

adequate long-term solution to control microorganisms in the IATCS coolant.

The OPA is incorporated into a porous resin material contained in a stainless-steel canister. The canister containing the OPA-incorporated resin is inserted into a coolant system loop, using flexible hose and quick disconnects, and is placed in line for 8 hours to deliver the OPA into the fluid. As the coolant fluid flows through the canister, the OPA elutes from the resin material into the coolant fluid. The total volume of the circulatory loops of the IATCS is 829 liters. The maximum concentration would be 350 milligrams (mg) of OPA per liter of coolant fluid. A total of 290,150 mg would be needed for the entire system. The OPA is incorporated into the resin at 210 mg of OPA per cm³ resin, resulting in potential total use of 1,382 cm³ of the OPA-containing resin. The level of OPA in the coolant is monitored periodically, and because OPA degrades over time, the concentration decreases to a level that is no longer effective in about 1 to 2 years. At this point, replenishment with new OPA-containing canisters is required.

Since authorizing emergency exemptions in 2011, the EPA expects this use to continue for the duration of the ISS program, which has been extended through 2030.

This notice provides an opportunity for public comment on the application. The Agency will review and consider all comments received during the comment in determining whether to issue the specific exemption requested by NASA.
