and we believe it is appropriate to rely on those current specifications for purposes of CJR–X.

We agree with the commenter that patients' preparation for discharge and recovery is highly relevant to the goals of the model. As an increasing share of LEJR procedures are performed in hospital outpatient departments, effective discharge preparation, patient education, and care coordination are important components of high-quality, patient-centered care that may contribute to improved recovery following surgery. Accordingly, we believe that this aspect of the patient experience is appropriately reflected as part of the OAS CAHPS measure used in CJR–X.

We also clarify that, given the modified start date of January 1, 2028 for CJR–X, as discussed in section X.C.2.a of this final rule, we have made conforming changes to the quality measures performance periods. As discussed in section X.C.2.e.(4)(a) of this final rule, the updated OAS CAHPS measure performance period for performance year 1 will be January 1, 2028–December 31, 2028. Accordingly, CJR–X participants in performance year 1 will be evaluated based on OAS CAHPS measure data from January 1, 2028 through December 31, 2028 performance period, and the national performance distribution used to assign performance percentiles will be derived from the same contemporary performance period using the finalized OAS CAHPS measure specifications in effect for that period. Because CJR–X will rely on contemporaneous performance data collected under the current OAS CAHPS measure specifications, rather than historical data collected during the period in which certain OAS CAHPS survey results were not publicly reported, we do not believe the prior public reporting status of the Preparation for Discharge and Recovery composite or other OAS CAHPS survey results has implications for the implementation of the finalized CJR–X scoring methodology.

Finally, as with other quality measures included in CJR–X, we will continue to monitor the performance of the OAS CAHPS measure over the course of the model, including its reliability, distribution of scores, and ability to meaningfully distinguish participant performance.

Comment: A commenter recommended that CMS score the HCAHPS surveys as pay-for-reporting measures during the first performance year of CJR–X.

Response: We appreciate the commenter's recommendation, but we continue to believe that HCAHPS is an appropriate pay-for-performance measure because it captures an important dimension of quality from the patient's perspective that is not reflected in clinical outcome or cost measures alone. Patient experience is a key component of high-quality, patient-centered care, and the HCAHPS Survey

assesses aspects of the inpatient experience, including communication with clinicians, responsiveness of hospital staff, care transitions, and overall hospital experience, that are particularly relevant to beneficiaries undergoing inpatient lower extremity joint replacement procedures.

HCAHPS is a mature, nationally standardized measure that has been widely implemented across Medicare programs for many years. We believe it is appropriate to maintain consistency with the CJR Model, which incorporated HCAHPS as a pay-for-performance measure in the composite quality score. Continuing this approach in CJR–X provides established policy continuity, while preserving a balanced quality framework that recognizes patient experience alongside clinical outcomes and episode spending.

After consideration of the public comments, we are finalizing without modification the proposal at §§ 512.635(c) and (d) to determine quality measure performance based on assigning the CJR–X participant's measure point estimate to a measure performance percentile based on the national distribution of measure results from hospitals eligible for payment under the IPPS.

(c) Quality Improvement

We recognized in the proposed rule that the CJR Model rewarded CJR participant hospitals for quality improvement, similar to the pay-for-performance policies under other programs such as the Hospital Value-Based Purchasing Program, in order to provide an incentive for quality improvement for CJR participant hospitals at all levels of quality performance (70 FR 73379). As in the CJR Model, we believed the heightened focus on episode spend and quality performance by CJR–X participants may lead to substantial year-over-year quality measure improvement. Nevertheless, we believe that the actual level of quality performance achieved in CJR–X should be most highly valued in the composite quality score to reward those CJR–X participants furnishing high-quality care to CJR–X beneficiaries.

We considered in the proposed rule, but did not propose, to include a policy that provides CJR–X participants quality improvement points when there is improvement of 2 deciles or more in comparison to the national distribution of measure results from the prior year, based on a comparison of relative quality measure performance over the most recent 2 years of available quality measure result data. CJR–X participants who are able to demonstrate quality improvement, could be awarded 10 percent of the maximum measure performance score, with a cap for the overall composite quality score at 20 points. This is the same methodology as was used in the CJR Model.

However, we did not propose to include quality improvement points in CJR–X because we believed CJR–X is structured to emphasize absolute quality performance on clinically meaningful outcomes, rather than short-term year-over-year changes that may reflect random variation or changes in case mix. Further, we stated in the proposed rule that we believe focusing on achievement-based performance promotes consistent accountability for patient safety, experience, and outcomes across CJR–X participant hospitals.

In addition, we noted in the proposed rule that CJR–X already provides incentives for improvement through its financial reconciliation structure, as hospitals can benefit from lower episode spending while maintaining quality thresholds. Excluding improvement points also supports transparency and predictability in quality scoring, allowing hospitals to better understand how quality performance affects reconciliation payments and to invest in sustained, long-term care redesign strategies. Lastly, this approach aligned with TEAM as quality improvement points are not included in the model's composite quality score calculation. Thus, we believed not including quality improvement points aligns with the goals of the model by balancing fairness, administrative simplicity, and accountability for high-quality, patient-centered care.

We sought comment on not including a policy for quality measure improvement for CJR–X.

The following is a summary of the public comments received on our proposal to not include a policy for quality improvement, and our responses to these comments:

Comment: A commenter supported the proposal to not include quality improvement points. They believed the current quality measure set is composed of measures with known challenges or low variation in performance resulting in little opportunity for improvement. They also noted that if CMS develops quality measures targeted to LEJR, inclusion of improvement points may be warranted.

Response: We thank the commenter for their support. We would consider reassessing the need for quality improvement points if different quality measures would be proposed for inclusion in CJR–X in future notice and comment rulemaking.

Comment: Many commenters recommended that CMS add quality improvement points or an improvement pathway, stating that hospitals should receive credit for year-over-year improvement and should not be judged only on absolute performance. A couple of commenters believed assigning points to quality measures based on relative performance compared to the national distribution of hospitals will always create winners and losers, even if a hospital has improved its performance over time and thus a separate approach to quality improvement is needed. A commenter believed that including quality improvement points rewards progress and prevents permanently disadvantaging hospitals that serve more complex patient populations. Another commenter recommended allowing CJR–X participants to qualify for a reconciliation payment based on quality improvement.

Response: We agree that encouraging quality improvement is an important overarching important goal of CJR–X. This includes CJR–X participants improving the quality of care provided to beneficiaries, improving the quality of collaboration between other providers and suppliers, and improving ways to reduce Medicare spending. However, we do not believe it is necessary or appropriate at this time to add separate quality improvement points when assessing quality performance. The CJR–X quality methodology is designed to provide a standardized, transparent, and comparable framework for assessing quality across participant hospitals. The purpose of the CJR–X quality methodology is not only to recognize whether a hospital improved relative to its own prior performance, but also to determine whether the hospital's quality performance is sufficient to support payment incentives under a nationwide episode payment model. A national distribution-based methodology gives CMS and CJR–X participants a common benchmark for assessing quality performance across hospitals, rather than creating hospital-specific standards that could vary based on each CJR–X participant's starting point.

We believe this approach is preferable for several reasons. First, it supports comparability across CJR–X participants by measuring performance against the same national reference point. This is especially important because CJR–X would apply nationally to eligible acute care hospitals, with limited exceptions, and the quality methodology must be administrable, transparent, and consistently applied across a broad set of participants. Second, the composite quality score methodology considers

overall quality performance across multiple complementary measures, rather than allowing performance on any single measure to determine the financial opportunity under the model. Third, linking reconciliation payment eligibility and discount factor reductions to composite quality score categories helps maintain a clear connection between financial incentives and the quality of episode care.

By contrast, a separate improvement pathway could allow a CJR–X participant to receive payment incentives based on relative improvement even if its overall quality performance remained below the standards CMS for CJR–X. While year-over-year improvement is important, CMS believes that payment incentives in CJR–X should remain tied to whether the CJR–X participant's overall quality performance meets the model's minimum quality expectations. This preserves accountability for beneficiary outcomes and avoids creating separate standards that could make results less comparable across CJR–X participants. We acknowledge some hospitals may serve more complex beneficiary populations, but beneficiaries in those hospitals should also continue to be protected by a meaningful minimum quality standard. A separate improvement-points pathway could allow a hospital to receive additional payment credit based on relative progress even if its overall quality performance remains below the thresholds CMS proposed for CJR–X.

We also believe the methodology already creates incentives for improvement given the link of quality performance to financial rewards through the adjustment of the discount factor. CJR–X participants that achieve at least ''Acceptable'' quality performance may be eligible for a reconciliation payment, and CJR–X participants with ''Good'' or ''Excellent'' performance may receive a reduced discount factor. Thereby through the structure of including quality levels, CJR–X participants are incentivized for continued efforts to improve the quality and efficiency of LEJR episodes.

Accordingly, we believe the national distribution-based composite quality score methodology is the better approach for CJR–X at this time because it maintains a uniform quality standard, supports comparability and transparency, links payment incentives to overall quality performance, and preserves beneficiary protections by ensuring that reconciliation payment eligibility is conditioned on meeting minimum quality expectations. CMS will monitor participant quality performance in connection with the quality methodology.

Comment: A commenter suggested that that certain hospitals, such as safety net, rural, and high acuity hospitals, should be provided quality improvement scoring pathway for the first few years of the model because they believe these hospitals may be penalized for starting further behind compared to other hospitals.

Response: We appreciate the commenter's recommendation to provide a quality improvement pathway for certain hospitals and recognize that all hospitals captured in CJR–X may not be providing same level of quality of care. However, we do not believe a separate quality improvement scoring pathway is necessary at this time. Applying a separate pathway only for certain hospital types could introduce additional complexity and may make quality performance less comparable across participant hospitals. We believe not including a separate quality improvement pathway is the better framework because it maintains a uniform quality standard across the model and preserves incentives for all CJR–X participants to improve quality.

We will monitor the quality performance of all CJR–X participants, including safety net, rural, high-acuity, and other participant hospitals during the model.

Comment: A couple of commenters recommended CMS include quality improvement points in CJR–X with specific recommendations. A commenter suggested adopting an quality improvement approach similar to the Skilled Nursing Facility Value-Based Purchasing Program where hospitals earn improvement points for better outcomes versus a baseline. Another commenter suggested providing partial credit for one-decile improvement because they believed partial credit for one-decile improvement would extend the benefit to a broader range of hospitals.

Response: We recognize the value of considering approaches that could better account for differences across participant hospitals, including differences in baseline performance, patient populations, and operational circumstances. At this time, we believe the current approach provides an appropriate framework for assessing quality performance in CJR–X because it applies a consistent methodology across participant hospitals, supports comparability, and preserves incentives for all participants to improve quality during the model. We believe adding separate partial credit for a one-decile improvement could increase complexity and reduce comparability across participants without clearly improving the model's ability to distinguish meaningful quality performance. We acknowledge the value of aligning quality assessment approaches with existing CMS quality programs, such as the Skilled Nursing Facility Value-Based Purchasing Program. We will monitor CJR–X quality performance, including whether there are shifts in quality improvement.

After consideration of the public comments, we are finalizing without modification the proposal to not include a policy for quality improvement. However, we may revisit this concept in future notice and comment rulemaking.

(d) Calculating the Composite Quality Score

We proposed adopting a similar calculation of the CJR Model composite quality but with modifications to account for outpatient quality measures. We stated in the proposed rule that the CJR Model CQS was constructed based on the performance of two inpatient quality measures and one voluntary inpatient measure. The measures were weighted 50 percent for the complications measure, 40 percent for patient experience measure, and 10 percent for the patient reported outcomes measure with the sum of quality points capped at 20 points. Given the greater proportion of episodes initiating in the outpatient setting, we proposed adopting two outpatient quality measures to capture quality performance for episodes in the outpatient setting. We indicated in the proposed rule that the CJR–X CQS methodology would account for these two measures by constructing an outpatient measure composite quality score that mimics the CJR Model weighting and quality point cap. Specifically, we proposed placing each of the five quality measures, as described in section X.C.2.g. of this final rule, into one of three quality domains. The domains would be complications, patient experience, and patient reported outcomes. We proposed for inpatient measures and outpatient measures to weight the complications domain at 50 percent, the patient experience domain at 40 percent, and the patient reported outcomes domain at 10 percent. We noted in the proposed rule that we believe the approach to weighting the quality domains represents a balanced and equitable approach to assessing hospital performance under CJR–X and aligns with the CJR Model. We stated the complications quality domain would be weighted most heavily because it reflects serious, clinically

significant outcomes that directly affect patient safety, recovery, and episode spending, and are supported by mature, well-validated, claims-based measures. We noted that patient experience measures receive substantial weight because effective communication, discharge planning, pain management, and care coordination are critical drivers of post-acute utilization and successful recovery in joint replacement episodes. Lastly, we sated that patient-reported outcome measures are included to capture improvements in pain and function that matter most to beneficiaries, while being weighted more modestly to reflect ongoing considerations related to response rates, data completeness, and measure stability. We stated in the proposed rule that together, this weighting approach promotes accountability for safety and outcomes while ensuring that patient-centered perspectives meaningfully inform quality performance, supporting a fair, reliable, and comprehensive assessment aligned with the goals of CJR–X. Table X.C–04 displays the quality measures and associated quality domain weights.

TABLE X.C-04: MEASURES AND QUALITY DOMAIN WEIGHTS FOR THE COMPOSITE QUALITY SCORE

Quality Domain	Quality Measures		Domain Weight in Composite Quality Score
	Inpatient Measure	Outpatient Measure	
Complications	Hospital-Level RSCR Following Elective Primary THA and/or TKA (CMIT ID #350)		50%
		Hospital Visits within 7 days of HOPD Surgery (CMIT ID #344, OP-36)	
Patient Experience	HCAHPS Survey (CMIT ID #338)		40%
		OAS CAHPS Survey (CMIT ID #162)	
Patient Reported Outcomes	Hospital-Level THA/TKA PRO-PM (CMIT ID #1618)		10%

Under this approach, we proposed we would score each CJR–X Model participant on the five proposed quality measures based on the CJR–X participant's performance percentile as compared to the national distribution of hospitals that are eligible for payment under the IPPS measure performance, assigning points according to the point values displayed in Table X.C–05.

TABLE X.C-05: POINT VALUES FOR CJR-X QUALITY MEASURES

Performance Percentile	Hospital-Level RSCR Following Elective Primary THA and/or TKA (CMIT ID #350)	Hospital Visits within 7 days of HOPD Surgery (CMIT ID #344, OP-36)	HCAHPS Survey (CMIT ID #338)	OAS CAHPS Survey (CMIT ID #162)	Hospital-Level THA/TKA PRO-PM (CMIT ID #1618)
$\geq 90^{th}$	10.00	10.00	8.00	8.00	2.00
$\geq 80^{th}$ and $< 90^{th}$	9.25	9.25	7.40	7.40	1.85
$\geq 70^{th}$ and $< 80^{th}$	8.50	8.50	6.80	6.80	1.70
$\geq 60^{th}$ and $< 70^{th}$	7.75	7.75	6.20	6.20	1.55
$\geq 50^{th}$ and $< 60^{th}$	7.00	7.00	5.60	5.60	1.40
$\geq 40^{th}$ and $< 50^{th}$	6.25	6.25	5.00	5.00	1.25
$\geq 30^{th}$ and $< 40^{th}$	5.50	5.50	4.40	5.40	1.10
$< 30^{th}$	0.00	0.00	0.00	0.00	0.00

We noted in the proposed rule that we believe that small point increments related to higher measure performance deciles would be the most appropriate way to assign more points to reflect meaningfully higher quality performance on the measures. The absolute differences for each decile among the five measures reflected the intended weight of the measure in the composite quality score.

After determining the point value for each measure, we proposed summing the performance points for the inpatient measures to construct the inpatient measure composite quality score and sum the outpatient measures to construct the outpatient measure composite quality score. We proposed at § 512.605 to define the ''inpatient measure composite quality score'' as the sum of inpatient quality measure point values capped at 20 points. Likewise, we proposed at § 512.605 to define the ''outpatient composite quality score'' as the sum of outpatient quality measure points values, capped at 20 points.

We proposed to assign each CJR–X participant an ''overall composite quality score,'' defined at § 512.605 as the sum of the weighted average of the inpatient measure composite quality score and the outpatient measure composite quality score, capped at 20 points. The inpatient and outpatient composite quality score would be weighted based on the proportion of inpatient to outpatient episodes. For example, if a CJR–X participant with 90 percent outpatient episode volume earned a 17.00 on their inpatient composite quality score and a 14.00 on their outpatient composite quality score, then their overall composite quality score would be calculated as follows:

- Inpatient measure composite quality score = 17.00
- Outpatient measure composite quality score = 14.00
- Inpatient/outpatient episode volume proportion—

++ 10 percent inpatient; and

++ 90 percent outpatient

- Overall composite quality score = ((0.10)*(17.00)) + ((0.90)*(14.00)) = 14.3

We stated in the proposed rule that we believe the proposed composite quality score methodology for CJR–X is a sound approach because it combines multiple, complementary quality measures into a single assessment of hospital performance across the episode of care, reflecting the multidimensional nature of quality in joint replacement. We noted that by incorporating measures of patient safety, patient experience, and patient-reported outcomes, the composite score avoids over-reliance on any single metric and improves the reliability and stability of quality assessment by mitigating the effects of random variation in individual measures. We indicated in the proposed rule that the methodology recognizes quality achievement and incentivizes meaningful progress across all CJR–X participants. We noted this standardized and transparent approach promotes equitable comparisons across CJR–X participants, enhances predictability in reconciliation outcomes, and aligns financial incentives with the patient-centered quality goals of the model.

We sought comment on our proposed methodology to calculate the composite quality score at § 512.635(b)(1) and (2) and on our definitions for the composite quality scores at § 512.605.

The following is a summary of the public comments received on our proposal to calculate the composite quality score, and our responses to these comments:

Comment: A few commenters supported the weighting of the complications, patient experience, and patient reported outcomes measures.

Response: We thank the commenters and we agree that these measures reflect important and complementary dimensions of quality for lower extremity joint replacement episodes.

Comment: Many commenters said the patient experience measures, the CAHPS and OAS CAHPS, were too heavily weighted. Of these commenters, some mentioned that patient experience measures captures hospital experience broadly rather than focusing on the LEJR procedure and does not capture a person's outcomes from surgery. Some commenters indicated the patient experience measures weighting is disproportionate and introduces risk that is largely outside hospitals' clinical control. A commenter recommended placing more emphasis on the complications or PRO–PM measures. Another commenter suggested dropping the patient experience measures assigns the 40 percent weight to an established readmission measure. A commenter suggested an alternative scoring approach such as an achievement threshold rather than a full percentile ranking to reflect the measure's distributional properties.

Response: We recognize commenters' concerns that patient experience measures may capture the hospital or outpatient facility experience broadly rather than focusing exclusively on the LEJR procedure. The CJR Model used the CAHPS for patient experience and as an expanded model we believe continuing this approach, along with the 40 percent weighting is appropriate until a more episode-specific patient experience measure is available.

Patient experience is a core component of quality in an episode-based payment model because communication, discharge planning, pain management, preparation for recovery, responsiveness, and care coordination directly affect whether beneficiaries understand and follow post-discharge instructions, participate in rehabilitation, avoid preventable complications, and transition safely across settings. The HCAHPS and OAS CAHPS are standardized survey instruments that allow consistent comparison across hospitals and outpatient settings and that their current use in existing CMS quality reporting programs avoids creating new CJR–X-specific reporting burden.

We do not agree that 40 percent weight is disproportionate. The complications domain is most heavily at weighted at 50 percent, patient experience at 40 percent, and patient-reported outcomes at 10 percent in the CQS methodology. This structure gives the greatest weight to clinically significant safety outcomes, while still giving substantial weight to the patient-centered processes that support successful recovery from LEJR episodes. We believe this is a balanced approach because complications, patient experience, and patient-reported outcomes measure different but complementary aspects of quality. Reducing patient experience weighting would place too much emphasis on clinical events alone and would not fully capture whether the episode was coordinated, understandable, and patient-centered.

We also do not agree that the patient experience measures capture matters that are largely outside hospitals' control. Although patient experience measures may reflect more than the technical performance of the surgical procedure, they assess domains that hospitals can meaningfully influence, including communication with providers and staff, discharge information, preparation for surgery and recovery, care coordination, and information about what to do if side effects occur. These factors are particularly important in CJR–X because the model holds participants accountable for care across the episode, including transitions after the anchor hospitalization or anchor procedure.

We appreciate the recommendation to place more weight on complications or the THA/TKA PRO–PM. The complications domain is already weighted most heavily at 50 percent because it reflects serious outcomes affecting patient safety, recovery, and episode spending. The PRO–PM is included at 10 percent because it captures pain, function, and health-related quality of life, but it is not heavily weighted to account for considerations related to response rates, data completeness, and measure stability.

We also do not believe it would be preferable to drop the patient experience measures and assign the 40 percent weight to an established readmission measure. Readmissions and hospital visits can be important indicators of safety and care coordination, but they do not capture beneficiaries' experience with communication, discharge preparation, pain management, and recovery instructions.

Finally, we appreciate the suggestion to use an achievement threshold rather than full percentile ranking. We believe the national distribution-based scoring approach is appropriate because it provides a transparent and comparable method for assessing CJR–X participants against a common benchmark. We also believe the minimum case or survey-count standards for inclusion in the national distribution and a 50th-percentile assignment for CJR–X participants without reportable measure values, new hospitals, or suppressed measure values, ensures these participants are not disadvantaged based on lack of applicable cases.

We will monitor measure performance under CJR–X in connection with the CQS methodology.

Comment: A commenter stated that concerns about the THA/TKA PRO–PM denominator are especially significant for CJR–X because the model would be mandatory and nationwide for many acute care hospitals. The commenter stated that CJR–X would give the THA/TKA PRO–PM greater weight than the original CJR model and also asserted that a small or non-representative PRO–PM denominator could produce an unstable quality estimate that directly affects a hospital's reconciliation payment eligibility and effective discount factor.

Response: We acknowledge the commenter's concerns and agree that CJR–X places more emphasis on the PRO–PM as compared to the CJR Model. The CJR Model helped to establish the PRO–PM and submission of patient reported data was voluntary in that model and therefore it would not have been appropriate to require a 10 percent weight in the CQS for CJR participants.

We believe the current CJR–X CQS approach is appropriate at this time because patient-reported outcomes are an important component of assessing quality for lower extremity joint replacement episodes. Claims-based measures and patient experience measures provide important information, but they do not capture beneficiaries outcomes. Including the THA/TKA PRO–PM in the CQS, and giving it meaningful, but not substantial, weight helps ensure that the model's financial incentives remain tied to outcomes that matter directly to beneficiaries. We also believe the CQS methodology mitigates the concern if unstable quality estimates because the PRO–PM is one component of a broader composite score, rather than the sole determinant of quality performance.

CMS may monitor the operation of the THA/TKA PRO–PM in CJR–X, including denominator size, representativeness, score stability, and effects on reconciliation payment eligibility and discount factor reductions.

Comment: A few commenters stated that CMS's increased emphasis on patient-reported outcome measures is significant because giving these measures greater weight than in prior models transforms patient engagement and longitudinal follow-up into a direct financial performance variable. Other commenters suggested placing more weight on the PRO–PM in the CQS.

Response: We agree that patient-reported outcome performance is an important component of assessing quality in an episode-based payment model because lower extremity joint replacement care is intended not only to avoid complications and readmissions, but also to improve beneficiaries' pain, function, mobility, and overall recovery experience. We believe weighting the Hospital-Level THA/TKA PRO–PM at 10 percent of the CQS is appropriate because it gives meaningful weight to outcomes that matter directly to beneficiaries while maintaining balance across the broader quality framework. A 10-percent weight creates a clear incentive for CJR–X participants to engage patients and monitor recovery after surgery, but it does not make the PRO–PM the dominant driver of the quality score. This balance is important because the CQS should reflect multiple dimensions of quality, including patient safety, patient experience, and patient-reported outcomes.

We also believe the 10-percent weight is appropriate because it supports continued movement toward more patient-centered quality measurement without creating an excessive or abrupt burden for hospitals. Patient-reported outcome collection requires workflow development, patient engagement, follow-up processes, and data submission infrastructure. By assigning the PRO–PM a meaningful but limited weight, CMS can encourage hospitals to build and strengthen these capabilities while preserving a stable and administrable quality methodology for CJR–X.

Comment: A couple of commenters identified a typographical error in Table X.C–05, for the HCAHPS and OAS CAHPS measures where ''5.40'' was used for the ≥30th and <40th percentile when it should have been ''4.40''.

Response: We thank the commenters for identifying this error. We have corrected this error in TABLE X.C–05 such that it reads ''4.40'' for the ≥30th and <40th percentile for the HCAHPS and OAS CAHPS measures.

Comment: A couple of commenters believed that the CQS was based on fragmented data or measures hospitals cannot reliably control and expressed concern about tying such measures to financial consequences. A commenter stated that the CQS methodology is derived from fragmented data that does not represent the proposed patient populations, specifically that hip fractures are unplanned and not included or represented in the PRO data. The commenter also noted that a substantially larger outpatient THA/TKA population will not have PRO data reported until 2029, well after the first performance year reconciliation. Another commenter indicated that approximately half of the CQS depends on measures, including the patient experience and patient reported outcome measures, that hospitals cannot reliably control under current specifications.

Response: The CQS is designed to evaluate CJR–X participants quality performance using measures that are already available through CMS quality reporting programs and that reflect important dimensions of care, including patient safety, patient experience, and patient-reported outcomes. Using existing measures supports reduces additional reporting burden and allows CMS to link payment incentives to quality domains that are relevant to episode-based care. Given the CJR–X Model uses measures hospitals already report to CMS, we believe adjusting the measure specifications would increase complexity and may lead to CJR–X participant confusion by deviating from existing, established specifications.

We acknowledge the commenter's concern that patients with a hip fracture are not included in the patient population for the Hospital-Level THA/TKA PRO–PM. However, we are not aware of a measure that best captures quality measurement for hip fracture cases, let alone a measure that hospitals currently report to CMS through existing CMS quality reporting programs that is specific to hip fracture and that would be available for use in the CJR–X quality methodology at this time. We note that participant submitted data from the CJR Model supported development of the Hospital-Level THA/TKA PRO–PM and we may consider how CJR–X could support the development of more clinically meaningful measures, such as ones that focus on fractures, for the model or for use in CMS Quality programs more broadly. We believe the current measure set for CJR–X is the most appropriate measure set that balances clinically appropriate measures while being mindful to participant reporting burden.

We also want to clarify that the outpatient hospital-level THA/TKA PRO–PM is not included in CJR–X at this time because we want hospitals to have some experience mandatorily reporting the measure in the Hospital Outpatient Quality Reporting Program before it would be included in CJR–X. We may consider this measure in future performance years of the model in order to capture an outpatient PRO–PM and improve our CQS methodology for outpatient episodes.

We will continue to assess whether additional or alternative measures could better capture quality of care for hip fracture episodes. If we identify an appropriate hip fracture-specific or otherwise more clinically relevant measures that are feasible for use in CJR–X, we may consider proposing changes to the quality methodology through future notice-and-comment rulemaking.

Comment: A few commenters wanted clarification on how the CQS was calculated. Specifically, if it was the sum of the two scores (inpatient measure composite quality score and the outpatient measure composite quality score) or the volume-weighted average of both scores. Another commenter requested clarification on whether the inpatient and outpatient composite scores are each capped and then weighted based on episode mix, or

whether a different methodology applies.

Response: We appreciate the commenters' requests for further clarification. The inpatient and outpatient measure composite quality scores are each calculated separately and capped at 20 points. CMS then calculates the overall composite quality score as a volume-weighted average of those two capped scores, based on the hospital's proportion of inpatient and outpatient CJR–X episodes. The overall composite quality score is also capped at 20 points.

Under this approach, CMS first calculates an inpatient measure composite quality score and an outpatient measure composite quality score, each capped at 20 points. CMS then weights those scores by the participant's inpatient and outpatient episode volume proportions to determine the overall CQS, also capped at 20 points. We believe this volume-weighted approach is appropriate because it accounts for the mix of inpatient and outpatient episodes at each hospital, rather than over-weighting either setting or treating hospitals with different episode distributions the same. This methodology better aligns the overall CQS with where the participant furnishes CJR–X episode care, supports fairer comparisons across hospitals with different inpatient and outpatient volume patterns, and preserves a single transparent score for determining the applicable CJR–X quality category. Like the CJR Model, we will be creating specifications for CJR–X participants that detail the CQS methodology and will make these specifications available before reconciliation.

Comment: A commenter wanted clarification on the methodology for the measure point estimate.

Response: A CJR–X participant would receive measure points based on the participant's performance percentile for each applicable quality measure compared to the relevant national distribution. The assigned measure points would correspond to the point values specified for each performance percentile range in TABLE X.C–05. Those measure points would then be summed to calculate the applicable inpatient measure composite quality score and outpatient measure composite quality score. As noted previously, we will be creating specifications for CJR–X participants that detail the CSQ methodology and will make these specifications available before reconciliation.

Comment: A commenter recommended CMS align performance measurement with quality of care to support equitable participation and accurate evaluation of episode outcomes.

Response: We believe the CQS methodology supports these goals by using multiple, complementary quality domains, including complications, patient experience, and patient-reported outcomes. This approach is intended to assess quality more comprehensively than any single measure could, while maintaining a standardized and transparent framework for comparing participant hospitals. The methodology also supports equitable participation by relying on measures already used in CMS quality reporting programs, which avoids creating new CJR–X-specific reporting requirements and promotes consistent application across participants.

We recognize the importance of continuing to evaluate whether the CQS measures accurately reflect care quality and episode outcomes for all participant hospitals and beneficiary populations. We will monitor measure performance, participant experience, and model outcomes, including whether refinements are needed to better align quality measurement with clinically meaningful outcomes.

Comment: A commenter requested whether procedure-specific or service-line-specific patient experience data specific to joint replacement could be made available and if not, does CMS view movement toward more targeted patient experience measurement for episode-based payment models as a longer-term program goal. They also inquired whether CMS conducted any analysis of the degree to which facility-wide, all-payer survey scores correlate with the specific Medicare LEJR patient experience that CJR–X is designed to improve.

Response: We agree that more targeted patient experience measurement could provide useful information for episode-based payment models, including CJR–X. Procedure-specific or service-line-specific patient experience data could help assess aspects of care that are especially relevant to LEJR episodes, such as preparation for surgery, communication about recovery expectations, discharge planning, rehabilitation coordination, and post-discharge follow-up.

At this time, we have not conducted all-payer analyses on this data, but we appreciate the suggestion may consider doing so in the future. At this time, we believe the use of HCAHPS and OAS CAHPS is the most appropriate approach for CJR–X because these measures are already established, standardized, and reported through existing CMS quality reporting programs. Using these measures supports national comparability, avoids creating new CJR–X-specific reporting burden, and allows CMS to incorporate patient experience into the Composite Quality Score using data infrastructure that is already available for hospitals and outpatient settings. Although these measures are not specific only to joint replacement, they capture important aspects of the care experience that are relevant to successful LEJR episodes, including communication, care coordination, discharge preparation, and responsiveness.

We did not propose nor are we aware of a separate procedure-specific patient experience measure for CJR–X that hospitals are already reporting. Before adopting such a measure, we would need to evaluate whether the data are available or could be collected consistently through existing survey infrastructure, whether the measure would be reliable and valid for Medicare LEJR beneficiaries, whether case volumes would support stable facility-level measurement, and whether implementation would impose additional burden on participants. CMS would also need to consider how any new or more targeted measure would interact with the existing CQS methodology and payment adjustments.

Comment: A commenter stated that a hospital scoring below the 30th percentile on OAS CAHPS receives zero quality performance points for that measure, while a hospital at the 70th percentile receives 6.80 points—that swing, driven by a 1-to-2 point absolute score difference on a 100-point scale, could meaningfully affect a hospital's composite quality score and downstream discount factor.

Response: We recognize the commenter's concern that relatively small absolute differences in scores may correspond to different percentile rankings and, therefore, different quality point values. These percentile rankings are commensurate with the CJR Model and we continue to believe this approach remains appropriate because percentile-based scoring provides a standardized and transparent method for comparing participant performance against the national distribution of hospitals reporting the measure. The point values are designed to reflect the intended weight of the patient experience domain in the CQS, while recognizing that higher performance on patient experience measures should contribute meaningfully to a participant's overall quality performance.

We also believe it is appropriate for OAS CAHPS to have a meaningful effect on the outpatient composite quality score because patient experience is an important dimension of quality for outpatient LEJR episodes. At the same time, OAS CAHPS is not the only determinant of the outpatient composite quality score. The proposed methodology balances patient experience with outpatient complications and patient-reported outcomes, so that no single measure fully determines overall quality performance. This structure helps ensure that the CQS reflects multiple dimensions of care, including safety, patient experience, and recovery outcomes.

We acknowledge that percentile-based scoring can be sensitive when the national distribution of measure scores is narrow. However, we believe this methodology is preferable to a less differentiated scoring approach because it preserves meaningful incentives for participants to improve patient experience and supports consistent comparisons across participants. We will monitor OAS CAHPS score distributions, score stability, and the effect of patient experience measure points on CQS categories and discount factor adjustments.

After consideration of the public comments, we are finalizing without modification the proposals at § 512.605 for the definitions of ''composite quality score'', ''inpatient measure composite quality score'', ''outpatient measure composite quality score'', and ''overall composite quality score''. We are also finalizing without modification our proposals at § 512.635(b)(1) and (2) to calculate the composite quality score.

f. Pricing and Payment Methodology

(1) Background

Given that we proposed CJR–X as an expansion of the CJR Model, as opposed to a new model concept, our pricing and payment methodology is fundamentally the same as the CJR Extension. However, as initially discussed in section X.C.1.b. of this final rule, we proposed a few minor modifications for CJR–X that would not fundamentally alter the methodology of the CJR Extension but would improve the accuracy of target prices and be responsive to concerns raised by the CJR evaluation results and stakeholder feedback. These minor adjustments would align with some of the policies we enacted in TEAM.

As stated in the proposed rule, we developed the methodologies for the CJR and BPCI Advanced Models, and refined them over time in response to observed changes in nationwide spending trends and payment system changes (such as the removal of TKA and THA from the IPO list, and the reclassifications of certain MS–DRGs), each new iteration drew from lessons learned in the previous iteration. With TEAM, we aimed to find a balance between simplicity and predictive accuracy of target prices, blending and building upon methods from both the original CJR Model and BPCI Advanced Model. Our goal was to choose a payment methodology that was as transparent and understandable as possible for participants of varying levels of statistical background and knowledge, but robust and statistically sophisticated enough to accurately predict performance year spending.

For CJR–X, we aimed to achieve a similar balance between simplicity and predictive accuracy, but with an added focus on long-term sustainability. As an expanded, national model, CJR–X is unique from the other models discussed here in that it is not being proposed as a finite, model test that will occur over a relatively short period of time. Therefore, we stated that when evaluating the different approaches to pricing and payment that have been used in other models, both past and present, we must also consider how each approach would perform in the long-term. We stated in the proposed rule that we believe that a pricing and payment methodology that is transparent, accurate, and adaptable to evolving payment and health care industry trends will be crucial for achieving our goals of improving quality and lowering costs over the long term.

We also noted that, whereas the goal for new (Phase I) models is to test and generate evidence on a novel payment policy design, the goal of model expansion (Phase II) is to take a payment policy design that has already proven effective and apply it to a larger scope of episodes. Thus, while we proposed several minor adjustments to the CJR Model pricing and payment methodology, in order to improve upon the policies that were tested, we must adhere to the general design and structure that was tested in and for which we can confidently predict the long-term effects on both quality and spending.

(a) CJR Model Pricing Methodology

We stated in the proposed rule that when designing the CJR Model payment methodology, some of the primary goals were simplicity and clarity, given that it was a mandatory model covering only one episode category. The original CJR Model payment methodology included a 3-year baseline period that rolled forward every 2 years. Target prices used a blend of participant-specific and regional spending, which shifted towards 100 percent regional spending for PYs 4 and 5. Downside risk was waived for the first performance year of the model to allow participants time to enact practice changes that would help them succeed in the model. Beginning in PY 2, participants were subject to both upside and downside risk, within stop-loss and stop-gain limits that increased to a maximum of 20 percent by PY 3 for most hospitals. The stop-loss and stop-gain limits were designed to ensure that participants would neither be subject to an unmanageable level of risk, nor be incentivized to stint on care to achieve savings. The original CJR Model payment methodology is described in detail in the 2015 CJR final rule, (80 FR 73324 through 73554).

We noted in the proposed rule that the original CJR Model payment methodology was modified in the 2021 CJR 3-Year Extension final rule. The CJR Model's 3-year extension and modification was due to a number of factors, as described in detail starting at 86 FR 23508. A principal reason for the modifications to the payment methodology was the fact that the original CJR Model target price methodology did not account for changing downward trends in spending on LEJR episodes, both among CJR participant hospitals and non-participant hospitals. The resulting reconciliation payments under the initial methodology rewarded participants for spending reductions that likely would have happened regardless of the model, which led to concerns that target prices could be too high for Medicare to achieve savings in the model over time.

The changes to the model increased the complexity in some ways (for example, the addition of risk adjustment multipliers) while simplifying it in other ways (for example, the removal of update factors) in order to calculate target prices that would more accurately reflect performance year spending. A retrospective Market Trend Factor was applied to target prices at reconciliation to capture changes in spending patterns that occurred nationally during the performance year. This market trend factor, in combination with the change from a 3-year baseline to a 1-year baseline, negated the need for setting-specific update factors that we had used previously to set purely prospective target prices. At the same time, our added risk adjustment increased target prices for episodes with more complex

patients, to better reflect the higher costs associated with those patients. The changes to the original CJR Model payment methodology are described in detail in the 2021 CJR 3-Year Extension final rule (86 FR 23508).

(b) TEAM Pricing Methodology

The TEAM methodology, as discussed in the FY 2025 IPPS/LTCH PPS final rule (89 FR 69748) and FY 2026 IPPS/LTCH PPS final rule (90 FR 37092), was designed with the goal of blending the most successful elements from the different CJR and BPCI Advanced Model iterations in order to strike a balance between predictability and accuracy. TEAM sets preliminary target prices at the MS–DRG/HCPCS episode type- and region-level using a 3-year baseline, trended forward to the performance year. Preliminary target prices are updated using the performance year data during the reconciliation process to account for updated spending trends (subject to a 3 percent cap) and normalization factor (subject to a 5 percent cap) and by adjusting for each participant's realized performance year case mix.

We stated in the proposed rule that TEAM's risk adjustment includes adjusters for age group, Hierarchical Condition Category (HCC) count, and beneficiary economic risk, as well as episode category-specific HCC adjusters and hospital-level adjusters including a hospital bed size factor and a safety net hospital factor. The risk adjustment factors will be calculated at the MS–DRG/HCPCS level using a weighted linear regression where episodes are weighted differentially based on whether they belong to year 1, 2, or 3 of the baseline periods. After risk adjusting for the performance year case mix, target prices are normalized to ensure that the average of the total risk-adjusted preliminary target price does not exceed the average of the total non-risk adjusted preliminary target price.

We indicated that TEAM participants will have the opportunity to achieve a reconciliation payment amount, after accounting for quality performance, if their performance year spending is below the reconciliation target price, or they may owe a repayment amount if their spending is above the reconciliation target price.

(2) Overview of CJR–X Pricing and Payment Methodology

We stated in the proposed rule, that while we describe each element of the pricing and payment methodology in detail in the following sections, here we present an overview of the proposed CJR–X pricing and payment methodology. At proposed § 512.640, we proposed to use 3 years of baseline data, trended forward to the performance year, to calculate target prices at the level of MS–DRG/HCPCS episode type and region. We proposed to group episodes from the baseline period by applicable MS–DRG for episode types that include only inpatient hospitalizations, and by applicable MS–DRG or HCPCS code for episode types that include both inpatient hospitalizations and outpatient procedures. We indicated that for episode types that include both inpatient hospitalizations (identified by MS–DRGs) and outpatient procedures (identified by HCPCS codes), HCPCS codes are combined for purposes of target pricing with the applicable MS–DRG representing an inpatient hospitalization without Major Complications and Comorbidities, as we expect those beneficiaries to have similar clinical characteristics and costs. After capping high-cost outlier episodes at the 99th percentile for each of the 4 proposed MS–DRG/HCPCS episode types, we proposed to use average standardized spending for each MS–DRG/HCPCS episode type in each region as the benchmark price for that MS–DRG/HCPCS episode type for that specific region, resulting in 36 MS–DRG/HCPCS episode type/region-level benchmark prices. We proposed to apply a prospective trend factor and a discount factor to benchmark prices (as well as a prospective normalization factor, described later in this section) to calculate preliminary target prices. We stated the prospective trend factor would represent expected changes in overall spending patterns between the most recent calendar year of the baseline period and the performance year, based on observed changes in overall spending patterns between the earliest calendar year of the baseline period and the most recent year of the baseline period. We stated that the discount factor would represent Medicare's portion of potential savings from the episode. At § 512.645(a), we proposed to risk adjust episode-level target prices at reconciliation by facility bed-size and safety net status, as defined in § 512.605, along with the following beneficiary-level variables: age group, Hierarchical Condition Category count (a measure of clinical complexity), beneficiary economic risk (the components of which are described in more detail in section X.C.2.f.(4). of this final rule), prior post-acute care use, disability status as reason for initial Medicare enrollment, and recent medical history (represented as 22 separate, binary variables indicating relevant services or HCC flags during the 180-day lookback). We proposed to calculate risk adjustment multipliers prospectively at the MS–DRG/HCPCS episode type level based on baseline data and hold those multipliers fixed for the performance year. To ensure that risk adjustment does not inflate target prices overall, we further proposed to calculate a prospective normalization factor based on the data used to calculate the risk adjustment multipliers. We proposed to apply the prospective normalization factor, in addition to the prospective trend factor and discount factor described previously, to the benchmark price to calculate the preliminary target price for each MS–DRG/HCPCS episode type and region. We proposed that the prospective normalization factor would be subject to a limited adjustment at reconciliation based on CJR–X participants' observed performance year case mix, such that the final normalization factor would not exceed +/− 5 percent of the prospective normalization factor. We stated we would use standardized payment data to perform these target price calculations. We indicated that a simplified equation for the construction of preliminary target prices would be—

Preliminary Target Price = Benchmark Price * Prospective Trend Factor * Prospective Normalization Factor * Risk Adjustment Multipliers * Discount Factor

We noted that construction of the reconciliation target price, as discussed in section X.C.2.f.(5)(d). of this final rule, would account for realized patient case mix and spending trends and result in updates to the trend factor and normalization factors.

As described in detail in the following sections, many of the payment and pricing policies that we proposed for CJR–X represent minor deviations from the policies that were tested in the original CJR Model and the CJR Extension. Many of the proposed policy adjustments reflect lessons learned from the CJR Model that were informed by CJR evaluation, which we believe would improve upon the CJR Model methodology in a manner that was predictable and would not fundamentally alter the general structure of the model that was tested. As discussed in section X.C.2.f.(1)(b). of the final rule, these same lessons informed the design of TEAM.

The following is a summary of general comments about our proposed pricing and payment methodology for CJR–X, and our responses to these comments:

Comment: Many commenters expressed concern that the proposed CJR–X pricing and payment methodology could create a ratchet effect in which prior savings and efficiency gains are incorporated into future benchmarks, resulting in progressively lower target prices over time. Commenters stated that this concern was especially important because CJR–X is proposed as an expanded national model without a defined end date. Commenters believed that annual rebasing, rolling regional benchmarks, heavier weighting of more recent baseline years, trend methodology, and application of the discount factor could operate together to reduce opportunities for continued savings, particularly for hospitals, regions, or providers that have already achieved efficiencies through prior participation in CJR, BPCI Advanced, TEAM, or other value-based care initiatives.

Commenters stated that continued downward pressure on target prices could penalize high-performing or historically efficient hospitals, create a ''race to the bottom,'' reduce financial predictability, and make it difficult for hospitals to sustain investments in care redesign, care coordination staff, data infrastructure, post-acute care relationships, physician alignment strategies, and quality improvement programs. Some commenters also expressed concern that, if LEJR spending has stabilized or if remaining savings opportunities are limited, further target price reductions could undermine access to medically necessary care, post-acute care, or high-quality care for higher-need beneficiaries. Commenters recommended that CMS adopt safeguards to mitigate the ratchet effect, including target price floors, limits on annual target price reductions, pricing protections for historically efficient hospitals, longer target price stability periods, glide paths, inflation-based updates, recognition of prior efficiency gains, additional stakeholder engagement, or ongoing monitoring of whether LEJR episode spending has reached a clinically sustainable level.

Response: We acknowledge commenters' concerns about target price sustainability and the potential for price ratcheting in a long-term expanded model. In the proposed rule, we recognized that CJR–X differs from prior finite model tests because it is proposed as an expanded national model and, therefore, the pricing and payment methodology must be transparent, accurate, and adaptable to evolving payment and health care industry trends over the long term. We also specifically recognized that participants in episode-based payment models have expressed concern about the ratchet effect, including the concern that participants could be penalized for achieving lower spending if those savings lead to lower target prices in subsequent years.

We proposed the CJR–X pricing and payment methodology to balance target price accuracy, predictability, long-term sustainability, and Medicare savings. Several features of the proposed methodology were intended to address these concerns while maintaining the general structure of the CJR Model payment policy that we have tested and are proposing to expand. These features include using a 3-year baseline period rather than a 1-year baseline period, using regional rather than hospital-specific target prices so that participants are not directly competing only against their own historical performance, applying prospective and limited retrospective trend factors to account for spending changes between the baseline and performance period, applying risk adjustment and normalization policies to account for differences in case mix, capping high-cost outlier episodes, and proposing a 2 percent discount factor rather than the 3 percent discount factor used for LEJR episodes in prior CJR and BPCI Advanced pricing.

We agree that target price sustainability will be important for CJR–X, particularly because CJR–X is intended to operate over a longer time horizon than a finite model test. We will continue to monitor CJR–X implementation, including target price sustainability, quality of care, beneficiary access, and potential unintended consequences, and may consider additional technical assistance, operational guidance, or future model modifications through notice and comment rulemaking if monitoring or evaluation identifies price ratcheting, unrealistic target prices, access barriers, or other concerning trends that warrant changes to the model.

However, we must also balance these concerns against the need to set target prices that reflect current spending patterns and do not overstate savings that would have occurred absent the model. Using older spending data, limiting rebasing too significantly, or establishing floors that are not tied to episode-specific spending patterns could reduce target price accuracy and could limit Medicare's ability to achieve savings under the model. We address the commenters' more specific recommendations regarding baseline rebasing in section X.C.2.f.(3)(a), regional target prices in section X.C.2.f.(3)(b), trend methodology in section X.C.2.f.(3)(f), discount factors in section X.C.2.f.(3)(g), and other pricing safeguards in the policy-specific sections that follow.

(3) Target Prices

(a) Baseline Period for Benchmarking

We proposed using 3 years of baseline episode spending to calculate benchmark prices, which we would further adjust as described in section X.C.2.f.(4). of this final rule to create preliminary target prices. Specifically, at § 512.605, we proposed to define ''baseline period'' as the 3-year historical period used to construct the preliminary target price and reconciliation target price for a given performance year. We also proposed to define ''baseline episode spending'' as total episode spending by all providers and suppliers associated with a given MS–DRG/HCPCS episode type for all hospitals in a given region during the baseline period. We proposed to roll this 3-year baseline period forward every year. Specifically, we proposed the following:

- To determine baseline episode spending for PY1, CMS would use baseline episode spending for episodes with anchor hospitalization start dates or anchor procedure dates beginning on or after October 1, 2023 and anchor hospitalization discharge dates or anchor procedure dates between October 1, 2023 and September 30, 2026.
- To determine baseline episode spending for PY2 and future performance years, CMS would use same 3-year cadence to roll the baseline period forward a year.
- For example, to determine baseline episode spending in PY2, CMS would use baseline episode spending for episodes with anchor hospitalization start dates or anchor procedure dates beginning on or after October 1, 2024 and anchor hospitalization discharge dates or anchor procedure dates between October 1, 2024 and September 30, 2027.

We stated in the proposed rule that the use of 3 years of baseline episode spending is consistent with our initial CJR methodology, as described in the 2015 CJR final rule (80 FR 73340). In that case, the 3-year baseline period moved forward every 2 years. However, in combination with the lack of a retrospective trend factor, the use of a 3-year baseline period that only moved forward every 2 years meant that our methodology was not able to capture the degree to which spending on LEJR episodes was decreasing nationwide,

both among CJR and non-CJR hospitals. As a result, we believed our target prices partially reflected spending decreases that were not due specifically to participation in CJR.

We stated in the proposed rule that subsequently, in the 2021 CJR 3-Year Extension final rule, we finalized a policy to use a 1-year baseline period that would move forward every year (with the exception of skipping data from 2020 due to COVID–19 irregularities) (86 FR 23514). In combination with a retrospective market trend factor, using 1 year of baseline episode spending updated every year meant that our target prices would not be inflated as they had been under the initial CJR methodology. BPCI Advanced employed a strategy that blends elements of both CJR approaches, with a longer baseline period (4 years) similar to the initial CJR methodology, but shifting forward every year, as we do in the CJR extension.

We noted in the proposed rule that participants in episode-based payment models have expressed concerns about a concept known as the ''ratchet effect'' when choosing the baseline period from which to calculate target prices. That is, participants do not want to be penalized for achieving lower spending by having lower target prices in subsequent years. We stated the use of fewer years of the most recent baseline episode spending, as well as more frequent rebasing, will generally decrease target prices more quickly year over year if overall episode spending decreases, as opposed to a longer, fixed baseline. However, we noted that we must balance this concern against the likelihood of having inaccurate target prices if we use older baseline episode spending or rebase less frequently.

We indicated in the proposed rule that in TEAM, we finalized a revised version of the BPCI Advanced strategy with a shorter, 3-year baseline that was rebased annually and temporally weighted to place greater emphasis on more recent years. As initially described in final rule establishing TEAM (89 FR 69748), we believe this approach will achieve a balance between providing target prices that sufficiently reflect up-to-date spending trends and mitigating the ratchet effect by allowing prices to adjust more gradually over time. Additionally, as discussed in section X.C.2.f.(3)(b). of this final rule, we proposed regional target prices based on regional average spending making CJR–X an achievement-based model. We noted in this framework, CJR–X participants would not compete against their historical selves but rather strive to outperform their regional peers. We also noted that individual improvements will not affect future target prices in a substantive way as the future benchmark is being calculated based on the performance of several hospitals. We believed a 3-year baseline period constructed using all hospital's spending would help produce a fair pricing approach that balances accuracy, simplicity, and mitigates CJR–X participants being penalized for successful past performance.

For CJR–X, we proposed to adjust baseline episode spending to trend all episode spending to the most recent year of the baseline period. We stated the adjustment would reflect the impact of inflation and any changes in episode spending due to evolving patterns of care, Medicare payment policies, payment system updates, and other factors during the baseline period. At § 512.605(e) we proposed to define a ''baseline year'' as any of the 3 fiscal years during a given baseline period. For example, baseline year 1 for PY 1 will be FY 2024 (October 1, 2023–September 30, 2024), baseline year 2 will be FY 2025 (October 1, 2024–September 30, 2025), and baseline year 3 will be FY 2026 (October 1, 2025–September 30, 2026). We proposed to calculate the adjustment factors for baseline years 1 and 2 by dividing average episode spending for baseline year 3 episodes by average episode spending for episodes from baseline years 1 and 2, respectively. We would then apply the applicable adjustment factors to the episode spending of each episode in baseline years 1 and 2. We indicated that this adjustment would bring all baseline episode spending forward to the most recent baseline year, so that baseline year 1 and 2 spending would be expressed in baseline year 3 dollars. We noted in the proposed rule that this method would be consistent with how we calculated the baseline trend factor for CJR in the performance years that used the 3-year baseline period, as described in the 2015 CJR final rule (80 FR 73342). We proposed to calculate these baseline trend factor adjustments at the MS–DRG/HCPCS episode type and region level.

In recognition of the fact that baseline episode spending from more recent years are likely to be a better predictor of performance year spending, we proposed to weight recent baseline episode spending more heavily than episode spending from earlier baseline years. Specifically, we proposed to weight episode spending from baseline year 1 at 17 percent, baseline year 2 at 33 percent, and baseline year 3 at 50 percent. We stated in the proposed rule that this method of weighting would mean that the most recent episode spending patterns, expected to be the most accurate predictor of performance year spending, would contribute most strongly to the benchmark price at 50 percent. The remaining 50 percent would be divided into thirds, with baseline year 2 contributing approximately ⅔, while baseline year 1, which is likely to be the least accurate predictor of performance year spending, would contribute ⅓.

We sought comment on our proposed definitions at § 512.605 and our proposals at § 512.640(b)(2) and (3) to use 3 years of baseline episode spending, rolled forward for each performance year, with more recent baseline years weighted more heavily, to calculate CJR–X target prices.

The following is a summary of the public comments received on our proposals to use a rolling 3-year baseline period, with more recent baseline years weighted more heavily, and our responses to these comments:

Comment: Many commenters expressed concern that the proposed use of a rolling 3-year baseline period, annual rebasing, and heavier weighting of the most recent baseline year would contribute to price ratcheting over time. Commenters stated that, as hospitals and regions reduce LEJR episode spending, those reductions would be incorporated into future benchmarks, resulting in lower target prices and reduced opportunities to earn reconciliation payments in subsequent performance years. Commenters stated that this effect could be particularly problematic for hospitals that have already achieved efficiencies through prior participation in CJR, BPCI Advanced, TEAM, or other value-based care initiatives.

Commenters recommended that CMS modify the baseline methodology to reduce the effect of annual rebasing on future target prices. Commenters suggested alternatives such as using a longer baseline period, rebasing less frequently, maintaining target prices for multiple performance years, weighting baseline years equally, applying inflation or other update factors instead of annually rebasing to more recent spending, limiting the frequency or magnitude of target price reductions, or adopting safeguards to prevent target prices from falling below sustainable levels.

Response: We acknowledge commenters' concerns that annual rebasing and recent-year weighting could contribute to price ratcheting if LEJR episode spending continues to decline over time. We considered these concerns in developing the CJR–X

baseline methodology. In the proposed rule, we recognized that using fewer years of more recent baseline episode spending and rebasing more frequently will generally decrease target prices more quickly year over year if overall episode spending decreases, as compared to using a longer or fixed baseline. We also recognized that this concern must be balanced against the likelihood of setting inaccurate target prices if older spending data are used or if rebasing occurs less frequently.

We proposed to use a rolling 3-year baseline period because we believe this approach balances target price accuracy, predictability, and mitigation of the ratchet effect. A 3-year baseline period allows target prices to reflect more than a single year of spending experience, which reduces the effect of year-to-year variation, outlier patterns, or unusual temporary changes in utilization. At the same time, rolling the baseline forward each year helps ensure that target prices remain connected to current LEJR episode spending patterns, changes in site of service, changes in Medicare payment policy, and evolving care delivery patterns. We believe that using substantially older data or freezing target prices for multiple years could cause target prices to diverge from current expected episode spending and could reduce the model's ability to generate Medicare savings.

We also proposed to weight the most recent baseline year more heavily because more recent spending is generally more predictive of performance-year spending than older spending. We believe the weighting methodology, under which baseline year 1 is weighted at 17 percent, baseline year 2 is weighted at 33 percent, and baseline year 3 is weighted at 50 percent, appropriately balances the predictive value of recent data with the stability provided by a multi-year baseline. Equal weighting or a longer fixed baseline would place more weight on older spending patterns that may no longer reflect current LEJR care delivery, post-acute care use, outpatient procedure volume, coding, or payment system changes.

We do not believe it would be appropriate to replace annual rebasing with inflation-only updates or to maintain target prices for multiple performance years without updating the underlying baseline. While these approaches could increase pricing stability for participants, they could also cause target prices to overstate expected episode spending if LEJR spending continues to decline or if care delivery patterns change. We believe that the rolling baseline methodology better supports the goals of CJR–X by maintaining a closer relationship between target prices and current regional episode spending while still smoothing spending experience across 3 baseline years.

We also note that CJR–X target prices are based on regional spending rather than hospital-specific spending. As a result, CJR–X participants are not competing only against their own historical performance, and an individual participant's efficiencies would not, by themselves, substantially determine that CJR–X participant's future target prices. We believe that using a 3-year baseline constructed from regional spending across hospitals helps mitigate concerns that a participant would be directly penalized for its own prior success, while preserving an achievement-based methodology that rewards participants for delivering efficient, high-quality LEJR episode care relative to regional spending patterns.

We acknowledge commenters' concerns that annual rebasing and recent-year weighting could contribute to price ratcheting if LEJR episode spending continues to decline over time. We considered these concerns in developing the proposed CJR–X baseline methodology. In the proposed rule, we recognized that using fewer years of more recent baseline episode spending and rebasing more frequently will generally decrease target prices more quickly year over year if overall episode spending decreases, as compared to using a longer or fixed baseline. We also recognized that this concern must be balanced against the likelihood of setting inaccurate target prices if older spending data are used or if rebasing occurs less frequently.

We proposed to use a rolling 3-year baseline period because we believe this approach balances target price accuracy, predictability, and mitigation of the ratchet effect. A 3-year baseline period allows target prices to reflect more than a single year of spending experience, which reduces the effect of year-to-year variation, outlier patterns, or unusual temporary changes in utilization. At the same time, rolling the baseline forward each year helps ensure that target prices remain connected to current LEJR episode spending patterns, changes in site of service, changes in Medicare payment policy, and evolving care delivery patterns. We believe that using substantially older data or freezing target prices for multiple years could cause target prices to diverge from current expected episode spending and could reduce the model's ability to generate Medicare savings.

We also proposed to weight the most recent baseline year more heavily because more recent spending is generally more predictive of performance-year spending than older spending. We believe the proposed weighting methodology, under which baseline year 1 is weighted at 17 percent, baseline year 2 is weighted at 33 percent, and baseline year 3 is weighted at 50 percent, appropriately balances the predictive value of recent data with the stability provided by a multi-year baseline. Equal weighting or a longer fixed baseline would place more weight on older spending patterns that may no longer reflect current LEJR care delivery, post-acute care use, outpatient procedure volume, coding, or payment system changes.

We do not believe it would be appropriate to replace annual rebasing with inflation-only updates or to maintain target prices for multiple performance years without updating the underlying baseline. While these approaches could increase pricing stability for participants, they could also cause target prices to overstate expected episode spending if LEJR spending continues to decline or if care delivery patterns change. We believe that the proposed rolling baseline methodology better supports the goals of CJR–X by maintaining a closer relationship between target prices and current regional episode spending while still smoothing spending experience across 3 baseline years.

We also note that CJR–X target prices are based on regional spending rather than hospital-specific spending. As a result, CJR–X participants are not competing only against their own historical performance, and an individual participant's efficiencies would not, by themselves, substantially determine that participant's future target prices. We believe that using a 3-year baseline constructed from regional spending across hospitals helps mitigate concerns that a participant would be directly penalized for its own prior success, while preserving an achievement-based methodology that rewards participants for delivering efficient, high-quality LEJR episode care relative to regional spending patterns.

We address commenters' broader recommendations regarding target price floors, administrative trend approaches, and other safeguards to address long-term target price sustainability in the discussion of trending prices in section X.C.2.f.(3)(f) of this final rule and related pricing safeguards in sections X.C.2.f.(3)(e) and X.C.2.f.(4) of this final rule. We will continue to consider monitoring data, evaluation findings,

operational experience, and stakeholder feedback in connection with the baseline methodology and related pricing policies.

After consideration of the public comments, we are finalizing without modification the proposals at § 512.605 to define ''baseline episode spending,'' ''baseline period,'' and ''baseline year'' and the proposals at § 512.640(b)(2) and (3) to use 3 years of baseline episode spending, rolled forward for each performance year, with more recent baseline years weighted more heavily, to calculate CJR–X target prices.

(b) Regional Target Prices

We proposed to provide target prices to CJR–X participants for each proposed MS–DRG/HCPCS episode type and region based on 100 percent regional data for all CJR–X participants prior to each PY. We stated in the proposed rule that this approach would be consistent with PYs 4 through 8 of the CJR Model and aligns with the approach implemented in TEAM (89 FR 69751). While CJR target prices used a blend of two-thirds hospital-specific data and one-third regional data for PYs 1 and 2, and one-third hospital-specific data and two-thirds regional data for PY 3, we stated our reasons in the 2015 CJR final rule for moving towards fully regional target pricing as participants gained more experience in the model (80 FR73347). We stated that target prices based on hospital-specific data would require a CJR–X participant to compete against its own previous performance and improve over that performance to receive a reconciliation payment. Conversely, target prices based on regional data would require a CJR–X participant to compete against its peers in that region, such that only a specific level of achievement, as opposed to improvement alone, would result in a reconciliation payment. For historically inefficient CJR–X participants, compared to their peers, hospital-specific target prices would be higher than regional target prices because hospital-specific baseline episode spending would be greater than average baseline episode spending for the region. We indicated that for CJR–X participants that are historically efficient compared to their peers, hospital-specific target prices would be lower than regional target prices because hospital-specific baseline episode spending would be lower than average baseline episode spending for the region. We noted in the 2015 CJR final rule that if we used 100 percent hospital-specific pricing in CJR, historically efficient hospitals could have fewer opportunities for achieving additional efficiencies under the model and would not be rewarded for maintaining high quality and efficiency, whereas less efficient hospitals would be rewarded for improvement even if they did not reach the same level of high quality and efficiency as the more historically efficient hospitals.

We sought comment on our proposal at § 512.640(b)(1) to provide regional target prices to all CJR–X participants for each PY.

The following is a summary of the public comments received on our proposal to construct regional target prices, and our responses to these comments:

Comment: A commenter supported CMS' proposal to use regional target prices, stating that regional benchmarking can help avoid requiring CJR–X participants to compete only against their own historical performance.

Response: We appreciate the commenter's support for the use of regional target prices. We proposed to use regional target prices because we believe regional pricing supports an achievement-based methodology and helps avoid requiring CJR–X participants to compete only against their own historical performance. Under a hospital-specific pricing methodology, a participant hospital's future target prices would be more directly affected by that hospital's own prior spending reductions, which could reduce the opportunity for historically efficient hospitals to earn reconciliation payments and could penalize hospitals for prior success. By contrast, regional target prices are based on broader regional spending experience, so CJR–X participants are evaluated relative to regional peers rather than solely against their own historical spending.

Comment: Many commenters raised concerns about the proposed use of 100 percent regional data to calculate target prices. Commenters stated that regional target prices may help mitigate some concerns associated with hospital-specific benchmarks, but that the proposed regional methodology may not sufficiently account for variation among hospitals and markets within the same region. Commenters stated that hospitals within a single region may face materially different labor costs, supply costs, implant costs, post-acute care availability, skilled nursing facility and inpatient rehabilitation facility capacity, rural or urban market conditions, Medicare Advantage penetration, patient complexity, referral patterns, and baseline resource levels. Commenters expressed concern that broad regional benchmarks could disadvantage hospitals in higher-cost local markets, hospitals with fewer post-acute care options, rural hospitals, safety net hospitals, Medicare-dependent, small rural hospitals, sole community hospitals, academic medical centers, or hospitals that have already achieved efficiencies relative to other hospitals in their region.

Some commenters stated that regional target prices could create volatility or unrealistic benchmarks if a region includes hospitals with substantially different cost structures, patient populations, or care delivery environments. Commenters also expressed concern that regional benchmarks may not adequately account for regional or local markets that have already achieved lower LEJR spending through prior participation in CJR, BPCI Advanced, TEAM, Medicare Advantage arrangements, or other value-based care initiatives. Commenters stated that, in these markets, regional target prices could reflect prior efficiency gains and leave limited opportunity for additional savings.

Commenters recommended that CMS modify the regional target price methodology or add safeguards to account for these concerns. Commenters suggested alternatives such as using more granular geographic areas, state-level benchmarks, urban and rural stratification, local market adjusters, post-acute care market adequacy adjustments, hospital-specific or hybrid hospital/regional benchmarks, peer groups based on hospital type or resource level, adjustments for historically efficient regions or hospitals, benchmark floors, hold-harmless protections, use of the higher of national or regional historical spending, additional transparency regarding regional benchmark construction, and ongoing monitoring of whether regional target prices create realistic opportunities for hospitals to achieve savings.

Response: We acknowledge commenters' concerns that hospitals within the same region may differ in ways that affect episode spending, including differences in local market conditions, patient populations, resource levels, prior efficiency, and post-acute care availability. We agree that these factors are important, but we do not believe they should be addressed primarily by replacing regional target prices with hospital-specific or more narrowly stratified benchmarks. Many of these concerns are addressed more directly through other aspects of the CJR–X pricing and payment methodology, including risk adjustment and normalization policies that account

for beneficiary and hospital-level factors, the high-cost outlier cap, and stop-loss protections. We address related comments regarding risk adjustment, safety net hospital status, rural hospitals, stop-loss protections, and post-acute care access in the applicable sections of this final rule.

We considered commenters' recommendations to use more granular geographic benchmarks, state-level benchmarks, urban and rural stratification, local market adjusters, peer-group-specific benchmarks, hospital-specific or hybrid hospital/regional benchmarks, benchmark floors, hold-harmless protections, or adjustments for historically efficient hospitals or regions. We do not believe that adopting these alternatives would be appropriate for CJR–X at this time. More granular or peer-group-specific benchmarks could reduce the number of episodes used to calculate benchmark prices, increasing volatility and reducing the stability and reliability of target prices. Hospital-specific or hybrid benchmarks could also reintroduce the concern that participants are competing against their own historical performance and could reduce the achievement-based incentives of the model.

We continue to believe that 100 percent regional target pricing better balances accuracy, stability, transparency, administrative feasibility, and model incentives for a nationally expanded model. Regional pricing helps reward hospitals that furnish efficient, high-quality LEJR episode care relative to broader regional spending patterns, rather than rewarding improvement alone without regard to whether the hospital's episode spending remains high relative to peers. We also believe it is important that target prices reflect current regional spending patterns and that CJR–X maintain incentives for hospitals to improve care coordination, reduce avoidable utilization, and maintain or improve quality.

We acknowledge commenters' requests for additional transparency regarding regional target price construction. We intend to provide CJR–X participants with information needed to understand model methodology, episode attribution, target prices, quality measures, reconciliation, and other operational requirements before the model begins. We will also continue to make model resources publicly available, including through the CJR–X Model-specific web page and other implementation materials.

We will continue to consider monitoring data, evaluation findings, operational experience, and stakeholder feedback to determine whether additional refinements to regional target pricing or related pricing policies may be warranted to support implementation, protect beneficiary access, preserve incentives for high-quality care, and maintain realistic opportunities for CJR–X participants to achieve savings.

Comment: Some commenters recommended that CMS revise the level of detail used to calculate CJR–X target prices. Commenters stated that target prices should better distinguish among different episode types, sites of service, and patient populations. Commenters recommended separate target prices for inpatient and outpatient LEJR episodes, separate target prices for hip replacements and other procedures, and different treatment for fracture-related episodes or other episodes expected to involve higher acuity or post-acute care needs.

Some commenters also raised concerns about site-of-care migration. Commenters stated that as lower-acuity LEJR procedures shift to outpatient or ASC settings, the remaining hospital-based episodes may reflect higher acuity, greater comorbidity burden, higher readmission risk, or greater post-acute care needs. Commenters recommended that CMS adjust target prices based on local ASC use or otherwise account for changes in hospital case mix caused by movement of healthier beneficiaries to outpatient or ASC settings.

A commenter recommended that CMS modify treatment of transfer episodes by excluding the amount paid to the initial admitting hospital when calculating target prices and actual episode spending. The commenter stated that this would avoid penalizing hospitals for clinically appropriate transfers.

Response: We acknowledge commenters' recommendations to use more granular target price categories or additional adjustments for site-of-care and episode-type differences. We agree that target prices should account for meaningful differences in expected episode spending. The proposed CJR–X methodology already calculates target prices at the MS–DRG/HCPCS episode type and region level, rather than using a single target price for all LEJR episodes. The methodology also applies beneficiary-level and hospital-level risk adjustment at reconciliation, including variables intended to account for clinical complexity, prior post-acute care use, social risk, and hospital-level characteristics.

We are not adopting additional separate target price tracks for inpatient and outpatient episodes, hip replacements and other procedures, fracture-related episodes within each MS–DRG/HCPCS episode type, or local ASC market share. Some of the differences identified by commenters are already reflected in the MS–DRG/HCPCS episode type structure, episode construction, or risk adjustment methodology. We also believe that creating additional separate pricing tracks for inpatient and outpatient episodes could undermine one of the goals of CJR–X, which is to support appropriate patient status and site-of-service decisions based on beneficiary clinical needs rather than model payment differences. Creating additional pricing cells could reduce episode volume within each cell, increase volatility, and make target prices less stable and less transparent for participants. We believe the proposed MS–DRG/HCPCS episode type-level methodology better balances payment accuracy, stability, transparency, appropriate site-of-service incentives, and administrative feasibility.

We recognize commenters' concerns that continued migration of lower-acuity LEJR procedures to outpatient or ASC settings could affect the mix of hospital-based episodes. We believe the proposed methodology is designed to account for changes in episode mix through MS–DRG/HCPCS episode type pricing, beneficiary-level risk adjustment, normalization, and trending policies. We are not adopting a local ASC-use adjustment because ASC market share may reflect many factors, including local practice patterns, beneficiary selection, payer mix, market capacity, and physician referral patterns, and we do not believe it would provide a reliable standalone basis for adjusting CJR–X target prices at model launch.

We also are not adopting the recommendation to exclude the amount paid to an initial admitting hospital when calculating target prices or actual episode spending for transfer episodes. The CJR–X episode payment methodology is intended to evaluate total episode spending for LEJR episodes, including spending that occurs across providers during the episode. Excluding payments to the initial admitting hospital could understate total episode spending and create inconsistency in how transfer and non-transfer episodes are measured. We believe concerns about higher-acuity transfer cases are better addressed through episode type, risk adjustment, high-cost outlier, and reconciliation policies rather than excluding a portion of episode spending from target price or actual spending calculations.

We will continue to assess whether CJR–X target prices appropriately reflect changes in site of care, episode mix, and patient complexity as care patterns evolve.

After consideration of the public comments, we are finalizing without modification the proposal at § 512.640(b)(1) to provide regional target prices to all CJR–X participants for each performance year.

(c) Services That Extend Beyond an Episode

We recognized that a CJR–X episode with a fixed 90-day post-discharge episode length, as discussed in section X.C.2.d.(3)(d) of this final rule, may result in some instances where a service included in the episode begins during the episode but concludes after the end of the episode and for which Medicare makes a single payment under an existing payment system. We noted in the proposed rule that an example would be a beneficiary in an episode who is admitted to a SNF for 30 days, beginning on day 65 post-discharge from the CJR–X anchor hospitalization or anchor procedure. The first 25 days of the SNF admission would fall within the episode, while the subsequent 5 days would fall outside of the episode. We proposed that, to the extent that a Medicare payment for included episode services spans a period of care that extends beyond the episode, these payments would be prorated so that only the portion attributable to care during the episode is attributed to the episode payment when calculating actual Medicare payment for the episode. For non-IPPS inpatient hospital (for example, CAH) and inpatient post-acute care (for example, SNF, IRF, LTCH, IPF) services, we proposed to prorate payments based on the percentage of actual length of stay (in days) that falls within the episode window. For HHA services that extend beyond the episode, we proposed that the payment proration be based on the percentage of days, starting with the first billable service date (''start of care date'') and through and including the last billable service date, that fall within the episode. We stated in the proposed rule that this policy would ensure that CJR–X participants are not held responsible for the cost of services that did not overlap with the episode period. For IPPS services that extend beyond the episode (for example, readmissions included in the episode definition), we proposed to separately prorate the IPPS claim amount from episode target price and actual episode payment calculations, called the normal MS–DRG payment amount for purposes of this final rule. We stated the normal MS–DRG payment amount would be pro-rated based on the geometric mean length of stay, comparable to the calculation under the IPPS post-acute care transfer policy at § 412.4(f) and as published on an annual basis in Table 5 of the IPPS/LTCH PPS final rules. As discussed in the proposed rule, consistent with the IPPS post-acute-care transfer policy, the first day for a subset of MS–DRGs (indicated in Table 5 of the IPPS/LTCH PPS final rules) would be doubly weighted to count as 2 days to account for likely higher hospital costs incurred at the beginning of an admission. If the actual length of stay that occurred during the episode is equal to or greater than the MS–DRG geometric mean, the normal MS–DRG payment would be fully allocated to the episode. If the actual length of stay that occurred during the episode is less than the geometric mean, the normal MS–DRG payment amount would be allocated to the episode based on the number of inpatient days that fall within the episode. If the full amount is not allocated to the episode, any remaining amount would be allocated to the 90-day post-episode payment calculation discussed in section X.A.3.(d)(5). of this final rule. We indicated in the proposed rule that this approach for prorating the normal MS–DRG payment amount is consistent with the IPPS transfer per diem methodology. We also noted that this methodology would be consistent with CJR and is described as applied to CJR in the 2015 CJR final rule (80 FR 73333).

We sought comment on our proposed methodology at § 512.655 for prorating services that extend beyond the episode.

We received no comments on our proposed methodology for prorating services that extend beyond the episode and are therefore finalizing without modification the proposal at § 512.655 for prorating services that extend beyond the episode.

(d) Episodes That Begin in One Performance Year and End in the Subsequent Performance Year

Given that we proposed episodes with a 90-day post-discharge period, we recognized that some episodes will begin during one performance year and end during the following performance year. We proposed that all episodes would receive the target price associated with the date of discharge from the anchor hospitalization or the anchor procedure, as applicable, regardless of the episode end date. We noted in the proposed rule that the assignment of target prices based on the date of discharge from the anchor hospitalization or the anchor procedure is different from the CJR model, where the target price was assigned based on the episode start date rather than the discharge date, but this proposed policy is consistent with BPCI Advanced. We stated that this slight modification of using the anchor hospitalization and anchor procedure date of discharge ensures the same approach is applied to target price assignment and reconciliation of episodes. As noted in section X.C.2.f.(5)(a). of this final rule, annual reconciliation is based on episodes with a date of discharge from the anchor hospitalization or a date of discharge from the anchor procedure during that performance year. We stated that if an episode starts in one performance year and has an anchor hospitalization discharge date that extends past the end of a performance year, that episode would factor into the next performance year's reconciliation, which is consistent with TEAM.

We sought comment on our proposal at § 512.640(a)(3) for applying target prices to an episode that begins in one performance year and ends in the subsequent performance year.

We received no comments on our proposal to apply target prices to episodes that begin in one performance year and end in the subsequent performance year and are therefore finalizing our proposal at § 512.640(a)(3) without modification.

(e) High-Cost Outlier Cap for Benchmarking

In the proposed rule we stated that given the broad proposed episode definition and 90-day proposed post-discharge period, we want to ensure that hospitals have some protection from the downside risk associated with especially high payment episodes, where the clinical scenarios for these cases each year may differ significantly and unpredictably. As we stated in the 2015 CJR final rule (80 FR 73335), we do not believe that the opportunity for a hospital's systematic care redesign of particular surgical episode has the significant potential to impact the clinical course of these extremely disparate high payment cases. In the 2015 CJR final rule (80 FR 73335), we finalized a policy to limit hospital responsibility for high episode payment cases by utilizing a high price payment ceiling at two standard deviations above the mean episode payment amount in calculating the target price and in comparing actual episode payments during the performance year to the target prices. We indicated in the proposed rule that this policy was designed to prevent participant

hospitals from being held responsible for catastrophic episode spending amounts that they could not reasonably have been expected to prevent. The policy, and the reasoning behind it, is described in detail at (80 FR 73335). However, as we described in 86 FR 23518, based on data from the first few years of the CJR model, we observed that the original 2 standard deviation methodology was insufficient to identify and cap high episode spending, as more episodes than expected exceeded the spending cap. We described in detail our reasoning for finalizing a change to the high episode spending cap in the 2021 CJR 3-Year Extension final rule (86 FR 23518). We finalized a change to the calculation of the high episode spending cap to derive the amount by setting the high episode spending cap at the 99th percentile of historical costs for each MS–DRG for each region. We stated the resulting methodology for the CJR Extension was similar to the BPCI Advanced methodology for capping high-cost episode spending at the 99th percentile for each MS–DRG. We proposed a similar high-cost outlier policy for CJR–X, which also aligns with TEAM. We proposed to cap both baseline episode spending and performance year episode spending at the 99th percentile of spending at the MS–DRG/HCPCS episode type, region and baseline year, referred to as the ''high-cost outlier cap'' and defined at proposed § 512.605. We proposed to determine the 99th percentile of spending at the MS–DRG/HCPCS episode type, region, and baseline year during the applicable time period, and then set spending amounts that exceed the high-cost outlier cap to the amount of the high-cost outlier cap. For instance, if the high-cost outlier cap was set at $30,000, an episode that had actual episode spending of $45,000 would have its spending amount, for purposes of the model, reduced by $15,000 when the cap was applied and therefore, the spending for that episode would be held at $30,000. We proposed to use capped episode spending when calculating benchmark prices in order to ensure that high-cost outlier episodes do not artificially inflate the benchmark. When calculating performance year episode spending at reconciliation, we proposed to use capped episode spending so that a CJR–X participant would not be held responsible for catastrophic episode spending amounts that they could not reasonably have been expected to prevent.

We sought comment on our proposal at § 512.605 to define ''high-cost outlier cap'' and our proposal at § 512.640(b)(4) for calculating and applying the high-cost outlier cap.

The following is a summary of the public comments received on our proposal to calculate and apply a high-cost outlier cap, and our responses to these comments:

Comment: Some commenters supported the intent of limiting the effect of unusually high-cost episodes but recommended that CMS revise the proposed high-cost outlier cap methodology. Commenters stated that capping episode spending only above the 99th percentile may not sufficiently limit the effect of unusually high-cost or clinically complex episodes on benchmark prices, target price accuracy, or reconciliation calculations.

Commenters recommended alternatives such as setting the high-cost outlier cap at the 90th percentile, using a 95th percentile cap, applying both low- and high-cost trims, using a threshold based on two standard deviations above the mean, or using different thresholds for hospitals with higher case mix or HCC burden. Commenters stated that these alternatives could reduce variability, improve target price accuracy, and limit the effect of extreme episode spending on model calculations.

Response: We acknowledge commenters' support for the intent of the high-cost outlier cap and their recommendations to use a different threshold or methodology. We proposed the high-cost outlier cap to limit the effect of unusually high-cost episodes in both benchmark price construction and performance-year episode spending. Under the proposal, spending above the 99th percentile would be capped at the MS–DRG/HCPCS episode type, region, and baseline year level, so extreme high-cost episodes would not artificially inflate benchmarks or disproportionately affect performance-year episode spending.

We are not adopting commenters' recommendations to lower the high-cost outlier cap to the 90th or 95th percentile, use a two-standard-deviation threshold, or apply both low- and high-cost trims. We recognize that these approaches would exclude or limit the effect of a larger number of episodes, but we believe doing so could reduce target price accuracy by treating more expected episode spending variation as outlier spending. The high-cost outlier cap is intended to limit the effect of extreme high-cost episodes, not to remove ordinary variation in LEJR episode spending that may reflect patient complexity, complications, post-acute care needs, or other factors that are part of the expected episode spending distribution.

We also are not adopting hospital-specific or participant-specific high-cost outlier thresholds based on tertiary referral status, case mix, HCC burden, or similar characteristics. The proposed cap is calculated at the MS–DRG/HCPCS episode type, region, and baseline year level, which maintains a consistent methodology across participants while still accounting for differences by episode type and region. We believe that using hospital-specific thresholds would add complexity, reduce comparability across participants, and make the cap less predictable. Concerns about patient and hospital-level differences are addressed more directly through the CJR–X risk adjustment methodology, while the high-cost outlier cap is designed to address extreme episode spending.

We previously used a two-standard-deviation methodology in the original CJR Model but later modified the high episode spending cap after experience showed that the original methodology was insufficient to identify and cap high episode spending. For the CJR Extension, we used a 99th percentile methodology similar to BPCI Advanced, and we proposed a similar high-cost outlier policy for CJR–X, which also aligns with TEAM. We continue to believe the 99th percentile methodology appropriately balances the goal of limiting the effect of extreme high-cost episodes with the need to preserve accurate benchmark and reconciliation calculations.

After consideration of the public comments, we are finalizing without modification the proposals at § 512.605 to define ''high-cost outlier cap'' and at § 512.640(b)(4) for calculating and applying the high-cost outlier cap.

(f) Trending Prices

In the proposed rule we stated that target prices are derived from a prediction based on previous Medicare spending patterns, but it is not possible to perfectly predict how Medicare spending patterns may change over the course of the performance year. We stated in the original BPCI model, prospective target prices were not provided to participants, so the trend factor was calculated retrospectively based on the observed spending during the performance period. Quarterly reconciliations in BPCI meant that participants could gain a sense of how their target prices tended to change over time and get relatively frequent feedback on their performance in the model. However, BPCI participants expressed concern with the uncertainty

of not knowing their target prices in advance.

As noted in the proposed rule, the initial CJR methodology and Model Years 1 through 3 of BPCI Advanced, CMS provided fully prospective target prices to participants. We stated that participants appreciated the certainty of prospective target prices, where we predict in advance how spending patterns might shift and hold those target prices firm even if we underpredicted or overpredicted spending. We noted this methodology included applying update factors to account for setting-specific payment system updates, allowing us to estimate how a given set of services performed during the baseline would be priced had those same services been subject to the fee schedules in effect during the performance period.

We stated in the proposed rule that in CJR, we originally overpredicted performance year spending, not accounting for the overall decline in spending on LEJR episodes nationwide that occurred outside of the model during its first few performance years. We also stated that in BPCI Advanced, we similarly overpredicted performance period spending for certain episodes because our methodology was unable to account for medical coding changes that occurred between the baseline and performance period, or during the performance period itself. For instance, in FY 2016, changes to medical coding guidance were made for Inpatient Congestive Heart Failure, such that certain patients who during the baseline would have been coded as the less expensive MS–DRG 292, were instead coded as the more expensive MS–DRG 291. We noted that this was done in spite of having the same clinical characteristics. This meant that many beneficiaries who received a target price associated with the more expensive MS–DRG 291, actually had the lower performance period costs previously associated with the less expensive MS–DRG 292. We indicated that the use of a fully prospective trend factor was unable to capture these changes in both practice patterns and coding guidelines.

Subsequently, we stated in the proposed rule that we modified both models' methodologies to include a retrospective trend adjustment. Starting in model year 4, we continued to provide BPCI Advanced participants with a prospective target price using an estimated trend factor, but we adjusted the target price at reconciliation based on the retrospective calculation of the trend factor using performance period data. We stated that initially, this policy included guardrails around the magnitude of the retrospective trend factor adjustment of +/−10 percent. In response to participant feedback, we lowered the maximum level of the retrospective trend factor adjustment to +/−5 percent starting in model year 6.

We noted in the proposed rule that in the CJR Extension, the retrospective trend was known as the market trend factor adjustment. It was fully retrospective and calculated at reconciliation, meaning that the unadjusted target price we posted on the CJR website prior to the performance year did not include a prospective trend factor. We stated that in response to participant requests, we provided estimates of the market trend factor on the CJR website based on the most recently available data to help participants estimate their potential target prices. The market trend factor was calculated separately for each MS–DRG/region combination. For the PY 8 reconciliation (corresponding to episodes that ended between January 1, 2024 and December 31, 2024), the highest market trend factor was 1.307 for MS–DRG 469 episodes in the Mountain region, while the lowest market trend factor was 0.998 for MS–DRG 470 episodes in the New England region.

As discussed in the proposed rule, in TEAM, we initially proposed a fully prospective trend factor adjustment based on the percentage difference between average regional MS–DRG/HCPCS episode type expenditures for baseline year 3 (the most recent baseline year) and baseline year 1 (the earliest baseline year) (89 FR 36430). Based on stakeholder feedback, we ultimately revised this approach to align more closely with the modified BPCI Advanced methodology. As described in the TEAM final rule (89 FR 69755), TEAM participants receive a preliminary target price that incorporates a prospective trend factor adjustment for each MS–DRG/HCPCS episode type and region, which reflects the average annual change in episode spending over the baseline period both regionally and nationally. We stated that at reconciliation, a retrospective trend factor adjustment is applied to preliminary target prices based on the average capped performance year episode spending vs. the average capped baseline episode spending. This retrospective adjustment is capped at +/−3 percent of the prospective trend adjustment in order to maintain predictability for participants. TEAM also further refined their prospective trend approach in the FY 2026 IPPS/LTCH PPS final rule (90 FR 37099) to incorporate a linear regression that includes all years in the baseline period to construct the trend, rather than a trend that only looked at the change from baseline year 1 to baseline year 3. TEAM also finalized the addition of two trend years to capture more years of data in the construction of the trend.

For CJR–X, we proposed to apply a ''prospective trend factor'', defined at proposed § 512.605, as the multiplier incorporated into the preliminary target price to estimate changes in spending patterns between the baseline period and the performance year. We also proposed to apply a +/−3 percent capped ''retrospective trend factor'', defined at proposed § 512.605, as the multiplier incorporated into the reconciliation target price to estimate realized changes in spending patterns during the performance year. We indicated in the proposed rule that this methodology would be similar to the approach used in TEAM. The key difference from TEAM is that CJR–X will not include the two trend years in the prospective trend factor, because we wanted to keep consistent the time frame of data we are sharing with CJR–X participants to the data used to construct target prices. For example, CJR–X would share three years of baseline data with CJR–X participants which would align with the baseline period used to construct the prospective trend, whereas TEAM shares 3 years of data that encompasses their baseline period but TEAM participants do not receive data associated with the two trend years. We believed using an approach similar with TEAM's, specifically applying a prospective trend with a +/−3 percent capped retrospective trend factor, will better account for significant spending changes that are not accounted for in the baseline while also ensuring that trends in regions where efficiency is improving over time do not overshoot what is feasible, leading to target prices that more accurately reflect spending patterns during the performance year.

Given our proposal to use a prospective trend factor to predict future spending for the purposes of pricing stability, we considered in the proposed rule but did not propose to include update factors that take into account Medicare payment system updates for each FY or CY and could improve pricing accuracy. Specifically, we considered a methodology similar to BPCI Advanced and Performance Years 1–5 of the CJR Model, where preliminary target prices were updated to reflect the most current FY and CY payment system rates using setting-specific update factors for payment system, including the IPPS, OPPS,

Physician Fee Schedule (PFS), Home Health Prospective Payment System (HH PPS), Medicare Economic Index (MEI), the IRF PPS, and the SNF PPS. However, we stated in the proposed rule that updating target prices using setting-specific update factors would result in CJR–X participants receiving more than one target price for an MS–DRG/HCPCS episode type in a performance year which can increase complexity. Further, we noted that while including update factors would generally increase target prices, it also decreases pricing stability since the preliminary target price would change due to the application of update factors. However, we are interested in capturing the most accurate episode spending in CJR–X that captures these payment system updates. We have included a policy in section X.C.2.f.(5)(d). of this final rule to account for this by updating the preliminary target price when constructing the reconciliation target price that avoids sharing update factors and having CJR–X participants manage multiple preliminary target prices within a given performance year.

We also considered in the proposed rule, but did not propose, alternative caps on the retrospective adjustment, including +/−5 percent and +/−10 percent of the prospective trend adjustment. Ultimately, we believed that a narrower adjustment range would improve stability and predictability for CJR–X participants. We stated that a lower cap on retrospective adjustments also mitigates the risk that target prices will be disproportionately impacted by performance year shifts in spending patterns that could not have been foreseen.

We sought comment on our proposal at § 512.640(b)(7) to apply a prospective trend factor to preliminary target prices and our proposal at § 512.645(f) to apply a retrospective trend factor with a +/−3 percent cap. We sought comment on our proposals at § 512.605 to define ''prospective trend factor'' and ''retrospective trend factor.''

We also requested comment on alternative ways to calculate the trend factor to both increase accuracy of prospective target prices and to mitigate the ratchet effect. We recognized in the proposed rule that spending on LEJR episodes has been decreasing over time and may reach a point where further decreases in spending could compromise quality and patient safety. The downward trend in LEJR episode spending we observed in the early years of CJR has stabilized in more recent years, suggesting that there may no longer be as much of an opportunity for participant savings as there was in the early years of CJR. In the case where spending has been decreasing but has since stabilized, trending the episode target price forward based on previous years' trends could result in target prices that are too low. In such a scenario, a retrospective trend adjustment might actually result in a higher target price than a fully prospective trend. We sought comment on ways to construct a trend factor that can result in a reasonable target price regardless of whether spending has been increasing, decreasing, or stabilizing.

For example, in the CY 2023 Physician Fee Schedule final rule, CMS finalized a policy to include a prospectively-determined component, the Accountable Care Prospective Trend (ACPT), in the factor used to update the benchmark to the performance year for ACO agreement periods starting on or after January 1, 2024 (see 87 FR 69881 to 69898). We stated in the proposed rule that this would help address the ratchet effect by insulating a portion of the update factor from the impact that ACO savings can have on retrospective national and regional spending trends. This type of trend is referred to as an administrative trend, because it is not directly linked to ongoing observed FFS spending. However, we recognize that there may be some concerns using administrative trends for episode-based payment models, as opposed to population-based payment models like ACOs, because administrative trends may not capture episode-specific trends, which could lead to higher or lower preliminary target prices when compared to actual performance year spending. We requested comment on this type of trending approach, or other potential ways to increase the accuracy of prospective target prices and mitigate the ratchet effect when we update CJR–X target prices.

The following is a summary of the public comments received on our proposals to apply a prospective trend factor to preliminary target prices and a capped retrospective trend factor to reconciliation target prices, and our responses to these comments:

Comment: A couple commenters supported CMS' proposed trending approach. These commenters supported the use of a prospective trend factor to update baseline episode spending to the performance year and supported the use of a capped retrospective trend factor to account for changes in episode spending during the performance year.

Response: We appreciate commenters' support for the proposed prospective trend factor and capped retrospective trend factor. We continue to believe that using both a prospective trend factor and a limited retrospective trend factor improves target price accuracy by accounting for changes in episode spending between the baseline period and the performance year.

Comment: Some commenters requested changes or clarification regarding the proposed prospective and retrospective trend methodology. Commenters expressed concern that the retrospective trend factor could make final target prices difficult for participants to predict during the performance year, increasing uncertainty about potential reconciliation payments or repayment responsibility. Commenters also requested additional information about how CMS would calculate the prospective and retrospective trend factors, including step-by-step methodology, the data used for each calculation, and how participants could independently estimate or model the trend factors.

Some commenters recommended that CMS provide additional trend information during the performance year, such as quarterly trend updates or other interim information to help participants understand whether episode spending is changing relative to baseline expectations. Commenters also requested that CMS account for Medicare FFS payment updates or other payment system changes between the baseline and performance year so that participants are not held financially responsible for changes outside their control. A commenter recommended that CMS align the CJR–X trend methodology more closely with TEAM to reduce operational differences across models.

Response: We acknowledge commenters' concerns that a retrospective trend factor may reduce certainty because final reconciliation target prices cannot be known with complete precision before the end of the performance year. We believe, however, that the limited retrospective trend factor is important because prospective trend factors may not fully capture actual changes in LEJR episode spending during the performance year. The proposed 3 percent cap on the retrospective trend factor is intended to balance these considerations by allowing reconciliation target prices to reflect actual spending changes while limiting the degree to which retrospective updates can increase or decrease target prices after the performance year.

We also acknowledge commenters' requests for additional detail and transparency regarding the trend methodology. We intend to provide

participants with information needed to understand the target price methodology, including how trend factors are calculated and applied. We will consider what additional operational materials, examples, or data can be shared to help participants estimate target prices and understand reconciliation calculations, while maintaining a methodology that can be administered consistently across all CJR–X participants.

We are not adopting a requirement to provide quarterly trend factor updates or to update target prices during the performance year based on interim trend calculations. We recognize that interim updates could provide additional visibility, but they could also create confusion if interim trends differ from the data ultimately used for reconciliation. We believe the proposed methodology better balances predictability and accuracy by providing prospective target prices before the performance year and applying a capped retrospective trend factor at reconciliation.

We also are not adopting a separate hold-harmless policy for Medicare FFS payment updates or other payment system changes between the baseline and performance year. The purpose of the trend methodology is to account for changes in episode spending over time, including changes that may result from payment policy, utilization, coding, or care delivery changes reflected in Medicare claims. We believe the proposed prospective and capped retrospective trend methodology provides an appropriate mechanism to account for these changes within the target price calculation.

We recognize the commenter's recommendation to align the CJR–X trend methodology more closely with TEAM. CJR–X and TEAM both use prospective and retrospective trend factors, but there are differences between the models, including the episode categories included, model structure, and pricing methodology. We believe the proposed CJR–X trend methodology is appropriate for LEJR episodes in CJR–X while maintaining substantial consistency with TEAM where appropriate. Although TEAM uses additional trend years in constructing its prospective trend, CJR–X is focused on a single episode category, and we believe that more recent LEJR spending patterns are likely to be the most relevant predictor of performance year spending rather than relying on earlier data that may be less predictive of future LEJR spending. We also believe it is important to align the data period used to construct target prices with the three years of baseline data shared with CJR–X participants because this alignment would improve transparency and make it easier for CJR–X participants to understand the data underlying their target prices.

Comment: Some commenters recommended that CMS adopt alternative trend approaches or additional monitoring related to the proposed trend methodology. Commenters recommended approaches such as regional trend factors, administrative or ACPT-like trend concepts, efficient-price benchmarks, or other methods intended to improve the accuracy and sustainability of the prospective and retrospective trend adjustments.

Some commenters recommended that CMS monitor whether LEJR episode spending trends have stabilized and assess whether the trend methodology continues to produce realistic target prices over time. Commenters stated that if regional or national LEJR spending trends have stabilized, continued downward updates through the pricing methodology could reduce opportunities for savings or create target prices that are difficult to achieve while maintaining quality and beneficiary access.

Some commenters recommended annual assessments, public reporting, or future refinements if the trend methodology produces unrealistic target prices, fails to reflect stabilized spending trends, or contributes to access, quality, or patient safety concerns.

Response: We acknowledge commenters' recommendations to use alternative trend approaches or additional monitoring if LEJR episode spending trends stabilize or if the proposed trend methodology produces target prices that are difficult to achieve while maintaining quality and beneficiary access. We agree that the trend methodology is an important component of target price accuracy because it affects how baseline episode spending is updated to the performance year and how final target prices reflect performance-year spending changes.

We are not adopting an administrative trend factor, ACPT-style benchmark, regional trend factor, efficient-price benchmark, or other alternative trend factor at this time. We believe the proposed prospective trend factor and capped retrospective trend factor are more directly tied to LEJR episode spending under CJR–X than an external administrative benchmark or a benchmark based on a separate model or population. The proposed methodology is designed to reflect changes in LEJR episode spending, payment policy, utilization, coding, and care delivery patterns over time, while the 3 percent cap on the retrospective trend factor limits the degree to which reconciliation target prices can change after the performance year.

We also are not adopting an automatic trend-based trigger or adjustment mechanism at this time. We recognize commenters' concerns that stabilized spending trends could reduce opportunities for additional savings if target prices continue to decline. However, an automatic trigger would require CMS to determine when spending has reached a sustainable level and how that determination should apply across regions, episode types, and performance years. We believe there is uncertainty about how to operationalize such a policy at model launch without reducing target price accuracy or weakening incentives for efficient, high-quality care.

We will assess whether the prospective and retrospective trend methodology continues to support accurate and sustainable target prices as CJR–X is implemented. This assessment may include consideration of LEJR episode spending trends, reconciliation results, quality performance, beneficiary access, site-of-care patterns, participant experience, and stakeholder feedback.

After consideration of the public comments, we are finalizing without modification the proposal at § 512.605 to define ''prospective trend factor'' and ''retrospective trend factor.'' We are also finalizing without modification the proposal at § 512.640(b)(7) to apply a prospective trend factor to preliminary target prices and at § 512.645(f) to apply a retrospective trend factor with a +/− 3 percent cap to reconciliation target prices.

(g) Discount Factor

In addition to the prospective trend factor, at proposed § 512.640(b)(8) we proposed to apply a discount factor, defined at proposed § 512.605, to the benchmark price when calculating preliminary target prices. Specifically, we proposed to apply a 2 percent discount factor to the benchmark price to serve as Medicare's portion of reduced expenditures from the episode. We stated in the proposed rule that this discount would be similar to the 2 percent discount factor applied to LEJR episode target prices in TEAM.

We noted in the proposed rule that in both the CJR Model and BPCI Advanced, we applied a 3 percent discount to benchmark prices when calculating preliminary target prices for LEJR episodes. However, based on

evidence and participant feedback from the final performance years of the CJR Extension, we believed that a 3 percent discount would not be sustainable for an expanded model and could result in more price ratcheting over a longer time horizon.

We also considered in the proposed rule but did not propose lower discount factors including 1.5 percent, 1 percent, or no discount factor. In addition, we considered linking the discount to variability in episode spending during the baseline, such that an episode with minimal variability in baseline spending might have a lower discount percentage, given that lower variability in baseline spending might indicate fewer opportunities for savings. We also considered in the proposed rule but did not propose to incrementally reduce the discount rate over a predetermined timeline and different ways to adjust the Medicare discount over time or based on differential savings opportunities for different episode types.

We sought comment on our proposal at § 512.605 to define ''discount factor'' and on our proposal at § 512.640(b)(8) to apply a 2 percent discount factor to preliminary episode target prices for CJR–X. We also sought comment on alternative discounts and discount adjustments.

The following is a summary of the public comments received on our proposal to apply a discount factor to preliminary target prices, and our responses to these comments:

Comment: Some commenters supported or expressed appreciation for CMS' proposal to apply a 2 percent discount factor rather than the 3 percent discount factor used for LEJR episodes in prior CJR and BPCI Advanced pricing. These commenters stated that the lower discount factor better recognized sustainability concerns in a mandatory national model, and some commenters stated that a 2 percent discount would be a meaningful and potentially achievable target.

Response: We appreciate commenters' support for the proposed 2 percent discount factor.

Comment: Many commenters opposed the proposed 2 percent discount factor or recommended that CMS reduce or eliminate the discount factor. Commenters stated that the 2 percent discount could be arbitrary, too aggressive, or difficult to achieve, particularly in a mandatory national model without a defined end date. Commenters expressed concern that the discount factor, when combined with annual rebasing, regional benchmarking, trend methodology, and prior efficiency gains, could further reduce opportunities for hospitals to earn reconciliation payments and could contribute to long-term price ratcheting.

Commenters stated that the proposed discount factor could be especially challenging for hospitals with narrow or negative margins, rural hospitals, safety net hospitals, hospitals with limited experience in bundled payment models, and hospitals that have already achieved efficiencies through prior participation in CJR, BPCI Advanced, TEAM, or other value-based care initiatives. Commenters expressed concern that the discount factor could reduce hospitals' ability to invest in care redesign, care coordination infrastructure, analytics, post-acute care relationships, quality improvement initiatives, or other activities needed to succeed under CJR–X. Commenters recommended that CMS eliminate the discount factor, reduce the discount factor to 1 percent or lower, apply no discount factor, or otherwise reduce the discount burden to better reflect realistic savings opportunities while preserving beneficiary access and quality of care.

Response: We acknowledge commenters' concerns that even a 2 percent discount factor may be difficult to achieve if target prices already reflect substantial prior efficiency or if LEJR spending in a region has stabilized. We considered these concerns in developing the proposed discount factor for CJR–X.

We proposed a 2 percent discount factor because CJR–X is an expansion of the tested CJR Model, which included a discount factor as part of the target price methodology. At the same time, we recognized that CJR–X is intended to operate over a longer time horizon than the original CJR Model test and that LEJR spending has declined since the CJR Model was first implemented. For those reasons, we proposed a lower discount factor than the 3 percent discount factor used for LEJR episodes in prior CJR and BPCI Advanced pricing.

We do not believe it would be appropriate to eliminate the discount factor or reduce it below 2 percent at this time. We have not tested a CJR-based LEJR episode payment model without a discount factor, and we do not have sufficient evidence to conclude that eliminating the discount factor would preserve the model's incentives, maintain the integrity of the tested CJR framework, and continue to satisfy the requirements for model expansion. We continue to believe that a 2 percent discount factor appropriately balances participant sustainability concerns with the need to maintain the CJR Model's tested episode-based accountability structure.

We also note that the 2 percent discount factor is the maximum discount factor that would apply before accounting for quality performance at reconciliation. CJR–X participants with higher composite quality scores may qualify for a reduced effective discount factor, as discussed in the quality-based reconciliation methodology section of this final rule. We believe this policy directly responds to concerns that the discount factor could create pressure to reduce spending without sufficient regard to quality, because it allows stronger quality performance to reduce the effective discount factor applied to reconciliation target prices.

We recognize commenters' concerns that hospitals or regions that have already achieved efficiencies may have fewer remaining opportunities to reduce episode spending. As discussed in the regional target price section of this final rule, we believe the use of regional target prices helps mitigate, though not eliminate, this concern by avoiding a methodology under which each participant is benchmarked only against its own historical performance. We also address broader concerns regarding target price sustainability, price ratcheting, annual rebasing, and trend methodology in the applicable pricing sections of this final rule.

We will continue to consider monitoring data, evaluation findings, operational experience, and stakeholder feedback to determine whether refinements to the discount factor or related pricing policies may be warranted to support implementation, protect beneficiary access, preserve incentives for high-quality care, and maintain realistic opportunities for CJR–X participants to achieve savings.

Comment: Many commenters recommended that CMS adopt an alternative discount factor formula or adjustment instead of applying a uniform 2 percent discount factor to all CJR–X participants. Commenters stated that a uniform discount factor may not account for differences in hospital readiness, prior efficiency, baseline spending, local market conditions, hospital resources, patient populations, quality performance, or remaining opportunities for savings.

Some commenters recommended that CMS phase in the discount factor, use a glide path with lower introductory discount factors during the initial years of CJR–X, or phase out the discount factor over time. Commenters stated that these approaches could help hospitals adapt to mandatory participation, build infrastructure for care redesign, avoid

excessive financial pressure during implementation, or account for evolving evidence about whether realistic savings opportunities remain over the longer term.

Commenters also recommended that CMS vary or adjust the discount factor based on hospital or episode characteristics. Commenters suggested lower or waived discounts for rural hospitals, safety net hospitals, sole community hospitals, Medicare-dependent, small rural hospitals, hospitals with limited experience in bundled payment models, or hospitals that have already achieved efficiencies through prior participation in CJR, BPCI Advanced, or other value-based care initiatives. Commenters also recommended discount factors based on a hospital's historical spending relative to regional target prices, baseline efficiency, episode-spending variation, episode type, or quality performance. A few commenters recommended replacing the discount factor with a first-dollar shared savings approach or another shared-savings methodology.

Response: We acknowledge commenters' recommendations to vary or adjust the proposed discount factor, including by using a phase-in or glide path, phasing out the discount factor over time, varying the discount factor by hospital or episode characteristics, or replacing the discount factor with another shared-savings approach.

We are not adopting a phase-in or glide path for the discount factor. We recognize that lower introductory discount factors could provide transition relief in the initial model years, but we believe the proposed 2 percent discount factor, together with the quality-based adjustment to the effective discount factor at reconciliation, provides a more straightforward and predictable structure for the start of CJR–X. We also note that the proposed 2 percent discount factor already reflects a reduction from the 3 percent discount factor used for LEJR episodes in prior CJR and BPCI Advanced pricing.

We are not adopting commenters' recommendations to vary the discount factor by hospital type, prior participation experience, baseline efficiency, historical spending relative to the region, local market characteristics, episode type, or baseline episode-spending variation at this time. We recognize that commenters raised these recommendations to address differences in hospital resources, market conditions, prior efficiency, and remaining savings opportunities. However, we believe many of these concerns are addressed more directly through policies designed for those specific issues, including regional target prices, risk adjustment and normalization, quality-based adjustments to the effective discount factor, and stop-loss protections for certain hospital categories. We are concerned that varying the discount factor across these dimensions could add complexity, reduce predictability and comparability across participants, and increase volatility without necessarily improving target price accuracy or model incentives.

We are also not adopting commenters' recommendation to replace the discount factor with a first-dollar shared savings approach or another shared-savings methodology. We believe retaining a discount factor is more consistent with the proposed CJR–X target price methodology and provides a simpler and more predictable structure for determining reconciliation payments.

We agree that the question of whether the discount factor should change over time is important for a longer-term expanded model. In particular, recommendations to phase out or otherwise reduce the discount factor in future years would depend on evidence about episode-spending trends, reconciliation results, quality performance, beneficiary access, participant experience, and whether realistic savings opportunities remain. We will consider monitoring data, evaluation findings, operational experience, and stakeholder feedback in assessing whether future refinements to the discount factor are warranted.

After consideration of the public comments, we are finalizing without modification the proposals at § 512.605 to define ''discount factor'' and at § 512.640(b)(8) to apply a 2 percent discount factor to preliminary episode target prices.

(h) Special Considerations for Low Volume Hospitals

In both the CJR Model and BPCI Advanced, we recognized in the proposed rule that hospitals that perform a number of episodes below a certain volume threshold would have insufficient volume to receive a target price based on their own baseline data. In the 2015 CJR final rule (80 FR 73285), we acknowledged that such hospitals might not find it in their financial interests to make systemic care redesigns or engage in an active way with the CJR model. At 80 FR 73292, we acknowledged commenter concerns about low volume providers, including but not limited to, observations that low volume providers could be less proficient in taking care of LEJR patients in an efficient and cost-effective manner, more financially vulnerable with fewer resources to respond to the financial incentives of the model, and disproportionately impacted by high-cost outlier cases. In spite of these potential challenges, we stated that the inclusion of low volume hospitals in the CJR Model was consistent with the goal of evaluating the impact of bundled payment and care redesign across a broad spectrum of hospitals with varying levels of infrastructure, care redesign experience, market position, and other considerations and circumstances (80 FR 73292).

We stated in the proposed rule that in the CJR Model, we set the low volume threshold as fewer than 20 LEJR episodes across the 3-year baseline years of 2012 through 2014. Low volume hospitals received target prices based on 100 percent regional data, rather than a blended target price that incorporated their participant-specific data, because a target price based on limited data is less likely to be accurate and reliable. We indicated that these hospitals were also subject to the lower stop-loss limits that we offered to rural hospitals, in recognition of the fact that they might be less prepared to take on downside risk than hospitals with higher episode volume. In the CJR 2017 final rule that reduced the number of mandatory MSAs, low volume hospitals were among the types of hospitals that were required to opt in if they wanted to remain in the model (82 FR 57072). In the 2020 final rule, we removed the remaining low volume hospitals from the CJR Extension when we limited the ''participant hospital'' definition to those hospitals that had been mandatory participants throughout the model (86 FR 23497).

We noted in the proposed rule that in BPCI Advanced, our low volume threshold policy was to not provide a target price for a given clinical episode category if performed at a hospital that did not meet the 41 clinical episode minimum volume threshold during the 4-year baseline period. This meant that no BPCI Advanced episodes would be triggered for that particular clinical episode category during the applicable performance period at that hospital. However, participants could continue to trigger other clinical episode categories for which they had enrolled and for which there was sufficient baseline volume. Additionally, clinical episodes that occurred at the hospital during the performance period, though not triggering a BPCI Advanced episode, would count toward the low volume threshold when that year became part of the baseline. Therefore, as the baseline

shifted forward each year, bringing a more recent year into the baseline and dropping the oldest year, a hospital could potentially meet the volume threshold and receive a target price for the clinical episode category for a subsequent performance period.

We stated in the proposed rule that in TEAM, if a TEAM participant does not meet the minimum baseline threshold of at least 31 episodes in a given episode category during the baseline period, the hospital's episodes are included in reconciliation calculations, but the hospital will not be held financially accountable for spending that exceeds the target price for that episode category in that performance year. We stated this effectively waives downside financial risk for the hospital for any episode categories in which it did not meet the low-volume threshold, providing protection against undue financial exposure while still allowing the hospital to participate in the model and benefit from savings, if applicable. We believe this policy is appropriate for TEAM given the increased number of episode categories mandatorily tested compared to the original CJR model and its time-limited test compared to longer-term CMS initiatives.

For CJR–X, we proposed a low volume policy that aligns with the approach we tested in BPCI Advanced because low volume hospitals were voluntary and ultimately removed from participation at the time of CJR Extension. We indicated in the proposed rule that we do not believe removing or excluding low volume hospitals is a good long-term policy for CJR–X since we recognize episode volumes can change over time. Also, there also may be instances when a hospital is just starting out and may have low volumes but then ramp up operations and see a substantial number of beneficiaries for LEJR procedures. Thus, we noted in the proposed rule that we believe a better policy for CJR–X would be to have a low volume policy that is responsive to episode volume changes year over year and acknowledges hospitals with low volume may not have the ability to spread risk when there is an insufficient number of procedures being performed. We proposed at § 512.605 to define ''low-volume hospital'' as a hospital with fewer than 31 LEJR episodes performed during the applicable baseline period. We proposed at § 512.640(a)(4) that low-volume hospitals would be excluded from reconciliation for the performance year. We stated in the proposed rule that as in BPCI Advanced, hospitals that do not meet the minimum volume threshold for a given performance year would not trigger CJR–X episodes or receive a target price. We stated that any LEJR episodes performed at these hospitals during the performance year would be excluded from regional benchmark calculations, although they would count toward the low volume threshold when that year becomes part of the baseline. Therefore, as the baseline shifts forward each year, bringing a more recent year into the baseline and dropping the oldest year, a hospital could potentially meet the volume threshold and trigger CJR–X episodes for a subsequent performance year.

We considered in the proposed rule implementing minimum episode volume thresholds during the performance year. Specifically, we considered excluding CJR–X participants from reconciliation if they initiate fewer than 10 or 15 LEJR episodes during that performance year. However, we were concerned that including minimum episode volume thresholds during the performance year may introduce program integrity issues where CJR–X participants steer CJR–X beneficiaries to other providers to be below the threshold and not be accountable for episodes in CJR–X.

We sought comment on our proposal at § 512.605 to define ''low-volume hospital'' and our proposal at § 512.640(a)(4) for setting and applying the low volume threshold at reconciliation.

The following is a summary of the public comments received on our proposal to exclude low-volume hospitals from reconciliation, and our responses to these comments:

Comment: A couple of commenters supported the proposal to exclude low-volume hospitals from reconciliation for a performance year. These commenters generally agreed that low-volume hospitals may have insufficient episode volume to support reliable target prices or meaningful reconciliation results.

Response: We thank the commenters for their feedback and support.

Comment: Many commenters stated that the proposed low-volume threshold of fewer than 31 LEJR episodes during the applicable baseline period was too low to support reliable benchmarking or meaningful performance assessment. Commenters stated that this threshold averaged roughly 10 episodes per year and would leave hospitals exposed to financial results driven by random variation, case mix differences, or a small number of complex or high-cost outlier cases. Some commenters stated that low-volume hospitals may lack sufficient episode volume to justify investments in care coordination staff, data infrastructure, analytics, post-acute relationships, or gainsharing arrangements. Commenters recommended that CMS substantially increase the threshold, determine the threshold empirically, consult actuarial or program evaluation experts, or adopt alternative thresholds such as 50, 75, or 100 LEJR episodes. Other commenters recommended that CMS apply the threshold annually, by episode category, during each baseline year, through a rolling average, through regional-specific standards, or through minimum performance-year volume criteria to improve predictability and reduce year-to-year volatility.

Response: We acknowledge commenters' concerns that low episode volume can increase the effect of random variation, case mix differences, and outlier cases on financial performance. We recognized these concerns in the proposed rule and proposed the low-volume policy because hospitals that perform a number of episodes below a certain volume threshold may have insufficient volume to receive a reliable target price based on their own baseline data and may not be able to spread risk when too few procedures are performed. We also recognized that low-volume hospitals may have fewer resources to respond to financial incentives and may be disproportionately affected by high-cost outlier cases, which is why we proposed to exclude low-volume hospitals from reconciliation for the performance year.

We considered the commenters' recommendations to increase the threshold or apply a different methodology. We note that in the CJR Extension, low volume hospitals were removed from the model based on a volume threshold from a static baseline prior to the start of the model. This meant that some hospitals that became low volume over time were not designated as such for purposes of CJR, and vice versa. The proposed CJR–X policy was designed to align with the approach tested in BPCI Advanced, under which a hospital that did not meet the applicable baseline volume threshold for an episode category would not trigger episodes or receive a target price for that category during the applicable performance period. We proposed this approach for CJR–X because it is responsive to changes in episode volume over time: episodes performed during a performance year would count toward the low-volume threshold when that year becomes part of the baseline, allowing a hospital that increases its LEJR volume to trigger CJR–X episodes in a later performance year. We also proposed this approach

because removing low-volume hospitals permanently from CJR–X would not be a good long-term policy where episode volumes may change over time.

We also considered commenters' recommendations to use annual, per-category, rolling-average, or performance-year thresholds. We considered minimum episode volume thresholds during the performance year, including excluding participants from reconciliation if they initiated fewer than 10 or 15 LEJR episodes during that performance year. However, we believe a baseline-period threshold is appropriate because it provides a prospective basis for determining whether a hospital will trigger CJR–X episodes and receive target prices for the performance year, while still allowing the threshold to update as the baseline shifts forward.

After consideration of the public comments, we are finalizing without modification the proposals at § 512.605 to define ''low-volume hospital'' and at § 512.640(a)(4) for setting and applying the low volume threshold at reconciliation.

(i) Preliminary Target Prices

We proposed to define ''preliminary target price'' as the target price provided to the CJR–X participant prior to the start of the performance year, which is subject to adjustment at reconciliation. We proposed at § 512.640(b)(9) that CMS would provide preliminary target prices to CJR–X participants, in a form and manner specified by CMS, prior to the start of each performance year. For instance, since the earliest episodes for a given performance year would end on January 1, and most of these episodes would have been initiated by an anchor hospitalization or anchor procedure that occurred near the end of November or the beginning of December of the previous calendar year, we proposed to provide preliminary target prices to the CJR–X participant by the end of November prior to each performance year. We proposed that preliminary target prices would be based on regional episode spending during the baseline period. We stated in the proposed rule that CJR–X participants would receive the preliminary target prices for each MS–DRG/HCPCS episode type that corresponded to their region. We proposed that these preliminary target prices would incorporate a prospective trend factor (as described in section X.C.2.f.(3)(f). of this final rule) and a discount factor (as described in section X.C.2.f.(3)(g). of this proposed rule), as well as a prospective normalization factor (as described in section X.C.2.f.(4). of this final rule).

We sought comment on our proposal at § 512.640(b)(9) to provide preliminary target prices to CJR–X participants prior to the start of each performance year.

The following is a summary of the public comments received on our proposal to provide preliminary target prices to CJR–X participants prior to the start of each performance year, and our responses to these comments:

Comment: Some commenters recommended that CMS provide preliminary target prices, target price methodologies, or related baseline data earlier or with more operational detail. Commenters stated that participants need timely target price information before the performance year to evaluate financial risk, plan budgets, educate care teams, enter into operational or contractual arrangements, and develop care redesign strategies.

Some commenters expressed concern that providing preliminary target prices by the end of November would not give participants sufficient time to prepare if CJR–X performance years began on October 1. These commenters recommended that CMS provide preliminary target prices before the beginning of the performance year, including no later than the end of August for an October 1 performance year start. A commenter recommended that CMS issue target prices in January, stating that doing so would better align with hospital operational realities and avoid competing fall reporting and regulatory deadlines.

Some commenters recommended that CMS provide target price update factors or other updated pricing information during the performance year as soon as they become available so that participants can better forecast financial performance before reconciliation. Commenters also requested that CMS publish target price methodologies with sufficient detail for participants to model performance prospectively and publish hospital-level baseline data before model launch so that participants can assess their starting position and operational risk.

Response: We agree with commenters that participants should have access to preliminary target prices and sufficient methodological information before they are held accountable for performance under CJR–X. We proposed at § 512.640(b)(9) to provide preliminary target prices to CJR–X participants prior to the start of each performance year, in a form and manner specified by CMS. We continue to believe that providing preliminary target prices before the start of each performance year is necessary to support participant planning, budgeting, care redesign, and operational readiness.

We acknowledge commenters' concerns that an end-of-November target price release would not precede an October 1 performance year start. As discussed in section X.C.2.a of this final rule, we are finalizing a January 1, 2028 start date for the first CJR–X performance year and aligning CJR–X performance years with the calendar year. Under that final policy, providing preliminary target prices by the end of November will give participants access to preliminary target prices before the start of each performance year. We are not adopting a January release timeline because participants should receive preliminary target prices before, rather than after, the start of the performance year.

We also acknowledge commenters' requests for target price update factors and updated pricing information during the performance year. We intend to provide participants with information needed to understand preliminary target prices, target price methodology, episode attribution, applicable adjustment factors, and reconciliation calculations. However, we are not adopting a requirement to update preliminary target prices during the performance year each time additional information or update factors become available. Preliminary target prices are, by definition, subject to adjustment at reconciliation, and piecemeal updates during the performance year could create confusion if interim information differs from the data ultimately used for reconciliation.

We acknowledge commenters' requests for target price methodology, baseline data, and other information that would allow participants to model performance prospectively and assess operational risk. We intend to provide implementation materials, data files, and methodological information, as appropriate, to help participants understand the CJR–X pricing methodology and prepare for participation. Any data shared with participants would be provided in a form and manner specified by CMS and would be subject to applicable privacy, security, operational, and data-use requirements.

After consideration of the public comments, we are finalizing without modification the proposals at § 512.640(b)(9) to provide preliminary target prices to CJR–X participants prior to the start of each performance year

(4) Risk Adjustment and Normalization

We stated in the proposed rule that in the original CJR Model methodology, we

first proposed that risk adjustment be limited to providing separate target prices for episodes initiated by MS–DRG 469 versus MS–DRG 470, because MS–DRGs under the IPPS are designed to account for some of the clinical and resource variations that exist and that impact hospitals' costs of providing care (80 FR 73338). In response to comments requesting further risk adjustment, in the 2015 CJR final rule we finalized a policy to risk-adjust target prices based on the presence of a hip fracture diagnosis code in order to capture a significant amount of patient-driven episode expenditure variation (80 FR 73339). As a result, we provided four separate target prices to participant hospitals based on MS–DRG 469 versus MS–DRG 470, and presence versus absence of a primary hip fracture. We stated that the impact of hip fractures on inpatient costs associated with a hip replacement was subsequently acknowledged by CMS' decision to create two new MS–DRGs (521 and 522) for hip replacements in the presence of a primary hip fracture (85 FR 58432). We incorporated these new MS–DRGs into the CJR Model episode definition as of October 1, 2020 via the November 2020 Interim Final Rule with Comment (IFC) (85 FR 71170).

We stated in the proposed rule that in the 2021 CJR 3-Year Extension final rule, we acknowledged the need for further risk adjustment to account for beneficiary-level factors that tend to impact spending in a way that is beyond the control of the provider. We introduced age bracket (less than 65 years, 65 to 74 years, 75 to 84 years, and 85 years or more), CJR HCC count (zero, one, two, three, and four or more), and dual eligibility (receiving both full Medicare and Medicaid benefits) as beneficiary-level risk adjustment factors that would be applied to each episode at reconciliation. The definition of these risk adjustment variables, and our reasoning for incorporating them into the risk adjustment methodology, is described in detail at 86 FR 23523.

We indicated in the proposed rule that the coefficients for the risk adjustment variables in the CJR Extension were calculated prospectively, prior to the beginning of each performance year, using a linear regression model. As we stated at 86 FR 23524, this regression model approach would allow us to estimate the impact of each risk adjustment variable on the episode cost of an average beneficiary, based on typical spending patterns for a nationwide sample of beneficiaries with a given number of CMS–HCC conditions, within a given age bracket, and with dual eligibility or non-dual eligibility status. We used an exponential model to account for the fact that LEJR episode costs are not normally distributed. A detailed description of the regression model begins at 86 FR 23524.

We explained in the proposed rule that at reconciliation, after applying the high-cost episode cap to remove outliers, the risk adjustment coefficients for the three risk adjustment variables were applied to the episode-level target price based on the applicable episode region and MS–DRG. However, since age, CJR HCC count, and dual eligibility status are inherently included in the regional target price, since regions with beneficiaries who are older, more medically complex, and socioeconomically disadvantaged tend to have higher average episode costs, we applied a normalization factor to remove the overall impact of adjusting for age, CJR HCC count, and dual eligibility on the national average target price, as described at 86 FR 23527.

By contrast, BPCI Advanced used a more complex risk adjustment model that included many more risk adjustment coefficients, including both patient and provider characteristics. Categories of patient characteristics included (but were not limited to): HCCs (individual flags, interactions, and counts), recent resource use, and demographics. We stated that provider characteristics, which were used to group hospitals into peer groups, included bed size, rural vs. urban, safety net vs. non-safety net, and whether or not the participant was a major teaching hospital. We noted that the first stage of the BPCI Advanced risk adjustment methodology used a compound log-normal model in order to account for the substantial right skew of the distribution of episode costs. This meant that it combined two log-normal distributions in order to capture costs associated with both low-cost episodes (which were the majority of episodes) and very high-cost episodes (which were fewer in number but exerted a strong influence on spending averages). However, participants found this risk adjustment model difficult to interpret, particularly since it was not widely used in other research or healthcare models.

We stated in section X.C.2.f.(4) the proposed rule (91 FR 19697) and reiterated in this section of the final rule that for TEAM, in an effort to simplify the risk adjustment methodology and allow participants to more easily calculate an episode-level estimated target price, we based our methodology on the CJR Extension methodology, with a few key differences. We indicated that rather than calculating one national set of risk adjusters across all MS–DRGs for a given episode category, we calculate risk adjustment coefficients at the MS–DRG/HCPCS episode type level. We considered calculating risk adjustment at the MS–DRG/HCPCS episode type/region level, but we believed that, when further subdivided into regions, the low volume of episodes for certain MS–DRG/HCPCS episode types would be insufficient to create accurate and reliable risk adjustment multipliers.

We stated that in the TEAM proposed rule, we initially proposed to use three beneficiary-level risk adjustment variables that were similar to the CJR Extension methodology, with two key differences. First, instead of using the annual HCC file to calculate the HCC count variable, we proposed to conduct a 90-day lookback of FFS Medicare claims for each beneficiary, beginning with the day prior to the anchor hospitalization or anchor procedure, and count the number of HCC flags assigned. We subsequently revised this to a 180-day lookback in the final rule (90 FR 37105). Second, instead of a dual-eligibility risk adjustment variable, we proposed a more comprehensive approach which accounted for dual eligibility status, as well as Low Income Part D Subsidy qualification and area-level socioeconomic deprivation. As discussed in the TEAM final rule (90 FR 37103), this beneficiary economic risk adjustment functions as a binary (yes=1, no=0) variable, with a value of 1 being assigned to episodes where the beneficiary meets at least one of the following three criteria as of the first day of the episode: (1) resides in an area that exceeds the 80th percentile threshold for National Community Deprivation Index; (2) eligible for Medicare Part D Low Income Subsidy; and (3) eligible for full Medicaid benefits.

We noted in the proposed rule that in addition to the three initially proposed risk adjustment variables, several additional beneficiary and participant-level risk adjustments were added to the TEAM target price methodology in response to public comments. This included hospital-level adjustments for bed size (250 beds or fewer, 251–500 beds, 501–850 beds, or 851+ beds) and safety net status, as defined in 42 CFR 512.505. Additionally, TEAM applied several episode category-specific beneficiary risk adjustment factors to target prices that were not used in the CJR Extension. These episode category-specific risk adjustment factors reflected the presence or absence of certain conditions or services during the 180-day lookback period. For the LEJR

episode category, this included binary risk adjustments (yes=1, no=0) for prior post-acute care use, disability as the original reason for Medicare enrollment, LEJR procedure, and 21 HCC flags, as detailed in 42 CFR 512.545(a)(6)(ii), including, but not limited to, morbid obesity [HCC 48] and diabetes with severe acute [HCC 36] or chronic [HCC 37] complications. The decision to risk adjust based on individual HCCs, in addition to the aggregate HCC count adjustment, was intended to reflect the differential effects that individual chronic conditions like diabetes or chronic kidney disease can have on total episode spending, allowing us to provide more accurate and nuanced target prices.

We also stated in the proposed rule that another key difference between the TEAM and CJR Extension risk adjustment methodologies is that, in TEAM, we provide a prospective normalization factor with preliminary target prices. We stated this prospective normalization factor is subject to a limited adjustment at reconciliation based on the observed case mix, up to +/−5 percent. We indicated that this allows participants to better estimate their target prices, as it incorporates the normalization factor prospectively, rather than only introducing the normalization factor at reconciliation. We noted in the proposed rule that we believe that this approach strikes a balance between predictability and protecting TEAM participants and CMS from significant shifts in patient case mix between the final baseline year and the performance year.

For CJR–X, we proposed at § 512.645 to use the same risk adjustment methodology and variables, as defined at proposed § 512.605, that are used in TEAM. Specifically, we proposed the following:

- To risk adjust target prices at the hospital level using a hospital bed size risk adjustment factor and a safety net risk adjustment factor.
- To risk adjust target prices at the beneficiary level using a 180-day lookback period to construct a ''CJR–X HCC count risk adjustment factor'', an ''age bracket risk adjustment factor'', a ''beneficiary economic risk adjustment factor'', and based on certain conditions or HCCs in the 180-day lookback period including—

++ Ankle procedure or reattachment, partial hip procedure, partial knee arthroplasty, total hip arthroplasty or hip resurfacing procedure, and total knee arthroplasty;
++ Disability as the original reason for Medicare enrollment;
++ Prior post-acute care use;
++ HCC 17: Cancer Metastatic to Lung, Liver, Brain, and Other Organs; Acute Myeloid Leukemia Except Promyelocytic;
++ HCC 36: Diabetes with Severe Acute Complications;
++ HCC 37: Diabetes with Chronic Complications;
++ HCC 48: Morbid Obesity;
++ HCC 125: Dementia, Severe;
++ HCC 126: Dementia, Moderate;
++ HCC 127: Dementia, Mild or Unspecified;
++ HCC 151: Schizophrenia;
++ HCC 155: Major Depression, Moderate or Severe, without Psychosis;
++ HCC 199: Parkinson and Other Degenerative Disease of Basal Ganglia;
++ HCC 224: Acute on Chronic Heart Failure;
++ HCC 225: Acute Heart Failure (Excludes Acute on Chronic);
++ HCC 226: Heart Failure, Except End-Stage and Acute;
++ HCC 238: Specified Heart Arrhythmias;
++ HCC 253: Hemiplegia/Hemiparesis[
++ HCC 267: Deep Vein Thrombosis and Pulmonary Embolism
++ HCC 280: Chronic Obstructive Pulmonary Disease, Interstitial Lung Disorders, and Other Chronic Lung Disorders
++ HCC 326: Chronic Kidney Disease, Stage 5
++ HCC 327: Chronic Kidney Disease, Severe (Stage 4)
++ HCC 383: Chronic Ulcer of Skin, Except Pressure, Not Specified as Through to Bone or Muscle
++ HCC402: Hip Fracture/Dislocation

- Include a ''prospective normalization factor'' that would be subject to a limited adjustment at reconciliation based on the observed case mix, up to +/−5 percent to construct the ''final normalization factor''. This is inclusive of TEAM's proposal to include the full baseline period in the construction of the prospective normalization factor, as discussed in section X.A.2.c.(3) of this final rule.

As described in section X.C.2.f.(1)(c) of this final rule, TEAM was designed to blend and improve upon policies from both BPCI Advanced and the CJR Model based on the cumulative evidence from both model tests. For CJR–X, we propose a risk adjustment methodology that builds upon lessons learned from both the CJR Model and BCPI Advanced. While the original CJR approach was straightforward, we recognized it did not fully account for key patient and provider complexities. The BPCI Advanced model offered greater precision but proved too complex for participants to interpret. For CJR–X, we sought to balance these considerations by integrating more precise adjustments for specific conditions and socioeconomic factors—thus improving upon CJR's simplicity—without sacrificing the transparency that was lost in BPCI Advanced. We believe this balanced approach will ensure that target prices are both equitable and actionable without fundamentally altering the model design or structure that was tested in the Phase I CJR Model.

We considered in the proposed rule, but did not propose, a more nuanced approach to the safety net hospital risk adjustment that segmented hospitals into 3 or more groups based on the share of FFS inpatient episodes provided to dual-eligible beneficiaries. We recognized that a binary risk adjustment for safety net hospitals may not accurately reflect the financial challenges for participants with a high percentage of dual-eligible episodes that do not meet the threshold for being classified as a safety net hospital, as defined in § 512.605. For example, the financial challenges faced by hospitals that fall just below the threshold are likely similar to those for hospitals that fall just above it. Furthermore, we recognized in the proposed rule that for participants on the margin, their status as a safety net hospital may change from year to year due to random variance and that this may not reflect the more persistent nature of the underlying challenges that the risk adjustment is attempting to address. However, we were concerned that the further segmentation of hospitals into smaller groups may result in sample size and accuracy problems. We proposed that a safety net hospital in CJR–X is a hospital in the top 25th percentile in their region for percentage of FFS LEJR inpatient episodes provided to dually eligible beneficiaries during the applicable baseline period. We sought comment on the proposal § 512.605 to use a binary safety net hospital risk adjustment.

To summarize, for CJR–X we proposed a risk adjustment methodology based on the CJR Extension methodology, but with refinements similar to those applied to the TEAM methodology. We believe these refinements will improve the accuracy of target price calculations without fundamentally altering the model design or structure that was tested in the Phase I CJR Model. As in both TEAM and the CJR Extension, we proposed to use baseline data to calculate risk adjustment multipliers

and hold them constant at reconciliation. We proposed that participants would be provided with these risk adjustment multipliers prior to the start of the performance year and would be able to use them to estimate their episode-level target prices. We proposed that, as in TEAM, these risk adjustment multipliers would be calculated at the MS–DRG level, resulting in a separate set of risk adjustment multipliers for each MS–DRG episode type. We also proposed to incorporate a prospective normalization factor into preliminary target prices, which would be subject to a limited adjustment at reconciliation.

We sought comment on our proposals at § 512.645(a) through (d) for risk adjusting episodes and at § 512.605 for the definitions of ''age bracket risk adjustment factor'', ''beneficiary economic risk adjustment factor'', ''CJR–X HCC count risk adjustment factor'', ''final normalization factor'', ''prospective normalization factor'', and ''safety net hospital''.

The following is a summary of the public comments received on our proposal to risk adjust and normalize target prices, and our responses to these comments:

Comment: Some commenters supported CMS' proposal to expand risk adjustment in CJR–X compared with the original CJR Model, including the use of additional beneficiary-level, social-risk, and hospital-level factors intended to better account for patient acuity, clinical complexity, social risk, and differences across participant hospitals.

Response: We thank the commenters for their support.

Comment: Some commenters requested clarification or modifications to the lookback period used to construct beneficiary-level risk adjustment factors. Commenters expressed concern that the proposed 180-day lookback period may be too short to capture chronic conditions, underlying comorbidities, and other risk factors that materially affect LEJR episode spending, particularly for beneficiaries with limited claims history or beneficiaries with non-elective episodes.

Commenters recommended that CMS use a longer lookback period, such as 12 months or 365 days. Some commenters also recommended that CMS include the anchor hospitalization or procedure in the lookback period or otherwise account for diagnoses and clinical information identified close to the start of the episode.

Response: We acknowledge commenters' concerns about the proposed 180-day lookback period. We proposed a claims-based lookback period so that beneficiary-level risk adjustment factors would be based on information available before the episode, rather than conditions, complications, coding, or utilization patterns that may arise during the episode itself. We believe this approach helps preserve episode-based accountability while still accounting for important beneficiary-level differences that are observable before the anchor hospitalization or procedure.

We are not adopting commenters' recommendations to use a 12-month or 365-day lookback period or to include the anchor hospitalization or procedure in the lookback period. A longer lookback period could capture additional historical diagnoses, but it may also place more weight on conditions that are less closely related to expected LEJR episode spending. Including the anchor hospitalization or procedure in the lookback period could create circularity by using information from the episode itself to adjust the episode target price. We believe the proposed 180-day lookback period appropriately balances the goal of capturing relevant pre-episode clinical information with the need to maintain a clear and administrable risk adjustment methodology.

We also note that CJR–X beneficiary eligibility criteria are designed to ensure that Medicare has complete and consistent claims data for included episodes. As proposed, beneficiaries must be enrolled in Medicare Part A and Part B, have Medicare as the primary payer, not be enrolled in a managed care plan, and meet the other beneficiary inclusion criteria for the model. These criteria help support the reliability of the claims data used for episode construction, spending calculations, and risk adjustment. We also note that a longer lookback period reduces episode volume because beneficiary eligibility must similarly extend back as far. Sufficient episode volume is important to spread financial risk and identify opportunities for savings and efficiency.

Comment: A couple commenters requested additional transparency regarding the beneficiary-level data used for risk adjustment. Commenters stated that participants should be able to understand, validate, and audit the beneficiary-level risk adjustment inputs used to calculate reconciliation target prices.

Commenters requested additional operational guidance on episode construction, beneficiary eligibility, claims history, incomplete data during the lookback period, and the data that would be made available to participants for risk-adjustment validation.

Response: We acknowledge commenters' requests for additional transparency regarding the beneficiary-level data used for risk adjustment. We intend to provide participants with information needed to understand the risk adjustment methodology, beneficiary-level risk adjustment factors, episode attribution, target price construction, and reconciliation calculations.

We also expect to provide operational guidance and implementation materials before the model begins, including information to help participants understand the data used in model calculations. Any beneficiary-level data shared with participants for model operations or validation would be subject to applicable privacy, security, and data-use requirements.

Comment: Many commenters recommended that CMS further expand or refine beneficiary-level risk adjustment to account for additional information related to medical history, clinical complexity, and episode-specific complexity. Commenters stated that the proposed methodology may not fully capture factors such as surgical complexity, revision history, fracture or non-fracture status, emergent or elective status, inpatient or outpatient episode initiation, frailty, functional limitations, cognitive impairment, behavioral health conditions, medically complex patients, prior post-acute care use, and conditions identified close to the start of the episode. Commenters stated that incomplete adjustment for these factors could result in target prices that are too low for hospitals treating higher-acuity beneficiaries or could create incentives to avoid beneficiaries who may require more intensive resources during or after LEJR episodes.
