RIN 0938–AV82

Medicare and Medicaid Programs; CY 2027 Payment Policies Under the Physician Fee Schedule and Other Changes to Part B Payment and Coverage Policies; Medicare Shared Savings Program Requirements; and Medicare Prescription Drug Inflation Rebate Program

AGENCY: Centers for Medicare & Medicaid Services (CMS), Department of Health and Human Services (HHS).

ACTION: Final rule.

SUMMARY: This final rule addresses: changes to the physician fee schedule (PFS); other changes to Medicare Part B payment policies to ensure that payment systems are updated to reflect changes in medical practice, relative value of services, and changes in the statute; codification of establishment of new policies for: the Medicare Prescription Drug Inflation Rebate Program under the Inflation Reduction Act of 2022; limiting Medicare coverage of certain individuals; the Ambulatory Specialty Model; updates to drugs and biological products paid under Part B; Medicare Shared Savings Program requirements; updates to the Quality Payment Program; updates to policies for Rural Health Clinics and Federally Qualified Health Centers; update to the Ambulance Fee Schedule regulations; codification of the Inflation Reduction Act and Consolidated Appropriations Act, 2026 provisions; updates to Clinical Laboratory Fee Schedule regulations; updates to the Medicare Promoting Interoperability Program.

DATES: These regulations are effective on January 1, 2027.

FOR FURTHER INFORMATION CONTACT:

MedicarePhysicianFeeSchedule@cms.hhs.gov, for any issues not identified below. Please indicate the specific issue in the subject line of the email. For all questions related to reporting a service on a claim, please contact your Medicare Administrative Contractor.

Michael Soracoe, Morgan Kitzmiller, or *MedicarePhysicianFeeSchedule@cms.hhs.gov,* for issues related to practice expense, work RVUs, conversion factor, and PFS specialty-specific impacts.

Hannah Ahn, Allison Bramlett, or *MedicarePhysicianFeeSchedule@cms.hhs.gov*, for issues related to potentially misvalued services under the PFS.

Mikayla Murphy, or *MedicarePhysicianFeeSchedule@cms.hhs.gov*, for issues related to direct supervision using two-way audio/video communication technology, telehealth, and other services involving communications technology.

MedicarePhysicianFeeSchedule@cms.hhs.gov, for issues related to E/M overlap between stand-alone visits and global periods, and E/M visit complexity add-on code (B1 and B2).

Terry Simananda, or *MedicarePhysicianFeeSchedule@cms.hhs.gov*, for issues related to smoking and tobacco use cessation, screening, brief intervention, and referral to treatment, psychiatric collaborative care model, and shared medical appointments.

Sarah Leipnik, or *MedicarePhysicianFeeSchedule@cms.hhs.gov*, for issues related to global surgery payment accuracy.

Pamela West, or *MedicarePhysicianFeeSchedule@cms.hhs.gov*, for issues related to comprehensive outpatient rehabilitation facility (CORF) services and KX modifier thresholds.

Zehra Hussain, or *MedicarePhysicianFeeSchedule@cms.hhs.gov*, for issues related to payment of skin substitutes.

Laura Kennedy, (410) 786–3377, Rebecca Ray, (667) 414–0879, and Jae Ryu, (667) 414–0765 for issues related to Drugs and Biological Products Paid Under Medicare Part B.

Lisa Parker, (410) 786–4949, or *FQHC–PPS@cms.hhs.gov*, Michele Franklin, (410) 786–9226, or *RHC@cms.hhs.gov*, and Patrick Sartini, (410) 786–9252 for issues related to FQHC and RHC payments.

Patrick Sartini, (410) 786–9252, or *CLFS_Inquiries@cms.hhs.gov* for issues related to the Clinical Laboratory Fee Schedule.

Sabrina Ahmed, (410) 786–7499, or *SharedSavingsProgram@cms.hhs.gov*, for issues related to the Medicare Shared Savings Program (Shared Savings Program) quality performance standard and other quality reporting requirements.

Kimberly Spalding Bush, (410) 786–3232, or *SharedSavingsProgram@cms.hhs.gov*, for issues related to the Shared Savings Program certified electronic health record technology (CEHRT) use requirements.

Janae James, (410) 786–0801, or *SharedSavingsProgram@cms.hhs.gov*, for issues related to Shared Savings Program beneficiary assignment and financial methodology.

Lucy Bertocci, (443) 681–0762, or *SharedSavingsProgram@cms.hhs.gov*, for issues related to reducing or eliminating Part B cost sharing, prepaid shared savings, beneficiary notifications, advance investment payments or identifying ACOs experienced with performance-based risk.

Elisabeth Daniel, (667) 290–8793, for issues related to the Medicare Prescription Drug Inflation Rebate Program.

Benjamin Picillo or Genevieve Kehoe, *AmbulatorySpecialtyModel@cms.hhs.gov*, or 1–844–711–2664 (Option 4) for issues related to the Ambulatory Specialty Model.

Amy Gruber, (410) 786–1542, for issues related to Ambulance Fee Schedule.

Kati Moore, (410) 786–5471, for inquiries related to the Merit-based Incentive Payment System (MIPS) track of the Quality Payment Program (QPP).

Trevey Davis, (410) 786–6600, for inquiries related to the Advanced Alternative Payment Models (APMs) track of QPP.

Jessica Warren, (410) 786–7519, and Lisa Marie Gomez, (410) 786–1175, for inquiries related to the Medicare Promoting Interoperability Program.

Steve Manning, (410) 786–1691, for inquiries related to limiting Medicare coverage of certain individuals.

I. Executive Summary

A. Purpose

This major final rule revises payment policies under the Medicare PFS and makes other policy changes, including to the implementation of certain provisions of the Full-Year Continuing Appropriations and Extensions Act, 2025 (Pub. L. 119–4, March 15, 2025), Further Continuing Appropriations and Other Extensions Act of 2024 (Pub. L. 118–22, November 17, 2023), Consolidated Appropriations Act, 2023 (Pub. L. 117–328, December 29, 2022), Inflation Reduction Act of 2022 (IRA) (Pub. L. 117–169, August 16, 2022), Consolidated Appropriations Act, 2022 (Pub. L. 117–103, March 15, 2022), Consolidated Appropriations Act, 2021 (CAA, 2021) (Pub. L. 116–260, December 27, 2020), Bipartisan Budget Act of 2018 (BBA of 2018) (Pub. L. 115–123, February 9, 2018), the Substance Use-Disorder Prevention that Promotes Opioid Recovery and Treatment for Patients and Communities Act (SUPPORT Act) (Pub. L. 115–271, October 24, 2018) and Consolidated Appropriations Act, 2026 (Pub. L. 119–75, February 3, 2026), related to Medicare Part B payment. In addition, this final rule includes other Medicare payment and eligibility provisions described in sections III. and IV.

This final rule updates policies for the Medicare Prescription Drug Inflation Rebate Program codified at 42 CFR parts 427 and 428 consistent with sections 1847A(i) and 1860D—14B of the Social Security Act (the Act). For the Medicare Part B Drug Inflation Rebate Program, this rule describes the identification of the Consumer Price Index for all Urban Consumers (CPI–U) for the payment amount benchmark quarter and the rebate period in certain instances when CPI–U survey data are unavailable and the calculation of the Part B rebate amount in such instances; clarifies the definition of ''first marketed date''; and clarifies that certain skin substitutes would not be excluded from the definition of a Part B rebatable drug. For the Medicare Part D Drug Inflation Rebate Program, this rule describes the identification of the CPI–U for the payment amount benchmark period and applicable period in certain instances when CPI–U survey data are unavailable and the calculation of the Part D rebate amount in such instances; modifies the methodology finalized in the CY 2026 PFS final rule to account for 340B-eligible units for AIDS Drug Assistance Program (ADAP) clients for the applicable period beginning October 1, 2025; and requires Medicare providers and suppliers that are 340B covered entities to submit Part D 340B claims data to the Medicare Part D Claims Data 340B Repository beginning in 2027.

This final rule modifies policies for the Shared Savings Program, which is a voluntary program that started in 2012. The program allows groups of providers and suppliers to form or participate in Accountable Care Organizations (ACOs), and to be held accountable for the quality and total cost of care for an assigned population of Medicare fee-for-service (FFS) beneficiaries.

B. Summary of the Key Provisions

Section 1848 of the Act requires us to establish payments under the PFS, based on national uniform relative value units (RVUs) that account for the relative resources used in furnishing a service. The statute requires that RVUs be established for three categories of resources: work, practice expense (PE), and malpractice (MP) expense. In addition, the statute requires that each year we establish, by regulation, the payment amounts for physicians' services paid under the PFS, including geographic adjustments to reflect the variations in the costs of furnishing services in different geographic areas.

In this major final rule, we are finalizing RVUs for CY 2027 for the PFS to ensure that our payment systems are updated to reflect changes in medical practice and the relative value of services, as well as changes in the statute. This final rule also includes discussions and provisions regarding several other Medicare Part B payment policies, and other policies regarding programs administered by CMS.

Specifically, this final rule addresses:

- Background (section II.A.)
- Determination of PE RVUs (section II.B.)
- Payment for Medicare Telehealth Services (section II.C.)
- Valuation of Specific Codes, Including Potentially Misvalued Codes (PMVC) (section II.D.)
- Redesigning Primary Care to Make America Healthy Again (section II.E.)
- Comprehensive Outpatient Rehabilitation Facility (CORF) Services and KX Modifier Threshold, and Medical Review Threshold (section II.F.)
- Supporting Beneficiaries Planning for Future Medical Decisions (section II.G.)
- Current Procedural Terminology (CPT) Request for Information (RFI) (section II.H.)
- Drugs and Biological Products Paid Under Medicare Part B: Discarded Drugs (section III.A.)
- Rural Health Clinics (RHCs) and Federally Qualified Health Centers (FQHCs) (section III.B.)
- Clinical Laboratory Fee Schedule (CLFS): CAA, 2026 (section III.C.)
- Changes to the Ambulatory Specialty Model (ASM) (section III.D.)
- Limiting Medicare Coverage of Certain Individuals (section III.E.)
- Medicare Prescription Drug Inflation Rebate Program (section III.F.)
- Medicare Shared Savings Program (section III.G.)
- Changes to the Regulations Associated with the Ambulance Fee Schedule (section III.H.)
- Request for Information (RFI) on Duplicate Laboratory Testing, Imaging, and Result Sharing and Interoperability (section III.I)
- CY2027 Modifications to the Quality Payment Program Reporting and Data Submission (section IV.)
- Collection of Information Requirements (section V.)
- Regulatory Impact Analysis (section VI.)

C. Summary of Costs and Benefits

Based on our estimates, the Office of Information and Regulatory Affairs in the Office of Management and Budget has determined that this final rule is economically significant under section 3(f)(1) of Executive Order 12866. As required by section 1848(d)(1)(A) of the Act, beginning in 2026, there are two separate conversion factors (CFs): one for items and services furnished by a qualifying APM participant (QP) as defined in section 1833(z)(2) of the Act and 42 CFR 414.1305 (referred to as the qualifying APM conversion factor) and another for items and services furnished by clinicians who are not QPs (referred to as the nonqualifying APM conversion factor), equal to the respective conversion factor for the previous year multiplied by the update established under section 1848(d)(20) of the Act for such respective conversion factor for such year. Under these provisions, the 2027 qualifying APM conversion factor represents a projected decrease of $0.62 (−1.83 percent) from the current conversion factor of $33.5675. Similarly, the 2027 nonqualifying APM conversion factor represents a projected decrease of $0.77 (−2.31 percent) from the current conversion factor of $33.4009.

For a detailed discussion of the economic impacts, see section VI., Regulatory Impact Analysis, of this final rule.

D. Public Comments in Response on the CY 2027 PFS Proposed Rule

We received approximately 43,100 timely pieces of correspondence on the CY 2027 PFS proposed rule that appeared in the **Federal Register** on July 14, 2026 (91 FR 43842 through 44557). We received comments from individuals, providers and suppliers, practitioners, and advocacy groups. We provide summaries of the public comments, and our responses are set forth in the various sections of this final rule under the appropriate headings. We note that we received some public comments that were outside the scope of the CY 2027 PFS proposed rule.

II. Provisions of the Rule for the PFS

A. Background

In accordance with section 1848 of the Social Security Act (the Act), CMS has paid for physicians' services under the Medicare physician fee schedule (PFS) since January 1, 1992. The PFS relies on national relative values that are established for work, practice expense (PE), and malpractice (MP), which are adjusted for geographic cost variations. These values are multiplied by a conversion factor (CF) to convert the relative value units (RVUs) into payment rates. The concepts and methodology underlying the PFS were enacted as part of the Omnibus Budget Reconciliation Act of 1989 (OBRA '89) (Pub. L. 101–239, December 19, 1989), and the Omnibus Budget Reconciliation Act of 1990 (OBRA '90) (Pub. L. 101–508, November 5, 1990). The final rule published in the November 25, 1991 **Federal Register** (56 FR 59502) set forth the first fee schedule used for Medicare payment for physicians' services.

We note that throughout this final rule, unless otherwise noted, the term ''practitioner'' is used to describe both physicians and nonphysician practitioners (NPPs) who are permitted to bill Medicare under the PFS for the services they furnish to Medicare beneficiaries.

B. Determination of PE RVUs

1. Overview

Practice expense (PE) is the portion of the resources used in furnishing a service that reflects the general categories of physician and practitioner expenses, such as office rent and personnel wages, but excluding malpractice (MP) expenses, as specified in section 1848(c)(1)(B) of the Act. As required by section 1848(c)(2)(C)(ii) of the Act, we use a resource-based system for determining PE RVUs for each physicians' service. We develop PE RVUs by considering the direct and indirect practice resources involved in furnishing each service. Direct expense categories include clinical labor, medical supplies, and medical equipment. Indirect expenses include administrative labor, office expenses, and all other expenses. The sections that follow provide more detailed information about the methodology for translating the resources involved in furnishing each service into service specific PE RVUs. We refer readers to the CY 2010 Physician Fee Schedule (PFS) final rule with comment period (74 FR 61743 through 61748) for a more detailed explanation of the PE methodology.

2. Practice Expense Methodology

a. Direct Practice Expense

We determine the direct PE for a specific service by adding the costs of the direct resources (that is, the clinical staff, medical supplies, and medical equipment) typically involved with furnishing that service. The costs of the resources are calculated using the refined direct PE inputs assigned to each CPT code in our PE database, which are generally based on our review of recommendations received from the American Medical Association (AMA)/Specialty Society Relative Value Scale (RVS) Update Committee (referred to as the RUC) and those provided in response to public comment periods. For a detailed explanation of the direct PE methodology, including examples, we refer readers to the 5-year review of work RVUs under the PFS and changes to the PE methodology in the CY 2007 PFS proposed rule (71 FR 37242) and the CY 2007 PFS final rule with comment period (71 FR 69629).

b. Indirect Practice Expense per Hour Data

We use survey data on indirect PEs incurred per hour (PE/HR) worked to develop the indirect portion of the PE RVUs. Prior to CY 2010, we primarily used the PE/HR by specialty obtained from the AMA's Socioeconomic Monitoring System (SMS). The AMA administered a new survey in CY 2007 and CY 2008, the Physician Practice Information Survey (PPIS). The PPIS is a multispecialty, nationally representative, PE survey of physicians and NPPs paid under the PFS using a survey instrument and methods highly consistent with those used for the SMS and the supplemental surveys. The PPIS gathered information from 3,656 respondents across 51 physician specialty and health care professional groups. We have stated that we believe the PPIS is the most comprehensive source of PE survey information available. We used the PPIS data to update the PE/HR data for the CY 2010 PFS for almost all of the Medicare-recognized specialties that participated in the survey.

When we began using the PPIS data in CY 2010, we did not change the PE RVU methodology or how the PE/HR data are used. We only updated the PE/HR data based on the new survey. Furthermore, as we explained in the CY 2010 PFS final rule with comment period (74 FR 61751), because of the magnitude of payment reductions for some specialties resulting from the use of the PPIS data, we transitioned its use over a 4-year period from the previous PE RVUs to the PE RVUs developed using the new PPIS data. As provided in the CY 2010 PFS final rule with comment period (74 FR 61751), the transition to the PPIS data was complete for CY 2013. Therefore, PE RVUs from CY 2013 forward are developed based entirely on the PPIS data, except as noted in this section.

Section 1848(c)(2)(H)(i) of the Act requires us to use the medical oncology supplemental survey data submitted in 2003 for oncology drug administration services. Therefore, the PE/HR for medical oncology, hematology, and hematology/oncology reflects the continued use of these supplemental survey data.

Supplemental survey data on independent labs from the College of American Pathologists were implemented for payments beginning in CY 2005. Supplemental survey data from the National Coalition of Quality Diagnostic Imaging Services (NCQDIS), representing independent diagnostic testing facilities (IDTFs), were blended with supplementary survey data from the American College of Radiology (ACR) and implemented for payments beginning in CY 2007. Neither IDTFs nor independent labs participated in the PPIS. Therefore, we continue to use the PE/HR that was developed from their supplemental survey data.

Consistent with our past practice, the previous indirect PE/HR values from the supplemental surveys for these specialties were updated to CY 2006 using the Medicare Economic Index (MEI) to put them on a comparable basis with the PPIS data.

We also do not use the PPIS data for reproductive endocrinology and spine surgery since these specialties are not separately recognized by Medicare, nor

do we have a method to blend the PPIS data with Medicare-recognized specialty data.

Previously, we established PE/HR values for various specialties without SMS or supplemental survey data by crosswalking them to other similar specialties to estimate a proxy PE/HR. For specialties that were part of the PPIS for which we previously used a crosswalked PE/HR, we instead used the PPIS based PE/HR. We use crosswalks for specialties that did not participate in the PPIS. These crosswalks have been generally established through notice and comment rulemaking and are available in the file titled ''CY 2027 PFS Final Rule PE/HR'' on the CMS website under downloads for the CY 2027 PFS final rule at *https://www.cms.gov/medicare/payment/fee-schedules/physician/federal-regulation-notices*.

c. Allocation of PE to Services

To establish PE RVUs for specific services, it is necessary to establish the direct and indirect PE associated with each service.

(1) Direct Costs

The relative relationship between the direct cost portions of the PE RVUs for any two services is determined by the relative relationship between the sum of the direct cost resources (that is, the clinical staff, medical supplies, and medical equipment) typically involved with furnishing each of the services. The costs of these resources are calculated from the refined direct PE inputs in our PE database. For example, if one service has a direct cost sum of $400 from our PE database and another service has a direct cost sum of $200, the direct portion of the PE RVUs of the first service would be twice as much as the direct portion of the PE RVUs for the second service.

(2) Indirect Costs

Under current policy, we allocate the indirect costs at the code level based on the direct costs specifically associated with a code and the greater of either the clinical labor costs or the work RVUs. We also incorporate the survey data described earlier in the PE/HR discussion. The general approach to developing the indirect portion of the PE RVUs is as follows:

- For a given service, we use the direct portion of the PE RVUs calculated as previously described and the average percentage that direct costs represent of total costs (based on survey data) across the specialties that furnish the service to determine an initial indirect allocator. That is, the initial indirect allocator is calculated so that the direct costs equal the average percentage of direct costs of those specialties furnishing the service. For example, if the direct portion of the PE RVUs for a given service is 2.00 and direct costs, on average, represent 25 percent of total costs for the specialties that furnish the service, the initial indirect allocator would be calculated so that it equals 75 percent of the total PE RVUs. Thus, in this example, the initial indirect allocator would equal 6.00, resulting in a total PE RVU of 8.00 (2.00 is 25 percent of 8.00 and 6.00 is 75 percent of 8.00).
- Next, under current policy, we add the greater of the work RVUs or clinical labor portion of the direct portion of the PE RVUs to this initial indirect allocator. In our example, if this service had a work RVU of 4.00 and the clinical labor portion of the direct PE RVU was 1.50, we would add 4.00 (since the 4.00 work RVUs are greater than the 1.50 clinical labor portion) to the initial indirect allocator of 6.00 to get an indirect allocator of 10.00. In the absence of any further use of the survey data, the relative relationship between the indirect cost portions of the PE RVUs for any two services would be determined by the relative relationship between these indirect cost allocators. For example, if one service had an indirect cost allocator of 10.00 and another service had an indirect cost allocator of 5.00, the indirect portion of the PE RVUs of the first service would be twice as great as the indirect portion of the PE RVUs for the second service.
- Then, we incorporate the specialty specific indirect PE/HR data into the calculation. In our example, if, based on the survey data, the average indirect cost of the specialties furnishing the first service with an allocator of 10.00 was half of the average indirect cost of the specialties furnishing the second service with an indirect allocator of 5.00, the indirect portion of the PE RVUs of the first service would be equal to that of the second service.

In the CY 2007 PFS final rule with comment period, we implemented the ''bottom up'' methodology for the development of PE RVUs (71 FR 69630–69643). We finalized the use of the work RVU or the clinical labor portion of the direct PE RVU, whichever is greater, to allocate indirect costs. We also finalized a modified formula for a global service (that is, a service with a professional component (PC) and a technical component (TC)) to utilize both the work RVU and the clinical labor PE RVU to allocate indirect costs. As noted in the CY 2007 PFS final rule with comment period, we do this to recognize that, for the PC service, indirect PEs will be allocated using the work RVUs, and for the TC service, indirect PEs will be allocated using the direct PE RVU and the clinical labor PE RVU. This also allows the global component RVUs to equal the sum of the PC and TC RVUs.

In recent years, as we have conducted analyses aimed at improving the accuracy of payment under the PFS, we have re-examined this longstanding policy that effectively allocates a larger share of indirect PE RVUs to services that can be reported using technical, professional, and global components than to those that cannot. We refer the reader to a report by RAND Corporation, under contract with CMS, which addresses several approaches to improving the accuracy of other PFS services relative to services that have a professional and technical component. This report is available at *https://www.rand.org/pubs/research_reports/RRA4720-2.html*.

This longstanding policy inadvertently advantages services that can be reported using technical, professional, and global components, referred to as ''triplet services'' in the report by RAND Corporation, because indirect PE RVUs are allocated on the sum, whereas services that can only be reported as a global service, referred to as ''non-triplet services'' in the report, depend on the maximum (rather than sum) of clinical labor PE RVUs and physician work RVUs. This is an unintended advantage of the arithmetic required for the global component RVUs to equal the sum of the PC and TC RVUs. As we stated in the proposed rule, we believe it would be more accurate than the current PE methodology to use the same allocation methodology for all PFS services. Therefore, we proposed to allocate indirect PE using both the work RVU and the clinical labor RVU for all services, with the exception of codes with 10- and 90-day global periods, instead of just applying that methodology to those services that can be reported using technical, professional, and global components (typically diagnostic and imaging services). In the description of the calculation of the PE methodology noted later in the section, we indicate the portion of the methodology that would be calculated differently under this proposal.

We received public comments on this proposal. The following is a summary of the comments we received and our responses.

Comment: Several commenters stated that CMS did not provide a rationale for excluding 10- and 90-day global codes from the proposed revised indirect PE

allocation in the proposed rule. Some commenters stated that the RAND analysis published alongside the proposed rule did not exclude these global codes, disagreed with CMS' exclusion of 10- and 90-day global codes and requested that we finalize their inclusion in the proposal to allocate indirect PE using both the work RVU and the clinical labor RVU for all services. Some commenters supported the exclusion of the 10- and 90-day global period codes from the proposal. They reiterated our ongoing questions and concerns about the current valuation of work and clinical labor RVUs for 10- and 90-day global period codes noted elsewhere in section II.B. of this final rule, and said that the proposed change should not be extended to those codes until the other questions and concerns are addressed. Another commenter requested that the exclusion of the 10- and 90-day global period codes does not further delay the separate work needed to correct documented misvaluation within global surgical payments.

Response: We appreciate the commenters' feedback and note that we inadvertently omitted a specific rationale for their exclusion in the proposed rule. We discussed difficulties and concerns with the global period codes elsewhere in section II.B. of the proposed rule (91 FR 43861) and similarly excluded 10- and 90-day global surgery services from the new ''CY 2027 PFS Proposed Rule Display Only TC PE RVUs'' public use file discussed in the proposed rule. Specifically, the use of bundled payments for the 10- and 90-day global surgery services results in aggregated valuation for all pre-operative, intra-operative, and post-operative services furnished over a defined period (10-, or 90-day global periods), including services by both physician and clinical staff and practice expense without clear visibility into how each component contributes to the total bundled valuation. This is the rationale referenced previously that was inadvertently omitted from the proposed rule.

This unintended advantage of the arithmetic required for the global component RVUs to equal the sum of the PC and TC RVUs has led to concerns of incorrect relativities between PFS services. While the RAND report recommends allocating indirect PE using the sum of work and clinical labor as a default for all services (that is, not just those with TC/PC splits), the report also notes that strategies CMS might pursue to mitigate these concerns could interact with other aspects of Medicare payment policy, leading to unintentional or undesired effects or the need for special adjustments or other consideration for certain PFS services.

Additionally, other RAND reports [1] [2] [3] [4] and recent OIG reports [5] [6] have consistently found that substantially fewer post-operative visits are typically provided to Medicare beneficiaries as part of 10- and 90-day global periods compared to the number of assumed post-operative visits considered in surgical procedure valuation. Including the 10- and 90-day global surgery services in the proposed revised indirect PE allocation would have significantly increased the indirect PE allocated to these services and amplified the payment distortions that result from including too many post-operative visits in global packages because there is work and clinical labor bundled into the valuation associated with the post-operative visits. Similar to how we do not believe codes with technical, professional, and global components should be advantaged over other services by the indirect PE allocation using both the work RVU and clinical labor RVU, we do not believe global period services should be advantaged by the proposal because they have additional work & clinical labor RVUs bundled into their post-operative periods.

Comment: A commenter expressed concern with the proposal, stating that the proposal was aimed at addressing the assertion in RAND's report that the current indirect PE methodology may contribute to overutilization of imaging services. The commenter stated that, absent evidence demonstrating that indirect PE allocation directly affects ordering behavior or utilization patterns, they believe we should proceed cautiously before implementing significant redistributions of RVUs based on assumptions regarding imaging utilization.

Response: We appreciate the commenter's feedback. We note that, as discussed in the proposed rule, this longstanding policy inadvertently advantages services that can be reported using technical, professional, and global components, and is an unintended advantage of the arithmetic required for the global component RVUs to equal the sum of the PC and TC RVUs. We note that we did not propose this change to address any utilization patterns discussed in RAND's report, but rather, to address the longstanding and unintended advantage because we believe it would be more accurate than the current PE methodology to use the same allocation methodology for all PFS services.

Comment: A commenter stated they could not determine whether CMS incorporated this proposed modification into the calculation of PE RVUs for the proposed rule. They stated that, in the separately published Sample Calculation of PE RVUs under Methodology for Selected Codes public use file, CMS indicated that the second component of the indirect PE allocator for CPT code 99213 is based on the work RVU and does not appear to incorporate the clinical labor as proposed.

Response: We appreciate the commenter's feedback and acknowledge the concern. Because this was a proposed change, our methodology public use files, such as the Sample Calculation of PE RVUs under Methodology for Selected Codes and CY 2027 PFS Proposed Rule Practice Expense Algorithm Technical Memo, displayed information regarding the methodology in its current state for the proposed rule, so as to not presume finalization of a proposal without notice and comment rulemaking. We provided the public with Addendum B and CY 2027 PFS Proposed Rule Fully Implemented PE RVUs for full transparency into implementation of these proposals. We also acknowledge that the formula displayed in step (20) of the published Sample Calculation of PE RVUs under Methodology for Selected Codes public use file indicated that the second part of the indirect PE allocator for CPT code 99213 is based on the work RVU but we note that the calculated value displayed in step (21) of the published file is correct. For the final rule, we note that our methodology public use files reflect all finalized proposals.

After consideration of the public comments, we are finalizing our proposal to allocate indirect PE using both the work RVU and the clinical labor RVU for all services, with the exception of codes with 10- and 90-day global periods, instead of just applying that methodology to those services that can be reported using technical, professional, and global components.

(3) Facility and Non-Facility Costs

For procedures that can be furnished in a physician's office, as well as in a facility setting, where Medicare makes a separate payment to the facility for its costs in furnishing a service, we establish two PE RVUs: facility and non-facility. The methodology for calculating PE RVUs is generally the same for both the facility and non-facility RVUs but is applied independently to yield two separate PE RVUs. In calculating the PE RVUs for services furnished in a facility, we do not include resources that would generally not be provided by physicians when furnishing the service. For this reason, the facility PE RVUs are generally lower than the non-facility PE RVUs. In the CY 2026 PFS final rule (90 FR 49292 through 49296), we finalized a modification in the allocation of indirect PE to reduce the portion of the facility PE RVUs allocated based on work RVUs to half the amount allocated to non-facility PE RVUs beginning in CY 2026.

(4) Services With Technical Components and Professional Components

Diagnostic services are generally comprised of two components: a professional component (PC); and a technical component (TC). The PC and TC may be furnished independently or by different healthcare providers, or they may be furnished together as a global service. When services have separately billable PC and TC components, the payment for the global service equals the sum of the payment for the TC and PC. To achieve this, we use a weighted average of the ratio of indirect to direct costs across all the specialties that furnish the global service, TCs, and PCs; that is, we apply the same weighted average indirect percentage factor to allocate indirect expenses to the global service, PCs, and TCs for a service. (The direct PE RVUs for the TC and PC sum to the global direct PE RVUs.)

(5) PE RVU Methodology

For a more detailed description of the PE RVU methodology, we direct readers to the CY 2010 PFS final rule with comment period (74 FR 61745 through 61746). We also direct readers to the file titled ''Calculation of PE RVUs under Methodology for Selected Codes'' which is available on our website under downloads for the CY 2027 PFS final rule at *https://www.cms.gov/medicare/payment/fee-schedules/physician/federal-regulation-notices.* This file contains a table that illustrates the calculation of PE RVUs as described in this final rule for individual codes.

(a) Setup File

First, we create a setup file for the PE methodology. The setup file contains the direct cost inputs, the utilization for each procedure code at the specialty and facility/non-facility place of service level, and the specialty specific PE/HR data calculated from the surveys.

(b) Calculate the Direct Cost PE RVUs

Sum the costs of each direct input.

Step 1: Sum the direct costs of the inputs for each service.

Step 2: Calculate the aggregate pool of direct PE costs for the current year. We set the aggregate pool of PE costs equal to the product of the ratio of the current aggregate PE RVUs to current aggregate work RVUs and the projected aggregate work RVUs.

Step 3: Calculate the aggregate pool of direct PE costs for use in ratesetting. This is the product of the aggregate direct costs for all services from Step 1 and the utilization data for that service.

Step 4: Using the results of Step 2 and Step 3, use the CF to calculate a direct PE scaling adjustment to ensure that the aggregate pool of direct PE costs calculated in Step 3 does not vary from the aggregate pool of direct PE costs for the current year. Apply the scaling adjustment to the direct costs for each service (as calculated in Step 1).

Step 5: Convert the results of Step 4 to an RVU scale for each service. To do this, divide the results of Step 4 by the CF. Note that the actual value of the CF used in this calculation does not influence the final direct cost PE RVUs as long as the same CF is used in Step 4 and Step 5. Different CFs would result in different direct PE scaling adjustments, but this has no effect on the final direct cost PE RVUs since changes in the CFs and the associated direct scaling adjustments offset one another.

(c) Create the Indirect Cost PE RVUs

Create indirect allocators.

Step 6: Based on the survey data, calculate direct and indirect PE percentages for each physician specialty.

Step 7: Calculate direct and indirect PE percentages at the service level by taking a weighted average of the results of Step 6 for the specialties that furnish the service. Note that for services with TCs and PCs, the direct and indirect percentages for a given service do not vary by the PC, TC, and global service.

We generally use an average of the 3 most recent years of available Medicare claims data to determine the specialty mix assigned to each code. Codes with low Medicare service volume require special attention since billing or enrollment irregularities for a given year can result in significant changes in specialty mix assignment. We finalized a policy in the CY 2018 PFS final rule (82 FR 52982 through 52983) to use the most recent year of claims data to determine which codes are low volume for the coming year (those that have fewer than 100 allowed services in the Medicare claims data). For codes that fall into this category, instead of assigning a specialty mix based on the specialties of the practitioners reporting the services in the claims data, we use the expected specialty that we identify on a list developed based on medical review and input from expert interested parties. We display this list of expected specialty assignments as part of the annual set of data files we make available as part of notice and comment rulemaking and consider recommendations from the RUC and other interested parties on changes to this list annually. Services for which the specialty is automatically assigned based on previously finalized policies under our established methodology (for example, ''always therapy'' services) are unaffected by the list of expected specialty assignments. We also finalized in the CY 2018 PFS final rule (82 FR 52982 through 52983) a policy to apply these service-level overrides for both PE and MP, rather than one or the other category.

In prior years, we reviewed information submitted during the proposed rule comment period regarding potential additions to the list of expected specialty assignments, to determine whether the specialty assignments commenters recommended were appropriate for the services in question. Our review process has been based on determining if the recommended specialty matched the dominant specialty in the claims data. However, we have long held reservations on whether this was the most accurate method for implementing updates to the expected specialty assignments list. Since these updates to the list were never formally proposed in the proposed rule of each calendar year, there was never an opportunity for interested parties to comment and provide feedback before the assignments were finalized in the final rule. We believe that it would provide greater transparency and more opportunities for public comment if additions to the expected specialty assignments list were instead proposed in each year's proposed rule.

Therefore, we did not finalize any additions to the expected specialty assignments list in the CY 2026 PFS final rule (90 FR 49270). We stated that we would instead review the list of approximately 75 low volume HCPCS codes submitted by commenters and propose additions to the list in this year's CY 2027 PFS proposed rule. We will also review any submissions for inclusion to the expected specialty assignments list by the same February 10th deadline that we have finalized in the past for consideration of RUC recommendations and invoice-based updates to supply and equipment pricing. We believe that synchronizing submissions to the expected specialty assignments list for low volume services with the same annual date used for RUC recommendations and invoice submissions will help standardize the process, while also providing more opportunities for feedback from interested parties by going through the annual comment process.

During the comment period for the CY 2026 PFS rule, several commenters stated that they had performed an analysis to identify all codes that meet the criteria to receive a specialty override under this CMS policy and drafted updated recommendations for codes that meet these criteria. Commenters stated that the purpose of assigning a specialty to these codes was to avoid the significant adverse impact on MP RVUs that results from errors in specialty utilization data magnified in representation (percentage) by small sample size. These commenters submitted a list of approximately 75 low volume HCPCS codes with recommended expected specialty assignments.

After reviewing the information provided by the commenters to determine whether the specialty assignments they recommended were appropriate for the services in question, based on determining if the recommended specialty matches the dominant specialty in the claims data, we proposed the additions to the list of expected specialty assignments for low volume services identified in Table A–B1. We agree with the commenters that, based on claims data, CPT codes 33277 through 33281 and 33287 through 33288 should be crosswalked to the Cardiac Electrophysiology specialty and that CPT codes 93584 through 93588 should be crosswalked to the Interventional Cardiology specialty. We also agree with commenters that CPT code 23077 should be crosswalked to the Surgical Oncology specialty. However, we do not have PE/HR data for these specialties as they were not part of the PPIS when it was conducted in 2007; therefore, we are crosswalking these CPT codes to the closest available specialties (Cardiology for the first two groups of codes and All Physicians for CPT code 23077), as listed on Table A–B1.

We disagree with the commenters on a series of additional suggested assigned specialties. In each case, there was another specialty which was reported more than twice as often in the claims data as the specialty suggested by commenters and in some cases reported as much as five times as often. Therefore, we proposed to crosswalk CPT codes 15135 and 41000 to the Otolaryngology specialty, CPT codes 26118 and 26650 to the Orthopedic Surgery specialty, CPT codes 93025 and 93150 to the Cardiology specialty, and CPT codes 93152 and 93153 to the Pulmonary Disease specialty as these were the dominant specialties in the claims data. These crosswalks are included in Table A–B1.

BILLING CODE 4169–69–P

TABLE A-B1: PROPOSED NEW ADDITIONS TO THE EXPECTED SPECIALTY ASSIGNMENT LIST

* Recommended specialty assignment crosswalked.

BILLING CODE 4169–69–C

Comment: Several commenters stated that they concurred with CMS that synchronizing submissions to the expected specialty assignments list for low volume services with the same annual date used for RUC recommendations and invoice submissions will help standardize the process, while also providing additional opportunities for feedback through annual rulemaking. Commenters stated that they would submit additional recommendations for CY 2028 rulemaking before the February 10, 2027 deadline.

Response: We appreciate the support for our proposed policy from the commenters.

Comment: Several commenters disagreed with the CMS proposed specialty assignment for the 21 codes where CMS diverged from the RUC's recommended specialty. For CPT codes 15135, 26118, 26650, 93152, and 93153,

commenters stated that, based on the description of work, the list of specialty societies that participated in the RUC survey process, and with respect to the whole population of patients who might receive this service, CMS should use the RUC's recommended specialty assignments even though they were not the top reported specialty in 2024 Medicare claims data.

Response: We disagree with the commenters and continue to believe that the proposed specialty assignments are the more accurate choice for these CPT codes. As we stated in the CY 2018 PFS final rule, we agree that the use of service-level overrides for low volume services would help mitigate annual fluctuations and provide greater stability in the valuation of these services (82 FR 52982). We finalized the creation of this list of assigned specialty for low volume services at this time with the intention of minimizing these annual fluctuations in valuation, not with the goal of matching each CPT code to its idealized specialty. We believe that it is more accurate to assign specialties based on the actual billing practices for each CPT code as reflected in the claims data, not what might have been intended by the CPT Editorial Panel at the time of the code's creation. All five of the CPT codes listed by commenters were reported twice as often by the assigned specialty that we proposed as compared with the RUC's recommended specialty; in the case of CPT code 93152, Pulmonary Disease was reported roughly five times more often than the recommended Cardiac Electrophysiology. We therefore continue to believe that the proposed specialty assignments are the most accurate choices for these codes.

Comment: Several commenters stated that for the approximately 15 CPT codes in Table A–B1 that did not have PE/HR data, CMS should use the available MP premium data and crosswalk the assigned specialty for these codes as recommended by the RUC for MP purposes. The commenters stated that the proposed CMS crosswalks could still be used for PE purposes due to the lack of PE/HR data. Commenters made this request for CPT codes 23077, 33277–33281, 33287, 33288, 93025, 93150, and 93584–93588.

Response: We disagree with the commenters that CMS should establish separate PE and MP crosswalks for the specialty assignment in these cases where there is no PE/HR data available. We specifically finalized this policy in the CY 2018 PFS final rule that we would apply these service-level overrides for both PE and MP, rather than one or the other category. We provided rationale at that time, stating that this would simplify the implementation of service-level overrides for PE and MP, and would continue to address stakeholder concerns about the year-to-year variability for low volume services (82 FR 52982–52983). Our rationale from the CY 2018 PFS final rule continues to apply, but we will continue to address stakeholder concerns as they arise.

Comment: A commenter asked CMS to confirm that low-volume echocardiographic services are assigned to cardiology or pediatric cardiology rather than to a specialty with a materially different cost structure. The commenter requested that CMS provide the underlying utilization crosswalk for these assignments so societies can verify them.

Response: As we noted in the proposed rule, the CPT codes associated with the Cardiac Electrophysiology specialty were all crosswalked to the Cardiology specialty due to a lack of PE/HR data. All of the proposed and finalized expected specialty assignments are included in the CY 2027 public use files associated with the PFS proposed and final rules as detailed previously.

Comment: A commenter requested that CMS add several codes to the expected specialty assignment for low volume services list as part of CY 2028 rulemaking and assign thoracic surgery as their expected specialty.

Response: We appreciate the feedback from the commenter, however we will consider these additional codes for inclusion to the expected specialty assignment list in next year's CY 2028 PFS proposed rule to allow for public comment.

After consideration of the comments, we are finalizing the new additions to the expected specialty assignment list as proposed in Table A–B1.

As noted in the proposed rule, the full list of expected specialty assignments is included in the CY 2027 public use files, which are available on the CMS website under downloads for the CY 2027 PFS final rule at *https://www.cms.gov/medicare/payment/fee-schedules/physician/federal-regulation-notices.*

Step 8: Calculate the service level allocators for the indirect PEs based on the percentages calculated in Step 7. The indirect PEs are allocated based on the three components: the direct PE RVUs; the clinical labor PE RVUs; and the work RVUs.

Under current policy, for most services the indirect allocator is: indirect PE percentage * (direct PE RVUs/direct percentage) + work RVUs.

There are two situations where this formula is modified:

- If the service is a global service (that is, a service with global, professional, and technical components), then the indirect PE allocator is: indirect percentage (direct PE RVUs/direct percentage) + clinical labor PE RVUs + work RVUs.
- If the clinical labor PE RVUs exceed the work RVUs (and the service is not a global service), then the indirect allocator is: indirect PE percentage (direct PE RVUs/direct percentage) + clinical labor PE RVUs.

(*Note:* Under current policy, for global services, the indirect PE allocator is based on both the work RVUs and the clinical labor PE RVUs. We do this to recognize that, for the PC service, indirect PEs would be allocated using the work RVUs, and for the TC service, indirect PEs would be allocated using the direct PE RVUs and the clinical labor PE RVUs. This also allows the global component RVUs to equal the sum of the PC and TC RVUs.)

For presentation purposes, in the examples in the download file titled ''Calculation of PE RVUs under Methodology for Selected Codes'', the formulas were divided into two parts for each service.

- The first part does not vary by service and is the indirect percentage (direct PE RVUs/direct percentage).
- Under current policy, the second part is either the work RVU, clinical labor PE RVU, or both depending on whether the service is a global service and whether the clinical PE RVUs exceed the work RVUs (as described earlier in this step).

We note that for CY 2026, we finalized a change to the methodology so that when work RVUs are used to allocate indirect PE to the facility RVUs, they are assigned at one-half the amount allocated to the non-facility PE RVUs for that same service. These PE methodology changes are discussed in greater detail in the CY 2026 PFS final rule (90 FR 49292 through 49296).

Proposed Step 8: Calculate the service level allocators for the indirect PEs based on the percentages calculated in Step 7. The indirect PEs are allocated based on the three components: the direct PE RVUs; the clinical labor PE RVUs; and the work RVUs.

The proposed indirect allocator is: indirect PE percentage *(direct PE RVUs/direct percentage) + work RVUs + clinical labor RVUs. The proposed change, as detailed in the proposed rule (91 FR 43842 through 44557), is to include both the work RVUs and clinical labor RVUs in the indirect allocator for all services, except for

codes with 10- and 90-day global periods, as opposed to including the work RVUs and clinical labor RVUs only for global services.

We stated that, if this proposed policy were to be finalized, this Proposed Step 8 would replace the Step 8 listed in the proposed rule (91 FR 43842 through 44557). We note that step was also listed earlier in this final rule. For presentation purposes, in the examples in the download file titled ''Calculation of PE RVUs under Methodology for Selected Codes,'' the formulas were divided into two parts for each service.

- The first part is the indirect percentage (direct PE RVUs/direct percentage).
- The second part is the sum of the work RVU and the clinical labor PE RVU, including the methodology change finalized in CY 2026 for services performed in the facility setting (when work RVUs are used to allocate indirect PE to the facility RVUs, they are assigned at one-half the amount allocated to the non-facility PE RVUs for that same service).

Apply a scaling adjustment to the indirect allocators.

Step 9: Calculate the current aggregate pool of indirect PE RVUs by multiplying the result of step 8 by the average indirect PE percentage from the survey data.

Step 10: Calculate an aggregate pool of indirect PE RVUs for all PFS services by adding the product of the indirect PE allocators for a service from Step 8 and the utilization data for that service.

Step 11: Using the results of Step 9 and Step 10, calculate an indirect PE adjustment so that the aggregate indirect allocation does not exceed the available aggregate indirect PE RVUs and apply it to indirect allocators calculated in Step 8.

Under current policy, calculate the indirect practice cost index (IPCI). We refer readers to the CY 2007 PFS final rule with comment period (71 FR 69633) for more information about the establishment of the IPCI.

Step 12: Using the results of Step 11, calculate aggregate pools of specialty specific adjusted indirect PE allocators for all PFS services for a specialty by adding the product of the adjusted indirect PE allocator for each service and the utilization data for that service.

Step 13: Using the specialty specific indirect PE/HR data, calculate specialty specific aggregate pools of indirect PE for all PFS services for that specialty by adding the product of the indirect PE/HR for the specialty, the work time for the service, and the specialty's utilization for the service across all services furnished by the specialty.

Step 14: Using the results of Step 12 as the denominator and Step 13 as the numerator, calculate the specialty specific indirect PE scaling factors.

Step 15: Using the results of Step 14, calculate an indirect practice cost index at the specialty level by dividing each specialty specific indirect scaling factor by the average indirect scaling factor for the entire PFS.

Step 16: Calculate the indirect practice cost index at the service level to ensure the capture of all indirect costs. Calculate a weighted average of the practice cost index values for the specialties that furnish the service. (Note: For services with TCs and PCs, we calculate the indirect practice cost index across the global service, PCs, and TCs. Under this method, the indirect practice cost index for a given service (for example, echocardiogram) does not vary by the PC, TC, and global service.)

Step 17: Apply the service level indirect practice cost index calculated in Step 16 to the service level adjusted indirect allocators calculated in Step 11 to get the indirect PE RVUs.

Proposal regarding Steps 12 through 17: We develop the indirect practice expense (PE) RVUs under the PFS to reflect the relative resources involved in furnishing the services. Since the implementation of the resource-based PE RVUs, we have assumed that aggregate specialty level practice costs derived primarily from the 2007 PE/HR survey data are a reasonable way to help establish the resource-based indirect PE RVUs. We have historically used that data both to allocate indirect costs to each code and to re-scale the resulting PE RVUs for each code at the end of the established methodology to ensure that the overall allocation of PE RVUs for each specialty across the PFS approximates those expected based on the index derived from the PE/HR survey data. Over time, however, we have identified various limitations of the survey data, especially as the data we use has become increasingly dated and are intrinsically limited to small, selective samples based on pre-determined assumptions about where costs are likely to differ, and, as we addressed in CY 2026 PFS rulemaking, have not been adequately updated. (We refer readers to an extended discussion of our concerns with and decision not to update this data in the CY 2026 PFS final rule at 90 FR 49286 through 49292.) This has resulted in a PE methodology that privileges the historic survey data over incorporation of more recent data about specific services and produces unpredictable and counterintuitive results that are not transparent to the public.

Because we have taken various steps to improve the data used in the pricing inputs and the indirect allocation methodologies, we are proposing to remove the steps of the current methodology that rely on the indirect practice cost index (IPCI) from the calculation of the PE RVUs. We proposed this change because the steps of the current methodology that rely on the IPCI calculation effectively favor the aggregate specialty-level survey data over the code level inputs and allocators and consequently limit the influence of improvements to inputs and allocation methodologies. We proposed to implement this change over a 2-year transition period. Specifically, in the first year, only half of the measured variation in the IPCI will be applied to the indirect allocator. In the second year, CY 2028, the IPCI will no longer be applied.

The steps of the current methodology that rely on the IPCI calculation are steps 12 through 17. Thus, under this proposal, steps 12 through 17 would no longer be a part of the calculation, starting for CY 2028, and the total PE RVU, prior to the calculation of final PE RVUs described at Step 18, would be the sum of step 5 (Direct Cost PE RVUs) and step 11 (Indirect Cost PE RVUs).

We received public comments on this proposal. The following is a summary of the comments we received and our responses.

Comment: Many commenters supported removing the IPCI from the PE methodology and agreed with CMS that the underlying data are nearly two decades old and no longer representative of current practice costs. Several commenters agreed that eliminating the IPCI reduces unintended and opaque effects on PE RVUs, and supported the 2-year transition as an appropriate way to mitigate disruption while implementing a more accurate methodology. Multiple commenters strongly supported removal, explaining that the IPCI has historically amplified payment advantages for specialties with higher aggregate indirect costs, such as those tied to expensive equipment, while disadvantaging specialties whose costs are driven primarily by clinical labor activities. A commenter cited its own analysis of the CY 2026 facility-based payment change, finding that specialties with very low facility utilization saw an average 12.4 percent decrease in their IPCI values while specialties with very high facility utilization saw an average 32.2 percent increase. The commenter stated that some specialties experienced PE RVU decreases as a result of how facility-based services were paid that were

opposite of CMS's stated policy intentions and highlighted that the counterintuitive and seemingly unintended decrease in PE RVUs for some specialties as a result of the CY 2026 rule demonstrates that the IPCI can create winners and losers based on unrelated policy changes, rather than actual practice expenses. Other commenters expressed disappointment that CMS did not instead update the underlying PPI Survey data using more recent survey efforts, but supported removing the IPCI in the absence of adoption of the updated survey data because the current methodology privileges antiquated, aggregate specialty-level survey data over code-level inputs and limits the influence of improvements to those inputs.

The Medicare Payment Advisory Commission (MedPAC) also supported eliminating the IPCI, citing its June 2025 report to Congress recommending that CMS improve the accuracy of Medicare's relative payment rates by using timely data that reflect the costs of delivering care, and noting that the IPCI is calculated using PE/HR survey data collected nearly two decades ago. MedPAC further encouraged CMS to seek additional ways to reduce reliance on that survey data, observing that even after IPCI removal, direct PE RVUs would still be multiplied by a ratio of indirect-to-direct PE costs drawn from the specialties billing a service, meaning indirect PE RVUs would remain adjusted based on decades-old, specialty-reported data. MedPAC stated that forgoing specialty-specific practice expense data has the potential to improve payment accuracy and make routine updates more practicable, and cited the AMA's updated PPI and CPI Survey efforts as examples of the difficulty of collecting representative specialty-level data: low response rates led to data based on a small number of practices for some specialties, acceptance of practices that volunteered or were recruited to report data, and inconsistent consolidation of specialty categories. MedPAC stated that these concerns led them to support CMS's decision not to incorporate that updated survey data into the ratesetting process.

Response: We appreciate the commenters' support and feedback on the proposal. We agree with the commenters that the CY 2026 facility indirect PE example illustrates precisely the type of unexpected effect that motivated CMS's proposal to remove the IPCI and believe that this is one of many examples that support removing the IPCI rather than preserving it. We also acknowledge that, while an updated survey may be preferable in principle, the data quality concerns with the available updated survey data support proceeding with removal of the IPCI now . We thank MedPAC for its support and its analysis of the continued role of PE/HR survey data in the indirect PE allocation. We agree with MedPAC that removing the IPCI does not fully eliminate CMS's reliance on this outdated survey data, as discussed further in the section. We may consider, in future rulemaking, additional approaches to reduce reliance on specialty-specific PE/HR data, consistent with the direction of the policies we are finalizing this year.

Comment: Some commenters stated the belief that the IPCI was used to allocate indirect PE and expressed concern that the specialty-specific differences in indirect costs continue to exist, but noted that CMS proposed to eliminate the IPCI without offering a reasonable, empirically supported alternative. Some commenters stated that CMS should not assume indirect costs are similar or equal across specialties without supporting data, citing certain specialties that have indirect costs exceeding what would be expected under a code-level-only approach, and recommended that CMS instead conduct its own updated survey of indirect costs rather than eliminate the IPCI.

Response: Some commenters seem to be confused that we proposed to remove all specialty-specific PE/HR data and we want to clarify that is not the case. As described previously, we still use the specialty-specific data to allocate indirect PE, but removing the IPCI means we would no longer re-scale the resulting PE RVUs to an index derived from the outdated survey data. The IPCI functions to force changes that would otherwise occur in indirect PE (that is payments for office overhead such as administrative staff and rent that cannot be directly attributed to individual services) back to the status quo, which is currently based on the physician overhead contained in the 2007 AMA Physician Practice Information (PPI) Survey. However, the continued use of the IPCI has resulted in a PE methodology that privileges the historic survey data over incorporation of more recent data about specific services, limits the influence of improvements to inputs and allocation methodologies, and produces unpredictable and counterintuitive results that are not transparent to the public. We proposed to remove the IPCI from our methodology for CY 2027 over a 2-year transition period, though for now we would retain the use of the survey data in other places in the methodology, as discussed previously. We continue to believe this proposed change will improve the transparency and stability of PE RVUs over time and better position us to make necessary refinements to the PE methodology to improve the accuracy of valuation of the PE portion of services paid under the PFS.

In the proposed rule, we acknowledged that the IPCI, because it is rooted in static PE/HR data, effectively resulted in stabilizing year-to-year changes in PE RVUs, especially due to changes in input valuations and changes to allocation methodologies, which is why we proposed the PE stabilization adjustment to further improve predictability and reduce volatility within the PE RVUs. We note that our proposal to eliminate the IPCI was not solely based on the age of the survey data, but also based on the fact that the IPCI can result in counter-intuitive payment outcomes and is a barrier to broader payment changes.

We do not agree that CMS should instead conduct a new survey of specialty-level indirect costs before removing the IPCI. As discussed previously in connection with MedPAC's comment, recent efforts to collect updated, representative specialty-level practice expense data encountered low response rates, relied on practices that volunteered or were recruited rather than being randomly sampled, and inconsistently consolidated specialty categories. We do not believe commissioning another specialty-level survey would resolve these structural difficulties, and we do not believe it is appropriate to delay improvements to the current methodology. We also do not agree that removing the IPCI assumes indirect costs are identical across specialties. Rather, our proposal reflects the conclusion that the IPCI is not a reliable means of capturing any genuine specialty specific variation in indirect costs that may exist, because it re-scales a code's indirect PE based on the mix of specialties that happen to bill it in claims data, not based on a direct measurement or acceptable proxy for the indirect costs those specialties incur in furnishing that specific service. We continue to believe that removing the IPCI results in PE RVUs that more accurately reflect the indirect resources a service requires.

Comment: Many commenters opposed removal of the IPCI or asked CMS to delay finalizing the proposal. Several commenters asked CMS to explain why a 2-year transition is sufficient given the scale of redistribution among specialties, and asked CMS to compare

payment trajectories under 2-year and 4-year transitions, noting that CMS has historically used four-year transitions for significant PE methodology changes, including the CY 2007 transition to the bottom-up PE methodology and the CY 2010 incorporation of Physician Practice Information Survey data. A commenter, while not opposing removal of the IPCI outright, stated that CMS should publish detailed impact analyses and supporting data before finalizing the proposal, and that if CMS proceeds, a stabilization mechanism is essential to prevent disruptions in PE that could jeopardize practice stability and patient access to care. Other commenters stated that CMS has not published code- and specialty-level impact analyses of the IPCI removal in isolation from the other proposed PE changes, making it difficult for stakeholders to evaluate the proposal's actual effects, and requested that CMS delay finalization until it demonstrates, through empirical validation and transparent impact analyses, that removing the IPCI produces more accurate resource-based relativity rather than assuming that eliminating an older data source necessarily improves accuracy.

Response: We recognize that the aggregate specialty impact tables published with the proposed rule do not isolate the effect of IPCI removal from our other PE proposals because all three policies affect PE RVUs concurrently. We agree with commenters that these proposals are interconnected and interact with one another, and therefore, we could not publish disaggregated specialty impact tables of each proposal individually without misconstruing their combined impact when they are implemented together. We note that, in the past, we have published impact tables for different alternatives considered, but we do not typically publish disaggregated policy impacts because of how these policies may interact.

We note that we published code-level impacts in the CY 2027 PFS Proposed Rule Fully Implemented PE RVUs public use file. While we have used 4-year transitions in the past to temper impacts over time, the proposed 5% PE stabilization adjustment proposed for CY 2027 already functions to phase in the changes to the PE RVUs and temper impacts over time. For example, for codes that experience large increases or decreases as a result of our PE methodology proposals, and are not the result of a revaluation, the PE stabilization adjustment effectively serves to phase in those changes over many years, often exceeding the 4-year transition we have used in the past. We acknowledge that this may not be the desired implementation for specialties that benefit from the proposed PE methodology changes, but we believe this results in a reasonable balance between safeguarding against significant, unintended payment volatility while still allowing meaningful progress toward more accurate PE valuations within a reasonable timeframe. We note that this 2-year transition, which phases in the removal of steps 12 through 17, is a distinct mechanism from the PE stabilization adjustment discussed later in the section, which separately caps the year-to-year change in any code's PE RVU. The two mechanisms work together: the 2-year transition sets the pace at which the IPCI's influence is phased out of the methodology, while the PE stabilization adjustment independently moderates how quickly any resulting change reaches a given code's final PE RVU.

Comment: A commenter requested that CMS detail how we would treat Non-Physician Practitioners (NPPs) under this new methodology. They stated that NPPs' specialty is obscured in the claims data because they are not able to be associated with their specialty when they enroll.

Response: As stated later in the section, to calculate the PE and MP RVUs, we exclude certain specialties, such as NPPs paid at a percentage of the PFS and low volume specialties, from the calculation. However, these specialties are still included to calculate the BN adjustment.

After consideration of public comments, we are finalizing the proposal to remove steps 12 through 17 that rely on the IPCI from the calculation of the PE RVUs over a 2-year transition period, as proposed.

(d) Calculate the Final PE RVUs

Step 18: Under current policy, add the direct PE RVUs from Step 5 to the indirect PE RVUs from Step 17 and apply the final PE budget neutrality (BN) adjustment. The final PE BN adjustment is calculated by comparing the sum of steps 5 and 17 to the aggregate work RVUs scaled by the ratio of current aggregate PE and work RVUs. This adjustment ensures that all PE RVUs in the PFS account for the fact that certain specialties are excluded from the calculation of PE RVUs but included in maintaining overall PFS BN. (See ''Specialties excluded from ratesetting calculation'' later in this final rule). Under the proposed policy, add the direct cost PE RVUs from Step 5 to the indirect cost PE RVUs from Step 11 and apply the final PE BN adjustment.

Proposed Step 19: Calculate and apply the PE stabilization adjustment for each PE RVU by comparing the result of step 18 with the results of the prior year's PE RVUs from step 18. As described in the proposed rule, we proposed to remove the IPCI from the PE methodology, which we believe will improve the transparency and stability of PE RVUs over time. However, we recognize that the IPCI, because it is rooted in static PE/HR data, effectively resulted in stabilizing year-to-year changes in PE RVUs, especially due to changes in input valuations and changes to allocation methodologies. We have long noted that extreme volatility in PE RVUs can have unintended consequences and distortions. To mitigate volatility that could otherwise occur, we proposed a PE stabilization adjustment to further improve predictability and reduce volatility within the PE RVUs. Specifically, we proposed that the PE RVU calculated after the application of the cognitive services floor and any adjustments that occur outside of the PE methodology will be subject to a cap and will not increase or decrease by more than 5 percent each year. In the proposed Step 19 we would compare the PE RVU after the application of the cognitive services floor and any code-level adjustments in the current ratesetting year to the allocation methodology from the prior year and then apply the 5 percent cap. We note that the proposed PE stabilization adjustment in Proposed Step 19 will be applied prior to the statutory phase-in of significant RVU reductions required by Section 1848(c)(7) of the Act, discussed in more detail later in this section, which limits all codes that are not new or revised to a 19 percent decrease in total RVU in an individual calendar year. Therefore, a code may be impacted by both the PE stabilization adjustment and the statutory phase-in, meaning a code's PE RVU may ultimately differ by greater than the PE stabilization adjustment detailed in proposed Step 19.

This proposed adjustment would not apply to new and revised codes or codes formerly contractor priced that are newly nationally priced, because it is not clear what the comparison PE RVU would be for those codes. Because we believe the benefits of the PE stabilization adjustment would ideally apply to new and revised codes and newly nationally priced codes, we sought comment on an approach that would allow us to expand the PE stabilization adjustment to these categories of codes.

Additionally, the proposed PE stabilization adjustment would not

apply to revalued codes because we believe the statutory phase-in sufficiently limits large reductions to individual codes undergoing review and/or revaluation, and limits the amount of time a revalued code would remain under or overvalued by being significantly constrained from reductions found to be appropriate through revaluation.

We received public comments on this proposal. The following is a summary of the comments we received and our responses.

Comment: Many commenters stated that CMS should identify the codes subject to the PE stabilization adjustment and the codes' final PE RVUs, similar to our published public use file of codes subject to the statutory phase-in of significant RVU reductions.

Response: We appreciate commenters' feedback and note that we are publishing this list as a public use file with this final rule, which can be found under the Downloads section for this rule at *https://www.cms.gov/medicare/payment/fee-schedules/physician/federal-regulation-notices*.

Comment: A commenter stated that they support the idea of adding a PE stabilization adjustment to the PE RVU methodology to mitigate volatility in PE RVUs and avoid unintended consequences. The commenter requested further explanation of how the proposed adjustment would operate and its relationship to the existing phase-in of significant RVU reductions. Multiple commenters requested that we exempt increases to direct PE inputs from the PE stabilization adjustment when supported by higher supply or equipment prices validated through the invoice submission process to ensure that direct PE resource costs are fully reflected in PE RVUs. Another commenter supported the proposal to establish a PE stabilization adjustment to safeguard against unintended payment swings while allowing CMS to continue modernizing the PE methodology, but stated that a 2 to 3 percent adjustment would be more appropriate, particularly for CY 2027 because CMS proposed multiple changes to the PE methodology. The commenter also supported CMS' consideration of extending the PE stabilization adjustment to new and revised codes and codes that are newly nationally priced and encouraged CMS to develop an appropriate methodology for providing comparable protection to newly established services without compromising the accuracy of their initial valuations. Another commenter requested that CMS extend the proposed PE stabilization adjustment to revalued codes, or at a minimum, to codes revalued on a single direct PE input cost change rather than a full RUC survey, and stated that the statutory phase-in of significant RVU reductions is not a sufficient cushion. Another commenter stated that we should modify the PE stabilization adjustment to either have a fixed duration or larger percentage because, as proposed, limiting annual changes to 5 percent would mean that, for the commenter's most commonly billed codes, it would take nearly a decade of phase-in before the RVUs fully reflected their current, updated valuation. The commenter recommends a 4-year, 5 percent PE stabilization adjustment that allows providers to prepare for the updated code values.

Response: We agree with the commenters that changes due to revaluation, such as changes to a code's direct PE prices, should be exempt from the PE stabilization adjustment. As noted previously, the PE stabilization adjustment will not apply to revalued codes, such as the commenter's example of PE input changes, because we believe the statutory phase-in sufficiently limits large reductions in total RVUs to individual codes undergoing review and/or revaluation. This exemption also limits the amount of time a revalued code would remain under- or overvalued by being significantly constrained from increases or reductions found to be appropriate through revaluation. Although revalued codes are excluded from the PE stabilization adjustment, significant decreases in total RVUs are statutorily phased-in for codes that are not new or revised. As the commenter mentioned, for CY 2027, we proposed changes to the supply code SA119's price, which decreased the PE RVU for CPT code 97610 (*Low frequency, non-contact, non-thermal ultrasound, including topical application(s), when performed, wound assessment, and instruction(s) for ongoing care, per day*). Because this reduction was the result of revaluation of the code's supply input, CPT code 97610 is exempt from the PE stabilization adjustment, but the statutory phase-in of significant total RVU decreases does apply because it is an existing code, not new or revised, whose total RVU decrease is greater than 19 percent. We do not agree with the commenter that we should apply the PE stabilization adjustment in these instances because it would extend the amount of time that a code would remain constrained from increases or reductions found to be appropriate through revaluation. Conversely, the PE RVU for CPT code 99285 (*Emergency department visit for the evaluation and management of a patient, which requires a medically appropriate history and/or examination and high level of medical decision making*) will increase as the result of our proposed PE methodology changes (that is, removal of IPCI). It is not subject to the 19 percent statutory phase-in of significant RVU decreases because it is an increase, but it is subject to the 5 percent PE stabilization adjustment and the increase will be effectively phased-in by that policy. We encourage interested parties to review the additional public use file provided with this final rule that details the codes subject to the PE stabilization adjustment.

We appreciate the commenters' request for further explanation of how the PE stabilization adjustment interacts with the existing statutory phase-in of significant RVU reductions. As illustrated by the examples noted previously, the two policies operate independently and apply to different sources of RVU change: the statutory phase-in applies to a code's total RVU decrease, and is implemented on the PE RVU, while the PE stabilization adjustment applies specifically to changes in PE RVUs, typically resulting from methodological changes rather than code-by-code changes (that is, the sum-based indirect PE allocation and removal of the IPCI proposed for CY 2027), and does not apply when the change results from revaluation. A code may therefore be subject to one, both, or neither policy depending on the source and magnitude of its RVU changes for a given year, although we note that it is unlikely for a code to be subject to both since revalued codes are exempt from the PE stabilization adjustment, which is the most likely source of significant decreases in total RVUs greater than 19 percent. The PE stabilization adjustment is primarily intended to mitigate volatility and improve predictability of the PE RVUs that result from changes to the PE methodology.

We appreciate the commenters' feedback about considering alternative higher and lower percentages and a fixed duration of the PE stabilization adjustment. However, as discussed previously, we believe 5 percent is a reasonable balance between safeguarding against significant, unintended payment volatility while still allowing meaningful progress toward more accurate PE valuations within a reasonable timeframe, and we are finalizing the PE stabilization adjustment at 5 percent as proposed. We are not extending the PE stabilization adjustment to new, revised, or newly nationally priced codes at this time

because it is not clear what the comparison PE RVU would be for those codes. However, we remain interested in a methodology that would extend the PE stabilization adjustment to these services and invite stakeholders to share methodological approaches for us to consider in future rulemaking.

After consideration of public comments, we are finalizing the proposals to remove steps 12 through 17 that rely on the IPCI from the calculation of the PE RVUs over a 2-year transition period, and to add a new step to the PE methodology to apply a 5 percent PE stabilization adjustment to the PE RVUs, as proposed.

Step 20: Apply the phase-in of significant RVU reductions and its associated adjustment. Section 1848(c)(7) of the Act specifies that for services that are not new or revised codes, if the total RVUs for a service for a year would otherwise be decreased by an estimated 20 percent or more as compared to the total RVUs for the previous year, the applicable adjustments in work, PE, and MP RVUs must be phased in over a 2-year period. In implementing the phase-in, we consider a 19 percent reduction as the maximum 1-year reduction for any service not described by a new or revised code. This approach limits the year 1 reduction for the service to the maximum allowed amount (that is, 19 percent) and then phases in the remainder of the reduction. To comply with section 1848(c)(7) of the Act, we adjust the PE RVUs to ensure that the total RVUs for all services that are not new or revised codes decrease by no more than 19 percent, and then apply a relativity adjustment to ensure that the total pool of aggregate PE RVUs remains relative to the pool of work and MP RVUs. For a more detailed description of the methodology for the phase-in of significant RVU changes, we refer readers to the CY 2016 PFS final rule with comment period (80 FR 70927 through 70931).

In summary, for CY 2027, we proposed, and have now finalized our proposals to:

- Modify step 8 to calculate indirect PE based on both work RVUs and clinical labor RVUs for all services except 10- and 90-day global period codes;
- Remove steps 12 through 17 that rely on the IPCI from the calculation of the PE RVUs over a 2-year transition period, and;
- Add a new step to apply a PE stabilization adjustment to the PE RVUs (new step 19).

(e) Setup File Information

- Specialties excluded from ratesetting calculation: To calculate the PE and MP RVUs, we exclude certain specialties, such as NPPs paid at a percentage of the PFS and low volume specialties, from the calculation. These specialties are included to calculate the BN adjustment. They are displayed in Table A–B2.

BILLING CODE 4169–69–P

TABLE A-B2: SPECIALTIES EXCLUDED FROM RATESETTING CALCULATION

Specialty Code	Specialty Description
49	Ambulatory surgical center
50	Nurse practitioner
51	Medical supply company with certified orthotist
52	Medical supply company with certified prosthetist
53	Medical supply company with certified prosthetist-orthotist
54	Medical supply company not included in 51, 52, or 53.
55	Individual certified orthotist
56	Individual certified prosthetist
57	Individual certified prosthetist-orthotist
58	Medical supply company with registered pharmacist
59	Ambulance service supplier, for example, private ambulance companies, funeral homes, etc.
60	Public health or welfare agencies
61	Voluntary health or charitable agencies
73	Mass immunization roster biller
74	Radiation therapy centers
87	All other suppliers (for example, drug and department stores)
88	Unknown supplier/provider specialty
89	Certified clinical nurse specialist
96	Optician
97	Physician assistant
A0	Hospital
A1	Skilled nursing facility
A2	Intermediate care nursing facility
A3	Nursing facility, other
A4	HHA
A5	Pharmacy
A6	Medical supply company with respiratory therapist
A7	Department store
A8	Grocery store
B1	Supplier of oxygen and/or oxygen related equipment (eff. 10/2/2007)
B2	Pedorthic personnel
B3	Medical supply company with pedorthic personnel
B4	Rehabilitation Agency
B5	Ocularist
C1	Centralized Flu
C2	Indirect Payment Procedure
C5	Dentistry

BILLING CODE 4169–69–C

- *Crosswalk certain low volume physician specialties:* Crosswalk the utilization of certain specialties with relatively low PFS utilization to the associated specialties.
- *Physical therapy utilization:* Crosswalk the utilization associated with all physical therapy services to the specialty of physical therapy.
- *Identify professional and technical services not identified under the usual technical component (TC) and professional component (PC or 26) modifiers:* Flag the services that are PC and TC services but do not use TC and PC/26 modifiers (for example, electrocardiograms). This flag associates the PC and TC with the associated global code for use in creating the indirect PE RVUs. For example, the professional service, CPT code 93010 (Electrocardiogram, routine ECG with at least 12 leads; interpretation and report only), is associated with the global service, CPT code 93000 (Electrocardiogram, routine ECG with at least 12 leads; with interpretation and report).
- *Payment modifiers:* In the CY 2013 PFS final rule with comment period (77 FR 68901), we introduced a more detailed methodology for adjusting volume and time to account for payment modifiers and other special payment rules, such as multiple procedure payment reductions, in the utilization data. We proposed that, beginning in CY 2027, we would utilize a new approach to account for payment modifiers and other special payment rules. For each paid claim line, we would calculate the ratio of allowed charges to the national PFS payment amount. This would account for differences resulting from payment modifiers and other special payment rules, as well as differences in geography. We proposed to use the same ratio to adjust time, rather than a separate calculation under our current methodology, with the exception of anesthesia, for which we calculate time using only procedures with modifiers indicating they are personally

performed. These proposed changes will allow us to more accurately capture any combination of modifiers and special payment rules and automatically account for updates in modifiers and/or special payment rules in future years. These proposed changes have a very minimal impact on the resulting PE RVUs but will produce a more accurate result. As under our current methodology, the adjusted volume will be displayed in the utilization public use file that is posted in conjunction with each PFS rule.

Comment: Several commenters identified large declines in the total allowed charges displayed for certain specialties, such as Pathology Independent Laboratories, and Physical and Occupational Therapy, in Table D–B5 ''Estimated Impact on Total Allowed Charges by Specialty'' of the CY 2027 PFS proposed rule (91 FR 44244–44248). Commenters stated that nothing in the PFS proposed rule appeared to explain declines of this scale and the figures seemed inconsistent with the considerably smaller percentage payment effects reported elsewhere in the table. Commenters asked whether these estimates arose from a reporting error or resulted from a change in data or methodology in the proposed rule.

Response: We appreciate commenters raising this issue. We identified and corrected a minor technical error that impacted the adjusted utilization of codes that are frequently furnished in multiple MTUS (miles, time, units), such as codes reported in time or square centimeter increments. This technical error in the adjusted utilization resulted in erroneous decreased allowed charges in Table D–B5 of the proposed rule for specialties that bill these types of codes like the specialties that commenters raised concerns about. We appreciate the feedback from interested parties in identifying this error, which has been corrected in the adjusted utilization for the final rule.

Comment: Some commenters noted that CMS has published detailed modifier-specific utilization data in the public use files with each proposed and final PFS rule for decades. Commenters expressed concern that CMS excluded all modifiers except for -26, -TC, and -53 in the utilization data public use file for this proposed rule, which commenters say is particularly challenging when CMS proposed changes to modifier 25 and for HCPCS code G2211 to instead be reported with modifiers. Commenters recommend that CMS change the ''CY 2027 2025 Utilization Data Crosswalked to 2027'' to include all modifiers to maintain a sufficient level of transparency for interested parties. Several commenters requested that CMS consider providing additional supporting materials such as utilization crosswalk files between the current and previous years. The commenters also requested the restoration of utilization file fields (such as undiscounted allowed services, PE, MP, and work discounted allowed services, and complete modifier columns).

Response: We no longer display the work, PE, and MP adjusted allowed services columns in the Utilization Data file because of our proposed changes to the adjusted utilization process, described previously. The proposed approach to calculate the ratio of allowed charges to the national PFS payment amount to adjust utilization means that all current payment modifiers, special payment rules, and geographic adjustments are accounted for in column G of the utilization data public use file. Additionally, the new columns H and I are discussed in the proposed rule at 91 FR 44248. Because the modifier -25 (column H) and modifier B1 (referred to as MOD1 in the proposed rule) and modifier B2 (referred to as MOD2 in the proposed rule) (column I) proposals impact adjusted utilization, they are also accounted for in the utilization data public use file, but we believed it would be best to publish these new columns separately to help commenters understand the impact of the proposals. As a result, Column J is the cumulative adjusted utilization of columns G, H, and I that was used in CY 2027 PFS ratesetting, effectively accounting for our proposed new approach to adjust utilization for current payment modifiers, geographic adjustments, and special payment rules, plus our proposed changes to modifier 25, modifier B1 (referred to as MOD1 in the proposed rule) and modifier B2 (referred to as MOD2 in the proposed rule). As the commenter mentioned, modifiers -26, -TC, and -53 (for select services) remain in the utilization data file because codes with these modifiers are listed with separate base RVUs in the payment files (that is, Addendum B) before any modifiers are applied, which distinguishes them from all other payment modifiers and geographic adjustments which typically impact payment for a claim at the time of processing.

We appreciate the commenters' feedback about the additional supporting materials that would be helpful for interested parties and may consider for future rulemaking. In an effort to improve transparency, we are including both allowed services and MTUS in the file for the final rule. We note that, for the proposed rule, the unadjusted and adjusted allowed services columns were inadvertently mislabeled and actually represented unadjusted and adjusted MTUS. For the purposes of ratesetting, for non-anesthesia services, MTUS represent the unit for which PFS rates are established and are the correct measure of service utilization. For the final rule, we have added allowed services to the file for reference since it reflects the number of times the service was provided, regardless of the number of units reported for each service, although it is not used in ratesetting. Anesthesia services do not have RVUs or payment amounts listed in our payment files but are included in the total RVU pool used to establish budget neutrality. To accomplish this, we use allowed services and calculate RVUs based on average allowed charges by service to capture anesthesia spending within the ratesetting process. Therefore, the file does not report MTUS for anesthesia services, only allowed services, which are reflected in the value in Column J of adjusted utilization file, which is used in ratesetting.

Comment: A commenter did not support the proposed new approach to account for payment modifiers and other special payment rules and requested that CMS eliminate all geographic adjustments from the PFS except for those designed to achieve a specific public policy goal (for example, to encourage physicians to practice in underserved areas). To the extent the proposed new approach to accounting for payment modifiers and other special payment rules also accounts for and potentially adjusts RVUs based on geography, the commenter opposed the proposal and would, instead, recommend that CMS continue to use its current approach or otherwise find an approach that does not further geographically adjust Medicare payments.

Response: Section 1848(e)(1)(A) of the Act requires us to develop Geographic Practice Cost Indices (GPCIs) to measure relative cost differences among localities compared to the national average for each of the three fee schedule components (that is, work, practice expense (PE), and malpractice (MP)), therefore, we do not have the statutory authority to eliminate all geographic adjustments from the PFS. Additionally, utilization at the geographic level has always been used in PFS ratesetting, but the new proposed approach allows us to more accurately capture any combination of modifiers, geographic adjustments, and special payment rules in the claims data that underpins PFS ratesetting.

Comment: A commenter stated that, when CMS transitioned to the PE methodology in CY 2007, utilization was assigned exclusively to physical therapy, not to the previously combined ''physical and occupational therapy practice expense pool.'' All prior crosswalks had been to PT and OT, and no policy rationale was given for dropping OT from the crosswalk in 2007. The commenter stated that this methodology resulted in all therapy treatment codes where OT or speech language pathology (SLP) account for the majority of billing volume, receiving PT's IPCI, which is the lowest of the three therapy disciplines. The commenter stated that even under the CY 2027 proposal to remove the IPCI over 2 years, the crosswalk continues to matter during the transition year as half the IPCI will still be applied, and the utilization crosswalk ensures that it will be applied at PT's lower index rather than the actual specialty blend, and requested for CMS to remove the following step when establishing the final CY 2027 setup file: ''Physical therapy utilization: Crosswalk the utilization associated with all physical therapy services to the specialty of physical therapy''.

Response: We did not propose to change how utilization is assigned to the therapy specialties for IPCI purposes, a policy which was finalized in CY 2007 rulemaking (71 FR 69635), and we are not finalizing a change since CY 2027 will be the only transition year before the elimination of the IPCI for CY 2028. We believe that this issue identified by the commenter provides an example of the public confusion and counterintuitive results associated with the IPCI which is why we proposed to transition away from its use.

After consideration of the comments, we are finalizing the new approach to account for payment modifiers and other special payment rules, as proposed, with the minor technical error identified corrected for the final rule.

- *Work RVUs:* The setup file contains the work RVUs from this final rule.

(6) Equipment Cost Per Minute

The equipment cost per minute is calculated as:

(1/(minutes per year * usage)) * price * ((interest rate/(1 − (1/((1 + interest rate) − life of equipment)))) + maintenance)

Where:

minutes per year = maximum minutes per year if usage were continuous (that is, usage = 1); generally, 150,000 minutes.
usage = variable, see discussion later in this final rule.
price = price of the particular piece of equipment.
life of equipment = useful life of the particular piece of equipment.
maintenance = factor for maintenance; 0.05.
interest rate = variable, see discussion later in this proposed rule.

Usage: We currently use an equipment utilization rate assumption of 50 percent for most equipment, with the exception of expensive diagnostic imaging equipment, for which we use a 90 percent assumption as required by section 1848(b)(4)(C) of the Act.

Useful Life: In the CY 2005 PFS final rule we stated that we updated the useful life for equipment items primarily based on the AHA's ''Estimated Useful Lives of Depreciable Hospital Assets'' guidelines (69 FR 66246). The most recent edition of these guidelines was published in 2018. This reference material provides an estimated useful life for hundreds of different types of equipment, the vast majority of which fall in the range of 5 to 10 years, and none of which are lower than 2 years in duration. We believe that the updated editions of this reference material remain the most accurate source for estimating the useful life of depreciable medical equipment.

In the CY 2021 PFS final rule, (85 FR 84482 through 84483) we finalized a proposal to treat equipment life durations of less than 1 year as having a duration of 1 year for the purpose of our equipment price per minute formula. In the rare cases where items are replaced every few months, we noted that we believe it is more accurate to treat these items as disposable supplies with a fractional supply quantity as opposed to equipment items with very short equipment life durations. For a more detailed discussion of the methodology associated with very short equipment life durations, we refer readers to the CY 2021 PFS final rule (85 FR 84482 through 84483).

- *Maintenance:* We finalized the 5 percent factor for annual maintenance in the CY 1998 PFS final rule with comment period (62 FR 33164). As we previously stated in the CY 2016 PFS final rule with comment period (80 FR 70897), we do not believe the annual maintenance factor for all equipment is precisely 5 percent, and we concur that the current rate likely understates the true cost of maintaining some equipment. We also noted that we believe it likely overstates the maintenance costs for other equipment. When we solicited comments regarding data sources containing equipment maintenance rates, commenters could not identify an auditable, robust data source that CMS could use on a wide scale. We noted that we did not believe voluntary submissions regarding the maintenance costs of individual equipment items would be an appropriate methodology for determining costs. As a result, in the absence of publicly available datasets regarding equipment maintenance costs or another systematic data collection methodology for determining a different maintenance factor, in the proposed rule, we did not propose a variable maintenance factor for equipment cost per minute pricing as we did not believe that we have sufficient information at present. We noted in the CY 2026 PFS proposed rule (90 FR 32593) that we would continue to investigate potential avenues for determining equipment maintenance costs across a broad range of equipment items.

- *Interest Rate:* In the CY 2013 PFS final rule with comment period (77 FR 68902), we updated the interest rates used in developing an equipment cost per minute calculation (see 77 FR 68902 for a thorough discussion of this issue). The interest rate was based on the Small Business Administration (SBA) maximum interest rates for different categories of loan size (equipment cost) and maturity (useful life). The interest rates are listed in Table A–B3.

TABLE A-B3: SBA MAXIMUM INTEREST RATES

Price	Useful Life	Interest Rate
<$25K	<7 Years	7.50%
$25K to $50K	<7 Years	6.50%
>$50K	<7 Years	5.50%
<$25K	7+ Years	8.00%
$25K to $50K	7+ Years	7.00%
>$50K	7+ Years	6.00%

We did not propose and we are not finalizing any changes to the equipment interest rates for CY 2027.

3. Adjusting RVUs To Match the PE Share of the Medicare Economic Index (MEI)

We have long stated that we believe that the MEI is the best measure available to determine the relative weights of the three components in payments under the PFS—work, practice expense (PE), and malpractice (MP). Accordingly, we believe that to ensure that the PFS payments reflect the relative resources in each of these PFS components as required by section 1848(c)(3) of the Act, the RVUs used in developing rates should reflect the same weights in each component as the cost share weights in the Medicare Economic Index (MEI). Accordingly, we have finalized to accomplish this (78 FR 74241 through 74242) by holding the work RVUs constant and adjusting the PE RVUs, MP RVUs, and conversion factor (CF) to produce the appropriate balance in RVUs among the three PFS components and payment rates for individual services, that is, that the total RVUs on the PFS are proportioned to approximately 51 percent work RVUs, 45 percent PE RVUs, and 4 percent MP RVUs. Historically, as the MEI cost shares are updated, we have proposed to modify steps 3 and 10 to adjust the aggregate pools of PE costs (direct PE in step 3 and indirect PE in step 10) in proportion to the change in the PE share in the MEI cost share weights, and to recalibrate the relativity adjustment that we apply in step 18 as described in the CY 2023 PFS final rule (87 FR 69414 and 69415) and CY 2014 PFS final rule (78 FR 74236 and 74237). The most recent recalibration was done for the CY 2014 RVUs.

However, due to overarching concerns with the data as described in the CY 2026 PFS final rule (90 FR 49287 through 49293) and our previously described policy goal to balance PFS payment stability and predictability with incorporating new data through routine updates to the MEI, we finalized our proposal to maintain the current PE/HR and 2006-based MEI cost shares (rather than transitioning to the 2017-based MEI cost shares). Additionally, for CY 2027, we proposed to continue to use the current PE/HR and 2006-based MEI cost shares for CY 2027 PFS ratesetting. We received public comments on this proposal. The following is a summary of the comments we received and our responses.

Comment: Few commenters requested that we implement the 2024 PPI and CPI Survey PE/HR data and cost shares in PFS ratesetting for CY 2027. Several commenters requested that we update the cost shares to the most currently available MEI. Several commenters supported our proposal to continue using the current PE/HR and 2006-based MEI cost shares for CY 2027 PFS ratesetting, or until the 2024 PPI Survey data may be considered. Some commenters stated that we should not implement the PPI and CPI Survey data until the issues discussed in the CY 2026 final rule have been addressed.

Response: We agree with commenters that we should continue using the current PE/HR and 2006-based MEI cost shares for CY 2027 PFS ratesetting, and may consider the commenters' feedback in future rulemaking as we consider data to update the cost shares.

After consideration of the public comments, we are finalizing our proposal to continue to use the current PE/HR and 2006-based MEI cost shares for CY 2027 PFS ratesetting.

4. Changes to Direct PE Inputs for Specific Services

This section focuses on specific PE inputs. The direct PE inputs are included in the CY 2027 direct PE input public use files, which are available on the CMS website under downloads for the CY 2027 PFS final rule at *https://www.cms.gov/medicare/payment/fee-schedules/physician/federal-regulation-notices*.

a. Standardization of Clinical Labor Tasks

As we noted in the CY 2015 PFS final rule with comment period (79 FR 67640 through 67641), we continue to make improvements to the direct PE input database to provide the number of clinical labor minutes assigned for each task for every code in the database instead of only including the number of clinical labor minutes for the preservice, service, and post service periods for each code. In addition to increasing the transparency of the information used to set PE RVUs, this level of detail would allow us to compare clinical labor times for activities associated with services across the PFS, which we believe is important to maintaining the relativity of the direct PE inputs. This information would facilitate the identification of the usual numbers of minutes for clinical labor tasks and the identification of exceptions to the usual values. It would also allow for greater transparency and consistency in the assignment of equipment minutes based on clinical labor times. Finally, we believe that the detailed information can be useful in maintaining standard times for particular clinical labor tasks that can be applied consistently to many codes as they are valued over several years, similar in principle to physician preservice time packages. We believe that setting and maintaining such standards would provide greater consistency among codes that share the same clinical labor tasks and could improve the relativity of values among codes. For example, as medical practice and technologies change over time, standards could be updated simultaneously for all codes with the applicable clinical labor tasks instead of waiting for individual codes to be reviewed.

In the CY 2016 PFS final rule with comment period (80 FR 70901), we solicited comments on the appropriate standard minutes for the clinical labor tasks associated with services that use digital technology. After consideration of comments received, we finalized standard times for clinical labor tasks associated with digital imaging at 2 minutes for ''Availability of prior images confirmed'', 2 minutes for ''Patient clinical information and questionnaire reviewed by technologist, order from physician confirmed and

exam protocoled by radiologist'', 2 minutes for ''Review examination with interpreting MD'', and 1 minute for ''Exam documents scanned into PACS'' and ''Exam completed in RIS system to generate billing process and to populate images into Radiologist work queue.'' In the CY 2017 PFS final rule (81 FR 80184 through 80186), we finalized a policy to establish a range of appropriate standard minutes for the clinical labor activity, ''Technologist QCs images in PACS, checking for all images, reformats, and dose page.'' These standard minutes will be applied to new and revised codes that make use of this clinical labor activity when they are reviewed by us for valuation. We finalized a policy to establish 2 minutes as the standard for the simple case, 3 minutes as the standard for the intermediate case, 4 minutes as the standard for the complex case, and 5 minutes as the standard for the highly complex case. These values were based upon a review of the existing minutes assigned for this clinical labor activity; we determined that 2 minutes is the duration for most services and a small number of codes with more complex forms of digital imaging have higher values. We also finalized standard times for a series of clinical labor tasks associated with pathology services in the CY 2016 PFS final rule with comment period (80 FR 70902). We do not believe these activities would be dependent on the number of blocks or batch size, and we believe that the finalized standard values accurately reflect the typical time it takes to perform these clinical labor tasks.

In reviewing the RUC-recommended direct PE inputs for CY 2019, we noticed that the 3 minutes of clinical labor time traditionally assigned to the ''Prepare room, equipment and supplies'' (CA013) clinical labor activity were split into 2 minutes for the ''Prepare room, equipment and supplies'' activity and 1 minute for the ''Confirm order, protocol exam'' (CA014) activity. We proposed to maintain the 3 minutes of clinical labor time for the ''Prepare room, equipment and supplies'' activity and remove the clinical labor time for the ''Confirm order, protocol exam'' activity wherever we observed this pattern in the RUC-recommended direct PE inputs. Commenters explained in response that when the new version of the PE worksheet introduced the activity codes for clinical labor, there was a need to translate old clinical labor tasks into the new activity codes, and that a prior clinical labor task was split into two of the new clinical labor activity codes: CA007 (*Review patient clinical extant information and questionnaire*) in the preservice period, and CA014 (*Confirm order, protocol exam*) in the service period. Commenters stated that the same clinical labor from the old PE worksheet was now divided into the CA007 and CA014 activity codes, with a standard of 1 minute for each activity. We agreed with commenters that we would finalize the RUC-recommended 2 minutes of clinical labor time for the CA007 activity code and 1 minute for the CA014 activity code in situations where this was the case. However, when reviewing the clinical labor for the reviewed codes affected by this issue, we found that several of the codes did not include this old clinical labor task, and we also noted that several of the reviewed codes that contained the CA014 clinical labor activity code did not contain any clinical labor for the CA007 activity. In these situations, we believe that the three total minutes of clinical staff time would be more accurately described by the CA013 ''Prepare room, equipment and supplies'' activity code, and we finalized these clinical labor refinements. We direct readers to the discussion in the CY 2019 PFS final rule (83 FR 59463 through 59464) for additional details.

Following the publication of the CY 2020 PFS proposed rule, a commenter expressed concern with the published list of common refinements to equipment time. The commenter stated that these refinements were the formulaic result of applying refinements to the clinical labor time and did not constitute separate refinements; the commenter requested that CMS no longer include these refinements in the table published each year. In the CY 2020 PFS final rule, we agreed with the commenter that these equipment time refinements did not reflect errors in the equipment recommendations or policy discrepancies with the RUC's equipment time recommendations. However, we believed it was important to publish the specific equipment times that we were proposing (or finalizing in the case of the final rule) when they differed from the recommended values due to the effect these changes can have on the direct costs associated with equipment time. Therefore, we finalized the separation of the equipment time refinements associated with changes in clinical labor into a separate table of refinements. We direct readers to the discussion in the CY 2020 PFS final rule (84 FR 62584) for additional details.

Historically, the RUC has submitted a ''PE worksheet'' that details the recommended direct PE inputs for our use in developing PE RVUs. The format of the PE worksheet has varied over time, and among the medical specialties developing the recommendations. These variations have made it difficult for the RUC's development and our review of code values for individual codes. Beginning with its recommendations for CY 2019, the RUC mandated the use of a new PE worksheet for its recommendation development process that standardizes the clinical labor tasks and assigns them a clinical labor activity code. We believe the RUC's use of the new PE worksheet in developing and submitting recommendations helps us simplify and standardize the hundreds of clinical labor tasks currently listed in our direct PE database. To facilitate rulemaking for CY 2027, we are displaying the Labor Task Detail public use file that contains the current listing of clinical labor activity codes. This file is available on the CMS website under downloads for the CY 2027 PFS final rule at *https://www.cms.gov/medicare/payment/fee-schedules/physician/federal-regulation-notices*.

b. Updates to Prices for Existing Direct PE Inputs

In the CY 2011 PFS final rule with comment period (75 FR 73205), we finalized a process to act on public requests to update equipment and supply price and equipment useful life inputs through annual rulemaking, beginning with the CY 2012 PFS proposed rule. Beginning in CY 2019 and continuing through CY 2022, we conducted a market-based supply and equipment pricing update using information developed by our contractor which updated pricing recommendations for approximately 1300 supplies and 750 equipment items currently used as direct PE inputs. Given the potentially significant changes in payment that would occur, in the CY 2019 PFS final rule, we finalized a policy to phase in our use of the new direct PE input pricing over a 4-year period using a 25/75 percent (CY PFS 2019), 50/50 percent (CY PFS 2020), 75/25 percent (CY PFS 2021), and 100/0 percent (CY PFS 2022) split between new and old pricing. We believe that implementing the proposed updated prices with a 4-year phase-in would improve payment accuracy while maintaining stability and allowing interested parties to address potential concerns about changes in payment for particular items. This 4-year transition period to update supply and equipment pricing concluded in CY 2022; for a more detailed discussion, we refer readers to the CY 2019 PFS final rule

with comment period (83 FR 59473 through 59480).

For CY 2027, we proposed to update the price of nine supplies and two equipment items in response to the public submission of invoices following the publication of the CY 2026 PFS final rule. These supply and equipment items with updated prices are listed in the valuation of specific codes section of the final rule under Table A–D9, CY 2027 Invoices Received for Existing Direct PE Inputs.

These proposed pricing updates included a request from the RUC to update the pricing of the moderate sedation pack (SA044) to more accurately reflect its components. The RUC determined that a sterile gown is not needed as part of the moderate sedation pack, however, a regular staff gown should be included to protect the sedation provider from all body fluids, substance, and excretions. The RUC also requested that a mask would be an appropriate addition in the sedation pack, resulting in a price change from the current $19.20, minus the $5.13 sterile gown, plus the $1.19 staff gown and $0.43 mask, for a new total price of $15.69. We proposed this $15.69 price for the SA044 moderate sedation pack which is reflected in Table A–D9, CY 2027 Invoices Received for Existing Direct PE Inputs.

Additionally, we received a potentially misvalued code (PMVC) nomination for SA119 kit, low frequency ultrasound wound therapy (MIST) and proposed an updated supply cost from $320.18 to $100 for SA119. We refer readers to section II.D. of this final rule for more information about this proposal.

Comment: Many commenters stated that they approved of the proposed pricing changes included in the CY 2027 PFS proposed rule. Different commenters stated their approval for the proposed change in pricing for the aquatic therapy pool (EQ050), the liposorber system (EQ174), the Universal Detection Kit (SA117), the Varithena admin pack (SA125), the Varithena (foam) (SD324), the Dorsal SI Joint Arthrodesis Implant (SD356), and the Esketamine (56 mg vial) (SH109) and Esketamine (84 mg vial) (SH110) supplies.

Response: We appreciate the support for our proposed pricing from the commenters.

Comment: A commenter stated that the existing supply cost for the purified protein derivative (SH059) supply falls short of covering the cost of the product, leading many pediatric practices to stop purchasing the product and potentially reducing patient access to tuberculosis skin testing. The commenter requested that CMS increase the supply cost for the SH059 purified protein derivative supply to better reflect the actual cost paid by practices and align payment with current market pricing; to this effect, the commenter submitted five invoices with updated pricing information.

Response: We appreciate the submission of these invoices from the commenter to assist in updating the price of the SH059 supply. In reviewing these invoices, we determined that they averaged out to a price of $138.60 by selling 10 doses in 1 mL vials, a substantial increase over the current $26.11 price for the SH059 supply. We were able to find unit prices of $36.70 and $51.44 when the product was sold in 50 doses of 5 mL vials which average together for a price of $44.07. Since we believe it would be more typical to purchase the SH059 in larger batch sizes given the considerable cost savings, we are finalizing an update in the price at the averaged $44.07 rate, which we note still constitutes a pricing increase of roughly 70% for the SH059 supply.

Comment: A commenter submitted invoices reflecting the costs associated with furnishing the SleepioRx product, together with a request to create a new direct PE supply code that refers to validated pricing for SleepioRx. The commenter stated that there was a lack of consistent contractor pricing for HCPCS code G0552 (*Supply of digital mental health treatment device and initial education and onboarding, per course of treatment that augments a behavioral therapy plan*) which uses this supply item and therefore creates an access barrier to Medicare beneficiaries with insomnia. The commenter urged CMS to establish a direct PE input supply code for SleepioRx, based on the submitted invoices and provide billing guidance to the Medicare Administrative Contractors (MACs).

Response: We appreciate the submission of these invoices from the commenter. We note that a supply code for this product was finalized last year in the CY 2026 PFS final rule, using the name ''Digital mental health device (insomnia)'' and using the supply code SD386 (90 FR 49460). This supply is currently not assigned to any CPT codes since HCPCS code G0552 is contractor priced and therefore cannot include any direct PE inputs; we did not propose to establish national pricing for HCPCS code G0552 and we are not finalizing a change in its contractor priced status at this time. However, we will update the price of the SD386 supply based on the invoices submitted by the commenters at a new price of $400.00. The SD386 supply is listed along with the other updated supply and equipment prices under Table A–D9, CY 2027 Invoices Received for Existing Direct PE Inputs.

Comment: A commenter requested that CMS establish new direct PE supply and equipment codes for the TearCare System, a technology that is used to perform the interventional procedure reported with CPT code 0563T (*Evacuation of meibomian glands, using heat delivered through wearable, open-eye eyelid treatment devices and manual gland expression, bilateral*) to treat dry eye disease (DED) due to meibomian gland dysfunction (MGD). The commenter specified that they were not requesting that CMS establish national pricing for CPT code 0563T, instead stating that establishing supply and equipment codes for these devices would provide greater transparency and consistency in valuation, support more uniform reimbursement policies nationwide, and better align payment with the resources associated with performing the procedure among the Medicare Administrative Contractors (MACs). The commenter submitted 16 invoices to support the establishment of these new supply and equipment codes associated with the resources used to furnish CPT code 0563T.

Response: We appreciate the submission of these invoices from the commenter with additional pricing information. After reviewing the invoices, we are finalizing the establishment of a new supply code for Smart Lids (SD397) at a price of $1000 and a new equipment code for a Smart Hub (EQ423) at a price of $6583.33 based on an average of the submitted invoices. As the commenter noted, these new direct PE inputs are currently not assigned to any CPT codes since CPT code 0563T is contractor priced and therefore cannot include any direct PE inputs. However, we have added them to the ratesetting database as requested by the commenter and they will appear in Table A–D10: CY 2027 Invoices Received for New Direct PE Inputs.

Comment: Several commenters submitted a series of invoices in support of establishing nonfacility pricing for CPT code 66984 (*Extracapsular cataract removal with insertion of intraocular lens prosthesis (1 stage procedure), manual or mechanical technique (eg, irrigation and aspiration or phacoemulsification); without endoscopic cyclophotocoagulation*) along with related CPT codes 65820, 66174, 66982, 66989, and 66991. Commenters stated that these invoices substantiated the direct PE costs of

performing cataract surgery and requested that CMS use them to develop nonfacility pricing for these codes.

Response: Although we appreciate the submission of these invoices from the commenters, we did not propose to establish nonfacility pricing for CPT code 66984 or any of the other related codes listed by the commenters. The submitted invoices included pricing for several dozen supply and equipment items, including some costs which are considered to be indirect under the current PE methodology such as building construction costs and service/licensing fees. It is unclear whether these invoices were intended to update the pricing for current supply and equipment items or establish new supply/equipment codes, as well as which items were intended to be associated with cataract surgery. We are not finalizing the creation of nonfacility pricing for CPT code 66984 or any of the other related codes listed by the commenters at this time; we remind interested parties that if they have reason to believe that individually services are inaccurately priced, we encourage them to submit a request under the potentially misvalued code initiative discussed elsewhere in this rule.

(1) Invoice Submission

We remind readers that we routinely accept public submissions of invoices as part of our process for developing payment rates for new, revised, and potentially misvalued codes. Often, these invoices are submitted in conjunction with the RUC-recommended values for the codes. To be included in a given year's proposed rule, we generally need to receive invoices by the same February 10th deadline we noted for consideration of RUC recommendations. However, as noted in the proposed rule we considered invoices submitted as public comments during the comment period following the publication of the CY 2027 PFS proposed rule and will consider any invoices received after February 10th or outside of the public comment process as part of our established annual process for requests to update supply and equipment prices. Interested parties are encouraged to submit invoices with their public comments or, if outside the notice and comment rulemaking process, via email at *PE_Price_Input_Update@cms.hhs.gov*.

(2) Supply Pack Pricing Update

Interested parties previously notified CMS that they identified numerous discrepancies between the aggregated cost of some supply packs and the individual item components contained within. The interested parties indicated that CMS should rectify these mathematical errors as soon as possible to ensure that the sum correctly matches the totals from the individual items, and they recommended that we resolve these pricing discrepancies in the supply packs during CY 2024 rule. The AMA RUC convened a workgroup on this subject and submitted recommendations to update pricing for a series of supply packs along with the RUC's comment letter for the CY 2024 rule cycle.

We appreciated the additional information and RUC workgroup recommendations regarding discrepancies in the aggregated cost of some supply packs. However, due to the projected significant cost revisions in the pricing of supply packs and because we did not propose to address supply pack pricing in the CY 2024 proposed rule, we stated in the CY 2024 final rule that this issue would be better addressed in future rulemaking. For example, the cleaning and disinfecting endoscope pack (SA042) is included as a supply input in more than 300 HCPCS codes, which could have a sizable impact on the overall valuation of these services, and which was not incorporated into the proposed RVUs published for the CY 2024 proposed rule. We stated that interested parties would be better served if we comprehensively addressed this topic during future rulemaking in which commenters could provide feedback in response to proposed pricing updates (88 FR 78833 through 78834).

For CY 2025, we proposed implementing the supply pack pricing update and associated revisions as recommended by the RUC's workgroup (89 FR 97726 through 97727). We proposed to update the pricing of the ''pack, cleaning and disinfecting, endoscope'' (SA042) supply from $19.43 to $31.29, to update the pricing of the ''pack, drapes, cystoscopy'' (SA045) supply from $17.33 to $14.99, to update the pricing of the ''pack, ocular photodynamic therapy'' (SA049) supply from $16.35 to $26.35, to update the pricing of the ''pack, urology cystoscopy visit'' (SA058) supply from $113.70 to $37.63, and to update the pricing of the ''pack, ophthalmology visit (w-dilation)'' (SA082) supply from $3.91 to $2.33. As recommended by the RUC workgroup, we also proposed to delete the ''pack, drapes, laparotomy (chest-abdomen)'' (SA046) supply entirely. The updated prices for these supply packs were listed in the valuation of specific codes section of this rule under Table A–B5, CY 2025 Invoices Received for Existing Direct PE Inputs (89 FR 97852).

In accordance with the RUC workgroup's recommendations, we also proposed to create eight new supply codes, including components contained within previously existing supply packs. Aside from the SB056 supply, which is a replacement in several HCPCS codes for the deleted SA046 supply pack, all of these new supplies are not included as standalone direct PE inputs in any current HCPCS codes, as they are, again, components contained within previously existing supply packs. We proposed to add:

- The kit, ocular photodynamic therapy (PDT) (SA137) supply at a price of $26.00 as a component of the SA049 supply pack;
- The Abdominal Drape Laparotomy Drape Sterile (100 in x 72 in x 124 in) (SB056) supply at a price of $8.049 as a replacement for the SA046 supply pack;
- The drape, surgical, legging (SB057) supply at a price of $3.284 as a component of the SA045 supply pack;
- The drape, surgical, split, impervious, absorbent (SB058) supply at a price of $8.424 as a component of the SA045 supply pack;
- The post-mydriatic spectacles (SB059) supply at a price of $0.328 as a component of the SA082 supply pack;
- The y-adapter cap (SD367) supply at a price of $0.352 as a component of the SA049 supply pack;
- The ortho-phthalaldehyde 0.55 percent (for example, Cidex OPA) (SM030) supply at a price of $0.554 as a component of the SA042 supply pack; and
- The ortho-phthalaldehyde test strips (SM031) supply at a price of $1.556 as a component of the SA042 supply pack.

The new supply pack component items were listed in the valuation of specific codes section of the rule under Table A–B8, CY 2025 PFS (89 FR 97722) New Invoices (89 FR 97853).

We also proposed the following additional supply substitutions based on the recommendations of the RUC workgroup. We proposed to remove the deleted SA046 supply pack and replace it with the drape, sterile, fenestrated 16in x 29in (SB011) supply for CPT codes 19020, 19101, 19110, 19112, 20101, and 20102. We proposed to remove the deleted SA046 supply pack and replace it with two supplies—the drape, sterile, three-quarter sheet (SB014) and the drape, towel, sterile 18in x 26in (SB019)—for CPT codes 19000 and 60300. We proposed to remove the deleted SA046 supply pack

and replace it with 2 supplies—the drape, towel, sterile 18in x 26in (SB019) and the newly created Abdominal Drape Laparotomy Drape Sterile (100 in x 72 in x 124 in) (SB056) supply—for CPT codes 22510, 22511, 22513, and 22514. We proposed to remove the deleted SA046 supply pack without replacing it with anything for CPT code 22526; the RUC workgroup did not make a recommendation on what to do with CPT code 27278, which also previously contained the SA046 supply pack. Therefore, we also proposed not to replace the SA046 supply pack with any supplies for this code. The RUC workgroup also recommended removing the SA046 supply pack from CPT code 64595 with no replacement; however, this code was recently reviewed at the April 2022 RUC meeting and it no longer includes the SA046 supply.

In the comments on the CY 2025 PFS proposed rule (89 FR 97727), several commenters supported the proposed supply pack pricing update as recommended by the RUC workgroup, however they indicated concern over the proposed decrease in the price of the urology cystoscopy visit pack (SA058) from $113.70 to $37.63. The commenters stated that the proposed pricing reduction in the SA058 supply could result in drastic payment rate cuts for physicians performing cystoscopy services in the office setting. The commenters requested that CMS either delay the pricing update or phase-in the supply pack changes over a 4-year period like it has done for other PE changes with significant redistributive effects, allowing independent urology practices to better prepare for the negative financial impact this change will have.

After considering these comments, we agreed that the use of a phased-in transition period would be appropriate to allow practitioners to adjust to the updated pricing of these supplies. During our previous supply and equipment pricing update in the CY 2019 PFS final rule (83 FR 59475), we finalized a policy to phase in any updated pricing that we established during the 4-year transition period for very commonly used supplies and equipment, such as sterile gloves (SB024) or exam tables (EF023), even if invoices were provided as part of the formal review of a code family. Based on this previously established policy, we finalized the use of a pricing transition for three supply packs in Table A–B4.

TABLE A-B4: CY 2025 SUPPLY PACK PRICING TRANSITION

CMS_ CODE	HCPCS Codes	CMS_2024 Price	Recommended Price	Year 1 (CY 2025) Price	Year 2 (CY 2026) Price	Year 3 (CY 2027) Price	Final (CY 2028) Price
SA042	306	$19.43	$31.29	$22.40	$25.36	$28.33	$31.29
SA058	38	$113.70	$37.63	$94.68	$75.67	$56.65	$37.63
SA082	145	$3.91	$2.33	$3.52	$3.12	$2.73	$2.33

Following the same pattern as our previous supply/equipment and clinical labor pricing updates, we finalized the implementation of this pricing transition over 4 years such that one-quarter of the difference between the current price and the fully phased-in price is implemented for CY 2025 PFS (89 FR 97722), one-third of the difference between the CY 2025 PFS (89 FR 97722) price and the final price is implemented for CY 2026 PFS, and one-half of the difference between the CY 2026 price and the final price is implemented for CY 2027, with the new direct PE prices fully implemented for CY 2028. For the other proposed supply packs, the cystoscopy drapes pack (SA045) is only included in seven HCPCS codes and the ocular photodynamic therapy pack (SA049) is only included in a single HCPCS code which do not meet these criteria established in previous rulemaking and described previously in this section. Therefore, we finalized each of them at their updated pricing for CY 2025 PFS (89 FR 97722) as proposed in the proposed rule. We believe that the use of this pricing transition will minimize any potential disruptive effects during the 4-year transition period that could be caused by other sudden shifts in RVUs due to the high number of services that make use of these very common supply packs.

Several commenters also stated that although five incomplete packs would have their pricing updated in the proposed rule, mathematical errors still remained for a number of additional supply packs. Commenters stated that only 3 of the 18 affirmed packs were priced correctly to match their components and provided tables showing the pricing of an additional 15 packs that needed mathematical correction by deconstructing the packs to determine the correct price through summing their individual components. Commenters requested that CMS initiate a correction of the packs pricing such that the sum of the individual components match the price of the corresponding pack as detailed in Table A–B5.

TABLE A-B5: SUPPLY PACK PRICING REQUESTED BY CY 2025 COMMENTERS

HCPCS Codes	Item Name	CMS Code	Current Price	New Price	% Change
111 codes	pack, basic injection	SA041	$10.45	$17.28	65%
560 codes	pack, cleaning, surgical instruments	SA043	$12.61	$11.09	-12%
3 codes	pack, moderate sedation	SA044	$18.55	$19.20	4%
4568 codes	pack, minimum multi-specialty visit	SA048	$5.02	$1.98	-61%
168 codes	pack, ophthalmology visit (no dilation)	SA050	$2.72	$1.35	-50%
239 codes	pack, pelvic exam	SA051	$20.16	$2.81	-86%
1079 codes	pack, post-op incision care (staple)	SA052	$4.80	$9.90	106%
469 codes	pack, post-op incision care (suture & staple)	SA053	$5.47	$11.54	111%
1708 codes	pack, post-op incision care (suture)	SA054	$4.62	$10.34	124%
12 codes	pack, post-op incision care, craniotomy	SA055	$7.30	$18.18	149%
24 codes	pack, post-op incision care, neurosurgical	SA056	$6.20	$16.05	159%
120 codes	pack, drapes, ortho, large	SA080	$37.30	$25.38	-32%
29 codes	pack, drapes, ortho, small	SA081	$2.25	$1.88	-16%
119 codes	pack, protective, ortho, large	SA083	$10.86	$14.75	36%
27 codes	pack, protective, ortho, small	SA084	$5.99	$8.15	36%

While we shared the concerns of the commenters regarding the need for accuracy in the pricing of these supply packs, we had reservations about their potential for pricing disruptions. Ten of these supply packs are included in the direct PE inputs for at least 100 HCPCS codes, and three of the packs are included in more than 1000 HCPCS codes. Many of these pricing updates would lead to drastic changes in pricing for these supply packs which are included in hundreds of HCPCS codes, such as the SA051 pelvic exam pack decreasing in price from $20.16 to $2.81 (−86 percent) and the SA048 minimum multi-specialty visit pack decreasing in price from $5.02 to $1.98 (−61 percent). We were particularly concerned that these changes in supply pack pricing could lead to significant shifts in the overall PE RVU for affected HCPCS codes, without these proposed rates appearing in the proposed rule or allowing any opportunity for public comment.

Therefore, we did not finalize pricing updates for these additional 15 supply packs as requested by commenters. We anticipated returning to this subject in future rulemaking to allow any changes in associated pricing for HCPCS codes to appear in the proposed rule and provide an opportunity for the public to comment. Should these supply pack pricing updates be proposed in future rulemaking, we anticipated that we might propose the same pricing transition described previously due to the number of potentially affected HCPCS codes. We finalized all of the other supply pack pricing changes as proposed, with the exception of the 4—year pricing transition for three supply packs as described previously in this section.

For CY 2026, we proposed to continue implementing the supply pack pricing update and associated revisions as previously recommended by the RUC's workgroup. We proposed to update the price of the 15 supply packs detailed in Table A–B5 which were received too late in CY 2025 PFS (89 FR 97722) to allow for proposed pricing or public comment. In the case of the surgical instruments cleaning pack (SA043), the moderate sedation pack (SA044) and the small ortho drapes pack (SA081), the proposed pricing update is modest enough that we proposed these supplies move immediately to their final prices for CY 2026.

For the 12 other supply packs, we proposed that they be incorporated into the muti-year supply pack pricing transition finalized in CY 2025 rulemaking. Rather than having two separate 4-year pricing transitions associated with supply packs, we proposed that these 12 additional supply packs fold into the previous pricing transition using the same methodology, such that one-third of the difference between the CY 2025 PFS (89 FR 97722) price and the final price is implemented for CY 2026, and one-half of the difference between the CY 2026 price and the final price is implemented for CY 2027, with the new direct PE prices fully implemented for CY 2028 (89 FR 97728). With the inclusion of the SA042, SA058, and SA082 supply packs which began their pricing transition for CY 2025, we proposed the total supply pack pricing update detailed in Table A–B6.

TABLE A-B6: SUPPLY PACK PRICING TRANSITION

CMS_ CODE	HCPCS Codes	CMS_2024 Price	Recommended Price	Year 1 (CY 2025) Price	Year 2 (CY 2026) Price	Year 3 (CY 2027) Price	Final (CY 2028) Price
SA042	306	$19.43	$31.29	$22.40	$25.36	$28.33	$31.29
SA058	38	$113.70	$37.63	$94.68	$75.67	$56.65	$37.63
SA082	145	$3.91	$2.33	$3.52	$3.12	$2.73	$2.33
SA041	111	$10.45	$17.28	-	$12.73	$15.00	$17.28
SA048	4568	$5.02	$1.98	-	$4.01	$2.99	$1.98
SA050	168	$2.72	$1.35	-	$2.26	$1.81	$1.35
SA051	239	$20.16	$2.81	-	$14.38	$8.59	$2.81
SA052	1079	$4.80	$9.90	-	$6.50	$8.20	$9.90
SA053	469	$5.47	$11.54	-	$7.49	$9.52	$11.54
SA054	1708	$4.62	$10.34	-	$6.53	$8.43	$10.34
SA055	12	$7.30	$18.18	-	$10.93	$14.55	$18.18
SA056	24	$6.20	$16.05	-	$9.48	$12.77	$16.05
SA080	120	$37.30	$25.38	-	$33.33	$29.35	$25.38
SA083	119	$10.86	$14.75	-	$12.16	$13.45	$14.75
SA084	27	$5.99	$8.15	-	$6.71	$7.43	$8.15
SD089	100	$20.56	$41.15	-	$27.42	$34.29	$41.15

Table A–B6 also includes the hydrophilic guidewire (SD089) supply which we proposed to transition in pricing over 3 years given its inclusion in approximately 100 HCPCS codes. We continue to believe that the use of this pricing transition will minimize any potential disruptive effects during the transition period that could be caused by other sudden shifts in RVUs due to the high number of services that make use of these very common supply items. After consideration of the public comments, we finalized our supply pack pricing policies as proposed in the CY 2026 PFS final rule (90 FR 49284).

For CY 2027, as stated in the proposed rule, these supply packs will continue with the third year of the previously finalized 4-year transition process as detailed in Table A–B6. In the proposed rule we noted that as is the case with other supply and equipment pricing, we would consider invoices associated with these supply packs which were submitted as public comments during the comment period following the publication of the CY 2027 PFS proposed rule as part of our established annual process for requests to update supply and equipment prices. We also encouraged interested parties to submit invoices with their public comments or, if outside the notice and comment rulemaking process, via email at *PE_Price_Input_Update@cms.hhs.gov*.

Comment: A commenter stated that they supported the continuing phase-in transition of supply pack pricing, specifically mentioning the SA041, SA042, SA048, SA052, SA053, and SA054 supply packs.

Response: We appreciate the support for our previously finalized policy from the commenter.

Comment: Several commenters stated that CMS should stop the continued pricing transition for the pelvic exam supply pack (SA051) and the cystoscopy visit supply pack (SA058). Commenters stated that these supply reductions were disconnected from actual practice costs and reductions in payment could create access barriers and push procedures into hospital outpatient departments where Medicare and patients generally pay more. Commenters requested that CMS freeze the price for these supply packs at their CY 2026 values and reconsider documentation of invoice pricing for these supplies.

Response: We share the concerns of the commenters regarding the large decreases in pricing associated with the SA051 and SA058 supply packs, which is why we finalized the use of a phased-in transition period in the CY 2025 PFS final rule (89 FR 97722). We note that the pricing of these supply packs was already finalized in the CY 2025 PFS final rule, with the four-year implementation continuing to take place in CY 2027. However, we also believe in the importance of valuing supply items at the most accurate market-based pricing available, and therefore we cannot continue to price these supply packs at rates much higher than the cost of the individual components that make up the total packs. We welcome the submission of updated invoices and other cost data associated with these supply packs for potential inclusion in future rulemaking; we note that we did not receive any invoices from commenters supporting different pricing for the SA051 and SA058 supply packs.

c. Technical Corrections to Direct PE Input Database and Supporting Files

Following the publication of the CY 2026 PFS final rule, the RUC submitted a potential technical correction issue related to global period assignment for approximately three dozen codes. The RUC stated that these codes had long descriptors which indicated that they were add-on codes ''(List separately in addition to code for primary procedure)''; however, these codes were assigned the XXX global period instead of the ZZZ global period. The RUC requested that CMS consider assigning the ZZZ global period for these codes as a technical correction.

We reviewed the list of codes submitted by the RUC and we agree that there appears to be a technical error in the global period assignment for these codes. Most of the affected codes have non-payable status codes and no RVUs, while the handful of affected HCPCS codes that do have RVUs specifically state in their descriptors that they were intended to be add-on codes, such as CPT code 88332 (Pathology consultation during surgery; each additional tissue block with frozen section(s)). We therefore proposed to change the following codes to the ZZZ global period:

TABLE A-B7: PROPOSED ZZZ GLOBAL PERIOD CODES

HCPCS	Short Descriptor
20930	Sp bone algrft morsel add-on
20936	Sp bone agrft local add-on
22841	Insert spine fixation device
81266	Str markers spec anal addl
81416	Exome sequence analysis
81426	Genome sequence analysis
81536	Oncology gynecologic
82952	Gtt-added samples
87187	Sc std microdil/agar mlc
87503	Influenza dna amp prob addl
87904	Phenotype dna hiv w/clt add
88314	Histochemical stains add-on
88332	Path consltj surg ea add blk
94645	Cont inhlj tx each addl hour
95940	Ionm in operatng room 15 min
95941	Ionm remote/>1 pt or per hr
99486	Suprv interfac trnsport addl
99602	Home nfs visit each addl hr
0054T	Bone srgry cmptr fluor image
0055T	Bone srgry cmptr ct/mri imag
0076T	S&i stent/chest vert art
0095T	Rmvl artific disc addl crvcl
0098T	Rev artific disc addl
0174T	Cad cxr with interp
0397T	Ercp w/optical endomicroscpy
G1028	Take home supply 8mg per 0.1
G2078	Take-home meth
G2079	Take-hom buprenorphine
G2080	Add 30 mins counsel
G2215	Home supply nasal naloxone
G2216	Home supply inject naloxon
S2351	Diskectomy, anterior, with d
S2900	Robotic surgical system

The RUC also requested assigning the ZZZ global period to three anesthesia codes: CPT codes 01953, 01968, and 01969. However, currently all anesthesia codes use the XXX global period, and it is unclear whether the concept of an add-on global period would apply to anesthesia coding given that they are valued using base units and time units, unlike all other PFS services. As noted in the proposed rule, we did not propose the ZZZ global period for these three codes at this time. We solicited comments from interested parties regarding the global period assignment for these three anesthesia codes, as well as the other codes listed in Table A–B7.

We received public comments on these proposals. The following is a summary of the comments we received and our responses.

Comment: Several commenters stated that they did not support assigning a ZZZ global period to CPT codes 01953, 01968, and 01969 and questioned the necessity and potential negative consequences of doing so. The commenters stated that although they understood the RUC's rationale for requesting a ZZZ global period assignment for CPT codes 01953, 01968, and 01969, they believed this would be an inappropriate policy change that could have unintended negative consequences. The commenters stated that the anesthesia code set does not currently utilize global periods beyond the perceived global period defined by the anesthesia start and stop times of an anesthesia service and establishing any structure that would appear to assign an anesthesia global period could lay the groundwork to establishing a defined generic or average global period that could impact the unique recognition and utilization of an actual case's unique start and stop times. The commenters stated that the administrative burden of ensuring that these downstream impacts would not occur would far outweigh any perceived benefit of unnecessarily assigning a ZZZ global period to these codes.

Response: We appreciate the feedback from the commenters; we agree that there are unique aspects to the anesthesia codes and therefore continue to believe that CPT codes 01953, 01968, and 01969 should retain the same XXX global period used by all other anesthesia codes.

After consideration of public comments, we are finalizing the change to a ZZZ global period for the codes listed in Table A–B7 as proposed. We are not finalizing a change in the global period for anesthesia CPT codes 01953, 01968, and 01969.

Comment: Several commenters, including the RUC, requested that CMS separately identify and pay for high-cost

disposable supplies. Commenters highlighted the outsized impact that high-cost disposable supplies have within the current practice expense RVU methodology, which not only accounts for a large amount of direct practice expense for these supplies but also allocates a large amount of indirect practice expense into the PE RVU for the procedure codes that include these supplies. Commenters stated that if high-cost supplies were paid separately with appropriate HCPCS codes, the disproportionate indirect expense would no longer be associated with that service, with the result that indirect PE RVUs would be redistributed throughout the specialty practice expense pool and the practice expense for all other services. Commenters requested that CMS separately identify and pay for high-cost disposable supplies priced more than $500 using appropriate HCPCS codes. Commenters stated that they had anticipated a response from CMS on this issue and argued that the pricing of these supplies should be based on a transparent process whereby items are reviewed and updated on an annual basis.

Response: We have received a number of prior requests from interested parties, including the RUC, to implement these separately billable alpha-numeric Level II HCPCS codes to allow practitioners to be paid the cost of high cost disposable supplies per patient encounter instead of per CPT code. We stated at the time, and we continue to believe, that this option presents a series of potential problems that we have addressed previously in the context of the broader challenges regarding our ability to price high cost disposable supply items. We did not propose and are not finalizing the implementation of standalone Level II HCPCS codes for high cost disposable supplies at this time. For further discussion of this issue, we direct the reader to our discussion in the CY 2011 PFS final rule with comment period (75 FR 73251).

This is a subject that we may consider for future rulemaking alongside other updates to the PE methodology. We appreciate the continued feedback from commenters as we consider potential approaches to this complicated topic.

d. Updates to Practice Expense (PE) Methodology—Site of Service Payment Differential

We proposed a significant refinement to our PE methodology to better reflect trends in physician practice settings in the CY 2026 PFS final rule (90 FR 49292 through 49297). Under the finalized policy, we allocate half the amount of indirect PE RVUs per work RVU for services furnished in the facility setting compared to those allocated to services furnished in the non-facility setting. We noted in the CY 2026 PFS proposed rule (90 FR 32374) that this change to the indirect cost allocation methodology was intended to better recognize the relative resources involved in furnishing services paid under the PFS in facility and non-facility settings. We compared this change to our current methodology prior to CY 2026, which functionally presumed approximately equal indirect costs incurred by physicians across sites of service. This presumption was initially made in the context of most practitioners maintaining office practices independent of the facilities in which they provided care, and as we discussed in the CY 2026 PFS proposed and final rules, appears to be inconsistent with contemporary trends in physician practice where some significant portion of services furnished in facility settings are performed by medical practitioners who do not maintain fully independent practices and are less likely to incur a comparable amount of indirect costs.

Since finalizing the proposal in the CY 2026 PFS final rule, we have heard from interested parties that the implementation of this policy resulted in an unintended, but significant, site of service differential for physician visits in nursing facility settings based solely on whether the beneficiary's stay is covered under Part A. For purposes of PFS payment, a service furnished to a patient in a skilled nursing facility during a Part A hospital stay (place of service 31) is considered to be in the ''facility'' setting, while a service furnished to a patient in a Part B stay (place of service 32) is considered to be in the ''non-facility'' setting, per the Medicare Claims Processing Manual (MCPM), Chapter 12, Section 20.4.2 at *http://www.cms.gov/Regulations-and-Guidance/Guidance/Manuals/Downloads/clm104c12.pdf*. Prior to CY 2026, the payment rate for these E/M services furnished in a skilled nursing facility (''facility'') and a nursing facility (''non-facility'') were equal. As intended, the 50 percent reduction to the allocation of indirect PE based on work RVUs that we finalized for CY 2026 shifted PE RVUs from the facility setting to the non-facility setting. However, for nursing facility and skilled nursing facility visits, the current site of service differential is determined based on the status of the beneficiary (that is, a Part A versus Part B stay) in that setting, rather than in the setting of care itself. Given that the resource costs for the professional involved in furnishing an E/M service would not be expected to differ based on whether the patient is in a Part A stay or not, we believe it is more accurate for these E/M services to be paid the same amount without regard to the beneficiary's Part A status.

Therefore, we proposed to address this anomaly for CY 2027 by equalizing the rate for nursing facility visits without regard to the beneficiary's status by setting the facility PE RVU equal to the non-facility PE RVU for CPT codes 99304 (*Initial nursing facility care, per day, for the evaluation and management of a patient, which requires a medically appropriate history and/or examination and straightforward or low level of medical decision making. When using total time on the date of the encounter for code selection, 25 minutes must be met or exceeded.*), 99305 (*Initial nursing facility care, per day, for the evaluation and management of a patient, which requires a medically appropriate history and/or examination and moderate level of medical decision making. When using total time on the date of the encounter for code selection, 35 minutes must be met or exceeded.*), 99306 (*Initial nursing facility care, per day, for the evaluation and management of a patient, which requires a medically appropriate history and/or examination and high level of medical decision making. When using total time on the date of the encounter for code selection, 50 minutes must be met or exceeded.*), 99307 (*Subsequent nursing facility care, per day, for the evaluation and management of a patient, which requires a medically appropriate history and/or examination and straightforward medical decision making. When using total time on the date of the encounter for code selection, 10 minutes must be met or exceeded.*), 99308 (*Subsequent nursing facility care, per day, for the evaluation and management of a patient, which requires a medically appropriate history and/or examination and low level of medical decision making. When using total time on the date of the encounter for code selection, 20 minutes must be met or exceeded.*), 99309 *(Subsequent nursing facility care, per day, for the evaluation and management of a patient, which requires a medically appropriate history and/or examination and moderate level of medical decision making. When using total time on the date of the encounter for code selection, 30 minutes must be met or exceeded.*), 99310 *(Subsequent nursing facility care, per day, for the evaluation and management of a patient, which requires a medically appropriate history and/or examination and high level of medical decision*

making. When using total time on the date of the encounter for code selection, 45 minutes must be met or exceeded.), 99315 *(Nursing facility discharge management; 30 minutes or less total time on the date of the encounter*), and 99316 *(Nursing facility discharge management; more than 30 minutes total time on the date of the encounter*).

This particular situation illuminates ongoing concerns regarding the current site of service differential. For example, interested parties have suggested that the current binary of facility and non-facility does not account for the range of employment models associated with physician services that drive significant differences in actual practice expenses. Interested parties have encouraged us to refine our previously finalized policy to ensure it is more empirically grounded and narrowly tailored to independent physicians, consistent with the policy's original intent. Interested parties have also stated that the facility PE reductions have had a disparate effect on hospital medicine groups and hospitalists, particularly those that operate independently from their hospital or health systems. Interested parties have stated that independent hospital medicine groups account for approximately one-third to one-half of the hospital medicine groups nationwide, and they are unable to cut administrative and overhead costs enough to absorb our CY 2026 facility PE reductions. As a result, some interested parties have stated that the reductions are accelerating the insolvency of independent physician practices and leading to an increase in hospital consolidation. We note that we have heard no general consensus among interested parties to this effect, and we have received feedback that this policy supports independent practices.

In the CY 2026 PFS proposed rule, we sought comments on whether our proposal to reduce the portion of the facility PE RVUs allocated based on work RVUs to half the amount allocated to non-facility PE RVUs was an appropriate reduction or whether we should consider a different percentage reduction for CY 2026 or in future years. In finalizing the proposal, we noted that, while our change to the methodology for CY 2026 represented a starting point to correcting historic distortions in the allocation of indirect PE costs across settings of care, we intended to further examine our methodology and consider additional refinements based upon feedback received and any studies or data sources identified.

For CY 2027, we remained open to more specific data that addresses the variability, as well as feedback on how to update the valuation and payment methodologies to better reflect the relative resources involved in furnishing the services, both across settings of care, and within the context of an evolving ecosystem of care models and business arrangements. Historically, we have relied extensively on specialty-specific PE/HR survey data and the binary site of service differential to best reflect variable PE costs.

To better inform our consideration of how to account for practice expenses under the PFS methodologies, including the current differentials that are effectuated based on the binary facility/non-facility settings of care, we sought comment on how PE costs vary for physicians and other professionals, not only based on whether they practice in part or exclusively in a facility setting but also based on how their costs vary when they are employed by health systems, hospitals, or other entities. We noted in the CY 2026 PFS final rule that (90 FR 49292) that the AMA has stated that physician practices maintain some indirect PE costs for physicians who are solely facility-based such as coding, billing, and scheduling. That being said, we generally agree with the concerns presented by MedPAC on the growth of exclusively facility-based physicians and agree that potential overpayments for indirect practice expense costs could be a driver of clinician movement to higher cost settings without creating commensurate clinical value. This is why we lowered indirect PE for facility-based physician to 50 percent in the CY 2026 PFS final rule.

Moving forward, we remain interested in ensuring indirect PE RVUs are appropriately accounting for indirect PE costs. As such, we sought information that will help illuminate to what extent these costs are truly incurred when the professionals are employed by the hospital and/or practice primarily in the hospital and are not already accounted for in the existing OPPS payments. For example, when a physician is employed by and practicing in a hospital, what portion of the indirect PE is associated with the PFS service, versus costs that are associated with the payment to the hospital, such as those paid under the OPPS?

We sought comment on the amount of indirect PE hospital-employed physicians incur when they furnish care within a facility. For these physicians, is the 50 percent indirect PE allocation accurate or could it possibly be less than 50 percent, such as 0 percent? In the case that there are little to no indirect costs incurred by the physician or other professionals, and these costs are borne by the hospital, we believe that these costs are not appropriately accounted for under the PFS and we may well be overestimating the relative resource costs compared to other PFS services. In consideration of the accuracy of the current 50 percent indirect PE allocation for services furnished in the facility setting, we are also seeking comment on whether and how we might, alternatively or additionally, define and identify physicians and professionals who are employed by hospitals, health systems, or other entities to ensure the services they furnish are not inappropriately consuming PE RVUs that would be more appropriately assigned to services furnished by professionals incurring comparatively greater practice expenses. Specifically, we sought comment on whether a new HCPCS modifier for employed physicians would be a reasonable way to identify and reduce facility PE from the services they perform in the facility setting, or whether there are other methods we could consider.

We sought comment on what are the primary variables we should consider to continue to improve our data sources, allocation methodologies, and payment rates across settings of care, to best reflect the resources involved in furnishing PFS services by professionals and suppliers operating in a complex marketplace, across settings of care. We remain interested in objective data regarding payment arrangements between hospitals, health systems, other employers and physicians, including which costs are incurred and whether the full range of costs are truly incurred by physicians and other professionals in these kinds of employment relationships. This would help us understand and improve how PE is allocated across settings of care, both in general and for specific kinds of services.

We received public comments on this proposal and comment solicitation. The following is a summary of the comments we received and our responses.

Comment: Commenters were unanimously supportive of our proposal to set the facility PE RVU equal to the non-facility PE RVU for nursing facility E/M codes (CPT codes 99304 through 99310, 99315 and 99316). We also received feedback in response to our comment solicitation on the current site of service differential finalized in the CY 2026 PFS final rule.

Response: We appreciate the commenters' support on our proposal. We received many comments on our comment solicitation regarding the site of service differential. Commenters agreed that using facility place-of-

service as a proxy for physician employment is imprecise, though they were divided on how to structure the differential going forward, with some supporting refinements such as additional specialty-specific adjustments and more detailed impact data. Most recommended replacing or supplementing this proxy with a more direct method of identifying hospital-employed physicians, with several suggesting independent practices self-identify given their incentive to do so. However, many commenters cautioned that employment status alone is not a reliable indicator of who bears indirect costs, noting that practices often continue to incur substantial administrative costs regardless of employment or site of service, and that the variety of employment arrangements makes any binary classification difficult to administer and prone to disputes. Commenters broadly urged CMS to take a more data-driven approach, including easing the impact on independent practices and reconsidering the reduction until better evidence is available. They also raised specialty-specific concerns and warned the policy could accelerate practice consolidation into hospital employment or acquisition by other entities. After consideration of public comments, we are finalizing to set the facility PE RVU equal to the non-facility PE RVU for nursing facility E/M codes (CPT codes 99304 through 99310, 99315 and 99316), as proposed. We may consider comments about the site-of-service differential in future rulemaking.

6. Strategies To Improve Payment Transparency, Accuracy, and Congruency Across Payment Systems

a. Professional and Technical Components

Because PFS services are paid across settings of care, and are the primary way that Medicare pays medical professionals, understanding the structure of PFS payment is a critical part of price transparency for Medicare, other payers, and consumers. Likewise, misunderstanding or confusion about what relative resources are incorporated in specific PFS payment rates can be a significant obstacle for payers and consumers navigating the health care market. For example, approximately 4,100 services paid as ''global surgical packages,'' (herein 'globals') are valued as bundled payments that aggregate multiple components of care into a single payment amount, including post-operative visits that are presumed to occur in particular settings (for example, inpatient hospital, outpatient hospital, office) regardless of where the services actually take place. Most PFS services are valued with a site of service binary, where the non-facility setting is the aggregation of all relative resources involved in furnishing the professional and technical aspects of the service, and the facility setting, where the rate generally excludes the facility costs involved in the service since those costs are addressed through separately reported facility fees. In contrast to these two constructs, there are other codes (mainly describing diagnostic and imaging services) that may be billed with professional component (PC, or modifier 26) and technical component (TC) modifiers, or without modifiers (global codes) that are paid for the complete global service. These differences in how payments are constructed and displayed can make it difficult for interested parties and CMS to evaluate relative payment rates, underlying resource costs, and value across settings of care.

These challenges are further compounded by differences across Medicare payment systems in how similar services are defined, bundled, and paid. For example, some payment systems incorporate technical inputs and facility resources into a single payment. This variation can obscure meaningful comparisons across sites of care and may complicate efforts to advance site-neutral payment policies aimed at reducing incentives for hospitals to acquire physician practices and limit site-of-care decisions based on financial considerations. As CMS continues to consider approaches that remove obstacles from market competition across settings of care, especially by improving transparency, comparability of PFS payments is an important foundational step.

We noted in the proposed rule, to facilitate more consistent comparisons across services and settings, we have developed a public use file that displays, for services that are not currently billable with TC/26 modifiers, RVUs amounts that reflect the relative resources involved in furnishing professional and technical aspects of the services, which is available on the CMS website under downloads for the CY 2027 PFS proposed rule at *https://www.cms.gov/medicare/payment/fee-schedules/physician/federal-regulation-notices*. This file is intended to improve transparency regarding how PFS payments may be conceptually divided between physician professional and technical components of the services, especially to illuminate the differences in fees between technical aspects of PFS services compared to facility fees across settings of care. We believe that making these components more visible, where feasible, may help interested parties better understand the structure of PFS payments and support more informed comparisons across settings of care. We noted that we have excluded 10- and 90-day global surgery services from display in this public use file since there are numerous ways to consider how the structure of payment for those codes may be best understood. The use of bundled payments for the 10- and 90-day global surgery services results in aggregated valuation for all pre-operative, intra-operative, and post-operative services furnished over a defined period (0-, 10-, or 90-day global periods), including services by both physician and clinical staff and practice expense without clear visibility into how each component contributes to the total bundled valuation. While we noted that the current structure of global surgery services has effectively obscured how the components of care are individually valued and limited our ability to disaggregate them for purposes of this public use file, we sought comment on how to address this problem, either in possible improvements to the global surgery packages or, at least, in the best way to make their component pieces transparent.

Additionally, we noted that there is a subset of additional exclusions from this public use file, such as codes subject to the cognitive services floor and the statutory phase-in of significant RVU reductions, due to technical challenges with how these policies are implemented that hinder the disaggregation of their component parts.

We emphasized in the proposed rule that we did not propose any changes to existing payment or billing policies, including the use of the 10- and 90-day globals. Rather, this effort is intended to improve transparency and provide a foundation for future rulemaking. We believe that greater visibility into how the professional and technical aspects of PFS services are valued and paid, where feasible, may enhance the ability of consumers, and payers (including CMS) to assess relativity across services, may enhance CMS's efforts to improve valuation over time, and support broader efforts to align payments across settings of care. We sought comment on several aspects of this approach. First, we sought comment on the utility of displaying RVUs associated with professional and technical aspects of services that are not currently billable with TC/26 modifiers, including how we may use this information to assess payment differences across settings. Again, we also sought comment on

potential approaches CMS could consider in future rulemaking to improve transparency for services currently paid as globals. Specifically, we were interested in feedback on how CMS could develop methodologies to more clearly identify and, where appropriate, disaggregate the underlying components of these services. We were also interested in comments on how CMS could ''right-size'' payments for the globals over time to ensure they remain aligned with current clinical practice and resource costs, are more readily updated based on empirical data, and do not obscure differences in cost and value across settings of care.

We received public comments on this comment solicitation. The following is a summary of the comments we received and our responses.

Comment: Some commenters were supportive of the CMS goal of improving transparency and developing more consistent information about the resources used to furnish services across different settings, but disagreed with our methodology of developing component-level values for services that the commenters say were not designed or valued as separately billable professional and technical components. Commenters stated that the display-only file raises significant methodological and policy questions, and that these values should not be treated as directly comparable, or used to support future payment changes, until CMS has completed further analysis and engaged affected interested parties. Another commenter stated that the proposed approach to create the file appears to be arbitrary and does not reflect allocations based on a thorough review of each service, and discouraged us from advancing future payment policy that relies on the public use file. The commenter stated that there are often justifiable reasons for cost variation between different sites of care and expressed concern that we intend to use the file in future years to equalize rates across sites of care that could result in hospitals being underpaid for care.

Response: We appreciate the commenters' support of our efforts to make available transparent information about the resources required to furnish services across settings. With respect to commenters who stated that the file's methodology was arbitrary or lacked utility, we note that estimating component-level resource use for display purposes does not require that those components be separately billable, and we believe such estimates can serve the transparency goals described in the proposed rule. We are open to alternative approaches to advancing comparisons across sites of care and may take any such suggestions into account in future rulemaking. We did not propose to use the file for payment comparisons in this rule. The display is intended only to begin building a transparency foundation, as described in the comment solicitation. We will consider commenters' methodological concerns before any future proposal that relies on cross-setting comparisons.

Comment: Some commenters stated that the re-presentation is more understandable to interested parties, but it would be more useful if CMS confirmed the systemic approach used or explained in greater detail how CMS developed the resource with sample calculations. Another commenter stated that they strongly support the establishment of this public use file because the AMA has historically been the gatekeeper of the relevant information utilized when determining RVU amounts. The commenter stated that the process is secretive and monetized access to databases has prevented interested parties from accessing and understanding the structure of PFS payments. Another commenter requested the addition of the code descriptors to the file to improve the readability and data analytics of the public use file.

Response: We appreciate the feedback from interested parties and may consider expanding the scope of the file in future rulemaking.

Comment: A commenter suggested that this file allows the opportunity for TC services under the MPFS to use the OPPS relativity data (excluding the packaged services) to assess the PE RVUs, rather than survey data. The commenter said that this would be similar to what CMS proposed for radiation oncology and proton beam treatment delivery services. They stated that they believe the public use file would provide greater accuracy to tie the RVUs to the audited hospital cost report data for the PE component, rather than survey data. The commenter also requested that we consider publishing the direct and indirect PE RVUs for facility and non-facility for all codes, and stated that this information available across services would provide valuable information and would increase transparency associated with RVUs and the PFS.

Response: We appreciate the feedback from interested parties. We may consider publishing the direct and indirect PE RVUs in future rulemaking.

b. Global Surgical Packages

We finalized a policy in the CY 2015 PFS final rule (79 FR 67582 through 67591) to transition all 10-day and 90-day globals to 0-day globals, allowing any post-operative visits furnished after the day of the procedure to be billed as a standalone visit. CMS was prohibited from implementing this policy through section 523(a) of the Medicare Access and CHIP Reauthorization Act (MACRA) and was required to collect data on how to best value globals. CMS did so through a research contract with RAND and a data-collection process over several years to develop data to improve the payment rates for these services. Data collection has been based on reporting of CPT code 99024 (*Postoperative follow-up visit, normally included in the surgical package, to indicate that an evaluation and management service was performed during a postoperative period for a reason(s) related to the original procedure*), which is limited to practices with 10 practitioners or more, limited to nine States, and is used solely for data collection so it has no associated payment with reporting the code. In the CY 2019 PFS final rule (83 FR 59503), we released findings that only 4 percent of reviewed 10-day globals and 67 percent of reviewed 90-day globals had one or more post-operative visit which occurred during the global period and sought comment on potential approaches for revaluing the globals based on these findings (83 FR 59504). In the CY 2023 PFS proposed rule (87 FR 45877 through 45880), CMS reviewed the prior work and conversations around global valuations, solicited feedback from the public, and has continued to explore ways over the years to address valuation of the globals that would be minimally disruptive to the PFS.

Over the past several years, CMS has taken several iterative steps to improve payment accuracy for the globals. In the CY 2025 PFS final rule (89 FR 97964 through 97968), CMS expanded the applicability of the transfer of care modifiers to address instances where separate practitioners are billing for standalone E/M visits during the global period more directly with mandatory reporting of payment modifiers in clinical cases when there is both a formal or informal transfer of care between practitioners furnishing distinct portions of a global service. CMS also created a post-operative care services add-on code to more appropriately reflect the time and resources involved for practitioners who were not involved in furnishing the surgical procedure. CMS is continuing to explore further steps to improve accountability and more accurate

payment and what additional next steps CMS could take to improve the payment rates for global services.

In keeping with the administration priorities and aligning spending and value, we proposed to pause the data collection required by MACRA based on RAND's findings over the past several years. We remain interested in how best to use and collect this data going forward and ways we might consider improving this data collection. We currently have several years of data that have continued to illustrate what we believe is the issue with the post-operative visits during the global period and how these visits are not occurring, yet providers are still being paid for these visits under the current global payment policy. Additionally, we believe that the current data collection may be causing undo burden to providers and we believe that pausing the data collection will aid in burden reduction for practitioners. We do however question whether a more robust data collection would be appropriate and if we should have all providers report CPT code 99024.

We also sought comment on the question, as to whether CMS should have all providers report CPT code 99024, and also other data sources we might consider to more accurately value the globals.

We received public comments on these proposals. The following is a summary of the comments we received and our responses.

Comment: Commenters were generally in support of the CMS proposal to pause the data collection required by MACRA to report CPT code 99024. Most commenters were not in support of CMS using that data for the revaluation process. Commenters were overall in agreement that expanding the data collection would pose undo administrative burden to providers and urged CMS to not expand the reporting. Commenters were not in support of using the information presented in the Public Use File (PUF), in particular the purely ''arithmetic approach'' to understand the valuation of the services based on the data that was analyzed. Many commenters were opposed to CMS using the reported data in the process of revaluation. Commenters stated that the underreporting of CPT code 99024 does not indicate or capture the post-operative work that was furnished even though a visit was not actually reported. Commenters noted that pausing the data collection allows for opportunity to evaluate the data limitations and develop a more accurate approach. Several commenters suggested CMS spend time understanding post operative care, how it is organized, as well as non-visit post-operative work that takes place even when a visit is not furnished as care extends beyond the post-operative visits.

Response: We appreciate the commenters' feedback and support of pausing the data collection of CPT code 99024. We understand the commenters' concerns that data collection may impose administrative burden and understand this concern with expanding the data collection beyond the sample that was required. We believe that a pause in the data collection allows CMS an opportunity to evaluate the data limitations and further refine our approach to data collection on the global surgical packages.

After consideration of public comments on our proposal, we are finalizing pausing the data collection as proposed. CMS remains interested in how to best capture post operative data to better inform valuation of post-operative services under the PFS.

As noted in the proposed rule, we posted a public use file with the proposed rule to display the imputed RVUs associated with both the 10- and 90-day post-operative visits based on a purely arithmetic approach to understand the valuation of the services based on the data that was analyzed. The public use file shows the current work RVUs, the number of post-operative visits that are reported to CMS using no-pay HCPCS code 99024, and the work RVUs remaining if all post-operative visits are removed. The public use file is available on the CMS website under downloads for the CY 2027 PFS final rule at *https://www.cms.gov/medicare/payment/fee-schedules/physician/federal-regulation-notices*. We solicited comments on potential revaluation strategies that we may consider through future rulemaking. We received public comments on these proposals. The following is a summary of the comments we received and our responses.

Comment: As stated previously, many commenters were not in support of using the information in the public use file to help inform revaluation of the global surgical packages. Other commenters thought it was a good first step toward the revaluation process. A few commenters supported aligning payment for global surgical services with services actually furnished, while others noted the reporting of CPT code 99024 did not specify the visit level or level of physician work. Other commenters supported the publication of the imputed post-operative visit RVU public use file while other commenters did not think CMS should use missing postoperative visit claims as proof that postoperative care is not being furnished.

Response: We thank the commenters for their feedback.

After consideration of public comments, we express appreciation for the feedback from commenters and will take the comments into consideration for possible future rulemaking.

C. Payment for Medicare Telehealth Services

As discussed in prior rulemaking, several conditions must be met for Medicare to make payment for telehealth services under the PFS. See further details and full discussion of the scope of Medicare telehealth services in the CY 2018 PFS final rule (82 FR 53006), the CY 2021 PFS final rule (85 FR 84502), the CY 2024 PFS final rule (88 FR 78861 through 78866), the CY 2026 PFS final rule (90 FR 49316 through 49320), and in 42 CFR 410.78 and 414.65. Our current 3-step review process reflects the stepwise method by which we consider requests to add services to or remove services from the Medicare Telehealth Services List, beginning with the CY 2026 Medicare Telehealth Services List:

Step 1. Determine whether the service is separately payable under the PFS.

Step 2. Determine whether the service is subject to the provisions of section 1834(m) of the Act.

Step 3. Review the elements of the service as described by the HCPCS code and determine whether each of them is capable of being furnished using an interactive telecommunications system as defined in § 410.78(a)(3).

1. Changes to the Medicare Telehealth Services List

a. Requests To Add Services to the Medicare Telehealth Services List for CY 2027

We did not receive any requests to add or remove services from the Medicare Telehealth Services List for CY 2027.

Consistent with the deadline for our receipt of code valuation recommendations from the American Medical Association's Relative Value Scale Update Committee (AMA RUC) and other interested parties established in the CY 2019 PFS final rule (83 FR 59491) and with the process set forth in prior calendar years, for CY 2027, requests to add services to the Medicare Telehealth Services List must have been submitted to and received by CMS by February 10, 2026. Consistent with the deadline for our receipt of code

valuation recommendations from the AMA RUC and other interested parties established in the CY 2019 PFS final rule (83 FR 59491) and with the process set forth in prior calendar years, for CY 2028, requests to add services to the Medicare Telehealth Services List must be submitted to and received by CMS by February 10, 2027. Each request submitted by the deadline to add a service to the Medicare Telehealth Services List must include any supporting documentation the requester wishes CMS to consider. Because we use the annual PFS rulemaking process to make changes to the Medicare Telehealth Services List, requesters are advised that any information submitted as part of a request is subject to public disclosure for this purpose. For more information on submitting a request to add services to the Medicare Telehealth Services List, including where to send these requests, and to view the current Medicare Telehealth Service List, see our website at *https://www.cms.gov/Medicare/Medicare-General-Information/Telehealth/index.html*.

We did not receive any requests to add or remove services from the Medicare Telehealth Services List for CY 2027 by the February 10, 2026 deadline. However we received public comments on this topic from interested parties. The following is a summary of the comments we received and our responses.

Comment: We received comments requesting services to be added to the Medicare Telehealth Services List during the public comment period for the CY 2027 proposed rule.

Response: For consideration in the CY 2027 PFS rulemaking, requests to add services to the Medicare Telehealth Services List for CY 2027 must have been received by February 10, 2026. For CY 2028, requests to add services to the Medicare Telehealth Services List must be submitted to and received by CMS by February 10, 2027.

Comment: Commenters highlighted that we did not align certain services on the Medicare Telehealth List with services being deleted for CY 2027. As discussed in section II.D under Adaptive Behavior Services, at the September 2025 CPT Editorial Panel meeting, the CPT Editorial Panel deleted CPT codes 0362T and 0373T. These codes are being replaced with CPT codes 97148, 97149, 97159, 97160, and 97173. As discussed in section II.D. under Speech-Language Pathology Services, at the September 2025 CPT Editorial Panel meeting, CPT code 92507 was replaced with 10 new codes (92654, 92655, 92656, 92657, 92658, 92659, 92660, 92661, 92662, and 92663).

Response: We thank commenters for this information. We inadvertently maintained these codes on the Medicare Telehealth Services List. We believe that these codes represent replacements for the codes currently describing these services on the Medicare Telehealth Services List. As such, we are finalizing the deletion of CPT codes 92507, 0362T, and 0373T and the addition of CPT codes 97148, 97149, 97159, 97160, 97173, 92654, 92655, 92656, 92657, 92658, 92659, 92660, 92661, 92662, and 92663 to the Medicare Telehealth Services List.

In accordance with our longstanding policy, requests to add services to the Medicare Telehealth Services List must be submitted to and received by CMS by February 10, 2026. We will not consider requests to add services submitted during the public comment period for the CY 2027 proposed rule. That said, CPT codes 92507, 0362T, and 0373T will be removed from the Medicare Telehealth Service List as they were inadvertently maintained. We will be replacing deleted CPT code 92507 with CPT codes 92654, 92655, 92656, 92657, 92658, 92659, 92660, 92661, 92662, and 92663. We will be replacing deleted CPT codes 0362T and 0373T with 97148, 97149, 97159, 97160, and 97173.

b. CMS Requirement To Add New Codes to the List

In the CY 2027 PFS proposed rule, we proposed to add HCPCS G-codes G0572 (*Advance care planning including the explanation and discussion of advance directives such as standard forms (with completion of such forms, when performed), first 20 minutes of clinical staff time with the patient, family member(s), directed by a treating physician or other treating qualified health care professional*), G0573 (*Advance care planning including the explanation and discussion of advance directives such as standard forms (with completion of such forms, when performed), each additional 20 minutes with the patient, family member(s), directed by a treating physician or other treating qualified health care professional (List separately in addition to code for primary procedure*)), G0686 (*Voluntary, group-based medical session involving multiple patients with common medical condition(s), receiving medical care in a group setting; billed and led by a physician or qualified nonphysician practitioner and may include services provided by other qualified healthcare professionals, clinical staff, or auxiliary personnel under the direction of the supervising physician or other practitioner. Session integrates group education, counseling, and peer support with individualized patient clinical assessment and care, 2–10 patients, billed once per patient, per session.*), G0903 (*Treatment of speech, language, voice, communication, and/or auditory processing disorder; individual; for the pediatric population age 21 and under*), and G0576 (*Office or other outpatient evaluation and management service(s) for the diagnosis and treatment of vaccine adverse effects, new or established patient; each 15 minutes personally performed by the physician or qualified healthcare professional (list separately in addition to CPT codes 99202, 99203, 99204, 99205, 99211, 99212, 99213, 99214, 99215, 99341, 99342, 99344, 99345, 99347, 99348, 99349, 99350))* to the Medicare Telehealth Services List. In the CY 2027 PFS proposed rule, we stated that these services, if finalized, will be separately payable under the PFS and will subject to the provisions of section 1834(m) of the Act, as they are inherently face-to-face services and would serve as a substitute for an in-person encounter. We also stated that we believe that the elements of these services as described by the HCPCS codes are capable of being furnished using an interactive telecommunications system as defined in § 410.78(a)(3). We refer readers to the relevant requirements in section II.D. of this final rule for further background on these codes.

We received public comments on our proposal to add G0572 and G0573 to the Medicare Telehealth Services List. The following is a summary of the comments we received and our responses.

Comment: Commenters generally supported our proposal to add these services to the Medicare Telehealth Services List. Many of these commenters supported our proposal to add the services to the Medicare Telehealth Services List if the codes are finalized.

Response: We appreciate the feedback from the commenters.

After consideration of public comments, we are finalizing as proposed to add GACP1 and G0573 2 to the Medicare Telehealth Services List, beginning in CY 2027.

We received public comments on our proposal to add G0686 to the Medicare Telehealth Services List. The following is a summary of the comments we received and our responses.

Comment: Commenters generally supported our proposal to add this service to the Medicare Telehealth Services List.

Response: We appreciate the feedback from the commenters. As discussed in section II.D of this rule, we are finalizing an add-on code for shared medical appointments, G0687.

After consideration of public comments, we are finalizing as proposed to add G0686 and G0687 to the Medicare Telehealth Services List, beginning in CY 2027.

We received public comments on our proposal to add G0903 to the Medicare Telehealth Services List. The following is a summary of the comments we received and our responses.

Comment: Commenters pointed out a discrepancy between the code descriptor for HCPCS code G0903 described in sections of the NPRM, which we described as ''pediatric population up to 18 or 21''. The finalized code descriptor, as described in II.D, is ''Treatment of speech, language, voice, communication, and/or auditory processing disorder; individual; for the pediatric population age 21 and under''.

Response: We thank commenters for pointing out the discrepancy. The corrected code descriptor for HCPCS code G0903 is ''Treatment of speech, language, voice, communication, and/or auditory processing disorder; individual; for the pediatric population up to age 21.''

Comment: Commenters generally supported our proposal to add these services to the Medicare Telehealth Services List.

Response: We appreciate the commenters for their feedback. After consideration of public comments, we are finalizing as proposed to add HCPCS code G0903 to the Medicare Telehealth Services List, beginning in CY 2027.

We received public comments on our proposal to add HCPCS code G0576 to the Medicare Telehealth Services List. The following is a summary of the comments we received and our responses.

Comment: Commenters generally supported our proposal to add these services to the Medicare Telehealth Services List.

Response: We appreciate the commenters for their feedback. After consideration of public comments, we are finalizing as proposed to add HCPCS code G0576 to the Medicare Telehealth Services List, beginning in CY 2027.

We are finalizing the addition of HCPCS codes G0576, G0572, G0573, G0686, G0687, and G0903 to the Medicare Telehealth Services List.

2. Telehealth Flexibilities and Modifiers

As discussed in the CY 2021 PFS final rule (85 FR 84506), legislation enacted to address the PHE for COVID–19 provided the Secretary with new authorities under section 1135(b)(8) of the Act, as added by section 102 of the Coronavirus Preparedness and Response Supplemental Appropriations Act, 2020 (Pub. L. 116–123, March 6, 2020) and subsequently amended by section 6010 of the Families First Coronavirus Response Act (Pub. L. 116–127, March 18, 2020) and section 3703 of the Coronavirus Aid, Relief, and Economic Security Act (CARES Act) (Pub. L. 116–136, March 27, 2020), to waive or modify Medicare telehealth payment requirements during the PHE for COVID–19.

We used these authorities to establish several flexibilities to accommodate changes in the delivery of care during the PHE. Through waiver authority under section 1135(b)(8) of the Act, in response to the PHE for COVID–19, we removed the geographic and site of service originating site restrictions in section 1834(m)(4)(C) of the Act, as well as restrictions in section 1834(m)(4)(E) of the Act on the types of practitioners who may furnish telehealth services, for the duration of the PHE for COVID–19. We also used waiver authority to allow certain telehealth services to be furnished via audio-only communication technology. At the end of the PHE for COVID–19, these waivers and interim policies were set to expire, and payment for Medicare telehealth services would have once again been limited by the requirements of section 1834(m) of the Act. These flexibilities have been extended by Congress numerous times since, most recently in the Consolidated Appropriations Act, 2026 (CAA, 2026) (Pub. L. 119—75, February 3, 2026).

Section 6209(a) and (b) of the CAA, 2026 extends the flexibilities for Medicare telehealth services to remove the geographic restrictions, extends the expanded list of acceptable originating sites, and extends the expanded array of practitioners eligible to furnish telehealth services from January 30, 2026 to the extended date of December 31, 2027. Section 6209(d) of the CAA, 2026 delays the in-person visit requirements for mental health services furnished through telehealth from January 30, 2026 to the extended date of January 1, 2028. Section 6209(e) of the CAA, 2026 extends the flexibilities to allow audio-only Medicare telehealth services from January 30, 2026 to the extended date of January 1, 2028. To align with these extensions, § 410.78 has been revised, detailed later in this final rule.

Additionally, section 6209(g) of the CAA, 2026, requires CMS to establish modifiers for telehealth services in certain instances, effective January 1, 2027. These modifiers do not affect payment and are required for claims for telehealth services that are furnished through a virtual telehealth platform by a physician or practitioner that contracts with an entity that owns such virtual platform; or for which a physician or practitioner has a payment arrangement with an entity for use of such virtual platform; and for claims for telehealth services that are furnished incident to a physician's or practitioner's professional service.

In accordance with section 6209(g) of CAA, 2026, we are creating modifiers BB and BC. Guidance on use of these modifiers will be available on the CMS website. Any updates to this policy will be issued via subregulatory guidance in accordance with section 6209(h) of the CAA, 2026, which authorizes the Secretary to implement section 6209 via program instruction or otherwise.

We did not solicit comments on creating modifiers BB and BC, however we received public comments on this topic from interested parties. The following is a summary of the comments we received and our responses.

Comment: Commenters requested additional information and clarifications on the use of these modifiers.

Response: Telehealth modifiers BB (*Claims for telehealth services that are furnished through a telehealth virtual platform by a physician or practitioner that contracts with an entity that owns such virtual platform, or for which a physician or practitioner has a payment arrangement with an entity for use of such virtual platform.*) and BC (*Telehealth services that are furnished incident to a physician's or practitioner's professional service.*) are required beginning January 1, 2027. These modifiers do not have payment implications. Information on these modifiers is available on the CMS website here: *https://www.cms.gov/medicare/coverage/telehealth*.

3. Telehealth Critical Care Consultations

In the CY 2017 PFS final rule (81 FR 80352 through 80353), we established HCPCS codes G0508 (*Telehealth consultation, critical care, initial, physicians typically spend 60 minutes communicating with the patient and providers via telehealth*) and G0509 (*Telehealth consultation, critical care, subsequent, physicians typically spend 50 minutes communicating with the patient and providers via telehealth*) to report telehealth consultations for a patient requiring critical care services. These services were modeled after CPT

codes 99291 (*Critical care, evaluation and management of the critically ill or critically injured patient; first 30 to 74 minutes*) and 99292 (*Critical care, evaluation and management of the critically ill or critically injured patient; each additional 30 minutes (list separately in addition to code for primary service*)).

When adding some services to the Medicare Telehealth Services List in the past, we have included certain frequency restrictions on how often physicians and other practitioners may furnish the service via telehealth. These include a limitation of one critical care consultation service furnished via telehealth per day, added in the CY 2017 final rule (81 FR 80198). In the CY 2026 PFS final rule, we finalized permanently removing frequency limitations on furnishing these services via telehealth (90 FR 49324 through 49325).

We continue to believe that physicians and other practitioners, who have the greatest familiarity and insight into the needs of individual beneficiaries, can use their complex professional judgment to determine whether they can safely furnish a service via telehealth, given the entirety of the circumstances, including the clinical profile and needs of the beneficiary, to determine the appropriate service modality. We strive to balance the goals of increasing physician or practitioner and patient choice of service modality with consideration of patient safety for all Medicare beneficiaries. As technology advances and more services may be safely furnished via telehealth and paid under the PFS, it is increasingly important for physicians and other practitioners to exercise their professional judgment in determining the generally appropriate service modality for their patients to receive a service.

Since the permanent removal of the frequency limitation of one critical care consultation service furnished via telehealth per day, we have received questions about language in the code descriptors for HCPCS codes G0508 *(Telehealth consultation, critical care, initial , physicians typically spend 60 minutes communicating with the patient and providers via telehealth*) and G0509 (*Telehealth consultation, critical care, subsequent, physicians typically spend 50 minutes communicating with the patient and providers via telehealth*) describing ''initial'' and ''subsequent'' consultations, as well as questions regarding the language about the typical time spent on the service. To clarify the requirements for billing these services, we proposed the following revised code descriptors:

- G0508: *Telehealth consultation, critical care; first 30 to 74 minutes.*
- G0509: *Telehealth consultation, critical care; each additional 30 minutes (List separately in addition to code for primary service*).

The following is a summary of the comments we received and our responses.

Comment: The majority of commenters supported our proposal to revise the code descriptors for HCPCS codes G0508 and G0509, as these revisions would clarify and streamline billing requirements. Commenters who did not support our proposal believed that the proposed code descriptors too closely mirror the code descriptors for CPT codes 99291 and 99292 and may cause more confusion, and that in practice, these codes may be used interchangeably. A few commenters suggested that we delete HCPCS codes G0508 and G0509 and only use CPT codes 99291 and 99292. One commenter stated that they are submitting CPT proposals to revise many CPT codes 99291 and 99292, and requested that we do not adopt any time increment changes for critical care until that CPT code proposal has been reviewed.

Response: We thank commenters for their feedback. After further review of claims data, we disagree that HCPCS codes G0508 and G0509 and CPT codes 99291 and 99292 are used entirely interchangeably, and we see a programmatic need to maintain both sets of codes. After consideration of public comments, we are finalizing as proposed.

4. Changes to Teaching Physicians' Billing for Services Involving Residents or Teaching Physicians With Virtual Presence

In the CY 2021 PFS final rule (85 FR 84577 through 84585), we finalized a temporary policy that allowed the teaching physician to have a virtual presence in all teaching settings, but only in clinical instances when the service was furnished virtually (for example, a three-way telehealth visit, with all parties in separate locations). This permitted teaching physicians to have a virtual presence during the key portion of the Medicare telehealth service for which payment was sought, through audio/video real-time communications technology, in all residency training locations through December 31, 2024.

As summarized in the CY 2025 PFS final rule (89 FR 97764 through 97765), commenters encouraged CMS to establish this policy permanently and include in-person services to promote access to care, and stated that teaching physicians should be allowed to determine when their virtual presence would be clinically appropriate based on their assessment of the patient's needs and the competency level of the resident. In the CY 2026 PFS final rule, we finalized a policy to permanently allow teaching physicians to have a virtual presence in all teaching settings, and in clinical instances only when the service is a three-way telehealth visit, with the teaching physician, resident, and patient in different locations.

We have received feedback from interested parties that indicates that our current policy for teaching physicians and residents can, in somewhat rare cases, cause logistical complexities in scenarios where either the teaching physician or resident is already in the same physical location as the beneficiary. For CY 2027, we proposed a modification to our previously finalized policy. Rather than requiring the teaching physician, resident, and patient to each be in a different location, we proposed to allow teaching physicians to bill for services involving residents when either the teaching physician or resident is in the same physical location as the beneficiary. We will generally interpret physical presence to be defined as either the teaching physician or resident in the same room as the beneficiary, but we sought comment on other scenarios in which this may be appropriate. We also proposed that this would only be applicable to services that are on the Medicare Telehealth Services List. As always, documentation in the medical record must continue to demonstrate whether the teaching physician was physically present or present through audio/video real-time communications technology at the time of the Medicare telehealth service, which includes documenting the specific portion of the service for which the teaching physician was present through audio/video real-time communications technology. In accordance with section 1842(b)(7)(A)(i)(I) of the Act, the teaching physician must have personal oversight and involvement over the management of the portion of the case for which the payment is sought. We sought comments on this proposal.

The following is a summary of the comments we received and our responses.

Comment: Many commenters supported our proposal, stating that the requirements finalized in the CY 2026 PFS final rule create unnecessary barriers to care and do not reflect

modern clinical practice. Commenters believed our proposed policy would provide flexibility and eliminate unnecessary barriers to care.

Response: We thank commenters for their feedback.

Comment: Commenters requested clarification regarding this policy. Specifically, commenters asked if clinical instances when the service is a three-way telehealth visit, with the teaching physician, resident, and patient all in different locations, would still be permitted.

Response: Yes, this proposal was intended to be additive to the policy finalized in the CY 2026 Final Rule.

Comment: Commenters requested confirmation that teaching physicians may bill for services involving residents when either the teaching physician or resident is in the same physical location as the beneficiary.

Response: As stated in the CY 2027 proposed rule (91 FR 43864), either the teaching physician or resident may be in the same physical location as the beneficiary.

Comment: Commenters requested that we allow for the teaching physician and resident to be in the same location, with the beneficiary being present remotely. Another commenter requested that we define these services based on the location of the patient, not of the teaching physician and/or resident.

Response: We thank commenters for their feedback and may consider this for future rulemaking.

Comment: Commenters requested information about the use of telehealth restrictions/guidance for teaching physicians billing for services involving residents or teaching physicians with virtual presence.

Response: All requirements for telehealth services would apply to these services, such as place of service codes and modifiers.

After consideration of public comments, we are finalizing as proposed and amending § 415.172.

5. Telehealth Originating Site Facility Fee Payment Amount Update

Section 1834(m)(2)(B) of the Act established the Medicare telehealth originating site facility fee for telehealth services furnished from October 1, 2001 through December 31, 2002 at $20.00, and specifies that, for telehealth services furnished on or after January 1 of each subsequent calendar year, the telehealth originating site facility fee is increased by the percentage increase in the Medicare Economic Index (MEI) as defined in section 1842(i)(3) of the Act. The proposed MEI percentage increase for CY 2027 was 2.5 percent and was based on the expected historical percentage increase of the 2017-based MEI. We proposed incorporating historical data through the second quarter of 2026 to determine the final CY 2027 MEI percentage increase. The final MEI update for CY 2027 is 2.6 percent reflecting historical data through the second quarter of 2026.

We received public comments on these proposals. The following is a summary of the comments we received and our responses.

Comment: Commenters generally supported the proposed update. A commenter requested that CMS assess whether the statutory update adequately accounts for the actual cost of supporting a telehealth encounter.

Response: We appreciate the feedback from commenters. As noted above, the payment amount and annal updates to the telehealth originating site facility fee are set in statute. Specifically, the telehealth originating site facility fee is increased by the percentage increase in the Medicare Economic Index (MEI) as defined in section 1842(i)(3) of the Act. It is not subject to recalculation based on additional external cost information.

After consideration of public comments, we are finalizing the CY 2027 increase to the telehealth originating site facility fee based on the most recent percentage increase in the 2017-based MEI of 2.6 percent, reflecting historical data through the second quarter of 2026 and shown in Table A–C1.

TABLE A-C1: THE MEDICARE TELEHEALTH ORIGINATING SITE FACILITY FEE

Time Period	MEI (%)	Facility Fee for Q3014
Oct. 1, 2001 to Dec. 31, 2002	n/a	$20.00
2003	3.0	$20.60
2004	2.9	$21.20
2005	3.1	$21.86
2006	2.8	$22.47
2007	2.1	$22.94
2008	1.8	$23.35
2009	1.6	$23.72
2010	1.2	$24.00
2011	0.4	$24.10
2012	0.6	$24.24
2013	0.8	$24.43
2014	0.8	$24.63
2015	0.8	$24.83
2016	1.1	$25.10
2017	1.2	$25.40
2018	1.4	$25.76
2019	1.5	$26.15
2020	1.9	$26.65
2021	1.4	$27.02
2022	2.1	$27.59
2023	3.8	$28.64
2024	4.6	$29.96
2025	3.5	$31.01
2026	2.7	$31.85
2027*	2.6	$32.68

*Reflects the most recent estimate of the CY 2027 MEI percentage increase, based on historical data through the second quarter of 2026.

D. Valuation of Specific Codes Including Potentially Misvalued Services Under the PFS

1. Background: Process for Valuing New, Revised, and Potentially Misvalued Codes

Establishing valuations for newly created and revised CPT codes is a routine part of maintaining the PFS. Since the inception of the PFS, it has also been a priority to revalue services regularly to make sure that the payment rates reflect the changing trends in the practice of medicine and current prices for inputs used in the PE calculations. Initially, this was accomplished primarily through the 5-year review process, which resulted in revised work RVUs for CY 1997, CY 2002, CY 2007, and CY 2012, and revised PE RVUs in CY 2001, CY 2006, and CY 2011, and revised MP RVUs in CY 2010, CY 2015, and CY 2020. Under the 5-year review process, revisions in RVUs were proposed and finalized via rulemaking. In addition to the 5-year reviews, beginning with CY 2009, CMS and the AMA's Relative Value Unit Update Committee (RUC) identified a number of potentially misvalued codes each year using various identification screens, as outlined in section II.C. of this final rule, Potentially Misvalued Services under the PFS. Historically, when we received RUC recommendations, our process had been to establish interim final RVUs for the potentially misvalued codes, new codes, and any other codes for which there were coding changes in the final rule with comment period for a year. Then, during the 60-day period following the publication of the final rule with comment period, we accepted public comments about those valuations. For services furnished during the calendar year following the publication of interim final rates, we paid for services based upon the interim final values established in the final rule. In the final rule with comment period for the subsequent year, we considered and responded to public comments received on the interim final values and typically made any appropriate adjustments and finalized those values.

In the CY 2015 PFS final rule with comment period (79 FR 67547), we finalized a new process for establishing values for new, revised and potentially misvalued codes. Under the new process, we include proposed values for these services in the proposed rule, rather than establishing them as interim final in the final rule with comment period. Beginning with the CY 2017 PFS proposed rule (81 FR 46162), the new process was applicable to all codes, except for new codes that describe truly new services. For CY 2017, we proposed new values in the CY 2017 PFS proposed rule for the vast majority of new, revised, and potentially misvalued codes for which we received complete RUC recommendations by February 10, 2016. To complete the transition to this new process, for codes for which we established interim final values in the CY 2016 PFS final rule with comment period (81 FR 80170), we reviewed the comments received during the 60-day public comment period following release of the CY 2016 PFS final rule with comment period (80 FR 70886),

and re-proposed values for those codes in the CY 2017 PFS proposed rule. We considered public comments received during the 60-day public comment period for the proposed rule before establishing final values in the CY 2017 PFS final rule. As part of our established process, we will adopt interim final values only in the case of wholly new services for which there are no predecessor codes or values and for which we do not receive recommendations in time to propose values.

As part of our obligation to establish RVUs for the PFS, we thoroughly review and consider available information including recommendations and supporting information from the RUC, the Health Care Professionals Advisory Committee (HCPAC), public commenters, medical literature, Medicare claims data, comparative databases, comparison with other codes within the PFS, as well as consultation with other physicians and healthcare professionals within CMS and the Federal Government as part of our process for establishing valuations. Where we concur that the RUC's recommendations, or recommendations from other commenters, are reasonable and appropriate and are consistent with the time and intensity paradigm of physician work, we proposed those values as recommended. Additionally, we continually engage with interested parties, including the RUC, regarding our approach for accurately valuing codes, and as we prioritize our obligation to value new, revised, and potentially misvalued codes. We continue to welcome feedback from all interested parties regarding valuation of services for consideration through our rulemaking process.

2. Methodology for Establishing Work RVUs

a. Background

For each code identified in this section, we conduct a review that includes the current work RVU (if any), RUC-recommended work RVU, intensity, time to furnish the preservice, intraservice, and postservice activities, as well as other components of the service that contribute to the value. Our reviews of recommended work RVUs and time inputs generally include, but have not been limited to, a review of information provided by the RUC, the HCPAC, and other public commenters, medical literature, and comparative databases, as well as a comparison with other codes within the PFS, consultation with other physicians and health care professionals within CMS and the Federal Government, as well as Medicare claims data. We also assess the methodology and data used to develop the recommendations submitted to us by the RUC and other public commenters and the rationale for the recommendations. In the CY 2011 PFS final rule with comment period (75 FR 73328 through 73329), we discussed a variety of methodologies and approaches used to develop work RVUs, including survey data, building blocks, crosswalks to key reference or similar codes, and magnitude estimation (see the CY 2011 PFS final rule with comment period (75 FR 73328 through 73329) for more information). When referring to a survey, unless otherwise noted, we mean the surveys conducted by specialty societies as part of the formal RUC process.

Components that we use in the building block approach may include preservice, intraservice, or postservice time and post-procedure visits. When referring to a bundled CPT code, the building block components could include the CPT codes that make up the bundled code and the inputs associated with those codes. We use the building block methodology to construct, or deconstruct, the work RVU for a CPT code based on component pieces of the code. Magnitude estimation refers to a methodology for valuing work that determines the appropriate work RVU for a service by gauging the total amount of work for that service relative to the work for a similar service across the PFS without explicitly valuing the components of that work. In addition to these methodologies, we frequently utilize an incremental methodology in which we value a code based upon its incremental difference between another code and another family of codes. Section 1848(c)(1)(A) of the Act specifically defines the work component as the resources that reflect time and intensity in furnishing the service. Also, the published literature on valuing work has recognized the key role of time in overall work. For particular codes, we refine the work RVUs in direct proportion to the changes in the best information regarding the time resources involved in furnishing particular services, either considering the total time or the intraservice time.

Several years ago, to aid in the development of preservice time recommendations for new and revised CPT codes, the RUC created standardized preservice time packages. The packages include preservice evaluation time, preservice positioning time, and preservice scrub, dress and wait time. Currently, there are preservice time packages for services typically furnished in the facility setting (for example, preservice time packages reflecting the different combinations of straightforward or difficult procedure, and straightforward or difficult patient). Currently, there are three preservice time packages for services typically furnished in the non-facility setting.

We have developed several standard building block methodologies to value services appropriately when they have common billing patterns. For example, in cases where a service is typically furnished to a beneficiary on the same day as an E/M service, we believe that there is overlap between the two services in some of the activities furnished during the preservice evaluation and postservice time. Our longstanding adjustments have reflected a broad assumption that at least one-third of the work time in both the preservice evaluation and postservice period is duplicative of work furnished during the E/M visit.

Accordingly, in cases where we believe that the RUC has not adequately accounted for the overlapping activities in the recommended work RVU and/or times, we adjust the work RVU and/or times to account for the overlap. The work RVU for a service is the product of the time involved in furnishing the service multiplied by the intensity of the work. Preservice evaluation time and postservice time both have a long-established intensity of work per unit of time (IWPUT) of 0.0224, which means that 1 minute of preservice evaluation or postservice time equates to 0.0224 of a work RVU.

Therefore, in many cases when we remove 2 minutes of preservice time and 2 minutes of postservice time from a procedure to account for the overlap with the same day E/M service, we also remove a work RVU of 0.09 (4 minutes $\times$ 0.0224 IWPUT) if we do not believe the overlap in time had already been accounted for in the work RVU. The RUC has recognized this valuation policy and, in many cases, now addresses the overlap in time and work when a service is typically furnished on the same day as an E/M service.

The following paragraphs discuss our approach to reviewing RUC recommendations and developing proposed values for specific codes. When they exist, we also include a summary of interested party reactions to our approach. We noted that many commenters and interested parties have expressed concern over the years with our ongoing adjustment of work RVUs based on changes in the best information we had regarding the time resources involved in furnishing individual services. We have been

particularly concerned with the RUC's and various specialty societies' objections to our approach given the significance of their recommendations to our process for valuing services and since much of the information we use to make the adjustments is derived from their survey process. We note that we are obligated under the statute to consider both time and intensity in establishing work RVUs for PFS services. As explained in the CY 2016 PFS final rule with comment period (80 FR 70933), we recognize that adjusting work RVUs for changes in time is not always a straightforward process, so we have applied various methodologies to identify several potential work values for individual codes.

We observed that for many codes reviewed by the RUC, recommended work RVUs have appeared to be incongruous with recommended assumptions regarding the resource costs in time. This has been the case for a significant portion of codes for which we recently established or proposed work RVUs that are based on refinements to the RUC-recommended values. When we adjusted work RVUs to account for significant changes in time, we started by looking at the change in the time in the context of the RUC-recommended work RVU. When the recommended work RVUs do not appear to account for significant changes in time, we employed different approaches (including survey data, building blocks, crosswalks to key reference or similar codes, and magnitude estimation) to identify potential values that reconcile the recommended work RVUs with the recommended time values. Many of these methodologies, such as survey data, building block, crosswalks to key reference or similar codes, and magnitude estimation have long been used in developing work RVUs under the PFS. In addition to these, we sometimes use the relationship between the old time values and the new time values for particular services to identify alternative work RVUs based on changes in time components.

In so doing, rather than ignoring the RUC-recommended value, we used the recommended values as a starting reference and then applied one of these several methodologies to account for the reductions in time that we believe were not otherwise reflected in the RUC-recommended value. If we believe that such changes in time are already accounted for in the RUC's recommendation, then we do not make such adjustments. Likewise, we do not arbitrarily apply time ratios to current work RVUs to calculate proposed work RVUs. We use the ratios to identify potential work RVUs and consider these work RVUs as potential options relative to the values developed through other options.

While we do not believe that the decrease in time as reflected in survey values should always equate to a one-to-one or linear decrease in newly valued work RVUs, we do believe that, since the two components of work are time and intensity, absent an obvious or explicitly stated rationale for why the relative intensity of a given procedure has increased, significant decreases in time should be reflected in decreases to work RVUs although not necessarily in a linear manner. If the RUC's recommendation has appeared to disregard or dismiss the changes in time, without a persuasive explanation of why such a change should not be accounted for in the overall work of the service, then we generally used one of the aforementioned methodologies to identify potential work RVUs, including the methodologies intended to account for the changes in the resources involved in furnishing the procedure (such as building blocks or crosswalks to key reference or similar codes).

Several interested parties, including the RUC, have expressed general objections to our use of these methodologies and suggested that our actions in adjusting the recommended work RVUs are inappropriate; other interested parties have also expressed general concerns with CMS refinements to RUC-recommended values in general. In the CY 2017 PFS final rule (81 FR 80272 through 80277), we responded in detail to several comments that we received regarding this issue. In the CY 2017 PFS proposed rule (81 FR 46162), we requested comments regarding potential alternatives to making adjustments that would recognize overall estimates of work in the context of changes in the resource of time for particular services; however, we did not receive any specific potential alternatives. As described earlier in this section, crosswalks to key reference or similar codes are one of the many methodological approaches we employed to identify potential values that reconcile the RUC-recommended work RVUs with the recommended time values when the RUC-recommended work RVUs did not appear to account for significant changes in time.

We received several comments regarding our methodologies for work valuation in response to the CY 2027 PFS proposed rule (91 FR 43865 through 43929) and the following is a summary of the comments we received and our responses.

Comment: Several commenters disagreed with CMS' reference to older work time sources and stated that their use led to the proposal of work RVUs based on flawed assumptions. Commenters stated that codes with ''CMS/Other'' or ''Harvard'' work time sources, used in the original valuation of certain older services, were not surveyed, and therefore, were not resource based. Commenters also stated that it was invalid to draw comparisons between the current work times and work RVUs of these services to the newly surveyed work time and work RVUs as recommended by the RUC.

Response: We agree that it is important to use the recent data available regarding work times and note that when many years have passed since work time has been measured, significant discrepancies can occur. However, we also believe that our operating assumption regarding the validity of the existing values as a point of comparison is critical to the integrity of the relative value system as currently constructed. The work times currently associated with codes play a very important role in PFS ratesetting, both as points of comparison in establishing work RVUs and in the allocation of indirect PE RVUs by specialty. If we were to operate under the assumption that previously recommended work times had been routinely overestimated, this would undermine the relativity of the work RVUs on the PFS in general, in light of the fact that codes are often valued based on comparisons to other codes with similar work times. Such an assumption would also undermine the validity of the allocation of indirect PE RVUs to physician specialties across the PFS.

Instead, we believe that it is crucial that the code valuation process take place with the understanding that the existing work times that have been used in PFS ratesetting are accurate. We recognize that adjusting work RVUs for changes in time is not always a straightforward process and that the intensity associated with changes in time is not necessarily always linear, which is why we apply various methodologies to identify several potential work values for individual codes. However, we reiterate that we believe it would be irresponsible to ignore changes in time based on the best data available, and that we are statutorily obligated to consider both time and intensity in establishing work RVUs for PFS services. For additional information regarding the use of old work time values that were established many years ago and have not since been reviewed in our methodology, we refer

readers to our discussion of the subject in the CY 2017 PFS final rule (81 FR 80273 through 80274).

Comment: Several commenters disagreed with the use of time ratio methodologies for work valuation. Commenters stated that this use of time ratios is not a valid methodology for valuation of physician services. Commenters stated that treating all components of physician time (preservice, intraservice, postservice and post-operative visits) as having identical intensity is incorrect and inconsistently applying it to only certain services under review creates inherent payment disparities in a payment system, which is based on relative valuation. Commenters stated that in many scenarios, CMS selects an arbitrary combination of inputs to apply rather than seeking a valid clinically relevant relationship that would preserve relativity. Commenters suggested that CMS determine the work valuation for each code based not only on surveyed work times, but also the intensity and complexity of the service and relativity to other similar services, rather than basing the work value entirely on time. Commenters recommended that CMS embrace the clinical input from practicing physicians when valid surveys were conducted and provide a clinical rationale when proposing crosswalks for valuation of services.

Response: We disagree and continue to believe that the use of time ratios is one of several appropriate methods for identifying potential work RVUs for particular PFS services, particularly when the alternative values recommended by the RUC and other commenters do not account for survey information that suggests the amount of time involved in furnishing the service has changed significantly. We reiterate that, consistent with the statute, we are required to value the work RVU based on the relative resources involved in furnishing the service, which include time and intensity. In accordance with the statute, we believe that changes in time and intensity must be accounted for when developing work RVUs. When our review of recommended values reveals that changes in time are not accounted for in a RUC-recommended work RVU, the obligation to account for that change when establishing proposed and final work RVUs remains.

We recognize that it would not be appropriate to develop work RVUs solely based on time, given that intensity is also an element of work, but in applying the time ratios, we are using derived intensity measures based on current work RVUs for individual procedures. We clarify that we do not treat all components of physician time as having identical intensity. If we were to disregard intensity altogether, the work RVUs for all services would be developed based solely on time values and this would not be accurate, as indicated by the many services that share the same time values but have different work RVUs. For example, among the codes reviewed in this CY 2027 PFS final rule, the following all share the same total work time of 45 minutes: CPT codes 55705, 61783, 63048, and 92527. However, these codes had very different proposed work RVUs of 1.88, 3.66, 3.38, and 0.92, respectively. These examples demonstrate that we do not value services purely based on work time; instead, we incorporate time as one of multiple different factors in our review process. Furthermore, we reiterate that we use time ratios to identify potentially appropriate work RVUs and then use other methods (including estimates of work from CMS medical personnel and crosswalks to key references or similar codes) to validate these RVUs. For more details on our methodology for developing work RVUs, we direct readers to the discussion in the CY 2017 PFS final rule (81 FR 80272 through 80277).

We do not believe that our review process is arbitrary in nature. Our reviews of recommended work RVUs and time inputs generally include, but have not been limited to, a review of information provided by the RUC, the HCPAC, and other public commenters, medical literature, and comparative databases, as well as a comparison with other codes within the PFS, consultation with other physicians and health care professionals within CMS and the Federal Government, as well as Medicare claims data. We also assess the methodology and data used to develop the recommendations submitted to us by the RUC and other public commenters and the rationale for the recommendations. In the CY 2011 PFS final rule with comment period (75 FR 73328 through 73329), we discussed a variety of methodologies and approaches used to develop work RVUs, including survey data, building blocks, crosswalks to key reference or similar codes, and magnitude estimation (see the CY 2011 PFS final rule with comment period (75 FR 73328 through 73329) for more information). Regarding the commenter's concerns regarding clinically relevant relationships, we emphasize that we continue to believe that the nature of the PFS relative value system is such that all services are appropriately subject to comparisons to one another. Although codes that describe clinically similar services are sometimes stronger comparator codes, we do not agree that codes must share the same site of service, patient population, or utilization level to serve as an appropriate crosswalk.

We have historically relied on survey data provided by the American Medical Association (AMA)/Specialty Society Relative Value Scale (RVS) Update Committee (referred to as the RUC) to estimate practitioner time, work intensity, and practice expense for the purpose of establishing RVUs for the codes used for payment under the PFS. As described in section II.D. of this final rule, CMS regularly revalues codes as part of its potentially misvalued codes initiative, as required by section 1848(c)(2)(K) of the Act, using RUC survey data that shows clinicians' estimates of how long a particular service takes to complete. In the CY 2025 PFS final rule, we summarized public comments that we had received expressing concerns with using RUC data as a source of valuation and identifying a need for empirical data in the context of valuing advanced primary care management services (89 FR 97898). In response to these comments, we indicated that we were open to alternative recommendations for how to price these and other services, and that we would consider all options presented to us with a preference for information with empirical evidence behind it. We also reminded commenters that we do not exclusively rely on RUC recommendations and can receive data and recommendations from other outside sources as well.

In the CY 2019 PFS final rule (83 FR 59515), in response to comments, we clarified that terms ''reference services,'' ''key reference services,'' and ''crosswalks'' as described by the commenters are part of the RUC's process for code valuation. These are not terms that we created, and we do not agree that we necessarily must employ them in the identical fashion for the purpose of discussing our valuation of individual services that come up for review. However, in the interest of minimizing confusion and providing clear language to facilitate feedback from interested parties, we stated that we would seek to limit the use of the term, ''crosswalk,'' to those cases where we made a comparison to a CPT code with the identical work RVU (83 FR 59515). We noted that we also occasionally make use of a ''bracket'' for code valuation. A ''bracket'' refers to when a work RVU falls between the values of two CPT codes, one at a higher

work RVU and one at a lower work RVU.

We look forward to continuing to engage with interested parties and commenters, including the RUC, as we prioritize our obligation to value new, revised, and potentially misvalued codes; and we will continue to welcome feedback from all interested parties regarding valuation of services for consideration through our rulemaking process. We refer readers to the detailed discussion in this section of the valuation considered for specific codes. Table A–DX contains a list of codes and descriptors for which we finalized work RVUs for CY 2027; this includes all codes for which we received RUC recommendations by February 10, 2026. The finalized work RVUs, work time and other payment information for all CY 2027 payable codes are available on the CMS website under downloads for the CY 2027 PFS final rule at *https://www.cms.gov/medicare/payment/fee-schedules/physician/federal-regulation-notices*.

b. Efficiency Adjustment

In the CY 2026 final rule, we finalized the establishment of an efficiency adjustment to the work RVUs, as well as corresponding updates to the intraservice portion of physician time inputs for non-time-based services, with refinements (90 FR 49334 through 49345). We finalized a policy to apply this efficiency adjustment to the intraservice portion of physician time and work RVUs every 3 years. To calculate the efficiency adjustment, we finalized the use of the MEI productivity adjustment over a 5-year look back period from CY 2022 to CY 2026. We noted that using more recent historical data from the BLS yielded an efficiency adjustment of 3.6 percent. As we discussed in the CY 2026 PFS proposed rule, our approach in applying an efficiency adjustment was to take into account changes in medical practice and to better reflect resources involved, and it was designed to be conservative in nature, as we were concerned about making too many changes at once to the current methodology. Therefore, we finalized the proposed efficiency adjustment of 2.5 percent. We also exempted additional codes, specifically time-based codes, services on the CMS telehealth list, and new codes for CY 2026, as reflected in the Codes Subject to Efficiency Adjustment file. We stated in the proposed rule that this file with efficiency adjustment exemptions would be issued annually and could be found in the public use files for CY 2027 but we note that this language was inadvertently included in the proposed rule. We plan to post the Codes Subject to Efficiency Adjustment file for each year that the efficiency adjustment is applied, therefore the file will be posted again for CY 2029 rulemaking. For a full discussion of the efficiency adjustment, we directed readers to the CY 2026 PFS final rule (90 FR 49334 through 49345).

For CY 2027 rulemaking, the RUC made a number of work RVU recommendations prior to the finalization of the efficiency adjustment in the CY 2026 PFS final rule. In these cases, where the RUC's work RVU recommendation was based on a pre-adjusted work RVU, we have treated the recommendation as though the RUC had recommended the efficiency adjusted valuation. For example, the RUC initially recommended a work RVU of 0.35 for CPT code 95944 based on a crosswalk to the pre-adjusted work RVU of CPT code 95885. The work RVU of this crosswalk code became 0.34 after applying the efficiency adjustment, which we have used as the recommended valuation for CPT code 95944. This policy affected a relatively small number of the codes reviewed for CY 2027, and we have noted in the preamble where the efficiency adjustment affected a work valuation.

3. Methodology for the Direct PE Inputs To Develop PE RVUs

a. Background

On an annual basis, the RUC provides us with recommendations regarding PE inputs for new, revised, and potentially misvalued codes. We review the RUC-recommended direct PE inputs on a code-by-code basis. Like our review of recommended work RVUs, our review of recommended direct PE inputs generally includes, but is not limited to, a review of information provided by the RUC, HCPAC, and other public commenters, medical literature, and comparative databases, as well as a comparison with other codes within the PFS, and consultation with physicians and health care professionals within CMS and the Federal Government, as well as Medicare claims data. We also assess the methodology and data used to develop the recommendations submitted to us by the RUC and other public commenters and the rationale for the recommendations. When we determine that the RUC's recommendations appropriately estimate the direct PE inputs (clinical labor, disposable supplies, and medical equipment) required for the typical service, are consistent with the principles of relativity, and reflect our payment policies, we use those direct PE inputs to value a service. If not, we refine the recommended PE inputs to better reflect our estimate of the PE resources required for the service. We also confirm whether CPT codes should have facility and/or non-facility direct PE inputs and refine the inputs accordingly.

Our review and refinement of the RUC-recommended direct PE inputs includes many refinements that are common across codes, as well as refinements that are specific to particular services. Table A–D11 details our refinements of the RUC's direct PE recommendations at the code-specific level. In section II.B. of this final rule, Determination of Practice Expense Relative Value Units (PE RVUs), we address certain refinements that will be common across codes. Refinements to particular codes are addressed in the portions of that section that are dedicated to particular codes. We note that for each refinement, we indicate the impact on direct costs for that service. We note that, on average, in any case where the impact on the direct cost for a particular refinement is $0.35 or less, the refinement has no impact on the PE RVUs. This calculation considers both the impact on the direct portion of the PE RVU, as well as the impact on the indirect allocator for the average service. In this final rule, we also note that many of the refinements listed in Table A–D11 result in changes under the $0.35 threshold and would be unlikely to result in a change to the RVUs.

We note that the finalized direct PE inputs for CY 2027 are displayed in the CY 2027 direct PE input files, available on the CMS website under the downloads for the CY 2027 PFS final rule at *https://www.cms.gov/medicare/payment/fee-schedules/physician/federal-regulation-notices*. The inputs displayed there have been used in developing the CY 2027 PE RVUs as displayed in Addendum B (see *https://www.cms.gov/medicare/payment/prospective-payment-systems/hospital-outpatient/addendum-a-b-updates*).

b. Common Refinements

(1) Changes in Work Time

Some direct PE inputs are directly affected by revisions in work time. Specifically, changes in the intraservice portions of the work time and changes in the number or level of postoperative visits associated with the global periods result in corresponding changes to direct PE inputs. The direct PE input recommendations generally correspond to the work time values associated with services. We believe that inadvertent discrepancies between work time values and direct PE inputs should be refined

or adjusted in the establishment of proposed direct PE inputs to resolve the discrepancies.

(2) Equipment Time

Prior to CY 2010, the RUC did not generally provide CMS with recommendations regarding equipment time inputs. In CY 2010, in the interest of ensuring the greatest possible degree of accuracy in allocating equipment minutes, we requested that the RUC provide equipment times along with the other direct PE recommendations, and we provided the RUC with general guidelines regarding appropriate equipment time inputs. We appreciate the RUC's willingness to provide us with these additional inputs as part of its PE recommendations.

In general, the equipment time inputs correspond to the service period portion of the clinical labor times. We clarified this principle over several years of rulemaking, indicating that we consider equipment time as the time within the intraservice period when a clinician is using the piece of equipment plus any additional time that the piece of equipment is not available for use for another patient due to its use during the designated procedure. For those services for which we allocate cleaning time to portable equipment items, because the portable equipment does not need to be cleaned in the room where the service is furnished, we do not include that cleaning time for the remaining equipment items, as those items and the room are both available for use for other patients during that time. In addition, when a piece of equipment is typically used during follow-up postoperative visits included in the global period for a service, the equipment time will also reflect that use.

We believe that certain highly technical pieces of equipment and equipment rooms are less likely to be used during all of the preservice or postservice tasks performed by clinical labor staff on the day of the procedure (the clinical labor service period) and are typically available for other patients even when one member of the clinical staff may be occupied with a preservice or postservice task related to the procedure. We also noted that we believe these same assumptions will apply to inexpensive equipment items that are used in conjunction with and located in a room with non-portable highly technical equipment items since any items in the room in question will be available if the room is not being occupied by a particular patient. For additional information, in that rule we referred readers to our discussion of these issues in the CY 2012 PFS final rule with comment period (76 FR 73182) and the CY 2015 PFS final rule with comment period (79 FR 67639).

(3) Standard Tasks and Minutes for Clinical Labor Tasks

In general, the preservice, intraservice, and postservice clinical labor minutes associated with clinical labor inputs in the direct PE input database reflect the sum of particular tasks described in the information that accompanies the RUC-recommended direct PE inputs, commonly called the ''PE worksheets.'' For most of these described tasks, there is a standardized number of minutes, depending on the type of procedure, its typical setting, its global period, and the other procedures with which it is typically reported. The RUC sometimes recommends a number of minutes either greater than or less than the time typically allotted for certain tasks. In those cases, we review the deviations from the standards and any rationale provided for the deviations. When we do not accept the RUC-recommended exceptions, we refine the proposed direct PE inputs to conform to the standard times for those tasks. In addition, in cases when a service is typically billed with an E/M service, we remove the preservice clinical labor tasks to avoid duplicative inputs and to reflect the resource costs of furnishing the typical service.

We refer readers to section II.B. of this final rule, Determination of Practice Expense Relative Value Units (PE RVUs), for more information regarding the collaborative work of CMS and the RUC in improvements in standardizing clinical labor tasks.

(4) Recommended Items That Are Not Direct PE Inputs

In some cases, the PE worksheets included with the RUC's recommendations include items that are not clinical labor, disposable supplies, or medical equipment or that cannot be allocated to individual services or patients. We addressed these kinds of recommendations in previous rulemaking (78 FR 74242), and we do not use items included in these recommendations as direct PE inputs in the calculation of PE RVUs.

(5) New Supply and Equipment Items

The RUC generally recommends the use of supply and equipment items that already exist in the direct PE input database for new, revised, and potentially misvalued codes. However, some recommendations include supply or equipment items that are not currently in the direct PE input database. In these cases, the RUC has historically recommended that a new item be created and has facilitated our pricing of that item by working with the specialty societies to provide us copies of sales invoices. For CY 2027 we received invoices for several new supply and equipment items. Tables A–D11 and A–D12 detail the invoices received for new and existing items in the direct PE database. As discussed in section II.B. of this final rule, Determination of Practice Expense Relative Value Units, we encourage interested parties to review the prices associated with these new and existing items to determine whether these prices appear to be accurate. Where prices appear inaccurate, we encourage interested parties to submit invoices or other information to improve the accuracy of pricing for these items in the direct PE database by February 10th of the following year for consideration in future rulemaking, similar to our process for consideration of RUC recommendations.

We remind interested parties that due to the relativity inherent in the development of RVUs, reductions in existing prices for any items in the direct PE database increase the pool of direct PE RVUs available to all other PFS services. Tables A–D11 and A–D12 also include the number of invoices received and the number of non-facility allowed services for procedures that use these equipment items. We provide the non-facility allowed services so that interested parties will note the impact the particular price may have on PE relativity, as well as to identify items that are used frequently, since we believe that interested parties are more likely to have better pricing information for items used more frequently. A single invoice may not be reflective of typical costs, and we encourage interested parties to provide additional invoices so that we may identify and use accurate prices in the development of PE RVUs.

In some cases, we do not use the price listed on the invoice that accompanies the recommendation because we identify publicly available alternative prices or information that suggests a different price is more accurate. In these cases, we include this in the discussion of these codes. In other cases, we cannot adequately price a newly recommended item due to inadequate information. Sometimes, no supporting information regarding the price of the item has been included in the recommendation. In other cases, the supporting information does not demonstrate that the item has been purchased at the listed price (for example, vendor price quotes instead of paid invoices). In cases where the information provided on the item allows

us to identify clinically appropriate proxy items, we may use existing items as proxies for the newly recommended items. In other cases, we include the item in the direct PE input database without any associated price. Although including the item without an associated price means that the item does not contribute to the calculation of the proposed PE RVU for particular services, it facilitates our ability to incorporate a price once we obtain information and are able to do so.

(6) Service Period Clinical Labor Time in the Facility Setting

Generally speaking, our direct PE inputs do not include clinical labor minutes assigned to the service period because the cost of clinical labor during the service period for a procedure in the facility setting is not considered a resource cost to the practitioner since Medicare makes separate payment to the facility for these costs. We address code-specific refinements to clinical labor in the individual code sections.

(7) Procedures Subject to the Multiple Procedure Payment Reduction (MPPR) and the Outpatient Prospective Payment System (OPPS) Cap

We noted in the proposed rule that the list of services for the upcoming calendar year that are subject to the MPPR for diagnostic cardiovascular services, diagnostic imaging services, diagnostic ophthalmology services, and therapy services are displayed in the public use files for the PFS proposed and final rules for each year. In addition, the list of procedures that meet the definition of imaging under section 1848(b)(4)(B) of the Act, and therefore, are subject to the OPPS cap, are also displayed in the public use files for the PFS proposed and final rules for each year. The public use files for CY 2027 are available on the CMS website under downloads for the CY 2027 PFS final rule at *https://www.cms.gov/medicare/payment/fee-schedules/physician/federal-regulation-notices*. For more information regarding the history of the MPPR policy, we referred readers to the CY 2014 PFS final rule with comment period (78 FR 74261 through 74263).

Effective January 1, 2007, section 5102(b)(1) of the Deficit Reduction Act of 2005 (DRA) (Pub. L. 109–171, enacted on February 8, 2006) amended section 1848(b)(4) of the Act to require that, for imaging services, if—(i) The technical component (TC) (including the TC portion of a global fee) of the service established for a year under the fee schedule without application of the geographic adjustment factor, exceeds (ii) The Medicare outpatient department (OPD) fee schedule amount established under the prospective payment system (PPS) for hospital OPD services under section 1833(t)(3)(D) of the Act for such service for such year, determined without regard to geographic adjustment under section 1833(t)(2)(D) of the Act, the Secretary shall substitute the amount described in clause (ii), adjusted by the geographic adjustment factor under the PFS, for the fee schedule amount for such TC for such year. As required by section 1848(b)(4)(A) of the Act, for imaging services furnished on or after January 1, 2007, we cap the TC of the PFS payment amount for the year (prior to geographic adjustment) by the Outpatient Prospective Payment System (OPPS) payment amount for the service (prior to geographic adjustment). We then apply the PFS geographic adjustment to the capped payment amount. Section 1848(b)(4)(B) of the Act defines imaging services as ''imaging and computer-assisted imaging services, including X-ray, ultrasound (including echocardiography), nuclear medicine (including PET), magnetic resonance imaging (MRI), computed tomography (CT), and fluoroscopy, but excluding diagnostic and screening mammography.'' For more information regarding the history of the cap on the TC of the PFS payment amount under the DRA (the ''OPPS cap''), we referred readers to the CY 2007 PFS final rule with comment period (71 FR 69659 through 69662).

For CY 2027, we identified new and revised codes to determine which services meet the definition of ''imaging services'' as defined at section 1848(b)(4)(B) of the Act for purposes of this cap. Beginning for CY 2027, we proposed to include the following services in Table A–D1 on the list of codes to which the OPPS cap applies:

TABLE A-D1: CY 2027 CODE ADDITIONS TO THE OPPS CAP LIST

CPT Code	CPT Long Descriptor
70560	*Magnetic resonance angiography, head and neck, including image postprocessing; without contrast material(s)*
70561	*Magnetic resonance angiography, head and neck, including image postprocessing; with contrast material(s)*
70562	*Magnetic resonance angiography, head and neck; without contrast material(s) in one or both body regions, followed by contrast material(s) and further sequences in one or both body regions, including image postprocessing*
97611	*Real-time fluorescence wound imaging with clinical darkness to identify presence, location, load of bacteria and measur wound size, per day*
92978	*Endoluminal imaging of coronary vessel or graft using intravascular ultrasound (IVUS) or optical coherence tomography (OCT) during diagnostic evaluation and/or therapeutic intervention including imaging supervision, interpretation and report; initial vessel (List separately in addition to code for primary procedure)*
92979	*Endoluminal imaging of coronary vessel or graft using intravascular ultrasound (IVUS) or optical coherence tomography (OCT) during diagnostic evaluation and/or therapeutic intervention including imaging supervision, interpretation and report; each additional vessel (List separately in addition to code for primary procedure)*

We received public comments on these proposals. The following is a summary of the comments we received and our responses.

Comment: Commenters supported the addition of CPT codes 70560, 70561, and 70562 to the OPPS cap list.

Response: We thank the commenters for their support.

We are finalizing the addition of the services listed in Table A–D1 to the list of codes subject to the OPPS cap as proposed.

c. Valuation of Specific Codes for CY 2027

(1) Fine Needle Aspiration (CPT codes 10005 and 10006)

The RUC received notification of interest from a specialty society to re-

review CPT codes 10005 (*Fine needle aspiration biopsy, including ultrasound guidance; first lesion*) and 10006 (*Fine needle aspiration biopsy, including ultrasound guidance; each additional lesion*) at the January 2026 meeting.

We proposed the RUC-recommended work RVUs of 1.35 for CPT code 10005 and 1.00 for 10006.

We proposed the RUC recommended direct PE inputs for CPT codes 10005 and 10006 with one modification. The RUC submitted an invoice associated with this code family for an update in the price of the portable ultrasound (EQ250) equipment from its current price of $41,612.53 to $83,750.00. However, based on our review of current market pricing for portable ultrasounds, it appears that this type of equipment is becoming less expensive, not doubling in price over current. We also have reason to believe that the type of portable ultrasound listed on the submitted invoice represented the upper end of the market as opposed to the typical case. This invoice stated that the product in question constitutes ''a high-performance diagnostic ultrasound system'' including a 23-inch flat panel monitor. It is also not clear from the submitted invoice that the product in question is even a portable version of an ultrasound system.

Given that the price on this invoice was significantly higher than other portable ultrasounds available for purchase, we did not propose to update the price of the EQ250 portable ultrasound which is used in many other HCPCS codes. Instead, we proposed to create a new equipment item that describes a ''Fine Needle Aspiration portable ultrasound'' (ER130) which we proposed to price at the submitted $83,750.00 price. The ER130 equipment is proposed to replace the previous EQ250 portable ultrasound at the same 37 minutes for CPT code 10005 and 17 minutes for CPT code 10006 as recommended by the RUC.

Comment: A few commenters expressed concern that the proposed work RVU for CPT code 10005 would result in nearly a 5 percent reduction in reimbursement, which would significantly affect interventional radiology and procedural services. These commenters reiterated that fine needle aspiration (FNA) is essential for prompt diagnosis of cancer and other serious illness and frequently helps patients avoid more invasive surgery, and cautioned that reduced reimbursement could jeopardize access to this high-value, cost-effective care. Commenters stated that FNA procedures were undervalued prior to the resurvey and stressed the importance of continued collaboration among specialty societies, the RUC, and CMS to preserve beneficiary access.

Response: We appreciate commenters' concerns regarding the magnitude of the change in reimbursement for CPT code 10005. However, absent additional data or an alternative survey-based valuation from commenters, we believe the survey 25th percentile work RVU of 1.35 (based on 268 responses) represents the best available information for valuing this service at this time. We did not receive an alternative survey-based valuation or additional data in the comments that would support a different work RVU for CPT code 10005. We will continue to work with the RUC and specialty societies, including interventional radiology, on the ongoing valuation of these services in future rulemaking cycles.

Comment: The majority of commenters supported the proposed work RVUs and modified direct PE inputs for CPT codes 10005 and 10006 and urged CMS to finalize them as proposed. Several commenters also supported creation of the new ER130 equipment item for portable ultrasound used in image-guided FNA, noting that equipment pricing has not kept pace with the cost of the technology needed to safely localize target lesions, and urged CMS to finalize the item as proposed.

Response: We appreciate commenters' support. We are finalizing the work RVUs of 1.35 for CPT code 10005 and 1.00 for CPT code 10006 as proposed. We also appreciate commenters' support for the new ER130 equipment item. We did not receive comments disputing this approach or the $83,750.00 price and therefore we are finalizing the ER130 equipment item, along with the other direct PE inputs, as proposed.

(2) Skin Cell Suspension Autograft (CPT codes 15006, 15007, 15008, and 15009)

In September 2025, the CPT Editorial Panel created four codes to report skin cell suspension autograft (SCSA): CPT code 15006 *(Skin cell suspension autograft (SCSA), trunk, arms, and/or legs; first 100 sq cm or less, or 1% of body area of infants and children),* CPT code 15007 *(Skin cell suspension autograft (SCSA), trunk, arms, and/or legs; each additional 100 sq cm, or each additional 1% of body area of infants and children, or part thereof (List separately in addition to code for primary procedure)),* CPT code 15008 *(Skin cell suspension autograft (SCSA), face, scalp, eyelids, mouth, neck, ears, orbits, genitalia, hands, feet, and/or multiple digits; first 100 sq cm or less, or 1% of body area of infants and children),* and CPT code 15009 *(Skin cell suspension autograft (SCSA), face, scalp, eyelids, mouth, neck, ears, orbits, genitalia, hands, feet, and/or multiple digits; each additional 100 sq cm, or each additional 1% of body area of infants and children, or part thereof (List separately in addition to code for primary procedure)).* The existing eight skin cell suspension autograft CPT codes (CPT codes 15011–15018) were deleted, and the ''Skin Cell Suspension Autograft'' guidelines were revised. The four new codes were surveyed for the January 2026 RUC meeting.

For CY 2027, we proposed the RUC-recommended work RVUs of 10.97 for CPT code 15006, 0.59 for CPT code 15007, 11.28 for CPT code 15008, and 0.98 for CPT code 15009. We proposed the RUC-recommended direct PE inputs for CPT codes 15006, 15007, 15008, and 15009 without refinement.

Comment: Commenters supported CMS' proposal of the RUC-recommended work RVUs and direct PE inputs for CPT codes 15006, 15007, 15008, and 15009. A commenter stated that two surgeons may perform distinct portions of the procedure simultaneously, which can reduce overall operative and anesthesia time and benefit the patient. The commenter stated that co-surgeon payment should be limited to circumstances where the surgeons' involvement is medically necessary and the documentation supports the distinct work performed by each surgeon, consistent with Medicare's existing co-surgery requirements. The commenter encouraged CMS to allow co-surgeon payment for the new SCSA codes when these requirements are met rather than creating a payment limitation that could discourage the most efficient surgical approach.

Response: We appreciate the commenters' support and feedback about the co-surgeon payment. We agree that co-surgeon payment may be appropriate for this service and are finalizing a co-surgery indicator of ''1'' for CPT codes 15006, 15007, 15008, and 15009.

After reviewing the comments, we are finalizing the work RVUs and direct PE inputs for CPT codes 15006, 15007, 15008, and 15009, as proposed, with the clarification that we are finalizing a co-surgery indicator of ''1'' for these services.

(3) Computer Assisted Surgical Navigation (CPT code 20985)

CPT code 20985 *(Computer-assisted surgical navigational procedure for musculoskeletal procedures, image-less (List separately in addition to code for*

primary procedure)) was first identified via the high-volume growth screen in April 2024.[7] The RUC's Relativity Assessment Workgroup (RAW) reviewed the action plan for 20985 and recommended that the RUC refer CPT code 20985 to the CPT Editorial Panel for revision, to modify the descriptor and address overlap with codes 0054T and 0055T. At the February 2025 CPT Editorial Panel meeting, CPT code 20985 was revised to remove ''image-less'' for reporting computer-assisted surgical navigational procedures for musculoskeletal procedures.

We proposed the RUC-recommended work RVU of 2.44, which is the current work RVU of CPT code 20985 after the efficiency adjustment was applied at the start of CY 2026. The RUC did not recommend and we did not propose direct PE inputs for CPT code 20985.

We did not receive any public comments on this policy, and therefore, we are finalizing as proposed.

(4) Ablation Therapy—Bone Tumors (CPT code 20994)

In February 2025, the CPT Editorial Panel approved new Category I add-on code 20994 (*Ablation therapy for reduction or eradication of bone tumor, including adjacent soft tissue when involved by tumor extension, cryoablation, open*) to describe and report cryoablation during an open surgical procedure where the bone is frozen after a tumor resection. CPT code 20994 was surveyed for the April 2025 meeting where the specialty recommended an interim value; the code was resurveyed at the September 2025 RUC meeting and recommendations submitted to CMS.

We proposed the RUC-recommended work RVU of 2.70 for CPT code 20994. The RUC did not recommend and we did not propose any direct PE inputs for this code.

Comment: A commenter stated that they supported the CMS proposal of the RUC-recommended work RVU for CPT code 20994.

Response: We appreciate the support for our proposed valuation from the commenter.

After consideration of the comments, we are finalizing the proposed work RVU of 2.70 for CPT code 20994.

(5) Intraosseous Fiducial Marker Placement (CPT codes 20988 and 20989)

At the May 2025 CPT Editorial Panel Meeting, CPT approved the addition of two codes and guidelines to report percutaneous intraosseous fiducial marker placement for the first target site and each additional target site, respectively: CPT codes 20988 (*Placement of localization marker(s) (e.g., fiducial marker[s]), intraosseous, percutaneous, including imaging guidance, when performed; first target site)* and 20989 *(Placement of localization marker(s) (e.g., fiducial marker[s]), intraosseous, percutaneous, including imaging guidance, when performed; each additional target site).* The specialties clarified that these codes are not new technology but are new codes to more accurately describe existing technology. These codes were surveyed for the October 2025 RUC meeting.

We proposed the RUC-recommended work RVU of 3.00 for CPT code 20988 and the RUC-recommended work RVU of 1.76 for CPT code 20989. We proposed the RUC-recommended direct PE inputs for both codes in the family without refinement.

Comment: Commenters supported our proposed values for the Intraosseous Fiducial Marker Placement codes.

Response: We appreciate the comments and after consideration of public comments, we are finalizing the work RVUs and direct PE inputs for the codes in the Intraosseous Fiducial Marker Placement family as proposed.

(6) Osteotomy—Spine (CPT codes 22210, 22212, 22214, and 22216)

In CY 2025 rulemaking, CPT codes 22210 (*Osteotomy of spine, posterior or posterolateral approach, 1 vertebral segment; cervical*), 22212 (*Osteotomy of spine, posterior or posterolateral approach, 1 vertebral segment; thoracic*), 22214 (*Osteotomy of spine, posterior or posterolateral approach, 1 vertebral segment; lumbar*), and 22216 (*Osteotomy of spine, posterior or posterolateral approach, 1 vertebral segment; each additional vertebral segment (List separately in addition to primary procedure)*) were nominated as potentially misvalued services.

At the September 2025 CPT Editorial Panel Meeting, CPT revised the existing codes and guidelines to clarify that the codes include complete resection of the interspinous ligament and the entirety of the ligamentum flavum (ie, laminar and subarticular) to allow deformity correction through spinal column realignment. The osteotomy includes resection of the inferior portion of the lamina, the inferior facet of the cranial vertebra, the superior portion of the lamina, and the superior facet of the caudal vertebra. Following the revisions to the CPT guidelines and parentheticals for the code family, CPT codes 22210, 22212, 22214, and 22216 were surveyed for the January 2026 RUC meeting.

We disagree with the RUC's recommended work RVU for CPT codes 22210, 22212, and 22214 and we proposed lower work RVUs in all three cases. We reviewed the RUC's recommended work valuations and found them to be high, relative to other codes with the same or similar times. We noted that although the surveyed intraservice work time decreased substantially for all three of these codes, the RUC recommended either maintaining the current work RVU (for CPT code 22210) or increasing the work RVU (for CPT codes 22212 and 22214), stating that there was compelling evidence for increased work valuation based on a change in the patient population and a change in technology. However, these services maintained the same code descriptors, with only minor changes to their billing guidelines, indicating that despite the changes in technology and patient population the underlying procedure remains significantly similar. Therefore, we do not agree with the RUC that there has been an increase in intensity which would account for these recommended work RVUs. While we do not believe that the decrease in time as reflected in survey values should always equate to a one-to-one or linear decrease in newly valued work RVUs, we do believe that since the two components of work are time and intensity, absent an obvious or explicitly stated rationale why the relative intensity of a given procedure has increased, significant decreases in time should be reflected in decreases to work RVUs although not necessarily in a linear manner.

In the case of CPT codes 22210, 22212, and 22214, we believe that the work RVUs should be reduced to account for the significant decreases in surveyed intraservice work time.

Additionally, the postoperative office visit levels in this code family are increasing from three level 2 evaluation and management visits to one level 4 and two level 3 office visits. The shifting of the post-operative visits in this code family to higher level office visit codes that require more time, maintains the total time and thus reflects a higher intensity and can contribute to a higher work RVU which highlights our overall concerns with visits during the global period and how we believe that all of these visits are not typically occurring. We refer readers to section II.B. of this final rule under ''b. Global Surgical Packages'' for that discussion.

We disagree with the RUC recommended value of 24.75 for CPT

[7] *https://www.ama-assn.org/system/files/raw-progress-report.pdf.*

code 22210 and we instead proposed a work RVU of 23.12 based on a crosswalk to CPT code 34701 (*Endovascular repair of infrarenal aorta by deployment of an aorto-aortic tube endograft including pre-procedure sizing and device selection, all nonselective catheterization(s), all associated radiological supervision and interpretation, all endograft extension(s) placed in the aorta from the level of the renal arteries to the aortic bifurcation, and all angioplasty/stenting performed from the level of the renal arteries to the aortic bifurcation; for other than rupture (e.g., for aneurysm, pseudoaneurysm, dissection, penetrating ulcer)*). This code has a lower intraservice time and a similar total time. We noticed that the surveyed intraservice time for CPT code 22210 is decreasing by nearly an hour, from 170 minutes to 120 minutes, indicating that the procedure typically takes much less time to perform than it did at the time of last review. Although the RUC has recommended significantly more postoperative time in the inpatient and outpatient visits, which has caused the total time of the procedure to increase slightly, we noted that this postoperative care should take place at a significantly lower intensity than the 50 minutes of intraservice time being removed from the code. We are concerned that, while the intraservice time for CPT code 22210 is decreasing from 170 to 120 minutes, this intraservice work time is being replaced with higher levels of post operative care to result in the total time being maintained similar to the current time. We believe that with the intraservice time going down, this reflects that the procedure has a lesser intensity than before and therefore it does not makes sense that the intensity of the post operative visit levels would increase. Separately, we continue to have concern with the post-operative visits in general and we do not believe the post-operative visits are happening and therefore would not justify the higher value.

We believe that it better serves relativity to propose a work RVU of 23.12, which maintains the current intensity of CPT code 22210, as opposed to proposing the RUC's recommended work RVU of 24.75 which results in an intensity increase for this code. We are supporting this proposed work RVU of 23.12 with a pair of other 90-day global codes with similar work time values: CPT code 34718 *(Endovascular repair of iliac artery, not associated with placement of an aorto-iliac artery endograft at the same session, by deployment of an iliac branched endograft, including pre-procedure sizing and device selection, all ipsilateral selective iliac artery catheterization(s), all associated radiological supervision and interpretation, and all endograft extension(s) proximally to the aortic bifurcation and distally in the internal iliac, external iliac, and common femoral artery(ies), and treatment zone angioplasty/stenting, when performed, for other than rupture (e.g., for aneurysm, pseudoaneurysm, dissection, arteriovenous malformation, penetrating ulcer), unilateral),* valued at a work RVU of 23.40 with an intraservice time of 120 minutes, and CPT code 34707 *(Endovascular repair of iliac artery by deployment of an ilio-iliac tube endograft including pre-procedure sizing and device selection, all nonselective catheterization(s), all associated radiological supervision and interpretation, and all endograft extension(s) proximally to the aortic bifurcation and distally to the iliac bifurcation, and treatment zone angioplasty/stenting, when performed, unilateral; for other than rupture (e.g., for aneurysm, pseudoaneurysm, dissection, arteriovenous malformation)),* valued at a work RVU of 21.72 with an intraservice time of 120 minutes.

We disagree with the RUC recommended value of 23.20 for CPT code 22212 and we instead proposed a work RVU of 21.72 based on a crosswalk to CPT code 34707. This code has a lower intraservice time and a slightly lower total time. We noticed that the surveyed intraservice time for CPT code 22212 is also decreasing significantly, from 147 minutes to 120 minutes, which is offset by the RUC's recommendation of significantly more time in the postoperative visits. We do not agree with the RUC that the work RVU should be increasing by nearly 3.00 RVUs for a procedure where the intraservice time, which is likely to be the most difficult and dangerous part of the procedure, is going down by approximately half an hour. We believe that the RUC's recommended work RVU of 23.20 results in an intensity increase for this code and therefore it better serves relativity to propose a work RVU of 21.72, which maintains the current intensity of CPT code 22212. This proposed work RVU of 21.72 accounts for the decrease in intraservice time and change in the level of the postoperative office visits and is well bracketed by CPT code 34701, valued at a work RVU of 23.12 work with an intraservice time of 120 minutes, and CPT code 38115 *(Repair of ruptured spleen (splenorrhaphy) with or without partial splenectomy),* valued at a work RVU of 21.33 with an intraservice time of 120 minutes.

We disagree with the RUC recommended value of 21.72 for CPT code 22214 and we instead proposed a work RVU of 19.53 based on a crosswalk to CPT code 44125 (*Enterectomy, resection of small intestine; with enterostomy*). This code has a lower intraservice time and a higher total time and its use as a crosswalk code maintains the current intensity of CPT code 22214. As was the case with the first two codes, we noticed that the surveyed intraservice time for CPT code 22214 is decreasing significantly, from 163 minutes to 120 minutes, which is offset by the RUC's recommendation of significantly more time in the postoperative visits. We do not agree with the RUC that the work RVU should be increasing for a procedure where the intraservice time, the most difficult and dangerous part of the procedure, is going down by more than half an hour. We believe that it better serves relativity to propose a work RVU of 19.53, which maintains the current intensity of CPT code 22214, as opposed to proposing the RUC's recommended work RVU of 21.72 which results in an intensity increase for this code. This proposed work RVU of 19.53 accounts for the decrease in intraservice time and change in the level of the postoperative office visits and is well bracketed by CPT code 38115, valued at a work RVU of 21.33 with an intraservice time of 120 minutes, and CPT code 42890 *(Limited pharyngectomy),* valued at a work RVU of 18.65 with an intraservice time of 120 minutes.

We proposed the RUC recommended work RVU of 3.00 for CPT code 22216, as this code maintains its current intensity at the RUC's recommended valuation and maintains relativity with other similar add-on codes.

We proposed the RUC recommended direct PE inputs for all the codes in this family without refinement.

Comment: For CPT code 22210 commenters disagreed with CMS's crosswalk proposal because it does not accurately account for the full amount of physician work or capture the overall intensity/complexity of the service. Commenters recommended more post-operative time in both the inpatient and outpatient visits.

Response: We continue to believe that the proposed work RVU of 23.12 for CPT code 22210 is the most accurate valuation for this service. In our review of this code, we compared CPT code 22210 to other similar 90-day global codes with 90 minutes of intraservice time and found that the RUC's

recommended work RVU of 24.75 was higher than other codes with similar time values.

The surveyed intraservice time for CPT code 22210 decreased by 50 minutes, from 170 to 120 minutes, indicating that the procedure typically takes less time to perform than it did when it was last reviewed by the RUC. The RUC recommended significantly more post-operative time in the inpatient and outpatient visits which caused the total time to increase for this service. The decrease in intraservice time directly relates to the intensity and we continue to believe that the decrease in intensity would lead to a decrease in work RVU. Looking at the time ratios based on the existing times for CPT code 22210 (170 minutes of total time) to the new proposed time values (120 minutes of total time), that further points to the RUC recommendation for this code as being too high. In addition, we do not believe that the post-operative visits contributing to the increase in total time are happening. We continue to believe that the two 90-day crosswalk codes selected fully capture the same time and intensity of the service.

Comment: For CPT code 22212 some commenters disagreed with the crosswalk codes selected by CMS. Some commenters believe that the physician work was underestimated. Commenters disagreed and stated that a significant decrease in intra-operative time does not necessarily reflect a decrease in intra-operative work but rather an increase in efficiency and intensity and that is captured by the RUC process. We note that the intraservice time ratio provided by the RUC does not support a higher work RVU for this code. Commenters stated that this procedure is often done with other procedures at the same time and would be subject to the MPPR policies and also note changes in the patient population who undergo these procedures and thus require higher level of postoperative care.

Response: We continue to believe that the proposed work RVU of 21.72 for CPT code 22212 is the most accurate valuation for this service. In our review of this code, we compared CPT code 22212 to other similar 90-day global codes with 90 minutes of intraservice time and found that the RUC's recommended work RVU of 23.20 was higher than other codes with similar time values based on our searches.

We continue to believe that the two determining factors of the work RVU are time and intensity and continue to believe that these elements were reflected in the 90-day codes selected as crosswalks. Looking at the time ratios based on the crosswalk code selected by the RUC, the time ratio suggests that the work RVU should be lower than the RUC recommendation. We believe that the work RVUs selected based on the crosswalks selected by CMS continue to maintain relativity within the family of codes. Given the roughly half hour decrease for this code in intraservice time based on the RUC survey, we believe that the crosswalk codes selected with similar time values accurately capture the time and intensity for the service.

Comment: For CPT code 22214 commenters disagreed with the crosswalk codes selected by CMS stating that they did not accurately account for the full breadth of work, intensity and complexity necessary to perform the services. Commenters noted that this procedure is often performed with other spine procedures and that there has been a change in the complexity of the patient population and it should be therefore cross walked to a code with higher post-operative care.

Response: We continue to believe that the proposed work RVU of 19.53 for CPT code 22214 is the most accurate valuation for this service. In our review of this code, we compared CPT code 22214 to other similar 90-day global codes with 90 minutes of intraservice time and found that the RUC's recommended work RVU of 21.72 was higher than other codes with similar time values.

We continue to believe that the time and intensity was accurately captured in the crosswalk codes selected by CMS. There was a decrease of 43 minutes of intraservice time for this code and that would directly correlate to a linear decrease in the work RVU. We believe the two other 90-day global codes selected accurately represent the same time and intensity and maintain relativity of the codes in this family.

We continue to believe that the determining factors of valuation are time and intensity and this is reflected in our proposed crosswalks. We understand that while the intra-time went down, the increase in total time resulted from a change in the level of post operative visits. Additionally, we want to note that the shifting of the post-operative visits in this code family to higher level office visit codes that require more time, maintains the total time and thus reflects a higher intensity and can contribute to a higher work RVU which highlights our overall concerns with visits during the global period and how we believe that all of these visits are not typically occurring.

After consideration of public comments, we are finalizing the work RVUs and direct PE inputs for CPT codes 22210, 22212, 22214, and 22216 as proposed.

(7) Arthroplasty—Shoulder (CPT Codes 23470 and 23472)

In April 2025, the RAW identified CPT code 23472 as having a site of service anomaly where Medicare data from 2021–2023 indicated it was performed less than 50 percent of the time in the inpatient setting yet included inpatient hospital E/M services within the global period. The RAW concluded that CPT code 23472 represented a site of service anomaly and identified CPT code 23470 as part of this family of services. The RUC therefore surveyed CPT codes 23470 (*Arthroplasty, glenohumeral joint; hemiarthroplasty*) and 23742 (*Arthroplasty, glenohumeral joint; total shoulder (glenoid and proximal humeral replacement (e.g., total shoulder))*) for the September 2025 meeting.

We disagreed with the RUC's recommended work RVU of 15.60 for CPT code 23470 and we instead proposed a work RVU of 13.81 based on a crosswalk to CPT code 27416 (*Osteochondral autograft(s), knee, open (e.g., mosaicplasty) (includes harvesting of autograft[s])*). The RUC recommended a work RVU of 15.60, which is the current work RVU of the RUC's crosswalk code 67107 (*Repair of retinal detachment; scleral buckling (such as lamellar scleral dissection, imbrication or encircling procedure), including, when performed, implant, cryotherapy, photocoagulation, and drainage of subretinal fluid*) after the efficiency adjustment was applied at the start of CY 2026. In reviewing CPT code 23470, we noted that the recommended intraservice time is decreasing from 113 minutes to 90 minutes (20 percent reduction), and the recommended total time is decreasing from 390 minutes to 330 minutes (22 percent reduction); however, the RUC-recommended work RVU is only decreasing from 17.44 to 15.60, which is a reduction of just over 10 percent. While we do not believe that the decrease in time as reflected in survey values should always equate to a one-to-one or linear decrease in newly valued work RVUs we do believe that, since the two components of work are time and intensity, absent an obvious or explicitly stated rationale for why the relative intensity of a given procedure has increased, significant decreases in time should be reflected in decreases to work RVUs although not necessarily in a linear manner.

More specifically, CPT code 23470 was identified by the RAW as having a

site of service anomaly in which the service was performed less than 50 percent of the time in the inpatient setting yet included inpatient hospital Evaluation and Management services within the global period. The RUC has recommended the removal of five inpatient hospital visits along with recommending a decrease of 23 minutes to the intraservice work time based on the survey. We stated in the proposed rule, that we did not believe that the RUC's recommended work decrease of fewer than two RVUs appropriately captures this decrease in procedure time and physician work for CPT code 23470. We also noticed that the RUC's recommended work RVU of 15.60 results in an intensity increase for CPT code 23470. We stated in the proposed rule that we disagreed that an increase in intensity for this code is warranted, particularly given that the typical case for the procedure is moving from the inpatient to outpatient setting. The code descriptor for CPT code 23470 also remains unchanged which suggests that there has been no significant change in the procedure's performance or intensity. Furthermore, we also found that the recommended work RVU of 15.60 was higher than nearly all of the other 90-day global codes with similar time values, and we noted in the proposed rule that we did not believe that this type of shoulder arthroplasty procedure, which is typically done on a routine and elective basis, would warrant an intensity and work valuation at the very top of the scale relative to other 90-day globals with similar time values. Because the PFS uses a relative value system, we noted that we believed it is important to highlight that these codes fail to maintain relativity with related surgical services. We therefore proposed a work RVU of 13.81 based on a crosswalk to CPT code 27416 which we stated in the proposed rule preserves the current intensity of CPT code 23470 and better maintains relativity with the rest of the PFS.

We disagreed with the RUC's recommended work RVU of 19.35 for CPT code 23472 and we instead proposed a work RVU of 17.49 based on a crosswalk to CPT code 67414 (*Orbitotomy without bone flap (frontal or transconjunctival approach); with removal of bone for decompression*). The RUC recommended a work RVU of 19.35, which is the current work RVU of the RUC's crosswalk code 61798 (*Stereotactic radiosurgery (particle beam, gamma ray, or linear accelerator); 1 complex cranial lesion*) after the efficiency adjustment was applied at the start of CY 2026. In reviewing CPT code 23472, we note that the recommended intraservice time is decreasing from 140 minutes to 120 minutes (15 percent reduction), and the recommended total time is decreasing from 448 minutes to 348 minutes (24 percent reduction); however, the RUC-recommended work RVU is only decreasing from 21.58 to 19.35, which is a reduction of just over 10 percent. While we do not believe that the decrease in time as reflected in survey values should always equate to a one-to-one or linear decrease in newly valued work RVUs we do believe that, since the two components of work are time and intensity, absent an obvious or explicitly stated rationale for why the relative intensity of a given procedure has increased, significant decreases in time should be reflected in decreases to work RVUs although not necessarily in a linear manner.

More specifically, CPT code 23472 was identified by the RAW as having a site of service anomaly in which the service was performed less than 50 percent of the time in the inpatient setting yet included inpatient hospital Evaluation and Management services within the global period. The RUC has recommended the removal of 3 inpatient hospital visits, one outpatient E/M visit, a decrease from a full to a half discharge visit, along with recommending a decrease of 20 minutes to the intraservice work time based on the survey. We stated in the proposed rule that we did not believe that the RUC's recommended work decrease of just over two RVUs appropriately captures this decrease in procedure time and practitioner work for CPT code 23472. We also noticed that the RUC's recommended work RVU of 19.35 results in an intensity increase for CPT code 23472. We stated in the proposed rule that we disagreed that an increase in intensity for this code is warranted, particularly given that the typical case for the procedure is moving from the inpatient to outpatient setting. We noted that the code descriptor for CPT code 23472 also remains unchanged which suggests that there has been no significant change in the procedure's performance or intensity. Furthermore, we also found that the recommended work RVU of 19.35 was higher than nearly all of the other 90-day global codes with similar time values, and we stated in the proposed rule that we did not believe that this type of total shoulder arthroplasty procedure, which is typically done on a routine and elective basis, would warrant an intensity and work valuation at the very top of the scale relative to other 90-day globals with similar time values. We therefore proposed a work RVU of 17.49 based on a crosswalk to CPT code 67414 which we stated in the proposed rule preserves the current intensity of CPT code 23472 and better maintains relativity with the rest of the PFS.

We proposed the RUC-recommended direct PE inputs for CPT codes 23470 and 23472 without refinement.

We received a large volume of comments disagreeing with the proposed valuations for CPT codes 23470 and 23472, as well as the related codes in the Arthroplasty—Hip (CPT code 27130) and Arthroplasty—Knee (CPT code 27447) code families. We will first address the general comments regarding this group of arthroplasty codes before addressing the comments specifically regarding valuation of each CPT code in their respective sections.

Comment: Many commenters detailed the clinical benefits of joint replacement procedures, stating that these were among the most successful procedures in modern medicine, restoring mobility, relieving pain, reducing disability, and allowing millions of Medicare beneficiaries to maintain their independence. Commenters stated that payment for the arthroplasty codes should accurately reflect the work, technical skill, clinical judgment, and risk required to perform these complex operations.

Response: We appreciate the additional detail provided by the commenters regarding the clinical benefits of these procedures. We agree with the commenters that these are important services that can restore mobility and improve quality of life for Medicare beneficiaries.

Comment: Many commenters stated that the proposed valuations for these arthroplasty procedures constituted unsustainable payment reductions and threatened the ability of independent orthopedic practices to continue caring for Medicare patients. Commenters stated that practices would have no choice but to limit Medicare volume, leaving local seniors to face significant delays in accessing surgical care, resulting in prolonged pain, loss of autonomy, and a higher demand for non-surgical interventions. Commenters stated that this would lead to delays in treatment and other barriers to accessing care as well as accelerating the acquisition of independent physician practices by hospitals and national health insurers.

Response: We share the concern of commenters regarding the importance of access to care for these services. We have factored these access concerns into the finalized work RVUs for these codes; see later in this section.

Comment: Many commenters disagreed that the shift in the typical site of service from inpatient to outpatient for the arthroplasty codes constituted less work. Commenters stated that what changed with the site of service was not whether postoperative work occurred, but how efficiently it could be delivered, stating that when a patient is discharged within hours of surgery, caregiver surveillance does not disappear but converts into a diffuse and less efficient set of activities. Commenters stated that the practitioner and the practitioner's staff absorb the care coordination that inpatient nursing and hospitalist services previously provided: same-day discharge planning, home health and durable medical equipment arrangement, anticoagulation management, wound and drainage monitoring by telephone and portal, early physical therapy coordination, and rapid triage of the complications that previously surfaced on an inpatient ward. Commenters stated that the practitioner's work does not decrease but actually increases when the patient leaves the hospital sooner.

Response: We clarify for commenters that we do not believe the movement of these procedures from typically inpatient to typically outpatient site of service has necessarily resulted in less work, or that the same postoperative care is no longer being provided by practitioners and clinical staff. Our proposed valuations recognize that longer and more complex outpatient E/M visits are now taking place for these procedures, such as CPT code 23470 changing from Level 2 outpatient E/M visits to Level 3 and Level 4 outpatient E/M visits in its global period. We believe that the removal of the inpatient hospital visits, combined with the increase in the visit level of the outpatient E/M visits, accurately reflects how the postoperative care has shifted along with the typical site of service. Our proposed valuations for the arthroplasty codes are largely based on the surveyed changes in work time, not the shift in site of service. We discussed the change in site of service since it reinforced our belief that there has been no significant change in the performance or intensity of these services. We agree with the commenters that merely changing the typical site of service has not necessarily reduced the work of these procedures; however, we disagree that changing the site of service has made the procedures *more* intense as the RUC recommended and some commenters suggested. We can also clarify for commenters that these services can still be provided in the inpatient setting, even if it is not the typical case, just as they previously could be provided in the outpatient setting when inpatient was typical.

Comment: Several commenters stated that some of the services for the arthroplasty codes continue to take place in the inpatient setting. Commenters stated that the arthroplasty codes were valued identically whether the patient was discharged within hours of surgery or remained hospitalized for several days, with the proposed valuations containing no stratification by site of service, no adjustment for length of stay, and no severity tier. Commenters stated that CMS should restore the inpatient hospital visits and full discharge visit to account for the resource cost of these services.

Response: We remind commenters that the PFS values services based on the typical case. Although some of these arthroplasty services will continue to be provided in the inpatient setting, it is clear that this is no longer the typical site of service. We therefore agree with the RUC's recommendation to remove the inpatient hospital visits and full discharge visit from the global period of these codes.

Comment: Several commenters stated that practitioners of these arthroplasty procedures have been at the forefront of the transition to value-based care as high-volume, high-value procedures present significant opportunities for improvements in quality and efficiency. Commenters stated that much of the effectiveness of these programs, however, has come from the shift from reactive, hospital-based postoperative work to proactive, office-based preoperative work which fall outside of the global surgical bundle because they are not included in the traditional RUC survey definition of ''pre-service activities,'' nor the time clinical staff spent providing certain pre-service activities for the patient and family. Commenters stated that penalizing surgeons for this successful collaboration, by eliminating valuation for postoperative visits while not reimbursing preservice optimization time, does not lead to more accurate payments.

Response: We appreciate these efforts by practitioners to deliver care for arthroplasty services which is both more proactive and more efficient, which we believe has been reflected in the decreased intraoperative survey times for these procedures. However, we believe that this additional work has been accurately captured in the updated survey times for the procedures, which include higher preservice and immediate postservice work times, as well as more complex postoperative E/M visits within the global period. For example, CPT code 23470 was recommended by the RUC and proposed by CMS in the proposed rule with 15 additional minutes of preservice work time (58 to 73 minutes) and 16 additional minutes of immediate postservice work time (19 to 35 minutes), along with the upcoding of the outpatient E/M visits described previously.

Comment: Several commenters stated that the proposed valuations for the arthroplasty codes were especially difficult to justify given their ongoing increase in utilization. Commenters stated that annual primary total knee arthroplasty volume among Medicare beneficiaries grew from roughly 604,000 in 2013 to over 1 million in 2022, and was projected to reach nearly 2.8 million by 2040, a further 176 percent increase from current levels. Primary total hip arthroplasty volume was projected to grow even faster, from roughly 595,000 in 2022 to over 2.1 million by 2040, an increase of roughly 265 percent. Commenters stated that reducing payment for hip, knee, and shoulder replacement at the same time demand for these procedures was rising sharply risked discouraging the workforce capacity needed to meet that demand.

Response: As stated previously, we share the concern of commenters regarding the clinical benefits and importance of access to care for these services. However, rapid utilization growth of these services only further emphasizes the need for accurate, resource-based valuation of the arthroplasty codes. We continue to believe that the updated work time data from the most recent surveys supports our proposed valuations for these codes.

Comment: Several commenters stated that the arthroplasty codes had been repeatedly reviewed over the past two decades. Commenters stated that CPT code 27130 has been reviewed five times, CPT code 27447 has been reviewed six times, and CPT code 23472 has been reviewed five times, with every review of all three codes since 2013 reducing their work RVUs. Commenters stated that a valuation process that produces a further reduction at every review for more than a decade is not converging on an accurate value.

Response: We disagree with the commenters that frequent review of the arthroplasty codes has produced inaccurate valuations. Since these are high volume services with rapidly increasing utilization, we believe that frequent reviews of these codes have

been warranted to ensure accurate valuations. These reviews have repeatedly produced surveys with reduced work times which have then been reflected in reduced work RVUs for the arthroplasty codes; this has been reflected in both the RUC's recommendations and CMS' finalized values. We believe that these updated valuations reflect the improved efficiencies in the arthroplasty codes, which no longer require the same time and effort that they did two decades earlier.

Comment: Several commenters cited a 2018 study published in the Journal of the American Medical Association which found that total hip arthroplasty took 5% longer than the PFS valued time, while total knee arthroplasty had an equal duration. Commenters stated that when the authors made these conclusions in 2018, the arthroplasty procedures had higher work RVUs than what CMS was proposing for CY 2027.

Response: While we appreciate this additional study provided by the commenters, it dates back to 2018 prior to the current review of these procedures. We believe that it is more accurate to base valuation on the most recent work and time surveys that took place in 2025.

The following comments were specifically directed at the proposed work RVUs for the shoulder arthroplasty (CPT codes 23470 and 23472).

Comment: Several commenters disagreed with the proposed work RVU of 13.81 for CPT code 23470. Commenters stated that the current valuation for CPT code 23470 was based on a review during the Harvard study that included responses from only 11 general orthopedic surgeons for intraservice time. Commenters stated that the existing Harvard times were not valid for relative comparison to the current survey or to other codes.

Response: We agree that it is important to use the recent data available regarding time, and we note that when many years have passed between when time is measured, significant discrepancies can occur. However, we also believe that our operating assumption regarding the validity of the existing values as a point of comparison is critical to the integrity of the relative value system as currently constructed. The times currently associated with codes play a very important element in PFS ratesetting, both as points of comparison in establishing work RVUs and in the allocation of indirect PE RVUs by specialty. If we were to operate under the assumption that previously recommended work times had routinely been overestimated, this would undermine the relativity of the work RVUs on the PFS in general, given the process under which codes are often valued by comparisons to codes with similar times and it would undermine the validity of the allocation of indirect PE RVUs to physician specialties across the PFS.

Instead, we believe that it is crucial that the code valuation process take place with the understanding that the existing work times, used in the PFS ratesetting processes, are accurate. We recognize that adjusting work RVUs for changes in time is not always a straightforward process and that the intensity associated with changes in time is not necessarily always linear, which is why we apply various methodologies to identify several potential work values for individual codes. However, we reiterate that we believe it would be irresponsible to ignore changes in time based on the best data available and that we are statutorily obligated to consider both time and intensity in establishing work RVUs for PFS services. For additional information regarding the use of old work time values in our methodology, we refer readers to our discussion of the subject in the CY 2017 final rule (81 FR 80273 through 80274).

Comment: Several commenters stated that they disagreed with the proposed crosswalk to CPT code 27416 at a work RVU of 13.81 to value CPT code 23470, and suggested that CMS should instead use the RUC's recommended crosswalk to CPT code 67107 at a work RVU of 15.60. Commenters stated that CPT code 27416 was not a valid crosswalk code because it is less intense due to lower neurovascular risk and lower risk of positioning complications. Commenters stated that CPT code 67107 was a more appropriate crosswalk, as its most recent survey was in 2016, whereas CPT code 27416 was last surveyed in 2008. Commenters stated that the intensity and risk of impact on vision in CPT code 67107 hold a risk that more closely approximates the risk of functional loss with neurovascular or infection complications that can be associated with CPT code 23470.

Response: We continue to have concerns regarding the increased intensity of CPT code 23470 as valued at the RUC's recommended work RVU of 15.60. As we discussed in the proposed rule, we also have concerns that the RUC's valuation does not adequately capture the changes in surveyed work time. However, we were persuaded by commenters that finalizing the proposed work RVU of 13.81 for CPT code 23470 could significantly affect providers, create barriers to accessing care for Medicare patients, and does not fully capture the resource costs of these procedures. For these specific codes, we were persuaded that the RUC-recommended work RVU of 15.60 reflected the associated time and intensity described by the commenters. We continue to remain concerned regarding the overall accuracy of these values and welcome additional information that we could consider for future rulemaking. We are therefore finalizing the RUC's recommended work RVU of 15.60 for CPT code 23470.

Comment: Several commenters disagreed with the proposed work RVU of 17.49 for CPT code 23472. Commenters stated that the typical operative technique for a total shoulder arthroplasty has changed since the last review 10 years ago to a ''reverse total shoulder arthroplasty'' (RTSA), under which the normal ''ball-and-socket'' structure of the shoulder is reversed. Commenters stated that this is the opposite of standard (anatomic) shoulder arthroplasty (ATSA) and that over the past decade, both the technology and indications for reverse procedures have expanded, making the surgery significantly more complex due to broader application, more challenging patient anatomy, and the need for specialized surgical skill and implant design. Commenters stated that comparison of current survey data for CPT code 23472 with older 2012 data reveals less intraoperative time but at a higher complexity and intensity, along with fewer hospital visits but higher-level office work. Commenter stated that the RUC's recommended work RVU of 19.35 reflected the increased intensity of the more complex procedure while also recognizing a decrease in total time.

Response: We appreciate the additional clinical details regarding CPT code 23472 provided by the commenters. We concur with the commenters that the clinical description of work for CPT code 23472 has undergone modest changes since the time of last review, which may account for a modest increase in the intensity of the procedure.

Comment: Several commenters stated that they disagreed with the proposed crosswalk to CPT code 67414 at a work RVU of 17.49 to value CPT code 23472, and suggested that CMS should instead use the RUC's recommended crosswalk to CPT code 61798 at a work RVU of 19.35. Commenters stated that CPT code 67414 has consequential risk with injury to the muscles or nerves of the orbital region but involves debridement or removal of structures with no

reconstruction. Commenters stated that CPT code 23472 has greater intensity than the CMS crosswalk code based on the need for approach, preparation, and critically extensive reconstruction using metal implants and polyethylene, along with moderate neurovascular risk due to retraction or direct injury during approach and implantation, risk of fracture, risk of injection, and risk of dislocation. Commenters stated that CPT code 23472 was most appropriately valued based on a direct work RVU crosswalk to CPT code 61798.

Response: We continue to have some concerns regarding the increased intensity of CPT code 23472 as valued at the RUC's recommended work RVU of 19.35. As we discussed in the proposed rule, we also have concerns that the RUC's valuation does not adequately capture the changes in surveyed work time. However, we were persuaded by commenters that finalizing the proposed work RVU of 17.49 for CPT code 23472 could significantly affect providers and create barriers to accessing care for Medicare patients, and does not fully capture the resource cost of these procedures. For these specific codes, we were persuaded that the RUC-recommended work RVU of 19.35 reflected the associated time and intensity described by the commenters. We continue to remain concerned regarding the overall accuracy of these values and welcome additional information that we could consider for future rulemaking. We are therefore finalizing the RUC's recommended work RVU of 19.35 for CPT code 23472.

After consideration of the comments, we are not finalizing our proposed work RVUs and are instead finalizing the RUC's recommended work RVUs for CPT codes 23470 and 23472. We are finalizing the direct PE inputs for these CPT codes as proposed.

(8) Arthroplasty—Hip (CPT Code 27130)

In April 2025, the RAW identified CPT code 27130 as having a site of service anomaly where Medicare data from 2021 through 2023 indicated it was performed less than 50 percent of the time in the inpatient setting yet included inpatient hospital Evaluation and Management services within the global period. The RAW concluded that the code represented a site of service anomaly, and the RUC therefore surveyed CPT code 27130 (*Arthroplasty, acetabular and proximal femoral prosthetic replacement (total hip arthroplasty), with or without autograft or allograft*) for the September 2025 meeting.

We stated in the proposed rule that we disagreed with the RUC's recommended work RVU of 16.70 for CPT code 27130 and we instead proposed a work RVU of 15.37 based on a crosswalk to CPT code 43774 (*Laparoscopy, surgical, gastric restrictive procedure; removal of adjustable gastric restrictive device and subcutaneous port components*). The RUC recommended a work RVU of 16.70, which is the current work RVU of the RUC's crosswalk code 67108 (*Repair of retinal detachment; with vitrectomy, any method, including, when performed, air or gas tamponade, focal endolaser photocoagulation, cryotherapy, drainage of subretinal fluid, scleral buckling, and/or removal of lens by same technique*) after the efficiency adjustment was applied at the start of CY 2026. In reviewing CPT code 27130, we noted that the recommended total time is decreasing from 377 minutes to 305 minutes (19 percent reduction); however, the RUC-recommended work RVU is only decreasing from 19.11 to 16.70, which is a reduction of 13 percent. While we do not believe that the decrease in time as reflected in survey values should always equate to a one-to-one or linear decrease in newly valued work RVUs we do believe that, since the two components of work are time and intensity, absent an obvious or explicitly stated rationale for why the relative intensity of a given procedure has increased, significant decreases in time should be reflected in decreases to work RVUs although not necessarily in a linear manner.

More specifically, CPT code 27130 was identified by the RAW as having a site of service anomaly in which the service was performed less than 50 percent of the time in the inpatient setting yet included inpatient hospital Evaluation and Management services within the global period. The RUC has recommended the removal of 2 inpatient hospital visits, a decrease from a full to a half discharge visit, along with recommending a decrease of 10 minutes to the intraservice work time based on the survey. We stated in the proposed rule that we do not believe that the RUC's recommended work decrease of just over two RVUs appropriately captures this decrease in procedure time and practitioner work for CPT code 27130. We also noticed that the RUC's recommended work RVU of 16.70 results in an intensity increase for CPT code 27130. We stated in the proposed rule that we disagreed that an increase in intensity for this code is warranted, particularly given that the typical case for the procedure is moving from the inpatient to outpatient setting. The code descriptor for CPT code 27130 also remains unchanged which suggests that there has been no significant change in the procedure's performance or intensity. Furthermore, we also found that the recommended work RVU of 16.70 was higher than nearly all of the other 90-day global codes with similar time values, and we stated in the proposed rule that we did not believe that this type of total hip arthroplasty procedure, which is typically done on a routine and elective basis, would warrant an intensity and work valuation at the very top of the scale relative to other 90-day globals with similar time values. We therefore proposed a work RVU of 15.37 based on a crosswalk to CPT code 43774 which we stated in the proposed rule preserves the current intensity of CPT code 27130 and better maintains relativity with the rest of the PFS.

We proposed the RUC-recommended direct PE inputs for CPT code 27130 without refinement.

Comment: A commenter stated that CMS cited a reduction in time for total hip arthroplasty from 377 minutes to 305 minutes, an approximately 19 percent decrease, as support for the proposed work value. The commenter requested that CMS clarify in the final rule precisely which time component this figure represents and how it was derived.

Response: We can clarify for the commenter that these updated work times for CPT code 27130 were recommended by the RUC based on new survey data. The work times for CPT code 27130, and all other CPT codes listed on the PFS, are included in the ''CY 2027 PFS Final Rule Physician Work Time'' public use file available on the CMS website under downloads for the CY 2027 PFS final rule at *https://www.cms.gov/medicare/payment/fee-schedules/physician/federal-regulation-notices*.

Comment: Several commenters disagreed with the proposed work RVU of 15.37 for CPT code 27130. Commenters stated that the work for CPT code 27130 has remained the same and is performed in less time, as captured by the RUC process, which accounts for an increase in intensity. Commenters stated that by definition the same work performed in less time is more intense; since CPT code 27130 still involves the same basic steps since its inception, an increase in efficiency should not be conflated with less work or less intensity.

Response: We remain unconvinced that there has been a significant increase in intensity for this code. Intensity of

work under the Physician Fee Schedule reflects skill, expertise, effort, stress, and other factors that influence the assessed relative value of time spent. We disagree with the commenters that performing the same work in less time inherently means that the intensity of a procedure has increased; changes in practice patterns, improvements in technology, or greater efficiencies in the delivery of care can all account for shorter procedure times without a corresponding increase in intensity. Commenters agreed with our statement in the proposed rule that CPT code 27130 had undergone no significant change in the procedure's performance as reflected by its unaltered code descriptor. Under our methodology for work valuation, if the surveyed work times are decreasing and there is general agreement that the procedure itself has remained unchanged, this supports a decrease in the work RVU, not a conclusion that the intensity of the procedure has increased to match the decrease in surveyed work time. However, we do note that the RUC's recommended work RVU of 16.70 for CPT code 27130 already constitutes a reduction from the current work RVU of 19.11 which we have concluded is more appropriate than the proposed work RVU of 15.37.

Comment: Several commenters stated that they disagreed with the proposed crosswalk to CPT code 43774 at a work RVU of 15.37 to value CPT code 27130, and suggested that CMS should instead use the RUC's recommended crosswalk to CPT code 67108 at a work RVU of 16.70. Commenters stated that CPT code 27130 has greater intensity/complexity than the CMS crosswalk code based on the need for approach, preparation, and critically extensive reconstruction using metal implants and polyethylene. Commenters stated that CPT code 27130 requires significantly more perioperative work, including management of pain/opioid medications, anticoagulation, dressing/closure, and perioperative services such as physical therapy and that total hip arthroplasty is performed standing, often with a lead apron, and involves significant soft tissue manipulation and limb support. Commenters stated that the proposed work RVU of 15.37 for CPT code 27130 creates a rank order anomaly when compared to CPT codes 27236 and 27125, which are less intense, of shorter duration, and typically performed for a fracture, implying less pre-operative work. Commenters stated that CPT code 27130 was most appropriately valued based on a direct work RVU crosswalk to CPT code 67108.

Response: We continue to have concerns regarding the increased intensity of CPT code 27130 as valued at the RUC's recommended work RVU of 16.70. As we discussed in the proposed rule, we also have concerns that the RUC's valuation does not adequately capture the changes in surveyed work time. However, we were persuaded by commenters that finalizing the proposed work RVU of 15.37 for CPT code 27130 could significantly affect providers and create barriers to accessing care for Medicare patients and does not fully capture the resource cost of these procedures. For these specific codes, we were persuaded that the RUC-recommended work RVU of 16.70 reflected the associated time and intensity described by the commenters. We continue to remain concerned regarding the overall accuracy of these values and welcome additional information that we could consider for future rulemaking. We are therefore finalizing the RUC's recommended work RVU of 16.70 for CPT code 27130.

After consideration of the commenters, we are finalizing the RUC's recommended work RVU of 16.70 for CPT code 27130. We are finalizing the direct PE inputs as proposed.

(9) Sacroiliac Joint Arthrodesis (CPT codes 27278 and 27279)

At the May 2025 CPT Editorial Panel meeting. CPT code 27278 (*Arthrodesis, sacroiliac joint, percutaneous or minimally invasive, including imaging guidance, unilateral; placement of intra-articular structural bone graft, metal and/or synthetic device(s) without cortical piercing, including use of osteopromotive material and/or obtaining bone graft, when performed*) was revised to include imaging guidance, placement of intra-articular structural bone graft, metal, and/or synthetic device(s) without cortical piercing and CPT code 27279 (*Arthrodesis, sacroiliac joint, percutaneous or minimally invasive, including imaging guidance, unilateral; placement of transarticular and/or intra-articular device(s) that engage bone with intrinsic fixation (e.g., screw[s], flange[s], blade[s]) piercing the lateral cortex of the sacrum and the medial cortex of the ilium (with or without piercing the lateral cortex of the ilium), including use of osteopromotive material and/or obtaining bone graft, when performed*) was revised to include placement of transarticular and/or intra-articular device(s) that engage bone with intrinsic fixation (*e.g.,* screw(s), flange(s), blade(s)) piercing the lateral cortex of the sacrum and the medial cortex of the ilium. CPT codes 27278 and 27279 were surveyed for the September 2025 RUC meeting.

We proposed the RUC-recommended work RVUs of 7.66 for CPT code 27278 (which is the current work RVU of the code after the efficiency adjustment was applied at the start of CY 2026) and 11.00 for CPT code 27279. We also proposed the RUC-recommended direct PE inputs for CPT codes 27278 and 27279 without refinement.

Comment: Commenters supported CMS's proposal of the RUC-recommended work RVUs and direct PE inputs for CPT codes 27278 and 27279 without refinements

Response: We thank the commenters for their support. After consideration of the public comment, we are finalizing as proposed.

(10) Arthroplasty—Knee (CPT code 27447)

In April 2025, the RAW identified CPT code 27447 as having a site of service anomaly where Medicare data from 2021–2023 indicated it was performed less than 50 percent of the time in the inpatient setting yet included inpatient hospital Evaluation and Management services within the global period. The RAW concluded that the code represented a site of service anomaly, and the RUC therefore surveyed CPT code 27447 (*Arthroplasty, knee, condyle and plateau; medial AND lateral compartments with or without patella resurfacing (total knee arthroplasty)*) for the September 2025 meeting.

We stated in the proposed rule that we disagreed with the RUC's recommended work RVU of 16.70 for CPT code 27447 and we instead proposed a work RVU of 15.94 based on a crosswalk to CPT code 65730 (*Keratoplasty (corneal transplant); penetrating (except in aphakia or pseudophakia)*). The RUC recommended a work RVU of 16.70, which is the current work RVU of the RUC's crosswalk code 67108 (R*epair of retinal detachment; with vitrectomy, any method, including, when performed, air or gas tamponade, focal endolaser photocoagulation, cryotherapy, drainage of subretinal fluid, scleral buckling, and/or removal of lens by same technique*) after the efficiency adjustment was applied at the start of CY 2026. In reviewing CPT code 27447, we noted that the recommended total time is decreasing from 374 minutes to 305 minutes (19 percent reduction); however, the RUC-recommended work RVU is only decreasing from 19.11 to

16.70, which is a reduction of 13 percent. While we do not believe that the decrease in time as reflected in survey values should always equate to a one-to-one or linear decrease in newly valued work RVUs we do believe that, since the two components of work are time and intensity, absent an obvious or explicitly stated rationale for why the relative intensity of a given procedure has increased, significant decreases in time should be reflected in decreases to work RVUs although not necessarily in a linear manner.

More specifically, CPT code 27447 was identified by the RAW as having a site of service anomaly in which the service was performed less than 50 percent of the time in the inpatient setting yet included inpatient hospital Evaluation and Management services within the global period. The RUC has recommended the removal of two inpatient hospital visits, a decrease from a full to a half discharge visit, along with recommending a decrease of 7 minutes to the intraservice work time based on the survey. We stated in the proposed rule that we did not believe that the RUC's recommended work decrease of just over two RVUs appropriately captures this decrease in procedure time and practitioner work for CPT code 27447. We also noticed that the RUC's recommended work RVU of 16.70 results in an intensity increase for CPT code 27447. We stated in the proposed rule that we disagreed that an increase in intensity for this code is warranted, particularly given that the typical case for the procedure is moving from the inpatient to outpatient setting. We further noted that the code descriptor for CPT code 27447 also remains unchanged which suggests that there has been no significant change in the procedure's performance or intensity. Furthermore, we also found that the recommended work RVU of 16.70 was higher than nearly all of the other 90 day global codes with similar time values, and we stated in the proposed rule that we did not believe that this type of total knee arthroplasty procedure, which is typically done on a routine and elective basis, would warrant an intensity and work valuation at the very top of the scale relative to other 90 day globals with similar time values. We therefore proposed a work RVU of 15.94 based on a crosswalk to CPT code 65730 which we noted preserves the current intensity of CPT code 27447 and better maintains relativity with the rest of the PFS.

We proposed the RUC-recommended direct PE inputs for CPT code 27447 without refinement.

Comment: Several commenters disagreed with the proposed work RVU of 15.94 for CPT code 27447. Commenters stated that the work for CPT code 27447 has remained the same and is performed in less time, as captured by the RUC process, which accounts for an increase in intensity. Commenters stated that by definition the same work performed in less time is more intense; since CPT code 27447 still involves the same basic steps since its inception, an increase in efficiency should not be conflated with less work or less intensity.

Response: As we stated for CPT code 27130, we remain unconvinced that there has been a significant increase in intensity for this code. Intensity of work under the Physician Fee Schedule reflects skill, expertise, effort, stress, and other factors that influence the assessed relative value of time spent. We disagree with the commenters that performing the same work in less time inherently means that the intensity of a procedure has increased; changes in practice patterns, improvements in technology, or greater efficiencies in the delivery of care can all account for shorter procedure times without a corresponding increase in intensity. Commenters agreed that with our statement in the proposed rule that CPT code 27447 had undergone no significant change in the procedure's performance as reflected by its unaltered code descriptor. Under our methodology for work valuation, if the surveyed work times are decreasing and there is general agreement that the procedure itself has remained unchanged, this supports a decrease in the work RVU, not a conclusion that the intensity of the procedure has increased to match the decrease in surveyed work time. However, we do note that the RUC's recommended work RVU of 16.70 for CPT code 27447 already constitutes a reduction from the current work RVU of 19.11 which we have concluded is more appropriate than the proposed work RVU of 15.94.

Comment: Several commenters stated that they disagreed with the proposed crosswalk to CPT code 65730 at a work RVU of 15.94 to value CPT code 27447, and suggested that CMS should instead use the RUC's recommended crosswalk to CPT code 67108 at a work RVU of 16.70. Commenters stated that CPT code 27447 has greater intensity/complexity than the CMS crosswalk code based on the need for approach, preparation, and critically extensive reconstruction using metal implants and polyethylene. Commenters stated that CPT code 27447 also has moderate neurovascular risk due to retraction or direct injury during approach and implantation, risk of fracture, risk of infection, and risk of dislocation, as well as total knee arthroplasty is performed standing, often with a lead apron, and involves significant soft tissue manipulation and limb support. Commenters stated that CPT code 27447 was most appropriately valued based on a direct work RVU crosswalk to CPT code 67108.

Several commenters stated that the RUC affirmed its April 2021 work RVU recommendation of 16.70 for CPT code 27446 (*Arthroplasty, knee, condyle and plateau; medial OR lateral compartment*). Commenters stated that CPT codes 27446 and 27447 should be valued similarly to preserve relativity with the other arthroplasty codes and requested that CPT code 27447 should be finalized at the RUC's recommended work RVU of 16.70 to match CPT code 27446.

Response: We continue to have concerns regarding the increased intensity of CPT code 27447 as valued at the RUC's recommended work RVU of 16.70. As we discussed in the proposed rule, we also have concerns that the RUC's valuation does not adequately capture the changes in surveyed work time. However, we were persuaded by commenters that finalizing the proposed work RVU of 15.94 for CPT code 27447 could significantly affect providers and create barriers to accessing care for Medicare patients and does not fully capture the resource cost of these procedures. For these specific codes, we were persuaded that the RUC-recommended work RVU of 16.70 reflected the associated time and intensity described by the commenters. We also concur that this code should be valued comparably to CPT code 27446 as identified by commenters. We are therefore finalizing the RUC's recommended work RVU of 16.70 for CPT code 27447. We continue to remain concerned regarding the overall accuracy of these values and welcome additional information that we could consider for future rulemaking.

After consideration of the comments, we are finalizing the RUC's recommended work RVU of 16.70 for CPT code 27447. We are finalizing the direct PE inputs as proposed.

(11) Implantation of Extra-Articular Shock Absorber—Medial Knee (CPT Code 27494)

At the September 2025 CPT Editorial Panel Meeting, CPT created a new Category I code to describe the implantation of a medial knee extra-articular shock absorber. CPT code 27494 (*Implantation of medial knee extra-articular shock absorber,*

including fluoroscopic guidance) was surveyed at the January 2026 RUC meeting.

We proposed the RUC-recommended work RVU of 13.16 for CPT code 27494. We proposed the RUC-recommended direct PE inputs for CPT code 27494 without refinement.

Comment: Commenters were generally not in support of our proposed values for Implantation of Extra-articular Shock Absorber—Medial Knee. Commenters disagreed with the proposed work RVU which was lower than the survey 25th percentile. Many commenters argued that the proposed work RVU did not account for the time and intensity needed to perform the service along with the cognitive load, demanding precision, and lack of margin for error with placement of the device under fluoroscopy. Several commenters noted that the RUC survey did not include other codes for joint replacements or neutral comparators such as knee arthroplasty or medial compartment orthopedic procedures. Several commenters noted that if the joint-sparing option is valued below the joint-replacing option, practitioners may not offer the procedure to beneficiaries which would decrease access to this less invasive option.

Response: We continue to believe that the proposed work RVU of 13.16 for CPT code 27494, based on the RUC recommendation, is the most accurate valuation for this service. In our review of this code, we compared CPT code 27494 to other similar 90-day global codes with 90 minutes of intraservice time and found that the RUC's recommended work RVU of 13.16 matched other codes with similar time values. The RUC looked at two key reference codes and compared the surveyed code to the top key reference code, CPT code 29916 (*Arthroscopy, hip, surgical; with labral repair)* which has a work RVU of 14.63 and intraservice time of 90 minutes, and CPT code 29888 (*Arthroscopically aided anterior cruciate ligament repair/ augmentation or reconstruction)* which has a work RVU of 13.94 and intraservice time of 98 minutes. The RUC noted that both services typically involve the same amount or slightly higher intraservice time as compared with CPT code 27494. Ninety percent of the survey respondents indicated the surveyed CPT code 27494 was more intense and complex to perform than these key references, making them relative to one another. We do not believe that other codes for joint replacements or neutral comparators such as knee arthroplasty procedures would necessarily be appropriate comparator codes solely based on clinical similarity, or that it would maintain relativity for CPT code 27494 to be valued significantly higher than every other 90-day global code in this range of time values. We continue to believe that the PFS is a relative value based system and we do not base valuation only on things that are clinically related but rather on time and intensity.

After consideration of the public comments, we are finalizing the work RVU and direct PE inputs for CPT code 27494 as proposed.

(12) Osteochondral Acellular Scaffold Implantation, Knee (CPT Code 27417)

At the September 2025 CPT Editorial Panel Meeting, CPT created a new Category I CPT code 27417 (*Acellular scaffold(s) (e.g., aragonite) implant(s), for osteochondral lesion(s), knee, open*), which describes open cartilage knee repair procedures with an acellular scaffold implant. Based on the inorganic nature of these implants, the CPT Editorial Panel included the term ''acellular scaffold'' in the code descriptor for 27417, as it is a more comprehensive term and further defines the types of regenerative implants being used that are neither autologous nor allogenic. The CPT Editorial Panel did not request deletion for existing Category III code 0737T, which is currently being reported for this procedure, since it may appropriately describe procedures with this type of implant joints other than the knee. CPT code 27417 was surveyed for the January 2026 RUC meeting.

We proposed the RUC-recommended work RVU of 9.53 for CPT code 27417. We proposed the RUC-recommended direct PE inputs for CPT code 27417 without refinement.

Comment: Commenters were not in support of our proposed values for CPT code 27417. Commenters recommended that CMS assign a work RVU of 12.00 which corresponds to the survey median result and would better reflect the procedure's complexity and required technical skill.

Response: We continue to believe that the proposed work RVU of 9.53 for CPT code 27417, based on the RUC recommendation, is the most accurate valuation for this service. The RUC based its recommendation on a crosswalk to CPT code 50590 *(Lithotripsy, extracorporeal shock wave*) which shares the same 60 minutes of intraservice time as CPT code 27417 and has a comparable total time. When we reviewed this code, we found that the RUC's recommended work RVU of 9.53 was already above the median valuation when compared to other 90-day global procedures with similar time values. Although we believed that this was appropriate given the open incision and implantation of an acellular scaffold implant device taking place in CPT code 27417, we disagree with the commenters that a work RVU of 12.00 based on the median survey result would appropriately preserve relativity. A work RVU of 12.00 would value CPT code 27417 higher than all other 90-day global codes with similar time values and create a rank order anomaly in terms of intensity. We continue to believe that the proposed work RVU of 9.53 is a more accurate valuation.

After consideration of public comments, we are finalizing the work RVU and direct PE inputs for CPT code 27417 as proposed.

(13) Cardiac Contractility Modulation (CPT Codes 33290, 33291, 33292, 33293, 33294, 33295, 33296, 33297, 33307, 33308, 33309, 93154, 93155, 93156, and 93157)

In May 2025, the CPT Editorial Panel approved a new family of 11 Category I CPT codes for insertion, removal, and replacement of cardiac contractility modulation (CCM) systems, generators, and leads in several combinations. A separate set of four codes was created to describe the corresponding CCM programming, interrogation, and remote interrogation services. All 11 of the insertion, removal, and replacement/ repositioning/revision CCM codes, as well as three programming, interrogation, and remote interrogation CCM services that involve physician work, were surveyed for the September 2025 RUC meeting.

The specialty societies detailed the four code subsets within the CCM code family. These include CCM insertion services: CPT codes 33290 (*Insertion of permanent cardiac contractility modulation system, including fluoroscopic guidance and programming of sensing and therapeutic parameters, with evaluation when performed; pulse generator and transvenous electrodes*), 33291 (*Insertion of permanent cardiac contractility modulation system, including fluoroscopic guidance and programming of sensing and therapeutic parameters, with evaluation when performed; pulse generator only*), 33292 (*Insertion of permanent cardiac contractility modulation system, including fluoroscopic guidance and programming of sensing and therapeutic parameters, with evaluation when performed; transvenous electrode, single*), and 33293 (*Insertion of permanent cardiac contractility*

modulation system, including fluoroscopic guidance and programming of sensing and therapeutic parameters, with evaluation when performed; transvenous electrode, dual); CCM removal services: CPT code 33294 (*Removal of a permanent cardiac contractility modulation system; pulse generator and transvenous electrodes*), 33295 (*Removal of a permanent cardiac contractility modulation system; pulse generator only*), 33296 (*Removal of a permanent cardiac contractility modulation system; transvenous electrode, single*), and 33297 (*Removal of a permanent cardiac contractility modulation system; transvenous electrode, dual*); CCM replacement, repositioning, and revision services: CPT code 33307 (*Removal and replacement of permanent cardiac contractility modulation system, pulse generator only*), 33308 (*Repositioning of previously implanted cardiac contractility modulation transvenous electrode(s), including fluoroscopic guidance and programming of sensing and therapeutic parameters*), and 33309 (*Relocation or revision of skin pocket for implanted cardiac contractility modulation pulse generator*); and CCM programming, interrogation, and remote interrogation services: CPT code 93154 (*Programming of the cardiac contractility modulation system (in person) with iterative adjustment of the implantable device to test the function of the device and select optimal permanent programmed values with analysis, including review and report by a physician or other qualified health care professional*), 93155 (*Interrogation device evaluation (in person) with analysis, review and report by a physician or other qualified healthcare professional, includes connection, recording and disconnection per patient encounter, implantable cardiac contractility modulation system*), 93156 (*Interrogation device evaluation (remote), up to 90 days, cardiac contractility modulation system with interim analysis, review and report(s) by a physician or other qualified health care professional*), and 93157 (*Interrogation device evaluation (remote), up to 90 days, cardiac contractility modulation system, remote data acquisition(s), receipt of transmissions, technician review, technical support, and distribution of results*).

We proposed the RUC-recommended work RVU for all of the codes in this family. We proposed a work RVU of 8.83 for CPT code 33290, work RVU of 5.66 for CPT 33291, work RVU of 6.00 for CPT 33292, work RVU of 6.23 for CPT 33293, work RVU of 9.90 for CPT 33294, work RVU of 4.79 for CPT 33295, work RVU of 7.30 for CPT 33296, work RVU of 8.39 for CPT 33297, work RVU of 6.00 for CPT 33307, work RVU of 5.00 for CPT 33308, work RVU of 5.12 for CPT 33309, work RVU of 0.90 for CPT 93154, work RVU of 0.80 for CPT 93155, and work RVU of 0.59 for CPT 93156. We note that several of these work RVUs were affected by the efficiency adjustment which was applied at the start of CY 2026, as the RUC recommendations were based on pre-adjustment work valuations. The RUC did not recommend, and we did not propose, a work RVU for CPT code 93157.

We proposed the RUC-recommended direct PE inputs for CPT codes 33290–33309 as well as for CPT codes 93154–93157 without refinement.

Comment: All commenters were in support of our proposal of the RUC-recommended work RVU and direct PE inputs for this code family.

After consideration of public comments, we are finalizing the RUC-recommended work RVU for CPT codes 33290–33297, 33307, 33308, 33309, 93154, 93155, 93156 as well as the RUC-recommended direct PE inputs for CPT codes 33290, 33309, 93154 and 93157 without refinement, as proposed.

(14) Insertion and Removal of Surgical Ventricular Assist Device (CPT Codes 33996, 33998, and 33994)

At the September 2025 CPT Editorial Panel meeting, the CPT Editorial Panel created three new category I CPT codes to describe the insertion and removal of a left heart ventricular assist device (VAD), specifically using an open arterial with conduit surgical approach. These new category I CPT codes include the insertion CPT codes 33994 *(Insertion of left heart ventricular assist device, including radiological supervision and interpretation, open; axillary, subclavian or innominate artery exposure with creation of conduit by infraclavicular or supraclavicular incision, unilateral)* and 33996 *(Insertion of left heart ventricular assist device, including radiological supervision and interpretation, open; aorta exposure with creation of conduit by transthoracic (e.g., median sternotomy, thoracotomy) incision)* as well as the removal CPT code 33998 *(Removal of left heart ventricular assist device with resection and stapling of graft conduit and skin closure (e.g., infraclavicular, supraclavicular).*

We proposed the RUC-recommended work RVU of 13.65 for CPT code 33994, work RVU of 17.52 for CPT 33996, and work RVU of 6.58 for CPT 33998.

We proposed the RUC-recommended direct PE inputs for CPT codes 33994, 33996, and 33998 without refinement.

Comment: All commenters were in support of our proposal of the RUC-recommended work RVU and direct PE inputs for this code family.

After consideration of public comments, we are finalizing the RUC-recommended work RVUs and direct PE inputs for CPT codes 33994, 33996, and 33998 without refinement, as proposed.

(15) Transcatheter Tricuspid Valve Implant, Edge-to-Edge Repair (CPT Codes 33469, 33466, and 33467)

In September 2025, the CPT Editorial Panel approved the addition of CPT codes 33469 *(Transcatheter tricuspid valve implantation (TTVI)/replacement with prosthetic valve, percutaneous approach, including right heart catheterization, temporary pacemaker insertion, and selective right ventricular or right atrial angiography, when performed),* CPT code 33466 *(Transcatheter tricuspid valve edge-to-edge repair (T–TEER), percutaneous approach; initial clip),* and CPT code 33467 *(Transcatheter tricuspid valve edge-to-edge repair (T–TEER), percutaneous approach; each additional clip during same session).* These codes were surveyed for the January 2026 RUC meeting.

The RUC recommended the inclusion of an inpatient hospital visit (CPT code 99233) within the global period of CPT codes 33469 and 33466, despite the fact that both codes were recommended with 0 day global periods. We disagree that this inpatient hospital visit should be included within the valuation of these services, as 0 day global periods are specifically defined to include only postoperative care that takes place on the day of the procedure itself without incorporating any postoperative days. We therefore proposed to remove the inpatient hospital visit (CPT code 99233) from both CPT codes 33469 and 33466, including the removal of 55 minutes of associated work time from each procedure.

We disagree with the RUC-recommended work RVU of 24.38 for CPT code 33469 and we instead proposed a work RVU of 17.52 based on a crosswalk to CPT code 95391 *(Percutaneous transcatheter closure of paravalvular leak; initial occlusion device, aortic valve).* Our review of CPT code 33469 found that the RUC's recommended work RVU of 24.38 placed it far higher than any other 0-day global code with similar time values on the PFS, especially after accounting for the removal of the work time associated with the inpatient hospital visit

described earlier in this section. Most codes with 120 minutes of intraservice time and approximately 220 minutes of total time were valued around a work RVU of 13.00–15.00 and there were zero codes valued higher than a work RVU of 17.52. While we concur that CPT code 33469 is a difficult and intensive procedure to perform, we do not believe it is accurately valued at 7 RVUs higher than any other code with comparable time values. We instead proposed a work RVU of 17.52 based on a crosswalk to CPT code 95391, the highest 0-day global valuation with comparable work times, as this will avoid distorting relativity with other services on the PFS. We also note that CPT code 33469 has comparable intensity at our proposed work RVU to the top reference code from the survey, CPT code 33477, which we believe better serves relativity than the RUC's recommended work RVU. The RUC's recommended work RVU of 24.38 would result in an intensity for CPT code 33469 nearly 50 percent higher than the already complex and difficult transcatheter pulmonary valve implantation procedure described in the reference code, which we do not believe would be typical.

For CPT code 33466, we disagree with the RUC's recommended work RVU of 23.92 and we instead proposed a work RVU of 17.06. Although we disagree with the RUC-recommended work RVU for CPT 33466, we concurred that the relative difference in work between CPT codes 33469 and 33466 is equivalent to the recommended interval of 0.46 RVUs. Therefore, we proposed a work RVU of 17.06 for CPT code 33466, based on the recommended interval of 0.46 below our proposed work RVU of 17.52 for CPT code 33469.

For CPT code 33467, we disagree with the RUC-recommended work RVU of 8.00 and we instead proposed a work RVU of 6.34 based on a crosswalk to CPT 22552 *(Arthrodesis, anterior interbody, including disc space preparation, discectomy, osteophytectomy and decompression of spinal cord and/or nerve roots; cervical below C2, each additional interspace (List separately in addition to code for primary procedure).* Our review of CPT code 33467 found that the RUC's recommended work RVU of 8.00 placed it far higher than almost any other add-on code with similar time values on the PFS, with the sole exception of CPT code 61642 (Balloon dilatation of intracranial vasospasm, percutaneous; each additional vessel in different vascular territory) which is an outlier valuation at a work RVU of 8.66. Most add-on codes with approximately 50 minutes of total time were valued around a work RVU of 3.00–5.00 and there was only a single code valued higher than a work RVU of 6.34. While we concur that CPT code 33467 is a difficult and intensive procedure to perform, we do not believe it is accurately valued at nearly two RVUs higher than other codes with comparable time values. We instead proposed a work RVU of 6.34 based on a crosswalk to CPT code 22522, the highest non-outlier add-on code valuation with comparable work times, as this will avoid distorting relativity with other services on the PFS. We note that this valuation will also maintain relative intensity between CPT code 33467 and the first two codes in the family at our proposed work RVUs.

The RUC did not recommend and we did not propose any direct PE inputs for the three codes in this family.

Comment: The majority of commenters disagreed with our proposal to exclude the inpatient hospital visit (CPT code 99233) from both CPT codes 33469 and 33466, including the removal of 55 minutes of associated work time from each procedure. These commenters believe the inpatient hospital visit should be included based on a survey for TTVR and T–TEER where the specialty societies requested, and the Research Subcommittee approved, use of the 000-day Global with visit survey template for the 000-day codes. Commenters also mentioned the TTVR codes are similar to the TAVR codes, which include a same-day post-operative visit. For CPT code 33469 many commenters disagreed with our crosswalk to CPT 95391 and recommended CMS to retain the RUC-recommended value. For CPT code 33466, many commenters disagreed with our proposal to adjust the relative difference through the usage of a recommended interval of 0.46 RVUs. These commenters stated that while they support a slightly higher value for this code, they do not believe any formulaic approach should be used as the primary methodology and rather CMS should rely on clinical inputs and specialty society committees to value services. Lastly, for CPT code 33467, many commenters disagree with our valuation based on the crosswalk to CPT code 22522 stating that it falls below the survey 25th percentile and is less intense than the surveyed code. A commenter also stated that CPT code 61642 is not an outlier, explaining that its high intensity as an add-on code reflects the significant inherent risk throughout the procedure.

Response: We thank the commenters for their feedback. We wish to clarify that our proposal to exclude an inpatient hospital visit (CPT code 99233) from both CPT codes 33469 and 33466 does not suggest that TTVR or T–TEER patients do not require inpatient postoperative care but rather, because 33469 and 33466 have 0-day global periods, we determined that a subsequent-day hospital visit (99233) and its associated 55 minutes should not be incorporated into the procedural work RVU. Accordingly, the exclusion of the inpatient visit is accounting for whether that subsequent-day visit represents physician work intrinsic to the typical tricuspid procedure, rather than considering whether TAVR codes historically included such a visit.

Additionally, for CPT code 33466, we stated in our proposal that we established the recommended interval of 0.46 based on the difference in work values between CPT codes 33469 and 33466. We believe the use of an incremental difference between codes is a valid methodology for setting values, especially in valuing services within a family of revised codes where it is important to maintain appropriate intra-family relativity. Historically, we have frequently utilized an incremental methodology in which we value a code based upon its incremental difference between another code or another family of codes. For example, in the CY 2025 PFS Final Rule, CMS concurred that the relative difference in work between CPT codes 66682 and 66683 is equivalent to the recommended interval of 1.93 RVUs (89 FR 97710). We note that the RUC has also used the same incremental methodology on occasion when it was unable to produce valid survey data for a service. Lastly, regarding CPT code 33467, we recognized in our proposal that CPT code 33467 is a difficult and intensive procedure to perform. As a result, we finalized a crosswalk to the highest add-on codes with comparable work times, CPT code 22522, the highest non-outlier add-on code to have a similar level of valuation.

After consideration of public comments, CMS will finalize as proposed (1) removal of the inpatient hospital visit (CPT code 99233) from both CPT codes 33469 and 33466, including the removal of 55 minutes of associated work time from each procedure; (2) a work RVU of 17.52 for CPT code 33469; (3) a work RVU of 17.06 for CPT code 33466; and (4) a work RVU of 6.34 for CPT code 33467. We are also finalizing no direct PE inputs for the three codes in this family as proposed.

(16) Percutaneous Transcatheter Closure (CPT Code 33340)

In April 2025, the RAW identified CPT code 33340 (*Percutaneous transcatheter closure of the left atrial appendage with endocardial implant, including fluoroscopy, transseptal puncture, catheter placement(s), left atrial angiography, left atrial appendage angiography, when performed, and radiological supervision and interpretation)* as a code that has Medicare utilization of 10,000 or more that has increased by at least 100 percent from 2018 through 2023. The specialty societies indicated and the RUC agreed that CPT code 33340 be surveyed for the January 2026 RUC meeting.

We disagree with the RUC's recommendation of the current work RVU of 9.99 for CPT code 33340 and we instead proposed a work RVU of 9.00 based on crosswalk to CPT code 37271 *(Revascularization, endovascular, open or percutaneous, femoral and popliteal vascular territory, with transluminal atherectomy, including transluminal angioplasty when performed, including all maneuvers necessary for accessing and selectively catheterizing the artery and crossing the lesion, including all imaging guidance and radiological supervision and interpretation necessary to perform the atherectomy and angioplasty when performed, within the same artery, unilateral; straightforward lesion, initial vessel).* The RUC survey indicated that the typical time needed to perform CPT code 33340 has decreased, with the intraservice time decreasing from 70 minutes to 62 minutes and the total time decreasing from 165 minutes to 154 minutes. While we do not believe that the decrease in time as reflected in survey values should always equate to a one-to-one or linear decrease in newly valued work RVUs we do believe that, since the two components of work are time and intensity, absent an obvious or explicitly stated rationale for why the relative intensity of a given procedure has increased, significant decreases in time should be reflected in decreases to work RVUs although not necessarily in a linear manner. The RUC's recommendation to maintain the current work RVU of 9.99 for CPT code 33340 can only be justified if the intensity to perform the service has increased over time. However, there has been no change to the code descriptor for CPT code 33340 and no apparent change in clinical practice which would warrant the roughly 15 percent increase in intensity as recommended by the RUC. Since we do not believe that there is evidence indicating that CPT code 33340 has typically become more intense to perform, we therefore proposed a work RVU of 9.00 which maintains the current intensity of the service. This valuation is based on a crosswalk to CPT code 37271, a recently reviewed service from CY 2026 that has a higher intraservice time and nearly identical total time.

We proposed the direct PE inputs for CPT code 33340 as recommended by the RUC without refinement.

Comment: The majority of commenters disagreed with our proposal due to what they stated was an underestimation of intensity for CPT 33340, significant cuts in the overall payment for CPT code 33340 in preceding years, and the belief that the proposed crosswalk does not reflect the clinical procedure and complications that can arise with CPT 33340. These commenters requested CMS to maintain the current value of the work RVU of 9.99 for this code.

Response: We thank commenters for their feedback. We continue to believe our proposed work RVU of 9.00 for CPT code 33340 is the most accurate valuation for this service based on a crosswalk to CPT 37271, which maintains the current intensity. Differences in clinical procedures alone do not establish that the crosswalk is inappropriate or that a different valuation is warranted. Additionally, as mentioned in our proposal, the recommendation to maintain the current work RVU of 9.99 for CPT code 33340 can only be justified if the intensity to perform the service has increased over time. However, there was no evidence to suggest the intensity has increased. Furthermore, CPT code 33340 was surveyed and because physician work reflects both the time and intensity required to furnish a service, a decrease in intensity supports a corresponding decrease in the work RVU.

In consideration of public comments, we are finalizing the work RVU and direct PE inputs for CPT code 33340 as proposed.

(17) Treatment of Incompetent Veins (CPT Codes 36470, 36471, 36465, 36466, 36473, and 36474)

In April 2025, the RAW identified CPT code 36465 (*Injection of non-compounded foam sclerosant with ultrasound compression maneuvers to guide dispersion of the injectate, inclusive of all imaging guidance and monitoring; single incompetent extremity truncal vein (e.g., great saphenous vein, accessory saphenous vein*), as a code that has Medicare utilization of 10,000 or more that has increased by at least 100 percent from 2018 through 2023. The RAW reviewed the action plan and the RUC recommended CPT code 36465 along with the family of services be surveyed for the January 2026 RUC meeting.

The RUC reviewed this family of services at the January 2026 meeting including all sclerosant treatment of incompetent veins. These services are: CPT code 36465; CPT code 36466 (*Injection of non-compounded foam sclerosant with ultrasound compression maneuvers to guide dispersion of the injectate, inclusive of all imaging guidance and monitoring; multiple incompetent truncal veins (e.g., great saphenous vein, accessory saphenous vein), same leg*); CPT code 36470 (*Injection of sclerosant; single incompetent vein (other than telangiectasia)*); CPT code 36471 (*Injection of sclerosant; multiple incompetent veins (other than telangiectasia), same leg*); CPT code 36473 (*Endovenous ablation therapy of incompetent vein, extremity, inclusive of all imaging guidance and monitoring, percutaneous, mechanochemical; first vein treated*); and CPT code 36474 (*Endovenous ablation therapy of incompetent vein, extremity, inclusive of all imaging guidance and monitoring, percutaneous, mechanochemical; subsequent vein(s) treated in a single extremity, each through separate access sites (List separately in addition to code for primary procedure)*).

For CY 2027, we proposed the RUC-recommended work RVUs for five of the six codes in this family. We proposed the RUC-recommended work RVU of 2.29 for CPT code 36465, 0.73 for CPT code 36470, 1.18 for CPT code 36471, 3.41 for CPT code 36473, and 1.71 for CPT code 36474.

We disagree with the RUC recommended work RVU of 2.93 for CPT code 36466. Instead, we proposed a work RVU of 2.62 based on a crosswalk to CPT code 57156 (*Insertion of a vaginal radiation afterloading apparatus for clinical brachytherapy*). In reviewing CPT code 36466, we noted that the recommended intraservice time is decreasing from 35 minutes to 30 minutes (14 percent reduction), and the recommended total time is decreasing from 76 minutes to 68 minutes (11 percent reduction); however, the RUC recommended maintaining the current work RVU of 2.93. While we do not believe that the decrease in time as reflected in survey values should always equate to a one-to-one or linear decrease in newly valued work RVUs we do believe that, since the two components of work are time and intensity, absent an obvious or explicitly stated rationale

for why the relative intensity of a given procedure has increased, significant decreases in time should be reflected in decreases to work RVUs although not necessarily in a linear manner. The RUC's recommendation to maintain the current work RVU of 2.93 for CPT code 36466 can only be justified if the intensity to perform the service has increased over time. However, there has been no change to the code descriptor for CPT code 36466 and no apparent change in clinical practice which would warrant the roughly 17 percent increase in intensity as recommended by the RUC. Since we do not believe that there is evidence indicating that CPT code 36466 has typically become more intense to perform, we therefore proposed a work RVU of 2.62 which maintains the current intensity of the service. This valuation is based on a crosswalk to CPT code 57156, which has the same intraservice work time of 30 minutes and higher total time.

Comment: We received a small number of comments. All commenters supported finalizing the proposed work RVU values that had been recommended by the RUC for CPT codes 36470, 36471, 36465, 36473, and 36474.

Response: We thank all the commenters for their feedback. After consideration of the comments received, we are finalizing as proposed the RUC-recommended work RVUs for five of the six codes in this family. We are finalizing the RUC-recommended work RVU of 2.29 for CPT code 36465, 0.73 for CPT code 36470, 1.18 for CPT code 36471, 3.41 for CPT code 36473, and 1.71 for CPT code 36474.

Comment: Most commenters disagreed with our proposed value for CPT code 36466. Commenters felt that CPT code 36466 was in fact more intense than had been represented in the prior RUC survey. They felt the RUC survey in 2016 was ambiguous about which veins were typically being treated. They asserted that CPT code 36466 typically involves more time treating the small saphenous and is more intense to perform.

Response: We do not believe that the decrease in time as reflected in survey values should always equate to a one-to-one or linear decrease in newly valued work RVUs, but we do believe that, since the two components of work are time and intensity, absent an obvious or explicitly stated rationale for why the relative intensity of a given procedure has increased, significant decreases in time should be reflected in decreases to work RVUs although not necessarily in a linear manner. In the proposed rule we said that the RUC's recommendation to maintain the current work RVU of 2.93 for CPT code 36466 can only be justified if the intensity to perform the service has increased over time. In light of the RUC's own survey showing a reduction in time for CPT code 36466 with intraservice time decreasing from 35 minutes to 30 minutes (14 percent reduction), we are not persuaded by commenters' assertions that the service had previously been reported for procedures that were actually less intense. We recognize that the clinical vignette has been updated but note that the code descriptor has not changed.

Comment: A commenter questioned how many CPT 36465/36466 treatment sessions are actually obtained, on average, from the Varithena product represented by the SD324 direct practice expense input.

Response: We do not have a way of independently verifying the supply quantity associated with the use of SD324. However, we are open to revisiting this in the future if an interested party can supply alternate data indicating that the 0.33 supply quantity is not typical for the procedures.

After consideration of the comments, we are finalizing the work RVU for CPT code 36466 as proposed. This value, maintaining the current intensity of the service, is based on a crosswalk to CPT code 57156 (Insertion of a vaginal radiation after loading apparatus for clinical brachytherapy) which has the same intraservice work time of 30 minutes and higher total time.

We are finalizing the direct PE inputs for all CPT codes in this family as proposed.

(18) Microvascular Bypass, Lymphatic Vessels (CPT Codes 38800 and 38801)

In September 2025, the CPT Editorial Panel approved two new Category I codes to describe microvascular bypass of lymphatic vessels, a microsurgical procedure. This newly created Category I CPT code family describes two services: a base code for the initial anastomosis, CPT code 38800 (*Microvascular anastomosis between a single vein opening and any number of lymphatic vessels, per limb; initial anastomosis*), and the add-on code for each additional anastomosis, CPT code 38801 (*Microvascular anastomosis between a single vein opening and any number of lymphatic vessels, per limb; initial anastomosis; each additional anastomosis (List separately in addition to code for primary procedure)*). CPT codes 38800 and 38801 were surveyed for the January 2026 RUC meeting.

We reviewed the RUC's recommended work valuations and found the RUC's recommended work RVU of 16.00 for CPT code 38800 to be high, based on a search of similarly timed codes in the RUC database. For CY 2027 we proposed a work RVU of 14.00, based on the RUC survey 25th percentile, for CPT code 38800. We proposed the RUC recommended work RVU of 6.00 for CPT code 38801. We proposed the RUC-recommended direct PE inputs for both CPT codes without refinement.

Comment: We received a handful of comments. A commenter asked that CMS ensure that payment for this procedure be adequate but did not opine as to what amount of work RVUs that would be. The rest opposed the proposed work RVU of 14.00, based on the RUC survey 25th percentile, for CPT code 38800 stating that the proposed work RVU did not accurately account for the physician work's intensity and complexity. A commenter described the physician work as almost entirely under an operating microscope at 10–30x magnification, suturing lymphatic channels of 0.2 to 1 millimeter with 10–0 and 11–0 suture far finer than a human hair. Another commenter stated that while ophthalmologic procedures use similar magnification and 10–0 or 11–0 sutures, they do not entail the complexity of CPT code 38800 which creates a patent lymphatic-to-venous anastomosis, a connection between a blocked lymphatic vessel and a small vein to bypass the blockage and drain trapped fluid back into the bloodstream. Commenters stated that CMS should finalize the RUC-recommended work RVU of 16.00 based on the median value from the survey.

Response: We continue to disagree with the commenters and believe that the proposed work RVU of 14.00 is a more accurate valuation for CPT code 38800. While we appreciate the additional clinical details associated with CPT code 38800 provided by the commenters, we continue to disagree that the intensity of this procedure would warrant a work valuation higher than approximately 95 percent of 90-day global codes with comparable time values. We note that the RUC recommended removing 17 minutes of preoperative work time, one CPT code 99231 inpatient hospital visit, and half of the CPT code 99238 discharge visit from the surveyed work time of CPT code 38800, a total of 56 minutes, which suggests that the survey respondents overestimated the work time and the work RVU for this code at the median value of 16.00. It is for this very reason that the RUC recommends the survey 25th percentile work RVU for most newly created codes that have no direct predecessor code. Although we do not

believe that the survey 25th percentile is always the most accurate valuation in these cases, we do believe that it best describes the work RVU of CPT code 38800 at 14.00.

After consideration of the comments, we are finalizing the work and direct PE inputs as proposed for CPT code 38800 and CPT code 38801.

(19) Diaphragmatic Hernia Repair (CPT Codes 39540, 39541, 39542, 39543, 39544, 39571, 39572, 39573, 39581, 39582, and 39590)

At the September 2025 CPT Editorial Panel, the committee revised two existing CPT codes, CPT code 39540 *(Repair, diaphragmatic hernia (other than neonatal), via laparotomy; traumatic, acute)* and CPT code 39541 *(Repair, diaphragmatic hernia (other than neonatal), via laparotomy; traumatic, chronic),* describing diaphragmatic hernia repair. They also created nine new Category I codes, CPT codes 39542 *(Repair, diaphragmatic hernia (other than neonatal), via laparotomy; nontraumatic (i.e., Bochdalek, Morgagni*)), 39543 *(Repair, diaphragmatic hernia (other than neonatal), via thoracotomy; traumatic, chronic),* 39544 *(Repair, diaphragmatic hernia (other than neonatal), via thoracotomy; nontraumatic (i.e., Bochdalek, Morgagni)),* 39571 *(Laparoscopy, surgical, with repair of diaphragmatic hernia (other than neonatal); traumatic, acute),* 39572 *(Laparoscopy, surgical, with repair of diaphragmatic hernia (other than neonatal); traumatic, chronic),* 39573 *(Laparoscopy, surgical, with repair of diaphragmatic hernia (other than neonatal); nontraumatic (i.e., Bochdalek, Morgagni)),* 39581 *(Thoracoscopy surgical, with repair of diaphragmatic hernia (other than neonatal); traumatic, chronic),* 39582 *(Thoracoscopy surgical, with repair of diaphragmatic hernia (other than neonatal); nontraumatic (i.e., Bochdalek, Morgagni)),* and 39590 *(Implantation of mesh or other prosthesis with open, laparoscopic, or thoracoscopic diaphragmatic hernia repair (List separately in addition to code for primary procedure))* that expanded the range of surgical interventions included in this code family. The RUC reviewed these services at the January 2026 meeting.

For CY 2027, we proposed the RUC recommended work RVUs of 24.00 for CPT code 39540, 26.00 for CPT code 39541, 25.75 for CPT code 39542, 26.41 for CPT code 39543, 25.94 for CPT code 39544, 22.04 for CPT code 39571, 26.60 for CPT code 39572, 27.00 for CPT code 39573, 25.44 for CPT code 39581, 25.94 for CPT code 39582, and 3.00 for CPT code 39590.

We proposed the RUC-recommended direct PE inputs for all CPT codes in this family without refinement.

Comment: Commenters were supportive of CMS' proposed work RVUs and direct PE inputs for this code family.

Response: We thank the commenters for their support. After consideration of the public comments, we are finalizing the work RVU and direct PE inputs as proposed.

(20) Diaphragm Repair (CPT Codes 39545 and 39580)

In May 2025, the CPT Editorial Panel revised CPT code 39545 (*Plication of diaphragm for eventration or paralysis, via thoracotomy*) to specify plication of the diaphragm for eventration or paralysis, via thoracotomy, and created CPT code 39580 (*Thoracoscopy, surgical, with plication of diaphragm for eventration or paralysis*) to report thoracoscopic plication of the diaphragm for eventration or paralysis.

For CY 2027, we proposed the RUC recommended work RVUs of 18.45 for CPT code 39545 and 20.00 for CPT code 39580. We proposed the RUC-recommended direct PE inputs for both CPT codes without refinement.

Comment: We received a couple of comments in support of CMS' proposed work RVUs and direct PE inputs for both CPT codes.

Response: We thank the commenters and appreciate their support for the proposal. After consideration of the comments received, we are finalizing the work and direct PE inputs as proposed for CPT code 39545 and CPT code 39580.

(21) Division of Median Arcuate Ligament (CPT codes 39562 and 39570)

In February 2025, the CPT Editorial Panel created two new codes to report open and laparoscopic median arcuate ligament syndrome (MALS) treatment: CPT code 39562 (*Division of median arcuate ligament and release of celiac trunk, with ganglionectomy, when performed*) and CPT code 39570 (*Laparoscopy, surgical, with division of median arcuate ligament and release of celiac trunk, with ganglionectomy, when performed*). The two new codes were surveyed for the April 2025 RUC meeting.

We proposed the RUC-recommended efficiency adjusted work RVUs of 26.41 for CPT code 39562 and 25.94 for CPT code 39570. We proposed the RUC-recommended direct PE inputs for CPT codes 39562 and 39570 without refinement.

Comment: A few commenters supported the proposed direct PE inputs for CPT codes 39562 and 39570. A commenter disagreed with the efficiency adjustment due to new services whose physician work was recently surveyed and evaluated through the valuation process. The commenter stated that CMS has not demonstrated that the physician time or intensity required for these specific procedures is reduced by the economy-wide productivity assumption underlying the efficiency adjustment.

Response: We appreciate the commenters' support of the proposed direct PE inputs for CPT codes 39562 and 39570. Regarding the comment on the efficiency adjustment, we clarify that we did not apply the efficiency adjustment directly to CPT codes 39562 or 39570. Rather, the RUC's recommended valuations for these new codes were based on crosswalks to existing codes, and the efficiency adjustment had previously been applied to those crosswalk codes as part of their own valuation. Because the crosswalk methodology relies on the current, adjusted work RVUs of the reference codes, it would not be appropriate to instead use the pre-adjustment values of those codes as the basis for crosswalking. We therefore believe it is appropriate that the valuations for CPT codes 39562 and 39570, derived from these crosswalks, reflect the adjustment as it applies to the source codes.

After consideration of the comments, we are finalizing as proposed the work RVUs of 26.41 for CPT code 39562 and 25.94 for CPT code 39570, and the direct PE inputs.

(22) Endoscopic Submucosal Dissection (CPT codes 4349843498 and 4599145991)

At the May 2025 CPT Editorial Panel Meeting, two new CPT codes were created for reporting endoscopic submucosal dissection (ESD) of both the upper and lower GI tract, including mucosal closure: CPT codes 4349843498 (*Endoscopic submucosal dissection (ESD) of upper gastrointestinal tract, including mucosal closure, when performed*) and 4599145991 (*Endoscopic submucosal dissection (ESD) of lower gastrointestinal tract, including mucosal closure, when performed*). These new CPT codes were surveyed at the September 2025 AMA RUC meeting.

For CY 2027, we proposed the RUC-recommended work RVUs of 15.00 for CPT code 4349843498 and 16.38 for CPT code 4599145991. We proposed the RUC-recommended direct PE inputs for

CPT codes 4349843498 and 4599145991 without refinement.

Comment: Several commenters stated that they supported the CMS proposal of the RUC-recommended work RVUs and work times for the new endoscopic submucosal dissection codes. Commenters stated that they appreciated CMS' recognition of the substantial practitioner time, skill, intensity, and clinical complexity involved in performing endoscopic submucosal dissection (ESD) of the upper and lower gastrointestinal tract.

Response: We appreciate the support from the commenters for our proposed valuations.

After consideration of the comments, we are finalizing the proposed work RVUs and direct PE inputs for the codes in the Endoscopic Submucosal Dissection family.

(23) Transoral Oropharyngeal Procedures (CPT codes 42808, 42985, and 42986)

In February 2025, the CPT Editorial Panel approved two new Category I codes that describe transoral endoscopic surgery under magnification for the removal of tumors in the oropharynx, including robotic assistance when performed: CPT code 42985 (*Transoral removal of oropharyngeal and/or pharyngeal neoplasm under magnification (e.g., microscope or telescope), includes robotic assistance, when performed, tongue base*) and CPT code 42986 (*Transoral removal of oropharyngeal and/or pharyngeal neoplasm under magnification (e.g., microscope or telescope), includes robotic assistance, when performed; tongue base; lateral pharyngeal wall, including tonsil*). CPT code 42808 (*Excision or destruction of lesion of pharynx, without magnification, any method*) was revised to clarify that it is done without magnification, and it was surveyed along with the two new codes at the April 2025 RUC meeting.

We proposed the RUC-recommended work RVU for all three codes in this family. We proposed a work RVU of 2.29 for CPT code 42808 (which is the current work RVU of the code after the efficiency adjustment was applied at the start of CY 2026), a work RVU of 20.00 for CPT code 42985, and a work RVU of 20.05 for CPT code 42986. We note that the RUC's recommended work RVU of 2.29 for CPT code 42808 assigns an intensity value of zero for this service; we sought comment from interested parties as to whether an alternate work valuation, such as the survey 25th percentile work RVU of 2.70, would be more appropriate.

We proposed the RUC-recommended direct PE inputs for all three codes without refinement.

Comment: Several commenters stated that they appreciated CMS proposing the RUC recommended work RVUs and direct PE inputs for CPT codes 42808, 42985 and 42986 without refinement.

Response: We appreciate the support for our proposals from the commenters.

Comment: Several commenters stated that maintaining the current work RVU of 2.29 as proposed was appropriate for CPT code 42808, which is lower than the survey 25th percentile work RVU of 2.70. Commenters stated that this recommendation maintained relativity with other similar otolaryngology codes in the 10-day global period in this work RVU range. Commenters stated that they did not believe there was compelling evidence to justify an increased work RVU for this service, even though the RUC recommended and CMS proposed work RVU of 2.29 for CPT code 42808 assigned an intensity value of zero for this service. The commenters urged CMS to finalize its proposal of the current work RVU of 2.29 for CPT code 42808.

Response: We appreciate the support for our proposals from the commenters.

After consideration of the comments, we are finalizing the work RVUs and direct PE inputs as proposed for the codes in the Transoral Oropharyngeal Procedures family.

(24) Congenital Duodenal Obstruction Repair (CPT codes 44011 and 44181)

At the May 2025 CPT Editorial Panel Meeting, two new CPT codes were created for reporting surgical treatment for congenital duodenal obstruction via an open or laparoscopic approach, that were previously reported using unlisted codes: CPT codes 44011 (*Duodenoduodenostomy or duodenojejunostomy for congenital duodenal obstruction*) and 44181 (*Laparoscopy, surgical; duodenoduodenostomy or duodenojejunostomy for congenital duodenal obstruction*). These new CPT codes were surveyed at the September 2025 AMA RUC meeting.

For CY 2027, we proposed the RUC-recommended work RVUs of 50.00 for CPT code 44011 and 52.60 for CPT code 44181. We proposed the RUC-recommended direct PE inputs for CPT codes 44011 and 44181 without refinement.

Comment: A commenter stated that they supported the CMS proposal of the RUC's recommended work RVUs and direct PE inputs.

Response: We appreciate the support for our proposals.

After consideration of the comments, we are finalizing the work RVUs and direct PE inputs as proposed for the codes in the Congenital Duodenal Obstruction Repair family.

(25) Irreversible Electroporation of Tumor, Pancreas (CPT code 48990)

In May 2025, the CPT Editorial Panel approved the addition of a new CPT code 48990 (*Ablation, irreversible electroporation of tumor(s) of the pancreas, open, including imaging guidance*) to report open irreversible electroporation (IRE) ablation of tumors of the pancreas.

We proposed the RUC-recommended work RVU of 25.19 for CPT code 48990, and the RUC-recommended direct PE inputs without refinement.

Comment: A commenter supported our proposal of the RUC recommendations.

Response: We thank the commenter for their support. After consideration of the public comments, we are finalizing as proposed.

(26) Prostate Biopsy Services (CPT codes 55705, 55707, 55708, 55709, 55710, 55711, 55714, 55715, and 55716)

This service was identified via the April 2022 RAW review of services performed by the same physician on the same date of service 75 percent of the time or more and was surveyed for the September 2024 RUC meeting. The data from the September 2024 survey indicated that the long descriptors did not adequately describe these services. While the codes were valued for the CPT 2026 cycle, the specialties and the RUC agreed that a new coding change application should be developed for the CPT Editorial Panel for restructuring in the CPT 2027 cycle. CPT revised the prostate biopsy code family in 2026 and it was surveyed for the January 2026 RUC meeting. The revisions to the family are as follows: CPT codes 55705 (*Biopsy, prostate, any approach, non-imaging guided*), 55707 (*Biopsy, prostate, transrectal, including imaging guidance, regional*), 55708 (*Biopsy, prostate, transrectal, including imaging guidance, regional and fusion-targeted lesion(s)*), 55709 (*Biopsy, prostate, transperineal, including imaging guidance, regional*), 55710 (*Biopsy, prostate, transperineal, including imaging guidance, regional and of fusion-targeted lesion(s)*), 76872 (*ultrasound, transrectal*), and 55714 (*Biopsy, prostate, including imaging guidance, in-bore-CT-or-MRI-guided; first targeted lesion*) have work RVUs that were reaffirmed from CY 2026 by the RUC. CPT codes 55711 (*Biopsy, prostate, transrectal or transperineal,*

including imaging guidance, fusion), 55716 (*Biopsy, prostate, transrectal or transperineal, including imaging guidance, fusion-targeted lesion(s) without regional; each additional targeted lesion (List separately in addition to code for primary procedure)*) and 55715 (*Biopsy, prostate, including imaging guidance, in-bore CT- or MRI-guided; each additional targeted lesion (List separately in addition to code for primary procedure)*) are new and/or revised codes for CY2027.

For CY 2027, we proposed the RUC-recommended work RVU for eight of the nine codes in the family. We proposed the RUC-recommended work RVUs of 1.88 for CPT code 55705, 2.63 for CPT code 55707, 3.39 for CPT code 55708, 3.23 for CPT code 55709, 3.81 for CPT code 55710, 2.37 for CPT code 55711, 3.62 for CPT code 55714, and 1.80 for CPT 55715.

For CPT code 55716, we disagree with the RUC-recommended work RVU of 0.80. In the interest of maintaining relativity with similarly timed codes, we instead proposed a work RVU of 0.68 based on a crosswalk to CPT code 93567 (*Injection procedure during cardiac catheterization including imaging supervision, interpretation, and report; for supravalvular aortography (List separately in addition to code for primary procedure)*). CPT code 55716 was surveyed with only 6 minutes of intraservice and total work time, yet the RUC recommended a work RVU of 0.80. We compared this recommended valuation against CPT code 55715, another add-on code within this same family, which was surveyed at 35 minutes of intraservice and total work time but with a recommended work RVU of 1.80. This results in CPT code 55716 having an intensity nearly triple that of CPT code 55715 which we do not believe would be typical. We also found that there were no other add-on codes in the RUC database with comparable time values to CPT code 55716 which had a work RVU approaching 0.80. The closest was CPT code 77063 (*Screening digital breast tomosynthesis, bilateral*) at a work RVU of 0.59, with that code having 8 minutes of work time instead of 6 minutes, and all other comparable add-on codes had a work RVU of 0.37 or lower. Although we agree that CPT code 55716 is a difficult and intensive procedure, we believe that the RUC's recommended work RVU of 0.80 assigns too much work valuation and intensity to the service, and does not maintain relativity with other related codes on the PFS.

We instead proposed a work RVU of 0.68 for CPT code 55716 based on a crosswalk to CPT code 93567. Our proposed work RVU of 0.68 is also supported with add-on CPT codes with similar work time values. CPT code 93566 (*Injection procedure during cardiac catheterization including imaging supervision, interpretation, and report; for selective right ventricular or right atrial angiography (List separately in addition to code for primary procedure)*) is valued at a work RVU of 0.49 with an intraservice time of 10 minutes and CPT code 64484 (*Injection(s), anesthetic agent(s) and/or steroid; transforaminal epidural, with imaging guidance (fluoroscopy or CT), lumbar or sacral, each additional level (List separately in addition to code for primary procedure)*) is valued at a work RVU of 0.98 with an intraservice time of 10 minutes.

We proposed the RUC-recommended direct PE inputs for all CPT codes in this family without refinement.

Comment: Several commenters supported the proposed work RVUs for CPT codes 55705, 55707, 55708, 55709, 55710, 55711, 55714, and 55715.

Response: We appreciate the support for our proposed valuations from the commenters.

Comment: Some commenters disagreed with the proposed work RVU of 0.68 for CPT code 55716. Commenters requested the RUC's recommended work RVU of 0.80 for the add-on CPT code 55716 rather than the proposed work RVU of 0.68. Commenters stated that the proposed valuation for CPT code 55716 understates the work involved and a work RVU of 0.68 would create a rank order anomaly with CPT code 76872. Commenters argued that the proposed crosswalk code for CPT code 55716 (CPT code 93567) does not accurately reflect the physician work or the intensity of this service being performed. Commenters stated that CPT code 55716 needs to be valued higher than CPT code 76872 because the former code has imaging and biopsy work while the later code is only an imaging code. Commenters felt the proposed work RVU of 0.80 would not maintain relativity within the family. Commenters felt the proposed work valuation of 0.68 would also be compounded by the effect of the conversion factor.

Response: We continue to believe CPT code 55716 is less intense compared to the predecessor CPT code 55715 which has a work RVU of 1.05 and included imaging in the code's valuation. Additionally, a work RVU of 0.80 would be vastly higher than any other comparable add on code in this range of time values. We also disagree with commenters that a work RVU of 0.68 would create a work order anomaly within the code family as compared with the imaging code CPT code 76872. However, CPT code 76872 is significantly longer than CPT code 55716, nearly quadruple the time with a total time of 23 minutes as compared to 6 minutes in duration for CPT code 55716. We agree with commenters that CPT code 55716 is significantly more intense but disagree that it is inappropriate for these codes to be valued similarly given the large discrepancy in their work times. We disagree with commenters that a work RVU of 0.68 would pose a rank order anomaly in this family as the greater intensity of CPT code 55716 is offset by the far greater time of CPT code 76872.

After consideration of the comments, we are finalizing a work RVU of 0.68 for CPT code 55716. We are also finalizing the work RVUs and direct PE inputs for the remaining codes in the Prostate Biopsy family as proposed.

(27) Maternity Care Services (CPT codes 59320, 59325, 59412, 59871, 59080, 59081, 59082, 59083, 59030, 59051, 59431, 59432, 59414, 59300, 59502, 59503, 59504, 59623, 59433, 59434, and 59160)

a. Background and Update

At the January 2026 AMA RUC meeting, the maternity global codes were revised to delete 17 legacy CPT codes, create 12 new CPT codes, and revise 9 CPT codes describing maternity care services. See Table A–D2 for a summary of the codes and their long descriptors. These codes were restructured from the maternity (MMM) global period to individual codes to reflect changes in practice. The previous MMM global period included 12 prenatal E/M visits bundled into CPT codes 59400, 59510, 59610, and 59618. In May 2025, the American College of Obstetricians and Gynecologists (ACOG) published new clinical guidelines, recommending that obstetrician-gynecologists and other maternity care professionals tailor the visit frequency and monitoring schedule to the needs of the pregnant woman. These new clinical guidelines provide a sample schedule for prenatal care services and visit frequency, which describes 8 visits for average-risk pregnant women without medical or pregnancy complications, and 13 visits for pregnant women with greater-than-average risk. This sample schedule specifies that additional services may be offered as needed throughout the pregnancy.

When the RUC reviewed these codes, they included 12 prenatal E/M visits (two level 2 established patient office

visits, eight level 3 established patient office visits, and two level 4 established patient office visits) in the calculations to make these changes budget-neutral despite the revisions to the clinical guidelines suggesting that 12 visits would no longer be typical. As the clinical guidelines have changed to reflect a revised assumption about the typical number of visits, estimating work neutrality based on the assumption that all 12 prenatal E/M visits in the base year would be reported in the predictive year overestimates the total utilization and as a result, undervalues the work RVUs as recommended by the RUC. To improve payment accuracy of the new codes, we proposed to refine the RUC's recommended utilization crosswalk to remove four E/M visits (two level 2 established patient office visits and two level 4 established patient office visits) from the utilization estimate calculation and reallocate those RVUs within the code family to the new labor and delivery codes. This would mean reallocating 11,810 additional work RVUs to the new labor and delivery codes (CPT codes 59080–594503). Since the RUC provided a utilization estimate of 12,791 for CPT codes 59080–594503, this would result in a 15 percent increase in work RVUs for each labor and delivery code. We would like to emphasize that we are not endorsing a reduced number of prenatal visits for pregnant women. Our recalculation of the utilization estimates in the valuation of these services should not be used to determine the appropriate number of visits to provide reasonable and necessary care to beneficiaries. As with all PFS services, maternity services should be furnished when medically reasonable and necessary.

There are no RUC-recommended direct PE inputs for these CPT codes. Table A–D2 also shows the RUC-recommended and CMS proposed work RVUs for the 21 CPT codes.

BILLING CODE 4169–69–P

TABLE A-D2: CPT LONG DESCRIPTORS AND WORK RVUS FOR MATERNITY SERVICES

CPT Code	Long Descriptors	RUC Recommended Work RVUs	CMS Work RVUs
Antepartum Care			
59320	*Cerclage of cervix, during pregnancy; vaginal*	3.02	3.02
59325	*Cerclage of cervix, during pregnancy; abdominal*	6.34	6.34
59412	*External cephalic version*	2.63	2.63
59871	*Removal of cerclage suture under anesthesia (other than local)*	2.15	2.15
Labor Management and Delivery			
59080	*Initial day labor management; straightforward, per day*	3.50	4.03
59081	*Initial day labor management; complex, per day*	4.50	5.18
59082	*Subsequent day labor management; straightforward, per day*	3.00	3.45
59083	*Subsequent day labor management; complex, per day*	4.20	4.83
59431	*Vaginal delivery, with or without episiotomy;*	8.00	9.20
59432	*Vaginal delivery, with or without episiotomy; after previous cesarean delivery*	9.00	10.35
59450 2	*Cesarean delivery; primary*	12.00	13.80
59450 3	*Cesarean delivery; repeat*	14.66	16.86
Labor Procedures, Other Procedures, and Postpartum			
59030	*Fetal scalp blood sampling*	0.90	0.90
59051	*Fetal monitoring during labor by consulting physician (ie, non-attending physician) or other qualified health care professional, with interpretation and report*	0.93	0.93
59414	*Delivery of placenta only (separate procedure)*	1.61	1.61
59300	*Repair of first or second-degree episiotomy or laceration, by other than attending physician or other qualified health care professional performing vaginal delivery care (separate procedure)*	1.76	1.76
59433	*Repair of episiotomy or laceration; third-degree laceration*	2.47	2.47
59434	*Repair of episiotomy or laceration; fourth-degree laceration*	4.14	4.14
59504	*Subtotal or total hysterectomy after cesarean delivery*	15.56	15.56
59623	*Uterine tamponade (eg, balloon, catheter, vacuum, packing material)*	2.15	2.15
59160	*Curettage, postpartum*	2.93	2.93

BILLING CODE 4169–69–C

We received public comments on these proposals. The following is a summary of the comments we received and our responses.

Comment: Many commenters supported our proposals to adopt CPT codes 59320, 59325, 59412, 59871,

59080, 59081, 59082, 59083, 59030, 59051, 59431, 59432, 59414, 59300, 594502, 594503, 59504, 59623, 59X1159433, 59434, and 59160. Commenters stated that these revised codes would create a uniform system between payors, as many other payors and payment systems such as the OPPS, have already adopted or proposed to adopt the revised coding structure. Additionally, commenters discussed that these codes would increase the transparency of antepartum and postpartum visits performed. Commenters also believed that the updated codes better reflect modern, personalized maternity care. Many commenters supported our proposed work RVU increases to the labor and delivery codes, as these services have become increasingly complex and require significant clinical decision-making, care coordination, and clinician work. A few commenters did not support our proposed increases to the labor and delivery codes, and requested us to finalize the RUC recommendations, because they believed that the RUC's recommendations account for the number of E/M visits increasing for some patients and decreasing for others. Some commenters believed that we should increase the work RVUs for all of the CPT codes, since in some clinical scenarios, the new codes could pay less than the current maternity codes. We also received several questions seeking coding guidance for the new maternity CPT codes.

Response: We appreciate the commenters for this information and will consider additional refinements in future rulemaking. Although we are not specifying a maximum number of antepartum or postpartum visits that can be billed, we expect that ACOG's guidelines will be followed, and that, as with all services paid under the PFS, all services furnished must be reasonable and necessary. We will also continue to consider methods of bundling under the PFS, including information on the range of antepartum or postpartum visits as stakeholders develop more familiarity with the new code set. We defer to CPT and/or the billing practitioner's MAC for clarification on coding guidance for the new maternity CPT codes.

After consideration of public comments, we are finalizing as proposed.

b. Comment Solicitation on Maintaining Current Coding Through Creation of HCPCS G-Codes

We were interested in thinking about different approaches to how maternity care codes are valued and paid under the PFS. Although the RUC asserts that these proposed coding changes discussed previously reflect clinical consensus, we had concerns that our adoption of the new codes would be disruptive based on how the longstanding existing code structure is currently accounted for in clinical practice patterns. We sought comment on whether CMS should create HCPCS G-codes that would maintain the current coding and payment for maternity services to ameliorate this concern, while we continue to consider the potential impact that changes in the maternity care code family have on clinical outcomes for maternal care. These codes would be used in lieu of adoption of the new CPT codes for purposes of Medicare payment. We were specifically interested in additional information to support or oppose this concern, as well as additional information to support or oppose the use of the creation of HCPCS G-codes in lieu of adoption of the new CPT codes.

Specifically, for payment for maternity care services under the PFS, we were considering, and sought comment on, the creation of 15 new HCPCS G-Codes for CY 2027 that reflect the previous MMM global code structure, with the code descriptors and work RVUs detailed in Table A–D3, as an alternative to the revaluation of the codes as discussed in section (a), of the proposed rule (91 FR 43842 through 44557). We sought public comment on these HCPCS G-codes and, after consideration of public comment, could finalize payment for these codes. We sought comment on these HCPCS G-codes and also sought comment on any other HCPCS G-codes that may be needed to reflect the necessary service elements for this code family. These HCPCS G-codes would adopt all current conditions of payment for the MMM global codes, as well as maintain the MMM global period, if finalized.

TABLE A-D3: POTENTIAL G CODES TO MAINTAIN PREVIOUS CODE SET

HCPCS G-Code	Long Descriptors	G-Code Work RVUs
GMAT1	Routine obstetric care including antepartum care, vaginal delivery (with or without episiotomy, and/or forceps) and postpartum care	37.00
GMAT2	Vaginal delivery only (with or without episiotomy and/or forceps);	14.37
GMAT3	Vaginal delivery only (with or without episiotomy and/or forceps); including postpartum care	18.76
GMAT4	Antepartum care only; 4-6 visits	7.8
GMAT5	Antepartum care only; 7 or more visits	14.3
GMAT6	Postpartum care only (separate procedure)	3.22
GMAT7	Routine obstetric care including antepartum care, cesarean delivery, and postpartum care	41.05
GMAT8	Cesarean delivery only;	16.13
GMAT9	Cesarean delivery only; including postpartum care	22.79
GMA10	Routine obstetric care including antepartum care, vaginal delivery (with or without episiotomy, and/or forceps) and postpartum care, after previous cesarean delivery	38.71
GMA11	Vaginal delivery only, after previous cesarean delivery (with or without episiotomy and/or forceps);	16.09
GMA12	Vaginal delivery only, after previous cesarean delivery (with or without episiotomy and/or forceps); including postpartum care	20.48
GMA13	Routine obstetric care including antepartum care, cesarean delivery, and postpartum care, following attempted vaginal delivery after previous cesarean delivery	41.57
GMA14	Cesarean delivery only, following attempted vaginal delivery after previous cesarean delivery;	16.66
GMA15	Cesarean delivery only, following attempted vaginal delivery after previous cesarean delivery; including postpartum care	23.32

We received public comments on these proposals. The following is a summary of the comments we received and our responses.

Comment: Almost all commenters were opposed to maintaining current coding through the creation of HCPCS G-codes. Commenters stated that the creation of these codes for Medicare would increase administrative burden and market confusion, as well as not representing some of the services described in the proposed CPT codes (including tamponade and 3rd and 4th degree laceration repair). Many commenters believed that the structure of these codes no longer reflect health care delivery, and the proposed CPT codes allow information gathering about the services performed and encourage patient-centered care that these HCPCS G-codes do not. Some commenters did not support finalizing these codes since we did not publish the Practice Expense (PE) and Malpractice RVUs associated with these HCPCS G-codes.

A few commenters supported the creation of these HCPCS G-codes. These commenters expressed concerns about potential cost-sharing, claims denials, more complex billing, and the additional resources needed to adopt the new CPT codes. Some commenters supported a set payment that the HCPCS G codes would provide, and not having payments that vary patient to patient when services are performed with the CPT codes. A few commenters stated that E/M coding does not specifically describe antepartum or postpartum care.

Response: We appreciate the commenters for this information. We disagree with commenters that any change in maternity coding discussed in this rule, whether the new CPT codes or the proposed HCPCS G-codes, would change any policies impacting cost-sharing or claims denials. While we understand that additional resources may be needed for the higher overall number of codes being billed, we believe that this provides valuable utilization information that cannot be obtained with the continued use of bundled codes. Although E/M coding does not specifically describe antepartum or postpartum care, these codes are used by many specialties to describe professional services that may not explicitly be stated in the E/M code descriptor.

Comment: Most commenters who requested the adoption of the HCPCS G-codes requested that we adopt both the CPT codes and the HCPCS G-codes for CY 2027. Some commenters requested adopting both codes, but having a defined sunset date and limiting the use of both code sets to Medicare. One of the primary reasons why commenters requested both code sets for CY 2027 was due to concerns about billing guidance for pregnancies that begin in CY 2026 and continue into CY 2027.

Response: We defer to AMA and ACOG guidance on the correct billing structure for pregnancies that begin in CY 2026 and continue into CY 2027.We also understand that there may be cases in which the prior CPT codes may be needed when billing and paying for episodes of care with service start dates in 2026. CMS published an enforcement discretion under 45 CFR 162.1101 allowing HIPAA covered entities to temporarily use CPT 2026 Maternity Care Services codes for billing and

payment purposes after January 1, 2027. Payers and health plans may issue business rules in advance of January 1, 2027 instructing providers, clearinghouses and other trading partners regarding CPT code use when billing for Maternal Care Service episodes of care in which services begin in 2026 and end in 2027. Questions can be sent to *AdministrativeSimplification@cms.hhs.gov* with the subject line: Enforcement Discretion.

After consideration of public comments, we are not finalizing the creation of these HCPCS G-codes, although we may consider the creation of bundled codes describing maternity care services in future rulemaking using the information on the billing patterns associated with the unbundled visit codes.

(28) Stereotactic Computer-Assisted Volumetric Navigation (CPT Codes 61781, 61782, and 61783)

In April 2024, CPT code 61783 (*Stereotactic computer-assisted (navigational) procedure; spinal (List separately in addition to code for primary procedure)*) was identified via the high-volume growth screen. In January 2025, the RAW reviewed the action plan for CPT code 61783 and determined that this service should be surveyed with the appropriate family of codes. The RUC recommended that CPT code 61781 be surveyed with CPT codes 61782 (*Stereotactic computer-assisted (navigational) procedure; cranial, extradural (List separately in addition to code for primary procedure)*) and 61783 (*Stereotactic computer-assisted (navigational) procedure; spinal (List separately in addition to code for primary procedure)*) for September 2025.

We proposed the RUC-recommended work RVU of 3.66 for CPT codes 61781 and 61783, and the RUC-recommended RVU of 2.06 for CPT code 61782. We note that all three of these RUC-recommended RVUs reflect the application of the CY 2026 efficiency adjustment described in the CY 2026 PFS final rule (90 FR 49334 through 49345).

We proposed the RUC's recommended direct PE inputs for CPT code 61782. Since CPT codes 61781 and 61783 are performed in the facility setting only, the RUC did not recommend, and we did not propose, any direct PE inputs for these two codes.

Comment: A commenter stated that this code describes an important service in rhinologic practice, including use in complex sinonasal and skull-base procedures, and expressed concern about the magnitude of the proposed reduction from the current value of 3.10 to the RUC-recommended RVU of 2.06 for CPT code 61782. They noted image-guided navigation requires significant physician time, technical skill, and mental effort, since surgeons must constantly integrate navigation data with live anatomy while working near critical structures.

Response: We thank the commenters for their feedback. After consideration of the public comments and re-review of this code family, we believe that the proposed work RVUs for these codes are appropriately valued; thus, we are finalizing the work RVUs for the codes as proposed.

(29) Percutaneous Lumbar Decompression (CPT Code 62287)

At the January 2025 RUC meeting, the surveying societies requested deletion of CPT code 62287 *(Decompression, percutaneous, of nucleus pulposus of intervertebral disc, any method utilizing needle-based technique to remove disc material under fluoroscopic imaging or other form of indirect visualization, with discography and/or epidural injection(s) at the treated level(s), when performed, single or multiple levels, lumbar)* due to declining Medicare utilization. At the May 2025 CPT Editorial Panel meeting, CPT reviewed additional utilization estimates, and requests from neurosurgery and radiology were received to resurvey and retain the code. CPT code 62287 was surveyed at the September 2025 AMA RUC meeting since it was not deleted in January 2025 with the other codes in the family.

We disagree with the RUC's recommended work RVU of 7.06 for CPT code 62287 and we instead proposed a work RVU of 6.23 based on a crosswalk to CPT code 46707 *(Repair of anorectal fistula with plug (e.g., porcine small intestine submucosa [SIS]))*. We believe that the RUC's recommended work RVU of 7.06 is an overestimation based on a comparison to other codes with similar time values, particularly the key reference code CPT code 22869 (*Insertion of interlaminar/interspinous process stabilization/distraction device, without open decompression or fusion, including image guidance when performed, lumbar; single level*). There was a decrease in the surveyed work times, such as the intraservice time decreasing from 60 minutes to 37 minutes, which was not fully accounted for in the RUC's recommended work RVU of 7.06. We also note that the procedure does not seem to have become more intense, as the code descriptor did not change.

In the interest of maintaining relativity with similarly timed codes, we instead proposed a work RVU of 6.23 based on a crosswalk to CPT code 46707. This code has an almost identical intraservice time and similar total time. The proposed work RVU accounts for the decrease in both intraservice time and total time and is well bracketed by CPT code 67912 *(Correction of lagophthalmos, with implantation of upper eyelid lid load (e.g., gold weight))*, valued at a work RVU of 6.20 with an intraservice time of 40 minutes, and CPT code 24358 *(Tenotomy, elbow, lateral or medial (e.g., epicondylitis, tennis elbow, golfer's elbow); debridement, soft tissue and/or bone, open)*, valued at a work RVU of 6.49 with an intraservice time of 40 minutes.

We proposed the RUC-recommended direct PE inputs for all of the codes in this family.

Comment: Commenters disagreed with the proposed work RVU of 6.23 for CPT 62287 stating that the complexity of the surveyed code's physician work was not adequately represented and was below the surveyed 25th percentile. Commenters also stated that the crosswalk does not maintain relativity within the code family and is not clinically related to the proposed code. Commenters stated that the proposed valuation does not adequately account for the technical precision, imaging interpretation, anatomical localization, clinical judgment, mental effort, procedural intensity, and risks associated with percutaneous lumbar decompression. Commenters disagreed that a time reduction alone deserves a lower value when the work is unchanged and that the valuation methodology should account for this shift in complexity rather than treat the reduced time alone as justification for a proportionally reduced work RVU.

Commenters stated that the RUC-recommended work RVU of 7.06 would be more appropriate for CPT code 62287 and cited CPT codes 62330 (*Decompression, percutaneous, with partial removal of the ligamentum flavum, including laminotomy for access, epidurography, and imaging guidance (i.e., CT or fluoroscopy), bilateral; one interspace, lumbar*) and 62331 (*Decompression, percutaneous, with partial removal of the ligamentum flavum, including laminotomy for access, epidurography, and imaging guidance (i.e., CT or fluoroscopy), bilateral; additional interspace(s), lumbar (List separately in addition to code for primary procedure)*) as relevant comparators within the lumbar decompression family. A commenter

identified CPT code 22869 (*Insertion of interlaminar/interspinous process stabilization/distraction device, without open decompression or fusion, including image guidance when performed, lumbar; single level*), the RUC's key reference service, as an appropriate crosswalk because it similarly involves invasive lumbar spine intervention, image guidance, spatial judgment, and spinal procedural risk.

Response: We thank the commenters for their feedback. We are not compelled by the arguments that a work RVU of 6.23 would not maintain relativity in the family. CPT code 62330 has a higher intraservice time and total time which accounts for why it has a higher work RVU as compared with our proposed valuation of CPT code 62287. We also note that CPT code 62330 has historically had a higher intensity than CPT code 62287, which would be reversed by the RUC's recommended work RVU of 7.06; we do not believe that this reversal of their relative intensities would be the case given that there was agreement from the commenters that the clinical practice of CPT code 62287 had not changed. We also do not believe that the work RVUs of CPT codes 62287 and 62331 are directly comparable since the latter code is an add-on procedure with only 43 minutes of total time. We disagree with the comment that identified CPT code 22869 as an appropriate crosswalk because it similarly involves invasive lumbar spine intervention, image guidance, spatial judgment, and spinal procedural risk. We want to reiterate that the PFS is a relative value-based system and not all reference codes are necessarily clinically related.

We continue to believe that since there was a decrease in the surveyed work times which was not fully accounted for in the RUC's recommended work RVU of 7.06, the work RVU should decrease correspondingly since valuation is based on time and intensity. We also continue to disagree that there has been a significant increase in intensity for this code which would warrant the work RVU recommended by the RUC. Intensity of work under the Physician Fee Schedule reflects skill, expertise, effort, stress, and other factors that influence the assessed relative value of time spent. We disagree with the commenters that performing the same work in less time inherently means that the intensity of a procedure has increased; changes in practice patterns, improvements in technology, or greater efficiencies in the delivery of care can all account for shorter procedure times without a corresponding increase in intensity. Commenters agreed that CPT code 62287 had undergone no significant change in the procedure's performance as reflected by its unaltered code descriptor. Under our methodology for work valuation, if the surveyed work times are decreasing and there is general agreement that the procedure itself has remained unchanged, this supports a decrease in the work RVU, not a conclusion that the intensity of the procedure has increased to match the decrease in surveyed work time. We believe that the agreement from the commenters that there has been no significant change in the clinical performance of CPT code 62287 supports our proposed work RVU of 6.23, not undermines it.

After consideration of the comments, we are finalizing the work RVU and direct PE inputs for CPT code 62287 as proposed.

(30) Laminectomy (CPT Codes 63045, 63046, 63047, and 63048)

In April 2025, the RAW identified CPT code 63047 (*Laminectomy, facetectomy and foraminotomy (unilateral or bilateral with decompression of spinal cord, cauda equina and/or nerve root[s], [e.g., spinal or lateral recess stenosis]), single vertebral segment; lumbar*) as a site of service anomaly where Medicare data from 2021 to 2023 indicated it was performed less than 50 percent of the time in the inpatient setting yet included inpatient hospital Evaluation and Management services within the global period with 2023 Medicare utilization over 10,000. The RAW also worked with the specialty societies and identified other codes 63045 (*Laminectomy, facetectomy and foraminotomy (unilateral or bilateral with decompression of spinal cord, cauda equina and/or nerve root[s], [e.g., spinal or lateral recess stenosis]), single vertebral segment; cervical*), 63046 (*Laminectomy, facetectomy and foraminotomy (unilateral or bilateral with decompression of spinal cord, cauda equina and/or nerve root[s], [e.g., spinal or lateral recess stenosis]), single vertebral segment; thoracic*) and 63048 (*Laminectomy, facetectomy and foraminotomy (unilateral or bilateral with decompression of spinal cord, cauda equina and/or nerve root[s], [e.g., spinal or lateral recess stenosis]), single vertebral segment; each additional vertebral segment, cervical, thoracic, or lumbar (List separately in addition to code for primary procedure)*) as part of this family of services. These services were surveyed for September 2025.

We proposed the RUC-recommended work RVUs for all four CPT codes in this family. We proposed a work RVU of 17.25 for CPT code 63045, a work RVU of 16.71 for CPT code 63046, a work RVU of 14.99 for CPT code 63047, and a work RVU of 3.38 for CPT code 63048. We note that several of these work RVUs were affected by the efficiency adjustment which was applied at the start of CY 2026, as the RUC recommendations were based on pre-adjustment work valuations.

We proposed the RUC recommended direct PE inputs for CPT codes 63045, 63046, 63047, and 63048 without refinement.

Comment: A commenter asked that the efficiency adjustment not be applied to these codes. We received other comments on this code family that were overall not in scope for CMS's proposal.

Response: We can clarify for the commenters that the efficiency adjustment was not directly applied to the review of these codes since their work and time survey data was newly produced for CY 2027. However, CPT codes 63045 and 63046 had their work valuations recommended by the RUC using crosswalks to other CPT codes, 22554 and 46710 respectively, which were subject to the efficiency adjustment. The proposed valuation for CPT code 63045 was therefore based on the adjusted work RVU of 17.25, the current work RVU of code 22554, rather than the pre-adjusted work RVU of 17.69 for that code. We do not agree that it would be appropriate to use crosswalks to pre-adjusted work RVUs as it would fail to maintain relativity and create significant confusion.

We are clarifying that the other comments received on this code family were overall not in scope for CMS's proposal.

After consideration of the public comments, we are finalizing the work RVUs and direct PE inputs for CPT codes 63045, 63046, 63047, and 63048 as proposed.

(31) Injection Anesthetic Agent (CPT Codes 64400 and 64405)

The RUC identified CPT code 64400 *(Injection(s), anesthetic agent(s) and/or steroid; trigeminal nerve, each branch (i.e., ophthalmic, maxillary, mandibular))* via their database flag, ''Do not use to validate physician work'', and recommended to survey this CPT code and the related CPT code 64405 *(Injection(s), anesthetic agent(s) and/or steroid; greater occipital nerve)* for the September 2025 meeting.

For CY 2027, we proposed the RUC-recommended work RVUs of 0.73 for CPT code 64400 (which is the current

work RVU of the code after the efficiency adjustment was applied at the start of CY 2026) and 0.84 for CPT code 64405.

We proposed the RUC-recommended direct PE inputs for both CPT codes without refinement.

Comment: Commenters were supportive of CMS' proposed work RVUs and direct PE inputs for this code family.

Response: We thank the commenters for their support. After consideration of the public comments, we are finalizing the work RVUs and direct PE inputs as proposed.

(32) MRA—Head, Neck (CPT Codes 70544, 70545, 70546, 70547, 70548, 70549, 70560, 70561, and 70562)

In April 2024, the RAW noted that the rate at which CPT codes 70547 (currently described as *Magnetic resonance angiography, neck; without contrast material(s)*) and 70544 (currently described as *Magnetic resonance angiography, head; without contrast material(s)*) are reported together continued to increase after the initial identification of the trend in April 2022 and a 2-year delay in review to allow practice patterns in the inpatient and outpatient setting go back to how they were prior to the COVID–19 pandemic. At the September 2025 CPT Editorial Panel, six CPT codes were revised to include ''image postprocessing'': CPT codes 70544 (*Magnetic resonance angiography, head, including image postprocessing; without contrast material(s)*), 70545 (*Magnetic resonance angiography, head, including image postprocessing; with contrast material(s)*), 70546 (*Magnetic resonance angiography, head, including image postprocessing; without contrast material(s), followed by contrast material(s) and further sequences*), 70547 (*Magnetic resonance angiography, neck, including image postprocessing; without contrast material(s)*), 70548 (*Magnetic resonance angiography, neck, including image postprocessing; with contrast material(s)*), and 70549 (*Magnetic resonance angiography, neck, including image postprocessing; without contrast material(s), followed by contrast material(s) and further sequences*). Three additional codes were created to bundle magnetic resonance angiography (MRA) head and neck with/without contrast: CPT codes 70560 (*Magnetic resonance angiography, head and neck, including image postprocessing; without contrast material(s)*), 70561 (*Magnetic resonance angiography, head and neck, including image postprocessing; with contrast material(s)*), and 70562 (*Magnetic resonance angiography, head and neck; without contrast material(s) in one or both body regions, followed by contrast material(s) and further sequences in one or both body regions, including image postprocessing*). The code family was surveyed for the January 2026 RUC meeting.

We proposed the RUC-recommended work RVU for all nine codes in the family. We proposed the RUC-recommended work RVUs of 1.17, 1.17, 1.44, 1.17, 1.46, 1.76, 1.77, 2.10, and 2.23 for CPT codes 70544, 70545, 70546, 70547, 70548, 70549, 70560, 70561, and 70562, respectively. We proposed the RUC recommended direct PE inputs for CPT codes 70544, 70545, 70546, 70547, 70548, 70549, 70560, 70561, and 70562 without refinement.

We received public comments on these proposals. The following is a summary of the comments we received and our responses.

Comment: The majority of commenters appreciated our proposal of the RUC-recommended work RVUs and direct PE inputs for the MRA Head and Neck code family (CPT codes 70544, 70545, 70546, 70547, 70548, 70549, 70560, 70561, and 70562) without refinement.

Response: We thank the commenters for their support.

Comment: A commenter disagreed with the proposed work RVUs for CPT codes 70560, 70561, and 70562, and requested that CMS value these codes at the sum of the components. The commenter noted, for example, the current work RVUs for CPT codes 70546 for the head (1.44) plus 70549 for the neck (1.76) equals 3.20. Therefore, they recommended the RVU for bundled CPT code 70562 for the head and neck combined should also equal 3.20 instead of the RUC-recommended RVU of 2.23 proposed by CMS. The commenter stated that this is the steepest cut (30.3 percent) of the three new bundled MRA codes, compared to billing separately, even though this is the most complex interpretation of the three new MRA codes performed without contrast materials, followed by the study with contrast materials. The commenter stated that the physician work, intensity, and complexity associated with interpreting these procedures did not decrease because the codes have been bundled.

Response: We continue to believe that the proposed RUC-recommended work RVUs for CPT codes 70560, 70561, and 70562 are appropriate. It is reasonable to expect that these three new bundled codes will achieve savings via elimination of duplicative assumptions of the resources involved in furnishing particular servicers. We believe the new bundled coding assigns more accurate work times, and thus, reflects efficiencies in resource costs that exist but are not reflected when these services are reported separately. The proposed RVUs for these codes maintain relativity within the MRA Head and Neck code family and appropriately account for the physician work required for these services.

After consideration of the public comments, we are finalizing the work RVUs and direct PE inputs for the codes in the MRA Head and Neck code family (CPT codes 70544, 70545, 70546, 70547, 70548, 70549, 70560, 70561, and 70562) as proposed.

(33) Computed Tomography-Upper Extremity With Contrast (CPT Codes 73200, 73201, and 73202)

In April 2025, the RAW identified CPT code 73201 (*Computed tomography, upper extremity; with contrast material(s)*) via the CMS/Other source and 2023 Medicare utilization over 20,000 screen. The family of services was surveyed for the January 2026 RUC meeting, including CPT codes 73200 *(Computed tomography, upper extremity; without contrast material*) and 73202 *(Computed tomography, upper extremity; without contrast material, followed by contrast material(s) and further sections).*

We proposed the RUC-recommended work RVUs of 1.00, 1.16, and 1.24 for CPT codes 73200, 73201, and 73202, respectively. We proposed the RUC recommended direct PE inputs for CPT codes 73200, 73201, and 73202 without refinement.

We received public comments on these proposals. The following is a summary of the comments we received and our responses.

Comment: Commenters supported our proposal of the RUC-recommended work RVUs and direct PE inputs for the Computed Tomography-Upper Extremity with Contrast (CPT codes 73200, 73201, and 73202) code family.

Response: We appreciate the support for our proposed values from the commenters.

After consideration of the comments, we are finalizing the work RVUs and direct PE inputs for the codes in the Computed Tomography-Upper Extremity with Contrast code family as proposed.

(34) Radiation Oncology Treatment Delivery (CPT Codes 77402, 77407, and 77412)

In the CY 2026 PFS final rule (90 FR 49379 through 49383), we finalized our proposal to utilize the relationship

between the Hospital Outpatient Prospective Payment System (OPPS) Ambulatory Payment Classifications (APC) relative weights for APCs 5621, 5622, and 5623 to inform the valuation of PE-only CPT codes 77402 (*Radiation treatment delivery; Level 1 (e.g., single-electron field, multiple-electron fields, or 2D photons), including imaging guidance, when performed*), 77407 (*Radiation treatment delivery; Level 2, single-isocenter (e.g., 3D or IMRT), photons, including imaging guidance, when performed*), and 77412 (*Radiation treatment delivery; Level 3, multiple isocenters with photon therapy (e.g., 2D, 3D, or IMRT) or a single-isocenter photon therapy (e.g., 3D or IMRT) with active motion management, or total skin electrons, or mixed-electron/photon field(s), including imaging guidance, when performed*) when paid under the PFS. We also stated that we calculated the RVUs for these codes so that the overall PE and MP RVUs for these services represent the same share of total PE and MP RVUs in CY 2025 and CY 2026. To accomplish this, we developed PE and MP RVUs using the assumed distribution of services indicated in the utilization crosswalk.

We proposed to utilize the RUC-recommended crosswalk for these services, which assumed that 45 percent of the billed charges would be reported with CPT code 77412. Some commenters stated that CPT code 77412 would represent only 15 percent of the volume for these services. We stated in the CY 2026 PFS final rule that it is difficult to ascertain how services furnished in the past would be most accurately reported using a future code set (90 FR 49385). In response to comments and considering the disparate information we received, we finalized a modified crosswalk that adjusted downward the estimated portion that CPT code 77412 would be reported compared to CPT code 77407 based on commenters who represent those who provide care in the non-facility setting. Specifically, we modified the utilization crosswalk to crosswalk 35 percent of the utilization to CPT code 77412 and 55 percent of the utilization to CPT code 77407. Since the publication of the CY 2026 PFS final rule, interested parties have reported that the 35 percent utilization assumption for CPT code 77412 was still overstated despite our downward adjustment in the CY 2026 PFS final rule, and that the actual utilization for CPT code 77412 is approximately 18 percent. Given the importance of the assumed distribution of services in ensuring that we achieved our target of maintaining the same share of total PE and MP RVUs, we reviewed the claims data to evaluate the actual distribution of utilization among CPT codes 77402, 77407, and 77412. We noted that during the first 3 months of 2026, CPT code 77412 comprised approximately 18 of the total volume of these services.

Given that we valued these services by utilizing the relative relationship between the OPPS APC relative weights rather than our standard PE methodology, shifts in utilization over time are not automatically incorporated into the annual development of PE RVUs for these services over time. Consequently, we proposed to refine the relativity within this family of codes for CY 2027 based on available claim data that corroborates the information submitted to us by outside parties. We did not propose to change the assumptions about the total number of services, but rather, to revalue the PE RVUs using the observed distribution of services, such that the PE and MP RVUs for these services represent the same share of total PE and MP RVUs as they did in CY 2025.

We received public comments on these proposals. The following is a summary of the comments we received and our responses.

Comment: Commenters generally supported recalibrating this family of codes but urged CMS to use both Q1 and Q2 CY 2026 claims data, not Q1 alone, for a more reliable utilization basis before finalizing CY 2027 values. One specialty society called the correction necessary, noting that OPPS-derived APC weights import hospital rate-setting anomalies into the PFS and that the restructured code set selects codes by clinical complexity, treatment area, target number, and dose rather than technique. This commenter said correcting the utilization assumption frees existing radiation oncology PE-pool RVUs to recalibrate CPT code 77407 without affecting overall PFS budget neutrality.

Other commenters cautioned that fixing the internal distribution within a fixed payment pool does not confirm the pool itself is adequate. Commenters reported a 23–30 percent decline in average radiation oncology payment from 2025 to 2026 that the proposed correction would not offset, and asked CMS to use existing authority to provide retrospective CY 2026 relief. This commenter stated that these payment reductions occurred with no corresponding drop in staffing, equipment, safety, or facility costs, calling current operations financially unsustainable. A freestanding practice cited a third-party financial model projecting only a 0.61 percent net increase in freestanding global revenue from 2026 to 2027, versus an estimated 14.21 percent increase under the OPPS methodology, with hospital outpatient departments paid about 34 percent more for the same three delivery levels. A commenter said the CY 2027 recalculation, though reasonable, preserves the same aggregate PE/malpractice pool without testing whether payment for a full treatment course is adequate.

Response: We appreciate the commenter's support for updating the utilization assumptions and its impact on recalibrating the valuation for CPT code 77407. We agree that aligning the utilization assumption with the restructured code set's selection criteria improves accuracy. Regarding the commenters who described declines in revenue of 23–30 percent from 2025 to 2026, we note that these figures are inconsistent with our estimates for Medicare payments. Regarding the commenter who stated that the proposed CY 2027 rate only yields a 0.61 percent net increase, we note that the proposed RVUs for CPT codes 77402, 77407, and 77412 increased significantly more than that: for instance, the total RVU for 77407 is approximately 12% higher than the CY 2026 total RVU.

With respect to the request to incorporate Q2 claims data for a more reliable utilization basis, we note that including these claims did not significantly alter the PE RVUs for these services. With respect to comments about payment adequacy, as we stated in the CY 2026 final rule, we calculated the proposed RVUs so that the aggregate PE and MP RVUs for this family of codes—weighted by each code's utilization volume—would remain consistent with CY 2025 levels. In other words, our goal was to preserve the overall RVU share represented by this code family, not to hold each individual code's RVUs constant. For CY 2027, we proposed to improve the precision of our calculation using actual utilization data. If interested parties believe other codes as part of the course of treatment are inadequately valued or should be closer to the OPPS values, we refer them to the potentially misvalued code process for consideration in future rulemaking. Under the PFS we use the best information available to calculate RVUs for a given year. We do not have statutory authority to provide retrospective 2026 payment adjustments.

Comment: A commenter recommended that CMS reassign CPT code 77407 to APC 5623 (Level 3

Radiation Therapy), reiterating a recommendation made in its CY 2026 comment letter. The commenter stated that the legacy IMRT codes (CPT codes 77385 and 77386) consolidated into the revised code family were previously assigned to APC 5623, and that keeping CPT code 77407 in APC 5622 undervalues a service now accounting for a substantial share of external-beam delivery volume. The same commenter recommended that CMS refine the transitional crosswalk mapping legacy CPT codes 77385/77386 and 77412 claims to the revised codes, noting that some services historically billed under legacy 77386 may more appropriately correspond to revised CPT code 77407 rather than CPT code 77412.

Response: We consider comments regarding APC assignments to be outside the scope of this final rule.

Comment: A commenter expressed concern regarding proposed reductions to core physician-work-based services, including radiation treatment planning (CPT code 77263), IMRT planning (CPT code 77301), conventional treatment management (CPT code 77427), and stereotactic treatment management (CPT codes 77432 and 77435). Commenters also expressed concern about reductions to other related services resulting from the efficiency adjustment. Commenters also expressed concerns about reduction resulting from the conversion factor reduction.

Response: We refer commenters to sections X.X and X.X of this final rule where we respond to comments about the efficiency adjustment and the reduction to the conversion factor.

Comment: Several commenters stated that because the CY 2026 code descriptors represent materially different, bundled services (including image guidance) but reuse legacy CPT numbers, many commercial payers have carried forward prior rates, edits, and authorization rules associated with the deleted codes, producing underpayment, downcoding, denials, and costly renegotiations outside traditional Medicare. Commenters requested that CMS recognize the redesigned codes as new services for payment purposes and work with the AMA CPT Editorial Panel and specialty societies to establish new, distinct CPT identifiers; pending such action, commenters recommended that CMS implement temporary HCPCS codes or another mechanisms to distinguish the redesigned services from prior code definitions and values.

Response: We acknowledge commenters' concerns about coding issues related to commercial payers. However, we consider these comments to be outside the scope of this final rule. We refer commenters to the CPT Editorial Panel to address issues related to CPT identifiers.

Comment: A commenter urged CMS not to treat the observed 18 percent Level 3 utilization rate as a quota or audit benchmark, arguing that early 2026 claims data were generated during a documented period of coding uncertainty, and that a longer, more mature claims period together with clear national coding/documentation guidance are needed before such a rate is relied upon. Commenters recommended that CMS formally clarify that the ~18 percent CPT code 77412 utilization figure is not intended to function as a fixed quota or audit trigger.

Response: The adjustment that we proposed to recalibrate the PE RVUs based on early claims history was intended to improve the accuracy of the PE RVUs. We did not intend to establish a benchmark for the percentage of claims billed with Level 3.

Comment: Commenters recommended that CMS evaluate the PFS and OPPS payment changes together, including their combined effects on practice closures, consolidation, Medicare spending, and rural access, and provide immediate transition protection for freestanding and rural centers while a fuller episode-level revaluation is completed. A commenter recommended that CMS support development of a longer-term, non-annually-volatile payment reform for radiation oncology, including the Radiation Oncology Case Rate (ROCR) Act, as a structural remedy to the volatility in payment.

Response: We acknowledge the commenters' concerns and may consider these issues in future rulemaking.

After consideration of the public comments, we are finalizing our proposal to revalue the PE RVUs using the observed distribution of services, such that the PE and MP RVUs for these services represent the same share of total PE and MP RVUs as they did in CY 2025.

(35) Proton Beam Treatment Delivery (CPT Codes 77520, 77522, 77523, and 77525)

Payment amounts for proton beam treatment delivery services described by CPT codes 77520 (*Proton treatment delivery; simple, without compensation*), 77522 (*Proton treatment delivery; simple, with compensation*), 77523 (*Proton treatment delivery; intermediate*), and 77525 (*Proton treatment delivery; complex*) are currently determined by local Medicare Administrative Contractors (MACs). We have not previously established RVUs for these services due to the unique nature of the equipment costs associated with these services compared to other capital costs addressed by our usual PE methodology. In the CY 2026 PFS proposed rule, we sought comment on establishing national payment rates for proton beam treatment delivery services. In the CY 2026 final rule (90 FR 49390), we indicated our intent to establish national pricing for proton beam treatment delivery services in future rulemaking.

Interested parties have raised concerns about wide geographic payment disparities with the current contractor pricing that are unrelated to the cost of providing care and have requested that CMS nationally price proton beam treatment delivery services. For example, 2024 claims data for CPT code 77525, which has the second highest utilization of the code family, reflects allowed charges that ranged from $122.15 to $1,374.26. Interested parties recommended that CMS establish identical payment rates for PFS and OPPS, calculating a weighted average of the payment rates to maintain budget neutrality across the PFS and OPPS. Other interested parties expressed concern about reliance on OPPS cost data to value proton beam treatment delivery services, as the substantial capital outlays required by freestanding centers could be greater than those faced by hospital systems and the freestanding centers lack the purchasing power or amortization flexibility that hospitals may have.

After considering the comments we received in response to the CY 2026 PFS rule regarding establishing national payment rates for proton beam treatment, similar to the policy we finalized for CY 2026 for radiation treatment delivery services, we proposed to calculate the PE RVUs for these services as follows:

- Use the total allowed charges paid by the MACs for CPT codes 77520, 77522, 77523, and 77525 to establish the pool of PE RVUs to allocate to the services in this code family.
- Allocate PE RVUs to the individual services using the relationship between the APC relative weights for APCs 5625 (to which CPT codes 77522, 77523, and 77525 are assigned) and APC 5623 (to which CPT code 77520 is assigned) under the OPPS. We believe our proposal appropriately balances interested parties' requests to establish national payment rates with the difficulties we have faced when considering the capital-intensive and

specialized resources for services like proton beam therapy services.

We received public comments on these proposals. The following is a summary of the comments we received and our responses.

Comment: Commenters broadly agreed that replacing inconsistent, non-transparent MAC-based pricing with a national methodology is a reasonable long-term goal. However, most commenters stated that the specific inputs, data sources, and allocation methodology proposed for CY 2027 are flawed, insufficiently disclosed, and would produce underpayment. Some commenters supported the general direction while requesting technical fixes. Another commenter supported proceeding with national pricing on the proposed CY 2027 timeline.

Response: We appreciate commenters' support for establishing a national payment rate for proton beam treatment delivery.

We did not use direct PE inputs to calculate the PE RVUs for these services, as we would under our standard PE methodology. Instead, we used the following two-step approach:

First, we calculated a pool of PE RVUs equal to the amount implied by the rates that MACs currently pay for these services. In other words, we started from current MAC payment levels, converted to RVU terms, rather than building the rate up from individual PE inputs (equipment, supplies, labor time, etc.).

Second, we allocated that pool of RVUs across the individual codes based on the relative relationship between the applicable Ambulatory Payment Classifications (APCs). For example, CPT 77520 is assigned to APC 5623, while CPT codes 77522, 77523, and 77525 are each assigned to APC 5625. At the time of the development of the proposed rule, the relative payment ratio of APC 5625 to APC 5623 was approximately 2.24. We therefore allocated the pool such that the PE RVU for each of CPT codes 77522, 77523, and 77525 was approximately 2.24 times the PE RVU for CPT 77520.

We note that the public use files accompanying the proposed rule inadvertently included a different set of inputs—specifically, inputs from previous RUC recommendations and an equipment utilization assumption. These had not previously appeared in the files because the files are only populated with direct PE inputs for services we price nationally. We confirm that we did not use these inputs—the previous RUC recommendations or the equipment utilization assumption—in calculating the PE RVUs. Our calculation relied solely on the MAC-rate-derived pool and the APC-relationship allocation described previously.

We disagree with commenters who stated that we insufficiently disclosed our methodology. We used this same two-step approach—(1) maintaining the pool of RVUs implied by current rates and (2) allocating that pool based on the relative relationship between applicable APCs—to establish payment rates for radiation oncology treatment delivery and surface radiation treatment codes in the CY 2026 final rule (90 FR 49379).

Comment: Some commenters criticized the proposed 90% equipment utilization assumption as inappropriate and understated for proton beam treatment delivery equipment. Commenters noted this rate is typically reserved for diagnostic imaging equipment, while other radiation oncology equipment generally assumes 60–70% utilization. Sensitivity analyses cited by commenters indicated that adopting a 70% utilization assumption would raise the proposed per-treatment payment from approximately $1,029 to over $1,300.

Response: As we stated earlier in this section, we did not use the direct PE inputs in the PUF to calculate the PE RVUs for these services. The equipment utilization assumption is therefore irrelevant to this calculation.

Comment: Some commenters stated that CMS published materially different, inconsistent proposed rate figures for the same codes within a single rulemaking cycle without explaining why the methodology changed. Commenters stated this rollout undermines confidence that the methodology is ready for finalization and makes it harder for stakeholders to evaluate or comment meaningfully on the proposal.

Response: We acknowledge that the PE RVUs we initially published did not match our proposed methodology, due to a separate technical error. After interested parties raised this issue, we posted corrected PE RVUs. There was no underlying change in methodology. We corrected this technical error 1 week after we published the proposed rule, and stakeholders confirmed they were aware of the correction. We therefore do not believe this limited stakeholders' ability to comment meaningfully.

Comment: Several commenters noted that the CY 2026 elimination of separately payable image guidance (CPT code 77014, replaced by the professional-only CPT code 77387) removed reimbursement for a technical resource that should now be reflected in the bundled proton beam treatment delivery rates, particularly given that over 92% of patients receive daily image-guided radiation therapy (IGRT). Commenters argued that the proposed methodology does not adequately account for this shift in cost.

Response: We reviewed claims data from CY 2025 and CY 2026 in response to this concern. We found that MAC payment rates increased significantly in 2026, reflecting the bundling of image guidance. We are therefore calculating the pool of current RVUs using the first two quarters of CY 2026 claims, which increases the PE RVUs for these services.

Comment: Several commenters stated that using OPPS relative weights—derived from hospital outpatient cost structures—to allocate payments among freestanding, MPFS-paid centers does not adequately capture these facilities' capital and operating costs. Commenters calculated that the proposed freestanding rate (approximately $1,029) sits approximately 28–30 percent below the comparable OPPS hospital rate (approximately $1,434), despite similar underlying equipment and staffing costs. One provider organization noted that only 14 of the 50 operating proton beam treatment delivery facilities nationally are freestanding, community-based centers paid under the MPFS. This organization stated that these centers lack other service lines to offset losses from underpayment. A commenter supported proceeding with national pricing but proposed a specific compromise: adopt a fixed 70 percent equipment utilization rate, discontinue CPT codes 77520 and 77522 as separately payable, and set a single rate of approximately $1,280 for CPT codes 77523 and 77525. The commenter positioned this proposal as a middle path between the proposed MPFS rate and the OPPS benchmark rate.

Response: We proposed to use the relationship between the APCs to which these CPT codes are assigned to allocate the pool of PE RVUs. We believe the relative relationship between the resources required to furnish each of these services under the PFS are likely to be similar to the relative relationship of the resources required under the OPPS. We acknowledge commenters' concerns about the considerable difference between the freestanding rate and the comparable OPPS rate. The current payment structure already reflects this difference, and we proposed to maintain the current pool of PE RVUs based on that structure. We may consider these comments in future rulemaking. We appreciate the commenter's alternative proposal: to establish a single payment rate of approximately $1,280 for CPT codes

77523 and 77525, to adopt a fixed 70 percent equipment utilization rate, and to discontinue separate payment for CPT codes 77520 and 77522. The CPT Editorial Panel, not CMS, is responsible for coding changes to CPT codes. As we explained earlier in this section, the equipment utilization assumption is irrelevant to calculating PE RVUs for these services. We are not adopting a rate of approximately $1,280. We believe our proposed approach—using the total pool of PE RVUs implied by the existing MAC-priced claims, updated with the first two quarters of CY 2026 claims data as described previously in response to comments on image guidance bundling—produces a more accurate rate. Consistent with the commenter's recommendation, our approach also results in a single payment rate for CPT codes 77523 and 77525.

Comment: Some commenters noted that MACs used materially different, non-transparent methodologies to generate the historical allowed charges being pooled. They noted that CPT 77525/77522 payment ratios ranged from 1.159x to 1.382x across MACs, even within the same locality. Commenters also noted that utilization-weighting the pooled data gives two to three MACs outsized combined influence—approximately 78%—over the resulting national rates. Other commenters recommended that CMS refine the methodology using validated practice-expense data specific to freestanding centers that furnish proton beam treatment delivery, rather than hospital-based cost data. Another commenter offered to supply facility-level data to assist.

Response: Commenters supported nationally pricing these services in part because of these non-transparent contractor payment methodologies, as we summarized earlier in this section. We believe that, generally speaking, national pricing for individual services is preferrable to contractor pricing since it better maintains relativity across the PFS and minimizes regional variations that can create barriers to care access. Although contractor pricing is appropriate for some services, most often used for new and emerging technologies, we believe that CPT codes 77520, 77522, 77523, and 77525 will be more accurately valued using our proposed national pricing.

We agree that weighting the data by utilization means, by definition, that rates where MACs more frequently furnish these services have greater influence on the average. We believe weighting by utilization is reasonable here. When practitioners continue to furnish a service at a given rate over time, that provides at least some evidence the rate has sufficiently sustained provider participation. We believe this approach achieves our goal of maintaining the pool of total PE RVUs implied by the rates that MACs currently pay for these services. We acknowledge commenters' recommendation to use a validated cost study specific to proton beam treatment delivery. However, our approach is intended to move away from direct PE inputs and instead use the relative relationship between the APCs to which these CPT codes are assigned.

Comment: A commenter stated that this approach may not satisfy the Social Security Act's resource-based valuation requirements. Commenters requested that we defer national pricing until at least January 1, 2028, and establish a defined period to validate the methodology.

Response: Section 1848(c)(2)(N) of the Act authorizes us to establish or adjust PE RVUs using cost, charge, or other data. Our approach—using the relative APC relationships to allocate the PE RVUs implied by the claims data—is resource-based because the APC relationships reflect differences in resource costs. We do not believe that deferring national pricing to CY 2028 and adding a period to validate the methodology would produce a more accurate payment rate than the methodology we are finalizing. We believe the total pool of PE RVUs implied by the current MAC-priced claims should serve as the source for calculating PE RVUs. Because we would use this same source regardless, changing the methodology further would not materially change the resulting PE RVUs.

Comment: Commenters raised a range of access-related concerns, including potential impacts on pediatric, rural, and other vulnerable patient populations; the risk of facility closures, particularly among freestanding centers with limited ability to offset losses; the effect of reimbursement policy on hospital-versus-freestanding market dynamics; and high rates of commercial prior-authorization denials for proton beam treatment delivery. Numerous individual patients and a joint patient advocacy letter also described proton beam treatment delivery as critical to their care and urged CMS not to finalize a methodology that could lead to treatment center closures.

Response: We appreciate the concerns commenters raised about patient access, including impacts on pediatric and rural populations, the risk of facility closures among freestanding centers, and the effect of payment policy on the hospital-versus-freestanding market. As we discussed previously in response to comments on the proposed methodology, our approach maintains the total pool of PE RVUs currently implied by MAC-priced claims. We updated this pool to reflect the first two quarters of CY 2026 claims data to account for the bundling of image guidance. This is not a reduction in overall payment for proton beam treatment delivery; rather, our approach redistributes the existing pool across codes using a transparent, national methodology instead of inconsistent contractor-specific rates.

We believe this approach mitigates the closure risk commenters raised, because it does not cut payment relative to current levels for the pool of services as a whole. We recognize that a national rate may still shift payment for some codes or facilities relative to what a single MAC previously paid. We will monitor claims and utilization data after implementation to assess whether this affects access, including for freestanding centers and vulnerable populations.

Commercial prior-authorization denials involve non-Medicare payer practices and fall outside the scope of Medicare's practice expense methodology. We encourage stakeholders to raise this issue through the appropriate commercial payer or regulatory channels. We thank the individual patients and advocacy organizations who shared their experiences, and we will continue to consider patient access as we monitor this policy's impact in future rulemaking.

Comment: Multiple commenters cited the same third-party Medicare claims analysis (2019–2022) to argue that proton beam treatment delivery produces downstream systemic savings that justify adequate reimbursement. Cited findings included the lowest 90-day mortality (approximately 2%), the lowest inpatient admission rate (10–11% versus 14% or more for other modalities), the longest time to emergency-room visit, and the lowest emergency-room visit costs among comparable modalities.

Response: We appreciate the data commenters provided on mortality, admission, and emergency-department outcomes for proton beam treatment delivery. These findings speak to its clinical value relative to other modalities, but they do not bear on how we set practice expense rates. The resource-based PE methodology sets RVUs according to the relative cost of furnishing a service—equipment, supplies, and staff time—not according

to a service's downstream clinical or cost outcomes. Section 1848(c)(2) directs us to value services based on the resources used to furnish them; it does not authorize us to adjust PE RVUs based on comparative efficacy or systemic savings.

After consideration of the comments received, we are finalizing our proposal, with the modification of using the claims data from the first two quarters of 2026 to establish the total pool of RVUs implied by the MAC-paid claims.

(36) Biofeedback Training (CPT Codes 90901, 90903, 90912, and 90913)

CPT codes 90901 (*Biofeedback training by any modality (e.g., EMG, EEG, ECG); initial 15 minutes of direct patient contact by physician or other qualified health care professional*), 90912 (*Biofeedback training, perineal muscles, anorectal or urethral sphincter, including EMG and/or manometry, when performed; initial 15 minutes of one-on-one physician or other qualified health care professional contact with the patient*) and 90913 (*Biofeedback training, perineal muscles, anorectal or urethral sphincter, including EMG and/or manometry, when performed; each additional 15 minutes of one-on-one physician or other qualified health care professional contact with the patient (List separately in addition to code for primary procedure)*) were surveyed at the January 2026 RUC meeting after having gone through revision at the September 2025 CPT Editorial Panel. CPT revised code 90901 to describe the initial 15 minutes of biofeedback training by a physician or other qualified health care professional with direct patient contact and created one new code, CPT code 90903 (*Biofeedback training by any modality (e.g., EMG, EEG, ECG); each additional 15 minutes of direct patient contact by physician or other qualified health care professional (List separately in addition to code for primary procedure)),* to describe each additional 15 minutes. CPT codes 90912 and 90913 were surveyed for the January 2026 RUC meeting since they are part of the same code family. CPT codes 90901 and new code 90903 were surveyed for the January 2026 RUC HCPAC Review Board meeting.

We proposed the HCPAC-recommended work RVUs of 0.61 for CPT code 90901 and 0.48 for CPT code 90903. We proposed the RUC-recommended work RVUs of 0.90 for CPT code 90912 and 0.50 for CPT code 90913.

We proposed the direct PE inputs recommended by the HCPAC and the RUC for all four codes in the family without refinement.

CPT codes 90901, 90912, and 90913 are all designated as sometimes therapy services, as such we proposed to designate CPT code 90903 as a sometimes therapy service.

Comment: Commenters supported the proposed values for Biofeedback Training. Commenters agreed with converting CPT code 90901 to a timed code and creating CPT code 90903. Commenters were generally supportive of designating CPT code 90903 as a sometimes therapy service.

Response: We appreciate the support for our proposed policies from the commenters.

After consideration of the public comments, we are finalizing the work RVUs and direct PE inputs for CPT codes 90901, 90903, 90912, and 90913 as proposed. We are also finalizing CPT code 90903 as a sometimes therapy service.

(37) Intracoronary Drug Delivery Balloon Services (CPT Codes 92922 and 92976)

In May 2025, the CPT Editorial Panel created two new codes, CPT code 92922 (*Percutaneous transcatheter therapeutic drug delivery by intracoronary drug-delivery balloon (e.g., drug-coated, drug-eluting), including mechanical dilation by nondrug-delivery balloon angioplasty, single major coronary artery and/or its branch(es)*) and CPT code 92976 (*Percutaneous transcatheter therapeutic drug-delivery by intracoronary drug-delivery balloon (e.g., drug-coated, drug-eluting), single major artery and/or its branches (List separately in addition to code for primary procedure)*) to describe percutaneous transcatheter therapeutic drug delivery by intracoronary drug-delivery balloons. The RUC reviewed these two new CPT codes at the September 2025 RUC meeting.

We reviewed the RUC's recommended work valuations and found the RUC's recommended work RVU of 10.00 for CPT code 92922 to be high, based on a search of 000 global day codes with between 45 and 75 minutes of intraservice time and between 109 and 149 minutes of total time in the RUC database. For CY 2027 we proposed a work RVU of 8.05, based on the RUC survey 25th percentile, for CPT code 92922. We proposed the RUC-recommended work RVU of 4.38 for CPT code 92976. The RUC did not recommend, and we did not propose any direct PE inputs for these codes.

Comment: We received a small number of comments. Nearly all commenters argued that CPT 92922 *(Percutaneous transcatheter therapeutic drug delivery by intracoronary drug-delivery balloon (e.g., drug-coated, drug-eluting))* contains all of the work of CPT code 92920 (*Percutaneous transluminal coronary angioplasty, single major coronary artery and/or its branch(es)*) plus some additional resource costs. Some commenters also described the additional physician work involving lesion assessment, vessel preparation, drug coated balloon (DCB) selection and sizing, evaluation of the angioplasty result, and determination of whether a stent-free result is safe and durable. As such, the CMS proposed work RVU results in a work RVU anomaly. A couple commenters asserted that this additional work makes the work of the entire procedure similar to the work of placing a stent and that a crosswalk to CPT code 92928 (*Percutaneous transcatheter placement of intracoronary stent(s), with coronary angioplasty when performed; single major coronary artery or branch).*

Response: After consideration of the comments, we have increased the work RVU because we were persuaded by commenters that we were creating a work RVU anomaly with our proposed valuation of 8.05. However, we find the RUC's recommended work RVU of 10.00 (60 minutes intraservice time and 129 minutes total time) for CPT code 92922 to be too high relative to other CPT codes with similar time values. We do not agree the additional work described by commenters raises the intensity of the procedure to warrant a crosswalk to CPT code 92928. Based on a search of 000 global day codes with between 45 and 75 minutes of intraservice time and between 109 and 149 minutes of total time in the RUC database we identified CPT code 43276 (*Endoscopic retrograde cholangiopancreatography (ERCP); with removal and exchange of stent(s), biliary or pancreatic duct, including pre- and post-dilation and guide wire passage, when performed, including sphincterotomy, when performed, each stent exchanged*) with an RVU of 8.62, with similar work time of 60 minutes and 123 minutes total time. The 8.62 work RVU value more accurately reflects the work RVU of CPT code 92922 with 60 minutes of intraservice work time and 129 minutes of total work time.

We are finalizing a work RVU of 8.62 based on a crosswalk to CPT code 43276. We are finalizing as proposed a work RVU of 4.38 for CPT code 92976. The RUC did not recommend, and we did not propose any direct PE inputs for these codes.

(38) Rotational Vestibular Assessment (CPT Codes 92527 and 92528)

At the September 2025 CPT Editorial Panel Meeting, CPT code 92546 was deleted, and replaced with two new codes to report rotational vestibular assessment. The two new codes, CPT code 92527 (*Rotational vestibular assessment by sinusoidal harmonic acceleration (SHA) testing with calibrated, computer-controlled chair, with interpretation and report (do not report 92527 in conjunction with 92270)*) and 92528 (*Rotational vestibular assessment by sinusoidal harmonic acceleration (SHA) testing with calibrated, computer-controlled chair, with interpretation and report; with velocity step testing (VST) (List separately in addition to code for primary procedure)*) were surveyed for the September 2025 RUC meeting.

We proposed the RUC-recommended work RVU of 0.92 for CPT code 92527.

We disagree with the RUC's recommended value of 0.48 for CPT code 92528 and we are instead proposing a work RVU of 0.35 which is the survey 25th percentile valuation. As valued by the RUC, the work RVU for add-on CPT code 92528 is half of the RUC's recommended work RVU of the base code (92527), despite the fact that CPT code 92528 has only 12 minutes of work time as compared with 45 minutes of work time for CPT code 92527. This leads to the intensity of CPT code 92528 being valued at double that of the base code, which we do not believe would be typical given that the same SHA testing is taking place in both services. We disagree with the RUC that valuing the work RVU of the add-on CPT code 92528 at half the work of the base CPT code 92527 would be appropriate, as this does not account for the substantial preservice and postservice work time contained in CPT code 92527, which together account for 20 of the 45 total minutes. We agree with the RUC that the intensity of this code is higher than the base code, and our proposed work RVU of 0.35 assigns a higher intensity to CPT code 92528 than CPT code 92527, but we disagree that the intensity of the add-on service would be double that of the base code.

We proposed the RUC recommended direct PE inputs for CPT codes 92527 and 92528 without refinement.

Additionally, in the CY 2023 PFS final rule (87 FR 69656 through 69663) we created an exception to the physician order requirement at 42 CFR 410.32(a)(4) to allow patients to directly access audiologists. We also delineated the vestibular function tests as those not applicable for use with the AB modifier (for direct access)—see Audiology Services on the PFS website at *https://www.cms.gov/medicare/payment/fee-schedules/physician/audiology-services*. Based on the foregoing, for the new Rotational Vestibular Assessment Codes, CPT codes 92527 and 92528 will be added to the audiology services code list but they will not be eligible to be billed with the AB modifier.

Comment: Commenters agreed with the proposal of the RUC-recommended work RVU for CPT code 92527 and the direct PE inputs for both codes, as well as their proposed addition to the audiology services list.

Response: We appreciate the support for our proposed policies from the commenters.

Comment: Commenters disagreed with CMS's proposed work RVU of 0.35 for add-on CPT code 92528. Commenters emphasized the relativity with the base code (CPT code 92527) and factors beyond intraservice and total time, including technical complexity, cognitive effort, clinical judgment, psychological stress, and patient monitoring. A commenter stated that CMS' proposed work RVU of 0.35, based on the survey's 25th percentile, could undervalue the service and impair access in smaller or underserved communities.

Response: We disagree with commenters regarding the technical complexity of performing the service as it is related to the add-on code. The two key reference services selected by the RUC, CPT code 92621 (*Evaluation of central auditory function, with report; each additional 15 minutes (List separately in addition to code for primary procedure)*) and CPT code 92627 (*Evaluation of auditory function for surgically implanted device(s) candidacy or postoperative status of a surgically implanted device(s); each additional 15 minutes (List separately in addition to code for primary procedure)*), each had a work RVU of 0.33 and 0.35 respectively and each had greater total time and intraservice time that was more similar to the proposed work RVU. As we stated in the proposed rule, the RUC's recommended work RVU of 0.48 for CPT code 92528 leads to its intensity becoming double that of the base code which we do not agree would be typical for this service given that the same SHA testing is taking place in both services. As we stated in the proposed rule, we disagree with the RUC that valuing the work RVU of the add-on CPT code 92528 at half the work of the base CPT code 92527 would be appropriate, as this does not account for the substantial preservice and postservice work time contained in CPT code 92527, which together account for 20 of the 45 total minutes. Commenters did not provide an explanation for why the intensity of the add-on code would be so much higher than the intensity of the base code. We agree with the RUC that the intensity of this code is higher than the base code, and our proposed work RVU of 0.35 assigns a higher intensity to CPT code 92528 than CPT code 92527, but we disagree that the intensity of the add-on service would be double that of the base code.

Comment: A commenter identified a projected 28% payment reduction from replacing CPT code 92546 with two new codes and requests broader reconsideration of Medicare financing and coverage constraints affecting audiologists.

Response: We believe that the valuation of CPT codes 92527 and 92528 more accurately represent how SHA testing currently takes place as compared with CPT code 92546 which was last reviewed in CY 2010. To the extent that payment reductions are taking place while shifting from the old coding to the new coding, this is due to the elimination of direct PE items which the RUC's PE Subcommittee recommended as no longer being typical for the procedures.

After consideration of the public comments, we are finalizing the work RVUs and direct PE inputs for CPT codes 92527 and 92528 as proposed.

(39) Video Head Impulse—Vestibular Function (CPT Codes 92513 and 92514)

At the September 2025 CPT Editorial Panel, the committee approved the addition of new CPT codes, 92513 *(Video head impulse testing (vhit) with recording, interpretation and report of lateral semicircular canal function*) and 92514 (*Video head impulse testing (vhit) with recording, interpretation and report of lateral and vertical semicircular canal function*) to report video head impulse testing (vHIT) and a corresponding parenthetical note. The RUC reviewed these services at the January 2026 meeting.

For CY 2027, we proposed the RUC-recommended work RVUs of 0.53 for CPT code 92513 and 0.84 for CPT code 92514. We proposed the RUC-recommended direct PE inputs for both CPT codes without refinement.

Comment: Commenters were supportive of CMS' proposed work RVU and direct PE inputs for this code family.

Response: We thank the commenters for their support.

After consideration of public comments, we are finalizing the work RVU and direct PE inputs as proposed.

As with CPT codes 92527 and 92528 in the previous section for Rotational Vestibular Assessment, CPT codes 92513 and 92514 for Video head impulse testing will be added to the list of Audiology Services; however, since they are vestibular function tests, they will not be eligible to be billed with the AB modifier in accordance with our policy established at 42 CFR 410.32(a)(4) and discussed in the CY 2023 PFS final rule (87 FR 69656 through 69663). (40) Speech-Language Pathology Services (CPT codes 92654, 92655, 92656, 92657, 92658, 92659, 92660, 92661, 92662, 92663, and 92508)

At the September 2025 CPT Editorial Panel meeting, CPT code 92507 (*Treatment of speech, language, voice, communication, and/or auditory processing disorder; individual*) was replaced with 10 new codes to report fluency disorder, speech sound production disorder, language comprehension and expression disorder, speech sound production disorder and language comprehension and expression disorder, and voice, upper airway dysfunction and/or resonance disorders. CPT codes 92654 (*Treatment of fluency disorder (e.g., stuttering and cluttering), direct (one-on-one) patient contact; initial 30 minutes*), 92655 (*Treatment of fluency disorder (e.g., stuttering and cluttering), direct (one-on-one) patient contact; each additional 15 minutes (list separately in addition to code for primary service)*), 92656 (*Treatment of speech sound production disorder (e.g., articulation, phonological process, apraxia, dysarthria), direct (one-on-one) patient contact; initial 30 minutes*), 92657 (*Treatment of speech sound production disorder (e.g., articulation, phonological process, apraxia, dysarthria), direct (one-on-one) patient contact; each additional 15 minutes (list separately in addition to code for primary service)*), 92658 (*Treatment of language comprehension and expression disorder (e.g., receptive and expressive language), direct (one-on-one) patient contact; initial 30 minutes*), 92659 (*Treatment of language comprehension and expression disorder (e.g., receptive and expressive language), direct (one-on-one) patient contact; each additional 15 minutes (list separately in addition to code for primary service)*), 92660 (*Treatment of speech sound production disorder (e.g., articulation, phonological process, apraxia, dysarthria) and language comprehension and expression disorder (e.g., receptive and expressive language), direct (one-on-one) patient contact; initial 30 minutes*), 92661 (*Treatment of speech sound production disorder (e.g., articulation, phonological process, apraxia, dysarthria) and language comprehension and expression disorder (e.g., receptive and expressive language), direct (one-on-one) patient contact; each additional 15 minutes (list separately in addition to code for primary service)*), 92662 (*Treatment of voice, upper airway dysfunction, and/or resonance disorders, direct (one-on-one) patient contact; initial 30 minutes*), 92663 (*Treatment of voice, upper airway dysfunction, and/or resonance disorders, direct (one-on-one) patient contact; each additional 15 minutes (list separately in addition to code for primary service)*), and 92508 (*Treatment of speech, language, voice, communication, and/or auditory processing disorder, group, 2 or more individuals*) are new and/or revised codes for CY 2027. Additionally, the introductory guidelines were revised to clarify reporting of the services. The code family was surveyed for the January 2026 RUC Health Care Professionals Advisory Committee (HCPAC) Review Board meeting.

For CY 2027, we proposed the HCPAC-recommended work RVU for all 11 codes in the family. We proposed the HCPAC-recommended work RVUs of 0.92 for CPT code 92654, 0.44 for CPT code 92655, 0.90 for CPT code 92656, 0.44 for CPT code 92657, 1.00 for CPT code 92658, 0.48 for CPT code 92659, 1.00 for CPT code 92660, 0.50 for CPT code 92661, 0.98 for CPT code 92662, 0.48 for CPT code 92663, and 0.28 for CPT code 92508.

We proposed the HCPAC-recommended direct PE inputs for all the codes in the family without refinement.

We received public comments on these proposals. The following is a summary of the comments we received and our responses.

Comment: Commenters supported replacing CPT code 92507 with 10 time-based, intervention-specific speech-language pathology codes and were generally in support of the proposed HCPAC-recommended work RVUs and direct PE inputs. Commenters supported the new codes as they recognize both the type of treatment being provided, the amount of clinician time required, and allow better transparency. Some commenters suggested that there be a delay in implementation of the 10 new CPT codes, stating that systems need to be updated. They requested implementation guidance, clinician education, audit flexibility, payment monitoring, telehealth inclusion, and protections against payment reductions, denials, and access disruptions. Several commenters requested a separate speech-language pathology impact analysis and some commenters asked for clarification of same-day billing with CPT codes 97129 (*Therapeutic interventions that focus on cognitive function (e.g., attention, memory, reasoning, executive function, problem solving, and/or pragmatic functioning) and compensatory strategies to manage the performance of an activity (e.g., managing time or schedules, initiating, organizing, and sequencing tasks), direct (one-on-one) patient contact; initial 15 minutes*) and 97130 (*Therapeutic interventions that focus on cognitive function (e.g., attention, memory, reasoning, executive function, problem solving, and/or pragmatic functioning) and compensatory strategies to manage the performance of an activity (e.g., managing time or schedules, initiating, organizing, and sequencing tasks), direct (one-on-one) patient contact; each additional 15 minutes (List separately in addition to code for primary procedure)*). Several commenters requested individualized National Correct Coding Initiative (NCCI) coding edits, and appropriate treatment of add-on codes under the multiple procedure payment reduction (MPPR).

Other commenters did not support the 10 new CPT codes as they believed the new codes would add administrative burden to updating the electronic health record with only weeks to update, build and test claims processing. Other commenters suggested that the codes mirror the other therapies such as physical therapy and occupational therapy in terms of having a base code and an add-on code for the services provided. Many commenters were against having separate valuation for the 10 new CPT codes as certain services that pay more may have unintended influence on clinical decision making and unintentionally influence which code is selected by practitioners. Some commenters noted that the transition to a 30-minute base code plus 15-minute add-on structure introduces rigid time constraints that could severely disrupt care. Several commenters noted the effects the Medicare rates have on other insurers, specifically Medicaid.

Response: We thank the commenters for their support of the 10 new CPT codes. We understand the feedback from commenters related to a request for a delay in implementation of the new code set. CMS has a statutory deadline in which to publish the final rule and other changes to the PFS that take effect on January 1, 2027. We typically publish codes and have them set to become active on January 1st of each

year and would not make an exception in this case. Therefore, the new coding will be effective starting January 1st. We thank commenters for the billing and implementation questions asked and we will take them into consideration for sub-regulatory guidance, MLNs, and other resources as needed. It is not typical for CMS to publish a separate impact analysis for an individual code family. CMS published the proposed RVUs and the proposed utilization crosswalk for all of the codes in this family which we believe was sufficient for interested parties to submit informed comments. We are aware of the effect Medicare rates have on other payers and we defer to state Medicaid programs to determine payment for the new G-code.

With regard to the NCCI edits, we defer to NCCI and the edits they put in place. This is outside of the scope of this proposal.

Comment: Some commenters disagreed with the reference codes selected by the HCPAC and specifically identified CPT code 97550 (*Caregiver training in strategies and techniques to facilitate the patient's functional performance in the home or community (e.g., activities of daily living [ADLs], instrumental ADLs [iADLs], transfers, mobility, communication, swallowing, feeding, problem solving, safety practices) (without the patient present), face to face; initial 30 minutes*) as a reference code. Commenters noted that CPT code 97550 describes 30 minutes of face-to-face caregiver training without the patient present whereas the proposed speech-language pathology codes describe direct treatment of the patient, requiring the speech-language pathologist to provide intervention. Commenters also noted that CPT codes 92584 (*Electrocochleography*) and 92651(*Auditory evoked potentials; for hearing status determination, broadband stimuli, with interpretation and report*) were used repeatedly as comparison services which both describe diagnostic testing rather than therapeutic treatment.

Response: We thank the commenters for their feedback. We believe there was a typo in the CPT code number as referenced by some commenters as the key reference service used by the HCPAC was CPT code 97530 (*Therapeutic activities, direct (one-on-one) patient contact (use of dynamic activities to improve functional performance), each 15 minutes*). We agreed with the HCPAC recommendations in the valuation of the 10 new codes for speech-language pathology. We understand the commenters inquiring why the services selected as reference codes were not identical to the new codes being created. We note that we looked at these compared to other similar XXX global day codes with similar intraservice times and the HCPAC recommendations matched other codes with similar time values. We want to reiterate that the PFS is a relative value-based system and not all reference codes are necessarily clinically related.

Comment: A few commenters gave suggestions of other comparator codes that can be used for the 10 new CPT codes. Commenters suggested that a more accurate work RVU comparison for 92658 and 92660 would be CPT codes 96158 (*Health behavior intervention, individual, face-to-face; initial 30 minutes*) with a work RVU of 1.66 and 90832 (*Psychotherapy, 30 minutes with patient*) with a work RVU of 1.94.

Response: We disagree with commenters regarding the suggested crosswalks for this code family. We continue to believe that the key reference services noted by the HCPAC accurately capture the time and intensity for these services.

Comment: Some commenters noted that the proposed valuation of the 10 new CPT codes poses a rank order issue.

Response: We disagree with the commenters that there is a rank order anomaly in the work valuation for the base codes in this family. We agree with the work RVUs recommended by the HCPAC and note that these codes are all valued similarly in terms of work RVUs and intensity. The codes with shorter surveyed work times, such as CPT codes 92654 and 92656, were proposed with lower work RVUs than the codes with longer surveyed work times, such as CPT codes 92658 and 92660, in recognition of the modest increases in duration for these services. We also note for commenters that the coding structure for these services has changed, consisting of 30 minute base codes and 15 minute add-on codes, which makes a direct comparison to the work RVUs of the predecessor codes infeasible.

Comment: Several commenters asked about specific CPT codes and whether they could be billed on the same date as the new speech-language pathology services. Other commenters noted other instances preventing speech-language pathologists from billing certain therapeutic interventions on the same date of service as any of the 10 new CPT codes. Other commenters asked about other audiology rehabilitation services.

Response: The 10 new CPT codes we proposed were merely replacing CPT code 92507. We believe that this would maintain the code and all associated billing rules which would apply to the 10 new codes. With regard to codes related to other therapeutic and auditory services, we thank the commenters for bringing them to our attention and note these comments were out of scope of this proposal. CMS may consider these comments for potential future rulemaking.

Comment: A commenter noted that the new CPT codes do not include a code for cognitive-communication and urged CMS to create a HCPCS G-code describing these services.

Response: We thank the commenter for their suggestion and may consider this for potential future rulemaking.

After consideration of public comments, we are finalizing the work RVUs and direct PE inputs for CPT codes 92654, 92655, 92656, 92657, 92658, 92659, 92660, 92661, 92662, 92663, and 92508 as proposed.

We proposed to designate these codes as always therapy services which means they must be furnished under a therapy plan of care regardless of who provides them and billed with a therapy modifier (this includes physicians and NPPs when they furnish the service or therapists furnish the services incident to the physician/NPP). We also proposed to designate the new CPT codes that each represent the initial 30 minutes—92654, 92656, 92658, 92660, and 92662—as subject to the MPPR for therapy services. The new CPT codes that represent each additional 15 minutes—92655, 92657, 92659, 92661 and 92663—are not subject to the MPPR as they are all add-on codes which we excluded from the MPPR in the CY 2011 PFS final rule along with contractor-priced and bundled codes (75 FR 73240) and noted in section 10.7 of chapter 5 of the Medicare Claims Processing Manual (MCPM).

We received public comments on these proposals. The following is a summary of the comments we received and our responses.

Comment: Commenters were generally in support of CMS' proposal to continue designating these services as always therapy services. Commenters were appreciative of CMS' proposal that the additional 15-minute add-on codes would not be subject to the therapy MPPR, although a few commenters asked CMS to exempt all speech-language pathology treatment codes including HCPCS code G0903 the from the MPPR. Many commenters requested that CMS clarify how the MPPR will apply to the new speech-language pathology codes, including HCPCS code G0903, and whether the MPPR is applied across therapy disciplines.

Response: Subsequent to the MPPR policy we established in the CY 2011

PFS final rule (75 FR 73232 through 73242), the therapy MPPR is applied to the PE component of the second and each subsequent code or unit of a service furnished to the same beneficiary, on the same date of service, by the same provider. If that provider furnishes physical and/or occupational therapy services in addition to speech-language pathology services, the MPPR will be applied across the therapy disciplines. The service with the highest PE relative value unit (RVU) is paid at 100% and, since April 1, 2013, the PE components of the remaining services are paid at 50%.

We appreciate the comments and after consideration of public comments, we are finalizing all 11 speech-language pathology treatment codes as always therapy (including the 10 new CPT codes and the revised CPT code 92508 that was previously designated as always therapy) and adding CPT codes 92654, 92656, 92658, 92660, and 92662 for the initial 30 minutes of the primary service to the list of codes that are subject to the therapy MPPR.

(a) Pediatric G–Code for Speech-Language Pathology Services

We have heard from interested parties of the need to preserve CPT code 92507 (*Treatment of speech, language, voice, communication, and/or auditory processing disorder; individual*) specifically related to the pediatric population. Interested parties stated that the 10 new CPT codes do not accurately capture the time and intensity of work as it relates to pediatric patients. To be responsive to interested parties, we proposed to create and pay separately for a new HCPCS code, HCPCS code G0903, to accurately reflect the time and resources spent in providing these services to pediatric patients.

We proposed the following code descriptor: HCPCS code G0903 (*Treatment of speech, language, voice, communication, and/or auditory processing disorder; individual; for the pediatric population up to age 21*). We proposed that HCPCS code G0903 would be reported by a speech-language pathologist performing these services specific to the pediatric population.

We proposed that this code could be billed only once per patient per day. We proposed to assign a XXX global period payment indicator for HCPCS code G0903. The XXX global period payment indicator would indicate that the global period does not apply to this service.

As previously discussed in this section, we proposed to designate HCPCS code G0903 as an always therapy service and add it to the list of codes that are subject to the MPPR for therapy services.

We received public comments on these proposals. The following is a summary of the comments we received and our responses.

Comment: A few commenters were in support of the pediatric G-code, while many commenters were mixed. Many commenters were not in support of the G-code for multiple reasons, citing duplication, inadequate clinical specificity, unclear pediatric age parameters, uncertain treatment time requirements, outdated valuation assumptions for CPT code 92507, and departure from the CPT process. Some commenters noted that replacing untimed CPT code 92507 with ten disorder-specific timed codes does not fit how pediatric therapy is delivered. Commenters questioned the time requirements and requested clarification regarding the proposed ''60-minute work time'' requiring 60 minutes of time for the service. Commenters specifically asked if the proposed 60-minute work time represented the valuation methodology only (similar to CPT code 92507), or if CMS is intending to require a minimum 60-minute treatment session in order to report the new G-code. Commenters noted concerns that the time requirement of 60 minutes is not clinically appropriate and may reduce the effectiveness of therapy due to fatigue, decreased attention, and diminished participation. A time of 60 minutes would also reduce the number of patients they could see and would as a result decrease access to care. Commenters also noted that face-to-face time alone cannot solely measure time for services.

Many commenters noted that if the new G-code was finalized, the code should be untimed as pediatric patients often cannot tolerate longer sessions. Commenters asked about the midpoint of time or if there was or was not a minimum of time required in order to bill the code. Other commenters asked if time referred to face-to-face time or total time of the encounter. Others asked if pre and post time were included. A few commenters requested the G-code to be timed. Other commenters shared concerns that inconsistent adoption of the new G-code across payors could create coding confusion, claim denials, and additional administrative burden.

Response: We note that the proposed new pediatric G-code was meant to maintain the current billing mechanism and valuation for CPT code 92507, which had a work RVU of 1.30. We believe that this value accurately captures the time and intensity of the work for providing these services. We understand from commenters the pre and post service work involved in furnishing these services and how the work for pediatric patients differs from that of an adult since there are many other components of care, caregivers who need training, follow ups, and school involvement. We did not propose for the G-code to be a timed code and did not include or propose a time in the code descriptor or a minimum session length. The midpoint of time would only apply to a code that is timed and as such, since we did not propose and are not finalizing the G-code to be a timed code, there would not be a minimum time required, of face-to-face time or total time, in order to bill for the service nor would there be a time threshold required for billing.

Comment: Many commenters asked for clarification and were unsure who in the pediatric population was eligible to bill the new G-code as the code descriptor was noted to be different and had separate references of ''up to 21'' and references of ''up to age 18 to 21'' in the telehealth section of the proposed rule. Commenters also asked CMS to obtain pediatric-specific data on time, intensity and cost before finalizing the valuation.

Response: We understand the confusion with regard to age that stemmed from different code descriptors in the proposed rule. We wish to clarify that the G-code may be billed for patients age 21 and under to be inclusive of as many pediatric patients as possible. In other words, the G-code may be billed for patients through age 21 years and 364 days, and after the patient's 22nd birthday, the 10 new CPT codes would be used.

Comment: Commenters requested clarification as to whether pediatric providers could bill using the 10 CPT codes or have to use HCPCS code G0903. Commenters asked CMS to allow clinicians to select HCPCS code G0903 or the timed treatment codes based on the service furnished, with the two pathways mutually exclusive on the same date of service. Commenters agreed that a mutually exclusive coding structure would prevent duplicate reporting while allowing for clinical need. Many commenters recommend using the differentiated CPT family for pediatric services while others suggested that CMS create HCPCS G-codes that mirrored all 10 new CPT codes but specific to the pediatric population. Commenters stated that the new proposed G-code does not distinguish between disorders.

Response: We thank commenters for their suggestion of creating 10 additional G-codes that would parallel

the 10 new CPT codes for speech-language services in the pediatric population. We wish to clarify that we did not preclude practitioners from utilizing the 10 new CPT codes for the pediatric population. We were persuaded by stakeholders that the new CPT codes may not work for all pediatric patients and that some practice workflows would work best with a specific G-code for billing pediatric patients. To provide the most flexibility to practitioners, we are allowing practitioners to select the codes, either the G-code or the 10 new CPT codes, that most appropriately encompass the services being provided. However, practitioners cannot use both codes (that is, the G-code and one of the 10 new CPT codes) concurrently as this would be double billing for services. We wish to clarify that CMS is permitting clinicians to report the new timed treatment codes for beneficiaries age 21 and under when those codes more accurately describe the clinical encounter. The G-code and the 10 new CPT codes would be mutually exclusive.

Comment: Many commenters asked CMS questions regarding the 10 new CPT codes and whether they can bill two of the CPT codes concurrently if two therapies were provided, for example if language and swallowing services are both provided concurrently. Many commenters submitted detailed lists of billing questions asking CMS to address in the final rule and prior to implementation for January 1st. Commenters asked CMS to provide clear guidance before implementation including reimbursement rates, authorization requirements, documentation standards, and billing rules.

Response: We thank the commenters for their comments. As stated previously, we will not preclude practitioners from using the 10 new CPT code for the pediatric population and we understand that there are different modalities in terms of treatment of speech-language disorders. We are providing flexibility to practitioners regarding the choice of coding they wish to use in their practice. We want to reiterate that billing the 10 new CPT code or the new G-code shall be mutually exclusive and practitioners cannot bill both at the same time. We are allowing clinicians to report the new timed treatment codes for beneficiaries age 21 and under when those codes more accurately describe the clinical services provided and it is possible for multiple CPT codes to be billed during a single encounter. We thank commenters for the billing and implementation questions asked and we will take into consideration for subregulatory guidance, MLNs, and other resources as needed. We wish to reiterate that we created the pediatric G-code, HCPCS G0903, in order to maintain the flexibility of the predecessor code, CPT code 92507. Therefore, all associated billing rules would apply to the new G-code.

We are finalizing the code descriptor for HCPCS code G0903 to read as follows: *Treatment of speech, language, voice, communication, and/or auditory processing disorder; individual; for the pediatric population age 21 and under.* We note that 'age 21 and under' would include patients up to 21 years and 364 days old.

Comment: Many commenters also requested that CMS specifically propose adding several new HCPCS G-codes to the telehealth list, including the new pediatric G-code HCPCS code G0903, to allow payment for the G-code when services are provided via telehealth and all necessary conditions are met. Commenters noted that the 10 new disorder-specific speech-language pathology treatment codes were not identified for addition to the telehealth list. Commenters noted that, given that CPT code 92507 has historically supported access to speech-language pathology services delivered through telehealth, CMS should ensure that replacing CPT code 92507 did not unintentionally disrupt beneficiary access to clinically appropriate telehealth services.

Response: We appreciate the comments related to telehealth and the Speech-Language Pathology Services and we refer to section II.D of this final rule for that discussion. The new G-code is being added to the telehealth list for CY 2027.

After a review of the comments, we are finalizing the designation of HCPCS code G0903 as an always therapy service and are adding it to the list of separately payable always therapy codes that are subject to the therapy MPPR.

(b) Valuation for HCPCS Code G0903

We note that the proposed valuation of HCPCS code G0903 is meant to reflect the time and resource costs, for speech-language pathology services inherent to the pediatric population. Therefore, we believe that CPT code 92507 serves as an appropriate reference for the purpose of valuing HCPCS code G0903. We believe there will be relatively the same work involved for HCPCS code G0903 when compared to the work of CPT code 92507 as it relates to pediatric patients, considering the amount of time needed to furnish the elements discussed earlier in this section. Therefore, we proposed a work RVU of 1.30, which represents the assigned work for 60 minutes of CPT code 92507. Additionally, we proposed a work time of 60 minutes established for CPT code 92507, personally performed by the billing practitioner.

We proposed the same direct PE inputs for HCPCS code G0903 as CPT code 92507, as we believe that the relative resource costs for this service will remain the same. To help inform whether our proposed valuation reflects the typical service for the pediatric population, we sought comment on the typical time and intensity practitioners spend furnishing these services.

We received public comments on these proposals. The following is a summary of the comments we received and our responses.

Comment: Many commenters stated that the proposed work RVU of 1.30 did not adequately value the time and intensity of the services and would cause a disparity between pediatric and adult services. Many commenters noted that therapists typically spend a lot of pre and post time related to the visit as well as follow up and caregiver training that is time not accounted for in the proposed valuation. Many other commenters maintained that the current valuation of CPT code 92507 would be best for the flow of their practices which serve primarily pediatric patients. Commenters asked for clarification on what the G0903 valuation assumption represents, including direct, pre-service, and post-service work. Commenters argued that pediatric services involve greater amounts of pre and post-service time and the proposed work RVU underestimates the time spent. Commenters questioned whether the proposed valuations adequately account for the clinician work and practice expenses involved in providing speech-language pathology services. Commenters also asked what pediatric data informed the valuation assumptions and said the survey used to establish the 10 new CPT codes was flawed.

Response: We mirrored the valuation of the new proposed G-code after the predecessor code CPT code 92507. It was our intention to maintain the existing billing mechanism for the pediatric population. We continue to believe that the same work is involved for HCPCS code G0903 when compared to the work of CPT code 92507 as it relates to pediatric patients, considering the amount of time needed to furnish the elements discussed earlier in this section.

Comment: Commenters suggested that a more accurate code comparator to the new proposed G-code, HCPCS code G0903, would be CPT code 90834 (*Psychotherapy, 45 minutes with patient*) as this captures the underlying definition behind CPT code 92507 and considers a similar underlying time of 38 to 52 minutes.

Most commenters strongly disagreed with the PE RVU assigned to the G-code as it was valued lower than the current PE RVU for CPT code 92507 and asked CMS to restore the CPT code 92507 PE value. Overall, many commenters were very concerned that the low valuation and reductions in speech therapy would directly impact their practices forcing them to close as a result of a significantly decreased reimbursement which will ultimately impact access to care and services that are most needed in the pediatric population. Commenters noted that this would impede practices from recruiting and retaining speech-language pathologists in their practices. Other commenters expressed that having the 10 different CPT codes for billing creates financial incentives to limit treatment of lower-reimbursed disorders.

Response: We thank commenters for their suggestions. We continue to believe our valuation is correct when compared to codes with similar time values. We continue to believe that the proposed work RVU of 1.30 for HCPCS code G0903 is the most accurate valuation for the new G-code. In our review of this code, we mirrored HCPCS code G0903 to the predecessor code, CPT code 92507 which is also a XXX global code with 60 minutes of intraservice time based on feedback we heard from interested parties. Maintaining the work RVU at 1.30 helps to maintain relativity among the therapy types.

Comment: We heard from many commenters regarding the significant cuts to practice expense and the financial impact to many pediatric practices and their ability to remain financially viable.

Response: We proposed to maintain the current PE RVU for CPT code 92507 (0.97) and continue to believe that maintaining the current PE RVU of CPT code 92507 for new code G0903 will help address the valuation and access concerns raised by commenters. Given our stated intention of keeping payment for HCPCS code G0903 consistent with the payment rate for CPT code 92507, we are finalizing maintaining the current PE RVU.

After consideration of public comments, we are finalizing the work RVUs and direct PE inputs for the new pediatric G-code as proposed with clarifications. We wish to clarify that the physician time of 60 minutes for the G-code is for the purpose of valuation and not a requirement for billing.

(41) Endoluminal Coronary Intravascular Ultrasound (IVUS) (CPT Codes 92978 and 92979)

In April 2025, the RAW identified CPT code 92978 (*Endoluminal imaging of coronary vessel or graft using intravascular ultrasound (IVUS) or optical coherence tomography (OCT) during diagnostic evaluation and/or therapeutic intervention including imaging supervision, interpretation and report; initial vessel (List separately in addition to code for primary procedure)*) as a code that has Medicare utilization of 10,000 or more that has increased by at least 100 percent from 2018 through 2023. CPT codes 92978 and 92979 (*Endoluminal imaging of coronary vessel or graft using intravascular ultrasound (IVUS) or optical coherence tomography (OCT) during diagnostic evaluation and/or therapeutic intervention including imaging supervision, interpretation and report; each additional vessel (List separately in addition to code for primary procedure)*) were surveyed for the January 2026 RUC meeting.

We disagree with the RUC-recommended work RVUs for these codes and instead we proposed work RVUs of 1.40 for CPT code 92978 and 1.04 for CPT code 92979 to account for the significant decreases in physician intraservice time for both codes. The RUC's recommendation to maintain current work RVUs for these codes does not appear to fully account for these intraservice time decreases. While we do not believe that the decrease in time as reflected in survey values should always equate to a one-to-one or linear decrease in newly valued work RVUs we do believe that, since the two components of work are time and intensity, absent an obvious or explicitly stated rationale for why the relative intensity of a given procedure has increased, significant decreases in time should be reflected in decreases to work RVUs although not necessarily in a linear manner, and we do not believe it is appropriate to decrease physician time while maintaining the current work RVUs.

We reviewed the RUC recommendations and found them to be high, relative to other codes with the same or similar work times. Based on a search of similarly timed codes in the RUC database, the RUC-recommended work RVU of 1.76 for CPT code 92978 is higher than 44 of 47 add-on codes with 15 minutes of physician intraservice time. Similarly, the RUC-recommended work RVU of 1.40 for CPT code 92979 would be the second highest work RVU for add-on codes with 12 to 14 minutes of physician intraservice time. Therefore, we disagree with the RUC recommended work RVU of 1.76 for CPT code 92978 and we are instead proposing a work RVU of 1.40 based on a crosswalk to CPT code 93572 (*Intravascular Doppler velocity and/or pressure derived coronary flow reserve measurement (coronary vessel or graft) during coronary angiography including pharmacologically induced stress, when performed; each additional vessel (List separately in addition to code for primary procedure)*). This proposed work RVU is higher than the reverse building block work RVU of 1.06 and results in a higher intensity for the code than its current work RVU and physician time. The resulting increase in intensity more accurately accounts for the RUC's assertion that the intensity and complexity has increased with the evolution of these services because a higher proportion of the skin-to-skin time is now dedicated to more intense activities and interventions.

We also disagree with the RUC recommendation to maintain the current work RVU of 1.40 for CPT code 92979 and proposed a work RVU of 1.04 based on the RUC-recommended increment of 0.36 work RVUs between CPT codes 92978 and 92979. Similarly, this represents an increase in intensity compared to the code's current work RVU and work time to account for the increased intensity that has occurred with the evolution of these services. The RUC did not recommend and we did not propose any direct PE inputs for CPT codes 92978 and 92979.

We received public comments on these proposals. The following is a summary of the comments we received and our responses.

Comment: Commenters disagreed with the proposed work RVUs for CPT codes 92978 and 92979 and stated that CMS should finalize the RUC-recommended work RVUs instead. Commenters stated that CMS had not adequately accounted for the intensity of physician work for these services and that the RUC recommendations preserved relativity within the code family and recognized their greater intensity. Commenters stated that a service should not lose a fifth of its value based on a survey time decrease.

Response: We continue to believe that changes in work time should be reflected in changes to the work RVU. We note that using the intraservice time ratio, the total time ratio, and the

reverse building block method for CPT codes 92978 and 92979 all would have resulted in even lower work RVUs of 1.06 and 0.73 respectively. The RVUs that we proposed resulted in a higher intensity for these codes than the current work RVUs and physician time.

Comment: A couple of commenters disagree with CMS making any valuation for CPT code 92979 based on an incremental difference.

Response: We continue to believe the use of an incremental work RVU difference of 0.36 between CPT codes 92978 and 92979 is a valid methodology for setting values, especially in valuing services within a family of revised codes where it is important to maintain appropriate intra-family relativity. Historically, we have frequently utilized an incremental methodology in which we value a code based upon its incremental difference between another code or another family of codes. We note that the RUC has also used the same incremental methodology on occasion when it was unable to produce valid survey data for a service.

After consideration of the public comments, we are finalizing the work RVUs for CPT codes 92978 and 92979 for the Endoluminal Coronary Intravascular Ultrasound (IVUS) code family as proposed. We did not propose and we are not finalizing any direct PE inputs for CPT codes 92978 and 92979.

(42) Autonomic Function Testing (CPT codes 95921, 95944, 95922, 95923, 95945, 95946, 95924, 95947, 95948, and 95949)

In February 2025, the CPT Editorial Panel created six new codes to report autonomic function testing with the use of a tilt table, sudomotor tests, and combined procedures to address an earlier RUC referral: CPT code 95944 (T*esting of autonomic nervous system function, with interpretation and report; use of tilt table*), CPT code 95945 (*Testing of autonomic nervous system function, with interpretation and report; sudomotor, thermoregulatory sweat test*), CPT code 95946 (*Testing of autonomic nervous system function, with interpretation and report; sudomotor, assessing the sympathetic skin response (SSR) potential*), CPT code 95947 (*Testing of autonomic nervous system function, with interpretation and report; combined parasympathetic and sudomotor testing, quantitative sudomotor axon reflex test (QSART) or silastic sweat imprint*), CPT code 95948 (*Testing of autonomic nervous system function, with interpretation and report; combined sympathetic adrenergic with at least 5 minutes of passive tilt (ie, tilt table) and sudomotor testing, quantitative sudomotor axon reflex test (QSART) or silastic sweat imprint*), and CPT code 95949 (*Testing of autonomic nervous system function, with interpretation and report; combined parasympathetic, sympathetic adrenergic function with at least 5 minutes of passive tilt (ie, tilt table), and sudomotor testing, quantitative sudomotor axon reflex test (QSART) or silastic sweat imprint*). The CPT Editorial Panel also revised four existing codes to include interpretation and report and clarification on tilt table use: CPT code 95921 (T*esting of autonomic nervous system function, with interpretation and report; cardiovagal innervation (parasympathetic function), including 2 or more of the following: heart rate response to deep breathing with recorded R–R interval, Valsalva ratio, and 30:15 ratio*), CPT code 95922 (*Testing of autonomic nervous system function, with interpretation and report; vasomotor adrenergic innervation (sympathetic adrenergic function), including beat-to-beat blood pressure and R–R interval changes during Valsalva maneuver and at least 5 minutes of passive tilt (i.e., tilt table)*), CPT code 95923 (*Testing of autonomic nervous system function, with interpretation and report; sudomotor, quantitative sudomotor axon reflex test (QSART) or silastic sweat imprint*), and CPT code 95924 (*Testing of autonomic nervous system function, with interpretation and report; combined parasympathetic and sympathetic adrenergic function testing with at least 5 minutes of passive tilt (i.e., tilt table)*). This code family was surveyed for the April 2025 RUC meeting. We proposed the RUC-recommended work RVU for seven of the ten codes in this family. We proposed a work RVU of 0.34 for CPT code 95944, a work RVU of 0.96 for CPT code 95922, a work RVU of 0.88 for CPT code 95923, a work RVU of 1.00 for CPT code 95945, a work RVU of 0.50 for CPT code 95946, a work RVU of 1.50 for CPT code 95924, and a work RVU of 1.17 for CPT code 95947. We note that several of these work RVUs were affected by the efficiency adjustment which was applied at the start of CY 2026, as the RUC recommendations were based on pre-adjustment work valuations.

We disagree with the RUC-recommended work RVU of 0.88 for CPT code 95921 and we are instead proposing a work RVU of 0.74 based on a crosswalk to CPT code 97813 (*Acupuncture, 1 or more needles; with electrical stimulation, initial 15 minutes of personal one-on-one contact with the patient*). When reviewing this code family, we noticed that CPT code 95921 had one of the highest intensities in the family at the RUC-recommended work RVU of 0.88 despite having some of the shortest surveyed work times and describing one of the seemingly least intensive procedures. The revised code descriptor for CPT code 95921 describes a single test for cardiovagal innervation, and we do not agree that this service should be valued with a higher intensity than some of the other codes in this family that contain multiple kinds of autonomic function testing. The RUC's recommended work RVU would also value CPT code 95921 at the same 0.88 as CPT code 95923 despite the latter code having significantly more total work time (32 minutes as compared to 25 minutes). We are aware that these codes share the same current work RVU, however the new surveyed work times indicate that CPT code 95921 typically takes less time to perform than CPT code 95923, and, since the two components of work are time and intensity, we believe that CPT code 95921 should be valued at a lower rate. Therefore we proposed a work RVU of 0.74 based on a crosswalk to CPT code 97813, an acupuncture procedure with the identical intraservice and total work time as CPT code 95921. We also note that this valuation of CPT code 95921 maintains the current intensity of the procedure, as well as better maintaining relativity with the other codes in the family.

We disagree with the RUC-recommended work RVU of 1.75 for CPT code 95948 and we are instead proposing a work RVU of 1.56 based on a crosswalk to CPT code 77047 (*Magnetic resonance imaging, breast, without contrast material; bilateral*). We disagree with the RUC's recommended work RVU of 1.75, based on the survey median result, as it represents a significant increase in work valuation and intensity over the other codes in this family. For example, the RUC recommended a work RVU of 1.50 for CPT code 95924 in comparison to 1.75 for this code, despite CPT code 95948 having only 5 minutes of additional intraservice time and 3 minutes of additional total time (50 minutes as compared with 47 minutes). CPT code 95948 would require an anomalously high intensity relative to the rest of the family to justify the recommended work valuation of 1.75, which we do not agree would be warranted here given that this code is performing the same autonomic function tests that take place in CPT code 95922 and 95923. Therefore we proposed a work RVU of 1.56 based on a crosswalk to CPT code 77047, a breast

MRI procedure with the identical intraservice time and similar total work time as CPT code 95948. We believe that this valuation of CPT code 95948 better maintains relativity with the other codes in the family instead of requiring an anomalously high intensity as was the case at the RUC's recommended work RVU.

We disagree with the RUC-recommended work RVU of 1.91 for CPT code 95949 and we are instead proposing a work RVU of 1.77 based on a crosswalk to CPT code 78831 (*Radiopharmaceutical localization of tumor, inflammatory process or distribution of radiopharmaceutical agent(s) (includes vascular flow and blood pool imaging, when performed); tomographic (SPECT), minimum 2 areas (eg, pelvis and knees, chest and abdomen) or separate acquisitions (eg, lung ventilation and perfusion), single day imaging, or single area or acquisition over 2 or more days*). As was the case with CPT code 95948, we believe that the RUC's recommended work RVU of 1.91 for CPT code 95949, based on the survey 25th percentile result, represents a significant increase in work valuation and intensity over the other codes in this family. While we do agree with the RUC that CPT code 95949 includes the most autonomic function tests and should have the highest intensity within the code family, we disagree that CPT code 95949 should be valued at a work RVU that results in an intensity approximately 50 percent higher than the rest of this family. To use the same example again, the RUC recommended a work RVU of 1.50 for CPT code 95924 in comparison to 1.91 for this code, despite CPT code 95949 having only 5 minutes of additional intraservice time and 7 minutes of additional total time (52 minutes as compared with 47 minutes). We believe that the work valuation and intensity are simply too high at the RUC's recommended work RVU of 1.91 as this does not maintain relativity with the other codes in this family, given that the same tests are being performed. Therefore, we proposed a work RVU of 1.77 based on a crosswalk to CPT code 78831, a radiopharmaceutical procedure with the identical intraservice time and similar total work time as CPT code 95949. We note that this work valuation still assigns the highest intensity in the family to CPT code 95949, while bringing it more in accordance with its peer codes. We believe that this valuation of CPT code 95949 better maintains relativity with the other codes in the family instead of requiring an anomalously high intensity as was the case at the RUC's recommended work RVU.

We proposed the RUC-recommended direct PE inputs for CPT codes 95921, 95944, 95922, 95923, 95945, 95946, 95924, 95947, 95948, and 95949 without refinement.

Comment: Several commenters stated that they supported CMS' proposal the RUC recommended work RVU for seven of the ten codes in this family.

Response: We appreciate the support for our proposed values from the commenters.

Comment: Several commenters disagreed with the proposed work RVU of 0.74 for CPT code 95921. Commenters stated that CPT code 95921 is ''slightly more intense'' than the rest of the codes in this family due to the short duration of the procedure and the number of tests performed, including heart rate response to deep breathing with recorded R–R interval, Valsalva ratio, and 30:15 ratio tests. Commenters stated that CPT code 95921 required the same practitioner work as CPT code 95923 and the same intraservice time of 15 minutes. Commenters stated that the only variation was the difference in preservice and postservice time of seven minutes; commenters stated that this difference in time was minimal and it was appropriate that these services be valued at the same work RVU of 0.88.

Response: We disagree with the commenters and continue to believe that CPT code 95921 is more accurately valued at the proposed work RVU of 0.74. The RUC's recommended work RVU of 0.88 would have assigned an intensity to CPT code 95921 roughly 50–70% higher than the other single test procedures in this family, such as CPT codes 95922, 95923, and 95945, as well as increasing its intensity by roughly 35 percent above the current intensity of the code. This valuation would not be ''slightly more intense'' in comparison to the rest of the family. Our proposed work RVU of 0.74 maintains the current intensity of CPT code 95921, which is modestly higher than the other single test procedures and matches the request of the commenters for a slight increase in intensity relative to the other single test procedures.

We also disagree with the commenters that CPT codes 95921 and 95923 should have the same work RVU. As we stated in the CY 2027 PFS proposed rule (91 FR 43887), we are aware that these codes share the same current work RVU, however the new surveyed work times indicate that CPT code 95921 typically takes less time to perform than CPT code 95923, and, since the two components of work are time and intensity, we believe that CPT code 95921 should be valued at a lower rate. While it is true that the difference in work time between these codes occurs in the preservice and postservice periods, we disagree with the commenters that this difference is minimal: CPT code 95921 has 25 minutes of total work time as compared against 32 minutes for CPT code 92923. This is a difference of roughly 25% in total procedure time which we continue to believe should be reflected in a lower work RVU for CPT code 95921.

Comment: Several commenters stated that the crosswalk code CMS used for valuation (CPT code 97813) was marked by the RUC with ''Do Not Use to Validate Physician Work.'' Commenters stated that CPT code 97813 met the RUC's survey response threshold, over 30, however, it will be reviewed in April 2029 since related CPT code 97814 did not meet the survey response threshold with 29 responses. Commenters stated that therefore CMS should not use CPT code 97813 as a crosswalk for valuing CPT code 95921. A separate commenter stated that the structure and valuation of CPT code 97813 did not adequately represent the full work, malpractice, and practice expense associated with the patient's entire treatment period, including time during which the patient remains under the practitioner's responsibility but is not receiving continuous one-on-one contact.

Response: We remind the commenters that the RUC's ''Do Not Use to Validate Physician Work'' indicator is an internal RUC identification that has not been proposed or finalized by CMS. We continue to believe that the nature of the PFS relative value system is such that all services are appropriately subject to comparisons to one another. Although codes that describe clinically similar services are sometimes stronger comparator codes, we do not agree that codes must share the same site of service, patient population, or utilization level to serve as an appropriate crosswalk. In the case of CPT code 97813, we believe that it is a strong crosswalk choice for valuation since it is a recently reviewed service with exactly the same surveyed work time values as CPT code 95921.

Comment: Several commenters disagreed with the proposed work RVU of 1.56 for CPT code 95948. Commenters stated that the intensity in the RUC recommended work RVU of 1.75 and work time of 30 minutes for CPT code 95948 falls in line with the other services in this family, and that the intraservice work per unit of time calculation was not useful when comparing XXX global period services

with relatively short intraservice times. Commenters stated that CPT code 95948 would not be anomalous with the other services in this family if valued at the RUC recommended work RVU 1.75; since CPT code 95948 is reported when both sympathetic and sudomotor function are tested (and requires the use of a tilt table), commenters stated that the combined tests are more complex due to the necessity of integrating more data points into a cohesive interpretation. Commenters stated that CPT code 95948 requires more total work time and should be valued higher than CMS crosswalk code 77047, and urged CMS to finalize the RUC's recommended work RVU of 1.75.

Response: We disagree with the commenters and continue to believe that CPT code 95948 is more accurately valued at the proposed work RVU of 1.56. We do not agree that the intensity for CPT code 95948 falls in line with other services in the family at the RUC's recommended work RVU; as we stated in the proposed rule, CPT code 95948 would require an anomalously high intensity relative to the rest of the family (roughly 20–50% higher depending on the code) to justify the recommended work valuation of 1.75. We do not agree that this valuation would be warranted given that this code is performing the same autonomic function tests that take place in CPT code 95922 and 95923. We do concur with the commenters that performing the two autonomic tests taking place in CPT code 95948 is more complex than performing them separately, which is why our proposed work RVU still assigns a higher intensity to this procedure than the intensities of CPT codes 95922 and 95923. We also note that our proposed work RVU of 1.56 assigns a higher intensity to CPT code 95948 than the historic codes that previously described autonomic function testing in recognition of this complexity. However, we continue to believe that the RUC's recommended work RVU of 1.75 is excessive since it accounts for almost no overlap at all in performing the two tests. CPT codes 95922 and 95923 would have a work RVU of 1.84 if simply added together and the RUC's recommended work RVU of 1.75 represents a decrease of only 5 percent. Since the sum of the work times of CPT codes 95922 and 95923 is 68 minutes while CPT code 95948 by itself was surveyed at 50 minutes, a decrease of more than 30 percent, there are clearly significant time savings taking place from combining the two tests which we believe supports the proposed work RVU of 1.56.

We also disagree with the commenters that intensity is not useful for comparing XXX global services given that the statute specifically tasks CMS with valuing services based on time and intensity. Although intensity is not a ''one size fits all'' tool and needs to be employed with care, the codes in this family cannot be valued properly without incorporating both time and intensity into the analysis.

Comment: Several commenters disagreed with the proposed work RVU of 1.77 for CPT code 95949. Commenters stated that because the survey 25th percentile is already a conservative measure of work, CMS' proposal to assign a work RVU below that level would result in an excessive and inappropriate reduction. Commenters stated that this approach failed to recognize that CPT code 95949 includes parasympathetic, sympathetic adrenergic, and sudomotor testing, making it the most comprehensive and complex service in the family. Commenters stated that valuing the service below the 25th percentile would not accurately reflect the intensity, clinical judgment, and total physician work involved and urged CMS to finalize the RUC's recommended work RVU of 1.91.

Response: We disagree with the commenters and continue to believe that CMS code 95949 is more accurately valued at the proposed work RVU of 1.77. As we stated in the proposed rule, we agreed that CPT code 95949 includes the most autonomic function tests and therefore our proposed work valuation still assigned it the highest work RVU and highest intensity in the family. However, we disagreed that CPT code 95949 should be valued at a work RVU that resulted in an intensity approximately 50 percent higher than the rest of this family; commenters did not provide an adequate rationale which would support a valuation that high. We continue to believe that this valuation of CPT code 95949 better maintains relativity with the other codes in the family instead of requiring an anomalously high intensity as was the case at the RUC's recommended work RVU. We also note that the RUC itself recommended the work RVU for multiple codes within this same code family below the survey 25th percentile, including CPT codes 95944 and 95923.

After consideration of the comments, we are finalizing the work RVUs and direct PE inputs for the codes in the Autonomic Function Testing family as proposed.

(43) Unattended Sleep Testing (CPT codes 95843, 95844, 95846, 95847, 95848, and 95849)

At the February 2025 CPT Editorial Panel meeting, CPT codes 95800 (*Sleep study, unattended, simultaneous recording; heart rate, oxygen saturation, respiratory analysis (e.g., by airflow or peripheral arterial tone), and sleep time*), 95801 (*Sleep study, unattended, simultaneous recording; minimum of heart rate, oxygen saturation, and respiratory analysis (e.g., by airflow or peripheral arterial tone)*) and 95806 (*Sleep study, unattended, simultaneous recording of, heart rate, oxygen saturation, respiratory airflow, and respiratory effort (e.g., thoracoab dominal movement)*) were deleted. They were replaced with six new CPT codes: 95843 (*Unattended sleep study, set-up, data acquisition and technical analysis; low complexity of 3–4 channels that generate at least 3–5 parameter categories*), 95844 (*Unattended sleep study, set-up, data acquisition and technical analysis; moderate complexity of 5–10 channels that generate at least 6–8 parameter categories*), 95846 (*Unattended sleep study, set-up, data acquisition and technical analysis; high complexity of 11 or more channels that generate at least 9 parameter categories*), 95847 (*Unattended sleep study, interpretation and report by a physician or other qualified health care professional; low complexity of 3–4 channels that generate at least 3–5 parameter categories*), 95848 (*Unattended sleep study, interpretation and report by a physician or other qualified health care professional; moderate complexity of 5–10 channels that generate at least 6–8 parameter categories*), and 95849 (*Unattended sleep study, interpretation and report by a physician or other qualified health care professional; high complexity of 11 or more channels that generate at least 9 parameter categories*).

This code family describes the reporting of unattended sleep studies with set-up, data acquisition, and technical analysis, and with interpretation and report by a physician or other qualified health care professional. These new codes were surveyed for the April 2025 RUC meeting.

For CY 2027, the RUC recommended a work RVU of 0.81 for CPT code 95847, a work RVU of 1.05 for CPT code 95848, and a work RVU of 1.60 for CPT code 95849. These codes are professional component only services and have no direct PE inputs; we also note that the RUC recommendations for CPT codes 95847 and 95848 were affected by the efficiency adjustment which was applied at the start of CY 2026, as the RUC recommendations were based on pre-adjustment work valuations. For CPT code 95847, we proposed the RUC's recommended work RVU of 0.81 and for CPT code 95848, we proposed the RUC's recommended work RVU of 1.05.

However, we disagree with the RUC's recommended work RVU of 1.60 for CPT code 95849 and we instead proposed a work RVU of 1.42 based on a crosswalk to CPT code 92014 (*Ophthalmological services: medical examination and evaluation, with initiation or continuation of diagnostic and treatment program; comprehensive, established patient, 1 or more visits*), which has 24 minutes of intraservice time and 37 minutes of total time. CPT code 95849 is a similarly timed code with 20 minutes of intraservice time and 39 minutes of total time. We are aware that the RUC's recommended work RVU is lower than the survey 25th percentile work RVU and further understand that the increase in intensity from moderate complexity of 5 to 10 channels that generate at least 6 to 8 parameter categories to complexity of 11 or more channels that generate at least 9 parameter categories may not be linear. The additional parameters could be more complex, which could result in higher intensity and may not be fully captured in the previous two codes. We agree that the intensity for CPT code 95849 should be higher; however, we do not believe that the intensity associated with the RUC recommended RVU of 1.60 is typical for this service since it would be nearly double the intensity of CPT codes 95847 and 95848. Therefore, we believe that CPT code 92014 is an appropriate crosswalk compared to the RUC's recommended crosswalk to CPT code 99203 (*Office or other outpatient visit for the evaluation and management of a new patient, which requires a medically appropriate history and/or examination and low level of medical decision making. When using total time on the date of the encounter for code selection, 30 minutes must be met or exceeded.*). We believe that our proposed valuation of 1.42, based on the crosswalk from 92014, more accurately values CPT code 95849 since it does not result in the sizable increase in intensity as recommended by the RUC. In addition, we have maintained relativity between the codes in this family with similarly timed codes.

For CPT codes 95843, 95844, and 95846, which are Practice Expense (PE) only codes, we proposed the RUC-recommended direct PE inputs. However, we noted concerns regarding two direct PE inputs: CA021 (Perform procedure/service—NOT directly related to physician work time) and CA042 (Perform procedure/service in post-service period—NOT directly related to physician work time). For CPT codes 95843 and 95844, the RUC recommended 15 minutes for the CA021 activity, and 25 minutes for CPT code 95846. The rationale for this increase from 15 minutes for CPT codes 95843 and 95844 to 25 minutes for CPT code 95846 was not clearly stated in the PE Summary of Recommendations although this is an increase of 66.7 percent. Similarly, for the CA042 activity, the RUC recommended 40 minutes for CPT code 95843, 50 minutes for CPT code 95844, and 70 minutes for CPT code 95846. We noted that there is a 10-minute increase from CPT code 95843 to CPT code 95844, and a 20-minute increase from CPT code 95844 to CPT code 95846. The rationale for these 10-minute and 20-minute increases was also not clearly stated. We appreciate that explanations for the direct PE inputs were provided in the PE Summary of Recommendations, given that this is a non-standard clinical labor activity. However, as CPT code 95843 describes a low-complexity study, CPT code 95844 describes a moderate-complexity study, and CPT code 95846 describes a high-complexity study, we welcomed public comments providing additional information, particularly regarding the increases in time for these direct PE inputs across these three CPT codes.

Also, for CPT codes 95843, 95844, and 95846, the RUC recommended use of the ''other'' formula for three new equipment items and based the time assumption of 960 minutes (that is, 16 hours). We are soliciting comments on whether it would be typical for the equipment in question to be worn for the full 16 hours. According to the PE Summary of Recommendations, patients typically arrive later in the day (for example, around 4 p.m.) for an appointment to perform a test run with the equipment, then take the equipment home and return it the following morning (typically around 9 a.m.). Therefore, the RUC recommended a 16-hour period, representing two nights, as this duration currently exists in the RUC database and is generally consistent with clinical practice. However, we sought public comments on whether two nights of use are required and typical for home sleep testing, as the reported equipment time may represent the total period the patient has the device outside the office rather than the time it is actually in use.

Lastly, we received invoices for a new supply item and three new equipment items for CPT codes 95843, 95844, and 95846. The new supply item is SA143 (Nox A1 Sensor Kit adult), and the new equipment items are EQ417 (Nox A1s System with SpO2, US), EQ418 (Apnea Link Air), and EQ419 (Apnea Trak Legacy). However, a single invoice for each supply or piece of equipment may not be reflective of typical costs, we encouraged interested parties to submit invoices to improve the accuracy of pricing for these items in the direct PE database.

We proposed the RUC-recommended direct PE inputs for CPT codes 95843, 95844, and 95846 without refinement.

Comment: Commenters overwhelmingly opposed our proposed work RVU of 1.42 for CPT code 95849, which we crosswalked to CPT code 92014 (*Ophthalmological services: medical examination and evaluation, with initiation or continuation of diagnostic and treatment program; comprehensive, established patient, 1 or more visits*).

The RUC disagreed with CMS's proposed work RVU of 1.42 for CPT code 95849 and urged CMS to finalize its original recommendation of 1.60 instead. The RUC stated that CPT code 95849 involves interpreting at least 11 channels and 9 or more parameter categories, representing roughly twice the complexity of the lowest-tier code in this family. The RUC identified the following reference comparator codes, which it noted have similar time values but higher work RVUs than CMS's proposed value: CPT code 74176 (*Computed tomography, abdomen and pelvis; without contrast material*); CPT code 78452 (*Myocardial perfusion imaging, tomographic (SPECT) (including attenuation correction, qualitative or quantitative wall motion, ejection fraction by first pass or gated technique, additional quantification, when performed); multiple studies, at rest and/or stress (exercise or pharmacologic) and/or redistribution*

and/or rest reinjection); and CPT code 93351 (*Echocardiography, transthoracic, real-time with image documentation (2D), includes M-mode recording, when performed, during rest and cardiovascular stress test using treadmill, bicycle exercise and/or pharmacologically induced stress, with interpretation and report; including performance of continuous electrocardiographic monitoring, with supervision by a physician or other qualified health care professional*). Based on this comparison, the RUC urged CMS to finalize a work RVU of 1.60 for CPT code 95849.

Many commenters urged CMS to finalize the RUC-recommended work RVU of 1.60 for CPT code 95849, noting that the RUC's recommended value of 1.60 falls below the survey's 25th percentile value of 1.75. According to the commenters, CPT code 95849 requires interpreting 11+ channels and 9+ parameter categories (roughly double the complexity of CPT codes 95847/95848), and the proposed crosswalk to CPT code 92014 did not reflect that intensity. Commenters stated that the RUC's recommended work RVU of 1.60 was already a conservative valuation relative to survey data. A commenter suggested a work RVU of 2.44, the value assigned to CPT code 95810 (*Polysomnography; age 6 years or older, sleep staging with 4 or more additional parameters of sleep, attended by a technologist*), arguing that interpretation of unattended studies can require greater physician effort. Another commenter proposed a compromise work RVU of 1.52.

Response: We appreciate the commenters for their feedback. We disagree that CPT code 99203 is an appropriate crosswalk, as its intraservice time exceeds that of CPT code 95849 by approximately 20 percent. We also do not find sufficient support for the claim that CPT code 95849 is twice as complex as CPT code 95848, given that unattended sleep studies of the highest complexity typically record no more than 10 to 12 parameters.

However, we were persuaded by the commenters that the proposed work RVU of 1.42 did not fully capture the clinical work and intensity described by CPT code 95849. We believe that CPT code 64567 (*Percutaneous electrical nerve field stimulation, cranial nerves, without implantation*) serves as a better crosswalk in light of the additional information provided by commenters, sharing identical intraservice and total time with CPT code 95849 at a work RVU of 1.50. We further find that a work RVU of 1.50 preserves more consistent intervals across the CPT code 95847, 95848, and 95849 family than the RUC-recommended 1.60, which would create a disproportionately large gap relative to CPT code 95848. Thus, we are finalizing a work RVU of 1.50 for CPT code 95849, based on a crosswalk to CPT code 64567. We believe this valuation reflects the identical time components shared between CPT codes 95849 and 64567, addresses commenters' concerns regarding the proposed rule's valuation, and results in a more appropriate distribution of relative values across the CPT code 95847, 95848, and 95849 family than either the proposed work RVU of 1.42 or the RUC-recommended work RVU of 1.60.

Comments: A commenter submitted results from an independent survey of sleep testing providers who subscribe to Sleep Review Magazine; this study shows that WatchPAT devices, not ApneaTrak Legacy, are the typical device for moderate-complexity sleep testing. Based on this data, the commenter asked CMS to replace equipment code EQ419 with supply code SD362 for CPT code 95844.

Response: We thank the commenter for the survey results. We note that the survey population consists of 60 subscribers to Sleep Review Magazine—a convenience sample of magazine subscribers, not a random or claims-based sample of Medicare-billing providers. Thus, these study results may not be representative of sleep medicine practitioners, patients, or providers broadly, and we believe that the study findings cannot be generalized beyond that limited group. We seek more generalizable study results.

Comments: Commenters raised concerns about the practice expense supply and equipment inputs for the new technical-component codes, with the greatest volume of comments addressing CPT code 95844. Commenters raised significant concerns about the direct practice expense inputs that CMS proposed for CPT code 95844 and suggested to weigh all supplemental invoices submitted.

Commenters stated that our proposed equipment input, based on equipment code EQ419 (ApneaTrak Legacy), does not reflect current clinical practice. Some commenters recommended to delete equipment code EQ419 from the direct PE inputs for 95844, and add supply code SD362 (WatchPAT ONE) as the replacement direct PE input by stating that one invoice for the new supply/equipment items may not reflect typical costs. Commenters further stated that EQ419 reflects approximately $20 in direct costs, compared with approximately $100 for SD362. Commenters recommended that CMS substitute SD362 for EQ419 in the direct PE inputs for this code.

Commenters submitted approximately 800 invoices to support an update in the pricing of the SD362 supply. Another commenter recommended adding a supply item for code CPT code 95844 priced between $73.32 and $105.97 per test and submitted 49 invoices for their own SANSA sensor kit.

Response: We thank the commenters for submitting invoices. We will update the price of supply code SD362 accordingly; based on the very large quantity of submitted invoices associated with this item and the wide range of prices varying from $45 to $243, we are finalizing the median price of $100.35 rather than attempting to calculate an average to avoid the effects of outliers. However, we were not persuaded by the commenters that the use of a disposable device would be more typical than the reusable equipment recommended by the RUC for CPT code 95844. Commenters described a wide variety of different devices that used different pricing structures, making it difficult to determine if any one of these would represent the typical case. Given this conflicting information, we are finalizing the direct PE inputs as proposed and not adding this new supply item to CPT code 95844, as it may not reflect typical cost.

Comments: Commenters were divided on the proposed equipment time of 960 minutes (16 hours) for the unattended sleep testing device used across this code family. Some commenters supported the proposed 960-minute input. These commenters, including the RUC, supported the proposed value, stating that it appropriately reflects the period the device is dedicated to one patient and unavailable for reuse, consistent with our existing PE methodology. Other commenters stated that 960 minutes understates real-world equipment time, particularly for mail-based distribution and repeat-night testing, both of which extend the period a unit is unavailable for reuse well beyond a single overnight cycle. These commenters recommended higher equipment time values, with several converging on approximately 64 hours as a conservative minimum.

Response: After consideration of the public comments, we believe that the time assumption of 960 minutes accurately reflects the typical equipment time. Although commenters provided examples of cases where patients could require more than two nights of use for the equipment, we remind interested parties that direct PE

inputs for the PFS are valued based on typical usage, not unusual or outlier cases.

Comments: Commenters including the RUC supported the RUC-recommended clinical labor time inputs CA021 and CA042 for CPT codes 95843 through 95846, stating that the incremental increases in staff setup, demonstration, and post-service data processing time appropriately reflect the added complexity of each code in the family. A commenter stated that if CMS revised the equipment input for these codes to reflect disposable rather than reusable devices, the post-service time in CA042 should be reduced accordingly, since disposable devices would eliminate the retrieval, cleaning, and refurbishment work currently reflected in that time.

Response: We thank the RUC and commenters for providing additional explanation regarding practice expense inputs for 95843–95846. We are finalizing the RUC recommended CA021 and CA042 clinical labor time inputs for CPT codes 95843 through 95846 as proposed.

Comments: Commenters also suggested that CMS define these terms clearly, tie them to FDA clearance, and align CPT coding with coverage policy. They stated that without clear and shared definitions, providers, manufacturers, and Medicare Administrative Contractors (MACs) could classify functionally similar devices into different complexity tiers, or count channels differently (for example, counting derived measurements or multiple EEG derivations as separate channels).

Response: We thank the commenters for their feedback and for the additional information provided.

Comment: Several commenters, including the RUC, stated that they would like to offer a technical correction to the utilization crosswalk from several 2026 deleted codes to new 2027 codes. The commenters stated that CPT codes 95843 and 95847 should crosswalk from CPT code 95800, while CPT codes 95844 and 95848 should crosswalk from CPT code 95806; the prior crosswalk used in the proposed rule was an unintended technical error submitted to CMS.

Response: After reviewing the information provided by the commenters, we agree with this technical correction. We are finalizing an update to the utilization crosswalk as described previously for CY 2027; the full utilization crosswalk table is available in the file titled ''CY 2027 PFS Final Rule 2025 Utilization Data Crosswalked to 2027'' on the CMS website under downloads for the CY 2027 PFS final rule at *https://www.cms.gov/medicare/payment/fee-schedules/physician/federal-regulation-notices.*

After consideration of the comments, we are finalizing the work RVUs and direct PE inputs for the codes in the Unattended Sleep Testing family as proposed, with the exception of finalizing a work RVU of 1.50 for CPT code 95849 as detailed previously.

(44) Laser Treatment for Inflammatory Skin Diseases (CPT Codes 96920, 96921, and 96922)

In May 2025, the CPT Editorial Panel revised three codes to reflect the intended use for inflammatory or auto-immune skin diseases (*e.g.,* psoriasis): CPT codes 96920 *(Laser treatment, 308–312 nanometer wavelengths, for inflammatory or auto-immune skin diseases (e.g., psoriasis); total area less than 250 sq cm),* 96921 *(Laser treatment, 308–312 nanometer wavelengths, for inflammatory or auto-immune skin diseases (e.g., psoriasis); 250 sq cm to 500 sq cm),* and 96922 *(Laser treatment, 308–312 nanometer wavelengths, for inflammatory or auto-immune skin diseases (e.g., psoriasis); over 500 sq cm).* These codes were last discussed in the CY 2025 PFS final rule (89 FR 97797 through 97801) and CY 2026 PFS final rule (90 FR 49303 through 49306). These revisions were based on flaws in the prior valuation process and a change in the patient population. The specialty society surveyed the code family for the September 2025 RUC meeting.

For CY 2027, we proposed the RUC-recommended work RVUs of 1.00 for CPT code 96920, 1.24 for CPT code 96921, and 1.50 for CPT code 96922. We proposed the RUC-recommended direct PE inputs for CPT codes 96920, 96921, and 96922 without refinement.

Comment: Commenters generally supported our proposal of the RUC recommended work RVUs and direct PE inputs for CPT code 96920, 96921, and 96922. A commenter requested refinements to various practice expense inputs, including the equipment utilization rate, maintenance costs, and recurring consumables that the commenter stated are required to operate the device for CPT codes 96920–96922. The commenter also requested that CMS treat excimer laser systems as a supply-based item.

Response: We thank commenters for their support of our proposals. For the practice expense refinements, we would like to acknowledge that the RUC's PE Subcommittee reconsidered direct PE inputs, which were developed based on typical clinical practice and current AMA RUC/PE guidelines, at the September 2025 RUC meeting, where no modifications were made. As stated in section II.B. of this final rule, we currently use an equipment utilization rate assumption of 50 percent for most equipment, with the exception of expensive diagnostic imaging equipment, for which we use a 90 percent assumption as required by section 1848(b)(4)(C) of the Act. We do not agree with the commenter that it would be appropriate to drastically reduce the utilization rate based on the limited data provided, as the utilization rate assumption of 50 percent is used for most equipment.

Additionally, as discussed in section II.B. of this final rule, we finalized a 5 percent factor for annual maintenance in the CY 1998 PFS final rule with comment period (62 FR 33164). As we previously stated in the CY 2016 PFS final rule with comment period (80 FR 70897), we do not believe the annual maintenance factor for all equipment is precisely 5 percent, and we stated that this estimate likely understates the true cost of maintaining some equipment. We also noted that we believe it likely overstates the maintenance costs for other equipment. When we solicited comments regarding data sources containing equipment maintenance rates, commenters could not identify an auditable, robust data source that CMS could use on a wide scale. As a result, in the absence of publicly available datasets regarding equipment maintenance costs or another systematic data collection methodology for determining a different maintenance factor, a variable maintenance factor for equipment cost per minute pricing was not proposed as we did not believe that we had sufficient information at that present time. Therefore, we reminded readers that we did not believe voluntary submissions regarding the maintenance costs of individual equipment items would be an appropriate methodology for determining costs.

As previously discussed in the CY 2025 PFS Final Rule (89 FR 97798), CMS currently does not include the costs of consumable gas (code EQ154) and the optical delivery system (code EQ155) in the direct practice expense cost for these services. The commenter requested the inclusion of EQ154 and EQ155 in our PE calculations for these services; however, the commenter's letter characterizes EQ154 and EQ155 as replacement/maintenance items, not equipment items that are used for each service. In response to the commenter's request that CMS treat excimer laser systems as a supply-based item, we

continue to believe, as was previously discussed in the CY 2025 PFS Final Rule (89 FR 97798), that the equipment item EQ161 (excimer laser), which the specialty society confirmed remains the typical equipment used for this code set, is available for purchase and is already accounted for under our equipment methodology. We previously did not propose the May 2023 RUC recommendation to change the business model for excimer lasers to a pay-per-use subscription-based model, as rental and licensing fees are typically considered forms of indirect PE under our methodology. We continue to believe that CPT codes 96920 through 96922 should not be valued based on a significantly more expensive pay-per-use rental version of the excimer laser when the same treatment is cheaper and available as a purchasable form of equipment.

After consideration of public comments, we are finalizing CPT codes 96920, 96921, and 96922 as proposed.

(45) Real-Time Fluorescence Wound Imaging (CPT Code 97611)

In September 2025, the CPT Editorial Panel created a new code to report real-time florescence wound imaging, CPT code 97611 (*Real-time fluorescence wound imaging with clinical darkness to identify presence, location, load of bacteria and measure wound size, per day*). The specialty society did not conduct a survey for CPT code 97611 because they determined it would be unable to conduct a successful survey that met the RUC's minimum survey threshold, and therefore, the RUC recommended contractor pricing for CY 2027.

Due to persistent payment variability for the predecessor CPT codes 0598T and 0599T, and limited geographical uptake of the technology, the device manufacturer requested that CMS actively price CPT code 97611 and provided work RVU and direct PE input recommendations. After consideration of the manufacturer's recommendations, we proposed a work RVU of 0.80 and physician pre-evaluation time of 6 minutes, intraservice time of 15 minutes, and immediate post service time of 5 minutes, totaling 26 minutes of physician time. For direct PE in the non-facility, we proposed a direct crosswalk of clinical labor activities and time from CPT code 97610 (*Low frequency, non-contact, non-thermal ultrasound, including topical application(s), when performed, wound assessment, and instruction(s) for ongoing care, per day*), with the addition of 10 minutes for CA026 Clean surgical instrument package for CPT code 97611, for a total of 42 minutes of clinical labor time. Additionally, we proposed the following supply items and quantities in the non-facility for CPT code 97611.

TABLE A-D4: SUPPLY ITEMS FOR CPT CODE 97611

Supply Code	Supply Description	Supply Quantity in the Nonfacility
SA043	pack, cleaning, surgical instruments	1
SB007	drape, sterile barrier 16in x 29in	1
SB019	drape-towel, sterile 18in x 26in	1
SB022	gloves, non-sterile	2
SB028	gown, surgical, sterile	1
SB044	underpad 2ft x 3ft (Chux)	1
SC056	syringe 50-60ml	1
SG018	bandage, Kling, non-sterile 3in	1
SG035	dressing, 3in x 4in (Telfa, Release)	2
SG051	gauze, non-sterile 4in x 4in	8
SG052	gauze, self-adherent roll 0.5in to 2in (Fabco, Gauztex)	72
SG079	tape, surgical paper 1in (Micropore)	12
SH069	sodium chloride 0.9% irrigation (500-1000ml uou)	1
SB061	MolecuLight DX Eco Dark Drapes	1

Additionally, we proposed the following equipment items and equipment minutes in the non-facility to correspond with the 30 and 36 minutes of clinical labor time included in the default and instrument pack equipment formulas, respectively, for CPT code 97611. The real-time fluorescence wound imaging system (ER131) was added to the direct PE database for inclusion in CPT code 97611 assuming a 5-year useful life and purchase price of $21,500 based on the provided invoices. We did not propose to include the carrying case for the real-time fluorescence wound imaging system in the equipment costs for CPT code 97611 as recommended by the device manufacturer. We have a longstanding policy that medical equipment must be at least $500 and all equipment inputs under $500 are considered indirect expense. We welcomed public comment on the appropriateness of our proposed work RVU and the typicality of our proposed physician work times and direct PE inputs.

TABLE A-D5: EQUIPMENT ITEMS FOR CPT CODE 97611

Equipment Code	Equipment Description	Equipment Minutes in the Nonfacility
EF015	mayo stand	30
EF031	table, power	30
EQ137	instrument pack, basic ($500-$1499)	36
EQ168	light, exam	30
ER131	real-time fluorescence wound imaging system	30

We sought comments on whether this service will typically be billed alongside wound debridement codes (that is, greater than 50 percent of the time), and if so, which of the proposed direct PE inputs may be duplicative of those already included in the wound debridement codes, such as CPT codes 11042 (*Debridement, subcutaneous tissue (includes epidermis and dermis, if performed); first 20 sq cm or less)* and 97597 (*Debridement (e.g., high pressure waterjet with/without suction, sharp selective debridement with scissors, scalpel and forceps), open wound, (e.g., fibrin, devitalized epidermis and/or dermis, exudate, debris, biofilm), including topical application(s), wound assessment, use of a whirlpool, when performed and instruction(s) for ongoing care, per session, total wound(s) surface area; first 20 sq cm or less)*). We noted in the proposed rule that CPT code 97611's predecessor codes, CPT codes 0598T and 0599T, were billed with wound debridement codes 35.1 percent and 46.6 percent of the time, respectively. However, we understand that such concurrent billing with wound debridement may become more common as adoption of this technology increases. For example, we sought comments on whether the following proposed supply items are duplicative of debridement codes if it is anticipated that these codes will be typically billed together: SB007, SB019, SB044, SC056, SF007, SG018, SG035, SG051, SG052, SG079, SH069 and SJ046. We also sought comments on whether these wound care supply items are typical for CPT code 97611, given that the code descriptor specifies wound imaging but does not include any wound care elements. Finally, we noted in the proposed rule that the direct PE crosswalk code, CPT code 97610, is billed alone 64.4 percent of the time and with debridement CPT code 11042 only 4.3 percent of the time. Therefore, we sought comments on the appropriateness of this code as a direct PE crosswalk considering the different billing patterns of CPT code 97610 and 97611 based on its predecessor codes.

We received public comments on these proposals. The following is a summary of the comments we received and our responses.

Comment: The majority of commenters supported the proposed valuation for CPT code 97611 and stated that it accurately represented the work and practice expense involved in providing a typical real-time wound imaging procedure.

Response: We thank the commenters for their support.

Comment: A couple of commenters did not support the proposed RVU of 0.80 and recommended contractor pricing for CPT code 97611 instead.

Response: We continue to believe that the proposed valuation for CPT code 97611 is appropriate and accurately represents the work and practice expense involved in performing this procedure. We believe that, generally speaking, national pricing for individual services is preferrable to contractor pricing since it better maintains relativity across the PFS and minimizes regional variations that can creates barriers to care access. Although contractor pricing is appropriate for some services, it is most often used for new and emerging technologies, and we believe that CPT code 97611 will be more accurately valued using our proposed national pricing.

Comment: A couple of commenters requested that the name of the new ER131 equipment item should be changed from the proposed ''MolecuLight DX System'' to ''real-time fluorescence wound imaging system.'' The commenters stated that direct PE item descriptions should accommodate qualifying technologies from multiple manufacturers and requested that CMS clarify that a product name in the PE database does not restrict payment to that manufacturer.

Response: We agree with the commenters that direct PE item descriptions should typically use generic descriptions rather than product names from specific manufacturers. We are therefore finalizing this change in the name of the ER131 equipment to the requested ''real-time fluorescence wound imaging system'' and clarifying that the equipment is not restricted to a single manufacturer. Also, all references to ER131 have been updated with the generic description.

Comment: A few commenters recommended removing supply items SF007 (blade, surgical (Bard-Parker)) and SJ046 (silver nitrate applicator) from the direct PE inputs for CPT code 97611 because neither of these items are used in performing fluorescence wound imaging. Commenters stated that a surgical blade is a debridement instrument and silver nitrate a hemostatic agent.

Response: We agree with the commenters and we are finalizing the removal of supply items SF007 and SJ046 from the direct PE inputs for CPT code 97611.

Comment: For new supply item SB061 (MolecuLight DX Eco Dark Drapes), a commenter wanted CMS to clarify that clinical darkness is an imaging condition achieved consistent with the real-time fluorescence wound imaging device's labeling, and that supply item SB061 may not always be required each time this service is performed, depending on the lighting conditions.

Response: We determine the direct PE for a specific service by adding the costs of the direct resources (that is, the clinical staff, medical supplies, and medical equipment) typically involved with furnishing that service. A supply item that is used more than 50 percent of the time when performing a service would be considered typical for that service. We were not persuaded by the commenter that the SB061 drape would be used less than 50 percent of the time given the need for clinical darkness in this procedure. We also note that we received several comments in support of the direct PE inputs proposed for CPT code 97611, including the SB061 drape.

Comment: Many commenters requested that CPT code 97611 not be considered a therapy service and remain on the Skilled Nursing Facility

Consolidated (SNF) Billing Exclusion list.

Response: We agree with the commenters and will not designate CPT code 97611 as a sometimes therapy service, which will allow it to remain on the list of services excluded from SNF consolidated billing.

Comment: A commenter stated that in hospital outpatient department (HOPD) wound care settings, the proposed facility PE RVU of 1.05 for 97611 should be evaluated against actual equipment, clinical labor, and supply costs. The commenter requested that CMS engage with HOPD wound care programs with real-time fluorescence imaging experience to validate whether the proposed PE inputs adequately reflect HOPD-specific cost structures.

Response: We did not propose any direct PE inputs in the Facility setting for CPT code 97611, following our standard PE methodology, as these costs would be borne by the institution under non-PFS payment systems. The PFS payment for this service in the facility setting only covers practitioner work, malpractice, and indirect PE costs; for hospital outpatient expenses, these would be accounted for under the OPPS.

Comment: A commenter noticed a typo for supply item SG018 (bandage, Kling, non-sterile 3in) as it was inadvertently listed as SF018 when we sought comments on whether the proposed supply items for 97611 are duplicative of those used for debridement codes. The description for SF018 is: cautery, monopolar, electrode, needle.

Response: We thank the commenter for pointing this out and agree that SF018 as it appeared in the text was a typo. We also note that SG018 was correctly listed in Table A–D4 for the supply items for CPT code 97611 and elsewhere.

Comment: We sought comments on whether CPT code 97611 would typically be billed with wound debridement codes (that is, greater than 50 percent of the time), and asked which of the proposed direct PE inputs may be duplicative of those already included in the wound debridement codes. Many commenters stated that CPT code 97611 would not typically be billed with debridement codes and that CMS should maintain separate, unbundled reimbursement for these PE inputs when imaging is furnished during the same encounter as wound debridement. Commenters stated that real-time fluorescence wound imaging informs clinical decision-making rather than performing tissue removal and that the imaging and the debridement are not interchangeable steps. Therefore, commenters stated that the direct PE inputs for 97611, including specialized imaging equipment and supplies, were separate and non-duplicative of those used in debridement procedures. A commenter's personal experience was that a debridement procedure was performed with real-time fluorescence wound imaging 42 percent of the time. Several other commenters said that it was reasonable to expect CPT code 97611 to be billed in a similar pattern as predecessor CPT codes 0598T and 0599T, which were only billed with wound debridement codes 35.1 percent and 46.6 percent of the time, respectively. Another commenter stated that CPT code 97611 would be separate from cellular, acellular, and matrix-like products (CAMP) application and debridement procedures (not a component of the procedural encounter).

Response: We thank the commenters for their feedback.

After consideration of public comments, we are finalizing the work RVU and direct PE inputs for CPT code 97611 as proposed, with the exception of the removal of supply items SF007 and SJ046 as detailed previously.

(46) Lactation Care Services (CPT Codes 98963 and 98964)

At the May 2025 CPT Editorial Panel meeting, two new CPT codes were created for reporting lactation care directed by a physician or qualified health care professional (QHP): CPT codes 98963 (*Lactation care directed by a physician or other qualified health care professional, including history, assessment, training, and report; first 30 minutes*) and 98964 (*Lactation care directed by a physician or other qualified health care professional, including history, assessment, training, and report; each additional 15 minutes*). These new CPT codes were surveyed at the September 2025 AMA RUC Meeting.

For CY 2027, we proposed the RUC-recommended work RVU of 0.18 for CPT code 98963. The RUC did not recommend, and we did not propose a work RVU for CPT code 98964, which has been designed as a PE only service.

We proposed the RUC-recommended direct PE inputs for CPT codes 98963 and 98964, including the creation of a new clinical staff type for Lactation Consultant (L076A) and a new EF052 equipment item (scale, infant, digital, fine gradation). We adopted CPT language and requirements for the Lactation Consultant: ''The qualifications of the lactation consultant/counselor must be recognized by a physician society, nonphysician health care professional society/association, or other appropriate source.'' We proposed to value this new clinical staff type at the same 0.76 rate per minute currently used by the RN (L051A) clinical staff type as recommended by the RUC; we sought comment regarding this new clinical staff type and whether there may be a more appropriate crosswalk than the RN clinical staff type. We proposed the RUC-recommendation of the RN clinical staff type as a proxy for pricing purposes, but sought comment on whether Lactation Consultants are typically RNs with additional credentialing/certification to be qualified to serve as a lactation consultant.

Comment: We received a large volume of public comments regarding the Lactation Care Services codes. Many commenters provided additional information concerning the clinical benefits of the care provided by lactation consultants. Commenters stated that lactation consultants obtain and evaluate maternal and infant histories, assess milk production and feeding effectiveness, observe feeds, evaluate milk transfer, identify maternal and infant risk factors, develop individualized care plans, provide counseling and education, document clinical findings, reassess response to interventions, and determine when referral or coordination with another healthcare professional is necessary. Commenters stated that families frequently present with multiple, overlapping concerns including pain while feeding, low milk production, pumping challenges, supplementation, bottle refusal, or concerns about the infant's ability to feed effectively which cannot always be addressed through a standardized approach. Many commenters provided personal accounts detailing the importance of the care that they received from lactation care services.

Response: We appreciate the additional details provided by the commenters regarding the clinical benefits of these services. We agree with the commenters regarding the importance of these lactation care services which have now been recognized with formal CPT coding.

Comment: Many commenters responded to the comment solicitation in the proposed rule regarding whether lactation consultants are typically RNs with additional credentialing/certification. Many commenters stated that lactation consultants are not necessarily RNs with additional credentialing; this included personal accounts from many lactation

consultants who clarified that they had significant training but were not certified as RNs. Commenters stated that holding both credentials reflects meeting two separate sets of requirements, rather than one credential containing the other, and cited other groups (such as registered dietitians, occupational therapists, and speech-language pathologists) who all practice in hospital settings without being expected to hold RN licensure. Commenters stated that an RN prerequisite for lactation consultants would add years of unrelated education and cost, restrict access to skilled lactation care, and could shrink a workforce that's already stretched thin. Many commenters cited International Board Certified Lactation Consultants (IBCLCs), an independent, lactation-specific credential with established education, clinical training, and certification requirements separate from RNs. Commenters requested CMS clarify that lactation consultants, including IBCLCs, are not required to be registered nurses.

Response: We appreciate the detailed feedback from the commenters regarding our lactation consultant comment solicitation. We can clarify for the commenters that our solicitation was intended for informational purposes and that we are not finalizing a requirement that lactation consultants must also be certified as RNs. Our proposed use of the RN was a proxy for the pricing of the lactation consultant clinical labor type, not intended as a new certification requirement.

Comment: Commenters stated that the code descriptors for CPT codes 98963 and 98964 were unclear whether these codes are intended to recognize the IBCLC as the professional furnishing and reporting the service, or whether they assume a model in which the IBCLC functions as clinical staff beneath another independently billing practitioner. Many commenters requested that CMS expressly recognize IBCLCs as qualified practitioners who may directly bill for the lactation services they provide. Commenters stated that lactation challenges most often emerge in the days and weeks after hospital discharge so a direct-supervision standard requiring the billing practitioner to be immediately available on-site would make these codes unusable in the postpartum setting where they are needed most.

Response: As we stated in the proposed rule, we adopted CPT language and requirements for the Lactation Consultant: ''The qualifications of the lactation consultant/counselor must be recognized by a physician society, nonphysician health care professional society/association, or other appropriate source.'' These licensing requirements are outside the scope of the code valuation for CPT codes 98963 and 98964 discussed in this portion of the rule; we did not propose and we are not finalizing IBCLCs or other lactation consultants as qualified practitioners who may directly bill for the lactation services they provide.

Comment: Several commenters requested that CMS add CPT codes 98963 and 98964 to the Medicare Telehealth Services List so that lactation support could reach patients in the home.

Response: We did not propose and we are not finalizing the addition of these codes to the Medicare Telehealth Services List. Although we understand that these lactation care services are sometimes provided in a home setting, the CPT codes as designed by the CPT Editorial Panel were not intended to be provided via telehealth.

Comment: Several commenters stated that comprehensive lactation care frequently involves two patients: the lactating parent and infant. Commenters stated that separate billing for the mother and infant when both receive distinct, medically necessary services is imperative to accurately value lactation healthcare. Commenters stated that separate billing should not be considered duplicate billing when the mother and infant are separate patients and each receives separately identifiable, medically necessary services supported by documentation.

Response: The coding instructions for CPT code 98963 specifically state that it is used to report lactation care services ordered by a physician or other QHP and provided by a lactation consultant/counselor in the office or other outpatient setting for a mother/baby dyad. Separate billing that requires additional medically necessary services would therefore not be typical for these codes.

Comment: Many commenters stated that lactation care services lasted significantly longer than the 30 minute duration described by CPT code 98963. Commenters stated that lactation care does not stop requiring professional judgment after the first 30 minutes and stated that the clinician continues to assess the parent-baby dyad, interpret findings, modify the care plan, evaluate response to interventions, and provide counseling for a much longer span of time. Different commenters stated that 60 minutes, 90 minutes, or 120 minutes constituted a typical amount of time for lactation care services and disagreed with the 30 minutes of time associated with CPT code 98963 as both insufficient to provide care and not typical of their patient encounters.

Response: We appreciate the feedback from the commenters regarding the typical duration of patient encounters for lactation care services. We note that the new CPT codes do not mandate 30 minute patient encounters, as CPT code 98963 can be billed for the first 30 minutes followed by CPT code 98964 for each additional 15 minutes. We believe that this remains the most appropriate time structure for the coding based on the current data available to CMS. However, given the volume of comments regarding how the proposed times for these codes did not match the experience of lactation care services providers, this is a subject that may warrant revisiting by CMS, the RUC, or the CPT Editorial Panel at a later date.

Comment: Many commenters disagreed with the proposed work RVU of 0.18 for CPT code 98963 and the lack of a proposed work RVU of CPT code 98964. Commenters stated that lactation care does not stop requiring professional judgment after the first 30 minutes. Commenters stated that the proposed work valuations undervalue the complex work involved in providing comprehensive lactation care, as lactation consultations are a clinical assessment that considers the needs of both the parent and the infant. Several commenters stated that CPT code 98963 should be valued comparably to CPT code 99213 at a work RVU of 1.30. Commenters requested that CMS assign an appropriate work RVU to add-on CPT code 98964 to compensate clinicians for direct, prolonged face-to-face care.

Response: We continue to believe that the proposed work RVU of 0.18 for CPT code 98963 as recommended by the RUC is the most accurate current valuation for this service. We agree with the RUC that CPT code 99211 is the most direct analog for CPT code 98963, as it describes an office or other outpatient visit for the evaluation and management of an established patient that may not require the presence of a physician or other qualified health care professional. Similarly, we continue to believe that CPT code 98964 was accurately valued as a PE-only code with no work RVU since it only contains clinical staff time for the lactation consultant. Based on the information that we have at present, we believe that these are the appropriate work valuations for CPT code 98963 and 98964. However, we do note that there was a flawed survey used by the RUC for these codes, due to a potential

misunderstanding by survey respondents regarding who was performing the service. As we stated previously in regard to the work times of these codes, given the volume of comments regarding how the proposed work RVUs for these codes did not match the experience of lactation care services providers, this is a subject that may warrant revisiting by CMS, the RUC, or the CPT Editorial Panel at a later date.

Comment: Several commenters stated that they supported the proposed direct PE inputs for CPT codes 98963 and 98964, including the proposed RN crosswalk as a reasonable minimum proxy for the time, skill, and clinical intensity of the lactation consultant. Other commenters disagreed and stated that the proposed 0.76 rate for the L076A clinical labor type did not represent the amount paid to an IBCLC, nor did it capture the complete cost of operating an accessible, compliant lactation care service. A commenter requested valuing the L076A clinical labor type at 0.90 per minute based on a study published in the Journal of Human Lactation in 2013 [8] along with current benchmarked salary data for the lactation consultant profession.

Response: We appreciate the additional data provided by the commenters regarding the typical salary of a lactation consultant. Based on this additional data, we are finalizing an increase in the pricing of the L076A lactation consultant clinical labor type, from the proposed 0.76 to 0.90 as provided by the commenters.

Comment: A commenter stated that the direct practice expense file also appeared to use the L076A clinical labor type for CPT code 98963 but the RN (L051A) clinical labor type for the add-on CPT code 98964. The commenter stated that CMS should correct or explain this inconsistency and use the lactation consultant staff type consistently when lactation care is performed by an appropriately qualified lactation consultant.

Response: We appreciate the assistance from the commenter in identifying this unintended technical error. We are correcting this error for the final rule; both CPT code 98963 and 98964 were intended to use the L076A lactation consultant for their clinical labor.

[8] Chetwynd E, Meyer A–M, Stuebe A, Costello R, Labbok M. Recognition of International Board Certified Lactation Consultants by Health Insurance Providers in the United States: Results of a National Survey of Lactation Consultants. Journal of Human Lactation. 2013;29(4):517–526. doi:10.1177/0890334413499974.

After consideration of the comments, we are finalizing the work RVUs and direct PE inputs for CPT code 98963 and 98964 as proposed, with the update to the pricing of the L076A clinical labor type and technical correction to the clinical labor used in CPT code 98964 detailed previously.

(47) Adaptive Behavior Services (CPT Codes 97151, 97152, 97148, 97149, 97180, 97153, 97154, 97159, 97160, 97155, 97173, 97156, 97157, 97158)

At the September 2025 CPT Editorial Panel meeting, the CPT Editorial Panel deleted CPT codes 0362T (*Behavior identification supporting assessment, each 15 minutes of technicians' time face-to-face with a patient, requiring the following components: administration by the physician or other qualified health care professional who is on site; with the assistance of two or more technicians; for a patient who exhibits destructive behavior; completion in an environment that is customized to the patient's behavior.*) and 0373T (*Adaptive behavior treatment with protocol modification, each 15 minutes of technicians' time face-to-face with a patient, requiring the following components: administration by the physician or other qualified health care professional who is on site; with the assistance of two or more technicians; for a patient who exhibits destructive behavior; completion in an environment that is customized to the patient's behavior.*), revised eight existing CPT codes: 97151 (*Behavior identification assessment, administered by a physician or other QHP, each 15 minutes of the physician's or other QHP's time face-to-face with patient and/or caregiver(s) administering assessments and discussing findings and recommendations, and non- face-to-face analyzing past data, scoring and/or interpreting the assessment, and preparing the report and/or treatment plan*), 97152 (*Behavior identification-supporting assessment, administered by technician, face-to-face with the patient, each 15 minutes*), 97153 (*Adaptive behavior treatment by protocol, administered by technician, face-to-face with one patient, each 15 minutes*), 97154 (*Group adaptive behavior treatment by protocol, administered by technician, face-to-face with two or more patients, each 15 minutes*), 97155 (*Adaptive behavior direction of technician and analysis by physician or other QHP, face-to-face with a patient, each 15 minutes*), 97156 (*Family adaptive behavior treatment guidance with analysis, administered by physician or other QHP (with or without the patient present), including discussing protocols and treatment targets and/or training the caregiver(s) to implement assessment or treatment protocols with the patient, face-to-face with caregiver(s) for 1 patient, each 15 minutes*), 97157 (*Multiple-family group adaptive behavior treatment guidance with analysis, administered by physician or other QHP (without the patient present), face-to-face with multiple sets of caregivers for multiple patients, each 15 minutes*) and 97158 (*Group adaptive behavior treatment with analysis, administered by physician or other QHP, face-to-face with multiple patients, each 15 minutes*), and created six new CPT codes: 97148 (*Behavior identification supporting assessment of harmful behavior, each 15 minutes of technician time face-to-face with a patient, requiring the following components: delivered by two technicians, for a patient who exhibits harmful behavior, conducted in an environment that is customized to the patient's behavior,*), 97149 (*Behavior identification supporting assessment of harmful behavior, each 15 minutes of technician time face-to-face with a patient, requiring the following components: delivered by two technicians, for a patient who exhibits harmful behavior, conducted in an environment that is customized to the patient's behavior, additional technicians present, each 15 minutes (list separately in addition to code for primary procedure)*), 97180 (*Adaptive behavior non-face-to-face services, personally performed by a physician or other QHP, each 15 minutes, with any of the following elements, when performed: review and analysis of data and session notes on patient treatment targets, clinical decision making regarding the need to modify treatment targets, goals, or protocols and/or making those modifications, clinical decision making regarding the need for additional assessment and developing or modifying assessment protocols, developing discharge or transition plan, reviewing treatment targets and/or revised assessment or treatment protocols with technician(s).*), 97159 (*Adaptive behavior treatment of harmful behavior, each 15 minutes of technician time with a patient, requiring the following components: delivered by two technicians, for a patient who exhibits harmful behavior, conducted in an environment that is customized to the patient's behavior.*), 97160 (*Adaptive behavior treatment of harmful behavior, each 15 minutes of technician time with a patient, requiring the following components: delivered by two*

technicians, for a patient who exhibits harmful behavior, conducted in an environment that is customized to the patient's behavior, each additional technician present, each 15 minutes (List separately in addition to code for primary procedure)), and 97173 (*Adaptive behavior treatment with analysis, administered by physician or other qualified health care professional, face-to-face with 1 patient, each 15 minutes*), to better specify appropriate time, define terms, address reporting gaps, and clarify reporting for technician and physician/QHP face-to-face and non-face-to-face adaptive behavior services. The RUC HCPAC Review Board reviewed the 14 codes in the revised code family at the January 2026 RUC HCPAC.

The RUC is recommending contractor pricing for all fourteen codes in the family. The existing CPT codes 97151 through 97158 are currently contractor priced. We proposed to contractor price the six new codes and make no change to the status indicator for the eight revised existing codes that are already contractor priced.

Comments: We received many comments on our proposal to adopt and contractor price the six new adaptive behavior services, CPT codes 97148, 97149, 97159, 97160, 97173 and 97180, and make no change to the status indicator for the eight revised CPT codes 97151, 97152, 97153, 97154, 97155, 97156, 97157, and 97158 that are already contractor priced. Nearly all commenters expressed support for the proposals. Many commenters asked CMS to add the new CPT codes to the telehealth list. Many commenters focused on the benefit of two new codes, CPT code 97159 and CPT code 97160, billing two technicians simultaneously.

A few commenters did not support CMS adoption of the new CPT codes. A commenter recommended the adoption of a bundled Adaptive Behavior Services coding framework of 3 comprehensive service categories: Assessment, Treatment, and Caregiver Training instead of adopting the six new codes into the existing code family. Another expressed concern that the adoption of CPT codes 97148, 97149, 97159, 97160, 97173 and 97180, particularly CPT code 97180 for non–face-to-face services, created heightened risks of insufficient documentation, upcoding, and duplicative or concurrent billing, potentially increasing spending without clear evidence of additional clinical value. Another commenter similarly recommended monitoring of utilization patterns to better understand how services are being furnished across settings and provider types and to assess whether beneficiaries are receiving evidence-based and clinically appropriate care. Another commenter advocated national pricing for CPT codes 97173 and 97180 but did not offer an opinion on what that pricing should be.

Response: We thank all the commenters and appreciate the support for our proposals. We believe that the coding framework developed by the CPT Editorial Panel will help specify appropriate times, define terms, address reporting gaps, and clarify reporting for face-to-face and non-face-to-face adaptive behavior services. We believe that the new coding better defines these services and provides a more comprehensive framework than the prior, more patchwork methods of reporting. With regards to national pricing, we agree with the HCPAC that since these services are currently contractor priced and the existing payment models and practice patterns are varied, the newly revised codes should also remain contractor priced at this time.

After consideration of the comments, we are finalizing contractor pricing for all fourteen codes in the family as proposed. Finally, we are adding CPT codes 97148, 97149, 97159, 97160, and 97173 to the Medicare Telehealth Services list. We are not adding CPT code 97180 as the service is a non-face-to-face service.

(48) Remote Monitoring (CPT Codes 98975, 98976, 98977, 98978, 98980, 98981, 98984, 98985, 98986, 98979, 99091, 99453, 99454, 99457, 99458, 99473, 99474, 99445, and 99470)

(a) Background and Overview

In recent years, we have established payment for two code families that describe certain remote monitoring services: remote physiologic monitoring (RPM) and remote therapy monitoring (RTM). In the CY 2018 PFS final rule, we summarized feedback from a comment solicitation aimed at informing new payment policies that would allow for separate payment for remote monitoring services (82 FR 53014). In the CY 2019 PFS final rule (83 FR 59574 through 59576), we established valuations and payment policy for the RPM code family. In the CY 2020 PFS final rule (84 FR 62697 through 62698), we explained that the RPM code family describes chronic care RPM services that involve the collection, analysis, and interpretation of digitally collected physiologic data, followed by the development of a treatment plan and the managing of a patient under the treatment plan (84 FR 62697). In the CY 2020 PFS final rule, we finalized that CPT codes 99457 and 99458 would be included as designated care management services, allowing RPM services to be furnished under the general supervision of the physician or other qualified health care professional (who is qualified by education, training, licensure/regulation and facility privileging) (84 FR 62698). In the CY 2023 PFS final rule, in response to comments, we clarified that RTM or RPM services could be billed concurrently with Chronic Care Management (CCM), Transitional Care Management (TCM), Principal Care Management (PCM), Chronic Pain Management (CPM), or Behavioral Health Integration (BHI) (86 FR 69528 through 69539).

In September 2024, the Current Procedural Terminology (CPT) Editorial Panel added one code and made code revisions to report RPM device supply for 2 to 15 days and 16 to 30 days within a 30-day period; created one new code and code revisions to report RPM treatment management services for the first 10 minutes, first 20 minutes, and each additional 20 minutes thereafter; added three RTM device supply codes to report respiratory, musculoskeletal and cognitive behavioral therapy for 2 to 15 days and 16 to 30 days within a 30-day period; created one new code and made code revisions to report RTM treatment management services for the first 10 minutes, first 20 minutes, and each additional 20 minutes thereafter; and revised remote monitoring guidelines. We reviewed the RUC recommendations for these services in the CY 2026 PFS final rule (90 FR 49394 through 49404). In response to recent reports and recommendations from the Office of the Inspector General (Additional Oversight of Remote Patient Monitoring in Medicare Is Needed [9] and Billing for Remote Patient Monitoring in Medicare [10]), for CY 2027, we proposed refinements to the policies surrounding remote physiologic and remote therapeutic monitoring, as detailed later in this section.

We received public comments on these proposals. The following is a summary of the comments we received and our responses.

Comment: Many commenters agreed with CMS' concern for protecting against fraud, waste, abuse, and fragmented care, such as programs that

[9] *https://oig.hhs.gov/reports/all/2024/additional-oversight-of-remote-patient-monitoring-in-medicare-is-needed/.*

[10] *https://oig.hhs.gov/reports/all/2025/billing-for-remote-patient-monitoring/.*

solicit beneficiaries for services they do not need and care models in which the billing practitioner lacks meaningful oversight. However, many commenters provided information about remote monitoring programs that deliver quality care and improve outcomes in a deflationary manner. Some commenters felt that requirements that could limit the adoption of RPM and RTM services were not in alignment with other stated CMS goals on advancing rural health and the adoption of innovative health technology, or with specific programs, including the Rural Health Transformation Program (RHTP) and the CMS Innovation Center's Advancing Chronic Care with Effective, Scalable Solutions (ACCESS) model.

Response: We thank commenters for their support. We agree that there are many remote monitoring programs that provide reasonable and necessary care, and we agree with commenters that identified potential fraud, waste, and abuse as concerns. We do not believe that these requirements would limit CMS goals on advancing rural health, or the adoption of innovative health technology, and CMS remains committed to expanding beneficiary and clinician access to high-value, technology-supported care, as evidenced by the Rural Health Transformation Program (RHTP) and the CMS Innovation Center's ACCESS model. Rather, the requirements would minimize factors that may contribute to potential fraud, waste, abuse, and fragmented care in remote monitoring services paid under the PFS.

Comment: Some commenters raised questions about the relationship between the ACCESS model and the proposed RPM and RTM policies, noting differences in their scope and payment approaches.

Response: We thank commenters for these comments. The ACCESS model is a separate CMS Innovation Center model testing outcome-aligned payments for technology-supported chronic care in Original Medicare, with payment primarily tied to beneficiary outcomes rather than specific activities. RPM and RTM services are PFS services that pay for the furnishing of specified remote monitoring services and related activities. The policies finalized in this final rule are intended to preserve access to appropriate RPM and RTM services while strengthening safeguards to maintain beneficiary and clinician access to technology-supported care and minimizing factors that may contribute to potential fraud, waste, abuse, and fragmented care for remote monitoring services paid under the PFS.

Comment: The AMA informed CMS that in response to our concerns over a lack of data to inform accurate valuation of these services, all 19 RPM and RTM codes will have their practice expense reviewed at the January 2027 RUC meeting.

Response: We thank the AMA for this information and look forward to reviewing any forthcoming recommendations from the RUC regarding the practice expense for these services.

Comment: Some commenters did not support the use of OIG reports to refine the policies surrounding RPM and RTM, including expressing concern that CMS was proposing to implement requirements not explicitly called for in the relevant OIG reports on RPM and RTM services. Some commenters stated that OIG's findings identified only a small number of practices as being of particular concern.

Response: We would like to clarify that the recommendations specified in the OIG reports are not the only measures that CMS is limited to in order to ensure that remote monitoring services paid under the PFS are not subject to potential fraud, waste, and abuse. Although we cited OIG's concerns around RPM in the proposed rule, CMS has also observed troubling trends that may indicate potential fraud, waste, abuse, and fragmented care. These trends align with, but also sometimes go beyond, what OIG has cited.

Comment: A few commenters stated that the OIG reports used data collected during the public health emergency (PHE), when observed growth in remote monitoring was part of a larger digital health transformation.

Response: The OIG report, Additional Oversight of Remote Patient Monitoring in Medicare Is Needed [11], used claims and encounter records with dates of service from January 1, 2019, through December 31, 2022. The OIG report, Billing for Remote Patient Monitoring in Medicare,[12] used claims and encounter records with dates of service from January 1, 2024, through December 31, 2024. Both OIG reports analyze claims and encounter data from before and after the COVID–19 PHE, which began on January 31, 2020 (retroactive to January 27, 2020) and ended on May 11, 2023. We agree with commenters that some of the growth in remote monitoring services during this time may have been in response to the PHE, but we have continued to see high growth of these services in the years since the end of the PHE that may indicate potential fraud, waste, abuse, and fragmented care.

Comment: Several commenters wrote that findings in published OIG reports were only applicable to RPM and not to RTM. Commenters stated that RPM and RTM are unique services, and that there is not sufficient published evidence to support applying uniform policies to both. These commenters believe that RTM should not raise the same program integrity concerns that may exist for RPM since RTM furnished by therapists has existing incident to, plan of care, and recertification requirements. Commenters also cited that RTM has not experienced recent high growth like RPM. Commenters also believed that RTM valuation was accurate and did not need to be refined, as RTM has gone through the RUC process twice in the past four years.

Response: We thank commenters for this information. While we agree with commenters that the OIG report was focused on RPM, we continue to believe that the concerns specified in the OIG reports and in this rule also apply to RTM. The RTM codes are newer and have not been subject to audits, as RPM has. We note that RTM services were not payable under the PFS until January 1, 2022. The OIG report, Additional Oversight of Remote Patient Monitoring in Medicare Is Needed,[13] used claims and encounter records with dates of service from January 1, 2019, through December 31, 2022. The OIG report, Billing for Remote Patient Monitoring in Medicare,[14] used claims and encounter records with dates of service from January 1, 2024, through December 31, 2024. At the time of these analyses, RTM was not payable for the entirety of the claims and encounter data review or was a new service with limited claims and encounter data. Although we agree with commenters that RTM has not experienced as large an increase in utilization as compared to RPM, we have observed an increase in utilization since these services have become payable under the PFS and since the OIG reports reviewed claims and encounter records. The program integrity concerns expressed in the proposed rule apply to both RPM and RTM services. We reiterate our concerns that RTM, like RPM, services may be

[11] *https://oig.hhs.gov/reports/all/2024/additional-oversight-of-remote-patient-monitoring-in-medicare-is-needed/.*

[12] *https://oig.hhs.gov/reports/all/2025/billing-for-remote-patient-monitoring/.*

[13] *https://oig.hhs.gov/reports/all/2024/additional-oversight-of-remote-patient-monitoring-in-medicare-is-needed/.*

[14] *https://oig.hhs.gov/reports/all/2025/billing-for-remote-patient-monitoring/.*

susceptible to fraud, waste, abuse, and fragmented care.

(b) Established Patient Requirements

In the CY 2021 PFS final rule (85 FR 84542 through 84546), we established that, when the PHE for COVID–19 ended, we again required that RPM services be furnished only to an established patient. Patients who received initial remote monitoring services during PHE were considered established patients for purposes of the new patient requirements that were effective after the last day of the PHE for COVID–19.

For CY 2027, we proposed to require that RTM services also be furnished only to established patients. We proposed this condition of payment because we believe that a practitioner with an established relationship with a patient would likely have had the opportunity to collect relevant patient history and conduct a physical exam, as appropriate. As a result, the practitioner would possess information needed to understand the current medical status and needs of the patient prior to ordering RTM services to collect and analyze the patient's data and would be able to use the results of remote therapeutic monitoring to manage the patient under a specific treatment plan or therapy plan of care.

This proposal would also assist in resolving OIG's findings that some practices did not have a prior relationship with patients for whom they billed remote monitoring services for (Billing for Remote Patient Monitoring in Medicare [15]).

We received public comments on these proposals. The following is a summary of the comments we received and our responses.

Comment: Many commenters expressed support for the requirement that RTM services be furnished only to established patients, as these changes would create symmetry between requirements for RTM and RPM services. We also received comments supporting both the established patient requirement and the initiating visit requirement as reasonable program integrity measures. Some commenters did not support our proposed requirement for RTM, and a few commenters requested that we no longer require that RPM have an established patient requirement. Some commenters expressed concern that requiring that patients be established before RTM services can be furnished adds unnecessary cost and administrative burden to practices and could delay the onset of monitoring for some patients.

Response: We thank commenters for their comments on our proposal. At this time, we continue to believe that an established patient requirement ensures that the practitioner would possess information needed to understand the current medical status and needs of the patient prior to ordering RTM services. This requirement also ensures that the practitioner collects and analyzes the patient's data and uses the results of remote therapeutic monitoring to manage the patient under a specific treatment plan or therapy plan of care.

Comment: Commenters requested CMS publish a precise definition of ''established patient'' for purposes of remote monitoring services.

Response: We are adopting the definition of ''established patient'' used elsewhere in the PFS. An established patient is one who has received any professional services from the physician or other qualified health care professional or another physician or other qualified health care professional of the same specialty who belongs to the same group practice within the past three years (see Medicare Claims Processing Manual, Chapter 12, section 30.6.7). Although, we note that for certain healthcare professionals, such as physical therapists, occupational therapists, and speech-language pathologists, an established patient is one who is receiving services furnished under a therapy plan of care that may extend throughout the length of that episode of care (see (86 FR 65116) and (87 FR 69643 and 69647)).

Comment: Many commenters requested that a beneficiary be considered an established patient after they have received an initiating visit. Commenters expressed that this would be important in scenarios where early intervention is important (post-discharge, post-injury, etc.).

Response: For the purposes of this policy, we would like to clarify that a beneficiary may be considered an established patient after they have met the initiating visit requirements for remote monitoring services detailed later in this section.

After consideration of public comments, we are finalizing the requirement that RTM services be furnished only to established patients.

(c) Initiating Visit Requirements

For CY 2027, we proposed that practitioners reporting RPM or RTM services must furnish a separately reportable initiating visit in association with the onset of RPM or RTM services, since these services require a level of care coordination that cannot be effective without appropriate evaluation of the patient's needs. The initiating visit would also ensure the billing practitioner assesses the beneficiary to determine clinical appropriateness of RPM or RTM and provide an opportunity to obtain the required beneficiary consent to receive RPM or RTM services. We proposed that RPM or RTM services must be initiated by the billing practitioner during a face-to-face (in-person or telehealth) visit. CPT codes that do not involve a face-to-face visit by the billing practitioner or are not separately payable under Medicare cannot be used as the visit for RPM or RTM initiation. If RPM or RTM is not discussed with the patient at that visit, that visit cannot count as the initiating visit for RPM or RTM. The RPM or RTM initiating visit can be separately billed.

We received public comments on these proposals. The following is a summary of the comments we received and our responses.

Comment: Commenters supported the overall objective of ensuring that patient monitoring begin from a clinical decision by a practitioner who has evaluated the patient.

Response: We thank commenters for their support of this proposal.

Comment: We received many comments suggesting additional clarification and requirements for our initiating visit proposal. Some commenters recommended CMS create a standard for documentation on how RTM/RPM data will be incorporated into the patient's treatment plans, as a condition of payment. A few commenters commented that such requirements could include information about the ordering provider, the type of health information being monitored, and the suspected/target health condition being monitored.

Response: We thank commenters for their suggestions and may consider this for future rulemaking. We are not finalizing any additional documentation requirements at this time, as we believe additional documentation requirements may create unnecessary administrative burden.

Comment: We received several comments seeking clarification and offering suggestions on which specific visit types and which specific practitioners would satisfy the requirements for an initiating visit. Many commenters recommended that a separate initiating visit only be required for certain beneficiaries or clinical scenarios, including exempting beneficiaries aligned to an Accountable Care Organization (ACO). Commenters suggested CMS adopt the same initiating visit requirements for RPM and RTM as are required for Chronic Care

Management (CCM) and Advanced Primary Care Management (APCM) services.

Response: We would like to clarify that while RPM or RTM services must be initiated by the billing practitioner during a face-to-face (in-person or telehealth) visit, the initiating visit does not have to be for the sole purpose of discussing remote monitoring services. CPT codes that do not involve a face-to-face visit by the billing practitioner or are not separately payable under Medicare cannot be used as the visit for RPM or RTM initiation. If RPM or RTM is not discussed with the patient at that visit, that visit cannot count as the initiating visit for RPM or RTM. At this time, we are not finalizing any exemptions to initiating visit requirements, including for patients aligned to ACOs, as these services require a level of care coordination that cannot be effective without appropriate evaluation of the patient's needs. We continue to believe that an initiating visit is the best way to ensure this evaluation is occurring.

Comment: Commenters additionally sought clarification on the definition of ''onset'' of RPM or RTM services. Commenters asked CMS to define the permissible amount of time between the initiating visit and the activation of monitoring. A number of commenters expressed concern that requiring a separate face-to-face initiating visit with the billing practitioner for patients already established with RTM services via discharge from a hospital or other facility would be duplicative and may lack a meaningful clinical benefit. Some commenters expressed concern that requiring practitioners reporting RPM or RTM services to furnish a separately reportable initiating visit in association with the onset of RPM or RTM services adds unnecessary cost and administrative burden to practices, could disadvantage some patients, and could delay the onset of monitoring for others. Some also expressed concern that some patients may be unduly burdened if required to travel solely for purposes of attending an initiating visit.

Response: We thank commenters for this information. At this time, we continue to believe that these services require a level of care coordination that cannot be effective without appropriate evaluation of the patient's needs and that an initiating visit before RPM or RTM services can begin is the best way to ensure this evaluation is occurring. For the purposes of this policy, the onset of RPM or RTM services refers to the onset of these services at the billing provider level. Billing for RPM or RTM services may not begin until the initiating visit has been furnished. We are not finalizing a restriction on the amount of time between the initiating visit and the activation of monitoring, as long as RPM or RTM is discussed with the patient at that visit. To minimize beneficiary burden associated with this initiating visit requirement, we are allowing initiating visits to be furnished via telehealth when furnished in accordance with the requirements in section 1834(m) of the Act. In addition, for the purposes of this policy, a beneficiary may be considered an established patient after they have met the initiating visit requirements. We are not establishing a definition of ''onset'' for RPM and RTM in this rule, however, we welcome ongoing feedback on this policy and may consider this additional information for future rulemaking.

Comment: Several commenters requested clarification on whether the initiating visit must be performed by the billing practitioner, or if it can be furnished by practitioners within the same practice.

Response: Like other services paid under the PFS, physicians in the same group practice who are in the same specialty must bill and be paid as though they were a single physician. We note that this is consistent with the Medicare Claims Processing Manual, Chapter 12, § 30.6.5—Physicians in Group Practice (Rev. 1, 10–01–03), where, ''Physicians in the same group practice who are in the same specialty must bill and be paid as though they were a single physician; physicians in the same group practice but in different specialties may bill and be paid without regard to common group membership.''

Comment: Commenters sought confirmation as to whether an initiating visit can be held over telehealth. We received several comments seeking clarification on how the telehealth pathway for the initiating visit will operate if the statutory telehealth flexibilities lapse.

Response: As discussed in the proposed rule, the initiating visit must be face-to-face, which may be an in-person or telehealth visit. CMS does not have statutory authority to further extend telehealth flexibilities. After December 31, 2027, absent further legislation, the use of telehealth services for purposes of the initiating visit for remote monitoring services will be limited by the requirements of section 1834(m) of the Act that remain in effect.

Comment: Some comments requested clarification on the documentation requirements needed to substantiate the initiating visit.

Response: We are not finalizing the requirement of any additional documentation requirements at this time outside of the documentation requirements for all services paid under the Physician Fee Schedule.

Comment: Several commenters sought clarification on whether the discussion of RPM and RTM needed to be the sole purpose of the visit, for it to qualify as an initiating visit.

Response: We would like to clarify that the initiating visit does not have to be for the sole purpose of discussing remote monitoring services. RPM or RTM must be discussed with the patient at that visit, but does not have to be the sole purpose of the visit or sole topic discussed.

Comment: We received multiple comments seeking clarification on what is meant by ''separately billable'' for purposes of an initiating visit. Commenters asked whether service could be initiated as part of a discharge service or global surgical service.

Response: We would like to clarify that the initiating visit can be separately billable, but does not have to be in all scenarios. We refer readers to the CY 2024 PFS Final Rule (88 FR 78883 through 78884) for additional discussion of RPM or RTM services during a global period.

Comment: Some commenters asked for clarification on how the new initiating visit requirement applies under the Community Health Center (CHC) or Federally Qualified Health Center (FQHC) Prospective Payment System (PPS), specifically whether a same-day qualifying visit requirement applies, and how the ''separately billable'' standards operate under encounter-based CHC billing versus the Physician Fee Schedule fee-for-service billing.

Response: Effective January 1, 2025, Rural Health Clinics (RHCs) and FQHCs are required to bill the individual CPT/HCPCS base codes and add-on codes for each of the care coordination services to receive payment separate from the Rural Health Clinic All-Inclusive Rate (RHC AIR) or FQHC PPS. RHCs and FQHCs may bill care coordination services either alone or with other payable services. If the care coordination service is furnished on the same day as a qualifying visit, the RHC or FQHC will receive two separate payments. Care coordination services are paid at the national non-facility PFS payment rates. Since RHCs and FQHCs report the individual care coordination codes, they must follow the requirements established under the PFS for each code.

Comment: Commenters asked whether each new episode of monitoring requires its own initiating visit. Commenters requested

clarification on whether a new initiating visit would be required when oversight of a patient is passed from an established billing practitioner to a new billing practitioner located within the same practice. Some commenters requested clarification on whether a new initiating visit would be required when a new or upgraded monitoring device is acquired by or for the patient. Commenters requested clarification on whether a new initiating visit would be required for patients after a clinical change, a temporary hold status has ended, or after a re-enrollment into an active monitoring program.

Response: We would like to clarify that an initiating visit would only be required before the onset of remote monitoring services for that beneficiary. A separate visit is not required for routine clinical changes, which could include, but are not limited to a change of device, clinical change, or change of billing practitioner within the same practice.

Comment: In situations where monitoring is initiated during a visit that also includes a higher-valued global-period procedure, a commenter recommended CMS not reduce the separately reportable E/M visit per the modifier 25 proposal.

Response: We refer readers to section XX of this final rule for additional details discussing modifier 25. As discussed in that section, we are not finalizing service level exceptions at this time. We believe that there are overlapping resource costs for procedures, including an initiating visit for remote monitoring.

Comment: We received several comments requesting that beneficiaries already established in a remote monitoring program be considered ''grandfathered'' for purposes of the initiating visit requirement.

Response: We agree with commenters that requiring beneficiaries who are already receiving remote monitoring services to have an initiating visit would be particularly burdensome. We would like to clarify that beneficiaries who are already receiving remote monitoring services before this policy becomes effective on January 1, 2027, would not need to have an initiating visit to continue remote monitoring services, so long as all other requirements for these services are met. CMS discourages any misuse of enrolling beneficiaries in remote monitoring services between the publication of this rule and January 1, 2027. As with all services paid under the PFS, all remote monitoring services furnished must be reasonable and necessary.

After consideration of public comments, we are finalizing as proposed.

(d) Supervision Requirements

Currently, RPM or RTM services may be outsourced to third-party companies that provide services via telephone and online contact only, using staff who have little to no established relationship with the beneficiary or other members of the care team and have little to no interaction with the office staff and billing practitioner. After reviewing the findings discussed in recent OIG reports, such as companies ''cold calling'' beneficiaries to solicit them for remote monitoring services they may not need (Additional Oversight of Remote Patient Monitoring in Medicare Is Needed [16]) and working to improve the transparency of ''incident to'' services, we believe outsourcing RPM/RTM services to a third party can fragment care, lead to insufficient involvement and oversight of the billing practitioner, or result in services that do not actually represent or facilitate all required aspects of RPM or RTM services. Provision of these services by entities having only a loose association with the treating practitioner can detract from longitudinal, patient-centered care. We do not believe that RPM or RTM services provided by clinical staff contracted by a third party can ensure the billing practitioner has adequate oversight, management, or collaboration to bill RPM or RTM services. If there is little oversight by the billing practitioner or a lack of clinical integration between a third-party providing RPM/RTM and the billing practitioner, we do not believe that the full scope of service elements required to bill these codes are being met.

We proposed to only allow payment for RPM or RTM services when furnished by clinical staff employed by the practice. To count the time spent by clinical staff providing aspects of RPM or RTM services, the clinical staff must be a direct employee of the practitioner or the practitioner's practice. This would have meant that for the purposes of billing Medicare, beginning January 1, 2027, the RPM and RTM codes could not be billed in cases where the service is not performed by clinical staff of the billing practitioner and will not allow contracting out to third-party companies. This does not mean the clinical staff must necessarily always be physically located within the practice, nor does it require that the beneficiary be on-site for the provision of remote monitoring services. Under our proposed revised policy, the time spent by clinical staff providing RPM or RTM services can be counted, provided that the clinical staff are under the general supervision of the billing practitioner, all other requirements of the ''incident to'' regulations at § 410.26 are met, and the clinical staff is a direct employee of the practitioner or the practitioner's practice. We sought comment on this proposal, specifically on how often third-party billing currently occurs and how this policy, if finalized, could impact access to remote monitoring services.

We received public comments on these proposals. The following is a summary of the comments we received and our responses.

Comment: Some commenters expressed support for CMS' proposal to only allow payment for RPM or RTM services when furnished by clinical staff employed by the practice. Some commented that it would better ensure that clinicians are made aware of relevant data collected, would support fraud prevention, and support quality outcomes.

Response: We thank commenters for supporting our proposal.

Comment: Several commenters suggested other program integrity-related requirements CMS could pursue in the future instead of this policy. Several commenters suggested CMS consider establishing stricter credentialing requirements for clinicians and vendors delivering RPM and RTM services. A few commenters suggested CMS consider limiting payment to conditions or disease states that have robust data demonstrating the value of remote monitoring services.

Response: We thank commenters for the additional information and may consider this for future rulemaking.

Comment: Many commenters requested that CMS clarify how this proposal relates to the technology used for remote monitoring services. For example, commenters requested that working with outside companies to license software platforms, purchase devices, and resolve technical issues not be prohibited.

Response: We would like to clarify that a practitioner or practice's use of a third-party technology platform does not affect the requirement that clinical staff must be a direct employee of the practitioner or the practitioner's practice. This policy would not prohibit working with vendors who do not supply third-party staff time, but supply software, devices, technical support, etc. The intent of this policy was not to

[16] *https://oig.hhs.gov/reports/all/2024/additional-oversight-of-remote-patient-monitoring-in-medicare-is-needed/.*

require billing practitioners to develop proprietary monitoring platforms or devices. Practices may obtain devices, software, connectivity, data hosting, cybersecurity, implementation support, technical assistance, and interoperability services from outside companies.

Comment: Commenters requested clarification regarding CMS' reasoning that remote monitoring services should be held to a higher standard than other services paid under the PFS that are assigned general supervision, as detailed in ''incident to'' regulations at 42 CFR 410.26. Commenters specified that the regulation text under § 410.26 defines employee, leased employee, and independent contractors, and permits these clinical staff types.

Response: We note that these services are assigned general supervision and we are not finalizing any changes to supervision requirements or to the regulation text under § 410.26, as it pertains to remote monitoring services.

Comment: Many commenters stated that allowing payment for RPM or RTM services only when they are furnished by clinical staff employed by the practice would unintentionally limit the types of practices that can offer these services and limit access to care for patients. Several commenters cited the example of academic health systems that employ clinical staff and faculty staff under different entities. Several commenters also cited hospitals utilizing clinical staff who are not direct employees as an example of an entity that would no longer be able to provide RPM or RTM services. A number of commenters expressed concerns that patients receiving RPM or RTM services would experience limited access to clinical staff and cited specific examples such as access becoming limited to only regular business hours instead of the 24/7/365 service that may be available via third parties. Some commenters stated that a reduction in the number of practices offering RPM or RTM services could increase overall costs to the healthcare system by driving patients towards in-person care and utilization of urgent care and emergency services.

Response: We thank commenters for their comments on our proposal. At this time, we continue to believe that allowing payment only when RPM or RTM services are furnished by clinical staff employed by the practice is the best way to ensure care is integrated, there is sufficient oversight and involvement of the billing practitioner and that services provided represent all required aspects of RPM or RTM services.

Comment: Commenters, whether they did or did not support our proposal, cited the increased cost of employing clinical staff in-house as opposed to using a third-party contractor. Many commenters expressed concern that small and independent practices lack the financial resources to fully manage remote monitoring programs with only staff under their direct employment. Some expressed concern this would disproportionally impact patients living in rural and underserved communities, those with multiple chronic conditions, and those with specialized needs. Many commenters expressed concerns that limiting payments to only RPM or RTM services furnished by clinical staff employed by the practice will exacerbate workforce shortages. Some stated that practices would be unable to hire adequate staff due to geographic limitations and other concerns. Some commenters noted that contracting with third parties afforded practices flexibility during periods in which they may be short-staffed or need access to clinical expertise not otherwise available in their own practice. Commenters also expressed concern that not allowing practices to contract out to third-party companies would limit their ability to develop partnerships with community providers not directly employed by the practitioner or the practitioner's practice, such as EMS agencies, paramedicine providers, and pharmacists.

Response: We thank commenters for this information. At this time, we continue to believe that allowing payment only when RPM or RTM services are furnished by clinical staff employed by the practice is the best way to ensure care is integrated, there is sufficient oversight and involvement of the billing practitioner and that services provided represent all required aspects of RPM or RTM services.

Comment: A few commenters noted that findings published by the OIG regarding the cold-calling and solicitation of beneficiaries could be properly addressed by requirements related to an initiating visit. Some suggested CMS pursue oversight and credentialing of third parties before implementing supervision requirements. Many commenters stated that requiring direct employment is not a reliable indication that staff are integrated into workflows and contributing to quality outcomes. Some suggested CMS should implement guidelines more closely connected to quality outcomes and audit to ensure compliance.

Response: We thank commenters for their comments on our proposal. At this time, we continue to believe that allowing payment only when RPM or RTM services are furnished by clinical staff employed by the practice is the best way to ensure care is integrated, there is sufficient oversight and involvement of the billing practitioner and that services provided represent all required aspects of RPM or RTM services.

Comment: Many commenters requested clarity on what ''employed by the practice'' means for purposes of payment for RPM or RTM services. Many cited examples of specific employment and contracting arrangements and asked for clarification on whether they would be acceptable under the proposed policy. Many also requested CMS consider exemptions for specific arrangements. Some commenters requested CMS define ''direct employee of the practitioner or the practitioner's practice'' for purposes of providing RPM or RTM services. Many commenters requested CMS delay any new requirements related to supervision requirements until at least January 1, 2028. Several provided specific examples of challenges that would be encountered if the proposed policy were to take effect on January 1, 2027. Some commenters expressed concerns that health systems relying on contracted staff for some portion of their RPM or RTM services would be unable to alter or discontinue their existing contracts prior to a January 1, 2027 effective date. Commenters stated that practices would need beyond January 1, 2027 to hire and train sufficient staff and establish appropriate workflows and processes. Many commenters requested CMS delay any new requirements related to supervision of staff until at least January 1, 2028. A few commenters expressed concern that not allowing adequate time for implementation could cause providers to be less willing to make substantial, multi-year investments in technology and infrastructure in the future.

Response: We thank commenters for this information. We disagree that the proposed policy would discourage future investment by practices in technology and infrastructure. However, we agree that it is appropriate to delay implementation of the proposed policy to allow sufficient time for implementation. We also agree with commenters that there may be a need for additional time for CMS to specify additional clinical staff arrangements that may be appropriate for remote monitoring services. Due to the additional information provided by

commenters, we are finalizing this proposal with modifications. Specifically, we are providing a 2-year delay in implementation to allow for practices to hire and train staff for ''in-house'' workflows for remote monitoring services. We would like to emphasize that, although we will continue to allow contracting out to third-party companies until December 31, 2028, all of the existing ''incident to'' and other rules for billing remote monitoring services under the PFS must be met. If there is little oversight by the billing practitioner or a lack of clinical integration between a third party and the billing practitioner, we do not believe the criteria for billing remote monitoring services are actually being met and therefore, the practitioner should not bill for remote monitoring services in those instances. As such, the billing practitioner must retain a certain level of involvement in remote monitoring services. The codes for reporting clinical staff time are valued to include a certain amount of ongoing work and supervision by the billing practitioner consistent with the included service elements that may not be delegated to any other parties. After consideration of public comments, we are finalizing that for the purposes of billing Medicare, beginning January 1, 2029, the RPM and RTM codes cannot be billed in cases where the service is not performed by clinical staff that is a direct employee of the practitioner or the practitioner's practice and contracting out to third-party companies will not be allowed after that time. Prior to this date, CMS will be publishing sub-regulatory guidance further clarifying clinical staff arrangements that may be appropriate for remote monitoring services.

(e) Valuation

Remote physiologic monitoring (RPM) represents the remote monitoring of parameters such as weight, blood pressure, and pulse oximetry to monitor a patient's condition and inform their management. The remote physiologic monitoring code set currently includes CPT codes 99091, 99445, 99453, 99454, 99457, 99458, 99470, 99473, and 99474 (code descriptors in Table A–D6). Remote therapeutic monitoring (RTM) represents the monitoring of adherence to at-home therapeutic interventions. For RTM, there are distinct device supply codes for three types of therapeutic monitoring: respiratory system, cognitive behavioral therapy, and musculoskeletal system monitoring. The remote therapeutic monitoring code set currently includes CPT codes 98975, 98976, 98977, 98978, 98979, 98980, 98981, 98984, and 98985 (code descriptors in Table A–D6). There are three components of RPM and RTM services: education and setup, device supply, and treatment management.

BILLING CODE 4169–69–P

TABLE A-D6: CY 2027 REMOTE MONITORING CODES

CPT Code	Long Descriptor
98975	Remote therapeutic monitoring (eg, therapy adherence, therapy response, digital therapeutic intervention); initial set-up and patient education on use of equipment
98976	Remote therapeutic monitoring (eg, therapy adherence, therapy response, digital therapeutic intervention); device(s) supply for data access or data transmissions to support monitoring of respiratory system, 16-30 days in a 30-day period
98977	Remote therapeutic monitoring (eg, therapy adherence, therapy response, digital therapeutic intervention); device(s) supply for data access or data transmissions to support monitoring of musculoskeletal system, 16-30 days in a 30-day period
98978	Remote therapeutic monitoring (eg, therapy adherence, therapy response, digital therapeutic intervention); device(s) supply for data access or data transmissions to support monitoring of cognitive behavioral therapy, 16-30 days in a 30-day period
98979	Remote therapeutic monitoring treatment management services, physician or other qualified health care professional time in a calendar month requiring at least 1 real-time interactive communication with the patient or caregiver during the calendar month; first 10 minutes
98980	Remote therapeutic monitoring treatment management services, physician or other qualified health care professional time in a calendar month requiring at least one interactive communication with the patient or caregiver during the calendar month; first 20 minutes
98981	Remote therapeutic monitoring treatment management services, physician or other qualified health care professional time in a calendar month requiring at least one interactive communication with the patient or caregiver during the calendar month; each additional 20 minutes (List separately in addition to code for primary procedure)
98984	Remote therapeutic monitoring (eg, therapy adherence, therapy response, digital therapeutic intervention); device(s) supply for data access or data transmissions to support monitoring of respiratory system, 2-15 days in a 30-day period
98985	Remote therapeutic monitoring (eg, therapy adherence, therapy response, digital therapeutic intervention); device(s) supply for data access or data transmissions to support monitoring of musculoskeletal system, 2-15 days in a 30-day period
98986	Remote therapeutic monitoring (eg, therapy adherence, therapy response, digital therapeutic intervention); device(s) supply for data access or data transmissions to support monitoring of cognitive behavioral therapy, 2-15 days in a 30-day period
99091	Collection and interpretation of physiologic data (eg, ECG, blood pressure, glucose monitoring) digitally stored and/or transmitted by the patient and/or caregiver to the physician or other qualified health care professional, qualified by education, training, licensure/regulation (when applicable) requiring a minimum of 30 minutes of time, each 30 days
99445	Remote monitoring of physiologic parameter(s) (eg, weight, blood pressure, pulse oximetry, respiratory flow rate), initial: device(s) supply with daily recording(s) or programmed alert(s) transmission, 2-15 days in a 30-day period
99453	Remote monitoring of physiologic parameter(s) (eg, weight, blood pressure, pulse oximetry, respiratory flow rate), initial; set-up and patient education on use of equipment
99454	Remote monitoring of physiologic parameter(s) (eg, weight, blood pressure, pulse oximetry, respiratory flow rate), initial; device(s) supply with daily recording(s) or programmed alert(s) transmission, 16-30 days in a 30-day period
99457	Remote physiologic monitoring treatment management services, clinical staff/physician/other qualified health care professional time in a calendar month requiring interactive communication with the patient/caregiver during the month; first 20 minutes
99458	Remote physiologic monitoring treatment management services, clinical staff/physician/other qualified health care professional time in a calendar month requiring interactive communication with the patient/caregiver during the month; each additional 20 minutes (List separately in addition to code for primary procedure)
99470	Remote physiologic monitoring treatment management services, clinical staff/physician/other qualified health care professional time in a calendar month requiring 1 real-time interactive communication with the patient/caregiver during the calendar month; first 10 minutes
99473	Self-measured blood pressure using a device validated for clinical accuracy; patient education/training and device calibration
99474	Self-measured blood pressure using a device validated for clinical accuracy; separate self-measurements of two readings one minute apart, twice daily over a 30-day period (minimum of 12 readings), collection of data reported by the patient and/or caregiver to the physician or other qualified health care professional, with report of average systolic and diastolic pressures and subsequent communication of a treatment plan to the patient

BILLING CODE 4169–69–C

For CPT codes 99453 and 98975, which are PE-only codes describing RPM and RTM initial set-up and patient education on use of equipment, respectively, we proposed to crosswalk the direct PE inputs from CPT code 99473 (*Self-measured blood pressure using a device validated for clinical accuracy; patient education/training and device calibration*), as we believe the existing valuation of CPT codes 99453 and 98975 may not accurately reflect the resource costs involved in those services. Specifically, we are concerned that, due to lack of information regarding the typical device used to perform these procedures, these services are overvalued. We believe that the typical device used for these procedures in the physician office setting may not be accurately captured in the data previously used for valuation, as we have received very little invoice or pricing information from interested parties for the specific devices used in RTM and RPM services. We believe that a crosswalk to the direct PE inputs associated with CPT code 99473 may more accurately capture the resource costs associated with a typical device set-up and patient education on use of equipment. We sought comment on this proposal, specifically information regarding the typical clinical workflow for the initial set-up and patient education on use of equipment services used in furnishing RPM or RTM and their associated costs.

For CPT codes 99445 and 99454, which are PE-only codes describing RPM device(s) supply with daily recording(s) or programmed alert(s) transmission, we proposed to crosswalk the direct PE inputs from CPT code 99474 (*Self-measured blood pressure using a device validated for clinical accuracy; separate self-measurements of two readings one minute apart, twice daily over a 30-day period (minimum of 12 readings), collection of data reported by the patient and/or caregiver to the physician or other qualified health care professional, with report of average systolic and diastolic pressures and subsequent communication of a treatment plan to the patient*). For CPT codes 98976, 98977, 98978, 98984, 98985, and 98986, which are PE-only

codes describing RTM device(s) supply for data access or data transmissions, we proposed to crosswalk the direct PE inputs from CPT code 93270 (*External patient and, when performed, auto activated electrocardiographic rhythm derived event recording with symptom-related memory loop with remote download capability up to 30 days, 24-hour attended monitoring; recording (includes connection, recording, and disconnection)).* We believe the existing valuation of CPT codes 99445, 99454, 98976, 98977, 98978, 98984, 98985, and 98986 may not accurately reflect the resource costs involved in these services, especially since we continue to lack data surrounding the typical RPM and RTM devices and the costs associated with them. Specifically, we are concerned that, due to lack of information regarding the typical device used to perform these procedures, these services are overvalued. We believe that the typical device used for these procedures in the physician office setting may not be accurately captured in the data previously used for valuation, as we have received very little invoice or pricing information from interested parties for the specific devices used in RTM and RPM services. We believe that the crosswalk to the direct PE inputs associated with the proposed codes discussed earlier may more accurately capture the resource costs associated with a typical device. We solicited comments on this proposal, specifically information regarding the typical devices used in furnishing RPM or RTM, not just their associated costs and invoices, but robust evidence detailing what providers are actually paying for these devices, including discounts or other typical pricing details. We sought other types of pricing data and information for RPM or RTM devices, including if the costs include software, hardware, or both, as well as more information about the typical devices. For CPT codes 99470, 99457, 99458, 98979, 98980, and 98981, which describe the physician/QHP work associated with treatment management, we proposed to eliminate PE inputs for these codes, as we believe resource costs for these services are accurately captured in the work RVUs, and we do not believe the typical clinical workflow for these services would involve clinical staff time. We proposed that the current work RVUs and current work times for these codes be maintained. We welcomed information regarding the typical clinical workflow for these services.

We solicited comments on these proposals, as well as requested general feedback from the public that may be useful in further development of our payment policies for remote monitoring services that are currently separately payable under the PFS.

We received public comments on these proposals. The following is a summary of the comments we received and our responses.

Comment: A few commenters expressed support for the revaluation of RPM and RTM codes as RPM payment in its current form incentivizes a focus on generating billable encounters, regardless of whether those interactions provide meaningful clinical value. We also received a comment expressing concern regarding incentive systems that rewarded intervention rather than clinical restraint. A few other commenters agreed with CMS that remote monitoring device costs have declined since the codes were first valued and requested CMS pair the revaluation with a published methodology and a transparent, periodically updated device cost benchmark.

Response: We thank commenters for their support of our proposals.

Comment: Many commenters expressed concern that CMS lacked adequate information on costs to properly revalue codes and requested CMS gather more information related to true costs of RPM and RTM services from stakeholders, including the RUC, before finalizing any revaluation of codes. Some recommended confidential submissions on cost data be accepted. Many commenters did not believe the services used in the crosswalks were analogous to the services described in the remote monitoring code set, including that the remote monitoring services are more comprehensive in the crosswalk codes. Commenters were concerned that the lower valuations may reduce incentives for thorough set up, education, and treatment management services. Some commenters stated that devices represented in the crosswalk were not analogous to the universe of devices used in RPM and RTM services. Commenters stated that some devices include enhanced features such as built-in internet connectivity, automatic data transmission capabilities, the generation of clinically actionable alerts, and connectivity capabilities in otherwise connectivity-limited areas. Commenters believed such devices were undervalued in the proposed crosswalk. A few commenters commented that RPM programs would be incentivized to adopt hardware based solely on price rather than devices selected for clinical benefit and recommended CMS base reimbursement on the capability of the device. Some commenters requested CMS disclose the data used to inform the final valuation of codes. Many commenters expressed concern that the proposed crosswalk of codes did not take into account fixed costs practices incur to support RPM and RTM programs, including infrastructure upkeep and connectivity costs, and costs related to accessing device-specific platforms and data generated from devices. Some commenters recommended CMS carry the current values forward while the revaluation is completed or phase-in any revaluation codes over a period of multiple years.

Response: We thank commenters for this additional information. The AMA informed CMS that in response to our concerns over a lack of data to inform accurate valuation of these services, all 19 RPM and RTM codes will have their practice expense reviewed at the January 2027 RUC meeting. We look forward to reviewing the information from the RUC, as well as any additional information that interested parties provide regarding the costs of these services for future rulemaking. We would also like to clarify that, for many of these remote monitoring CPT codes, the phase-in of significant RVU reductions and its associated adjustment will be applied (cite PE step 19). Section 1848(c)(8) of the Act requires CMS to phase-in decreases in total RVUs for a service that is not a new or revised code over two years if the RVUs would otherwise be decreased by an estimated amount equal to or greater than 20 percent. Since a 19 percent reduction is the maximum 1-year reduction for any service not described by a new or revised code, many of these changes will be phased in over multiple calendar years.

After consideration of public comments, we are finalizing the work and direct PE inputs as proposed for CPT codes 99445, 99453, 99454, 98975, 98976, 98977, 98984, and 98985.

Comment: A few commenters requested that CMS clarify the status and valuation of CPT codes 98978 and 98986.

Response: As discussed in the proposed rule, CPT codes 98978 and 98986 will be actively priced beginning in CY 2027. Since these codes were formerly contractor priced, they are considered to be ''new or revised'' codes and therefore the phase-in transition does not apply like it does to the other remote monitoring codes (for additional information regarding the phase-in of significant RVU reductions, we direct readers to the CY 2016 PFS final rule (80 FR 70927 through 70929)). In the

proposed rule, the valuation of CPT codes 98978 and 98986 was lower than the RTM device supply codes for other conditions. Due to being assigned different indirect PE allocations in the NPRM, CPT codes 98978 and 98986 had different valuations. We agree with commenters data that these codes do not have drastically different resource costs than RTM device supply codes for other conditions and that CPT codes 98978 and 98986 should be treated like other device supply codes. As discussed in the CY 2026 PFS final rule, we continue to believe that since the device is supplied to the beneficiary for the full 30-day period, regardless of the number of days that data is transmitted, these codes should be assigned the same valuation.

After consideration of public comments, for CY 2027, we are finalizing that CPT codes 98978 and 98986 be crosswalked to CPT code 98977 to ensure that all three codes share the same PE RVU.

Comment: Some commenters expressed concern that the proposed reimbursement valuation changes do not adequately recognize the clinical resources required to furnish clinically meaningful RPM and RTM services. Several commenters suggested that the proposals to eliminate expenses associated with clinical labor based on an assumption that a typical clinical workflow for some services would not involve clinical staff time, were inherently in tension with other proposals to only allow payment for RPM or RTM services when furnished by clinical staff employed by the practice. Many commenters also identified that clinical staff time is specified in the code descriptors for these services.

Response: We thank commenters for the additional information regarding the typical clinical workflow for these services. After reviewing this information, we agree with commenters that clinical staff are often used when furnishing treatment management services for remote physiologic and remote therapeutic monitoring.

After consideration of public comments, we are not finalizing as proposed to eliminate direct PE inputs for CPT codes 99470, 99457, 99458, 98979, 98980, and 98981.

(f) Comment Solicitation in the Proposed Rule

We have concerns about the administrative burden of the numerous remote monitoring codes and proliferation of this code family. We also continue to work to implement recommendations from the recent OIG reports that we are concerned cannot be fully resolved with the current coding structure of the remote monitoring code family, such as ensuring that beneficiaries receive all components of the remote monitoring service. For example, the OIG report found that, ''About 43 percent of enrollees who received remote patient monitoring did not receive all 3 components of it, raising questions about whether the monitoring is being used as intended.'' (Additional Oversight of Remote Patient Monitoring in Medicare Is Needed [17]).

We also considered, and sought comment on, bundling CPT codes 99453, 99445, 99454, 99091, 99470, 99457, 99458, 98975, 98984, 98976, 98985, 98977, 98986, 98978, 98979, 98980, and 98981 through the creation of new codes that describe initial set up and monthly monitoring/management for RPM and RTM, respectively. For payment for remote monitoring services under the PFS, we also considered, and sought comment on, the creation of four new HCPCS G-Codes:

- GRPM1: RPM initial set-up and patient education.
- GRPM2: Remote monitoring of physiologic parameter(s) (*e.g.,* weight, blood pressure, pulse oximetry, respiratory flow rate), per calendar month, including:

++ Device(s) supply with daily recording(s) or programmed alert(s) transmission.

++ 2 or more days of data transmission.

++ Treatment management services, requiring at least one real-time interactive communication with the patient/caregiver; time totaling at least 20 minutes.

- GRTM1: RTM initial set-up and patient education.
- GRTM2: Remote monitoring of therapeutic parameter(s) (e.g., therapy adherence, therapy response, digital therapeutic intervention), per calendar month, including:

++ Device(s) supply for data access or data transmissions.

++ 2 or more days of data transmission.

++ Treatment management services, requiring at least one real-time interactive communication with the patient or caregiver; time totaling at least 20 minutes.

We sought comment on these HCPCS G-codes and also sought comment on any other revisions needed to the code descriptors to reflect the necessary service elements for this code family. These HCPCS G-codes would adopt all current conditions of payment for the remote therapeutic and remote physiologic codes finalized in prior rulemaking, as well as the proposed established patient, initiating visit, or supervision or both requirements outlined earlier in this section, if finalized. As drafted, all service elements outlined in the G-code descriptors would be required each calendar month. We sought public comment on these HCPCS G-codes.

The creation of these G-codes could alleviate administrative burden, as this would reduce the number of remote monitoring codes from 17 to four. These HCPCS G-codes would also ensure that beneficiaries receive treatment management services when receiving remote monitoring services. According to the OIG Reports, billing for Remote Patient Monitoring in Medicare [18] and Additional Oversight of Remote Patient Monitoring in Medicare Is Needed,[19] some beneficiaries do not regularly receive treatment management services. The OIG Report, Additional Oversight of Remote Patient Monitoring in Medicare Is Needed,[20] also stated that 43 percent of enrollees who received remote patient monitoring did not receive at least one of the three components (patient education and set-up, device supply, and treatment management). Although we have not required that providers bill for all three components, this data from the OIG Report raises questions about how these services are being used. By incorporating device supply, data transmission, and treatment management into one code, we could ensure that those service elements are always provided.

In the CY 2024 PFS final rule (88 FR 79071 through 79073), we finalized the policy to add the suite of services that comprise RPM and RTM services to the general care management code, G0511 beginning January 1, 2024 as the requirements for RPM and RTM services are similar to the non-face-to-face requirements for the general care management services furnished in RHCs and FQHCs. Beginning January 1, 2025, RHCs and FQHCs are required to bill the individual codes that make up the general care management HCPCS code, G0511 (89 FR 97998 through 98010). Accordingly, we sought comment on

[17] *https://oig.hhs.gov/reports/all/2024/additional-oversight-of-remote-patient-monitoring-in-medicare-is-needed/.*

[18] *https://oig.hhs.gov/reports/all/2025/billing-for-remote-patient-monitoring/.*

[19] *https://oig.hhs.gov/reports/all/2024/additional-oversight-of-remote-patient-monitoring-in-medicare-is-needed/.*

[20] *https://oig.hhs.gov/reports/all/2024/additional-oversight-of-remote-patient-monitoring-in-medicare-is-needed/.*

implementing these HCPCS G-codes in RHCs and FQHCs.

We sought comment on valuation for these HCPCS G-codes. For GRPM1 and GRTM1, which could be PE-only codes describing RPM and RTM initial set-up and patient education on use of equipment, respectively, we could crosswalk the direct PE inputs from CPT code 99473 (*Self-measured blood pressure using a device validated for clinical accuracy; patient education/training and device calibration*). We sought comment on this valuation, specifically information regarding the typical clinical workflow for the initial set-up and patient education on the use of equipment services used in furnishing RPM or RTM and their associated costs.

For GRPM2, we could crosswalk the work RVU input of 0.61 RVUs from CPT code 99457 and the direct PE inputs from CPT code 99474 (*Self-measured blood pressure using a device validated for clinical accuracy; separate self-measurements of two readings one minute apart, twice daily over a 30-day period (minimum of 12 readings), collection of data reported by the patient and/or caregiver to the physician or other qualified health care professional, with report of average systolic and diastolic pressures and subsequent communication of a treatment plan to the patient*).

For GRTM2, we could crosswalk the work RVU input of 0.62 RVUs from CPT code 98980 and the direct PE inputs from CPT code 93270 (*External patient and, when performed, auto activated electrocardiographic rhythm derived event recording with symptom-related memory loop with remote download capability up to 30 days, 24-hour attended monitoring; recording (includes connection, recording, and disconnection)).*

We received public comments on this comment solicitation. We appreciate the commenters for their comments. After consideration of public comments, we will take the comments into consideration for possible future rulemaking.

(49) National Payment for Non-Sheet Form Skin Substitutes

In the CY 2026 PFS final rule (90 FR 49500), we finalized contractor pricing for non-sheet form skin substitutes. We stated that these products have the potential to be payable as skin substitutes; but that the units, as expressed in a product's coding, are difficult to standardize for payment purposes. Therefore, we finalized that we would maintain the current coding mechanism for these products and would direct the Medicare Administrative Contractors (MACs) to determine appropriate payment, which is generally consistent with how these products are currently paid. We stated that we would continue to evaluate payments for these products to determine if an alternative payment methodology may be better suited to non-sheet products.

Based on ongoing analysis and feedback from internal and external interested parties, we have come to believe that, on the balance, the resource costs per cm^2 for non-sheet form skin substitutes is consistent with the resource costs associated with sheet form skin substitutes. For non-sheet skin substitute products, cm^2 reflects the wound surface area treated rather than the physical dimensions of the product. Therefore, for CY 2027, we proposed to nationally price the non-sheet form skin substitutes consistent with the payment rates associated with the sheet form skin substitutes. For a list of the non-sheet form skin substitutes, please refer to the skin substitutes section located on the CMS website (*https://www.cms.gov/medicare/payment/fee-schedules/physician-fee-schedule/skin-substitutes*).

We received public comments on these proposals. The following is a summary of the comments we received and our responses.

Comment: Many commenters raised concerns with our previously finalized skin substitute policy in the CY 2026 PFS Final Rule. These commenters stated specific concerns with the decision to weigh the national payment rate for sheet form skin substitutes of $127.14 per cm^2 for CY 2026 using product-specific hospital outpatient data as they believe it is not indicative of true costs across both settings of care. Commenters also mentioned they believe the $127.14 per cm^2 payment rate is too low. Additionally, commenters noted that CMS should not update the skin substitute payment rate using ASP data and instead use an inflationary update to ensure increases in manufacturer costs are appropriately captured in the payment rate. Lastly, some commenters also suggested CMS should remove the geographic adjustments to skin substitute products serviced in office settings due to patient access issues.

Response: We appreciate the feedback expressed by commenters regarding their concerns about our overall approach to payment for skin substitute products. However, we note that we did not propose any changes to the payment rate itself nor any changes to how the payment rate is calculated or updated. Instead, we proposed in the CY 2027 PFS Proposed Rule to establish the same national payment rate for non-sheet skin substitutes that is consistent with the payment rate established for the sheet form skin substitutes.

Comment: A few commenters requested CMS to clarify what payment amount will be used for the non-sheet form skin substitute products.

Response: The same rate established for the sheet-form skin substitutes of $127.14 per cm^2 will apply for the non-sheet form skin substitute products.

Comment: Many commenters raised concerns that measuring non-sheet form skin substitute products per cm^2 does not fully account for three-dimensional wound characteristics, including depth and volume. Additionally, a few commenters suggested that CMS recognize the concepts of Internal Surface Area (ISA) and Therapeutic Treatment Area (TTA) as described in the recently published wound-care consensus recommendations as an alternative unit of measure.

Response: We acknowledge commenters' concerns that non-sheet skin substitute products may be used to treat wounds of varying depth and volume. However, we do not believe that these factors prevent the use of a per cm^2 payment methodology as a per cm^2 payment rate accounts for differences in wound surface area that can be used to estimate volume. We therefore do not believe that differences in product form, or variations in wound depth and volume alone, necessarily warrant a separate payment methodology for non-sheet products.

Comment: A few commenters questioned that the per cm^2 approach for non-sheet form skin substitute does not align with the products' code descriptors because they contain various forms of measurement such as, ''per mL,'' ''per cc,'' or ''per mg.'' These commenters requested CMS to clarify how the proposed nationally priced payment approach of per cm^2 for non-sheet skin substitute products would correspond with the variety of measurements displayed in the current code descriptors.

Response: We acknowledged in the CY 2026 PFS final rule that non-sheet skin substitute products may be described and supplied using units other than square centimeters, including milliliters, cubic centimeters, milligrams, or other units (90 FR 49500). Similar to how non-sheet form skin substitute products are currently being paid under MAC pricing with no modifications to the code descriptors, we believe it is appropriate to maintain existing HCPCS descriptors that

accurately reflect the form and quantity of the product. Our proposal to establish a per cm^2 payment for non-sheet form skin substitute products based on wound surface area does not require that the product itself be packaged or marketed in a per cm^2 unit.

Comment: Many commenters brought to our attention the proposed rule provides limited instruction regarding the interaction between the new HCPCS application codes (G0681–G0684) and the corresponding non-sheet form skin substitute product HCPCS codes. Some of these commenters urged CMS to create national payment rates for G0681–G0684, with the same RVUs as the current administration codes for sheet form skin substitutes described under CPT codes 15271–15278.

Response: We thank commenters for their feedback and clarify that HCPCS application codes G0681–G0684 are only to be used for non-sheet form skin substitute products. CMS stated in the CY 2027 PFS Proposed Rule that we would align the same payment rate for sheet form skin substitute products as we would for the non-sheet form skin substitute products. We maintain this consistency is relevant for the application codes for non-sheet form skin substitutes described under HCPCS G0681–G0684. Therefore, CMS will establish a national payment rate for the non-sheet form skin substitute application codes G0681–G0684 similar to how CPT codes 15271–15278 are currently paid.

Comment: Some commenters requested CMS provide additional analysis, including HCPCS-defined billing units, price basis, cost data, conversion assumptions, and sensitivity analyses used to reach its resource-equivalence conclusion. These commenters stated our proposal is unsupported and additional information on analyses is required to understand how CMS came to the approach that non-sheet form skin substitutes can be treated on a per cm^2 basis.

Response: We thank commenters for their feedback. However, we disagree that our proposal to standardize payment for non-sheet form skin substitute products reflects an unsupported assumption of resource equivalence. In the CY 2026 rulemaking, we specifically sought comment on how non-sheet form skin substitute products furnished in units such as milliliters, cubic centimeters, and milligrams could be incorporated into a standardized payment methodology. After taking into consideration the comments received from the CY 2026 PFS Proposed Rule, we determined that additional evaluation was warranted and finalized contractor pricing for CY 2026 while we continued to assess an appropriate methodology. Our CY 2027 proposal reflects that continued evaluation and feedback from interested parties. We therefore believe our proposal effectively demonstrates the progression of our consideration of non-sheet form skin substitute products.

Comment: Many commenters were in support of our proposal to nationally price non-sheet form skin substitutes consistent with the payment rate associated with sheet form skin substitutes. These commenters agreed with CMS's assessment that the resource costs per cm^2 for non-sheet form skin substitutes is consistent with the resource costs associated with sheet form skin substitutes. Additionally, commenters noted our proposal would protect beneficiaries and ensure good value for the Medicare program and thus taxpayers. Lastly, commenters also stated they believe our proposal will continue to address unsustainable spending growth and clinical inconsistency in the skin substitute product space.

Response: We thank commenters for their support and reiterate our commitment to protecting beneficiaries, promoting appropriate use of Medicare resources, and safeguarding taxpayer dollars while further preventing fraud, waste, and abuse.

After consideration of the public comments, we are finalizing our proposal to nationally price the non-sheet form skin substitutes on a per cm^2 basis, consistent with the payment rates associated with the sheet form skin substitutes.

(50) Smoking and Tobacco Use Cessation (CPT Codes 99406, 99407) and Structured Assessment, Brief Intervention, and Referral to Treatment (SBIRT) (HCPCS Codes G2011, G0396, G0397)

The Trump Administration Executive Order, ''Establishing the President's Make America Health Again Commission''[21] is a top priority for CMS, as such we continue to focus on the prevention and management of chronic disease. Chronic disease remains a significant public health concern, with three in four American adults having at least one chronic condition, and more than half having two or more chronic conditions. Many preventable chronic diseases are caused by a short list of risk behaviors, including smoking, poor nutrition, physical inactivity, and excessive alcohol use.[22] These patterns reinforce the need for accessible behavioral health services that can help individuals reduce these risk behaviors.

In the CY 2024 PFS final rule (88 FR 79006 through 79010), we finalized an increase in the valuation for timed behavioral health services under the PFS by applying an upward adjustment of 19.1 percent to the work RVUs for time-based psychotherapy codes payable under the PFS. This increase is being implemented over a 4-year transition period.

We believe similar adjustments are warranted for smoking and tobacco use cessation, CPT codes 99406 (*Smoking and tobacco use cessation counseling visit; intermediate, greater than 3 minutes up to 10 minutes*) and 99407 (*Smoking and tobacco use cessation counseling visit; intensive, greater than 10 minutes*) and screening, brief intervention, and referral to treatment (SBIRT) services, HCPCS codes G2011 (*Alcohol and/or substance (other than tobacco) misuse structured assessment (e.g., audit, dast), and brief intervention, 5–14 minutes*), G0396 (*Alcohol and/or substance (other than tobacco) misuse structured assessment (e.g., audit, dast), and brief intervention 15 to 30 minutes*), and G0397(*Alcohol and/or substance (other than tobacco) misuse structured assessment (e.g., audit, dast), and intervention, greater than 30 minutes*).

Smoking and tobacco cessation and SBIRT services are evidence supported behavioral health interventions. Quitting smoking provides immediate health improvements including lowering the likelihood of developing lung cancer and other smoking-related cancers, and reduces the risks of coronary heart disease, stroke, and chronic obstructive pulmonary disease. Evidence based smoking and tobacco cessation treatments are effective, including the combination of behavioral counseling and medication therapy.[23] SBIRT effectively addresses substance use. In primary care and other clinical settings, SBIRT has been shown to help decrease unhealthy substance use and misuse.[24]

The smoking and tobacco cessation services (CPT codes 99406 and 99407) and SBIRT services HCPCS codes G0396 and G0397 were last valued in 2008, and the SBIRT service HCPCS code G2011 was created and last valued in

[21] *https://www.whitehouse.gov/presidential-actions/2025/02/establishing-the-presidents-make-america-healthy-again-commission/.*

2019. Given the evidence supported role these services play in preventing and managing chronic disease and behavioral health conditions including alcohol and/or substance misuse, we believe that valuation should more accurately reflect the clinical intensity and work associated with these time-based services.

Therefore, we proposed applying the same upward adjustment of 19.1 percent to the work RVUs for these time-based services aligning with the adjustments made to the time-based psychotherapy codes, in conjunction with the fourth and final year of the phase-in for time-based psychotherapy codes that we finalized in the CY 2024 PFS final rule (88 FR 79006 through 79010). Although the upward adjustment of 19.1 percent for the time-based psychotherapy codes has been implemented over a 4-year period, with CY 2027 being the fourth year, we proposed to apply the full 19.1 percent to smoking and tobacco use cessation services and SBIRT services in this final year of the transition. This approach ensures that these services are brought into alignment with the psychotherapy codes at the completion of the 4-year phase-in timeline, rather than initiating a new multiyear phase-in period. We proposed to refine the work RVU of smoking and tobacco use cessation services codes as follows: for CPT code 99406 by increasing the work RVU to 0.29 from the current 0.24, and CPT code 99407 by increasing the work RVU to 0.60 from the current 0.50; and for the SBIRT services codes, we proposed to refine the work RVU as follows, for HCPCS code G2011 by increasing the work RVU to 0.39 from the current 0.33, for HCPCS code G0396 by increasing the work RVU to 0.77 from the current 0.65, and for HCPCS code G0397 by increasing the work RVU to 1.55 from the current 1.30.

We received public comments on these proposals. The following is a summary of the comments we received and our responses.

Comment: Commenters were overwhelmingly in support of the proposed upward adjustment of 19.1 percent to the work RVUs for Smoking and Tobacco Use Cessation (CPT codes 99406, 99407) and SBIRT (HCPCS codes G2011, G0396, G0397) services. Commenters indicated that these services are important for prevention, chronic disease management, behavioral health integration, and improved patient outcomes.

Response: We thank the commenters for their support. Additionally, we are clarifying that although the proposed rule described SBIRT as *screening, brief intervention, and referral to treatment,* for purposes of PFS payment, SBIRT, specifically HCPCS codes G2011, G0396, and G0397, are defined as *structured assessment, brief intervention, and referral to treatment for substance use disorders.*

Comment: Many commenters recommended that similar upward valuation adjustments should also be applied to other time-based behavioral health codes, including neurobehavioral status exam, developmental test administration, psychological testing evaluation, neuropsychological testing evaluation, and test administration and scoring services. Some of the commenters indicated that these codes describe time-based behavioral health services and are intended to inform diagnosis and care recommendations for a wide range of medical and psychological issues. The commenters continued to state that lagging values for these services impacts patient access and discourages workforce development in these areas.

Response: We thank commenters for this feedback. After consideration of the comments, we continue to believe, as stated in the CY 2024 PFS final rule (88 FR 79009), that the codes referenced by the commenters are describing psychological and neuropsychological testing services, which are distinct from the psychotherapy services with regard to the nature of the work, such that, these codes describing psychological and neuropsychological testing services are not necessarily timed services that are provided without assistance from clinical staff. Therefore, these services do not fit the same criteria as the services addressed in the CY 2024 PFS final rule, which formed the basis for increasing the valuation of smoking and tobacco cessation and SBIRT services. However, we may consider updates to the valuation of these services for future rulemaking.

Comment: Several commenters supported applying the full upward adjustment of 19.1 percent to the work RVUs without an additional phase-in period. However, a couple of commenters recommended a phase-in approach in the work RVU increase, similar to how the psychotherapy codes were phased in over a four-year transition period.

Response: We thank commenters for this feedback. After consideration of the comments, we will apply the full 19.1 percent to the work RVUs to smoking and tobacco use cessation services and SBIRT services in this final year of the of the phase of these updates.

Comment: A few commenters requested that CMS re-evaluate and apply comparable adjustments to HCPCS code G2213 (*Initiation of medication for the treatment of opioid use disorder in the emergency department setting, including assessment, referral to ongoing care, and arranging access to supportive services (list separately in addition to code for primary procedure)*) for consistency with SBIRT codes since CMS originally established the valuation of G2213 using a direct crosswalk to HCPCS code G10397, one of the SBIRT codes. A commenter recommended for CMS to apply the same work RVU adjustment to HCPCS codes G0442 (*Annual alcohol misuse screening, 5 to 15 minutes*) and G0443 (*Brief face-to-face behavioral counseling for alcohol misuse, 15 minutes*), in future rulemaking.

Response: We thank commenters for this feedback; we may consider updates to the valuation of these services in future rulemaking.

Comment: A commenter recommended replacing HCPCS G0396 and G0397 with CPT codes 99408 and 99409, to assist with reducing administrative burden due to recognition of different codes by different payers.

Response: We thank the commenter for this feedback. As explained in the CY 2008 PFS final rule (72 FR 66371) and CY 2013 PFS final rule (77 FR 68955), the code descriptions for CPT codes 99408 (*Alcohol and/or substance (other than tobacco) abuse structured screening (e.g., AUDIT, DAST), and brief intervention (SBI) services; 15 to 30 minutes*) and 99409 (*Alcohol and/or substance (other than tobacco) abuse structured screening (e.g., AUDIT, DAST), and brief intervention (SBI) services; greater than 30 minutes*), suggest that these CPT codes may describe services that include screening services, and the screening component would not meet the statutory requirements for coverage under section 1861(a)(1)(A) of the Act. Screening services are not covered by Medicare without specific statutory authority, therefore, we will continue to use HCPCS codes G0396 and G0397.

Comment: A commenter recommended that CMS review and revalue HCPCS codes G3002 and G3003 as a potentially misvalued services.

Response: Commenters are welcome to submit codes by February 10th of the coming year for consideration as potentially misvalued services in the CY 2028 PFS proposed rule. See the discussion regarding Potentially Misvalued Services Under the PFS in this final rule for more information on how to submit a nomination for a potentially misvalued code.

Comment: A few commenters supported the proposal to increase the work RVUs for Smoking and Tobacco Use Cessation and SBIRT and requested CMS ensure that the change does not disrupt existing community health center (CHC) prospective payment system (PPS) reimbursement. The commenters also indicated that CHCs do not currently have a reimbursement pathway for SBIRT and recommend establishing a pathway for CHCs to receive payment for SBIRT.

Response: We thank commenters for the support. We do not intend for the changes in PFS valuation of Smoking and Tobacco Use Cessation and SBIRT to affect the CHC PPS payment for these services. The CHC reimbursement pathway for SBIRT is outside the scope of this proposal.

After consideration of public comments, we are finalizing our proposal to apply the same upward adjustment of 19.1 percent to the work RVUs for these time-based services, Smoking and Tobacco Use Cessation (CPT codes 99406, 99407) and SBIRT (HCPCS codes G2011, G0396, G0397), aligning with the adjustments made to the time-based psychotherapy codes, in conjunction with the fourth and final year of the phase-in for time-based psychotherapy codes that we finalized in the CY 2024 PFS final rule (88 FR 79006 through 79010).

(51) Psychiatric Collaborative Care Model (CoCM) (CPT Codes 99492, 99493, 99494, G2214) and APCM BHI add-on Codes (HCPCS Codes G0568, G0569)

Patients with chronic health conditions are ''more likely to have related behavioral health concerns and find it easier to improve chronic conditions when these concerns are also addressed.''[25] Integrating behavioral health with primary care has been shown to improve outcomes like reductions in depression severity and enhancing patient's experience of care.[26]

In the CY 2017 PFS final rule (81 FR 80230), we established separate payment for three services, HCPCS codes G0502 (*Initial psychiatric collaborative care management, first 70 minutes in the first calendar month of behavioral health care manager activities, in consultation with a psychiatric consultant, and directed by the treating physician or other qualified health care professional, with the following required elements: outreach to and engagement in treatment of a patient directed by the treating physician or other qualified health care professional; initial assessment of the patient, including administration of validated rating scales, with the development of an individualized treatment plan; review by the psychiatric consultant with modifications of the plan if recommended; entering patient in a registry and tracking patient follow-up and progress using the registry, with appropriate documentation, and participation in weekly caseload consultation with the psychiatric consultant; and provision of brief interventions using evidence-based techniques such as behavioral activation, motivational interviewing, and other focused treatment strategies*), G0503 (*Subsequent psychiatric collaborative care management, first 60 minutes in a subsequent month of behavioral health care manager activities, in consultation with a psychiatric consultant, and directed by the treating physician or other qualified health care professional, with the following required elements: tracking patient follow-up and progress using the registry, with appropriate documentation; participation in weekly caseload consultation with the psychiatric consultant; ongoing collaboration with and coordination of the patient's mental health care with the treating physician or other qualified health care professional and any other treating mental health providers; additional review of progress and recommendations for changes in treatment, as indicated, including medications, based on recommendations provided by the psychiatric consultant; provision of brief interventions using evidence-based techniques such as behavioral activation, motivational interviewing, and other focused treatment strategies; monitoring of patient outcomes using validated rating scales; and relapse prevention planning with patients as they achieve remission of symptoms and/or other treatment goals and are prepared for discharge from active treatment*), and G0504 (*Initial or subsequent psychiatric collaborative care management, each additional 30 minutes in a calendar month of behavioral health care manager activities, in consultation with a psychiatric consultant, and directed by the treating physician or other qualified health care professional (list separately in addition to code for primary procedure); (use G0504 in conjunction with G0502, G0503*), used to bill for monthly services furnished using the psychiatric collaborative care model (CoCM), an evidence-based approach to behavioral health integration that enhances ''usual'' primary care by adding care management support and regular psychiatric inter-specialty consultation. The G-codes were valued to account for the work of the treating physician or other qualified health care professionals, based on a direct crosswalk to the work values for the complex Chronic Care Management (CCM) services, CPT codes 99487 (*Complex chronic care management services with the following required elements: multiple (two or more) chronic conditions expected to last at least 12 months, or until the death of the patient, chronic conditions that place the patient at significant risk of death, acute exacerbation/ decompensation, or functional decline, comprehensive care plan established, implemented, revised, or monitored, moderate or high complexity medical decision making; first 60 minutes of clinical staff time directed by a physician or other qualified health care professional, per calendar month.*) and 99489 (*Complex chronic care management services with the following required elements: multiple (two or more) chronic conditions expected to last at least 12 months, or until the death of the patient, chronic conditions that place the patient at significant risk of death, acute exacerbation/ decompensation, or functional decline, comprehensive care plan established, implemented, revised, or monitored, moderate or high complexity medical decision making; each additional 30 minutes of clinical staff time directed by a physician or other qualified health care professional, per calendar month (List separately in addition to code for primary procedure)*). The valuation also accounted for the work of the psychiatric consultant, based on an estimated 10 minutes of psychiatric consultant time per patient per month, such that the work RVU was based on a crosswalk to the work per minute of a level 3 established patient office visit. These G-codes were replaced by CPT codes 99492, 99493, and 99494, which we established for payment under the PFS in the CY 2018 PFS final rule (82 FR 53077 and 53078). In the CY 2021 PFS final rule (85 FR 84548 through

[25] *https://integrationacademy.ahrq.gov/about/integrated-behavioral-health#:~:text=Integrated%20behavioral%20health%20offers%20many,these%20concerns%20are%20also%20addressed.*

[26] Balasubramanian, Bijal, Deborah Cohen, Katelyn Jetelina, Miriam Dickinson, Melinda Davis, Rose Gunn, Kris Gowen, Frank DeGruy 3rd, Benjamin Miller, Larry Green. ''Outcomes of Integrated Behavioral Health with Primary Care.'' J Am Board Fam Med. 2017 Mar-Apr;30(2):130–139.doi: 10.3122/jabfm.2017.02.160234.

84574), we increased the work RVUs for certain CPT codes that rely upon or are analogous to office/outpatient evaluation and management (O/O) (E/M) visits, consistent with the increases in values finalized for O/O E/M visits for CY 2021, such that the CoCM services valuation were updated as follows: 99492 (work RVU increased from 1.70 to 1.88), 99493 (work RVU increased from 1.53 to 2.05) and 99494 (work RVU remained 0.82).

Interested parties have expressed concerns regarding the current valuation of CoCM and requested revaluation for these services. They stated that the current valuation undervalues the medical decision-making performed by the billing practitioner and psychiatric consultant and undervalues the labor rates assigned to the CoCM service. The interested parties recommend valuing the work RVUs for the two physicians or other qualified health care professional based on a blended rate based on level 4 and 5 O/O E/M visits based on medical decision-making, CPT codes 99204 and 99205 (for new patients), and 99214 and 99215 (for established patients), to account for the medical decision-making required for the CoCM service. CPT code 99492 would be adjusted from a work RVU of 1.88 to 3.67, 99493 from a work RVU of 2.05 to 2.99, and 99494 from a work RVU of 0.82 to 1.50. The interested parties noted that their recommendation would result in a higher work RVU for the initial psychiatric collaborative care management service, CPT code 99492, compared to the subsequent psychiatric collaborative care management service, CPT code 99493, since the initial month generally involves a new patient requiring more medical decision making. The interested parties recommend valuing CPT code 99494 at 50 percent of CPT code 99493. In addition, the interested parties requested refinements to the direct PE inputs, specifically for the Behavioral Health Care Manager clinical labor type (L057B). They recommend increasing the clinical labor value for Behavioral Health Care Manager (L057B) from a per minute rate of $0.57 to $0.70 per minute by crosswalking the valuation to CORF social worker/psychologist (L045C), rather than to the genetic counselors (L057A) which was used when the original CoCM G-codes were established.

After reviewing the feedback from the interested parties, we reviewed the valuation of the CoCM codes and considered Medicare claims data for levels 3 through 5 O/O E/M services. The Medicare claims data shows that level 5 E/M visits (CPT codes 99205 and 99215), which represent the highest complexity of evaluation and management services, are billed substantially less frequently than level 3 E/M services (CPT codes 99203 and 99213) and level 4 E/M services (CPT codes 99204 and 99214). Based upon this billing pattern, we believe that a blended level 3 and 4 E/M rate would be more appropriate to value CoCM. Therefore, we proposed to refine the work RVUs of CoCM as follows: CPT codes 99492 would be adjusted from a work RVU of 1.88 to 2.75, 99493 from a work RVU of 2.05 to 2.26, and 99494 from a work RVU of 0.82 to 1.13, which is 50 percent of 99493.

We also proposed conforming changes to the valuation of HCPCS codes G2214, G0568, and G0569, which also describe psychiatric collaborative care services. For HCPCS code G2214 (*Initial or subsequent psychiatric collaborative care management, first 30 minutes in a month of behavioral health care manager activities, in consultation with a psychiatric consultant, and directed by the treating physician or other qualified health care professional),* we proposed to refine the work RVU from 0.77 to 1.13, representing one half of the time described by the existing code that describes subsequent months of CoCM services (CPT code 99493), consistent with how the code was valued in the CY 2021 PFS final rule (85 FR 84547 through 84548). For HCPCS code G0568 (*Initial psychiatric collaborative care management, in the first calendar month of behavioral health care manager activities, in consultation with a psychiatric consultant, and directed by the treating physician or other qualified health care professional, with the following required elements: outreach to and engagement in treatment of a patient directed by the treating physician or other qualified health care professional, initial assessment of the patient, including administration of validated rating scales, with the development of an individualized treatment plan, review by the psychiatric consultant with modifications of the plan if recommended, entering patient in a registry and tracking patient follow-up and progress using the registry, with appropriate documentation, and participation in weekly caseload consultation with the psychiatric consultant, and provision of brief interventions using evidence-based techniques such as behavioral activation, motivational interviewing, and other focused treatment strategies (list separately in addition to the advanced primary care management code*)), we proposed to refine the work RVU from 1.88 to 2.75, aligning with the direct crosswalk to the work RVU of CPT code 99492. For HCPCS code G0569 (*Subsequent psychiatric collaborative care management, in a subsequent month of behavioral health care manager activities, in consultation with a psychiatric consultant, and directed by the treating physician or other qualified health care professional, with the following required elements: tracking patient follow-up and progress using the registry, with appropriate documentation, participation in weekly caseload consultation with the psychiatric consultant, ongoing collaboration with and coordination of the patient's mental health care with the treating physician or other qualified health care professional and any other treating mental health providers, additional review of progress and recommendations for changes in treatment, as indicated, including medications, based on recommendations provided by the psychiatric consultant, provision of brief interventions using evidence-based techniques such as behavioral activation, motivational interviewing, and other focused treatment strategies, monitoring of patient outcomes using validated rating scales, and relapse prevention planning with patients as they achieve remission of symptoms and/or other treatment goals and are prepared for discharge from active treatment (list separately in addition to advanced primary care management code)),* we proposed to refine the work RVU from 2.05 to 2.26, as this code was valued based on a direct crosswalk to the work RVU of CPT code 99493.

Additionally, consistent with the changes proposed for CPT codes 99492–99494, we proposed refinements to the direct PE inputs for HCPCS codes G2214, G0568, and G0569 by revaluing the rate of Behavioral Health Care Manager (L057B) with a per minute rate of $0.57 to $0.70. This proposed change is based on a crosswalk of valuing Behavioral Health Care Manager (L057B) to the clinical labor CORF social worker/psychologist (L045C), as opposed to basing the rates to genetic counselors as discussed in the CY 2017 final rule (81 FR 80350). We also note that HCPCS codes G2086 (*Office-based treatment for opioid use disorder, including development of the treatment plan, care coordination, individual therapy and group therapy and counseling; at least 70 minutes in the first calendar month*), G2087 (*Office-based treatment for opioid use disorder, including care coordination, individual*

therapy and group therapy and counseling; at least 60 minutes in a subsequent calendar month), and G2088 (*Office-based treatment for opioid use disorder, including care coordination, individual therapy and group therapy and counseling; each additional 30 minutes beyond the first 120 minutes (list separately in addition to code for primary procedure))* include clinical labor minutes for a Behavioral Health Care Manager (L057B), and therefore as part of this proposal, we also proposed that that same increase in valuation for L057B from $0.57 to $0.70 would also apply to HCPCS codes G2086–G2088.

We received public comments on these proposals. The following is a summary of the comments we received and our responses.

Comment: Commenters were overwhelmingly in support of the proposal to increase payment for CoCM (CPT codes 99492, 99493, 99494, G2214) and conforming changes to the APCM add-on codes (HCPCS codes G2214, G0568, and G0569). The commenters indicated that the current payment rates are undervalued. A commenter indicated the current CoCM rates are insufficient to sustain school-based pediatric implementation in underserved communities. A commenter indicated that the proposed increase would bring payment closer in line with the real resources required and would meaningfully strengthen the incentive for practices to adopt and sustain this model.

Response: We appreciate the support for our proposal.

Comment: Several commenters indicated that CMS' proposed blended level 3 and 4 E/M valuation remains inadequate. Some of the commenters recommend a blend of level 4 and 5 E/M rate to better reflect the clinical complexity and intensity of CoCM which would result in a work RVU of 3.67 for CPT code 99492, a work RVU of 2.99 for CPT code 99493, and a work RVU of 1.50 for CPT code 99494 and HCPCS code G2214. The commenters state that if CMS could not adopt the full work RVU recommendation, they urged a valuation floor at no less than a level 4 E/M valuation: a work RVU of 3.25 for CPT code 99492, a work RVU of 2.56 for CPT code 99493, and a work RVU of 1.28 for CPT code 99494 and HCPCS code G2214. The commenters recommended related increases for HCPCS codes G0568 and G0569. The commenters stated that the level 4 E/M benchmark more appropriately captures the clinical complexity, intensity and care coordination inherent in CoCM services than the current proposal.

Response: We appreciate the feedback regarding the valuation of CoCM services. We were persuaded by their comments and will finalize the CoCM codes (CPT codes 99492, 99493, 99494, and HCPCs code G2214) and APCM add-on codes (HCPCS codes G0568, G0569) based on the level 4 E/M valuation. Specifically we are finalizing a work RVU of 3.25 for CPT code 99492, a work RVU of 2.56 for CPT code 99493, work RVU of 1.28 for CPT code 99494 and HCPCS code G2214, a work RVU of 3.25 for HCPCS code G0568, and a work RVU of 2.56 for HCPCS code G0569.

Comment: Several commenters recommended increasing the valuation of the general behavioral health integration (BHI) codes (CPT code 99484 and HCPCS code G0323), alongside the CoCM codes. Some of the commenters stated that the general BHI codes should remain model-agnostic to support diverse evidence-based care models and support diverse workforce participation. Some commenters also recommended related increases in the valuation of HCPCS G0570, and office-based treatment for opioid use disorder service HCPCS code G2086, G20876 and G2088.

Response: We thank commenters for their input and welcome additional feedback on the valuation of general BHI services and office-based treatment for opioid use disorder services. We may consider valuation updates for these services in future rulemaking.

Comment: Commenters were overwhelmingly in support of increasing the Behavioral Health Care Manager (L057B) clinical labor rate from $0.57 to $0.70 per minute using the CORF social worker/psychologist crosswalk. Commenters indicated that this adjustment more accurately reflects the qualifications, training, and responsibilities of behavioral health care managers.

Response: We appreciate the support for this proposal.

Comment: A few commenters recommended removing unnecessary requirements that limit who can provide and/or bill for integrated care, such that psychologists, social workers, nurses, and other behavioral health professionals would be able to bill and get reimbursed directly for the integrated care services they provided. A commenter requested clarification that the management of alcohol use disorder (AUD) constitutes a qualifying behavioral health integration (BHI) activity under the Advanced Primary Care Management (APCM) behavioral add-on codes (G0568, G0569, and G0570).

Response: As discussed in CY 2017 Final Rule (81 FR 80231), we believe that the CoCM services would be reported by the treating physician or other qualified health care professional and include the services of the treating physician or other qualified health professional, the behavioral health care manager who would furnish the services incident to services of the treating physician or other qualified health care professional, and the psychiatric consultant whose consultative service would be furnished incident to services of the treating physician or other qualified health care professional. The management of alcohol use disorder (AUD) may qualify as behavioral health integration (BHI) under the APCM behavioral health add-on code. Beneficiaries can receive BHI services if they have an eligible condition, such as SUD, including AUD. Therefore, when all applicable billing and service requirements are met, management of AUD may be furnished as part of BHI services under the APCM behavioral health add-on code.

Comment: A commenter recommended that CMS should ensure that remote therapeutic monitoring (RTM) for cognitive behavioral therapy and the collaborative care model are treated as complementary rather than competing pathways, because a beneficiary receiving collaborative care may also benefit from an FDA-authorized digital therapeutic, and Medicare policy should not force a choice between them

Response: CoCM and RTM may be billed concurrently when reasonable and necessary. The minutes counted for the CoCM services cannot also be counted towards other services.

Comment: A commenter encouraged CMS to explicitly recognize appropriately structured, evidence-based group intervention as permissible behavioral health care manager activities within CoCM.

Response: Please refer to the Shared Medical Appointments (SMA) section for a more detailed discussion. If the billing practitioner determines a shared medical appointment is the appropriate route for providing CoCM services for a patient, and the patient consents to the SMA, assuming all SMA criteria are met, the billing practitioner may bill the service using the SMA procedure code. We would also note that services provided under an SMA cannot be billed separately because the minutes of the service counted toward the SMA service code cannot also be counted for any other billed service.

After consideration of the public comments, we find many of the commenters' suggestions persuasive and are finalizing as proposed with a

modification to base the valuation for the CoCM codes and APCM add-on codes on a level 4 E/M visit. We are also finalizing revaluing the rate of the Behavioral Health Care Manager (L057B) clinical labor type with a per minute rate of $0.70.

(52) Tympanostomy (HCPCS Code G0561)

In January 2026, the Practice Expense (PE) Subcommittee reviewed the following practice expense only add-on HCPCS code G0561 (*Tympanostomy with local or topical anesthesia and insertion of a ventilating tube when performed with tympanostomy tube delivery device, unilateral)* on the Medicare Physician Fee Schedule which is currently contractor priced.

The RUC recommended one direct PE input for a new supply item, an Automated PE tube delivery device (SD395), and submitted invoices to price the supply at $497.50. We proposed the RUC-recommended direct PE input for HCPCS code G0561 without refinement.

The RUC did not recommend, and we did not propose a work RVU for HCPCS code G0561, which has been designed as a PE only service.

We received public comments on our proposals. The following is a summary of the comments we received and our responses.

Comment: A commenter explained that because a bilateral procedure requires two separate, single-use tympanostomy tube delivery devices—one for each ear—application of the standard 150-percent bilateral adjustment would recognize only half the cost of the second device. The commenter noted that if the 150-percent bilateral payment methodology were applied to HCPCS code G0561, it would recognize only 50 percent of the practice expense (PE) value of the second device, despite the fact that the second device is purchased and consumed at 100 percent of its cost. The commenter requested that CMS establish a payment and claims-processing methodology for HCPCS code G0561 that recognizes 100 percent of the PE value associated with each separately utilized single-use device in a bilateral procedure, along with clear guidance on billing units and modifiers.

An additional commenter recommended addressing this issue through unit-based reporting rather than a modifier, explaining that the automated tube delivery device described by HCPCS add-on code G0561 is supplied, purchased, and billed as a discrete unit, meaning that modifier 50 would not be appropriate to use when reporting a bilateral case. This commenter stated that when the primary tympanostomy procedure (CPT code 69433) is performed bilaterally, HCPCS code G0561 should be reported with two units to reflect the utilization of two automated tube deployment devices, rather than by appending modifier 50.

Another commenter, while supporting the proposed valuation, requested that CMS ensure that the G code is paid in full for both ears so that the provider is not unintentionally disadvantaged by application of a multiple procedure payment reduction policy, reasoning that in cases where the G code is reported twice for bilateral procedures, two devices are used, so the G code should be reimbursed in full, once for each ear, when performed bilaterally.

Response: We appreciate commenters bringing this issue to our attention and agree that the standard bilateral payment adjustment methodology does not appropriately reflect the resource costs associated with HCPCS code G0561 when the underlying tympanostomy procedure is performed bilaterally. As commenters explained, HCPCS code G0561 describes the use of a discrete, single-use automated tympanostomy tube delivery device. When the primary procedure (CPT code 69433) is performed on both ears, two separate devices are purchased and consumed in their entirety—one for each ear. The standard bilateral adjustment under indicator ''1,'' which pays 100 percent for the first side and 50 percent for the second, is designed for procedures in which the bilateral performance generates efficiencies relative to a single-sided procedure (for example, shared setup, positioning, or overhead). That rationale does not apply to HCPCS code G0561, because the device used for the second ear represents a full, independent, non-reusable cost rather than an incremental or duplicative one.

We agree with commenters that reporting via modifier 50 is not well suited to this code. Because G0561 is defined and billed as a discrete per-device unit rather than as a procedure capable of being performed on paired anatomic structures in the same operative pass, we are finalizing an approach under which HCPCS code G0561 is reported with two units—rather than modifier 50 or modifiers RT/LT—when the primary procedure is performed bilaterally, consistent with the recommendation of the commenter who addressed this issue. This unit-based approach more accurately reflects that two distinct devices were supplied and used.

Consistent with this unit-based reporting methodology, we are also revising the bilateral surgery indicator assigned to HCPCS code G0561 from ''1'' to ''3.'' A bilateral indicator of ''3'' signifies that the standard bilateral payment adjustment does not apply to the code; rather, each reported unit is paid at 100 percent of the fee schedule amount, subject to any other generally applicable payment adjustments. This change ensures that both devices used in a bilateral procedure are reimbursed at their full PE value, addressing the concern raised by the first commenter that a 150-percent bilateral adjustment would otherwise recognize only 50 percent of the value of the second device.

We also agree with the commenter who requested that HCPCS code G0561 be paid in full for both ears without reduction under multiple procedure payment policies. Because each unit of HCPCS code G0561 reflects the full, independent cost of a separately purchased and consumed device rather than a duplicate or overlapping service, we do not believe it is appropriate to apply a multiple procedure payment reduction across the two reported units of this add-on code.

Comment: A commenter appreciated CMS's proposal to add supply code SD395 to the direct PE inputs for HCPCS code G0561 but stated that there are additional direct PE inputs for equipment, supplies, and labor that must be included for HCPCS code G0561. The commenter noted that when CMS originally adopted HCPCS code G0561, CMS explicitly acknowledged that the purpose of the code was to describe the additional resource costs related to higher expected intraservice work, plus the cost of the tympanostomy tube delivery device used during the tympanostomy procedure. The commenter therefore argued that it is not sufficient to adopt national pricing reflecting only the device supply cost. The commenter further stated that while it does not disagree with the establishment of supply code SD395 with an associated cost of $497.50, it strongly disagrees that the national average Medicare payment amount for HCPCS code G0561 should be less than $497.50. The commenter recommended that, if CMS requires additional time to determine appropriate additional inputs, CMS maintain contractor pricing for CY 2027 rather than finalize SD395 as the sole input.

Response: We appreciate the commenter's support for the addition of supply code SD395 to the direct PE inputs for HCPCS code G0561, and we

have considered the commenter's concerns regarding the sufficiency of this input and the recommendation to continue contractor pricing.

We disagree that contractor pricing should be maintained for HCPCS code G0561 for CY 2027. Having obtained the additional information we previously indicated was necessary (90 FR 49348), we no longer believe it is appropriate to delay the assignment of national pricing for this code. Contractor pricing is intended to serve as an interim payment mechanism while adequate information is developed to support accurate, nationally applicable direct PE inputs; it is not intended to persist indefinitely once that information becomes available.

With respect to the commenter's assertion that additional direct PE inputs for equipment, supplies, and labor beyond SD395 are necessary to fully capture the resource costs associated with HCPCS code G0561, we note that the same specialty society's RUC Advisors, who are positioned to evaluate the full scope of resources involved in furnishing this service, concluded that HCPCS code G0561 reflects additional practice expense only and specifically identified no additional physician work associated with the code. We are not aware of additional evidence in the record identifying specific equipment, supply, or labor inputs beyond those reflected in SD395 that the commenter believes should be included. To the extent the commenter possesses specific information regarding additional direct PE inputs it believes are necessary to accurately value HCPCS code G0561 or CPT code 69433, we direct the commenter to the established process for nominating a code as potentially misvalued. Under our regulations at § 414.22(b)(3), interested parties may submit a request, together with supporting evidence, that we examine a code believed to be potentially misvalued through the annual potentially misvalued code nomination process. We believe this process is the appropriate vehicle through which the commenter may submit the specific additional input information it believes supports a higher valuation, rather than through continued contractor pricing of HCPCS code G0561.

Comment: A commenter stated that they supported the RUC's recommendation to establish national pricing for HCPCS code G0561 based on direct invoice costs. The commenter submitted an invoice for $525.00 reflecting the acquisition cost of the Automated PE tube delivery device (SD395) supply and requested that CMS use this invoice to support HCPCS code G0561's pricing, rather than the proposed $497.50 supply cost.

Response: We appreciate the submission of this additional invoice associated with the SD395 supply. Rather than disregarding the earlier invoices used to establish the proposed $497.50 supply cost, however, we are instead averaging the two invoice prices together and finalizing a price of $511.25 for the SD395 supply.

After consideration of public comments, we are finalizing our proposal to adopt a new direct PE input under supply code SD395 and modify our proposed supply cost of $497.50 to $511.25. We are also finalizing our proposals to apply national pricing to HCPCS code G0561, retain it as a PE-only service, and provide payment at 100 percent of the applicable fee schedule amount for each unit when HCPCS code G0561 is reported with two units in connection with a bilateral tympanostomy procedure described by CPT code 69433.

(53) Evaluation and Management (E/M) Visit Complexity Add-On (HCPCS Code G2211)

(a) Background

In the CY 2024 PFS final rule (88 FR 78970 through 78982), we finalized separate payment for the O/O E/M visit complexity add-on code, HCPCS code G2211 (*Visit complexity inherent to evaluation and management associated with medical care services that serve as the continuing focal point for all needed health care services and/or with medical care services that are part of ongoing care related to a patient's single, serious condition or a complex condition. (Add-on code, list separately in addition to office/outpatient evaluation and management visit, new or established)*). This policy was originally proposed in CY 2019, as part of a proposed overhaul to the E/M code set (83 FR 59628) where we proposed two codes, one for primary care and one for non-procedure specialty care. We learned that the CPT Editorial Panel and AMA RUC were planning to review and refine the O/O E/M code set, so we did not finalize this proposal or the other proposed changes to the E/M code set. The CPT Editorial Panel and AMA RUC reviewed and refined the O/O E/M code set, which were finalized by CMS in the CY 2021 PFS final rule (84 FR 62844 through 62856). We combined the two proposed complexity add-on codes into one, and we finalized separate coding and payment for HCPCS code add-on code GPC1X in the CY 2020 PFS final rule (84 FR 62854 through 62856). This became HCPCS code G2211 in the CY 2021 final rule (85 FR 84569). However, implementation of G2211 was delayed by Congress (section 113 of Division CC of the Consolidated Appropriations Act, 2021 (Pub. L. 116–260, December 27, 2020) (CAA, 2021)), and we began actively paying for HCPCS code G2211 in CY 2024.

In the CY 2026 PFS final rule (90 FR 49462 through 49464), we finalized our proposal to allow HCPCS code G2211 to be billed as an add-on code with the home or residence E/M visits code family (CPT codes 99341, 99342, 99344, 99345, 99347, 99348, 99349, 99350). We finalized refinements to the code descriptor of HCPCS code G2211 *(Visit complexity inherent to evaluation and management associated with medical care services that serve as the continuing focal point for all needed health care services and/or with medical care services that are part of ongoing care related to a patient's single, serious condition or a complex condition. (Add-on code, list separately in addition to home or residence or office/outpatient evaluation and management service, new or established)* to reflect this change.

This service is intended to recognize the longitudinal relationship between the patient and the practitioner, which differentiates the E/M visit from visits that are not longitudinal in nature. As discussed in section II.E. of the proposed rule (91 FR 43842 through 44557), we are continuing to examine primary care in the PFS, and how we can appropriately recognize the resource costs of longitudinal and especially primary care, given the generality of E/M coding.

(b) Changes to the Billing Mechanism for Inherent Complexity

(i) Modifier MOD1

Since we began actively paying for HCPCS code G2211 in CY 2024, we have come to believe that the resource costs of furnishing longitudinal care for beneficiaries is not best characterized as a separate service requiring a separate code. Rather, we believe that since this work is an inherent part of the visit, it would be more accurately valued as a modifier to the base E/M code. We also believe that transitioning HCPCS code G2211 from an add-on code to a modifier will be more streamlined from an operational perspective. This should also reduce operational burden, as it will not require the submission of a separate claim line, because the modifier will be placed on the claim line for the associated E/M code. We therefore proposed to replace HCPCS

code G2211 with a modifier, which we referred to in the proposed rule as MOD1, which was a placeholder to be replaced with a two-digit HCPCS modifier. We are finalizing modifier B1 as the modifier to replace placeholder MOD1. Later in this section, we will discuss placeholder MOD2, which we are finalizing as modifier B2.

We proposed that modifier MOD1 will be billed under the same circumstances that HCPCS code G2211 is billed now. We discussed in the CY 2024 final rule (88 FR 78973) that HCPCS code G2211 was intended to characterize the associated E/M code as a service with a practitioner who serves as the continuing focal point for all needed health care services, or with medical care that is part of ongoing care related to a patient's single, serious, or complex condition. HCPCS code G2211 was meant to describe the inherent complexity of these visits that would otherwise be unaccounted for. The application of the add-on code is not based on the characteristics of particular patients (even though the rationale for valuing the code is based on recognizing the typical complexity of patient needs), but rather the relationship between the patient and the practitioner.

We proposed to match the code descriptor for HCPCS code G2211 to MOD1, with some technical changes. The new proposed modifier descriptor is: *Visit complexity inherent to new or established office/outpatient or home or residence evaluation and management service, associated with medical care services that serve as the continuing focal point for all needed health care services and/or with medical care services that are part of ongoing care related to a patient's single, serious condition or a complex condition.*

We received public comments on these proposals. The following is a summary of the comments we received and our responses.

Comment: Many commenters supported the proposed change, stating that the transition to a modifier eliminates duplicative documentation while preserving recognition of longitudinal, post-acute, and transitional care. Other commenters who supported the shift to a modifier stated that the modifiers will increase payer standardization and reduce confusion, denials, and EHR errors. Some commenters expressed concerns with the introduction of a new modifier, citing tracking and payer-adherence difficulties. Additionally, we received comments that noted that most EHR systems limit claims to four billing modifiers per code, and providers may already use all four slots in certain situations, leaving no room to add a fifth modifier.

Response: We appreciate commenters' support for the proposal and agree with commenters that the introduction of a modifier will simplify billing by reducing duplicative documentation and promoting consistency across payers. We also acknowledge the concerns regarding the administrative burden of transitioning from a standalone HCPCS code to a modifier.

Regarding the four-modifier limit some EHR systems impose, we note that the claim form itself is not limited to four modifiers. The Medicare Claims Processing Manual (CMS Internet-Only Manual, Pub. 100–04, Ch. 26) explains that the claim form has the ability to capture up to four modifiers, and if more than four modifiers are needed, providers should use modifier -99 (overflow) as the fourth modifier and enter the additional modifiers in the narrative field of the claim. We believe this overflow mechanism addresses the EHR slot limitation described by commenters, and we encourage providers and EHR vendors to configure billing systems to support modifier -99 and the narrative field where necessary to accommodate modifiers B1 and B2 alongside other required modifiers.

Comment: Commenters requested that we confirm whether the modifiers can be associated with virtual or telehealth visits.

Response: We thank commenters for requesting clarification regarding the applicability of the modifier when the service is furnished via telehealth. Since both HCPCS code G2211 and the O/O and home or residence E/M visits are currently on the Medicare telehealth services list, we are clarifying that Modifiers B1 and B2 can be used when an O/O or home/residence E/M visit is furnished via telehealth, provided all other requirements are met.

Comment: Commenters raised concerns that eliminating HCPCS code G2211 as a standalone code and replacing it with a modifier that carries no independent work RVU value would impact productivity-based compensation for physicians. Commenters asked that we publish a crosswalk file to map modifier values to comparable RVUs at each E/M level so practices and health systems can accurately account for physician compensation. Others requested that CMS publish its resource-based rationale, utilization assumptions, and specialty-level budget-neutrality effects before finalizing the differential, and asked CMS to revise its utilization estimates with additional evidence that the modifier payment scales proportionally with the E/M service.

Response: We acknowledge that this represents a shift in direct-RVU calculated income for this service. Although productivity-based models are a common compensation structure, there are other compensation strategies that could account for this modifier. Furthermore, modifiers B1 and B2 are only two of many modifiers that affect a HCPCS or CPT code's reimbursement amount, and for this reason we believe this change is consistent with other instances in which the PFS has adjusted payment mechanisms. We are sympathetic to the operational concerns that may arise from the switch from HCPCS code G2211 to modifiers B1 and B2. In response, we are publishing a public use file (PUF) with this final rule that maps modifier B1 and modifier B2 values to comparable RVUs at each E/M level. This file will be available on the CMS website under downloads for the CY 2027 PFS final rule at *https://www.cms.gov/medicare/payment/fee-schedules/physician/federal-regulation-notices*. Regarding specific data surrounding this policy such as utilization assumptions and specialty-level budget neutrality calculations, we are often asked for specific information regarding the impacts of a policy, however, we have historically only published the cumulative specialty-level impacts of all policies.

After consideration of public comments, we are finalizing the creation of modifier B1 as proposed. We note that modifier MOD1 was a placeholder code in the proposed rule. The finalized modifier descriptor for modifier B1 is: (*Visit complexity inherent to new or established office/outpatient or home or residence evaluation and management service, associated with medical care services that serve as the continuing focal point for all needed health care services and/or with medical care services that are part of ongoing care related to a patient's single, serious condition or a complex condition).*

(ii) Modifier MOD1 Valuation

When HCPCS code G2211 was finalized in the CY 2020 PFS final rule (84 FR 82854 through 82855), we crosswalked it to 100 percent of the valuation of CPT code 90785 *(Interactive complexity (List separately in addition to the code for primary procedure)),* which was created to capture additional work that occurs with certain psychiatric and psychotherapy codes. We believed that this service was analogous to the additional work involved in maintaining a longitudinal relationship

with patients as described by CPT code 90785. CPT code 90785 has a work RVU of 0.33 and a physician time of 11 minutes. In reexamining this policy after a few years of utilization, we have come to believe that a flat rate as described by HCPCS code G2211 does not reflect the variation in work of the various E/M visit levels.

TABLE A-D7: COMPARISON OF HCPCS CODE G2211 WITH BASE CODES

Base CPT code	Total NF RVU of HCPCS code G2211	Total NF RVU of Base CPT code	HCPCS code G2211 as percentage of base-code
99212	0.52	1.78	0.52/1.78: **29%**
99215	0.52	5.76	0.52/5.76: **9%**

Table A–D7 illustrates that the addition of HCPCS code G2211 as an add-on to the associated E/M visit represents a higher increase in total value for base codes with lower total non-facility RVUs than it does for more intense services. For example, HCPCS code G2211 has a total RVU of 0.52 in the non-facility (NF) setting. CPT code 99212 (*Office or other outpatient visit for the evaluation and management of an established patient, which requires a medically appropriate history and/or examination and straightforward medical decision making. When using total time on the date of the encounter for code selection, 10 minutes must be met or exceeded.*) has a total NF RVU of 1.78. So, when HCPCS code G2211 is appended to CPT code 99212, the overall value of the service is increased by 29 percent. However, when HCPCS code G2211 is appended to CPT code 99215 (*Office or other outpatient visit for the evaluation and management of an established patient, which requires a medically appropriate history and/or examination and high level of medical decision making. When using total time on the date of the encounter for code selection, 40 minutes must be met or exceeded.*) with a NF total RVU of 5.76, it only represents a 9 percent increase in the total value of the service. We believe that HCPCS code G2211 should reflect an increase to the base code that is proportional across all types of E/M visits. Therefore, we proposed a modifier to replace HCPCS code G2211 with the valuation of 16 percent of the base E/M code. We established this percentage using a weighted average of the percentage increase that G2211 comprised relative to the O/O E/M code, weighted by HCPCS code G2211 utilization and adjusted to achieve budget neutrality.

We received public comments on these proposals. The following is a summary of the comments we received and our responses.

Comment: Many commenters supported the underlying concept of scaling the complexity payment to the level of the base E/M service, specifically endorsing the 16 percent valuation rather than applying a flat amount. Several commenters noted that replacing HCPCS code G2211 with MOD1 more appropriately pays for complexity reflected in medical decision-making and physician work across E/M levels. Some commenters requested that CMS retain a flat rate valuation for the modifier rather than scaling it to the E/M level. A commenter supported this with a quantitative analysis showing that a percentage-based modifier would shift value away from the HCPCS codes 99213/99214 visits that make up most primary care. This commenter recommended retaining HCPCS code G2211's flat rate value and setting a floor so no E/M level receives less than 0.33 work RVUs.

Response: We appreciate commenters' support for the proposed valuation of modifier B1 and scaling the complexity payment to the level of the base E/M service and agree that this approach more accurately accounts for the complexity reflected in medical decision-making and physician work across E/M levels. We appreciate the concern that this valuation structure may shift value away from primary care; our intention is to more accurately pay for the intensity of longitudinal care by aligning it to a percentage of the base code. As illustrated in Table A–D7, a flat rate add-on produces a disproportionate benefit for lower-intensity visits and a comparatively smaller benefit for higher-intensity visits, and we understand that there are trade-offs in any system. We believe this approach is the correct one, but we appreciate commenters bringing this to our attention, and we may re-examine this in future rulemaking.

(c) G2211 in Medicare Accountable Care Organizations (ACOs)

(i) Background

The Medicare Shared Savings Program (Shared Savings Program) established under section 1899 of the Act, offers doctors, hospitals, and other health care providers an opportunity to create an Accountable Care Organization (ACO). Shared Savings Program ACOs are groups of doctors, hospitals, and other health care professionals that work together to give patients high—quality, coordinated service and health care, improve health outcomes, and manage costs.[27] In Original Medicare, physicians are reimbursed for reasonable and necessary services necessary for diagnosis or treatment of illness or injury. In an ACO, the doctor-patient relationship in Original Medicare is expanded such that the doctors, hospitals and other health care professionals are not just providing services under the reasonable and necessary standard, but there is additional work conducted to manage the beneficiaries' overall health, considering their personal health goals and values. This is how CMS defines an ''accountable care relationship,'' and this relationship may lead patients to be less likely to get repeated medical tests or unnecessary services, since clinicians consider a patient's entire health history when developing a treatment plan, and the doctors and other health professionals communicate and collaborate to improve the patient's long-term health.[28] CMS believes accountable care supports the professional ethos of health professionals to take responsibility for their patients in a way that beneficiaries expect. When these accountable care relationships succeed and the ACO succeeds in delivering high-quality care and reducing expenditures, the ACO may be eligible to share in the savings. For more information on the Shared

Savings Program and policies directly relating to Shared Savings Program, see section III.G. of the proposed rule (91 FR 43842 through 44557).

The CMS Innovation Center recently announced the Long-term Enhanced ACO Design (LEAD) Model which will launch on January 1, 2027. LEAD builds upon previous accountable care work and was designed to attract health care providers that have previously had limited participation in ACOs. It also aims to encourage health care providers to deliver preventive care, empower beneficiaries to be more actively involved in their care, and support health care providers who serve high needs and dually eligible beneficiaries to improve care and reduce costs.

(ii) Modifier MOD2

In the PFS, we have established a complexity add-code (HCPCS code G2211) that we proposed to change to a modifier (MOD1) that supports care relationships which may approximate but are not accountable care. This modifier is meant to recognize the additional complexity of services associated with providing ongoing, longitudinal care to a beneficiary. We proposed that the complexity of care established in that longitudinal relationship fundamentally differs in Original Medicare where physicians are providing all reasonable and necessary care for diagnosis and treatment of a clinical condition versus when they are in an accountable care relationship. As previously discussed, we proposed applying the complexity add-on (we proposed to change this to a modifier) to reflect the ongoing resource costs associated with being the focal point for all needed health care services performed under this reasonable and necessary standard.

We believe this standard is distinct from care provided in an ACO, where in addition to being responsible for all needed health care services that are part of ongoing care, clinicians are also responsible for managing the accountable care relationship, which involves managing a beneficiary's overall health, personal goals, values, and coordinating care with responsibility for both quality and cost. We consider the complexity associated with serving as the focal point of care for all necessary services within an accountable care relationship, responsibility for the entire patient, and responsibility for quality and cost of care, to be inherently more complex than serving in this role outside of an accountable care relationship. We are therefore proposing two levels for this modifier to reflect the additional resource costs associated with accountable care.

For example, the most common condition for which HCPCS code G2211 was billed in 2024 in Original Medicare was hypertension.[29] Outside of an accountable care relationship, the complexity add-on (proposing in this rule to change to a modifier) would be billed by clinicians for E/M visits managing a beneficiary's hypertension over time. The additional time and resource costs for serving as this focal point in care may address a patient's reservations about initiating pharmacologic treatment for hypertension (for example, perhaps the beneficiary wishes to trial complementary or alternative medicine approaches, so the clinician and patient engage in shared decision-making to understand the risks and benefits of this approach preceding pharmacologic intervention).[30] They may also discuss risk factor reduction (for example, smoking cessation) and lifestyle changes (for example, following the dietary approaches to stop hypertension or 'DASH' diet and meeting physical activity recommendations), or perhaps engage in motivational interviewing to facilitate behavior change. While the current HCPCS code G2211 is meant to take into account the additional time and resource intensity for these services, we expect even more from clinicians participating in an ACO.

For example, a beneficiary has general anxiety disorder and hypertension and monitors their blood pressure at home. They have an instance in which their blood pressure exceeds 140/90mmHg, and they also feel panic or a sense of impending doom or chest pain. They decide to go to the emergency room, but the slightly elevated blood pressure may or may not be the physiologic trigger of their symptoms. This patient may continue to seek care at the emergency room for similar episodes indefinitely unless their practitioner identifies this trend on their own and provides education to the patient on distinguishing the symptoms of anxiety from hypertension, and when it may be appropriate to go to the emergency room. If this same patient was in an ACO, that ACO might have already established admission discharge transfer (ADT) notifications which would alert the team (near-real time) for the admission. This would allow for earlier intervention to ensure that both the patient's anxiety and blood pressure were being managed in the correct setting, and that the patient had the best information to understand their intersecting conditions.

The additional time and resources associated with coordinating care for this complex patient considering both quality and cost are distinct. We proposed differentiating the resource costs associated with HCPCS code G2211 outside of and within an accountable care environment to account for the additional resource costs associated with serving as the focal point of care for the entire beneficiary within an accountable care relationship. We are clarifying that we do not believe every encounter a patient has within an ACO qualifies as longitudinal. For example, if instead of presenting to the ED, the patient calls the clinic and is able to see another ACO participant, ACO professional, ACO provider/supplier (as each is defined at § 425.20, for the Shared Savings Program), or LEAD Participant Provider who is available the same day, this encounter would not necessarily meet the criteria of inherent complexity, if that practitioner is not supporting the beneficiary's longitudinal care, and if this visit is not more inherently complex. Simply providing an E/M visit while being part of an ACO does not necessarily meet the threshold of inherent complexity.

We believe that MOD2 aligns with the goals of the Shared Savings Program and LEAD, which involve groups of health care providers working together to enhance beneficiary health through high quality, longitudinal primary and preventative care. One of the features of Shared Savings Program and LEAD ACOs is that beneficiaries benefit from ACO participants balancing goals of having total cost of care accountability and improving quality of care, while avoiding unnecessary services and medical errors. While the specifics vary between the Shared Savings Program and the LEAD model, in general, participating ACOs are required to report quality measures that align with these objectives, and they are measured against their past performance, and the performance of similar ACOs.[31]

While these measures span a broad area of topics, many measures are focused on longitudinal care and care

coordination, such as chronic disease management, preventive care and screenings and reducing avoidable hospitalizations.[32] Current participation in the Shared Savings Program helps provide and future participation in LEAD will help provide a framework to allow health care providers to collaborate to give coordinated high-quality care, while also enabling investment to achieve those goals. For example, health care providers may join ACOs to help defray the costs of large capital investments such as electronic medical records.[33] Health care providers also cite help with care coordination and quality reporting as a reason to join, increasing their access to resources and expertise to help with these areas in their practice.[34] We also want to encourage health care providers to form and join ACOs to coordinate care for their beneficiaries. Similarly, ACO participants, ACO professionals, ACO providers/suppliers (as each is defined at § 425.20, for the Shared Savings Program), and LEAD Participant Providers often provide advanced primary care to beneficiaries regardless of whether a particular beneficiary is assigned, aligned, or attributed to their ACO. Advanced primary care is a patient-focused approach to care wherein health care providers take extra steps to actively manage a beneficiary's health care needs.[35] Further, additional beneficiaries to whom a health care provider provides care might be assigned to that ACO in the future, so encouraging similar care to be provided to all beneficiaries served by health care providers in ACOs would be in the interest of the ACO. This level of care coordination, which includes advanced primary care, is often inherent by virtue of participation in an ACO.[36]

We proposed to match the descriptor of MOD2 to MOD1 and HCPCS G2211, with some small differences. The new proposed modifier descriptor is: *Visit complexity inherent to new or established office/outpatient or home or residence evaluation and management service, associated with medical care services furnished by a participant or practitioner participating in a Medicare accountable care organization. Services must serve as the continuing focal point for all needed health care services and/or be part of ongoing care related to a patient's single, serious condition or complex condition.*

(ii) Modifier Valuation for Medicare ACO Participants

With these goals in mind, we proposed that, in place of reporting G2211, ACOs would have the option to report a modifier on a claim (referred to in this proposed rule as placeholder MOD2, which if finalized would be replaced with a two-digit HCPCS modifier), which will be valued at 32 percent of the associated E/M visit when performed by Shared Savings Program ACO participants, ACO professionals, and ACO providers/suppliers (as each is defined at § 425.20), as well as Participant Providers in the LEAD Model. We proposed that MOD2 would pay twice the rate of MOD1 to better account for the inherent complexity of some visits in the ACO context, specifically applying to Shared Savings Program and LEAD ACOs in situations that require increased time and intensity. This increased valuation is meant to reflect the cognitive work of providing longitudinal care, follow-up discussions through an assigned care coordinator with the beneficiary or other providers, and expanded access to educational resources, care options, and provider communication methods. The value-based care provided through a Shared Savings Program or LEAD ACO puts greater emphasis on integrated care, meaning health care providers work together to address a person's physical, mental, behavioral and social needs. In this way, providers treat an individual as a whole person, rather than focusing on a specific health issue or disease.[37] [38]

The differential payment we proposed to provide to Shared Savings Program ACO participants, ACO professionals, and ACO providers/suppliers (as each is defined at § 425.20) and to LEAD Participant Providers would further support the CMS Innovation Center 2025 Strategy to Make America Healthy Again which focuses on empowering Americans to achieve their health goals and live healthier lives.[39] We recognize that not all E/M visits represent longitudinal care and so we would not expect MOD2 to be included on all claims for E/M visits, only visits that have an increased visit complexity that requires an increased valuation, as described in the examples provided earlier in this section.

We received public comments on these proposals. The following is a summary of the comments we received and our responses.

Comment: We received comments in support of the higher rate for modifier B2 noting that it would serve as an appropriate incentive for accountable care participation. Many commenters supported the differential as recognition of accountable care investments that are inherent to ACO participants. According to commenters, these investments include care coordination, data analytics, and population health management, none of which are reflected in standard fee-for-service payment. Commenters also noted that the differential accounts for the work of addressing social and behavioral factors that influence health outcomes. Additionally, they explained that improving quality while responsibly managing total cost of care requires infrastructure and interdisciplinary care teams and that the higher rate recognizes this investment. Commenters also stated that the higher payment rate creates a meaningful financial incentive for clinicians to participate in an accountable care relationship. A commenter suggested that CMS provide specific guidance to providers that beneficiaries assigned to an ACO are automatically eligible for the utilization of modifier B2 by ACO participants or automatically apply the modifier, when applicable. In addition to support modifier B2, we received comments opposed to paying the higher rate (32 percent) only to ACO-participating clinicians while limiting other clinicians to billing modifier B1 (16 percent) for what they characterized as identical clinical work. Some commenters supported the general shift from HCPCS code G2211 to a modifier but explicitly opposed the 32 percent ACO-specific tier. Commenters expressed concern that we have not provided empirical evidence for the differential, that MOD2 could be billed for beneficiaries not attributed to the ACO, that it would increase aggregate beneficiary cost-sharing, and that it could reduce net Medicare savings under ACO models by rewarding billing volume over shared-savings performance. Other commenters, including MedPAC, raised concerns that because the modifier increases payment as a percentage of the underlying E/M

[39] *https://www.cms.gov/priorities/innovation/about/strategic-direction.*

service, beneficiaries receiving higher-level E/M visits would face correspondingly higher cost-sharing obligations, regardless of whether that beneficiary is assigned to an ACO. MedPAC additionally noted that this proposal could impact a Medicare ACO's ability to generate net savings for Medicare by maximizing payments through the delivery of services eligible for the MOD2 modifier.

Several commenters argued that the clinical resources of longitudinal care do not depend on ACO participation and that reserving the higher payment for ACO participants risks separating payment from the resources required to furnish care, explaining that independent practices also coordinate complex care and maintain ongoing relationships with patients.

Response: We acknowledge the concerns raised by many commenters who opposed paying modifier B2 at 32 percent only to ACO-participating clinicians while limiting other clinicians to the 16 percent modifier B1 rate for what they viewed as identical clinical work. We acknowledge the comments that increasing the value of the modifier when billed by ACO participants increases the cost sharing for beneficiaries and that it could impact an ACO's expenditures and shared savings. The use of the higher rate modifier is optional for ACO participants and ACOs can take the factors raised by commenters into consideration when choosing whether to bill the higher rate modifier. We also note that in Section III.G.6.2 of this final rule, we are finalizing a Part B cost sharing support policy under which eligible ACOs could offer cost sharing support for all Part B items and services except durable medical equipment, prosthetics, orthotics, supplies and prescription drugs for eligible beneficiaries under the Shared Savings Program. Under the Part B cost sharing support, an approved ACO could choose to offer cost sharing reductions for these services for their assigned beneficiaries which could, in some cases, mitigate for the higher cost sharing associated with the modifier.

We agree with commenters that clinicians in ACOs make investments in care coordination, data infrastructure, population health management, quality improvement, and patient engagement that extend beyond an individual billable encounter and that the PFS can better align fee-for-service payment with the infrastructure and support required to deliver accountable care. We agree with commenters that the proposal creates a direct financial incentive for clinicians to join and remain in ACOs and note that the higher modifier B2 rate serves as an appropriate recognition of the relative resource costs in this setting, including additional investments ACOs make, and that it continues CMS's recognition of the value of longitudinal care for beneficiaries with complex needs.

We acknowledge the comment suggesting that CMS consider providing guidance to practitioners that could increase the utilization of modifier B2 by ACO participants and will consider this for the future. We reiterate that we expect that not all E/M services provided by ACO participants would meet the definition of longitudinal care, and we remind practitioners that each code or modifier that is billed must be medically reasonable and necessary, which we feel would be a difficult standard to maintain in any automatic processes. We additionally explained in the proposed rule's Regulatory Impact Analysis (91 FR 44248) that the proposal to pay for services furnished in an ACO using a modifier (B2) that pays 32 percent of the total RVUs for the E/M service on the claim is expected to increase payment for practitioners that furnish a higher percentage of their services in ACOs.

After consideration of public comments, we are finalizing modifier B2 as proposed. We note that modifier MOD2 was a placeholder code in the proposed rule. The finalized modifier descriptor is B2 (*Visit complexity inherent to new or established office/outpatient or home or residence evaluation and management service, associated with medical care services furnished by a participant or practitioner participating in a Medicare accountable care organization. Services must serve as the continuing focal point for all needed health care services and/or be part of ongoing care related to a patient's single, serious condition or complex condition.).*

(iii) Use of MOD2 Modifier by ACOs

Modifier MOD2 would be exclusively available for ACO participants, ACO professionals, and ACO providers/suppliers (as each is defined at § 425.20, for the Shared Savings Program), as well as LEAD Participant Providers, when the visit complexity is met, provided the individual is a medical professional who can bill office and outpatient E/M visits or home visit services, regardless of specialty. Utilization and claims of either modifier will be included in ACOs' expenditure calculations for benchmarking and performance year expenditures and used in the determination of total cost of care.

As described earlier in this section, we proposed a differential payment for MOD2 that is meant to provide a meaningful increase in the way we pay for primary care provided by ACO participants, ACO professionals, and ACO providers/suppliers (as each is defined at § 425.20, for the Shared Savings Program), as well as LEAD Participant Providers who often provide additional care coordination to beneficiaries in their care as demonstrated by their participation in an ACO, as described in the examples provided earlier in this section. We are further proposing that the use of this modifier be voluntary; and ACO participants, ACO professionals, ACO providers/suppliers (as each is defined at § 425.20, for the Shared Savings Program), and LEAD Participant Providers would determine if this modifier is necessary based on visit complexity and would append MOD1, MOD2, or no modifier, as appropriate. Additionally, we proposed that ACO participants, ACO professionals, and ACO provider/suppliers (as each is defined at § 425.20, for the Shared Savings Program), as well as LEAD Participant Providers may bill this modifier for all beneficiaries to whom they provide care, regardless of whether that beneficiary is assigned, aligned, or attributed to an ACO, to encourage similar care to be provided to all beneficiaries served by health care providers who participate in ACOs. Given that ACO Primary Care Flex (ACO PC Flex) Model participation is predicated on participation in the Shared Savings Program, we proposed that ACO PC Flex Model ACOs may also utilize the MOD2 modifier. Finally, we proposed that LEAD Participant Providers billing under a Participant TIN that is in a LEAD ACO may bill modifier MOD2. Refer to the discussion later in this section for additional information on the use of modifier MOD2 on alignment in the LEAD model.

We received public comments on these proposals. The following is a summary of the comments we received and our responses.

Comment: Commenters expressed support for the enhanced ACO payment as a lever to grow accountable care participation and improve care coordination, requesting that it apply to Advanced APMs as well as Shared Savings Program ACOs. Commenters supported allowing ACO participants to bill MOD2 for all beneficiaries they treat, not only those assigned to the ACO, viewing this as recognition of the broader care-management infrastructure ACOs maintain and use for all

beneficiaries. Commenters also asked CMS to extend MOD2 eligibility to CMS Innovation Center models Kidney Care Choices and Enhancing Oncology. Additionally, we received comments asking how the higher MOD2 payment interacts with ACO expenditure benchmarking, so the incentive does not partially cancel itself.

Response: We thank commenters for their support and agree with commenters that the enhanced ACO payment is a mechanism to grow accountable care participation and strengthen care coordination.

Regarding the comments mentioning that this incentive extends to Advanced APMs as well as Shared Savings Program ACOs, we clarify that the utilization of modifier B2 is specific to ACO participants in the Shared Savings Program ACOs, the LEAD model, and ACO PC Flex. While certain tracks within these or other CMS Innovation Center models may represent Advanced APMs, this policy does not extend to all Advanced APMs or to other CMS Innovation Center models. We may consider such an expansion for future rulemaking. In response to inquiries concerning ACO expenditure benchmarking, we clarify that claims including modifier B1 or B2 will not be carved out of Shared Savings Program, LEAD, or ACO PC Flex financial calculations, including benchmark determination, financial reconciliation, or assignment plurality determinations. Modifier B2 is meant to reflect the additional resources associated with longitudinal care provided by ACO participants; however, ACOs remain accountable for the total cost of care for their beneficiaries and carving out these expenditures would be counter to that goal.

Comment: Several commenters urged CMS to finalize the changes as proposed and, notably, to require Medicare Advantage plans to adopt the 32 percent modifier on the same timeline as traditional Medicare without added MA-specific documentation or prior authorization requirements.

Response: We appreciate commenters' interest in payment parity and in limiting administrative burden for practitioners who participate in both traditional Medicare and MA, however, we note that this rule is issued under our authority to establish payment policy for services furnished to beneficiaries under the traditional Medicare fee-for-service program under Part B. It does not directly govern the methodologies MA organizations use to pay contracted providers under Part C.

Comment: Some commenters requested that CMS broaden MOD1 and MOD2 eligibility across several settings and code sets. Commenters stated that the beneficiaries most in need of longitudinal care are also in settings such as nursing facilities, Rural Health Clinics (RHCs), Federally Qualified Health Centers (FQHCs), and Critical Access Hospitals (CAHs). Others asked for the use of MOD1 and MOD2 in conjunction with codes beyond E/M codes, such as collaborative care management services, the shared medical appointment codes proposed earlier in this section, and medical nutrition therapy.

Response: We thank commenters for their thoughtful feedback and interest in ensuring that beneficiaries get the longitudinal care they need. We note that many of the settings commenters recommended are paid under different payment structures or systems, and so extending this policy to those structures would need to be examined in separate rulemaking. We have received similar comments regarding the extension of HCPCS code G2211 (now modifiers B1 and B2) to other settings in several rulemaking cycles, and we addressed these concerns most recently in the CY 2026 PFS final rule (90 FR 49462 through 49464). We are clarifying that modifiers B1 and B2 may only be used in conjunction with E/M visits performed in the O/O or home or residence setting and may not be performed in conjunction with E/M visits in other settings, such as SNF, RHC, FQHC, CAH, or other places of service. The limit on place of service for use of these modifiers is tied to the location and type of the E/M visit, rather than the modifier. We may consider changes to this policy in future rulemaking, and we welcome continued engagement with practitioners in these settings.

We also thank the commenters for their ideas on other types of services that may be more inherently complex when the practitioner has a longitudinal relationship with the patient, such as collaborative care management services. However, we disagree that E/M services provided in other settings do not adequately recognize the increased complexity of this relationship in the valuation of those services. HCPCS code G2211 (now modifiers B1 and B2) was originally designed to capture the differences in complexity between different types of E/M visits provided in an office/outpatient or home/residence settings, which is not the case for E/M visits provided in other settings or services captured within a prospective payment system.

(A) Impacts on Assignment of Beneficiaries to Shared Savings Program ACOs

HCPCS code G2211 is included in the definition of primary care services used for purposes of assignment under § 425.400(c). Although we proposed that HCPCS code G2211 be deleted, under this proposal, it would remain in the regulations at § 425.400(c) to be included for purposes of determining the population of OM beneficiaries for whose care the ACO is accountable under 42 CFR subpart F, and for determining whether an ACO has achieved savings under 42 CFR subpart G, and will continue to be used for assigning beneficiaries to an ACO in benchmark years during which HCPCS code G2211 was still an allowable service. If the proposal is finalized, the code will no longer be payable, and there will be no impact on future calculations of allowed charges used for purposes of assignment.

We proposed that Modifier MOD2 can be appended to O/O or home or residence E/M services exclusively by ACO participants, ACO professionals, ACO providers/suppliers (as each is defined at § 425.20, for the Shared Savings Program), and LEAD Participant Providers who can bill O/O or home or residence E/M service, regardless of specialty. In performing claims-based assignment under the Shared Savings Program, CMS determines whether allowed charges for a beneficiary's primary care services (as identified for ACO professionals, including at Electing Teaching Amendment hospitals and Method II Critical Access Hospitals, and services furnished at an FQHC or RHC) in an ACO are greater than allowed charges for the beneficiary's primary care services in any other ACO, or other individual health care providers, or groups of health care providers identified by Medicare-enrolled billing TINs or CMS Certification Numbers that are not participating in the Shared Savings Program. In making this determination, we determine where the beneficiary received the plurality of his or her primary care services.

The allowed charges associated with O/O or home or residence E/M services billed with or without modifiers MOD1 or MOD2 will be used in determining beneficiary assignment. Since the CPT codes identified as O/O or home or residence E/M services are included in the definition of primary care services used for purposes of assignment as defined in 42 CFR 425.400(c), we do not believe that changes to the regulatory text are required. Certain operational changes will need to be implemented

which will be communicated via Change Request,[40] Medicare Learning Network (MLN) Matters® article,[41] or other sub-regulatory guidance.

We received no comments on this section of the proposal.

(B) Impacts on Assignment of Beneficiaries to LEAD ACOs

In LEAD, if this proposal is finalized, we will handle the deletion of HCPCS code G2211 and the transition to the modifiers similarly to the Shared Savings Program. As indicated in Appendix C of the LEAD Request for Applications, the HCPCS code G2211 code is one of the Primary Care Qualified Evaluation and Management (PQEM) services that CMS uses to align beneficiaries to LEAD ACOs via claims-based alignment. We will continue to use HCPCS code G2211 allowable charges to conduct claims-based alignment in LEAD when HCPCS code G2211 was an allowable service in the requisite claims look back period. For example, when conducting initial claims-based alignment in Performance Year (PY) 2027, we will reference claims from October 1, 2025 to September 30, 2026. HCPCS code G2211 allowable charges will be included in the claims-based alignment run since it is an allowable service during this period.

When aligning beneficiaries to LEAD ACOs, CMS looks first for an existing primary care relationship within the claims lookback period. If 10 percent or more of a beneficiary's PQEM allowable charges (measured by dollar amount) were billed by physicians or non-physician health care providers with a primary-care specialty (family medicine, internal medicine, geriatrics, general practice, nurse practitioner, physician assistant, and clinical nurse specialist), alignment is based solely on these primary care providers. If less than 10 percent of a beneficiary's PQEM allowable charges were billed by primary-care specialties, alignment considers certain non-primary care providers that manage chronic or complex conditions (for example, cardiology, nephrology, endocrinology, psychiatry, etc.). The beneficiary is aligned to a LEAD ACO if the Participant TIN that furnished the largest share of allowable charges incurred for PQEM services during the lookback period is participating in a LEAD ACO.

Once the claims-based alignment look back period rolls forward to include 2027 (and future years) the LEAD alignment methodology will include the allowed charges associated with modifier MOD1 and MOD2 when conducting claims-based alignment (the underlying O/O or home or residence E/M service that will be modified by MOD1 and MOD2 are already LEAD PQEM services). LEAD ACOs will be accountable for expenditures incurred by using either modifier MOD1 or MOD2. Expenditures associated with modifier MOD1 and MOD2 will be included in total Medicare Parts A and B expenditures when CMS conducts financial settlement for LEAD ACOs. More information on the impact to claims processing, capitated payments, and LEAD benchmarks will be shared with ACOs that were selected for participation in LEAD in PY 2027.

We received no comments specific to this section of the proposal.

(iv) MOD1 and MOD2 Billed With Modifier -25

When we finalized the HCPCS code G2211 policy in the CY 2021 PFS final rule (85 FR 84572), we did not limit the use of HCPCS code G2211 with O/O E/M visits in which CPT Modifier -25 was appended. CPT Modifier -25 denotes a significant, separately identifiable O/O E/M visit by the same physician or other qualified health care professional on the same day as a procedure or other service. We finalized HCPCS code G2211 as payable in the CY 2024 PFS final rule (88 FR 78974), and in the CY 2025 PFS final rule (89 FR 97856 through 97858), we finalized that we would allow payment of HCPCS code G2211 with Modifier -25 when the O/O E/M base code is reported by the same practitioner on the same day as an annual wellness visit (AWV), vaccine administration, or any Medicare Part B preventative service when furnished in the office or outpatient setting. For CY 2027, we proposed to maintain the same limitations we established for HCPCS code G2211 in the CY 2025 PFS final rule (89 FR 97856 through 97858) for MOD1 and MOD2 when billed with Modifier -25.

Later in this section, we are making additional proposals related to changes for payment when modifier -25 is appended. Given these changes, we sought comment on whether we should consider changes to this policy, such as allowing MOD1 or MOD2 to be billed with modifier -25 when an O/O E/M is performed on the same day as a 0-, 10-, or 90-day global procedure?

We received public comments on these proposals. The following is a summary of the comments we received and our responses.

Comment: Commenters requested that CMS clarify how the proposed changes to payment for modifier -25 interact with the new HCPCS code G2211-replacement modifiers, given that both provisions affect the same E/M claim line. Commenters supported allowing the B1 and B2 modifiers with modifier -25 whenever both sets of requirements are independently met, and another asked CMS to confirm the modifiers would apply to 0-, 10-, and 90-day global procedures regardless of -modifier 25 status.

Response: We appreciate commenters' feedback on the interaction between modifiers B1 and B2 and modifier -25. Currently, as finalized in the CY 2025 PFS final rule (89 FR 97856 through 97858) and the CY 2026 PFS final rule (90 FR 49462 through 49464), HCPCS code G2211 is not payable when the O/O E/M visit or home or residence E/M is reported with modifier -25, except when the same-day service is an annual wellness visit, vaccine administration, or another Medicare Part B preventive service, including the Initial Preventive Physical Examination, furnished in the office or outpatient or home or residence setting. We are not revising this policy in this final rule.

(54) Shared Medical Appointment (HCPCS Codes G0686 and G0687)

In accordance with President Trump's Executive Order, ''Establishing the President's Make America Healthy Again Commission,'' [42] the Administration is directing agency focus towards understanding and drastically lowering chronic disease rates. As part of this commitment, we remain focused on the prevention and management of chronic disease, including through approaches that address underlying behavioral and lifestyle drivers of health.

In CY 2026, we solicited feedback on how CMS could further support the prevention and management of chronic diseases. In response to our request for information on chronic disease prevention and management, commenters indicated that many services that help prevent and manage chronic disease, such as lifestyle modification support, health education, and peer support, require time, coordination and multidisciplinary engagement that is not adequately supported under the current PFS. Additionally, many commenters indicated that social isolation and loneliness is a persistent barrier to

[40] Available at *https://www.cms.gov/medicare/regulations-guidance/transmittals.*

[42] *https://www.whitehouse.gov/presidential-actions/2025/02/establishing-the-presidents-make-america-healthy-again-commission/.*

effective care for Medicare beneficiaries. The commenters indicated that although health care providers are already implementing interventions to identify and address social isolation, these efforts are resource intensive and not adequately supported under the current PFS.

Based on this feedback, we recognize the importance of health care delivery approaches that enable multidisciplinary support, foster beneficiary engagement, and encourage sustainable lifestyle and behavioral changes. Shared medical appointments (SMAs) are one such approach to offer a group-based environment in which beneficiaries can receive clinical guidance while also engaging with peers facing similar health challenges. SMAs may also help address social isolation and loneliness for some beneficiaries.

SMAs, also known as shared medical visits or group visits, are voluntary group-based sessions where multiple patients with a common chronic condition, such as type 2 diabetes mellitus, receive medical care together. In general, SMAs involve more than one healthcare provider, such as a person trained or skilled in delivering patient education or facilitating patient interaction and a prescribing practitioner to make and initiate a comprehensive care plan. SMAs generally last from 60 to 120 minutes and incorporate time for social integration, interactive education, and adjustments to the patient's care plan.[43] Compared with group education alone, SMAs allow patients to participate in clinical care activities that are tailored to the needs of both the group and the individual participants.[44] During the SMA session, a practitioner may meet with a patient individually in a private or semi—private manner or conduct the visit in a group setting where other patients are able to listen and, in some cases, contribute to the discussion.[45]

Reported advantages of shared medical appointments include providing patients more time with their health care provider, creating opportunities for patients to learn from and share self-management strategies with one another, improving access to care, incorporating nonpharmacologic treatment approaches, enhancing the overall quality of care, and helping reduce emergency department visits.[46]

Currently there is no CPT or HCPCS code specifically designated for SMAs. However, practitioners typically bill SMAs using existing Evaluation and Management (E/M) codes, CPT codes 99212–99215, based on medical decision-making criteria; and if another billable clinician such as a registered dietician assists with the SMA, the registered dietician may also bill for their portion of the SMA separately (for example, CPT code 97804 (*Medical nutrition therapy; group (2 or more individual(s)), each 30 minutes)*). Therefore, we proposed to create coding and valuation specifically for SMAs.

We proposed that SMAs be limited to beneficiaries who have received a professional service from the billing physician or other qualified health professional or another physician or other qualified health care professional of the exact same specialty and subspecialty who belongs to the same group practice within the previous 12 months. We believe this requirement is necessary to ensure beneficiaries have an existing clinical relationship with the practitioner before the beneficiary is integrated into a group-based medical care setting.

We proposed requiring beneficiaries to consent to SMA participation, since they may elect to receive individual medical appointments instead. Additionally, we proposed that beneficiaries must consent to confidentiality terms because personal health information would be discussed in the group setting.

SMA sessions generally last 60 to 120 minutes and may include up to 25 patients, however SMAs most commonly consist of 6 to 10 patients.[47] We proposed establishing SMAs as 60-minute sessions with a maximum of 10 beneficiaries per session.

The expansion of telehealth services has increased opportunities for SMAs to improve access for individuals in geographically remote areas, and those with transportation challenges. We proposed that SMA sessions can be held either in-person or via telehealth, and we proposed to add the SMA service to the Medicare Telehealth list accordingly.

We proposed that each shared SMA session be documented in each participating beneficiary's medical record. Each beneficiary receives individualized clinical care, and the medical record must reflect the specific services that the individual beneficiary received during the SMA session. The need for individualized care may depend on the intervention and surrounding evidence. Therefore, if a beneficiary requires a level of individualized care that extends beyond what can appropriately be provided within the group-based session of a SMA, that individualized care should be provided in a separate individual medical appointment. The services provided to the group as a whole at each session would also need to be captured in the medical record. We seek comments on additional guardrails to consider in preventing fraud, waste and abuse when billing SMAs, such as following an evidence-based protocol for delivery of the intervention, conducting fidelity checks to ensure it is being delivered as intended, identifying key outcomes and goals that are established in shared decision making, and ensuring that the interventionist is trained in the intervention as appropriate.

SMAs are an approach in managing chronic conditions, especially among motivated patients.[48] SMAs are an appropriate healthcare delivery approach for conditions that are modifiable with lifestyle change, including diabetes mellitus, obesity, hypertension, and hyperlipidemia, such that behavioral changes including diet, physical activity, and self-management can influence health outcomes. Therefore, we proposed to establish coding and payment for SMAs provided for medical conditions that are modifiable with lifestyle change. We seek comment on how to determine when SMAs would be appropriate, including identifying which medical conditions would be considered modifiable with lifestyle change, and suggest we would typically consider those conditions with medical guidelines that include lifestyle change as part of prevention and treatment of the condition in this category, such as evidence-based interventions that support lifestyle change.[49] For example,

Continued

the 2026 Standards of Care in Diabetes published by the American Diabetic Association (ADA) include lifestyle changes including improving nutrient composition and reducing caloric intake, establishing physical activity regimens to support weight loss, and highlighting the role of Medical Nutrition Therapy (MNT) as part of nutrition education.[50] While the exact content the SMA and desired behavioral change would vary (for example, improving diet and exercise as part of both prevention and management of Type 2 Diabetes) we would not consider medication adherence or titrating medications for Type 2 Diabetes to be appropriate for an SMA, but we would consider SMAs focused on improving nutrient composition to be an appropriate SMA activity, for example. CMS acknowledges the substantial changes in patients' lives associated with coping with chronic illness, the behavioral modifications inherent in managing serious and unexpected illnesses, however we would reserve SMA provision for just those conditions which may be treated or prevented with lifestyle changes.

SMAs typically involve multiple healthcare providers, usually two to four. The sessions are generally led by a physician, physician assistant (PA), or an advanced practice registered nurse (APRN), and may have ancillary staff help when the provider is meeting with patients individually.[51] We proposed that a SMA session is billed and led by a physician or qualified nonphysician practitioner and may include other qualified healthcare professionals, clinical staff, or auxiliary personnel. We proposed that HCPCS code G0686 would be billed once per patient, per session and would accept any documentation to demonstrate the care was rendered so long as the physician or qualified nonphysician practitioner co-signature is included. In instances where another qualified healthcare professional, such as a registered dietitian, provides a service during the SMA session, such as CPT code 97804 (*Medical nutrition therapy; group (2 or more individual(s)), each 30 minutes),* that service is considered part of the SMA and should not be billed separately, in addition to the physician or qualified nonphysician practitioner billing for the SMA.

We proposed requiring each SMA session to include the following components:

- Evaluation and Management (E/M) elements, consistent with the complexity of the beneficiary's condition. Individualized clinical care with medical documentation in the medical record that reflects the specific services that the individual beneficiary received during the SMA session.
- Education, based upon evidence-based content, and discussions related to self—care, wellness, and disease management.
- Discussion of positive lifestyle changes, focusing on behavior modification. Medication management, as clinically appropriate and applicable.

In the event it is medically necessary for a beneficiary to receive an E/M visit on the same day as a SMA by the same physician or other qualified health professional or another physician or other qualified health care professional of the exact same specialty and subspecialty who belongs to the same group practice, we proposed that any time and effort cannot be counted more than once. We proposed not to consider and treat this as two E/M same-day visits and seek public comment on this proposal. Additionally, we seek comments on what components must be required for each SMA session.

We proposed the following descriptor for SMAs:

HCPCS code G0686: *Voluntary, group-based medical session involving multiple patients with common medical condition(s), receiving medical care in a group setting; billed and led by a physician or qualified nonphysician practitioner and may include services provided by other qualified healthcare professionals, clinical staff, or auxiliary personnel under the direction of the supervising physician or other practitioner. Session integrates group education, counseling, and peer support with individualized patient clinical assessment and care, 2–10 patients, billed once per patient, per session.*

Because SMA sessions would integrate group education, counseling, and peer support with individualized patient clinical assessment and care, in developing the valuation for the SMA HCPCS code, we proposed to use a building block methodology that sums up the values associated with two reference codes. For the overall E/M elements of the SMA service, we are incorporating the work RVUs, work time and direct PE inputs associated with a level 3 O/O visit for an established patient, CPT code 99213 (*Office or other outpatient visit for the evaluation and management of an established patient, which requires a medically appropriate history and/or examination and low level of medical decision making. When using total time on the date of the encounter for code selection, 20 minutes must be met or exceeded.),* which has a work RVU of 1.30, and a total work time of 30 minutes, which is based on a pre-service evaluation time of 5 minutes, an intraservice time of 20 minutes, and a post service time of 5 minutes. E/M visit level selection does not need to be based on time; practitioners may select the visit level based on the level of medical decision making (MDM). Additionally, as we discussed earlier in this section, we proposed that SMAs be limited to beneficiaries who have received a professional service from the billing physician or other qualified health professional or another physician or other qualified health care professional of the exact same specialty and subspecialty who belongs to the same group practice within the previous 12 months. Given this pre-existing clinical relationship and the anticipated clinical profile of beneficiaries that would participate in an SMA, we believe that the level 3 O/O visit for an established patient represents the most typical level of service for the individualized patient clinical assessment component of the SMA.

For the group education, counseling, and peer support elements of the SMA service, we are incorporating CPT code 96202 (*Multiple-family group behavior management/modification training for parent(s)/guardian(s)/caregiver(s) of patients with a mental or physical health diagnosis, administered by physician or other qualified health care professional (without the patient present), face-to-face with multiple sets of parent(s)/guardian(s)/caregiver(s); initial 60 minutes*), which has a work RVU of 0.43 and a total work time of 15 minutes, which is based on a pre-service evaluation time of 2 minutes, an intraservice time of 10 minutes, and a post service time of 3 minutes.

While a SMA may include up to 10 beneficiaries in a 60—minute session, the individualized care for a participating beneficiary may vary, such that some beneficiaries may receive more or less individualized care than others; nonetheless, documentation in the medical record must reflect the specific services that the individual beneficiary received during the SMA session. As we price services under the PFS based on a typical case, the proposed valuation for HCPCS code G0686 reflects a typical SMA session and is not intended to represent the

[50] American Diabetes Association Professional Practice Committee for Diabetes. ''5. Facilitating Positive Health Behaviors and Well-Being to Improve Health Outcomes: Standards of Care in Diabetes—2026.'' *Diabetes Care,* vol. 49, suppl. 1, 2026, pp. S89–S131, *https://doi.org/10.2337/dc26-S005.*

[51] *https://pmc.ncbi.nlm.nih.gov/articles/PMC7781059/pdf/10.1177_1559827620943819.pdf.*

exact time distribution for every beneficiary in every SMA. We note that the total work time proposed is for the purposes of valuation and not meant as a requirement for billing. We believe this reflects a typical amount of time for both the individualized patient clinical assessment and the beneficiary's proportionate share of group education, counseling, and peer support that occurs concurrently across all participating beneficiaries during a SMA session.

Considering the aforementioned building block methodology for SMA valuation, we proposed a work RVU of 1.73 and a total work time of 45 minutes, which is based on a pre-service evaluation time of 7 minutes, an intraservice time of 30 minutes, and a post service time of 8 minutes.

In addition to seeking comments on establishing the proposed HCPCS code G0686, we also seek comment on the proposed work RVUs, work times, and direct PE inputs.

We received public comments on these proposals. The following is a summary of the comments we received and our responses.

Comment: Many commenters expressed strong support for CMS's proposal to establish a dedicated code and payment pathway for SMAs and stated that SMAs are an effective approach for managing chronic conditions. Many stakeholders highlighted evidence for SMAs, noting improved patient outcomes, reduced emergency and inpatient utilization, enhanced engagement, and greater efficiency in chronic disease management. Several commenters emphasized that SMAs are particularly valuable for populations with multiple chronic conditions, behavioral health needs, and those facing social isolation or barriers to care. A few commenters recommended that CMS treat the creation of the SMA code as an iterative first step, with ongoing refinement based on utilization and outcomes data. A few commenters opposed the establishment of a dedicated code and payment for SMAs under the Medicare PFS, suggesting instead that CMS test these concepts through limited demonstration or alternative payment models (APM) first.

Response: We appreciate the feedback received from commenters regarding creating coding and payment for SMAs. As we recognize the value that SMAs may bring to managing chronic disease, we are finalizing coding and payment for SMAs.

Comment: Several commenters supported SMAs as an appropriate approach for conditions modifiable with lifestyle change. Commenters supported the creation of coding for SMAs and some recommended eligibility of specific conditions including but not limited to tobacco use disorder, alcohol use disorder, other substance use disorders, obesity, behavioral health conditions, fibromyalgia and central sensitization syndromes, polycystic ovary syndrome, and infertility-associated metabolic and hormonal conditions. Another commenter stated CMS should avoid establishing an exhaustive list of eligible diagnoses and instead recommended that eligibility be available when authoritative clinical guidelines or sufficient evidence base recognize lifestyle modification.

Many commenters supported broadening the eligible conditions for SMAs beyond the proposed ''lifestyle-modifiable'' criteria. Several commenters recommended not restricting SMAs to conditions deemed ''lifestyle-modifiable,'' citing reviews and/or experience demonstrating benefits across hypertension, diabetes, heart failure, obesity, COPD, osteoporosis, migraine, chronic pain, depression, cancer survivorship, Parkinson's disease, rheumatoid arthritis, neuromuscular disease, and prenatal care. Several commenters noted that most Medicare beneficiaries participating in SMAs have multiple chronic conditions, making diagnosis-specific or lifestyle-only restrictions impractical and inconsistent with real-world clinical care.

Response: We thank commenters for their feedback, including the commenters supporting SMAs as an appropriate approach for conditions modifiable with lifestyle change, and commenters that recommended specific conditions for SMA services. After consideration of the comments, we are not creating an exhaustive list of eligible diagnoses and conditions, and we continue to believe that SMAs are an appropriate approach for conditions that are modifiable with lifestyle change. To the extent that conditions, including those that commenters recommended for inclusion, are modifiable with lifestyle change, they would not be precluded from the SMA service.

Comment: Several commenters raised the importance of patient choice, privacy, and voluntary participation as considerations for SMA designs. A commenter stated that participation in SMAs should remain voluntary since HIPAA protects patient health information and many commenters may feel uncomfortable discussing sensitive medical concerns in front of others. The commenter cautioned that paying for SMAs could unintentionally encourage practices to rely more heavily on group visits for efficiency rather than patient preference, and SMAs should not replace the option of one-on-one appointments for patients who prefer them. A commenter recommended clarification on confidentiality terms including prohibition on beneficiaries posting information about other participants on social media. Commenters recommended that CMS require clear documentation of consent and confidentiality terms, with a couple comments specifically suggesting that consent be documented in the medical record.

Response: We thank the commenters for feedback regarding voluntary participation in SMAs and continue to believe that SMAs must be voluntary. We have updated the code descriptor to emphasize this point. We also continue to believe that beneficiaries need to consent to SMA participation and must consent to confidentiality terms. These requirements are intended to ensure that participation in SMAs is based on informed patient choice, and that privacy is protected. We agree that SMAs should not replace the option of one-on-one appointments for patients who prefer them and that clear documentation of consent and confidentiality, including prohibitions on sharing information about other participants are needed safeguards.

Comment: Many commenters recommended greater flexibility in the session duration for SMAs, rather than the proposed 60-minute limit. Many commenters recommended that CMS allow sessions to extend to 90 or 120 minutes, citing evidence and operational experience that longer sessions are often necessary to accommodate comprehensive education, peer discussion, individualized clinical care, and skills-based learning. Several commenters suggested either establishing add-on codes for longer sessions or permitting sessions to exceed 60 minutes, stating this would better reflect real-world practice and improve the effectiveness of SMAs. A few commenters noted that patient surveys and operational realities identify group discussion and shared learning as beneficial components of participation, and that additional time is needed to support these elements. Some commenters noted that rigid time limits could reduce access and limit the value of SMAs for patients with complex needs.

However, a few commenters supported the proposed 60-minute duration as a reasonable safeguard. A commenter expressed support for the 60-minute session requirement, noting it

provides a safeguard for quality and clinical appropriateness, but also encouraged CMS to evaluate future increases in session duration based on outcomes data and operational experience.

Response: We thank commenters for their input regarding SMA session duration. After consideration of comments received, we were persuaded by commenters that the SMA service code should allow for a longer session duration than the originally proposed 60-minutes. We are finalizing an add-on code (HCPCS code G0687) that will permit up to two units in 30-minute increments, providing greater flexibility for practitioners to accommodate group education, counseling, peer support, individualized clinical assessment and care. Practitioners may bill up to two additional 30-minute units when medically necessary, allowing an SMA to last up to 120 minutes in total. A 120-minute SMA session would have a combined work RVU of 3.47.

Comment: Many commenters recommended increasing the proposed group size limit of 10 beneficiaries per session, with many suggesting allowing up to 15 beneficiaries per session, and a few advocating for larger groups, such as up to 20 participants. Several commenters recommended increasing the group size to better reflect operational realities, peer-reviewed evidence, and the need to accommodate attrition and no-shows. Several commenters stated that group sizes of 12–15 are common in SMA models, and that a cap of 10 beneficiaries would result in smaller groups due to cancellations, thereby undermining peer dynamics. A few commenters recommended setting a minimum group size (such as five patients) to ensure operational flexibility for smaller or rural practices that may struggle to reach higher numbers. Some commenters suggested that CMS allow practitioners to use their judgment in determining the appropriate group size based on patient needs, session duration, and care team composition. One comment referenced peer reviewed literature supporting effective SMAs with groups of 8–20 patients and recommend allowing SMA billing for groups of up to 20 patients. A few commenters supported the proposed cap of 10 beneficiaries per session. One of the commenters stated that the cap sessions at 10 participants provide reasonable safeguards for quality and clinical appropriateness. Another commenter support that no more than 10 beneficiaries may participate in a SMA per session, as this is the maximum number of participants who can benefit from a session and whom practitioners can serve at a time. A couple of commenters support a limit of 2 to 10 patients per session as the requirement would provide reasonable safeguards while preserving flexibility for them to design group visits to meet their patients' needs.

Response: We thank commenters for their feedback regarding the proposed group size for SMAs. After consideration of comments, we continue to believe that we should limit SMAs to a maximum of 10 beneficiaries per session. This approach is intended to provide patients with more individualized time with the practitioner when needed, ensuring that each beneficiary participating in the SMA receives adequate attention and support. We understand that a larger SMA group size may boost operational efficiency and help accommodate attrition or no-shows, however we have concerns that increasing the group size further could dilute the quality of clinician-patient interaction and potentially undermine the peer dynamics that are central to successful SMA models.

Comment: A majority of commenters strongly supported the inclusion of multidisciplinary teams in SMAs, emphasizing that effective group visits depend on the participation of multiple clinicians, including physicians, nurse practitioners, physician assistants, dietitians, behavioral health specialists, pharmacists, physical therapists, health coaches, acupuncturists, and other allied health professionals. Several commenters highlighted the importance of team-based care for addressing the complex medical, behavioral, and lifestyle needs of Medicare beneficiaries. Many commenters urged CMS to ensure that the SMA payment structure adequately supports the work of the full interdisciplinary team, warning that insufficient valuation could push practices toward a bare-minimum version of the benefit rather than the comprehensive model intended.

Several commenters requested preserving separate billing for distinct, nonduplicative services furnished by qualified professionals during SMAs, such as group medical nutrition therapy (MNT), diabetes self-management training (DSMT), physical activity interventions, and behavioral health services. A few commenters recommended allowing registered dietitians and other specialists to bill for their services separately when appropriate, rather than bundling all work into a single SMA payment. A few commenters supported the proposed requirements for physician or qualified nonphysician practitioner leadership, describing them as reasonable safeguards for quality and clinical appropriateness. However, most commenters requested greater flexibility, including allowing auxiliary personnel and allied health professionals to furnish components of SMAs under appropriate supervision.

Response: We thank commenters for supporting and providing feedback regarding the inclusion of multidisciplinary teams in SMAs. We agree that team-based care is important for addressing the complex medical, behavioral, and lifestyle needs of Medicare beneficiaries. Services provided under an SMA cannot be billed separately because the minutes of the service counted toward the SMA service code cannot also be counted for any other billed service. This ensures that the SMA payment structure remains consistent and avoids duplication of billing for overlapping services.

Comment: A few commenters supported the proposed valuation for SMA as a reasonable starting point. A commenter expressed general support for the building block methodology and encouraged CMS to monitor outcomes and revisit the valuation as needed. Several commenters addressed the proposed valuation for SMAs, and several commenters expressed concerns that the building block methodology may undervalue the complexity and resources required for effective group visits. Many commenters stated the combination of CPT 99213 and 96202 (resulting in 1.73 work RVUs) may not adequately reflect the work involved in moderate or high-complexity SMAs, especially those serving patients with multiple chronic conditions and requiring multidisciplinary team input. A few commenters suggested a crosswalk to group health behavior intervention codes (CPT codes 96164 and 96165) instead of CPT code 96202 for the group education, counseling, and peer support elements, arguing that these codes better capture the service delivery and intensity of SMAs. Several commenters recommended tiered complexity codes (analogous to CPT codes 99213 and 99214), the addition of the complexity add-on code (HCPCS code G2211), or time-based payment options to ensure that the valuation matches the clinical work and team-based care required. A couple of commenters stated that the proposed valuation underestimates clinician time and administrative complexity, and recommended increases to the work RVU to incentivize the use of SMAs and

support sustainable delivery. A commenter raised concerns about the utilization estimate for SMAs. The commenter noted that CMS's addenda tables project 410,100 unadjusted allowed services for 2027 and stated the assumptions underlying this estimate were not clearly explained. The commenter cautioned that the projected number may be too high and could result in resources being removed from the fee schedule. The commenter requested CMS to clarify its methodology for estimating utilization to ensure that resource allocation is appropriate and sustainable.

Response: We thank commenters for their feedback regarding the valuation of SMAs. We appreciate the support for the proposed methodology and the encouragement to monitor outcomes and revisit the valuation as needed. As previously discussed, after consideration of comments, we are finalizing the addition of a new add-on code for SMAs (HCPCS code G0687) to account for additional time spent during the session, in 30-minute increments up to two units. The new add-on code will be valued at half the work RVU of the base code, resulting in a finalized work RVU of 0.87. With this additional coding and the option to add time as needed for the duration of the SMA, we believe that the valuation of the add on code and valuation of the base SMA code with a work RVU of 1.73 work is appropriate for SMAs.

Additionally, in response to the commenter who provided input on the SMA utilization estimate for 2027, we note that the estimate was based on approximately 3 percent of the utilization of CPT code 99213 specifically billed by primary care specialties, including family practice, general practice, and internal medicine; this translated into approximately 0.6 percent of all billings of CPT code 99213. Our understanding is that practitioners are currently billing for shared medical appointments using CPT code 99213, and the projected utilization for HCPCS code G0686 would replace some of this utilization. We derived the 3 percent estimate from a published survey,[52] in which 3 out of the 107 survey respondents were actively involved in group visits at the time of survey, which indicated that less than 3 percent of primary care clinicians were actively involved in furnishing group visits. We will continue to monitor utilization and outcomes, and welcome ongoing feedback as we may refine the valuation in future rulemaking.

Comment: Several commenters provided feedback regarding same-day billing for E/M visits and SMAs, with a majority expressing support for allowing separate billing when both services are medically necessary and distinctly documented. Many commenters recommended clarification to permit same-day billing for E/M visits and SMAs, provided that the time and work for each service are not double-counted and that documentation clearly supports the distinct nature of each encounter. Several commenters emphasized that prohibiting same-day billing could create barriers to comprehensive patient care, delay necessary evaluation and treatment, and increase administrative burden for both patients and providers. A couple of commenters requested clarification that the limitation on counting same-day SMA and E/M services separately would not preclude separate payment for distinct, medically necessary services that require privacy and cannot appropriately be furnished in a group setting. Other commenters recommended explicit billing guidance to ensure that practitioners can address acute issues that arise during SMA sessions without being penalized.

Response: We thank commenters for their feedback regarding same-day billing for E/M visits and SMAs. We agree with the majority of commenters and will finalize our proposal such that in the event it is medically necessary for a beneficiary to receive an E/M visit on the same day as an SMA by the same physician or more than one physician in the same specialty in the same group, we are finalizing that any time and effort cannot be counted more than once. Accordingly, we will not consider or treat this as two separate E/M same-day visits. This approach is intended to ensure that time and work are not double counted, maintaining the integrity of documentation and billing while supporting comprehensive patient care.

Comment: Many commenters expressed strong support for permitting SMAs to be delivered via telehealth, emphasizing that this flexibility would expand access for rural, mobility-limited, and underserved populations. Several commenters recommended finalizing the proposal to add SMAs to the Medicare Telehealth Services List. Many commenters highlighted that telehealth delivery is essential for overcoming transportation barriers, supporting continuity of care, and enabling participation for beneficiaries with functional limitations. A few commenters requested clarification in the final rule that SMAs may be furnished in hybrid formats, with some participants attending in person and others joining via telehealth, and that the SMA service should be billable for each beneficiary present regardless of modality.

Response: We appreciate the support from commenters and are finalizing that SMA sessions can be held either in-person or via telehealth and clarifying that SMAs may be furnished in hybrid formats, with some participants attending in person and others joining via telehealth.

Comment: Many commenters opposed the proposed 12-month existing clinical relationship with the practitioner requirement, arguing that it would unnecessarily restrict access to SMAs and delay care for patients who could benefit from group visits. Several commenters recommended removing or relaxing the 12-month existing clinical relationship with the practitioner requirement. Many commenters suggested that eligibility should be determined by medical necessity and practitioner judgment, rather than the timing of a prior visit. Several commenters requested to allow referrals from any treating clinician within a health system, not just the same specialty or group practice, to preserve continuity of care and expand timely access. A couple of commenters stated that conditioning SMA access on a documented prior encounter introduces avoidable delays, especially for patients newly diagnosed or identified as needing intervention. Some commenters stated that the 12-month existing clinical relationship with the practitioner requirement could exclude complex beneficiaries and create administrative burdens for small or rural practices.

A few commenters supported the proposed 12-month existing clinical relationship with the practitioner requirement and expressed support for the 12-month prior-visit requirement, describing it as a reasonable safeguard for quality and clinical appropriateness.

Response: We thank commenters for their feedback regarding the proposed 12-month existing clinical relationship with the practitioner requirement for SMAs. After consideration of comments, we continue to believe that a 12-month existing clinical relationship between the practitioner and patient is appropriate. This relationship is important for determining whether SMAs would be suitable and beneficial for the patient. By maintaining this requirement, we aim to safeguard clinical appropriateness and quality of

[52] *https://pmc.ncbi.nlm.nih.gov/articles/PMC5932677/.*

care, while supporting continuity between the practitioner and patient.

Comment: Several commenters described the operational frequency and cadence of SMAs based on their experience and other evidence. A commenter referenced evidence-based cadences from literature, referencing intensive weekly series of 6 to 16 weeks followed by monthly or quarterly maintenance. A couple of commenters reported that their programs commonly operate SMAs once weekly for several weeks or once monthly for ongoing support, reflecting the need for flexibility to accommodate patient needs and program goals. Many commenters recommended allowing operational flexibility and avoid imposing rigid frequency limits, noting that the optimal cadence may vary depending on the condition, patient population, and care model. A few commenters suggested that if CMS establishes a per-beneficiary limit, it should be set at not fewer than 36 sessions per calendar year to accommodate intensive and maintenance schedules documented in the literature.

Response: We thank commenters for providing valuable information regarding the operational frequency and cadence of SMAs. After consideration of the comments, we are finalizing a frequency limit of not more than one SMA session per week per beneficiary.

Comment: Many commenters provided detailed recommendations for program integrity and safeguards, reflecting broad consensus that robust protection is essential for SMAs. Several commenters emphasized the importance of individualized documentation for each participant, attendance verification (such as sign-in sheets or platform logs), documented consent and confidentiality terms, and staff training in group facilitation and SMA protocols. A couple of commenters recommended routine claims audits and periodic outcomes review as part of the integrity framework. Several commenters suggested establishing a reasonable annual encounter limit (for example, at least 36 sessions per beneficiary per year) to prevent runaway volume while supporting intensive and maintenance schedules.

A few commenters cautioned against rigid structural limits (such as diagnosis, duration, or group size) as primary safeguards, arguing that individualized documentation and compliance audits are more effective and less burdensome. Some commenters requested balanced safeguards against administrative burden, ensuring that legitimate SMAs remain practical for small, rural, and community practices.

Response: We thank the commenters for providing detailed recommendations regarding program integrity and safeguards for SMAs. After consideration of commenter's input, we are finalizing the requirement that each SMA session be documented in each participating beneficiary's medical record. This documentation ensures individualized care and accountability, and we will continue to monitor this process and welcome ongoing feedback. We note that it may be beneficial for practitioners to retain attendance verification for the SMAs (such as sign-in sheets or platform logs) as this may be helpful in the event of a routine claims audit. We would appreciate additional information on recommended staff training requirements for SMAs and may address this along with additional safeguards in future rulemaking.

Comment: Commenters stated that the proposed rule did not clearly address whether RHCs and FQHCs may furnish and bill for SMAs and requested that CMS explicitly extend G0686 eligibility to these settings. Commenters cited the high chronic disease burden and access barriers (rural geography, transportation, limited specialty care) faced by beneficiaries served by RHCs and FQHCs. Another commenter also requested that, if RHCs and FQHCs are permitted to furnish SMAs, CMS allow separate payment for a same-day individual E/M visit when a beneficiary requires individualized attention for an acute issue arising during a group session.

Response: We thank the commenters for their comments. A billable RHC or FQHC visit requires a medically necessary, face-to-face, one-on-one encounter between a beneficiary and an RHC or FQHC practitioner (§ 405.2463). SMAs, by design, involve concurrent group participation and do not meet this definitional requirement.

Comment: Several commenters raised concerns about cost sharing and out-of-pocket costs for beneficiaries participating in SMAs. A commenter recommended that CMS address beneficiary cost sharing in the final rule, urging that copayments for SMAs should not exceed those charged for individual appointments. A couple of commenters emphasized the importance of reducing cost-sharing barriers to ensure equitable participation, especially for underserved and vulnerable populations. Many commenters highlighted that minimizing out-of-pocket costs would help maximize access to SMAs and support health equity.

Response: We thank the commenters for their feedback. In response to the comments regarding elimination of beneficiary cost sharing for SMA services, most services covered under Medicare Part B carry cost sharing obligations (deductible and co-payment) unless the statute specifies that they do not apply. SMA services would be subject to applicable deductible and co-payment requirements as we do not have statutory authority that would allow us to remove or waive applicable cost sharing for SMA services.

Comment: Several commenters provided feedback on how HCPCS code G0686 should be described and coded. Many commenters recommended that the descriptor should clearly identify SMAs as voluntary, group-based medical sessions that integrate individualized clinical assessment and care with group education, counseling, and peer support. Several commenters requested that the code language explicitly require individualized documentation for each participant, consent and confidentiality terms, and allow for multidisciplinary team participation under appropriate supervision. Many commenters urged preserving flexibility in the descriptor language, allowing practitioners to determine session length, group size, and team composition based on clinical need and operational realities. Several commenters emphasized that SMAs should not be characterized as group visit, as this understates the SMA service, and they recommend adopting terminology that includes the term ''medical.''

A few commenters raised concerns about the use of the term ''peer support'' in the SMA descriptor as this may be confused with peer support services provided by peer support specialists. They recommended removing or avoiding the term in the SMA code description. Conversely, a few commenters appreciate explicitly identifying education and peer support in the code description.

Response: We thank commenters for providing feedback regarding the SMA descriptors. After considering comments, we are modifying the code descriptor with technical refinements and changes. Although the code descriptor already included the term ''voluntary'', we modified the code descriptor to emphasize the voluntary nature of SMAs. We also acknowledge commenters' emphasis that SMAs should be described by including the term ''medical'' and are finalizing the descriptor to begin with the terms

''Group-based medical session.'' The inclusion of the term ''peer support'' in the descriptor is intended to reflect the supportive interaction among patients within SMAs. The long descriptors for SMAs will be finalized as follows:

HCPCS code G0686: *Group-based medical session involving multiple patients with common medical condition(s) and receiving medical care in a group setting. The voluntary session is billed and led by a physician or other qualified healthcare professional (QHP) and may include services provided by other QHPs, clinical staff, or auxiliary personnel under the direction of the supervising physician or QHP. The voluntary session integrates group education, counseling, and peer support with individualized patient clinical assessment and care, includes 2–10 patients, billed once per patient, first 60 minutes.*

HCPCS code G0687: *Group-based medical session involving multiple patients with common medical condition(s) and receiving medical care in a group setting. The voluntary session is billed and led by a physician or other qualified healthcare professional (QHP) and may include services provided by other QHPs, clinical staff, or auxiliary personnel under the direction of the supervising physician or QHP. The voluntary session integrates group education, counseling, and peer support with individualized patient clinical assessment and care, includes 2–10 patients, billed per patient, each additional 30 minutes (list separately in addition to code for primary service).*

After consideration of the public comments, we are finalizing our proposal to create coding and separate payment for shared medical appointments with modifications. We are finalizing an add on code (HCPCS code G0687) with a work RVU of 0.87. Practitioners may bill up to two additional 30-minute units when medically necessary, allowing an SMA to last up to 120-minutes, and resulting in a combined work RVU of 3.47 for the SMA session. We are finalizing the HCPCS G0686 valuation as proposed. We are finalizing a frequency limit of not more than one SMA session per week per beneficiary. Additionally, we are finalizing a modified long descriptor for HCPCS G0686. However, we continue to welcome additional information and continued engagement on SMAs and may consider refinements through future rulemaking.

(55) Vaccine Adverse Effects Management (HCPCS Code G0576)

Vaccines prevent serious illnesses and even death in persons who receive them and serve a public health benefit. Vaccines are intended to produce active immunity to specific antigens. An adverse reaction is an undesirable side effect that occurs after a vaccination. Vaccine adverse reactions are classified as (1) local; (2) systemic; or (3) allergic. Local reactions (for example, redness) are usually the least severe and most frequent. Systemic reactions (for example, fever) occur less frequently than local reactions, and severe allergic reactions (for example, anaphylaxis) are the least frequent reactions.[53] Licensed vaccines are safe and effective; however, adverse events have been reported after administration of each type of available vaccine.[54] Vaccine providers should be familiar with identifying immediate-type allergic reactions, including anaphylaxis, and be competent in treating these events at the time of vaccine administration. Providers, including practitioners, should also have a plan in place to contact emergency medical services immediately in the event of a severe acute vaccine reaction.[55]

Before a vaccine is licensed, the Food and Drug Administration (FDA) takes steps to make sure the vaccine is safe. FDA requires that a vaccine goes through extensive safety testing. Even though careful studies are done before a vaccine is licensed, rare adverse effects may not be found until a vaccine is given to millions of people with different backgrounds and medical histories.[56] According to clinical trial data, most vaccine-associated adverse events are mild; however, severe adverse reactions such as anaphylaxis, myocarditis, thrombotic events, and pneumonitis have been reported.[57] After a vaccine is licensed, the Vaccine Adverse Event Reporting System (VAERS) is one of the mechanisms used to monitor for any problems, or ''adverse events,'' that happen after vaccination.[58]

We believe that the CPT evaluation and management code set may capture the work and clinical decision making involved in the evaluation and management of most vaccine adverse reactions. However, we believe that physician and nonphysician practitioners' work may not be accurately reflected under the CPT medical decision-making framework relating to the evaluation and management of rare and severe vaccine adverse reactions. E/M visits, like other services under the PFS, are valued based on an assumption of a typical case. We believe that these are additional resource costs that don't fit under a typical E/M. Therefore, we proposed an add-on code and payment for diagnosis and management of a suspected vaccine adverse reaction for services going above and beyond those captured in an evaluation and management (E/M) visit. These services entail listening to patient concerns, answering questions, and building trust; selecting diagnosis strategies and conveying information in a manner specific to each patient's concerns, cultural and religious beliefs, and literacy level; providing patients with appropriate resources; and planning with patients the treatment of symptoms of vaccine adverse effects. We proposed that this add-on code, HCPCS code G0576 (*Office or other outpatient evaluation and management service(s) for the diagnosis and treatment of vaccine adverse effects, new or established patient; each 15 minutes personally performed by the physician or qualified healthcare professional (list separately in addition to CPT codes 99202, 99203, 99204, 99205, 99211, 99212, 99213, 99214, 99215, 99341, 99342, 99344, 99345, 99347, 99348, 99349, 99350)*), would be payable when a physician or nonphysician practitioner (NPP): (1) establishes and documents a temporal relationship to vaccination, and (2) performs a medically appropriate assessment to rule out alternative causes.

For the purposes of valuation, we proposed a direct crosswalk for HCPCS code G0576 to HCPCS code G2212 (*Prolonged office or other outpatient evaluation and management service(s) beyond the maximum required time of the primary procedure which has been selected using total time on the date of the primary service; each additional 15 minutes by the physician or qualified healthcare professional, with or without direct patient contact (List separately in addition to CPT codes 99205, 99215, 99483 for office or other outpatient evaluation and management services) (do not report G2212 on the same date of service as 99358, 99359, 99415, 99416) (do not report G2212 for any time unit less than 15 minutes)*) for 0.61 work RVUs and for direct PE inputs.

[58] Ibid.

We welcomed comments on whether a second HCPCS code for 15 minutes of physician or NPP work time should be finalized and structured as a stand-alone code to more accurately capture the work entailed in cases where a patient is being evaluated for only a vaccine related complaint, outside the context of an E/M visit being furnished for a separate complaint. We also welcomed comments on whether in finalizing such a stand-alone HCPCS code we should crosswalk its work RVU and PE inputs to HCPCS code G2212.

We received many public comments on these proposals. The following is a summary of the comments we received and our responses.

Comments: The majority of comments expressed were identical, anonymous comments expressing support for the new vaccine adverse effects HCPCS add-on code G0576. These commenters requested that this and other immunization administration codes be removed from National Correct Coding (NCC) bundling when billed with E/M codes on the same date of service, as bundling defeats the purpose of encouraging screening/preventive services. A few other commenters expressed unqualified support and a few others expressed support but asked CMS to monitor utilization for potential misuse of the code that would result in duplicative billing or unnecessary testing or services that are not supported by the patient's presentation. A couple of commenters requested consideration of policies beyond the scope of this rulemaking.

Finally, many commenters opposed the creation of the HCPCS code G0576 because they felt that the new coding is clinically unnecessary given existing coding mechanisms and furthermore the new coding risks generating misleading data that could be used to overstate vaccine-related harm and undermine public confidence in immunization. Some felt that the separate payment could create incentives to misattribute nonspecific symptoms to vaccination without clear clinical evidence. Nearly all of those that were opposed asked that CMS articulate a clearer distinction between the proposed HCPCS code G0576 service and work that is already reportable through established E/M coding and diagnosis reporting mechanisms. A commenter suggested that G0576 is fundamentally counseling services and should be explicitly described as such in the code descriptor and accompanying guidance. Another commenter asked that CMS issue clear guidance so that practitioners and billing staff can reliably determine when HCPCS code G0576 applies instead of a base code E/M or prolonged E/M service. Commenters generally requested clear guidance regarding the documentation necessary to establish the required temporal relationship and medically appropriate assessment of alternative causes stating that requirements should reflect reasonable clinical documentation and should not become rigid technical conditions that generate denials despite the furnishing of medically necessary care. Another commenter also felt that HCPCS code G0576 was more of a counseling service that should be taking place before a vaccination is given rather than after the vaccination has already taken place and bemoaned that CMS coding does not allow clinicians to report vaccine counseling time when a vaccine is not administered. Finally, a commenter stated that the apparent frequency of suspected vaccine adverse reactions could reflect differences in provider coding behavior, reimbursement incentives, documentation practices, and patient attribution—not differences in the underlying incidence or severity of adverse events.

Response: We thank commenters for their comments. We believe that physician and nonphysician practitioners' work may not be accurately reflected under the CPT medical decision-making framework relating to the evaluation and management of rare and severe vaccine adverse reactions. E/M visits, like other services under the PFS, are valued based on an assumption of a typical case. We believe that these services involve additional resource costs that do not fit under a typical E/M service code. These services entail listening to patient concerns, answering questions, and building trust; selecting diagnosis strategies and conveying information in a manner specific to each patient's concerns, cultural and religious beliefs, and literacy level; providing patients with appropriate resources; and planning with patients the treatment of symptoms of suspected vaccine adverse effects.

After consideration of public comments, we are finalizing coding and payment for HCPCS add-on code G0576 (*Office or other outpatient evaluation and management service(s) for the diagnosis and treatment of vaccine adverse effects, new or established patient; each 15 minutes personally performed by the physician or qualified healthcare professional (list separately in addition to CPT codes 99202, 99203, 99204, 99205, 99211, 99212, 99213, 99214, 99215, 99341, 99342, 99344, 99345, 99347, 99348, 99349, 99350)*) as proposed for the diagnosis and management of a suspected vaccine adverse reaction. We expect practitioners to support reporting of HCPCS code G0576 with sufficient evidence in the medical record for services going above and beyond those captured in an E/M visit. We are finalizing adding HCPCS code G0576 to the Medicare Telehealth List.

(56) Health Coaching (CPT Codes 0591T, 0592T, and 0593T)

Per the Trump Administration's Executive Order, ''Establishing the President's Make America Healthy Again Commission,'' [59] the Administration is directing agency focus towards understanding and drastically lowering chronic disease rates, through thinking on nutrition, physical activity, healthy lifestyles, over-reliance on medication and treatments, the effects of new technological habits, environmental impacts, and food and drug quality and safety. Furthermore, the Executive Order directs that agencies shall ensure the availability of expanded treatment options and the flexibility for health insurance coverage to provide benefits to support beneficial lifestyle changes and disease prevention.

As such, in the CY 2026 PFS proposed rule, we sought comment on a wide range of possible rulemaking topics to promote prevention and management of chronic disease, and in particular, asked more detailed questions surrounding health coaching and motivational interviewing. More specifically, we asked whether we should consider coding and payment for health coaching and motivational interviewing beyond the current contractor-priced CPT codes describing health coaching, as an incident-to service performed under general supervision of a billing practitioner, what an appropriate description would be, what types of clinical staff perform motivational interviewing, how long a session lasts, the overlap between motivational interviewing and health coaching, training requirements for motivational interviewing and health coaches, the types of clinical circumstances where motivational interviewing and health coaching are performed, relevance for audiovisual or audio-only telecommunication, the experience of payers and providers using the CPT Category III CPT codes, and relevance for Evidence-Based Programs that effectively manage or prevent chronic disease. Commenters

[59] *https://www.whitehouse.gov/presidential-actions/2025/02/establishing-the-presidents-make-america-healthy-again-commission/.*

responded, stating that health coaching could support CMS' goal of preventing or managing chronic disease. Many health coaches wrote about their personal experience working with patients with chronic diseases, assisting them in making behavioral and lifestyle changes to self-manage their conditions, and noted that health coaching is a low-cost and highly effective strategy that empowers patients to manage their health. Many commenters requested paying separately for health coaching via the creation of HCPCS G-codes or another payment mechanism that would allow providers to reliably schedule and bill for health coaching services. Commenters also emphasized the importance of requiring that these services be provided by health coaches with appropriate training and certification.

To ensure we adequately capture the time and resources for health coaching, we proposed conditions of payment and valuation for 0591T (*Health and well-being coaching face-to-face; individual, initial assessment, 60–90 minutes*), 0592T (*Individual, follow-up session, at least 30 minutes),* and 0593T (*Health and well-being coaching, group [2 or more individuals], at least 30 minutes*). CPT code 0593T would be billed once per beneficiary in the group.

We also proposed to adopt the CPT prefatory language for 0591T, 0592T, and 0593T: ''Health and well-being coaching is a patient-centered approach wherein patients determine their goals, use self-discovery or active learning processes together with content education to work toward their goals, and self-monitor behaviors to increase accountability, all within the context of an interpersonal relationship with a coach. The health and well-being coach is qualified to perform health and well-being coaching by education, training, national examination and, when applicable, licensure/regulation, and has completed a training program in health and well-being coaching whose content meets standards established by an applicable national credentialing organization. The training includes behavioral change theory, motivational strategies, communication techniques, health education and promotion theories, which are used to assist patients to develop intrinsic motivation and obtain skills to create sustainable change for improved health and well-being.''

We proposed that CPT codes 0591T, 0592T, and 0593T may be performed under direct supervision of the billing practitioner, as defined by § 410.26(a)(3). We also proposed that when the service is performed under direct supervision by auxiliary personnel, the auxiliary personnel must have received appropriate certification to perform the services, which includes, but is not limited to, fulfilling the National Board for Health and Wellness Coaching National Standards, the National Commission for Health Education Credentialing eligibility for Certified Health Education Specialists, or the American Holistic Nurses Credentialing national standards for Certified Nurse Coaches. In response to the Request for Information (RFI) in the CY 2026 PFS proposed rule (90 FR 49479 through 49480), we received comments from interested parties pointing us towards these standards. We also proposed that appropriate certification for auxiliary personnel to perform the services can also be fulfilled by receiving training from the evidence-based health promotion and disease prevention programs funded under the Older Americans Act and overseen by the Administration for Community Living (ACL). These programs undergo review, meet significant evidence thresholds, and have training requirements built into the program requirements. We solicited comments on these certification standards for auxiliary personnel performing these services.

Furthermore, we understand that occasionally, community-based organizations (CBOs) are the entities that employ health coaches. As noted in the CY 2023 PFS final rule (87 FR 69790) and explained in the CY 2023 PFS proposed rule (87 FR 46102), when we refer to CBOs, we mean public or private not-for-profit entities that provide specific services to the community or targeted populations in the community to address the health needs of those populations. They may include community care hubs, community-action agencies, housing agencies, area agencies on aging, centers for independent living, aging and disability resource centers or other non-profits that apply for grants or contract with healthcare entities to perform social services. They may receive grants from other agencies in the U.S. Department of Health and Human Services, including Federal grants administered by the Administration for Children and Families (ACF), Administration for Community Living (ACL), the Centers for Disease Control and Prevention (CDC), the Health Resources and Services Administration (HRSA), the Substance Abuse and Mental Health Services Administration (SAMHSA), or State-funded grants to provide social services. Generally, we believe such organizations know the populations and communities they serve and may have the infrastructure or systems in place to assist practitioners to provide these services. We noted that individuals employed by CBOs may operate under general supervision of the billing practitioner, as long as the training and certification guidelines outlined earlier in this section are met.

Finally, we proposed national payment for CPT codes 0591T, 0592T, and 0593T. We proposed to crosswalk work and direct PE inputs for 0591T and 0592T to CPT codes 99490 (Chronic care management) and 99439 (Chronic care management, each additional 20 minutes), respectively, since, like Chronic Care Management (CCM), these visit-based services are performed under general supervision. For 0593T, since it is a group visit billed in 30-minute increments, we proposed to crosswalk the work and PE inputs to CPT code G0109 (Group diabetes self-management training). Therefore, we proposed a work RVU of 1.00 for CPT code 0591T, 0.70 for CPT code 0592T, and 0.23 for CPT code 0593T. Since multiple sessions in the same calendar month may be needed, we did not propose frequency limitations for these codes, as long as they are reasonable and necessary. We will monitor utilization and may re-evaluate these policies in future rulemaking. These services were added to the Medicare Telehealth Services List in the CY 2024 PFS Final Rule (88 FR 78859 through 78860).

We solicited comments on the valuation of these services and the conditions of payment. We also solicited comments on whether we should consider creating HCPCS G-codes to describe these services for CY 2027, rather than actively pricing these Category III CPT codes that describe health coaching services, including what the potential benefits of G-codes would be compared to using the existing codes.

We received public comments on these proposals. The following is a summary of the comments we received and our responses.

Comment: The majority of commenters were in support of finalizing national payment for health and well-being services, emphasizing their value in chronic disease prevention, patient engagement, adherence and bridging the gap between clinical advice and sustainable behavior change. A few commenters do not recommend establishing coding or payment for these services under the PFS and suggested testing these concepts through a limited

demonstration or an alternative payment model (APM) first.

Response: We appreciate all input received from commenters regarding national payment for health and well-being services. After consideration of the comments submitted in response to the CY 2026 Request for Information (RFI) on health coaching and comments received on this proposed rule, we are finalizing national pricing for health and well-being coaching, as we recognize the value these services bring to chronic disease prevention. While a few commenters suggested further testing through limited demonstration or APMs, we do not believe this is necessary. These codes have been in effect since January 1, 2020, and are already recognized and used by practitioners. We believe that establishing national pricing at this time best supports the advancement and accessibility of health and well-being coaching services.

Comment: Many commenters were in support of national payment for health and well-being services but raised concerns regarding the proposed valuation for the codes. The commenters indicated that the proposed valuation undervalues the time and professional contribution required for effective health coaching for CPT codes 0591T and 0592T, which would lead to non-utilization of the codes. Commenters noted that the chronic care management codes may provide a reasonable conceptual reference point citing similarities in longitudinal care and general supervision. Several commenters stated that the proposed valuation for the health coaching codes are undervalued because the time used to value the codes are significantly less than what is required. A few commenters, indicated that the proposed crosswalk for the 60-minute initial assessment, CPT code 0591T to CPT code 99490, and the 30-minute follow-up session, CPT code 0592T to CPT code 99439, uses only the first 20-minute increment of the Chronic Care Management (CCM) codes, resulting in both codes being allotted approximately 25 minutes of clinical labor time, such that a 60-minute session and a 30-minute session are valued nearly identically, and both at a fraction of their actual time, leading to payment rates that do not reflect the duration and effort required for these services. A few commenters recommended prorating the CCM crosswalk practice-expense RVUs to reflect the actual time the coaching service requires. Another commenter recommended work RVUs of approximately 3.15, 1.10, and 0.30 for the health coaching services respectively, and if CMS did not adopt this refinement, they recommend at a minimum adopting another commenter's recommended work RVU values of 3.00, 1.05, and 0.29 respectively. Some commenters recommended finalizing national payment as proposed.

Response: We thank the commenters for communicating their concerns, indicating that the time duration of the proposed crosswalk codes would undervalue the health coaching services. Several commenters expressed concerns that our proposed crosswalks for CPT codes 0591T and 0592T did not adequately account for the time required to furnish these services. We agree that the proposed crosswalks do not sufficiently reflect the time associated with furnishing these services. Therefore, in consideration of the comments received, we are valuing the work RVU of CPT code 0591T at 1.81 and CPT code 0592T at 1.00, based on a crosswalk to CPT codes 99487 and 99489. We are crosswalking the work RVUs, work times, and direct PE inputs directly to these complex care management codes that account for more time, specifically, 60 minutes of clinical staff time and each additional 30 minutes, which more closely aligns with the health coaching service CPT codes 0591T and 0592T respectively. We continue to believe crosswalking the work RVU of CPT code 0593T to G0109 is appropriate and were not persuaded that CPT code 0593T required additional time and work valuation. Therefore, we are finalizing it as proposed.

Comment: Many commenters provided feedback on the supervision requirements for health and well-being coaching services (CPT codes 0591T, 0592T, 0593T). The majority of commenters expressed strong support for general supervision, based on operational feasibility, and stated that CMS's proposal was inconsistent because CMS crosswalked the valuation of CPT codes 0591T and 0592T to Chronic Care Management (CCM) codes (CPT codes 99490 and 99439) which are furnished under general supervision, while proposing direct supervision for health coaching itself, and would separately allow health coaches employed by community-based organizations to work under general supervision. Many commenters indicated that direct supervision for health coaching would create unnecessary barriers and would impede access for populations most in need. Some commenters requested adding language that would provide health coaching under general supervision by updating the codes to the designated care management services provision at § 410.26(b)(5), enabling general supervision for health coaching. Nurse organizations and credentialed nurse coaches specifically requested exemption from supervision requirements for licensed professionals, advocating for deference to state scope-of-practice laws and direct billing pathways. A few commenters supported direct supervision. Some commenters recommended that virtual or on-call supervision (real-time audio-video availability) could satisfy the requirements of direct supervision, consistent with recent CMS policy for incident-to services.

Response: We thank the commenters for their feedback regarding the supervision requirements for health coaching. Based on comments received, we now agree that health and well-being coaching should be performed under general supervision of the billing practitioner instead of as proposed with direct supervision. We believe this position is supported by several factors, including that chronic care management services can be delivered under general supervision which offers flexibility for auxiliary personnel to provide services without the billing practitioner being physically present. Additionally, 24/7 access is not necessary for health coaching and is not a required element for similar services such as Community Health Integration (CHI) and Principal Illness Navigation (PIN), which also operate under general supervision. We also want to note that direct supervision is typically reserved for highly clinical services where immediate oversight is needed to reduce potential harm, whereas health coaching is not as directly clinical and aligns more closely with services CMS historically allows under general supervision. As many commenters noted, CMS proposed health coaching codes valuation using a crosswalk to chronic care management codes which permit general supervision, and behavioral health services with similar goals also allow general supervision. We believe that requiring direct supervision would be inconsistent with other chronic care management services and could limit the operability and uptake of health coaching, especially among community-based organizations employing health coaches. Therefore, we are finalizing that health coaching may be furnished under general supervision, ensuring greater workforce capacity, improved patient access, and alignment with CMS's established practices. Additionally, we are making updates to

§ 410.26(b)(5) to specify general supervision for health coaching services accordingly.

Comment: Many commenters provided feedback on qualification and credentialing pathways for health and well-being coaching. Many commenters supported the credentialing pathway of the National Board for Health & Wellness Coaching (NBHWC), citing the rigor of its nationally standardized examination and training process as a quality safeguard. In addition, some commenters advocated for explicit retention of the National Commission for Health Education Credentialing (NCHEC) pathways, including Certified Health Education Specialist (CHES) and Master Certified Health Education Specialist (MCHES), as qualifying credentials for health coaching auxiliary personnel. Some commenters requested for American Holistic Nurses Credentialing Corporation (AHNCC) board-certified Nurse Coaches (NC–BC, HWNC–BC) be explicitly recognized among qualified personnel. Some commenters supported CMS's proposal to recognize training completed through evidence-based health promotion and disease-prevention programs funded under the Older Americans Act and overseen by the Administration for Community Living (ACL), and some commenters recommended aligning the Older Americans Act to HCPCS codes G0108 and G0109 rather than health coaching codes. Several commenters recommended allowing professionals such as occupational therapists, exercise professionals, registered dietitians, pharmacists, community health workers, and social workers to be included as eligible health coaches. They recommended that qualification standards be based on demonstrated skills and competency in evidence-based behavior change principles, allowing these professionals to serve as health coaches, if they can show they have the appropriate education, training and competency to deliver health and well-being coaching services. Several commenters recommended that occupational therapists be recognized as qualified health coach providers without requiring additional certification. Some commenters indicated that credentialing standards should be flexible, avoiding an exhaustive list that could inadvertently exclude qualified professionals as the workforce evolves.

Response: We note that as previously discussed, we are finalizing that CPT codes 0591T, 0592T, and 0593T may be performed under general supervision, as defined by § 410.26(a)(3). In addition, we continue to believe that auxiliary personnel must have received appropriate certification to perform the services, which includes, but is not limited to, fulfilling the National Board for Health and Wellness Coaching National Standards, the National Commission for Health Education Credentialing eligibility for Certified Health Education Specialists, or the American Holistic Nurses Credentialing national standards for Certified Nurse Coaches. In addition, we agree with the comments submitted in response to the RFI in the CY 2026 PFS proposed rule (90 FR 49479 through 49480) that appropriate certification for auxiliary personnel to perform the services can be fulfilled by receiving training from the evidence-based health promotion and disease prevention programs funded under the Older Americans Act and overseen by the Administration for Community Living (ACL) because these programs undergo review, meet significant evidence thresholds, and have training requirements built into the program requirements. Accordingly, we are finalizing as proposed. As such, auxiliary personnel who have received appropriate certification to perform the services, which includes, but is not limited to, fulfilling the National Board for Health and Wellness Coaching National Standards, the National Commission for Health Education Credentialing eligibility for Certified Health Education Specialists, or the American Holistic Nurses Credentialing national standards for Certified Nurse Coaches, and/or have received training from the evidence-based health promotion and disease prevention programs funded under the Older Americans Act and overseen by the Administration for Community Living (ACL) may provide health coaching services under general supervision of a physician or non-physician practitioner. The applicable list of the evidence-based health promotion and disease prevention programs funded under the Older Americans Act and overseen by the Administration for Community Living (ACL) can be found on the *ACL.gov* website (*https://acl.gov/programs/health-wellness/disease-prevention*).

Comment: Many commenters recognized the essential role of community-based organizations (CBOs) in delivering health and well-being coaching services, emphasizing their unique ability to engage local populations and address social drivers of health. Many commenters noted that CBOs are trusted entities within their communities. Credentialed health education specialists, such as CHES and MCHES professionals, frequently work in CBOs and bring expertise in health education, behavior change, communication, and program implementation. Commenters recommended CMS explicitly allow CBOs to employ and furnish health coaching services under general supervision, highlighting that CBOs may lack on-site practitioners but can still provide high-quality, evidence-based coaching through trained personnel.

Response: We thank the commenters for their feedback. CBOs often employ health coaches, and individuals employed by CBOs may operate under general supervision of the billing practitioner as long as the training and certification guidelines outlined earlier in this section are met. Accordingly, auxiliary personnel employed by a CBO, or otherwise affiliated with a CBO that employs health coaches, who have received appropriate training and certification to perform health coaching services, may provide health coaching services under general supervision of a physician or non-physician practitioner.

Comment: Commenters overwhelmingly supported the inclusion of telehealth as an allowable delivery option for health and well-being coaching services, emphasizing its critical role in expanding access for Medicare beneficiaries who face geographic, transportation, mobility, or caregiving barriers. Commenters also recommended flexible delivery as essential for accommodating evening and weekend sessions, and for matching beneficiaries with specialized coaches, such as those fluent in American Sign Language or with expertise in particular health conditions. Several commenters requested CMS to clarify that audio-only telehealth encounters should be permitted when video is not feasible, ensuring accessibility for individuals with sensory, cognitive, or technological limitations.

Response: We thank the commenters for their support. These services were added to the Medicare Telehealth Services List in the CY 2024 PFS Final Rule (88 FR 78859 through 78860). Section 6209(e) of the CAA, 2026 extends the flexibilities to allow audio-only Medicare telehealth services from January 30, 2026 to the extended date of January 1, 2028. Please refer to section II.C. Payment for Medicare Telehealth Services of this final rule for additional information.

Comment: Several commenters supported CMS's proposal to not propose frequency limitations on health and well-being coaching services. The commenters noted that the frequency and duration of coaching sessions

should be determined by clinical need and beneficiary-specific goals, rather than arbitrary caps. Several commenters highlighted that higher-frequency coaching is often necessary during the early period of a new patient relationship.

Response: We thank the commenters for their support in not establishing frequency limits for health and well-being services. Since multiple sessions in the same calendar month may be needed, we are not finalizing frequency limitations for these codes, as long as they are reasonable and necessary. We will monitor utilization and may re-evaluate these policies in future rulemaking.

Comment: Several commenters provided feedback regarding adopting the CPT prefatory language for 0591T, 0592T and 0593T. Commenters expressed the importance of maintaining clear, inclusive, and precise descriptors as established by the AMA CPT Editorial Panel. Several commenters recommended preserving the existing CPT language, which defines the scope, session duration, and credentialing standards for health coaching. Some commenters suggested that CMS revise the CPT code descriptors to clarify minimum session times, such as specifying ''at least 60 minutes'' for the initial assessment (CPT code 0591T), ''at least 30 minutes'' for follow-up (CPT code 0592T), and ''each 30 minutes'' for group coaching (CPT code 0593T), to help ensure consistent billing and proper reimbursement, especially for sessions that may require accommodations or longer durations. Some commenters recommended adopting language that would allow multiple units of CPT code 0593T to be billed for longer group sessions.

Many commenters advocated transitioning from temporary Category III CPT codes to permanent HCPCS G-codes for health and well-being coaching. The commenters stressed the need for payment stability and billing clarity. Conversely, several commenters supported retaining the Category III CPT codes, stating that the existing Category III codes are already recognized nationally, and retaining them would ease dual Medicare-commercial billing, reduce administrative complexity, and provide a clear path for eventual conversion to permanent Category I CPT status. The commenters stated creating new G codes could introduce confusion, duplicative coding, and especially for practices and payers already set up to use the existing CPT codes.

Response: We thank the commenters for their feedback on the adoption of CPT prefatory language for codes 0591T, 0592T, and 0593T. After consideration of comments, we will finalize adopting the CPT prefatory language for these codes and retain the Category III CPT codes, 0591T, 0592T, and 0593T. We agree with commenters that maintaining the established CPT prefatory language and CPT codes, which are recognized nationally, will help ensure clarity and consistency. We believe this approach will help avoid unnecessary confusion and administrative complexity, especially for practices and payers already set up to use the existing CPT codes.

Comment: Many commenters recommended not limiting health coaching services solely to medical conditions, emphasizing the importance of including behavioral health needs within the scope of reimbursable coaching. The commenters stated that health and well-being coaching can play an important role in supporting beneficiaries with stress management, sleep improvement, treatment engagement, and broader health behavior change. The commenters stated that behavioral health and medical health are deeply interconnected, and that coaching interventions often address factors such as motivation, adherence, self-management, and lifestyle modification, which are relevant for both physical and behavioral health outcomes.

Response: We thank the commenters for their feedback regarding including behavioral health needs within the scope of reimbursable health coaching services. Behavioral health needs should not be precluded from being addressed by health coaches when medically necessary.

Comment: Commenters requested that CMS expand recognized delivery settings for the coaching codes (CPT 0591T, 0592T, 0593T) to explicitly include RHCs and FQHCs. A commenter stated the proposed ''employing entity'' provision is limited to community-based organizations and asked CMS to confirm RHCs and FQHCs may report the codes on a fee-for-service basis. Another commenter stated that RHC exclusion under the proposed policy is inconsistent with CMS's goal of aligning payment across settings, and noted that RHCs already employ certified health coaches; this commenter urged CMS to permit RHC billing for coaching services.

Response: We thank the commenters for their comments. Health and well-being coaching services furnished under the general supervision of an RHC or FQHC practitioner, do not constitute a billable RHC or FQHC visit (§ 405.2463).

After consideration of the public comments, we are finalizing our proposal with modifications. Specifically, we are finalizing the valuation for health and well—being coaching, CPT codes 0591T and 0592T based on a crosswalk to CPT codes 99487 and 99489, with work RVUs of 1.81 and 1.00 and finalizing the valuation of CPT code 0593T as proposed. We are also finalizing that health coaching may be furnished under general supervision and updating § 410.26(b)(5) accordingly.

(57) Vascular Embolization or Occlusion Procedure With Use of a Pressure-Generating Catheter (HCPCS Code G0577)

HCPCS code C9797 (*Vascular embolization or occlusion procedure with use of a pressure-generating catheter (e.g., one-way valve, intermittently occluding), inclusive of all radiological supervision and interpretation, intraprocedural roadmapping, and imaging guidance necessary to complete the intervention; for tumors, organ ischemia, or infarction*) was created for the April, 2025 Quarterly Release for the OPPS and Ambulatory Surgical System (ASC) to describe use of a pressure-generating catheter inclusive of imaging guidance for vascular embolization. Subsequently, we also created HCPCS code C8004 (*Simulation angiogram with use of a pressure-generating catheter (e.g., one-way valve, intermittently occluding), inclusive of all radiological supervision and interpretation, intraprocedural road mapping, and imaging guidance necessary to complete the angiogram, for subsequent therapeutic radioembolization of tumors*) to describe the simulation angiogram associated with the use of the pressure-generating catheter described by HCPCS code C9797 for the April, 2025 OPPS Quarterly Release. For CY 2026, HCPCS code C9797 is assigned to APC 5194 with a payment rate of around $18,729 while HCPCS code C8004 is assigned to APC 5193 with a payment rate of around $11,874. Currently both HCPCS codes C9797 and C8004 are only payable in the OPPS and ASC settings, as there is currently no coding for the physician office setting describing use of this technology. Under the PFS, vascular embolization procedures are reported using CPT code 37243 (*Vascular embolization or occlusion, inclusive of all radiological supervision and interpretation, intraprocedural roadmapping, and imaging guidance necessary to complete the intervention; for tumors, organ*

ischemia, or infarction) regardless of the technology used to perform the service.

Interested parties have indicated that use of this technology has expanded beyond the OPPS and ASC settings and into the physician office setting; however, the resource costs associated with CPT code 37243 do not accurately account for the use of innovative catheter technology. While this technology may not yet be typical and as such is appropriately absent from the valuation of CPT code 37342, we are concerned that the lack of appropriate coding and payment for the use of innovative catheter technology may negatively impact access in the non-facility setting.

Beginning July 1, 2026, we began making separate payment for vascular embolization or occlusion procedure with the use of a pressure-generating catheter through the contractor priced HCPCS code G0577 (*Vascular embolization or occlusion procedure with use of a pressure-generating catheter (e.g., one-way valve, intermittently occluding), inclusive of all radiological supervision and interpretation, intraprocedural roadmapping, and imaging guidance necessary to complete the intervention; for tumors, organ ischemia, or infarction performed in the non-facility setting)* and proposed to nationally price this service for CY 2027. We sought comment on whether there is a need for creation of a HCPCS G-code to mirror HCPCS code C8004 as currently there are no claims for this service in the HOPD setting.

In the CY 2026 PFS final rule, we finalized use of the relationship between the OPPS APC relative weights to inform the PE RVUs for those services under the PFS. We believe a similar policy is necessary here to establish the initial valuation for vascular embolization using a pressure generating catheter given the lack of pricing information in the non-facility setting. Therefore, we proposed to use the relative relationship between the approximate APC payment amounts between CPT code 37243 and HCPCS code C9797 to value the PE portion of HCPCS code G0577 and a direct crosswalk to the work and MP RVUs associated with CPT code 37243 as well as the physician time. We sought comments on these values. We also noted in the proposed rule that this valuation is preliminary and we will consider updates for future rulemaking if use of this technology becomes more widespread in the non-facility setting.

Comment: We received comments requesting clarification on the methodology used to value the PE RVUs for HCPCS code G0577, noting that the reference to approximate APC payment amounts could not be independently replicated. Another comment separately raised a concern that the published PE RVU and total non-facility RVU for G0577 in the proposed rule addenda did not appear consistent with applying the adjustment ratio to the PE RVU alone before adding work and malpractice RVUs and requested that we review the calculation.

Response: We are revising our methodology for the final rule. Rather than relying on a single OPPS-based ratio, we compared the relative payment relationship between CPT code 37243 and HCPCS code C9797 under two measures of OPPS payment: the ratio of the OPPS APC payment amounts for the two codes, and the ratio of the OPPS geometric mean costs for the two codes. We then averaged the resulting ratios to produce a single adjustment factor. We are applying this adjustment factor to the existing non-facility PE RVUs for CPT code 37243 to derive the non-facility PE RVUs for HCPCS code G0577. Consistent with our proposal, we are finalizing a direct crosswalk of the work RVUs, malpractice RVUs, and physician time from CPT code 37243 to HCPCS code G0577. We confirm that the adjustment factor is applied to the PE RVUs only; the work and malpractice RVUs are added afterward to determine total RVUs. We reiterate that this valuation is preliminary.

Comment: We received comments in favor of establishing an office-based G-code analogous to HCPCS code C8004, even though no claims for C8004 currently exist in the hospital outpatient setting. Commenters noted that simulation angiograms are a clinically necessary planning step for radioembolization procedures, and that the absence of a non-facility reporting mechanism may create care fragmentation and access barriers for beneficiaries receiving the corresponding embolization procedure in the office-based setting.

Response: We appreciate the support from commenters for establishing a non-facility analog to HCPCS code C8004. We are not finalizing a new G-code for this service in this final rule, as we believe further utilization experience with HCPCS code G0577 will help inform whether, and how, to value a corresponding non-facility simulation angiogram code. We will consider establishing such a code in future rulemaking as this technology becomes more widely used in the non-facility setting.

Comment: We received a comment expressing broader concern that incorporating the cost of high-cost disposable supplies directly into PFS payment amounts creates budget-neutrality pressure that can erode physician work RVUs over time. The commenter urged the development of a separate, transparent payment pathway for high-cost disposable supplies outside the physician fee schedule.

Response: We appreciate the comment and share the goal of ensuring that payment for innovative technologies is accurate and sustainable. However, establishing a payment pathway for high-cost disposable supplies outside the PFS would require a broader policy change beyond the scope of this final rule. We will continue to consider this feedback as we evaluate our approach to valuing services that rely on high-cost disposable technology in future rulemaking.

Comment: A commenter requested that CMS revise the parenthetical language in the code descriptors for HCPCS codes G0577, C9797, C8004, and C1982 from ''(for example, one-way valve, intermittently occluding)'' to ''(for example, one-way valve or occlusion balloon, intermittently or temporarily occluding)'' to clarify that the descriptor is not limited to a specific device type. Separately another commenter requested that the long descriptor for G0577 be updated to mirror recent updates made to the C9797 descriptor in the October 2026 HCPCS file update.

Response: We appreciate the suggestions regarding the parenthetical language in the code descriptors for HCPCS codes G0577, C9797, C8004, and C1982, as well as the request to align the G0577 long descriptor with the October 2026 update to C9797. Requests to revise HCPCS Level II code descriptors are addressed through the HCPCS Level II coding process, outside of this rulemaking. Information on how to submit a request for a code descriptor change is available on the CMS website at *https://www.cms.gov/medicare/coding-billing/healthcare-common-procedure-system/level-ii-coding-process*.

After consideration of the public comments, we are finalizing our proposal to establish separate payment for HCPCS code G0577, with a revised methodology for determining its non-facility PE RVUs.

(58) Accounting for E/M Resource Overlap Between Stand-Alone Visits and Global Periods

(a) Background

Surgical procedures with a global surgery period include all the necessary services normally provided by the practitioner before, during, and after a procedure. The global surgery payment includes things like pre-operative visits, typical intra-operative services for that procedure, post-operative follow-up visits, supplies, and other services such as dressing changes, and removal of items used during or after surgery like sutures, staples, splints, or casts.[60] The payment and coding structure of global surgery periods includes the same foundational pieces as other codes in the PFS: work RVUs, practice expense RVUs, and malpractice RVUs. The work RVUs include time crosswalked from E/M codes to reflect the valuation of things such as pre-operative and post-operative visits. Given that global surgical packages already account for the resource costs associated with visits, standalone E/M codes are not billable on the same day as a procedure code unless they are significant and separately identifiable from the procedure. These visits are identified through appending of modifier –25 to the claim. This proposal is meant to address the likely overlap and duplication of payment between the E/M services already paid for during the global surgical package, and any additional E/M services billed for through the use of modifier –25 as significant and separately identifiable.

The PFS has other existing policies where we reduce payments if multiple procedures are furnished on the same day for the same patient, the multiple procedure payment reduction (MPPR) policies. MPPR is a longstanding Medicare policy to reduce payment by 50 percent for the second and subsequent surgical procedures furnished on the same day to the same patient, largely based on the efficiencies in PE and pre- and post-surgical physician work. Since the implementation of the PFS, MPPR policies were also established on nuclear medicine diagnostic procedures, the professional and technical component of diagnostic imaging, the technical component of diagnostic cardiovascular and ophthalmology procedures, and always-therapy services. In the 2019 PFS proposed rule (83 FR 35840 through 35841), as part of a suite of proposals designed to modify the payment structure of E/M visits, we proposed to reduce payment by 50 percent for the least expensive 0-day global procedure or visit that the same physician (or a physician in the same group practice) furnishes on the same day as a separately identifiable E/M visit, currently identified on the claim by an appended modifier –25.

In the 2019 PFS final rule (83 FR 59638 through 59640), many commenters opposed this proposal, stating that current billing rules allow these services to be billed only when modifier –25 is used, which makes it clear that the visits are significant and separately identifiable. Other commenters described that the RUC review process includes adjustments to account for any costs that the RUC considers duplicative, which means that CMS is making an unnecessary second adjustment. Commenters also stated that CMS provided insufficient rationale for a 50 percent payment reduction instead of other potential adjustments. Some physician organizations and patient advocacy groups also stated concerns that physicians might respond to financial incentives to bring patients back for necessary visits on a different day to avoid triggering the payment reduction. MedPAC, among others, were supportive of the proposal, stating that when a standalone E/M visit occurs on the same day as a procedure, there are efficiencies such as pre- service and post-service clinician work and practice expense, that are not currently accounted for in the system. Other commenters suggested alternative reductions, such as a 5 percent or 25 percent reduction.

In our response to commenters in the CY 2019 final rule (83 FR 59638 through 59640), we stated that we continued to have concerns about 0- and 10-day global periods on the same day as E/M visits. We appreciated the efforts of the RUC to address overlaps when they recognize that a code is often reported with a same day E/M visit, but we also noted that the RUC tends to recommend only minor adjustments to physician time and direct PE inputs to account for overlap. We also discussed that there are several thousand codes with global periods, and while we routinely prioritize review of high-volume services, we believe code-level reviews are not a practical solution to ensuring the accuracy of accounting for these types of efficiencies. We also stated that if practitioners begin deliberately scheduling visits on separate days to avoid the payment adjustment, this could create undue burden and create potential medical risk for beneficiaries.

We did not finalize this proposal in CY 2019 for a few reasons. First, we had concerns related to balancing the appropriate valuation of these codes with potential disruption to patient care. We reiterated that we find the possible practice of scheduling medical services to maximize payment highly problematic, and we invited interested party feedback regarding how to address these challenges. Second, we did not finalize any of the suite of proposals related to the valuation of the E/M code set in CY 2019, as the AMA and the CPT Editorial Panel stated plans to revisit coding for O/O E/M, and we delayed further action to allow that process to play out (83 FR 59638).

(b) Proposed Changes to Payments Using Modifier –25

As we stated in the CY 2019 final rule (83 FR 59638 through 59640), we continue to believe that there are efficiencies when the same physician (or a physician in the same group practice) provides an E/M service for the same patient in conjunction with a procedure with a global period, and that we are likely duplicating payment under the current payment methodology. We proposed to reduce payment, as described later in this section, when a separately identifiable O/O E/M visit is furnished by the same physician (or a physician in the same group practice) on the same day as a 0-, 10-, and 90-day global procedure. Under this proposal, the most expensive service (either surgical or E/M visit) would be paid at 100 percent, and all other surgical procedure(s) or E/M visit(s) would be paid at 50 percent. For example, a patient receives an O/O E/M visit using CPT code 99212 (*Office or other outpatient visit for the evaluation and management of an established patient, which requires a medically appropriate history and/or examination and straightforward medical decision making. When using total time on the date of the encounter for code section, 10 minutes must be met or exceeded*) at a dermatologist's office, and then has two skin lesions removed, one using CPT code 11300 (*Shaving of epidermal or dermal lesion, single lesion, trunk, arms, or legs; lesion diameter 0.5 cm or less*) and one using CPT code 11301 (*Shaving of epidermal or dermal lesion, single lesion, trunk, arms or legs; lesion diameter 0.6 to 1.0 cm).* Using 2026 RVU values, the total non-facility (NF) RVU of CPT code 99212 is 1.78, the total NF RVU of CPT code 11300 is 2.89, and the total NF RVU of CPT code 11301 is 3.48. Since CPT code 11301 is the highest paid service, CPT code 11301 will be paid at 100 percent (total RVU

[60] *https://www.cms.gov/files/document/mln907166-global-surgery-booklet.pdf.*

of 3.48), and CPT code 11300 and the payment for CPT code 99212 will both be reduced by 50 percent, CPT code 11300 down to 1.445 RVUs and CPT code 99212 down to 0.89 RVUs.

The 50 percent value aligns with our previous proposal from CY 2019 PFS proposed rule (83 FR 35840 through 35841) and matches the longstanding surgical MPPR discussed previously in this section. We welcomed comments on the value of this adjustment, including whether it would be more appropriate to match a different MPPR value, such as 25 percent.

We received public comments on these proposals. The following is a summary of the comments we received and our responses.

Comment: Commenters noted that we proposed but did not finalize this policy for CY 2019. Commenters asked us to explain why we re-proposed this policy for CY 2027, seeking to understand what had changed between 2019 and now. Other commenters had a more general objection, stating that this was the ''wrong policy in 2019'' and ''remains the wrong policy now.''

Many commenters also disagreed with our view that there are existing efficiencies that are currently unaccounted for when an O/O E/M is furnished on the same day as a 0-, 10-, or 90-day global procedure. Many commenters disagreed that we had proven the existence of this overlap, and we received several comments requesting more information on the empiric data CMS used to make this claim. Commenters also stated that the RUC process already takes any overlap into account through the existing process of screening procedures that are furnished with an E/M visit on the same day more than 50 percent of the time. These commenters felt that the RUC process was sufficient and questioned our assertion that it was inadequate. The RUC responded to our claim that the corresponding edits they make to account for overlap are insufficient by asserting that the overlap is small, therefore, the adjustments are accordingly small. Other commenters stated that this proposal was too broad and recommended that we take a more granular code-level approach. Commenters also recommended that we work with the RUC to identify and account for overlap or use other existing processes such as the Potentially Misvalued Code (PMVC) process.

Several commenters supported our proposal. MedPAC noted that they supported this proposal in 2019, and they continue to believe there are efficiencies in providing these services on the same day to the same patient, such as in pre-service and post-service clinician work and practice expense that are not accounted for in the current payment system. They also noted that this policy would have redistributive effects within the PFS, increasing payment rates for many types of services such as primary care and behavioral health services. A few other commenters supported our proposal, with a commenter stating that we struck an appropriate balance between reducing duplicative payment for overlapping services and preserving reimbursement for separately identifiable E/M services that involve additional clinical work beyond what is captured in the procedural payment.

AHIP (America's Health Insurance Plans) provided detailed comments in support of our proposal, citing 2024 Original Medicare claims data which showed that approximately 50 million of the 220 million O/O E/M visits in 2024 were billed with modifier –25, representing approximately $5.7 billion in total Medicare allowed charges. AHIP hypothesized that if one quarter of the resource costs fully overlap with the same resources included in surgical procedures, that would be approximately $1.5 billion in annual Original Medicare PFS payments that are redundant and inappropriate. They went on to emphasize that the potential for redundancy not only extends to physician work and clinical resources, but to indirect practice expense and overhead, which they stated represents approximately 75 percent of the indirect practice expense costs per hour for surgical services. AHIP went on to say that when an E/M visit is performed with a procedure, there is only one professional claim filed, making coding, billing, and revenue cycle management much more efficient, as well as front office staff work and use of the waiting room, exam room, electronic health record, IT equipment, and other administrative costs.

AHIP also discussed that the current methodology that is applied by CMS and the RUC to account for overlap is applied only on a case-by-case basis. The analysis done by AHIP using publicly available RUC documents and the Medicare Carrier 5% standard analytic file dataset indicates that overlap adjustments appear to have only been incorporated into physician time and/or valuation for fewer than 100 global surgical procedures. However, AHIP stated that Medicare claims data indicate that more than 800 procedures are reported with modifier –25 and a same day O/O E/M visit. They went on to state that since this process relies on Original Medicare claims data and a 5% sample of Medicare beneficiaries, this may under-identify overlap associated with newer services, lower-volume procedures, or procedures primarily furnished to non-Medicare populations, and added that this process likely recognizes only a small subset of services impacted and is likely applied inconsistently across the PFS. AHIP also provided a few examples of codes with unaddressed overlap. The first code they cited is CPT code 52000 *(Cystourethroscopy (separate procedure)),* which had over 700,000 Original Medicare claims in 2024 and is reported with an E/M service almost half the time. This code was last reviewed by CMS and RUC in the CY 2018 rulemaking cycle, but no overlap was accounted for in physician work time, medical staff and indirect practice expense resources. AHIP also cited CPT code 17261 *(Destruction, malignant lesion (eg, laser surgery, electrosurgery, cryosurgery, chemosurgery, surgical curettement), trunk, arms, or legs; lesion diameter 0.6 to 1.0 cm),* which had approximately 130,000 Original Medicare claims in 2024 and occurs with a same-day E/M more than 40 percent of the time. In this code, roughly 30 percent of the procedure's total physician time is pre-service and immediate post-service work, and yet the valuation reflects no overlap adjustment. AHIP also stated that since O/O E/M services are now selected based on either medical decision-making or total practitioner time, it may not always be straightforward for clinicians to distinguish between work attributable to the separately reported E/M service and the work that is already reflected in the procedure's pre-service, intraservice, or post-service valuation, which further supports the need for a systematic approach to overlap adjustments.

AHIP also noted that our proposal would likely improve relativity across services since the current methodology undertaken by the RUC to account for these efficiencies is inconsistent and is not flexible enough to handle individual patient encounters. AHIP also pointed out that for procedures where overlap has already been incorporated into the RVU valuation, providers who furnish the procedure without an associated E/M visit are not receiving payment that reflects the full resources required to perform the service. AHIP agrees with CMS that the code-by-code approach does not fully address the large number of surgical procedures and widespread use of modifier –25.

Response: We thank all the commenters for their comments. Regarding the presence of overlap

between O/O E/M visits and global periods, as we stated in the CY 2019 final rule (83 FR 59640), ''We continue to have significant concerns about the appropriate payment when codes with global periods, especially 0- and 10-day global periods, are billed on the same day as an E/M visit. Generally, we understand that the global codes are valued to include the typical amount of evaluation and management furnished to patients as part of the service.''

We went on to state (83 FR 59640), ''Although many commenters suggested that the overlapping resource costs between global codes and E/M visits billed on the same day have already been accounted for, we are not persuaded by the statements that the RUC process has achieved this goal, and we agree with MedPAC's assessment of the significant problem with valuation of codes that describe global services. We acknowledge and appreciate the efforts of the RUC to address overlaps when they recognize that a code is usually reported with a same day E/M visit. However, as observers to the RUC process, we have noted a general tendency for the RUC to recommend only minor adjustments in physician time and direct PE inputs to account for overlap. We also often make adjustments to the RUC-recommended valuation in cases where the agency believes there is overlap between services frequently billed together that has not been adequately addressed through the RUC process. More importantly, even if the RUC valuation process better accounted for the overlapping resource costs, those adjustments would be made to national valuation of particular codes based on snapshot, national claims data for a given year, and would apply to all physicians reporting the services regardless of whether or not these particular physicians were achieving the efficiencies that occur when visits are reported on the same day as codes with global periods.''

We believe that these concerns have not been adequately addressed in the intervening years. We note that while the RUC continues to assert that this overlap is accounted for, we did not receive a list of codes from the RUC outlining all codes where the RUC has already accounted for overlap. We have also found no other process to validate which specific codes out of the thousands of global procedures for which overlap has been accounted, beyond individually searching through RUC meeting materials. Regarding the comments asking us for a more empiric analysis or data, we welcome additional information from the public to help inform a process for addressing overlapping resources in the future. Additionally, we welcome feedback from the RUC and others regarding particular codes that may be misvalued for consideration through future rulemaking.

We thank MedPAC for their continued support of this policy, and we agree with MedPAC's assertion that there is still overlap that is unaccounted for, such as in pre- and post-service clinician work and practice expense. We also thank the commenters who noted this policy is meant to strike a balance between allowing these services to occur on the same day while recognizing that there are efficiencies that are not currently recognized.

We appreciate the work and data analysis done by AHIP, and we believe that this analysis further supports our point. We note that the current RUC process to account for overlap is only used when the global code is billed more than 50 percent of the time with an O/O E/M visit with modifier –25 appended. Both of the codes provided by AHIP support this assertion, and we note that both codes are frequently billed with O/O E/M visits, but do not meet the 50 percent threshold. We also note that one of those codes, CPT code 17261, was last reviewed by the RUC in 2010, furthering our point that this piecemeal approach to accounting for overlap code by code relies on a RUC process that is not an accurate representation of the current reality, since it represents decades-old data. In the CY 2026 PFS final rule (90 FR 49335), we reiterated similar concerns surrounding the delay and piecemeal approach to RUC data when we finalized the efficiency adjustment. We noted that while there is significant variability in how often codes are reviewed by the RUC, we estimated that there is an average of 17.69 years since the last review of a code. This delay also has an impact on accounting for the overlap of O/O E/M services and global procedures, since any overlap that the RUC takes into account only happens when codes are reviewed.

Comment: We received several comments discussing our proposed application of this policy to services provided by the same physician (or a physician in the same group practice). Commenters representing large multi-specialty group practices and academic medical centers noted that beneficiaries may schedule several appointments the same day with physicians of different specialties, especially if they have to travel for these appointments. Commenters recommended we modify our language to say, ''same physician (or a physician in the same specialty in the same group practice).'' Another commenter recommended that we limit it only to the services provided by the same physician.

Response: We thank the commenters for pointing this out, and we agree with them that our intention was not to target services furnished the same day by practitioners of different specialties. We are amending our application of this policy to services furnished by, ''the same physician (or a physician in the same specialty in the same group practice).'' We note that this is consistent with the Medicare Claims Processing Manual, Chapter 12, § 30.6.5—Physicians in Group Practice (Rev. 1, 10–01–03), where, ''Physicians in the same group practice who are in the same specialty must bill and be paid as though they were a single physician; physicians in the same group practice but in different specialties may bill and be paid without regard to common group membership.''

Comment: We received many comments that discussed the potential impact of our proposed 50 percent reduction in reimbursement, describing diminishing operational margins, staffing cuts, and inability to take on more Medicare patients if we finalize a 50 percent payment reduction. Other commenters stated that this policy would have a compounding impact with other reductions in payment such as the CY 2026 PFS final rule efficiency adjustment, declining Medicare conversion factors over the years, and the impact of inflation on costs such as staffing and supplies. We received comments from across the health care industry, including practitioners, health systems, private practices, and clinical and non-clinical support staff describing the potential impacts of this policy. These commenters reported that the impacts of this policy would directly impact their operational capacity to see Medicare patients and reiterated that this policy would have devastating impacts on the beneficiaries that they serve.

Most commenters stated that there was no payment reduction that would be appropriate. A few commenters stated that if a payment reduction was necessary, 25 percent would be an acceptable alternative. Another commenter stated that 50 percent seemed too steep, but that a 20 percent reduction would be more reasonable. A few other commenters stated that if we proceeded with a payment reduction, it should be below 50 percent. While AHIP supported a 50 percent payment reduction, they recommended that we phase in the policy, with a 25 percent

reduction for CY 2027 and CY 2028, with a 50 percent reduction going into effect for CY 2029 to minimize disruption. Another commenter recommended that we go forward with a 50 percent payment reduction but requested that we create a clear and objective exception process to account for the ''limited'' circumstances in which a beneficiary requires a separate clinical assessment involving distinct decision-making, evaluation, counseling, or examination that goes beyond the work accounted for in the global procedure. A few commenters including the RUC and the AMA also noted that our 2019 proposal only included 0-day global periods, and they questioned our inclusion of 10- and 90-day global procedures in our proposal this year.

Response: We are sensitive to the overwhelming response we received from commenters. We are also sensitive to the potential compounding impacts of many different policies across the healthcare system. Our intention with this proposal was to more accurately pay for the relative resource costs involved in furnishing an O/O E/M visit on the same day as a global procedure. We also appreciate the commenters who put forth suggestions for other percentages, such as 25 percent or 20 percent as alternatives, or those who stated it should be below 50 percent. While we acknowledge that the RUC takes overlap into account in some instances, we continue to believe that the RUC's approach is piecemeal and both underestimates the amount of overlap and does not recognize cases in which overlap exists when both codes are billed in conjunction less than 50 percent of the time.

In response to comments, and in acknowledgement of the overlap that has already been accounted for through the limited current RUC process, we are finalizing a 20 percent reduction in payment to all services except the highest value service when an O/O E/M visit is performed on the same day with the same practitioner (or a practitioner of the same specialty in the same group practice) as a service with a 0-day global period. We believe that a 20 percent reduction in payment is both responsive to commenters and strikes a balance between paying more accurately for services performed on the same day and the real-world impact of this policy. We reiterate that our original proposed reduction of 50 percent was based on long-standing MPPR payment reductions for surgical services. However, there are other MPPRs of 25 percent for the Technical Component (TC) of diagnostic cardiovascular services, as well as a 20 percent reduction to the TC for diagnostic ophthalmology, and a 5 percent reduction for the Professional component (PC) of diagnostic imaging. We reiterate that we welcome feedback and collaboration with the RUC and through the existing PMVC process.

Regarding an exception process, we invite feedback through PMVC nominations, and we welcome code specific recommendations from the RUC. Regarding the inclusion of 10- and 90-day global periods in this proposal, commenters are correct that we did not include these periods in the CY 2019 proposal. As we stated in the proposed rule (91 FR 43908), we believe overlap exists between any global period and an O/O E/M service performed on the same day for the same patient. We agree with commenters that the resources involved in furnishing a 10- or 90-day global service occur throughout the global period, making the overlap that occurs on just one day of a 10- or 90-day global period more difficult to quantify. We are therefore finalizing this policy to apply only to O/O E/M visits billed on the same day as 0-day global procedures. While we proposed to apply this policy only to O/O E/M visits, we sought comments on whether it should also apply to other E/M visits, such as inpatient E/M visits.

We received public comments on these proposals. The following is a summary of the comments we received and our responses.

Comment: We received several comments about applying this policy to only O/O E/M visits. A few commenters sought clarification on whether this policy applies to other E/M codes, such as emergency room or critical care codes. Several other commenters asked us not to expand this policy to any other E/M visits, including inpatient E/M visits. A commenter encouraged us to expand this policy to inpatient E/M visits, stating that the overlap that they believe exists in O/O E/M visits also exists in inpatient settings.

Response: We thank commenters for their feedback. We reiterate that we are finalizing that this policy only applies when an office/outpatient E/M visit is performed on the same day as a 0-day global procedure.

After consideration of public comments, we are finalizing the application of this policy to O/O E/M codes (CPT codes 99202, 99203, 99204, 99025, 99211, 99212, 99213, 99214, and 99215).

We also reiterate that we do not find it appropriate to schedule medical services for patients to maximize payment, which would create undue burden and potential medical risk for beneficiaries. We have a number of data analysis tools to monitor for potentially problematic utilization patterns which may be useful in the future, if necessary, for monitoring for this practice, including distinct claims editing to identify problematic utilization patterns, comparative billing reports to identify to providers their outlier status, and medical review capabilities to determine if the patterns are problematic and indicative of waste or abuse. We also sought comment on whether or not it is necessary to revise the conditions of payment to mitigate such payment abuses.

We received public comments on these proposals. The following is a summary of the comments we received and our responses.

Comment: We received many comments stating that this proposal would ''require'' patients to come back for a second, separately billed visit, as physicians respond to the reduced payment by scheduling the evaluation and the procedure on separate days. A few commenters expressed concern that practices or health systems may put processes in place that prevent practitioners from performing an O/O E/M visit on the same day as a global procedure. Other commenters stated that we were ''forcing'' practitioners to ''choose between our patients and our own financial viability.'' We received several comments from beneficiaries that included a copy of a letter or outreach they received from their practitioner or practitioner's office. Others included pictures of letters posted in their doctors' offices. These letters either implied or stated directly that Medicare would no longer pay for same day procedures and that beneficiaries would be forced by Medicare to come back another day.

Many commenters requested that CMS monitor utilization to ensure that beneficiaries were not being brought back to maximize payment. Many commenters stated that requiring beneficiaries to come back another day for a surgical procedure would impose a direct burden on beneficiaries through a second copayment, additional transportation and time away from work, have disproportionate impact on rural and underserved beneficiaries, and added difficulty for those who rely on caregiver support.

However, a supportive commenter refuted the claim of higher cost-sharing, noting that beneficiary cost-sharing would decrease under this proposal since beneficiaries are generally responsible for 20 percent coinsurance, and when overlapping expenses are

paid separately for the procedure and the E/M visit, beneficiaries incur additional cost even though those services were effectively only used once during the single encounter. This commenter also noted that this policy would support payment accuracy, program integrity, and the prudent stewardship of Medicare resources.

Response: We would like to clarify that this policy does not prohibit same-day procedures from occurring with an office visit. We see comments received and patient letters that imply a limit on same-day procedures as highly concerning, as we feel that practitioners who are directly misleading their patients are not operating in good faith of the doctor-patient relationship. We would also like to reiterate that we find the possible practice of scheduling medical services to maximize payment problematic. As noted in the proposed rule, we have a number of data analysis tools to monitor for potentially problematic utilization patterns which CMS plans to use to monitor for this practice. These tools include distinct claims editing to identify problematic utilization patterns, comparative billing reports to identify to providers their outlier status, and medical review capabilities to determine if the patterns are problematic and indicative of waste or abuse.

We agree with the commenters who noted that cost-sharing burden would decrease under this policy, and we would like to reiterate that if practitioners bring patients back another day for their procedure, this would actually increase beneficiary cost-sharing.

(c) Intravitreal Eye Injections

We also sought comment on how this policy might apply to an E/M visit reported on the same day as intravitreal eye injection, such as CPT code 67028, a high volume 000-day global code. In recent years, since new injected medications were developed to treat retinal diseases, there has been new focus from auditors (such as the OIG), MACs, professional eye associations and the AMA, to better understand the standard of care for patients receiving these treatments, in terms of when same-day eye examinations are clinically indicated and separately identifiable from the injection procedure, for the injected eye or the fellow eye. We have heard that patients with retinal diseases require examination every one to three months based on their treatment response, and importantly, both eyes are examined at each visit because of the high incidence of bilateral (though often asynchronous) involvement. The associations have written to CMS outside of the rulemaking process, indicating that around 50 percent of the time, a separately reported E/M visit on the same day to examine the eye(s) may be prompted or required by the symptom or condition for which the injection is being provided. The fellow eye could require examination if the patient reports symptoms in that eye when they present for an injection, and same-day exams determine if the type of medication is appropriate and the length of time between injections can be extended.

To help us ensure accurate payment and address questions raised in the most recent OIG audit, we sought to better understand the clinical circumstances involved, and any overlap with resources already accounted for in valuation of the global procedure, such as for (1) established patients without symptoms in the fellow eye; (2) established patients with symptoms in the fellow eye, whether prior or newly reported upon presenting for their injection; (3) new patients; (4) does it vary according to diagnosis and exam findings; (5) are injections in the fellow eye always deferred to another day; and (6) how CMS might be able to confirm or ensure that the visit being reported is significant and separately identifiable absent medical record review, for example, should we expect to see a new or different diagnosis code on the claim. See *https://oig.hhs.gov/reports/all/2025/medicare-payments-for-evaluation-and-management-services-provided-on-the-same-day-as-eye-injections-were-at-risk-for-noncompliance-with-medicare-requirements/*.

We also sought to better understand whether the E/M work associated with new patients is typically included in valuation of the minor procedures, or whether there is extra work for new patients that is significant and separately identifiable enough to always warrant separate payment.

Comments: We received many comments from specialty societies, providers, practitioners and other stakeholders describing the standard of care for patients receiving intravitreal injections, any overlap with resources already accounted for in valuation of the global procedure, and how our proposal to apply an MPPR to same-day visits reported with Modifier 25 on the same day as global procedures might apply to an E/M visit reported on the same day as intravitreal eye injection.

Response: We appreciate all of the detailed information provided by comments and will consider this information for future rulemaking.

(59) Revisions to Teaching Physician Policy Related to the Primary Care Exception

(a) Background

As a general matter, E/M visit codes under the PFS can only be reported when the care is personally provided by a qualified practitioner. Currently, under the primary care exception described at § 415.174, in the case of certain visit codes of lower and mid-level complexity, Medicare contractors may be able to make PFS payment for a service provided by a resident without the presence of a teaching physician, but in specific outpatient primary care centers and when certain conditions must be met. For example, the teaching physician must direct the care from such proximity as to constitute immediate availability (that is, to effectively provide direct supervision).

During the Public Health Emergency (PHE) for the 2019 Novel Coronavirus (COVID–19) pandemic, CMS allowed through an interim final rule (85 FR 19230 through 19292) that all levels of an O/O E/M service provided in specified primary care centers may be provided under supervision of the teaching physician by interactive telecommunications technology (85 FR 19259). At the conclusion of the PHE this flexibility expired, such that only lower and mid-level complexity visits (as specified by CMS in program instructions) could be provided without the presence of a teaching physician under the terms specified in § 415.174.

Additionally, in the CY 2020 PFS final rule (84 FR 62851 through 62854), E/M visits were revised to allow visits to be based on time and medical decision making. According to our claims data, we note that the most commonly billed O/O E/M visit level is now a moderate level visit (level 4), whereas in the past, a mid-level (level 3) visit was most common.

(b) Revisions to Current Policy

We have received multiple requests from interested parties requesting us to allow residents to perform moderate and high (level 4 and 5) E/M visits under the supervision of the teaching physician and to defer to the clinical judgment of that graduate medical education (GME) program as to whether or not these high level visits may be performed without the presence of the teaching physician.

After consideration and evaluation of interested parties' requests, we proposed that all levels of an O/O E/M service provided in primary care centers, and meeting the requirements in § 415.174, may be provided under direct supervision of the teaching

physician in such cases where the teaching physician believes such care is clinically appropriate and without the presence of a teaching physician. Specifically, we proposed modifications to the requirements at § 415.174 Exception: Evaluation and management services furnished in certain centers, to expand coverage of services for teaching physicians as part of a graduate medical education (GME) program. We proposed to modify the requirements for certain E/M codes to allow physician fee schedule payment for a service furnished by a resident provided under direct supervision. We proposed to modify paragraph (a) to state that certain evaluation and management codes (as specified by CMS in program instructions), may be paid by the physician fee schedule and are thus proposing to remove the language ''of lower and mid-level complexity'' to potentially allow for certain moderate and higher-level evaluation and management codes to be billed if the visit meets all the criteria in § 415.174. We proposed § 415.174 (a) to read as follows: ''In the case of certain evaluation and management codes (as specified by CMS in program instructions), Medicare Administrative Contractors (MACs) may make physician fee schedule payment for a service furnished by a resident without the presence of a teaching physician. For the exception to apply, all of the following conditions must be met.''

We believe this proposal would provide some autonomy to residents as well as the teaching physician if the specific GME program would support it. We considered that some visits may take more time in the beginning since residents are still learning and we will continue to monitor the visit levels over time. We welcomed comments on this proposal.

We received public comments on these proposals. The following is a summary of the comments we received and our responses.

Comment: Commenters were overall in support of our proposal that all levels of an office/outpatient E/M service provided in primary care centers, and meeting the requirements in § 415.174, may be provided under direct supervision of the teaching physician in such cases where the teaching physician believes such care is clinically appropriate and without the presence of a teaching physician. Commenters noted this will improve resident training and allow the program to prepare senior residents to practice autonomously. Other commenters noted this policy would discourage inadvertent downcoding driven by billing constraints and would allow teaching physicians to focus their supervision on residents who need the most guidance. Other commenters noted that residents must develop experience caring for patients across the full spectrum and this policy would support that.

Several commenters noted that expanded resident autonomy should be accompanied by maintaining the current safeguards and appropriate oversight and accountability. The commenters stated that teaching physicians must retain ultimate responsibility for patient care and clinical decision-making, and documentation should continue to demonstrate compliance with supervision requirements and continue to clearly identify the respective roles of the resident and teaching physician. Additionally, commenters supported our proposed regulation text change to 42 CFR § 415.174.

We received many comments asking CMS to make other changes to the primary care exception (PCE) to include adding preventive and whole-person services to the PCE, as well as requests to add specific psychotherapy services when billed with specific E/M visits, to update the language that restricts the PCE to services furnished in centers where the residents are being claimed for GME payments by a hospital, and to update the ''teaching setting'' definition to include Federally Qualified Health Centers. These comments were out of scope for this year's proposal.

Response: We thank the commenters for their support and feedback. We are finalizing as proposed that all levels of an O/O E/M service provided in primary care centers, and meeting the requirements in § 415.174, may be provided under direct supervision of the teaching physician in such cases where the teaching physician believes such care is clinically appropriate and without the presence of a teaching physician. We are also finalizing the proposed changes to 42 CFR § 415.174. We express appreciation for the feedback from commenters on other policies related to the primary care exception and will take the comments into consideration for possible future rulemaking.

(60) Bundled Payments Under the PFS for Substance Use Disorders (HCPCS Codes G2086, G2087, and G2088)

In the CY 2020 PFS final rule (84 FR 62673), we finalized the creation of new coding and payment describing a bundled episode of care for the treatment of Opioid Use Disorder (OUD). Then, in the CY 2021 PFS final rule, we finalized a revision to the code descriptors for HCPCS codes G2086, G2087, and G2088 by replacing ''opioid use disorder'' with ''a substance use disorder'' in response to requests to expand these bundled payments to be inclusive of other substance use disorders (SUDs), not just OUD, stating we agreed that doing so could expand access to needed care.

The codes are:

- HCPCS code G2086: *Office-based treatment for a substance use disorder, including development of the treatment plan, care coordination, individual therapy and group therapy and counseling; at least 70 minutes in the first calendar month.*
- HCPCS code G2087: *Office-based treatment for a substance use disorder, including care coordination, individual therapy and group therapy and counseling; at least 60 minutes in a subsequent calendar month.*
- HCPCS code G2088: *Office-based treatment for a substance use disorder, including care coordination, individual therapy and group therapy and counseling; each additional 30 minutes beyond the first 120 minutes (List separately in addition to code for primary procedure).*

Interested parties have pointed out disparities in payment for HCPCS codes G2086 through G2088 compared to payment for similar services under the Medicare Opioid Treatment Program (OTP) benefit. They state that both OTPs and non-OTP outpatient addiction treatment settings can provide American Society of Addiction Medicine ASAM Level 1.7's suite of services that include medically managed outpatient treatment services, including evaluation and management of intoxication, withdrawal, biomedical concerns, and common low complexity psychiatric concerns. They state that the only clinical difference between these places of service at ASAM Level 1.7 is that OTPs can provide methadone for the treatment of OUD, and the other cannot due to Federal regulations. OTPs are also governed by extensive Federal and State regulations, unlike office-based practices which are not federally regulated settings but may be subject to extensive State regulations. They note that since the time these codes were created, there is now a new Level 1.0 that describes remission monitoring services or services to patients in stable remission, similar to services described by outpatient E/M codes. The new Level 1.5 provides outpatient counseling and psychotherapeutic services, appropriate for patients with mild SUDs and those in early remission, and a new Level 1.7 that describes medically-managed outpatient treatment, including withdrawal management. They state

that the services described by HCPCS codes G2086–G2088 align with Level 1.5, but that there is no existing coding under the PFS to describe level 1.7.

We welcomed additional information on this topic, including whether we should consider updates to the rates for HCPCS codes G2086 through G2088, and/or whether additional coding is needed to describe the ASAM 1.7 level of care.

We received public comments on this comment solicitation. After consideration of public comments, we express appreciation for the feedback from commenters and will take the comments into consideration for possible future rulemaking.

(61) Software as a Medical Service (SaMS) Laboratory Analyses

In recent years, there have been rapid developments in the use of software-based technologies with novel functionalities to support clinical decision-making in the outpatient and physician office settings. New clinical software, which includes clinical decision support software, clinical risk modeling, and computer aided detection (CAD), is becoming increasingly available to practitioners. These technologies often perform data analysis of diagnostic images from patients, relying on complex algorithms or statistical predictive modeling to aid in the diagnosis or treatment planning of a patient's condition. In previous rulemaking, we have referred to these algorithm-driven services that assist practitioners in making clinical assessments or diagnoses as Software as a Service (SaaS). Unlike prescription digital therapeutics (PDTs), for example PDTs that provide cognitive behavioral therapy to treat substance disorders or chronic insomnia, SaaS technologies do not currently treat illnesses or patient injuries. SaaS is also separate from remote patient monitoring (RPM) and remote therapeutic monitoring (RTM), which are digital healthcare tools for tracking patient data outside traditional office settings (90 FR 49394). For CY 2027, we proposed a change in terminology (91 FR 43910). We noted that we now understand that, in other industries, the existing SaaS terminology is used for general cloud-based computing service models outside of a health care context, which may cause confusion as we are using it to describe specific services that provide a medical function for purposes of PFS Medicare payment policy. To dispel any ambiguity and clarify that distinction, we proposed to change our terminology from SaaS to Software as a Medical Service (SaMS) to refer to software-based technologies that support clinical decision making through algorithmic analysis, including those that provide clinical or diagnostic functionality. We welcomed public comments on the proposed change in terminology.

For further discussion of this terminology and other OPPS SaMS proposals, please see the CY 2027 Hospital Outpatient Prospective Payment System (OPPS) and Ambulatory Surgical Center (ASC) Final Rule.

We received public comments on our proposed terminology change from SaaS to SaMS. The following is a summary of the comments we received and our responses.

Comment: Several commenters supported the proposed terminology change from SaaS to SaMS. A commenter explained that the proposed terminology would clarify the distinction between clinical algorithms and generic cloud tooling. A commenter requested that we clarify whether the transition to SaMS is intended solely as a naming convention or whether it reflects broader distinctions regarding the scope, classification, valuation or payment treatment of these technologies.

Response: We thank the commenters for their support. The terminology change from SaaS to SaMS seeks to clarify, as a commenter explained, the distinction between clinical algorithms used to furnish these services and generic cloud tooling.

Comment: Some commenters did not support our proposed terminology change, stating that our proposed definition is too broad, and we should limit SaMS to stand-alone software services that analyze previously generated diagnostic information, excluding services that examine a patient specimen and make a new clinical measurement, or should distinguish between a stand-alone software analysis and software that is an integrated component of a laboratory, imaging, or other diagnostic service. Some commenters requested additional clarifications regarding inclusion and exclusion criteria and how our terminology relates to FDA's Software as a Medical Device (SaMD) or CPT's AI terminology.

Response: We thank commenters for the additional information. At this time, our aim is to limit our definition of SaMS to refer to software-based technologies that support clinical decision making through algorithmic analysis, including those that provide clinical or diagnostic functionality. This also aligns with the definition and terminology discussed in the CY 2027 OPPS final rule. We note that we will consider these comments as we continue to refine this definition and terminology.

Based on the comments received, for CY 2027, we are finalizing our proposal to change the terminology for these algorithm-based software services that are paid under Medicare from ''SaaS'' to ''SaMS.''

In recent years, we have seen an increase in laboratory tests that combine laboratory analyses, such as genomic sequencing or immunoassays, with computer algorithms to produce a clinical test result. The AMA CPT Editorial Panel created a category called Multi-Analyte Assays with Algorithmic Analysis (MAAA's), to categorize test codes that combined laboratory analyses with computer algorithms to generate clinical information. More recently, however, we are seeing the development of distinct algorithmic analyses alone with distinct CPT codes.

For example, when the genomic sequencing of an individual is performed, this sequencing will likely only need to be performed once by a laboratory. However, once the genomic sequence has been generated, the subsequent algorithmic analyses of that sequence data can be performed an infinite number of times to produce a wide range of results and/or diagnostic or risk-related information. These secondary analyses of original genomic sequences can be proprietary and unique to a single laboratory, but could also be conducted at a range of settings. For purposes of this final rule, we are referring to subsequent stand-alone algorithmic analyses as ''SaMS analyses performed on laboratory tests''.

As discussed in the proposed rule, currently, certain SaMS analyses performed on laboratory tests are treated as clinical diagnostic laboratory tests (CDLTs) and paid under the Clinical Laboratory Fee Schedule (CLFS) (91 FR 43911). Section 1861(s) of the Act specifies items and services included as ''medical and other health services'' under Part B, including diagnostic X-ray tests, diagnostic laboratory tests, and other diagnostic tests as described in section 1861(s)(3) of the Act. Sections 1833(h) and 1834A of the Act and the implementing regulations at 42 CFR part 414, subpart G, set forth the CLFS rate setting methodologies for CDLTs. We stated in the proposed rule that we do not believe it is appropriate to consider these secondary algorithmic analyses, when performed alone, to be CDLTs or establish CLFS payment rates for these analyses because we believe these secondary algorithmic analyses may not

currently require laboratory services or entities, to perform them.

Our position, as stated in the proposed rule, is that the secondary analyses, which have distinct CPT codes,[61] are ''other diagnostic tests'' under section 1861(s)(3) of the Act as opposed to ''diagnostic laboratory tests.'' As noted previously, Medicare will not pay for CDLTs on the CLFS unless they are furnished by laboratories that meet applicable certification requirements. Tests that examine materials derived from the human body are assigned to and paid under the CLFS only when furnished by such certified laboratories, in accordance with 42 CFR 410.32(d). Because SaMS analyses performed on laboratory tests are downstream evaluations of the data generated by a prior laboratory test, which are described by distinct CPT codes, an entity that performs only algorithmic analyses of previously sequenced data may not meet the definition of a ''laboratory'' under 42 CFR 493.2 or qualify for payment under CLFS. We believe SaMS that evaluate data generated by a prior laboratory test should not be treated as CDLTs for Medicare payment purposes.

As discussed in the proposed rule, we are also concerned that paying for these analyses based on existing CLFS payment methodologies may create significant vulnerabilities for the Medicare program, due to the lack of data transparency and CDLTs not being subject to beneficiary cost-sharing or budget neutrality. Section 414.508 outlines the rate setting methodologies CMS uses to set payment rates for new tests on the CLFS. Under § 414.508(b), CMS determines the payment amount based on either crosswalking or gapfilling methodologies until applicable information is available to establish a payment amount under the methodology described in § 414.507(b). Crosswalking is used if it is determined that a new CDLT is comparable to an existing test, multiple existing test codes, or a portion of an existing test code. Gapfilling is used when no comparable existing CDLT is available. Public consultation for payment for new CDLTs is required in determining payment amounts, receiving public comments and recommendations (and data on which the recommendations are based) as well as recommendations from the Medicare Advisory Panel on CDLTs per 42 CFR § 414.506. A significant challenge to the rate setting process for CMS is in receiving transparent data from laboratories outlining resource costs of a test, particularly for the algorithmic portions of tests that are combined with other analytes. In the past, laboratories have explained to CMS that the algorithmic components of laboratory tests are highly proprietary and details cannot be shared. Thus, CMS has worked with the limited information available on the details of methods or resources for the algorithmic portions of tests or analyses and has thus far relied on the other laboratory methods provided in the CPT descriptor (that is, NGS sequencing, RT–PCR, or DNA methylation analysis). As we have gathered more information on SaMS analyses performed on laboratory tests, we now believe that since these analyses are entirely computer-based, comparison based on laboratory methodologies is not appropriate. We believe that these analyses are substantially similar to other SaMS already paid under the PFS. Additionally, in contrast to the PFS, the CLFS generally does not include beneficiary cost-sharing or budget neutrality adjustments, which limits transparency regarding pricing and creates challenges for ensuring appropriate valuation of these services.

CMS has an interest in ensuring that services that are fundamentally similar are paid for and treated in the same way, regardless of the setting of care in which the service is furnished. Since we believe SaMS analyses performed on laboratory tests perform algorithmic analyses on previously generated data, we believe SaMS analyses performed on laboratory tests are substantively similar to other SaMS technologies that are currently paid under the PFS. Accordingly, we believe that whether the SaMS performs algorithmic analyses of an imaging test (for example, CT scan) or whether it performs an algorithmic analysis on data generated from a laboratory test, all algorithmic analyses should be treated consistently from a payment perspective. We believe that this approach for SaMS technologies would promote stability and predictability in payment for similar services.

Finally, we note that CMS and CDC issued a Request for Information (RFI) on July 16, 2026, regarding CLIA regulations, the results of which may be used to help inform the agencies as to what types of action, if any, should be taken to update the existing CLIA regulations through future notice and comment and rulemaking (91 FR 43586). The RFI closed for comments on September 15, 2026. CMS may refine SaMS payment and policies based on RFI responses and make changes in future rulemaking.

For CY 2027, we proposed to contractor price ten HCPCS codes describing various SaMS analysis performed on laboratory tests under the PFS (91 FR 43911). We note that SaMS analyses performed on laboratory tests would not require FDA marketing authorization in order to receive payment under the PFS. SaMS payment and policies may be refined in future rulemaking. Table A–D8 in the proposed rule (91 FR 43912) shows the list of currently payable SaMS analysis performed on laboratory tests under the CLFS that we proposed to contractor price under the PFS. These ten HCPCS codes were identified by the CPT descriptor for the code. We noted in the proposed rule that, if there were no laboratory methods included in the code descriptor, and only an algorithmic analysis was described, we identified the code as a SaMS laboratory analysis. We referred to the 2027 Hospital Outpatient Prospective Payment System (OPPS) and Ambulatory Surgical Center (ASC) Proposed Rule (91 FR 41918) for discussion of payment for these services under the OPPS, where we proposed to assign the same SaMS analysis performed on laboratory tests to new technology APCs.

We invited public comment on this proposed list and any other similar analyses that should be removed from the CLFS and contractor priced under the PFS. We sought comment more broadly on other approaches to payment for these services, including, but not limited to, a direct crosswalk to the proposed OPPS new technology APC dollar amounts for all proposed analyses, a subset of these analyses, or specific analyses as opposed to contractor pricing.

In addition, for CY 2027 and subsequent years, we proposed to assign any new codes that describe SaMS analysis performed on a laboratory test to contractor pricing for payment under the PFS. We requested public comment on these proposals, including the list of ten HCPCS codes that we identified as SaMS analyses performed on laboratory tests, as well as any additional HCPCS codes that we should designate as SaMS analyses performed on laboratory tests and pay under the PFS rather than the CLFS. We stated in the proposed rule that CMS may finalize a policy that includes such payment for additional HCPCS codes in the PFS final rule based on public comment.

We received public comments on these proposals. The following is a summary of the comments we received and our responses.

[61] We note that the AMA has created Category III CPT codes that describe secondary algorithmic analyses performed on laboratory tests. *https://www.ama-assn.org/system/files/cpt-category3-codes-long-descriptors.pdf.*

Comment: Some commenters, including large cancer treatment centers, supported our proposal to establish a payment methodology for software-based analyses performed on laboratory tests distinct from the underlying laboratory test. These commenters supported migrating software-based analyses performed on laboratory tests from payment under the CLFS to payment under the PFS and agreed that such analyses are better characterized as ''other diagnostic tests.'' Commenters added that this policy correctly recognizes algorithmic re-analysis of previously obtained data as a separately payable clinical service. In addition, commenters expressed support for establishing a consistent, cross-setting payment framework for algorithmic analyses, citing that this policy seeks to adapt and evolve with changing healthcare environments. The commenters noted that it is especially critical that this payment policy evolve to reflect the value and resource costs of these technologies.

Response: We thank the commenters for their support and note that we will consider these comments as we continue to refine this payment policy.

Comment: Some commenters, including independent laboratories, supported our proposal but requested that CMS develop the payment methodology transparently, and ensure the payment for algorithm-driven services rests on evidence of clinical benefit. Commenters requested that CMS establish a payment mechanism for these services when the patient is seen in a place of service not paid under the PFS, noting that as proposed, the framework would leave no payment mechanism for a substantial share of medically necessary testing. Commenters requested CMS establish a defined, confidential process through which laboratories may submit cost and clinical outcomes data to support valuation as CMS develops a more comprehensive payment methodology. One commenter supported the proposal but requested that CMS defer changes to CLFS payment for algorithm-only laboratory analyses until the necessary coding, regulatory, and operational infrastructure has been established.

Response: CMS appreciates the suggestion to be transparent and thoughtful in the implementation of this policy. We believe that publicly proposing this policy in the proposed rule, inviting comments, and addressing those comments in this rule has made this process transparent. We also appreciate the recommendation to evaluate the clinical benefit of a given SaMS analyses performed on laboratory tests. We remind readers that our goal in this rulemaking cycle is to establish the category of SaMS analyses performed on laboratory tests and the general payment mechanism for those services under the PFS. Regarding a request to establish a separate confidential process through which laboratories may submit cost and clinical data, we remind commenters that we are available to meet with interested parties where information may be shared with CMS. However, because payment rates are finalized through the notice-and-comment rulemaking process, which requires providing the underlying reasoning for our proposals and final policy, establishing a separate confidential process would not be compatible with the existing rulemaking process. Further, finalizing this policy would not eliminate Medicare payment for these services, or prohibit certain facilities from billing Medicare, but rather, it would define how these services would be paid under the PFS. We do not believe that it is appropriate to delay the movement of SaMS analyses performed on laboratory tests from the CLFS to the PFS, given the speed at which SaMS technologies are developing and the goal of having a consistent policy across payment systems for similar services. These similar algorithm-based services will be billed and paid for under the same payment system, depending on the hospital or physician setting (that is, OPPS or PFS).

Comment: A few commenters, specifically large laboratory associations, requested that we not finalize the policy as proposed. Commenters generally believed that CMS should engage with the laboratory community more closely prior to finalizing payment changes for SaMS analyses performed on laboratory tests. Commenters specifically expressed concerns that the proposed policy could inadvertently create duplicate or inconsistent payment pathways and fragment integrated laboratory services by separating algorithmic analyses from the laboratory responsible for validation, quality, clinical interpretation, and reporting. Several commenters expressed concerns regarding the implications of introducing beneficiary cost sharing for services that generally are not subject to cost sharing under the CLFS if this policy were to be finalized. Some commenters explained that, if CMS is concerned about unregulated software vendors billing Medicare, CMS should condition Medicare payment for designated SaMS laboratory services on performance by a CLIA-certified, appropriately accredited laboratory.

Response: We acknowledge the commenters' concerns and we will continue to consider them while we implement the policy. Regarding cost sharing, we acknowledge that while cost sharing shifts some costs to beneficiaries, it also encourages greater efficiency by health care providers and more economical delivery of medically necessary items and services, which would contain unnecessary growth in Medicare spending long-term to the benefit of both Medicare and beneficiaries.

We disagree with concerns that this final policy would fragment integrated laboratory services, as this policy would apply to HCPCS codes that already recognize a distinct SaMS analysis component. To ensure that this policy only impacts HCPCS codes describing the secondary analyses, we requested public comment on the list of HCPCS codes we proposed to designate as SaMS analyses performed on laboratory tests. As discussed further in this section, based on public comments received, PFS payment for HCPCS codes describing integrated services, meaning those codes that describe both the wet lab and SaMS secondary analyses, is not being finalized under this policy for CY 2027. These HCPCS codes would continue to be paid under the CLFS.

Concerns about billing and regulations regarding vendors of SaMS analyses performed on laboratory tests are outside of the scope of this final rule.

While we understand the commenters' concerns, we believe that the proposed policy provides a uniform payment pathway for SaMS that should be implemented for CY 2027. We continue to maintain that paying for SaMS analyses performed on laboratory tests under the CLFS may create significant vulnerabilities for the Medicare program, due to the challenges in receiving transparent data regarding the algorithms themselves and CDLTs on the CLFS generally not being subject to beneficiary cost-sharing or budget neutrality. As mentioned previously, we believe SaMS technologies generally should be treated and paid for consistently across the Medicare program because these algorithm-based services are functionally equivalent, despite differences in the type of clinical service or data. For example, both SaMS currently paid under the OPPS and the SaMS analyses performed on laboratory tests that we proposed to pay for under PFS perform algorithm-based analyses on existing data. We anticipate that resource costs may be

similar between these kinds of services. For SaMS analyses performed on laboratory tests, paying for these services under the PFS means similar algorithm-based services will be billed and paid for under the same payment system. We will continue to engage the broader laboratory community in further dialogue as we consider potential refinements to this policy in future rulemaking.

Comment: Some commenters, especially large laboratory associations, asked CMS to not finalize its proposal to reassign SaMS analyses performed on prior laboratory tests to the PFS and to continue paying for these services as CDLTs on the CLFS. A few commenters urged CMS to exempt current and future software-based laboratory tests from this proposed policy and only designate the proposed tests as SaMS analyses performed on laboratory tests.

Response: CMS appreciates these comments but believes it is important for SaMS-based technologies to be treated consistently across the Medicare program, rather than establishing distinct payment policies for similar SaMS, depending on whether the analysis is performed on an imaging service or on a laboratory test.

Comment: Commenters generally expressed concern that the proposed framework to distinguish SaMS analyses performed on laboratory tests from other laboratory tests would be challenging to apply in practice. Commenters stated that these services have generally been classified and paid as CDLTs under the CLFS, reflecting longstanding treatment from CMS, the AMA CPT process, and the FDA. Commenters expressed concern regarding using CPT code descriptors to determine which HCPCS codes should be designated as a SaMS analyses performed on a laboratory test since descriptors do not always indicate whether activities, such as slide preparation or immunostaining, are included in the reported service. Commenters explained that although SaMS analyses performed on laboratory tests are defined as being both separate from specimen examination and entirely computer-based, several of the examples CMS identified appear to involve wet lab components, creating uncertainty regarding how the criteria would be operationalized, and that as a result, interested parties may face difficulty determining whether a given service qualifies as a purely algorithmic analysis or should continue to be treated as a laboratory test incorporating wet lab processes. Commenters requested that CMS provide additional guidance and examples to support consistent classification and payment for these services.

Response: Medicare utilizes the description of services as provided by the HCPCS code descriptors in determining appropriate payment.- For the proposed policy, we identified services listed on the CLFS that indicated algorithmic analysis in the CPT long descriptor and in the description of intraservice work (as provided by AMA in its valuation of CPT codes) and proposed to treat those services as SaMS analyses performed on laboratory tests. Specifically, we considered code descriptors that included phrases such as ''augmentative algorithmic analysis'' or ''previously established sequence,'' as we believed that these indicated that the code described SaMS analyses performed on laboratory tests. We requested public comments on the proposed list of codes, understanding that we may have inadvertently omitted certain codes or included codes that do not solely describe subsequent, computer-based analyses as intended.

We appreciate the comments regarding the proposed list of codes. In this final rule, we have removed a few HCPCS codes from the proposed list, based on an additional understanding of the code descriptors and public comments received, but we retained the HCPCS codes that contained phrases such as ''augmentative algorithmic analysis'' or ''previously established sequence'', which we discuss in further detail later in this section. We believe that the finalized list of HCPCS codes being reassigned from the CLFS to the PFS is limited to those that are entirely computer-based secondary analyses and do not include specimen examination performed as part of the wet lab component.

Comment: Commenters requested that CMS incorporate additional specificity into the SaMS definition to ensure that technologies and services with meaningful differences, such as algorithm-only laboratory-developed tests, laboratory Software as a Medical Device, and imaging Software as a Medical Device, are not treated as equivalent for payment purposes. A commenter proposed that CMS limit the services included in this policy to algorithmic reanalysis of a prior laboratory test's reported results, and exclude any service that examines a patient's specimen, physical or digitized, or that measures a defined analyte from that specimen.

Response: We appreciate the commenters' input. We remind readers that our goal in this rulemaking cycle is to establish the category of SaMS analyses performed on laboratory tests and the general payment mechanism for those services under the PFS, noting that payment alignment is a priority for these technologies. We will take the definitional concerns raised by the commenters, including incorporating additional specificity regarding differences in SaMS service for purposes of Medicare payment, into consideration for future rulemaking. We welcome public engagement from interested parties on these issues, including whether there are additional services that should be designated as SaMS in the future.

Comment: Some commenters, particularly large laboratory associations, disagreed with the premise underlying our proposal, explaining that the diagnostic testing process as a whole, not the physical location where the final computational step occurs, is what defines a CDLT. These commenters did not agree that the absence of a new wet-lab step converts a patient-specific computational analysis of laboratory-derived data into something other than laboratory testing and argued that treating the final analytical step as severable from the laboratory service that produced the underlying data misconstrues how these tests are developed, validated, and clinically interpreted. Relatedly, these commenters requested that CMS confirm in the final rule that a test incorporating a laboratory assay measuring an analyte from the specimen remains a CDLT paid under the CLFS, and that specimen preparation, staining, and digitization are not the ''prior laboratory test'' on which SaMS designation depends.

Response: We disagree with these commenters that the location of the final analytical step is immaterial to the payment classification of these services. While we recognize that the underlying specimen collection, sequencing, or other data-generating steps may require laboratory services, the algorithmic analysis at issue here is a separate step that is performed on data that has already been generated, and may not necessarily require access to the specimen or laboratory equipment. The fact that a service has historically been billed and paid as a single, integrated CDLT on the CLFS does not mean that each component of that service must continue to be paid as such, particularly where the analytical component is distinguishable from the data-generating component as provided by the HCPCS code descriptor, both in the resources required to perform it and in the manner in which its costs are incurred. Accordingly, we are finalizing our

proposal to treat the algorithmic analysis as an ''other diagnostic test'' under section 1861(s)(3) of the Act distinct from the underlying laboratory test for purposes of PFS payment. We will take the definitional concerns regarding SaMS into consideration for future rulemaking.

Comment: Several commenters urged CMS to coordinate this policy with the pending CLIA RFI issued by CMS and the CDC on July 16, 2026, regarding the appropriate level of CLIA oversight of ''dry-lab'' facilities that perform computational analyses without a traditional wet-lab component, so that the two efforts do not produce conflicting outcomes.[62] Commenters noted that CMS and the CDC are actively considering, through that RFI, whether CLIA certification is required to furnish these types of services, and argued that it is premature for CMS to conclude in this rule that such services are not ''laboratory'' services for payment purposes before that RFI is complete. Commenters requested that CMS defer any changes to this PFS payment policy pending the outcome of the CLIA RFI, given the potential for the policies under consideration there to directly conflict with the proposal at issue here. A commenter separately requested that CMS clarify that CLIA's scope includes facilities that produce and examine information obtained through analysis of materials derived from the human body.

Response: CMS appreciates these comments. We plan to coordinate and collaborate across the relevant agencies to ensure oversight and payment policies are consistent.

Comment: Commenters requested that CMS confirm it does not intend, in addressing the Medicare billing of SaMS analyses performed on laboratory tests, to change the regulatory structure under which laboratories and the tests they provide are governed. Commenters noted that the proposal could be read to create ambiguity on this point, and requested that CMS include the following clarifying statement in the final rule: that algorithmic interpretation of specimen-derived pathology data, performed within or under arrangement with a CLIA-certified laboratory, remains subject to CLIA.

Response: This policy does not seek to make changes to the requirements governing CLIA-certified laboratories. We consider these algorithmic analyses as ''other diagnostic tests'' that are performed on an underlying laboratory test. This policy seeks to provide consistency in paying for all SaMS algorithmic analyses in the PFS. We will take the regulatory concerns raised by commenters, including incorporating additional specificity regarding SaMS services and CLIA, into consideration for future rulemaking. We welcome public engagement from interested parties on these issues.

Comment: While we proposed contractor pricing in the proposed rule, many commenters did not support the proposal to contractor price these services, as they stated they did not believe these services have different costs in different Medicare Administrative Contractor (MAC) geographic jurisdictions and that this proposal would place additional burden on MACs. Other commenters asserted that contractor pricing these services would lead to less payment predictability than when they were paid for as CDLTs under the CLFS. Some commenters requested that we crosswalk the PFS payment for these services to the OPPS payment rates, as the OPPS payment rates are using current CLFS payment rates to inform their pricing, in order to encourage site-neutral pricing between payment systems. A few commenters requested that, if contractor pricing is finalized, we communicate with MACs to encourage a published uniform national methodology, so that beneficiary access does not depend on jurisdiction. Some commenters did not agree with our proposal to assign any new codes that describe SaMS analysis performed on a laboratory test to contractor pricing for payment under the PFS in subsequent years.

Response: We thank commenters for the additional information. As discussed in the CY 2027 OPPS Final Rule, this is a first step towards a more comprehensive payment policy. We agree with commenters that contractor pricing these services could lead to less payment predictability than when they were paid for as CDLTs under the CLFS, as contractor priced services could vary between MACs. We agree with commenters that a more predictable payment methodology would be crosswalking OPPS payment rates for these services, as they are using CY 2026 CLFS payment rates to inform their pricing. This payment methodology would also encourage site-neutral pricing between payment systems, which could encourage providers to choose the most clinically appropriate setting based on patient needs rather than financial incentives. Therefore, we are finalizing national pricing for these services under the PFS for CY 2027, based on a crosswalk to the OPPS payment rates. Additionally, we acknowledge that these codes should have been included with a procedure status indicator of ''C'' in Addendum B of the NPRM, however they were inadvertently not included. These services will be included in Addendum B of the CY 2027 PFS Final Rule with a procedure status indicator of A (active). To crosswalk payment rates from the OPPS, we calculated this value by dividing the OPPS payment rate, which is represented in a dollar amount, by the CY 2027 PFS conversion factor in order to convert the OPPS payment rate dollar amount into RVUs. The resulting value will be the PE RVU for the SaMS services detailed later in this section.

Comment: We received comments regarding the specific list of HCPCS codes we proposed to designate as SaMS analyses performed on laboratory tests. Commenters generally agreed that the following CPT codes describe algorithmic analyses and may be designated as SaMS laboratory analyses:

- 0510U—Oncology (pancreatic cancer), augmentative algorithmic analysis of 16 genes from previously sequenced rna whole transcriptome data, reported as probability of predicted molecular subtype
- 0512U—Oncology (prostate), augmentative algorithmic analysis of digitized whole-slide imaging of histologic features for microsatellite instability (msi) status, formalin-fixed paraffin embedded (ffpe) tissue, reported as increased or decreased probability of msi-high (msi-h)
- 0513U—Oncology (prostate), augmentative algorithmic analysis of digitized whole-slide imaging of histologic features for microsatellite instability (msi) and homologous recombination deficiency (hrd) status, formalin fixed paraffin-embedded (ffpe) tissue, reported as increased or decreased probability of each biomarker
- 0418U—Oncology (breast), augmentative algorithmic analysis of digitized whole slide imaging of 8 histologic and immunohistochemical features, reported as a recurrence score
- 0376U—Oncology (prostate cancer), image analysis of at least 128 histologic features and clinical factors, prognostic algorithm determining the risk of distant metastases, and prostate cancer-specific mortality, includes predictive algorithm to androgen deprivation-therapy response, if appropriate

[62] 91 FR 43586, available at *https://www.federalregister.gov/documents/2026/07/16/2026–14358/request-for-information-clinical-laboratory-improvement-amendments-of-1988-clia-regulations.*

Response: We thank the commenters for their support. We are finalizing assigning CPT codes 0510U, 0512U, 0513U, 0418U, and 0376U to active pricing under the PFS as SaMS analyses performed on laboratory tests. Please refer to Table A–D8 for the list of services we are finalizing as SaMS analyses performed on laboratory tests.

Comment: We received a comment noting that CPT codes 81417 and 81427 both describe post-sequencing data analysis but were not included in the proposed list of CPT codes to designate as SaMS analyses performed on laboratory tests for purposes of payment under the PFS. We also received a comment noting that CPT codes 81417 (Exome (*e.g.,* unexplained constitutional or heritable disorder or syndrome); re-evaluation of previously obtained exome sequence (*e.g.,* updated knowledge or unrelated condition/syndrome)) and 81427 (Genome (*e.g.,* unexplained constitutional or heritable disorder or syndrome); re-evaluation of previously obtained genome sequence (*e.g.,* updated knowledge or unrelated condition/syndrome)) both describe post-sequencing data analysis but were not included in the proposed list of CPT codes to designate as SaMS analyses performed on laboratory tests for purposes of payment under the PFS.

Response: We thank the commenter for bringing these codes to our attention. We agree that CPT codes 81417 and 81427 codes should be designated as SaMS analyses performed on laboratory tests for purposes of payment under the PFS because they provide a secondary or subsequent stand-alone algorithmic analysis of a previously obtained exome or genome sequence. Therefore, for CY 2027, we are finalizing assigning CPT code 81417 and 81427 as actively priced under the PFS.

Comment: Some commenters asserted that certain codes that we proposed to designate as SaMS analyses performed on laboratory tests for payment under the PFS should not be finalized as proposed because they possess, or may possess, wet lab components. Per the commenters, the following CPT codes have wet lab components:

- 0511U—Oncology (solid tumor), tumor cell culture in 3d microenvironment, 36 or more drug panel, reported as tumor-response prediction for each drug
- 81416—Exome (*e.g.,* unexplained constitutional or heritable disorder or syndrome); sequence analysis, each comparator exome (*e.g.,* parents, siblings) (list separately in addition to code for primary procedure)

Similarly, a commenter opposed finalizing CPT code 0414U (Oncology (lung), augmentative algorithmic analysis of digitized whole slide imaging for 8 genes (alk, braf, egfr, erbb2, met, ntrk1–3, ret, ros1), and kras g12c and pd-l1, if performed, formalin-fixed paraffin-embedded (ffpe) tissue, reported as positive or negative for each biomarker) as a SaMS analysis performed on a laboratory test for payment under the PFS because the service includes a wet lab component if performed, as designated in the descriptor. A commenter opposed similarly designating CPT code 0220U (Oncology (breast cancer), image analysis with artificial intelligence assessment of 12 histologic and immunohistochemical features, reported as a recurrence score) as a SaMS analysis performed on a laboratory test because the code is ambiguous on whether it includes wet lab steps. A commenter pointed out that CPT code 0208U (Oncology (medullary thyroid carcinoma), mrna, gene expression analysis of 108 genes, utilizing fine needle aspirate, algorithm reported as positive or negative for medullary thyroid carcinoma) was deleted effective January 1, 2022, and therefore, should not be included on the final list for payment under the PFS.

Response: We agree with commenters that CPT codes 0511U and 81416 both involve wet lab analyses as outlined in each CPT descriptor, and therefore, should not be paid under the PFS. Since the code descriptors integrate both the wet lab and secondary algorithmic analyses, rather than only the computer-based secondary analyses component, we agree to not designate CPT codes 0511U and 81416 as SaMS analyses performed on laboratory tests. These HCPCS codes would continue to be paid under the CLFS.

However, we do not agree with commenters that CPT code 0414U should be paid under the CLFS, as the descriptor characterizes the service as an augmentative algorithmic analysis. Commenters pointed out that the descriptor allows for additional analysis ''if performed,'' if, for example, a slide needs to be redone for the purpose of the analysis. However, our understanding is that the ''if performed'' language does not indicate that the algorithmic analysis is optional, but instead refers to the optional analysis of additional biomarkers. Therefore, we are finalizing assignment of CPT code 0414U to active pricing for payment under the PFS.

Regarding CPT code 0220U, we similarly disagree with the commenters that the code descriptor is ambiguous on whether a wet lab component is included. The descriptor cites ''image analysis with artificial intelligence'', which we believe is similar to other SaMS laboratory analyses of existing images or slides.

Finally, we appreciate the comment noting that CPT code 0208U was deleted, and agree that it should not be included on the final list for payment under the PFS.

Comment: Commenters requested that CMS confirm that super-intelligence enabled diagnostic analyses performed in CLIA-certified independent laboratories after the hospital encounter are eligible for separate payment under the PFS framework. Commenters further requested that CMS permit laboratories to bill Medicare for these services when developed as laboratory-developed tests, noting that if such tests are not billable by laboratories under the PFS laboratories would effectively be prohibited from directly billing and receiving payment for services they perform.

Response: As we stated in the proposed rule, the services that we designate as SaMS, specifically SaMS analyses performed on laboratory tests, will be assigned active pricing when paid for under the PFS. We refer readers to the CY 2027 OPPS final rule for discussion on how SaMS analyses performed on laboratory tests will be paid under the OPPS.

Comment: A commenter requested that CMS confirm the applicable date of service for algorithm-only laboratory analyses, noting that if such services are classified as ''other diagnostic tests'' rather than clinical diagnostic laboratory tests, the laboratory date-of-service policy would not apply.

Response: We confirm that because we are classifying SaMS analyses performed on laboratory tests as ''other diagnostic tests'' under section 1861(s)(3) of the Act, they would not be subject to the date of service policy as outlined in 42 CFR § 414.510.

After consideration of public comments, we are finalizing our proposal for CY 2027 to reassign certain HCPCS codes describing SaMS analyses performed on laboratory tests that are currently paid under the CLFS. We are finalizing that these services be priced using crosswalked OPPS rates. However, we are finalizing the proposed code list with certain modifications, based on public comments received. In total, for CY 2027, we are finalizing assigning 14 SaMS analyses performed on laboratory tests to active pricing under the PFS. We intend to continue to engage with the laboratory community on these finalized changes,

and acknowledge the definitional concerns regarding SaMS services and the applicable payment and regulatory frameworks. We will consider expanding and further clarifying the scope of the policy through future rulemaking. For CY 2027, as provided in the CY 2027 OPPS/ASC final rule, CMS is setting OPPS payment rates for 14 HCPCS codes that describe SaMS analyses performed on laboratory tests. These OPPS rates are based on the CY 2026 CLFS payment rates for the corresponding services, with the codes assigned to new technology APCs whose payment bands align with the applicable current CLFS rates.

Refer to Table A–D8 for the final list of SaMS analyses performed on laboratory tests for CY 2027. The final CY 2027 payment rates can be found in Addendum B to this final rule via the CMS website at *https://www.cms.gov/medicare/payment/fee-schedules/physician/federal-regulation-notices*.

BILLING CODE 4169–69–P

TABLE A-D8: FINAL SAMS ANALYSES PERFORMED ON LABORATORY TESTS FOR CY 2027

HCPCS Code	Long Descriptor
0510U	Oncology (pancreatic cancer), augmentative algorithmic analysis of 16 genes from previously sequenced rna whole transcriptome data, reported as probability of predicted molecular subtype
0512U	Oncology (prostate), augmentative algorithmic analysis of digitized whole-slide imaging of histologic features for microsatellite instability (msi) status, formalin-fixed paraffin embedded (ffpe) tissue, reported as increased or decreased probability of msi-high (msi-h)
0513U	Oncology (prostate), augmentative algorithmic analysis of digitized whole-slide imaging of histologic features for microsatellite instability (msi) and homologous recombination deficiency (hrd) status, formalin fixed paraffin-embedded (ffpe) tissue, reported as increased or decreased probability of each biomarker
0414U	Oncology (lung), augmentative algorithmic analysis of digitized whole slide imaging for 8 genes (alk, braf, egfr, erbb2, met, ntrk1-3, ret, ros1), and kras g12c and pd-l1, if performed, formalin-fixed paraffin-embedded (ffpe) tissue, reported as positive or negative for each biomarker

HCPCS Code	Long Descriptor
0418U	Oncology (breast), augmentative algorithmic analysis of digitized whole slide imaging of 8 histologic and immunohistochemical features, reported as a recurrence score
0220U	Oncology (breast cancer), image analysis with artificial intelligence assessment of 12 histologic and immunohistochemical features, reported as a recurrence score
0376U	Oncology (prostate cancer), image analysis of at least 128 histologic features and clinical factors, prognostic algorithm determining the risk of distant metastases, and prostate cancer-specific mortality, includes predictive algorithm to androgen deprivation-therapy response, if appropriate
81417	Exome (eg, unexplained constitutional or heritable disorder or syndrome); re-evaluation of previously obtained exome sequence (eg, updated knowledge or unrelated condition/syndrome)
81427	Genome (eg, unexplained constitutional or heritable disorder or syndrome); re-evaluation of previously obtained genome sequence (eg, updated knowledge or unrelated condition/syndrome)
1106T (placeholder code X623T)	Oncology (breast), augmentative algorithmic analysis of histomorphologic features in digitized hematoxylin and eosin stained slides from formalin-fixed paraffin-embedded (FFPE) breast cancer tissue, algorithm-derived parameters reported as 5-year and 10-year risks of distant metastasis, including digitization of glass microscope slides and hematoxylin and eosin staining of tissue sections, when performed
1107T (placeholder code X624T)	Oncology (prostate), augmentative algorithmic analysis of histomorphologic features in digitized hematoxylin and eosin stained slide(s) from formalin-fixed paraffin-embedded (FFPE) prostate cancer tissue, algorithm-derived parameters reported as 10-year risk of distant metastasis and prostate cancer specific mortality, including hematoxylin and eosin staining of tissue sections and digitization of glass microscope slides, when performed
1097T (placeholder code X614T)	Oncology (pancreas), augmentative algorithmic analysis of histomorphologic features in digitized slides from formalin-fixed paraffin-embedded pancreatic cancer tissue, algorithm-derived parameters reported as prediction of response to fluorouracil backbone versus gemcitabine backbone chemotherapy, including hematoxylin and eosin staining of tissue sections and digitization of glass microscope slides, when performed
1063T (placeholder code X568T)	Oncology (bladder), augmentative algorithmic analysis of histomorphologic features in digitized slides from formalin-fixed paraffin-embedded (FFPE) bladder cancer tissue (high-grade, non-muscle invasive), with clinicopathologic variables entered by the qualified health care professional; algorithm-derived parameters reported as prognostic of recurrence and progression, including hematoxylin and eosin staining of tissue sections, and digitization of glass microscope slides, when performed

HCPCS Code	Long Descriptor
1064T (placeholder X569T)	Oncology (bladder), augmentative algorithmic analysis of histomorphologic features in digitized slides from formalin-fixed paraffin-embedded (FFPE) bladder cancer tissue (high-grade, non-muscle invasive), with clinicopathologic variables entered by the qualified health care professional; algorithm-derived parameters reported as predictive of response to Bacillus Calmette-Guérin (BCG) therapy, including hematoxylin and eosin staining of tissue sections, and digitization of glass microscope slides, when performed

BILLING CODE 4169–69–C

(62) Caregiver Training Services (CTS)

In the CY 2025 PFS final rule (89 FR 97817 through 97821), we finalized new G—codes and payment for direct care CTS: HCPCS codes G0541 *(Caregiver training in direct care strategies and techniques to support care for patients with an ongoing condition or illness and to reduce complications (including, but not limited to, techniques to prevent decubitus ulcer formation, wound care, and infection control) (without the patient present), face-to-face; initial 30 minutes),* G0542 *(Caregiver training in direct care strategies and techniques to support care for patients with an ongoing condition or illness and to reduce complications (including, but not limited to, techniques to prevent decubitus ulcer formation, wound care, and infection control) (without the patient present), face-to-face; each additional 15 minutes (list separately in addition to code for primary service) (use g0542 in conjunction with g0541)),* and G0543 *(Group caregiver training in direct care strategies and techniques to support care for patients with an ongoing condition or illness and to reduce complications (including, but not limited to, techniques to prevent decubitus ulcer formation, wound care, and infection control) (without the patient present), face-to-face with multiple sets of caregivers).*

We sought comment on whether the resource costs associated with these services are best reflected through this existing coding or whether these resources costs are reflected in the valuation of other codes paid under the PFS, such as E/M visits.

We received public comments on this comment solicitation. The following is a summary of the comments we received and our responses.

Comment: We received many comments that supported maintaining separate coding and payment for caregiver training services. Commenters were nearly unanimous in recommending that CMS retain separate coding and payment for CTS rather than incorporating these resource costs into E/M valuation. Additionally, commenters noted that caregiver training needs often do not coincide with an E/M encounter, and that requiring CTS to be billed with or incorporated into an E/M visit would unnecessarily restrict when this training could occur, as well as impose more restrictive supervision or location requirements.

Response: We thank the commenters for their feedback on whether the resource costs associated with direct care CTS are best reflected through existing HCPCS codes G0541, G0542, and G0543. We will consider these comments for potential future rulemaking.

(63) Payment for Physician-Patient Clinical Trial Discussions

Despite the U.S. investing over $50 billion annually in biomedical research, fewer than 7 percent of adult cancer patients enroll in clinical trials.[63] A central and modifiable reason is that physicians rarely initiate conversations about clinical trials with their patients. For example, national survey data show that 70 percent of oncologists discuss trials with less than a quarter of their patients,[64] yet more than 50 percent of eligible patients enroll when actively offered a clinical trial.[65]

Time and administrative burden are documented as the top barrier to conversations between physician and patients about participation in clinical trials in virtually every survey.[66] The current valuation of existing visit codes does not account for the additional time and resource costs associated with the structured physician counseling regarding clinical trial eligibility, options, risks and benefits associated with counseling a beneficiary on whether to enroll in a clinical trial.

We therefore sought comment on whether we should effectuate payment for these resource costs through the creation of a HCPCS G-code describing a minimum of 20 minutes of physician or other QHP time spent on clinical trial counseling.

We sought comment on accurate valuation for this service, including inputs for work and practice expense, and whether the service should be available as a Medicare telehealth service. Interested parties suggested a work RVU value between 1.00 and 1.50 RVUs would accurately account for the physician work associated with this service.

We also sought comment on what documentation requirements we might consider for such a service, such as the trial(s) discussed and the patient's decision.

Comment: Commenters broadly supported creating a payment mechanism for physician-patient clinical trial counseling, agreeing that uncompensated time discourages enrollment. Commenters differed on code structure, with some preferring a modifier or add-on to the E/M visit over a standalone HCPCS G-code. On billing eligibility, some commenters supported allowing RNs and other advanced practice providers to bill. Most commenters supported the suggested work RVU range, though some preferred tiered time increments, and several suggested potential crosswalks to

existing codes. Commenters unanimously supported telehealth availability to improve access for beneficiaries. Regarding documentation, most commenters favored minimal requirements and some proposed specific elements, generally agreeing on documenting the trial(s) discussed, time spent, and the substance of the conversation.

Response: We thank commenters for their input on this potential HCPCS G-code for physician-patient clinical trial counseling. Commenters supported the policy's goals but offered differing views on code structure, billing eligibility, valuation, telehealth availability, and documentation requirements. We will take these recommendations into account should we propose to establish this code in future rulemaking.

BILLING CODE 4169–69–P

TABLE A-D9: CY 2027 WORK RVUs FOR NEW, REVISED, AND POTENTIALLY MISVALUED CODES

HCPCS	Descriptor	CY 2026 Work RVU	Proposed CY 2027 Work RVU	Final CY 2027 Work RVU	CMS time refinement
0591T	Health and well-being coaching face-to-face; individual, initial assessment	C	1.00	1.81	Yes
0592T	Health and well-being coaching face-to-face; individual, follow-up session, at least 30 minutes	C	0.70	1.00	Yes
0593T	Health and well-being coaching face-to-face; group (2 or more individuals), at least 30 minutes	C	0.23	0.23	Yes
10005	Fine needle aspiration biopsy, including ultrasound guidance; first lesion	1.42	1.35	1.35	No
10006	Fine needle aspiration biopsy, including ultrasound guidance; each additional lesion	0.98	1.00	1.00	No
15006	Skin cell suspension autograft (SCSA), trunk, arms, and/or legs; first 100 sq cm or less, or 1% of body area of infants and children	NEW	10.97	10.97	No
15007	Skin cell suspension autograft (SCSA), trunk, arms, and/or legs; each additional 100 sq cm, or each additional 1% of body area of infants and children, or part thereof	NEW	0.59	0.59	No
15008	Skin cell suspension autograft (SCSA), face, scalp, eyelids, mouth, neck, ears, orbits, genitalia, hands, feet, and/or multiple digits; first 100 sq cm or less, or 1% of body area of infants and children	NEW	11.28	11.28	No
15009	Skin cell suspension autograft (SCSA), face, scalp, eyelids, mouth, neck, ears, orbits, genitalia, hands, feet, and/or multiple digits; each additional 100 sq cm, or each additional 1% of body area of infants and children, or part thereof	NEW	0.98	0.98	No
20985	Computer-assisted surgical navigational procedure for musculoskeletal procedures	2.44	2.44	2.44	No
20988	Placement of localization marker(s) (eg, fiducial marker[s]), intraosseous, percutaneous, including imaging guidance, when performed; first target site	NEW	3.00	3.00	No
20989	Placement of localization marker(s) (eg, fiducial marker[s]), intraosseous, percutaneous, including imaging guidance, when performed; each additional target site	NEW	1.76	1.76	No
20994	Ablation therapy for reduction or eradication of bone tumor, including adjacent soft tissue when involved by tumor extension, cryoablation, open	NEW	2.70	2.70	No
22210	Osteotomy of spine, posterior or posterolateral approach, 1 vertebral segment; cervical	24.75	23.12	23.12	No
22212	Osteotomy of spine, posterior or posterolateral approach, 1 vertebral segment; thoracic	20.47	21.72	21.72	No
22214	Osteotomy of spine, posterior or posterolateral approach, 1 vertebral segment; lumbar	20.49	19.53	19.53	No
22216	Osteotomy of spine, posterior or posterolateral approach, 1 vertebral segment; each additional vertebral segment	5.88	3.00	3.00	No
23470	Arthroplasty, glenohumeral joint; hemiarthroplasty	17.44	13.81	15.60	No

4. Potentially Misvalued Services Under the PFS

a. Background

Section 1848(c)(2)(B) of the Act directs the Secretary to conduct a periodic review, not less often than every 5 years, of the relative value units (RVUs) established under the PFS. Section 1848(c)(2)(K) of the Act requires the Secretary to periodically identify potentially misvalued services using certain criteria and to review and make appropriate adjustments to the relative values for those services. Section 1848(c)(2)(L) of the Act also requires the Secretary to develop a process to validate the RVUs of certain potentially misvalued codes (PMVC) under the PFS, using the same criteria used to identify PMVC, and to make appropriate adjustments.

As outlined in section II.D. of this final rule, under Valuation of Specific Codes, each year we develop appropriate adjustments to the RVUs taking into account recommendations provided by the American Medical Association (AMA)/Specialty Society Relative Value Scale (RVS) Update Committee (referred to as the RUC), MedPAC, and other interested parties. For many years, the RUC has provided us with recommendations on the appropriate relative values for new, revised, and potentially misvalued PFS services. We review these recommendations on a code-by-code basis and consider these recommendations in conjunction with analyses of other data, such as claims data, to inform the decision-making process as authorized by statute. We may also consider analyses of work time, work RVUs, or direct practice expense (PE) inputs using other data sources, such as the Veterans Health Administration (VHA), National Surgical Quality Improvement Program (NSQIP), the Society for Thoracic Surgeons (STS), and the Merit-based Incentive Payment System (MIPS) data. In addition to considering the most recent available data, we assessed the results of physician surveys and specialty recommendations submitted to us by the RUC for our review. We also consider information provided by other interested parties such as from the general medical-related community and the public. We conduct a review to assess the appropriate RVUs in the context of contemporary medical practice. We noted in the proposed rule that section 1848(c)(2)(A)(ii) of the Act authorizes the use of extrapolation and other techniques to determine the RVUs for physicians' services for which specific data are not available and requires us to take into account the results of consultations with organizations representing physicians who provide the services. In accordance with section 1848(c) of the Act, we determine and make appropriate adjustments to the RVUs.

In its March 2006 Report to the Congress (*https://www.medpac.gov/document/report-to-the-congress-2006-medicare-payment-policy/*), MedPAC discussed the importance of appropriately valuing physicians' services, stating that misvalued services can distort the market for physicians' services, as well as for other health care services that physicians order, such as hospital services. In that same report, MedPAC postulated that physicians' services under the PFS can become misvalued over time. MedPAC stated, ''When a new service is added to the physician fee schedule, it may be assigned a relatively high value because of the time, technical skill, and psychological stress that are often required to furnish that service. Over time, the work required for certain services would be expected to decline as physicians become more familiar with the service and more efficient in furnishing it.'' We believe services can also become overvalued when PE costs decline. This can happen when the costs of equipment and supplies fall, or when equipment is used more frequently than is estimated in the PE methodology, reducing its cost per use. Likewise, services can become undervalued when physician work increases, or PE costs rise.

As MedPAC noted in its March 2009 Report to Congress (*https://www.medpac.gov/docs/default-source/reports/march-2009-report-to-congress-medicare-payment-policy.pdf*), in the intervening years since MedPAC made the initial recommendations, CMS and the RUC have taken several steps to improve the review process. Also, section 1848(c)(2)(K)(ii) of the Act augments our efforts by directing the Secretary to specifically examine, as determined appropriate, potentially misvalued services in the following categories:

- Codes that have experienced the fastest growth.
- Codes that have experienced substantial changes in PE.
- Codes that describe new technologies or services within an appropriate time-period (such as 3 years) after the relative values are initially established for such codes.
- Codes which are multiple codes that are frequently billed in conjunction with furnishing a single service.
- Codes with low relative values, particularly those that are often billed multiple times for a single treatment.
- Codes that have not been subject to review since implementation of the fee schedule.
- Codes that account for the majority of spending under the PFS.
- Codes for services that have experienced a substantial change in the hospital length of stay or procedure time.
- Codes for which there may be a change in the typical site of service since the code was last valued.
- Codes for which there is a significant difference in payment for the same service between different sites of service.
- Codes for which there may be anomalies in relative values within a family of codes.
- Codes for services where there may be efficiencies when a service is furnished at the same time as other services.
- Codes with high intraservice work per unit of time.
- Codes with high PE RVUs.
- Codes with high-cost supplies.
- Codes as determined appropriate by the Secretary.

Section 1848(c)(2)(K)(iii) of the Act also specifies that the Secretary may use existing processes to receive recommendations on the review and appropriate adjustment of potentially misvalued services. In addition, the Secretary may conduct surveys, other data collection activities, studies, or other analyses, as the Secretary determines to be appropriate, to facilitate the review and appropriate adjustment of potentially misvalued services. This section also authorizes the use of analytic contractors to identify and analyze potentially misvalued codes, conduct surveys or collect data, and make recommendations on the review and appropriate adjustment of potentially misvalued services. Additionally, this section provides that the Secretary may coordinate the review and adjustment of any RVU with the periodic review described in section 1848(c)(2)(B) of the Act. Section 1848(c)(2)(K)(iii)(V) of the Act specifies that the Secretary may make appropriate coding revisions (including using current processes for consideration of coding changes), which may involve consolidating individual services into bundled codes for payment under the PFS.

b. CY 2027 Identification and Review of Potentially Misvalued Services

In the CY 2012 PFS final rule with comment period (76 FR 73058 through

73059), we finalized a process for the public to nominate PMVC. In the CY 2015 PFS final rule with comment period (79 FR 67606 through 67608), we modified this process whereby the public and interested parties may nominate PMVC for review by submitting the code with supporting documentation by February 10th of each year. Supporting documentation for codes nominated for the annual review of PMVC may include the following:

- Documentation in peer reviewed medical literature or other reliable data that demonstrate changes in physician work due to one or more of the following: technique, knowledge and technology, patient population, site-of-service, length of hospital stay and work time.
- An anomalous relationship between the code being proposed for review and other codes.
- Evidence that technology has changed physician work.
- Analysis of other data on time and effort measures, such as operating room logs or national and other representative databases.
- Evidence that incorrect assumptions were made in the previous valuation of the service, such as a misleading vignette, survey, or flawed crosswalk assumptions in a previous evaluation.
- Prices for certain high-cost supplies or other direct PE inputs that are used to determine PE RVUs are inaccurate and do not reflect current information.
- Analyses of work time, work RVU, or direct PE inputs using other data sources (for example, VA, NSQIP, the STS National Database, and the MIPS data).
- National surveys of work time and intensity from professional and management societies and organizations, such as hospital associations.

We evaluate the supporting documentation submitted with the nominated codes and assess whether the nominated codes appear to be PMVC appropriate for review under the annual process. In the following year's PFS proposed rule, we publish the list of nominated codes and indicate for each nominated code whether we agree with its inclusion as a PMVC. The public has the opportunity to comment on these and all other proposed PMVC. In each year's final rule, we finalize our list of PMVC.

In each proposed rule, we seek nominations from the public and from interested parties of codes that they believe we should consider as potentially misvalued. We receive public nominations for PMVC by February 10th and we display these nominations on our public website (*https://www.cms.gov/medicare/payment/fee-schedules/physician/federal-regulation-notices*), where we include the submitter's name, their associated organization and the submitted studies for full transparency. We sometimes receive submissions for specific PE-related inputs for codes, and discuss these PE-related submissions, as necessary under the Determination of PE RVUs section of the rule. We summarize later in this section this year's submissions under the PMVC initiative. For CY 2027, we received 15 requests concerning various codes as PMVC.

The nominations are as follows:

(1) Nasal Sinus Irrigation (CPT Codes 31000 and 31002)

We received a request from one nominator to review nasal sinus irrigation codes, CPT 31000 *(Lavage by cannulation; maxillary sinus (antrum puncture or natural ostium))*, and CPT 31002 *(Lavage by cannulation; sphenoid sinus)*, as potentially misvalued. We reviewed this code family for the CY 2026 PFS final rule and our extensive discussion and rationale for finalizing the current values can be found at 90 FR 49310 through 49311.

We appreciate the information we received from the nominator. However, we note the information was the same as last year's submission. Additionally, the aforementioned CY 2026 PFS final rule specifically mentions for nasal sinus irrigation that interested parties were encouraged to submit relevant documentation, such as invoices or other evidence that demonstrates the typical resource costs for providing these services (90 FR 49311). However, we did not receive any invoices from the nominator.

In consideration of the information provided in this potentially misvalued nomination request as well as our previous valuation review and decision stated in the CY 2026 PFS final rule, we sought comments on the typicality and usage of the nasal sinus irrigation codes, CPT codes 31000 and 31002.

Comment: A few commenters recommended CMS increase the price of nasal sinus irrigation codes based on newly submitted invoices. A commenter submitted seven invoices associated with a sinonasal suction irrigation system, at an average price of $334.27, and requested that CPT codes 31000 and 31002 should be referred to the RUC as potentially misvalued so that the associated non-facility direct PE inputs could be reviewed and updated. Another commenter agreed with CMS that the values of these services should not change due to the lack of sufficient evidence.

Response: We thank commenters for their feedback. CMS continues to believe that any revaluation should reflect current clinical practice and reliable evidence regarding service frequency, circumstances of use, and the physician work and practice expense resources required to furnish the services.

After consideration of the public comments, we are not finalizing any changes to the direct PE inputs of CPT codes 31000 and 31002 at this time due to the conflicting information that we received from commenters. However, in light of the invoices that we received from commenters, we do nominate CPT Codes 31000 and 31002 as potentially misvalued. Additionally, we will add a sinonasal suction irrigation system (SD398) supply to the ratesetting database at a price of $334.27 for potential future inclusion in CPT codes.

(2) Urethral Bulking Material (CPT Code 51715)

We received a request from a nominator to review CPT code 51715 *(Endoscopic injection of implant material into the submucosal tissues of the urethra and/or bladder neck)* as potentially misvalued. The nominator stated that CPT code 51715 currently does not include a supply for the implant material necessary to properly perform CPT code 51715 in the office setting, which is a clinically desired place of service for this treatment. The nominator requested that CMS create a supply code for a urethral bulking agent sold in 2 mL vials, with a non-facility quantity of 1 priced at an average of $1,175 and incorporate this new supply into CPT code 51715 to appropriately value the service in the non-facility setting.

We appreciate the nominator submitting invoices regarding the pricing of this urethral bulking agent. Given the information provided by the nominator as well as factoring in the amount of time that has passed since CPT code 51715 was last formally reviewed in the 1990s, we proposed to create a new supply code (SD396) for this urethral bulking agent. The SD396 supply is based on a 2 mL vial which we proposed to price at the requested $1,175 based on an average of the submitted invoices. We proposed to add 1 quantity of this supply to CPT code 51715 in the non-facility setting to reflect current clinical practice. Given the cost of this supply and the length of time since last review, we also sought comment on whether CPT code 51715

should be referred to the RUC for review.

Comment: Many commenters were in support of our proposal to price SD396, representing a 2 mL vial, at the requested price of $1,175 based on the average of the submitted invoices. Some of these commenters noted this increase in price is a necessary step as the current reimbursement structure is too low and unsustainable. Additionally, several commenters stated that the proposed price of $1,175 remains too low based on the cost of the product alone, particularly when accounting for geographic variation. However, some commenters, including the AMA, mentioned CPT code 51715 has already been identified by the RUC's RAW on the high-volume growth screen and an action plan will be reviewed at the September 2026 RUC meeting to determine whether the code should be re-reviewed. As a result, these commenters urged CMS to delay finalizing any decision until the RAW's review of the action plan is complete.

Response: We appreciate the considerable support from commenters regarding our proposal. Upon reviewing the submitted invoices, we continue to believe the proposed price is appropriate. Furthermore, while the RUC reviewed these codes at the September 2026 RUV meeting, the nominator submitted invoices, which does support a price increase. CMS will look forward to reviewing the recommendations from the RUC through our standard process.

After consideration of public comments, CMS will finalize its proposal to price SD396, representing a 2 mL vial, at the requested price of $1,175.

(3) Complex Cystometrogram (CPT Codes 51728 and 51729)

We received a request from a nominator to review CPT code 51728 *(Complex cystometrogram (i.e., calibrated electronic equipment); with voiding pressure studies (i.e., bladder voiding pressure), any technique)* and CPT code 51729 *(Complex cystometrogram (i.e., calibrated electronic equipment); with voiding pressure studies (i.e., bladder voiding pressure) and urethral pressure profile studies (i.e., urethral closure pressure profile), any technique).* The nominator submitted invoices to request a pricing increase in the supply codes SD017 (catheter balloon), SD027 (catheter pressure), and SD131 (tubing pressure) for CPT codes 51728 and 51729. The invoices submitted from the requestor are dated from January 2025 to October 2025 and the nominator specifically is requesting an increase in the price of the SD017 supply from $35.89 to $74.00, an increase in the price of the SD027 supply from $19.35 to $86.80, and an increase in the price of the SD131 supply from $2.90 to $25.48.

We appreciate the information submitted from the nominator and note we previously reviewed these supply codes in the CY 2026 PFS final rule and stated, ''Given the differences between the names of the items in question, and the significant increases in requested pricing, we proposed not to update the pricing of these three supplies as we cannot verify that the invoices refer to the same supply items.'' (90 FR 49279) Taking into consideration the invoice for the SD017 supply listed a ''Abdominal Sensor Catheter'', the invoice for the SD027 supply listed a ''Single Sensor Catheter'', and the invoice for the SD131 supply listed a ''Tubing, Pump, Infusion Line'' our rationale that we cannot verify the names of items in question remains the same. Therefore, based on a lack of additional information submitted to explain the differences in names of the supply codes in question, we did not propose to update the pricing of these three supplies as we were still unable to verify that these invoices refer to the same supply items.

Comment: A commenter mentioned that CMS should continue to work with the nominator to confirm product mapping and recognize current costs that are documented. The same commenter also believes that the CMS rationale for declining updates based on an inability to verify the names of items in question was not sufficient. Another commenter did submit documentation to substantiate invoices submitted previously, which they believe provides information that will help connect the commercial invoice terminology and the generic CMS supply descriptions. No new invoices were submitted during this comment period.

Response: We thank commenters for their feedback as well as for the additional documentation. We note that, under the potentially misvalued code review process, CMS must consider whether submitted invoices accurately reflect the supplies being valued. When the invoiced items do not correspond to the supplies in question, their medical relationship alone does not provide an appropriate basis for valuation. Due to the highly technical nature of the product documentation submitted by the commenters, we still cannot establish with certainty that the previously submitted invoices from CY 2026 correspond to the supply items in question. However, after reviewing these new materials, we believe that the preponderance of the available information supports the contention of the commenters that the prior invoices match the supply items in question, and that there is sufficient evidence to support updating their prices.

After consideration of the public comments, we are therefore finalizing an update in the price of the catheter, balloon, rectal pressure (SD017) supply from $35.89 to $74.00, an update in the price of the catheter, pressure, urodynamic (SD027) supply from $19.35 to $86.80, and an update in the price of the transducer dome (pressure) (SD125) supply from $3.58 to $17.32. We are also finalizing CPT codes 51728 and 51729 as potentially misvalued as we believe that these codes would benefit from additional formal review. CPT codes 51728 and 51729 have not been reviewed in nearly two decades, they have reasonably high utilization at more than 50,000 annual services, and we continue to have concerns about the accurate pricing of these supplies which we believe could be more accurately determined through a full review.

(4) Carpal Tunnel Release Procedure (CPT Code 64728)

We received a request from one nominator to review CPT code 64728 *(Decompression; median nerve at the carpal tunnel, percutaneous, with intracarpal tunnel balloon dilation, including ultrasound guidance)* as potentially misvalued. The nominator stated that this code is misvalued due to the following reasons: (1) the anomalous relationship between the valuation for CPT code 64728 and other CPT codes for carpal tunnel release procedures; (2) Incorrect assumptions were made based on the previous valuation of the service, including a misleading survey and flawed crosswalk assumptions; and (3) Analysis of work relative value units (RVUs) from reliable data sources support increased valuation. The nominator requested an increase in work RVUs to appropriately reflect the intensive work associated with this procedure.

This code family was reviewed in the CY 2026 PFS final rule and our extensive discussion for finalizing a work RVU of 2.70 can be found in 90 FR 49374 through 49376. We previously addressed the concerns of the nominator in this preamble and we have received no new data for CY 2027 which would support a higher valuation for CPT code 64728. Based on the lack of new information submitted for CY 2027, we do not believe this code to be potentially misvalued. We sought comment on this issue, including the

submission of new information to support the request.

Comment: A commenter believes CMS should continue to evaluate the valuation of CPT code 64728 due to misalignment in the work RVUs for this code. This commenter specifically mentioned the relative time and intensity of physician work among open, endoscopic, and ultrasound-guided carpal tunnel release techniques are not appropriately reflected in the proposed work RVUs. However, another commenter concurred with the CMS proposal that CPT code 64728 is not potentially misvalued and mentioned that the comparison code the nominator listed as a means of an increase is inappropriate. Additionally, the same commenter also noted that the intensity of work per unit of time for CPT code 64728 already exceeds that of the comparator codes cited as evidence of undervaluation.

Response: We appreciate the feedback from commenters.

After consideration of the public comments, we continue to believe CPT code 64728 is not potentially misvalued. Commenters were unable to provide new cost information which would support a higher valuation for CPT code 64728 and we received support from some commenters who agreed that the code was not potentially misvalued.

(5) Electronic Analysis of Implanted Neurostimulator Pulse Generator/ Transmitter (CPT Codes 95970, 95976, 95977)

We received a request from one nominator to review CPT codes 95970 (*Electronic analysis of implanted neurostimulator pulse generator/ transmitter (e.g., contact group[s], interleaving, amplitude, pulse width, frequency [Hz], on/off cycling, burst, magnet mode, dose lockout, patient selectable parameters, responsive neurostimulation, detection algorithms, closed loop parameters, and passive parameters) by physician or other qualified health care professional; with brain, cranial nerve, spinal cord, peripheral nerve, or sacral nerve, neurostimulator pulse generator/ transmitter, without programming*), 95976 (*Electronic analysis of implanted neurostimulator pulse generator/ transmitter (e.g., contact group[s], interleaving, amplitude, pulse width, frequency [Hz], on/off cycling, burst, magnet mode, dose lockout, patient selectable parameters, responsive neurostimulation, detection algorithms, closed loop parameters, and passive parameters) by physician or other qualified health care professional; with simple cranial nerve neurostimulator pulse generator/transmitter programming by physician or other qualified health care professional*), and 95977 (*Electronic analysis of implanted neurostimulator pulse generator/ transmitter (e.g., contact group[s], interleaving, amplitude, pulse width, frequency [Hz], on/off cycling, burst, magnet mode, dose lockout, patient selectable parameters, responsive neurostimulation, detection algorithms, closed loop parameters, and passive parameters) by physician or other qualified health care professional; with complex cranial nerve neurostimulator pulse generator/transmitter programming by physician or other qualified health care professional*).

The nominator stated they believe this code family is potentially misvalued due to differing valuations relative to the recently reviewed CPT codes 93150 (*Therapy activation of implanted phrenic nerve stimulator system, including all interrogation and programming*), 93151 (*Interrogation and programming (minimum one parameter) of implanted phrenic nerve stimulator system*), and 93153 (*Interrogation without programming of implanted phrenic nerve stimulator system*), despite being clinical similar services. The nominator also believed there were discrepancies in equipment used to perform each procedure as opposed to what is included in the current valuation due to inaccurate assumptions about what clinical specialties most commonly furnish these procedures. To support their requests, the nominator shared 2024 utilization data showing an increase in certain clinical specialties furnishing these services. We appreciate the additional information and sought comment on the appropriate valuation of this code family as well as any additional information on the typical specialty and resource costs associated with furnishing these procedures.

Comment: A few commenters appreciated CMS soliciting comment on CPT codes 95970, 95976, 95977 and believe CMS should evaluate this code family as potentially misvalued because these codes are undervalued relative to the required work and practice expense, historical valuations, and comparable analysis and programming codes. A commenter reiterated that for valuation purposes, the resource costs associated with CPT codes 95970, 95976, and 95977 should be compared to the existing peripheral nerve stimulation codes, CPT codes 93150, 93151, and 93153.

Response: We thank the commenters for their feedback and note that in accordance with 1848(c) of the Act we take into account the typical specialty and resource costs associated with furnishing these procedures when assessing if a code family is potentially misvalued.

Comment: Many commenters were in disagreement that CPT codes 95970, 95976, 95977 were potentially misvalued or that they should be valued similarly to CPT codes 93150, 93151, and 93153 only because they involve interrogation and programming of implanted neurostimulation devices. These commenters also stated utilization trends or changes in specialty participation do not establish comparable resource requirements and that valuation should reflect the physician work and practice expense resources required to furnish each service. Furthermore, the AMA noted the RUC will place CPT codes 95970, 95976 and 95977 on the next level of interest (LOI) for review of work and direct practice expenses and submit recommendations to CMS for the CY 2028 Medicare Physician Payment Schedule.

Response: We thank commenters for their feedback. We also support the RUC survey process as a reliable and transparent approach for evaluating PE inputs and determining whether services are appropriately valued.

After consideration of the public comments, we will not finalize any changes to CPT codes 95970, 95976 and 95977 at this time as we were persuaded by the commenters that these codes are not potentially misvalued. We look forward to reviewing any recommendations submitted by the RUC for potential CY 2028 rulemaking.

(6) Scalp Cooling (CPT Codes 97007, 97008, 97009)

We received a request from one nominator to review the mechanical scalp cooling family of services described by CPT codes 97007 *(mechanical scalp cooling, including individual cap supply with head measurement, fitting, and patient education),* 97008 *(mechanical scalp cooling; including hair preparation, individual cap placement, therapy initiation, and pre-cooling period),* and 97009 *(mechanical scalp cooling; each 30 minutes),* as potentially misvalued. We reviewed this code family for the CY 2026 PFS final rule and our extensive discussion and rationale for finalizing the current values can be found at 90 FR 49405 through 49406.

The nominator stated that they believe this code family may be potentially misvalued based on newly available empirical evidence (a Time and Motion Study) that demonstrates incorrect assumptions were made

during our prior valuation decision for the CY 2026 PFS final rule. They reference in their nomination that the August 2024 Time and Motion Study demonstrated that the clinical staff and PE inputs required to furnish this service are materially greater than those reflected in the current valuation and were not made available to CMS prior to our valuation review and decision for CY 2026. Specifically, the nominator recommended an increase in PE clinical staff time to 103 minutes for CPT code 97007, 52 minutes for 97008, and 23 minutes for 97009.

We appreciate the information we received from the nominator. However, we disagree with their assertion that CMS did not have the results of the August 2024 Time and Motion Study when making our valuation decision for CY 2026. The aforementioned CY 2026 PFS final rule discussion outlines the information considered for the valuation decision and specifically mentions the August 2024 Time and Motion Study results as well as the public comments received for the CY 2026 PFS proposed rule, which reflect the requested increase in PE clinical staff time. We assure the nominators and readers of this discussion that all the information provided in this potentially misvalued nomination request was considered when making our previous valuation review and decision for CY 2026. Accordingly, we disagree with the assertion that this family is misvalued. However, we sought comment, particularly updated information that could support a change in valuation for these services.

We received public comments on these proposals. The following is a summary of the comments we received and our responses.

Comment: A few commenters disagreed that this code family is not potentially misvalued. They believe that the current PE inputs do not adequately account for the clinical labor required to furnish these services. Commenters specifically requested increased clinical staff (oncology nurse OCN) time inputs as well as an increase to the cooling cap supply item, SA141 Scalp Cooling Cap/Kit, which they support with some submitted documentation. A commenter also referenced the Time and Motion study in support of their recommendations.

Response: We thank commenters for their feedback. As mentioned in our previous discussion for the CY 2026 proposed rule, we did review the Time and Motion Study results when making our valuation decisions for CY 2026 and we continue to believe that the current clinical staff time captured in the direct PE inputs for this code family adequately account for the resources involved with furnishing this service. Additionally, we acknowledge the request to update the direct PE supply item, SA141 Scalp Cooling Cap/Kit. We do not believe that updating the supply cost at this time for SA141 is necessary, as this supply was just priced for CY 2026 based on several valid vendor invoices. While we did receive documentation from the commenter, we did not receive a valid invoice for this request.

After consideration of public comments, we are finalizing the work RVUs and direct PE inputs as proposed for CPT codes 97007, 97008, and 97009.

(7) Hyperbaric Oxygen Under Pressure (HCPCS Code G0277)

The RUC has requested the deletion of HCPCS code G0277 *(Hyperbaric oxygen under pressure, full body chamber, per 30-minute interval),* and recommended that CPT code 99183 be revised to be time-based as well to appropriately describe the treatment delivery, attendance and supervision. The RUC concluded that maintaining a separate G-code creates unnecessary coding complexity without adding clinical or administrative value and that one clear and consistent coding structure should exist for this service.

In 2015, CMS created HCPCS code G0277 to describe direct practice expense inputs associated with CPT code 99183 *(Physician or other qualified health care professional attendance and supervision of hyperbaric oxygen therapy, per session).* We noted that under the Outpatient Prospective Payment System (OPPS), the treatment used to be reported using separate treatment code C1300 *(Hyperbaric oxygen under pressure, full body chamber, per 30-minute interval.)* Therefore, we created HCPCS code G0277 to report the treatment delivery and to maintain consistency with the OPPS coding and PFS payment systems.

HCPCS code G0277 was identified as a high-volume growth code that has Medicare utilization of 10,000 or more. High utilization of this magnitude reflects that the code has been broadly adopted across multiple care settings and underscores its operational importance within the Medicare program. Deleting or replacing a high-volume code without an equivalent can disrupt billing practices, create reporting gaps, and impose unnecessary administrative burden on providers who have integrated it into their standard practice. As such, we believe there is a reason to continue to maintain the use of the G-code for hyperbaric oxygen therapy since HCPCS code G0277 is utilized in multiple Medicare payment systems to report the time the patient uses the hyperbaric oxygen therapy. Accordingly, we proposed to maintain HCPCS code G0277.

Comment: Several commenters opposed the AMA RUC's recommendation to crosswalk HCPCS code G0277's direct practice expense (PE) inputs into CPT code 99183 (multiplied by a factor of 4) and delete G0277. These commenters supported CMS's proposal to retain HCPCS code G0277 as a distinct code and preserve separate reporting of CPT code 99183 and HCPCS code G0277. Commenters stated that the two-code structure accurately reflects physician work and treatment-delivery costs as separate resources.

Commenters stated that CPT code 99183 and HCPCS code G0277 describe clinically and operationally distinct services. They explained that CPT code 99183 describes physician attendance and supervision during hyperbaric oxygen therapy, while HCPCS code G0277 describes the resources required to deliver the treatment itself, including the hyperbaric chamber, oxygen-delivery and monitoring systems, trained ancillary staff, and associated safety and maintenance requirements. A commenter stated that physicians who report HCPCS code G0277 understand the existing distinction between HCPCS code G0277 and CPT code 99183, and that deleting HCPCS code G0277 and revising CPT code 99183 would introduce confusion into an area of billing that functions appropriately under the current structure.

Commenters further stated that because HCPCS code G0277 is a HCPCS code rather than a CPT code, the RUC referred CPT code 99183 to the CPT Editorial Panel for possible revision. Commenters explained that the RUC's current recommendation to convert CPT code 99183 into a time-based code incorporating delivery, attendance, and supervision would require either incorporating multiple 30-minute PE segments into CPT code 99183 or substantially redefining the code, neither of which has been adopted through the CPT process. Commenters stated that this approach would also increase administrative burden for small, office-based practices.

Several commenters stated that similar coding changes have previously caused Medicare and commercial payment disruption, citing extended Medicare prepayment review and delayed commercial payer adoption following implementation of HCPCS code G0277 in 2015. Commenters stated

that consolidating HCPCS code G0277 into CPT code 99183 could result in comparable disruption.

Many commenters recommended that CMS retain HCPCS code G0277 as a distinct code, preserve separate reporting of CPT code 99183 and HCPCS code G0277, reject the RUC's recommended crosswalk and deletion of HCPCS code G0277, continue to evaluate physician work and treatment-delivery resources independently, and evaluate the effects of any future restructuring across all applicable sites of service.

Response: We thank the commenters for their feedback and support of retaining CPT code 99183 and HCPCS code G0277 as two distinct codes. We agree that the two codes reflect distinct components of care.

Comment: The RUC stated that the CY 2026 proposed rule did not adopt the RUC's earlier recommendation to establish direct practice expense (PE) inputs for CPT code 99183 or to delete HCPCS code G0277. The RUC reiterated its recommendation that CMS crosswalk the January 2023 direct PE inputs for HCPCS code G0277 to CPT code 99183, multiplied by a factor of four to reflect a full two-hour treatment session, and that CMS delete HCPCS code G0277 on the basis that CPT code 99183, once revalued, could appropriately account for the service.

Response: We thank the commenter for their feedback. However, we continue to believe that two codes represent separate components of care. We also note that HCPCS code G0277 has high utilization and broad adoption across care settings. Deleting such a high-volume code without an appropriate equivalent can disrupt billing practices, creating reporting gaps and imposing an unnecessary administrative burden on providers.

Comment: A commenter took no position on CMS's proposal to retain HCPCS code G0277 or the RUC's recommendation to delete it and revise CPT code 99183. The commenter instead urged CMS to continue collaborating with the RUC and affected specialty societies to develop a coding structure that accurately reflects the service while avoiding duplication and administrative complexity.

Response: We thank the commenters for their feedback.

After consideration of the public comments, we continue to believe the existing coding structure, which distinguishes professional attendance and supervision (CPT code 99183) from treatment-delivery resources (HCPCS code G0277), remains appropriate and should be maintained. Therefore, for CY 2027, we are finalizing the proposal to maintain HCPCS code G0277 as a distinct code and to preserve separate reporting of CPT code 99183 and HCPCS code G0277.

(8) Image-Guided Robotic Linear Accelerator Stereotactic Radiosurgery (HCPCS Codes G0339 and G0340)

Image-guided robotic linear accelerator-based stereotactic radiosurgery services are currently reported by and paid for using HCPCS G-codes established the in CY 2007 PFS final rule HCPCS codes G0339 *(Image-guided robotic linear accelerator-based stereotactic radiosurgery, complete course of therapy in one session or first session of fractionated treatment)* and G0340 *(Image-guided robotic linear accelerator-based stereotactic radiosurgery, delivery including collimator changes and custom plugging, fractionated treatment, all lesions, per session, second through fifth sessions, maximum five sessions per course of treatment)*. In April 2025, the RAW identified HCPCS code G0340 with 2023 Medicare utilization over 10,000 and Medicare status of ''C'' contractor priced. The Workgroup requested an action plan for G0340 for September 2025. In September 2025, the Workgroup reviewed the action plan and recommended that the RUC request that CMS delete G0339 and G0340 having identified a CPT code 77373 (*Stereotactic body radiation therapy, treatment delivery, per fraction to 1 or more lesions, including image guidance, entire course not to exceed 5 fractions)* that is available to report in lieu of G0339 and G0340.

A review of Medicare claims data shows that HCPCS codes G0339 and G0340 are billed frequently. HCPCS code G0339 was billed approximately 3,000 times and HCPCS code G0340 12,000 times in 2024 respectively. As such, we believe there is a reason to maintain the G codes for image-guided robotic linear accelerator-based stereotactic radiosurgery services since both sets of codes are billed so frequently, and we do not want to cause disruption in billing practice. Since the RUC planned on reviewing these codes during its September 2026 meeting if the codes are not deleted for CY 2027, we welcomed the RUC's additional information regarding appropriate coding and payment for these services.

Comment: The RUC recommended that CMS delete HCPCS codes G0339 and G0340 for CY 2027 rather than maintain them. The commenter stated that only 17 centers in 11 states currently offer robotic radiosurgery, and that of 234 physicians who reported these codes in 2023, 68 no longer offer the service and 20 have retired. The RUC further noted that CMS's own provider-and-service data show only 68 practice locations billed HCPCS code G0339 and only 96 billed HCPCS code G0340 in 2024, notwithstanding the higher claims-line counts cited in the proposed rule. The commenter argued this indicates the affected provider population is small and identifiable, such that requiring these practices to report existing CPT code 77373 in lieu of the G-codes would not impose material burden, and would promote uniform payment across all stereotactic body radiation therapy modalities. The commenter indicated the RAW would review action plans for both codes again at its September 2026 meeting to further support deletion.

Other commenters, including a specialty society representing radiation oncology professionals, supported continued use of the G-codes in the near term but urged CMS to treat the coding question as secondary to a broader valuation concern. These commenters stated that stereotactic radiosurgery and stereotactic body radiation therapy share capital-intensive and infrastructure-dependent characteristics with other radiation treatment delivery services for which we have already adopted OPPS-informed practice expense methodologies (for example, CPT codes 77402, 77407, and 77412, and proposed proton beam delivery codes). These commenters recommended that, rather than resolving valuation through the G-code deletion question alone, CMS link SRS/SBRT services to OPPS data beginning January 1, 2028, consistent with the stated rationale for adopting alternative PE methodologies for other radiation oncology services that do not fit the standard non-facility PE framework.

An individual commenter, a practicing radiation oncologist, did not comment specifically on the coding treatment of HCPCS codes G0339 and G0340, but urged CMS broadly to avoid payment reductions affecting stereotactic body radiation therapy and stereotactic radiosurgery services. The commenter stated that these modalities allow patients, including those in rural areas, to complete treatment in as few as five sessions rather than a longer conventional course, and that reduced payment for the planning, physics, and management services supporting these modalities could jeopardize access to this care.

Response: We acknowledge the RUC's data showing that utilization of HCPCS codes G0339 and G0340 is concentrated among a limited number of practice

locations (68 and 96, respectively, in 2024). However, we continue to place significant weight on the high overall claims volume associated with these codes—approximately 3,000 claims for HCPCS code G0339 and over 12,000 claims for HCPCS code G0340 in 2024—which indicates that these services remain a frequently furnished and clinically significant component of radiation oncology care for Medicare beneficiaries, even though they are billed by a comparatively small number of sites. We are concerned that deleting high-volume codes without a transition period could disrupt billing practices, create reporting gaps, and impose administrative burden on the providers who have integrated them into standard practice, regardless of how many distinct locations are affected. We are therefore not finalizing deletion of HCPCS codes G0339 and G0340 for CY 2027.

Comment: A commenter was concerned about the broader importance of maintaining adequate payment for the planning, physics, and management services that support stereotactic body radiation therapy and stereotactic radiosurgery, including the role these modalities play in enabling shorter courses of treatment for patients in rural and underserved areas.

Response: While this comment did not address the coding treatment of HCPCS codes G0339 and G0340 specifically, we considered it alongside the broader comments regarding valuation methodology for these services. We will consider any future recommendations, together with the high utilization of these codes and the comments on OPPS-informed valuation methodology for SRS/SBRT services, in future rulemaking.

(9) Request for Revaluation of Physician Work Time Based on Empiric Data (CPT Codes 15734, 19318,19380, 23472, 27130, 27447, 37227, 37229, 43281, 43644, 47120, 88305, 88307)

An interested party nominated 13 CPT codes as potentially misvalued. These codes are listed in Table A–D14.

TABLE A-D14: CPT CODES NOMINATED FOR REVALUATION BASED ON CHANGES IN PHYSICIAN WORK TIME

CPT Codes	Description
Integumentary system (CPT codes 15734, 19318, 19380)	
15734	Muscle, myocutaneous, or fasciocutaneous flap obtained from the trunk
19318	Breast reduction
19380	Revision of reconstructed breast (eg, significant removal of tissue, re-advancement and/or re-inset of flaps in autologous reconstruction or significant capsular revision combined with soft tissue excision in implant-based reconstruction
Musculoskeletal system (CPT codes 23472, 27130, 27447)	
23472	Arthroplasty, total shoulder (glenoid and proximal humeral replacement (eg, total shoulder)
27130	Arthroplasty, acetabular and proximal femoral prosthetic replacement (total hip arthroplasty), with or without autograft or allograft
27447	Arthroplasty, knee, condyle and plateau; medial AND lateral compartments with or without patella resurfacing (total knee arthroplasty)
Cardiovascular system (CPT codes 37227 and 37229)	
37227	with transluminal stent placement(s) and atherectomy, includes angioplasty within the same vessel, when performed*
37229	with atherectomy, includes angioplasty within the same vessel, when performed*
Digestive system (CPT codes 43281, 43644, 47120)	
43281	Laparoscopy, surgical, repair of paraesophageal hernia, includes fundoplasty, when performed; without implantation of mesh
43644	Laparoscopy, surgical, gastric restrictive procedure; with gastric bypass and Roux-en-Y gastroenterostomy (roux limb 150 cm or less)
47120	Hepatectomy, resection of liver; partial lobectomy
Surgical pathology (CPT codes 88305 and 88307)	
88305	Level IV - Surgical pathology, gross and microscopic examination
88307	Level V - Surgical pathology, gross and microscopic examination

*Deleted as of CY 2026.

The nominator provided evidence that current physician work time values in the PFS do not accurately reflect real-world clinical practice for 13 CPT codes across five code families. Their methodology focused on codes involving large discrepancies between empirically derived intraservice estimates and intraservice times assigned in the PFS. The nominator did not assert that their research provided confirmatory evidence for every intraservice time discrepancy, which is why their analysis focused on coding families related to the 13 CPT codes listed previously (Table A–D14). They provided additional details on their findings related to the 13 CPT codes and other codes included in their coding families in this section.

Using the 2023 Maryland All-Payer Claims Database (MD–APCD), the nominator's analysis indicates that some of these codes are likely to be overvalued. In their nomination, their analysis reveals that the 88305 (Level IV Tissue Exam by Pathologist) code had the highest number of provider days with intraservice time exceeding an 8-hour workday, with more than 1,763 days, which was significantly higher than the other 12 CPT codes. There were 587 instances of physicians billing 88305 so many times in a single day that the total intraservice time exceeded 24 hours. For these 1,763 days, when they added up the total time spent on services (including other codes billed in a day, and pre-services times as well), the average time that services were billed for during these days was 2,217 minutes (approximately 37 hours). Additionally, despite the name of the code being ''Tissue Exam by Pathologist,'' they found that gastroenterologists and dermatologists

frequently billed this code while exceeding eight hours of work in a single day. According to the nominator, data from a 2016 Urban study [67] indicated that the median intraservice time for 88305 was only 2 minutes, compared to 25 minutes in the PFS, which is a 1,250 percent difference—larger than any of the empiric differences between NSQIP and the PFS intraservice times.

They also reviewed additional codes outside of the Urban study that are in the Level IV tissue exam by pathologist coding family, specifically CPT codes 88302, 88304, 88307, and 88309, to conduct a thorough check. As a result, they found that CPT code 88307 had 40 provider days where the total intraservice time exceeded 8 hours. The nominator suggested that CMS should consider reviewing the physician time for all codes within this family to address the existing PFS intraservice times.

In addition, they stated that several codes from the integumentary systems—CPT codes 15734 (*Muscle, myocutaneous, or fasciocutaneous flap; trunk*), 19318 (*Breast reduction*), and 19380 (*Revision of reconstructed breast (eg, significant removal of tissue, re-advancement and/or re-inset of flaps in autologous reconstruction or significant capsular revision combined with soft tissue excision in implant-based reconstruction)*)—are likely overvalued as clinicians spend 34, 90 and 14 days, respectively, performing these services, where the intraservice times of these codes themselves were more than 8 hours. Over these days, clinicians spent an average of 32, 17, and 41 hours when the PFS times for all services they billed on these days were summed (including pre-service times). The RAND study [68] identified that 21 codes in the integumentary system had PFS intraservice times that were likely too long, and 3 codes had PFS intraservice times that were likely too short.

In the musculoskeletal system, they identified specific procedures with extended service times. For CPT codes 23472 (*Arthroplasty, glenohumeral joint; total shoulder (glenoid and proximal humeral replacement (e.g., total shoulder))*), 27130 (*Arthroplasty, acetabular and proximal femoral prosthetic replacement (total hip arthroplasty), with or without autograft or allograft*), and 27447 (*Arthroplasty, knee, condyle and plateau; medial AND lateral compartments with or without patella resurfacing (total knee arthroplasty)*), there were 12, 10, and 26 Provider Days, respectively, that exceeded the 8-hour intraservice thresholds. These instances resulted in average total service times of 19, 19, and 21 hours, respectively. The NSQIP RAND study found that 97 musculoskeletal codes had intraservice times that were likely too long, while 14 had intraservice times that were likely too short.

According to the nominator, CPT codes 43281 (*Laparoscopy, surgical, repair of paraesophageal hernia, includes fundoplasty, when performed; without implantation of mesh*), CPT 43644 (*Laparoscopy, surgical, gastric restrictive procedure; with gastric bypass and Roux-en-Y gastroenterostomy (roux limb 150 cm or less)*), and CPT code 47120 (*Hepatectomy, resection of liver; partial lobectomy*) were found to have 15, 14, and 10 practitioner days, respectively, where the intraservice time exceeded 8 hours. On these days, the providers recorded average total service times of 25, 33, and 52 hours, respectively. Additionally, the nominator stated that the 2015 NSQIP RAND study identified 86 digestive system codes that were likely too long and 12 codes that were likely too short.[69]

In the proposal rule, we stated that we appreciated the detailed information provided to us by external interested parties and welcomed comments from the public regarding any potential actions for CY 2027 or for future rulemaking. We acknowledged the limitations associated with NSQIP data in terms of its applicability to other settings, as it is representative of the hospital setting, however we believe this empirical data may be a better input than limited survey data. Therefore, we sought comment on whether we should make these changes for CY 2027, or for future rulemaking, and whether we should consider making corresponding changes to the work RVUs for these services or if changes to the physician time would be sufficient.

Comment: The RUC and many commenters requested that CMS not rely on data from the Maryland Health Care Commission (MHCC). The RUC noted that 5 of the 13 codes do not warrant further action: CPT codes 37227 and 37229 were deleted for CY 2026, and CPT codes 23472, 27130, and 27447 were resurveyed for CY 2027 with RUC-recommended decreases to physician time, work RVUs, and post-operative visits, as reflected elsewhere in this final rule. The RUC raised concerns about the reliability of the MHCC methodology, including limited sample size, failure to account for specialty-specific billing patterns, and use of claims data that may not reflect actual physician work time. Commenters requested that CMS not rely on this data and, if CMS proceeds with review, that we defer action on the remaining 8 codes to the CY 2028 PFS rulemaking cycle.

Many commenters urged CMS not to revalue these codes based on data from the MHCC, and instead to refer any valuation question to the RUC process. First, they stated that MHCC's methodology was flawed (for example, it mistakenly assumes the billed date equals the date the physician actually performed the work). Second, they stated that only about 2.9% of CPT code 88305 provider-days exceeded MHCC's 8-hour threshold, which is not typical. Also, multiple commenters stated that the 2016 Urban Institute pilot study's 2-minute time estimate for CPT code 88305 (versus the current 25-minute PFS value) relied on a convenience sample. Many commenters noted that a pure time-based claims analysis misses the real intensity of the pathology work.

A couple of commenters supported the use of empirical, claims-based data to revalue potentially misvalued codes. A commenter stated that such data are more reliable than survey data submitted through the RUC process, and recommended that CMS collect such data on an ongoing basis rather than through isolated or one-time efforts. Another commenter recommended that CMS adopt empirically derived operative times from the National Surgical Quality Improvement Program (NSQIP) in place of current PFS time estimates when valuing potentially misvalued codes, noting that NSQIP data, while skewed toward complex cases at academic medical centers, offer a more reliable empirical basis and a more gradual transition than other data sources. This commenter further recommended that CMS evaluate and revalue entire families of related codes, rather than individual codes in isolation, to avoid rank-order anomalies and unintended distortions in clinical practice. Finally, the commenter re-examined Maryland's all-payer claims database and found that the discrepancy

[67] *https://www.urban.org/research/publication/collecting-empirical-physician-time-data-piloting-approach-validating-work-relative-value-units.* Stephen Zuckerman, PhD, Katie Merrell, BA, Robert A. Berenson, MD, Susan Mitchell, RHIA, Divvy Upadhyay, MD, MPH, Rebecca Lewis, MPH, Collecting Empirical Physician Time Data: Piloting an Approach for Validating Work Relative Value Units. *https://www.urban.org/sites/default/files/publication/87771/2001123-collecting-empirical-physician-time-data-piloting-approach-for-validating-work-rel.ative-value-units_0.pdf.*

persisted, confirming its statement that CPT code 88305 is overvalued. Given this result, the commenter reiterated its recommendation that CMS adopt the Urban Institute's empirically derived intraservice time of 2 minutes.

Response: We thank the commenters for their feedback, and we appreciate the commenter's follow-up analysis regarding CPT code 88305. The majority of commenters opposed this approach to revaluing the potentially misvalued codes using empirical data and recommended referring any valuation questions to the RUC process. We must also note a range of concerns about using empirical data for revaluation, including the representativeness of the underlying data sources, the methodology used to translate empirical data into revised time and work values, and the potential effects of the proposed changes on affected specialties and on beneficiary access to care.

After considering public comments, we are neither revaluing the cited codes based on the empirical data provided nor finalizing any changes to these codes. However, we may take these comments into consideration in future rulemaking and welcome additional studies and data submissions on this topic.

(10) Request for Reassessment of Assigned RVUs for ''Harvard-Valued'' Codes (CPT Codes 24515, 22216, 22210, 64721, 29824, 20610, and 20680)

We received notification from concerned interested parties about the ''Harvard-valued'' codes from 1992 that have not undergone a reassessment of assigned RVUs for over 20 years in some cases (see Table A–D15). We share their concerns about whether the current values for the CPT codes accurately reflect the resource inputs associated with furnishing the services. Because the CPT codes have not been recently reviewed and potentially significant technological changes have occurred during this time, we proposed these CPT codes as potentially misvalued and requested that the RUC and other interested parties review these services in terms of appropriate work RVUs, work time assumptions and direct PE inputs.

TABLE A-D15: CPT CODES NOMINATED FOR REVALUATION BASED ON ASSIGNED RVUS FOR "HARVARD-VALUED" CODES

CPT Codes	Description
24515	Open treatment of humeral shaft fracture, with or without internal fixation, includes repair of fracture fragments
22216	Spine, posterior or posterolateral technique, 3–6 vertebral segments, cervical or thoracic; includes all decompression and fusion work
22210	Spine, posterior or posterolateral technique, single vertebral segment, cervical or thoracic; includes all decompression and fusion work
64721	Neuroplasty and/or transposition; median nerve at carpal tunnel
29848	Endoscopy, wrist, surgical, with release of transverse carpal ligament
29824	Arthroscopy, shoulder, distal claviculectomy, includes debridement, limited capsular release as needed
20610	Arthrocentesis, large joint(s) (eg, shoulder, elbow, hip, knee, or wrist); with or without injection, including ultrasound guidance if performed
20680	Removal of deep implant, includes incision, dissection, and closure; eg, plates, rods, screws, or nails

Comment: The majority of commenters, including the RUC and several specialty societies, disputed the factual basis for including these codes on the list of potentially misvalued services. Commenters stated that seven of the eight identified codes have, in fact, been surveyed and revalued by the RUC subsequent to the original 1992 Harvard valuation, in some instances as recently as the January 2026 RUC meeting, and provided documentation of survey dates and corresponding rule cycles for each code. A commenter noted that CPT code 29824 was created in 2002, a decade after implementation of the Harvard-based RBRVS and therefore cannot reflect an unrevised Harvard value. Commenters stated they were unable to identify a rationale supporting the nomination because the nomination letter was not included in the public use files accompanying the proposed rule. Commenters requested that we remove these codes from consideration as potentially misvalued.

Another commenter representing urologic surgeons did not dispute that certain services within this category may warrant review, but expressed concern regarding the methodology by which any resulting revaluation would occur. The commenter stated that changes in surgical technique, particularly the adoption of minimally invasive approaches, have altered physician work in more than one direction simultaneously, reducing intraoperative time in some cases while increasing equipment complexity, intraoperative decision-making, and preoperative optimization associated with treating an older and more medically complex patient population. The commenter recommended that CMS rely on specialty society input and published survey data before proposing any revised values, rather than assuming that a reduction in operative time corresponds to a proportional reduction in physician work. An additional commenter supported the inclusion of long-unreviewed 1992-era codes for reassessment and recommended that CMS extend the same reasoning to legacy gynecologic surgical codes of comparable age, which the commenter stated reflect a documented and sustained valuation disparity relative to comparably complex procedures.

Response: We acknowledge commenters' documentation that seven of the eight codes have undergone subsequent RUC survey and revaluation since 1992, and that CPT code 29824 was established in 2002. However, our proposal was not premised on these codes retaining unrevised 1992 Harvard values; rather, our concern is whether the currently assigned work RVUs, time assumptions, and direct PE inputs still

accurately reflect the resources involved in furnishing these services in light of technological and practice changes. A prior RUC survey does not foreclose the need for further review where subsequent changes in technique or technology may warrant it, and we do not believe the revaluation history identified by commenters is sufficient basis to remove these codes from consideration.

We recognize commenters' concerns regarding the absence of nomination documentation in the public use files and will consider whether additional transparency is appropriate in future rulemaking.

Regarding the methodology concern, we agree that changes in surgical technique may affect physician work in more than one direction and that revaluation should not assume operative time and physician work decline proportionally. We will take this into account, in coordination with the RUC, as these codes proceed through review.

We note, however, that section 1848 of the Social Security Act assigns CMS the responsibility for establishing relative values for physicians' services. We are not in a position to commit to adopting specialty society recommendations in every instance or to treat survey data as dispositive; there are cases in which claims data, internal consistency across the fee schedule, or other evidence leads us to propose a value that differs from the RUC-recommended value. We believe this approach is consistent with our statutory obligation to ensure that relative values reasonably reflect the relative resources involved in furnishing a service.

We will continue to consider specialty society input and published survey data as important components of our valuation process in this and future rulemaking cycles, and we encourage continued engagement from specialty societies and other stakeholders in this process.

With respect to legacy gynecologic surgical codes, we did not propose such codes as potentially misvalued in this cycle and are not identifying them as such in this final rule. Interested parties may nominate potentially misvalued services, including these, through our established annual nomination process.

After consideration of public comments, we are finalizing the identification of CPT codes 20610, 20680, 22210, 22216, 24515, 29824, 29848, and 64721 as potentially misvalued, as proposed.

(11) Allergy Immunotherapy (CPT Code 95165)

In the CY 2001 PFS final rule (65 FR 65393), we discussed the direct PE inputs for CPT code 95165 *(Professional services for the supervision of preparation and provision of antigens for allergen immunotherapy; single or multiple antigens (specify number of doses)).* As in the case of venoms, some non-venom antigens cannot be mixed together, that is, they must be prepared in separate vials. An example of this is mold and pollen. Therefore, some patients will be injected at one time from one vial—containing in one mixture all of the appropriate antigens—while other patients will be injected at one time from more than one vial. We extensively discussed how the practice expense component for mixing a multidose vial of antigens was computed, and how we observed that the most common practice at the time was to prepare a 10 cc vial; we also observed that the most common use was to remove aliquots with a volume of 1 cc. Therefore, a physician's removing 10 1cc aliquot doses captured the entire PE component for the service.

Recently we have received interested parties' communication from relevant specialties on the definition of a dose as it pertains to an allergy immunotherapy. They are concerned that clinical practice is not using this method of dosage to treat patients and the definition that Medicare is using is causing general confusion. They note that Medicare's 1 cc aliquot dose is now creating reimbursement-driven changes to medical practice, rather than changes that align with clinical practice and is increasingly adopted by commercial payers and Medicaid plans, thereby negatively impacting the delivery of medically necessary and cost-effective patient care to Medicare beneficiaries. According to the specialty societies, when this Medicare policy was implemented, few Medicare beneficiaries received allergy immunotherapy—most practices report that less than 5 percent of patients receiving treatment at that time were Medicare beneficiaries. Today, specialty societies report, Medicare beneficiaries often comprise more than 20 percent of an individual practice's allergy immunotherapy patients.

We invited comment from the wider medical community, including analyses or studies, regarding CPT code 95165 and the definition of an allergy immunotherapy dose. In particular, we stated in the proposed rule, we are interested in how these concepts are interpreted and implemented within clinical practice.

Additionally, Medicare utilizes a medically unlikely edit (MUE) of 30 doses per claim to flag potential overutilization. Specialty societies claim a more appropriate policy should use common clinical practice, by having an annual limit on doses of medically necessary treatment. For example, the annual limit of up to 160 doses per year during the first year of therapy would be higher to account for the build-up phase, then reduced to 130 or fewer doses per year thereafter when the beneficiary is receiving maintenance doses.

We welcomed comments, including research or opinions from the medical community, on appropriate annual dose limits billed for CPT code 95165 based on clinical practice.

Comment: Commenters were nearly unanimous in urging CMS to rescind the current definition of a dose for CPT code 95165 as a 1 cc aliquot and instead align with the definition used for the companion CPT codes 95115 and 95117, under which a dose is a single injection from a multidose vial. They argued the 1 cc standard, unchanged since 2000, does not reflect current practice, since maintenance doses are typically prepared at approximately 0.5 cc—meaning the existing definition effectively pays for only about half of clinically prepared doses. Building on this, commenters noted that certain allergens, such as molds, cockroach antigen, and pollens, cannot be safely combined due to proteolytic activity and cross-reactivity, requiring multiple separately prepared vials that the current definition does not account for. A commenter added historical context, citing a 2002 HHS OIG report that found the original 1 cc definition was based on inaccurate dosing data at the time of adoption, a finding never addressed through subsequent rulemaking.

Commenters further argued that the stakes of this definition have grown over time, since Medicare beneficiaries now make up a much larger share of immunotherapy patients than when the policy was adopted—reportedly over 20 percent today compared to under 5 percent historically—and Medicaid programs and commercial payers increasingly mirror Medicare's definition, extending its effects well beyond the Medicare population.

Closely related to the dose definition, commenters addressed the 30-unit per-claim MUE applied to CPT code 95165, asking CMS to eliminate it in favor of an annual, per-beneficiary parameter that reflects higher utilization during the buildup phase and lower utilization

during maintenance, paired with an exception process for documented medical necessity. Recommended annual limits varied: two national societies proposed up to 150 doses in the first year and 120 during maintenance; a multistate alliance and a regional society recommended up to 160 doses in the first year and 130 during maintenance, consistent with figures referenced in the proposed rule; and one individual commenter recommended a higher limit of 200 doses, citing patients on accelerated buildup protocols requiring four or more separately prepared vials.

Several commenters extended these concerns into related payment methodology requests, recommending that CMS recognize preparation of dilution vials during the buildup phase as a separately payable component, recalculate the direct practice expense input for antigen supply costs using a representative mix of invoice data across vial sizes rather than the largest available vial, and exclude any resulting valuation correction from the proposed 5 percent practice expense stabilization limit, or alternatively allow accelerated implementation of such a correction.

To illustrate the practical scope of these issues, several commenters offered supporting data. A commenter representing a large practice reported thousands of patients actively receiving immunotherapy, drawn from a Medicare-related population exceeding 8,000 individuals over an18-month period, and stated that its standard preparation methodology uses 2 cc per unit—twice the volume recognized under the current definition. Other commenters, particularly those in rural and medically underserved areas, reported that Medicare and Medicaid beneficiaries make up a disproportionate share of their immunotherapy patients, in some cases exceeding 60 percent, and expressed concern that inadequate reimbursement could lead to discontinuation of immunotherapy services where few or no alternative providers exist.

Commenters also tied these access concerns to patient safety, stating that maintaining separate dosing conventions for Medicare and non-Medicare patients introduces variability into dosing and labeling that may increase the risk of medical error, and that MUE-driven delays in preparing multiple vials on separate dates could compound this risk, particularly for patients with severe allergic disease, including venom hypersensitivity.

Finally, commenters situated these recommendations within the broader clinical and economic significance of allergen immunotherapy, noting that it remains one of the few disease-modifying treatments available for allergic rhinitis, allergic asthma, and related conditions, and that reduced access could increase downstream use of medications, emergency care, and other services. A commenter cited a published cost-effectiveness analysis suggesting that reimbursement reductions causing access reductions beyond a modeled threshold would not be cost-effective from either a societal or health-system perspective.

Response: We agree that the current volume-based definition, unchanged since 2000, no longer reflects contemporary clinical practice, under which maintenance doses are routinely prepared in volumes smaller than 1 cc. We further agree that this discrepancy has had the practical effect of valuing only a fraction of the doses actually prepared and administered. We also recognize that certain allergen combinations cannot safely be consolidated into a single vial due to proteolytic activity and cross-reactivity, and that the revised definition better accommodates the use of multiple, separately prepared vials in these clinical circumstances. With respect to the 2002 HHS OIG findings regarding the data underlying the original 1 cc standard, we acknowledge that this definitional change addresses a long-standing inconsistency between Medicare policy and current clinical practice.

The recommendation to eliminate the 30-unit per-claim MUE for CPT code 95165 in favor of an annual, per-beneficiary utilization parameter—including the specific thresholds proposed for buildup and maintenance phases and the associated medical necessity exception process—is outside the scope of this rulemaking. MUE values are established and maintained through a subregulatory process administered separately from the annual PFS rulemaking cycle. We will refer this recommendation to the appropriate subregulatory process for further consideration.

The recommendations regarding payment methodology, including separate payment for dilution vial preparation, recalculation of the direct practice expense input for antigen supply costs based on a representative mix of vial-size invoice data, and an exclusion or accelerated correction relative to the proposed 5 percent practice expense stabilization limit, raise substantive questions about current valuation inputs that merit further review beyond the scope of this rule. We intend to consider these recommendations, along with the supporting utilization and practice-cost data submitted, in future rulemaking.

We appreciate the data provided regarding the growing share of Medicare beneficiaries within the immunotherapy patient population and the extension of Medicare's dose definition into Medicaid and commercial coverage policies. We also appreciate the concerns raised regarding access in rural and medically underserved areas, and the patient safety considerations associated with maintaining divergent dosing conventions across payers. We recognize the clinical and economic significance of allergen immunotherapy as a disease-modifying treatment and will take the broader cost-effectiveness and access considerations raised into account as we evaluate the remaining payment methodology questions in future rulemaking.

After consideration of the public comments received, we are finalizing our proposal to revise the definition of a dose for CPT code 95165 from a 1 cc aliquot to a single injection from a multidose vial, consistent with the definition used for CPT codes 95115 and 95117. The recommendation to adopt an annual, per-beneficiary utilization parameter in place of the current MUE will be referred to the appropriate subregulatory process for further consideration.

(12) Ultrasonic Wound Assessment (CPT Code 97610)

An interested party nominated CPT code 97610 (*Low frequency, non-contact, non-thermal ultrasound, including topical application(s), when performed, wound assessment, and instruction(s) for ongoing care, per day*) as potentially misvalued due to an inflated supply costs direct PE input. The nominator stated that this inflation causes a site of service disparity where CMS pays significantly more for the non-facility practice expense compared to the hospital outpatient (OPPS) payment rate. The CY 2026 non-facility PE RVU of 11.51 for CPT code 97610 results in a payment of $384, compared to an OPPS payment rate of $205, representing a payment differential of $179. The nominator stated that this disparity is primarily driven by the $320 direct PE input, SA119 (kit, low frequency ultrasound wound therapy (MIST)). The nominator provided a hyperlink to the UltraMIST® system manufacturer's Investor Presentation [70] from December 2025 which states that ''consumable costs = ~$100/procedure (list price).'' On slide 13 of the

[70] *https://sanuwave.com/investors/presentations.*

presentation, it states that the single use applicators are $100 and that the pricing reflects manufacturer's suggested retail price (MSRP). The nominator also estimated an implied sales price of $86 per disposable kit on average using publicly available manufacturer disclosures and Medicare claims data. The nominator stated that the manufacturer reported $21.0 million in U.S. consumable and parts net revenue for CY 2024. The nominator was able to estimate the total volume of kits sold by the manufacturer by assuming each of the 745 unique billing NPIs in Medicare claims have approximately one of the ~1,000 UltraMist® systems in the field, such that the 181,851 Medicare claim lines account for 74.5 percent of total volume ($21.0 million/[181,851/{745/1,000}] = $86), noting that actual sales price would vary due to volume-based or other supplier discounts, commercial utilization, and other factors.

We agree with the nominator and proposed CPT code 97610 as potentially misvalued. Additionally, we proposed to change the cost of supply code SA119 to $100 in the direct PE database. We sought comment on this proposal and invited interested parties to submit paid invoices for supply code SA119 (kit, low frequency ultrasound wound therapy (MIST)). We also noted that physician time may be currently overstated for CPT code 97610, as the December 2025 Investor Presentation asserts that the procedure takes about 3 to 20 minutes, with an average of 6 minutes. The current total physician time is nearly 26 minutes, with a work RVU of 0.39. Because the current intraservice time is over double the time asserted by the supply manufacturer in the Investor Presentation, we sought comment on whether the typical physician time to perform this service is closer to the manufacturer's assertion of 6 minutes or the current intraservice time of nearly 15 minutes.

Comment: Several commenters stated that an input price of $100 for supply code SA119 does not reflect the wide range of costs across different device manufacturers and technologies used to furnish CPT code 97610 (such as Vaporox, Sanuwave, and Arobella). Commenters reported supply costs ranging from $20 to $250 in some geographic areas, and specifically requested that CMS evaluate costs across all technologies rather than relying on data from a single manufacturer's investor presentation. The most common cost for SA119 that commenters referenced was $125, particularly among small practices and individual providers. Most commenters requested that CMS rely on paid invoice data rather than pricing derived from an investors presentation. Several commenters stated they would provide invoices for the device and applicator upon request, though a couple of commenters submitted an invoice to substantiate alternative costs for SA119. The commenters submitted invoices for a per-use device fee ranging from $60 to $125 discussed later in this section, and a disposable treatment kit specific to Vaporox ranging from $35 to $50.

Response: We note that commenters gave us a range of costs for SA119, but no commenters asserted that they pay the current $320.18 for SA119. We appreciate commenters' input regarding the range of costs across different technologies used to furnish CPT code 97610. We appreciate the commentators' submission of invoices and note in response to commentors who stated they would submit invoices upon request, that we specifically requested invoice submission in the proposed rule. However, consistent with our standard ratesetting methodology, we establish direct PE inputs and their values to reflect the typical cost of furnishing a service, not the costs associated with any one product, manufacturer, or business arrangement.

Comment: The AMA RUC indicated that they intend to review an action plan at their September 2026 meeting to determine whether this code should be re-reviewed. The RUC and several other commenters requested that CMS delay finalization of changes to CPT code 97610 pending this RUC review process. Other commenters raised coding concerns, noting the code lacks depth, size, wound quantity, or anatomic-site distinctions, and same-day billing restrictions with other wound care codes, and requested referral back to the RUC on these grounds as well.

Response: While we recognize that the RUC may consider resurveying and revaluation for a future rulemaking cycle, we do not believe it is appropriate to delay finalization on the individual supply cost concern identified through our misvalued code initiative, considering no commenters asserted that they pay the current $320.18 for SA119 and we believe it is significantly overvalued. In the event that there is a new RUC review of this service, we would look forward to receiving any additional information, invoices, or new data about the broader coding structure, specifically regarding depth, size, wound quantity, or anatomic-site distinctions, and same-day billing restrictions.

Comment: A commenter stated that they pay $97 for the single use UltraMIST applicator but requested that CMS maintain the current $320.18 price for the kit because it carried the cost of other consumables (such as saline, dressings, PPE, and clinician travel between homes) and created a margin for practices to recover the $27,500 device cost.

Several commenters stated that CMS conflated the cost of the single-use applicator with the cost of the SA119 kit. A commenter stated that the kit includes the applicator and tubing, plus saline and dressings purchased separately. The commenter also stated that their members report kit pricing above and below our proposed $100 depending on purchase volume. Several commenters requested that CMS include saline in CPT code 97610's supplies, with a commenter specifically requesting the inclusion of SH069 (sodium chloride 0.9% irrigation (500–1000ml uou)).

Response: We can clarify that the proposed $100 price for supply code SA119 is intended to reflect the cost of the kit, consistent with the cited manufacturer's investor presentation describing $100 in consumable costs. Supply code SA119 is separate and distinct from the other direct PE supplies included in CPT code 97610 which are not affected by our proposal. We note that the valuation of CPT code 97610 already accounts for multiple different bandages, dressings, gauzes, and PPE. We encourage commenters to review the direct PE input public use files, available on the CMS website, which detail all supply, equipment, and clinical labor direct PE inputs. We note that a couple of commenters provided invoices and they indicated the single-use disposable treatment kit specific to Vaporox ranges from $35 to $50. We do not believe that this range is representative of the typical kit cost across all technologies and devices. Additionally, we agree with the commenters that saline should be a supply input for CPT code 97610 and we are therefore adding 1 quantity of supply code SH069 to CPT code 97610 in the non-facility setting for the final rule.

Comment: Several commenters stated that they did not agree with the proposed $100 for SA119 because they use the Vaporox system and pay a per-treatment operating or rental charge for the device, in addition to a separate $50 device-specific disposable kit cost. Commenters stated that this per-treatment cost of $160 in total, rather than the $100 figure derived from a competing manufacturer's disclosed consumable price, should be used to value supply code SA119 because they made no capital equipment investment

and pay per use instead. A couple of commenters provided invoices, but they corroborated the commenters' prices. Another commenter stated that some of their members use an alternative system with higher capital acquisition cost but reusable applicators that are autoclaved between patients rather than discarded. The commenter stated that those practices have significantly lower supply costs, while capital acquisition, equipment, and clinical labor costs are higher. A few commenters stated that the MIST Therapy system acquisition cost is significantly higher than cost indicated in the investors presentation, but did not provide invoices to substantiate their figures for consideration in updating the device cost in the direct PE database.

Response: We do not agree that a pay-per-use operating charge should be used to set the direct PE supply input for SA119. As we have stated in rulemaking as recent as CY 2025 (89 FR 97798), while we understand that there may be alternative business models, we do not believe a rental, subscription, or per-use fee of an equipment item that is still available to be purchased and is already accounted for with our equipment methodology is appropriate. Similarly, while we appreciate the submissions of per-use invoices for the Vaporox device, we believe that the typical cost of the device is appropriately and adequately accounted for in the equipment formulas for EQ372 (MIST Therapy System) and EQ368 (MIST Therapy Cart) (based on our standardized formula which accounts for years of useful life, utilization rate, purchase price, and minutes per year of use, outlined in detail in section II.B. of this final rule, Determination of PE RVUs). We do not believe that CPT code 97610 should be valued based on a significantly more expensive pay-per-use business model when the same treatment is cheaper and available as a purchasable form of equipment.

Comment: Some commenters requested that, if CMS must finalize a price of $100 for SA119, it should phase in the reduction over time.

Response: As discussed in section II.B. of this final rule, we note that the proposed changes to the supply code SA119's price decreased CPT code 97610's PE RVU. Because this reduction was the result of revaluation of the code's supply input, CPT code 97610 is exempt from the proposed PE stabilization adjustment, but the statutory phase-in of significant total RVU decreases will apply because its total RVU decrease is greater than 19 percent. Therefore, we agree with commenters and note that the reduction in total RVUs that resulted from the updated price for SA119 will be phased in, not due to a staggered implementation of the SA119 supply price, but rather due to the preexisting phase-in transition policy (see the CY 2016 PFS final rule 80 FR 70927 through 70929 for additional details).

Comment: Many commenters provided feedback in response to our comment solicitation about physician time, mostly stating that our current physician time is not overstated or, in some cases, possibly understated. A few commenters stated that service is performed primarily by clinical staff under supervision, and that physician time may be overstated for the wound assessment and documentation portions of the service that are performed by a physician. Some commenters provided detailed clinical labor activities and times, some indicating undervaluation. A commenter highlighted possible clinical labor anomalies and stated they planned to survey its membership for corrected clinical labor inputs prior to the PFS final rule. Another commenter provided empirical times: a single wound takes 24.9 minutes of physician time and 4.1 minutes of clinical staff time, and each additional wound adds 12 minutes of physician time and 3 minutes of clinical staff time. The commenter stated that treating 2 wounds per encounter is typical. Another commenter provided aggregated data over 41 months and 110,237 recorded treatments that showed machine-recorded active device runtimes averaged 43.4 minutes, with a median of 42 minutes and a range of 14 to 56 minutes.

Response: We thank the commenters for the detailed feedback. We reiterate that we did not propose any changes to physician time, work RVU, or clinical labor time but appreciate the commenters feedback that the current physician and clinical labor times are not overstated.

After consideration of public comments, we are finalizing the addition of 1 quantity of SH069 to CPT code 97610 in the non-facility setting, and a supply cost of $125 for SA119. We note that we are finalizing $125 despite the lack of an invoice to substantiate that price because we believe the current price of $320.18 is significantly overpriced based on commenters' feedback, and $125 was the most common price commenters referenced for SA119. We believe this strikes a balance between the few invoices we received for the single-use disposable treatment kit specific to Vaporox that ranges from $35 to $50, the lack of consensus and clarity about what is included in the SA119 kit, the range of technologies used to furnish CPT code 97610, and the absence of any support or indication from commenters that the current price of $320.18 for SA119 is accurate. We continue to invite interested parties to submit paid invoices reflecting actual costs for supply code SA119 and information about what is included in the kit for consideration in future rulemaking.

(13) Autologous Platelet Rich Plasma (HCPCS Code G0465)

We received a request from a nominator to review HCPCS code G0465 *(Autologous platelet rich plasma (PRP) or other blood-derived product for diabetic chronic wounds/ulcers, using an FDA-cleared device for this indication, (includes as applicable administration, dressings, phlebotomy, centrifugation or mixing, and all other preparatory procedures, per treatment)* as potentially misvalued. The nominator requested that CMS update the work RVUs for HCPCS code G0465 from 1.78 to 5.50 based on the results of an independent survey of physicians and qualified health professionals who have training and experience treating chronic, non-healing diabetic wounds that was performed by a third party in the Fall of 2025. The nominator also requested that CMS update its policy to state that multiple procedure payment adjustments do not apply to HCPCS code G0465. Additionally, in the CY 2025 PFS Final rule, we finalized crosswalking G0465 to CPT code 15275 (*Application of skin substitute graft to face, scalp, eyelids, mouth, neck, ears, orbits, genitalia, hands, feet, and/or multiple digits, total wound surface area up to 100 sq cm; first 25 sq cm or less wound surface area*), however, the nominator believes this is not an appropriate crosswalk for G0465.

We thanked the nominator for submitting the information, including the survey conducted by the third party. However, we note the sample size of the survey shows only 34 respondents and so we have concerns as to whether this is a representative sample size of practitioners furnishing this service. Additionally, we continue to believe that the MPPR payment adjustment is applicable to multiple units of this service billed to the same beneficiary on the same day due to overlapping resource costs. Given that no additional information was submitted to support the increase in work RVU, we did not propose this code as potentially misvalued.

Comment: Many commenters urged CMS to reconsider HCPCS code G0465 as potentially misvalued. A few

commenters referenced the concern with the sample size of the submitted survey and recommended CMS to reconsider based on their updated survey results that included an expanded sample size of 21 new respondents, bringing the total to 54 respondents. Additionally, many commenters disagreed with the decision to keep the MPPR payment adjustment for HCPCS code G0465. Some commenters mentioned that the MPPR payment adjustment causes a direct financial disincentive for physicians to treat every wound patient within a single visit because chronic diabetic wound patients frequently present with more than one active wound. Some commenters requested CMS to instead change the MPPR indicator from 2 to 0 or establish a wound-specific modifier for HCPCS code G0465, similar to the A1–A9 modifiers used under the surgical dressings policy article. Some commenters also noted they believe the crosswalk code, CPT code 15275, is not appropriate as it describes fundamentally different services and the work is not comparable.

Response: We thank commenters for their feedback and for submitting the newly submitted survey results that include an expanded sample size. However, we continue to believe that a payment reduction is warranted when this service is furnished more than once during the same encounter, as certain resources are shared or are not incurred independently with each additional unit.

After consideration of public comments and given the new information submitted, we nominate HCPCS code G0465 as potentially misvalued.

E. Request for Information: Redesigning Primary Care To Make America Healthy Again

1. Introduction

Primary care is an essential component of the HHS Secretarial priority to ''Make America Healthy Again'' commonly known as MAHA.[71] Relatively and accurately valuing primary care is essential. It is the cornerstone of a high-functioning health care system, helping enable the shift in U.S. health care toward a focus of preventive rather than reactive medicine—for health care rather than ''sick care.''[72] Critical to this transition is incentivizing investment in high-value care that reduces health care costs (especially from chronic disease) in the long term. Building off recent HHS rulemaking that established such incentives for commercial health plans,[73] we are interested in how Original Medicare may similarly be able to incorporate more robust incentives to invest in high-value care, which will reduce costs of care in the long-term within the Physician Fee Schedule (PFS). More specifically, the agency solicited comment on how we might reconsider primary care service valuation to better support this objective amidst what may be a meaningful shift in how primary care is delivered given more recent technological innovation.

Primary care services delivered in the physician office were the locus for continuous, coordinated, and comprehensive care when the PFS was established in 1992. This definition of primary care as a beneficiary's first point of contact with the health care system[74] has been increasingly challenged by broader access to medical information through digital resources. This may accelerate as the increasing adoption of technology reshapes access to increasingly sophisticated sources of medical information before beneficiaries ever show up in the doctor's office.[75] Advances in technology, including generative and agentic superintelligence (SI)[76], are poised to transform both beneficiary experience[77] and the role of the primary care clinicians.[78] These were not anticipated when defining the relative value units and time and intensity of services delivered by physicians, which are essential inputs to the PFS.[79]

To both support broader MAHA priorities and to reconcile with how technology is reshaping primary care delivery for beneficiaries and clinicians, we are seeking comment on how to re-imagine and improve the relative valuation of primary care services. We are focused on understanding how that re-imagination might occur within the current construct of office/outpatient (O/O) evaluation and management (E/M) services as well as via alternatives to fee-for-service payment, including through outcomes-based payment and/or the expansion of prospective primary care payment (PPCP). The latter, in particular, has long been a goal of external policy experts, including as a recommendation from the 2021 National Academy of Science, Engineering, and Medicine report '*Implementing High Quality Primary Care,'* which recommends team-based delivery supported by 'hybrid' payment models that combine prospective monthly and visit-based payments.[80] Over the past decade, the CMS Innovation Center tested PPCP in Medicare using a series of increasingly sophisticated hybrid payment approaches from the Comprehensive Primary Care initiative (CPC) to Primary Care First (PCF). The lessons learned from these Innovation Center model tests led Medicare to establish advanced primary care management (APCM) codes in the CY 2025 PFS final rule as a first step towards PPCP.[81] The potential changes to primary care practice with increasing adoption of technology also raises concerns for increasing opportunity for fraud, waste, and abuse from malicious actors.[82] For these and other reasons, as the agency thinks about the re-imagination of primary care payment in the PFS, we considered first establishing PPCP permanently in the Medicare

Shared Savings Program. We also sought to better understand if there are suggestions on how to implement PPCP within the broader Original Medicare program with appropriate guardrails.[83]

We sought comment on three main topics:

- *Reconsidering relative primary care payment in the Medicare PFS:* We are increasingly concerned about the relative undervaluation of primary care services. We would like feedback on how to reconsider this relative undervaluation in the PFS under the current paradigm of O/O E/M visits, the Annual Wellness Visit (AWV), and care management codes. We seek comment on updating this code set, and how or if CMS should consider a 'two-track' approach to care management services with one track focused on technology enabled care and the other track focused on 'traditional' care management.

- *The payment implications of technology-enablement of primary care:* We are seeking comment on how technology and clinical AI are impacting primary care, both broadly and more narrowly within the care management codes and the AWV. We also would like to better understand how CMS might update its approach to paying for technology-enabled care given the potentially transformative effects on the beneficiary and clinician experience. If we were to approach paying for technology-enabled primary care differently, how should we consider the relative valuation, in terms of time and intensity of services? How else could these services be valued? How should we consider evidence of the impact or outcome of technology-enabled services in primary care?

- *Establishing Prospective Primary Care Payment in the Medicare Shared Savings Program:* Given the series of CMS Innovation Center PPCP model tests, how should CMS approach establishing PPCP in the Shared Savings Program, and more broadly across Original Medicare?

In short, this RFI sought comment on how we should evaluate which of the payment models discussed previously in this section (FFS payment models, outcomes-based payments, or prospective payment) makes the most sense for primary care given the rapid changes that may arise for recent technological innovation.

2. Reconsidering Relative Primary Care Payment in the Medicare Physician Fee Schedule

a. O/O E/M Visits

Under the PFS, in accordance with section 1848 of the Social Security Act (''the Act''), we establish payment amounts for covered physicians' services and update payment policies to address changes, including those in medical practice, coding, or new data on relative value components. Original Medicare's fee-for-service payments for primary care services are overwhelmingly made through traditional O/O E/M visit codes. E/M codes describe a broad range of physician services that occur in an office setting, and do not distinguish between a one-time consultative visit and care that is part of a longitudinal care relationship, which may require additional time, coordination, and resources. We have previously described our concern that the complexity of services required to provide longitudinal care is not fully incorporated as part of the valuation of the work RVUs when the E/M code itself is used as the primary way to report the work of the professional (88 FR 78972). The physician community had previously supported this view when they highlighted that the existing E/M services, such as office visits, do not adequately describe the typical non-face-to-face care management work required by certain categories of beneficiaries most often served by primary care practitioners (78 FR 43337).

As a result, specialties that do not routinely furnish procedural interventions or diagnostic tests and for which E/M visits represent a greater share of total allowed services are paid differently and generally less than their counterparts who routinely furnish procedural interventions and diagnostic tests. Section 1848 of the Act prohibits specialty-specific payment under the PFS, so we cannot vary the conversion factor or the number of relative value units for a physician's service based on the specialty type of the physician. Instead, in CY 2021, we adopted the RUC's recommendations for increased E/M work RVUs, based on their review of physician time for the E/M visit code set (84 FR 62851 through 62854). Next, in the CY 2024 PFS final rule, we took steps to better recognize the inherent complexity of visits associated with primary and longitudinal care of patients by finalizing Healthcare Common Procedure Coding System (HCPCS) code G2211 *(Visit complexity inherent to evaluation and management associated with medical care services that serve as the continuing focal point for all needed health care complex condition. (Add-on code, list separately in addition to office/outpatient evaluation and management service, new or established)).* HCPCS code G2211 is used by practitioners furnishing services as the continuing focal point for all the patient's needed health care services, including but not limited to primary care practitioners (88 FR 78969). In the CY 2026 PFS final rule (90 FR 49462 through 49464), we finalized our proposal to allow HCPCS code G2211 to be billed as an add-on code with the home or residence E/M visits, in addition to office/outpatient E/M visits. We are proposing changes to HCPCS code G2211 for CY 2027; see section II.D of this proposed rule for further discussion.

The current O/O E/M code set may still insufficiently reflect differences in the nature and intensity of care provided. As such, we are considering establishing distinct categories of O/O E/M visits in future rulemaking. Potential categories could be longitudinal care, acute care, or consultative visits, with distinctions based on the clinical purpose of the encounter and the associated resource costs of furnishing care. Longitudinal care visits involve care delivered both during and between encounters as part of an ongoing comprehensive care relationship. During these visits, a beneficiary establishes, maintains, or updates that relationship. For example, a beneficiary returns to the clinic 3 months after their AWV for ongoing management of their diabetes, which requires an oral medication titration, and elevated blood pressure and hyperlipidemia, which includes a discussion about lifestyle modification. The practitioner also notices that they are overdue for an immunization, schedules them for a necessary screening test, and updates their plan of care accordingly. We would distinguish this visit (including the valuation of the pre- and post-service time and proximity to prior visits) from the care delivered in an acute care visit. In the future, we may consider valuing these visits as a combination of the E/M service furnished during the encounter and certain between-visit care management activities. In contrast, acute care visits are focused on the evaluation and management of a discrete, episodic problem that is generally resolved after treatment. For example, a beneficiary may seek care for a sore throat and suspected streptococcal pharyngitis, with no

expectation of an ongoing care relationship related to that condition once it is resolved. While consultative visits are distinct from longitudinal and acute care visits because they are furnished in response to a referral to address a specific clinical question, consultative services could be considered similar in complexity to acute care, distinguished largely by consultative services typically including an evaluation of the patient and communication of findings or recommendations back to the referring practitioner.

We also noted that CPT codes exist and are paid by private payers for consultative services (for example, CPT codes 99242 through 99245), although they are not paid by Medicare. We are seeking comment on whether to consider the complexity of these services to be closer to the acute care services versus the longitudinal care services. As a general matter, we expected to consider consultative visits to be less complex than longitudinal care visits. We sought feedback on further actions we could take around appropriate valuation of primary care services:

- What updates to the HCPCS code G2211 policy (or the proposed modifiers, MOD1 and MOD2) should CMS consider to ensure the clinician billing HCPCS code G2211 (or proposed modifiers, MOD1 and MOD2) is serving as the focal point for beneficiaries, and that the practitioner is also considering preventive care, risk factor reduction, and other services necessary for coordinating the care of beneficiaries who have a complex condition?

Comment: Commenters broadly agreed that clinicians serving as the 'focal point' in care is best expressed through the ongoing relationship and the clinical responsibility taken for patients, not through a documentation checklist. Commenters were mixed on whether the current specialist utilization of HCPCS code G2211 is appropriate or if there additionally needs to be required coordination of care with primary care clinicians to ensure preventive services and risk factor reduction is addressed. Commenters agreed that supporting longitudinal care is the priority and that discrete or time-limited care should not qualify.

Response: We will consider these comments for future rulemaking.

- Given the broad range of changes CPT makes annually, we recognize updates to the CPT code set to reflect distinctions among O/O E/M visits by the function of the visit (longitudinal, acute, or consultative) may have significant advantages within the current billing and coding ecosystem. However, absent a change in CPT coding, should we consider the possibility of creating G codes to better recognize distinction between and among these kinds of visits? If so, what categories should we consider? How could we effectively differentiate longitudinal care visits from acute care visits? What number of levels would be needed and for which settings of care? Should we use existing CPT codes as templates? How should we consider valuing these potential G-codes under the PFS, including the basis for the standard inputs: work RVUs, time values, specialty mix for utilization crosswalks, direct PE inputs, etc.? How would practitioners balance and manage the increasing number and complexity of these codes?
- If CMS were to propose longitudinal or primary care visit types, what should the service period be? Should subsequent care management services be bundled in? If so, for what period of time? Which care management services might be included?

Comment: Commenters stated the importance of appropriately valuing longitudinal work and the current challenges with limited differentiation in O/O E/M services. A few commenters endorsed revisiting consultative visits through existing CPT codes. Commenters highlighted that the current coding structure of E/M visits billed along with HCPCS code G2211 and/or APCM can potentially address the differences in the physician work conducted within an existing E/M visit and highlighted that the flexibility of addressing acute and longitudinal concerns in the same visit is an important flexibility. Commenters also suggested that rather than creating functional visit categories, CMS may consider simplifying E/M visits to fewer levels alongside a per-beneficiary per-month (PBPM) payment in a hybrid payment structure.

Response: We will consider these comments for future rulemaking.

- Are there specific data on the resources used in furnishing longitudinal care, acute care, or consultative services CMS should consider for potential categorization of O/O E/M services?

Comment: Commenters generally highlighted the challenges associated with differentiating the resource costs associated with longitudinal, or consultative services, and suggested potential 'empiric' data sources to identify gaps in the resource requirements currently identified.

Response: We will consider these comments for future rulemaking.

Comment: Commenters broadly agreed that the PFS structurally undervalues primary care. Primary care organizations, payers, and policy groups urged rebalancing payment away from fee-for-service, while FQHCs asked that any changes preserve their existing payment structure. Specialty organizations agreed primary care is undervalued but opposed funding it through cuts to specialty services, citing their own longitudinal and cognitive care needs; hepatology and cardiology groups specifically warned against disrupting specialty access. Many commenters favored voluntary, risk-adjusted, hybrid prospective payment for predictable revenue, with primary care groups preferring hybrid/sub-capitation over full capitation over access concerns. Others argued primary care should formally include behavioral health and lifestyle support.

Response: We will consider these comments for future rulemaking.

3. Care Management Code 'Family'

We have for the last 14 years sought to unbundle services previously considered bundled into E/M services through separate coding and payment for care management services. In 2013, the agency implemented a transitional care management code for post-discharge care (77 FR 68978). This was then followed by the creation of a broader family of codes for care management, including for beneficiaries with multiple chronic conditions or chronic care management (CCM) (78 FR 74414), for those requiring complex medical decision-making (for example, complex CCM, 81 FR 80349), and for those with a single or principal condition (principal care management (PCM), 85 FR 84697). In total, the CCM and PCM code families now include five sets of codes which are reported monthly on a timed basis, each set with a base code of 20 to 60 minutes and an add-on code for each additional 30 minutes. In the CY 2025 PFS final rule (89 FR 97859), we finalized three APCM codes (HCPCS codes G0556, G0557, and G0558) to recognize the evolving way primary care practices manage prevention and chronic condition management through interprofessional care teams. See Table A–E1 for more specificity on the purpose of each of the codes.

Despite these important steps to pay separately for care management services, uptake of the care management

codes has been limited.[84] Interested parties cite cost-sharing and non-trivial documentation requirements as the primary barriers to broader adoption.[85] In response to these considerations, we removed the CCM requirement to count and document the minutes of care management services provided in the patients' medical record when billing APCM services. Interested parties had stated this was so burdensome it limited their use of the CCM Current Procedural Terminology (CPT) codes. At the same time, the agency was concerned about program integrity and therefore code auditability. In the absence of medical record documentation, we required that if a practitioner billed the APCM codes, they must report the Value in Primary Care MIPS Value Pathway (89 FR 97864). Despite these changes, uptake in the first year was less than anticipated. We seek feedback on whether a different payment structure might be more appropriate as well as what might be done to further simplify the code set and associated requirements.

TABLE A-E1: CARE MANAGEMENT SERVICES PAID UNDER THE PFS

Service	Description
Care Management Services	
Chronic Care Management (CCM) (CPT Codes 99487, 99489, 99490, 99491, 99439, 99437)	Management of all care for patients with two or more serious chronic conditions, timed, per month.
Principal Care Management (PCM) (CPT Codes 99424, 99425, 99426, 99427)	Management of all care for patients with one serious chronic condition, timed, per month.
Transitional Care Management (TCM) (CPT Codes 99495, 99496)	Management of transition from acute care or certain outpatient stays to a community setting, with face-to-face visit (bundled into payment for the code), once per patient within 30 days post-discharge.
Advanced Primary Care Management (APCM) (HCPCS G0556, G0557, and G0558)	Management of all care for patients with or without chronic conditions, not timed, per month.
Communication Technology-Based Services	
Remote Physiologic Monitoring (RPM) and Remote Therapeutic Monitoring (RTM) (CPT codes 99453, 99445, 99454, 99470, 99457, 99458, 99091)	Remote monitoring and assessment of physiologic data or adherence and response to therapeutic treatment, timed, per month.

We also sought comment on how to reconfigure the care management code 'family' to better establish effective relative payment options for between visit care management services and how supervision requirements may need to change in technology-enabled care models where patients may initially engage with digital tools or receive care entirely in a digital environment. In addition, given our concerns about fraud, waste, and abuse in the care management code families, we would like to better understand how to ensure care management services are impacting care.

To improve the utilization of care management services where it is clinically appropriate, we sought comment on the following questions:

- What additional requirements should CMS consider to reduce fraud, waste, and abuse in care management services? Specifically on the following:

++ What is the appropriate 'trigger' or initiating visit for care management services? How would this change if it were an initiating visit vs. another event?

++ Should CMS consider changing supervision requirements in care management services to prevent fraudulent billing of care management services? What is the appropriate supervision requirement for care management services?

++ How should data submission to CMS change to verify services are received?

++ What guardrails should CMS consider to prevent inappropriate billing?

++ What proportion of care management services must be delivered by the supervising provider, versus auxiliary personnel?

Comment: Commenters cautioned that CMS may be overstating FWA concern among 'ordinary' physician practitioners who are personally furnishing care management services, and a broader concern may be the underreporting of care management services due to cost-sharing and documentation requirements. For the FWA that does exist, commenters highlighted the importance of using claims analytics to identify outliers and potential FWA, or require 'time-stamped, user-attributed' audit records to be produced on request for care management services. Many commenters suggested that the central solution for reducing FWA in care management is making the care plan and accountable practitioner the center of program-integrity verification.

Response: We will consider these comments for future rulemaking.

- Are there specific data on the resources used in furnishing advanced primary care, which incorporates population health management, enhanced communication technology, and longitudinal care management? We welcome submission of any such data.

Comment: Commenters highlighted a series of existing resources to understand the resource costs associated with delivering advanced primary care, including a series of reports from the National Academies of Science, Engineering, and Math (NASEM) and from the State of Rhode Island. Commenters highlight a series of resource costs not currently accounted for in O/O E/M services, including members of the clinical workforce, EMR and HIE platforms and population

[84] Agarwal SD, Basu S, Landon BE. The Underuse of Medicare's Prevention and Coordination Codes in Primary Care: A Cross-Sectional and Modeling Study. Ann. Intern. Med. 2022 Aug;175(8): 1100–1108. doi: 10.7326/M21–4770. Epub 2022 Jun 28. PMID: 35759760; PMCID: PMC9933078.

[85] Agarwal SD, Barnett ML, Souza J, Landon BE. Adoption of Medicare's Transitional Care Management and Chronic Care Management Codes in Primary Care. *JAMA.* 2018;320(24):2596–2597. doi:10.1001/jama.2018.16116

health registries and platforms to support advance primary care functions like 24/7 access, referrals and scheduling workflows, as well as clinical governance and operational oversight.

Response: We will consider these comments for future rulemaking.

• To what extent are the current care management codes duplicative? Are there efficiencies to be gained in simplifying the current care management code 'family' into a more efficient code set? To what extent would this improve appropriate utilization of care management services?

Comment: Commenters agreed there was substantial overlap in the activities conducted by current care management codes but often differed on the clinical purpose for such activities being duplicative. Commenters differed on whether APCM, CCM, PCM, or TCM were most duplicative.

Response: We will consider these comments for future rulemaking.

• If reducing the number of care management codes would not increase efficiency or utilization of appropriate services, how else can CMS standardize the requirements across the care management codes?

Comment: Commenters agreed on the importance for 'harmonizing' or creating common standards for requirements across the services, such as the initiating visit requirements, beneficiary consent, supervision, responsibility for updating the care plan, and documentation of meaningful activity.

Response: We will consider these comments for future rulemaking.

• As care management becomes increasingly technology-enabled, how should CMS consider changing the code family and their relative valuations? How can CMS ensure that automated billing leveraging technology reflects actual care delivered to beneficiaries by care teams or practitioners?

Comment: Commenters largely did not agree with a differentiation of care management services by technology requirement or between 'technology-first' and 'traditional' care management services.

Response: We will consider these comments for future rulemaking.

• Should CMS create 'technology-enabled care management' codes or a 'two-track' approach to care management? How should we ensure these codes are appropriately differentiated?

Comment: Commenters largely did not accept a ''technology-first vs. traditional'' differentiation for care management, citing cost sharing, overlapping billing rules, and infrastructure costs as the real barriers. Some commenters favored clinically based differentiation instead. Other commenters discussed the importance of embedding care management in accountable, outcomes-based care regardless of delivery mode. Most commenters agreed that clinical integration should be a priority, and aligning requirements matters more than cutting the number of codes.

Response: We will consider these comments for future rulemaking.

4. Payment Implications of Technology Enablement of Primary Care

a. Changes to Primary Care and Care Management Due to Technology and Clinical AI

Adoption of new technology and AI tools in primary care has the potential to transform clinical care to such a degree that it may challenge how we traditionally think about care delivery. However, clinician-facing AI tools that are currently in widespread use are more focused on administrative burden reduction and clinical decision-support. For example, tools focused on *reducing clinician documentation burden* (for example, AI scribes) have perhaps been the most widely taken up by clinicians,[86] with an estimated 25% penetration among all US physicians.[87] Early system-level evaluations demonstrate generally increased productivity among adopters along with decreases in perceived documentation burden.[88] The most widely used AI tool in primary care is likely a *clinical decision-support* application, Open Evidence, which more than forty percent of US physicians have self-reported using as of the CY 2027 Proposed Rule.[89] This software allows clinicians to ask an AI chat interface a wide variety of clinical questions and receive answers based on a large language model only drawing from well-known peer reviewed journals and guidelines (that is, not the entire internet). *AI-assisted care delivery* agents have been deployed in a number of health systems but have not yet reached widespread use, to the best of CMS' knowledge.[90] In general, we note greater technological adoption may support a shift in care management from reactive, manual processes to proactive, data-driven, and personalized care.

In short, we believe technology is being used in increasingly innovative ways throughout primary care but would like to better understand that usage. Given this changing backdrop, we sought comment on how we develop a comprehensive and consistent approach to payment for technology-enabled care given likely lower cost-to-serve but potentially higher quality of care delivered. There are challenges in establishing appropriate valuation methodologies, due to the rapidly evolving nature, accuracy, impact, and scope of these technologies as well as the limited transparency into underlying costs and effect of these tools in primary care and other specialties.

One potential approach may be to link payment more directly to demonstrated clinical outcomes. We sought additional information on how to best structure payment for these technologies in a way that aligns with our agency's mission to increase quality, improve health, reduce costs, and strengthen the healthcare system. Clinical technology tools of interest would include those that provide clinical decision-making support that deliver AI-assisted (or augmented, etc.) primary care, or that are otherwise of note. We sought input on the following:

• Our understanding is that clinical documentation and clinical decision-support tools are currently the most commonly used applications of AI in primary care. Does this reflect current practice? In particular, are there additional *clinical* AI tools and new technologies that are frequently being used in primary care settings with high accuracy, demonstrated safety, and clinical outcomes reported? If so, please describe how they impact the clinical workflow and the beneficiary experience.

• If you are a physician furnishing primary care services, how has your practice been impacted or how do you

[89] OpenEvidence. (2025, July 15). *OpenEvidence, the fastest-growing application for physicians in history, announces $210 million round at $3.5 billion valuation. https://www.openevidence.com/announcements/openevidence-the-fastest-growing-application-for-physicians-in-history-announces-dollar210-million-round-at-dollar35-billion-valuation.*

[90] Examples include ''Cedars-Sinai Connect'', from *https://www.cedars-sinai.org/csconnect.html* or 'Hartford Healthcare GPT' *https://www.aha.org/aha-center-health-innovation-market-scan/2026-05-19-hartford-healthcare-embraces-ai-patientgpt.* Retrieved May 31, 2026.

expect it will be impacted by clinical AI tools?

- How has incorporating technology and AI tools impacted the resource costs associated with primary care practice, in terms of the time and intensity of services delivered?
- How has the implementation of clinical AI tools led to improvements in the quality of care, or reduced downstream costs? In general, please cite any evidence available for your comments.
- If these tools are increasing productivity, what are clinicians and other health professionals doing with the additional time/bandwidth created? Are you seeing more patients in visits, engaging more with population-health management or care management, accomplishing administrative tasks, or something else?
- How do you ensure patient data and privacy is adequately protected during use of these tools?
- Please describe areas *where clinical AI tools in primary care are not well captured* in the current coding and payment system and suggest how these may be incorporated to facilitate *high-value,* technology-enabled primary care.

What lessons can CMS learn and adopt from private payors with respect to clinical AI? More specifically, we asked the following:

- What can CMS learn from how private payors have approached payment and coverage of clinical AI in primary care? How are they monitoring for beneficiary safety, privacy, fraud, waste, and abuse?
- How could private payor coverage of clinical AI in primary care streamline or otherwise facilitate CMS coverage or payment?
- From an outcomes-based perspective, how should CMS evaluate and monitor the impact of technology-enabled care in primary care?
- What outcomes would accurately capture whether these technologies have improved or negatively affected primary care practice for both clinicians and beneficiaries? Are there different outcomes for short-term and long-term impacts?

What type of outcomes data should be shared with CMS? For example, to what extent would submission via Fast Healthcare Interoperability Resources (FHIR)-based APIs of clinical outcomes or activity sets be an appropriate approach by which to tie payment?

- What submission frequency and formats would be most appropriate?
- How can we collect those outcomes in a way that minimizes administrative burden?
- Are there other payment structures, beyond outcomes-based and prospective (which will be discussed in the next section), that would be more suited to the unique nature and impact of these technologies? If so, please describe.

Comment: Many commenters were broadly skeptical of AI use in health care, citing current problems with AI models, and asked us to ensure that any care we pay for in the future has proven value in the clinical setting. Other commenters reminded us that health care is driven by human compassion and clinical judgement, expressing concern that increased use of technology does not always equal improved outcomes. Commenters broadly support AI-enabled tools that help clinicians synthesize longitudinal patient information, identify gaps in screenings and vaccinations, flag risk factors, and generate clinically meaningful summaries from health risk assessments, prior visits, wearable data, and test results. Many note that these tools are especially valuable for automating repetitive, non-clinical tasks like questionnaire administration and documentation, freeing physicians to better focus on direct patient interaction, care planning, and shared decision-making. Regarding privacy, commenters argued existing HIPAA and HITECH protections already govern AI-enabled tools and cautioned against a duplicative AI-specific regime, while others called for better data infrastructure and standardization to support broader adoption.

Response: We will consider these comments for future rulemaking.

5. Technology and AI-Augmentation in Primary Care Via the Medicare AWV

As we at CMS endeavor to shift US health care toward a focus on preventive rather than reactive medicine—for health care rather than 'sick care'—there may be no more obvious starting place for Medicare than the Initial Preventive Physical Exam (IPPE) and Medicare Annual Wellness Visits (AWVs). The IPPE is a one-time preventive check-up where practitioners review the beneficiary's medical history, make sure they are up to date on important screenings and vaccines, and talk with the beneficiary about their family history and how to stay healthy.[91] Then every year following, beneficiaries have a conversation-focused visit to create a personalized prevention plan, called an AWV.[92]

The IPPE was established under section 611 of the Medicare Prescription Drug, Improvement, and Modernization Act of 2003 (Pub. L. 108–173), and the AWV was established under section 4103 of the Affordable Care Act (Pub. L. 111–148), which requires Medicare to cover an AWV in which a personalized prevention plan is created. The payment for AWVs has been updated to reflect the resource costs associated with advanced care planning (80 FR 70956), review of opioid use (85 FR 84713), and optionally physical activity and nutrition (90 FR 49483). The current requirements for the IPPE and AWV can be found on the CMS website.[93]

Section 1861(hhh)(1) of the Act establishes the requirements for 'personalized prevention plans' and the subsequent subsection 1861(hhh)(4)(F) directs the Secretary to encourage the use of, integration with, and coordination of health information technology in the AWV, and gives the Secretary the authority to experiment with the use of personalized technology focusing on health behavior change. We sought comment on whether advances in technology, including clinical AI, could improve the effectiveness, personalization, and both beneficiary and clinician experience for the AWV. Despite the importance of prevention and early identification of risk factors, evidence regarding the impact of the AWV on outcomes is mixed. Some studies have found that an AWV visit is associated with increased use of preventive services[94] but may not sufficiently close gaps in preventive care.[95] However, other studies have found no substantive association between AWV adoption and improvements in evidence-based screening, acute care utilization, or spending,[96] or potentially increasing

downstream low-value services.[97] Given the heterogeneity of these findings, we are interested in whether technology-enabled AWVs can improve not only the proportion of Medicare beneficiaries completing an AWV but also meaningful outcomes.

We sought comment on whether clinical adoption of technology including clinical AI tools may facilitate transformation of the AWV from a point-in-time assessment to a more continuous, data-driven, and beneficiary-specific preventive care function. The function of these tools may support AWV completion from pre-visit activities as well as activities during and after the clinical encounter. As examples, clinical AI tools may support pre-visit collection of beneficiary reported information such as in the health risk assessment, adapting questions to a beneficiary's language or health literacy level.[98] For reviewing the medical and family history, AI tools have demonstrated superiority to human experts in summarizing health information from structured and unstructured fields.[99] During the clinical encounter, AI tools may also support standardized clinical workflows embedded in the electronic health record environment,[100] identify beneficiaries who may warrant additional assessment, and generate suggested follow up steps for clinicians to review.[101] Following the encounter, AI tools may assist with developing post-encounter instructions in the language and health literacy level of the patient.[102]

We believe much of this can occur under current CMS billing guidance, and reiterate that under the statute and regulations, the AWV must be performed by a physician or other health professional, or team of medical professionals directly supervised by a physician currently enrolled as a Medicare provider. We are interested in what barriers—if any—these requirements create to innovative AWV delivery models in which an AI technology company develops or operates these clinical AI tools and affiliates with a Medicare enrolled provider or supplier. We sought comment on the following:

- How can CMS improve the effectiveness, efficiency, personalization, and beneficiary experience of the IPPE and Medicare AWV?
- Which, if any, AWV components are being delivered (or could be) more efficiently delivered through technology and clinical AI-enabled tools? Please comment on how technology is being used today within the AWV, how that has changed over the last year, and how the community sees that changing over the next couple of years. Which activities require direct involvement by a physician, qualified non-physician practitioner, or medical professional under physician supervision?
- Could AI-enabled AWVs improve health outcomes that prior studies have found to be inconclusive?
- What evidence should CMS consider regarding whether technology or clinical AI-enabled AWVs improve clinical usefulness of visit and clinical outcomes, beneficiary reported outcomes, or utilization? In particular, research around changes in the use of preventive services, the application of preventive services to individual clinical risk factor assessment or in low-value downstream utilization are of specific interest.
- What existing statutory, regulatory, enrollment, billing, supervision, documentation, data-sharing or other requirements may create barriers to an AI technology company delivering AWV-related services while employing or contracting with appropriately licensed physicians or other medical professionals to perform AWVs? To what extent may program integrity concerns exist with these models?
- In what circumstances should CMS consider payment or policy changes that would allow technology-enabled organizations, including AI technology companies, to participate in AWV delivery models, either directly or through partnerships with Medicare-enrolled providers or suppliers?
- How should CMS evaluate whether AI-enabled AWVs are improving outcomes rather than merely increasing AWV volume, documentation completeness, coding intensity, or low-value care follow 'cascades' of services? Specifically, for which outcomes should CMS hold technology companies accountable?
- How could CMS optimize information sharing from AWV throughout the duration of the primary care relationship? Where could AI-enabled tools facilitate this process?

Comment: Commenters supported using technology to help make the prevention plan developed through the AWV more dynamic and longitudinal, including by supporting follow-through after the visit. Commenters noted that technology could support specific AWV elements, including with health risk assessment, history reconciliation, provider lists, medication review, screenings, and even drafting prevention plans. At the same time, commenters agreed interpretation, judgment, counseling, and plan approval must stay with the practitioner under current regulations. Commenters identified digital cognitive assessment tools as one area not yet ready for reliable use in the AWV. Most opposed separate payment or valuation for AWV technology, viewing its use instead as an enhancement to the existing AWV service.

Response: Section 1861(hhh) of the Act and 42 CFR § 410.15 establish the requirements for the Medicare AWV. In light of commenters' interest in how technology could support completion of the AWV and enhance its impact, we take this opportunity to clarify how AI/SI could be used within those existing statutory and regulatory requirements. We emphasize at the onset of this discussion that any use of AI/SI in connection with the Medicare AWV must preserve clinician autonomy in the practice of medicine, consistent with the role of the health professional in furnishing the AWV as set forth in the statute and regulations. We may also propose additional improvements to the AWV in future rulemaking, including establishing opt-out procedures for beneficiaries who do not wish to utilize new technology.

As set forth in the statute, the elements of the 'personalized prevention plan' include a health risk assessment, collecting information on beneficiaries' individual and medical family history, measuring objective health indicators (for example, vital signs, BMI), detecting cognitive impairment, and establishing a screening schedule.

In particular, this personalized prevention plan is meant to support the ''furnishing of personalized health advice and a referral, as appropriate, to health education or preventive counseling services or programs aimed at reducing identified risk factors and improving self-management, or community-based lifestyle interventions to reduce health risks and promote self-management and wellness, including weight loss, physical activity, smoking cessation, fall prevention, and nutrition.''

We reiterate that section 1861(hhh)(4)(F) directs the Secretary to encourage the use of health information technology and ''experiment with the use of personalized technology'' focusing on developing self-management skills and adherence to provider recommendations in order to improve or maintain the health status of beneficiaries, which we view as encouraging technology to support health behavior change. The list later in this section identifies the AWV components and 'elements' reflected in section 1861(hhh) of the Act and 42 CFR § 410.15, and describes how clinical AI/SI tools could assist in furnishing them. We reiterate that the AWV must be conducted by a health professional, and we believe these clarifications may help those health professionals use technology to support a 'personalized prevention plan,' including for certain functions that may occur outside the clinician encounter or asynchronously, consistent with existing requirements:

++ Health Risk Assessment (HRA): The statute and regulations identify the HRA as an evaluation tool that collects self-reported information, may be completed prior to the visit, and may be administered independently by the beneficiary. The statute further contemplates that the HRA may be furnished through an ''interactive telephonic or web-based program'' or other means the Secretary determines appropriate, provided that beneficiary privacy is protected. Consistent with these provisions, clinical AI/SI could administer the health risk assessment questionnaire, collect updated medical history or current care provider information, and summarize clinical information prior to the clinician encounter, where the HRA is reviewed and augmented by the clinician.

++ Medical/Family History: AI/SI may extract information from the electronic medical record for review and verification by the clinician, who establishes or updates the medical and family history during the encounter.

++ Current Providers/Suppliers: AI/SI may reconcile the current providers and suppliers list for review and verification by the clinician, who establishes or updates the list during the encounter.

++ Use of Medications, Supplements, and Other Substances: AI/SI may reconcile the current list of medications/supplements/other substances used, for review and verification by the clinician.

++ Routine Measurements: Under current technology, we are not aware of how AI/SI could be used to measure weight or waist circumference, blood pressure, or other routine measurements, and do not clarify a role for using AI/SI in furnishing this element at this time.

++ Cognitive Impairments: The regulations require assessment of cognitive function by direct observation, with due consideration of information obtained from the beneficiary and others. We are not aware of how AI/SI could be used to conduct a cognitive assessment under the current regulatory standard.

++ Depression Risk Review: AI/SI may administer an appropriate screening instrument selected by the clinician and flag or escalate responses *prior* to the clinician encounter, for review by the clinician.

++ Functional Ability and Safety Review: AI/SI could conduct appropriate screening questions or a screening questionnaire selected by the clinician *prior* to the clinical encounter, the results of which may be reviewed by the clinician during the encounter.

++ Written 5–10 year screening schedule: AI/SI may generate a list of recommended screenings to be reviewed and prioritized by the clinician during the encounter.

++ Personalized Prevention Plan: AI/SI may support generation of a draft personalized prevention plan including individualized health advice and referrals to health education or preventive counseling services or programs, for review and approval by the clinician. This personalized prevention plan is meant to support patients' overall health goals and risk factor reduction and self-management, in areas such as fall prevention, nutrition, physical activity, substance avoidance, social engagement, weight loss, or cognition.

++ Advanced Care Planning: AI/SI may, at the *discretion* of the beneficiary, support prompting patient discussions on preparing an advance directive, future care decisions, caregiver identification, and other priorities to support an advance care planning discussion as part of the AWV, conducted by the clinician.

We anticipate there may be resource requirement shifts associated with the technology-enablement of the AWV as well as potentially other physician services. While we reiterate that we are providing payment for the physician service, we are aware of many beneficiary-facing applications which patients may use to support their health, and these novel technologies could support beneficiaries in *implementing* the personalized prevention plan as developed between the Medicare beneficiary and their physician or non-physician practitioner as part of the Medicare AWV.

To ensure beneficiaries have access to the best possible care including novel technologies should beneficiaries elect to do so, and acknowledging the Secretary's authority to ''experiment with the use of personalized technology'' to support beneficiary self-management skills and adherence to provider recommendations to improve the health status of beneficiaries, we further clarify that should organizations provide a software application to a Medicare beneficiary to support their implementation of a personalized prevention plan, such remuneration may implicate both the Federal Anti-Kickback Statute and the Beneficiary Inducements Civil Monetary Penalty Law (that is, ''Beneficiary Inducements CMP'') and would need to be evaluated on a case by case basis.

We reiterate that in future rulemaking we may provide additional clarifications or flexibilities on how the Medicare AWV is conducted, however under current regulations these physician or non-physician practitioner functions may be enhanced by clinical AI/SI, and while we pay for the furnishing of the service to develop a personalized prevention plan, organizations may choose to provide beneficiaries with applications to support their self-management skills and implement these personalized prevention plans. These clarifications, we reiterate, are intended to support beneficiaries adopting technology to improve their health and do not constitute the practice of medicine or replace the beneficiary and physician or non-physician practitioner relationship.

6. Developing Prospective Payment in the Shared Savings Program

a. Background

We stated at the beginning of this request for information that we are interested in further developing prospective primary care payment (PPCP) in Original Medicare, beginning with the Shared Savings Program. There

is growing recognition that the fee-for-service (FFS) payment model has inherent limitations as a primary care payment mechanism, as it is not designed to support the comprehensive, coordinated care that primary care requires. In 2015, the Medicare Payment Advisory Commission (MedPAC) recommended a per beneficiary payment for primary care providers to support additional care coordination activities for Medicare beneficiaries.[103] MedPAC explained that while a per beneficiary payment in itself will not guarantee an increase in care coordination activities or even an increase in compensation for eligible primary care practitioners, it would be a first step in transitioning from FFS to a beneficiary-centered payment approach that encourages care coordination, including the non-face-to-face activities that are a critical component of care coordination.[104]

In a 2021 report on implementing high-quality primary care, the National Academies of Sciences, Engineering, and Medicine (NASEM) recommended that health care payers ''pay for primary care teams to care for people, not doctors to deliver services'' and encouraged payers to adopt a hybrid reimbursement model that combines FFS and capitation over time with an overarching goal to eventually pay for the majority of primary care services through risk-adjusted prospective payment.[105] NASEM recommended that a hybrid reimbursement model—with a mix of FFS and lump-sum or per-person payments—become the default method for paying for primary care teams.[106] NASEM found that with time, hybrid reimbursement models show improvements in care and reductions in use, particularly for people with multiple complex chronic conditions.[107]

Over the past 13 years, the CMS Innovation Center has tested a number of models that have progressively moved away from FFS billing, including: CPC, Comprehensive Primary Care Plus (CPC+), PCF, Next Generation ACO (NGACO), Global and Professional Direct Contracting (GPDC) Model, ACO REACH, and ACO Primary Care (PC) Flex. These models have focused on testing whether Medicare payment for primary care services through hybrid payments (a mix of FFS and capitated payments), population-based payments (PBPs), or total care capitation (TCC) improves quality of care for beneficiaries and reduces Medicare spend. Evidence from these models suggests that primary care capitation (PCC) is most effective when it is embedded in an accountable care framework, such as the Shared Savings Program.[108] Model design and evaluations are available on the model-specific websites that can be found on *https://www.cms.gov/priorities/innovation/models#views=models*.

Previous Innovation Center primary care model tests have yielded lessons that shape current and future work, including the development of codes and payment for APCM services. Participants, namely clinicians, in primary care models have indicated, however, difficulties with investing in and maintaining primary care redesign activities due to a range of challenges. First, additional non-visit-based primary care payments have been generally layered upon base payments that are still predominantly FFS in structure. While payment for APCM services represents a meaningful step toward non-visit-based payments in concept, we do not view APCM as the end goal of primary care payment reform. The payment amounts associated with APCM are predicated on furnishing and billing APCM services. As such, APCM retains the fundamental structure of FFS billing and may not provide sufficient incentives for practices to focus on proactive, population-based non-visit care management activities.

Second, Innovation Center model funding that supports salaries for clinical and administrative staff, who are needed for advanced primary care coordination and population health functions, is contingent on continued participation in these models. Unlike APCM codes,[109] which are billing codes paid under the PFS and can be used to support ongoing primary care workforce investments, once the models end, practices are left without the funding that they received under the models for the clinical and administrative staff that had supported population health functions. Based on a review of internal CMS data related to billing for APCM services, billing for APCM services is higher for Shared Savings Program ACO-assigned beneficiaries compared to Medicare beneficiaries outside of an ACO. This finding suggests that the accountability and care management infrastructure associated with ACOs may support more robust adoption of non-visit based primary care payment mechanisms.

Table A–E3 identifies recent Innovation Center models that tested capitated payment arrangements. As outlined in the table, the payment arrangements tested across these models reflect a progression from hybrid (FFS + capitation) payment structures to PBPs and TCC, with each successive model designed to build upon the experience of previous models. CPC+ and PCF relied on care management fees, performance-based incentive payments, and PBPs that partially replaced traditional FFS billing. While neither model reduced total Medicare expenditures or achieved net savings, the CPC+ evaluation found that independent practices who spent a longer time in the model, and those participating in the Shared Savings Program tended to have more favorable results.[110] This finding underscores the importance of embedding primary care

[108] *See, for example,* O'Malley A, Singh P, Fu N, et al. Independent Evaluation of the Comprehensive Primary Care Plus (CPC+): Final Report. Mathematica, page xviii. December 2023. *https://www.cms.gov/priorities/innovation/data-and-reports/2023/cpc-plus-fifth-annual-eval-report.*

[109] Three APCM codes and payment amounts were established in the CY 2025 Physician Fee Schedule final rule (89 FR 97859 through 97902). In the CY 2026 PFS final rule, CMS established three new G-codes (HCPCS codes G0568, an add-on code based on CPT code 99492, G0569, an add-on code based on CPT code 99493 for CoCM services delivered to patients also receiving APCM services, and G0570, an add-on code for general behavioral health integration services based on CPT code 99484) to be billed as add-on services to APCM base codes: HCPCS codes G0556, G0557, and G0558 (90 FR 49464 through 49471).

[110] O'Malley A, Singh P, Fu N, et al. ''Independent Evaluation of the Comprehensive Primary Care Plus (CPC+): Final Report,'' page 209. Mathematica. December 2023. *https://www.cms.gov/priorities/innovation/data-and-reports/2023/cpc-plus-fifth-annual-eval-report.*

payment reform within an accountable care framework.

Other Innovation Center models that have tested different kinds of cash flow and primary care capitated payments have focused on ACOs in models that build on the foundation of the Shared Savings Program. For example, ACOs in the NGACO model could select from four payment mechanisms: (1) traditional FFS; (2) FFS with a fixed per beneficiary per month (PBPM) infrastructure payment; (3) PBPs that gave ACOs a fixed percentage of expected FFS claims reductions in prospective monthly payments; or (4) all-inclusive PBPs, in which the ACO received expected FFS claim reductions in prospective monthly payments. Three quarters of NGACOs primarily chose FFS-based payment mechanisms such as the FFS or FFS with infrastructure payment (FFS+ISP). NGACOs electing PBP mechanisms had larger spending reductions of 3 percent ($409.1 per beneficiary per year (PBPY), p<0.01), compared with 1.3 percent ($172.9 PBPY, p<0.01) for NGACOs electing FFS-based payment mechanisms. Additionally, NGACOs, particularly the 35 that remained through PY 6, showed improvements in model reported quality measures over time for prevention and screening and for chronic disease management. Further, 25 of 35 NGACOs had reduced cumulative Medicare spending while maintaining or reducing rates of ambulatory care-sensitive conditions-related hospitalizations or 30-day unplanned readmissions, tended to reduce outpatient spending and Emergency Department visits, and tended to reduce skilled nursing facility spending and utilization. Over the course of the model, NGACOs invested in initiatives to better manage their patient populations, toward the goals of reduced spending and improved quality.[111]

Under the GPDC Model [112] (the successor to the NGACO model) and the ACO REACH model,[113] we offered two capitation options: (1) TCC (a PBPM capitated payment for all Medicare Part A and Part B services) and (2) PCC for primary care services equal to seven percent of the estimated total cost of care and composed of both a base amount and an enhanced amount designed to provide upfront revenue. Direct contracting entities and ACOs that selected PCC could also select an advanced payment option (APO), which provided upfront payments for services beyond primary care.

The ACO PC Flex model extends capitated payment arrangements to ACOs participating in the Shared Savings Program. The model is designed to test how prospective payments and increased funding for primary care in ACOs affects health outcomes, quality, and costs of care within the Shared Savings Program.[114] Model participants are limited to ACOs that participate in the Shared Savings Program and qualify as a ''low revenue ACO'' as defined by § 425.20.[115] ACOs participating in the ACO PC Flex Model receive two payments: a monthly PPCP and a one-time advanced shared savings payment. The PPCP is a PBPM payment for primary care services that replaces FFS payments for eligible primary care services with a monthly prospective payment composed of a county base rate (based on a county's average primary care spending), an ACO enhanced amount, and a population adjustment.[116] ACOs are required to spend at least 90 to 95 percent (depending on the performance year) of the total PPCP payment on the provision of care.[117] The ACO enhanced amount includes three types of payment enhancements: (1) the county enhancement, which is applied at the county level in counties designated as low spending counties relative to standardized spending nationally; (2) the flex enhancement, which is applied at the ACO level to all PC Flex ACOs, regardless of location or utilization, and (3) the enhancement add-on, which is a fixed amount PBPM for a performance year that may be used to increase the ACO enhanced amount for underlying changes in the Medicare PFS that are not reflected in the rate book. The enhanced amount will not be subject to recoupment in full by CMS based on the PC Flex ACO's performance in achieving shared savings.[118] Although interest in the ACO PC Flex model was robust, many eligible ACOs that expressed initial interest in the model ultimately did not submit applications, citing challenges associated with the application timeline. Additionally, several interested parties shared that concurrent interest in the Making Care Primary model was a factor in their decision not to participate in ACO PC Flex.

The Innovation Center recently announced the Long-term Enhanced ACO Design (LEAD) model,[119] which is scheduled to begin on January 1, 2027. As currently designed, LEAD's capitated payment architecture builds directly on the framework used in ACO REACH and ACO PC Flex. Similar to ACO REACH and the ACO PC Flex model, participating ACOs will be required to select from either: (1) TCC payment or (2) PCC payment. The LEAD model plans to offer ACOs that elect PCC the option to receive additional payments to extend value-based arrangements beyond primary care. Specifically, ACOs may elect the non-primary care capitation (NPCC) or the APO to support alternative payment arrangements for non-primary care providers. It is anticipated that these options would allow ACOs to incrementally expand capitation beyond primary care without adopting full TCC.

TABLE A-E2: CAPITATED PAYMENT ARRANGEMENTS IN SELECT CMS INNOVATION CENTER MODELS

Model	Type	Capitated Payment Arrangement Options
Comprehensive Primary Care Plus (CPC+) 2017-2021	Hybrid (OM+ capitation)	FFS base + care management fees + performance-based incentive payments. Alternative payments to partially replace FFS billing available to Track 2 practices.
Primary Care First (PCF) 2021-2025	Population-based payments	Quarterly population-based payments that exceed FFS rates + flat visit fees replaced E/M billing + performance-based adjustment (based on performance measures) of -10 percent to 50 percent + payment accuracy adjustment to account for primary care furnished outside participating PCF practices.
Next Generation ACO (NGACO) 2016-2021	OM + Hybrid + Population-based payments	Four options: (1) FFS; (2) FFS + fixed per-beneficiary per-month infrastructure payment; (3) population-based payments as fixed percent of expected FFS claims; (4) all-inclusive population-based payments (prospective monthly payments based on expected FFS claim reductions).
Global and Professional Direct Contracting (GPDC) 2021-2022	Primary care capitation or Total Care Capitation	Two monthly payment options: (1) primary care capitation (PCC) payment or (2) total care capitation (for all Medicare Part A and Part B services). PCC includes a base primary care capitation amount + enhanced primary care capitation amount. Advanced payment option available for ACOs that select PCC.
ACO REACH 2023-2026	Primary care capitation or Total Care Capitation	Two monthly payment options: (1) primary care capitation (PCC) payment or (2) total care capitation. PCC consists of base primary care capitation amount + enhanced primary care capitation amount. Advanced payment option available for ACOs that select PCC.
ACO PC Flex 2025-2029	Primary Care Capitation	Monthly prospective primary care payment (PPCP) to replace FFS for eligible primary care services + one-time $250,000 advance shared savings payment. PPCP consists of: county base rate + ACO enhanced amount + population adjustment. Enhanced amount consists of: county enhancement + flex enhancement.
Long-term Enhanced ACO Design (LEAD) 2027-2036 (planned)	Primary Care Capitation or Total Care Capitation	Two monthly payment options are planned: (1) primary care capitation (PCC) payment or (2) total care capitation. As currently designed, PCC consists of: a base primary care capitation amount + enhanced primary care capitation amount. As currently designed, Advanced payment option and non-primary care capitation payment may be available for ACOs that select PCC.

b. Primary Care Capitated Payment Arrangements Considerations for the Shared Savings Program

The goal of capitated payments is to give health care providers additional flexibility in how they deliver care and to reduce the volume-based incentives of Original Medicare (OM) payment. With capitated payments, health care providers receive steady, predictable cash flow that is not tied to the number of services they provide. This flexibility frees health care providers to deliver care in innovative and flexible ways, such as non-face-to-face care management, telehealth, and electronic messaging, without worrying about foregone OM revenue, tying these services to overall outcomes. We are interested in building on the experience of previous Innovation Center models that tested capitated payment arrangements. Section 1899(i)(2) of the Act authorizes the Secretary to use partial capitation in which an ACO is at financial risk for some, but not all, of the items and services covered under parts A and B, such as at risk for some or all physicians' services or all items and services under part B, provided that the partial capitation payments for a year made under the partial capitation model do not result in additional program expenditures than would otherwise be expended for such ACO for such beneficiaries for such year if the model were not implemented. The Secretary may limit a partial capitation model to ACOs that are highly integrated systems of care and to ACOs capable of bearing risk, as determined to be appropriate by the Secretary. Additionally, section 1899(i)(3) of the Act authorizes the Secretary to use other payment models instead of the one-sided model described in section 1899(d) of the Act as long as the Secretary determines that the other payment model will improve the quality and efficiency of items and services furnished to Medicare beneficiaries without additional program expenditures.

We have previously described how primary care teams are central to the relative success of Shared Savings Program ACOs.[120] [121] In 2024, as in previous years, ACOs comprised of larger proportions of primary care clinicians had significantly higher net per capita savings than ACOs comprised of smaller proportions of primary care clinicians (with $403 vs $224 in net per capita savings).[122] In recent years, we have received significant input from interested parties regarding opportunities to increase participation in ACO initiatives. One such option to increase participation would be to identify ways that the Shared Savings Program can support ACOs' efforts to strengthen primary care, such as by providing prospective monthly primary care capitated payments to primary care practices, to reduce reliance on OM payments and support innovations in care delivery that better meet beneficiary needs.

In the CY 2026 PFS proposed rule (90 FR 32502), we solicited comments on whether CMS should consider new payments to Shared Savings Program ACOs for prospective monthly APCM payments to be delivered to primary care practices that satisfy the APCM billing requirements, with the payments reconciled under the ACO benchmark. Nearly all commenters supported giving ACOs the option to receive prospective APCM payments. Only one commenter opposed prospective APCM payments, arguing that APCM delivery solely through ACOs risks undermining the core principles of CCM.

In the CY 2027 PFS proposed rule, we sought feedback about developing prospective primary care payment arrangements in the Shared Savings Program. Specifically, we requested input on the following questions:

ACO and ACO Participant Readiness

- To what extent are Shared Savings Program ACOs and ACO participants, and their associated health care providers (referred to herein as ''ACO providers/suppliers''), ready to take on capitated payment arrangements? Please

[120] ''Medicare Shared Savings Program Continues to Deliver Meaningful Savings and High-Quality Health Care'', October 29, 2024, Press Release. *https://www.cms.gov/newsroom/press-releases/medicare-shared-savings-program-continues-deliver-meaningful-savings-high-quality-health-care.*

[121] ''Medicare Shared Savings Program Saves Medicare More Than $1.8 Billion in 2022 and Continues to Deliver High-quality Care'', August 24, 2023, Press Release. *https://www.cms.gov/newsroom/press-releases/medicare-shared-savings-program-saves-medicare-more-1–8-billion-2022-continues-deliver-high-quality.*

[122] Medicare Shared Savings Program Accountable Care Organizations Updated Performance Year 2024 Financial and Quality Results Fact Sheet, September 29, 2025. *https://www.cms.gov/files/document/fact-sheet-ssp-py24-financial-quality-results.pdf.*

describe ACO and ACO participant level of readiness for each of the following:

++ Hybrid capitation (a combination of capitated and OM payments).

++ Full capitation for primary care services (that could enable ACOs to provide downstream payments to ACO participants).

++ PBPs as a fixed percentage of expected OM claims.

We are interested in understanding what operational changes ACOs would need to undertake to effectively receive, manage, and distribute capitated payments. Please describe any barriers or conditions—legal, financial, or operational—that could affect an organization's readiness to participate in each type of arrangement.

• If an ACO received capitated payments for primary care services furnished by ACO providers/suppliers billing through the TIN of an ACO participant (as defined in § 425.20), what organizational and programmatic goals would the ACO seek to advance with those payments? For example, we are interested in understanding whether ACOs would use capitated payments to expand the scope or capacity of existing care coordination and population health programs, or whether capitated payments would instead enable ACOs to operationalize new care delivery initiatives. Please describe the specific types of initiatives that ACOs would seek to implement, and how ACOs would ensure that these payments went to support primary care practices directly.

Eligibility for Participation

• Should CMS limit access to capitated payment arrangements exclusively to ACOs participating in two-sided risk tracks (BASIC tracks C, D, E or the ENHANCED track), or should all ACOs be eligible to receive some form of capitated payments, regardless of the ACO's participation track? ACOs participating in two-sided risk tracks must establish a repayment mechanism prior to the start of an agreement period, and we are interested in whether similar proof that an ACO could repay losses should be required as a condition for receiving capitated payments, even for ACOs in one-sided risk tracks.

• Should CMS limit capitated payment arrangements to ACOs with prior risk-bearing experience—either through participation in a previous Shared Savings Program agreement period in a two-sided risk track (BASIC tracks C, D, E or the ENHANCED track) or through prior participation in a risk-bearing track in an Innovation Center model, such as ACO REACH—or should risk-bearing ACOs in their first Shared Savings Program agreement period also be eligible to participate in capitated payment arrangements? Why would commenters support one approach over the other? We are interested in whether prior experience with risk-bearing should be an explicit prerequisite for capitated payment eligibility or whether risk-bearing ACOs in their first agreement period should also be eligible to participate in capitated payment arrangements.

• Should CMS permit some, but not all, ACO participants within an ACO to participate in capitated payment arrangements, or should CMS require all ACO participants within an ACO to participate in capitated payment arrangements?

• Should CMS establish a minimum percentage of attributed beneficiaries for whom eligible primary care practices must be furnishing care management services to receive capitated payments, either at the ACO level or at the individual ACO participant level?

• To what extent should the payment design and structure differ based on the level of risk or participation track of an ACO?

Payment Design and Structure

• What percentage of base year OM payments should be replaced by PCC, and what factors should guide this determination? For example, under the ACO REACH model, the PCC payment—including both the base PCC and the enhanced PCC—is set at 7 percent of the REACH ACO's prospective monthly performance year benchmark, a level designed to provide ACOs with a predictable, non-visit-based revenue stream for primary care services.

• What services should be included in primary care capitation (and reciprocally, in a fee reduction) to accurately capture an appropriate scope of primary care services furnished to beneficiaries, balancing the importance of providing up-front flexible payments, with the potential for risk to practices if service utilization grows? For example, under both the ACO REACH and ACO PC Flex models, the set of services eligible for primary care capitated payments is based on a specific list of CPT and HCPCS codes billed by primary care specialists (health care providers with specific specialty codes). In both models, the PCC bundle includes certain E/M office visits along with CCM, behavioral health integration, transitional care management, AWVs, advance care planning, and virtual communication services.

• We are interested in feedback about whether and in what form we should establish an enhanced primary care payment amount—in addition to the base primary care capitated payment amount—as a feature of primary care capitated payment arrangements in the Shared Savings Program. Specifically, we are interested in:

++ Calculation: For example, in ACO REACH, the enhanced primary care payment is calculated as a fixed percentage of the ACO's performance year benchmark, while in ACO PC Flex, the Flex Enhancement component of the primary care payment is calculated as a fixed dollar amount ($125) per eligible beneficiary per year, with additional enhancements (that is, the County Enhancement) derived from county-level or regional spending benchmarks.

++ Reconciliation: In ACO REACH, enhanced primary care capitation (EPCC) is subject to recoupment at the end of the performance year. In ACO PC Flex the enhanced amount is included in total cost of care, subject to offsets from the prior savings adjustment and/or the regional adjustment.

• We are interested in whether CMS should consider offering an advanced payment option (APO) within the Shared Savings Program, similar to the APO offered by the ACO REACH model, to ACOs that have elected PCC. Specifically, we are interested in:

++ Does the availability of an APO enhance an ACO's ability to align specialist financial incentives with the ACO's total cost of care goals, or do the structural and administrative requirements of implementing an APO within the Shared Savings Program present barriers that outweigh the potential benefits?

++ Do Shared Savings Program ACOs have access to sufficient data—shadow bundles, claims data, public use files, and data from arrangements with other payers—to support the development and ongoing administration of an APO? If not, what data would be necessary?

• The ACO REACH model has offered TCC as a payment option for ACOs assuming the highest level of financial risk. The LEAD model also plans to offer TCC as a payment option for ACOs assuming the highest level of financial risk. We are interested in whether CMS should provide a full capitation option to Shared Savings Programs ACOs. Specifically, we seek feedback on:

++ Should CMS consider offering a full capitation option to Shared Savings Program ACOs that have demonstrated readiness to administer prospective payments, under which all Medicare Part A and Part B services furnished to assigned beneficiaries by ACO providers/suppliers billing through the TIN of ACO participants—but not

services furnished to assigned beneficiaries by providers that are not on the ACO's participant list—would be paid through a TCC payment?

++ Should CMS limit full capitation to ACOs in tracks with the highest level of risk—ENHANCED track or BASIC track Level E—on the basis that full capitation should be reserved for ACOs that have already assumed downside financial risk and the organizational readiness to manage prospective payment for Medicare Part A and Part B services?

++ Are there other flexibilities that CMS should give ACOs to make TCC effective?

++ How should CMS calculate the per-beneficiary, per-month payment amount under a full capitation arrangement in the Shared Savings Program? Under ACO REACH, the monthly TCC payment amount paid to the ACO equals 1/12 of the performance year benchmark, adjusted by the TCC withhold.

• Should CMS issue prospective capitated payments on a monthly or quarterly basis? Please describe the potential advantages, disadvantages, and operational implications of each approach.

• Should capitated payments be paid to ACOs and distributed downstream to ACO participants, or should CMS make payments directly to ACO participants that provide primary care services, similar to how CMS makes payments for APCM services, and what are the implications of each approach? Should CMS consider alternative mechanisms for delivering capitated payments directly to ACO Participants that are also primary care practices participating in Shared Savings Program ACOs? If so, what payment design, infrastructure, and policy considerations should guide the development of such alternative payment mechanisms?

• If capitated payments are issued directly to ACOs, should CMS require ACOs to provide a specific percentage of those payments to ACO participants that provide primary care services? How might this be audited? Additionally, should CMS require ACOs to have written capitated payment agreements with ACO participants to specify that a minimum percentage of the capitated payment will flow to ACO participants?

Care Delivery Requirements

• Should CMS require ACOs seeking to participate in capitated payment arrangements to make commitments to specific care delivery goals as a condition for participation? If so, what goals should be required and how should compliance be assessed and enforced? For example, we are interested in whether we should require ACOs to submit a primary care transformation plan—similar to the care delivery requirements under the CPC+ model, which required participating practices to demonstrate progress across five comprehensive primary care functions, including access and continuity, care management, comprehensiveness and coordination, patient and caregiver engagement, and planned care and population health—that specifies measurable targets for care delivery improvements, such as expanding after-hours access, increasing care management for high-risk beneficiaries, or reducing avoidable emergency department utilization.

• How should CMS balance meaningful capitated payment levels with reduced administrative and reporting burdens for participating ACOs, and what primary care delivery requirements should CMS establish as conditions of eligibility for capitated payment arrangements in the Shared Savings Program? Should compliance with any care delivery requirements be monitored on a quarterly or annual basis, with the potential for payment recoupment in cases of noncompliance?

• Should CMS require that ACOs and ACO participants receiving capitated payments demonstrate the use of data-driven risk stratification methods to identify high-risk beneficiaries and target enhanced care management resources toward those beneficiaries? CMS provides Shared Savings Program ACOs with data that could be used for risk stratification, such as claims-based beneficiary data, risk scores, and quality performance reports. We are interested in whether CMS should require ACOs and ACO participants to use these data as a baseline input for their risk stratification methodologies or whether ACOs and ACO participants should be given the flexibility to design their own risk stratification approaches.

• Should care delivery requirements for capitated payment eligibility increase depending on the level/type of capitated payment selected by the ACO or ACO participants? For example, should ACOs that are receiving a higher percentage of capitated payments be subject to more comprehensive care delivery requirements or should a uniform set of care delivery requirements apply to all ACOs, regardless of the percentage of capitated payments they receive?

Comment: Most commenters responding to the RFI on developing prospective payment in the Shared Savings Program were generally supportive of developing primary care capitated payment arrangements within the Shared Savings Program, although views were mixed on design details, ACO readiness, eligibility criteria, payment structure, and mechanisms for ensuring payment adequacy. Commenters encouraged CMS to evaluate an ACO's operational readiness as a criterion to determine whether an ACO is qualified to receive primary care capitated payments and otherwise recommended allowing all risk-bearing ACOs to participate in capitated payment arrangements, without imposing restrictive eligibility criteria or minimum participation thresholds. Commenters provided specific recommendations about payment design, such as: (1) offering primary care capitation similar to the options offered by ACO REACH, along with a CMS-administered hybrid option to provide predictable prospective revenue while retaining a portion of FFS payments; (2) per-member-per-month payments covering care management and preventive services; (3) building on the ACO Primary Care Flex Model; (4) developing FQHC/RHC-specific enhancements and true-up mechanisms, and (5) pairing monthly capitated payments for care-coordination with FFS payments for patient-facing services. To ensure payment adequacy, a few commenters emphasized that any capitated payments must meaningfully increase Medicare's historically inadequate investment in primary care and urged CMS to provide monthly practice and beneficiary-level data, along with technical assistance on cash flow, claims, and reconciliation. One commenter recommended preserving encounter-level FFS claims data to protect attribution, clinician identification, and other essential Shared Savings Program and Innovation Center model functions.

Response: We will consider these comments for future rulemaking.

c. Primary Care Capitated Payment Arrangements Considerations Outside of the Shared Savings Program

Though CMS is first exploring the development of PPCP within the guardrails of accountable care discussed in the third section of this RFI, we are also considering extending these efforts in future years to develop a bundled or capitated approach, called a 'global period' in the broader Original Medicare program (OM). In OM, many services, including surgical and maternity care services, are managed as 'global' periods by OM, where reasonable and necessary medical services are delivered throughout an episode. Primary care, once an initiating visit has occurred,

could also be reimbursed over an interval of care consistent with the development of a trusting, longitudinal relationship between clinician and patient. We have not previously proposed a primary care 'global' period, in part because of the difficulty to ascertain where a primary care relationship starts, and where it stops, through claims data or other information readily obtained by CMS. We do attribute beneficiaries to organizations participating in alternative payment models, such as ACOs in the Medicare Shared Savings Program, based on a plurality of primary care services delivered and also maintain the possibility for beneficiaries to voluntarily align to a Shared Savings Program ACO through Medicare.gov where beneficiaries select a primary care provider.

To establish a primary care global period would require a number of services to be 'bundled' within the primary care global code family, including the IPPE or AWV, O/O E/M services, and care management services such as advanced primary care management services. Central to the challenge inherent in bundling together previously disparate services is ensuring beneficiaries would maintain access to care. CMS could monitor for any potential denials or limitations in care associated with the transition to a global period. We also would like to seek public input on which and how many of the services should be bundled, if they should be bundled entirely or through a 'hybrid' capitation with reduced FFS model, and how best to establish the payment levels for this global period. We seek input on the following:

- What would be the appropriate services to bundle in such a primary care global period (for example, E/M, care management codes, AWV, etc.)? How should the agency consider the benefits and drawbacks regarding quality of care, patient safety, and evidence regarding care delivery changes in a fully or globally capitated approach with no per-visit payment vs. a hybrid payment approach with reduced per-visit payment and per-member per-month payment?
- For both a fully capitated and hybrid payment approach, CMS has in past considered patient complexity (for example, number of chronic conditions or HCC level) in our alternative payment models for primary care. How should CMS approach defining these levels or stratum for payments in a fully capitated or hybrid payment model for primary care? How many levels should be considered?
- In the absence of an encounter, is there another appropriate 'trigger' or initiation for a primary care global period? How long should it last? Is beneficiary receipt of an AWV in the previous 12 months sufficient?
- What necessary reporting requirements and accountability should CMS require for clinicians receiving primary care capitated payments? For example, should there be explicit minimum visit requirements for a clinician to be eligible to receive primary care capitated payments for their Original Medicare patients? Should we require specific clinical outcomes-based reporting? If so, what clinical outcomes should we measure?
- Broadly, to what extent should the approach Original Medicare takes to primary care payment differ between the Shared Savings Program and the broader program? If yes, how?
- In so much as the agency considers a prospective primary care payment (PPCP) for primary care, to what extent should the IPPE/AWV be the initiating visit for that global period? *Comment:* Commenters strongly endorsed the development of a hybrid payment for primary care in the Physician Fee Schedule, and many emphasized the importance of developing a hybrid payment for primary care in the PFS distinct from any action CMS takes on ACO prospective payment. Commenters highlighted that there are many physician services priced in a 'global' period of various numbers of days, however commenters highlighted that hybrid primary care payments, which include both per service (e.g., visit) and global period payments, may require additional steps like attribution to ensure payments are made to the correct entities. Commenters highlighted some services, such as vaccinations, should remain paid on a per service basis, but agreed most services can be priced based on 'typical' monthly utilization. For longitudinal primary care services, many commenters believe these can be priced on the basis of a 'visit fee' and 'typical' monthly care management services expected to be received that can be bundled together. Other commenters specifically highlighted the importance of building on the advanced primary care management (APCM) services as a 'natural starting point' for developing a typical monthly bundle of between-visit care or care management. Other commenters emphasized cost sharing will be a barrier (as it is for APCM) if it persisted in this future care management bundle for a hybrid payment. Commenters suggested that as primary care is undervalued in the Physician Fee Schedule that hybrid payment should increase primary care resources rather than simply bundling together the existing services. Commenters highlighted the importance of 'attribution' for monthly bundled care coordination services to reflect the primary care relationship, and specifically recommended against the monthly payment having a 'trigger' for a specific visit. Further, commenters emphasized the importance of administrative simplification to reduce clinician burden.

Response: We will consider these comments for future rulemaking.

F. Comprehensive Outpatient Rehabilitation Facility (CORF) Services and KX Modifier Threshold, and Medical Review Threshold

1. Technical Corrections of CORF Regulations

During rulemaking for CY 2008 (72 FR 66399), we made several regulation text revisions and redesignations at § 410.100 without changing a related regulatory provision of § 410.105 for the requirements for coverage of CORF services. We also created a new subpart M at 42 CFR 414.1105 for payment of CORF items and services that includes references to § 410.100 without making the corresponding revisions to the sections that were amended during CY 2008 PFS rulemaking.

We proposed to revise § 410.105(b)(3)(ii) for the home environment evaluation to indicate that the home environment evaluation is specified at § 410.100(l) and not § 410.100(m) as it currently reads.

We proposed to amend the regulation at § 414.1105(c) for CORF supplies and durable medical equipment to indicate that the supplies and durable medical equipment that are CORF services is specified at § 410.100(k) instead of § 410.100(l), as it currently reads. At the same time, we also proposed to remove from § 414.1105(c) language that relates to CORF drugs and biologicals because the provisions relating to payment for drugs and biologicals that are CORF services are at § 414.1105(d), which was added in the CY 2008 PFS final rule.

We requested comments on these proposals.

We did not receive public comments on this provision, and therefore, we are finalizing as proposed.

2. KX Modifier Thresholds

The KX modifier thresholds were established through section 50202 of the Bipartisan Budget Act of 2018 (Pub. L. 115–123, February 9, 2018) (BBA) and were formerly referred to as the therapy cap amounts. These per-beneficiary

amounts under section 1833(g) of the Act (as amended by section 4541 of the Balanced Budget Act of 1997) (Pub. L. 105–33, August 5, 1997) are updated each year based on the percentage increase in the Medicare Economic Index (MEI). Specifically, these amounts are calculated by updating the previous year's amount by the percentage increase in the MEI for the upcoming calendar year and rounding to the nearest $10.00. Thus, for CY 2027, we proposed to increase the CY 2026 KX modifier threshold amount by the most recent forecast of the 2017-based MEI. For CY 2027, the proposed MEI increase was estimated to be 2.5 percent and was based on the expected historical percentage increase of the 2017-based MEI. We also proposed to update the MEI increase for CY 2027 based on historical data through the second quarter of 2026, and we proposed to use such data, if appropriate, to determine the final MEI percentage increase and the CY 2027 KX modifier threshold amounts in the CY 2027 PFS final rule.

Section 1833(g)(7)(B) of the Act describes the targeted medical review (MR) process for services of physical therapy, speech-language pathology, and occupational therapy services. The threshold for targeted MR is $3,000 through CY 2027. Effective beginning with CY 2028, the MR threshold levels will be annually updated by the percentage increase in the MEI, per section 1833(g)(7)(B) of the Act. Consequently, for CY 2027, the MR threshold is $3,000 for physical therapy and speech-language pathology services combined and $3,000 for occupational therapy services. Section 1833(g)(5)(E) of the Act states that CMS shall identify and conduct targeted medical review using factors that may include the following:

- The therapy provider has had a high claims denial percentage for therapy services under this part or is less compliant with applicable requirements under this title.
- The therapy provider has a billing pattern for therapy services under this part that is aberrant compared to peers or otherwise has questionable billing practices for such services, such as billing medically unlikely units of services in a day.
- The therapy provider is newly enrolled under this title or has not previously furnished therapy services under this part.
- The services are furnished to treat a type of medical condition.
- The therapy provider is part of a group that includes another therapy provider identified using the factors described previously in this section.

We track each beneficiary's incurred expenses for therapy services annually and count them towards the KX modifier and MR thresholds by applying the PFS rate for each service less any applicable multiple procedure payment reduction (MPPR) amount for services of CMS-designated ''always therapy'' services (see the CY 2011 PFS final rule at 75 FR 73236). We also track therapy services furnished by critical access hospitals (CAHs), applying the same PFS-rate accrual process, even though they are not paid for their therapy services under the PFS and may be paid on a cost basis (effective January 1, 2014) (see the CY 2014 PFS final rule at 78 FR 74406 through 74410).

When the beneficiary's incurred expenses for the year for outpatient therapy services exceed one or both of the KX modifier thresholds, therapy suppliers and providers use the KX modifier on claims for subsequent medically necessary services. Using the KX modifier, the therapist and therapy provider attest that the services above the KX modifier thresholds are reasonable and necessary and that documentation of the medical necessity for the services is in the beneficiary's medical record. Claims for outpatient therapy services exceeding the KX modifier thresholds without the KX modifier included are denied.

We received public comments on these proposals. The following is a summary of the comments we received and our responses.

Comment: A few commenters expressed support for the proposal to increase the therapy threshold to $2,540 for physical therapy and speech-language pathology services combined, and to establish a separate $2,540 threshold for occupational therapy. They also supported increasing the targeted medical review threshold to $3,000, stating that these updates better reflect the current health care environment while maintaining appropriate program integrity safeguards.

Response: We appreciate the commenters' support for the increase to the KX modifier threshold amounts based on the CY 2027 MEI update. We also want to clarify that the targeted medical review threshold has been $3,000 since CY 2018 and that it will be increased annually by the percentage increase in the MEI effective January 1, 2028.

After consideration of public comments, we are finalizing the CY 2027 increase to the KX modifier threshold amount based on the most recent percentage increase in the 2017-based MEI reflecting historical data through the second quarter of 2026 of 2.6 percent. Therefore, for CY 2027, multiplying the CY 2026 KX modifier threshold amount of $2,480 by the final CY 2027 percentage increase in the MEI of 2.6 percent ($2,480 × 1.026) and rounding to the nearest $10.00 results in a final CY 2027 KX modifier threshold amount of $2,540 for physical therapy and speech-language pathology services combined and $2,540 for occupational therapy services.

G. Supporting Beneficiaries Planning for Future Medical Decisions

1. Advance Care Planning (ACP) Services (HCPCS Codes G0572 and G0573)

a. Background

Medicare currently pays for ACP services as an optional element of the annual wellness visit (AWV) or a Part B medically necessary service (see 80 FR 70955 and *https://www.cms.gov/files/document/mln-advanced-care-planning.pdf*). While the Social Security Act covered a similar service as a voluntary part of the initial preventive physical exam under section 1861(ww)(3) of the Act since CY 2012, in CY 2016 we adopted new coding developed by the American Medical Association for payment of ACP services as a separate Part B medically necessary service or an optional element of the annual wellness visit (AWV). In the proposed rule, we proposed to create additional codes in this family that more explicitly describe and value the contributions of clinical staff in the provision of ACP services. We emphasized, and reiterate here, that clinicians must not, under any circumstances, attempt to influence their patients' decisions for ACP.

For CY 2015, the CPT Editorial Panel created two new codes describing ACP services by physicians and other qualified healthcare professionals (QHPs): CPT code 99497 (*Advance care planning including the explanation and discussion of advance directives such as standard forms (with completion of such forms, when performed), by the physician or other qualified health care professional; first 30 minutes, face-to-face with the patient, family member(s), and/or surrogate*) and an add-on code, CPT code 99498 (*Advance care planning including the explanation and discussion of advance directives such as standard forms (with completion of such forms, when performed), by the physician or other qualified health care professional; each additional 30 minutes (List separately in addition to code for primary procedure))* (80 FR 70955).

In the CY 2015 PFS final rule with comment period (79 FR 67670), we assigned a PFS interim final status indicator of ''I'' (Not valid for Medicare purposes. Medicare uses another code for the reporting and payment of these services. This code is not subject to a 90-day grace period.) to CPT codes 99497 and 99498. We had received many public comments in response to the CY 2015 proposed rule recommending that we recognize and make separate payment for both CPT codes, in view of the time required to furnish the services and their importance for the quality of care and treatment of the patient. In the CY 2015 PFS final rule with comment period we responded that we would consider paying for CPT codes 99497 and 99498 after we had the opportunity to go through notice and comment rulemaking (80 FR 70955).

The following year, in the CY 2016 PFS final rule, we finalized our proposal to assign CPT codes 99497 and 99498 a PFS status indicator of ''A'' (Active) with RVUs based on the RUC recommended values. We adopted the RUC-recommended work RVU, physician time and direct PE inputs: 1.5 work RVUs and 1.4 work RVUs for CPT codes 99497 and 99498, respectively. We also added ACP as an optional element, at the beneficiary's discretion, of the AWV and made conforming changes to our regulations at § 410.15 that describe the conditions for and limitations on coverage for the AWV (80 FR 70959). In addition to adopting both CPT codes, we adopted CPT provisions regarding the reporting of timed services (80 FR 70956). We have also instructed practitioners that when reporting ACP as part of managing a beneficiary's illness, the condition discussed with the beneficiary is reported on the claim, whether or not an E/M visit is billed the same day (*https://www.cms.gov/files/document/mln-advanced-care-planning.pdf*). When ACP services are part of an AWV and furnished on the same day by the same practitioner as the AWV, an administrative exam or exam diagnosis is reported along with modifier 33 indicating the ACP services are preventive and not subject to cost sharing (*https://www.cms.gov/files/document/mln-advanced-care-planning.pdf*). In the CY 2016 PFS final rule, we also adopted CPT's coding guidance for ACP performed in conjunction with an E/M visit. CPT prefatory language indicates that when using CPT codes 99497 and 99498, no active management of the problem(s) is undertaken during the time period reported, and these codes may be reported separately if performed on the same day as most E/M visits.[123] We cited a clinical vignette from the RUC recommendations, illustrating when the services described by CPT codes 99497 and 99498 could be reasonable and necessary for the diagnosis or treatment of illness or injury, stating that this could occur in conjunction with the management or treatment of a patient's current condition, such as a 68 year old male with heart failure and diabetes on multiple medications seen by his physician for the E/M of these two diseases, including adjusting medications as appropriate (80 FR 70955). In addition to discussing the patient's short-term treatment options, the patient might express interest in discussing long-term treatment options and planning, such as the possibility of a heart transplant if his congestive heart failure worsens, and advance care planning including the patient's desire for care and treatment if the patient suffers a health event that adversely affects the patient's decision-making capacity (80 FR 70956). In this case the physician would report a standard E/M CPT code for the E/M service and one or both of the CPT codes describing ACP, depending upon the duration of the ACP service (80 FR 70956). Moreover, the ACP service would not necessarily have to occur on the same day as the E/M service (80 FR 70956).

The CPT Codebook published by the American Medical Association contains prefatory language that describes CPT codes 99497 and 99498 as a ''face-to-face service between a physician or other qualified health care professional and a patient, family member, or surrogate in counseling and discussing advance directives, with or without completing relevant legal forms.'' [124] While this code descriptor language indicates that the time being billed is personally spent by the physician/QHP and the codes are valued accordingly, we finalized a provision in the CY 2016 PFS final rule that allowed the time of clinical staff to be counted if the billing physician or other billing practitioner managed, participated and meaningfully contributed to the provision of the services, because public commenters persuaded us that ACP was performed at times by a team of a treating physician or other treating practitioner and their staff. Therefore, in the CY 2016 PFS final rule (80 FR 70957), we stated that we believed the services described by CPT codes 99497 and 99498 could be appropriately provided by physicians or using a team-based approach where ACP would be provided by physicians, non-physician practitioners (NPPs), and other staff under the order and medical management of the beneficiary's treating physician or treating practitioner. To provide clarity on who could report the new codes, we noted that the CPT code descriptors described the services as furnished by physicians or other qualified health professionals, which for Medicare purposes, has been consistent with allowing these codes to be billed by the physicians and NPPs whose scope of practice and Medicare benefit category include the services described by the CPT codes and who are authorized to independently bill Medicare for those services. Therefore, we finalized that only these practitioners may report CPT codes 99497 and 99498, and ''incident to'' rules in § 410.26 would apply when these services would be provided incident to the services of the billing practitioner under a minimum of direct supervision. We stated that we expected the billing physician or NPP, in addition to providing a minimum of direct supervision, to manage, participate and meaningfully contribute to the provision of the services. Also, we noted that PFS payment rules would apply when ACP is furnished incident to other physicians' services, including where applicable, that State law and scope of practice must be met (80 FR 70959). Accordingly, even though CPT codes 99497 and 99498 describe (and are valued as) services performed only by the billing practitioner, we finalized a policy allowing the time of clinical staff to be included since we did not have G codes at that time that would have provided coding specific to that situation.

b. Updates for CY 2027

Since 2016, we have heard from interested parties that ACP services may be under-utilized because some practitioners believe that only time they personally spend can count. While growth in ACP services utilization has been increasing, interested parties have communicated to CMS that the increase in utilization is not commensurate with the need for ACP services. Utilization of ACP services has increased since 2016 from about 650,000 services to about 2.5 million per year in 2025. We note that for patients in critical care, advance care planning is bundled into payment for the critical care service codes (CPT codes 99291–2) and is therefore not separately billed, so these patients may receive ACP services that is not

[123] Current Procedural Terminology, (CPT®) 2026 (CPT Codebook), Professional Edition, American Medical Association, page 61.

[124] CPT Codebook 2026, AMA, page 61.

identifiable in the claims data. We believe that new coding could more accurately distinguish and value the work of the billing practitioners from time that is spent by their clinical staff in the provision of ACP services. Therefore, we proposed to create two new HCPCS codes to describe ACP services furnished by clinical staff under the direct supervision of the billing physician or other practitioner (and incidental to their professional services), and proposed that the existing CPT codes 99497 and 99498 would only be used to report time personally spent by the billing practitioner. The new codes would be: HCPCS G-code GACP1 (*Advance care planning including the explanation and discussion of advance directives such as standard forms (with completion of such forms, when performed), first 20 minutes of clinical staff time with the patient, family member(s), surrogate directed by a treating physician or other treating qualified health care professional) and* GACP2 *(Advance care planning including the explanation and discussion of advance directives such as standard forms (with completion of such forms, when performed), each additional 20 minutes with the patient, family member(s),* surrogate *directed by a treating physician or other treating qualified health care professional (List separately in addition to code for primary procedure)).*

We proposed a work RVU of 1.00 for HCPCS code GACP1, based on a crosswalk to the work time of CPT code 99490 (*Chronic care management services with the following required elements: multiple (two or more) chronic conditions expected to last at least 12 months, or until the death of the patient, chronic conditions that place the patient at significant risk of death, acute exacerbation/decompensation, or functional decline, comprehensive care plan established, implemented, revised, or monitored; first 20 minutes of clinical staff time directed by a physician or other qualified health care professional, per calendar month*). For direct PE, we proposed 20 minutes of clinical labor (L037D) in the service period. We proposed a work RVU of 0.7 for HCPCS code GACP2, based on a crosswalk to the work time of CPT code 99439 (*Chronic care management services with the following required elements: multiple (two or more) chronic conditions expected to last at least 12 months, or until the death of the patient, chronic conditions that place the patient at significant risk of death, acute exacerbation/decompensation, or functional decline, comprehensive care plan established, implemented, revised, or monitored; each additional 20 minutes of clinical staff time directed by a physician or other qualified health care professional, per calendar month (List separately in addition to code for primary procedure)).* For direct PE, we proposed 20 minutes of clinical labor (L037D) in the service period.

As proposed, the new G codes and CPT codes 99497 and 99498 could be reported together, if time thresholds by the billing practitioner and clinical staff were each met with these respective code sets. We sought public comment on whether it would be better for the new G codes to represent, and be valued for, the combined time of a billing practitioner and their clinical staff within a single code, in case, for example, the billing practitioner and staff did not meet time thresholds for separate reporting of their respective times, but might meet the threshold for a code combining their time. For both the existing codes (describing physician time but allowing use for clinical staff time, as discussed previously) and new ACP codes (describing clinical staff time) to be paid ''incident to,'' the reporting practitioner must furnish a prior professional service to which the services of the clinical staff are incidental, such as a prior E/M visit or ACP services personally performed by the billing practitioner the same day. Our manual provides that ''[s]uch a service or supply could be considered to be incident to when furnished during a course of treatment where the physician performs an initial service and subsequent services of a frequency which reflect his/her active participation in and management of the course of treatment'' (Medicare Benefit Policy Manual, Chapter 15, Section. 60.1.B, available at *https://www.cms.gov/regulations-and-guidance/guidance/manuals/downloads/bp102c15.pdf*).

We received many public comments on our proposal to create two new HCPCS codes to describe ACP services furnished by clinical staff under the direct supervision of the billing physician or other practitioner (and incident to their professional services). We thank all public commenters, including those who responded in depth about their typical clinical practice and team structure. The following is a summary of the comments we received and our responses.

Comment: Most commenters supported the proposal to create two new HCPCS codes to describe ACP services furnished by clinical staff. However, many recommended that we reconsider the supervision level. Many favored allowing payments for ACP services furnished under general supervision. Some of the commenters who recommended general supervision recommended direct supervision by audio visual technology in lieu of general supervision. Some commenters wrote that there are rural areas where audio visual technology is not reliable. Several commenters opposed the new coding noting that currently, our policy permits counting clinical staff time in reporting ACP services if the billing practitioner managed, participated and meaningfully contributed to the provision of the service. They stated concern that the new coding could increase documentation and billing burden and potentially discourage collaborative ACP workflows. A commenter surmised that the primary challenge appeared to be provider awareness and understanding of existing billing guidance rather than a deficiency in the current code structure.

Response: We are finalizing HCPCS code G0572, formerly GACP1, (*Advance care planning including the explanation and discussion of advance directives such as standard forms (with completion of such forms, when performed), first 20 minutes of clinical staff time with the patient, family member(s), surrogate directed by a treating physician or other treating qualified health care professional)* as proposed. We are making a technical correction to and finalizing HCPCS G-code G0573, formerly GACP2, *(Advance care planning including the explanation and discussion of advance directives such as standard forms (with completion of such forms, when performed), each additional 20 minutes of clinical staff time with the patient, family member(s), surrogate directed by a treating physician or other treating qualified health care professional (List separately in addition to code for primary procedure))* by inserting '*of clinical staff time'* after ''*minutes*''. This technical correction is for clarity and consistency with HCPCS code G0572. At the outset, we acknowledge that there is room to increase provider awareness and understanding of existing billing guidance. To that end we will update our Advance Care Planning MLN Fact Sheet in the near future. We reiterate here, as we did in the proposed rule, that direct supervision may be satisfied by use of audio-visual technology. While we acknowledge the limitations of audio visual technology in rural areas addressing those limitations is beyond the scope of this rule. We are persuaded

by commenters that the proposed coding better recognizes their team structures and clinical practices.

Comment: Most commenters supported the proposal that the new G codes and CPT codes 99497 and 99498 could be reported together, if time thresholds by the billing practitioner and clinical staff were each met with these respective code sets.

Response: We are finalizing the proposal that HCPCS codes G0572 and G0573 and CPT codes 99497 and 99498 could be reported together, if time thresholds by the billing practitioner and clinical staff are each met with these respective code sets. Additionally, when counting time for HCPCS codes G0572 and G0573, we are also permitting the counting of practitioner time in combination with clinical staff time to meet the time threshold if clinical staff time otherwise would not meet the time threshold to report the code.

We sought clarity from interested parties about whether ''incident to'' criteria (the requirement for the billing practitioner to perform initial and subsequent services reflecting their participation in and management of the course of treatment) are typically met for beneficiaries needing ACP services, by a separately billed E/M visit (whether the same day as the ACP services or prior), or might best be included in a new code inclusive of combined time spent by both a reporting practitioner and their clinical staff. If the billing practitioner is by definition participating and managing by performing part of the ACP code itself, there would not be a need to require a prior initiating visit as we do for care management services provided ''incident to.'' To help us craft new coding in a manner that reflects typical clinical practice as well as ''incident to'' rules governing payment for services by clinical staff, we sought public comments that specify or clarify for the alternative new coding, the typical care team structure; how much time is typically spent by the billing practitioner and spent by their staff, and when; and the clinical circumstances of patients, for example, the care settings and whether the patient is typically a well patient or is doing advance care planning in conjunction with a particular illness. This would inform how the coding structure reflects work that is personally performed by the billing practitioner in conjunction with ACP.

We received many public comments on these ''incident to'' requirements and possible alternative coding. The following is a summary of the comments we received and our responses.

Comment: Many commenters noted a lack of clarity about 'incident to' requirements as applied to ACP services. Some recommended that we incorporate clinical staff training requirements into the code descriptors. Some took the opportunity to advocate for general supervision analogizing ACP services and their delivery to care management coding. Some requested that we do not finalize a same-day E/M or other unnecessary initiating-visit requirement. Others asked whether the new ACP clinical staff coding could be reported in institutional settings such as skilled nursing facilities and nursing facilities.

Response: First, it is important to note that ACP services are not care management services. ACP services, as a voluntary component of a Part B annual wellness visit, can be described as a preventive benefit under Medicare benefit categories. As such, AWV services may not be furnished 'incident to' the services of a physician's professional services. These are two distinct Medicare benefit categories. Furthermore, the Social Security Act § 1861(hhh)(3) specifies limited types of ''health professionals'' who may furnish AWV services. The health professionals included in this definition are codified at § 410.15, Annual wellness visits providing Personalized Prevention Plan Services: Conditions for and limitations on coverage. As physician services, ACP services are required to be reasonable and necessary for the diagnosis or treatment of illness or injury. As physician services, ACP services may be furnished 'incident to' the services of a physician. In part relevant to commenter's recommendations about qualifications, § 410.26, Services and supplies incident to a physician's professional services: Conditions, provides for the qualifications of auxiliary personnel who can provide services incident to a physician's professional services by deferring to States, noting in part that auxiliary personnel means an individual who ''meets any applicable requirements to provide incident to services, including licensure, imposed by the State in which the services are being furnished.'' As such, we are not prescribing qualifications for clinical staff who may furnish ACP services. Section 410.26 also generally requires incident to services under the direct supervision of the physician or other practitioner, except specifically for designated care management services and behavioral health services.

Second, as physician services, ACP services are required to be reasonable and necessary for the diagnosis or treatment of illness or injury. As such, we have stated that ACP services occur in conjunction with the management or treatment of a patient's condition. While we have not stated that an initial visit is required for ACP services, a prior visit for the patient's diagnosis or treatment is presumed. However, we have also stated that while an ACP service is furnished in conjunction with the management or treatment of a patient's condition the ACP service does not have to occur on the same day as the E/M service (80 FR 70956). We did not propose and are not finalizing otherwise. As for reporting in institutional settings, consolidated billing rules apply to services furnished by clinical staff in institutional settings.

Comment: Some commenters stated a desire for alternative coding that would be additional and optional and would allow combining time spent by both a reporting practitioner and their clinical staff. They desired this option to meet time thresholds or comport with their existing clinical and billing practice.

Response: At this time, we are not finalizing additional coding that would combine time spent by billing practitioners and their clinical staff. Many commenters stated that the additional combined coding would create confusion and administrative burden. We note that we will apply CPT provisions regarding the reporting of timed services to HCPCS code G0572 that we have previously adopted for existing ACP services (80 FR 70956). We also note that HCPCS code G0573 can be reported once the full 20 minutes of clinical staff time or clinical staff time plus practitioner time has been spent under G0572.

Comment: Most commenters described ACP services as team-based and led by physicians and other practitioners, with clinical staff continuing the services under supervision. Nearly all commenters stated concern about documentation burden and requested guidance.

Response: Consistent with existing documentation requirements, billing practitioners should ensure that for timed services, they should include sufficient notes in the medical record to support the time spent furnishing the service that would permit correct billing of timed services. The time counted for reporting one service code must not also be counted to meet the time requirements of another service code being reported.

Finally, for CY 2027 we are finalizing the addition of both HCPCS codes

G0572 and G0573 to the Medicare Telehealth list.

2. Request for Information (RFI) on Community-Based Palliative Care

a. Background

In the FY 2027 Hospice proposed rule, we solicited comment on the development of community-based palliative services outside of the hospice benefit (90 FR 17360). By community-based palliative care, we are broadly considering where palliative services can be delivered outside of the hospital, in outpatient clinics, in patients' homes, and other non-hospital settings. In this request for information we sought feedback on whether current evaluation and management (E/M) services, care management services, and ACP services reflected current billing and payment practices for physicians and other health professionals delivering palliative services, as well as on whether challenges in meeting documentation requirements, issues with compliance, or enhancements to current services could be considered to better enhance palliative care service delivery. In addition, in the 2027 ESRD proposed rule, concurrently, we are requesting information to advance payment policy and better understand the differences between maintenance dialysis and dialysis delivered in a comfort-focused context. Comments regarding either of these subjects are best delivered to their respective rules.

In coordination with these requests for information, we are additionally seeking comment on the specific requirements we should consider given the prior CMS Innovation Center model tests focused on complex and serious illness care. The evaluation findings from these prior tests are best summarized in the CMS Innovation Center white paper on '*Palliative care projects: Synthesis of Evaluation Results 2012–2021'*.[125] These results indicate that a comprehensive approach to palliative care services, including access to interdisciplinary teams, home visits, and shared-decision-making may improve care for Medicare beneficiaries.

We continue to prioritize reducing fraud, waste, and abuse throughout CMS programs, and have prioritized reducing fraud, waste, and abuse in hospice programs. While hospice care is not palliative care, in related disciplines and sites of care we are very interested in how to better address fraud, waste, and abuse.

Where should CMS focus on potential fraud, waste, and abuse in community-based palliative care? Please support your statements with peer-reviewed evidence or evidence from your institution with sufficient detail for review.

b. Eligibility for Serious Illness Care

Defining which beneficiaries are eligible for serious illness care is a principal challenge in palliative and supportive care. While many Medicare beneficiaries may benefit from additional supportive care to manage pain and symptom burden, understanding which beneficiaries should be eligible for this service is of central importance to Medicare. For example, complex chronic care management services require two or more chronic conditions placing the beneficiary at high risk for hospitalization, decline, or death, and requires moderate to high complexity medical decision-making. To elect the Medicare Hospice Benefit, two or more physicians must certify a beneficiary is within 6 months to the end of their life (or, if a beneficiary does not have an attending physician, then the hospice physician alone is permitted to provide the certification).

We are requesting feedback on eligibility and care management services, and for all comments please support your statements with peer-reviewed evidence or evidence from your institution (in sufficient detail for review):

- For any future supportive or palliative care service for Medicare beneficiaries, should eligibility be restricted to certification of a likely life expectancy duration?
- If eligibility is restricted to those beneficiaries with a terminal prognosis, is there evidence to suggest a reasonable interval (that is, less than 1 year of life expectancy as in some States' Medicaid programs)?

c. Eligibility for Palliative Services

Defining eligibility for palliative services beyond the potential criterion of a terminal prognosis is likely necessary to better understand who is eligible for serious illness care.[126] While for complex care management services we restrict eligibility to beneficiaries requiring moderate to complex medical decision making as well as a count of chronic conditions, common definitions of serious illness include not just chronic condition counts but also indicators of the impact on a person's daily function or excessive caregiver strain.[127]

We are requesting feedback on the following:

- For any future supportive or palliative care service for Medicare beneficiaries, how could we consider impact on the daily functions of life or activities of daily living as part of who is eligible for the service?
- Would eligibility best be based on impact on daily function, on caregiver strain, or both?
- How can we avoid overly burdensome requirements for defining eligibility for services?

d. The Future of the Care Management Services

In section II.E. of this proposed rule, we are explicitly reconsidering the future of the care management services that form the basis for payment adequacy for important between visit care (in addition to E/M services for outpatient or home visits). Care for the seriously ill involves interdisciplinary care teams and involves even greater coordination and between visit care than primary care services.[128]

We are requesting feedback on the following:

- How should we differentiate the care management requirements for seriously ill beneficiaries from other Medicare beneficiaries?
- What are the essential service elements that must be included? For example(s), continuity with a designated team member, access to timely clinical support, comprehensive symptom and caregiver assessment, electronic care plans, coordination with treating physicians, patient/caregiver education, timely follow up after ED/discharge. What other service elements should be included? Should any not be included?

e. Advanced Primary Care Management

Currently, for Advanced Primary Care Management (APCM) services (HCPCS codes G0556 through G0558), we require physicians to report to the MIPS Value Pathway for primary care as part of our safeguards for high quality primary care. If we elect to develop additional care management services for seriously ill beneficiaries, however we

[125] *https://www.cms.gov/priorities/innovation/data-and-reports/2022/palliative-care-synthesis-2012-2021.*

[126] Kelley AS, Covinsky KE, Gorges RJ, McKendrick K, Bollens-Lund E, Morrison RS, Ritchie CS. Identifying Older Adults with Serious Illness: A Critical Step toward Improving the Value of Health Care. Health Serv Res. 2017 Feb;52(1):113–131. doi: 10.1111/1475–6773.12479. Epub 2016 Mar 18. PMID: 26990009; PMCID: PMC5264106.

[127] *https://pmc.ncbi.nlm.nih.gov/articles/PMC5756466/pdf/jpm.2017.0548.pdf.*

[128] *https://www.capc.org/toolkits/building-and-supporting-effective-palliative-care-teams/.*

may define serious illness in the future, determining how best to report quality of care safeguards will be essential to ensure high quality care delivery.

We are requesting feedback on the following:

- Should care management services for seriously ill beneficiaries also require reporting to a MIPS Value Pathway? Which quality measures should be reasonably included?
- If no viable MIPS Value Pathway reporting mechanism is found, what are the essential quality elements required for palliative care management? Is sole reporting of ambulatory palliative care patients feeling heard and understood (CBE 3665) sufficient? Should other measures be considered?

Comment: Commenters broadly supported the development of community-based palliative services in Original Medicare. Commenters also noted concern about establishing prognosis as an eligibility criterion, given the clinical uncertainty of prognosis, and reasoned instead for the use of criteria to define serious illness needs such as symptom burden, functional decline/frailty, cognitive impairment, complex care needs, utilization, and/or caregiver strain. Commenters emphasized the importance of defining palliative care services for beneficiaries *prior to* hospice election while beneficiaries continue curative or disease-modifying treatment. Commenters suggest any future community palliative services in the PFS support interdisciplinary team-based care and recognize intensive longitudinal and between-visit work, highlighting the inadequacy of current E/M payments and the existing care management codes. Commenters differed on whether home-based capabilities should be required for community palliative services. For quality measurement, commenters emphasized addressing 'what matters' rather than focusing on documentation, and 'what matters' according to commenters is goal-concordant care, symptom management, caregiver experience/support, days at home and fewer hospitalizations. While commenters acknowledge our important actions to safeguard against fraud, waste, and abuse in hospice, they emphasize that these concerns may be less prominent in defining potential future community-based palliative services in the Physician Fee Schedule.

Response: We will use these comments to advise future rulemaking.

3. Request for Information on Intensive Lifestyle Interventions To Slow Progression of Alzheimer's Disease

a. Background

In the CY 2026 Physician Fee Schedule proposed rule, CMS sought comment in a 'Prevention and Management of Chronic Disease' Request for Information (90 FR 32507), addressing management and self-management of chronic disease, services that address root causes of disease, social isolation and loneliness, improving physical activity, intensive lifestyle interventions, enhancing uptake of the annual wellness visit (AWV), supporting partnerships with AAAs and community care hubs, and addressing motivational interviewing and health coaching. For some topics, responses were of adequate depth for CMS to consider further action, addressed elsewhere in this rule, but as is not uncommon when CMS requests information across a broad range of topics, in other areas responses were limited in the depth and granularity necessary for CMS to address the resource costs to establish coding and payment options. Because of the overwhelming priority for CMS to support the aging processes, given that American older adults commonly cite their fear of Alzheimer's as an even greater health related fear than the development of cancer,[129] and the growing evidence base for using lifestyle changes to slow the progression of cognitive decline and the development of Alzheimer's disease and Alzheimer's disease-related dementias (AD/ADRD), CMS is requesting additional information to better understand the resource costs and requirements for developing intensive lifestyle interventions to reduce the risk of AD/ADRD for Medicare beneficiaries. Intensive lifestyle interventions would be in concert with but would not specifically include risk factor reduction in modifiable behaviors such as controlling contributing conditions (for example, hypertension, diabetes), eliminating tobacco use (in any form), and addressing hearing loss.[130] In other countries, there is randomized controlled trial evidence that multi-domain approaches can slow cognitive decline amongst at-risk older adults,[131] which appear to be superior to individual domain interventions such as physical activity programming or diet changes.[132] In the U.S. there have also been a number of studies demonstrating the potential impact of diet changes on cognition (for example, the MIND trial demonstrated improved cognition for both groups undergoing diet changes, however one diet was not shown to be superior).[12 13 14 133] To support high-value care, the payer assuming financial risk for an individual's health would do so over a long-term to give that payer an incentive to invest in high-value care that reduces health care costs over that long-term. As discussed in the recent HHS Notice of Benefit and Payment Parameters for 2027,[134] creating these incentives for payers throughout the healthcare system is an HHS priority. Outside of these needed incentives exists Medicare fee-for-service, which has historically employed price-setting regimes that are not market-based and are slow to change with improvements and health innovations. As HHS continues to improve incentives for private payers to invest in preventive health care, we are interested in how to ensure fee-for-service Medicare is similarly able to benefit from better incentives to invest in high-value care.

To better understand resource costs associated with intensive, multi-domain interventions:

- Given the discussion of the evidence to date on the effectiveness of intensive lifestyle interventions for CMS to pursue, we are particularly interested in demonstrations of cost-savings associated with these and other interventions. Please cite any evidence available in your discussion.
- Given CMS' concern for addressing fraud, waste, and abuse throughout the Medicare program, please comment on any potential or observed FWA in

[134] *https://www.govinfo.gov/content/pkg/FR-2026-05-20/pdf/2026-10050.pdf.*

diagnosis, treatment, or management of AD/ADRD.

- Given the emerging role of biomarker diagnostic testing (for example, p-tau217, et al.) for AD/ADRD leading to early diagnosis, please provide any evidence supporting earlier detection and its role in supporting improving AD/ADRD care and any potential role in identifying eligibility for an intensive lifestyle intervention focused on AD/ADRD.
- What are the essential domains to address in a multi-domain intensive lifestyle intervention to reduce the risk of cognitive decline for older adults at risk for developing AD/ADRD that would be appropriate to include under Medicare?
- Should these interventions be made available as a one-time service (that is, to teach older adults how to make changes in their lifestyle to help reduce AD/ADRD risk) or on a recurring (for example, annual) basis?
- Should the eligibility for these services be restricted to beneficiaries with a diagnosis of mild cognitive impairment (MCI), or early-stage dementia? If so, how should this diagnosis be made or confirmed?

Respondents to the general intensive lifestyle intervention question in the prior RFI focused on the differentiation between intensive lifestyle interventions (ILIs) and intensive behavioral therapy (IBT) where ILIs are more multi-domain, longitudinal, and comprehensive and typically incorporate a multi-disciplinary team and are delivered in a community setting, and noting these are needed flexibilities that current IBT coding does not currently accommodate. To better understand the resource costs and requirements for future AD/ADRD ILI services:

- Given ILI's are multi-domain, and likely include physical activity, nutrition, potentially additional domains such as sleep and stress management, who are the essential interdisciplinary team members that CMS should account for in developing appropriate resource costs for future services?
- How should supervision be determined for AD/ADRD ILI's? Is general supervision sufficient for ensuring clinical safety and oversight? Is direct supervision required?

While there are many variations of ILI's focusing on AD/ADRD that are delivered, the essential 'dose' of intervention or minimum frequency and duration of a future service, as well as the modality (that is, must this intervention be delivered purely in person, can it be delivered virtually) are all important to consider:

- What is the minimum frequency of sessions for an AD/ADRD ILI per week? What is the minimum number of weeks that will be necessary?
- Should CMS require a future AD/ADRD ILI to be delivered in person? Can it be delivered virtually?

Finally, while we are currently accepting applications for a CMS Innovation Center payment model to generate evidence associated with lifestyle interventions (MAHA ELEVATE),[135] including potentially intensive lifestyle interventions focused on reducing risk and/or slowing progression of AD/ADRD, currently CMS has no endorsement process for specific interventions. In development of the CMS Health Technology Ecosystem[136] and the library of applications:

- How should CMS support the development of our Health Technology Ecosystem to support older adults reducing their risk for developing AD/ADRD using intensive lifestyle changes?

Please note, this is a request for information (RFI) only. In accordance with the implementing regulations of the Paperwork Reduction Act of 1995 (PRA), specifically 5 CFR 1320.3(h)(4), this general solicitation is exempt from the PRA. Facts or opinions submitted in response to general solicitations of comments from the public, published in the **Federal Register** or other publications, regardless of the form or format thereof, provided that no person is required to supply specific information pertaining to the commenter, other than that necessary for self-identification, as a condition of the agency's full consideration, are not generally considered information collections and therefore not subject to the PRA.

We received public comments in response to this request for information.

Comment: Commenters generally view the evidence on intensive lifestyle interventions as a promising opportunity to continue to develop potential PFS services, and recommend focusing interventions early in the disease trajectory, such as for beneficiaries with mild cognitive impairment (MCI) or early-stage Alzheimer's Disease (ADRD) and where cognitive decline is identified through a validated assessment. Commenters endorse the use of a multi-domain model (versus a single-intervention) in the design of future intensive lifestyle intervention services, and many commenters recommended domains such as physical activity, nutrition, cardiovascular and other chronic disease management, and social engagement and provided mixed responses on sleep and stress management. Many commenters also recommend a structured, longitudinal intervention, using flexible, team-based services (including hybrid and virtual services) which may be furnished with other existing dementia services. For biomarker testing, commenters were mixed on the role of biomarker testing and emphasized it may be one component to early ADRD detection and diagnostic confirmation but cautioned against unvalidated or unnecessary biomarker testing.

Response: We will consider this for potential future rulemaking.

H. Current Procedural Terminology (CPT) Request for Information (RFI)

The Current Procedural Terminology (CPT®) coding system is owned and copyrighted by the American Medical Association (AMA) and CMS uses CPT® under a royalty-free licensing agreement with the AMA.[137] The CPT® coding system was introduced by the AMA in 1966,[138] in part to ''encourage the use of standard terms and descriptors to document procedures in the medical record'' and ''help communicate accurate information on procedures and services to agencies concerned with insurance claims,'' and it ''provided the basis for a computer oriented system to evaluate operative procedures and contributed basic information for actuarial and statistical purposes.''[139] The CPT® coding system went through a series of early version changes and in 1977 the AMA established the CPT–4 or 4th edition which established the current five-digit numeric structure of the CPT® coding system still used

today.[140] The Health Care Financing Administration or HCFA, later renamed CMS,[141] in 1983 required the use of the Healthcare Common Procedure Coding System (HCPCS) for physician services and expanded to non-physician services in 1991.[142] and since this time HCPCS Level I services have been considered synonymous with CPT, where Level II HCPCS refers to additional products, supplies, and services not included in the CPT® codes.[143]

Following the passage of the Health Insurance Portability and Accountability Act of 1996 (HIPAA) the Department of Health and Human Services (HHS) in subsequent regulation defined the combination of HCPCS, as maintained and distributed by HHS, and CPT–4, as maintained and distributed by the AMA, as the nationally required medical data code sets for physician services, physical and occupational therapy services, radiologic procedures, clinical laboratory tests, other medical diagnostic procedures, hearing and vision services, and transportation services including ambulance services (45 CFR 162.1002(a)(5)). This is commonly understood as a regulatory requirement for CPT–4 codes to be used to define physician services. While this is HHS' current regulatory interpretation of the HIPAA (Pub. L. 104–191), it is important to note that HHS has only specified in regulation that HCPCS and CPT–4 to be used in combination. There is no specification in the HIPAA statute regarding the manner in which these national coding sets may be used or how they may be combined, and only HHS interpretation, not the Act itself, mentions CPT®.

New CPT® codes are introduced by the CPT® Advisory Committee. This committee was established following the initial publication of the CPT® coding system in 1966, which provides advice on procedure coding and appropriate nomenclature as relevant to the committee member's specialty and consists of ''members of national medical specialty societies seated in the AMA House of Delegates.''[144] When a new CPT® code is defined by the CPT® Advisory Committee, it is then assigned a payment value by the AMA Relative Value Scale Update Committee or RUC.[145]

The AMA RUC was established in 1992, after CMS transitioned to the resource-based relative value scale (RBRVS), to provide recommendations on the valuation of physician services. As established in section 1848 of the Act, CMS began paying for physician services in 1998 on the basis of a product of the relative value of the physician service, incorporating the physician work, the practice expense, and the malpractice component. These elements form the basis for the RBRVS. The components of physician services were originally established by a team of Harvard researchers (William Hsiao, et al.) and CMS has occasionally referenced the 'Harvard' valuations making reference to these original contributions.[146] According to the AMA, the AMA RUC ''*provides medicine a voice in shaping Medicare relative values,*'' and by all published estimates this has been an effective mechanism.[147]

There has also been longstanding concern expressed over the Federal reliance on a private organization with such an obvious conflict of interest providing information on the time and resource requirements to conduct physician services when this information may influence their own payment. For nearly 20 years, MedPAC has expressed concern over the influence of the AMA RUC to value services, specifically noting that CMS has ''*over-relied on specialty societies with a financial stake in the process*'' and has recommended that CMS establish a separate group of experts to make payment recommendations.[148] Further, we note the historic reliance on the CPT and RUC process as a potential contributor to the development of US health care as a 'sick care' system with limited emphasis on prevention and lifestyle modifications and which may inhibit progress on the Secretarial priority to Make America Healthy Again. Additionally, we note a recent National Academies of Sciences, Engineering, and Medicine (NASEM) report recommending RUC alternatives for establishing primary care payment valuation and recommendations for alternative sources for data collection.[149]

Given these longstanding concerns, we sought comment on a number of areas regarding the influence of the CPT® coding system and the AMA process on physician payment policy as part of the Secretarial priority to Make America Healthy Again.

(1) What, if any, evidence is there for CMS to consider regarding the harms or challenges associated with AMA's monopoly over CPT–4 licenses for health care entities? We sought comments on potential improvements to patient care diverted or delayed due to AMA'S monopoly over CPT codes, including inhibited innovations and acquisition or maintenance costs of CPT® licensure.

Comment: Commenters identified issues with the AMA's CPT® licensure process, but many commenters shared their concerns with the challenges associated with introducing alternative coding standards to CPT® and highlighted the importance of having a unified national coding standard. Very few commenters agreed with removing royalties from the CPT process. Issues identified by commenters included the perceived legal discrepancy between the CPT–4 code set being federally mandated and the fact that it is owned privately.

Response: We thank commenters for their feedback, and we will use these comments to advise us for future rulemaking.

(2) What, if any, evidence is there that the generation of CPT–4 codes follows a process of identification of medical

necessity? What opportunities or examples from other populations, sites of care, or international health systems could instruct a process of identification of medical necessity in the CPT–4 code development process?

Comment: Commenters generally answered this question by highlighting the importance of differentiating between the AMA's process for CPT–4 code development and the subsequent and distinct process for the RUC to assign relative payment recommendations. Commenters emphasized the role of CPT® as a nomenclature system and that medical necessity decisions are left to payors.

Response: We thank commenters for their feedback, and we will use these comments to advise us for future rulemaking.

(3) A combination of CPT–4 and HCPCS codes were formally adopted by HHS as the legal standard for national coding for physician and other services as part of implementing HIPAA (45 CFR 162.1002(a)(5)). If CMS were to revisit this standard in future rulemaking, which if any alternatives exist to CPT–4 for CMS to consider as part of the national coding standard for physician services? Would CMS need to specify a separate legal standard, or could CMS allow for private competition to supplement the existing CPT–4 coding standard?

Comment: Many commenters expressed concern about transitioning to alternative or multiple coding standards, and advocated for CMS to improve the current standard. Others highlighted that while there is no unified national standard the CPT functions can decompose across a number of code sets (for example, inpatient procedures may utilize the CMS ICD–10–PCS coding system, general clinical services may utilize SNOWMED CT®, labs may utilize LOINC®, etc.) and highlighted where CMS has already begun to make progress on this mapping through CMS' development of HCPCS codes such as chronic care management or principal illness navigation.

Response: We thank commenters for their feedback, and we will use these comments to advise us for future rulemaking.

(4) What objective alternatives exist, or could be developed, to maintain a more objective process to the current AMA CPT and RUC committee processes? How would these alternatives support or inhibit innovation?

Comment: Many commenters suggested opportunities to improve the AMA CPT® Editorial Panel process of developing new CPT® codes and the AMA Relative Value Update Committee or RUC process of making recommendations to CMS on the valuation, or relative resources involved in, furnishing a physician service. In addition to specific suggestions for improvements, commenters also highlighted a perceived bias against 'cognitive' in favor of 'procedural' services (including several examples of cognitive work that was 'invisible' such as managing patient portal messages) and the challenges in measuring and attributing resources of diffuse longitudinal work, especially regarding the undervaluation of primary care services. Commenters also highlighted the contribution of the AMA RUC towards creating a shortage of primary care practitioners.

Commenters made many more recommendations to improve the AMA RUC process than the CPT® Editorial Panel process. On the CPT process, commenters suggested methods to improve transparency, such as by publishing a formula to define 'widespread use' to better keep pace with advances in technology. On the AMA RUC process, commenters suggested improvements to the data sources used, improvements to the composition of the committee, and suggestions for reducing the conflict of interest inherent in a group of physicians recommending how they or their colleagues will be reimbursed for their services. Many commenters made additional recommendations for AMA RUC improvements, including incorporating more objective or 'empiric' data in their recommendations, such as incorporating EMR or registry data rather than surveying practicing physicians. Commenters suggested a series of structural reforms to the AMA RUC, including changing the specialty composition of the committee members (*e.g.* more geriatrics and primary care representation, or representation proportional to the number of practicing physicians rather than a single representative for each specialty). Commenters suggested a series of recommendations to make the AMA RUC process more transparent, including that the AMA RUC make public their methodology in a public repository which would include the standards and data used in their valuation recommendations for physician work. Other commenters recommended CMS independently verify RUC recommendations before accepting them. Commenters also recommended CMS establish an external advisory body (for example, using a technical expert panel or an existing Federal Advisory Committee) that may work alongside the RUC to supplement the existing process, although commenters differed on their recommendations for who should constitute this external advisory body (i.e. non-physician experts or physician and non-physician experts) or if it should supplement, or replace, the AMA RUC. Commenters recommending an AMA RUC replacement suggested it may be modeled on the Medicare Payment Advisory Committee (MedPAC) which advises Congress on the Medicare program.

In addition to providing suggestions related to the data used for making valuation recommendations, the committee composition, potential solutions for addressing conflicts of interest, and potential supplemental or alternative committee structures, commenters also made recommendations on how the AMA RUC could make recommendations to CMS beyond the relative resource costs or valuation for physician services, to also include other areas of importance to CMS, such as value-based payment or outcomes-based payment. Commenters also suggested the AMA identify a process for retiring low-value services.

Response: We thank commenters for their feedback. While the original intent of this request for information was for CMS to better understand potential harms associated with the AMA's monopoly on CPT–4 licensing and solicit comments on alternative coding standards for physician services, to adequately describe the CPT–4 code development process required us to describe both the CPT® Editorial Panel and the AMA Relative Value Scale Update Committee (RUC). We will consider comments received on the CPT® process for future rulemaking. The overwhelming majority of public comments focused on the AMA RUC.

Given the robust public response focused on improvements to the AMA RUC, CMS is considering a number of potential avenues for improving this process that could take into consideration commenters' recommended changes to the RUC that could enhance transparency, improve data used for making payment recommendations, modify committee composition, take steps to become more independent, or evaluate retirement of low-value services.

It is in both CMS and the public's interest to consider input from doctors and front-line medical health professionals about the medical services they perform in their daily patient care,

and we reiterate that CMS considering the relative resource costs associated with services in accordance with 42 U.S.C. 1395w–4(c) when setting payment for physician services. CMS reiterates the RUC or other organizations may submit data to support valuation of physician services, and we encourage all organizations to do so.

Any organization providing recommendations on the relative resources required for furnishing a physician service should consider using empiric data to establish their recommendations. This may include use of empiric data sources such as statistically valid sampling of clinicians, auditable cost reports in physician settings or other government or non-government payment systems, and other information relevant to assessing both supply- and demand-side factors relevant to assessing the value of a given item or service, including data on market prices.

For examples of using empiric data and data on market prices, in recent rulemaking CMS has proposed and finalized use of data for specific services in the Medicare Outpatient Prospective Payment System that we believe are applicable for clinician rate setting in the Physician Fee Schedule as well. As part of CMS' broader strategy of considering market-based data to inform rate setting, we welcome more information about negotiated rates between clinicians and private payors in a number of specific contexts (for example, rates negotiated by Medicare Advantage plans caring for a comparable population to Original Medicare, self-insured employers, or commercial payors both within and outside of other government health programs). Such feedback will help to advance CMS's priority of aligning program spending with the value of health care items and services by adopting relevant best practices from market contexts.

In addition to providing resource recommendations on the basis of empiric data and market-based information, CMS is also very interested in information on the clinical outcomes the service would be reasonably expected to achieve, including information on distribution or clinical variation in outcomes that would be reasonably expected (or not expected) to occur. We believe that considering application of outcomes-based payment within Medicare is an important factor in progressing towards more accountable and value-based care that is a longstanding priority of CMS.

We highly value the expertise of volunteer groups of physicians who submit relative resource recommendations and reaffirm the crucial role for physicians to provide input to the federal government based on their firsthand expertise regarding complex medical procedures and non-procedural services. CMS also reiterates that we have sole authority to establish payment rates for physician services for the Medicare program, and we strongly encourage any group submitting data to support rate setting for physician services to both utilize empiric data and further submit information on the clinical outcomes that may be expected based on the physician service being furnished. We may in future rulemaking establish these or additional requirements for organizations providing information on the relative resources involved in furnishing physician services.

To describe what information would be helpful for CMS regarding the outcomes expected upon furnishing a physician service, to use an example from the 2027 Physician Fee Schedule, CPT code 27447 describes a total knee arthroplasty (TKA). In addition to understanding the relative resources associated with furnishing the service, which are typically provided by the RUC, CMS would like to better understand the expected outcomes. After a total knee arthroplasty, what proportion of Medicare beneficiaries would have improved range of motion of the affected joint? What proportion would not? What proportion would have improvements in pain, either total or partial resolution? What is a typical recovery time from surgery? What proportion of patients in an orthopedic surgeon's practice would expect to have complications from the procedure, should they be a surgical site infection, venous thromboembolism (or many other potential complications)? What proportion of TKA recipients may eventually require revision of the joint, and on what time horizon? CMS sees clear value in understanding these expected outcome distributions to understand 'typical' practice or practice within commonly clinically accepted standards and practices as we seek to accurately value physician services.

(5) What are the benefits and drawbacks of paying for physician procedural services on the basis of the underlying International Classification of Diseases, 10th Revision (ICD–10) procedure code, as an alternative to CPT–4 code? How could the International Classification of Diseases, 10th Revision, Procedure Coding System (ICD–10–PCS) services be grouped or bundled into payment categories, similar to Medicare Severity Diagnosis Related Groups (MS–DRGs), or Outpatient Prospective Payment System (OPPS) Ambulatory Payment Classifications (APCs)? What other alternatives exist for bundling or grouping procedural services?

Comment: Commenters highlighted that while CPT–4 codes and ICD–10 procedure codes may overlap, there are differences, and suggested there may be potential drawbacks to considering physician payment on the basis of ICD–10 procedure codes. There were few commenters specifically addressing bundling services in methods analogous to the MS–DRGs or OPPS APCs.

Response: We thank commenters for their feedback, and we will use these comments to advise us for future rulemaking.

III. Other Provisions of the Proposed Rule

A. Drugs and Biological Products Paid Under Medicare Part B

1. Requiring Manufacturers of Certain Single-Dose Container or Single-Use Package Drugs To Provide Refunds With Respect to Discarded Amounts (§§ 414.902 and 414.940)

a. Background

Section 1847A(h) of the Act requires manufacturers to provide a refund to CMS for certain discarded amounts from a refundable single-dose container or single-use package drug (hereinafter referred to as ''refundable drug'') for calendar quarters beginning January 1, 2023.

The calculation of the refund is codified at § 414.940(c). For a new refund quarter (as defined at § 414.902) beginning on or after January 1, 2023, an amount equal to the estimated amount (if any) by which:

- The product of the total number of units of the billing and payment code for such drug that were discarded during such new refund quarter; and the amount of payment determined for such drug or biological under section 1847A(b)(1)(B) or (C) of the Act, as applicable, for such new refund quarter.
- Exceeds an amount equal to the applicable percentage of the estimated total allowed charges for such drug for the new refund quarter.

Section 1847A(h)(3)(B)(i) of the Act establishes an applicable percentage of 10 percent, but provides that, in the case of a refundable drug that has unique circumstances involving similar loss of product as that described in section 1847A(h)(8)(B)(ii) of the Act, the Secretary, through notice and comment rulemaking, may increase such applicable percentage as determined

appropriate by the Secretary. Section 1847A(h)(8)(B)(ii) of the Act describes a drug or biological approved by the Food and Drug Administration (FDA) for which dosage and administration instructions included in the labeling require filtration during the drug preparation process, prior to dilution and administration, and require that any unused portion of such drug after the filtration process be discarded after the completion of such filtration process. Drugs with an increased applicable percentage are listed on the CMS website.[150]

For previous rulemaking in which we finalized to increase the applicable percentage of a drug with unique circumstances involving similar loss of product as that described in section 1847A(h)(8)(B)(ii) of the Act, we explained specifically why the loss of product met the statutory requirements. In the CY 2023 Physician Fee Schedule (PFS) final rule (87 FR 69729), we finalized an increase in the applicable percentage for a drug reconstituted with a hydrogel and administered via ureteral catheter or nephrostomy tube into the kidneys, where a substantial amount of reconstituted hydrogel adheres to the vial wall during preparation and cannot be withdrawn for administration. Because this unavoidable preparation-related loss is similar to the loss described in section 1847A(h)(8)(B)(ii) of the Act, we stated that such a drug that is reconstituted with a hydrogel and has variable dosing based on patient-specific characteristics (for example, Jelmyto® (mitomycin for pyelocalyceal solution)) should be considered to have unique circumstances as described in section 1847A(h)(3)(B)(ii) of the Act that would warrant an increased applicable percentage.

In the CY 2024 PFS final rule (88 FR 79057), we increased the applicable percentage for certain drugs with low volume doses and stated that such drugs have unique circumstances because certain FDA-labeled amounts on the vial or package are unused and discarded after administration of the labeled dose and these amounts are not available to be administered. The unique circumstances described for such drugs are similar to loss of product from filtration described in section 1847A(h)(8)(B)(ii) of the Act because in both circumstances, such amounts lost are amounts that are not part of the recommended dose and are not available to be administered to the patient (one being loss due to labeled amounts remaining in the filter and the other due to labeled amounts remaining in other areas such as the vial or syringe).

In the CY 2024 PFS final rule, we also finalized an increased applicable percentage for certain orphan drugs furnished to fewer than 100 unique beneficiaries per calendar year. We explained (88 FR 79053 through 79057) that because of the substantial statistical variation (based on demonstrated JW modifier claims data from 2021 and 2022) from quarter to quarter for such drugs, we believe it would be difficult to optimize the presentation of the drug to consistently minimize the discarded amounts to less than 10 percent given the small number of patients receiving the drug. We considered the higher percentage of unused and discarded amounts from such drugs as unavoidable loss due to both the low number of unique beneficiaries receiving the drug contributing statistically higher variability in discarded amounts. Also, due to the low numbers of patients available to study for rare disease, it may be more difficult to determine the most efficient vial size for the patient population who receive the drug post-marketing. We stated this is similar to the loss of product due to filtration described in section 1847A(h)(8)(B)(ii) of the Act because the loss is unavoidable in both circumstances. In the case of filtration described in statute, the loss is unavoidable because certain amounts of product will be left within the filter and unavailable for administration; in the case of rarely utilized orphan drugs, the loss is unavoidable because of the variability of potential doses (and low number of patients receiving the drug) leading to an inability to develop a package size that will result in a consistent average percentage of discarded units.

We stated in the CY 2024 PFS final rule (88 FR 79057) that we do not consider the following to be unique circumstances warranting an increased applicable percentage at this time: weight-based doses, body surface area (BSA)-based doses, varying surface area of a wound, loading doses, escalation or titration doses, tapering doses, and dose adjustments for toxicity because we believe manufacturers can optimize the availability of products for these circumstances to limit the percentage of discarded units for a drug, unlike the circumstances of manufacturers of drugs that require filtration during the preparation process, as described in section 1847A(h)(8)(B)(ii) of the Act.

We also explained in the CY 2024 PFS final rule (88 FR 79060) that, while we cannot anticipate future drug development or what unique circumstances might arise, we can offer our analysis of the unique circumstances we consider involving similar loss of product as that described in section 1847A(h)(8)(B)(ii) of the Act for drugs that are reconstituted in hydrogel and with variable dosing based on patient-specific characteristics (87 FR 69727 through 69731), drugs with low volume doses, and rarely utilized orphan drugs (88 FR 79052 through 79057). Regarding examples of evidence, we noted minimum vial fill studies and dose preparation studies in the CY 2024 PFS proposed rule, both of which are suitable for justifying increased applicable percentages because they can establish that certain unusable amounts of a product are necessarily included in a container to safely and consistently administer the labeled therapeutic dose to a patient.

b. Application for Increased Applicable Percentage

Section 1847A(h)(3)(B)(ii) of the Act permits the Secretary to increase the applicable percentage for a refundable drug that has unique circumstances through notice-and-comment rulemaking. In the CY 2024 PFS final rule (88 FR 79057 through 79060), we finalized an application process (CMS–10835, OMB 0938–1435) by which manufacturers can apply for an increased applicable percentage for a drug and may request that we consider an individual drug to have unique circumstances for which an increased applicable percentage is appropriate. Under § 414.940(e)(2), an application must be submitted by February 1 of the CY prior to the year the increased applicable percentage would apply; for a drug that is not FDA-approved by February 1, the application must have FDA approval by August 1, and the manufacturer must notify CMS and submit the FDA-approved label by September 1 of that year. The application must include a written request that the drug be considered for an increased applicable percentage based on its unique circumstances; FDA-approved labeling for the drug (or, if the drug is not approved by the February 1 application deadline described in paragraph (e)(2) of this section, documentation of FDA acceptance of the application for review); justification for the consideration of an increased applicable percentage based on such unique circumstances; and justification for the requested increase in the applicable percentage. Following review of timely applications, CMS will summarize its analyses of applications and propose

[150] *https://www.cms.gov/medicare/payment/part-b-drugs/discarded-drugs.*

appropriate increases in rulemaking. If adopted, the increased applicable percentage will be the applicable percentage beginning January 1 of the following calendar year.

In the CY 2027 PFS proposed rule (91 FR 43954 through 43956) we discussed the one application we received requesting an increased applicable percentage for consideration for CY 2027 from the manufacturer of Leukine® (sargramostim),[151] who resubmitted a request for a 72 percent applicable percentage after applying the previous 2 years. The applicant submitted the information required at § 414.940(e)(1), including, as applicable, FDA-approved labeling for the drug, justification for consideration of an increased applicable percentage, and justification for the requested applicable percentage.

Leukine® is a leukocyte growth factor with five FDA-approved indications related to hematological conditions and hematopoietic recovery, as well as one indication to increase survival following acute exposure to myelosuppressive doses of radiation. The applicant's submitted FDA-approved labeling for the drug does not include the adjuvant uses described in the application (further described later in this paragraph) due to ongoing cancer vaccine adjuvant trials. The applicant reemphasized that multiple sponsors are in late-stage development, with a total of 27 Phase II and Phase III clinical trials, an increase from 22 reported in the previous year, investigating Leukine® as a vaccine adjuvant for oncology indications, specifically to stimulate the immune response of dendritic cells when used alongside these vaccines. We note that cancer treatment vaccines differ from the vaccines that protect against viruses, such as the influenza virus. Instead of preventing disease, cancer treatment vaccines aim to stimulate the immune system to attack existing cancer cells in the body.[152] The applicant stated that it has no ownership stake in the development of these cancer treatment vaccines and does not possess control or influence over the design and execution of the clinical trials. The applicant further explained that the estimated completion dates for Phase III clinical trials vary, with the earliest expected in late 2026 [153] [154] and the latest in March 2029.[155] Since the publication of proposed rule (91 FR 43842), we identified that the estimated completion date for one of the three Phase III clinical trials has been updated to December 2031.[5]

The adjuvant use of Leukine® in predetermined dosage is distinct from its six FDA-approved indications, all of which have dosages that are based on body weight or BSA. The adjuvant use dosages of Leukine® in clinical trials are generally much smaller than dosages for indications in the FDA-approved labeling. The smallest dose of Leukine® used for vaccine adjuvant purposes of which the applicant is aware (that is, 70 mcg) would lead to as much as 72 percent of the drug being discarded from a single-dose 250 mcg lyophilized vial, which is the only size available commercially. The applicant suggests that if use of these small doses were to become more common for an approved indication, the percentage of discarded units could increase the discarded drug refund amount that could be owed by the applicant, even though the applicant lacks control or knowledge of the potential variability of the discarded amounts that may occur if Leukine® were used for such purposes. The applicant notes that if another manufacturer were to seek FDA approval for adjuvant use of sargramostim but was not involved in its production, the available single-dose 250-mcg vial presentation of Leukine® would likely not be optimized for the small doses being studied in these trials. The applicant also expresses concern about potential refund liability if small-dose adjuvant use becomes more common.

The application builds on prior submissions by reiterating that Leukine® appears on FDA's list of essential medicines,[156] that the Administration for Strategic Preparedness and Response (ASPR) has documented a requirement to procure and stockpile Leukine® as a medical countermeasure for neutropenia resulting from acute radiation syndrome,[157] and that the applicant continues to collaborate with the Biomedical Advanced Research and Development Authority (BARDA). In this application, the applicant also newly states that Leukine® has been designated a ''Medical Product Priority'' by the Department of Defense (DoD) under Public Law 115–92 (enacted December 12, 2017).[158] DoD maintains a Medical Product Priority list as part of the DoD–FDA coordination framework established following Public Law 115–92 and formalized in the FDA-DoD Memorandum of Understanding.[159] Under this framework, DoD identifies and maintains a list of its highest-priority medical products to support focused, recurring engagement with FDA; however, we could not corroborate a Leukine® designation using resources available for public review. The applicant's 2022 public announcement of an Other Transaction Agreement with the DoD references Leukine® as a potential medical countermeasure for sulfur mustard gas exposure,[160] but it does not reference a ''Medical Product Priority'' designation. Additionally, a study published in 2025 comparing essential medicines across U.S. Federal agencies and the World Health Organization did not identify Leukine® on DoD's operational medicines list. The study noted that the DoD operational medicines list is a subset of FDA's essential medicines list—meaning medicines on the DoD list also appear on FDA's list, but not all medicines on FDA's list appear on the DoD list.[161] Nevertheless, these emergency-response and preparedness-related listings or designations do not, by themselves, demonstrate unique circumstances related to discarded amounts for purposes of an increased applicable percentage because they are designed to support Federal planning, procurement, and interagency coordination to ensure adequate supply of essential products, rather than to provide evidence of drug-specific, unavoidable product loss similar to loss of product as described in section 1847A(h)(8)(B)(ii) of the Act.

In the CY 2027 PFS proposed rule (91 FR 43955), we explained as part of CMS's review of the application, we analyzed existing claims data from the first quarter of 2018 through the last quarter of 2025 and found the percentage of units discarded for Leukine® (HCPCS code J2820) ranged from 1.1 percent to 4.9 percent, which

[161] ML Janvrin, A Kanagaratnam, VA Suarez et al. A comparison of the essential medicines lists of the U.S. Department of Health and Human Services, the U.S. Department of Defense, the U.S. Food and Drug Administration, and the World Health Organization, Journal of the American Pharmacists Association, 65(5), 2025.

is below the applicable percentage of 10 percent. The quarterly discarded percentages during this time frame were stable, with a standard deviation of less than 1 percentage point and values tightly clustered around a mean of approximately 2.4 percent. We noted that this is lower than the 6.21 percent average standard deviation observed for rarely utilized orphan drugs, as reported in the CY 2024 PFS final rule (88 FR 79053). Accordingly, the applicant's requested applicable percentage relies on assumptions about hypothetical future dosing and utilization that are not evident in Part B claims data available to date.

At the time of the CY 2026 PFS proposed rule, the impact of a potential adjuvant indication with a type of immunotherapy commonly referred to as cancer vaccines [162] on the current percentage of units discarded was uncertain. Additionally, it was not yet known whether sargramostim would be approved for additional indications and dosages described by the applicant, and the available data was insufficient for CMS to determine whether Leukine® had unique circumstances prompting an increase in the applicable percentage. Therefore, we did not propose to increase the applicable percentage in the CY 2026 PFS proposed rule. The applicant agreed with CMS's rationale for this decision.

Although the applicant agreed with CMS's rationale in the CY 2026 PFS proposed rule, they submitted a new application for CY 2027 with updated information on oncology vaccine-adjuvant clinical trials and projected timing for potential FDA approvals, as well as an asserted DoD ''Medical Product Priority'' designation. However, the core uncertainties identified in the CY 2026 PFS proposed rule persist: the absence of FDA-approved labeling for the asserted adjuvant indication(s) or dosage(s) and uncertainty regarding whether such uses would be utilized to an extent that discarded amounts would exceed the applicable percentage in a calendar quarter.

The existing claims data and trends for discarded amounts of sargramostim discussed earlier do not support a determination that Leukine® has qualifying unique circumstances that would support an increased applicable percentage under section 1847A(h)(3)(B)(ii) of the Act. Unlike the analysis leading to an increased applicable percentage for certain orphan drugs which relied on evidence indicating that certain orphan drugs have unavoidable loss of drug similar to the loss of product described in section 1847A(h)(8)(B)(ii) of the Act, the justification presented by the applicant for an increased applicable percentage for their product is based largely on projections regarding potential future oncology vaccine-adjuvant use at smaller doses. These projections assume a utilization scenario in which sargramostim use would shift predominantly to the studied indications at the lowest study dose discussed earlier in this section, rather than remaining primarily under the FDA-approved indications, for which claims data currently demonstrate very low discarded amount percentages with no trending increase. In the absence of qualifying unique circumstances, we did not reach the question of whether the requested applicable percentage would be appropriate.

Accordingly, we did not propose an increase in the applicable percentage for Leukine® for CY 2027. We stated that the applicant may reapply in a future application cycle when more information, such as FDA-approved labeling reflecting new indications or dosages, becomes available.

The following is a summary of the comments we received and our responses.

Comment: We received one comment related to the single application we received for an increased applicable percentage beginning in CY 2027. The manufacturer of Leukine® acknowledged CMS's rationale that there was insufficient information to determine whether Leukine® had unique circumstances warranting an increased applicable percentage and stated that it intends to reapply in a future rulemaking cycle when additional data are available.

The commenter further stated that, beyond the circumstances presented in its original request in the proposed rule, the current 250-mcg vial represents the optimal vial size for Leukine®'s current FDA-approved indications and for additional treatment indications under development. The commenter reiterated that it should not bear discarded drug refund liability attributable to utilization decisions made by unrelated third-party manufacturers over which it has no ownership interest, control, or influence. In support of its request, the commenter also cited Leukine®'s federal designations, marketing authorization in the European Union, and role in the Strategic National Stockpile, stating that refund liability affecting continued production or availability of the product could carry broader public health and national security implications.

Response: We appreciate the commenter's feedback and intent to submit additional data supporting its request in a future application cycle for Leukine®. With respect to the commenter's concern that it should not bear discarded drug refund liability attributable to utilization decisions made by unrelated third-party manufacturers, we note that, based on the claims data described previously, the percentage of discarded units for Leukine® has remained well below the applicable percentage of 10 percent. Because Leukine®'s discarded amounts have not exceeded the applicable percentage, no refund has been owed under the discarded drug refund program for Leukine® to date.

With respect to vial size and indications under development, the commenter provided insufficient data showing that the projected small-dose use or resulting discarded amounts are indicative of unique circumstances involving similar loss of product as that described in section 1847A(h)(8)(B)(ii) of the Act. Absent sufficient evidence demonstrating such unique circumstances, these considerations do not warrant an increased applicable percentage.

Regarding federal designations, marketing authorization in the European Union, and the Strategic National Stockpile, the manufacturer has not shown that these facts provide evidence of drug-specific, unavoidable product loss similar to loss of product as described in section 1847A(h)(8)(B)(ii) of the Act in order to demonstrate unique circumstances related to discarded amounts for purposes of an increased applicable percentage. As discussed in the proposed rule (91 FR 43955), the federal designations and stockpile requirement are designed instead to support federal planning, procurement, and interagency coordination to ensure adequate supply of essential products. Similarly, marketing authorization in the European Union does not demonstrate that a refundable drug has unique circumstances involving loss of product similar to that described in section 1847A(h)(8)(B)(ii) of the Act that would support an increased applicable percentage under section 1847A(h)(3)(B)(ii) of the Act. Such authorization also does not substitute for the FDA approval and labeling requirements specified in § 414.940(e)(1)(ii) and (e)(2).

Accordingly, we continue to find that there is insufficient information at this time to determine that Leukine® has unique circumstances warranting an increased applicable percentage. The

[162] *https://www.cancerresearch.org/treatment-types/cancer-vaccines.*

manufacturer may submit a new application for consideration in a future rulemaking. As described at § 414.940(e), the application (including reapplication) for an increased applicable percentage is due by February 1 of the calendar year prior to the year in which the increased applicable percentage would apply.

Comment: A commenter requested CMS reconsider the policy discussed in the CY 2024 PFS final rule that weight-based doses, BSA-based doses, loading doses, escalation, or titration doses, tapering doses, and dose adjustments for toxicity are not unique circumstances. The commenter stated that discarded amounts may be unavoidable when continuously variable, patient-specific doses must be prepared from a discrete set of available vial sizes and compared such loss to the loss associated with required filtration described in section 1847A(h)(8)(B)(ii) of the Act. The commenter stated that vial-size optimization has not adequately reduced discarded amounts for BSA-dosed products and recommended that, if CMS maintains its current policy, that CMS should publish data on discarded amounts for BSA-dosed Part B oncology drugs with a high volume of claims to provide greater transparency into that policy. The commenter also requested that CMS ensure the discarded drug refund policy does not influence clinicians to select doses or products based on vial economics rather than clinical considerations, while recognizing dose rounding within clinically validated parameters.

Response: We thank the commenter for describing the challenges associated with matching patient-specific and variable dosing regimens, including weight-based doses, BSA-based doses, loading doses, escalation, or titration doses, tapering doses, and toxicity-related dose adjustments, to available vial or container sizes. These comments are out of scope for this final rule, as we did not make proposals or discuss these topics in the proposed rule.

We previously discussed similar dosing circumstances in the CY 2023 PFS final rule (87 FR 69715). For example, we explained that when an induction or loading dose is administered, a larger amount of drug may subsequently be left in the single-dose container compared with the amount of drug left in the container if a typical dose had been administered. Nevertheless, we explained that amounts left in the vial were considered unused and discarded because they were not part of the dose intended to produce a therapeutic effect.

With respect to vial-size optimization that has not adequately reduced discarded amounts for BSA-dosed products, we continue to believe that manufacturers can use vial-size optimization studies to identify a set of container sizes for which less than 10 percent of the labeled amount, while recognizing that introducing or modifying vial sizes may present operational and economic challenges for manufacturers and may impose additional burdens on providers that must stock and administer those vial sizes, as discussed in the CY 2023 PFS final rule (87 FR 69713). Notwithstanding these operational considerations, section 1847A(h) of the Act requires manufacturers to pay refunds calculated under the statutory formula when the amount of discarded units exceeds the applicable percentage of estimated total allowed charges. Consistent with the 2020 data discussed in the CY 2023 PFS final rule, data collected since implementation of the program indicate that Medicare Part B spending on discarded amounts remains concentrated among a relatively small number of products. We note that § 414.940(e) provides a process through which a manufacturer may request an increased applicable percentage for a refundable drug with product-specific unique circumstances and supporting information.

With respect to the request that CMS publish data on discarded amounts for BSA-dosed Part B oncology drugs, CMS issues annual discarded drug refund reports through the Manufacturer Payment Portal. These reports include quarterly information on discarded billing units and the refund amount for a manufacturer's refundable drugs, including those dosed based on BSA. Oncology drugs account for about half of all refundable drugs that owed a refund in the first two program years. Manufacturers of refundable drugs for which no refund is due also receive reports reflecting a zero-refund amount. Separately, CMS publishes prior program-year refund information and quarterly Part B spending by drug on its website.

Finally, the discarded drug refund policy does not require clinicians to change a clinically appropriate dose, select a different product, or round a dose based on a manufacturer's refund liability. The refund requirement applies to manufacturers after Medicare claims are processed and does not affect Medicare's payment to providers for administered and discarded amounts. Consistent with CMS policy, discarded amounts are identified using the JW modifier; the JZ modifier is required on claims when there are no discarded amounts.

Comment: A commenter stated that CMS should improve flexibility under the discarded drug refund policy by recognizing additional unique circumstances in which discarded amounts may exceed the 10 percent threshold. The commenter indicated that therapies such as cell and gene therapies and other personalized treatments have complex, time-sensitive manufacturing and administration processes that may necessitate additional product availability at the time of treatment, resulting in unavoidable discarded drug. The commenter further suggested that drugs undergoing post-market optimization (for example, changes to vial size or fill volume) require extended regulatory and manufacturing timelines that exceed the 18-month exemption period and that a categorical unique circumstance is warranted for such products.

Response: The establishment of additional categorical unique circumstances is out of scope for this final rule. We do not address in this rulemaking whether the therapy types or product characteristics identified by the commenter would, as categories, satisfy the standard in section 1847A(h)(3)(B)(ii) of the Act. Manufacturers may request consideration of an increased applicable percentage for an individual drug through the application process at § 414.940(e), which requires justification for consideration of an increased applicable percentage based on the drug's unique circumstances and justification for the requested applicable percentage. The existing application process remains available for CY 2028 and subsequent years in accordance with the requirements and deadlines at § 414.940(e).

Comment: A commenter recommended improvements to the administration of the discarded drug refund policy. A commenter stated that drugs with multiple indications and varied dosing requirements may require flexibility in vial sizing and urged CMS to amend the Medically Unlikely Edit (MUE) policy so that discarded units identified with the JW modifier are not counted toward unit-of-service calculations. The commenter suggested that CMS standardize and enhance the completeness and accuracy of discarded drug refund report, noting frequent data gaps (such as missing total allowed units or newly launched drugs in the exemption period) that hinder manufacturers' ability to verify refund

obligations or reduce discarded amounts.

Response: We appreciate the commenter's recommendations regarding the content of the discarded drug refund reports and providing additional examples regarding report completeness and consistency. Comments requesting enhancement of data elements in the report for standardization and data accuracy, including for drugs not eligible for refunds under the discarded drug refund policy (for example, drugs that are within the 18-month exclusion period), and comments requesting exclusion of JW modifier-identified discarded units from MUE unit-of-service calculations, are out of scope for this final rule. However, we may take this information into consideration for future policy development and potential operational enhancements.

Comment: Several commenters provided feedback regarding the interaction between the discarded drug refund policy and the Maximum Fair Price (MFP) for selected drugs payable under Part B. Several commenters questioned whether the current discarded drug refund policy's calculation for selected drugs under the Medicare Drug Price Negotiation Program is aligned with CMS's policy requiring manufacturers to provide access to the MFP for both administered and discarded units. A commenter stated that using an ASP-based payment limit for discarded drug refund calculation may create inconsistencies for selected drugs payable under Part B reimbursed at the MFP. Another commenter urged CMS to exclude selected drugs payable under Part B from the discarded drug refund program during their price applicability period, drawing an analogy to CMS's policy of excluding discarded unit for which a discarded drug refund is owed from Part B inflation rebate reconciliation and asked CMS to apply that same non-duplication principle to MFP-eligible discarded units. As an alternative, several commenters requested that CMS confirm the discarded drug refunds for selected drugs payable under Part B will be calculated using the MFP-based payment amount so that manufacturers can plan for MFP effectuation, with a commenter specifically requesting clarification before January 1, 2028.

Response: We appreciate the commenter's recommendations and concerns. The proposed rule did not address the methodology for calculating estimated total allowed charges for selected drugs subject to MFP, and we did not propose or solicit comments on these issues. We are therefore not finalizing any policies with respect to these comments in this final rule. However, we note that the statutory framework governing the discarded drug refund requirement, including the definition of a refundable drug, the exclusions specified in section 1847A(h)(8)(B) of the Act, and the refund calculation methodology under section 1847A(h)(3)(A) of the Act, is set forth in statute and discussed later in this section.

Section 1847A(h)(8)(A) of the Act defines a refundable drug and section 1847A(h)(8)(B) of the Act specifies the categories excluded from that definition. In the CY 2023 PFS final rule, we implemented section 1847A(h) of the Act and finalized at § 414.902 the definition of a refundable single-dose container or single-use package drug, including the statutory exclusions for radiopharmaceuticals and imaging agents, certain drugs requiring filtration during preparation, and certain drugs approved or licensed on or after November 15, 2021, for which payment has been made under Part B for fewer than 18 months (87 FR 69710 through 69724). In the CY 2025 PFS final rule (89 FR 97973 through 97974), we further clarified the implementation of the 18-month exclusion and the identification of single-dose containers and single-use packages for purposes of this definition. The exclusions specified in section 1847A(h)(8)(B) of the Act and implemented at § 414.902 apply to drugs that meet the conditions specified in those provisions. We are not establishing additional exclusions in this final rule.

Section 1847A(h)(3)(A) of the Act and § 414.940 provide that the refund amount is an amount equal to the estimated amount (if any) by which the product of the number of discarded units and the amount of payment determined under either section 1847A(b)(1)(B) of the Act in the case of a single source drug or biological product or section 1847A(b)(1)(C) of the Act in the case of a biosimilar biological product, as applicable, exceeds an amount equal to the applicable percentage of the estimated total allowed charges for such drug during the calendar quarter. Section 1847A(b)(1)(B) specifies that in the case of a single source drug or biological product that is a selected drug (as referred to in section 1192(c) of the Act), with respect to a price applicability period (as defined in section 1191(b)(2) of the Act), the amount of payment determined under such section is 106 percent of the MFP for such drug and year during such period.

Comment: A commenter expressed support for the discarded drug refund policy as a means of reducing payment for excessive discarded amounts. The commenter stated that the current modifier-based approach to identifying discarded amounts, including use of the JW and JZ modifiers, imposes administrative burden and does not directly address incentives associated with vial size. The commenter recommended that Medicare instead base payment on the quantity of drug actually administered, using electronic medication administration record data or claims reconciliation where feasible, rather than relying on manual modifier reporting. The commenter also stated that manufacturers should bear the cost of discarded amounts attributable to product packaging beyond clinically unavoidable levels.

Response: We appreciate the commenter's support for the discarded drug refund policy, including the commenter's concern that incentives associated with vial size can contribute to excessive discarded amounts. The discarded drug refund policy addresses that concern directly, by requiring manufacturers to provide refunds for discarded amounts of refundable single-dose container or single-use package drugs for which payment is made under Part B exceeding an applicable percentage of the estimated total allowed charges for such a drug (less the amount paid for packaged drugs) during the quarter.

Section 1847A(h) of the Act establishes the manufacturer refund at issue for certain discarded amounts and does not alter Medicare's longstanding payment policy. When a provider or supplier must discard an unused portion of a separately payable drug from a single-dose container or single-use package after administering a dose to a Medicare beneficiary, Medicare provides payment for both the administered amount and the appropriately discarded amount, up to the amount indicated on the product labeling. Section 1847A(h) of the Act further provides for determining discarded amounts using a mechanism such as the JW modifier (or any successor modifier that includes the same data) and under the JW and JZ modifier policy finalized in the CY 2023 PFS final rule, the JZ modifier is required when there are no discarded amounts from single-dose containers or single-use packages payable under Part B (87 FR 69718 through 69719). This claims-based reporting of administered and discarded amounts is the mechanism CMS uses to identify discarded amounts for purposes of

calculating refunds under section 1847A(h) of the Act. The commenter's recommendations to limit Medicare payment to the quantity administered and to replace the JW and JZ modifier requirements with an electronic medication administration record-based or other claims-reconciliation mechanism would involve changes to existing Medicare Part B payment and claims reporting policies and are out of scope for this final rule.

As explained in the CY 2023 PFS final rule regarding provider burden (87 FR 69716), we continue to believe providers are the only party that can obtain complete and accurate information on used and discarded amounts of variably dosed drugs. While we acknowledge that, in some situations, it may be difficult to quantify discarded quantities of drugs and associate the specific amount with a single beneficiary, we believe that, in most situations, there are no practical impediments that would prevent billing providers or other staff, such as nurses or pharmacists, from incorporating the measurement of discard amounts into the process of preparing and administering the drug. We also believe that the observation and recording of no discard amounts using the JZ modifier does not add additional burden beyond the existing requirement of measuring discarded amounts by use of the JW modifier. If a provider is already required to determine whether there are discarded amounts from single-dose packages, then they are already assessing and documenting what is needed for the JZ modifier.

Regarding the commenter's recommendation to shift to manufacturers the cost of amounts attributable to product packaging beyond clinically unavoidable levels, this recommendation is also out of scope for this final rule. Section 1847A(h) of the Act requires manufacturers to provide a refund to CMS for certain discarded amounts from a refundable drug. The refund is based on the amount of discarded drug that exceeds an applicable percentage, which is required to be at least 10 percent of total charges for the drug in a given calendar quarter. Accordingly, to the extent the commenter's recommendation that manufacturers be responsible for discarded amounts beyond clinically unavoidable levels would result in an applicable percentage below 10 percent, that recommendation would not be consistent with the statutory requirement that the applicable percentage be at least 10 percent under section 1847A(h) of the Act. Section 1847A(h)(3)(B)(ii) of the Act permits the Secretary, through notice-and-comment rulemaking, to increase the applicable percentage for a refundable drug with qualifying unique circumstances.

Comment: A commenter recommended that CMS establish a national Medicare Part B payment framework for radiopharmaceuticals furnished outside the hospital outpatient setting, citing variation across MACs in payment amounts, documentation requirements, and claims-processing practices that may create uncertainty for providers and affect beneficiary access. The commenter recommended that such a framework include a national quarterly payment file, a standardized pricing hierarchy using ASP, WAC, or acquisition-cost data, as appropriate, limited use of invoice pricing, consistent treatment across MAC jurisdictions, greater payment transparency, and a timely correction process. The commenter also requested that CMS initiate rulemaking and convene a technical advisory group to develop a national framework.

Response: We note that these comments are out of scope for this final rule because the proposed rule did not include any proposals regarding a national Medicare Part B payment framework for radiopharmaceuticals furnished outside the hospital outpatient setting. We appreciate the commenter's feedback and may consider these comments in future notice-and-comment rulemaking regarding broader policies for payment of radiopharmaceuticals in the physician office.

Comment: A commenter recommended payment stability for biologicals and protection access to infusion-based therapies and stated that women veterans rely heavily on biologics for autoimmune disease, osteoporosis, and cancer.

Response: We appreciate the commenter's concerns regarding access to biologicals and infusion-based therapies, including the concerns raised regarding women veterans. We recognize the importance of beneficiary access to medically necessary Part B drugs and biologicals. However, the commenter's recommendations regarding broader payment stability for biologics and access to infusion-based therapies are out of scope for this final rule.

In summary, after consideration of public comments, we are not increasing the applicable percentage for Leukine®.

B. Rural Health Clinics (RHCs) and Federally Qualified Health Centers (FQHCs)

1. Background on RHC and FQHC Payment Methodologies

As provided in 42 CFR part 405, subpart X of our regulations, RHC and FQHC visits generally are defined as face-to-face encounters between a patient and one or more RHC or FQHC practitioners during which one or more RHC or FQHC qualifying services are furnished. RHC and FQHC practitioners are physicians, nurse practitioners (NPs), physician assistants (PAs), Certified Nurse Midwives (CNMs), clinical psychologists (CPs), licensed marriage and family therapists, mental health counselors, and clinical social workers, and, subject to certain conditions, a registered nurse or licensed practical nurse that is furnishing care to a homebound RHC or FQHC patient in an area verified as having shortage of home health agencies. Transitional Care Management (TCM) services can also be paid by Medicare as an RHC or FQHC visit. In addition, Diabetes Self-Management Training (DSMT) or Medical Nutrition Therapy (MNT) services furnished by a certified DSMT or MNT program may also be considered FQHC visits for Medicare payment purposes. Only medically necessary medical, mental health, or qualified preventive health services that require the skill level of an RHC or FQHC practitioner are RHC or FQHC billable visits. Services furnished by auxiliary personnel acting under the supervision of the RHC or FQHC practitioner, are considered incident to the visit and are included in the per-visit payment.

RHCs generally are paid an all-inclusive rate (AIR) for all medically necessary medical and mental health services and qualified preventive health services furnished on the same day (with some exceptions). The AIR is subject to a payment limit, meaning that an RHC will not receive any payment beyond the specified limit amount per visit. As of April 1, 2021, all RHCs are subject to statutory upper payment limits determined in accordance with section 1833(f) of the Act, as amended by section 130 of Division CC of the Consolidated Appropriations Act, 2021 (Pub. L. 116—260).

FQHCs were paid under the same AIR methodology until October 1, 2014. Beginning on that date, in accordance with section 1834(o) of the Act (as added by section 10501(i)(3) of the Patient Protection and Affordable Care Act (Pub. L. 111–148, March 23, 2010)), FQHCs began to transition to the FQHC

PPS system, in which they are paid based on the lesser of the FQHC PPS rate or their actual charges. The FQHC PPS rate is adjusted for geographic differences in the cost of services by the FQHC PPS geographic adjustment factor (GAF). The rate is increased by 34 percent when an FQHC furnishes care to a patient that is new to the FQHC, or to a beneficiary receiving an initial preventive physical examination (IPPE) or has an annual wellness visit (AWV). Section 1834(o)(2)(B)(ii) of the Act requires the FQHC PPS base rate be updated annually by the percentage increase in a market basket of Federally qualified health center goods and services as promulgated through regulations, or if such an index is not available, by the percentage increase in the Medicare Economic Index (MEI) (as defined in section 1842(i)(3) of the Act) for the year involved. See section III.B.4 of this final rule, for the final CY 2027 updates.

Under the general authority of section 1834(o) of the Act, CMS codified at §§ 405.2462 and 405.2464 to pay historically excepted tribal FQHCs using the Medicare outpatient per visit rate established annually by IHS, rather than the FQHC PPS rate (80 FR 71089). These rates are set by IHS under sections 321(a) and 322(b) of the Public Health Service (PHS) Act based on prior-year cost reports. The outpatient per visit rate applies only to provider-based IHS or tribal facilities (see § 413.65(m)) and historically excepted tribal FQHCs. For CY 2026, the outpatient per visit rate is $733 per visit in the lower 48 States.

Both the RHC AIR and FQHC PPS payment rates were initially designed to reflect the cost of all services and supplies that an RHC or FQHC furnished to a patient in a single day. These nearly all-inclusive rates are not adjusted at the individual level for the complexity of individual patient health care needs, the length of an individual visit, or the number or type of practitioners involved in the patient's care. Instead, for RHCs, all costs for the facility over the course of the year are aggregated, and an AIR is derived from these aggregate expenditures. For FQHCs, the FQHC PPS base rate is updated annually by the percentage increase in a market basket of Federally qualified health center goods and services as discussed in section III.B.4 of this final rule.

RHCs and FQHCs are also paid for non-face-to-face care management work involved in coordinating care outside of the RHC AIR and FQHC PPS (§ 405.2464(c)). That is, payment is based on the PFS national non-facility payment rate and is made in addition to the otherwise billable visit for patients utilizing chronic care management (CCM), principal care management (PCM), general behavior health integration (BHI), chronic pain management (CPM), remote physiologic monitoring (RPM), remote therapeutic monitoring (RTM), community health integration (CHI), principal illness navigation (PIN), PIN-peer support services, advanced primary care management (APCM), and psychiatric collaborative care model (CoCM). In addition, payment is based on the PFS national non-facility payment rate and is made in addition to the otherwise billable visit for communication technology-based services (CTBS) and remote evaluation services (§ 405.2464(e)).

In the CY 2026 PFS final rule (90 FR 49556 through 49558), we finalized a policy that effective January 1, 2026, services that are established and paid under the PFS and designated as care management services would be considered ''care coordination services'' for purposes of separate payment for RHCs and FQHCs. The care coordination codes can be found in the PFS table entitled ''Designated Care Management Services'', which is published annually with the PFS Final Rule Addenda on the CMS website.

2. Payment for Certain Preventive Services

a. Background

Medicare Part B covers a comprehensive set of preventive services aimed at promoting early detection and reducing the risk of chronic disease.[163] These services include wellness visits (such as the IPPE and AWV), evidence-based screenings for cancer and chronic conditions, behavioral health and risk factor screenings, certain vaccinations, and preventive counseling interventions. Coverage for many of these services was expanded under sections 4103 and 4104 of the Patient Protection and Affordable Care Act (Pub. L. 111–148); the services are covered without beneficiary cost-sharing when furnished according to Medicare requirements. Collectively, they are designed to support proactive, patient-centered care and improve long-term health outcomes, particularly when delivered in primary care settings. CMS has implemented these statutory provisions through regulations at 42 CFR part 410, which define, among other things, the coverage, eligibility, and frequency requirements for preventive services.

CMS also establishes and updates coverage of preventive services through the National Coverage Determination (NCD) process, if such services are recommended with a grade of A or B by the U.S. Preventive Services Task Force (USPSTF). These processes specify the conditions under which preventive services are considered reasonable and necessary for Medicare beneficiaries.

Payment for preventive services is made in accordance with applicable Medicare payment systems, for example, the PFS under 42 CFR part 414. CMS provides additional operational guidance through subregulatory instructions, including manuals and program transmittals, to ensure consistent implementation of coverage and payment policies. Beneficiary copayment and deductible (where applicable) is waived by the Affordable Care Act for the IPPE and AWV, and for Medicare-covered preventive services recommended by the USPSTF with a grade of A or B.

When statutorily permissible, we pay for covered preventive services under Medicare Part B to RHCs and FQHCs pursuant to such facilities' encounter-based payment methodologies, rather than as PFS separately billable services, except where the statute specifies otherwise.

RHCs are paid under the AIR methodology for a limited number of qualified preventive health services furnished by an RHC practitioner. FQHCs are paid under the FQHC PPS for qualified preventive health services and preventive primary health services required under section 330 of the PHS Act.[164] A qualified preventive health service refers to a Medicare-covered preventive service that also meets the requirements for a billable RHC or FQHC visit, including a face-to-face encounter with a RHC or FQHC practitioner (that is, the service is at a level that requires the expertise of a RHC or FQHC practitioner).

[163] *https://www.cms.gov/medicare/prevention/prevntiongeninfo/medicare-preventive-services/mps-quickreferencechart-1.html.*

[164] Section 1861(aa)(3) of the Act (42 U.S.C. 1395x(aa)(3)) defines Federally Qualified Health Center (FQHC) services to include services and supplies furnished by an FQHC, including preventive primary health services required under section 330 of the Public Health Service Act (42 U.S.C. 254b).

Specifically, RHCs and FQHCs are paid for the professional component of allowable preventive services when the program requirements are met and frequency limits (where applicable) have not been exceeded.[165] In this context, professional component refers to the practitioner's clinical service associated with a preventive service, as opposed to the technical or ancillary elements of the service. Preventive services furnished in other settings, for example, physician offices, are generally paid on a service-by-service basis. However, preventive services that do not constitute a separate billable RHC or FQHC visit must be furnished as part of a qualified RHC or FQHC visit (for example, an evaluation and management (E/M) visit) to be billable to Medicare. If a preventive service that is not part of a billable RHC or FQHC visit is furnished to a beneficiary, it may not be payable under Medicare.

b. Federal Initiatives To Improve Health Outcomes and Access to Care

(1) The Make America Healthy Again (MAHA) Commission

On February 13, 2025, the President signed an Executive Order establishing the MAHA Commission within the Department of Health and Human Services (HHS).[166] The Commission is chaired by the Secretary of HHS and includes representatives from multiple Federal agencies. The Commission was directed to assess contributing factors to chronic disease and to develop a coordinated Federal strategy to improve population health outcomes, with an initial focus on pediatric populations.

In 2025, the Commission released an assessment identifying a range of factors associated with chronic disease, including dietary patterns, environmental exposures, physical inactivity, and other behavioral and upstream drivers of health. The Commission subsequently issued a strategy outlining potential Federal actions to address these factors through cross-agency coordination, research, and programmatic initiatives.[167]

Although the Commission's initial focus is on childhood health, its findings are relevant to Federal health programs serving other populations, including Medicare beneficiaries. Chronic conditions associated with the factors identified by the Commission are prevalent among Medicare beneficiaries and are significant drivers of program expenditures.

(2) The Rural Health Transformation (RHT) Program

The RHT Program was authorized by section 71401 of Public Law 119–21 (July 4, 2025), which CMS refers to as the Working Families Tax Cut (WFTC) legislation, and empowers States to strengthen rural communities across America by improving healthcare access, quality, and outcomes by transforming the healthcare delivery ecosystem. The RHT Program represents a $50 billion Federal investment over five Federal fiscal years (FY 2026 to FY 2030), with $10 billion available annually, intended to strengthen health care infrastructure, expand access to care, and improve health outcomes in rural communities across the United States.

The program has five strategic goals, grounded in the permissible uses of funds under the statute: Make Rural America Healthy Again—Support rural health innovations and new access points to promote preventive health and address the root causes of disease; Sustainable Access—Improve the efficiency and long-term sustainability of rural health care providers as enduring access points for care; Workforce Development—Strengthen recruitment and retention of qualified health care professionals in rural communities; Innovative Care—Advance innovative care models that improve health outcomes, coordinate care, and promote flexible care arrangements; and Technology Innovation—Foster the adoption of innovative technologies that promote efficient care delivery, data security, and access to digital health tools for rural facilities, providers, and patients.[168]

c. Increasing Access to Diabetes Self-Management Training (DSMT) and Medical Nutrition Therapy (MNT) Services in RHCs

Section 4105 of the Balanced Budget Act of 1997 (Pub. L. 105–33) added section 1861(qq) of the Act to permit Medicare coverage of outpatient DSMT services when these services are furnished by a certified provider who meets certain quality standards. This program is intended to educate beneficiaries in the successful self-management of diabetes. The program includes instructions in self-monitoring of blood glucose; education about diet and exercise; an insulin treatment plan developed specifically for the patient who is insulin dependent; and motivation for patients to use the skills for self-management. DSMT services may be covered by Medicare only if the treating physician or treating qualified non—physician practitioner who is managing the beneficiary's diabetic condition certifies that such services are needed. The referring physician or qualified non-physician practitioner must maintain the plan of care in the beneficiary's medical record and documentation substantiating the need for training on an individual basis when group training is typically covered, if so ordered. A designated certified provider bills for DSMT provided by an accredited DSMT program. Certified providers must submit a copy of their accreditation certificate to the contractor. The statute states that a ''certified provider'' is a physician or other individual or entity designated by the Secretary that, in addition to providing outpatient self-management training services, provides other items and services for which payment may be made under title XVIII of the Act, and meets certain quality standards.

We designated all providers and suppliers that bill Medicare for other individual services such as hospital outpatient departments, renal dialysis facilities, physicians and durable medical equipment suppliers, as eligible to be certified providers. All suppliers/providers who may bill for other Medicare services or items and who represent a DSMT program that is accredited as meeting quality standards can bill and receive payment for the entire DSMT program.

Registered dietitians are eligible to bill on behalf of an entire DSMT program on or after January 1, 2002, if the provider employing or contracting with the dietitian has obtained a Medicare provider number. A dietitian may not be the sole practitioner of the DSMT service.[169] Under our regulations at § 410.144(a)(4)(ii), there is an exception for dietitians working in rural areas. In a rural area, an individual who is qualified as a registered dietitian and as a certified diabetic educator who is currently certified by an organization approved by us may furnish training and is deemed to meet the multidisciplinary team requirement. DSMT requirements for coverage, beneficiary eligibility, services and frequency of services and provider certification and accreditation are

codified in 42 CFR 410 subpart H and the National Coverage Determination (NCD) 40.1.[170]

Section 1861(s)(2)(V) of the Act authorizes Medicare Part B coverage of MNT for certain beneficiaries who have diabetes or a renal disease. Regulations for MNT were established effective January 1, 2002, at 42 CFR 410 subpart G (66 FR 55246 and 55331). The NCD 180.1 establishes the duration and frequency limits for the MNT benefit and coordinates MNT and DSMT.[171] MNT services are defined in section 1861(vv) of the Act as nutritional diagnostic, therapy, and counseling services provided by a registered dietitian or nutrition professional for the purpose of disease management under a referral by a physician. The provider qualifications for registered dieticians and nutrition professionals are defined in § 410.134.

Effective January 1, 2022, coverage of MNT, for the first year a beneficiary receives MNT, with either a diagnosis of renal disease or diabetes as defined at 42 CFR 410.130, is 3 hours of administration. Coverage in subsequent years for renal disease or diabetes is 2 hours. The dietitian/nutritionist may choose how many units are administered per day as long as all of the other requirements of the NCD and §§ 410.130 through 410.134 are met. Under the exception at § 410.132(b)(5), additional hours are considered to be medically necessary and covered if the physician determines that there is a change in medical condition, diagnosis, or treatment regimen related to diabetes or renal disease that requires a change in MNT and orders additional hours during that episode of care. If the physician determines that receipt of both MNT and DSMT is medically necessary in the same episode of care, Medicare will cover both DSMT and MNT initial and subsequent years without decreasing either benefit as long as DSMT and MNT are not provided on the same date of service.

In the CY 2027 PFS proposed rule (91 FR 43958) we stated that section 5114 of the Deficit Reduction Act of 2005 amended section 1861(aa)(3) of the Act to add DSMT and MNT services as covered and paid under the FQHC benefit, effective January 1, 2006. Then the Affordable Care Act further expanded the scope of FQHC services to include preventive services defined under section 1861(ddd)(3) of the Act; however, RHCs were not similarly addressed. Under this statutory authority, DSMT and MNT services furnished by certified providers are stand-alone billable visits in FQHCs when all of the requirements are met. If DSMT or MNT services are provided on the same day as another qualified visit, the FQHC is paid for one visit, and the charges associated with DSMT or MNT are waived from coinsurance obligations (79 FR 25447). We noted in the CY 2027 PFS proposed rule, group DSMT is not payable in FQHCs because Medicare payment is limited to individual, face-to-face encounters under the FQHC PPS, and group training does not meet the definition of a billable visit.

We explained in the CY 2027 PFS proposed rule, for RHCs, DSMT services and MNT services rendered by registered dietitians or nutrition professionals are included under the RHC benefit, if all relevant program requirements are met. Separate payment under Part B to RHCs for these services provided by these practitioners is precluded as set forth in regulations at §§ 414.63 and 414.64. However, RHCs are permitted to become certified providers of DSMT and MNT services and bundle the cost of such services into their clinic payment rates. The provision of these services would not generate an RHC visit, though their costs may be included in the cost report and used for determining the AIR.[172] Consequently, RHCs are not paid for encounters where only DSMT or MNT services are provided.

We also explained in the CY 2027 PFS proposed rule that interested parties have expressed concern about access to DSMT and MNT services in RHCs for several years (91 FR 43958). Those commenters stated that, because these are preventive services, not treating these services as a separate encounter is impacting access to care for rural beneficiaries. They stated that there are additional concerns regarding the payment for DSMT and MNT services between RHCs and FQHCs and rural interested parties have requested aligning payment for these services. They believe that we should recognize DSMT and MNT services as a qualified visit for RHCs when these services are provided by a certified provider and all the requirements are met. They believe that the utilization rate is low for beneficiaries receiving care in RHCs and explained that if we allow RHCs to receive payment for furnishing DSMT and MNT services, then this rate may increase.

In the CY 2027 PFS proposed rule (91 FR 43959) we discussed recent studies that highlight a continued need for DSMT and MNT services in rural areas, driven by rising diabetes prevalence and significant access disparities. Some of the barriers identified for people living in rural communities, especially for getting access to diabetes education and prevention programs, include limited number of providers, longer distance to medical facilities, higher costs, outdated cultural beliefs, lack of transportation, and limited community resources. More efforts to reduce these barriers may help reduce the overall high burden of diabetes in the rural US.[173] We explained that the necessity of DSMT and MNT in rural areas is supported by findings such that, they are clinically essential, diabetes control is improved, complications are reduced, lower costs, rural populations have equal or greater need, there are higher diabetes burden (widely established in rural health literature), access is systematically worse in rural areas, there are fewer providers, geographic maldistribution, and lower utilization despite need. Therefore, we opined that expanding DSMT and MNT in rural areas is not just beneficial, it is necessary to address documented health differences in access and outcomes.[174] In addition, we stated that we have observed low utilization for these services in rural settings. That is, we provided an analysis of Medicare claims data from 2024 that indicated that utilization of DSMT and MNT in RHC settings is substantially lower than in comparable care settings. In CY 2024, DSMT services were furnished to approximately 125 RHC beneficiaries, representing 0.005 percent of the total RHC beneficiary population of approximately 2.3 million. MNT services were furnished to approximately 439 RHC beneficiaries, representing 0.019 percent of the total RHC beneficiary population. On a claims basis, DSMT accounted for 0.002 percent and MNT for 0.007 percent of total RHC claims in CY 2024. By comparison, FQHCs showed DSMT utilization rates approximately 22 times higher and MNT utilization rates

approximately 28 times higher than RHCs on a per-beneficiary basis. On a claim basis, FQHC utilization of DSMT and MNT exceeded RHC utilization by approximately 31 times and 32 times, respectively. Rural physician offices, whose patients share the geographic and demographic characteristics of RHC patient populations, showed DSMT and MNT utilization rates approximately 17 times and 7 times higher than RHCs, respectively, on a per-beneficiary basis. We observed that the analysis further demonstrated that within the PFS setting, where DSMT and MNT are most readily identifiable in claims data, these services represent a very small share of total Medicare spending less than 0.01 percent and 0.02 percent of total PFS line item payments, respectively, in CY 2024. We stated that these findings could suggest that beneficiaries receiving care in RHCs may have disproportionately lower participation due to potential provider shortages and structural payment barriers when compared to other settings of care.

As such, we explained that we believed we should attempt to align access and payment for RHCs and FQHCs to the extent possible, given the statutory differences in benefit design between the two settings of care. Because DSMT and MNT are affirmatively covered Medicare Part B benefits under sections 1861(s)(2)(S) and 1861(s)(2)(V) of the Act, respectively, and are defined under sections 1861(qq) and 1861(vv) of the Act, we stated there is a compelling basis for ensuring these clinically essential services are payable under the RHC benefit. We stated that continuing to exclude these services from RHC payment limits access for rural Medicare beneficiaries and would be inconsistent with both the statutory coverage framework and the foundational purpose of the RHC program (91 FR 43959). We explained that reducing differences between RHCs and other settings in which DSMT and MNT are furnished and paid, such as in FQHCs and physician office, may help expand access to care for Medicare beneficiaries in rural areas. We also stated that this policy would strengthen access to services that address chronic conditions prevalent among Medicare beneficiaries which are significant drivers of program expenditures.

In the CY 2027 PFS proposed rule (91 FR 43959), we stated that since DSMT and MNT services may be furnished by certified providers other than RHC practitioners as defined in §§ 410.141 and 410.134, respectively, these services could be furnished by certified providers under the direct supervision of an RHC practitioner. Direct supervision does not require the physician (or other supervising practitioner) to be present in the same room. However, the physician (or other supervising practitioner) must be present in the RHC or FQHC and immediately available to provide assistance and direction throughout the time the incident to service or supply is being furnished. See definitions at § 405.2401(b) ''Direct Supervision.''

For the reasons discussed previously, we proposed to recognize DSMT and MNT services as qualified preventive services that are covered and paid the AIR as stand-alone billable visits under the RHC benefit (91 FR 43959). We proposed that to constitute as a billable RHC visit, these services would need to be furnished by a certified provider under the direct supervision of RHC professional staff. We stated that we believe aligning payment policies in RHCs with other settings, for example FQHCs and physician offices, would help expand access to care for Medicare beneficiaries in rural areas while supporting Federal initiatives to strengthen rural healthcare. As such, we proposed to revise § 405.2463(a) and (b)(2) to allow DSMT and MNT services to be stand—alone billable visits in RHCs. We proposed that, similar to FQHCs, when DSMT or MNT is furnished on the same day as another qualified visit, the RHC would be paid one AIR for that encounter. We explained that we considered these policies to align an incongruency between FQHC and RHC access to preventive services and that we did not expect in future rulemaking to propose additional preventive services beyond those which are currently paid for in FQHCs and physician offices. We invited public comments on these proposals.

We received approximately 130 comments on this proposal from a broad range of commenters, including national physician and nurse practitioner associations, registered dietitian and nutrition professional organizations, disease-specific advocacy organizations, rural health clinic and health center representation organizations, individual RHCs and health systems, state and regional primary care associations, medical device and pharmaceutical industry commenters, and individual clinicians, dietitians, nurses, and students practicing in rural and underserved communities. The following is a summary of the comments we received and our responses.

Comment: The majority of the commenters were supportive of the proposal to recognize DSMT and MNT services as qualified visits for RHCs when these services are provided by a registered dietician or nutritional professional. Commenters stated that they believe providing separate reimbursement for DSMT and MNT encounters furnished in RHCs will strengthen the ability of rural practices to offer comprehensive, patient-centered care and improve access to services that are essential for the prevention and management of chronic disease. Most commenters framed the proposal as correcting a long-standing inconsistency: DSMT and MNT have been separately billable in FQHCs since the Deficit Reduction Act of 2005, and in physician offices for even longer, but RHCs have been able only to absorb these costs into their cost report and have not been able to generate a separately payable visit. Commenters characterized this as an unnecessary inconsistency or a structural payment barrier that CMS is now proposing to close, and specifically credited CMS's own stated rationale—that aligning RHC policy with FQHCs and physician offices would expand rural access.

A large subset of commenters went further than general endorsement and cited CMS's claims data from the CY 2027 PFS proposed rule (91 FR 43959) directly as evidence the current structure suppresses utilization rather than reflects a lack of need. Several of these commenters explicitly argued that this gap cannot be explained by differences in clinical need, since rural Medicare beneficiaries carry a disproportionate burden of diabetes and chronic kidney disease—the very conditions MNT is intended to treat.

Many commenters pointed to structural barriers specific to rural beneficiaries, that is, longer travel distances, clinician and registered dietitian nutritionist (RDN) workforce shortages, and limited specialty access—arguing that bundling DSMT/MNT into another visit compounds rather than accommodates these constraints. A smaller number of commenters supplied concrete, clinic-level accounts as indication that the barrier is payment structure, not clinical capability or willingness. One commenter reported it had previously offered DSMT and MNT at its RHCs but could not sustain clinician coverage once the services proved unpayable as stand-alone visits and stated it would restore and expand both services if separate payment were finalized. Another commenter cited a member poll finding that 23.5% of responding RHCs already furnish DSMT/MNT today but are unable to generate payment for doing so under current rules.

Response: We thank commenters for their support of this proposal to recognize DSMT and MNT services as qualified visits for Rural Health Clinics (RHCs) when furnished by a registered dietitian or nutrition professional. We appreciate the clinic-level experience commenters shared illustrating the practical effect of the current payment structure, including accounts of discontinued services and of RHCs that currently furnish DSMT and MNT without generating separate payment. We believe this information supports our expectation that this policy would enable RHCs to sustain and, in some cases, restore or expand access to these services for their patients. We believe that the commenter feedback received underscores the importance of aligning payment policies across care settings to expand access and address longstanding inconsistencies.

Comment: One commenter did not dispute the clinical value of DSMT and MNT but opposed making them stand-alone billable visits, cautioning that per-visit billing risks recreating an encounter-counting dynamic. The commenter recommended incorporating DSMT/MNT into a Primary Care Month or diabetes episode-based payment, with incentives tied to clinical outcomes rather than visit volume.

Response: We thank the commenter for their suggestion and appreciate the commenter's support for the clinical value of DSMT and MNT and their broader concern about avoiding payment structures that incentivize volume over outcomes. However, RHCs are paid on the basis of an all-inclusive rate and subject to a payment limit per visit (§ 405.2462(a)). Our proposal to recognize DSMT and MNT as stand-alone, qualified visits under the RHC AIR payment methodology is consistent with how these services are already recognized and paid in other settings, such as physician offices and FQHCs. Under current policy, RHCs cannot bill for DSMT and MNT when it is the only service furnished in a day, which we believe may have limited beneficiary access to these services. We believe that making DSMT and MNT stand-alone, qualified visits removes this access barrier and aligns payment incentives with furnishing medically necessary diabetes education and nutrition counseling.

We recognize the commenter's broader point about episode-based or population-based payment models that tie payment to clinical outcomes rather than visit counts. We agree that such models may hold promise for chronic disease management, including diabetes care, and note that Medicare has several programs that tie payment to diabetes-related care and clinical outcomes. RHCs can participate in Accountable Care Organizations (ACOs) under the Medicare Shared Saving Program, a value-based care initiative which allows ACOs that reduce healthcare costs while meeting quality benchmarks, including diabetes management metrics, to earn a share of the savings they generate. However, the RHC benefit as structured under current statute and regulations does not provide for incentives tied to clinical outcomes.

Comment: Several commenters asked CMS to confirm that DSMT and MNT may be furnished in a group or shared format. One commenter recommended that CMS remove its general limitation on group visits in RHCs, or at minimum establish a DSMT/MNT-specific exemption similar to the exemption previously adopted for intensive outpatient services furnished in RHCs, noting that DSMT in particular is often delivered in a group education format.

Response: We recognize that the Medicare DSMT and MNT benefit permits training to be furnished in both individual and group settings under the requirements applicable to that benefit. However, whether a service is covered under the Medicare DSMT or MNT benefit is distinct from whether the service constitutes a payable visit under the RHC or FQHC payment methodology. The RHC and FQHC payment methodologies are generally based on a qualifying visit between an individual beneficiary and a qualified practitioner. Consistent with this longstanding framework, group services generally do not constitute payable RHC or FQHC visits, as detailed in § 405.2463.

We also do not agree that the payment policies for intensive outpatient program services provide a basis for establishing a comparable exception for DSMT or MNT. Effective January 1, 2024, Medicare coverage and payment for IOP services furnished by RHCs and FQHCs were established pursuant to section 4124 of the Consolidated Appropriations Act, 2023 (Pub. L. 117–328). The payment policies applicable to group therapy furnished as part of an IOP implement that distinct statutory benefit and payment framework. Accordingly, the availability of payment for qualifying group therapy under the IOP benefit does not alter the requirements that otherwise apply in determining whether a service constitutes a payable RHC or FQHC visit.

Comment: Several commenters would like CMS to remove the direct supervision requirement. They noted that requiring direct supervision which they understood to mean that the supervising physician or practitioner would have to be physically present in the RHC and immediately available throughout the entire DSMT or MNT encounter—is inconsistent with how these services are furnished in every other Medicare setting. These commenters noted that FQHCs and physician offices require only a physician referral and provider certification, with no supervision requirement and RDNs bill independently under their own provider number once a referral is made. Commenters stated that importing a direct-supervision standard for RHCs alone runs counter to CMS's own stated objective of reducing payment and operational differences between RHCs and other settings, and that it would recreate, in a different form, the access barrier the proposal is intended to resolve: in rural clinics where the supervising physician or NP is typically fully scheduled, requiring that practitioner to remain immediately available for the full duration of a DSMT or MNT encounter would mean the service either displaces physician visit time or does not occur. Two commenters submitted specific proposed regulatory text, recommending that CMS collapse proposed § 405.2463(a)(2) into paragraph (a)(1) and list qualified MNT and DSMT providers, as defined under 42 CFR part 410, subparts G and H, directly among the practitioners whose face-to-face encounters constitute a billable RHC visit—without a separate supervision clause. One commenter recommended a different resolution: transitioning DSMT and MNT from direct to general supervision, which they believe would allow RHCs to contract with external or telehealth-based RDN networks rather than requiring an on-site supervising practitioner, an approach they stated is particularly important for small, resource-constrained rural clinics that cannot staff a full-time RDN.

Other commenters, generally representing physician and nursing professional associations, supported the direct supervision requirement as an appropriate mechanism for team-based care and practitioner oversight. One commenter supported the requirement and specifically noted that it appropriately includes nurses among the RHC professional staff who may provide supervision. Another commenter characterized the requirement as appropriately recognizing the value of team-based care while allowing RHCs to leverage the

expertise of qualified health professionals such as registered dietitians under practitioner oversight. A third commenter supported the proposal's approach of supervision by RHC professional staff, such as a nurse practitioner.

Response: With respect to the supportive comments, we agree that this policy would recognize team-based care models. Allowing RHCs to bill for DSMT and MNT encounters furnished by a registered dietitian or nutrition professional, under practitioner oversight, reflects the role these professionals already play in furnishing these services in other settings and allows RHCs to make full use of this expertise without requiring a billing practitioner to furnish the service directly.

We also acknowledge the other commenters' concerns regarding workforce limitations and access barriers associated with direct supervision in rural clinics, and their observation that MNT and DSMT are furnished and paid without a comparable supervision requirement in FQHCs and physician offices under §§ 410.130 through 134 and 410.140 through 146. However, as discussed above, DSMT and MNT are separately identified Part B benefits, with payment available under the physician fee schedule when applicable requirements are met. Congress also specifically expanded the FQHC benefit to include these services, and we recognize DSMT and MNT encounters as billable FQHC visits. The RHC benefit was not similarly amended. Under existing RHC policy, DSMT and MNT services may be included in clinic costs, but they do not independently generate an RHC visit payment. To receive payment for an encounter in an RHC, the service furnished must be at the skill level of an RHC practitioner. To be in compliance with the regulation at § 405.2463, we required direct supervision for DSMT and MNT services furnished by certified providers in RHCs

We have, however, considered commenters' concerns about the operational burden of requiring the supervising practitioner's continuous, on-site presence for the full duration of the encounter and offer clarification. Under § 405.2401(b), direct supervision means that the physician (or other supervising practitioner) must be present in the RHC or FQHC and immediately available to furnish assistance and direction throughout the performance of the service. It does not, however, mean that the physician (or other supervising practitioner) must be present in the room when the service is performed. We clarify that, consistent with § 405.2401(b), the presence of the physician (or other practitioner) includes virtual presence through audio/video real-time communications technology (excluding audio-only). We believe this clarification addresses much of the concern about scheduling conflict commenters described, without requiring a change to the underlying practitioner scope of service requirement.

For the recommendation to adopt general, rather than direct, supervision for DSMT and MNT services in RHCs, we decline to make this change in this final rule. We continue to believe direct supervision, as clarified above to include virtual presence, is necessary to maintain the connection to RHC practitioner services required under § 405.2463. We recognize the appeal of a general supervision model for enabling RHCs to contract with external or telehealth-based RDN networks, particularly for clinics unable to staff a full-time RDN, and we will continue to evaluate this feedback in consideration of statutory authority for potential policy refinements.

We clarify one point raised by a commenter who supported the direct supervision requirement on the understanding that it includes nurses among the RHC professional staff who may provide the required supervision. The direct supervision requirement for DSMT and MNT services is satisfied only by an RHC practitioner. Registered nurses and other RHC professional staff who do not meet the skill level of an RHC practitioner may not serve as the supervising individual for purposes of this requirement.

Comment: A recurring concern across several supportive comments was that the proposal, while expanding access to DSMT and MNT, did not clearly define or protect the role of the RDNs who are the specialists trained to deliver these services. One commenter supported the proposal but asked that the Academy of Nutrition and Dietetics be included as an interested party in implementation discussions and separately opposed any accompanying restrictions on physicians that might come at RDNs' expense.

Other commenters focused less on payment parity and more on whether RHCs will have access to qualified nutrition professionals. One commenter noted that many rural clinics lack in-house dietitians, and that the proposal does not clearly specify that an RDN (in person or virtual) must be the one furnishing the service. Similarly, the commenter asked CMS to be explicit about the RDN clinical role providing clear guidance on staffing, referral, documentation, and care coordination arguing that nutrition policy too often names the intervention but leaves the clinician vague, which risks leaving the workforce question unaddressed even if the payment pathway is finalized.

Response: We thank commenters for their support for expanding access to DSMT and MNT services in RHCs. We recognize the important clinical role of RDNs and agree that recognizing these services as billable visits should not obscure the qualifications of the professionals who furnish them. This proposal addresses payment for qualifying DSMT and MNT encounters under the RHC benefit; it does not replace the service-specific requirements governing who may furnish these services. For MNT, provider qualifications for RDNs and nutrition professionals continue to be governed by § 410.134. For DSMT, instructor and multidisciplinary team qualifications, including the existing rural exception permitting a dually qualified registered dietitian and certified diabetes educator to satisfy the multidisciplinary team requirement in rural areas, continue to be governed by § 410.144(a)(4). This proposal does not alter, narrow, or supersede those qualification standards in RHCs. We also did not propose any restriction on physician billing for other services as a condition of, or offset to, this proposal.

We acknowledge commenters' concerns regarding the availability of qualified nutrition professionals in rural communities. We believe that recognizing DSMT and MNT services as stand-alone billable visits under the RHC benefit will help address a payment barrier and support RHCs in making these services more readily available, creating greater opportunities for rural Medicare beneficiaries to benefit from the expertise of RDNs and other qualified professionals.

We appreciate the recommendation to include the Academy of Nutrition and Dietetics in implementation discussions and welcome input from the Academy, RDNs, RHCs, and other interested parties. Our objective is to improve access to these covered services while maintaining the professional qualifications and program requirements applicable to their delivery.

Comment: Several commenters requested CMS permit separate payment when DSMT or MNT is furnished on the same day as another qualifying RHC visit. They cited continuity of care, the complementary nature of these services, and the burden rural beneficiaries face when required to make multiple trips.

One commenter specifically recommended extending the FQHC same-day multiple-visit exception in § 405.2463(c)(3) to RHCs.

Other commenters stated that the one-AIR-per-day limit could eliminate the financial incentive to furnish DSMT or MNT during the same visit as medical care, particularly when patients cannot return on another day. They recommended separate, stackable AIR payments or a carve-out similar to existing RPM and RTM payment policies. A commenter relatedly requested a supplemental payment mechanism in the FQHC PPS context.

Some commenters sought only implementation guidance, asking CMS to clarify payment when DSMT or MNT is furnished on the same day as another qualified RHC visit. Another commenter asked CMS to confirm whether RHCs would follow the same one-visit-per-day treatment currently applicable to FQHCs.

Response: We thank the commenters for their feedback regarding same day billing for DSMT and MNT services furnished in RHCs. One commenter's recommendation relied on § 405.2463(c)(3) as a provision currently permitting FQHCs paid under the reasonable cost system to receive payment for more than one visit per day when DSMT or MNT is furnished alongside another visit. We note that FQHCs no longer bill Medicare under the reasonable cost system for most services; all FQHCs bill under the FQHC PPS. Under the FQHC PPS, DSMT or MNT furnished on the same day as another qualified visit results in payment for one visit, unless the exception under § 405.2463(c)(4) is applicable.

Consistent with the RHC AIR payment methodology's existing treatment of multiple same-day services (§ 405.2463(c)(1)), and with the comparable FQHC treatment under the FQHC PPS described above, when DSMT or MNT is furnished on the same day as another qualified RHC visit, the RHC will be paid one AIR for that encounter, rather than separate, stackable AIR payments for each service. This approach maintains consistency between RHC and FQHC treatment of same-day visits, which has been the general organizing principle of encounter-based payment under both the RHC AIR and FQHC PPS methodologies. That is, encounters with more than one RHC or FQHC practitioner on the same day, or multiple encounters with the same RHC or FQHC practitioner on the same day, constitute a single RHC or FQHC visit and are payable as one visit. This policy applies regardless of the length or complexity of the visit, the number or type of practitioners seen, whether the second visit is a scheduled or unscheduled appointment, or whether the first visit is related or unrelated to the subsequent visit. This would include situations where an RHC or FQHC patient has a medically necessary face-to-face visit with an RHC or FQHC practitioner and is then seen by another RHC or FQHC practitioner, including a specialist, for further evaluation of the same condition on the same day, or is then seen by another RHC or FQHC practitioner, including a specialist, for evaluation of a different condition on the same day.

We understand commenters' concern that this approach may limit the near-term financial incentive for RHCs to furnish DSMT or MNT alongside an existing medical visit, particularly given that rural beneficiaries may consolidate care into a single visit for reasons of distance, cost, and transportation. We did not propose a stackable or supplemental payment mechanism, or a carve-out of DSMT or MNT from the AIR, however, as such a change would be a substantial departure from the per-diem, encounter-based structure of the AIR methodology generally and was outside the scope of this proposal as presented in the proposed rule.

Comment: One commenter requested CMS to clarify whether the stand-alone DSMT/MNT billing treatment would extend to ''historically excepted Tribal FQHCs'', which are paid under a separate methodology—the IHS outpatient per-visit rate under §§ 405.2462(f) and 405.2464(d)—rather than the standard FQHC PPS rate the proposed rule's discussion references. The commenter asked whether a DSMT or MNT encounter would count as a qualifying visit at these centers on the same terms as RHCs and FQHCs. The commenter supported the request by noting that AI/AN adults have the highest diagnosed diabetes prevalence of any tracked group, concentrated in the same rural areas this proposal targets.

Response: We thank the commenter for this clarifying question. Historically excepted Tribal FQHCs are paid at the lesser of the Medicare outpatient per-visit rate as set annually by the IHS, or the actual charge for the service, under §§ 405.2462(g)(1)(ii) and 405.2464(d). The proposal does not change that payment methodology, and historically excepted Tribal FQHCs are paid this way for all covered services, including DSMT and MNT. We note, as finalized in the CY 2016 PFS final rule, historically excepted Tribal FQHCs are paid for services included in the FQHC benefit (80 FR 71089 through 71096). Under this authority, DSMT and MNT services furnished by certified providers are stand-alone billable visits in FQHCs when all of the requirements are met, without a supervision requirement.

For whether a DSMT or MNT encounter constitutes a qualifying visit, we confirm that DSMT (G0108 Diabetes outpatient self-management training services, individual, per 30 minutes) is a qualifying visit for both FQHC payment codes G0466 (FQHC visit, new patient) and G0467 (FQHC visit, established patient). We also confirm that MNT (97802 Medical nutrition therapy; initial assessment and intervention, individual, face-to-face with the patient, each 15 minutes) is a qualifying visit for both FQHC payment codes G0466 (FQHC visit, new patient) and G0467 (FQHC visit, established patient). Also, MNT (97803 Medical nutrition therapy; re-assessment and intervention, individual, face-to-face with the patient, each 15 minutes) and (G0270 Medical nutrition therapy; reassessment and subsequent intervention(s) following second referral in same year for change in diagnosis, medical condition or treatment regimen (including additional hours needed for renal disease), individual, face to face with the patient, each 15 minutes) are each a qualifying visit for FQHC payment code G0467 (FQHC visit, established patient).[175]

We acknowledge the commenter's observation that American Indian and Alaska Native adults have the highest rate of diagnosed diabetes of any racial or ethnic group tracked by CDC, underscoring the importance of ensuring clarity on this point for historically excepted Tribal FQHCs and confirm that, when Tribal FQHCs provide DSMT or MNT services, these services qualify as an FQHC visit.

Comment: Several commenters requested CMS clarify whether DSMT and MNT may be furnished through telecommunication technology, including in group or shared formats, by all personnel otherwise qualified under the existing benefits. They emphasized that virtual access is particularly important for rural beneficiaries who may have limited access to RDNs and diabetes educators.

Other commenters recommended making telehealth payment permanent, eliminating geographic and originating-site restrictions, paying RHC telehealth services at the full AIR rather than the

[175] *https://www.cms.gov/medicare/medicare-fee-for-service-payment/fqhcpps/downloads/fqhc-pps-specific-payment-codes.pdf.*

lower physician fee schedule rate, and using CMMI or other demonstration authority to test accredited virtual or asynchronous DSMT models in RHCs and FQHCs.

Commenters also noted that, while in-person DSMT and MNT would qualify for the full stand-alone AIR, virtually delivered services would be paid at a lower and declining physician fee schedule rate. They stated that this disparity could discourage virtual care in rural clinics with limited on-site staffing and undermine access for beneficiaries least able to travel. One commenter therefore recommended extending the in-person-visit waiver under section 6209(c) of the CAA, 2026 to DSMT and MNT, allowing virtually delivered services to receive the same stand-alone AIR through at least 12/31/2027.

Response: We appreciate commenters' support for expanding access to DSMT and MNT services for beneficiaries receiving care in RHCs and FQHCs, including through the use of telecommunications technology. As discussed in section III.B.3. of this final rule, the Congress has extended through December 31, 2027, the authority for RHCs and FQHCs to furnish certain non-behavioral health services as Medicare telehealth services. As HCPCS codes 97802 and G0108 are listed in the Medicare telehealth services list, they are eligible for payment under the payment policy for non-behavioral services when furnished via telecommunications technology in RHCs and FQHCs. Under the current framework, non-behavioral health services furnished by an RHC or FQHC using telecommunications technology are paid under the methodology set forth in § 405.2464(g), rather than the RHC AIR or FQHC PPS. This methodology bases payment on the national average payment rates of the list of services available as Medicare telehealth services under the Physician Fee Schedule. DSMT and MNT services furnished through telecommunications technology remain subject to the applicable RHC and FQHC telehealth requirements and payment methodology and do not qualify for AIR payment solely because the same service would be payable as a stand-alone visit if furnished in person.

We also acknowledge commenters' concerns that differences between payment for in-person and telehealth services may affect RHCs' ability to invest in or expand virtual care arrangements. Similar concerns were raised in response to our broader proposals concerning RHC and FQHC telehealth policy, including requests to pay for non-behavioral health telehealth services at the RHC AIR or FQHC PPS rate. As explained in section III.B.3. of this final rule, revisions to the payment methodology for non-behavioral telehealth services are outside the scope of the conforming changes finalized in this rulemaking. We will consider commenters' views, as appropriate, in the context of future rulemaking addressing RHC and FQHC telehealth payment policy.

For requests concerning expansion or permanent extension of telehealth flexibilities, elimination of geographic or originating-site requirements, and use of Innovation Center or other demonstration authority to test virtual or asynchronous models, these recommendations concern broader Medicare telehealth, benefit, payment, or demonstration policies that are outside the scope of this rulemaking. We therefore are not addressing those recommendations substantively in this final rule but may take them into consideration in future policy development.

After consideration of public comments, we are finalizing our proposal to recognize DSMT and MNT services as qualified preventive services that are covered and paid the AIR as stand-alone billable visits under the RHC benefit. To constitute as a billable RHC visit, these services would need to be furnished by a certified provider under the direct supervision of an RHC practitioner. As we clarified above, consistent with the definition of ''direct supervision'' in § 405.2401(b), the presence of the physician (or other supervising practitioner) includes virtual presence through audio/video real-time communications technology (excluding audio-only). We believe this clarification mitigates the burden of workforce limitations that may exist in RHCs since it offers a virtual direct supervision option. We believe aligning payment policies in RHCs with other settings, for example FQHCs and physician offices, would help expand access to care for Medicare beneficiaries in rural areas while supporting Federal initiatives to strengthen rural healthcare. We are also finalizing our proposal to revise § 405.2463(a) and (b)(2) to allow DSMT and MNT services to be stand—alone billable visits in RHCs, as proposed. Similar to FQHCs, when DSMT or MNT is furnished on the same day as another qualified visit, the RHC would be paid one AIR for that encounter.

Comment: In addition to the comments addressed previously, several commenters offered recommendations that, while related to DSMT and MNT generally, go beyond the specific scope of this proposal. We summarize these comments below but do not address them substantively in this final rule, as they concern separate statutory or regulatory provisions, or policy changes not proposed in the CY 2027 PFS proposed rule.

Expanding Eligible Diagnoses/Populations Beyond Diabetes and CKD: Several commenters recommended that CMS broaden MNT and DSMT eligibility beyond the current diabetes and chronic kidney disease diagnoses to include obesity, hypertension, dyslipidemia, cardiovascular disease, malnutrition, and other chronic conditions, or extend DSMT to beneficiaries with pre-diabetes.

Diabetes Prevention Program (MDPP) Alignment: One commenter stated that the rural-access rationale supporting this proposal should also support recognizing the Medicare Diabetes Prevention Program (MDPP) within the RHC and FQHC benefit structure, and separately requested CMS to allow MDPP suppliers to use their existing NPI rather than obtain a second one.

Referral Pathway: One commenter requested CMS amend § 410.132(c) to permit MNT referral by nonphysician practitioners (NPs and PAs) authorized to refer for DSMT, noting that most RHCs are staffed predominantly by mid-level practitioners who currently cannot generate a qualifying MNT referral.

A small number of additional recommendations fell outside the scope of this proposal: removing the one-year expiration on the initial 10 hours of DSMT; reconsidering CMS's general valuation methodology for low-intensity preventive services; requiring state Medicaid programs to recognize RDNs as eligible MNT providers, and revisiting the 85 percent-of-PFS payment cap for RDN-furnished MNT; encouraging referral pathways from DSMT/MNT to medically tailored meal programs; and addressing the effect of the proposed CY 2027 conversion factor reduction on PFS-billed MNT codes.

Response: We appreciate the commenter's feedback however these comments are outside the scope of this proposal.

3. Services Furnished Using Telecommunication Technology

a. Background

Section 3704 of the Coronavirus Aid, Relief, and Economic Security Act (CARES Act) (Pub. L. 116–136, March 27, 2020) directed the Secretary to establish payment for RHC and FQHC services that are provided as Medicare telehealth services by RHCs and FQHCs

serving as a distant site (that is, where the practitioner is located) during the PHE for COVID–19. Specifically, section 1834(m)(8)(B) of the Act, as added by section 3704 of the CARES Act, required that, for the duration of the PHE for COVID–19, the Secretary develop and implement payment methods for FQHCs and RHCs that serve as a distant site. The payment methodology outlined in the CARES Act requires that rates be based on rates that are similar to the national average payment rates for comparable telehealth services under the Medicare PFS. Accordingly, we established payment rates for these services furnished by RHCs and FQHCs based on the average PFS payment amount for all Medicare telehealth services, weighted by volume in a Special Edition Medicare Learning Network Article (SE20016). Congress has extended this payment flexibility beyond the PHE for COVID–19 through a series of statutory amendments, most recently under section 6209(c) of the CAA, 2026, which extended this payment flexibility through December 31, 2027.

We codified this payment policy at 42 CFR 405.2464(g). As amended in the CY 2025 PFS final rule (89 FR 98554), § 405.2464(g) states that for an encounter furnished using interactive, real-time, audio/visual telecommunications technology or for certain audio-only interactions in cases where the patient is not capable of, or does not consent to, the use of video technology services that are not described in § 405.2463(b)(3), payment to RHCs and FQHCs are subject to the national average payment rates for comparable services under the PFS and costs associated with these services shall not be used in determining payments under the RHC all-inclusive rate or the FQHC prospective payment system.

In the CY 2022 PFS final rule (86 FR 65210 and 65211), we revised payment for mental health visits in RHCs and FQHCs furnished via interactive, real-time, audio/visual or audio-only telecommunications technology. Instead of paying for these services under the national average payment rates for comparable services under the PFS, as is done for non-behavioral health services, we amended the regulation at § 405.2463 to permit mental health visits in RHCs and FQHCs furnished via audio/visual or audio-only telecommunication to be paid under the RHC AIR and FQHC PPS rates. In addition, to align with the Medicare telehealth statutory requirements for mental health services, we finalized at §§ 405.2463(b)(3) and 405.2469(d) that there must be an in-person mental health service furnished within 6 months prior to the furnishing of the telecommunications service and that an in-person mental health service (without the use of telecommunications technology) must be provided at least every 12 months while the beneficiary is receiving services furnished via telecommunications technology for diagnosis, evaluation, or treatment of mental health disorders, unless, for a particular 12-month period, the physician or practitioner and patient agree that the risks and burdens outweigh the benefits associated with furnishing the in-person item or service, and the practitioner documents the reasons for this decision in the patient's medical record.

However, beginning with section 304 of Division P of the Consolidated Appropriations Act, 2022 (CAA, 2022) (Pub. L. 117–103, March 15, 2022), the in—person visit requirements for mental health visits were delayed. These requirements were further delayed through various laws that included extension of the telehealth flexibilities. Following the publication of the CY 2026 PFS final rule, section 6208 of the Continuing Appropriations, Agriculture, Legislative Branch, Military Construction and Veterans Affairs, and Extensions Act, 2026 (Pub. L. 119–37, November 12, 2025) extended the delay until January 30, 2026. Most recently, section 6209(d) of the CAA, 2026 extended the abeyance of the RHC/FQHC mental health in-person requirements through December 31, 2027.

b. Conforming Regulatory Text Changes

In the CY 2027 PFS proposed rule (91 FR 43960), we explained that because section 6209(c) of the CAA, 2026 extended authority for CMS to pay for FQHC and RHC non-behavioral health telecommunication technology services as Medicare telehealth services, we did not propose any modifications for this provision to § 405.2464(g).

We also explained that because section 6209(d) of the CAA, 2026 extended the abeyance of the RHC and FQHC mental health in-person requirements through December 31, 2027, we proposed to make conforming regulatory text changes at §§ 405.2463(b)(3) and 405.2469(d). We stated that this provision, as proposed, would require that the in-person visit requirements not apply to any services furnished through December 31, 2027.

We received public comments on our proposal. The following is a summary of the comments we received and our responses.

Comment: Commenters supported our proposal to make regulatory changes to conform to statutory requirements. Commenters stated that telehealth-related flexibilities in general improve access to behavioral health and other services for beneficiaries in rural and underserved areas, where provider shortages, transportation barriers, mobility limitations, and long travel distances may make in-person care difficult to obtain. A commenter noted that these flexibilities may facilitate access to substance use disorder treatment, including the initiation and continuation of treatment through telehealth. Another commenter described the importance of telehealth for individuals with significant mobility, respiratory, communication, and other functional limitations and encouraged CMS to preserve flexible access to telehealth, including audio-only services when clinically appropriate.

Response: We appreciate commenters' support for our proposed conforming changes. The regulatory revisions proposed in this rulemaking are conforming changes intended to reflect statutory requirements.

Comment: Several commenters also urged that the telehealth flexibilities be made permanent rather than extended for limited periods. These commenters stated that successive temporary extensions create uncertainty for RHCs and FQHCs and may discourage investment in telehealth infrastructure, staffing, and other resources necessary to sustain telehealth services over the long term.

Response: We acknowledge commenters' concerns regarding the effects of temporary extensions on RHCs' and FQHCs' ability to plan for and invest in telehealth services. The amendments addressed in this section are conforming changes intended to reflect current statutory requirements, including the statutory extension through December 31, 2027, of the delay of the in-person visit requirements for RHC and FQHC mental health services furnished using telecommunications technology. Because the duration of that extension is established by statute, making the extension permanent is beyond the scope of these conforming amendments.

Comment: Some commenters expressed concerns regarding payment for non-behavioral health services furnished by RHCs using telecommunications technology. Commenters asserted that payment under HCPCS code G2025 is lower than the payment RHCs would receive under the RHC AIR for an in-person visit and,

in some cases, lower than Medicare Physician Fee Schedule payment for comparable services. Commenters stated that this payment methodology may create a financial disincentive for RHCs to furnish or expand telehealth services and requested that CMS reconsider the payment methodology, establish payment parity, or align payment for RHC telehealth services with the RHC AIR. A commenter described the use of RHC telehealth to furnish specialty services, including pulmonology, gastroenterology, and neurology services, and stated that higher payment would support expansion of specialty care in rural communities.

Response: We appreciate commenters' concerns regarding the potential effects of the current payment methodology on RHCs' and FQHCs' ability to furnish or expand telehealth services, including specialty care. The proposed changes concerning payment for non-behavioral health services furnished using telecommunications technology were limited to conforming and technical changes to reflect current statutory authority. Accordingly, broader revisions to the payment methodology, including requests to establish payment parity or align payment for these services with the RHC AIR or FQHC PPS, are outside the scope of this rulemaking. We may consider commenters' views, as appropriate, in the context of future rulemaking addressing RHC and FQHC telehealth payment policy.

Comment: A commenter reiterated their support for an alternative approach that CMS considered in the CY 2026 PFS final rule (90 FR 49561) whereby CMS would change the definition of an RHC or FQHC medical visit to include visits furnished using telecommunications technology so that such services would be paid under the RHC AIR or FQHC PPS, similar to how we previously revised the regulations for mental health visits. The commenter stated that the current payment differential between in-person and medical telehealth visits limits RHCs' ability to invest in telehealth technology and incorporate telehealth into their care delivery models. The commenter acknowledged that the special payment rule for RHC and FQHC telehealth services was established by statute but urged CMS to further consider whether it has authority to adopt an alternative approach or work with Congress to address the payment differential. The commenter also requested that CMS further explain statements made in prior rulemaking regarding potential unintended consequences, program integrity concerns, and administrative burden associated with the alternative payment approach discussed in the CY PFS 2026 final rule. The commenter questioned whether such concerns would arise in practice and suggested that CMS could address potential program integrity concerns through claims modifiers or other safeguards rather than maintaining the current payment methodology.

Response: The regulatory revisions proposed in this rulemaking are conforming changes intended to reflect statutory requirements, and revisions to the payment methodology for non-behavioral services furnished using telecommunications technology are out of scope for purposes of this rulemaking. We note that our proposed changes concerning payment for non-behavioral health services furnished using telecommunications technology were limited to conforming and technical changes to reflect current statutory authority. We may consider commenters' views, as appropriate, in the context of any future rulemaking addressing RHC and FQHC telehealth payment policy.

After consideration of public comments, we are finalizing as proposed conforming amendments to §§ 405.2463(b)(3) and 405.2469(d). These amendments reflect the statutory extension through December 31, 2027 of the delay of the in-person visit requirements for RHC and FQHC mental health services furnished using telecommunications technology. Other technical amendments to § 405.2469(d) proposed in the CY 2027 PFS proposed rule are addressed separately in section III.B.5.c. of this final rule.

4. CY 2027 FQHC PPS Market Basket Update

Section 1834(o)(2)(B)(ii) of the Act requires the FQHC PPS base rate be updated annually by the percentage increase in a market basket of Federally qualified health center goods and services as issued through regulations, or if such an index is not available, by the percentage increase in the MEI (as defined in section 1842(i)(3) of the Act) for the year involved. For CY 2027 (that is, January 1, 2027, through December 31, 2027), we proposed to use an estimate of the percentage increase in the 2022-based FQHC market basket to update payments to FQHCs based on the best available data (91 FR 43960). Additionally, as finalized in the CY 2025 final rule (89 FR 98032), a productivity adjustment is included in the 2022-based FQHC market basket.

For CY 2027, we proposed to update the CY 2026 FQHC PPS base rate by the historical percentage increase through the second quarter of 2026 of the productivity-adjusted FQHC market basket (which we refer to as the FQHC market basket update). For CY 2027, the proposed FQHC market basket update was estimated to be 2.5 percent and was based on the expected historical percentage increase of the FQHC market basket update. Multiplying the CY 2026 FQHC PPS base rate amount of $207.72 by the proposed CY 2027 FQHC market basket update of 2.5 percent ($207.72 × 1.025) resulted in a proposed CY 2027 FQHC PPS base rate amount of $212.91. In the CY 2027 proposed rule, we proposed that the CY 2027 market basket update and the productivity adjustment would be updated to reflect historical data through the 2nd quarter of 2026 (91 FR 43960).

We received public comments on these proposals. The following is a summary of the comments we received and our responses.

Comment: Several commenters noted appreciation for the proposed CY 2027 market basket update for Federally Qualified Health Centers (FQHCs), also referred to as community health centers (CHCs). These commenters stated that while the proposed 2.5 percent increase is appreciated, it does not resolve their underlying concern that Medicare payments have not kept pace with the actual cost of furnishing comprehensive care in FQHCs.

Commenters stated that the CY 2027 update relies on the 2022-based FQHC market basket, which reflects a cost structure several years removed from CY 2027, and noted that general inflation has grown at a faster rate than the FQHC market basket updates between 2022 and 2026. Commenters also described concurrent cost pressures facing CHCs, including workforce recruitment and retention costs, health information technology and cybersecurity investments, administrative and compliance requirements, anticipated Medicaid coverage losses, and instability affecting the 340B Drug Pricing Program.

Commenters stated that annual market basket adjustments alone cannot correct an underlying prospective payment system (PPS) methodology that was established more than a decade ago and may no longer adequately capture the cost and complexity of contemporary care provided by these facilities. These commenters requested CMS undertake a comprehensive evaluation of the FQHC PPS using current Medicare cost report data and identify opportunities to simplify Medicare cost reporting while preserving the information needed to accurately assess FQHC costs.

Response: We appreciate the commenters' concern regarding inflationary pressure facing FQHCs/CHCs and the proposed CY 2027 market basket update.

The 2022-based FQHC market basket is a fixed-weight, Laspeyres-type index that measures price changes over time. A Laspeyres-type price index measures the change in price, over time, of the same mix of goods and services purchased in the base period. Any changes in the quantity or mix of goods and services (that is, intensity) purchased over time are not measured.

Since the inception of the FQHC PPS, the FQHC payment rates (with the exception of statutorily-mandated updates) have been updated by the FQHC market basket percentage increase.

Additionally, the market basket updates appropriately differ from other payment updates (such as increases in the Consumer Price Index) that are not consistent in concept with the statutory requirement for the index to reflect the relative costs associated with furnishing FQHC visits.

We appreciate commenters' concerns regarding the adequacy of the FQHC PPS methodology and the suggestion that we undertake a comprehensive evaluation of the system using current Medicare cost report data. We recognize that FQHCs continue to face evolving operational and financial pressures, and we value the ongoing feedback we receive through the rulemaking process on how well the FQHC PPS reflects current costs of care.

We agree that the annual market basket update described in this rule is required by section 1834(o)(2)(B)(ii) of the Act and is intended to adjust the FQHC PPS base rate for input price inflation; however, it is not intended to serve as a mechanism for broader structural revisions to the payment methodology itself. A comprehensive reevaluation of the FQHC PPS, including the underlying cost reporting requirements and payment structure, would require a more extensive process involving consideration of statutory authority, detailed analysis of current Medicare cost report data, and opportunity for additional interested parties input beyond the scope of this annual update. Regarding the monitoring of trends in FQHC costs and operations, including the impact of the factors commenters raised, we may take these concerns into account as we consider future policy development.

Final Rule Action: As is our general practice, we proposed in the CY 2027 PFS proposed rule that if more recent data became available, we would use such data, if appropriate, to derive the final CY 2027 FQHC market basket update for the final rule. Therefore, for this final rule, based on historical data through the second quarter 2026, the final 2022-based FQHC market basket update for CY 2027 is 2.6 percent, which is 0.1 percentage point higher than the projected CY 2027 market basket update in the proposed rule. Multiplying the CY 2026 FQHC PPS base rate amount of $207.72 by the final CY 2027 FQHC market basket update of 2.6 percent ($207.72 × 1.026) results in a final CY 2027 FQHC PPS base rate amount of $213.12.

5. Technical Changes

a. Section 405.2464(b)(1) and (2)

In the CY 2027 PFS proposed rule (91 FR 43960), we proposed revisions at § 405.2464(b)(1) and (2) to correct the references within these paragraphs so that they reference the appropriate paragraph or sections under subpart X of part 405. We also proposed to revise § 405.2464(b)(1) by replacing ''paragraphs (d) and (e)'' with ''paragraphs (c) and (h)'' since the payment discussed under these paragraphs are not based on the FQHC PPS per diem rate. In addition, we proposed to revise § 405.2464(b)(2)(i) and (ii) to reference § 405.2462(e), explaining that this reference should have been revised when we redesignated this section in the CY 2022 PFS final rule (86 FR 65660).

b. § 405.2464(g)

In the CY 2025 PFS final rule (89 FR 98015 through 98017) we discussed medical visit services furnished via telecommunications technology. We revised § 405.2464 by adding new paragraph (g) to reflect our payment policy for these services. That is, for non-behavioral health services, an encounter furnished using telecommunications technology, payment to RHCs and FQHCs are subject to the national average payment rates for comparable services under the PFS and costs associated with these services shall not be used in determining payments under the RHC AIR or the FQHC PPS. During a recent review of our regulation, we noticed that we inadvertently used the term ''an encounter'' instead of ''services.'' Therefore, in the CY 2027 PFS proposed rule (91 FR 43960 and 43961), we proposed to revise § 405.2464(g) to be consistent with the authority under section 1834(m)(8) of the Act.

c. Section 405.2469(d)

In the CY 2022 PFS final rule (86 FR 65210 and 65211), we explained that § 405.2469(d) was revised to describe the same in-person mental health visit requirement applicable under § 405.2463. In subsequent PFS rulemaking, we described revisions to both provisions as technical changes intended solely to conform the regulations to the applicable statutory delay of the in-person requirement. Because the current text of § 405.2469(d) separately restates the technology modalities and in-person requirement language, it creates an unnecessary risk of divergence from § 405.2463(b)(3). Accordingly, in the CY 2027 PFS proposed rule (91 FR 43961), we proposed to revise the regulatory text at § 405.2469(d) to align the description of permissible telecommunications modalities with the language used in § 405.2463. Specifically, § 405.2469(d) currently refers to audio-only interactions in cases where beneficiaries do not wish to use, or do not have access to, devices that permit two-way, audio/video communication. In contrast, § 405.2463 permits the use of audio-only interactions in cases where the patient is not capable of, or does not consent to, the use of video technology. To ensure consistency across these provisions we proposed to revise the descriptions to match what is described at § 405.2463, namely that the use of audio-only interactions is permissible in cases where the patient is not capable of, or does not consent to, the use of video technology. We also proposed to revise § 405.2469(d) to align the description of the in-person visit requirement for mental health services with the requirements set forth in § 405.2463(b)(3). We explained that these amendments are non-substantive and clarifying because they do not alter payment policy; they merely align duplicative regulatory text and eliminate any potential internal inconsistency.

We did not receive public comments on these technical changes, and therefore, we are finalizing them as proposed.

6. Miscellaneous Comments

We received comments that were out of scope from what we proposed in the CY 2027 PFS final rule for RHCs and FQHCs. A summary of these comments organized by subject area, and our response follow.

Comments: Workforce and Scope of Practice. Several commenters requested that CMS expand the range of practitioners recognized or permitted to independently order and bill certain services. Commenters requested that lactation consultants be permitted to enroll as independent Medicare Part B

practitioners; that pharmacists be explicitly recognized as RHC and FQHC practitioners; and that CMS establish a billing mechanism to reimburse Community Health Workers (CHWs) or their supervising practitioners for travel time associated with home and community-based visits.

Group Visits and the RHC ''Group Services'' Prohibition. Commenters requested that CMS revisit or remove the longstanding prohibition on billing for ''group services'' in RHCs, noting that this limitation restricts the ability of newly recognized practitioners—including Marriage and Family Therapists and Mental Health Counselors—to bill for group, family, or couples therapy.

Behavioral Health Access and Parity. Commenters asked CMS to adopt less restrictive, non-stigmatizing regulatory terminology for mental health and substance use disorder (SUD) services; to permit clinically appropriate combinations of behavioral health services on the same day without arbitrary exclusions; to promote payment parity across CMHCs, RHCs, FQHCs, and hospital outpatient departments; and to reconsider the current interpretation limiting RHCs to providing no more than 49 percent of services as behavioral health services.

Qualifying Visit List Modernization. Commenters stated that the CHC and FQHC qualifying visit lists have not kept pace with changes in Medicare-covered services since 2017, and recommended that CMS establish a regular process for reviewing and updating these lists, including recognition of standalone visits furnished by psychiatric nurse practitioners and clinical pharmacists.

Separate Payment for Part B Drugs and Biologicals. Commenters requested that CMS establish separate payment, outside the FQHC PPS bundled rate, for Part B drugs and biologicals administered by injection, similar to existing exceptions for preventive vaccines. Commenters cited the growing share of high-cost biologics and the risk that acquisition costs for certain injectables may approach or exceed the PPS base payment.

Annual Wellness Visits. Commenters requested that CMS allow RHCs to bill an Annual Wellness Visit (AWV) and a same-day medical visit as two separately reimbursed encounters, consistent with existing FQHC policy, and that CMS permit Registered Nurses to independently furnish AWVs in the RHC setting, consistent with policy in traditional office settings.

Response: We appreciate these comments. However, these suggestions are outside the scope of the proposed rule. We may consider them for future rulemaking.

C. Clinical Laboratory Fee Schedule (CLFS): Consolidated Appropriations Act (CAA), 2026

1. Background on the Clinical Laboratory Fee Schedule

Prior to January 1, 2018, Medicare paid for clinical diagnostic laboratory tests (CDLTs) on the Clinical Laboratory Fee Schedule (CLFS) under section 1833(a), (b), and (h) of the Act. Under the previous payment system, CDLTs were paid based on the lesser of: (1) the amount billed; (2) the local fee schedule amount established by the Medicare Administrative Contractor (MAC); or (3) a national limitation amount (NLA), which is a percentage of the median of all the local fee schedule amounts (or 100 percent of the median for new tests furnished on or after January 1, 2001). In practice, most tests were paid at the NLA. Under the previous payment system, the CLFS amounts were updated for inflation based on the percentage change in the Consumer Price Index for All Urban Consumers (CPI–U), and reduced by a productivity adjustment and other statutory adjustments, but were not otherwise updated or changed. Coinsurance and deductibles generally do not apply to CDLTs paid under the CLFS.

Section 1834A of the Act, as established by section 216(a) of the Protecting Access to Medicare Act of 2014 (PAMA), required significant changes to how Medicare pays for CDLTs under the CLFS. In a final rule that appeared in the June 23, 2016 **Federal Register** (81 FR 41036), entitled Medicare Clinical Diagnostic Laboratory Tests Payment System (hereinafter referred to as the CLFS final rule), we established requirements to implement section 1834A of the Act at 42 CFR part 414, subpart G.

Under the CLFS final rule, ''reporting entities'' must report to CMS during a ''data reporting period'' ''applicable information'' collected during a ''data collection period'' for their component ''applicable laboratories.'' The first data collection period occurred from January 1, 2016, through June 30, 2016. The first data reporting period occurred from January 1, 2017, through March 31, 2017. On March 30, 2017, we announced a 60-day period of enforcement discretion for the application of the Secretary's potential assessment of civil monetary penalties for failure to report applicable information with respect to the initial data reporting period.[176]

In the CY 2018 PFS proposed rule (82 FR 34089 through 34090), we solicited public comments from applicable laboratories and reporting entities to better understand the applicable laboratories' experiences with data reporting, data collection, and other compliance requirements for the first data collection and reporting periods. We discussed these comments in the CY 2018 PFS final rule (82 FR 53181 through 53182) and stated that we would consider the comments for potential future rulemaking or guidance.

As part of the CY 2019 Medicare PFS rulemaking, we finalized two changes to the definition of ''applicable laboratory'' at § 414.502 (see 83 FR 59667 through 59681, 60074; 83 FR 35849 through 35850, 35855 through 35862). First, we excluded Medicare Advantage plan payments under Part C from the denominator of the Medicare revenues threshold calculation to broaden the types of laboratories qualifying as an applicable laboratory. Second, consistent with our goal of obtaining a broader representation of laboratories that could potentially qualify as an applicable laboratory and report data, we also amended the definition of applicable laboratory to include hospital outreach laboratories that bill Medicare Part B using the CMS–1450 14x Type of Bill.

2. Payment Requirements for Clinical Diagnostic Laboratory Tests

In general, under section 1834A of the Act, the payment amount for each CDLT on the CLFS furnished beginning January 1, 2018, is based on the applicable information collected during the data collection period and reported to CMS during the data reporting period and is equal to the weighted median of the private payor rates for the test. The weighted median is calculated by arraying the distribution of all private payor rates, weighted by the volume for each payor and each laboratory. The payment amounts established under the CLFS are not subject to any other adjustment, such as geographic, budget neutrality, or annual update, as required by section 1834A(b)(4)(B) of the Act. Additionally, section 1834A(b)(3) of the Act, implemented at § 414.507(d), provides for a phase-in of payment reductions, limiting the amounts the CLFS rates for each CDLT (that is not a new advanced diagnostic laboratory test (ADLT) or new CDLT) can be reduced

[176] *https://www.cms.gov/Medicare/Medicare-Fee-for-Service-Payment/ClinicalLabFeeSched/Downloads/2017-March-Announcement.pdf.*

as compared to the payment rates for the preceding year. Under the original provisions enacted by section 216(a) of PAMA, for the first 3 years after implementation (CY 2018 through CY 2020), the reduction could not be more than 10 percent per year. For the next 3 years after implementation (CY 2021 through CY 2023), section 216(a) of PAMA stated that the reduction could not be more than 15 percent per year. Under sections 1834A(a)(1) and (b) of the Act, as enacted by PAMA, for CDLTs that are not ADLTs, the data collection period, data reporting period, and payment rate update were to occur every 3 years. As such, the second data collection period for CDLTs that are not ADLTs was originally scheduled to take place from January 1, 2019, through June 30, 2019, and the next data reporting period was originally scheduled to take place from January 1, 2020, through March 31, 2020, with the next update to the Medicare payment rates for those tests based on that reported applicable information scheduled to take effect on January 1, 2021.

Section 216(a) of PAMA established a new subcategory of CDLTs known as ADLTs, with separate reporting and payment requirements under section 1834A of the Act. The definition of an ADLT is set forth in section 1834A(d)(5) of the Act and implemented at § 414.502. Generally, under section 1834A(d) of the Act, the Medicare payment rate for a new ADLT is equal to its actual list charge during an initial period of 3 calendar quarters. After the new ADLT initial period, ADLTs are paid using the same methodology based on the weighted median of private payor rates as other CDLTs. However, under section 1834A(d)(3) of the Act, updates to the Medicare payment rates for ADLTs occur annually instead of every 3 years.

Additional information on the private payor rate-based CLFS is detailed in the CLFS final rule (81 FR 41036 through 41101) and is available on the CMS website.[177]

3. Previous Statutory Revisions to the Data Reporting Period and Phase-In of Payment Reductions

Beginning in 2019, Congress repeatedly extended the data reporting periods for CDLTs that are not ADLTs and revised the phase-in of CLFS payment reductions through multiple laws, including: section 105 of the Further Consolidated Appropriations Act, 2020 (FCAA) (Pub. L. 116–94, December 20, 2019); section 3718 of the Coronavirus Aid, Relief, and Economic Security Act (CARES Act) (Pub. L. 116–136, March 27, 2020); section 4 of the Protecting Medicare and American Farmers from Sequester Cuts Act (PMAFSCA) (Pub. L. 117–71, December 10, 2021); section 4114 of the Consolidated Appropriations Act, 2023 (CAA, 2023) (Pub. L. 117—328, December 29, 2022); section 502 of the Further Continuing Appropriations and Other Extensions Act, 2024 (FCAOEA, 2024) (Pub. L. 118–22, November 17, 2023); and section 221 of the Continuing Appropriations and Extensions Act, 2025 (CAEA, 2025) (Pub. L. 118–83, September 26, 2024). For a detailed discussion of these statutory revisions, please see the CY 2025 PFS final rule (89 FR 98038 through 98043) and the prior PFS rules referenced in the CY 2025 discussion.

4. Additional Statutory Revisions to the Data Reporting Period, Phase-In of Payment Reductions, and Data Collection Period

Section 6209 of the Continuing Appropriations, Agriculture, Legislative Branch, Military Construction and Veterans Affairs, and Extensions Act, 2026 (Pub. L. 119–37, enacted November 12, 2025) made further revisions to the CLFS requirements for the next data reporting period for CDLTs that are not ADLTs and to the phase-in of payment reductions under section 1834A of the Act. Specifically, section 6209(b) of the Continuing Appropriations, Agriculture, Legislative Branch, Military Construction and Veterans Affairs, and Extensions Act, 2026 delayed the next data reporting period for CDLTs that are not ADLTs so that reporting would be required during the period of February 1, 2026 through April 30, 2026, instead of the data reporting period of January 1, 2025 through March 31, 2025 established under the FCAOEA, 2024.

Section 6209 of the Continuing Appropriations, Agriculture, Legislative Branch, Military Construction and Veterans Affairs, and Extensions Act, 2026 did not modify the data collection period that applies to the next data reporting period for these tests. Thus, under section 1834A(a)(4)(B) of the Act, as amended by section 105(a)(1) of the FCAA, the next data reporting period for CDLTs that are not ADLTs (February 1, 2026, through April 30, 2026) continued to be based on the data collection period of January 1, 2019, through June 30, 2019, as defined in § 414.502.

Section 6209(a) of the Continuing Appropriations, Agriculture, Legislative Branch, Military Construction and Veterans Affairs, and Extensions Act, 2026 amended the provisions in section 1834A(b)(3) of the Act regarding the phase-in of payment reductions under the CLFS. First, it extended the statutory phase-in of payment reductions resulting from private payor rate implementation by an additional year, that is, through CY 2029. It further amended section 1834A(b)(3)(B)(ii) of the Act to specify that the applicable percent for CY 2026 was 0 percent, meaning that the payment amount determined for a CDLT for CY 2026 shall not result in any reduction in payment as compared to the payment amount for that test for CY 2025. Section 6209(b) of this law further amended section 1834A(b)(3)(B)(iii) of the Act to state that the applicable percent of 15 percent would apply for CYs 2026 (January 31, 2026 through December 31, 2026), 2027, and 2028.

Most recently, section 6226 of the Consolidated Appropriations Act, 2026 (CAA, 2026) (Pub. L. 119–75, February 3, 2026) amended section 1834A of the Act to revise the data reporting period, data collection period, and requirements for the phase-in of payment reductions. Specifically, section 6226 of the CAA, 2026 revised the next required data reporting period for CDLTs that are not ADLTs to be May 1, 2026 through July 31, 2026, and specified that the applicable data collection period is January 1, 2025 through June 30, 2025.

Section 6226 of the CAA, 2026 also amended section 1834A(b)(3) of the Act to specify that the applicable percent was 0 percent for all of CY 2026, meaning that the payment amount determined for a CDLT for CY 2026 shall not result in any reduction in payment as compared to the payment amount for that test for CY 2025, and to extend the statutory phase-in of payment reductions resulting from private payor rate implementation by an additional year, that is, through CY 2029. Therefore, the applicable percent of up to 15 percent would apply for CYs 2027 through 2029. Section 6226 of the CAA, 2026 further provided that, notwithstanding any other provision of law, the Secretary may implement the amendments made by this section by program instruction or otherwise.

5. Conforming Regulatory Changes

In the CY 2027 PFS proposed rule (91 FR 43962—43963) we stated that in accordance with section 6226 of the CAA, 2026, we proposed to make certain conforming changes to the data reporting and payment requirements at 42 CFR part 414, subpart G. Specifically, we proposed to revise § 414.502 to

[177] *https://www.cms.gov/medicare/payment/fee-schedules/clinical-laboratory-fee-schedule/clfs-history.*

update the definitions of both the ''data collection period'' and ''data reporting period,'' specifying that the data collection period is the 6-month period from January 1 through June 30, during which applicable information is collected and that precedes the data reporting period, and that the data reporting period for CDLTs that are not ADLTs is the 3-month period, May 1 through July 31, and for ADLTs is the 3-month period, January 1 through March 31, during which a reporting entity reports applicable information to CMS and that follows the preceding data collection period. We also proposed to revise § 414.504(a)(1) to indicate that initially, data reporting begins January 1, 2017, and is required every 3 years beginning May 1, 2026. In addition, we proposed to make conforming changes to our requirements for the phase-in of payment reductions to reflect the amendments in section 6226 of the CAA, 2026. Specifically, we proposed to revise § 414.507(d) to indicate that for CY 2026, payment may not be reduced by more than 0.0 percent as compared to the amount established for CY 2025, and for CYs 2027 through 2029, payment may not be reduced by more than 15 percent as compared to the amount established for the preceding year.

We noted in the proposed rule that the CYs 2018 through 2026 CLFS payment rates for CDLTs that are not ADLTs are based on applicable information collected in the data collection period of January 1, 2016 through June 30, 2016. Under current law, the CLFS payment rates for those tests for CY 2027 through CY 2029 will be based on applicable information collected during the data collection period of January 1, 2025 through June 30, 2025, and reported to CMS during the data reporting period of May 1, 2026 through July 31, 2026.

We received public comments on our proposal. The following is a summary of the comments we received and our responses.

Comment: Commenters supported our proposal to make regulatory changes to conform to the statutory requirements pursuant to section 6226 of the CAA, 2026. Several commenters, however, expressed concerns about the private payor rate-based CLFS methodology and the potential effects of future payment reductions. Commenters stated that reported private payor rates may not fully reflect the costs or market value of laboratory services or adequately represent the range of laboratories furnishing services to Medicare beneficiaries, including physician-office, hospital outreach, rural, community-based, and oncology laboratories. Commenters cited inflationary pressures, labor and supply costs, limited negotiating leverage with commercial insurers, and increasing regulatory requirements, and expressed concern that additional payment reductions under the CLFS could affect laboratory sustainability, beneficiary access, diagnostic innovation, and practice consolidation. Similarly, another commenter expressed concern that upcoming CLFS rates could result in substantial payment reductions beginning in 2027 and continuing through 2029. The commenter stated that such reductions could make it difficult to invest in new or expanded laboratory services and could threaten access to care, particularly in rural areas.

Commenters urged CMS to monitor the completeness and representativeness of reported private payor data and the effects of resulting CLFS payment rates, limit or defer payment reductions where possible, and consider broader changes to CLFS data collection and rate setting. Another commenter recommended that CMS evaluate whether the applicable laboratory methodology and low-expenditure threshold result in sufficiently representative data and examine whether increasing Medicare Advantage penetration affects which laboratories satisfy the applicable laboratory criteria.

A commenter also urged Congress and CMS to further delay CLFS payment reductions while evaluating alternative approaches to data collection and rate setting and recommended that future payment updates rely on transparent and representative market data that account for laboratory services furnished across diverse provider settings.

Response: We appreciate the support of commenters for our proposed conforming regulatory changes and we appreciate their concerns regarding the completeness and representativeness of private-payor data, the composition of the reporting population, and the potential effects of CLFS payment changes. As the regulatory revisions proposed in this rulemaking are conforming changes intended to reflect statutory requirements, revisions to the statutory private payor rate-based methodology and timing of payment reductions are out of scope for purposes of this rulemaking. We note that the recommended changes to the statutory timing of payment reductions, the private payor rate-based methodology, or to other requirements established by section 1834A of the Act would require further Congressional action. We note that section 1834A(b)(3) of the Act limits the amount by which the payment amount for an existing test may be reduced, compared with the payment amount for the preceding year, as a result of implementing updated CLFS rates based on applicable information. Accordingly, the actual payment reduction for a particular test will depend on the applicable weighted median private payor rate and may be less than 15%, or may not result in a reduction, while the statutory phase-in provision prevents an annual payment reduction from exceeding 15 percent for CYs 2027 through 2029.

We will take the commenters' other recommendations, such as suggestions to review the regulatory low expenditure threshold, under advisement.

Comment: A commenter recommended that CMS publish comparisons between CLFS payment amounts and publicly available consumer cash prices as a transparency measure and continue to examine the definition of ''applicable laboratory'' to improve the representativeness of reported data.

Response: We appreciate the commenter's recommendation and agree with the importance of health care price transparency. Under current hospital price transparency requirements at 45 CFR part 180, the amount that a hospital negotiates with private payers for clinical laboratory services are required to be posted publicly in a hospital's machine-readable file (MRF) if the hospital furnishes the item or service and the lab is part of the licensed hospital. Hospitals are also required to include cash prices and gross charges in their MRFs if they have been established for that item or service. We believe that these price transparency requirements meet the criteria to facilitate the type of comparisons the commenter is requesting.

We also note that revisions to the definition of ''applicable laboratory'' are out of scope for purposes of this rulemaking.

Comment: A commenter recommended that CMS not publish code-level weighted median private-payor rates calculated under PAMA before applying the statutory phase-in of payment reductions when those amounts differ from the applicable Medicare payment rates. According to the commenter, when CMS disclosed these underlying calculations during the initial PAMA rate-setting cycle in 2018, laboratories reported that commercial payors used them as reimbursement benchmarks. The commenter urged

CMS to publish only the operative CLFS payment rate for each test code and present additional information concerning the reported data and rate-setting methodology in an appropriately aggregated form that cannot be used to establish code-specific commercial payment rates.

Response: In the CLFS final rule (81 FR 41071 through 41073) which implemented section 1834A of the Act, we stated that we intended to make available to the public a file that includes summary or aggregate-level private payor rate and volume data for each test code such as, the unweighted median private payor rate, the range of private payor rates, the total, median and mean volume, and the number of laboratories reporting. We stated that such information would also be released to the public before the final rates are published to better enable the public to comment on the general accuracy of the reported data. During the initial implementation of section 1834A of the Act, we published the raw data that contained reported private payor rate and volume information used in implementing the private payor rate-based CLFS; this included private payor data by HCPCS code, reported private payor payment rate, and associated volume of tests.[178] [179] To protect laboratory confidentiality, CMS removed laboratory National Provider Identifiers from the public-use file and excluded reported information for tests with volumes below 10. We also posted preliminary CLFS payment rates for CY 2018 to provide interested parties with an opportunity to review and comment on the information used in establishing the new payment rates and the final data. These files included private payor rates and volumes and preliminary and final weighted median-based payment rates. For the current data reporting period that ended on July 31, 2026, we similarly made information publicly available to permit interested parties to understand how the applicable CLFS payment rates were derived and to assess the general accuracy of the reported data.[180]

We recognize the commenter's concern that code-level information could be used by commercial payors for purposes other than the Medicare rate setting process, including as a benchmark in establishing commercial payment rates. Weighted median-based rates for test codes, however, are aggregate calculations derived from applicable information reported to CMS for the specific purpose of implementing the Medicare CLFS methodology under section 1834A of the Act. We continue to believe that publication of the code-level weighted medians serves an important transparency function by allowing interested parties to review and comment on revised CLFS payment rates before they are made effective. In addition, section 1834A(a)(10) of the Act and the implementing CLFS regulation at § 414.504(f) establish confidentiality requirements for applicable information reported to CMS under this payment system. In particular, CMS or its contractors will not disclose applicable information reported to CMS in a manner that would identify a specific payor or laboratory, or that reveals the prices charged or payments made to a specific laboratory, except to permit the Comptroller General, the Director of the Congressional Budget Office, and the Medicare Payment Advisory Commission, to review the information, or as CMS determines is necessary to implement CLFS requirements, such as disclosures to the HHS Office of Inspector General or the Department of Justice for oversight and enforcement activities. CMS will continue to comply with these protections when releasing CLFS information to the public.

Consistent with our established process, in the interests of transparency, we continue to believe that publishing the code-level weighted medians allows interested parties to understand and assess how the CLFS rates were calculated and implemented and is helpful to inform their comments on the general accuracy of the reported data.

6. Technical Correction (§ 414.523(a)(1))

a. Background

Section 1833(h)(3)(A) of the Act generally requires the Secretary to provide for and establish a nominal fee to cover the appropriate costs in collecting the sample on which a CDLT was performed and for which Medicare payment is made, in addition to the amounts provided under the Medicare CLFS. In addition, section 1834A(b)(5) of the Act requires that, when the sample is collected from an individual in a skilled nursing facility (SNF) or by a laboratory on behalf of a home health agency (HHA), the otherwise applicable nominal specimen collection fee be increased by $2.00.

In the CY 2023 PFS final rule (87 FR 69744 through 69760), we finalized a policy to codify specimen collection fee provisions at § 414.523(a)(1), including updating the base specimen collection fee amount and establishing an annual CPI–U update. In that rulemaking, we also stated that the statutory $2.00 increase for specimens collected from a Medicare beneficiary in a SNF or by a laboratory on behalf of an HHA would continue to apply, consistent with section 1834A(b)(5) of the Act. However, due to a drafting or codification error, the operative regulatory text implementing this increase in the CY 2023 PFS final rule (87 FR 70225 through 70226) was not fully included in § 414.523(a)(1), and only a partial introductory clause remains in paragraph (a)(1)(v). Specifically, the introductory text to § 414.523(a)(1) states that payment is made ''[e]xcept as provided in paragraph (a)(1)(v),'' but § 414.523(a)(1)(v), as codified, consists only of the fragment: ''For a specimen collected from a Medicare beneficiary.'' This text is incomplete and does not contain operative language establishing an exception or alternative payment methodology. In addition, other provisions within § 414.523(a)(1), including paragraph (a)(1)(ii), already specify that the specimen must be collected from a Medicare beneficiary, creating an apparent internal inconsistency when read together with the introductory exception clause.

b. Technical Correction

In the CY 2027 PFS proposed rule (91 FR 43963), we explained that to resolve this internal inconsistency and accurately reflect the statutory provisions and longstanding policy, we proposed to revise § 414.523(a)(1) to restore the complete and operative language implementing the statutory $2.00 increase. That is, we proposed revising § 414.523(a)(1)(v) to state that for a specimen collected from a Medicare beneficiary in a skilled nursing facility or on behalf of a home health agency, the specimen collection fee otherwise paid under paragraph (a)(1) of this section is increased by $2.00.

We noted that we do not believe that this proposal reflects a substantive policy change. In the CY 2023 PFS proposed rule (87 FR 46043), we proposed to codify existing specimen collection fee policies and to

[178] *https://www.cms.gov/medicare/medicare-fee-for-service-payment/clinicallabfeesched/downloads/cy2018-clfs-payment-rates.zip;https://www.cms.gov/medicare/medicare-fee-for-service-payment/clinicallabfeesched/downloads/cy2018-clfs-payment-rates-analytics.zip*

[179] *https://data.cms.gov/provider-characteristics/hosptials-and-other-facilities/medicare-clinical-laboratory-fee-schedule-private-payer-rates-and-volumes;*

[180] *https://www.cms.gov/files/zip/clfs-raw-rates-volumes.zip*; *https://www.cms.gov/files/zip/cy-2027-preliminary-weighted-median-2027-clfs-rate-calculations-raw-vs-trimmed-rates.zip*

incorporate the statutory $2.00 increase for SNF and HHA collections into § 414.523(a)(1) as a discrete paragraph. Specifically, we proposed that, beginning April 1, 2014, for a specimen collected from a Medicare beneficiary in a SNF or on behalf of an HHA, the specimen collection fee otherwise paid under § 414.523(a)(1) would be increased by $2.00, consistent with section 1834A(b)(5) of the Act. In the CY 2023 PFS final rule (87 FR 69744 through 69760), we finalized policies consistent with this framework, including the continued application of the statutory $2.00 increase.

We noted in the CY 2027 PFS proposed rule that it has been, and continues to be, CMS' policy to pay the specimen collection fee only for qualifying specimens collected from Medicare beneficiaries, and to apply the additional $2.00 increase for specimens collected from a Medicare beneficiary in a SNF or by a laboratory on behalf of an HHA, as required by statute. We stated that we have consistently implemented this policy operationally through claims processing systems, subregulatory guidance, and annual payment updates.

We received public comments on our proposal. The following is a summary of the comments we received and our responses.

Comment: Some commenters expressed support for our proposal to revise § 414.523(a)(1)(v) to state that for a specimen collected from a Medicare beneficiary in a SNF or on behalf of an HHA, the specimen collection fee otherwise paid under paragraph (a)(1) of this section is increased by $2.00.

Response: We appreciate commenters' support for this proposal.

Comment: A commenter stated that, as CMS acknowledged that this existing regulation text is internally inconsistent, the current regulation is ambiguous and inoperative. The commenter therefore disagreed with CMS's characterization of the revision as a technical correction rather than a substantive policy change. The commenter requested that CMS clarify in the final rule that the revision to § 414.523(a)(1) applies only prospectively.

Response: We appreciate the commenter's concern. We disagree that the correction establishes a new substantive payment policy. As discussed in the proposed rule, section 1834A(b)(5) of the Act requires that the otherwise applicable specimen collection fee be increased by $2.00 for a specimen collected from a Medicare beneficiary when the sample is collected from an individual in a SNF or by a laboratory on behalf of an HHA. In the CY 2023 PFS final rule FR 87 (69744 through 69751), we finalized the implementation of this statutory increase and stated that it would continue to apply. We have also consistently implemented this policy through our claims-processing systems, payment rate files and subregulatory guidance.[181] The regulatory text at § 414.523(a)(1)(v) inadvertently omitted the remainder of the introductory clause but retained the operative language providing for payment of the specimen collection fee under the circumstances specified elsewhere in paragraph (a)(1). The correction therefore restores the complete introductory language and resolves the internal inconsistency without changing the policy as reflected in the statute. While the regulatory text modification is effective January 1, 2027, we continue to believe that this revision reflects current policy and we are finalizing it as proposed.

Comment: A commenter encouraged CMS to issue clear contractor instructions addressing specimen collection fees, travel allowances, collections from multiple residents during one trip, residents' Part A or Part B status, independent laboratory claims, and SNF consolidated billing.

Response: We will consider whether additional subregulatory guidance is needed to assist laboratories in billing in accordance with the specimen collection policies. We also appreciate concerns regarding access to laboratory services in rural and low-volume areas.

After consideration of public comments, we are finalizing as proposed the revisions to §§ 414.502, 414.504(a)(1), and 414.507(d) to update the CLFS data collection and reporting periods, the three-year data reporting cycle, and the phase-in of payment reductions consistent with section 6226 of the CAA, 2026, as well as the technical correction to § 414.523(a)(1) to restore language regarding the statutory $2.00 specimen collection fee increase for specimens collected from Medicare beneficiaries in SNFs or on behalf of HHAs.

D. Changes to the Ambulatory Specialty Model (ASM)

1. Executive Summary and Background

a. Executive Summary

(1) Purpose

We proposed to make changes to the Ambulatory Specialty Model (ASM or model) effective on the model start date of January 1, 2027 in the CY 2027 PFS proposed rule (91 FR 43963 through 43997). Based on the feedback we received after the publication of the CY 2026 PFS final rule and our own internal review, we determined that several technical refinements and adjustments to the model would facilitate implementation as well as improve the incentives initially intended in the model's design. This final rule will update and revise provisions related to ASM. This final rule also includes technical corrections to the regulatory text.

(2) Summary of Major Provisions

ASM is a mandatory alternative payment model tested by the CMS Center for Medicare and Medicaid Innovation (Innovation Center) under section 1115A of the Act. ASM will have 5 performance years that begin January 1, 2027 and end December 31, 2031, with performance-based payment adjustments occurring 2 calendar years (CYs) following the end of each ASM performance year.

We finalized ASM through notice-and-comment rulemaking in the Medicare and Medicaid Programs; CY 2026 Payment Policies Under the Physician Fee Schedule and Other Changes to Part B Payment and Coverage Policies; Medicare Shared Savings Program Requirements; and Medicare Prescription Drug Inflation Rebate Program final rule (hereinafter ''CY 2026 PFS final rule'') (90 FR 49562 through 49720). As described in detail in section III.D.2 of the CY 2027 PFS proposed rule (91 FR 43963 through 43997), we proposed the following modifications:

- Revising select ASM definitions and adding new ASM definitions.
- Clarifying ASM participant exceptions from specified model requirements due to taxpayer identification number (TIN) changes before or during an ASM performance year.
- Excepting certain ASM heart failure participants from specified model requirements due to a redesignated specialty type.
- Incorporating an option to terminate ASM participants under certain circumstances.
- Incorporating an option for data submission for the improvement activities ASM performance category at either the individual or group level.
- Clarifying the scoring of multiple quality measure data submissions from ASM participants in small practices.
- Adding an administrative claims-based low back pain imaging quality measure and replacing the patient-reported outcome measure for low back

[181] *https://www.cms.gov/files/document/mm14345-travel-allowance-fees-specimen-collection-cy-2026-updates.pdf*

pain with a functional status outcome process measure.

- Adjusting benchmarking and scoring policies for quality measures.
- Adding a quality ASM performance category scoring incentive for the voluntary submission of patient-reported outcome (PRO) data to support the development of patient-reported outcome performance-based measures (PRO–PM) under ASM.
- Revising requirements of the Promoting Interoperability ASM performance category to align with proposed changes to the Merit-based Incentive Payment System (MIPS) Promoting Interoperability performance category and adding a Promoting Interoperability measure suppression policy.
- Incorporating a rural scoring adjustment for ASM participants in rural areas.
- Revising the contents of the ASM performance report.
- Clarifying language on the application of ASM payment adjustments when an ASM participant reassigns billing rights to a new TIN during an ASM payment year.
- Clarifying the availability of the CMS-sponsored model arrangements and patient incentives safe harbor and applicability of programmatic waivers for ASM to reflect that such flexibilities are associated with active performance under ASM and would not be available or applicable during an ASM performance year in which an ASM participant is either ineligible for or excepted from, specified model requirements.
- Revising provisions establishing collaborative care arrangement (CCA) requirements to improve clarity and update the permissible parties, remuneration conditions, documentation requirements, and compliance terms.
- Clarifying and reorganizing select regulatory text to improve readability and flow.

The policies finalized in this final rule reflect our commitment to ensuring ASM's incentives help drive quality of care improvements for beneficiaries and reductions in Medicare expenditures.

b. Background

(1) Statutory Authority

Section 1115A of the Act authorizes the Secretary to test innovative payment and service delivery models to reduce program expenditures under Medicare, Medicaid, and the Children's Health Insurance Program (CHIP) while preserving or enhancing the quality of care furnished to beneficiaries. Under this authority, we may test models that modify payment methodologies, establish accountability for quality and cost outcomes, and incorporate financial risk arrangements. Under the authority of sections 1115A and 1871(a)(2) of the Act, through notice-and-comment rulemaking, we finalized ASM in the CY 2026 PFS final rule that published in the November 5, 2025, **Federal Register** (90 FR 49562 through 49720).

(2) Background

ASM will test whether holding physician specialists accountable for the quality and cost of care associated with the longitudinal management of specific chronic conditions, heart failure and low back pain, can reduce Medicare expenditures while preserving or enhancing quality of care for Medicare fee-for-service (FFS) beneficiaries. Clinical decisions made by specialists in ambulatory settings can meaningfully influence disease progression as well as downstream utilization and spending. ASM's design, in its goal to reduce Medicare expenditures while preserving or enhancing the quality of care, aims to: (1) improve the management of chronic disease and slow disease progression through more effective risk assessment; (2) increase active collaboration between specialists and primary care providers, and (3) reduce avoidable hospitalizations and low-value procedures (that is, procedures that provide little clinical benefit or the risk of harm outweighs its potential benefit).

In developing ASM, we considered specialist-managed conditions that often require ongoing outpatient management, diagnostic evaluation, medication management, coordination by specialists with other clinicians across different care settings, and, in some cases, procedural or surgical intervention (90 FR 49562 through 49564). Based on these factors, ASM selects individual specialists who manage one of two ASM targeted chronic conditions, heart failure or low back pain. As we designed ASM's participation criteria and performance evaluation framework to cover multiple conditions and associated specialists, we continue to explore whether including additional conditions and specialists would be appropriate.

Our goal with the model test is to select specialists who have a meaningful level of engagement in the care of Medicare FFS beneficiaries with ASM targeted chronic conditions as ASM participants. Under the provisions finalized in the CY 2026 PFS final rule (90 FR 49571 through 49596), we select ASM participants by a combination of a Taxpayer Identification Number (TIN) and a National Provider Identifier (NPI). ASM participants are clinicians who meet four ASM participant eligibility criteria: (1) bill claims under the Medicare Physician Fee Schedule, (2) have a selected physician specialty type relevant to an ASM targeted chronic condition, (3) meet a historical volume threshold of condition-specific episode-based cost measure (EBCM) episodes, and (4) have a service location in a selected mandatory geographic area (that is, selected Core-Based Statistical Areas (CBSAs) and metropolitan divisions). ASM heart failure participants include cardiologists, and ASM low back pain participants include physicians with specialty types of anesthesiology, interventional pain management, neurosurgery, orthopedic surgery, pain management, and physical medicine and rehabilitation.

ASM evaluates ASM participants across four ASM performance categories: quality, cost, improvement activities, and Promoting Interoperability. The evaluation of ASM participant performance leverages the MIPS Value Pathways (MVP) framework, which utilizes a cohesive set of measures and activities focused on performance in furnishing care for a particular specialty or clinical condition. ASM participants must meet each ASM performance category's requirements and report required data. We use data reported by ASM participants and other administrative data, such as inputs gathered from claims, to evaluate each ASM participant's performance on an annual basis. We determine a composite final score for each ASM participant based on performance across the four ASM performance categories and adjust final scores to account for beneficiary medical and social complexity as well as practice size.

Based on performance relative to other specialists treating the same ASM targeted chronic condition in an ASM cohort, ASM participants will receive a positive, neutral, or negative payment adjustment on all Medicare Part B claims for covered professional services during the CY 2 years following the applicable ASM performance year (for example, performance during the 2027 ASM performance year results in the application of ASM payment adjustments during the 2029 ASM payment year). Payment adjustments will range from negative 9 percent to positive 9 percent in the first 2 ASM payment years, gradually increasing to 12 percent in the final ASM payment year.

We refer readers to the CY 2026 PFS final rule (90 FR 49562 through 49720) and ASM's provisions at 42 CFR part 512, subpart G, for additional information on all provisions finalized prior to this final rule.

We received public comments about ASM. We note that some of these public comments were outside the scope of the CY 2027 PFS proposed rule. These out-of-scope public comments are not addressed with responses in this final rule. Summaries of the public comments that are within the scope of the proposed rule and our responses to those public comments are set forth in the various sections of this final rule under the appropriate heading.

The following is a summary of general comments related to ASM:

Comment: Several commenters supported ASM, specifically the focus on specialty care related to the longitudinal management of high-impact chronic conditions, such as heart failure and low back pain. A commenter stated that this shift to value-based care could reward specialists who have historically operated solely within a fee-for-service environment. Commenters noted ASM's potential to improve care quality and reduce costs for beneficiaries with low back pain and heart failure, both high-volume and high-cost conditions, through value-based care and payment.

Response: We thank commenters for their support of ASM.

Comment: Many commenters opposed launching ASM under the current timeline. Some commenters recommended that CMS establish a transition period, such as delaying ASM by 6 months to 1 year, using a pilot or reporting-only period of 1 year, or phasing in mandatory accountability after a testing period.

Response: We appreciate the commenters' concerns regarding the ASM implementation timeline and recommendations for a delayed start, pilot period, reporting-only period, or phased implementation of financial accountability. We do not agree that such a transition period is necessary. We finalized ASM in the CY 2026 PFS final rule, which was published in the **Federal Register** on November 5, 2025, more than one year before the model's January 1, 2027 start date. The CY 2026 PFS final rule identified the specialties included in the model and established the model's requirements. Following publication of the CY 2026 PFS final rule, we released the mandatory geographic areas in which ASM will be tested, issued preliminary and final ASM participant lists for the 2027 ASM performance year, and conducted targeted outreach to ASM participants regarding their participation status and model requirements. Taken together, we believe the advance notice provided through rulemaking and our implementation activities preceding the model's launch provide sufficient time to understand the requirements of and prepare for participation in the model. We also appreciate commenters' concerns regarding the application of financial accountability based on 2027 ASM performance. However, performance-based payment adjustments tied to measures of cost and quality are well established in Medicare and are not unique to ASM. In CY 2024, only 18.4 percent of Original Medicare payments were made on a fee-for-service basis without a link to quality or value,[182] reflecting the extent to which Original Medicare payments have incorporated quality and cost.

Comment: Many commenters stated concerns about the administrative and financial burden of ASM, citing costs associated with reporting, data management, care coordination, interoperability, and workflow redesign. Several commenters stated that workforce shortages, rising labor costs, increasing administrative requirements, and payment reductions elsewhere in the Medicare program may limit the ability of organizations to successfully participate in ASM. Comments emphasized CMS should design ASM to minimize unnecessary administrative burden and provide sufficient implementation time.

Response: We appreciate commenters' concern about the burden associated with ASM. We note that we have taken steps in this final rule to reduce burden, such as efforts to reduce ASM participant notifications and paperwork under the exceptions process and reduce reporting burden in the Promoting Interoperability ASM performance category for the 2027 ASM performance year. We believe these additional steps will help alleviate administrative and reporting burden for ASM participants. With respect to concerns about Medicare reimbursement and labor costs, we refer readers to the portions of this final rule discussing the underlying payment structure of the PFS.

Comment: A few commenters stated their viewpoints on the appropriateness of including additional conditions within ASM in the future. A commenter opposed expanding ASM to oncology, citing concerns that episode-based cost measures could be driven by oncology drug costs and differences in treatment regimens and case mix that may not reflect clinician efficiency or quality. Another commenter stated that amyotrophic lateral sclerosis (ALS)provides a compelling example of specialty-led care and that CMS should consider how insights from specialty-focused models could be applied to complex neurological diseases, such as ALS.

Response: We thank the commenters for their feedback on the pros and cons of potential conditions that we could consider for future inclusion in ASM. Should we propose the inclusion of a new ASM targeted chronic condition and new ASM cohort, we would do so through future notice-and-comment rulemaking.

Comment: A few commenters stated concerns that, if MVPs become the primary MIPS reporting option, ASM participants could report similar measures under the MVP framework while being subject to a different scoring methodology and greater financial risk and recommended that CMS end ASM if MVP reporting becomes mandatory. A commenter opposed the use of the MVP framework under ASM since they believe that MVPs reshuffled existing MIPS metrics and are focused on single specialties that do not align with the patient or care team. A few commenters recommended that CMS align policies and share insights across CMS as MIPS proposed to move towards full MVP adoption in CY 2029.

Response: We did not make any proposals in the CY 2027 PFS proposed rule related to the use of the MVP framework within ASM, and therefore, consider these comments out of scope. We refer readers to section IV.A.3 of this final rule for additional information about the MVP strategy in the Quality Payment Program.

Comment: A commenter recommended that CMS coordinate transitions between ASM and the Quality Payment Program to avoid duplicative reporting requirements or unintended payment penalties for clinicians moving between the programs.

Response: We note that we are sharing data on ASM participants across CMS to ensure that information displayed in Quality Payment Program eligibility information reflects mandatory ASM participation. We intend to make public information on these processes and the frequency at which such information will be updated through additional guidance posted on the ASM website or through direct electronic communication to ASM participants.

2. Changes to Provisions of the Ambulatory Specialty Model (ASM)

a. Definitions

In the CY 2026 PFS final rule, we finalized certain terms for ASM. We described these finalized definitions in context throughout section III.C.2 of the CY 2026 PFS final rule and codified them at § 512.705 (90 FR 49569).

After internal review of ASM's provisions, we believed minor modifications to select definitions would improve the readability and overall clarity of ASM's provisions.

Accordingly, we proposed at § 512.705 to modify the definition of ''ASM beneficiary'' to clarify this term means a Medicare FFS beneficiary who is being treated by an ASM participant for an ASM targeted chronic condition. We believe this edit would improve the precision of the definition by using the finalized definition of ''ASM targeted chronic condition'' that is used throughout ASM's provisions, rather than just ''targeted chronic condition'' as the definition currently reads.

We also proposed to revise the definition of ''Dual eligible proportion'' at § 512.705 for clarity. Specifically, we proposed to clarify that the definition of ''Dual eligible proportion'' means ''the share of an ASM participant's beneficiaries who are dually eligible Medicare beneficiaries'' to more clearly refer to an ASM participant.

We refer readers to section III.D.2.f.(3) of this final rule for comments and responses on the proposed definition of ''Rural area'' as it is described in context of the rural scoring adjustment. We are also finalizing a revision to the definition of ''Small practice'' as described in context of the small practice reporting policy.

We sought comment on the proposed revisions to the ''ASM beneficiary'' and ''Dual eligible proportion'' definitions at § 512.705.

We received public comments on these proposals. The following is a summary of the comments we received and our responses.

Comment: A few commenters supported the proposed revisions to the ASM beneficiary definition.

Response: We appreciate the commenters' support for the definition revision.

Comment: A few commenters supported the proposed revisions to the dual eligible proportion definition.

Response: We appreciate the commenter's support for the definition revision

After consideration of public comments, we are finalizing the revisions to the definitions of ''ASM beneficiary'' and ''dual eligible proportion'' as proposed at § 512.705.

b. Participation

(1) Background

As discussed in the CY 2026 PFS final rule (90 FR 49571 through 49596), we designed ASM with a focus on clinicians who commonly treat Medicare FFS beneficiaries in an ambulatory setting, develop longitudinal relationships with patients, and co-manage beneficiaries with primary care providers (PCP). In addition, we believe clinicians who treat ASM targeted chronic conditions are well-positioned to benefit from improved integration between specialty and primary care, creating greater opportunities to incentivize high-value care and tertiary prevention.

We determined the model would assess quality of care provided at the individual clinician level, as identified by a combination of TIN and NPI, rather than at the level of a group practice or facility, with limited exceptions, to align accountability with individual clinical decision-making and to better capture variation in individual clinical practice patterns among clinicians within the same organization (90 FR 49574). As a result, each ASM participant is individually responsible for meeting model requirements and is evaluated independently for the purposes of ASM performance category scoring, final scoring, and determining an ASM payment adjustment factor and corresponding ASM payment multiplier.

(2) Mandatory Participation

In the CY 2026 PFS final rule (90 FR 49571 through 49574), we finalized that once a clinician meets the ASM participant eligibility criteria and is selected as an ASM participant, they remain an ASM participant for the duration of the ASM test period. Once selected as an ASM participant, there may be circumstances where the ASM participant does not meet the ASM participant eligibility criteria for a specific ASM performance year. Accordingly, we developed a policy whereby an ASM participant is only subject to certain ASM requirements for the ASM performance year(s) in which they meet ASM participant eligibility criteria. We also finalized provisions that describe the effect of not meeting ASM participant eligibility criteria for an ASM performance year (90 FR 49571 through 49574). Specifically, under existing provisions, an ASM participant who does not meet ASM participant eligibility criteria for an ASM performance year is: (1) not subject to the requirements for performance assessment described at § 512.715, data submission described at § 512.720, and final scoring described at § 512.745; (2) not subject to payment adjustment described at § 512.750 for the corresponding ASM payment year; and (3) not eligible for Medicare program waivers described at § 512.775 provided under the model for the applicable ASM performance year.

To clarify and better incorporate policies related to exceptions of specific ASM performance requirements and ASM participant terminations, we proposed to revise our regulatory text describing mandatory ASM participation and the effects of not meeting ASM participant eligibility criteria for an ASM performance year.

Specifically, we proposed at § 512.710(a)(1) that a clinician who we select as an ASM participant for at least one ASM performance year is considered an ASM participant for the duration of the ASM test period unless we (1) terminate ASM in accordance with Standard Provisions for Mandatory Innovation Center Models described at § 512.165, or (2) terminate the ASM participant as described under § 512.710(h). We refer readers to section III.D.2.b.(5) of this final rule for further discussion on finalized provisions related to ASM participant terminations. We believe this revision is consistent with our original policy finalized in the CY 2026 PFS final rule describing that an ASM participant, once selected, remains an ASM participant for the ASM test period.

We also proposed to add a paragraph heading and revise § 512.710(a)(2) to clarify that this paragraph describes the effects of not meeting ASM participant eligibility criteria for an ASM performance year. We proposed to move select regulatory text at current § 512.710(a)(2)(i) to § 512.710(a)(2) to improve readability and to incorporate new proposals on the effects of not meeting ASM participant eligibility criteria for an ASM performance year.

First, we proposed to separate select regulatory text included in current § 512.710(a)(2)(i) into separate paragraphs by revising paragraph § 512.710(a)(2)(ii) and adding new paragraph § 512.710(a)(2)(iii). As we proposed, § 512.710(a)(2)(i) would describe the specified model requirements that an ASM participant would not be required to meet for the applicable ASM performance year, § 512.710(a)(2)(ii) would describe the specific model requirements not applicable for the corresponding ASM payment year, and § 512.710(a)(2)(iii)

would describe an ASM participant's ineligibility for waivers provided under the model for the applicable ASM performance year. These revisions do not introduce substantive changes to previously finalized provisions describing the effects of an ASM participant not meeting ASM participant eligibility criteria for an ASM performance year; rather, we believe such revisions help clarify that not meeting ASM participant eligibility criteria would not nullify the application of ASM payment adjustments on Medicare Part B claims for covered professional services during the corresponding ASM payment year based on performance in a prior ASM performance year. For example, a clinician may be selected for mandatory participation for the 2027 ASM performance year. If that ASM participant does not meet the ASM participant eligibility criteria for the 2029 ASM performance year, the revisions here help clarify that while the ASM participant would not be subject to the applicable performance assessment, data reporting, and scoring requirements during the 2029 ASM performance year (that is, CY 2029), but that ASM payment adjustments based on the ASM participant's performance from the 2027 ASM performance year would still be applied in CY 2029.

Second, we proposed at § 512.710(a)(2)(iv) that an ASM participant who does not meet ASM participant eligibility criteria for an ASM performance year would not be eligible for the CMS-sponsored model arrangements and patient incentives safe harbor described at § 512.765 for the applicable ASM performance year. We stated in the proposed rule that we believe this proposal is consistent with our intent to make this safe harbor available for ASM performance years where the ASM participant is actively performing in the model (90 FR 49709).

We sought comment on our proposed revisions to §§ 512.710(a)(1) and 512.710(a)(2).

We received public comments on these proposals. The following is a summary of the comments we received and our responses.

Comment: A commenter stated that not allowing the safe harbors and Medicare program waiver to apply in ASM performance years when the ASM participant is not actively performing in the model could create operational and compliance challenges for ASM participants. A commenter believed that this proposal would create transition challenges due to providers inadvertently continuing arrangements or incentives originally structured under ASM waivers without realizing those protections no longer apply during an ASM performance year that the ASM participant was not required to meet the specified ASM requirements. A commenter recommended that ASM participants should continue to have access to the CMS-sponsored model arrangements and patient incentives safe harbor in every ASM performance year even if they do not meet the ASM participant eligibility criteria for that ASM performance year.

Response: We appreciate these comments and address comments pertaining to the CMS-sponsored model safe harbor at § 512.765 in section III.D.2.h of this final rule. With respect to waivers, we do not believe that it is appropriate to continue to make the waivers available under § 512.775 during a period in which an ASM participant is not eligible for specified requirements under the model.

We also received public comments on ASM's participation provisions that were out of scope to proposals in the CY 2027 PFS proposed rule. These out-of-scope public comments are not addressed with responses in this final rule.

After consideration of public comments described in this section of this final rule and described in section III.D.2.h of this final rule, we are finalizing the proposals at §§ 512.710(a)(1) and 512.710(a)(2) as proposed.

(3) Specialty Type

Participation in ASM is limited to clinicians who are within specialties and furnish covered professional services related to ASM targeted chronic conditions—heart failure or low back pain. As finalized in the CY 2026 PFS final rule, we determine specialty type based on the specialty code most frequently reported on a clinician's Medicare Part B claims (90 FR 49583 through 49585). Medicare Administrative Contractors (MACs) derive specialty codes on claims from clinician-reported specialty types provided during Medicare enrollment. Physicians report their specialty type as part of their Medicare enrollment application through the Provider Enrollment, Chain, and Ownership System (PECOS) or through submission of the CMS 855I paper application.[183] The Medicare enrollment form is also used for revalidations and ad hoc changes to certain information. We use data from the CY 2 years prior to each ASM performance year to determine whether a clinician meets the model's specialty type criteria. For example, we use CY 2025 data, including specialty type data, to select final ASM participants for the 2027 ASM performance year.

For the ASM heart failure cohort, we finalized inclusion of physicians with a specialty type of cardiology. Our rationale for including cardiologists as ASM heart failure participants, as explained in the CY 2026 PFS final rule, is that they commonly provide care to Medicare FFS beneficiaries with heart failure and are well-positioned to manage outcomes by ensuring patients are optimized on guideline-directed medical therapy to prevent exacerbation of their condition (90 FR 49576). We did not finalize the inclusion of other cardiac-related specialties (for example, cardiac electrophysiology, intensive cardiac rehabilitation, cardiac surgery, interventional cardiology, and advanced heart failure and transplant) as these clinicians are often proceduralists and not commonly involved in the longitudinal management of patients with heart failure (90 FR 49576). Because one of ASM's goals is to measure the performance of clinicians with similar patterns of heart failure care, we include cardiologists, but not other cardiac-related specialties, even though those cardiac-related specialists may be attributed patients with heart failure as measured through the heart failure EBCM (90 FR 49577).

For the ASM low back pain cohort, we finalized inclusion of physicians who have a specialty of anesthesiology, pain management, interventional pain management, neurosurgery, orthopedic surgery, or physical medicine and rehabilitation. In the CY 2026 PFS final rule (90 FR 49577 through 49580), we emphasized that specialty types for the ASM low back pain cohort include physicians who are most directly involved in the evaluation and management of low back pain and whose clinical decision-making is expected to meaningfully influence downstream utilization and spending. We explained that the included specialists commonly furnish services to Medicare FFS beneficiaries with low back pain and play a central role in determining the use of imaging, injections, procedures, and surgical interventions. We also noted that we did not include certain other specialties that may occasionally treat low back pain but are not typically responsible for its longitudinal management. By focusing on a defined set of specialties with similar roles in managing low back pain, we aim to support more meaningful comparisons of performance and to

[183] *https://www.cms.gov/medicare/cms-forms/cms-forms/cms-forms-items/cms019477.*

align model incentives with opportunities to improve care coordination, reduce unnecessary procedures, and promote evidence-based treatment.

We did not propose any adjustments to the specialty types included in each ASM cohort as finalized at § 512.710(d) in the CY 2026 PFS final rule (90 FR 49576 through 49580). As part of the CY 2027 PFS proposed rule, we proposed to correct small typographical errors in the regulatory text at §§ 512.710(d)(1) and 512.710(d)(2) that did not introduce substantive changes to existing provisions.

We sought comment on the proposed correction of the typographical errors at §§ 512.710(d)(1) and 512.710(d)(2).

We received public comments on these proposals. The following is a summary of the comments we received and our responses.

Comment: A commenter appreciated and supported the corrections to the typographical errors in the proposed rule.

Response: We thank the commenter for their support.

We also received public comments more generally related to specialty type and ASM participant selection.

Comment: A commenter raised concerns about the accuracy of the preliminary ASM heart failure cohort ASM participant list, stating that they believed several preliminary ASM participants have a primary PECOS specialty type designations other than cardiology.

Response: We thank the commenter for their feedback. As we describe earlier in this section of this final rule, we identify a clinician's specialty based on the specialty code indicated on the plurality of a clinician's Medicare Part B claims for the purpose of selecting ASM participants. As we discussed in the CY 2026 PFS final rule (90 FR 49584), these claims-based specialty codes are derived from PECOS data; however, there may be some differences between a PECOS specialty type and the Medicare Part B claim-based specialty type because of how MACs process specialty type data from Medicare Part B claims. Therefore, we believe that it is possible for a clinician's PECOS specialty type designation and the specialty type derived from Medicare Part B claims used to select ASM participants to differ. We refer readers to section III.D.2.b.(4).(b) for further discussion on the rationale for using PECOS specialty type designations for the purposes of ASM participant exceptions.

Comment: A commenter stated that they do not agree with the use of Medicare Part B claims to determine specialty type for the purposes of ASM participant selection because CMS is modifying how specialty status is determined for groups reporting MVPs under the Quality Payment Program.

Response: We thank the commenter for their feedback but note that we did not propose any modifications to source of specialty type data that we will use to select ASM participants. Therefore, we believe this comment is out of scope. We refer readers to the CY 2026 PFS final rule (90 FR 49583) for further discussion on the use of Medicare Part B claims to determine specialty type for the purposes of selecting ASM participants. We also refer readers to the CY 2026 PFS final rule for further discussion on the finalized self-attestation process during MVP registration for identifying group specialty composition (90 FR 49843). We believe that the specialty type identification for the purposes of selecting ASM participants differs from the policy intent of self-attestation for identifying group specialty composition for the purposes of reporting an MVP under the Quality Payment Program and therefore believe that exact alignment is not necessary at this time.

We also received public comments related to the specialty types included in the ASM low back cohort that were distinct from comments related to an alternative we considered for excepting ASM low back pain participants from specified ASM requirements due to specialty type redesignations. We summarize these comments and respond to them here but also refer readers to section III.D.2.b.(4).(b) of this final rule for additional comments and responses related to the alternative we considered.

Comment: A few commenters recommended that we remove the specialty types of neurosurgery and orthopedic surgery from the specialty types in the ASM low back pain cohort. A commenter recommended that we exclude ASM participants who are total joint/hip-treating orthopedic providers, who could be identified from EBCM episodes where the diagnosis migrates from a low back pain code to a hip-specific code within a defined window. Another commenter recommended removal of neurosurgeons as ASM participants since they were not one of the most common specialty types attributed the low back pain EBCM episodes during that measure's field testing and because none of the quality measures for the ASM low back pain cohort are included in the MIPS Neurosurgery Specialty Set. A commenter stated that they believe that neurosurgery and orthopedic spine surgery specialists should be excepted from the model since their clinical decision-making, patient populations, treatment pathways, and outcomes differ substantially from those of clinicians whose practices focus primarily on the non-surgical management of low back pain

Response: We thank the commenters for their feedback. We did not make any proposals related to the specialty types that we include in the ASM low back pain cohort in the CY 2027 PFS proposed rule; therefore, we believe these comments are out of scope. We refer readers to the CY 2026 PFS final rule (90 FR 49577) for additional discussion on the justification of including neurosurgeons and orthopedic surgeons in the ASM low back pain cohort.

Comment: A commenter opposed the inclusion of the anesthesiology specialty type in the ASM low back pain cohort.

Response: We note that this comment is outside the scope of the proposed rule as we did not make any proposals related to the inclusion or exclusion of specific specialty types in the ASM participant eligibility criteria for the ASM low back pain cohort. We refer readers to the CY 2026 PFS final rule (90 FR 49577) for additional discussion on the justification of including anesthesiologists in the ASM low back pain cohort.

Comment: A commenter recommended that Certified Registered Nurse Anesthetists (CRNA) should be considered a low back pain specialty type for inclusion in the ASM low back pain cohort.

Response: We appreciate this commenter's recommendation. We note that this comment is outside the scope of the proposed rule as we did not make any proposals related to the inclusion or exclusion of specific specialty types in the ASM participant eligibility criteria for the ASM low back pain cohort. We refer readers to our discussion of why we did not include nonphysician practitioners, such as CRNAs, in ASM in the CY 2026 PFS final rule (90 FR 49575). Should we consider inclusion of these specialty types in the ASM low back pain cohort in the future, we would do so through notice-and-comment rulemaking.

Comment: A commenter stated that we should reconsider the exclusion of neuromusculoskeletal medicine and osteopathic manipulative medicine specialists from ASM since these specialists have the strongest conservative-care comparator.

Response: We thank the commenter for their feedback. We note that this

comment is outside the scope of the proposed rule as we did not make any proposals related to the inclusion or exclusion of specific specialty types in the ASM participant eligibility criteria for the ASM low back pain cohort. Should we consider inclusion of these specialty types in the ASM low back pain cohort in the future, we would do so through notice-and-comment rulemaking.

Comment: A few commenters discussed inclusion of specialties outside those currently included in ASM. A commenter recommended psychologists be able to participate in ASM as this would strengthen the model's ability to address the medical, behavioral, and psychosocial factors that influence health outcomes and advance CMS' goals of high-quality, person-centered care. A commenter recommended using measure attribution to identify physical therapist involvement in a low back pain episode as CMS does for ASM's administrative claims-based measures and commit to a pathway for physical therapist participation or formal care partnership as the model matures. A commenter encouraged CMS to provide explicit opportunities for pharmacist participation in ASM, noting their important role as part of an interdisciplinary team contributing to chronic disease management, medication optimization, care coordination, and quality improvement.

Response: We acknowledge the important role physical therapists, psychologists, pharmacists, and other clinicians play in whole-person care. ASM is designed around cohorts of clinicians who furnish comparable services and have a similar ability to influence the care and outcomes for which they are held accountable. This approach supports meaningful peer comparisons and consistent performance assessment within the model. We did not propose expanding ASM participation to additional clinician types at this time.

After consideration of public comments, we are finalizing the proposed correction of the typographical errors at §§ 512.710(d)(1) and 512.710(d)(2) describing specialty types as proposed.

(4) ASM Participant Exceptions

We recognize that there may be limited circumstances in which an ASM participant selected for participation for an ASM performance year should be excepted from certain ASM requirements for that ASM performance year and consequently excepted from the application of an ASM payment multiplier to the ASM participant's Medicare Part B payments for covered professional services during the corresponding ASM payment year. Accordingly, we finalized a narrow set of ASM participant ''exclusions,'' or situations in which an ASM participant is excepted from specified ASM requirements in the CY 2026 PFS final rule to balance operational feasibility with the need for robust evaluation and generalizable findings (90 FR 49582 through 49583). As finalized at § 512.710(c), an ASM participant who stops reassigning billing rights to the TIN we used to select the ASM participant and begins reassigning billing rights to a new TIN during an ASM performance year is not subject to certain ASM requirements—specifically the requirements for performance assessment described at § 512.715, data submission described at § 512.720, final scoring described at § 512.745, and payment adjustment described at § 512.750—and is no longer eligible for Medicare program waivers provided under the model described at § 512.775 for the applicable ASM performance year. An exception from specified ASM requirements for one ASM performance year does not apply for the entire ASM test period because we consider clinicians who meet ASM participant eligibility criteria for at least one ASM performance year to be an ASM participant for the remainder of the ASM test period. This means that an ASM participant will receive payment adjustments during a corresponding ASM payment year based on performance from an ASM performance year for which they were required to meet these specified ASM requirements (90 FR 49571 through 49574). In other words, if an ASM participant meets the ASM participant eligibility criteria for the 2027 and 2028 ASM performance years, but not the 2029 and 2030 ASM performance years, by continuing to remain an ASM participant, the ASM payment multipliers calculated based on the ASM participant's performance during the 2027 and 2028 ASM performance years would be applied to the ASM participant's Medicare Part B payments for covered professional services during the corresponding ASM payment years (that is, CY 2029 and CY 2030 respectively).

After internal review, we believed it would be more precise to refer to the situations in which an ASM participant is not required to meet specified ASM requirements for applicable ASM performance year(s) as ''exceptions'' to ASM requirements rather than ASM participant ''exclusions.'' We believed this revision to the terminology would better capture the intended policy to not require an ASM participant to meet certain ASM requirements for an ASM performance year under certain circumstances. Accordingly, we proposed revisions to existing regulatory text to clarify the current circumstances under which an ASM participant may be excepted from certain ASM requirements and proposed new provisions to include additional circumstances under which an exception would apply.

In the CY 2027 PFS proposed rule (91 FR 43968), we proposed, in addition to the current exception due to a change in the reassignment of billing rights (that is, change in TIN), to recognize a new exception. Specifically, we proposed that ASM heart failure participants who meet certain specialty type redesignation requirements may be excepted from specified model requirements. For each exception, we discussed proposals around the requirements and process for notifying us of a change that may warrant an exception. Finally, in accordance with the revisions to § 512.710(a)(2) discussed earlier in this section of this final rule, we made proposals at § 512.710(c) to describe the effect and duration of an exception due to a change in TIN or redesignation of primary specialty type.

(a) Exceptions Due to TIN Changes

In the CY 2026 PFS final rule (90 FR 49582 through 49583), we finalized that an ASM participant who stops reassigning billing rights to the TIN used to select the ASM participant and begins reassignment to a new TIN during the same ASM performance year would no longer be subject to specified ASM requirements for that ASM performance year under either TIN if the ASM participant notifies us of the reassignment change within 30 days. We explained that a TIN change during an ASM performance year may limit our ability to determine continued ASM participant eligibility and assess performance under the model using consistent claims history and EBCM data.

Since the finalization of the CY 2026 PFS final rule, interested parties have shared examples with us of additional circumstances, beyond changes in reassignment, that impact a clinician's affiliation with a particular TIN (for example, retirement from practice) and inquired whether those circumstances would qualify an ASM participant for an exception from specific ASM requirements. Our previously finalized provisions also did not account for

situations when an ASM participant reassigned their billing rights to a new TIN before the start of an ASM performance year. After internal review, we believed that it would be appropriate to address such circumstances in ASM's provisions.

Accordingly, we made multiple proposals in the CY 2027 PFS proposed rule (91 FR 43968) to simplify the exception from specified model requirements based on TIN changes including to recognize additional TIN change scenarios for possible exception from specified ASM requirements.

First, we proposed to redesignate the provisions at current § 512.710(c)(1), which describes the notification process for TIN changes that occur during an ASM performance year, as new § 512.710(c)(1)(i)(B). We proposed to revise § 512.710(c)(1) to describe how we may determine an exception applies. Specifically, we proposed that an ASM participant who demonstrates the circumstances described by an exception apply (that is, change in TIN or approved primary specialty type redesignation) would be excepted from specified ASM requirements, subject to CMS determination for the duration specified for each exception. For each of these exception situations, we discussed the proposed requirements that an ASM participant would be required to meet and, later in this section of this proposed rule, the duration of the exception.

Second, we proposed at new § 512.710(c)(1)(i) that an ASM participant who (1) stops reassigning billing rights to the TIN we used to select them as ASM participant for an applicable ASM performance year and (2) satisfies the TIN change notification requirements at proposed § 512.710(c)(1)(i)(A) or § 512.710(c)(1)(i)(B), as applicable, may be excepted from specified ASM requirements. We believed this provision provided additional clarity on how the notification processes proposed at §§ 512.710(c)(1)(i)(A) and 512.710(c)(1)(i)(B) could lead to an exception.

Third, we proposed new provisions related to ASM participant TIN changes that occur before the start of an ASM performance year. At § 512.710(c)(1)(i)(A), we proposed that an ASM participant who stops reassigning billing rights to the TIN that we used to select them as an ASM participant before the applicable ASM performance year must notify us in writing no later than 60 days after the start of the applicable ASM performance year; after receiving such notice, we may determine an exception to specified ASM requirements applies for the ASM performance year. We recognized that ASM participants may change organizational affiliations between the time we select ASM participants and the start of an ASM performance year. Based on our previously finalized provisions related to the TIN change exception in the CY 2026 PFS final rule, we believed that the same challenge of having consistent claims history and EBCM data to evaluate ASM participant eligibility criteria under the new TIN would apply in this circumstance and thus an exception would be appropriate. We believe that requiring the ASM participant to notify us in writing no later than 60 days after the start of the ASM performance year would provide an adequate window to provide us with notice of such change after we release the list of ASM participants for a given ASM performance year.

Finally, we proposed at § 512.710(c)(1)(i)(B) that an ASM participant who stops reassigning their billing rights to the TIN we used to select them for participation in ASM during an ASM performance year would not be required to reassign billing rights to a new TIN during the same ASM performance year to be potentially eligible for an exception from specified ASM requirements. We believed the proposed modification would capture additional organizational affiliation changes, such as retirements, that merit an exception from specified ASM requirements. We further believed this proposal was consistent with the original intent of the TIN change exception policy we finalized in the CY 2026 PFS final rule. We also proposed that an ASM participant who changes their TIN during an ASM performance year would need to provide written notice of the change in a form and manner determined by us within 30 days of stopping reassignment to that TIN. We believe that adding this additional detail on the form of the notification and required timing would clarify the notification process for ASM participants.

We sought comment on our proposal at § 512.710(c)(1) describing the notice and determination process for an exception from specified model requirements. We also sought comment on our proposal at § 512.710(c)(1)(i) to describe the requirements for an exception from specified model requirements for an ASM participant who stops reassigning billing rights to the TIN we used to select them as an ASM participant. We also sought comment on: (1) our proposed notification process for TIN changes that occur before the start of an ASM performance year described at § 512.710(c)(1)(i)(A); (2) our proposal to remove the requirement that an ASM participant who no longer reassigns their billing rights to the TIN we used to select them as an ASM participant during an ASM performance year must begin reassigning billing rights to a new TIN to be eligible for exception as described at § 512.710(c)(1)(i)(B); and (3) our proposal that an ASM participant must provide written notice of the change in TIN within 30 days of stopping reassignment of billing rights to the ASM participant's TIN as described at § 512.710(c)(1)(i)(B).

We received public comments on these proposals. The following is a summary of the comments we received and our responses.

Comment: Several commenters supported providing exceptions when an ASM participant changes TIN affiliation.

Response: We appreciate the commenters for their support of these proposals.

Comment: Several commenters recommended changes or clarifications to the proposed process for ASM participant exceptions. A few commenters recommended simplifying the notification process, extending the notification timeframes (for example, to 60 or more days), providing more flexibility in the notification timeframe, or using information already available to CMS through its enrollment systems to identify TIN changes that may lead to an ASM participant exception.

Response: We thank commenters for their feedback on the proposed notification process for ASM participant exceptions related to TIN changes. While we had proposed to require that ASM participants notify us of a TIN change to align with the finalized notification process in the CY 2026 PFS final rule (90 FR 49582), we recognize that this process could increase administrative burden on ASM participants. We also acknowledge that we could identify and validate TIN changes through CMS enrollment systems. For these reasons, we believe that we would be able to identify changes in the TIN affiliations of ASM participants through our administrative data and could therefore except an ASM participant without requiring an ASM participant to notify us of such change. By removing the notification requirement, we also believe that it would be appropriate for CMS to notify an ASM participant that we determined an exception applies to ensure that the ASM participant is aware of the exception. We will directly notify ASM participants who receive an exception.

ASM participants may voluntarily provide written to us if they believe they meet the conditions for an exception; however, we emphasize that such notification is not required. We intend to publish guidance describing how ASM participants may submit these voluntary notifications.

Comment: A commenter recommended that CMS establish a streamlined process to notify organizations when newly affiliated clinicians have been identified as ASM participants and may qualify for an exception, and to allow an adequate review and correction period for the notifications.

Response: We thank the commenter for their feedback. As discussed earlier in this section of this final rule, we publicly release the list of ASM participants annually and notify ASM participants using emails available through our administrative systems. Our original proposals for the TIN change-based exception provided for a notification process initiated by the ASM participant depending on whether the TIN change occurred before the applicable ASM performance year or occurs during an ASM performance year. Based on the feedback we received from commenters, we believe that removing the requirement that ASM participants notify us of such enrollment change for purposes of ASM would reduce administrative burden on ASM participants because we can identify changes in organizational affiliations through our administrative data, provided ASM participants keep their Medicare enrollment files up-to-date.

After consideration of public comments, we are finalizing these proposals with modification at § 512.710(c)(1). We are removing the proposed requirements for an ASM participant to notify CMS of a TIN change for our determination that an exception applies. Instead, we will evaluate administrative data to determine if TIN changes occur and would result in an ASM participant exception. ASM participants must continue to keep their Medicare enrollment information up to date, but do not need to separately notify CMS of such enrollment change for purposes of ASM. We also are adding clarifying language at § 512.710(c) that we will notify an ASM participant in a form and manner determined by CMS if we determine that they qualify for an ASM participant exception. As described later in this section of this final rule, the effective date of the exception will be the date specified in the notice we provide. The notification will also specify the ASM performance year(s) and corresponding ASM payment years(s) for which the exception applies. We are retaining regulatory text providing that an ASM participant who believes they meet the requirements for an exception under §§ 512.710(c)(1)(i) or (c)(1)(ii) may voluntarily provide written notice of the change to CMS in a form and manner determined by CMS but emphasize ASM participant notification to CMS is not required for an exception determination.

We refer readers to section III.D.2.b(4)(c) for additional information on finalized provisions related to the effect and duration of exceptions related to TIN changes.

(b) Exceptions Due to Heart Failure-Related Specialty Type Redesignations

In the CY 2026 PFS final rule, we did not propose or consider an exception based on redesignations of specialty type made through Medicare enrollment before or during an ASM performance year.

Since publication of the CY 2026 PFS final rule, we received interested parties' feedback that we should consider adjustments to ASM participant eligibility determinations based on more recent Medicare enrollment information related to specialty type, which is used to derive the Medicare Part B claims-based specialty type that we use to evaluate ASM participant eligibility criteria.

We believe that using historical data to evaluate ASM participant eligibility criteria for each ASM performance year is still appropriate. In the CY 2026 PFS final rule (90 FR 49583 through 49585), we explained that determining a clinician's specialty type based on historical data from 2 CYs before an ASM performance year provides an objective and consistent approach because it allows us to use historical claims data to evaluate clinician specialty type, as well as the EBCM episode threshold, as part of the ASM participant eligibility criteria. This approach also supports operational feasibility because it enables us to provide advance notification for ASM participants to prepare for the start of an ASM performance year.

However, we recognize that clinicians may not have had sufficient time to formally update an out-of-date specialty type before the end of CY 2025 because ASM was not finalized until November 2025. For example, specialty type redesignations made in CY 2026 would not be reflected in the CY 2025 data used to select final ASM participants for the 2027 ASM performance year. Setting an appropriate scope of ASM participant exceptions is important in a mandatory model such as ASM to preserve the integrity of the model design and evaluation, and to ensure a representative ASM participant population. While allowing unrestricted ASM participant exceptions due to specialty type redesignations could introduce selection bias and undermine the model test, we believe that certain limited and clinically appropriate redesignations may warrant consideration based on the timing of ASM's announcement and selection of ASM participants.

Accordingly, we proposed in the CY 2027 PFS proposed rule (91 FR 43968) that ASM heart failure participants who officially redesignate their primary specialty type through an approved Medicare enrollment application (either PECOS or CMS–855 form paper application) to a limited set of specialty types and demonstrate proof of board certification would be excepted from specified ASM requirements and ineligible for Medicare program waivers and the safe harbor provisions available in the model for the applicable ASM performance year and for all remaining ASM performance years in the ASM test period.

Specifically, we proposed at § 512.710(c)(1)(ii) that we may approve an exception from specified model requirements for an ASM heart failure participant upon receipt of written notification of updated Medicare enrollment to the following redesignated primary specialty types described at § 512.710(c)(1)(ii)(A): cardiac electrophysiology, cardiac surgery, interventional cardiology, advanced heart failure and transplant cardiology, and adult congenital heart disease. We proposed at § 512.710(c)(1)(ii)(B) that an ASM heart failure participant who redesignated their primary specialty type through an approved Medicare enrollment application (either PECOS or CMS–855 form paper application) would need to provide us written notification of the approved redesignation, along with verification of board certification in the newly designated primary specialty type described under § 512.710(c)(1)(ii)(A) within 30 days of the effective date of the approved redesignation.

We believed that recognizing an exception for ASM heart failure participants who redesignate their specialty type to one of the proposed specialty types would be appropriate because these specialty types reflect highly specialized or procedure-focused practice areas that are distinct from the broader management of cardiovascular disease and heart failure captured under

the cardiology specialty. Excepting cardiac electrophysiology, cardiac surgery, and interventional cardiology would be appropriate because these specialties are predominantly procedure—focused and are generally organized around the performance of invasive or technical interventions rather than the longitudinal medical management of cardiovascular disease. Cardiac electrophysiology primarily involves the diagnosis and treatment of cardiac arrhythmias through procedures such as ablation and device implantation; interventional cardiology centers on catheter—based interventions (for example, percutaneous coronary intervention). Cardiac surgery involves operative treatment for cardiac conditions. Advanced heart failure and transplant cardiology specialists primarily manage patients with end-stage heart failure, mechanical circulatory support, or transplant-related care, while adult congenital heart disease specialists treat individuals with complex congenital conditions that persist into adulthood. Because the specialty types proposed for exception represent narrower scopes of practice than general heart failure management, their exception from specified requirements would help ensure that ASM remains focused on specialists who manage heart failure in a comprehensive and ongoing manner, thereby improving the specificity and consistency of the ASM heart failure cohort.

To be excepted from the specified ASM requirements under this proposal, we proposed that the ASM participant must (1) officially redesignate their primary specialty type to one of the specialty types described earlier through an approved Medicare enrollment application and (2) provide evidence of board certification in the redesignated specialty to ensure that an exception to specified ASM requirements is valid and appropriate. While Medicare enrollment requirements stipulate a clinician must supply documentation supporting eligibility for Medicare enrollment under § 424.510(d), these enrollment regulations do not specify a mechanism for substantiating specialty type. Initial enrollment, revalidation, and any interim changes to an existing enrollment require a physician to select a primary specialty and attest that they meet all State or Federal requirements for their selected primary specialty. Physicians must meet the same requirements for any secondary specialty selected. They must also provide information on the active certification relating to their selected primary specialty type, specifically certification number, effective date, certifying entity, and State where issued. If no certification is associated with the selected primary specialty, then the physician must report the certification relevant to the secondary specialty.[184] MACs have operational authority to validate reported information, including requesting supporting documentation, if needed. In addition to requiring the redesignation through a Medicare enrollment application, we believed that requiring an ASM participant to report additional proof of board certification in one of the proposed specialty types eligible for exception would promote a more accurate approach to the exception process while avoiding unrestricted or unverified exceptions that could introduce selection bias into the model test. Further, all of the proposed specialty types for exception have a certifying entity that provides evidence of board certification. The American Board of Internal Medicine (ABIM) provides board certification for cardiac electrophysiology, interventional cardiology, advanced heart failure and transplant cardiology, and adult congenital heart disease specialty types. The American Board of Thoracic Surgery provides board certification for the cardiac surgery specialty type. Therefore, we believed that an ASM heart failure participant seeking an exception would be able to produce evidence of board certification for all specialty types proposed for exception.

We considered an alternative proposal whereby we would only recognize specific specialty type redesignation-based exceptions that occur during 2027 and 2028 ASM performance years to limit the number of ASM participants potentially excepted. Based on the announcement of ASM in the CY 2026 PFS final rule in November 2025, we believed that potential ASM participants may not have had adequate time to officially redesignate their primary specialty type such that it is reflected in the Medicare Part B claims used to select ASM participants for these ASM performance years. For example, a 2027 ASM participant who redesignated their primary specialty type in CY 2026 would not have that change reflected in the CY 2025 claims data used to evaluate their eligibility. A similar timing challenge could occur for the 2028 ASM performance year because we will use CY 2026 data to select ASM participants for the 2028 ASM performance year. We believe that finalization of ASM in the CY 2026 PFS final rule provided potential ASM participants advanced notice to redesignate their specialty type, if appropriate, for CY 2027, which is the year of data that we will use to select ASM participants for the 2029 ASM performance year. However, we recognized that appropriate specialty type redesignations could occur after the 2028 ASM performance year and that allowing the potential for an exception based on specific specialty type redesignations for a longer period would retain consistency in the application of the proposed exception for specified ASM requirements.

We considered but did not propose exceptions based on specialty type redesignations for ASM low back pain participants. Unlike cardiac specialties, the specialty types included in the ASM low back pain cohort typically do not have Medicare specialty types that reflect further specialization that would be appropriate for excepting ASM low back pain participants. We also believed that the larger number of specialty types in the ASM low back pain cohort would naturally capture common changes in specialty type by ASM low back pain participants over time. For example, we would capture an anesthesiologist ASM low back pain participant who redesignates their primary specialty type to pain management or interventional pain management over the course of the ASM test period through our existing use of historical Medicare Part B claims to identify specialty type. Our rationale for recognizing exceptions based on specialty type redesignation was to ensure each ASM cohort represents specialists who can be appropriately held accountable for longitudinal management of heart failure or low back pain. Accordingly, we believed that the existing ASM low back pain participant specialty type criteria, together with the minimum episode attribution volume for the low back pain EBCM, accomplishes this objective and allowing unrestricted exceptions based on specialty type redesignations in the ASM low back pain cohort could introduce selection bias into the model test.

We sought comment on the proposed timeline and documentation requirements for notifying us of an ASM heart failure participant specialty type redesignation for the purpose of determining an exception proposed under § 512.710(c)(1)(ii). We also sought comment on the proposed specialty types—cardiac electrophysiology, cardiac surgery, interventional cardiology, advanced heart failure and

[184] *https://www.cms.gov/medicare/cms-forms/cms-forms/cms-forms-items/cms019477.*

transplant cardiology, and adult congenital heart disease—to which an ASM heart failure participant may redesignate their primary specialty type through an approved Medicare enrollment application to be considered for an exception from specified ASM requirements.

We received public comments on these proposals. The following is a summary of the comments we received and our responses.

Comment: Many commenters supported establishing an exception process for ASM heart failure participants whose specialty designation changes or whose clinical practice does not align with the broader longitudinal management of heart failure targeted by the ASM.

Response: We thank the commenters for their support of these proposals.

Comment: A few commenters recommended that the CMS use information already available through Medicare enrollment systems to identify qualifying specialty type redesignations or eliminate duplicative ASM participant notification requirements. A commenter recommended that the exceptions should occur automatically without requiring notification or submission of additional documentation.

Response: We appreciate the commenters' recommendations on potential efficiencies in the proposed notification requirements for exceptions. After further consideration, we recognize that this process could increase administrative burden on ASM participants. We also acknowledge that we could identify and validate qualifying specialty type redesignations through PECOS. Since we can identify such redesignations through our administrative enrollment data, we believe we can remove the requirement for an ASM heart failure participant to notify us of such change within a specified time period. We also believe that it would be appropriate for us to notify an ASM heart failure participant that an exception applies to ensure that the ASM heart failure participant is aware of the effect and duration of the exception.

Comment: A few comments opposed the exception based on ABIM board certification since it may be unnecessarily burdensome and exclude certain physicians without that specific board certification. A commenter provided an example of an electrophysiologist who has ABIM certification and may later choose to stop maintaining the ABIM certification and begin maintaining their certification through the National Board of Physicians and Surgeons, which many hospitals accept for credentialing. Another commenter suggested that if CMS finalizes the board certification requirement to qualify for an exception, then CMS should also exclude physicians from ASM if they are not board certified in any of the specialty types included in ASM.

Response: We thank commenters for their feedback on the proposal to require an ASM heart failure participant to notify us of a qualifying specialty type redesignation and provide evidence of board certification in that specialty type. We would like to clarify that we did not propose a specific board certification (for example, ABIM) that would be required for each specialty type; we had provided illustrative examples of the types of certifying bodies for the proposed specialty type redesignations in the CY 2027 PFS proposed rule (91 FR 43969). This proposal was intended to provide us with additional evidence by which to validate a newly redesignated specialty type. However, upon further review and in response to interested parties' comments, we acknowledge that requiring the submission of additional documentation may increase administrative burden on ASM heart failure participants to receive an exception due to an approved specialty type redesignation. We believe that continuing to require the ASM heart failure participant to formally redesignate their specialty type in PECOS would be sufficient for the purposes of excepting the ASM heart failure participant from specified ASM requirements. We do not agree that requiring evidence of board certification for the purposes of an exception means that we should except all selected ASM participants who lack evidence of board certification. As discussed earlier in this section of this final rule, a clinician must attest that they meet all State or Federal requirements and report their active certification information for their selected primary as part of their Medicare enrollment. Therefore, we did not consider requiring board certification within a selected ASM selected specialty as an additional requirement in the ASM eligibility criteria for selecting ASM participants in the CY 2026 PFS proposed rule.

Comment: A commenter recommended that CMS should develop a standardized online tool that allows ASM heart failure participants and designated staff to submit specialty type redesignation-based exception requests along with supporting documentation and forms if applicable.

Response: We thank the commenter for this suggestion. As discussed earlier in this section of this final rule, we believe that the proposed notification and documentation requirements for the proposed specialty type redesignation-based exceptions may unnecessarily increase administrative burden on ASM heart failure participants and are therefore not finalizing them. We will determine exceptions based on enrollment data, so we encourage ASM participants to maintain updated enrollment data through the applicable enrollment application (PECOS or through submission of the CMS 855I paper application). We will directly notify ASM participants who receive an exception. We also intend to update publicly available ASM participant data periodically during the calendar year to indicate whether an ASM participant has received an exception.

ASM participants may voluntarily notify us if they believe they meet the conditions for an exception but emphasize that such notification is not required.

Comment: A commenter suggested that ASM should except ASM heart failure participants who are certificated specialists in hypertension since it would be in the same spirit as excluding ASM heart failure participants with a specialty type of advanced heart failure.

Response: We thank the commenter for the recommendation. We note that a clinician cannot select a specialty type of a certified specialist in hypertension as part of their Medicare enrollment at this time, so we would not be able to consider that specialty type for ASM heart failure participant exceptions at this time.

Comment: In the context of the proposed ASM heart failure participant specialty type redesignation-based exception, a commenter recommended that there should be a correction window after the posting of a final ASM participant list to allow for validation of the list against board certification, taxonomy and claims before the ASM performance year begins.

Response: As a mandatory model, ASM uses the ASM participant eligibility criteria to select ASM participants. We publicly release the list of ASM participants annually and notify ASM participants using emails available through our administrative systems. Accordingly, we did not believe that a general correction window related to ASM participant selection was needed except in the situations we had considered for ASM participant exceptions as described in the CY 2026 PFS proposed rule. Our original proposals for the ASM heart failure participant specialty type-based exceptions allowed a window for

qualifying ASM heart failure participant to notify us of such changes that may qualify them for an exception. Based on the feedback we received from commenters, we believe that removing the notification requirement would reduce administrative burden on ASM participants because we can identify these specialty type redesignations through our administrative data and notify ASM heart failure participants of a CMS-determined exception. As described earlier in this section of this final rule, we will notify ASM participants who are excepted. We also intend to release updated public-facing data on ASM participant status on a periodic basis, such as quarterly. While we will rely on administrative enrollment data to determine all ASM exceptions, ASM participant may voluntarily notify us if they believe they meet the requirements for an exception in a form and manner specified by us.

We also sought comment on our alternative to only consider exceptions for specific specialty type redesignations based on notifications that occur during the 2027 and 2028 ASM performance years. We did not receive any comments on this alternative.

Finally, we sought comment on whether we should consider ASM low back pain participant exceptions based on primary specialty type redesignations, including rationale on specific specialty type redesignations that we could consider for ASM low back pain participants.

We received public comments on this alternative. The following is a summary of the comments we received and our responses.

Comment: Several commenters recommended that CMS better align participation in the ASM low back pain cohort with clinicians' specialty and actual scope of practice. A few commenters recommended that similar specialty type redesignation-based exceptions should be available to ASM low back pain participants based on their scope of practice. A few commenters recommended establishing a specialty redesignation or clinical-scope exception for ASM participants whose practices are highly specialized, procedure-focused, or do not involve longitudinal management of low back pain.

Response: We appreciate the commenters' feedback. We disagree with the commenters' suggestion that an additional exception should be included based solely on scope of practice. As discussed in the CY 2026 PFS final rule (90 FR 49577), we believe that attribution of low back pain EBCM episodes to a clinician, when considered in combination with a clinician's specialty type, provides sufficient evidence that a clinician furnishes longitudinal management related to low back pain care and is appropriate to select as an ASM low back pain participant. We sought comments on specific specialty type redesignations that may be appropriate for excepting ASM low back pain participants from specified ASM requirements because we believe that exceptions should relate to the ASM participant eligibility criteria used to select ASM participants. We believe that incorporating an additional criterion related to scope of practice beyond the EBCM episode volume and specialty type criteria would be unnecessary at this time. Should we wish to propose additional criteria, and consider it for the purposes of exceptions, we would do so through future notice-and-comment rulemaking.

Comment: A commenter stated that reliance on specialty codes alone may inadvertently include clinicians whose current clinical practice no longer aligns with the intended ASM population. A commenter suggested that ASM should recognize subspecialty differences within the ASM low back pain cohort for possible exceptions, providing an example of a spine surgeon who is predominantly focused on deformity, complex revision surgery, or other specialized spine conditions and who may not function as a longitudinal manager of routine low back pain.

Response: As discussed in the CY 2026 PFS final rule (90 FR 49577), we believe that a clinician's specialty type, when considered in combination with the low back pain EBCM episode threshold of 20 historical episodes, provides sufficient evidence that a clinician furnishes longitudinal management related to low back pain care and is appropriate to include in the ASM low back pain cohort. We appreciate the commenter's feedback on recognizing subspecialty differences within the ASM low back pain cohort and acknowledge that there are limited physician specialty types available as part of Medicare enrollment that indicate further sub-specialization within the treatment of low back pain that could be used for excepting ASM low back pain participants from specified ASM requirements. We continue to believe that the specialty types finalized for the ASM low back pain cohort are the most appropriate physician specialty types to include in the ASM low back pain cohort for the reasons described in the CY 2026 PFS final rule (90 FR 49577). The low back pain EBCM triggering and confirming claim structure, which is limited to a specific set of service and diagnosis codes, focuses on identifying episodes of care that are related to low back pain. While it includes diagnosis codes for a range of conditions that we determine to be relevant to the clinical management of low back pain, we also note that the low back pain EBCM methodology has exclusions for specific diagnoses or conditions to strengthen the specificity of the low back pain EBCM; these exclusions currently include cauda equina syndrome, myelopathy, osteoporotic compression fracture, spinal infection, spinal neoplasm, and trauma.[185] Therefore, we continue to believe that use of the low back pain ECBM and a minimum episode threshold in the ASM participant eligibility criteria is appropriate for selecting ASM low back pain participants.

Comment: A commenter recommended that ASM participants should be able to request an exception if beneficiaries with low back pain represent only a small proportion of an ASM participant's total patient panel.

Response: We do not agree that we should except ASM low back pain participants if management of low back pain only represents a small proportion of their patient panel. As discussed in the CY 2026 PFS final rule (90 FR 49585), we believe that the use of a 20-episode threshold for the low back pain EBCM is appropriate for selecting ASM low back pain participants who provide a higher volume of services related to low back pain and are involved in its longitudinal management, and therefore, could be held accountable for quality and cost related to low back pain care. Further, our final scoring provisions require that an ASM participant must receive a score in the cost ASM performance category to receive a final score for an ASM performance year; that is, if an ASM low back pain participant is not attributed at least 20 low back pain EBCM episodes during the applicable ASM performance year, then they will not receive a final score and will automatically receive an ASM payment adjustment factor that results in a neutral payment adjustment during the corresponding ASM payment year. We believe these final scoring provisions account for situations where a change in clinical practice (for example, furnishing fewer services related to the management of low back pain) and make it inappropriate to hold

[185] *https://qpp-cm-prod-content.s3.amazonaws.com/uploads/3568/2026-cost-measure-codes-lists.zip.*

an ASM participant accountable for quality and cost outcomes under the model. We refer readers to the CY 2026 PFS final rule (90 FR 49668) and § 512.745(a)(2) for additional information on the requirements to receive a final score under ASM.

Comment: A commenter recommended that CMS establish a consistent mechanism across episode-based payment models that allow clinicians whose scope of practice, patient population, subspecialty designation, or care patterns do not align with model assumptions to request redesignations or targeted exceptions.

Response: We appreciate the commenter's suggestion to establish a consistent exception process across episode-based payment models implemented by the Innovation Center. At this time, we believe that it is appropriate for each model to define their own participation policies and, if appropriate, exception policies that are tailored to model goals, participant profiles, and operational designs.

We also refer readers to section III.D.2.b.(3) of this final rule for additional comment summaries and responses more generally related to specialty types selected for participation in ASM.

After consideration of public comments, we are finalizing the proposals related to specialty type redesignation exceptions for ASM heart failure participants with modifications. We are finalizing the description of the exception based on ASM heart failure participant specialty type redesignation, while removing from the final regulatory text the proposed reference to ASM participant-initiated notification requirements at § 512.710(c)(1)(ii) and § 512.710(c)(1)(ii)(B).

We are finalizing the proposed specialty type redesignations for ASM heart failure participants as proposed at § 512.710(c)(1)(ii)(A). We are adding language in the regulatory text at § 512.710(c)(1) to state that CMS will provide notice to an ASM participant of a CMS-determined exception, including as described under § 512.710(c)(1)(ii). We are also including language at § 512.710(c)(1) that an ASM participant may voluntarily provide written notice to CMS that they believe an exception applies in a form and manner specified by us.

(c) Effect and Duration of Exceptions to Specific ASM Performance Requirements

We proposed at § 512.710(c)(2) to define the effect of an approved exception for an ASM participant. Specifically, we proposed that an ASM participant with an approved exception would: (1) not be subject to performance assessment described at § 512.715, data submission described at § 512.720, and final scoring described at § 512.745 for the applicable ASM performance year; (2) not be subject to payment adjustments described at § 512.750 for the corresponding ASM payment year; (3) not be eligible for Medicare program waivers available under the model described at § 512.775 for the applicable ASM performance year, and (4) not be eligible for the CMS-sponsored model arrangements and patient incentives safe harbor described at § 512.765 for the period for which we determine an exception applies. We believed that the proposed effect of an exception retains the intent of the finalized provisions related to ASM participant exclusions due to TIN changes in the CY 2026 PFS final rule while adding new elements that strengthen program integrity. This proposal was also similar to the effect of an ASM participant not meeting the ASM participant eligibility criteria for an ASM performance year discussed in more detail in the CY 2027 PFS proposed rule (91 FR 43965).

We proposed at § 512.710(c)(3)(i) that an exception related to a TIN change would be effective on the CMS-determined date and would only apply for the applicable ASM performance year. We believed that limiting an exception to a single ASM performance year would allow us to select the ASM participant with the exception (that is, the same TIN/NPI combination) for a future ASM performance year should the NPI again reassign billing rights to that same original TIN and meet ASM participant eligibility criteria under that original TIN.

We considered whether to extend an exception related to a TIN change for the remainder of the ASM test period. However, we believed that this approach could lead to unnecessary exceptions for later ASM performance years, particularly in the case that an excepted ASM participant begins reassigning billing rights to the same original TIN under which we previously selected them as an ASM participant, and excepted them, for a previous ASM performance year.

We proposed at § 512.710(c)(3)(ii) that an exception related to specialty type redesignation would be effective on the CMS-determined date and would apply for the applicable ASM performance year and remain effective for all ASM performance years in the remainder of the ASM test period. We believed that excepting ASM participants for specified specialty type redesignations for the remainder of the ASM test period would be appropriate since these ASM participants do not represent the target specialty type of an ASM cohort, and would, therefore, improve the specificity and consistency of the ASM cohort for the purposes of performance comparison.

We considered effectuating the exception related to specialty type redesignation type on the CMS-determined date and only having it apply for the applicable ASM performance year. However, we believed that effectuating the exception for the remainder of the ASM test period would be preferrable since we believe an ASM participant would be unlikely to revert to their previous primary specialty type redesignation during the remainder of the ASM test period.

We sought comment on the proposed effect of an exception from specified ASM requirements at § 512.710(c)(2). We did not receive specific comments on the proposed effect of an exception as proposed at § 512.710(c)(2).

We also sought comment on the proposed duration of an exception related to TIN changes as proposed at § 512.710(c)(3)(i), as well as the alternative we considered of setting the duration of a TIN change-related exception as the remainder of the ASM test period. We also sought comment on the proposal at § 512.710(c)(3)(ii) that an exception related to specialty type redesignation would apply for the ASM performance year for which we provide notice that the exception applies and for the remainder of the ASM test period. Finally, we sought comment on the alternative we considered to effectuate an exception related to specialty type redesignation for the applicable ASM performance year only.

We received public comments on these proposals. The following is a summary of the comments we received and our responses.

Comment: A few commenters requested clarification regarding the duration of exceptions related to TIN changes or recommended avoiding repeated notification requirements when the circumstances supporting an exception have not changed. A commenter highlighted that under the duration-relation proposal, an ASM participant would need to notify CMS of the same organizational change every ASM performance year to continue the exception. A few commenters recommended that the exception should continue in each subsequent ASM performance year unless the NPI reassigns billing rights to the same TIN under which they were selected as an ASM participant later in the ASM test period.

Response: We appreciate the commenters' feedback on the duration of an exception related to a TIN change. Based on our use of historical information to select ASM participants and determine for which ASM performance years ASM participants must meet specified requirements, we acknowledge that the duration of a TIN change-based exception, as proposed, could require repeated notifications from an ASM participant. Consider an ASM participant who must meet the 2027 ASM performance year requirements but stops reassigning billing rights to TIN A (that is, the original TIN) and begins reassigning billing rights to TIN B during the 2027 ASM performance year. Given our use of historical data to select ASM participants and determine which ASM performance years they must meet specified requirements, we may still identify EBCM episodes attributed to the ASM participant under TIN A during CY 2026 and CY 2027. Accordingly, this ASM participant could be required to meet specified ASM requirements under TIN A for the 2028 and 2029 ASM performance years. Under the proposed notification requirement and duration of the TIN change-based exception, this example ASM participant would be required to notify us multiple times of this TIN change for the 2028 and 2029 ASM performance years. As discussed earlier in this section of this final rule, we are not finalizing the ASM participant notification requirements. Accordingly, we acknowledge that proposed duration of the TIN change-based exception would be potentially confusing to ASM participants if not effectuated for the ASM test period for which they remain unaffiliated with the TIN under which we originally selected them as an ASM participant. We intentionally designed ASM's participation provisions to account for movements across organizations and to select new ASM participants across the ASM test period, meaning that the same NPI under a different TIN could be selected as an ASM participant if they meet all ASM participant eligibility criteria later in the ASM test period. Accordingly, should an ASM participant decide to again reassign billing rights to their original TIN under which we selected them as an ASM participant (for example, TIN A in the earlier scenario) after an exception applies, but later in the ASM test period, we would not want to prevent that ASM participant from actively participating in ASM under this original TIN again. Therefore, we believe it would be appropriate to modify the duration of a TIN change-based exception to begin in the CMS-specified ASM performance year and last for the remainder of the ASM test period unless the ASM participant begins reassigning billing rights to that original TIN under which we selected the NPI as an ASM participant when they otherwise meet the ASM participant eligibility criteria under that original TIN for a future ASM performance year. Because we select an ASM participant using a unique TIN and NPI combination, we note that an NPI who we excepted under their original TIN could be selected as an ASM participant under a new TIN for a future ASM performance year should they meet the ASM participant eligibility criteria under that new TIN.

Comment: A commenter recommended that an exception related to a TIN change should take effect automatically and be retroactive to the beginning of the ASM performance year in which the change occurs.

Response: We thank the commenter for their feedback. We would like to clarify that we proposed that a TIN change-based exception would apply for a specific ASM performance year and would be effective as of the CMS-specified date in the notice we provide to the ASM participant.

Comment: Several commenters supported the proposal that an exception related to a specialty type redesignation would apply for the remainder of the ASM test period.

Response: We thank the commenters for their support of this proposal.

Comment: A commenter suggested that CMS should clarify the effect on exceptions resulting from moving away from an ASM mandatory geographic area, retirement, and death.

Response: We thank the commenter for their recommendations. We believe that an ASM participant no longer furnishing services in one of ASM's mandatory geographic areas would be covered by exceptions related to TIN changes. Additionally, as we discussed earlier in this final rule, we believe that the revisions to the exceptions based on TIN changes (that is, no longer reassigning billing rights to a TIN) will also capture retirements. Under the finalized ASM participant termination provisions discussed later in this section of this final rule, we will terminate a deceased ASM participant from participation in the model.

After consideration of public comments, including specific recommendations from commenters to remove notification requirements related to ASM participant exceptions, we are finalizing the proposed effect of an exception from specified ASM requirements at § 512.710(c)(2) with a modification. Specifically, to further clarify our intent in the proposed rule, we are finalizing that an exception is effective as of the date we specify in the notice to an ASM participant that the exception applies. We finalize this change to conform with the removal of the proposed requirement that an ASM participant provide notice to us regarding exceptions. We have also finalized regulatory text at § 512.710(c)(2)(i) through (iv) to add clarifications regarding effective dates. As noted throughout this section of this final rule, an ASM participant may voluntarily notify us if they believe they meet the criteria for an exception in a form and manner specified by CMS, but emphasize that such notice is not required to receive an exception.

We are finalizing the duration of exceptions described at § 512.710(c)(3) with modifications. For the duration of an exception related to TIN changes described at § 512.710(c)(3)(i), we are finalizing that a TIN-based exception will continue for the remainder of the ASM test period unless the ASM participant: (1) begins reassigning billing rights to the TIN under which they receive an exception later in the ASM test period and (2) meets ASM participant eligibility criteria under that TIN for a future ASM performance year. We are finalizing the proposed duration of an exception related to a specialty type redesignation at § 512.710(c)(3)(ii) as proposed but with modifications to clarify and align the regulatory text.

We provide several illustrative examples of how an exception related to a TIN change will work in practice, including the effect of such exceptions on the application of payment adjustments under ASM. In our first example, ASM participant Dr. A (TIN A/NPI A) receives a final score and an ASM payment multiplier for their performance at TIN A in the 2027 ASM performance year. Dr. A receives an exception applicable for the 2028 ASM performance year based on termination of billing rights to TIN A and reassignment of billing rights to TIN B. Under TIN B, Dr. A remains located in the same mandatory geographic area as they were located under TIN A. Dr. A is not required to meet the specified ASM requirements under TIN A or TIN B for the 2028 ASM performance year and for the rest of the ASM test period unless they begin reassigning billing rights to TIN A or TIN B and meet the ASM participant eligibility under either TIN for a future ASM performance year. However, because Dr. A began reassigning billing rights to TIN B after

the end of the 2027 ASM performance year but before the end of the 2029 ASM payment year, we will apply the ASM payment multiplier determined for the 2027 ASM performance year to payments for Medicare Part B covered professional service claims submitted by Dr. A under TIN B during the 2029 ASM payment year. We refer readers to section III.D.2.g. of this final rule and § 512.750(f) for additional information on payment adjustment provisions related to TIN changes that occur after an ASM performance year but before the end of the corresponding ASM payment year. We also note that Dr. A in this example could be selected as an ASM participant under TIN B for the 2030 ASM performance year if they meet ASM participant eligibility criteria under TIN B based on CY 2028 data. In this situation, Dr. A would be included in the list of ASM participants for the 2030 ASM performance year.

We also provide an example of how an exception due to TIN changes will work for an NPI who is selected as an ASM participant under multiple TIN/NPI combinations. As discussed in the CY 2026 PFS final rule, we believe that it would be rare, but possible, for the same NPI to be selected as an ASM participant under multiple TINs for the same ASM performance year (90 FR 49602). An exception based on a TIN change for one TIN/NPI combination does not affect the ASM participant's obligation to meet specified ASM requirements under any other TIN/NPI combination for which we selected the NPI as an ASM participant. For example, Dr. B (NPI B) is selected as an ASM participant under TIN C and TIN D for the 2028 ASM performance year. If Dr. B stops reassigning billing rights to TIN C during the 2028 ASM performance year and receives an exception applicable for the 2028 ASM performance year and the remainder of the ASM test period, then Dr. B is excepted from the specified ASM requirements under TIN C but must continue to meet ASM's requirements under TIN D for the 2028 ASM performance year and any future ASM performance years for which Dr. B meets the ASM participant eligibility criteria under TIN D.

We also provide several illustrative examples of how the exception related to specialty type redesignations will work in practice, including the effect of such exception on the application of payment adjustments under ASM. For example, consider ASM heart failure participant Dr. C (TIN E/NPI C) who receives a final score and an ASM payment multiplier for their performance under TIN E for the 2027 ASM performance year. Dr. C is notified of an exception during the 2028 ASM performance year because they redesignated their primary specialty type to cardiac electrophysiology as part of their Medicare enrollment. Dr. C will be excepted from the specified ASM requirements for the 2028 ASM performance year and the remainder of the ASM test period under TIN E. However, they will continue to receive payment adjustments on their Medicare Part B covered professional service claims submitted under TIN E during the 2029 ASM payment year based on the ASM payment multiplier determined for their performance during the 2027 ASM performance year. As we emphasized in the CY 2026 PFS final rule (90 FR 49696 through 49699), our goal is to maintain accountability for an ASM participant's performance for a given ASM performance year through performance-based payment adjustments during the corresponding ASM payment year.

A specialty type redesignation-based exception will apply to all TIN/NPI combinations for which we select the NPI as an ASM participant. For example, Dr. D (NPI D) is considered an ASM heart failure participant under TIN F and TIN G for the 2028 ASM performance year. Dr. D redesignates their primary specialty type to interventional cardiology as part of their Medicare enrollment during the 2028 ASM performance year. After our identification of the specialty type redesignation and providing notification, Dr. D will be excepted from specified ASM requirements for the 2028 ASM performance year and the remainder of the ASM test period under both TIN F and TIN G.

(5) ASM Participant Terminations

In the 2026 PFS final rule, we finalized application of the Standard Provisions for Mandatory Innovation Center Models (42 CFR part 512, subpart A) to ASM (90 FR 49720). These provisions describe actions that we may take to remediate actions associated with risks to program integrity.

As discussed in the proposed rule, these standard provisions are not intended to encompass all terms and conditions that apply to each Innovation Center model, because each model has unique design features and implementation plans that may require additional, more tailored provisions (91 FR 43971).

We proposed to include an additional remedial action for purposes of ASM starting in 2027 whereby we could terminate an ASM participant from participation in the model upon our determination that one or more grounds for remedial action described in § 512.160(a) has taken place. In addition, we proposed that we could terminate an ASM participant if we determine that continued participation would be inconsistent with the purposes of ASM or applicable law (91 FR 43971). Under this proposal, any termination of an ASM participant's participation would occur only upon a determination by CMS. For the avoidance of doubt, our proposal did not establish a right for an ASM participant to terminate their own participation.

We proposed to codify this provision at § 512.710(h) and to include a corresponding reference to termination in § 512.710(a)(1), which addresses the duration of participation under ASM.

We sought comment on this proposal at § 512.710(h).

In this section of this final rule, we summarize and respond to the public comments we received on these proposals.

Comment: A commenter expressed concern that termination of an ASM participant from the model could have significant consequences for ongoing remuneration and for model-related safe harbor and waiver protections, including potential retroactive liability for conduct undertaken in reliance on those protections.

Response: We appreciate concerns raised by commenters and provide clarifications as to our intent. We proposed § 512.710(h) to allow us to terminate an ASM participant only if we determine that (1) one or more grounds for remedial action described at § 512.160(a) have occurred, or (2) the ASM participant's continued participation would be inconsistent with the purposes of ASM, ASM's regulations, or applicable law. As discussed in the proposed rule, the grounds for remedial action at § 512.160(a) include failure to comply with Innovation Center model or Medicare program requirements, actions that threaten patient health or safety, submission of false data or representations, and changes in control that present a program integrity risk. The proposed regulatory text connects termination to these existing grounds for remedial action, adding termination as a supplemental action that we could take when appropriate. We believe the grounds for remedial action are sufficiently specified at § 512.160(a).

With respect to our proposal at § 512.710(h)(1)(ii) addressing termination when continued participation would be inconsistent with the purposes of ASM, the

requirements of ASM under its regulations, or applicable law, we do not intend for this provision to establish an open-ended basis for termination. Instead, our intent is to provide the ability for CMS to address situations where continued participation no longer makes sense due to changes in circumstances concerning the ASM participant in consideration of the model's structure and purpose. Examples of termination under this provision that we envision may include but are not limited to when an ASM participant is deceased.

We also appreciate the commenter's request for clarification on how termination affects the availability of the CMS-sponsored model arrangements and patient incentives safe harbor. We refer readers to section III.D.2.h of this final rule for discussion of safe harbor policies.

Comment: A commenter stated concern with the termination proposal, noting that it is unbounded by any specified notice requirement from CMS.

Response: We appreciate this commenter's remarks and agree that our regulations should describe a notice requirement in the event we terminate an ASM participant from the model. Accordingly, we are finalizing a modification to § 512.710(h) to add new paragraph § 512.710(h)(2) stipulating that, if we terminate an ASM participant from the model, we will provide notification to that ASM participant and specify the effective date of such termination in that notice. This approach preserves our ability to respond to circumstances arising during the model test period while informing an ASM participant of the basis for the termination.

Comment: A commenter expressed concern that CMS' proposal would terminate Medicare billing rights without adequate process. The commenter recommended that CMS establish a formal notice-and-cure process that includes written notice of the specific grounds for termination, at least a 30-day cure period for remediable violations, and an administrative appeal before an independent decision-maker prior to termination.

Response: We disagree that termination under proposed § 512.710(h) would affect a clinician's Medicare billing rights. The termination authority at § 512.710(h) applies only to a clinician's participation in ASM; it does not terminate, suspend, revoke, or otherwise directly affect a clinician's Medicare enrollment or billing privileges. These matters are outside the scope of ASM, its regulations, and this rulemaking. Termination, as the term is used under § 512.710(h), refers solely to termination from ASM.

As stated above, we nevertheless recognize that termination from ASM has consequences for model-related obligations and protections and are modifying our final policy to address concerns around notification of termination.

As described, we are finalizing § 512.710(h)(2) to state that we will provide notice of termination to an ASM participant identifying the grounds for termination and the effective date of a termination. We refer the commenter to the standard provisions at part 512, subpart A for information regarding administrative appeals processes.

We believe the modification we are finalizing to provide notice to ASM participants of termination, together with the existing framework under part 512, subpart A, appropriately balances transparency with our ability to respond to circumstances where termination is warranted.

After consideration of public comments, we are finalizing with modification our proposal at § 512.710(h) to terminate an ASM participant on grounds of remedial action or when participation is inconsistent with the model, its regulations, or applicable law. We are finalizing paragraphs §§ 512.710(h)(1), 512.710(h)(1)(i), and 512.710(h)(1)(ii) as proposed. We are finalizing the addition of new paragraph § 512.710(h)(2) to specify that, in the event an ASM participant is terminated from ASM, we will provide notice to the ASM participant specifying the grounds for termination and the effective date of such termination. We believe these modifications made in final regulation address commenters' requests for clarification and concerns.

c. Data Submission

(1) Background

We finalized in the CY 2026 PFS final rule that an ASM participant must meet established data submission requirements across the quality, improvement activities, and Promoting Interoperability ASM performance categories, consistent with §§ 512.725, 512.735, and 512.740, respectively (90 FR 49596 through 49605). We did not establish data submission requirements for the cost ASM performance category or for administrative claims-based quality measures as we will calculate performance on these measures using administrative claims data.

For the quality ASM performance category, we require the submission of numerator and denominator data for at least one required quality measure that satisfies the data completeness criteria (that is, data is submitted on at least 75 percent of the ASM participant's patients that meet a quality measure's denominator criteria). ASM participants in small practices (that is, a TIN with 15 or fewer clinicians) may submit quality data at the group (that is, TIN) level, while ASM participants in non-small practices must submit quality measure data at the individual (that is, TIN/NPI) level. Data submission for the improvement activities ASM performance category requires an ASM participant to attest at the group (that is, TIN) level. Finally, ASM participants must report the Promoting Interoperability ASM performance category at the group (that is, TIN) level. Regardless of the data submission level for each ASM performance category, each ASM participant receives an individual-level final score and corresponding ASM payment adjustment factor and ASM payment multiplier, which is used to adjust payments for each ASM participant's Medicare Part B covered professional service claims.

(2) Quality ASM Performance Category Data Submission for ASM Participants in Small Practices

In the CY 2026 PFS final rule, we finalized policies at § 512.720(a) describing data submission for the quality ASM performance category, including the requirement that quality measure data be submitted at the individual (that is, TIN/NPI) level. We also finalized at § 512.720(f) that ASM participants in small practices may report quality ASM performance category data at the group (that is, TIN) level.

In the CY 2027 PFS proposed rule (91 FR 43971), we proposed to reorganize § 512.720(a)(1)(i) and make technical, clarifying edits to the organization and text of our regulations to bring greater clarity to our provisions and better reflect our policy intent. We proposed to relocate where we describe small practice quality measure reporting from § 512.720(f) to new § 512.720(a)(1)(i)(C). Section 512.720(a)(1)(i)(C) would provide that an ASM participant in a small practice has the option to submit ASM quality measure data at either the group (that is, TIN) level or the individual (that is, TIN/NPI) level, consistent with our policy intent to provide ASM participants in small practices with flexibility in reporting ASM quality measure data.

We also proposed to make technical modifications at § 512.720(a)(1)(i)(A) to

correct a minor typographical error and at § 512.720(a)(1)(i)(B) to cross-reference new § 512.720(a)(1)(i)(C).

We solicited public comment on these proposals. The following is a summary of the public comments we received and our responses.

Comment: A few commenters supported CMS addressing typographical errors and the proposal to consolidate and clarify the regulatory text regarding quality data submissions, noting reorganized text improves readability and clarity.

Response: We appreciate the commenters' support and agree that the reorganized text improves readability.

Comment: Several commenters broadly supported allowing ASM participants in small practices to submit quality measure data at either the group level or the individual level and appreciated clarifications included in the proposed rule. Commenters stated that this flexibility recognizes the operational realities and varying administrative capacities of small practices while preserving meaningful quality measurement and accountability.

Response: We appreciate commenters' support for our proposed clarification regarding small practice quality ASM performance category data submissions.

After consideration of public comments, we are finalizing our proposals at § 512.720(a)(1)(i)(A) to correct a minor typographical error, clarify the small practice reporting flexibility for the quality ASM performance category at § 512.720(a)(1)(i)(C), and update at § 512.720(a)(1)(i)(B) to cross-reference new § 512.720(a)(1)(i)(C).

(3) Improvement Activities ASM Performance Category Data Submission

In the CY 2026 PFS final rule, we finalized that ASM participants submit improvement activity ASM performance category data by attesting to the completion of required improvement activities at the group (that is, TIN) level (90 FR 49599 through 49602). We believed that group-level data submission would be appropriately reflective of the team-based care and coordination envisioned by the improvement activities (90 FR 49601). We also believed that group-level data submission for the improvement activities ASM performance category would reduce administrative burden (90 FR 49601).

Since the publication of the CY 2026 PFS final rule, we received feedback from interested parties that group-level data submission for improvement activities may have unintentional consequences for certain ASM participants. In response to this feedback, we proposed at § 512.720(a)(1)(ii)(B) to allow an ASM participant to submit data for the improvement activities ASM performance category at either the group (that is, TIN) level or the individual (that is, TIN/NPI) level (91 FR 43972). We noted in the proposed rule that such policy would not affect how an ASM participant or its affiliated TIN may choose to structure a CCA required under improvement activity (IA)–2.

We sought comment on our proposal at § 512.720(a)(1)(ii)(B) to allow ASM participants to attest to completing ASM's improvement activities at either the group (that is, TIN) level or the individual (that is, TIN/NPI) level.

We received public comments on this proposal. The following is a summary of the comments we received and our responses.

Comment: Many commenters supported CMS' proposal to allow ASM participants to submit improvement activity ASM performance category data at either the individual (that is, TIN/NPI) level or the group (that is, TIN) level. A commenter described how this policy would reduce the risk of subjecting ASM participants within a TIN to scoring penalties if certain ASM participants within the same TIN do not perform the required activities. Several commenters stated such flexibility reduces administrative burden for physicians practicing within larger organizations, including integrated delivery systems. A commenter that supported individual-level reporting noted this better aligns individual accountability frameworks with individual clinical decision-making, consistent with ASM's stated design principles.

Response: We appreciate commenters' support for our policy. We agree that this flexibility can reduce the risk of unintended scoring consequences while allowing practices to use group-level reporting where it aligns with their existing workflows. We appreciate the comment that individual level reporting supports the model's broader individual accountability framework.

Comment: Several commenters recommended further flexibilities beyond those proposed, including that CMS recognize subgroups for purposes of ASM improvement activity data submissions. A commenter stated that the proposed approach to allow for group or individual level reporting would increase the burden on a subgroup of physicians who meet the requirements for ASM improvement activities.

Response: We appreciate commenters' recommendations. However, we are not adopting additional reporting levels, such as subgroups. Introducing subgroup or other reporting configurations would add complexity to data submission, validation, and scoring and could make the reporting framework more difficult for ASM participants to understand and implement. We believe permitting reporting at either the individual or group level provides meaningful flexibility while maintaining a clear and administratively workable reporting structure. Further, we disagree that our proposal would create additional burden for subgroups of ASM participants. A TIN that includes multiple ASM participants may attest to completing the improvement activities ASM performance category data at the TIN level if all ASM participants within that TIN perform the required activities. If that group also includes non-ASM participants, that group could still attest ''yes'' to ASM improvement activities so long as all ASM participants in the group met the activity's requirements. If only some ASM participants within that group perform the required improvement activities, then individual level reporting would be available for those ASM participants who performed the required activities, and those ASM participants that did not perform required activities would not be able to submit an affirmative attestation. Thus, we do not agree there would be added benefit from subgroup reporting that would overcome the complexity it would introduce.

We also received comments on the improvement activities ASM performance category that were out of scope from the proposed rule, which are not addressed in this rule. However, we thank commenters for providing input on these matters.

After consideration of public comments, we are finalizing our proposal at § 512.720(a)(1)(ii)(B) to allow ASM participants to attest to completing ASM improvement activities at either the group (that is, TIN) level or the individual (that is, TIN/NPI) level.

(4) Treatment of Multiple Data Submissions for the Quality, Improvement Activities, and Promoting Interoperability ASM Performance Categories

In the CY 2026 PFS final rule, we finalized policies addressing the treatment of multiple data submissions for the quality, improvement activities, and Promoting Interoperability ASM performance categories at § 512.720(e) (90 FR 49604 through 49606). For the

quality and improvement activities ASM performance categories, when we receive multiple data submissions for an individual ASM participant from multiple organizations (for example, a qualified registry, practice administrator, or an electronic health record (EHR) vendor), we calculate and score each submission and assign the highest score to the ASM participant. When we receive multiple data submissions for an individual ASM participant from the same organization, we score the most recent submission. For the Promoting Interoperability ASM performance category, we calculate each submission and assign the highest score.

In the CY 2027 PFS proposed rule, we proposed technical modifications to regulatory text describing multiple data submissions to bring greater clarity to our regulatory structure by addressing each ASM performance category under a separate regulatory paragraph. Except for the proposed new policy for small practices at proposed § 512.720(e)(1)(iii), discussed later in this section of this final rule, the remaining revisions to § 512.720(e)(1) would not constitute substantive changes from the policies finalized in the CY 2026 PFS final rule. Specifically, we proposed to:

- Address the multiple data submissions policy for the quality ASM performance category at § 512.720(e)(1), the improvement activities ASM performance category at § 512.720(e)(2), and the Promoting Interoperability ASM performance category at § 512.720(e)(3). To accomplish this, we would:

++ Add the informative heading ''Quality ASM performance category'' to § 512.720(e)(1).

++ Revise §§ 512.720(e)(1)(i) and 512.720(e)(1)(ii) to reflect our policy for scoring multiple data submissions for the quality ASM performance category and make technical revisions to the text.

++ Redesignate existing § 512.720(e)(2) describing our multiple data submission policy for the Promoting Interoperability ASM performance category as new paragraph § 512.720(e)(3)(i).

++ Redesignate the portions of §§ 512.720(e)(1)(i) and 512.720(e)(1)(ii) that address our multiple data submission policy for the improvement activities ASM performance category to §§ 512.720(e)(2)(i) and 512.720(e)(2)(ii).

++ Add the informative heading ''Improvement activities ASM performance category'' at § 512.720(e)(2).

++ Revise newly redesignated §§ 512.720(e)(2)(i) and 512.720(e)(2)(ii) to make technical clarifications for the treatment of multiple data submissions for the improvement activities ASM performance category.

++ Add the informative heading ''Promoting Interoperability ASM performance category'' to new paragraph § 512.720(e)(3).

We invited public comment on this proposed reorganization of § 512.720(e).

We received public comments on these proposals. The following is a summary of the comments we received and our responses.

Comment: A few commenters supported CMS' reorganization of the multiple data submission provisions of regulations. A commenter stated that such revisions bring greater clarity to the treatment of multiple submissions and scoring methodologies and help to reduce administrative complexity while supporting consistent and transparent performance assessment.

Response: We appreciate the commenters' support and agree that the revisions will bring greater clarity to our policies on multiple data submissions and the effect on performance assessment.

After consideration of public comments, we are finalizing the proposed policies at §§ 512.720(e)(1) through (3) describing treatment of multiple data submissions for the quality, improvement activities, and Promoting Interoperability ASM performance categories as proposed.

(a) Multiple Data Submissions for the Quality ASM Performance Category for ASM Participants in Small Practices

In the CY 2026 PFS final rule, we finalized that ASM participants in small practices may report quality measures in the quality ASM performance category at the group (that is, TIN) level (90 FR 49602). We finalized this policy because we recognize that reporting quality measures at the individual (that is, TIN/NPI) level may be particularly burdensome for ASM participants in small practices who may have limited capacity for data aggregation and reporting. We believe that EHR customization for individual-level reporting, and the costs associated with updating reporting mechanisms, may pose a more significant burden on ASM participants in small practices compared to ASM participants in larger practices because small practices may not have the requisite support, such as infrastructure or staffing, to facilitate individual-level reporting. Importantly, this reporting flexibility does not change ASM's intention to measure individual ASM participant performance; rather, this flexibility is limited to the reporting and scoring of ASM non-administrative claims-based quality measures. All other reporting and scoring requirements for the cost and quality ASM performance categories remain at the individual ASM participant level regardless of practice size. ASM participants in small practices will retain the option to report quality measure data at the individual level if they choose.

After internal review of the provisions finalized in the CY 2026 PFS final rule, we believe that permitting multiple submissions at different reporting levels within a small practice could create unintended incentives and scoring effects. If multiple reporting levels are permitted within the same small practice, an ASM participant's quality ASM performance category score could depend in part on the reporting level used, rather than on a consistent approach to reporting and evaluating quality performance. For example, a small practice could submit individual-level data for higher-performing ASM participants and group-level data for lower performing ASM participants. This variability could reduce comparability across ASM participants and create inconsistent scoring outcomes among ASM participants in similar practice arrangements. We believe ASM participants in small practice should report quality data at the reporting level that best meets their needs and capabilities.

We proposed at § 512.720(e)(1)(iii) that if we receive any quality ASM performance category data at the group (that is, TIN) level from an ASM participant in a small practice, we would score the group-level submission and assign that score to all individual ASM participants in the small practice. This proposal would mean that any individual (that is, TIN/NPI) level submission received for any ASM participants in that small practice would not be scored if any group-level quality data submission is received.

We believe this proposal maintains the desired reporting flexibility to decrease the administrative burden for ASM participants in small practices while preserving the integrity of the ASM scoring framework. Specifically, ASM participants in small practices would continue to have the option to report non-administrative claims-based ASM quality measures at either the group or individual level. Our proposed policy would mitigate the opportunity for ASM participants in small practices to submit data at multiples levels most opportune to achieve a higher score and establish a consistent scoring framework so that ASM participants in small practices are encouraged to submit required data based on needs and capabilities, rather than strategic

performance considerations. Table B–D1 in this section of this final rule summarizes existing finalized policies and new proposals relating to our treatment of multiple data submissions for the quality ASM performance category.

TABLE B-D1: TREATMENT OF MULTIPLE DATA SUBMISSIONS FOR THE QUALITY ASM PERFORMANCE CATEGORY

ASM Participant in a Small Practice	Multiple Quality Data Submissions Received	Source of Multiple Quality Data Submissions	Group-level Quality Data Submission Received	Quality Data Submission Scored
No	No	N/A	Not Permitted	Individual-level (TIN/NPI)
	Yes	Multiple Organizations	Not Permitted	Highest Individual-level (TIN/NPI)
		Single Organization	Not Permitted	Most Recent Individual-level (TIN/NPI)
Yes	No	N/A	Yes	Group-level (TIN)
			No	Individual-level (TIN/NPI)
	Yes	Multiple Organizations	Yes	Highest Group-level (TIN)
			No	Highest Individual-level (TIN/NPI)
		Single Organization	Yes	Most Recent Group-level (TIN)
			No	Most Recent Individual-level (TIN/NPI)

We sought comment on our proposal at § 512.720(e)(1)(iii) to score any group-level quality data submission received from small practices and assign that score to all ASM participants in the small practice regardless of any individual-level quality data submission received for individual ASM participants in that same small practice.

We received public comments on our proposal. The following is a summary of the comments we received and our responses.

Comment: A commenter supported the policy whereby CMS would score all ASM participants in a small practice using group-level (TIN) data when a group-level data submission is received, rather than allow ASM participants in small practices to submit quality data at multiple levels and receive the best score. The commenter noted that selective submission of quality data undermines the comparability and integrity of ASM's quality scoring, invites gaming, and would be difficult for CMS to audit or validate at scale.

Response: We appreciate support for our proposal and agree this would help promote integrity in quality ASM performance category scoring and mitigate selective data submissions that could undermine that integrity.

Comment: Several commenters did not support CMS' proposal. A commenter stated that, due to the disadvantaged position small practices experience in MIPS, CMS should take the higher score if multiple ASM quality submissions are received from a small practice at different levels. Another commenter posited that CMS' policy would prevent a practice from submitting individual level data for the subset of ASM participants in the practice who can individually meet the minimum case requirements for a measure, while submitting TIN level data for those ASM participants without enough patients to be scored individually on the measure. According to the commenter, this could result in differences in the numbers of measures that ASM participants can report, which the commenter believed would be contrary to CMS' goal of accurately comparing performance across ASM participants.

Response: We note that ASM is distinct from MIPS. ASM incorporates flexibilities designed to support small practices, including the ability to report quality data at either the individual level or the group level. The treatment of multiple data submission policy does not eliminate that flexibility; rather, it establishes how we will score submissions when we receive both individual level and group level quality data for ASM participants within the same small practice. We have also established a 10-point final score adjustment for ASM participants in small practices to account for the additional administrative and reporting burdens they may experience.

At this time, we do not believe it is necessary or appropriate to select the higher score when both group-level and individual-level quality data are submitted by ASM participants in a small practice. Doing so could create an incentive to submit quality data at multiple reporting levels based on which submission is expected to produce the more favorable score and could result in inconsistent scoring among similarly situated ASM participants. Assigning the group-level score to all ASM participants in the small practice when CMS receives a group-level submission establishes a clear and consistent approach to scoring, preserves comparability across ASM participants, and reduces the potential for reporting-level selection to influence scoring outcomes.

After consideration of public comments, we are finalizing as proposed our policy at § 512.720(e)(1)(iii). This provision describes that, if we receive a TIN-level data submission in the quality ASM performance category for an ASM participant in a small practice, we score the TIN-level submission and assign that score to all individual ASM participants in the small practice, regardless of any TIN/NPI-level submission(s) received for one or more of those ASM participants.

d. Quality ASM Performance Category

(1) Background

As discussed in the CY 2026 PFS final rule, the quality ASM performance category supports the broader goals of the model by incentivizing improvements in the quality of care and reductions in unnecessary or low—value services for patients with heart failure and low back pain. To accomplish these objectives, we finalized in the CY 2026 PFS final rule the use of ASM cohort-specific quality measure sets at § 512.725(b) (heart failure) and § 512.725(c) (low back pain). ASM participants must report all measures applicable to their ASM cohort, with administrative claims-based measures calculated by us. This structure is similar to other CMS programs, such as MIPS Value Pathways (MVPs), that entail reporting on a clinically relevant subset of measures tailored to an eligible clinician's specialty and patient population. It also minimizes reporting burden, promotes consistency in measurement over the duration of the ASM test period, and supports rigorous evaluation by maintaining a stable set of quality indicators.

In finalizing these policies, we sought to ensure that each ASM cohort-specific quality measure set reflects agency goals to advance value-based care by linking payment to meaningful improvements in clinical outcomes and beneficiary experience. The measures selected for ASM represent a mix of utilization-focused measures, evidence-based care measures, and patient—reported outcome or experience measures. This structure supports nationwide measurement efforts focused on outcomes, safety, and patient experience.

We intended for the quality measure sets applicable to each ASM cohort to remain stable throughout the ASM test period; however, we may propose additions or removals through notice-and-comment rulemaking if refinements to the measure sets are warranted. Such updates may be considered in response to interested parties' feedback, changes in clinical guidelines, updates to measures used in ASM or other CMS programs, or the development of new quality measures. This framework keeps the quality ASM performance category aligned with current clinical practice while providing predictability that may reduce administrative burden over time.

(2) Low Back Pain Quality Measure Set

(a) Low Back Pain Imaging Measure for the ASM Low Back Pain Cohort

In the CY 2026 PFS proposed rule, we proposed inclusion of the ''Magnetic Resonance Imaging (MRI) Lumbar Spine for Low Back Pain, Respecified to Be Relevant to ASM Participants Treating Low Back Pain'' measure in the ASM low back pain quality measure set (90 FR 32593 through 32597), but did not finalize its inclusion based on interested parties' feedback (90 FR 49616 through 49618). We indicated in the CY 2026 PFS final rule that we intended to revisit the inclusion of this measure in future notice-and-comment rulemaking (90 FR 49617). We intended to revisit this policy because the ASM low back pain cohort had only four quality measures, and none were focused on excess utilization or efficiency. As our goal is to have a well-rounded measure set for each ASM cohort that includes this focus area, we sought to include a measure that would complete the ASM low back pain quality measure set.

In the CY 2027 PFS proposed rule, we proposed at § 512.725(c)(5) to include the ''Magnetic Resonance Imaging (MRI) Lumbar Spine for Low Back Pain (modified for ASM)'' measure in the ASM low back pain quality measure set. We stated that this proposal would meet the goals of the ASM low back pain cohort's quality measure set of including an excess utilization focused measure. This measure is modified from the ''Magnetic Resonance Imaging (MRI) Lumbar Spine for Low Back Pain'' measure that was specified for use in hospital outpatient departments at the facility level and previously included in the Hospital Outpatient Quality Reporting Program (HOQRP) as OP–8 (73 FR 68766).[186] While we removed the measure from the HOQRP in 2017 due to limited reliability from low average facility-level volumes, we have since re-evaluated the measure for use in ASM. In reassessing this measure, we considered interested parties' feedback, technical expert input, and measure reevaluation activities.

Commenters and experts indicated that, while the clinical concept remains important for assessing low-value imaging, the prior specification presented challenges related to attribution at the facility level, small sample sizes, and limited applicability to certain care delivery contexts. Interested parties also recommended exploring refinements to improve measure reliability and alignment with clinician decision-making in ambulatory specialty settings.

In response, we have made targeted specification modifications to improve the measure's applicability and statistical reliability in the ASM context. We believe these modifications address the previously identified limitations while preserving the measure's clinical intent of reducing unnecessary imaging for low back pain.

We believe the proposed administrative claims-based quality measure would effectively evaluate overuse and incentivize reductions in inappropriate MRI imaging for low back pain. Routine imaging (such as MRI) is not recommended for patients with non-specific low back pain in the absence of certain clinical indicators and concerning features.[187] However, analyses have shown that a significant proportion of patients with low back pain undergo imaging, often within the first few weeks of symptom onset, despite the lack of clear indication.[188] Overuse of imaging for low back pain can lead to unnecessary health care costs and potential patient harm from the cascade effect, where MRI findings, many incidental, may prompt further unnecessary testing or procedures.[189] [190] By including this measure in the ASM low back pain quality measure set, ASM would aim to incentivize adherence to evidence-based guidelines and a

reduction of unnecessary MRIs for patients with uncomplicated low back pain, where an MRI is not clinically indicated, particularly in the initial stages of evaluation and management. We believe this could also improve patient experience to the extent it reduces time spent at medical appointments and out—of—pocket health care costs. Furthermore, as an administrative claims-based quality measure, ASM low back pain participants would not assume new reporting requirements for this measure. We would provide detailed measure information for the MRI Lumbar Spine for Low Back Pain (modified for ASM) on the ASM website before the start of the 2027 ASM performance year, if finalized, to educate ASM participants on how they would be measured.

Our modifications seek to improve clinical validity and reliability for the purposes of ASM. Two of our modifications were related to denominator exclusions and the measure's performance period. We also made modifications to provider attribution, minimum case count, and the lookback period for antecedent care, for which we offer alternative options that seek comment on. We believe the modifications we proposed as part of the ''Magnetic Resonance Imaging (MRI) Lumbar Spine for Low Back Pain (modified for ASM)'' measure to be appropriately tailored to measure performance related to potentially unnecessary MRI utilization for patients with low back pain.

We sought comment on the inclusion of MRI Lumbar Spine for Low Back Pain (modified for ASM) measure in the ASM low back pain quality measure set at § 512.725(c)(5).

We received public comments on these proposals. The following is a summary of the comments we received and our responses.

Comment: Several commenters supported CMS' proposal to include the Magnetic Resonance Imaging (MRI) Lumbar Spine for Low Back Pain (modified for ASM) measure in the ASM low back pain quality measure set. Commenters appreciated CMS' efforts to improve the measure's applicability and statistical reliability and noted that use of an administrative claims-based measure could reduce reporting burden. Another commenter recommended that CMS publicly release the measure specifications, testing results, and supporting documentation before finalizing the measure.

Response: We appreciate commenters' support for the Magnetic Resonance Imaging (MRI) Lumbar Spine for Low Back Pain (modified for ASM) measure. We agree that since this is an administrative claims-based measure calculated by CMS, we expect its inclusion to limit additional reporting burden on ASM participants. We also intend to release additional resources, including detailed measure specifications, in advance of the start of the model to support ASM participant understanding and implementation.

Comment: Several commenters opposed finalizing the Magnetic Resonance Imaging (MRI) Lumbar Spine for Low Back Pain (modified for ASM) measure or recommended postponing its implementation. Commenters questioned whether the modified measure had been sufficiently tested and validated for use at the individual clinician level, noting that the measure on which it was based had previously been removed from the Hospital Outpatient Quality Reporting Program in part because of reliability concerns. Commenters recommended that CMS publicly release the complete measure specifications, reliability and validity testing results, feasibility analyses, and other supporting documentation before using the measure for performance assessment and payment. Some commenters also questioned whether the modified measure had undergone sufficient independent or consensus-based review.

Response: We appreciate commenters' feedback regarding the testing, reliability, and transparency of the Magnetic Resonance Imaging (MRI) Lumbar Spine for Low Back Pain (modified for ASM) measure. In CY 2026 PFS rulemaking, we proposed a version of this measure but did not finalize its inclusion in ASM in response to interested parties' feedback (90 FR 49616 through 49618). At that time, we indicated that we intended to revisit the measure in future rulemaking. This provided additional time to reevaluate the measure, conduct further testing, obtain technical expert and interested parties' input, and refine the measure specifications and methodology.

Based on this additional analysis, we determined that the modified measure achieves sufficient reliability for assessing performance at the individual ASM participant level. As discussed in the CY 2027 PFS proposed rule, we made several modifications intended to improve the measure's clinical validity and reliability, including refinements to the denominator exclusions and use of a 24-month performance period and a 20-case minimum. Our testing showed that these changes increased case volume and improved the stability and reliability of ASM participant-level performance estimates.

We recognize commenters' interest in reviewing additional technical information. CMS intends to release detailed measure specifications and other implementation resources in advance of the first ASM performance year. Because the measure will be calculated using administrative claims data and will not require ASM participants to submit additional measure data, we believe this approach provides ASM participants adequate notice and information to understand how their performance will be assessed without creating additional quality data reporting burden. Accordingly, we do not believe it is necessary to further delay implementation of the measure.

Comment: Several commenters expressed concern that an administrative claims-based measure may not adequately distinguish clinically appropriate from potentially unnecessary lumbar spine MRIs. Commenters stated that claims may not capture the complete clinical history, symptoms, or other factors that inform an imaging decision, particularly for patients with complex spinal conditions. Commenters were concerned that the measure could therefore characterize clinically appropriate imaging as overutilization and create incentives to delay or avoid medically necessary imaging. A commenter also stated that the measure does not assess potential underutilization of MRI and therefore may not provide a balanced assessment of quality.

Response: We appreciate commenters' concerns regarding whether this measure can appropriately distinguish potentially unnecessary imaging from clinically indicated MRI use. We carefully reevaluated the measure for use in ASM, including through clinical review, interested parties' feedback, and measure testing, and made targeted specification changes intended to improve its clinical validity and applicability to ASM participants.

We do not intend to discourage MRI use when imaging is clinically appropriate. Rather, the measure is designed to identify potentially unnecessary imaging for patients with low back pain in circumstances where immediate imaging may provide limited clinical benefit. As part of our clinical review, we retained denominator exclusions for conditions and ''red flag'' signs and symptoms for which more immediate imaging may be warranted, including relevant malignant neoplasms and autoimmune conditions. We also aligned the exclusion logic with the

HEDIS Use of Imaging Studies for Low Back Pain measure where supported by clinical review. These exclusions are intended to avoid assessing imaging as potentially unnecessary when the available claims information indicates a clinical circumstance warranting more immediate imaging.

More broadly, the measure is not intended to reduce MRI utilization indiscriminately or to establish that lower MRI utilization is always better. Its clinical focus is on avoiding imaging before it is indicated, including circumstances in which conservative or antecedent care would generally be appropriate before proceeding to MRI.

We also recognize that this measure is focused specifically on excess utilization and is not designed to assess every dimension of imaging quality, including underutilization. The measure is one component of a broader ASM low back pain quality measure set intended to assess multiple aspects of care. For these reasons, we believe the measure provides a meaningful and appropriately targeted assessment of potentially unnecessary MRI utilization while preserving appropriate imaging for beneficiaries with clinical indications.

Comment: A few commenters questioned the need for a separate MRI utilization measure because the low back pain episode-based cost measure already captures imaging and other utilization. These commenters stated that an additional MRI-focused quality measure could create duplicative accountability and potentially overemphasize reductions in a single service.

Response: We appreciate commenters' concerns regarding potential overlap between the Magnetic Resonance Imaging (MRI) Lumbar Spine for Low Back Pain (modified for ASM) measure and the low back pain episode-based cost measure. We do not consider the measures duplicative because they assess different aspects of performance. The episode-based cost measure evaluates resource use and spending across the broader low back pain episode, while the MRI quality measure is specifically designed to assess whether lumbar spine imaging occurs in circumstances where appropriate antecedent care would generally be expected before imaging.

Accordingly, the MRI measure is not intended simply to reward lower MRI utilization. Rather, it provides a more targeted assessment of potentially unnecessary imaging by considering whether imaging occurred after appropriate antecedent care and by excluding clinical circumstances in which more immediate imaging may be warranted. An MRI may contribute to overall episode spending regardless of whether it was clinically appropriate; the quality measure provides additional information about the appropriateness and timing of that utilization that is not captured by an aggregate episode-based cost measure. We therefore believe the measures are complementary and together provide a more complete assessment of value in low back pain care.

Comment: A commenter also requested clarification regarding how the proposed rolling 24-month performance period would operate.

Response: We appreciate the commenter's request for clarification. By a rolling 24-month performance period, we mean that the measure will include all eligible lumbar spine MRI studies occurring during the applicable two-year performance period used to calculate an ASM participant's measure score. The 2-year window will move forward with each successive ASM performance year rather than operate as a single fixed 24-month period that permanently resets the measure.

We selected a 2-year performance period because testing showed that expanding the performance period from 1 year, as used in the original OP–8 measure, to 2 years approximately doubled denominator volume. The additional case volume improves measure stability and supports more reliable performance assessment, particularly for ASM participants with lower annual imaging volumes.

Comment: Other commenters recommended that CMS provide ASM participants with sufficient advance notice of the final measure specifications and timely performance data before holding ASM participants financially accountable.

Response: We appreciate commenters' recommendations regarding advance notice and access to performance information. We intend to make detailed measure specifications and other implementation resources available in advance of the start of the model. We believe this timing provides sufficient notice because the measure will be calculated by CMS using administrative claims data and will not require ASM participants to establish new EHR functionality, reporting infrastructure, or other systems to submit measure data.

We also note that CMS has signaled its continued interest in an MRI utilization measure for the ASM low back pain cohort across successive rulemaking cycles, including in the CY 2026 PFS rulemaking, when we did not finalize the measure but stated our intent to revisit it in future rulemaking. We recognize the value of timely performance information in helping ASM participants understand their performance and identify opportunities for improvement and, as we further develop ASM's data sharing strategy, we will consider opportunities to provide relevant measure information and performance data to support transparency and ongoing improvement.

We discussed modifications to the measure's specifications in the proposed rule, as well as sought comment on potential alternatives to the proposed modifications related to provider attribution, minimum case count, and the lookback period for antecedent care.

(i) Denominator Exclusions

We conducted an evaluation of the measure's denominator exclusions to ensure that they reflect current clinical guidelines and appropriately identify cases where early lumbar spine imaging is clinically justified. This evaluation focused on exclusions that previously removed a large number of cases under the OP–8 specifications and involved reviewing each diagnosis code individually. Removing a large number of cases in OP–8 presented risks to the applicability and reliability of the measure.

We identified three clinical areas that had a large number of exclusions: cancer diagnoses, neurological impairment, and autoimmune or inflammatory conditions. Physicians assessed each code under these categories for appropriateness to include in the measure denominator. Most conditions, such as ''red flag'' signs and symptoms and for malignant neoplasms and autoimmune disorders where imaging would be warranted (regardless of completion of conservative therapy), were maintained as denominator exclusions. Conditions, such as benign neoplasm of the colon and hemangioma of skin and subcutaneous tissue, were removed as denominator exclusions since their presence would not warrant an immediate MRI for a patient with low back pain; the condition alone would not preclude a patient with low back pain from attempting conservative therapy prior to receiving a lumbar MRI. To improve clinical validity and acceptability, conditions and diagnoses were not removed as denominator exclusions if they were present in the list of denominator exclusions in the Healthcare Effectiveness Data and Information Set (HEDIS) Use of Imaging

Studies for Low Back Pain measure.[191] Under this approach, we ultimately aligned with the same exclusion logic used in the HEDIS Use of Imaging Studies for Low Back Pain measure and only diagnosis codes present in that measure and supported by clinical review remained as denominator exclusions in our ASM measure. As a result of these refinements, the ASM measure's exclusion criteria differ from the prior OP8 specification in these three clinical areas with the goal of more closely aligning to evidence—based practice guidelines.

In our analysis, these changes result in the inclusion of a significant number of imaging studies that would previously have been excluded, representing 52 percent of the cases that would have been removed under the earlier specification. Retaining these cases strengthens this measure by increasing denominator volume and improving our ability to identify potentially unnecessary imaging. We believe these refinements enhance the measure's clinical validity by ensuring that exclusions are limited to diagnoses that represent appropriate indications for more immediate imaging that do not warrant a prior trial of conservative therapy.

We received public comments on the denominator exclusions. The following is a summary of the comments we received and our responses.

Comment: A few commenters raised concerns about the revised denominator exclusions for the Magnetic Resonance Imaging (MRI) Lumbar Spine for Low Back Pain (modified for ASM) measure. Commenters acknowledged CMS's efforts to better account for circumstances in which early imaging may be clinically appropriate but stated that claims-based exclusions may not capture all clinical circumstances that warrant an MRI. Commenters expressed concern that the measure could therefore penalize clinically appropriate imaging or create incentives to delay medically necessary diagnostic evaluation.

Response: We appreciate commenters' concerns that claims-based exclusions may not capture every clinical circumstance in which an MRI is appropriate. In developing the modified measure, we conducted a detailed clinical review of the denominator exclusions, including review of individual diagnosis codes, to identify circumstances in which early imaging is clinically warranted. We retained exclusions for relevant ''red flag'' signs and symptoms and other conditions for which more immediate imaging may be appropriate regardless of antecedent conservative care.

The measure is intended to assess patterns of potentially unnecessary imaging across an ASM participant's eligible cases, rather than determine that every individual MRI included in the measure was clinically inappropriate. The 20-case minimum and 24-month performance period are intended to produce a more stable assessment and reduce the influence of isolated or atypical events. Accordingly, a single clinically appropriate MRI that is not captured by an exclusion is less likely to disproportionately affect an ASM participant's overall measure performance.

Comment: Other commenters recommended additional transparency regarding the revised denominator exclusions, including more information on the affected diagnosis codes and the clinical review supporting the changes. Commenters also questioned whether alignment with the HEDIS Use of Imaging Studies for Low Back Pain measure is sufficient for evaluating individual physician performance.

Response: We appreciate commenters' recommendations regarding transparency. As summarized in the CY 2027 PFS proposed rule, we conducted a diagnosis code-level clinical review of the denominator exclusions and intend to release additional measure specifications in advance of the 2027 ASM performance year. The historical OP–8 specifications are publicly available, and we used the HEDIS Use of Imaging Studies for Low Back Pain measure as an additional clinical cross-check, not as the sole basis for determining the measure's appropriateness for individual ASM participant-level assessment. That determination also reflected clinical review, technical input, and measure testing.

After consideration of public comments, we are finalizing as proposed the denominator exclusions for the Magnetic Resonance Imaging (MRI) Lumbar Spine for Low Back Pain (modified for ASM) measure.

(ii) Performance Period

We evaluated the performance period for the measure to ensure that ASM participant-level scores are reliable and suitable for use in the model's quality assessment framework. The original HOQRP version of the measure used a single-year performance period, which limited the number of eligible MRI studies available for scoring and contributed to concerns about measure reliability.[192] To address these issues, we tested an expanded performance period that included all eligible lumbar spine MRI studies occurring within a rolling 24—month window. Under this approach, each MRI meeting denominator criteria during the 2—year period was included in measure calculation, thereby significantly increasing the number of cases available for analysis. Testing showed that the expanded 2—year performance period resulted in approximately a 100 percent increase in denominator volume relative to a 1—year period. This increase in case volume improved the precision of ASM participant-level estimates and reduced small—sample volatility, particularly for clinicians with lower annual MRI volumes. We believe that a 2—year performance period enhances measure stability and supports more dependable performance assessment across all ASM low back pain participants and overcomes limitations and concerns that existed when the measure existed in the HOQRP. This is especially important for utilization measures, where annual case counts can vary substantially among specialties and practice types. Based on these findings, we believe that a rolling 24—month period provides the most robust and actionable representation of clinician imaging practices.

We received public comments on the performance period. The following is a summary of the comments we received and our responses.

Comment: A commenter supported the proposed expansion of the performance period for the Magnetic Resonance Imaging (MRI) Lumbar Spine for Low Back Pain (modified for ASM) measure.

Response: We appreciate the commenter's support and note that this change improves the precision and stability of ASM participant-level estimates and reduces small-sample volatility. We believe this approach supports more reliable performance assessment, particularly for ASM participants with lower annual MRI volumes.

Comment: A commenter raised concerns about the proposed rolling 24-month performance period, including that it differs from the one-year periods used for other ASM quality measures, may include imaging furnished before

[191] National Committee for Quality Assurance. *Use of Imaging Studies for Low Back Pain (LBP).* NCQA, *https://www.ncqa.org/report-cards/health-plans/state-of-health-care-quality-report/use-of-imaging-studies-for-low-back-pain-lbp/.* Accessed 6 Apr. 2026.

[192] Hospital Outpatient Specifications Manuals, Hospital Outpatient Quality Reporting. CMS.gov. Accessed March 27, 2026. *https://qualitynet.cms.gov/outpatient/specifications-manuals.*

ASM begins, and may allow the same imaging event to affect performance in consecutive years. The commenter also questioned whether the longer period could delay the effect of practice changes and is primarily intended to increase case volume.

Response: We appreciate the commenter's concerns. We selected a 24-month performance period based on testing showing that it approximately doubled denominator volume compared with a one-year period, improving the precision and stability of ASM participant-level estimates and reducing small-sample volatility. The longer period is intended to support more reliable performance assessment, particularly for ASM participants with lower annual MRI volumes, rather than simply increase the number of ASM participants measured. Although some imaging events may contribute to consecutive annual measurement windows, the measure assesses aggregate performance across all eligible cases rather than assigning a separate penalty to an individual MRI. We believe this approach provides a more stable representation of imaging practices while allowing performance to change as newer cases enter the rolling window.

After consideration of public comments, we are finalizing as proposed the 24-month performance period for the Magnetic Resonance Imaging (MRI) Lumbar Spine for Low Back Pain (modified for ASM) measure.

(iii) Provider Attribution

The management of low back pain often involves several specialists over an extended period, and diagnostic and treatment decisions typically develop through multiple clinical encounters rather than a single visit. In modifying the original HOQRP measure for use in ASM, we had to address how to transition the measure from its original hospital outpatient department attribution method, which assigned imaging only to the facility that billed the MRI claim, to an approach that reflects physician—level accountability. This work included evaluating a single—participant attribution method that assigns each MRI to the physician with the highest number of qualifying encounters during the lookback period and a multiple—participant attribution method that assigns the MRI to all physicians who provided qualifying services to the patient. Testing showed that the multiple—participant method increased the number of attributed MRI studies by roughly 26 percent after exclusions, which strengthened measure stability and improved representation of the various physicians involved in that beneficiary's care. Multiple attribution better reflects real—world care patterns, particularly in increasingly common cases where beneficiaries receive longitudinal care by different team members over time. This approach also supports ASM's goals by recognizing the shared nature of clinical responsibility for decisions that influence downstream utilization and patient outcomes. Also, including all clinicians who contributed meaningfully to the beneficiary's care ensures that performance assessment captures the full set of ASM low back pain participants who may influence imaging decisions. We believe this attribution method provides a more complete and accurate understanding of imaging practices within the ASM low back pain cohort. For these reasons, we proposed multiple—participant attribution.

We also considered an alternative approach that would attribute each MRI to a single physician. Under this option, an MRI would be assigned to the ASM participant who furnished the highest number of qualifying encounters during the attribution window, which reflects a single point of clinical responsibility for many beneficiaries. This approach would provide a more streamlined assignment method and could reduce attribution complexity for the measure, but may not be reflective of real-world practice patterns and results in fewer attributed beneficiaries per ASM participant and thus slightly lower measure reliability.

We sought comment on the proposed use of a multiple-participant attribution method for this quality measure. We also sought comment on the alternate proposal of an attribution method involving a single ASM participant.

We received public comments on the provider attribution. The following is a summary of the comments we received and our responses.

Comment: Several commenters raised concerns regarding attribution of MRI utilization to ASM participants who may not have ordered the imaging or meaningfully influenced the imaging decision. Commenters stated that participation in a beneficiary's longitudinal low back pain care does not necessarily indicate responsibility for a particular MRI and expressed particular concern with attributing the same MRI to multiple ASM participants. Commenters recommended that CMS more closely align attribution with the clinician responsible for, or able to influence, the imaging decision and avoid attributing imaging ordered before the specialist became involved in the beneficiary's care or imaging required under applicable coverage policies.

Response: We appreciate commenters' feedback regarding attribution of MRI utilization. In response to these concerns, we are finalizing the alternative single-participant attribution methodology described in the proposed rule, under which each MRI will be attributed to the ASM participant with the highest number of qualifying encounters during the applicable lookback period. This approach avoids attributing the same MRI to multiple ASM participants and is intended to tie accountability more directly to the ASM participant with the strongest demonstrated treatment relationship during the relevant period. Although this approach results in fewer attributed beneficiaries and slightly lower reliability than multiple-participant attribution, we believe it more appropriately balances measure reliability with commenters' concerns regarding accountability.

Comment: A commenter supported the alternative single-participant attribution methodology, under which each MRI would be attributed to the ASM participant with the highest number of qualifying encounters during the lookback period.

Response: We appreciate the commenter's support. As discussed, after consideration of public comments, we are finalizing the alternative single-participant attribution methodology.

Comment: Other commenters stated that the alternative single-participant attribution methodology may still attribute an MRI to a clinician who did not order or influence the imaging decision. These commenters recommended that accountability be more directly tied to the clinician responsible for the MRI decision and expressed concern that specialists who become involved later in a beneficiary's care could otherwise be held accountable for earlier imaging decisions.

Response: We appreciate commenters' concerns. Although single-participant attribution may not identify the ordering clinician in every instance, attributing each MRI to the ASM participant with the highest number of qualifying encounters provides a consistent claims-based approach that more closely aligns accountability with the ASM participant who had the strongest treatment relationship during the lookback period. We believe this approach is preferable to multiple attribution because it avoids holding several ASM participants accountable for the same imaging event while preserving a practicable methodology for the measure.

Comment: A commenter recommended using episode-based cost measures triggered by discrete clinical events, such as surgery, injection, or initiation of specialist care, rather than the proposed MRI measure. The commenter believed this approach would better align ASM participant accountability with services and costs within the clinician's control.

Response: We appreciate the commenter's suggestion. ASM already assesses broader resource use through the low back pain episode-based cost measure, while the MRI quality measure serves a distinct purpose by assessing potentially unnecessary imaging and whether appropriate antecedent care occurred before MRI. We therefore believe the MRI measure provides complementary information and are not adopting the suggested alternative.

After consideration of public comments, we are finalizing the alternative proposal to use a single-participant attribution methodology, under which each MRI will be attributed to the ASM participant with the highest number of qualifying encounters during the applicable lookback period.

(iv) Minimum Case Count

We evaluated the appropriate minimum case count threshold for the MRI Lumbar Spine for Low Back Pain (modified for ASM) measure to ensure that clinician—level performance scores are reliable for use in the model's quality assessment framework. Low case volumes may produce substantial variation in provider scores and a wider distribution of results, which could reduce the measure's ability to distinguish true performance differences. At lower thresholds, such as one or 10 cases, our analysis found that many ASM low back pain participants would have insufficient volume to support stable estimates, and reliability decreased accordingly. At a threshold of 20 cases, the measure showed stronger reliability and a narrower distribution of scores across ASM participants, indicating that estimates were more consistent and reflective of meaningful patterns of imaging use. The threshold of 20 cases aligns with the ASM participant eligibility criteria that, in part, requires an ASM low back pain participant to have historically been attributed at least 20 low back pain EBCM episodes. The threshold of 20 cases also aligns with the case minimums for the other quality measures in the ASM low back pain quality measure set. This alignment ensures that the case count threshold is both operationally feasible and representative of the expected care volume for ASM participants. In addition, maintaining a minimum of 20 cases reduces the influence of isolated or atypical events that may disproportionately affect results when volumes are low. The analysis further showed that a substantial proportion of ASM low back pain participants would continue to meet eligibility for scoring at this case threshold, preserving the ability to assess quality performance across a broad ASM participant population. We believe that maintaining a minimum of 20 cases appropriately balances inclusiveness and methodological rigor. For these reasons, we proposed a threshold of 20 cases for the MRI Lumbar Spine for Low Back Pain (modified for ASM) measure.

We also considered an alternative minimum case count of 10 for the MRI Lumbar Spine for Low Back Pain (modified for ASM) measure. A threshold of 10 would allow a greater number of ASM low back pain participants to be scored on the measure, particularly those with smaller patient panels or lower annual imaging volume. Although reliability is lower at this threshold relative to a minimum of 20 cases, a 10—case minimum would offer meaningful insight into specialist practice patterns while expanding the proportion of ASM low back pain participants scored on the measure.

We sought comment on the proposed minimum case count of 20. We also sought comment on the alternate proposal of a minimum case count of 10.

We received public comments on these proposals. The following is a summary of the comments we received and our responses.

Comment: A few commenters supported the proposed 20-case minimum, stating that it appropriately aligns with other ASM case minimums and provides greater reliability than the alternative 10-case threshold.

Response: We appreciate commenters' support. As discussed later in this section of this final rule, we believe the 20-case minimum appropriately balances measure reliability with the number of ASM participants eligible to be scored on the measure.

Comment: A few commenters expressed concern that a 20-case minimum may be too low to support sufficiently reliable ASM participant-level results, noting that individual cases could have a meaningful effect on performance rates and that the prior OP–8 measure used higher minimum case counts at the hospital level. Commenters also opposed the alternative 10-case minimum because lower volumes could increase score volatility.

Response: We appreciate commenters' concerns regarding reliability at lower case volumes. Our testing of the modified measure at the ASM participant level found that a 20-case minimum produced stronger reliability and more stable estimates than lower thresholds, while also aligning with ASM low back pain eligibility criteria and the case minimums used for other ASM low back pain quality measures. The OP–8 hospital thresholds are not directly comparable because that measure assessed performance at the facility level under different specifications. For ASM, we specifically tested the modified measure at the individual ASM participant level and use a 24-month performance period to increase case volume and stability. We therefore believe the 20-case minimum appropriately balances reliability with the number of ASM participants eligible to be scored on the measure and are not adopting the 10-case alternative.

After consideration of public comments, we are finalizing as proposed the 20-case minimum for the Magnetic Resonance Imaging (MRI) Lumbar Spine for Low Back Pain (modified for ASM) measure.

(v) Lookback Period

We evaluated the attribution lookback period to determine the timeframe during which clinician services should be considered for assigning each lumbar spine MRI to ASM low back pain participants. The measure needs a lookback period long enough to capture clinical encounters that inform decisions about imaging, while still maintaining a clear and comprehensive lookback approach. Chronic low back pain is managed over extended periods, and patients frequently receive evaluation and treatment, and require care coordination from multiple clinicians during this time. Based on these care patterns, we examined whether a longer window would more accurately identify the set of clinicians who meaningfully influence imaging decisions. Testing demonstrated that a 365-day lookback period compared to a shorter window like 90-days substantially increased the number of attributed MRI studies by approximately 27 percent. We believe a 365-day period better reflects the longitudinal nature of chronic low back pain management and ensures that attribution captures the full course of care that precedes a patient's imaging event. A full-year window also aligns with the model's annual ASM performance year and improves consistency across the various quality

measures included in the model. We believe that adopting a 365-day lookback window strengthens the completeness of performance assessment by ensuring that clinicians who contribute meaningfully to care are appropriately included. For these reasons, we proposed to use a 365-day lookback period for attribution of MRI studies within the measure.

We also considered an alternative 120-day lookback period. This approach would limit attribution to ASM low back pain participants who furnished lower back pain-related services in closer proximity to the imaging event and, therefore, would provide a more focused reflection of recent clinical decision-making. However, it would also result in fewer cases per ASM participant, which could create a narrower view of the ASM participant's trends related to MRI referral and low back pain.

We sought comment on the proposed 365-day lookback period and the alternative of a 120-day lookback period.

We received public comments on these proposals. The following is a summary of the comments we received and our responses.

Comment: Other commenters supported a longer lookback period for the MRI measure, with a commenter noting that a 365-day period would be acceptable if the attribution methodology accurately identifies the accountable ASM participant.

Response: We appreciate commenters' support. We believe the 365-day lookback appropriately reflects the longitudinal nature of low back pain care, and our decision to finalize single-participant attribution further narrows accountability to one ASM participant.

Comment: A few commenters raised concerns that the proposed 365-day lookback period could attribute an MRI to an ASM participant whose involvement in the beneficiary's care occurred well before the imaging decision. Some commenters supported the 120-day alternative or another shorter period that would more closely reflect recent clinical decision-making, while others stated that even 120 days may be too long. Commenters also questioned whether the additional cases captured by the 365-day period sufficiently reflect care that ASM participants could meaningfully influence.

Response: We appreciate commenters' concerns. We continue to believe a 365-day lookback period appropriately reflects the longitudinal nature of chronic low back pain management and captures antecedent care that may occur over an extended period before imaging. Our testing showed that the 365-day period increased attributed MRI studies by approximately 27 percent compared with a 90-day period, supporting a more complete and reliable assessment of imaging patterns. The lookback period is not intended to establish that every prior encounter directly caused the imaging decision, but rather to identify the relevant course of low back pain care preceding the MRI. In addition, our decision to finalize single-participant attribution will narrow accountability relative to the proposed multiple-participant approach by attributing each MRI to only one ASM participant.

After consideration of public comments, we are finalizing the proposed 365-day lookback period.

After consideration of public comments, we are finalizing the inclusion of the Magnetic Resonance Imaging (MRI) Lumbar Spine for Low Back Pain (modified for ASM) measure in the ASM low back pain quality measure set at § 512.725(c)(5), with the measure specifications described earlier in this section of this final rule, including a modification to use the alternative single-participant attribution methodology rather than the proposed multiple-participant attribution methodology.

(b) Removing Functional Status Change for Patients With Low Back Impairments (MIPS Q220) and Adding Functional Outcome Assessment (MIPS Q182)

In the CY 2026 PFS final rule (90 FR 49620 through 49622), we finalized inclusion of Functional Status Change for Patients with Low Back Impairments (MIPS Q220) in the ASM low back pain quality measure set because it captures functional outcomes that are directly relevant to patients' experience of low back pain and their ability to perform daily activities. We noted that the measure aligns with the model's emphasis on patient-centered outcomes and longitudinal management and complements the broader set of prevention and utilization—focused measures included in the ASM low back pain quality measure set.

Since publication of the CY 2026 PFS final rule, the measure steward has indicated that they no longer intend to maintain Functional Status Change for Patients with Low Back Impairments (MIPS Q220), including key operational components such as the survey's online portal. Consistent with this change, we are removing this measure from the MIPS measure inventory.

Accordingly, we proposed at § 512.725(c)(4) to remove the Functional Status Change for Patients with Low Back Impairments (MIPS Q220) from the ASM low back pain quality measure set and replace it with Functional Outcome Assessment (MIPS Q182). This proposal would address the absence of the MIPS 220 measure by replacing one measure of functional status with another.

We believe that Functional Outcome Assessment (MIPS Q182) represents an appropriate replacement as it meets similar goals as MIPS Q220 and may be familiar to many ASM low back pain participants. However, we noted that we intended to pursue the potential future adoption of a more robust patient-reported outcome-based performance measure (PRO–PM) to further emphasize the importance of functional status improvement within ASM. Such a change to the ASM low back pain quality measure set would be proposed via future notice—and—comment rulemaking.

Functional Outcome Assessment (MIPS Q182) promotes the routine assessment of functional status and requires clinicians to document a care plan when functional outcome deficiencies are identified. As such, the measure supports a more patient—centered approach to care by encouraging ASM participants to incorporate patients' reported experiences and functional status assessments and limitations into clinical decision—making. The measure leverages patient—reported outcome tools and surveys to facilitate meaningful communication between clinicians and their patients regarding symptoms, daily functioning, and treatment goals; as a result, identified concerns can be addressed as part of the evaluation and management of the patient.

We believe that systematic measurement and improvement of functional status can increase patient self—efficacy, improve overall well—being, and potentially reduce downstream healthcare utilization and costs. Additionally, the use of validated and standardized assessment tools may enhance the reliability and sensitivity of detecting functional impairments and monitoring changes over time, particularly among older adults with low back pain.[193]

Although Functional Outcome Assessment (MIPS Q182) does not require the use of a specific instrument, examples of appropriate, validated tools relevant to the ASM low back pain cohort include the Modified Oswestry

[193] Wong AY, Karppinen J, Samartzis D. Low back pain in older adults: risk factors, management options and future directions. *Scoliosis and Spinal Disorders.* 2017;12(1):1–23. doi: *https://doi.org/10.1186/s13013-017-0121-3.*

Disability Index and the Patient—Reported Outcomes Measurement Information System (PROMIS). The use of such tools is supported by clinical guidelines and professional organizations. For example, the American Academy of Orthopedic Surgeons recommends the Modified Oswestry Disability Index as a preferred instrument for assessing functional outcomes in spine care.[194] [195] These functional status instruments may also capture information related to modifiable risk factors, such as physical activity levels and social isolation, which can inform clinical discussions and interventions aimed at preventing the progression of low back pain and associated comorbid conditions.

This proposal also responded to interested parties' feedback regarding operational concerns with Functional Status Change for Patients with Low Back Impairments (MIPS Q220). In addition, Functional Outcome Assessment (MIPS Q182) aligns with the Quality Payment Program's Rehabilitative Support for Musculoskeletal Care MIPS Value Pathway (MVP), further supporting its inclusion in the ASM. We also note that Functional Outcome Assessment (MIPS Q182) has a MIPS CQM collection type, the same collection type as the Functional Status Change for Patients with Low Back Impairments (MIPS Q220).

By embedding accountability for assessing and addressing functional status into the ASM quality measure set for ASM participants who treat low back pain, this measure supports a comprehensive, longitudinal approach to low back pain management, including appropriate evaluation, treatment planning, and ongoing monitoring of patient outcomes.

We sought comment on our proposal at § 512.725(c)(4) to remove the Functional Status Change for Patients with Low Back Impairments (MIPS Q220) from the ASM low back pain quality measure set and replace it with Functional Outcome Assessment (MIPS Q182).

We received public comments on these proposals. The following is a summary of the comments we received and our responses.

[194] North American Spine Society. Clinical Guidelines for Multidisciplinary Spine Care: Diagnosis and Treatment of Low Back Pain. North American Spine Society; 2020.

[195] Performance Measures by Orthopaedic Subspecialty. Aaos.org. Published 2025. Accessed April 23, 2025. *https://www.aaos.org/quality/research-resources/patient-reported-outcome-measures/performance-measures-by-orthopaedic-subspecialty*.

Comment: Several commenters supported CMS' proposal to replace Functional Status Change for Patients with Low Back Impairments (MIPS Q220) with Functional Outcome Assessment (MIPS Q182). Commenters supported maintaining a functional status measure in the low back pain quality measure set and noted the flexibility to use different validated assessment instruments.

Response: We appreciate commenters' support. We agree that Functional Outcome Assessment (MIPS Q182) provides an appropriate way to maintain a focus on functional status while allowing flexibility in the assessment instrument used.

Comment: A few commenters supported CMS' proposal to remove Functional Status Change for Patients with Low Back Impairments (MIPS Q220), recognizing that the measure steward no longer intends to maintain the measure.

Response: We appreciate commenters' support. As discussed in the proposed rule, the measure steward no longer intends to maintain Functional Status Change for Patients with Low Back Impairments (MIPS Q220), including key operational components needed to support continued use of the measure. We therefore believe removal of the measure from the ASM low back pain quality measure set is appropriate.

Comment: Other commenters supported removal of Functional Status Change for Patients with Low Back Impairments (MIPS Q220) but opposed replacing it with Functional Outcome Assessment (MIPS Q182).

Response: We appreciate commenters' support for removing MIPS Q220 and recognize their concerns regarding the proposed replacement. Given the measure steward's decision to discontinue MIPS Q220, we believe it is important to maintain a functional status component within the ASM low back pain quality measure set rather than leave this aspect of care unmeasured. Functional Outcome Assessment (MIPS Q182) is currently the most appropriate available replacement because it supports routine assessment of functional status and development of a care plan when deficiencies are identified. While we may pursue more robust outcome-based measurement in the future, we believe MIPS Q182 provides an appropriate step toward maintaining a focus on functional status in ASM.

Comment: Several commenters raised concerns that Functional Outcome Assessment (MIPS Q182) is available only as a MIPS CQM and not as an eCQM, which could require some practices to establish new registry, vendor, or reporting workflows.

Response: We recognize commenters' concerns regarding the MIPS CQM collection type. Functional Status Change for Patients with Low Back Impairments (MIPS Q220), which was previously finalized for ASM, was also available as a MIPS CQM, so ASM participants have had notice that reporting a functional status measure in the ASM low back pain cohort may require MIPS CQM reporting capabilities. We recognize that replacing the measure may still require updates to existing workflows and systems, and we expect ASM participants and their reporting partners will use the implementation period before reporting is due to make necessary adjustments. We also intend to provide additional implementation information to support that transition in advance of model start.

Comment: Several commenters questioned the clinical value of Functional Outcome Assessment (MIPS Q182), noting that it is a broadly applicable process measure rather than a low back pain-specific outcome measure. Commenters also raised concerns regarding high MIPS performance rates, documentation burden, frequency of assessment, and potential patient survey fatigue.

Response: We recognize these concerns but believe Functional Outcome Assessment (MIPS Q182) is the most appropriate currently available option for maintaining functional status measurement within the ASM low back pain quality measure set. The measure advances ASM participants toward greater consideration of functional status by encouraging clinicians to assess functional limitations and incorporate identified deficiencies into the patient's care plan, while allowing flexibility in the standardized assessment instrument used. Although the measure has demonstrated high performance in MIPS, we do not expect MIPS performance distributions to necessarily translate directly to ASM because ASM requires ASM participants to report all applicable ASM cohort measures rather than allowing clinicians to select among measures. We also recognize concerns regarding physician and patient burden; however, we believe routine discussion of functional status and incorporation of identified needs into treatment planning are important components of high-quality low back pain care and can support a more patient-centered care plan.

Comment: A few commenters recommended using a more condition-specific functional improvement measure or PRO–PM instead of

Functional Outcome Assessment (MIPS Q182), or delaying replacement of MIPS Q220 until such a measure is available.

Response: We appreciate commenters' recommendations and agree that more robust condition-specific outcome measurement could further advance the goals of ASM. However, the currently available options suitable for immediate inclusion in ASM are limited, and we do not believe leaving functional status unmeasured while a future measure is developed is preferable. Functional Outcome Assessment (MIPS Q182) provides a flexible interim approach because it does not prescribe a single assessment instrument and allows ASM participants to select an appropriate validated tool for their practice and patient population. We believe this flexibility facilitates implementation while moving ASM toward greater emphasis on functional outcomes, and we intend to continue exploring more robust PRO–PMs for future rulemaking.

Comment: A commenter requested additional guidance regarding acceptable functional assessment instruments, timing and documentation requirements, care-plan expectations, and use of existing PRO collection platforms.

Response: We appreciate the commenter's request for additional implementation guidance. The measure specifications for Functional Outcome Assessment (MIPS Q182) describe the applicable assessment and care-plan requirements and allow use of multiple validated functional assessment instruments, rather than prescribing a single survey or tool. This flexibility is intended to allow practices to use approaches that fit their existing workflows, practice goals, and minimize unnecessary burden. We intend to provide additional measure guidance in advance of the start of the model to support ASM participant implementation. After consideration of public comments, we are finalizing as proposed our policy at § 512.725(c)(4) to remove Functional Status Change for Patients with Low Back Impairments (MIPS Q220) from the ASM low back pain quality measure set and finalizing as proposed to replace it with Functional Outcome Assessment (MIPS Q182).

(3) Data Completeness Requirement for the Quality ASM Performance Category

As discussed in the CY 2026 PFS final rule (90 FR 49631), we finalized policies to establish a data completeness requirement for applicable quality measures in the quality ASM performance category. Under this requirement, ASM participants reporting MIPS clinical quality measures (MIPS CQMs) or eCQMs would be required to submit data for at least 75 percent of patients who meet the denominator criteria for each measure, regardless of payer.

The regulatory text at § 512.725(f)(3) describing the data completeness requirement includes a non-substantive typographical error of a misplaced possessive ''s'' on ''ASM''.

We proposed at § 512.725(f)(3) to correct this typographical error so that it would read: ''CMS excludes from an ASM participant's total measure achievement points and total available measure achievement points any measure required under paragraph (b) or (c) of this section that meets the respective measure's data completeness requirement but does not have a benchmark.'' We believe this correction clarifies the regulatory text without substantively changing the policy under existing provisions.

We sought comment on our proposal to modify § 512.725(f)(3) to correct this typographical error.

We did not receive public comments on this provision, and therefore, we are finalizing as proposed.

(4) Scoring and Benchmarks for Quality Measures

As discussed in the CY 2026 PFS final rule (90 FR 49634 through 49635), we finalized policies to benchmark and score ASM quality measures. We will use measure—specific benchmarks where separate benchmarks are calculated for each measure and collection type to reflect meaningful performance differences among ASM participants. Quality measure benchmarks will be derived from ASM participant data from the current or prior ASM performance years, or another CMS—determined period. We determined that separate benchmarks by collection type (for example, MIPS CQM and eCQM) are more appropriate than a single benchmark for each measure aggregated across collection types due to established scoring variation across collection types. Benchmarks will be decile—based percentile distributions, which enable consistent scoring and translate measure performance values uniformly. To score reported data against the benchmarks, ASM participants' performance on each measure will be mapped to decile ranges, with one to 10 achievement points assigned according to the decile in which the measure's reported rate falls.

In the CY 2026 PFS final rule, we explained that administrative claims—based quality measures do not require data submission (90 FR 49616) and finalized corresponding administrative claims—based quality measure scoring policies (90 FR 49630). However, we did not specify whether we would score such measures at the group (that is, TIN) or individual (that is, TIN/NPI) level.

We proposed to specify the level at which we would calculate administrative claims—based quality measures. Specifically, we proposed at § 512.725(e)(3)(i) to score all administrative claims—based quality measures at the individual (that is, TIN/NPI) level to ensure that performance assessment reflects individual ASM participant performance regardless of eligibility to report quality measures at the group (that is, TIN) level. Administrative claims—based quality measures do not require ASM participants to submit data, thereby reducing reporting burden for all ASM participants, including those that may be from a small group practice and otherwise receive flexibilities for ASM quality measures that require reporting. Scoring administrative claims-based quality measures at the individual (that is, TIN/NPI) level preserves the model's intended focus on individual specialist accountability without increasing burden.

We also proposed modifications to §§ 512.725(h)(1) and 512.725(h)(2) to clarify quality ASM performance category scoring policies applicable to quality measures reported by an ASM participant, compared to administrative claims—based quality measures calculated by us. These proposals aim to align regulatory text with the nature of quality measure collection types, distinguishing quality measures for which ASM participants actively submit data from administrative claims—based quality measures that we calculate and therefore do not require data submission.

Accordingly, we proposed to reorganize and revise regulatory text at § 512.725(h)(1)(i) to clarify the different requirements that administrative claims-based quality measures and non-administrative claims-based quality measures must meet to be scored. Specifically, we proposed to remove the phrase ''on which data is submitted'' from § 512.725(h)(1)(i), which describes how ASM participants are awarded achievement points for quality measures that meet the specified criteria, to conform with the proposed reorganization of this section of regulatory text.

We also proposed to describe all scoring requirements for non-administrative claims-based quality measures at § 512.725(h)(1)(i)(A).

Specifically, we proposed to redesignate former regulatory text § 512.725(h)(1)(i)(A) through (h)(1)(i)(C) as § 512.725(h)(1)(i)(A)(*1)* through (h)(1)(i)(A)(*3*), respectively. We then proposed to revise § 512.725(h)(1)(i)(A) to describe that quality measures other than administrative claims-based quality measures must meet the requirements described at § 512.725(h)(1)(i)(A)(*1)* through (h)(1)(i)(A)(*3*) to be scored. We also proposed to redesignate regulatory text formerly at § 512.725(h)(1)(i)(D) to § 512.725(h)(1)(i)(B) and to revise text to clarify the scoring requirements for administrative claims-based quality measures. We noted in the proposed rule that these proposed revisions do not make substantive changes to existing scoring requirements but would provide greater clarity to ASM participants on the specific requirements for quality measures to be scored.

We also proposed to clarify our provisions related to the determination of quality measure benchmarks. Specifically, we proposed to remove § 512.725(h)(2)(iii), which describes the periods we may use to calculate administrative claims-based quality measure benchmarks. We believe this paragraph is unnecessary in light of § 512.725(h)(2)(i), which sufficiently describes the periods we may use to calculate any quality benchmark, whether administrative claims-based or otherwise. To conform with this proposal, we also proposed to remove cross-references to § 512.725(h)(2)(iii) from §§ 512.725(h)(1)(i)(D) and 512.725(h)(2)(i), as well as redesignate former § 512.725(h)(2)(iv) as new § 512.725(h)(2)(iii). These proposals would allow more flexibility in determining appropriate and fair benchmarks and ensure that benchmark time periods align with the performance periods of the administrative claims-based quality measures.

We also proposed to clarify quality measure scoring when we are unable to determine a benchmark. Specifically, we proposed at § 512.725(h)(2)(iv) that we would exclude any required quality measure for which we cannot calculate a benchmark in the determination of an ASM participant's quality ASM performance category score. We would do so by removing the total measure achievement points (that is, the points calculated for the numerator of the quality ASM performance category score) and the total available measure achievement points (that is, the points calculated for the denominator of the quality ASM performance category score) from the quality ASM performance category score calculation for any quality measure that lacks a benchmark. While we state that a quality measure must have a benchmark to be scored under proposed § 512.725(h)(1)(i), we believe that this proposal clarifies the effect of a quality measure lacking a benchmark on the overall quality ASM performance category score.

We sought comment on our proposal at § 512.725(e)(3)(i) to score all administrative claims—based quality measures at the TIN/NPI level. We also sought comment on our proposed reorganization of regulatory text at § 512.725(h)(1)(i) to separately describe the scoring requirements for non-administrative claims-based quality measures and administrative claims-based quality measures. We sought comment on our proposals at § 512.725(h)(2) to clarify provisions related to the determination of quality measure benchmarks. Finally, we sought comment on our proposal at § 512.725(h)(2)(iv) describing how we would account for quality measures without benchmarks in the quality ASM performance category score calculation.

We received public comments on these proposals. The following is a summary of the comments we received and our responses.

Comment: A commenter supported CMS' proposal to score administrative claims-based quality measures at the individual TIN/NPI level and to separately describe scoring requirements for administrative claims-based and other quality measures.

Response: We appreciate the commenter's support. We believe these policies appropriately preserve individual specialist accountability while clarifying the scoring requirements applicable to different quality measure types.

Comment: A few commenters opposed scoring all administrative claims-based quality measures at the individual TIN/NPI level. Commenters stated that individual-level scoring may not adequately reflect team-based care, particularly for ASM participants in small practices that report other quality measures at the TIN level. Commenters recommended allowing administrative claims-based measures to be calculated at the TIN level in those circumstances.

Response: We appreciate commenters' concerns regarding team-based care. We continue to believe that scoring administrative claims-based quality measures at the individual TIN/NPI level appropriately preserves ASM's focus on individual specialist accountability, including for ASM participants that report other quality measures at the TIN level. At the same time, care furnished by the broader care team may still influence the beneficiary outcomes and utilization reflected in an individual ASM participant's administrative claims-based measure performance, and group-level reporting of other applicable quality measures can further reflect team-based performance. Because these measures are calculated by CMS using claims data, individual-level scoring also does not create additional data submission burden for ASM participants.

Comment: A few commenters supported CMS' proposal to exclude a required quality measure from scoring when CMS cannot establish an applicable benchmark. Commenters stated that ASM participants should not be disadvantaged by measures that cannot be validly benchmarked and emphasized the importance of accurate performance assessment.

Response: We appreciate commenters' support. We agree that ASM participants should not be scored on a required quality measure when an applicable benchmark cannot be established. Excluding such a measure from both total achievement points and total available measure achievement points helps ensure that the quality ASM performance category score reflects only measures that can be meaningfully benchmarked.

Comment: A few commenters recommended that quality measure benchmarks be based on prior-year performance rather than current-year ASM performance. Commenters expressed concern that current-year benchmarks would prevent ASM participants from knowing performance expectations in advance and could result in lower scores despite improvements in performance. A commenter specifically recommended using prior-year MIPS performance to establish benchmarks during the initial ASM performance year.

Response: We appreciate commenters' concerns regarding benchmark predictability. We continue to believe it is important to retain flexibility to establish benchmarks. Current-year ASM data may provide the most representative comparison because they reflect the actual ASM participant population, applicable measure specifications, and collection types, whereas prior-year MIPS data may reflect different reporting populations and reporting choices. This flexibility is particularly important in the early years of ASM and for new or modified measures where comparable prior-year data may be limited. Accordingly, we are not limiting quality measure

benchmarks solely to prior-year performance data.

After consideration of public comments, we are finalizing as proposed our policies at § 512.725(e)(3)(i) to score all administrative claims-based quality measures at the individual TIN/NPI level. We are also finalizing as proposed the revisions at § 512.725(h)(1)(i) to clarify the scoring requirements applicable to administrative claims-based and non-administrative claims-based quality measures, and the revisions at § 512.725(h)(2) related to the determination of quality measure benchmarks. Finally, we are finalizing as proposed § 512.725(h)(2)(iv), under which a required quality measure for which we cannot calculate a benchmark will be excluded from both total measure achievement points and total available measure achievement points in calculating the quality ASM performance category score.

(5) Voluntary Data Submission for the Development of Patient-Reported Outcome-Based Performance Measures (PRO–PMs)

As discussed in the CY 2026 PFS final rule (90 FR 49612), we are considering future adoption of one or more patient-reported outcome-based performance measures (PRO–PMs) in ASM that would evaluate changes in patient-reported health status, physical function, symptoms, aggregate patient-reported health status, or other related outcomes over time. Unlike a functional status process measure that assesses whether a functional status assessment or other patient-reported assessment was completed, a PRO–PM would collect information directly from patients to assess whether the care furnished by an ASM participant is associated with improvement in, or slowing of decline in, ASM beneficiary-reported outcomes. We believe such measures could better capture outcomes that matter to ASM beneficiaries and support more patient-centered specialty care. Standardized assessment of patient-reported health status using a validated questionnaire can be useful for providing incremental information related to patient functional status and prognosis. It is also an independent predictor of hospitalization and mortality.[196] PRO–PMs may also encourage ASM participants to incorporate the patient voice and lived experience into clinical decision-making, treatment planning, longitudinal monitoring, and shared decision-making. At this time, we are considering the development of PRO–PMs specific to each ASM targeted chronic condition.

We are interested in using the Patient-Reported Outcomes Measurement Information System (PROMIS) as the basis for a PRO–PM as it is a set of standardized, validated patient-reported outcome instruments that can be used to assess domains such as physical function, symptoms, pain interference, mental health, social health, and quality of life.[197] We believe PROMIS would allow for a standardized measurement framework across ASM participants, ASM targeted chronic conditions, and care settings. Unlike other patient-reported outcome (PRO) instruments that exclusively focus on a particular clinical population, PROMIS includes domains relevant across chronic conditions and can be administered through flexible formats, including short forms and computer adaptive tests. It also has condition-specific profiles, like PROMIS+HF, that is relevant to ASM.[198] Finally, other Innovation Center models either use or plan to use PROMIS, such as the Advancing Chronic Care with Effective, Scalable Solutions (ACCESS) Model.[199] We also note that PROMIS is already a permitted standardized tool to satisfy the Functional Status Assessments for Heart Failure measure (MIPS Q377) in the ASM heart failure cohort quality measure set and the Functional Outcome Assessment measure (MIPS Q182) in the ASM low back pain cohort quality measure set.

We recognize that some ASM participants may currently use different patient-reported assessment instruments. To the extent scientifically appropriate, existing crosswalks or linking methods may help inform transitions from other instruments to PROMIS. For example, PROsetta Stone provides methods for linking PROMIS scores with other patient-reported outcome measures (PROMs) that assess similar concepts, which may support comparability across instruments.[200] This could provide flexibility for ASM participants using other instruments while preserving the standardized measurement framework that would be important for PRO–PM development.

While we were prioritizing PROMIS data collection, we were also interested in collecting data from other PRO instruments where appropriate to support evaluation and validation of PROM-to-PROM crosswalks that may facilitate future PRO–PM implementation.

We believed providing an opportunity for voluntary data submission would be an important step toward developing meaningful, patient-centered outcome measures for ASM. Incentivizing early submission of PROMIS and, potentially, other PRO data would help us determine whether future PRO–PMs are feasible and appropriate to be proposed for inclusion in the model through notice-and-comment rulemaking. This voluntary data submission approach would have also provide ASM participants an opportunity to build PRO data collection infrastructure before any future PRO–PM would be proposed as a quality measure used in evaluating performance under ASM.

(a) Quality ASM Performance Category Scoring Incentive for Voluntary Patient-Reported Outcome (PRO) Data

To support the development of PRO–PMs under ASM, we proposed to establish a voluntary data submission opportunity and scoring incentive for ASM participants to report PRO data, including data collected using PROMIS instruments and, as applicable, other CMS-specified PRO instruments. The goal of this data submission was to support the development, testing, and potential future inclusion of PRO–PMs in ASM's quality measure sets. Since ASM currently does not require ASM participants to submit PROMIS or other PRO data for measure development purposes, we recognize that there may be insufficient incentives for ASM participants to voluntarily collect and submit such data. We believed establishing an appropriate incentive for voluntary data submission by ASM participants would support efforts to collect the data needed to inform PRO–PM development and whether any developed PRO–PM would be feasible for inclusion in an ASM cohort's quality measure set during the ASM test period. We believed this proposal is consistent with the Innovation Center's authority under section 1115A of the Act to test

innovative payment and service delivery models that improve the quality and coordination of care, including approaches that support development and assessment of patient-centered quality measurement and beneficiary-reported outcomes.

Specifically, we proposed at § 512.725(i) to create a quality ASM performance category scoring incentive by adding 5 points to an ASM participant's quality ASM performance category score for an applicable ASM performance year if the ASM participant submits beneficiary-level PRO data that meets criteria established by CMS, provided such additional points would not cause the ASM participant's score to exceed the maximum quality ASM performance category score otherwise available under the model. We refer readers to section III.D.2.f.(4) of the proposed rule where we proposed to notify an ASM participant if they meet the data submission requirements to receive the quality ASM performance category scoring incentive through their annual ASM performance report.

We believed that this scoring incentive approach would recognize the additional effort required to collect and submit PRO data and would avoid disadvantaging ASM participants not yet prepared to voluntarily collect and submit PRO data. The proposed 5-point scoring incentive added to the quality ASM performance category score represents half of the maximum quality measure achievement points for a single quality measure. We believed this amount appropriately incentivizes voluntary data submission by offering an increase to the quality ASM performance category score without equaling the maximum achievement points that can be earned through performance on quality measures. We believed such an approach would preserve the integrity and importance of the existing quality measure set required of each ASM participant. We further believed that structuring the scoring incentive so that an ASM participant's total quality ASM performance category score cannot exceed the category's maximum score would preserve the integrity and fairness of performance comparisons while encouraging voluntary data submission.

Eligibility for the scoring incentive for voluntary data submission would have been limited to the ASM cohorts for the ASM performance years in which we are actively developing a PRO–PM. For example, if we had establish a voluntary heart failure PRO data submission opportunity in the 2027 ASM performance year, only ASM heart failure participants would have been eligible to receive the 5-point scoring incentive for the 2027 ASM performance year and ASM low back pain participants would not have been eligible for the scoring incentive for that year.

We clarify that we did not propose at this time to (1) adopt a new PRO–PM in the quality measure for either ASM cohort, (2) evaluate ASM participants on PROMIS performance, or (3) require ASM participants to collect or submit PROMIS or other PRO data. Rather, this proposal was intended to support voluntary data collection to support our evaluation of the feasibility, reliability, validity, and appropriateness of one or more future PROMIS-based or other PRO-based PRO–PMs before any such measure would be proposed for inclusion in an ASM cohort's quality measure set, which we proposed through future notice-and-comment rulemaking.

We considered an alternative approach under which ASM participants could receive a higher number of additional points as this could provide greater incentive to voluntarily submit sufficient data for measure development purposes. We did not propose a higher number of additional points because it could reduce the distinction between the measure achievement points available for existing performance-based quality measures and the voluntary submission of PRO data for measure development purposes. Conversely, we did not propose a lower number of additional points to the quality ASM performance category score because we believed this may not provide a sufficient incentive to encourage meaningful participation in voluntary data submission.

We also considered an alternative approach to award 10 points, the maximum quality measure achievement score, for the existing PROM-related process measure for ASM participants who successfully: (1) submit a required PROM-related process measure included in the quality ASM performance category measure set and (2) voluntarily submit the CMS-specified PRO data for an applicable ASM performance year. For example, under this alternative, an ASM heart failure participant who successfully reports the Functional Status Assessments for Heart Failure measure (MIPS Q377) and voluntarily submits the CMS-specified PRO data would have automatically received 10 measure achievement points for the Functional Status Assessments for Heart Failure measure regardless of actual performance as assessed against the applicable benchmark. For the same reasons noted earlier in this section of this final rule regarding our intent to draw distinction between performance-based quality measurement and data submission, we did not propose this alternative. Additionally, we believed this approach would not provide meaningful incremental incentives for some ASM participants because those ASM participants who successfully collect and voluntarily submit the required PRO data may already be likely to perform well on the associated PROM-related process measure.

We also considered establishing a tiered incentive structure under which the number of additional points awarded to the quality ASM performance category score would have been scaled based on the quantity, completeness, representativeness, or other related characteristics of the voluntarily submitted PRO data. For example, ASM participants that submit data for a larger number of ASM beneficiaries, achieve higher response or follow-up completion rates, or submit additional data elements that could support measure development and testing would have received a larger scoring incentive than ASM participants that meet the minimum data submission requirements. We did not propose this alternative because our goal was that all voluntarily submitted data intended for measure development should meet the minimum requirements necessary to support reliable and scientifically sound measure development and testing. We were concerned that a tiered approach could create an incentive that prioritizes submission volume over data quality or could imply that data meeting the minimum submission requirements is less valuable for measure development purposes. Therefore, we believed a single incentive tied to successful completion of all required data submission requirements was a more appropriate approach.

We also considered whether to encourage voluntary PRO data submission through non-scoring mechanisms, such as providing ASM participants with enhanced feedback reports, analytic tools, educational resources, or other related support. We recognized that such resources could be of operational value to ASM participants while supporting our development of PRO-based quality measures. However, we did not propose a non-scoring-based incentive as we did not believed this would, by itself, provide sufficient incentive to encourage broad voluntary participation in PRO data collection and submission activities. While we may consider providing operational support or

resources in the future, we believed a direct scoring incentive is more likely to generate the quantity and quality of data necessary to support timely PRO–PM development and testing.

We further considered another alternative whereby the maximum quality ASM performance category score would not be capped, allowing an ASM participant's quality ASM performance category score to exceed the maximum points otherwise available for the quality ASM performance category for the limited purpose of encouraging voluntary PRO data submission. For example, under this alternative, an ASM participant who earns a quality ASM performance category score of 46 points and voluntarily submits PRO data for the applicable ASM performance year would receive 51 points out of 50 points available for the final quality ASM performance category. We did not propose this alternative because it would be inconsistent with the existing quality ASM performance category scoring methodology. The quality and cost ASM performance categories were intentionally designed to have equal weight in the calculation of a final score. Allowing the quality ASM performance category score to exceed its current maximum could disrupt that balance and place disproportionate emphasis on quality scoring relative to cost performance. We believed maintaining the current maximum quality ASM performance category score preserves comparability across ASM participants and the integrity of the quality scoring framework.

Finally, we considered another alternative incentive whereby we would add additional points to the final score of an ASM participant who successfully reports the CMS-specified PRO data for the applicable ASM performance year. Under this approach, the additional points would have been added to the final score after calculation of any applicable ASM performance category scores to directly increase the ASM participant's final score. We did not propose this alternative because it would disconnect the incentive from the quality ASM performance category, where the benefits of collecting and reporting PRO data are most appropriately reflected. In addition, applying additional points directly to an ASM participant's final score could have broader effects on overall model performance and payment adjustment outcomes than intended and would be less consistent with the targeted objective of encouraging voluntary data submission to support future PRO–PM development.

We sought comment on our proposal at § 512.725(i) to provide 5 additional points to the quality ASM performance category score of an ASM participant who voluntarily submits CMS-specified PRO data and meets all data submission requirements for an applicable ASM performance year. We sought comment on all alternatives that we considered. We also invited comment on whether the proposal and alternatives would support voluntary data submission to achieve the goal of developing PRO–PMs applicable to ASM. Comments and responses regarding these topics are summarized below following the requirements for successful voluntary PRO data submission.

(b) Requirements for Successful Voluntary PRO Data Submission

Development of a valid, reliable, and feasible PRO–PM requires sufficient beneficiary-level PRO data prior to implementation and scoring of the measure. In particular, data is needed to: (1) analyze measure reliability and validity, (2) evaluate feasibility of data collection and submission, (3) measure response rates and missingness, (4) examine potential nonresponse bias, (5) identify appropriate risk adjustment variables, and (6) determine whether a measure can meaningfully and fairly distinguish performance across ASM participants within a given ASM cohort. For potential PRO–PMs, development may require that data be collected over an extended episode or longitudinal assessment period, including baseline and follow-up PRO assessments. Accordingly, early collection and submission of PRO data by ASM participants is important to support timely development and testing of PRO–PMs such that we could propose measures for future inclusion in ASM's respective quality measure sets through future notice-and-comment rulemaking.

To support PRO–PM development, we would specify the applicable PRO instrument(s), the required data that an ASM participant would need to voluntarily submit, and applicable data collection periods. Accordingly, we proposed to define the data submission requirements that an ASM participant would need to meet to ensure we receive sufficient and reliable data to develop and test PRO–PMs applicable to ASM.

Specifically, at § 512.725(i)(1), we proposed to define all data submission requirements an ASM participant would need to meet to receive the proposed scoring incentive in the quality ASM performance category for an applicable ASM performance year.

First, at § 512.725(i)(1)(i), we proposed that an ASM participant would need to submit CMS-specified baseline assessment data for at least 20 ASM beneficiaries during the first data collection period specified by us. By baseline data, we mean the initial CMS-specified PRO assessment data collected for an ASM beneficiary during the applicable data collection period that occurs before the collection of any corresponding follow-up assessment data for the beneficiary. After baseline data is collected, an ASM participant would submit CMS-specified follow-up assessment data for at least 20 ASM beneficiaries for whom they previously submitted a baseline assessment during the preceding data collection period specified by us.

Our goal in establishing minimum baseline and follow-up assessment requirements is to ensure we receive sufficient longitudinal PRO data to support development and testing of future PRO–PMs. We believed that collecting baseline assessment data initially then collecting corresponding follow-up assessment data during a subsequent data collection period would allow us to evaluate changes in beneficiary-reported outcomes over time while reducing operational burden during the initial year of data collection. The specific amount of time between a baseline and follow-up assessment would depend on the selected PRO instrument(s) and ASM targeted chronic condition, however, we anticipate that a collection period of at least 6 months between a beneficiary's baseline and follow-up assessments may be necessary to allow sufficient time to observe meaningful changes in patient-reported outcomes. We would provide specifications regarding the timing of baseline and follow-up assessments and specific data collection periods through sub-regulatory technical guidance.

Second, at § 512.725(i)(1)(ii), we proposed that an ASM participant would need to report all required data elements for the applicable PRO instrument as specified by us for the applicable data collection period. We anticipate that required data elements would include at least: (i) the PRO instrument name and version, (ii) ASM participant identification information, (iii) ASM beneficiary identification information and linkage information, (iv) assessment date, (v) baseline or follow-up assessment indicator, (vi) mode of administration, (vii) item-level responses, (viii) nonresponse and missingness indicators, (ix) raw and standardized scores, (x) score calculation method, and (xi) other data elements needed to support measure

testing and risk adjustment model testing. If testing would require use of a crosswalk, such as PROsetta, we anticipate that we would also require reporting of data elements specific to the crosswalk. The required data elements and format in which an ASM participant would need to submit the data would be specific to the selected PRO instrument(s) and would be specified by us in sub-regulatory technical guidance.

Third, at § 512.725(i)(1)(iii), we proposed that an ASM participant would need to submit data on a minimum set of risk variables for each ASM beneficiary from whom they collect PRO data. Risk adjustment is necessary to ensure that performance results under a PRO–PM reflect quality of care rather than patient complexity to avoid penalizing clinicians who may serve higher-risk beneficiary populations. Reporting a minimum set of risk variables for each ASM beneficiary receiving a PRO assessment would allow us to develop a scientifically acceptable, robust, and reliable risk model for any developed PRO–PM. The reported risk variable data would be used to conduct assessments of association between risk variables and the measured PRO to inform risk variable selection and ensure the risk model captures the most clinically and statistically relevant risk variables. Example risk variables could include but are not limited to age, race, ethnicity, socioeconomic status, clinical comorbidities, baseline clinical severity, physiological measures (for example, body mass index or blood pressure), pain history, surgical history, disease classification, medication usage, behavioral factors, functional and disability status, and other condition-specific characteristics. We believed that the risk variables would be different for each ASM targeted chronic condition for which we would develop a PRO–PM. We intend to provide the minimum risk variables applicable for the selected PRO instrument(s), including each risk variable's technical specifications, through sub-regulatory technical guidance.

Fourth, at § 512.725(i)(1)(iv), we proposed that an ASM participant must submit the PRO data for any applicable data collection period by the generally applicable data submission deadline for the applicable ASM performance year, which is March 31st, or later in the calendar year, as specified by us, following the close of the applicable ASM performance year. We recognize that, depending on the applicable PRO instrument, measure concept, and assessment interval, baseline and follow-up assessments for an ASM beneficiary may need to occur across ASM performance years to allow a sufficient interval between the initial and follow-up PRO assessments. In such cases, we would specify through technical guidance how ASM participants would submit baseline and follow-up data for data collection periods that span ASM performance years and how this would impact the availability of the scoring incentive for a given ASM performance year. We believed that aligning the voluntary PRO data submission deadline with the generally applicable data submission deadline for ASM performance category data would streamline and simplify the data submission and would provide us adequate time to confirm if the submitted PRO data meets the requirements to receive the proposed scoring incentive for the quality ASM performance category. We anticipate that the PRO data submission would occur through one or more mechanisms, such as a CMS-specified file format, registry submission, qualified clinical data registry or other intermediary, Health Level Seven Fast Healthcare Interoperability Resources (HL7 FHIR)-based submission, or another electronic submission mechanism specified by CMS. We would provide additional operational details through technical guidance, including applicable submission deadlines, data formats, validation processes, and any minimum data completeness or case minimum requirements. We also seek to preserve flexibility to align submission requirements with existing ASM participant workflows and health information technology capabilities to the extent feasible.

We recognize that in some instances ASM participants may need to correct their voluntary data submission. Accordingly, we proposed at § 512.725(i)(2) that ASM participants could correct and resubmit any PRO data corresponding with voluntary data submission by the proposed data submission deadline of March 31st in accordance with the generally applicable data submission deadline for the applicable ASM performance year, or a later date specified by CMS. Because the proposed scoring incentive would affect the quality ASM performance category score, we proposed to only accept timely submissions, corrections, or resubmissions and reject those received after the data submission deadline. We believed this approach is necessary to preserve the integrity and finality of the scoring process and payment adjustment methodology and to align voluntary PRO data submission with other ASM performance category data submission requirements. We would consider providing submission error reports or other technical feedback identifying errors, missing data elements, beneficiary linkage issues, data completeness concerns, or other issues before the applicable data submission deadline to support ASM participants.

Relatedly, we proposed at § 512.725(i)(3) that an ASM participant may seek review under ASM's timely error notice process for technical errors related to CMS' determination of whether the ASM participant met the voluntary PRO data submission requirements or correctly received the quality ASM performance category scoring incentive for the applicable ASM performance year as provided in the ASM participant's annual ASM performance report. To align with ASM's timely error notice requirements and process described at § 512.755, the ASM participant may submit a written timely error notice if they believe an error occurred in calculations due to data quality, misapplication of methodology, or other related issues that would relate to whether the ASM participant qualified for the proposed quality ASM performance category scoring incentive for the applicable ASM performance year. Examples of such errors include beneficiary linkage errors, failure to account for data timely submitted by the ASM participant, or other technical errors in our evaluation of the voluntary PRO data submission against data requirements.

We considered requiring that an ASM participant submit PRO data on more than 20 ASM beneficiaries or fewer than 20 ASM beneficiaries during each CMS-specified data collection period specified. We also considered requiring that an ASM participant submit PRO data on a minimum percentage of their ASM beneficiaries (for example, 25 to 100 percent) during the applicable data collection period. However, we believed an adequate number of ASM participants collecting and reporting PRO data on a minimum of 20 ASM beneficiaries each would provide an adequate sample size for PRO–PM development and align with the 20-case minimum for quality measures under ASM.

We also considered requiring an ASM participant to submit PRO data more frequently during an ASM performance year (for example, quarterly or biannually). Multiple data submission time points, such as quarterly or on a rolling basis rather than a single annual

submission, may offer several advantages. It would enable the selected submission mechanism (for example, data submission portal) to provide ASM participants who voluntarily submit data with timely, actionable feedback on the quality of the data submitted, flagging inaccuracies and offering opportunities for correction and resubmission before the applicable data collection period and ASM performance year ends. Iterative data collection and feedback could support a continuous improvement process, helping ASM participants identify and resolve data quality issues early. This would be particularly helpful for avoiding the scenario where a provider submits data once annually, only for that data to be found unusable at the point of determining eligibility for the quality ASM performance category scoring incentive. More frequent data submissions would likely improve the quality of data for measure development and testing. While more frequent data submission would offer several advantages, we believed that aligning the voluntary data submission deadline with the overall data submission deadline for ASM performance category data would be administratively simpler for ASM participants.

We also considered requiring ASM participants to submit both baseline and follow-up assessment data for the same ASM beneficiaries during a single ASM performance year. Under this alternative, an ASM participant would be required to collect and submit both the initial and follow-up PRO assessments within the same ASM performance year to receive the voluntary PRO data submission scoring incentive. We recognize that this approach could accelerate collection of matched assessment data and potentially expedite certain measure development and testing activities. However, we did not propose this alternative because the appropriate interval between baseline and follow-up assessments may vary depending on the selected PRO instrument, the targeted chronic condition, and the future PRO–PM concept under development. We are also concerned that requiring both assessments within a single ASM performance year could limit flexibility, increase operational burden on ASM participants, and reduce the amount of time available to observe meaningful changes in ASM beneficiary-reported outcomes.

For any data collection period following a baseline data collection period, we considered that an ASM participant would need to submit baseline assessment data for additional ASM beneficiaries that were either newly eligible for a selected instrument or had not previously been assessed using a selected instrument. This new baseline data would be in addition to the follow-up assessment data that we proposed to require. We believed that this structure could increase the amount of data available to develop a PRO–PM over time. However, we would require additional information to determine the minimum number of new baseline assessments that would be appropriate to require the ASM participant to collect during a subsequent data collection period.

We also considered whether to require additional criteria for successful voluntary PRO data submission, including submission of a denominator file of eligible ASM beneficiaries; use of a CMS-specified sampling methodology, such as consecutive, all-eligible, all-payer, or random sampling; minimum response or completion rates; minimum baseline and follow-up completion thresholds; and documentation of exclusions, where applicable, for identified ASM beneficiaries. We did not propose these additional requirements at this time because the appropriate denominator, sampling approach, response-rate threshold, completion threshold, and exclusion documentation requirements may vary based on the selected PRO instrument, ASM targeted chronic condition, data submission mechanism, and measure concept under consideration for development.

We sought comment on the proposed requirements for voluntary PRO data submission at § 512.725(i)(1) that an ASM participant would need to meet to receive the proposed quality ASM performance category scoring incentive. We also sought comment on all alternatives considered and other data submission requirements we should consider supporting PRO–PM development under ASM. Additionally, we sought comment on the appropriate timing of data submission and the scope of data elements that should be required for successful voluntary data submission, particularly data elements necessary to evaluate a PRO–PM's feasibility, reliability, and validity. We also invited comment on the specific risk variables applicable for each ASM targeted chronic condition that we should require ASM participants to report. We were particularly interested in comments on the earliest feasible timeframe for ASM participants to begin collecting and submitting PROMIS or other CMS-specified PRO data, the operational challenges ASM participants may face, and the types of technical assistance or guidance that would facilitate voluntary data submission. Finally, we sought comment on data submission mechanisms that would simplify the voluntary reporting of PRO data to support PRO–PM development under ASM.

We received public comments on these proposals. The following is a summary of the comments we received and our responses.

Comment: Many commenters supported the proposed voluntary PRO data submission opportunity and associated quality scoring incentive, stating that the approach could encourage PRO data collection and support development of future PRO–PMs.

Response: We appreciate commenters' support for voluntary PRO data collection and the proposed scoring incentive. As discussed later in this section of this final rule, although we are not finalizing the proposal at this time, we remain interested in advancing PRO–PM development for ASM.

Comment: Several commenters supported the goal of advancing voluntary patient-reported outcome (PRO) data collection and developing PRO-based measures for ASM but recommended continued testing and validation before PRO measures are used for performance accountability. Commenters generally supported maintaining a voluntary approach while additional experience with PRO collection is developed.

Response: We appreciate commenters' support for advancing patient-reported outcome measurement. Interested parties' feedback raised important considerations regarding the readiness, feasibility, and implementation of the proposed approach and gave us reason to take additional time before establishing this policy. We believe additional development will help support broad ASM participant adoption and the collection of sufficiently complete and useful data for development of a future PRO–PM. Accordingly, we are not finalizing the proposed voluntary PRO data submission opportunity or associated scoring incentive at this time. We remain interested in advancing PRO–PM development for ASM and will continue to explore opportunities to obtain information and data needed to support measure development and testing.

Comment: Several commenters raised concerns regarding the proposed 5-point scoring incentive, including whether it could disadvantage ASM participants that are unable to submit PRO data,

particularly smaller practices with fewer resources. A commenter recommended considering a direct financial incentive rather than incorporating the incentive into ASM quality scoring.

Response: We appreciate commenters' feedback regarding the proposed scoring incentive and differences in ASM participants' ability to collect and submit PRO data. These comments highlighted the importance of designing an approach that encourages broad participation without creating unintended barriers for practices with fewer resources and contributed to our decision not to finalize the proposal at this time. If we explore a similar approach in the future, we will consider commenters' recommendations regarding incentive design, practice burden, and opportunities for broad participation.

Comment: Several commenters identified operational and administrative considerations associated with voluntary PRO data collection, including EHR integration, vendor and licensing costs, submission mechanisms, baseline and follow-up assessments, and the burden of meeting minimum data submission requirements. Commenters recommended flexible reporting approaches and sufficient advance notice of technical requirements.

Response: We appreciate commenters' feedback regarding the operational requirements associated with PRO data collection. These considerations contributed to our decision to take additional time before implementing such an approach. We believe further development could help minimize implementation burden, support broader adoption, and improve the completeness and usefulness of data collected for PRO–PM development. We will consider commenters' recommendations regarding reporting flexibility, technical specifications, implementation timelines, and advance guidance as we continue this work.

Comment: Other commenters recommended that future PRO data collection support digital quality measurement, provide clarity and flexibility regarding acceptable instruments, address accessibility and survey burden, and provide timely and actionable information to clinicians and patients.

Response: We appreciate these recommendations. We agree that instrument selection, accessibility, interoperability, ASM participant and patient burden, and the usefulness of collected information are important considerations in developing an effective PRO data collection approach. We will consider this feedback as we continue to explore opportunities to support PRO–PM development for ASM.

After consideration of public comments, we are not finalizing our proposals at § 512.725(i) to establish a voluntary PRO data submission opportunity and associated quality ASM performance category scoring incentive, including the proposed requirements for successful voluntary PRO data submission. We remain interested in advancing PRO–PM development for ASM and will continue to explore opportunities to obtain information and data needed to support measure development and testing. These efforts may inform a future proposal to include a PRO–PM in an ASM quality measure set through notice-and-comment rulemaking.

e. Promoting Interoperability ASM Performance Category

(1) Background

In the CY 2026 PFS final rule, we finalized at § 512.740(b)(2) that an ASM participant must report on Promoting Interoperability objectives and measures, as specified in MIPS technical documents (90 FR 49658 through 49661). Specifically, under §§ 512.740(b)(2)(i) through (iv), we finalized inclusion of the following objectives under the Promoting Interoperability ASM performance category:

- Electronic Prescribing;
- Health Information Exchange (HIE);
- Provider to Patient Exchange; and
- Public Health and Clinical Data Exchange (90 FR 49658).

We also finalized inclusion of attestations under §§ 512.740(b)(3) and 512.740(b)(4).

In the CY 2027 PFS proposed rule, we proposed a number of changes to the Promoting Interoperability ASM performance category requirements. For the 2027 ASM performance year, we proposed to include the Electronic Prior Authorization measure as an optional and unscored measure; remove the Security Risk Analysis measure attestation requirement; remove ONC-related attestations; establish measure-level exclusions for the measures under the Public Health and Clinical Data Exchange objective; and adopt a Promoting Interoperability measure suppression policy. For the 2028 ASM performance year, we proposed that the Electronic Prior Authorization measure and the new Electronic Prior Authorization for Prescription Drugs measure would both be required under the HIE objective.

Comment: Many commenters raised concerns about the administrative burden associated with the Promoting Interoperability ASM performance category. A few commenters questioned whether the category is necessary, stating that ASM participants already have incentives to use EHRs and other health IT functionalities when such tools improve care, facilitate coordination, or reduce costs. Several commenters recommended an exemption or automatic Promoting Interoperability ASM performance category credit for any ASM participant who is listed as a provider or supplier in an MSSP ACO that qualifies as an advanced APM or who participates in a voluntary advanced APM, since such models or programs require use of certified health information technology as a condition of participation.

A commenter expressed concern that Promoting Interoperability measures and attestations in ASM would add administrative burden and expose ASM participants to payment reductions without a corresponding benefit to patients. Commenters stated that compliance would require substantial investments of time, administrative effort, and financial resources for ASM participants, particularly in small practices, including hiring consultants with specialized expertise in ASM reporting and EHR implementation.

Many commenters requested that CMS recognize special-status circumstances in ASM that would exempt certain ASM participants from Promoting Interoperability ASM performance category requirements, including for ASM participants who are in small practices, rural areas, or non-rural areas upon demonstration that a hardship exists due to the conditions of the community in which they practice. Commenters are also recommended exemptions for ASM participants who are hospital-based, ASC-based, or non-patient-facing.

Commenters generally supported the proposed first-year flexibility proposed for the Electronic Prior Authorization measure, noting support for optional, unscored treatment in 2027. Some commenters also recommended a similar phased approach to the Electronic Prior Authorization for Prescription Drugs measure, including an initial optional or bonus period before mandatory reporting.

Separately, several commenters recommended a reporting-only or penalty-free transition year of ASM requirements and financial accountability more broadly. A commenter specifically recommended designating 2027 as a reporting-only

transition year without negative payment adjustments. Commenters stated that additional preparation time would allow participants and their vendors to develop reporting infrastructure, become familiar with model requirements, and adjust IT systems, EHR templates, and clinical workflows. A commenter recommended a structured ramp-up similar to the approach taken at the inception of MIPS.

Response: We acknowledge commenters' concerns about the administrative burden of the Promoting Interoperability ASM performance category, especially in the first ASM performance year and appreciate recommendations for a phased-in approach. We continue to believe that interoperable health information supports the care coordination and patient access goals of ASM, and that interoperability remains a critical part of effective upstream chronic condition management. For these reasons, we are retaining the Promoting Interoperability ASM performance category and decline to eliminate the category at this time or adopt special-status or categorical exemptions, consistent with the rationale stated in the CY 2026 PFS final rule (90 FR 49663 through 49664).

After consideration of the comments, however, we are revising our approach to the Promoting Interoperability ASM performance category during the initial year of ASM implementation to reduce reporting burden. As detailed below, we are finalizing a transition policy for the 2027 ASM performance year where all Promoting Interoperability ASM performance category measures and attestations described in § 512.740(b) will be treated as voluntary and unscored. In the 2027 ASM performance year only, we will provide full credit for the Promoting Interoperability ASM performance category for an ASM participant who uses CEHRT as defined in § 414.1305 for a minimum of a continuous 180-day period in 2027 and reports the CEHRT ID and performance period to CMS, as specified in §§ 512.720(a)(1)(iii)(A)(*3*) and (*4*). Use of CEHRT is required under our current regulations and we would retain this requirement for the 2027 ASM performance year under this transition policy.

We believe this final policy is responsive to commenters' concerns regarding initial year administrative burden and expands upon our proposal to establish a transition policy for the Electronic Prior Authorization measure to treat this measure as optional and not scored. Under our 2027 transition policy, all measures described under § 512.740(b) will be optional and unscored for the 2027 ASM performance year.

(a) Final 2027 Performance Year ASM Transition Policy

For the 2027 ASM performance year only, we are establishing a transition year policy for the Promoting Interoperability ASM performance category that expands upon proposals to reduce reporting burden. The policy we are finalizing provides broader first-year flexibility to reporting and scoring across the Promoting Interoperability ASM performance category. We believe a uniform transition gives all ASM participants a clear set of first-year reporting requirements while they develop the capabilities needed for full reporting beginning with the 2028 ASM performance year.

Specifically, to receive a 100-point score for the Promoting Interoperability ASM performance category for the 2027 ASM performance year, ASM participants must use CEHRT A as defined at § 414.1305 for any continuous 180-day period in 2027 and submit the following information to CMS:

- The CMS EHR Certification ID (CEHRT ID) from the Certified Health IT Product List (CHPL) for the CEHRT used in accordance with § 512.720(a)(1)(iii)(A)(*3*); and
- The start and end dates of the applicable performance period as described in § 512.740(a); that is, any continuous 180-day period within calendar year 2027 in accordance with § 512.720(a)(1)(iii)(A)(*4*).

As finalized through CY 2026 rulemaking, Promoting Interoperability ASM performance category data must be submitted at the TIN level in accordance with § 512.720(a)(1)(iii)(B)

We will assign a 100-percent Promoting Interoperability ASM performance category score if an ASM participant fulfills these requirements, which were finalized in the CY 2026 PFS final rule (90 FR 49654) starting in the 2027 ASM performance year. We will assign a zero-percent category score for an ASM participant who does not submit this information. Under § 512.745(a)(1)(iv), a 100-percent category score produces no negative Promoting Interoperability adjustment to the final score; a zero-percent category score produces the maximum 10-point negative adjustment when a final score is calculated.

For the 2027 ASM performance year, an ASM participant is not required to submit numerator and denominator data, yes/no measure responses, measure exclusions, or attestations for performance measures described in § 512.740(b. This includes the e-Prescribing and Query of Prescription Drug Monitoring Program measures; Health Information Exchange reporting options; the Provider to Patient Exchange measure; the Immunization Registry Reporting and Electronic Case Reporting measures; and the Electronic Prior Authorization measure. The SAFER attestation will not be required in 2027. The Security Risk Analysis and ONC direct review and ONC–ACB surveillance attestations are also not required as we are finalizing removal of these attestations as detailed below.

These measures will be treated as voluntary and unscored. This means that an ASM participant may elect to submit measure performance data or yes/no attestation statements to us on Promoting Interoperability measures, but we will not score that data and it will not contribute to the category performance score. Because no measure is scored in 2027, measure exclusions, redistribution of points, and measure suppression policies will not affect the category score.

We emphasize that, for the 2027 ASM performance year, ASM participants must do the following to receive a 100-percent Promoting Interoperability ASM performance category score:

- Must use CEHRT as defined at § 414.1305 for the ASM performance year.
- Must report to CMS the CMS EHR Certification ID (CEHRT ID) from the Certified Health IT Product List (CHPL) and the start date and end date for the applicable performance period as set forth in § 512.740(a).
- Must submit this information at the TIN level, as required under § 512.720(a)(1)(iii)(B).

Under § 512.745(a)(1)(iv), a 100-percent category score produces no negative Promoting Interoperability adjustment to the final score; a zero-percent category score produces the maximum 10-point negative adjustment when a final score is calculated.

This transition policy is limited to the 2027 ASM performance year, as it impacts the 2029 ASM payment year payment adjustment. Beginning with the 2028 ASM performance year, the Promoting Interoperability ASM performance category requirements described in § 512.740(b) and 512.740(c) will apply.

We are adopting this transition policy in response to comments concerning the burden and operational feasibility of implementing the Promoting Interoperability requirements during the first year of ASM. Rather than establish categorical exemptions or special-status

policies that would apply only to particular ASM participants, we believe that a uniform, one-year transition policy provides a clearer and more administrable approach and affords all ASM participants the same flexibility to develop reporting capabilities. At the same time, retaining the requirement to use CEHRT and report the CMS EHR Certification ID and the applicable performance period maintains the model's emphasis on the use of CEHRT and supports ASM participants' preparation for full Promoting Interoperability reporting beginning with the 2028 ASM performance year.

We continue to believe that interoperability and the use of CEHRT are important to ASM's goals of improving care coordination, patient access to health information, and effective management of chronic conditions. The transition policy does not alter those underlying policy objectives. Rather, it modifies the reporting and scoring requirements applicable during the first ASM performance year to address implementation concerns raised by commenters while maintaining the infrastructure necessary for full implementation in subsequent years.

To implement our 2027 transition policy for the Promoting Interoperability ASM performance category, we are making the following changes to the regulatory text. At § 512.740(b), we are adding prefatory language specifying that, beginning with the 2028 ASM performance year, to earn a Promoting Interoperability ASM performance category score greater than zero, an ASM participant must be a meaningful EHR user and must meet the criteria that follow, which include reporting on Promoting Interoperability objectives and measures and fulfilling attestation requirements. Specifically, we would modify the paragraph header at § 512.740(b) to read ''Reporting for the Promoting Interoperability ASM performance category beginning in the 2028 ASM performance year.'' We are revising the header text at § 512.740(c) to specify that its scoring provisions apply beginning in the 2028 ASM performance period by modifying the text to read ''Scoring the Promoting Interoperability ASM performance category beginning in the 2028 ASM performance year.''

We are adding new § 512.740(d) to describe the transition policy for the Promoting Interoperability ASM performance category for the 2027 ASM performance year to convey the following:

- Notwithstanding paragraphs (b) and (c) of this section, for the 2027 ASM performance year, an ASM participant satisfies the reporting requirements for the Promoting Interoperability ASM performance category by using CEHRT as defined at § 414.1305 for the ASM performance year and submitting, in accordance with § 512.720(a)(1)(iii), both—

++ The CMS EHR Certification ID for the CEHRT used by the ASM participant; and

++ The start date and end date of the performance period used by the ASM participant, as described in paragraph (a) of this section, consisting of a continuous 180-day period within the calendar year.

- CMS assigns a Promoting Interoperability ASM performance category score of 100 percent to an ASM participant that satisfies paragraph (d)(1) of this section.
- Beginning with the 2028 ASM performance year, paragraphs (b) and (c) of this section apply without regard to the transition policy described in this paragraph (d).

Table B–D2 summarizes the final policy as it pertains to objectives and measures in the Promoting Interoperability ASM performance category for the 2027 ASM performance year. All listed measures are optional and unscored; measure exclusions and redistribution of points do not apply.

BILLING CODE 4169–69–P

TABLE B-D2: ASM PROMOTING INTEROPERABILITY OBJECTIVES AND MEASURES FOR THE 2027 ASM PERFORMANCE YEAR

Objectives	Measures		Available Points (based on performance)	Redistribution if exclusion is claimed
e-Prescribing	e-Prescribing		Optional, unscored	Not applicable
	Query of PDMP			
Health Information Exchange (HIE)	Select one of the following three reporting options:			
	Option 1	Support Electronic Referral Loops by Sending Health Information		
		Support Electronic Referral Loops by Receiving and Reconciling Health Information		
	Option 2	HIE Bi-Directional Exchange		
	Option 3	Enabling Exchange under TEFCA		
	Electronic Prior Authorization measure			
Provider to Patient Exchange	Provide Patients Electronic Access to Their Health Information			
Public Health and Clinical Data Exchange	Report to the following public health or clinical data registries: 1. Immunization Registry Reporting 2. Electronic Case Reporting			
	Option to report one of the following public health agency or clinical data registry measures: • Public Health Registry Reporting, • Clinical Data Registry Reporting, or • Syndromic Surveillance Reporting			

BILLING CODE 4169–69–C

(2) Update to CEHRT Definition

Under § 512.705, we define CEHRT for the purposes of ASM as technology that meets the requirements set forth in MIPS regulations at § 414.1305. We did not propose to depart from this approach. Therefore, updates finalized to the definition of CEHRT under MIPS are incorporated for purposes of ASM under the existing definition at § 512.705. We refer readers to Section IV.A.4.f.(4) of this final rule for a discussion on the definition of CEHRT under MIPS as finalized under this rule.

(3) Electronic Prior Authorization Measures in the Health Information Exchange Objective

(A) Overview

In the ''Medicare and Medicaid Programs; Patient Protection and Affordable Care Act; Advancing Interoperability and Improving Prior Authorization Processes for Medicare Advantage Organizations, Medicaid Managed Care Plans, State Medicaid Agencies, Children's Health Insurance Program (CHIP) Agencies and CHIP Managed Care Entities, Issuers of Qualified Health Plans on the Federally-Facilitated Exchanges, Merit-based Incentive Payment System (MIPS) Eligible Clinicians, and Eligible Hospitals and Critical Access Hospitals in the Medicare Promoting Interoperability Program'' final rule (89 FR 8758) (hereinafter referred to as the ''2024 CMS Interoperability and Prior Authorization final rule''), we finalized requirements for Medicare Advantage organizations, Medicaid managed care plans, State Medicaid agencies, CHIP agencies, CHIP managed care entities, and issuers of qualified health plans on the Federally-facilitated Exchanges (collectively, ''impacted payers'') to improve the electronic exchange of health care information and streamline prior authorization for medical items and services. Impacted payers must implement and maintain prior authorization application programming interface (API) technology to communicate information related to prior authorization requests (89 FR 8763). As we explained in the 2024 CMS Interoperability and Prior Authorization final rule, the efficiencies associated with payer implementation of these APIs will be more fully realized when requesting providers also use API-enabled processes to submit prior authorization requests. Accordingly, we finalized the addition of an Electronic Prior Authorization measure as a required measure for MIPS eligible clinicians under the MIPS Promoting Interoperability performance category HIE objective (89 FR 8910 through 8927).

(B) Electronic Prior Authorization Measure in the 2027 ASM Performance Year

We proposed to include the Electronic Prior Authorization measure (Measure ID # PI_HIE_7) in the Promoting Interoperability ASM performance category under the HIE objective, consistent with MIPS, starting in the 2027 ASM performance year as an optional, unscored ASM Promoting Interoperability measure, without any scoring penalty for non-reporting. We proposed to codify this measure for ASM at § 512.740(b)(2)(ii)(B) and to rely on the measure specifications used in MIPS for the Electronic Prior Authorization measure. We refer readers to section IV.A.4.f.(4) of this final rule for discussion of the technical specifications for the Electronic Prior Authorization measure under MIPS.

To report the Electronic Prior Authorization measure, an ASM participant would submit a ''yes'' response attesting they satisfactorily met the requirements of the measure. We did not propose to adopt any exclusions for this measure for the 2027 ASM performance year, since the measure was proposed as optional and attesting ''no'' or not attesting at all would not result in a scoring penalty. We also considered, but did not propose, awarding 5 bonus points to the Promoting Interoperability ASM performance category score for voluntarily attesting ''yes'' to this measure in 2027. We explained that optional reporting could encourage ASM participants to develop capabilities before required reporting begins, but that adding bonus points would introduce scoring complexity inconsistent with ASM's approach to other optional Promoting Interoperability measures. We sought comment on both the proposed optional, unscored approach and the 5-point bonus alternative (91 FR 43985 through 43986). We received comments on both approaches.

Comment: Several commenters supported including the Electronic Prior Authorization measure under the HIE objective as an optional, unscored measure for the 2027 ASM performance year. Commenters recommended CMS provide a 2027 ''grace period'' for this measure to allow ASM participants time to implement and develop the necessary workflows and infrastructure to support the measure requirements. A commenter supported voluntary reporting in 2027, but suggested CMS evaluate the measure's technical feasibility and administrative effects before requiring it in 2028.

Response: We appreciate commenters' support for providing implementation flexibility for the Electronic Prior Authorization measure during the 2027 ASM performance year.

Comment: A few commenters recommended that CMS make the Electronic Prior Authorization measure available as a bonus measure for the 2027 ASM performance year, while retaining a no penalty policy for non-reporting or failure to meet the measure. In contrast, a commenter opposed the alternative to create bonus points for reporting the Electronic Prior Authorization measure, adding it would not create an effective incentive.

Response: We appreciate comments on our alternative approach that considered creating bonus points associated with optional reporting in 2027, however we believe the addition of any bonus points would be unnecessary under the transition policy we are finalizing for the 2027 ASM performance year.

After considering public comments, we finalize our policy to adopt the Electronic Prior Authorization measure as an optional, unscored measure for the 2027 ASM performance year, with modification, at § 512.740(b)(2)(ii)(B)(1). We finalize our proposal to rely on MIPS specifications, as modified and described in Section IV.A.4.f.(4) of this final rule. We are modifying our proposed regulatory text to remove the prefatory text specifying this measure is optional and unscored in the 2027 ASM performance year, since our final policy is to treat all measures as optional and unscored in 2027 and it is not necessary to state this for the Electronic Prior Authorization measure. We are also modifying text at § 512.740(b)(2)(ii) to remove the language ''For each ASM performance year'' as this is not necessary

(C) Electronic Prior Authorization Measure Beginning With the 2028 ASM Performance Year

In the CY 2027 PFS proposed rule, we proposed several changes to the HIE objective of the Promoting Interoperability ASM performance category starting in the 2028 ASM performance year to incorporate the two measures supporting electronic prior authorization. Specifically, beginning with the 2028 ASM performance year, we proposed to require ASM participants report both the Electronic Prior Authorization measure (Measure ID # PI_HIE_7) and the Electronic Prior Authorization for Prescription Drugs measure (Measure ID # PI_HIE_8). We proposed to codify these requirements at § 512.740(b)(2)(ii)(C)(*1*) and (*2*), respectively.

For the Electronic Prior Authorization measure, which applies to medical items and services other than prescription drugs, we proposed that an ASM participant would satisfy the measure requirement by submitting a ''yes'' response or claiming an applicable exclusion. We proposed to recognize the same measure specifications and exclusions as adopted for MIPS. The measure would not contribute points to the Promoting Interoperability ASM performance category score; however, an ASM participant that submits a ''no'' response, fails to submit an attestation, or does not claim an applicable exclusion would receive a score of zero for the Promoting Interoperability ASM performance category.

Comment: A few commenters supported incorporating the Electronic Prior Authorization measure into the Promoting Interoperability ASM performance category beginning in 2028. Several commenters supported having this measure be optional and unscored before requiring it.

Response: We appreciate the commenters' support for transition policies for this measure as well as for including this measure in 2028.

Comment: Several commenters did not support making the measure an all-or-nothing Promoting Interoperability requirement upon full implementation in CY 2028.

Response: We appreciate this feedback however we continue to believe that the proposed scoring approach is appropriate as it is consistent with the scoring methodology for other required measures that require an affirmative attestation or claim of an applicable exclusion to avoid a score of zero for Promoting Interoperability. We intend to assess implementation experience, payer and health IT readiness, technological advancements, and the availability of ONC-certified health IT as the measure becomes required.

After consideration of public comments, we are finalizing our proposed policy with modification. This measure will be required starting in 2028 as proposed; however, we are relocating this provision in our regulatory text to § 512.740(b)(2)(ii)(B)(*1*) under this final rule.

(D) Electronic Prior Authorization for Prescription Drugs Measure

We proposed to require the Electronic Prior Authorization for Prescription Drugs measure beginning with the 2028

ASM performance year. The measure would apply to prescription drugs covered under a pharmacy benefit and dispensed at pharmacies. We proposed that an ASM participant would satisfy the measure by submitting a ''yes'' response attesting that the ASM participant requested electronic prior authorization using CEHRT for at least one prescription drug during the applicable performance period, or by claiming an applicable exclusion. We proposed to adopt the same measure specifications and exclusion criteria proposed for this measure under the MIPS Promoting Interoperability performance category. As with the Electronic Prior Authorization measure, the Electronic Prior Authorization for Prescription Drugs measure would not contribute points to the Promoting Interoperability ASM performance category score; however, submission of a ''no'' response, failure to submit an attestation, or failure to claim an applicable exclusion would result in a score of zero for the Promoting Interoperability ASM performance category.

ASM participants would continue to be required to satisfy one of the three existing HIE reporting options specified at § 512.740(b)(2)(ii), in addition to satisfying both electronic prior authorization measure performance requirements. We proposed an effective date starting in the 2028 ASM performance period to provide ASM participants additional time to prepare to report these measures successfully.

Comment: Several commenters opposed requiring the Electronic Prior Authorization for Prescription Drugs measure beginning in the 2028 ASM performance year, stating that additional time is needed for health technology infrastructure development, deployment, workflow integration, and payer readiness. A commenter recommended making the measure available for bonus credit in 2028 and delaying required reporting until 2029. A few commenters recommended CMS allow a year for optional, unscored reporting but without bonus points, before the measure becomes required. A commenter recommended a phased implementation approach with sufficient time for testing and evaluation before considering whether the measure should be mandatory, including consideration of whether electronic prior authorization reduces administrative burden, reduces approval times, and improves patient access.

Response: We appreciate the commenters' recommendations. We believe that delaying required reporting until the 2028 ASM performance year provides for a meaningful period of continued development, testing, and workflow integration while also supporting the aim to advance interoperable, standards-based electronic exchange. We further note that there are exclusions available, if applicable, for the Electronic Prior Authorization for Prescription Drugs measure. We therefore do not believe it is necessary to make the measure optional or available only for bonus credit in 2028.

Comment: A few commenters supported efforts to reduce administrative burden and delays in patient care associated with prescription drug prior authorization but opposed making the Electronic Prior Authorization for Prescription Drugs measure an ''all-or-nothing'' requirement for the Promoting Interoperability ASM performance category. Commenters stated that successful electronic prior authorization may depend on the capabilities of payers, pharmacy benefit managers, health IT developers, and other entities outside the ASM participant's control and expressed concern that ASM participants could receive a zero score because of those external dependencies.

Response: We appreciate commenters' concerns regarding dependencies on other entities. We recognize that successful electronic prior authorization implementation requires coordination across a continuum. We will evaluate readiness to report this measure as we progress toward the 2028 ASM performance year and make changes if necessary, in future rulemaking.

After consideration of public comments, we finalize our proposed policy with modification. Starting in the 2028 ASM performance year, an ASM participant must report on one of the three HIE options, as well as report the Electronic Prior Authorization measure, or claim an exclusion, and Electronic Prior Authorization for Prescription Drugs measure, or claim an exclusion. We are modifying the location of where we describe the final policy for the Electronic Prior Authorization for Prescription Drugs measure such that it is codified at § 512.740(b)(2)(ii)(B)(*2*).

(4) Exclusions to the Public Health and Clinical Data Exchange Objective in the Promoting Interoperability ASM Performance Category

We proposed to clarify that measure-level exclusions are available to ASM participants for the measures under the Immunization Reporting Registry and Electronic Case Reporting objective by amending our regulation at § 512.740(b)(2)(iv). Under our proposal, an ASM participant would receive full credit for the Public Health and Clinical Data Exchange objective by reporting both Public Health and Clinical Data Exchange measures (Immunization Registry Reporting and Electronic Case Reporting), reporting one measure and claiming one exclusion, or claiming two exclusions. We believe this proposal would simplify ASM participant reporting requirements by aligning exclusions available in MIPS and redistributing points for excluded measures in accordance with MIPS redistribution policies.

We proposed to adopt the same exclusions as MIPS includes for these measures for ASM. We sought comment on this proposal at § 512.740(b)(2)(iv).

We received public comments on these proposals. The following is a summary of the comments we received and our responses.

Comment: Several commenters supported aligning exclusions for Immunization Registry Reporting and Electronic Case Reporting measures with MIPS, particularly when public health agency readiness or connectivity is outside a provider's control.

Response: We appreciate support for our proposal to recognize exclusions for the Immunization Registry Reporting and Electronic Case Reporting measures under the Public Health and Clinical Data Exchange objective.

After consideration of public comments, we are finalizing our policy to establish measure-level exclusions for this objective at § 512.740(b)(2)(iv) as proposed.

(5) Security Risk Analysis Measure

The Health Insurance Portability and Accountability Act of 1996 (HIPAA), as implemented through the HIPAA Security Rule (45 CFR part 160 and subparts A and C of part 164), includes administrative safeguards required of covered entities and business associates, including a risk analysis component and a risk management component. The Security Risk Analysis measure was adopted to require that MIPS eligible clinicians attest to having conducted a security risk analysis and security risk management activities as required by the HIPAA Security Rule. In the CY 2026 PFS final rule (90 FR 49656), we incorporated this measure into the Promoting Interoperability ASM performance category by requiring that ASM participants complete the actions included in the MIPS Promoting Interoperability Security Risk Analysis measure. At the time, we believed it would help drive more secure, efficient, and meaningful use of CEHRT under ASM.

To reduce reporting burden, beginning with the 2027 ASM performance year, we proposed to remove the requirement at § 512.740(b)(3)(ii) that an ASM participant submit an affirmative attestation as to completing a security risk analysis within the calendar year. We consider the use of CEHRT to demonstrate security risk analysis and security risk management activities sufficient as it complies with requirements pertaining to the security of data created and maintained by CEHRT in accordance with the HIPAA Security Rule.

We proposed to redesignate current § 512.740(b)(3)(iii) as § 512.740(b)(3)(ii) to conform our regulations with the proposed removal of the Security Risk Analysis measure.

We received public comments on this proposal; the following is a summary of comments and our responses.

Comment: Several commenters supported removing the Security Risk Analysis attestation. A commenter noted this proposal removes duplicate processes, while emphasizing that providers continue to have broader security risk analysis and risk management obligations under the HIPAA Security Rule.

Response: We agree that removing this measure would help reduce reporting burden. After consideration of public comments, we are finalizing as proposed our policy to remove the Security Risk Analysis measure as a required attestation starting in the 2027 ASM performance year and to redesignate current § 512.740(b)(3)(iii) as § 512.740(b)(3)(ii).

(6) Supporting Providers With the Performance of CEHRT

In the CY 2026 PFS final rule (90 FR 49661), we finalized that an ASM participant must support the performance of CEHRT by submitting certain affirmative attestations to receive a Promoting Interoperability ASM performance category score greater than zero. Specifically, as finalized at §§ 512.740(b)(4)(i)(A)(1) and 512.740(b)(4)(i)(A)(2), an ASM participant must support the performance of CEHRT by:

- Providing acknowledgement of the requirement to cooperate in good faith with the Office of the National Coordinator for Health Information Technology (ONC) direct review of the ASM participant's health information technology certified under the ONC Health IT Certification Program if a request to assist in ONC direct review is received; and
- If requested, cooperate in good faith with ONC direct review of the ASM participant's health information technology certified under the ONC Health IT Certification Program as authorized by 45 CFR part 170, subpart E, to the extent that such technology meets (or can be used to meet) the definition of CEHRT, including by permitting timely access to such technology and demonstrating its capabilities as implemented and used by the ASM participant in the field.

An ASM participant may optionally attest to the following:

- The ASM participant acknowledges the option to cooperate in good faith with ONC–ACB surveillance of his or her health information technology certified under the ONC Health IT Certification Program if a request to assist in ONC–ACB surveillance is received.
- If requested, that the ASM participant cooperates in good faith with ONC–ACB surveillance of the ASM participant's health information technology certified under the ONC Health IT Certification Program as authorized by 45 CFR part 170, subpart E, to the extent that such technology meets (or can be used to meet) the definition of CEHRT, including by permitting timely access to such technology and demonstrating its capabilities as implemented and used by the ASM participant in the field.

Consistent with the proposal to remove these attestations from the MIPS Promoting Interoperability performance category, we proposed to remove the ONC Direct Review attestation and ONC–ACB Surveillance attestation from the Promoting Interoperability ASM performance category starting in the 2027 ASM performance year.

This aligns with our goals of reducing administrative burden while focusing on high-value, outcome-oriented measures. Removing attestations from the Promoting Interoperability ASM performance category reduces the number of discrete manual steps and reporting fields required for successful adherence to reporting requirements without diminishing central goals of the Promoting Interoperability ASM performance category.

We sought comment on the proposal to remove the ONC Direct Review attestation and ONC–ACB Surveillance attestation.

We received public comments on this proposal. The following is a summary of the comments we received and our responses.

Comment: A few commenters supported removing ONC Direct Review and ONC–ACB Surveillance attestations to reduce duplicative reporting burden while maintaining underlying health information technology and security obligations.

Response: We appreciate the commenters' support.

After consideration of public comments, we are finalizing our proposals to remove the measures described at §§ 512.740(b)(4)(i)(A)(*1*) and 512.740(b)(4)(i)(A)(*2*) as proposed.

(7) Adopting a Measure Suppression Policy for the Promoting Interoperability ASM Performance Category

We finalized a measure suppression policy under the MIPS Promoting Interoperability performance category beginning with the CY 2026 MIPS performance year (90 FR 49881 through 49887). Under this policy, when circumstances arise that impede effective measurement of a MIPS Promoting Interoperability measure, we may suppress the measure by excluding it from MIPS Promoting Interoperability performance category scoring or from the determination of whether a MIPS clinician is a meaningful EHR user for the applicable MIPS performance year (§ 414.1380(b)(4)(iii)).

A decision to suppress a measure does not eliminate the requirement that MIPS eligible clinicians report the measure. However, regardless of the data, attestation, or other information related to the suppressed measure that is submitted by the MIPS eligible clinician, the suppressed measure would not affect the objective's score or the determination of meaningful EHR user status (90 FR 49883).

We did not adopt a measure suppression policy for the Promoting Interoperability ASM performance category because ASM performance had not yet begun. We stated we would monitor developments as the first ASM performance year approaches, with the goal of maintaining alignment with the MIPS Promoting Interoperability performance category where possible and indicated we may propose changes in future rulemaking.

After further consideration, we proposed at § 512.740(c)(2) to adopt a Promoting Interoperability measure suppression policy within ASM starting in the 2027 ASM performance year. Specifically, we proposed that if certain circumstances occur that impact our assessment of ASM participant performance on a measure specified for the Promoting Interoperability ASM performance category under § 512.740(b), we may suppress the affected measure by: (1) excluding it from our calculation of the Promoting Interoperability ASM performance

category objective score under § 512.740(c); or (2) excluding it from the determination of meaningful EHR user status, if the affected measure is not scored. We proposed to redesignate current § 512.740(c)(2) describing the Promoting Interoperability ASM performance category scoring policy as § 512.740(c)(3), without making changes to that existing regulatory text, to describe the measure suppression policy at § 512.740(c)(2).

For an applicable ASM performance year, we proposed to determine whether circumstances warrant suppression of an ASM Promoting Interoperability measure based on consideration of the same factors we identified for MIPS (90 FR 49883):

- The nature, breadth, and duration of the circumstance's effect on ASM participants' ability to fulfill the measure requirement;
- The availability of certified health IT modules to fulfill the measure;
- Whether the circumstance affects the measure such that calculating the measure score would lead to misleading or inaccurate results, including with respect to performance or compliance;
- Out-of-date or conflicting technical standards;
- Technical or operational capacity of required partners; or
- Other factors as determined by CMS.

We further proposed that, if we determine that a measure must be suppressed, we would notify ASM participants through existing communication channels. To the extent technically feasible, we intended to notify ASM participants prior to the beginning of the applicable data submission period. We noted in the proposed rule that, like in MIPS, the duration of suppression for a measure in ASM would be for an entire ASM performance year. If prolonged issues persist regarding a given circumstance, we would assess the circumstance to determine if a measure would warrant suppression for a subsequent ASM performance year.

We believed this policy would ensure the integrity of the ASM scoring methodology while protecting ASM participants from being penalized for circumstances beyond their control.

We invited public comment on our proposal at § 512.740(c)(2) to adopt a measure suppression policy within ASM.

Comment: A few commenters supported adopting a measure suppression policy for the Promoting Interoperability ASM performance category. Commenters supported aligning the policy with the MIPS to allow measures to be suppressed or excluded from scoring when circumstances outside an ASM participant's control prevent performance or reporting.

Response: We agree with commenters that this policy would help avoid holding ASM participants responsible for circumstances beyond their control.

After consideration of the comments, we finalize the proposal to adopt a measure suppression policy at § 512.740(c)(2) as proposed.

f. Final Score

(1) Background

In the CY 2026 PFS final rule (90 FR 49664 through 49679), we adopted a scoring methodology to evaluate the annual performance of each ASM participant through a final score. The final score represents an ASM participant's aggregate performance on a scale of zero to 100 points based on applicable performance standards for measures and activities in each ASM performance category. This scoring framework promotes accountability for performance across ASM participants within each ASM cohort. We use the final score to determine the ASM payment adjustment factor applied to an ASM participant's Medicare Part B claims for covered professional services during the corresponding ASM payment year.

We calculate the final score based on performance in the quality, cost, improvement activities, and Promoting Interoperability ASM performance categories (90 FR 49677). We also established policies to award additional points to ASM participants who furnish care to complex patient populations and to ASM participants who are part of small practices or who are solo practitioners (90 FR 49670 through 49676).

(2) Requirements To Receive a Final Score

In the CY 2026 PFS final rule (90 FR 49668 through 49669), we finalized that an ASM participant must meet minimum data submission requirement to receive a final score for an ASM performance year. An ASM participant who does not meet these data submission requirements receives a final score of zero points for the applicable ASM performance year, which results in the maximum negative payment adjustment applicable for the corresponding ASM payment year. Conversely, an ASM participant who meets the minimum data submission requirements but cannot be evaluated on quality and cost performance does not receive a final score and instead receives a neutral payment adjustment for the applicable ASM payment year. We refer readers to Table B–D8 in the CY 2026 PFS final rule for a summary of ASM's final score policies and their impact on payment adjustments (90 FR 49670).

After internal review of ASM's final scoring provisions, we believe we could clarify regulatory text describing when we will not assign an ASM participant a final score. Specifically, we proposed to revise § 512.745(a)(2)(iii)(B) by striking the ''Do not receive'' language that starts §§ 512.745(a)(2)(iii)(B)(*1*) and 512.745(a)(2)(iii)(B)(*2*). We then proposed to revise § 512.745(a)(2)(iii)(B) to read ''Do not receive either:'', referring to the conditions described at §§ 512.745(a)(2)(iii)(B)(*1*) and 512.745(a)(2)(iii)(B)(*2*). These specific changes do not introduce substantive changes to current requirements.

We sought comment on the proposed changes to clarify the regulatory text at § 512.745(a)(2)(iii)(B).

We did not receive public comments on this provision, and therefore, we are finalizing the regulatory text at § 512.745(a)(2)(iii)(B) as proposed.

(3) Rural Scoring Adjustment

In the CY 2026 PFS proposed rule, we considered, but did not propose, including a rural scoring adjustment in the calculation of an ASM participant's final score (90 FR 32604), as our analysis of historic data did not reveal a systematic difference in expected performance between likely ASM participants in rural and non-rural areas. In response to our discussion considering the rural scoring adjustment in the CY 2026 PFS proposed rule, we received interested parties' feedback recommending that we award a rural scoring adjustment to ASM participants in rural areas because ASM participants in rural areas face unique demands (90 FR 49676). However, we finalized ASM's final score policy without including a rural scoring adjustment.

The CY 2026 PFS final rule did establish policies to award additional points on the final score to ASM participants who furnish care to complex patient populations (up to 10 points) and to ASM participants who are part of small practices (10 points for ASM participants in small practices, 15 points for solo practitioner ASM participants) (90 FR 49670 through 49676). In the CY 2026 PFS final rule, we noted that small practice and solo practitioner scoring adjustments better support ASM participants in small practices by compensating for increased administrative burden and additional

reporting requirements (90 FR 49676). We noted in the CY 2026 PFS final rule that we expected a high degree of overlap between ASM participants in rural areas and those in small practices based on historical MIPS performance data that we analyzed (90 FR 49677), indicating that ASM participants in rural areas would be eligible for the small practice scoring adjustment and be supported accordingly. We also noted that a rural scoring adjustment could weaken incentives for ASM participants in large rural systems to improve (90 FR 49676).

However, as supported by interested parties' comments on the CY 2026 PFS proposed rule, together with additional research and analysis, the unique circumstances facing ASM participants in rural areas may warrant adjustments to their final scores. We recognize that ASM participants in rural areas may face structural challenges that affect their ability to perform under ASM, including limited resources for technology modernization, workforce shortages that constrain reporting capacity, and barriers to system interoperability. A 2025 analysis of physician participants in the Quality Payment Program found significantly higher physician adoption of EHRs in urban areas (74 percent) compared to rural areas (64 percent).[201] Another recent study suggests that physicians in rural areas were less likely to report ideal interoperability experiences for medication notes.[202] A report from the HHS Office of the National Coordinator for Health IT (ONC) notes that urban hospitals were more likely to engage in routine interoperable exchange (47 percent were routinely interoperable) than their rural counterparts (36 percent were routinely interoperable).[203] These findings align with interested parties' feedback highlighting additional interoperability barriers faced by rural clinicians. Accordingly, as stated in the proposed rule we believe ASM's existing scoring methodology may not adequately address the complex factors that may affect rural ASM participant's performance particularly because ASM has a unique focus on incentivizing interoperability improvements to strengthen care coordination.

Additionally, our analysis of preliminary ASM participants for the 2027 ASM performance year provided an updated understanding of the practice size of ASM participants in rural areas. In previous notice-and-comment rulemaking, we noted that we expected ASM participants in rural areas were primarily practicing in small practices and, therefore, would qualify for ASM's small practice or solo practitioner scoring adjustments (90 FR 49677). An additional rural scoring adjustment, on top of small practice or solo practitioner adjustments, for these ASM participants could have been duplicative and result in a disproportionate scoring benefit. However, upon review of updated data on preliminary ASM participants for the 2027 ASM performance year, we found that ASM participants in rural areas are typically part of larger practices and would be less likely to receive the small practice scoring adjustment.

To address continued interested parties' feedback about ASM participants in rural areas and additional analysis of preliminary ASM participants for the 2027 ASM performance year, we proposed the inclusion of a rural scoring adjustment in the calculation of an ASM participant's final score. We stated that we believe adding a rural scoring adjustment would adequately increase final scores to account for the unique challenges faced by this group of ASM participants.

To determine if an ASM participant is in a rural area, we proposed at § 512.705 to adopt the same definition and determinations of a ''rural area'' as defined, interpreted, and updated at § 414.1305 under MIPS. We believe that aligning our rural area definition with MIPS will reduce confusion for ASM participants in rural areas who have previously participated in MIPS and received associated flexibilities with rural special status under MIPS.

To incorporate the rural scoring adjustment proposal into ASM's regulatory text, we first proposed to redesignate current § 512.745(a)(5) as new § 512.745(a)(6). We then proposed at new § 512.745(a)(5) to add 5 points to the final score of an ASM participant who (1) is in a rural area as proposed to be defined at § 512.705, and (2) meets the requirements to receive a final score greater than zero as described at § 512.745(a)(2)(i) for an applicable ASM performance year. We emphasize that ASM participants in rural areas remain eligible to receive ASM's small practice or solo practitioner scoring adjustment and the complex patient scoring adjustment if they meet such scoring adjustment's eligibility criteria described at § 512.745(a)(4) and § 512.745(a)(3), respectively.

We considered but did not propose an alternative rural scoring adjustment policy to add 5 points to the final score of each ASM participant who (1) is in a rural area as proposed to be defined at § 512.705, (2) meets the requirements to receive a final score greater than zero as described at § 512.745(a)(2)(i) for an applicable ASM performance year, and (3) does not receive a small practice scoring adjustment as described in § 512.745(a)(4). However, rural practices regardless of size often face thinner operating margins that limit their potential investment in the quality and technology infrastructure necessary to succeed in ASM.[204] Uneven access to affordable broadband may further burden ASM participants in rural areas by financially challenging their ability to leverage health information exchanges and data sharing.[205] We believe that a rural scoring adjustment for ASM participants in small and non-small rural practices alike most accurately accounts for the potential burdens faced by ASM participants in rural areas.

We also considered but did not propose an alternative policy waiving Improvement Activity 2 (IA–2), Establishing Communication and Collaboration Expectations with Primary Care using CCAs, for ASM participants in rural areas. Although ASM participants in rural areas may face challenges forming partnerships with primary care practices due to limited primary care availability,[206] we believe that a rural scoring adjustment more broadly accounts for challenges that could affect ASM participant performance across the four ASM performance categories compared to only waiving IA–2.

To account for the proposed addition of the rural scoring adjustment, we proposed corresponding adjustments to the final score formula at

§ 512.745(a)(6). We also proposed to revise § 512.745(a) to cross-reference the final score formula now described at § 512.745(a)(6).

We sought public comment on our proposed definition of rural area at § 512.705 and our proposal at § 512.745(a)(5) to add 5 points to the final score of an ASM participant who is in a rural area and meets the requirements to receive a final score greater than zero. We also sought comment on the alternative we considered to only add the rural scoring adjustment to the final scores of ASM participants in rural areas who are not eligible to receive a small practice scoring adjustment, as well as the alternative to waive IA–2 for ASM participants in rural areas. We sought comment on our corresponding proposal at § 512.745(a)(6) to incorporate the rural scoring adjustment into the final score formula.

We received public comments on these proposals. The following is a summary of the comments we received and our responses.

Comment: Many commenters supported the proposed 5-point rural scoring adjustment, stating that it would recognize the unique infrastructure, technology, staffing, workforce, and access challenges faced by ASM participants serving rural communities. Commenters supported allowing eligible rural ASM participants to receive the rural scoring adjustment in addition to the small practice or solo practitioner and complex patient scoring adjustments. Commenters requested clarifications regarding how the rural adjustment would interact with the small practice and solo practitioner scoring adjustments and whether the adjustments would be cumulative.

Response: We appreciate the commenters' support of the rural scoring adjustment policy and application. We refer readers to the CY 2027 proposed rule (91 FR 43990), where we propose that ASM participants who are eligible for the rural scoring adjustment are also eligible for the complex patient scoring adjustment and/or small practice scoring adjustment provided that they meet the requirements as specified in sections § 512.745(a)(3) and § 512.745(a)(4) respectively.

Comment: Several commenters supported the proposed rural scoring adjustment but recommended modifications or additional safeguards. A commenter recommended limiting the rural adjustment to ASM participants who are not eligible for the small practice scoring adjustment, stating that receiving both adjustments could reduce incentives for performance improvement. Another commenter recommended an additional adjustment for physicians caring for disproportionately high numbers of low-income or socially complex beneficiaries.

Response: We appreciate the commenters' feedback and acknowledge the commenters' recommendation to limit awarding the rural scoring adjustment to ASM participants who are not eligible for the small practice scoring adjustment. However, we disagree and stress that each scoring adjustment targets the unique challenges faced in different practice types. The small practice scoring adjustment is focused on correcting issues such as CEHRT implementation, and staff training costs (90 FR 49674). While the rural adjustment addresses workforce shortages, and thinner operating margins (91 FR 43990). We believe that an ASM participant in a rural area and small practice may experience both sets of challenges; thereby necessitating the need for the scoring adjustments to be additive.

We also stress that as stated earlier in this section of the final rule, preliminary ASM participant data for the 2027 ASM performance year found that ASM participants in rural areas are typically part of larger practices. Awarding both the small and rural scoring adjustments to a smaller percentage of ASM participants who meet both scoring adjustment requirements recognizes the significant challenges these ASM participants may face while not substantially changing scoring and payment incentives.

Additionally, we do not believe that the 5-point rural adjustment significantly diminishes the incentive for ASM participants receiving this scoring adjustment to improve. Because ASM's payment methodology remains tied to an ASM participant's performance relative to their ASM cohort, and not a pre-set performance threshold, an ASM participant who might receive both adjustments would still have an incentive to improve their performance components that factors into the final score. If an ASM participant's performance improves more than others in their ASM cohort, the ASM scoring and payment framework rewards the ASM participant with an increase in their payment adjustment factor regardless of their small or rural scoring adjustments.

Lastly, we note that the CY 2026 final rule finalized at § 512.745(a)(3) the ASM complex patient scoring adjustment. The complex patient scoring adjustment accounts for the HCC risk scores and the proportion of dually eligible beneficiaries of an ASM participant. We refer readers to the CY 2026 final rule where we document the link between dual eligible status and income level (90 FR 49674).

Comment: A commenter recommended that CMS consider similar adjustments to the rural scoring adjustment be awarded to non-rural clinicians and practices facing comparable resource or operational constraints, including small independent specialty practices, hospital-based or ambulatory surgical center (ASC) clinicians, and non-patient-facing clinicians.

Response: We thank the commenter for their recommendation. We emphasize that the ASM complex patient scoring adjustment as finalized at § 512.745(a)(3) accounts for social and medical risk factors faced by ASM participants regardless of size or geography. We did not consider awarding an additional scoring adjustment to ASM participants in hospitals or ambulatory surgical centers because we believe that the complex patient scoring adjustment adequately accounts for the challenges ASM participants serving in those practices face. We also stress that to receive a final score, an ASM participant must be attributed 20 EBCM episodes for the ASM performance year. If ASM participants do not meet the minimum 20 case threshold they would receive an automatic neutral payment adjustment (90 FR 49669). Furthermore, as part of the EBCM methodology, to qualify as an ASM participant a specialist would need to have billed at least 30 percent of triggering or confirming codes on Part B Physician/Supplier claim lines related to the ASM condition for the beneficiary (90 FR 49579). We therefore disagree with the commenter that a positive adjustment should be made to the final scores of non-patient-facing ASM participants. We expect that the EBCM minimum threshold and billing requirements will award ASM final scores primarily to patient-facing clinicians.

Comment: A commenter recommended comparing an ASM participant's performance with their peers in similar practice environments, patient populations, shared resource constraints, and geographic characteristics rather than relying solely on additional scoring adjustments like the rural scoring adjustment.

Response: We thank the commenter for their creative approach to scoring; however, we disagree and believe that a rural scoring adjustment adequately supports ASM participants in rural

areas facing targeted challenges. As discussed in the CY 2026 final rule (90 FR 49684) we finalized our proposal to calculate incentive pools and payment adjustment factors separately for each ASM cohort. We believe that calculating payment adjustments separately by ASM cohort supports meaningful comparisons among ASM participants treating the same targeted chronic condition. Further stratifying ASM participants based on practice environment, patient population, resource constraints, or geographic characteristics would result in smaller comparison groups. Thereby creating a situation in which small differences in an ASM participant's final score could lead to vastly different payment adjustment factors, an outcome not aligned with the model's stated goal of creating meaningful payment incentives (90 FR 49684).

Comment: A commenter requested that to account for specialists practicing at multiple sites who predominantly serve rural communities, CMS determine rural status based on the plurality of ASM beneficiaries served during the ASM performance year rather than solely on the specialist's primary PECOS enrollment address.

Response: We thank the commenter for their proposal to determine rural status based on the location of the plurality of ASM beneficiaries served during the ASM performance year. As discussed earlier in this section of this final rule, we believe that calculating the ASM rural scoring adjustment using the same definition and determinations of a ''rural area'' as defined, interpreted, and updated at § 414.1305 under MIPS will significantly reduce confusion and burden. We will provide specifications regarding the identification of the ASM participant's ZIP Code for use in the rural scoring adjustment determination through sub-regulatory technical documentation.

Comment: A few commenters opposed the proposed rural scoring adjustment, while acknowledging that some rural practices face additional challenges. Commenters stated that rural status alone may not reliably identify ASM participants facing greater barriers to ASM performance because some non-rural practices may experience comparable or greater socioeconomic, access, infrastructure, or patient-population challenges, while some rural practices may not experience any such challenges. A few commenters recommended addressing differences in practice circumstances through attribution, risk adjustment, benchmarks, measure specifications, and other relevant factors rather than adding points to ASM participants' final scores. Commenters also expressed concern that, because ASM performance is scored relative to other ASM participants, increasing the final scores of ASM participants in rural areas would affect the relative standing and payment adjustments of ASM participants in non-rural areas.

Response: We acknowledge commenters' concerns that some ASM participants in non-rural areas may experience similar or comparable challenges. However, the rural scoring adjustment is not intended to address all differences in ASM participant or patient circumstances. ASM includes other methodological features that account for relevant differences in performance. For example, the cost ASM performance category incorporates risk adjustment, as described in the CY 2026 PFS final rule (90 FR 49638), and MIPS Q492 in the quality measure set for the ASM heart failure cohort includes a risk-adjustment model incorporating demographic, clinical, and social risk factors. We believe these methodologies, together with the rural scoring adjustment and other applicable ASM scoring adjustments, appropriately account for differences in ASM participant and patient circumstances.

We also acknowledge that the ASM payment adjustment factors are determined relative to the performance of other ASM participants in the ASM cohort. We do not believe however that this effect provides a basis for excluding circumstances associated with ASM participants in rural areas. As discussed earlier in this section of the final rule the ASM rural adjustment is meant to correct for unmeasured disadvantages, rather than simply giving an arbitrary advantage to ASM participants in rural areas.

Comment: A commenter stated that its analysis of historical MIPS performance among likely ASM participants showed similar average performance for rural and non-rural physicians, while showing larger differences between small and large practices. The commenter therefore recommended that CMS not establish a rural scoring adjustment and instead waive interoperability requirements for ASM participants in rural areas and for ASM participants in non-rural areas when community conditions create a hardship.

Response: We appreciate the commenter's analysis of historical MIPS performance data among likely ASM participants. However, we stress that ASM's requirements differ in important respects from MIPS, including the improvement activities ASM performance category. Consequently, we do not believe that historical MIPS performance data provides an appropriate basis for determining whether a rural scoring adjustment is warranted under ASM.

As finalized in the CY 2026 final rule at § 512.735(c)(2) IA–2 requires established communication and collaborations with primary care using a CCA. As discussed earlier in this section of this final rule, ASM participants in rural areas may face challenges forming partnerships with primary care practices due to limited primary care availability. Therefore, we believe that historical MIPS performance may not fully reflect the circumstances and challenges ASM participants in rural areas experience when they move from MIPS to ASM.

We also considered but ultimately did not propose waiving IA–2 for ASM participants in rural areas in the CY 2027 proposed rule (91 FR 43990). A central goal of the ASM is to incentivize ASM participants to ensure that their patients have a regular source of primary care (90 FR 49563). We therefore believe that removing IA–2 entirely for ASM participants in rural areas would not provide sufficient incentive for improved care coordination.

Comment: A commenter supported the proposed 5-point rural scoring adjustment but stated that it would be insufficient to address the structural and financial challenges facing rural specialists in Kentucky and Indiana. The commenter cited rural hospital closure risks, Medicaid payment shortfalls, low rural hospital operating margins, and physician shortages in both States and expressed concern that the potential negative ASM payment adjustment could further threaten the financial viability of rural specialty care. The commenter also stated that many rural ASM participants may not qualify for the small practice scoring adjustment because CMS's analysis indicated that rural ASM participants tend to be in larger practices. The commenter recommended that CMS exempt Kentucky and Indiana from mandatory ASM participation or establish differential penalty structures for ASM participants in rural areas until additional geographic adjustments, infrastructure supports, and rural-specific quality measures are in place.

Response: We appreciate the commenters' feedback and support. We do though believe that the rural scoring adjustment appropriately addresses the structural concerns the commenter highlighted facing practices in Kentucky and Indiana. We also note that the rural scoring adjustment does not operate in

isolation. Eligible ASM participants, including those in Kentucky and Indiana, may also receive the complex patient scoring adjustment as described in § 512.745(a)(3). Elsewhere in the ASM performance category scoring methodology, the cost ASM performance category incorporates risk adjustment into the EBCM used to calculate the cost ASM performance category score as described in the CY 2026 PFS final rule (90 FR 49638); and the Risk-Standardized Acute Unplanned Cardiovascular-Related Admission Rates for Patients with Heart Failure measure (MIPS Q492) incorporates risk adjustment on demographic, clinical, and social risk factors (90 FR 49607).

We acknowledge that the rural scoring adjustment does not eliminate ASM's peer-relative scoring or guarantee avoidance of a negative payment adjustment. However, we believe the adjustment appropriately recognizes rural circumstances while preserving ASM's underlying goal of comparing ASM participants to their peers within an ASM cohort. We do not believe a separate payment adjustment structure for ASM participants in rural areas is appropriate as that would decrease the size of the ASM cohort and thereby create an inappropriate payment approach as discussed earlier in this section of this final rule. We refer readers to the CY 2026 final rule for a complete discussion regarding mandatory participation and its importance in ensuring a valid and robust model evaluation (90 FR 49589).

Comment: A commenter stated that it lacked sufficient information and comparative data to assess the proposed rural scoring adjustment and recommended that CMS examine anticipated differences in ASM scores between ASM participants in rural areas and ASM participants in non-rural areas before implementing the adjustment.

Response: We appreciate the commenter's recommendation; however, we believe that we have sufficient information to implement this adjustment as proposed. As discussed earlier in this section of this final rule, ASM participants in rural areas face specific interoperability and primary care coordination challenges. We believe that these circumstances could make success difficult for ASM participants in rural areas and therefore a rural scoring adjustment is warranted. We will closely monitor the results of the ASM rural scoring adjustment, and any modification will be made in future notice-and-comment rulemaking.

After consideration of public comments, we are finalizing our proposed corresponding adjustments to the final score formula at § 512.745(a)(6), our proposal to revise § 512.745(a) to cross-reference the final score formula now described at § 512.745(a)(6), our proposed definition of rural area at § 512.705, our proposal at § 512.745(a)(5) to add 5 points to the final score of an ASM participant who is in a rural area and meets the requirements to receive a final score greater than zero, and our corresponding proposal at § 512.745(a)(6) to incorporate the rural scoring adjustment into the final score formula.

(4) ASM Performance Report

In the CY 2026 PFS final rule (90 FR 49678), we finalized that we will provide performance information to each ASM participant for each ASM performance year through an annual ASM performance report. The ASM performance report will include information on each ASM performance category score, scoring adjustments as applicable, the final score, the ASM payment adjustment factor, and the ASM payment multiplier.

To incorporate additional information on scoring incentives and scoring adjustments proposed in the proposed rule, we proposed to revise the structure of the regulatory text on the ASM performance report in § 512.745(b). These proposed structural revisions to the regulatory text's structure are intended to improve readability on the logical flow of components of the annual ASM performance report, starting with each ASM performance category score, scoring incentives, scoring adjustments, final score, and ending with the resulting payment adjustment information. These specific changes do not introduce substantive changes to current requirements.

We also proposed at revised § 512.745(b)(2) to provide ASM participants with information on whether they receive the quality ASM performance category scoring incentive for successful voluntary reporting of PRO data through the annual ASM performance report, as applicable. We refer readers to section III.D.2.d.(5) of the proposed rule for additional information on the proposed voluntary PRO data submission and associated quality ASM performance category scoring incentive.

We also proposed at revised § 512.745(b)(5) to provide ASM participants with information on their rural scoring adjustment, if applicable, in the annual ASM performance report.

We believe these proposals would help an ASM participant understand their performance and whether they qualified for new scoring incentives and scoring adjustments proposed in the proposed rule.

We sought comment on our proposed clarifying revisions to § 512.745(b). We also sought comment on our proposal at § 512.745(b)(2) to provide information on the quality ASM performance category incentive for voluntary reporting of patient-reported outcome data, as applicable, and our proposal at § 512.745(b)(5) to provide information on the rural scoring adjustment, as applicable, in the annual ASM performance report.

We received public comments on the proposals to include additional scoring information in the ASM performance report as well as general comments on the ASM performance report. The following is a summary of the comments we received and our responses.

Comment: Several commenters supported the proposed revisions to the annual ASM performance report. Commenters recommended that CMS provide ASM participants with transparent, detailed, and actionable performance information to help ASM participants understand and improve their performance. Commenters requested that the report identify the specific measures contributing to performance results, explain the attribution methodology as applied to ASM participants' patient populations, provide measure-level results, and identify specific opportunities for remediation. Commenters also recommended enhanced data sharing for cost and administrative claims measures and stated that ASM participants need access to sufficiently detailed attributed beneficiary-level data to audit their results.

Response: We thank the commenters for their support of the revisions to the annual ASM performance report. We agree that the ASM performance report should provide ASM participants with sufficient information to understand their performance across the ASM performance categories. However, to allow all ASM participants access to their performance data, regardless of whether they followed the attestation and data sharing agreement process for CMS sharing of beneficiary-identifiable information, we stress that the ASM performance report will not contain beneficiary identifiable information. As discussed in the CY 2026 final rule, the ASM performance report is designed to complement the other proposed data sharing approaches discussed in § 512.760(d) which are also designed to help ASM participants improve their ASM performance category score performance.

Comment: A few commenters recommended that CMS provide performance and attribution information more frequently than through an annual ASM performance report. A few commenters recommended monthly and quarterly reports identifying beneficiaries attributed to each ASM participant to allow ASM participants to validate attribution, support care coordination, and better understand the populations contributing to their quality, cost, and overall ASM performance scores. Another commenter requested that CMS specify when performance data would be delivered during each ASM performance year and provide ASM participants with sufficiently timely information to identify improvement opportunities and implement targeted strategies before accountability begins.

Response: We thank commenters for their recommendation to relay frequent performance and attribution reporting. However, we stress that we made no proposed changes to the cadence of the ASM performance report and are not making changes to its cadence in this final rule. The ASM performance report serves as the final source of information on the ASM Participant's annual performance in each ASM performance category and their resulting ASM payment adjustment factor and multipliers. We note though that the annual ASM performance report is not the only mechanism where we deliver performance data to ASM participants. We refer commenters to § 512.760(d) where we detail data sharing policies that help ASM participants understand their progress towards improving upon the model's performance metrics. These include information on beneficiary attribution, measure-specific dashboards, and appropriate aggregate data.

Comment: A commenter recommended permitting designated health system and accountable care organization personnel to receive model communications and performance reports on behalf of participating specialists, stating that integrated organizations may have analytic capabilities needed to translate performance information into actionable changes.

Response: We thank the commenter for their feedback. However, we note that we did not propose any changes to the recipients of the ASM performance report and are not making changes to the report recipient policy in this final rule. We will take the commenter's recommendation into consideration and any changes to the recipients of the ASM performance report will be made in future notice-and-comment rulemaking.

After consideration of public comments, and as discussed in section III.D.2.d.(5) of this final rule, we are not finalizing our proposal to establish voluntary PRO data submission and the associated quality ASM performance category scoring incentive. Accordingly, we are not finalizing the proposed revision at § 512.745(b)(2) to include in the annual ASM performance report whether an ASM participant received the quality ASM performance category scoring incentive for successful voluntary reporting of PRO data.

We are finalizing our proposal to make revisions to regulatory text at § 512.745(b). We are also finalizing our proposal to provide information on the rural scoring adjustment, as applicable, in the annual ASM performance report at § 512.745(b)(4), with corrections to numbering.

g. Payment Approach

(1) Background

In the CY 2026 PFS final rule, we finalized the overall payment approach for ASM (90 FR 49679 through 49699). We will apply performance-based payment adjustments to all payments for Medicare Part B covered professional service claims from ASM participants during an ASM payment year based on their performance during the corresponding prior ASM performance year. We explained that this approach will create meaningful financial incentives tied to performance in the model, while maintaining administrative feasibility and transparency (90 FR 49679 through 49680). To determine these payment adjustments, we finalized a methodology to compare ASM participant performance within each ASM cohort using final scores, which reflect ASM participants' performance across the four ASM performance categories (90 FR 49681 through 49683). We also finalized a methodology to calculate ASM payment adjustment factors and ASM payment multipliers used to apply the payment adjustments from the distribution of final scores (90 FR 49685 through 49696). We also finalized the level of two-sided risk (that is, the maximum and minimum payment adjustment), including the gradual increase in the two-sided ASM risk level from 9 percent in the 2027 and 2028 ASM performance years to 12 percent in the 2031 ASM performance year. We explained that this methodology supports strong incentives for performance improvement while maintaining ASM risk levels similar to MIPS during early model years. We will apply the ASM payment multiplier to all payments for Medicare Part B for covered professional services, not only those services related to each ASM cohort's ASM targeted chronic condition, during an ASM payment year (90 FR 49696 through 49699).

(2) Application of ASM Payment Adjustments With Changes in TIN Affiliations

In the CY 2026 PFS final rule, we finalized that Medicare Part B professional service claims submitted by an NPI who is an ASM participant for an ASM performance year but under a TIN (1) that we did not select the NPI as an ASM participant for the applicable ASM performance year and (2) to which the NPI began assigning billing rights after the ASM performance year but before the end of the corresponding ASM payment year would be adjusted using the ASM payment multiplier calculated for the ASM participant. In the limited instances where a single NPI is selected as an ASM participant under multiple TINs for an ASM performance year, we finalized that we would apply the highest of any ASM payment multipliers to all Medicare Part B covered professional service claims submitted under a new TIN during the applicable ASM payment year (90 FR 49696). We refer readers to Table B–D10 in the CY 2026 PFS final rule for additional information on how ASM payment adjustments will be applied under multiple scenarios (90 FR 49697). The goal of these policies is to maintain accountability for the ASM participant's performance through the application of their performance-based payment adjustments. By doing so, we track accountability to the ASM participant regardless of their specific TIN affiliation at the time we make payment adjustments.

While we did not propose substantive changes to these policies in the proposed rule, we noted that there are inconsistencies in the regulatory text describing how we will adjust payment in situations where the ASM participant begins reassigning billing rights to a new TIN during an ASM payment year.

Accordingly, to maintain consistency with the regulatory text governing the application of ASM's payment adjustments as described at § 512.750(a), we proposed to revise the regulatory text at §§ 512.750(f)(1) and (f)(2) to replace the phrases ''adjusts payments'' and ''adjust claims'' with ''multiplies the amount otherwise paid under Medicare Part B for covered professional services''. We also proposed clarifying revisions to § 512.750(f)(1). We

proposed to remove unnecessary text at § 512.750(f)(1)(i) because we only calculate ASM payment multipliers for ASM participants with final scores as described at § 512.750(c)(1). To improve readability of the provision with the proposed removal of § 512.750(f)(1)(i), we proposed to revise § 512.750(f)(1) to incorporate the text previously described at § 512.750(f)(ii).

We also proposed revisions to clarify how we would adjust payments for NPIs selected as ASM participants under multiple TINs and who reassign billing rights to a new TIN after an ASM performance year. Accordingly, we proposed to remove unnecessary language in § 512.750(f)(2) and § 512.750(f)(2)(i) to more clearly describe how we would adjust payments using the highest ASM payment multiplier calculated for an NPI who we select as an ASM participant under multiple TINs. We also proposed at § 512.750(f)(2)(ii) to replace the phrase ''assigning billing rights'' with ''reassigning billing rights'' to improve the accuracy of the regulatory text. These proposals do not create substantive changes to the proposed policies but would ensure clarity and consistency in language used to describe the application of payment adjustments under ASM under § 512.750.

We sought comment on our proposals to revise the regulatory text at § 512.750(f)(1) and § 512.750(f)(2).

We received public comments about ASM's payment approach that were outside the scope of the CY 2027 PFS proposed rule. These out-of-scope public comments are not summarized nor addressed with responses in this final rule.

We did not receive specific comments related to the proposed revisions to regulatory text at § 512.750(f)(1) and § 512.750(f)(2), and therefore, are finalizing as proposed.

h. Applicability of CMS-Sponsored Model Safe Harbor at 42 CFR 1001.952(ii)

In the CY 2026 PFS final rule, we determined that the CMS-sponsored model arrangements and patient incentives safe harbor at § 1001.952(ii) is available to ASM participants that comply with applicable requirements (90 FR 49709). We codified the availability of the safe harbor for ASM at § 512.765 with respect to remuneration associated with beneficiary incentives and remuneration exchanged under CCAs.

Once a clinician is selected as an ASM participant for any ASM performance year during the ASM test period, that clinician remains an ASM participant for the duration of the ASM test period. However, in limited circumstances, an ASM participant may not be required to meet specified model requirements for an ASM performance year. Specifically, if we determine that an ASM participant does not satisfy the ASM participant eligibility criteria as specified under § 512.710(a)(2) or is determined to meet an exception under § 512.710(c), the ASM participant is not: (1) subject to ASM performance assessment under § 512.715, (2) required to submit data under § 512.720, (3) subject to final scoring under § 512.745, and (4) eligible for the waivers available under the model described at § 512.775 (90 FR 49572, 90 FR 49583).

When we finalized these policies in the CY 2026 PFS final rule, we did not address how a period of ineligibility or excepted status affects the availability of the CMS-sponsored model arrangements and patient incentive safe harbor (§ 1001.952(ii)), as made available for ASM under § 512.765.

We proposed that the CMS-sponsored model arrangements and patient incentives safe harbor would be available only for remuneration attributable to periods during which an ASM participant is performing under the model. Conversely, the CMS-sponsored model arrangements and patient incentives safe harbor would not be available for remuneration attributable to a period during which an ASM participant is not performing under the model due to not meeting ASM participant eligibility criteria as described at § 512.710(a)(2) or a determination that an exception applies under § 512.710(c)

We proposed to add § 512.765(c) to provide that the CMS-sponsored model arrangements and patient incentives safe harbor is available only with respect to remuneration attributable to a period during which the ASM participant is performing under the model. We further proposed to specify that the safe harbor is not available with respect to remuneration attributable to any period of the ASM test period during which the ASM participant does not meet the ASM participant eligibility criteria as specified in § 512.710(a)(2) or is excepted from specified ASM requirements under § 512.710(c).

We sought comment on this proposal.

Comment: Several commenters requested clarification regarding the applicability of the fraud and abuse safe harbors when ASM participants become ineligible for, are excepted from specified ASM requirements, or exit the model.

Response: We appreciate the commenters' requests for clarification. The CMS-sponsored model arrangements and patient incentives safe harbor, as applied to ASM under § 512.765, is available only with respect to remuneration attributable to a period during which an ASM participant is performing under the model.

Eligibility under § 512.710(a)(2) is determined on an annual ASM performance year basis. Therefore, if CMS determines that an ASM participant does not meet the eligibility criteria for a particular ASM performance year, the safe harbor would not be available to protect remuneration attributable to that ASM performance year.

An exception under § 512.710(c), by contrast, may become effective during an ASM performance year. Under § 512.710(c), we determine whether an exception applies, provide notice to the ASM participant, and specify the effective date of the exception in the notice. In response to requests for clarification, we are finalizing § 512.765(c) with modification to more precisely describe the period for which the safe harbor is unavailable and to align this provision with the exception provisions at § 512.710(c). Specifically, we are clarifying the safe harbor is unavailable for remuneration attributable to the period beginning on the date specified in the exception notice, which is described in § 512.710(c)(2)(iv). This modification retains our original intent that the safe harbor would not be available during the period an exception applies but provides greater certainty around when that period begins by tying that date to the date specified in an exception notice. An exception does not affect the availability of the safe harbor for remuneration attributable to a period before the date specified in an exception notice, provided all requirements for the safe harbor are met.

''Remuneration attributable to'' refers to the period in which the underlying model activities occurred, rather than the date on which remuneration is exchanged. As we explained in the CY 2027 PFS proposed rule (91 FR 43992), remuneration related to model performance in one period may be exchanged in a subsequent period. Any such exchange must still satisfy all applicable safe harbor conditions.

Comment: A few commenters recommended alternatives to our proposal regarding the periods during which the safe harbor would be available under ASM. For example, commenters recommended establishing a ''wind-down period'' or making the

safe harbor available for the duration of the ASM test period regardless of whether an ASM participant remains eligible for, or subject to the requirements of, the model. One commenter stated that conditioning safe harbor availability on an ASM participant's eligibility is inconsistent with ASM's goal of improving care for patients with chronic conditions and could adversely affect patients and physicians. Specifically, the commenter expressed concern that annual fluctuations in attributed patient counts around the 20-patient threshold could cause ASM participants to lose safe harbor protection and discontinue in-kind patient engagement incentives or arrangements supporting primary care practices, even when they continue treating the same patients. The commenter stated that an ASM participant who furnished an item or service to a beneficiary during an ASM performance year in which the ASM participant met the eligibility criteria could be required to withdraw the item or service in a later year if the ASM participant subsequently became ineligible.

Response: We appreciate the commenters' feedback. We disagree that the safe harbor should remain available for the duration of the ASM test period regardless of whether an ASM participant remains eligible for the model or is subject to an exception from specified ASM requirements. We continue to believe that limiting the safe harbor under § 512.765 to remuneration attributable to periods during which an ASM participant is performing under the model appropriately balances program integrity and beneficiary protections with the need to provide ASM participants flexibility to furnish or exchange remuneration that supports beneficiary and primary care engagement consistent with the purposes and requirements of the model.

We also disagree with the characterization that our proposal would require an ASM participant to retrieve an item or service already furnished to an ASM beneficiary as a patient incentive under § 512.770 solely because the ASM participant subsequently becomes ineligible for the model or is subject to an exception under § 512.710(c). Neither § 512.765 nor § 512.770 requires an ASM participant to retrieve an item or service that was furnished in accordance with § 512.770 solely because of a subsequent change in the ASM participant's eligibility or exception status.

Comment: A commenter expressed concern that termination of an ASM participant from the model could have significant consequences for ongoing remuneration and for model-related safe harbor and waiver protections, including potential retroactive liability for conduct undertaken in reliance on those protections.

Response: The CMS-sponsored model arrangements and patient incentives safe harbor would not be available to a clinician who is terminated from ASM because that clinician is no longer an ASM participant after they are terminated. Under § 512.765, the CMS-sponsored model arrangements and patient incentives safe harbor is available only for remuneration furnished in accordance with the collaborative care arrangements that meet all safe harbor requirements set forth in §§ 1001.952(ii) and 512.771 or in the form of ASM beneficiary engagement incentives that meet all safe harbor requirements set forth in §§ 1001.952(ii) and 512.770. Termination does not, by itself, retroactively remove safe harbor protection for remuneration exchanged or furnished before the effective date of termination that otherwise satisfies all applicable requirements.

We are finalizing our proposal at § 512.765(c) with modification. Under our final policy, the safe harbor at § 512.765 will not be available with respect to remuneration attributable to: (1) any ASM performance year for which we determine that the ASM participant does not meet the ASM participant eligibility criteria under § 512.710(a)(2); or (2) in the case of an exception under § 512.710(c)(1), to the period described in § 512.710(c)(2)(iv).

i. Collaborative Care Arrangements (CCAs)

(1) Background

The improvement activities ASM performance category is intended to advance core goals of ASM to drive better outcomes through improved care coordination, increased collaboration between specialists and primary care practices, and interventions that address upstream drivers of health.

We finalized two improvement activities for ASM in the CY 2026 PFS final rule at § 512.735 that we believe best support these aims:

- Improvement Activity 1 (IA–1): Connecting to Primary Care and Ensuring Completion of Health-Related Social Needs Screening; and
- Improvement Activity 2 (IA–2): Establishing Communication and Collaboration Expectations with Primary Care using CCAs (90 FR 49648 through 49655).

To receive the maximum score available for the improvement activities ASM performance category, an ASM participant must attest ''yes'' to both improvement activities.

IA–2 specifications require an ASM participant to enter into at least one collaborative care arrangement (CCA) with a primary care practice with which the ASM participant shares a patient who is an ASM beneficiary. IA–2 also requires that a CCA address at least three of the five elements specified at § 512.735(c)(2)(ii): data sharing, co-management, transitions in care planning, closed-loop communication, and care coordination integration.

In addition to IA–2 specifications at § 512.735(c)(2)(ii), we outline requirements for CCAs at § 512.771. The function of the CCA is to memorialize the coordination activities central to ASM and described in IA–2.

We proposed certain updates to the CCA provisions at § 512.771 to improve implementation by ASM participants and primary care practices and to more closely align CCA conditions with IA–2 by revising § 512.771(a) and adding new paragraph § 512.771(d). In summary, proposed changes to § 512.771 included:

- Permitting one or more ASM participants to enter into a CCA with the same primary care practice, provided each ASM participant reassigns billing rights through the same entity's TIN and are named as parties to the CCA;
- Clarifying the requirement that an ASM participant and a primary care practice share a patient who is an ASM beneficiary and how this requirement applies in the context of the limitation on considering the volume or value of referrals;
- Streamlining the provision containing an illustrative list of authorities with which parties to a CCA must comply to simplify it, improve clarity, and reduce ambiguity;
- Updating the provisions that currently reference any elective exchange of payments between CCA parties to instead refer to the elective exchange of remuneration, to reflect a broader scope of value that may be exchanged under a CCA;
- Reorganizing regulatory requirements under § 512.771(a) that are associated only with the exchange of any elective remuneration under a CCA such that they appear together under a new paragraph at § 512.771(d) to bring greater clarity and to distinguish between those requirements that apply to all CCAs and those that apply only to CCAs that electively include the exchange remuneration;

- Revising the payment limitation that caps the exchange of remuneration based on an ASM participant's performance adjustment such that it can be more readily calculated in a timely manner and requiring that parties that elect to exchange remuneration before the limitation can be calculated reconcile any amounts that exceed the limitation following reconciliation;
- Clarifying that current requirements relating to traceability will continue to apply to monetary remuneration;
- Updating the contemporaneous documentation requirements to reflect any remuneration exchanged and adding requirements to bring transparency into the methodologies used to determine the value of such remuneration; and
- Relocating the conditions associated with remuneration at current §§ 512.771(a)(7) and 512.771(a)(8) to new paragraphs §§ 512.771(d)(2) and 512.771(d)(3), respectively, in accordance with our proposal to address requirements associated with CCAs that include an exchange of remuneration together under one paragraph. To conform with this relocation, we would redesignate existing sections §§ 512.771(a)(9) through 512.771(a)(13) to §§ 512.771(a)(7) through 512.771(a)(11). We would revise newly redesignated § 512.771(a)(7) (former § 512.771(a)(9)) to reference ''[a]ll parties'' rather than ''[b]oth parties'' and revise newly redesignated § 512.771(a)(9) (former § 512.771(a)(11)) to update documentation requirements as described, but otherwise would not revise text at newly redesignated § 512.771(a)(8) (former § 512.771(a)(10)), § 512.771(a)(10) (former § 512.771(a)(12)), or § 512.771(a)(11) (former § 512.771(a)(13)).

(2) Parties to a CCA

In the CY 2026 PFS final rule, we finalized at § 512.771(a)(1) a requirement that a CCA be in writing, signed by both parties, and contain the effective date of the arrangement. We also finalized at § 512.771(a)(2) a requirement that a CCA be exclusively between an ASM participant and a primary care practice with which the ASM participant shares at least one established patient who is an ASM beneficiary. At that time, we considered, but declined to permit, multiple ASM participants reassigning billing rights through the same TIN to be parties to a single CCA with a primary care practice party, citing concerns around the ability of ASM participants to accurately track any remuneration exchanged under a multi-ASM participant arrangement (90 FR 49712).

Following publication of the CY 2026 PFS final rule, we received interested party feedback anticipating significant burden associated with establishing separate CCAs for each individual ASM participant when more than one ASM participant is in the same group practice and such ASM participants wish to collaborate with the same primary care practice. As an example, 20 ASM participants operate within a single health system and reassign their billing rights to that system's TIN. Even if such ASM participants coordinate care regularly with the same primary care practice and wish to establish a CCA with the same primary care practice, the current regulation would require negotiation, execution, documentation, and tracking of 20 separate CCAs.

We believe that requiring a separate CCA for each ASM participant could impose administrative burden without a corresponding programmatic benefit. We now believe that concerns related to tracking remuneration under CCAs involving multiple ASM participants could be addressed through more targeted safeguards that apply to CCAs that elect to include remuneration, rather than a broader restriction applicable to all CCAs, including those that do not involve any exchange of remuneration.

Accordingly, we proposed to amend §§ 512.771(a)(1) and 512.771(a)(2) to permit one or more ASM participants to be parties to the same CCA, provided that each ASM participant be named as a party to the CCA and all ASM participants reassign billing rights to the same TIN. We would maintain the existing requirements at § 512.771(a)(1) that the CCA be in writing and specify an effective date; we would also maintain the requirement that a CCA be signed by the parties but proposed to amend regulatory text to stipulate CCA execution would be required for ''all'' parties rather than ''both'' parties.

We believed restricting a multi-ASM participant CCA to ASM participants within the same TIN is appropriate as clinicians who practice under the same group practice are more likely to be supported by shared operations, such as shared EHR systems, clinical support staff, and standardized administrative workflows. Accordingly, we believe terms of a CCA could be standardized across ASM participants within the same organization (that is, TIN) without compromising the level of detail needed to support meaningful care coordination. In contrast, ASM participants from separate, unaffiliated TINs may have distinct infrastructure, care coordination needs, support structures, and operational workflows. It is therefore unclear how a single arrangement could establish cohesive terms regarding shared responsibilities with a primary care partner in a manner consistent with the intent of CCAs. We are concerned that attempting to encompass these different capabilities and variable workflows within a single agreement could result in vague, overly broad, or highly fragmented contractual terms, which could undermine the intent of the CCA.

Our proposal to permit one or more ASM participants billing under the same TIN to join the same CCA with a primary care practice does not alter ASM's fundamental accountability framework. As noted, we proposed to clarify that any ASM participant seeking to join and rely on one CCA be expressly named as a party to the arrangement. We believe such requirement maintains individual ASM participant accountability, while reducing administrative burden. We did not propose to permit a group practice or TIN to serve as a sole contracting party on behalf of unnamed ASM participants, as this could obfuscate individual ASM participant accountability and introduce operational complexity, particularly when an ASM participant departs a group practice during an ASM performance year. Requiring each ASM participant to be named as a party would mitigate such concerns while still reducing contracting burden.

We clarified in the proposed rule that we did not intend to establish and did not propose prescriptive requirements around the meaning of a ''primary care practice'' that must be a party to a CCA. Our intent is that a CCA reflects coordination between the ASM participant and their ASM beneficiary's source of primary care services. We refer readers to discussion in response to interested party questions in the CY 2026 PFS final rule for further information (90 FR 49653).

Our proposal intended to reduce burden for ASM participants who practice within the same group and coordinate care with the same primary care practice. It does not intend to discourage individual CCAs. ASM participants who belong to the same group may continue to enter into separate CCAs and should consider a separate arrangement when doing so better reflects individual clinical relationships, sources of primary care for their individual ASM beneficiary panel, and care coordination needs.

We sought comment on these proposals. The following is a summary of the comments we received and our responses.

Comment: Many commenters supported CMS' proposal to permit one or more ASM participants reassigning billing rights through the same TIN to be parties to the same CCA with a primary care practice. Commenters stated that requiring separate CCAs for each ASM participant would impose unnecessary administrative burden on both ASM participants and primary care practices. Commenters representing integrated health systems stated that a single CCA would better reflect practice operations where clinicians share EHR systems, clinical support staff, and administrative infrastructure. A commenter stated that requiring a primary care practice to sign multiple duplicative agreements could make such practices less willing to assent to further agreements.

Response: We appreciate commenters' support. We agree that permitting ASM participants who reassign billing rights through the same TIN to enter into a single CCA with the same primary care practice would help reduce duplicative negotiation, execution, documentation, and tracking and better reflect shared operations. At the same time, requiring each ASM participant to be expressly named as a party to the CCA preserves individual accountability for satisfying applicable ASM requirements. We believe this approach appropriately balances administrative flexibility with the accountability and oversight objectives of the CCA requirements.

Comment: A few commenters recommended that CMS not limit multi-participant CCAs to ASM participants under one TIN. A commenter stated that such limitation would prevent solo practitioners or small practices from entering into a common CCA with a primary care practice. A commenter described that a single agreement could facilitate collaboration and reduce contracting burden and noted that independent practices may already contract collectively through arrangements such as independent practice associations. A commenter stated that ASM participants may practice within the same health system but reassign billing rights through different affiliated TINs and recommended that CMS permit such ASM participants to enter into a common CCA where they can demonstrate shared EHR infrastructure, unified workflows, and consolidated data governance.

Response: We appreciate commenters' consideration of varying organizational structures, including solo practitioners and small practices and integrated systems with multiple TINs but shared systems. We continue to believe that the TIN establishes the most appropriate boundary for a multi-participant CCA.

As we stated in the proposed rule, ASM participants practicing under the same TIN are more likely to share operational infrastructure, including EHR systems, clinical support staff, and standardized administrative workflows, such that a common set of CCA terms can meaningfully apply to each ASM participant. We recognize that some integrated delivery systems operating across multiple TINs may have comparable levels of operational integration. However, the degree and nature of integration across such systems may vary, and the existence of shared clinical or administrative systems across TINs would not, by itself, provide a similarly clear and readily administrable basis for determining which ASM participants should be permitted to participate under a common CCA.

We also distinguish such integrated delivery systems from independent practice associations and other joint-contracting arrangements. The existence of a contractual mechanism through which otherwise independent practices negotiate or contract collectively does not necessarily demonstrate that ASM participants share the operational infrastructure, workflows, or care-coordination processes necessary to support a common CCA. Accordingly, we do not believe that participation in an independent practice association or other joint-contracting arrangement, by itself, provides a sufficient basis to extend the multi-participant CCA policy across TINs. We may address ways to alleviate burden associated with CCAs for solo practitioners or small practices as appropriate based on experiences under the model, such as through additional resources or in future rulemaking.

Comment: A few commenters observed that CMS proposed to permit multi-participant CCAs while enforcing strict remuneration limits and restricting safe harbor applicability during exception periods. A commenter recommended that CMS tailor safe harbors for integrated delivery networks to allow alignment between employed primary care, hospital facilities, and specialists.

Response: We note that, as revised, the limitation on remuneration under a CCA is structured to account for and scale with the number of ASM participants joining a CCA. We proposed such revision to account for the proposed change allowing multi-participant CCAs.

We clarify that the applicability of the CMS-sponsored model arrangements and patient incentives safe harbor to ASM as described at § 512.765 is tailored to ASM since it was made available for purposes of ASM, rather than specifically to an integrated delivery system.

Comment: Commenters suggested that ASM participants or primary care practices may already participate in accountable care models, such as accountable care organizations (ACOs) and that such existing collaborations or shared infrastructures should count toward meeting CCA requirements. A commenter noted that the requirement for a formal contractual arrangement between ASM participants and primary care providers may impose burden without clear evidence of care improvement. Another commenter noted that requiring a new written arrangement where effective collaboration is already documented and operating adds paperwork without a demonstrated clinical gain. The commenter further asked CMS to publish model arrangement templates and operational guidance well in advance of the model start date, so that participants have time to evaluate requirements, build the workflows, execute the arrangements and train staff before performance is measured.

Response: We continue to believe that CCAs will drive meaningful collaboration by facilitating conversation and agreement among primary care and specialists on responsibilities for managing shared patient's care. Organizations that have existing pathways between ASM participants and primary care practices that facilitate those activities envisioned by IA–2 and CCAs can leverage those existing structures when meeting ASM requirements.

We appreciate requests for resources to assist with preparations for ASM, including CCAs, and note that we have published resources on our website to assist ASM participants with preparing for improvement activity requirements, including CCAs. We will continue to engage with ASM participants to learn what additional resources and information is needed to support them.

Comment: A commenter recommended that authorized leadership within a practice be permitted to execute a CCA on behalf of the respective parties, for example, cardiology leadership and primary care leadership—rather than requiring each individual ASM participant's signature. The commenter stated this flexibility would be particularly beneficial for large practices and organizations with 100 or more participating providers.

Response: We appreciate the commenter's concern regarding the burden associated with executing a CCA that includes multiple ASM participants. The purpose of the signature and party requirements under § 512.771 is to ensure that each ASM participant relying on the CCA is expressly identified as a party, is bound by the arrangement, and remains accountable for the applicable requirements thereunder. We do not intend to prescribe the internal process by which a party determines who has authority to execute an agreement on its behalf, provided the CCA is executed in accordance with applicable law and each ASM participant relying on the CCA is expressly named as a party and bound by its terms.

Comment: Several commenters recommended that CMS eliminate ASM improvement activities, eliminate CCAs, or continue to substantially simplify CCAs to reduce compliance and documentation burden. Commenters expressed concern that requiring a formal contractual arrangement between ASM participants and primary care providers could discourage collaboration, particularly where care coordination structures are already in place. Several commenters recommended CMS minimize overlapping requirements, such as for practices that already participate in programs such as the Medicare Shared Savings Program, in an integrated health system, or in an advanced APM by excepting from IA–2 requirements any ASM participants who demonstrate that they have existing coordination structures with primary care. A commenter suggested it is impractical to have detailed formal arrangements with multiple practices when as few as one patient is shared between each practice. The commenter further expressed that there is no requirement on primary care practices to join a CCA and anticipated this would create difficulty for specialists to convince primary care partners to engage in a CCA, recommending that CMS eliminate the CCA requirement and allow specialists to determine the best way to engage with primary care practices in the communities they serve.

Response: We appreciate commenters' concerns and recognize that some ASM participants may already have established mechanisms to coordinate with primary care practices. Where an ASM participant and a primary care practice have established care coordination infrastructure, those efforts may support meeting the requirements of the CCA. However, the existence of an affiliation or an informal collaboration would not, by itself, satisfy ASM performance requirements. As specified in § 512.771, a CCA must meet certain conditions, including that it be in writing, identify the parties, involve at least one shared patient who is an ASM beneficiary, and address at least three of the five collaborative elements specified at § 512.735(c)(2)(ii). We do not believe it would be appropriate to except an ASM participant from IA–2 or the associated CCA requirement based solely on affiliation status or on participation in another program or model. We continue to believe that requiring a CCA provides an important opportunity for specialists and primary care practices to formalize expectations regarding co-management, care coordination, data sharing, transitions in care planning, and infrastructure support for shared patients.

We emphasize that, although we encourage ASM participants to enter into multiple CCAs where doing so would support care coordination for a broader population of ASM beneficiaries, IA–2 requires only one CCA. An ASM participant therefore is not required to establish a CCA with every primary care practice with which they share a patient. Accordingly, we do not agree with the commenter's characterization that IA–2 necessarily requires detailed formal arrangements with every such practice.

We also appreciate the concern that primary care practices are not independently required to enter into a CCA. ASM is designed to include specialists as ASM participants, not primary care practices. We believe that primary care practices will be interested in efforts to address gaps in care for their patients and in collaborating with specialists for this purpose.

Comment: A commenter recommended that CMS establish a 90-day grace period from January 1, 2027 through March 31, 2027, during which an ASM participant would not receive a reduction to the improvement activities ASM performance category score for not having a CCA in place. The commenter stated that such a period would provide additional time to establish a CCA with primary care, EHR workflows, and data-sharing infrastructure.

Response: We appreciate the commenter's consideration of the steps that may be necessary to operationalize a CCA. However, we do not believe a separate 90-day grace period is necessary. Under § 512.735(a), the performance period for the improvement activities ASM performance category is a minimum of 90 continuous days within the applicable calendar year. Thus, an ASM participant is not required to have a CCA in place by January 1, 2027, or even by March 31, 2027. Rather, the ASM participant may use time during CY 2027 to establish the necessary workflows, data-sharing processes, and written CCA and still complete the required continuous 90-day performance period for improvement activities for the 2027 ASM performance year.

Comment: Several commenters supported CMS' refinements to CCA regulations at § 512.771 ahead of the model launch, stating that expanded CCA flexibilities would help make the model more administrable.

Response: We appreciate the commenters' support and agree that revisions will improve operationalizing CCAs.

After consideration of the comments, we are finalizing our policy at § 512.771(a)(1) and § 512.771(a)(2) to permit more than one ASM participant billing under the same TIN to join a common CCA, provided each ASM participant is named as a party to the CCA, with minor modifications to the regulatory text. We make a textual modifications to § 512.771(a)(1) from the proposed regulatory text to specify that the CCA must be exclusively between an ASM participant, or one or more ASM participants who reassign billing rights through the same TIN, and a primary care practice. We are modifying the final regulatory text at § 512.771(a)(2) to state that a primary care practice party must share one or more patients who are ASM beneficiaries with at least one ASM participant party to the collaborative care arrangement. This retains the substance of the proposal while making clear a CCA may be with one ASM participant regardless of whether that clinician reassigns billing rights.

(3) Requirement That CCA Parties Share a Patient Who Is an ASM Beneficiary

Sections 512.735(c)(2)(i) and 512.771(a)(2) require that parties to a CCA share a patient who is an ASM beneficiary. In the proposed rule, we proposed to retain the requirement at § 512.771(a)(2) that an ASM participant party or parties and the primary care practice party share at least one patient who is an ASM beneficiary. Under the proposal, this requirement would be satisfied if at least one that an ASM participant party or ASM participant parties and the primary care practice share a patient who is an ASM beneficiary would be satisfied so long as at least one shared patient who is ASM

beneficiary exists between any one ASM participant party to the CCA and the primary care practice party, regardless of the total number of ASM participants who are parties to that CCA.

The purpose of requiring the parties to share ''one or more'' patients who are ASM beneficiaries is to ensure a clear nexus exists between the CCA and coordination activities undertaken on behalf of shared ASM beneficiaries. In the absence of any shared ASM beneficiaries, there would be no common patient population with respect to which the parties could coordinate care consistent with the purpose of the CCA.

We also proposed to remove the term ''established'' from § 512.771(a)(2). Current § 512.771(a)(2) provides that, for purposes of satisfying the shared ASM beneficiary requirement, the ASM beneficiary must be an ''established'' patient. By contrast, the IA–2 specifications at § 512.735(c)(2)(i) do not include an ''established'' patient requirement. Upon further review, we concluded that the ''established'' qualifier is unnecessary and creates an inconsistency between § 512.771(a)(2) and the IA–2 specifications. We therefore proposed to remove the term ''established'' from § 512.771(a)(2) to align the CCA requirement with § 512.735(c)(2)(i).

Comment: A commenter supported the proposal to require the ASM participant or ASM participants and the primary care practice who are parties to the CCA share at least one patient who is an ASM beneficiary, agreeing that shared patients encourage collaboration and should be an expectation of the CCA. The commenter also agreed with the proposal to remove the term ''established.''

Response: We appreciate the support and agree that a shared patient relationship is fundamental to the purpose of a CCA.

We are finalizing our proposal at § 512.771(a)(2) that the primary care practice party share at least one patient who is an ASM beneficiary with at least one ASM participant party to the CCA, and finalizing the removal of the term ''established'' from § 512.771(a)(2) to conform with the IA–2 specifications at § 512.735(c)(2)(i).

(4) Requirement To Comply With Applicable Laws

We finalized in the CY 2026 PFS final rule at § 512.771(a)(5) that both parties to a CCA must comply with all applicable statutes, regulations, and guidance, including without limitation: Federal criminal laws; the False Claims Act (31 U.S.C. 3729 *et seq.*); the anti-kickback statute (42 U.S.C 1320a-7b(b)); the civil monetary penalties law (42 U.S.C. 1320a-7a); and the physician self-referral law (42 U.S.C. 1395nn).

We proposed to remove the illustrative list of legal authorities from § 512.771(a)(5) while retaining the requirement that parties to a CCA comply with all applicable statutes, regulations, and guidance (91 FR 43994). We invited comment on this proposal.

We did not receive public comments on this provision and therefore are finalizing without modification our changes to § 512.771(a)(5), which remove the illustrative list of legal authorities while retaining the requirement that all parties comply with applicable statutes, regulations, and guidance, and replacing ''[b]oth'' with ''[a]ll'' parties, as proposed.

(5) Restriction on Conditioning Remuneration on Referrals

In the CY 2026 PFS final rule, we established that neither the opportunity to enter a CCA nor the amount of any payment under a CCA may be conditioned, directly or indirectly, on the volume or value of past or anticipated referrals or business generated by, between, or among the parties to the arrangement or any other person (90 FR 49711). Separately, § 512.771(a)(2) requires that an ASM participant and a primary care practice party to a CCA share at least one patient who is an ASM beneficiary.

After review of our regulations, we became concerned that the current language at § 512.771(a)(6), when read together with the shared-beneficiary requirement at § 512.771(a)(2), could be interpreted to unnecessarily constrain the formation of the CCAs. The existence of shared ASM beneficiaries may reflect existing care relationships between ASM participants and primary care practices. As a result, § 512.771(a)(6) could be read to preclude prospective CCA parties from considering the existence of the very beneficiary-sharing relationship required under § 512.771(a)(2). We did not intend for this prohibition on conditioning entry into a CCA on referrals or business generated to prevent parties from considering whether they satisfy the shared-beneficiary requirement that is itself a requirement to CCAs.

Accordingly, we proposed to revise § 512.771(a)(6) to clarify that an ASM participant may consider, as a criterion for entering into a CCA, whether the ASM participant and a primary care practice share at least one patient who is an ASM beneficiary, provided that consideration of the shared-beneficiary relationship is for purposes of furthering the care coordination objectives of the CCA. Under the proposed revision, consideration of the existence of such a shared-beneficiary relationship would not, by itself, constitute conditioning the opportunity to enter into a CCA on the volume or value of referrals or other business generated.

We sought comment on this proposal and targeted revision intending to permit parties to consider whether they share one or more ASM beneficiaries for purposes of satisfying the shared-beneficiary requirement at § 512.771(a)(2) and furthering the purpose of the CCA. We also invited comment on whether our proposed approach is sufficiently clear and appropriately accommodates the operational realities of how practices contemplate establishing CCAs.

We received public comment on this proposal. The following is a summary of comments received and our responses.

Comment: A commenter agreed with the proposal that potential remuneration under a CCA should not be dependent on referral patterns or the generation of business based on referrals.

Response: We appreciate the commenter's agreement with our proposal.

After consideration of public comment, we are finalizing our proposed changes to § 512.771(a)(6) as proposed, which permits prospective parties to consider whether they share at least one patient who is an ASM beneficiary for purposes of furthering the care-coordination objectives of the CCA, while preserving the prohibition on conditioning participation or remuneration on the volume or value of past or anticipated referrals or other business generated.

(6) CCAs That Include the Exchange of Remuneration

In the CY 2026 PFS final rule, we stated our intent to allow ASM participants and their primary care partners to negotiate arrangements that are best suited to their practices (90 FR 49712). We also recognized that parties to a CCA may wish to include model-related incentives under a CCA to support shared accountability for the outcomes of ASM beneficiaries and to support coordination activities that benefit shared patients (90 FR 49713). Accordingly, we made the CMS-sponsored model arrangements safe harbor at § 1001.952(ii)(1) available under ASM at § 512.765 to protect remuneration exchanged under a CCA, provided that all requirements of the safe harbor at § 1001.952(ii)(1) and CCA

regulations at § 512.771 are met (90 FR 49713).

As stated in the proposed rule, we believe that provisions of § 512.771 that refer to payments exchanged under a CCA should be revised to apply more broadly to remuneration exchanged under a CCA to the extent applicable. Applying these provisions to remuneration would better align § 512.771 with § 512.765 and the CMS-sponsored model arrangements safe harbor at § 1001.952(ii)(1), both of which address remuneration. It would also more accurately reflect the full range of value that parties may exchange under a CCA, including monetary payments and in-kind items or services that support care coordination and other model-related activities.

Accordingly, we proposed to revise § 512.771 such that applicable provisions referencing payment instead reflect and apply more broadly to remuneration exchanged under a CCA. We believed this proposed modification would clarify that safe harbor protections, as well as requirements, apply to both monetary and in-kind remuneration exchanged under a CCA. We emphasized in the proposed rule that remuneration is not a required element of a CCA. Rather, parties to a CCAs may elect to include monetary or in-kind incentives that promote improvement activities or the goals of the model, provided that all applicable requirements are met (90 FR 49654). In-kind remuneration, such as shared data analytics platforms, care managers, or technology infrastructure could support the type of care coordination envisioned by ASM.

We also proposed to add new paragraph § 512.771(d) to introduce the additional requirements that apply when parties to a CCA elect to exchange remuneration. We would relocate conditions applicable to CCAs that elect to include remuneration such that they appear together under new paragraph § 512.771(d). We believe this construction would more clearly distinguish the regulatory requirements that apply to all CCAs from the additional conditions that apply when remuneration is exchanged under a CCA.

We received public comments on these proposals.

Comment: A few commenters stated that CMS appeared to be expanding application of the requirements under § 512.771 to include the broader category of remuneration, rather than just payment and expressed concern specifically in regard to application of the limitation described at § 512.771(d)(2) to in-kind remuneration, rather than just payment.

Response: We appreciate these comments and address these concerns in the section discussing § 512.771(d)(2), given that the expressed concerns are more closely associated with that specific provision rather than with the proposed change to expand the scope of the protections under the safe harbor more broadly.

After consideration of public comment, we are finalizing without modification the proposed changes to § 512.771, which revise references from ''payment'' to instead apply to ''remuneration'' as applicable. We are also finalizing our proposal to reorganize § 512.771 such that provisions applying to all CCAs are addressed together, and provisions that apply only to remunerative CCAs are addressed under § 512.771(d).

(a) Requirement for Remuneration To Reasonably Relate To CCA Purpose

In the CY 2026 PFS final rule, we finalized at § 512.771(a)(3) that a CCA must be entered into for the purpose of either furthering the ASM participant's performance in the improvement activities ASM performance category or furthering the clinical goals of the model as described by § 512.771(b) (90 FR 49712 through 49714).

We proposed to require at new § 512.771(d)(1) that any remuneration exchanged by the parties to a CCA be reasonably related to the purpose of the CCA, as defined in § 512.771(a)(3). We believed that aligning the purpose of any exchange of remuneration with the purpose of the CCA would support bona fide care coordination incentives while protecting program integrity.

We sought comment on our proposal at § 512.771(d)(1) to require that any remuneration exchanged under a CCA be reasonably related to the purpose of the arrangement, consistent with § 512.771(a)(3).

We did not receive public comment on the proposal at § 512.771(d)(1) to require that any remuneration exchanged under a CCA be reasonably related to the purpose of the arrangement as defined in § 512.771(a)(3) and therefore are finalizing it as proposed.

(b) Limitation on Remuneration

In the CY 2026 PFS final rule (90 FR 49712 through 49714), we finalized a limitation to the amount of any payments exchanged under a CCA at § 512.771(a)(7). Specifically, we finalized a requirement that any payment exchanged under a CCA must not exceed the sum total of the payment adjustments made to an ASM participant's claims for a given ASM payment year, which would be calculated based on the of application of the ASM payment adjustment factor to the ASM participant's payments for Medicare Part B covered professional services during the corresponding ASM payment year.

Our intent was to ensure that any financial or in-kind exchanges between CCA parties remain appropriately tied to patient outcomes and ASM's clinical goals (90 FR 49712).

We stated in the proposed rule our belief that the methodology finalized in the CY 2026 PFS final rule may be difficult for parties to operationalize and warrants revision. ASM payment adjustments are applied 2 CYs after the applicable ASM performance year. As a result, the information needed to determine the maximum amount permitted to be exchanged may not be available until well after the close of the applicable ASM performance year. This could create operational difficulty for parties that wish to exchange remuneration during or near the ASM performance year when care coordination activities are occurring.

Accordingly, we proposed updates to modify the temporal period used to calculate this limitation and provide for a reconciliation and repayment process to support compliance with the limitation. Consistent with our organizational update to § 512.771, we proposed to include the revised limitation on remuneration in new § 512.771(d)(2).

We proposed to tie the limitation on remuneration to performance-based payment adjustments made to an ASM participant's payments for Medicare Part B covered professional services using the ASM participant's ASM payment adjustment factor for the applicable ASM performance year, multiplied by the amount otherwise paid to the ASM participant by CMS under Medicare Part B for covered professional services during that ASM performance year. Stated another way, the proposed revision would change the temporal period used to calculate the limitation amount from the ASM payment year to the ASM performance year. Under both the current and proposed methodologies, the operative component is the ASM payment adjustment factor based on performance for the ASM performance year; the proposed revision changes only the temporal period used to calculate the limitation amount.

In accordance with our proposal permitting more than one ASM participant to join the same CCA, we

proposed to clarify that the remuneration limitation under proposed § 512.771(d)(2) would be calculated separately for each ASM participant that is a party to a CCA.

We also proposed additional safeguards to support consistent implementation of this limitation. Specifically, under proposed § 512.771(d)(2)(i), the CCA would be required to specify a methodology for identifying and calculating the total value of remuneration exchanged under the arrangement for the ASM performance year and determine whether the total value exceeds the applicable limitation. To the extent that remuneration is in-kind, we proposed at § 512.771(d)(2)(ii) that the valuation of such remuneration would be based on the offeror's costs using any reasonable accounting methodology, or the fair market value of the in-kind item or service. We believed this would support ASM participants that elect to exchange in-kind remuneration in ensuring such exchange complies with our regulations. Under proposed § 512.771(d)(2)(iii), the arrangement would be required to provide for reconciliation, if applicable, after the limitation is determined. Under proposed § 512.771(d)(2)(iv), if the total value of remuneration exchanged under the arrangement for the ASM performance year exceeds the limitation, the party that received the excess amount would be required to repay that excess amount to the other party within a reasonable time. We believed these provisions would promote consistent administration, clarify compliance requirements, and facilitate CMS oversight. We anticipated that these revisions to the remuneration limitation would establish a more viable pathway for parties to exchange remuneration during or close to the applicable ASM performance year by offering greater regulatory certainty that, should those exchanges exceed the final limitation, there would be a defined mechanism to reconcile the difference later.

We also recognized the inherent complexity with a limitation based on a mathematical formula as described in proposed § 512.771(d)(2) in the context of in-kind remuneration. Valuing in-kind remuneration to ensure it does not exceed the calculated threshold, and 'repaying' excess in-kind value during the reconciliation process, may present operational difficulties that could impede good faith exchanges of in-kind items or services intended to support the purpose of the CCA. We considered but did not propose an alternative where the limitation in proposed § 512.771(d)(2) would apply only to monetary payments (or cash equivalents) exchanged under a CCA. Under such alternative, we would establish a separate limitation for in-kind remuneration, such as requiring that any in-kind items or services exchanged meet a fair market value and commercial reasonableness standard rather than a limitation based on a dollar amount. While a separate safeguard tailored to in-kind remuneration could ease operational burden for ASM participants and their primary care partners, we believe that having one mathematical formula for valuing any remuneration exchanged under a CCA would be simpler for parties to CCAs to implement and therefore did not propose this approach.

We sought comment on these proposals.

We received public comments on these proposals. The following is a summary of the comments we received and our responses.

Comment: A few commenters opposed applying the existing payment limitation more broadly to all remuneration exchanged under a CCA. A commenter stated that extending the limitation to in-kind support could make arrangements involving resources such as care managers difficult to operationalize, particularly where an ASM participant receives a negative payment adjustment and could effectively require a primary care practice to compensate an ASM participant for the value of in-kind support, noting that it appeared CMS was expanding the scope of the limitation in the proposed rule. Furthermore, another commenter expressed concern that this limitation would require practices to value and document in-kind arrangements that may lack published market-pricing benchmarks, making valuation complex and potentially contentious. Lastly, commenters recommended that CMS issue sub-regulatory guidance describing acceptable methodologies for valuing in-kind CCA remuneration, eliminate the limitation all together, or establish a fixed dollar threshold

Response: We appreciate the commenters' concerns and questions regarding this proposal. We did not intend to create additional burden or limit bona fide in-kind remuneration exchanged to advance a clinical goal of ASM in a manner that makes the provision of in-kind support impractical. We did not propose to establish a fixed dollar threshold however we may consider this suggestion in the future.

We are finalizing § 512.771(d)(2) as proposed. This provision describes the upper limit of remuneration exchanged under a CCA and describes a reconciliation process if the amount exchanged exceeds the limitation once it can be calculated.

With experience implementing ASM, we may modify the limitation on remunerative CCAs described through future rulemaking if we determine codified limitations present unnecessary and unintended barriers.

(c) Other Requirements for Remuneration Exchanged Under a CCA

We finalized in the CY 2026 PFS final rule that any payment exchanged under a CCA must be solely between the parties and be made by check, electronic funds transfer, or another traceable cash transaction (§ 512.771(a)(8)) (90 FR 49712 through 49714). Consistent with our organizational update to § 512.771, we proposed to include this requirement, with revisions to address remuneration more broadly, in new § 512.771(d)(3).

Specifically, we would require that any remuneration exchanged under a CCA be solely between the parties and that, to the extent the exchange is a monetary payment, payment must be made by check, electronic funds transfer, or other traceable transaction at § 512.771(d)(3).

We sought comment on these proposals.

We did not receive public comments on the proposal to relocate and revise the traceability requirement at new § 512.771(d)(3) and therefore are finalizing changes as proposed.

(d) Documentation Requirements

We finalized a requirement that ASM participants maintain contemporaneous documentation regarding all CCAs, including the relevant agreement and date and amount of payment at § 512.771(a)(11).

We proposed to update documentation requirements to better support ASM participants and their primary care partners in their compliance with applicable regulations and to update references to conform with other changes proposed under § 512.771, including that we proposed to redesignate existing §§ 512.771(a)(11) to 512.771(a)(9).

Specifically, we proposed to revise the documentation requirement at proposed revised § 512.771(a)(9) such that an ASM participant would be required to maintain contemporaneous documentation, in accordance with § 512.135, regarding all CCAs entered into, records of all remuneration exchanged for each ASM participant under a CCA, a description of the

remuneration, the value of the remuneration, the methodology for determining the value of any in-kind remuneration, and the date on which the remuneration was exchanged.

We also proposed to require documentation of the identity of each ASM participant that would be a party to the CCA. We proposed this change to conform with our proposal that a CCA may include more than one ASM participant to promote appropriate recordkeeping regarding the identity of each ASM participant covered by a CCA.

Together, we believed these proposed changes would clarify the minimum documentation that must be maintained by an ASM participant, better support compliance, and reduce ambiguity regarding documentation when a CCA includes multiple ASM participants as parties. These proposed changes would be reflected in proposed revised § 512.771(a)(9), if finalized.

We considered requiring that ASM participants maintain documentation supporting that all ASM participants who join the same CCA reassign their billing rights through the same TIN as a safeguard supporting compliance with our proposal that, if more than one ASM participant joins as a party to a CCA, such ASM participants must all reassign billing rights to the same TIN. We did not propose this approach as we believe we would be able to verify this information based on data already available to us.

We sought comment on these proposed changes.

Comment: Several commenters recommended CMS keep documentation requirements as simple as possible, particularly for arrangements involving multiple ASM participants. One commenter encouraged CMS to recognize existing care-coordination infrastructure and to further simplify documentation and record-retention requirements so that ASM participants can focus resources on clinical collaboration rather than administrative activities of limited incremental value to beneficiaries.

Response: We appreciate commenters' interest in keeping documentation requirements simple. The requirements at revised § 512.771(a)(9) specify the minimum documentation an ASM participant must maintain—contemporaneous documentation of relevant written agreements. This is the primary documentation requirement unless the CCA elects to include remuneration. Where remuneration is exchanged, we proposed to require a record and description of the remuneration, its value, the methodology for valuing any in-kind remuneration, and the date exchanged. We believe these requirements reflect the minimum necessary to support compliance and oversight, particularly where multiple ASM participants are parties to a single CCA. We do not believe these provisions establish overly burdensome documentation requirements and that such records are necessary to support compliance.

Comment: A commenter requested that CMS craft regulations regarding remuneration and documentation requirements with technology-enabled coordination in mind, noting that much of the coordination these arrangements contemplate occurs asynchronously through shared care plans, event notifications, electronic consultation, and shared access to monitoring data. The commenter recommended that documentation expectations be satisfiable through the electronic record rather than through a parallel paper trail.

Response: We appreciate the suggestion and agree with the commenter on the importance of technology-enabled coordination. The documentation requirements at revised § 512.771(a)(9) require an ASM participant to maintain contemporaneous documentation of all CCAs, including the written agreement and specified information regarding remuneration, if included under a CCA. Our regulations do not prescribe the medium in which the documentation must be maintained. ASM participants may satisfy these requirements through appropriate electronic means, including existing electronic health record and data systems, rather than a separate paper record.

After consideration of public comments, we are finalizing our policies at § 512.771(a)(9) as proposed, which make updates to the documentation requirements for remunerative CCAs to include additional elements describing any remuneration, its value, the methodology for valuing any in-kind remuneration, and the date exchanged.

j. Medicare Program Waivers

In the CY 2026 PFS final rule, we finalized at § 512.775 a waiver of MIPS reporting obligations for an ASM participant in each ASM performance year in which the ASM participant meets ASM eligibility criteria at § 512.710(b), except as specified in § 512.710(a)(2). Section 512.710(a)(2) addresses circumstances in which an ASM participant does not meet eligibility requirements for mandatory participation for a given ASM performance year.

We proposed to update § 512.775 to reflect our policy that when an ASM participant is excepted from specified ASM requirements pursuant to § 512.710(c), the MIPS waiver would similarly not apply in ASM performance years in which an exception applies. Specifically, we proposed to update § 512.775(a) to replace the reference to ''§ 512.710(a)(2)'' with ''§ 512.710(a)(2) or § 512.710(c)''. We sought comment on this proposal.

We received public comments on these proposals. The following is a summary of the comments we received and our responses.

Comment: A commenter supported CMS' efforts to align ASM regulations with CMS' stated policy. The commenter requested clarification how the MIPS waiver will apply as traditional MIPS sunsets and MVP reporting becomes required in CY 2029, including whether any ASM reporting waiver would extend to MVP reporting obligations.

Response: We appreciate this comment. We do not intend the transition to MIPS Value Pathways (MVPs) to impact the waiver of MIPS performance and associated payment adjustments for purposes of ASM under § 512.775. The transition to MVPs envisions moving MIPS eligible clinicians to MVPs, and thus we do not believe at this time that revisions to our regulatory text are necessary to account for this transition. However, we may revisit the regulatory text in the future if it would add clarification that the waiver's scope applies to MVP reporting, once the transition occurs.

After consideration of the comments, we are finalizing § 512.775 as proposed.

3. Technical Corrections to Provisions of ASM

a. Technical Corrections to ASM Risk Level

We are taking this opportunity to make a technical correction to § 512.750(c)(1)(i) to restore regulatory text at paragraphs (A) through (E) of § 512.750(c)(1)(i) that were erroneously removed from the Code of Federal Regulations (CFR).

On March 12, 2026, we published a correcting amendment in the **Federal Register** (91 FR 12071) titled ''Medicare and Medicaid Programs; CY 2026 Payment Policies Under the Physician Fee Schedule and Other Changes to Part B Payment and Coverage Policies; Medicare Shared Savings Program Requirements; and Medicare Prescription Drug Inflation Rebate Program; Correction'' (hereinafter, March 2026 Correcting Amendment).

The March 2026 Correcting Amendment was intended to correct typographical and technical errors in the CY 2026 PFS final rule. However, the March 2026 Correcting Amendment contained an erroneous amendatory instruction for § 512.750(c)(1)(i). The instruction was intended to revise only the introductory text of § 512.750(c)(1)(i) but instead inadvertently removed paragraphs (A) through (E) of § 512.750(c)(1)(i) from the CFR. This removal was not intended.

Accordingly, we are restoring § 512.750(c)(1)(i)(A) through (E) through this final rule.

(1) Waiver of Proposed Rulemaking and Delay in Effective Date

We ordinarily publish a notice of proposed rulemaking in the **Federal Register** to provide a period for public comment before the provisions of a rule take effect, in accordance with section 553(b) of the Administrative Procedure Act (APA) (5 U.S.C. 553(b)). However, this notice-and-comment procedure may be waived if the Secretary finds, for good cause, that notice and comment is impracticable, unnecessary, or contrary to the public interest, and incorporates a statement of that finding and the reasons therefor in the notice.

We find good cause to waive notice and comment under 5 U.S.C. 553(b)(B) and section 1871(b)(2)(C) of the Act to restore paragraphs (A) through (E) of § 512.750(c)(1)(i). Notice and comment is unnecessary because the regulatory text we are restoring was previously proposed, subject to public comment (90 FR 32609), and finalized in the CY 2026 PFS final rule (90 FR 49688). The March 2026 Correcting Amendment did not intend to remove or substantively modify § 512.750(c)(1)(i)(A) through (E), and such revision was not discussed nor described in the preamble of that document.

We also find good cause to waive the 30-day delay in effective date under 5 U.S.C. 553(d)(3) and section 1871(e)(1)(B)(ii) of the Act because application of a delay would be impracticable Delaying restoration of the regulatory text at § 512.750(c)(1)(i)(A) through (E) would unnecessarily prolong a discrepancy between the CFR and our policy previously finalized through notice-and-comment rulemaking under the CY 2026 PFS and could result in confusion among the public and affected parties.

Accordingly, this final rule restores paragraphs (A) through (E) of § 512.750(c)(1)(i) as finalized in the CY 2026 PFS final rule.

b. Technical Correction to Small Practice Definition

We are also making a correction to the definition of ''small practice'' at § 512.705 such that a small practice means ''a TIN consisting of 15 or fewer clinicians at the time CMS identifies ASM participants for an ASM performance year as described at § 512.710(g)''. The definition at § 512.705 finalized in the CY 2026 PFS states that a small practice is ''a practice consisting of 15 or fewer clinicians . . .''.

In the CY 2027 PFS proposed rule preamble, we described a small practice as ''a TIN with 15 or fewer clinicians'' (91 FR 43971). This statement reflects our policy intent and how we will operationalize ASM's policies that may involve a small practice. We did not propose to amend § 512.705 in the CY 2027 PFS proposed rule to expressly provide that the operative unit for defining a ''small practice'' is the TIN. However, using the TIN as the operative unit of a ''practice'' for purposes of identification is supported by the ASM regulatory scheme and by broader Medicare policies and is consistent with our policy intent.

We find good cause to waive notice-and-comment rulemaking for finalizing the change to the definition of ''small practice'' such that it is defined at the TIN-level as notice-and-comment is unnecessary. As explained earlier in this section of this final rule, this amendment makes clear that we will use the TIN as the unit for identifying a small practice and brings our regulatory text into alignment with our preamble statements (91 FR 43971, 91 FR 43972) and policy intent. This amendment does not adopt a different mechanism for counting clinicians, change the 15-clinician threshold, or modify the time at which practice size is determined. Nor does this amended definition change which practices qualify for small-practice treatment or alter the applicable scoring or reporting policies. An additional opportunity for public comment is unnecessary because the amendment simply aligns the regulatory definition with the policy intent as described in preamble statements rather than establishing or changing substantive criteria for small-practice treatment.

Accordingly, we are finalizing a correction to ''small practice'' at § 512.705 to better reflect our intent and policy such that the definition reflects that a small practice means a TIN consisting of 15 or fewer clinicians.

E. Limiting Medicare Coverage of Certain Individuals

1. Background

On July 4, 2025, Public Law 119–21, which we refer to as the ''Working Families Tax Cut'' (WFTC) legislation, was enacted. Section 71201 of the WFTC legislation amended title XVIII of the Social Security Act (the Act) to add a new section 1899C, which provides that, subject to subsection 1899C(b) of the Act, an individual may be entitled to, or enrolled for, Medicare benefits only if the individual is in one of the following four groups: (1) a citizen or national of the United States; (2) an alien who is lawfully admitted for permanent residence under the Immigration and Nationality Act (INA) (lawful permanent resident or LPR); (3) an alien who has been granted the status of Cuban and Haitian entrant (CHE);[207] or (4) an individual who lawfully resides in the United States[208] in accordance with a Compact of Free Association (COFA migrant).

Prior to enactment of the WFTC legislation, benefits payable under the Medicare program for noncitizens generally depended on whether the individual was ''lawfully present.'' Section 401 of the Personal Responsibility and Work Opportunity Reconciliation Act of 1996 (PRWORA) (Pub. L. 104–193, August 22, 1996), codified at 8 U.S.C. 1611, generally provides that, subject to certain exceptions, only ''qualified aliens'' are eligible for Federal public benefits. However, section 401(b)(3) of PRWORA provides that Medicare benefits under title XVIII of the Act are not limited solely to ''qualified aliens,'' but instead may be available to individuals who are lawfully present in the United States. Section 401(b)(2) of PRWORA similarly provides that noncitizens who are lawfully present in the United States may be eligible for benefits payable under title II, such as Social Security retirement or disability insurance benefits. Historically, before paying Medicare or title II benefits, the Social Security Administration (SSA) used a common process to verify an individual's lawful presence status by determining whether the applicant was a U.S. citizen or was otherwise lawfully present in the United States and whether the individual resided in the United States. The SSA maintains a large set of policy and operational guidance, called Program Operations

[207] As defined in section 501(e) of the Refugee Education Assistance Act of 1980 (Pub. L. 96–422).

[208] See section 402(b)(2)(G) of the Personal Responsibility and Work Opportunity Reconciliation Act of 1996 (PRWORA).

Manual System (POMS), that CMS and the SSA update as needed. The SSA's procedures for verifying lawful presence before payment of title II and Medicare benefits are delineated in POMS. Prior to the statutory changes to Medicare eligibility made by the WFTC legislation, a noncitizen could qualify for payment of Medicare benefits if they met all other eligibility criteria and the individual was in an immigration status or category considered lawfully present under 8 CFR 1.3(a), which encompasses a broad range of immigration classifications. These ''lawfully present'' categories included, but were not limited to, the following:

- An alien who is an LPR.[209]
- An alien who is granted asylum.[210]
- An alien admitted to the United States as a refugee.[211]
- An alien who is paroled into the United States for a period of at least 1 year.[212]
- An alien who is a Cuban and Haitian entrant.[213]
- An individual who lawfully resides in the United States under a Compact of Free Association (COFA).[214]

The WFTC legislation did not modify the requirements for payment of title II benefits under sections 202(y) and 223 of the Act. As such, noncitizens who are lawfully present in the United States, as defined by 8 CFR 1.3(a), may remain eligible for payment of title II benefits. As a result, eligibility for payment of title II benefits is no longer coextensive with eligibility for payment of Medicare benefits under title XVIII of the Act for certain noncitizens. Because continued reliance on the lawful presence verification framework used to determine noncitizen eligibility for payment of title II benefits would conflict with section 1899C of the Act when applied to Medicare, we proposed to establish Medicare-specific definitions and related enrollment and termination criteria concerning citizenship, nationality, and immigration status.

2. Limiting Coverage Under Medicare Part A and Part B to Certain Individuals

a. Amending the Eligibility Criteria for Part A and Part B

Sections 226 and 226A of the Act establish the conditions under which individuals are entitled to Medicare Part A benefits based on attainment of age 65, disability, or end-stage renal disease (ESRD). Individuals entitled to Medicare Part A under these provisions are not required to pay premiums for such coverage (known herein as premium-free Medicare Part A) and may elect to enroll in Medicare Part B. In general, individuals entitled to title II retirement benefits prior to attaining age 65 or entitled to title II disability benefits, upon attainment of age 65 or after satisfying any applicable waiting period, respectively, are automatically enrolled in premium-free Medicare Part A and will be enrolled automatically in Medicare Part B unless they decline Medicare Part B enrollment.[215] There are no statutory requirements for citizenship, nationality, immigration status, or residency in sections 226 and 226A of the Act. Eligibility determinations, including citizenship and lawful presence verification, for premium-free Medicare Part A have historically been made through the title II lawful presence verification framework administered by the SSA.

Section 1818 of the Act establishes the conditions under which certain individuals who are not entitled to premium-free Medicare Part A may enroll in the hospital insurance program by paying a monthly premium (herein referred to as premium Medicare Part A). Under section 1818 of the Act, an individual who has attained age 65, enrolled in Medicare Part B, and is not otherwise entitled to premium-free Medicare Part A may enroll if the individual is a resident of the United States and is either a citizen of the United States or an alien lawfully admitted for permanent residence who has resided continuously in the United States for the 5 years immediately preceding the month in which the individual applies for enrollment.

Section 1836 of the Act establishes eligibility requirements for Medicare Part B (also known as supplementary medical insurance). Under section 1836 of the Act, an individual may enroll in Medicare Part B if the individual is entitled to Medicare Part A or, alternatively, has attained age 65, is a resident of the United States and is either a citizen of the United States or an alien lawfully admitted for permanent residence who has resided continuously in the United States for the 5 years immediately preceding the month in which the individual applies for enrollment. The WFTC legislation did not eliminate the 5-year continuous residency requirement for LPRs in sections 1818(a)(3) and 1836(a)(2) of the Act and, as a result, we did not propose to alter this requirement. In other words, LPRs who meet the 5-year continuous residency requirement and other applicable Medicare requirements would maintain their Medicare benefit.

Similar to premium-free Medicare Part A, enrollment in Medicare Part B under section 1836(a)(1) of the Act has historically been administered in coordination with the SSA's lawful presence verification framework for confirming citizenship, nationality, lawful presence, and residency status for payment of title II benefits. However, section 1899C of the Act establishes specific statutory categories of individuals who may be entitled to, or enrolled in, Medicare under title XVIII of the Act. As a result, title II's lawful presence requirements no longer fully align with the Medicare Part B eligibility framework established by section 1899C of the Act.

To align Medicare eligibility regulations with section 1899C of the Act, we proposed to add a new definition of ''eligible noncitizen'' at 42 CFR 400.200 that includes the categories of noncitizens eligible for Medicare under sections 1899C(a)(2) through (4) of the Act. Specifically, the proposed definition would state that an ''eligible noncitizen'' is an individual who is (1) an alien lawfully admitted for permanent residence under the INA; (2) an alien who has been granted the status of CHE, as defined in section 501(e) of the Refugee Education Assistance Act of 1980 (Pub. L. 96–422); or (3) an individual who lawfully resides in the United States in accordance with a COFA referred to in 8 U.S.C. 1612(b)(2)(G).

The proposed definition of ''eligible noncitizen'' was not intended to apply to noncitizen U.S. nationals who are expressly eligible for Medicare under section 1899C(a)(1) of the Act. The proposed definition of ''eligible noncitizen'' applicable to Medicare eligibility would be distinguishable from the immigration status or category criteria in 8 CFR 1.3 applicable to noncitizen eligibility for title II benefits, which continues to be based on the ''lawfully present'' framework in section 401(b)(2) of PRWORA.

Further, we proposed to amend regulations at 42 CFR part 406 (Medicare Part A) and 42 CFR part 407 (Medicare Part B) to incorporate the proposed definition of ''eligible noncitizen.'' We proposed to add that, effective July 4, 2025, an individual must be a citizen or national of the United States or an eligible noncitizen

[209] Under the Immigration and Nationality Act (INA) [8 U.S.C. 1101 *et seq.*].

[210] Under section 208 of INA [8 U.S.C. 1158].

[211] Under section 207 of INA [8 U.S.C. 1157].

[212] Under section 212(d)(5) of INA [8 U.S.C. 1182(d)(5)].

[213] As defined in section 501(e) of the Refugee Education Assistance Act of 1980 (Pub. L. 96–422).

[214] Public Law 99–239; Public Law 99–658; see also 8 U.S.C. 1612(b)(2)(G).

[215] Section 1837 of the Act and the enrollment process outlined in 42 CFR 407.17.

as a basis for entitlement. These changes were proposed to be added or included in the following sections:

• Premium-Free Medicare Part A:

++ New paragraph (a)(2) was proposed to be added to § 406.5 (Basis of eligibility and entitlement). This proposed new paragraph would add the requirement that, in addition to satisfying the applicable age, disability, or ESRD-based entitlement criteria, an individual must also be a citizen or national of the United States or an eligible noncitizen. This revision would align the eligibility and entitlement criteria for premium-free Medicare Part A with section 1899C(a) of the Act.

++ New paragraph (a)(2) was proposed to be added to § 406.10 (Individual age 65 or over who is entitled to Social Security or Railroad Retirement benefits, or who is eligible for Social Security benefits). This proposed new paragraph would clarify that individuals age 65 or over who otherwise qualify for premium-free Part A through Social Security or Railroad Retirement pathways must also satisfy the citizenship, nationality, or immigration status or category requirements established by section 1899C(a) of the Act. This would ensure that automatic or application-based entitlement under this section is limited to U.S. citizens, U.S. nationals, and eligible noncitizens.

++ Paragraph (b)(2) was proposed to be revised in § 406.11 (Individual age 65 or over who is not eligible as a Social Security or Railroad Retirement benefits beneficiary, or on the basis of government employment). This proposed revision would align the eligibility language in § 406.11 with section 1899C(a) of the Act and clarify that individuals qualifying under this pathway must also satisfy the citizenship, nationality, or immigration status or category standards in section 1899C(a) of the Act. This change would ensure that entitlement is not available under this section unless the individual is a U.S citizen, U.S. national, or eligible noncitizen.

++ New paragraph (a)(2) was proposed to be added to § 406.12 (Individual under age 65 who is entitled to Social Security or Railroad Retirement disability benefits). This proposed new paragraph would provide that individuals under age 65 who otherwise qualify for premium-free Part A on the basis of disability must also meet the citizenship, nationality, or immigration status or category requirements of section 1899C(a) of the Act. This would align the regulation implementing premium-free Part A entitlement based on disability with the requirements in section 1899C(a) of the Act.

++ New paragraph (c)(4) was proposed to be added to § 406.13 (Individual who has ESRD). This proposed new paragraph would clarify that individuals who otherwise qualify for premium-free Part A on the basis of ESRD must also be a citizen or national of the United States or an eligible noncitizen. This revision would align the regulation implementing premium-free Part A entitlement based on ESRD with the eligibility limitations in section 1899C(a) of the Act.

• Premium Medicare Part A:

++ In § 406.20 (Basic Requirements), paragraphs (b)(2)(i) and (b)(2)(ii) were proposed to be revised and new paragraphs (b)(2)(iii), (b)(2)(iv), and (c)(5) were proposed to be added. These proposed revisions would update the eligibility requirements for enrollment in premium Part A to incorporate the proposed definition of eligible noncitizen. These changes would align premium Part A eligibility with section 1899C(a) of the Act by clarifying that only U.S. citizens, U.S. nationals, and eligible noncitizens may enroll under this pathway.

• Medicare Part B:

++ New paragraphs (a)(2)(ii)(A) through (D) were proposed to be added in § 407.10 (Eligibility to Enroll). These proposed revisions would update the Part B enrollment regulation to incorporate the proposed definition of eligible noncitizen. These proposed changes would align the Part B eligibility regulation with section 1899C(a) of the Act and clarify that only U.S. citizens, U.S. nationals, and eligible noncitizens may enroll under this pathway.

We noted in the proposed rule that the WFTC legislation also has implications for the Medicare Part B Immunosuppressive Drug benefit (Part B–ID) under section 1836(b) of the Act. Part B–ID is a limited Part B benefit that provides coverage only for immunosuppressive drugs for certain individuals whose entitlement to Medicare based solely on end-stage renal disease (ESRD) ended 36 months after a successful kidney transplant and who do not have other disqualifying health coverage. Although eligibility for Part B–ID is governed by the specific criteria set forth in § 407.55, individuals seeking to enroll in, or remain enrolled in, Part B–ID must also satisfy the citizenship, nationality, or immigration status or category requirements in section 1899C(a) of the Act. Accordingly, we proposed to revise § 407.55 (Eligibility to Enroll) to add new paragraphs (a)(1) and (2) to clarify that eligibility for Part B–ID is also subject to the limitations established by section 1899C(a) of the Act.

We received a number of comments that were outside the scope of the policies discussed in the proposed rule (for example, general immigration policies, general opposition or support of the WFTC, effects on safety-net providers, eligibility requirements for other HHS programs, the broader health care system, and employers). We will not be addressing those comments in this rulemaking.

We also received a number of comments on the changes to the eligibility criteria as well as general comments on CMS and the SSA's implementation of these statutory changes. The following is a summary of the general comments we received and our responses.

Comment: Multiple commenters expressed general opposition to, or concern regarding, implementation of section 71201 of the WFTC legislation and the mandated changes to the eligibility criteria for all parts of the Medicare program. Some commenters, while noting CMS's obligation to implement the statute, urged CMS to use its available administrative authority to minimize harm with the implementation of these provisions and take into consideration the disproportionate impact on certain populations that have greater communication barriers, resources, and physical and mental health care needs and the potential harm to broader community health, such as preventable hospitalizations and communicable disease outbreaks.

Response: We acknowledge the commenters' feedback. The WFTC legislation established section 1899C of the Act, which requires that, in order to be enrolled or entitled to Medicare, an individual must be a U.S. citizen or national, a lawful permanent resident, an alien who is a CHE, or a COFA migrant, and these new eligibility requirements apply to all parts of Medicare. As noted by the commenters, CMS is obligated to implement the new Medicare eligibility requirements as established by section 1899C of the Act.

To help beneficiaries impacted by the statutory changes prepare for implementation of these changes, CMS, along with the SSA, plans to conduct an outreach effort for impacted individuals, caregivers, and relevant interested parties including healthcare providers, taking into account the needs of the impacted population, such as using existing resources to address language barriers. In addition, we are finalizing policies in this final rule to notify those

who will be terminated from coverage due to not meeting requirements in section 1899C of the Act and to provide information regarding how individuals can regain Medicare should they become eligible again. Finally, we appreciate commenters' concerns regarding potential broader community health effects, including preventable hospitalizations and communicable disease outbreaks. However, these potential downstream effects are beyond the scope of this rulemaking.

Comment: Multiple commenters noted that implementation of these new Medicare requirements are being implemented at the same time similar changes are occurring with Medicaid and eligibility for premium tax credits (PTCs) as enacted in sections 71109 and 71301 of the WFTC legislation, respectively. Commenters also expressed concern that the cumulative effect of these coverage changes could increase administrative burdens on healthcare providers and disproportionally impact dual-eligible populations. A commenter also suggested that CMS coordinate implementation and information provided regarding the Medicaid and Medicare eligibility changes to limit disruption on dual-eligible enrollees.

Response: We acknowledge the commenters' concerns. Implementation of changes to Medicaid and changes to eligibility for PTCs in the WFTC legislation and the potential impact due to loss of coverage from those two programs are outside of scope of this final rule. We note that the related statutory provisions have different applicability dates: section 71109 applies beginning October 1, 2026; section 71302 applies for taxable years beginning after December 31, 2025; and section 71301 applies for plan years beginning on or after January 1, 2027. These differing statutory timelines limit the extent to which implementation of the Medicare, Medicaid, and Marketplace changes can be aligned. We acknowledge that the cumulative changes could impact health care providers and dual-eligible enrollees disproportionately. CMS plans to conduct outreach to impacted individuals, caregivers, providers, plans, and other interested parties on the changes to Medicare eligibility. We plan to include states and those serving dual-eligible enrollees who are losing eligibility for both Medicare and Medicaid in our outreach efforts.

Comment: A commenter requested that CMS and HHS urge Congress to grandfather individuals who were already Medicare beneficiaries when the law was enacted and who had Medicare taxes withheld for many years. The commenter also requested clarification on the treatment of individuals pursuing lawful permanent residence status and if Medicare coverage could continue without interruption while status is pending. Another commenter requested clarification on whether individuals who were granted asylum and are currently enrolled in Medicare would be impacted.

Response: We appreciate the commenters' concerns. The new eligibility criteria in section 1899C of the Act does not provide the authority to grandfather individuals enrolled into Medicare prior to enactment. The commenter's request that CMS and HHS advocate for such a legislative change is outside the scope of this rulemaking, which implements section 1899C as enacted. Further, the new eligibility criteria require that an individual be either a U.S. citizen or national or an eligible non-citizen in order to be enrolled or entitled to Medicare, and once this rule goes into effect, coverage must be terminated in accordance with this final rule if an individual does not meet that requirement. Further, noncitizens who do not meet the new eligibility requirements set forth in section 1899C of the Act will no longer be eligible to be entitled to or enrolled in Medicare, including individuals granted asylum, unless the individual also has an immigration status or category that meets the requirements of section 1899C(a). Further, the fact that an individual has applied for an immigration status or category that, if approved, would meet the requirements of section 1899C(a) does not, in itself, confer eligibility. In other words, a pending application for a particular immigration status or category is not sufficient. An individual's application for an immigration status or category that meets the requirements of section 1899C(a) must have been granted.

Comment: A commenter expressed concern that the title and abstract of the proposed rule did not specifically identify the provisions addressing Medicare eligibility based on citizenship, nationality, or immigration status or category and that beneficiaries, immigrant rights organizations, and other interested parties primarily focused on Medicare eligibility could therefore have difficulty identifying or locating these provisions.

Response: We acknowledge the commenter's concern. Including this provision, ''Limiting Medicare Coverage of Certain Individuals,'' in the Physician Fee Schedule proposed rule provided CMS with the opportunity to reach a broad audience of interested parties and ensure timely implementation of the new statutory requirements, especially in regard to the grace period population outlined in Section 1899C(b)(2)(A) and (B). In addition to being included in the broader proposed rule, this provision was highlighted in fact sheets and outreach materials on the proposed rule. Based on the comprehensive feedback we received from a variety of stakeholders on the proposed rule, we are confident that interested parties were able to locate these provisions and provide thoughtful feedback.

Comment: Multiple commenters requested that CMS and the SSA conduct robust outreach and interested parties' engagement before implementing section 1899C of the Act. Commenters' recommendations include training, educational materials, frequently asked questions (FAQs), phone scripts, provider education, and other resources to organizations that will assist affected individuals, including State Health Insurance Assistance Programs (SHIPs), Aging and Disability Resource Centers (ADRCs), Area Agencies on Aging, legal services organizations, immigrant-serving organizations, disability and aging organizations, community health centers, religious organizations, Medicare providers, Medicare Advantage (MA) organizations, Part D sponsors, Medicaid managed care organizations, and Programs of All-Inclusive Care for the Elderly (PACE) organizations.

Response: We plan to conduct a robust outreach and education effort that is accessible, multimodal, and broad in reach. CMS and the SSA have been working to develop a comprehensive communications plan to support implementation of section 1899C of the Act and to provide timely and understandable information to affected individuals and the organizations that assist them. We also plan to use existing communication and education channels, including the Medicare Learning Network (MLN), to provide information and educational resources to Medicare providers and other interested parties. We have also notified the SHIPs of the changes in eligibility and are planning additional communications to the provider community. CMS will continue to coordinate with the SSA and other partners, as appropriate, to refine materials and outreach activities.

Comment: Several commenters noted the impact on providers needing to verify Medicare eligibility and to provide guidance to their patients who lose Medicare due to not meeting the requirements in section 1899C of the

Act. Commenters requested guidance for providers and other interested parties that includes information on the implementation timing, guidance on eligibility file updates, and on processes related to the new enrollment periods.

Response: We acknowledge the commenters' request for guidance. As mentioned above, CMS and the SSA plan to conduct a robust outreach and education effort that includes using MLN to share relevant information with providers regarding the implementation of the new eligibility criteria, including information on timing and enrollment periods. CMS will take the feedback provided by the commenters into account when developing future communications. Regarding eligibility verification, there are no changes proposed to the HIPAA Eligibility Transaction System (HETS) associated with the implementation of section 1899C of the Act and providers should continue to use this system to verify Medicare eligibility using existing procedures.

Comment: A commenter requested that CMS work with the SSA to establish new POMS processes and procedures for implementing section 1899C of the Act and protecting individuals affected by the new Medicare eligibility restrictions. The commenter also requested that the new POMS provisions be made available to the public for comment before implementation.

Response: CMS recognizes that implementation of section 1899C of the Act will require coordination with the SSA and clear operational instructions for the review, notice, termination, correction, and enrollment processes. CMS will coordinate with the SSA, as appropriate, regarding updates to operational guidance, including POMS instructions, needed to support implementation of section 1899C of the Act. As POMS represent internal agency guidance and technician instructions, POMS are not made available to the public prior to publication.

CMS will continue to coordinate with the SSA, as appropriate, to support accurate implementation of section 1899C of the Act and to provide information needed by affected individuals, the SSA staff, and other partners.

Comment: Multiple commenters recommended that CMS engage in ongoing data analysis and monitoring of the implementation of section 1899C of the Act. Commenters recommend tracking the number of notices sent, eligibility determinations corrected prior to termination and actual terminations due to ineligibility based on the criteria in section 1899C(a) of the Act. A commenter also recommended that CMS track related appeals, challenges, complaints, requests for language access, use of the newly established SEP, and track the dates between attaining qualifying eligibility status for Medicare and reinstating coverage, which should be considered a core implementation outcome. This commenter recommended that where legally permissible and statistically reliable, these outcomes should be examined by State, language, disability status, race and ethnicity, and other relevant characteristics.

Commenters also recommended monitoring impacts to individuals after Medicare coverage is terminated including tracking gaps in coverage, uncompensated care due to loss of Medicare, ability to acquire alternative health coverage, emergency health care use, and interruptions in care.

Multiple commenters suggested that CMS make the number of individuals who lose or regain Medicare eligibility due to the implementation of section 1899C of the Act publicly available. In addition, several commenters also recommended that CMS report on a variety of measures publicly, including terminations, corrections, reenrollment, coverage gaps, language assistance, complaints, and the impact of uncompensated care particularly on safety-net providers, and unnecessary use of acute care due to loss of Medicare. A commenter recommended using CY 2026 as a baseline for these measurements and reporting annually on these measures compared against the baseline year.

Response: We thank the commenters for their suggestions on monitoring and oversight of the implementation of section 1899C of the Act and the recommendation to report data and analysis publicly. CMS and the SSA track a number of internal measures to monitor enrollment and eligibility in Medicare and will utilize existing resources to monitor the number of individuals who receive notice of termination, if terminations become effective, and those who regain eligibility. CMS and the SSA also monitor enrollment periods used and will continue to monitor the use of all SEPs, including the newly established SEP. CMS does track the amount of uncompensated care reported to us by hospitals for purposes of Medicare Uncompensated Care Payments and we will monitor this data to help assess the impact of section 1899C to the extent that the changes are significant enough to fall outside the expected variability range. We will take the commenters' suggestions on additional measures to monitor implementation into consideration in our oversight and monitoring of the implementation of section 1899C of the Act. We do not track and analyze the healthcare experience of individuals who are no longer enrolled in Medicare.

Finally, we do not publicize granular data on Medicare terminations or enrollments. Currently, we publish enrollment reports that provide summarized information on total Medicare enrollees, Original Medicare enrollees, Medicare Advantage and other health plan enrollees, newly enrolled beneficiaries, deaths, Medicare-Medicaid enrollees, and Medicare Part D enrollees by yearly trend, demographic characteristics, and geography. We will take the recommendations for making additional data and analysis publicly available into consideration.

Comment: A commenter recommended that CMS establish a formal mechanism through which SHIPs, community health centers, civil-rights organizations, aging organizations, disability groups, legal-service providers, and other community-based organizations could report implementation issues for section 1899C of the Act.

Response: We appreciate the commenter's recommendation. We have regular communication with interested parties, including SHIPs, States, providers, and community-based organizations and appreciate feedback provided during those communications on our programs, especially newly implemented policies. We will take this recommendation into consideration on whether additional communication channels are warranted to monitor the implementation of section 1899C of the Act.

Comment: Several commenters opposed the proposed definition of ''eligible noncitizen'' and requested that CMS retain the prior, broader definition to allow a larger group of lawfully present noncitizens to remain eligible for Medicare. A commenter suggested that CMS provide clear and consistent definitions across Medicare programs.

Response: We thank commenters for their comments regarding the proposed definition of ''eligible noncitizen.'' As noted above, Section 1899C(a) of the Act establishes the categories of individuals who may be entitled to, or enrolled for, Medicare based on citizenship, nationality, or immigration status or category. Because these eligibility categories are established by statute, CMS does not have authority to retain the prior, broader lawful-presence

standard for Medicare eligibility. The defined term of ''eligible noncitizen'' provides a clear and consistent way to refer to the three categories of noncitizens who remain eligible under section 1899C(a), rather than repeating each category throughout the Medicare regulations. Using the term ''eligible noncitizen'' across the applicable Medicare regulations promotes consistency and readability while maintaining the eligibility requirements established by statute.

After consideration, we are finalizing the definition of ''eligible noncitizen'' at § 400.200, and the incorporation of that definition into the eligibility requirements in 42 CFR 406 (§§ 406.5, 406.10 through 406.13, 406.20) and 42 CFR 407 (§§ 407.10 and 407.55), as proposed.

b. Termination of Entitlement for Individuals Who Were Entitled to, or Enrolled for, Medicare as of July 4, 2025, in Accordance With Section 71201 of the WFTC Legislation (''Grace Period'' Population)

Due to the statutory changes to Medicare eligibility made by section 71201 of the WFTC legislation, individuals who are not U.S. citizens or U.S. nationals and who have an immigration status or category other than LPR, CHE, or COFA migrant, and who were entitled to, or enrolled for, Medicare as of July 4, 2025, will no longer be eligible for Medicare on the date that is 18 months after July 4, 2025. As shorthand, we are referring to this 18-month time period as the ''grace period'' and the applicable individuals identified and notified during the grace period as the ''grace period population.'' Section 1899C(b)(2)(A) of the Act directs the SSA to complete a review of all individuals entitled to, or enrolled for, Medicare as of July 4, 2025, and identify those beneficiaries entitled to, or enrolled for, Medicare as of July 4, 2025, who do not meet the requirements of section 1899C(a) of the Act. Section 1899C(b)(2)(A) of the Act provides the SSA with 1 year to complete this task for the grace period population. Section 1899C(b)(2)(B) of the Act directs the SSA to provide notice to such beneficiaries as soon as practicable after identifying such beneficiaries that their entitlement to, or enrollment in, Medicare will be terminated as of the date that is 18 months after July 4, 2025.

As stated in the proposed rule, the notice will inform them that the SSA records indicate that they do not meet one of the eligibility criteria in section 1899C(a) of the Act, and their Medicare entitlement and enrollment will be terminated if they cannot provide evidence proving eligibility. The proposed rule also stated that individuals would be instructed to contact the SSA if they believe the information is incorrect and to provide updated evidence of eligibility before their entitlement and enrollment is terminated. In addition, the proposed rule also stated that, if applicable, the notice would state that a formal initial determination of ineligibility will be sent prior to their termination date if the individual takes no action to update their records or if the individual confirms that they do not meet the eligibility criteria in section 1899C(a) of the Act. As proposed, the SSA would provide a termination notice towards the end of December 2026 to all identified individuals determined to be ineligible based on data available to the SSA. The termination notice would explain that the identified individuals do not satisfy the requirements in section 1899C(a) of the Act and therefore are not entitled to, and may not be enrolled for, Medicare. As explained in the proposed rule, the notice would state that termination of enrollment will be effective February 1, 2027. The notice would inform individuals of their appeal rights under existing appeals regulations for initial determinations delineated in 42 CFR, part 405, subpart I, specifically 42 CFR 405.900(b)(1), which establishes that appeals of initial determinations for entitlement to benefits under Part A or Part B of Medicare are administered in accordance with the SSA's regulations governing reconsiderations of these initial determinations at 20 CFR, part 404, subpart J.

We noted in the proposed rule that entitlement to premium-free Part A and enrollment in premium Part A and Part B are referenced in the Act as ''monthly insurance benefits'' or ''benefits for a month'' (see section 226(c)(1) and (2) of the Act) and entitlement to or enrollment in Medicare always begins on the first day of the month and always ends on the last day of the month (see section 1838(a) and (b) of the Act). Consequently, the termination in proposed §§ 406.14(d)(2), 406.28(g)(3)(ii), and 407.27(e)(3)(ii) would be at the end of the calendar month.

Accordingly, we proposed to amend the following regulations to implement termination procedures for individuals who were entitled to, or enrolled for, Medicare as of July 4, 2025, but do not meet or potentially do not meet the eligibility requirements of section 1899C(a) of the Act:

- Premium-Free Medicare Part A:

++ New § 406.14 (End of Entitlement Due to Change in Citizenship, Nationality, or Immigration Status or Category) was proposed to be added, in accordance with section 1899C(b)(1) of the Act, to establish the termination framework for individuals who were entitled to premium-free Part A as of July 4, 2025, but who either do not meet or potentially do not meet the eligibility requirements of section 1899C(a) of the Act. Specifically, new paragraph (b) would provide that individuals entitled or enrolled as of July 4, 2025, who either do not meet or potentially do not meet the requirements of § 406.5(a)(2) will be identified and notified by the SSA per section 1899C(b)(2) of the Act. Individuals not meeting § 406.5(a)(2) requirements will have their entitlement or enrollment terminated in accordance with paragraph (d).

++ New paragraph (b)(3) was proposed to be added to § 406.10 (Individual age 65 or over who is entitled to Social Security or Railroad Retirement benefits, or who is eligible for Social Security benefits) to add a cross reference to the termination provision in the new § 406.14.

++ New paragraph (d)(2)(v) was proposed to be added to § 406.12 (Individual under age 65 who is entitled to Social Security or Railroad Retirement disability benefits) to add a cross reference to the termination provision in the new § 406.14.

++ New paragraph (f)(3) was proposed to be added to § 406.13 (Individual who has end-stage renal disease) to add cross reference to the termination provision in the new § 406.14(b).

- Premium Medicare Part A:

++ New paragraph (g)(1) was proposed to be added to § 406.28 (End of Entitlement Due to Change in Citizenship, Nationality, or Immigration Status or Category) in accordance with section 1899C(b)(1) of the Act, to establish the termination framework for individuals who were entitled to, or enrolled for, premium Part A as of July 4, 2025, but who either do not meet or potentially do not meet the eligibility requirements of section 1899C(a) of the Act. Specifically, the new paragraph (g)(1) would provide that individuals entitled to or enrolled as of July 4, 2025, who either do not meet or potentially do not meet the requirements of § 406.20(b)(2) will be identified and notified by the SSA per section 1899C(b)(2) of the Act. Individuals not meeting § 406.20(b)(2) requirements will have their entitlement or enrollment terminated in accordance with paragraph (3).

- Medicare Part B:

++ New paragraph (e)(1) was proposed to be added to § 407.27 (Termination of entitlement: Individual), in accordance with section 1899C(b)(1) of the Act, to establish the termination framework for individuals who were enrolled in Part B as of July 4, 2025, but who either do not meet or potentially do not meet the eligibility requirements of section 1899C(a) of the Act. Specifically, the new paragraph (e)(1) would provide that individuals enrolled as of July 4, 2025, who either do not meet or potentially do not meet the requirements of § 407.10(a)(2) will be identified and notified by the SSA per section 1899C(b)(2) of the Act. Individuals not meeting § 407.10(a)(2) requirements will have their enrollment terminated in accordance with paragraph (3).

We address all comments related to the proposed termination processes in the next section.

c. Termination Process for Certain Noncitizens Entitled to, or Enrolled for, Medicare Who Were Not Identified and Notified by the SSA Per Section 1899C(b)(2) of the Act (Outside of the ''Grace Period'' Population)

We turn now to the proposed termination processes that would be used for all other individuals whose eligibility for Medicare, including both initial eligibility and continued eligibility, is impacted by the statutory changes to Medicare eligibility made by section 71201 of the WFTC legislation and whose entitlement and enrollment was not terminated by the SSA under the processes implementing section 1899C(b) of the Act. The proposed termination processes for this population provides the framework to terminate enrollment in Medicare if they are not eligible to be entitled or enrolled per section 1899C of the Act while ensuring all impacted individuals are notified of termination and retain their appeal rights. Under this proposal, all terminations made under section 1899C of the Act would be prospective.

We proposed that entitlement and enrollment for those not identified during the grace period and found not to meet the citizenship, nationality, or immigration status or category requirements in section 1899C(a) of the Act would end according to the termination processes in the following proposals: § 406.14(c) and (d) for those with premium-free Part A, § 406.28(g)(2) and (3) for those with premium Part A, and § 407.27(e)(2) and (3) for those with Part B benefits. The proposed termination processes in §§ 406.14(d), 406.28(g)(3) and 407.27(e)(3) included providing notice to such individuals that their entitlement and enrollment for Medicare will be terminated if they do not meet section 1899C(a) of the Act, and for terminating entitlement or enrollment where the SSA determines that the individual either does not or no longer meets the requirements of section 1899C(a) of the Act.

As stated, this proposed termination process would apply to anyone enrolled in Medicare whom the SSA determines does not meet eligibility requirements under section 1899C(a) of the Act and was not part of the grace period population per section 1899C(b)(2)(B) of the Act. The proposed rule acknowledged that there would be a period of time between enactment of the WFTC legislation on July 4, 2025, and the SSA starting to screen individuals for new Medicare enrollment under the criteria in section 1899C(a) of the Act, which we noted in the proposed rule is expected to begin in 2026. Individuals enrolled after enactment of the WFTC legislation but before screening procedures are implemented do not fall into the grace period population because they were not enrolled as of the date of enactment. Thus, the proposed rule noted that individuals enrolled during the previously discussed time period who do not meet the eligibility requirements in section 1899C(a) of the Act would be terminated according to proposed §§ 406.14(d), 406.28(g)(3) or 407.27(e)(3), as appropriate.

Additionally, the proposed termination process would apply to anyone enrolled in Medicare whom the SSA determines does not meet the eligibility requirements in section 1899C(a) of the Act and was not notified as part of the grace period population per section 1899C(b)(2)(B) of the Act. This would include individuals whose status changed prior to the finalization of this rule, such as an individual who was enrolled in Medicare in October 2024 and met the eligibility requirements under section 1899C(a) of the Act based on their conditional LPR status when the SSA identified and notified the grace period population. Therefore, they were not included in the grace period population per section 1899C(b)(2)(B) of the Act. However, if the SSA's records indicate that their conditional LPR status is scheduled to expire in December 2026, and the status is not extended and is terminated accordingly, this proposed termination process would apply upon termination of their conditional LPR status and would provide the framework for this individual's Medicare enrollment to be terminated as they would no longer satisfy the requirements of section 1899C(a) of the Act. We emphasized that the same process would also apply to individuals enrolled after this proposed rule is implemented, if finalized as proposed. As an example, consider the case of an individual enrolled in Medicare with conditional LPR status whose enrollment began in April 2028. In February 2030, the SSA records indicate that the individual's conditional LPR status expires in April 2030, and the status is not extended. Upon termination of the individual's status following expiration of their conditional LPR status in April 2030, the individual would no longer satisfy the requirements of section 1899C(a) of the Act, and the SSA would send notice to the individual that they no longer meet the requirements of section 1899C(a) of the Act. As a result, under the proposed process for termination of enrollment, the individual's Medicare enrollment would be terminated at the end of the month following the month in which the notice is dated.

There are several circumstances in which individuals are identified as no longer meeting the requirements of section 1899C(a) of the Act outside the grace period. We proposed the same termination process for individuals in these circumstances in proposed §§ 406.14(d), 406.28(g)(3) or 407.27(e)(3), as appropriate.

For these individuals outside the grace period, we proposed that a termination notice from the SSA would be sent to each individual identified as ineligible. We proposed the notice would explain that, per data available to the SSA, the individual does not satisfy the requirements of section 1899C(a) of the Act. Under the proposed termination process, an individual would not lose Medicare entitlement or enrollment during the month in which the SSA determines that the individual does not or no longer meets the requirements of section 1899C(a) of the Act. Rather, Medicare entitlement or enrollment would terminate at the end of the month following the month in which the notice is dated. For example, if the date of the termination notice is in March 2027, termination would be effective at the end of April 2027. This proposed termination timeline would be explained in the notice. We emphasized that the SSA will not terminate anyone's entitlement or enrollment prior to notification. Further, no termination of Medicare would occur for any individual entitled to, or enrolled for, Medicare for failure to meet the requirements of section 1899C(a) of the Act prior to the effective date of this rule, if finalized as proposed. We proposed an effective date of January 1, 2027.

We proposed that individuals whose Medicare entitlement and enrollment are terminated because they do not meet the requirements of section 1899C(a) of the Act would be provided appeal rights under our existing appeals regulations for initial determinations. Appeals of initial determinations for entitlement to benefits under Medicare Part A or Part B are administered in accordance with 20 CFR, part 404, subpart J (*see* 42 CFR 405.900(b)(1)). We proposed to include the information about appeal rights in the proposed termination notices.

We also proposed that termination notices would be sent to affected individuals on an ongoing basis, as applicable, when the SSA receives information that an individual enrolled in Medicare does not meet the requirements of section 1899C(a) of the Act.

In the proposed rule, we explained that these proposals are necessary to ensure implementation of section 1899C of the Act is consistent with the efficient administration of the Medicare program under section 1102(a) of the Act. Therefore, to implement the proposed termination framework, we proposed adding and revising the following sections:

- Premium-Free Medicare Part A:

++ New § 406.14 (End of entitlement due to change in citizenship, nationality, or immigration status or category) would be added. The proposed new § 406.14(c) would provide the termination framework for individuals entitled to premium-free Part A who were not identified and notified by the SSA per section 1899C(b)(2) of the Act and were subsequently determined by the SSA to not meet the requirements of § 406.5(a)(2). Proposed § 406.14(d) describes the proposed termination notice and appeal rights in accordance with existing regulations governing Medicare entitlement determinations, states the effective date of premium-free Part A entitlement termination, and states that the individual should contact the SSA if their citizenship, nationality, or immigration status or category changes such that they may be entitled to, or enrolled for, premium-free Part A benefits.

++ New paragraph (b)(3) would be added to § 406.10 (Individual age 65 or over who is entitled to Social Security or Railroad Retirement benefits, or who is eligible for Social Security benefits). This proposed new paragraph would add a cross-reference to § 406.14 so that individuals entitled to, or enrolled for, premium-free Part A through the age-65 pathway would be subject to the termination procedures in that section if they do not or no longer meet the citizenship, nationality, or immigration status or category requirements in section 1899C(a) of the Act.

++ New proposed paragraph (d)(2)(v) would be added to § 406.12 (Individual under age 65 who is entitled to Social Security or Railroad Retirement disability benefits). This proposed new paragraph would add cross-references to § 406.14(b) and (c) so that disability-based premium-free Part A entitlement would be subject to the proposed termination procedures for an individual who does not or no longer meets the citizenship, nationality, or immigration status or category requirements in section 1899C(a) of the Act.

++ New proposed paragraph (f)(3) would be added to § 406.13 (Individual who has ESRD). This proposed new paragraph would add a cross-reference to § 406.14 to specify that individuals entitled to, or enrolled for, premium-free Part A on the basis of ESRD would be subject to the proposed procedures for termination when an individual does not or no longer meets the citizenship, nationality, or immigration status or category requirements in section 1899C(a) of the Act.

- Premium Medicare Part A:

++ New proposed paragraph (g)(2) was proposed to be added to § 406.28 (End of entitlement) for individuals who were entitled to, or enrolled for, premium Part A, who were not identified and notified by the SSA per section 1899C(b)(2) of the Act and were subsequently determined by the SSA as not meeting the requirements of § 406.20(b)(2). Under proposed paragraph (g)(2), entitlement would end as provided under paragraph (g)(3) of this section.

++ New proposed paragraph (g)(3) was proposed to be added to § 406.28 (End of entitlement). It describes the proposed termination notice, which would specify the individual's appeal rights in accordance with existing regulations governing Medicare entitlement determinations, state the effective date of premium Part A enrollment termination, and state that the individual should contact the SSA if their citizenship, nationality, or immigration status or category changes such that they may be entitled to, or enrolled for, premium Part A benefits.

++ Paragraphs (a) and (b) of § 406.50 was proposed to be revised to change the word ''alien'' to ''eligible noncitizen.''

- Medicare Part B:

++ New proposed paragraph (e)(2) was proposed to be added to § 407.27 (Termination of entitlement: Individual enrollment). This new paragraph would specify that individuals who are enrolled in Part B, who were not identified and notified by the SSA per section 1899C(b)(2) of the Act and were subsequently determined by the SSA as not meeting the requirements of § 407.10(a)(2), would have their enrollment terminated under the new proposed paragraph (e)(3) of the section.

++ New proposed paragraph (e)(3) would be added to § 407.27 (Termination of entitlement: Individual enrollment). This new paragraph would describe the termination notice, which would specify the individual's appeal rights in accordance with existing regulations governing Medicare entitlement determinations, state the effective date of Part B enrollment termination, and state that the individual should contact the SSA if their citizenship, nationality, immigration status or category changes such that they may be enrolled for, Part B benefits.

We received public comments on the proposed termination process. The following is a summary of the comments we received and our responses.

Comment: Multiple commenters recommended that the preliminary notice be sent to the grace period population as early as possible and well in advance of their termination date. Commenters requested multiple notices, with several commenters specifying at least three notices and several recommending that preliminary notices be sent at least 90 days before termination. A commenter suggested color coded notices and another recommended patient navigators and providing notices through a variety of methods, such as phone calls, text messages, e-mails, and letters.

Response: We acknowledge the comments regarding the timing and frequency of notices to the grace period population. We stated in the proposed rule that, in accordance with section 1899C(b)(2)(B) of the Act, the SSA would send, as soon as practicable, notice to individuals identified as not meeting or potentially not meeting one of the eligibility criteria in section 1899C(a). Accordingly, the SSA plans to send to these individuals a preliminary notice in November 2026. As such, preliminary notices will be sent almost 90 days before a termination would take effect. The preliminary notice will instruct the individual to contact the SSA and provide updated evidence of eligibility and inform them that they could potentially lose entitlement to Part A and/or enrollment in Part B. Individuals who do not establish continued eligibility will subsequently

receive a formal termination notice in December 2026 before their Medicare entitlement and/or enrollment terminates.

Additionally, CMS plans to send a notice in December 2026 to those affected following the SSA's preliminary notice. CMS's notice will emphasize the importance of reviewing SSA's preliminary notice and encourage individuals to call 1–800–MEDICARE or reach out to the SSA for any needed assistance. CMS will include in the notice taglines in 14 different languages for those with limited English proficiency. CMS also plans to send emails to beneficiaries who have a *Medicare.gov* account and are receiving a disenrollment notice from the SSA. CMS's and the SSA's call centers are prepared for calls from beneficiaries. CMS has also notified the SHIPs of the changes in eligibility and is planning communications to the provider community.

At this point, color-coded notices are not feasible. We will take into consideration other mechanisms of communication, such as outbound telephone calls and text messages, as those avenues become available. We believe the SSA preliminary notice, the CMS notice, and the SSA termination notice, as well as emails to those with a *Medicare.gov* account, provide several opportunities for affected and potentially affected individuals to be informed in advance of proposed termination dates.

Comment: Multiple commenters recommended that notices explain the basis for the determination of ineligibility (including the specific immigration status of the individual), the effective date of termination, the information or records relied upon, the documentation the individual may submit to establish continued eligibility or correct the determination, applicable appeal or review rights, the availability of good-cause extensions of appeal deadlines, and where the individual may obtain free assistance. Another commenter suggested that CMS make notices to impacted individuals available for comment and review before distribution.

Response: CMS appreciates the commenters' recommendations regarding the content of notices. The preliminary notice will explain that based on the information that the SSA has, the individual does not or potentially does not meet the requirements of section 1899C(a) of the Act and will instruct the individual to contact the SSA and provide updated evidence if they believe the determination is incorrect. The notices will also explain how to obtain a copy of and correct their immigration record with the United States Citizenship and Immigration Services (USCIS). The preliminary notice will provide contact information for the SSA, including the website, customer service number, and a telephone number for contacting their local office.

If the individual fails to provide updated or sufficient evidence of eligibility and the SSA subsequently determines that the individual does not meet the requirements of section 1899C(a) of the Act, the termination notice will explain the determination, state the effective date of termination, and provide information regarding the individual's appeal rights. The termination notice will also inform the individual that an appeal filed after the deadline may be accepted if the individual shows good cause for the late filing. For assistance, the notice provides the SSA customer service number, website, and telephone number for contacting their local SSA office.

CMS and SSA have an existing process for developing notices and communications to Medicare enrollees and will follow the current process for issuance of these new notices consistent with applicable statutory and regulatory requirements and we will not be issuing these notices for public comment prior to release.

Creating individualized notices delineating the sources relied upon, the immigration status of each individual, and the specific documentation needed to maintain eligibility is not operationally feasible at this time. The notices are similar in content to what was previously used for individuals who were not lawfully present. However, the SSA will ensure that guidance for evidentiary requirements for Medicare entitlement and enrollment is clear for both employees and the public. Finally, CMS and the SSA will take these suggestions regarding including individualized information in the preliminary notice into consideration for future updates.

Comment: Multiple commenters requested that notices clearly explain that a determination under section 1899C of the Act concerns Medicare entitlement or enrollment and does not, by itself, terminate an individual's Social Security title II benefits.

Response: We thank commenters for the recommendation. The SSA will be issuing notices based on whether the individual is receiving Medicare only or both title II and Medicare benefits. That is, if the individual is only receiving Medicare coverage, the notice will only refer to Medicare benefits, whereas individuals that are entitled to title II benefits, but not entitled to Medicare, will receive a notice stating that they will continue to receive title II benefits and their Medicare entitlement and enrollment will be terminated.

Comment: A commenter requested that CMS require that notices sent out by the SSA and any other entity contain an explanation of the Cuban and Haitian Entrant (CHE) classification, how to prove the classification, and community resources to assist individuals in determining whether they qualify as a CHE.

Response: We thank the commenter for this recommendation. The preliminary and termination notices from the SSA will state the citizenship and immigration categories that qualify for Medicare entitlement and enrollment under section 1899C of the Act. In addition, the notices will direct individuals to the USCIS to get a copy of their immigration record to determine their status and how to correct the records, if necessary. The USCIS also provides information on the types of documentation that may be presented to demonstrate CHE status.[216] Finally, as noted above, CMS and the SSA plan outreach to community resources, such as organizations that assist affected individuals, including SHIPs and other community-based and immigrant-serving organizations, to help connect individuals with additional information and assistance regarding the new Medicare eligibility requirements.

Comment: Multiple commenters requested that notices comply with the language-access requirements of section 1557 of the Affordable Care Act and other Medicare language access requirements; be written in plain language and at an accessible reading level; be translated into commonly spoken languages; and be accessible to individuals with disabilities and limited English proficiency.

Response: We thank commenters for these recommendations. The SSA will develop and issue these notices consistent with current applicable Federal plain-language, language-access, and accessibility requirements.

The SSA has existing procedures for providing notices in accessible formats to certain individuals who are blind or visually impaired through its Special Notice Option program. Under these procedures, available notice options include Braille, large print, audio CD, a Microsoft Word file on CD, certified mail, or first-class mail accompanied by a follow-up telephone call, as

[216] *https://www.uscis.gov/save/resources/information-for-save-users-cuban-haitian-entrants.*

applicable. The SSA's POMS GN 00211.001, Section 504 of the Rehabilitation Act of 1973: Standard and Non-Standard Accommodations, also provides procedures for requests for other notice accommodations. These existing accessibility processes will continue to apply, as appropriate, to individuals receiving the SSA's communications.

The SSA also provides language assistance to individuals who prefer to conduct business in a language other than English. The SSA provides free interpreter services by telephone and in Social Security offices, where interpreters are available in more than 200 languages. The SSA translates most Social Security notices into Spanish; notices not available in Spanish include a Spanish-language cover letter offering translation assistance through a local Social Security office. The SSA also makes public information materials available in multiple languages through its Multilanguage Gateway.

Finally, CMS plans to send a courtesy notice to the grace period population and to those individuals outside the grace period following the SSA's notice. CMS's notice will include taglines in 14 different languages for those with limited English proficiency and contains a statement informing individuals that they can request accommodations.

Comment: A couple of commenters recommended that Medicare termination notices include information to help affected individuals maintain access to health care after their Medicare entitlement or enrollment ends. Commenters requested that CMS and the SSA provide information regarding continuity-of-care considerations and resources that may assist individuals in identifying other health coverage options for which they may be eligible. Some commenters also recommended that CMS and the SSA facilitate handoffs to alternate coverage options or providers to help individuals transition from Medicare coverage.

Response: We appreciate the commenters' concerns regarding continuity of care and access to other health coverage following termination of Medicare. As availability of other coverage options will be dependent on an individual's circumstances, it will not be feasible to include information on other health care options in individual notices or facilitate handoffs to alternative coverage options. CMS and the SSA plan to implement a robust outreach and education effort with the implementation of section 1899C of the Act and will include relevant information on other health coverage options available, whenever possible.

Comment: Multiple commenters requested that CMS and the SSA provide individuals outside the grace period population with earlier and more robust notice before terminating Medicare entitlement or enrollment under section 1899C of the Act. Commenters recommended that individuals outside the grace period population receive a preliminary notice at least 90 days before termination. Commenters also recommended that preliminary notices be provided on an ongoing basis for individuals identified after the initial implementation period.

Response: We thank commenters for their recommendations regarding advance notice for individuals outside the grace period population. The SSA plans to send a preliminary notice in November 2026 to all individuals it has identified as not meeting or potentially not meeting the requirements of section 1899C(a) of the Act, regardless of whether the individual is within the grace period population. As such, preliminary notices will be sent almost 90 days before a termination would take effect. The preliminary notice will inform individuals that the SSA's records indicate that they may not meet the requirements of section 1899C(a) of the Act, instruct them to contact the SSA and provide updated evidence of eligibility, and inform them that they could potentially lose entitlement to Part A and/or enrollment in Part B. Similar to the grace period population, individuals who receive the preliminary notice who do not establish continued eligibility will subsequently receive a formal termination notice in December 2026 before their Medicare entitlement and/or enrollment terminates. As discussed previously, termination for those individuals outside of or not notified as part of the grace period population will be effective at the end of the month following the month in which the termination notice is dated. Therefore, for these individuals, this final rule provides that, based on a December 2026 termination notice date, the earliest that Medicare entitlement/enrollment termination will occur is at the end of January 2027. In practical terms for Medicare beneficiaries, this means that they will not have Medicare coverage beginning February 1, 2027.

To note, the SSA and CMS currently plan to send preliminary notices only to Medicare enrolled individuals that the SSA is able to identify before November 2026 as not meeting or potentially not meeting the requirements of section 1899C(a) of the Act. The preliminary notice is an additional implementation measure intended to provide affected individuals with an opportunity to update their records during the initial transition to the new Medicare eligibility requirements established by section 1899C of the Act. Because this rule implements new statutory eligibility requirements and establishes a new termination framework, we believed that additional advance communication was appropriate during this transitional period. However, once the new requirements have been fully implemented, notices will be sent consistent with the process described in this final rule.

Comment: Multiple commenters requested that CMS explicitly hold harmless individuals who became entitled to, or enrolled in, Medicare after July 4, 2025, before the SSA implemented screening procedures for the new eligibility requirements under section 1899C of the Act, and who are subsequently determined not to meet the new eligibility requirements. A commenter requested that terminations not apply retroactively to physician payments and that guidance be provided regarding services rendered prior to an individual's termination date.

Response: We thank commenters for these recommendations. Individuals who were enrolled in Medicare after July 4, 2025, but before the SSA implemented screening for the requirements of section 1899C(a) of the Act, and who are subsequently determined not to meet those requirements, will have their Medicare entitlement or enrollment terminated prospectively under the termination process described previously. Their Medicare entitlement or enrollment will not be retroactively terminated for the months in which they were enrolled.

Accordingly, CMS will take no action to recover any Medicare payments for services rendered before the individual's prospective termination due to not meeting the requirements of section 1899C(a) of the Act. Claims for services rendered prior to a termination of entitlement and enrollment will be processed according to existing procedures. Because the termination framework does not retroactively terminate the individual's Medicare entitlement or enrollment for those months, a separate hold-harmless policy is not necessary.

Comment: Multiple commenters were concerned with the high likelihood of erroneous terminations and requested that CMS and the SSA delay implementation to establish stronger pre-termination review procedures and safeguards for all individuals whose

Medicare entitlement or enrollment may be terminated under section 1899C of the Act. A commenter also recommended that CMS extend the 18-month grace period, which would in effect delay implementation of terminations for individuals in the grace period population.

Response: We appreciate the commenters' recommendations. The SSA used and is using the most current information and verification tools available to it to make accurate determinations under section 1899C of the Act, including information or documentation provided by individuals. Individuals identified as potentially not meeting the requirements of section 1899C(a) of the Act, including those individuals in the 18-month grace period population, will receive a preliminary notice and have an opportunity to provide updated evidence to the SSA before a formal determination of ineligibility is made. We believe that sufficient safeguards have been established to identify ineligible individuals and to provide them with opportunities to furnish updated evidence of eligibility and appeal determinations that individuals believe are erroneous. Further, section 1899C(b)(1) of the Act specifies that individuals entitled to, or enrolled for Medicare benefits as of July 4, 2025, who no longer meet the requirements under section 1899C(a) of the Act, will have their Medicare entitlement and enrollment terminated beginning on the date that is 18 months after July 4, 2025. No provision in section 1899C of the Act permits extension of the grace period.

Comment: Multiple commenters stated that, regardless of when or how an individual is identified as potentially ineligible, the individual should have a meaningful opportunity to correct inaccurate, incomplete, outdated, or inconsistent citizenship, nationality, or immigration status or category information before coverage ends or to promptly restore coverage.

Response: We thank commenters for these recommendations. As noted previously, individuals identified as not meeting or potentially not meeting the requirements of section 1899C(a) of the Act prior to November 2026 will be sent preliminary notices from the SSA instructing them to contact the SSA and provide updated evidence if they believe they meet the requirements of section 1899C(a) before a formal notice of termination of entitlement and enrollment is sent. Further, any individual identified as not meeting the requirements of section 1899C(a) of the Act will receive a termination notice stating that their enrollment will be terminated at the end of the month following the month in which the notice is dated and will have the opportunity for successive levels of appeals, including a reconsideration, a hearing before an administrative law judge, a hearing before the Appeals Council, and filing a complaint with a Federal district court, subject to any applicable requirements for each level of appeal.

Comment: Multiple commenters also requested that CMS clarify what happens when an individual submits documentation before the scheduled termination date but agency review remains pending. Commenters urged CMS and the SSA to delay Medicare terminations when an individual has timely submitted documentation or other information to establish continued eligibility under section 1899C of the Act but agency review remains pending, and not to terminate coverage solely on the basis of an automated data match or incomplete administrative record..

Response: We appreciate the commenters' request for clarification and recommendation that Medicare termination be delayed while an eligibility review or correction request is pending. Except as provided in section 1899C(b)(1) of the Act, an individual may not remain entitled to, or enrolled for, Medicare unless the individual meets the requirements of section 1899C(a) of the Act. CMS therefore does not have authority to establish a continued-coverage exception based solely on the pending status of an eligibility review or correction request. In some cases, an individual may submit documentation before termination, but the SSA may not complete its review until after the termination has taken effect. If the SSA subsequently determines that the individual met the applicable Medicare eligibility requirements at the time of termination, existing procedures allow the prior determination to be corrected and Medicare entitlement or enrollment to be reinstated retroactively, as appropriate. For premium Part A or Part B, the individual may be responsible for applicable premiums for any retroactive period. Once entitlement or enrollment is restored retroactively, Medicare claims for covered services furnished during the restored period may be processed, consistent with applicable Medicare claims rules.

Individuals have the right to file an appeal, or a request for reconsideration, within 60 days of receiving notice of the SSA's determination. The 60-day timeframe for filing a request for reconsideration may be extended for good cause. Finally, in making a determination under section 1899C(a), the SSA will consider available information from its records and any updated information or documentation provided by the individual. As available to SSA and appropriate, SSA will also consider information available from records from other agencies.

Comment: Multiple commenters requested that termination notices clearly explain applicable reconsideration, appeal, and judicial review rights, including how to challenge an erroneous determination. Further, multiple commenters requested that Medicare coverage continue during a timely appeal process.

Response: We appreciate these comments and note that termination notices sent by the SSA to individuals that do not meet the requirements of section 1899C(a) of the Act will provide information regarding the individual's appeal rights and how to request the first level of appeal, which is a request for reconsideration. Appeals of Medicare Part A and Part B entitlement determinations are administered under 20 CFR part 404, subpart J. This process provides for reconsideration, a hearing before an administrative law judge, Appeals Council review, and judicial review, as applicable. However, section 1899C of the Act does not provide CMS with authority to extend Medicare coverage during an appeal.

Comment: Multiple commenters also requested that notices explain how individuals may request good-cause extensions of appeal deadlines when they need additional time to gather documentation, are receiving medical treatment, or otherwise cannot file within the standard timeframe.

Response: We appreciate the commenters' request. As noted previously, appeals of initial determinations, or a request for reconsideration, regarding Medicare Part A or Part B entitlement and enrollment are governed by existing SSA appeals procedures. Under those procedures, a request for reconsideration generally must be filed within 60 days after the individual receives notice of the initial determination. An individual who misses the filing deadline can request an extension based on good cause, including where the individual did not timely receive the notice. Termination notices will state that individuals can file beyond the 60-day reconsideration deadline if they have a good reason.

Comment: Several commenters requested expedited appeal or pre-termination review procedures for individuals who are terminated or denied enrollment in order to challenge

determinations that the individuals believe are erroneous. A commenter suggested that reconsideration decisions be issued within a set timeframe. Additionally, a commenter recommended that the appeal timeframe be changed to run from the time the person first became aware that they are not covered, for example, when they learn at a medical appointment that they no longer have Medicare, rather than from the notice date.

Response: We thank commenters for these recommendations. As noted previously, appeals of initial determinations regarding Medicare Part A or Part B entitlement are governed by existing SSA reconsideration procedures. Under the existing process, a request for reconsideration generally must be filed within 60 days after the individual receives notice of the initial determination, rather than 60 days from the date of the notice. This ensures that the time required for delivery of the notice does not reduce the individual's 60-day period to request reconsideration. SSA generally presumes that an individual receives the notice five days after it is mailed, unless the individual shows otherwise. If an individual does not timely receive the notice or otherwise has good cause for missing the filing deadline, the individual may request an extension for good cause under existing SSA procedures, which may include situations in which an individual demonstrates that they did not receive notices. If an individual timely requests reconsideration, and the SSA determines that the individual meets the requirements of section 1899C(a) and that their Medicare entitlement and enrollment should not have been terminated, the SSA will reinstate Medicare entitlement and enrollment, as appropriate. The SSA's existing appeals procedures have been used for decades to adjudicate questions of Medicare entitlement and enrollment, and we believe these procedures are well suited to address eligibility issues under section 1899C(a) of the Act. Therefore, we are not adopting a separate appeals process or timelines for individuals who are terminated for failure to meet the eligibility criteria under section 1899C(a) of the Act.

Comment: Multiple commenters expressed concern that individuals may be incorrectly identified as ineligible and therefore denied or terminated for Medicare under section 1899C of the Act because citizenship, nationality, or immigration-status information maintained across Federal systems may be incomplete, outdated, delayed, or inconsistent. Commenters stated that the SSA may need to coordinate with CMS, DHS, USCIS, and other Federal agencies to ensure that noncitizen status is accurately and timely established and that individuals who remain eligible are not swept into termination processes because of data-sharing delays, database mismatches, name or identifying-information discrepancies, pending document renewals, or other record errors.

Response: We thank commenters for their comments regarding the accuracy of citizenship, nationality, and immigration status or category information used to implement section 1899C of the Act. To reduce the risk of erroneous determinations resulting from incomplete, outdated, or inconsistent records, the SSA will only use data that has been determined appropriately accurate to assure fairness in its determinations. The SSA will also consider updated information or documentation provided by the individual. When available information indicates that an individual may not meet the requirements of section 1899C(a) of the Act, individuals will have an opportunity to contact the SSA and provide updated evidence if they believe the information is incorrect or has changed.

CMS will continue to coordinate with the SSA and other Federal agencies, as appropriate, regarding implementation of these verification processes and explore opportunities to enhance coordination and ensuring up-to-date information.

Comment: A commenter requested that CMS address potential confusion among mixed-status families, or families that have members with different Federal health insurance program enrollments when issuing immigration-related Medicare notices. The commenter stated that notices should clearly identify whose Medicare eligibility is changing, whose eligibility is not changing, and where families can obtain reliable assistance. The commenter also requested that CMS state plainly that a Medicare eligibility change affecting one household member does not, by itself, alter another eligible family member's Medicare, Medicaid, or other health-program eligibility. Another commenter stated that confusion about eligibility or administrative complexity may deter individuals and families from seeking needed healthcare services.

Response: We acknowledge the commenters' concerns regarding communications to mixed-status families. Eligibility determinations under section 1899C of the Act are made with respect to the individual whose Medicare entitlement or enrollment is being reviewed. A change in one individual's Medicare eligibility under section 1899C of the Act does not, by itself, change another family member's eligibility for Medicare, Medicaid, or another health program; eligibility for other household members continues to be determined under the requirements applicable to each program. CMS and the SSA will address these issues, as appropriate, through beneficiary notices, educational materials, and subregulatory guidance.

Comment: Several commenters expressed concern that the SSA may not have sufficient staffing, resources, systems, or call-center capacity to implement section 1899C of the Act accurately and timely and recommended that CMS and the SSA prepare the SSA field offices and call centers, develop standardized scripts and multilingual materials, and ensure staff are trained to respond to questions from affected individuals and organizations assisting them.

Response: We thank commenters for their comments regarding the SSA staffing and operational capacity. CMS and the SSA are coordinating to ensure a robust outreach effort, including call center scripts, updated educational and translated materials, and training of the SSA field office technicians. The SSA is working to ensure sufficient customer service in addressing interested parties' questions and the processing of documentation.

After consideration of public comments, we are finalizing, as proposed, the provisions pertaining to termination processes for certain noncitizens entitled to, or enrolled for, Medicare—both the grace period population, as well as those that fall outside of the grace period.

3. Enrollment Pathway for Individuals Who Gain or Regain Eligibility

Section 1899C of the Act limits eligibility for Medicare to specified categories of individuals based on citizenship, nationality, or immigration status or category. As a result, except as provided in section 1899C(b) of the Act, no individual may be entitled to, or enrolled for, Medicare if the individual does not meet the requirements of section 1899C(a) of the Act. Conversely, individuals may later become eligible if their citizenship, nationality, or immigration status or category changes, such that they satisfy section 1899C(a) of the Act, as well as applicable Medicare eligibility requirements.

To address circumstances in which individuals who initially did not meet the eligibility requirements of section

1899C(a) of the Act at the time they met all other Medicare eligibility requirements but, subsequently, do meet the section 1899C(a) of the Act requirements, we proposed to establish a special enrollment period (SEP) under §§ 406.27(f) and 407.23(f). The SEP would also apply to those individuals whose Medicare entitlement or enrollment is terminated because they do not or no longer meet the requirements in section 1899C(a) of the Act, but who subsequently experience a change such that they meet the requirements of section 1899C(a) of the Act. Establishing an SEP for these scenarios is within the Secretary's authority under sections 1837(m) and 1838(g) of the Act, which provide for the establishment of SEPs for exceptional conditions. In the proposed rule, we stated that we consider the enactment of the WFTC legislation and addition of section 1899C of the Act to constitute an exceptional condition because it created a new and narrower class of noncitizens who may be eligible for Medicare than are eligible for title II benefits, despite the close associations between title II entitlement and Medicare entitlement, as discussed in section III.F.1. of the proposed rule, and despite the fact that lawful presence has been the standard for noncitizen eligibility for both title II and Medicare benefits for decades. In addition, the statutory changes made by the WFTC legislation fundamentally altered the consequences of changes in immigration status. We noted in the proposed rule that prior to enactment of the WFTC legislation, noncitizens enrolled in Medicare who had a loss of lawful presence status would have remained enrolled in Medicare, but payment for benefits would have been suspended. Now, in accordance with section 1899C of the Act, an individual who no longer meets the requirements of section 1899C(a) of the Act must have their entitlement and enrollment terminated. If such an individual later meets the requirements of section 1899C(a) of the Act, it may be at a time that does not clearly fall within an established enrollment period. In addition, individuals who otherwise meet the eligibility requirements for Medicare but for the eligibility requirements of section 1899C(a) of the Act may gain eligibility at a time that does not clearly fall within an established enrollment period. For this proposed SEP, we also proposed that the general rule in §§ 406.27(a) and 407.23(a) that an individual must have missed an enrollment period due to the exceptional condition would not apply. We believe this is necessary because, for example, as explained below, the 7-month initial enrollment period under sections 1818(c)(1) and 1837(d) of the Act does not align well with the unpredictable nature as to when an individual may experience a change in citizenship, nationality, or immigration status or category, such that they would meet the requirements of section 1899C(a) of the Act. As another example, an individual may lose and subsequently regain eligibility under section 1899C(a) of the Act during a period that does not overlap with an otherwise available enrollment period, such that no enrollment period is actually missed. Accordingly, this SEP would be available to individuals who later meet, or again meet, the requirements of section 1899C(a) of the Act, regardless of whether an enrollment period was missed.

We proposed that the SEP would begin in the month in which the individual, upon contacting the SSA, provides sufficient documentation to establish eligibility, and the proposed SEP would end 6 months later. The duration of this proposed SEP would be the same time frame afforded to individuals granted an SEP for exceptional conditions under §§ 406.27 and 407.23. We proposed that entitlement and enrollment would be prospective for premium Part A and Part B, beginning with the first day of the month following the month of enrollment. We believed a prospective effective date is appropriate and consistent with the Secretary's authority under section 1818(c)(8) of the Act for premium Part A and section 1838(g) of the Act for Part B to establish the date on which coverage begins for individuals enrolling during an SEP, in a manner consistent, to the extent practicable, with protecting continuity of health benefit coverage. Although an individual may in some cases be able to demonstrate an earlier date on which the requirements of section 1899C(a) of the Act were met, we proposed a uniform prospective effective date for premium Part A and Part B because citizenship data in the SSA records is gathered and verified at a point in time and does not provide a reliable or administrable basis for consistently establishing earlier eligibility dates for enrollment purposes. In addition, a retroactive effective date for premium Part A and Part B could require the assessment of back-due premiums for months of coverage that the individual had not yet affirmatively elected, which would add operational complexity and could create unexpected financial obligations for beneficiaries. We believed a prospective-only approach is therefore the most practicable and administrable method for implementing this SEP for premium Part A and Part B.

We considered an alternative pathway which consisted of establishing an initial enrollment period for premium Part A and Part B for eligible noncitizens who would have been eligible for Medicare based on entitlement to benefits under title II of the Act and attainment of age 65 or completion of the 24-month waiting period for disability benefits, as applicable, but whose entitlement was never effectuated because they did not meet the citizenship, nationality, or immigration status or category requirements specified in section 1899C(a) of the Act. However, we note that the 7-month initial enrollment period articulated in sections 1818(c)(1) and 1837(d) of the Act is largely tied to the attainment of age 65 or completion of the 24-month waiting period for disability benefits and begins on the first day of the third month before the month in which an individual meets the eligibility requirements for premium Part A and Part B. Traditionally, this 3-month pre-eligibility period provides an opportunity for individuals to explore coverage options (for example, original Medicare or MA) and enroll in Part A and Part B. This 3-month period helps individuals avoid delays and gaps in coverage. As a practical matter, such an initial enrollment period could not be applied in an analogous manner to changes that would make an individual eligible for Medicare by virtue of meeting the requirements of section 1899C(a) of the Act because an individual may not be enrolled for Medicare benefits unless and until they meet the requirements of section 1899C(a) of the Act. As a result, establishing an initial enrollment period under sections 1818(c)(2) and 1837(d) of the Act or these individuals would effectively shorten the enrollment period by 3 months because such individuals could not be enrolled in Medicare until the section 1899C(a) of the Act requirements are met, which would conflict with the requirements of the Act. Instead, we opted for a proposed approach of establishing a SEP for individuals enrolling in Medicare for the first time, as well as individuals who lost and regained Medicare, due to changes in citizenship, nationality, or immigration status or category because it comports with the requirements of the Act.

For premium-free Medicare Part A, we proposed that entitlement may be retroactive for up to 6 months, but not

earlier than the first month in which the individual met all the eligibility requirements in proposed § 406.5(a). Under this proposal, if acceptable evidence establishes the month in which the individual first satisfied the citizenship, nationality, or immigration status or category requirements in § 406.5(a)(2), the SSA would use that month, subject to the applicable retroactivity limit. If the earliest month of eligibility cannot be established based on acceptable documentary evidence, entitlement would instead begin on the first day of the month in which the SSA verifies that the individual satisfies § 406.5(a)(2).

Accordingly, to implement the enrollment processes described earlier for individuals who establish or reestablish eligibility under section 1899C(a) of the Act, we proposed to amend the regulations at 42 CFR part 406 (Medicare Part A) and 42 CFR part 407 (Medicare Part B) to specify the availability, duration, and effective date rules for enrollment under these circumstances. We proposed to add and revise the following sections:

- Premium-Free Medicare Part A:

++ Paragraph (b) would be revised in § 406.6 (Application or enrollment for hospital insurance) to include the citizenship, nationality, or immigration status or category requirements in section 1899C(a) of the Act for individuals who need not file an application for hospital insurance.

++ New paragraph (f) would be added to § 406.6 (Application or enrollment for hospital insurance) to establish rules for individuals who would otherwise qualify for premium-free Part A based on entitlement to title II benefits, but who were not entitled because they did not meet the citizenship, nationality, or immigration status or category requirements in section 1899C(a) of the Act at the time they otherwise would have become eligible. It would also specify how such individuals may initiate entitlement upon later meeting those requirements and clarify the applicable entitlement effective date, including the circumstances under which premium-free Part A entitlement would begin consistent with current law. Paragraph (1) applies to those who meet the conditions of paragraph (b) of this section and, as such, need not file an application for hospital insurance. These individuals must contact the SSA to initiate entitlement to hospital insurance. Paragraph (2) applies to those who meet the conditions of paragraph (c) of this section and, as such, must file an application for hospital insurance. These individuals must contact the SSA to file such application.

- Premium Medicare Part A:

++ Paragraph (f) would be redesignated as paragraph (g) and new paragraph (f) would be added to § 406.27 (Special enrollment periods for exceptional conditions). This new paragraph would establish an SEP for individuals whose premium Part A enrollment was previously terminated because they lost the citizenship, nationality, or immigration status or category required under section 1899C(a) of the Act, but who later regain a qualifying status and again become eligible. The SEP would also apply to individuals who would otherwise meet the eligibility requirements for Medicare, except for those in section 1899C(a) of the Act, and later meet the eligibility requirements of section 1899C(a) of the Act. The new provision would specify the availability and duration of this SEP and clarify that enrollment under this pathway would be prospective, consistent with the Secretary's authority to establish SEPs for exceptional conditions. An individual does not need to miss an applicable enrollment period to be eligible for this SEP.

- Medicare Part B:

++ Paragraph (f) would be redesignated as paragraph (g) and new paragraph (f) would be added to § 407.23 (Special enrollment periods for exceptional conditions). This new paragraph would establish a SEP for individuals whose Part B enrollment was terminated because they no longer met the citizenship, nationality, or immigration status or category requirements in section 1899C(a) of the Act, but who subsequently regain a qualifying status and again become eligible to enroll. The SEP would also apply to individuals who otherwise met the eligibility requirements for Medicare, except for those in section 1899C(a) of the Act, and later meet the eligibility requirements of section 1899C(a) of the Act. It would specify the duration of the SEP and the prospective effective date of Part B coverage for individuals enrolling under this pathway. An individual does not need to miss an applicable enrollment period to be eligible for this SEP.

We received public comments on these proposals. The following is a summary of the comments we received and our responses.

Comment: Multiple commenters expressed support for CMS's proposal of an SEP but urged CMS to extend the proposed 6-month SEP, with some recommending either an 8-month, 12-month, or an indefinite SEP, because affected individuals may need additional time to obtain immigration or citizenship documentation, secure appointments with the SSA, update Federal records, and complete verification.

Response: We appreciate commenters' suggestions and concur with extending the duration of the SEP. We recognize the unique challenges that individuals may face and the additional time that may be required to obtain documentation from their countries of origin, navigating through immigration processes, updating documentation, and providing pertinent documentation to the SSA. Therefore, we are modifying the proposed SEP from 6 months to 12 months to account for the additional time that may be required and to provide flexibility to individuals establishing Medicare eligibility. The SEP will begin on the first day of the month in which the individual contacts the SSA and provides sufficient information to establish that the applicable eligibility requirements are met, and ends the last day of the 12th month after the month in which the individual provides sufficient evidence of eligibility.

Comment: Multiple commenters also requested that individuals enrolling under the SEP be permitted to elect prospective or retroactive premium Part A and Part B coverage. Several commenters suggested allowing individuals to select the retroactive coverage start month.

Response: We concur with commenters' suggestions to allow the choice of prospective or retroactive coverage for premium Part A and Part B enrollment. The option to select retroactive coverage is intended to provide time for individuals who become eligible for Medicare following a change in citizenship, nationality, or immigration status or category to gather relevant paperwork and contact the SSA, while preventing extended gaps in coverage. As noted above, in the proposed rule, prospective-only entitlement and enrollment for premium Part A and Part B was proposed due to the fact that citizenship and immigration status data in the SSA records is gathered and verified at a point in time, which we were concerned would not provide a reliable or administrable basis for establishing earlier, retroactive eligibility dates for enrollment purposes. We were also concerned that retroactive eligibility for premium Part A and Part B could result in back-due premiums, which would add operational complexity and could create unexpected financial obligations for beneficiaries. However, upon

reviewing comments on the proposed rule and after further consideration, we are finalizing providing beneficiaries the option of prospective or retroactive coverage for premium Part A and Part B enrollment. We recognize that it is feasible to provide evidence of and to verify retroactive eligibility for Medicare, especially as verification procedures and informational databases improve in the future. Allowing for retroactive coverage will minimize gaps in coverage and provide flexibility for individuals to obtain documentation and make a choice that best fits their circumstances. The choice of retroactive coverage will also allow individuals to determine whether they can pay retroactive premiums. The limit of retroactive coverage to six months serves as a guardrail by limiting the amount of retroactive premiums owed and mitigating potential abuse of individuals delaying enrollment and using the SEP to avoid late enrollment penalties.

We are modifying the proposed effective date for premium Part A and Part B to state that the default will be for a prospective enrollment date, that is, the first day of the month following the month of enrollment, but individuals will have the option to elect retroactive coverage. When individuals use the SEP, they will be presented with the option of retroactive coverage through enrollment forms and prompts, which the SSA will then process. The individual will need to provide the SSA with sufficient evidence of retroactive eligibility. If an individual chooses retroactive coverage, the effective coverage date is 6 months before the month of enrollment, but not before the month in which the individual meets all of the Medicare eligibility requirements. The individual must provide sufficient documentation for which the SSA can verify their eligibility for any months of retroactive coverage. The individual would not be allowed the option to pick the number of retroactive months, which is consistent with other SEPs that allow retroactive enrollment. In addition, the individual would be required to pay all applicable premiums if they choose a retroactive enrollment date. To illustrate, if a 70-year old individual who was previously ineligible for Medicare goes to an SSA office in July of 2029, applies for and uses a Medicare special enrollment period, and presents evidence of becoming a lawful permanent resident three months earlier, that individual could select the option of retroactive coverage. The individual would be responsible for paying three months of retroactive premiums since only three months of retroactive Medicare eligibility has been established and verified. If the individual cannot pay retroactive premiums as a one-time payment, the individual could request an installment plan, per the SSA's existing procedures.[217] In the event of retroactive coverage, the individual would inform their providers of their retroactive entitlement/enrollment status and the provider could submit claims to the Medicare Administrative Contractor for payment and reimburse previously paid claim amounts to the individual or other payor.

We are adopting a 6-month retroactive coverage period, which aligns the treatment of premium Part A and Part B under this SEP with the retroactive coverage period applicable to premium-free Part A. This SEP is not intended to replace or limit the Secretary's authority under section 1837(h) of the Act and 42 C.F.R. §§ 406.38 and 407.32 to provide appropriate relief where the statutory requirements are satisfied.

Comment: Multiple commenters further urged CMS to ensure that individuals whose Medicare coverage is interrupted because they no longer meet the requirements of section 1899C(a) of the Act, and who later regain eligibility, are not subject to late enrollment penalties, or other disadvantages attributable solely to the statutory termination or processing delays. Commenters stated that these individuals should not be treated as having voluntarily declined or delayed Medicare enrollment and requested protections to facilitate prompt reenrollment and minimize gaps in coverage and care.

Response: We appreciate these comments regarding late enrollment penalties and other enrollment consequences. Individuals who enroll in premium Part A or Part B using the SEP will not be assessed a late enrollment penalty in connection with the enrollment, consistent with the treatment of SEPs for exceptional conditions under sections 1818(c) and 1839(b) of the Act. The SEP provides individuals with the opportunity to enroll once eligibility is established minimizing gaps in coverage and care and avoiding any late enrollment penalties.

Comment: A few commenters requested that CMS and the SSA maintain accessible nondigital pathways, such as telephone, mail, and in-person appointments, for individuals to correct citizenship, nationality, or immigration status information and to enroll or reenroll in Medicare after meeting the requirements of section 1899C(a) of the Act.

Response: We thank the commenters for their comments. The SSA has a national customer service number, as well as a telephone number and address for individuals to contact their local social security office, which often have in-person appointments available. In addition, individuals can create an individualized social security account on ssa.gov. CMS and the SSA will maintain the existing pathways and consider additional pathways as they become available to allow individuals to update their documentation and verify eligibility.

Comment: A couple commenters requested that CMS clarify how Medicare enrollment rules apply to individuals who first become eligible for Medicare because they newly meet the citizenship, nationality, or immigration status or category requirements in section 1899C(a) of the Act. The commenters stated that individuals who qualify for Medicare for the first time based on a change to an eligible immigration status or citizenship should be entitled to the same initial enrollment period as other new Medicare enrollees.

Response: We acknowledge the comments regarding initial enrollment periods (IEP) for individuals who first meet the citizenship, nationality, or immigration status or category requirements under section 1899C(a) of the Act. We considered establishing an IEP for individuals who would otherwise initially meet the age- or disability-based Medicare requirements, but whose Medicare entitlement or enrollment was not effectuated because they did not meet the requirements of section 1899C(a) of the Act. However, as discussed in the proposed rule, the IEPs in sections 1818(c) and 1837(d) of the Act are tied to an individual's attainment of age 65 or completion of the 24-month disability waiting period. Those IEPs include a period before the individual first becomes eligible for Medicare, which allows the individual to enroll before eligibility begins and avoid delays in coverage.

That predictable timeframe and structure does not apply in the context of when an individual may attain eligible non-citizen status for Medicare. In this circumstance, eligibility to enroll or be entitled to Medicare is predicated on a future change in citizenship, nationality, or immigration status or category, and the timing of any such change is likely unpredictable. Therefore, an IEP beginning three

[217] POMS HI 00805.180—Payment of Premium Arrearage.

months before the month in which the individual first meets section 1899C(a) of the Act proves infeasible. More pointedly, applying the IEP provisions in sections 1818(c) and 1837(d) of the Act in the cases of individuals who meet the requirements of section 1899C(a) later than when they meet, for example, the age or disability criteria for Medicare eligibility would be unfair to those individuals, as they would functionally lose out on several months of an enrollment period that they would have been eligible for during an IEP based on age or disability.

Sections 1818(c) and 1837(m) of the Act authorize the Secretary to, in his discretion, establish the SEP for individuals who first meet the requirements of section 1899C(a) of the Act, or who lose and later regain Medicare eligibility due to a change in citizenship, nationality, or immigration status or category. In exercising this discretion, the Secretary is establishing an enrollment period timeframe that provides an analogous enrollment opportunity that they would have during an initial IEP. Further, the extension of the SEP to 12 months, along with the option of up to 6 months of retroactive coverage provides a greater opportunity for enrollment and minimizes gaps in coverage.

Comment: A commenter also requested clarification on whether a protective filing date for an SEP would be established when a person contacts the SSA in person.

Response: The SSA's rules on protective filing dates for disability applications are not relevant for purposes of the timing or duration of the SEP. We are finalizing, as proposed, that the SEP begins on the first day of the month in which the individual contacts the SSA and provides the SSA with sufficient information to demonstrate that the Medicare eligibility requirements have been met. This policy will apply regardless of how the individual contacts the SSA or whether the individual provides the information (necessary to prove U.S. citizenship or nationality or eligible noncitizen status) in person, by mail, or electronically (such as through an individual's ssa.gov account), which will then require verification by the SSA. The individual will have 12 months from the month in which the individual contacts the SSA and provides the SSA with sufficient information to demonstrate that the Medicare eligibility requirements have been met to enroll prospectively using the SEP. As noted previously, an individual enrolling during the SEP may elect retroactive coverage of up to 6 months, but not before the month in which the individual first met all of the Medicare eligibility requirements. The requirements for retroactive coverage for premium Part A and Part B are at §§ 406.27(f)(3)(ii) and 407.23(f)(3)(ii).

The effective date rules in this SEP do not govern coverage established under a State buy-in agreement under sections 1843 and 1818(g) of the Act; the beginning of coverage under a buy-in agreement continues to be governed by §§ 406.26(b) and 407.47.

After consideration of public comments, we are finalizing the changes to §§ 406.27 and 407.23 as proposed, with the following modifications:

- Sections 406.27(f)(2) and 407.23(f)(2) would be revised to reflect that the SEP duration is 12 months; and
- In §§ 406.27 and 407.23, paragraph (f)(3) would be revised to reflect that individuals enrolling during the SEP will have prospective coverage (that is, the first day of the month following the month of enrollment) unless they elect retroactive coverage (up to 6 months).

4. Limiting Coverage Under Medicare Part C, Medicare Part D, and Cost Plans to Certain Individuals

Under section 1851(a)(3) of the Act, MA is available only to individuals who are entitled to Medicare Part A and are enrolled in Medicare Part B. Medicare Part D (the Medicare prescription drug benefit) is available to individuals who are entitled to Medicare Part A or are enrolled in Medicare Part B, as specified in section 1860D—1(a)(3) of the Act. Section 1876(a)(1)(A) of the Act outlines eligibility requirements to enroll in Medicare cost plans and provides that individuals may enroll in cost plans if they are entitled to Medicare Part A and are enrolled in Part B or are enrolled in Part B only. Eligibility for enrollment in an MA plan, Part D plan, or cost plan is therefore dependent on an individual's underlying entitlement to and/or enrollment in Medicare Part A and/or Part B, as applicable. Prior to the enactment of section 1899C of the Act, individuals who satisfied the statutory conditions for Medicare Part A entitlement and/or Medicare Part B enrollment, as applicable, were likewise eligible to enroll in MA plans, Part D plans, or cost plans, provided they met applicable enrollment requirements. The eligibility requirements in section 1899C of the Act apply to all parts of Medicare. Individuals who do not meet the eligibility requirements of section 1899C of the Act are not eligible for Medicare Part A or Part B and may not enroll or remain enrolled in MA plans, Part D plans, or cost plans.

Individuals enrolled in MA plans, Part D plans, or cost plans who do not meet the eligibility requirements of section 1899C of the Act must be disenrolled from those plans. Under 42 CFR 417.460(b)(2)(iii), 422.74(b)(2)(ii), and 423.44(b)(2)(ii), individuals who lose eligibility for enrollment are involuntarily disenrolled from the plan. Such disenrollments will be prospective and effective the first day of the calendar month following the month in which the plan receives a notice from CMS of the individual's loss of entitlement to Part A or Part B as specified under 42 CFR 417.460(h), 422.74(d)(5), and 423.44(d)(3).

Plans do not process these disenrollments. CMS processes these automatically through the MARx system when the SSA provides updated eligibility and entitlement records and CMS will notify the plan of the disenrollment due to loss of entitlement, through MARx transaction reply codes. Plans have the option, but are not required, to provide a notice of disenrollment due to loss of entitlement. Since the SSA provides a loss of entitlement notice for Part A and Part B, there is no need to require plans to provide additional notification.

Accordingly, we proposed to amend the regulations at 42 CFR part 417, part 422, and part 423 to incorporate the new eligibility limitations established by section 1899C of the Act. We proposed to revise the following sections to reflect the applicability of section 1899C of the Act:

- Paragraph (b) of § 417.2 (Basis and scope): We proposed to amend paragraph (b) of § 417.2 to add a reference to section 1899C of the Act, which establishes eligibility limitations applicable to cost plan enrollment.
- Paragraphs (a)(1)(xii) and (a)(2) of § 422.1 (Basis and scope): We proposed to amend § 422.1 to add paragraph (a)(1)(xii) to reference section 1899C of the Act, which establishes eligibility limitations applicable to MA enrollment. We further proposed to remove and reserve paragraph (a)(2) that references 8 U.S.C. 1611.
- Paragraphs (a)(1) and (3) of § 423.1 (Basis and scope): We proposed to amend paragraph (a)(1) of § 423.1 to add a reference to section 1899C of the Act, which established eligibility limitations applicable to Part D enrollment. We further proposed to remove and reserve paragraph (a)(3) of § 423.1 that references 8 U.S.C. 1611.

We also proposed to add that effective July 4, 2025, an individual must be a citizen or national of the United States or an eligible noncitizen as a basis for entitlement. We proposed to revise the following sections to add this language:

• Paragraph (h) of § 417.422 (Eligibility to enroll in an HMO or CMP).

• Paragraph (a)(7) of § 422.50 (Eligibility to elect an MA plan).

• Paragraph (a)(1)(iii) of § 423.30 (Eligibility and enrollment).

Additionally, we proposed to update the regulations at 42 CFR part 417, part 422 and part 423 to clarify the circumstances under which individuals must be disenrolled from MA plans, Part D plans, or cost plans due to failure to meet the eligibility requirements of section 1899C of the Act. Though failure to meet the eligibility requirements of section 1899C of the Act results in a loss of Part A and Part B eligibility, we proposed to create an involuntary disenrollment process for MA plans, Part D plans, and cost plans that is separate from the existing loss of entitlement to Part A or Part B disenrollment process. Administratively, separating failure to meet section 1899C of the Act eligibility requirements from all other reasons for loss of Part A or Part B entitlement allows CMS to better track the impact of this provision and create new technical processes with the SSA and internally. Specifically, we proposed to revise the following sections to add this language:

• Paragraphs (b)(2)(iv) and (j) of § 417.460 (Disenrollment of beneficiaries by an HMO or CMP): We proposed to amend paragraph (b)(2)(iv) of § 417.460 to state that a cost plan must disenroll an enrollee if they no longer meet the requirements of § 417.422(h). We proposed to amend paragraph (j) of § 417.460 related to the disenrollment effective date to apply to an enrollee who is not a U.S. citizen, U.S. national, or eligible noncitizen.

• Paragraphs (b)(2)(v) and (d)(9) of § 422.74 (Disenrollment by the MA organization): We proposed to amend paragraph (b)(2)(v) of § 422.74 to state that an MA plan must disenroll an enrollee if they no longer meet the requirements of § 422.50(a)(7). We proposed to amend paragraph (d)(9) of § 422.74 related to the disenrollment effective date to apply to an enrollee who loses U.S. citizenship or nationality, or eligible noncitizen status.

• Paragraphs (b)(2)(vi) and (d)(8) of § 423.44 (Involuntary disenrollment from Part D coverage): We proposed to amend paragraph (b)(2)(vi) of § 423.44 to state that a Part D plan must disenroll an enrollee if they no longer meet the requirements of § 423.30(a)(1)(iii). We proposed to amend the heading for paragraph (d)(8) of § 423.44 related to the disenrollment effective date to apply to an enrollee who loses U.S. citizenship or nationality, or eligible noncitizen status.

We also proposed to amend the regulations at 42 CFR part 422 and part 423 to replace the SEP that is currently applicable when an individual who is a non-U.S. citizen attains lawful presence status. Under this proposal, the SEP would apply when an individual verifies their eligible noncitizen/citizenship status with the SSA, after attaining the eligibility requirements of section 1899C(a) of the Act. The SEP would begin when the individual provides the SSA with sufficient information to demonstrate that the requirements of § 406.20(b)(2) and § 407.10(a)(2)(ii) have been met. Providing this information to the SSA and establishing eligibility would result in automatic entitlement for Part A, assuming that the individual was otherwise eligible for premium-free Part A. For Part B entitlement, the individual would also need to enroll in Part B under § 407.4(a)(2), after which the individual would become entitled to Part B.

We proposed to revise this language in the following sections:

• Paragraph (b)(16) of § 422.62 (Election of coverage under an MA plan).

• Paragraphs (c)(21)(i) and (ii) of § 423.38 (Enrollment periods).

Because eligibility to elect an MA plan requires an individual to be both entitled to Medicare Part A and enrolled in Medicare Part B, we proposed, that the SEP at § 422.62(b)(16) would last for 2 calendar months after the month in which the individual becomes entitled to Medicare Part A and enrolled in Medicare Part B. Similar to the way the MA Initial Coverage Election Period (ICEP) works under § 422.62(a)(1), we proposed that this SEP would be available as soon as the individual is entitled to Medicare Part A and enrolled in Medicare Part B. As a result, this SEP would be available to individuals who previously had and lost Part A and/or Part B because they did not have eligible noncitizen/citizenship status. For such individuals, they would not have access to the ICEP because their new entitlement to Medicare Part A and enrollment in Medicare Part B would not be their ''first'' entitlement, as required by the ICEP. We proposed this SEP as a way of ensuring that individuals gaining eligible noncitizen/citizenship status have the opportunity to enroll in MA upon becoming entitled to Medicare Part A and enrolling in Medicare Part B. Consequently, this SEP will replace the existing SEP for gaining ''lawful presence status,'' which is no longer a relevant eligibility criterion and needs to be removed. An enrollment using this SEP would be effective the first day of the calendar month following the month in which the election is made, as specified in § 422.68(d).

We proposed that the Part D SEP at § 423.38(c)(21)(i) and (ii) would last for 2 calendar months after either the individual's Part A or Part B entitlement or enrollment date, as applicable, since they can differ and individuals are eligible for Part D with either Part A or Part B. We also proposed that the SEP would end based on the earlier of the two dates. The Part D SEP needs a different timeline than its Part C equivalent since the eligibility criteria for the two programs differ. Importantly, we intended for this SEP to be used surrounding the period that an individual establishes their eligible noncitizen/citizenship status with the SSA, so we proposed that the SEP eligibility window begins upon the entitlement to Part A or enrollment in Part B, whichever is earlier. This timeline ensures that the SEP is based upon both the eligibility requirements for Part D and the intent to provide these individuals with an opportunity to enroll in Part D when initially eligible to make such an election after establishing eligible noncitizen/citizenship status. This SEP would also replace the existing SEP for gaining ''lawful presence status.'' An enrollment using this SEP would be effective the first day of the calendar month following the month in which the election is made, as specified in § 423.40(c).

We received public comments on the proposals related to limiting coverage under MA, Part D, and cost plans. The following is a summary of the comments we received and our responses.

Comment: Many commenters urged CMS to require MA, Part D, PACE, and cost plans to issue multiple notices to ensure impacted enrollees are fully informed of their loss of coverage as people may not connect the SSA termination notice with the health care they receive through these other programs. A commenter stated plans need to inform enrollees that the premiums they pay for their private health plans will stop being deducted from their SSA check, including what to do if premiums continue to be collected after their Medicare eligibility ceases.

Response: We thank the commenters for these recommendations. We do not believe multiple notices from MA, Part D, PACE, and cost plans should be a required condition of plan disenrollment. Disenrollment from MA, Part D, and cost plans following loss of

Part A or Part B entitlement is derivative of the underlying SSA Medicare entitlement determination. After the SSA updates entitlement records, CMS effectuates the plan disenrollment and notifies the plans. Plan premiums cease based on the disenrollment date. Our current regulations do not require plans to issue a disenrollment notice in this instance because the SSA provides notice of the loss of Medicare entitlement. The termination notices issued by the SSA will contain a statement that termination of entitlement and enrollment to Part A and Part B may impact any MA or Part D enrollment. We maintain our current regulations and continue to encourage plans to provide the enrollee with a notice of disenrollment using the model notice that includes language to contact the SSA as it pertains to Medicare entitlement.[218] CMS will continue to coordinate with the SSA and consider additional implementation guidance for plans.

Comment: Many commenters urged CMS to develop and require plans to use standard phone scripts and educational materials for their members explaining these changes in the law, and to refer their affected enrollees to resources in their local community (for example, SHIPs, ADRCs, Area Agencies on Aging, etc.). They also suggested that CMS provide training, educational materials, FAQs, scripts, and other resources to organizations that will assist affected individuals.

Response: CMS thanks the commenters for their suggestions. While our current regulations or policies finalized in this final rule do not require plans to use standard phone scripts and educational materials for their members explaining changes in the law and to refer their affected enrollees to resources in their local community, CMS intends to conduct a robust outreach and education effort that is accessible, multimodal, and broad in reach. CMS and the SSA have been working to develop a comprehensive communications plan to support implementation of section 1899C of the Act, including updated webpages and beneficiary materials and prepared scripts for 1–800–MEDICARE. CMS also plans to use existing communication and education channels, including the Medicare Learning Network (MLN), to provide information and educational resources to Medicare providers, SHIPs, and other interested parties. CMS will continue to coordinate with the SSA and other partners, as appropriate, to refine materials and outreach activities, including existing model disenrollment notices.

Comment: A few commenters suggested ongoing Medicare-related plan coverage pending a decision on a termination of enrollment appeal, including MA, Part D, cost, and PACE. Commenters suggested that MARx and other internal systems should reflect when an appeal is filed and a termination date communicated to plans should be suspended until the outcome of the appeal.

Response: We appreciate the commenters' suggestion. Disenrollment from MA, Part D, and cost plans following loss of Part A or Part B entitlement is derivative of the underlying Medicare entitlement determination. Continued Medicare coverage pending a decision on an appeal does not apply to terminations based on the eligibility requirements in section 1899C(a) of the Act. If an appeal results in a determination that the individual met the applicable Medicare eligibility requirements at the time of termination, including section 1899C(a) of the Act, the SSA will correct the prior determination and restore Medicare entitlement or enrollment retroactively, as appropriate, consistent with existing procedures. Related plan reinstatement would be addressed based on the corrected period of entitlement or enrollment, in line with current procedures.[219]

Comment: Several commenters expressed support for establishing SEPs for individuals who become eligible noncitizens. A commenter suggested extending the MA and Part D SEPs from two months to at least 6 months to enroll in a plan following restoration of Medicare eligibility and coverage, or align these enrollment opportunities with the longer Part A and Part B SEP. A commenter suggested that the SEP for enrollment into a plan start when an individual receives actual notice, rather than from the Part A and/or Part B entitlement date. Another commenter expressed that individuals should receive written notice of the SEP availability with clear start and end dates. A commenter questioned whether the SEP would require CMS approval and be restricted to the Medicare Online Enrollment Center and for guidance on interactions with other SEPs.

Response: We thank the commenters for their feedback. Our proposed SEP would have started when the individual was entitled to Part A and/or enrolled in Part B, as applicable; however, with the option to choose retroactive coverage in premium Part A and Part B, we are making a conforming modification to the MA and Part D SEPs at §§ 422.62(b)(16)(i) and 423.38(c)(21)(ii), respectively, to start the SEP for MA when the individual receives notice of Part A entitlement and Part B enrollment, and to start the SEP for Part D when the individual receives notice of either Part A entitlement or Part B enrollment. The MA SEP continues for an additional 2 calendar months after the month in which notice of Part A entitlement and Part B enrollment is received. For the Part D SEP, the SEP continues for an additional two calendar months after the month in which the individual received notice of the Part A entitlement or Part B enrollment, whichever is earlier. As discussed previously, the intent of the SEP is to provide individuals with an opportunity to enroll in a plan when initially eligible to make such an election after establishing eligible noncitizen status (or U.S. citizenship or nationality). We believe that the SEP start date and the two-month duration are appropriate and provide sufficient time for a beneficiary to select a plan, if desired, and is consistent with other SEPs for MA and Part D.

With respect to the question of whether utilization of this SEP would require CMS approval and be limited to CMS enrollment mechanisms, we are not requiring CMS approval. We will provide guidance, as appropriate, on the use of the SEP and possible considerations with other SEPs. CMS also intends to conduct a robust outreach and education effort and has been working with the SSA to develop a comprehensive communications plan to support implementation of section 1899C of the Act and to provide timely and understandable information, including SEP availability with clear start and end dates, to affected individuals and the organizations that assist them.

Comment: Several commenters recommended that CMS establish clear, coordinated, and timely implementation guidance and procedures for these eligibility changes, including specific operational guidance for MA organizations and Part D sponsors. A commenter suggested that CMS should clearly delineate the responsibilities of

[218] Model notices are available in the Medicare Advantage Enrollment and Disenrollment Guidance Appendices and Exhibits: MA Exhibit 14 (Model Notice of Disenrollment Due to Loss of Medicare Part A and/or Part B) and Part D Exhibit 14 (PDP Model Notice of Disenrollment Due to Loss of Part D Eligibility), available at: *cms.gov/files/document/cy-2027-ma-appendices-exhibits.pdf.*

[219] See Section 70.3.1 of the Medicare Advantage and Part D Enrollment and Disenrollment Guidance.

CMS, other Federal agencies, and MA and Part D plans.

Response: We agree with the commenters' recommendations and will issue operational guidance or other operational resources for plans, as needed.

Comment: A few commenters encouraged CMS to coordinate disenrollment and reenrollment across Medicare Part A, Part B, Part C, Part D, and cost plans to minimize gaps in coverage and disruptions in care. In addition, they urged CMS to facilitate advance and prompt data sharing of identified individuals who are losing Medicare entitlement to all plans.

Response: We acknowledge the commenters' concerns. CMS and the SSA data systems have regular data exchanges regarding enrollments and disenrollments and CMS promptly communicates enrollment and disenrollment information to plans. CMS and the SSA will continue to coordinate and consider additional implementation guidance for plans.

Comment: Another commenter stated that CMS explains in the proposed rule that it—and not the plans—processes plan disenrollments and that CMS will notify plans of disenrollment due to loss of entitlement. The commenter noted that CMS also clarified that plans may, but are not required, to separately notify their members of disenrollment, yet CMS proposes to codify this process at §§ 422.74(b) and 423.44(b) as a reason for which a plan must disenroll an individual. The commenter recommended a revision to the proposed regulations text to clarify that MA organizations are not independently responsible for effectuating disenrollments, consistent with CMS's stated intent in the proposed rule.

Response: While we acknowledge the commenter's recommendation, we respectfully decline to revise the proposed regulatory text. As discussed previously, CMS effectuates the plan disenrollment (after the SSA updates entitlement records) and notifies the plans. This is in accordance with §§ 422.74(d)(5) and 423.44(d)(3), which are unaffected by this rule. The proposed amendments to §§ 422.74(b) and 423.44(b) pertain to the implementation of section 1899C of the Act.

After consideration of public comments, we are finalizing the changes to 42 CFR 417, 42 CFR 422, and 42 CFR 423 as proposed with the following changes. We made conforming modifications to §§ 422.62(b)(16)(i) and 423.38(c)(21)(ii) to clarify that the MA and Part D SEPs start the month that the individual receives notice and continues for a subsequent 2 calendar months. We also made conforming modifications to §§ 417.460(j), 422.74(d)(9), and 423.44(d)(8) to clarify that disenrollment is effective the first day of the month following the month in which the plan receives notice from CMS that the individual is ineligible.

F. Medicare Prescription Drug Inflation Rebate Program

1. Background

a. Overview of the Medicare Prescription Drug Inflation Rebate Program

Sections 11101 and 11102 of the Inflation Reduction Act of 2022 (IRA) (Pub. L. 117—169, enacted August 16, 2022) established requirements under which drug manufacturers must pay inflation rebates if they raise their prices for certain drugs payable under Part B and/or covered under Part D faster than the rate of inflation. Specifically, section 11101 of the IRA amended section 1847A of the Act by adding new subsection (i) which establishes a requirement for drug manufacturers to pay rebates into the Federal Supplementary Medical Insurance Trust Fund for Part B rebatable drugs if the specified amount, as determined under section 1847A(i)(3)(A)(ii) of the Act, exceeds the inflation—adjusted payment amount, which is calculated as set forth in section 1847A(i)(3)(C) of the Act. The IRA, under section 1847A(i)(5) of the Act, also provides for an adjustment to the beneficiary coinsurance amount in cases where the price of a Part B rebatable drug increases faster than the rate of inflation such that the beneficiary coinsurance is calculated based on the lower inflation—adjusted payment amount instead of the applicable payment amount. Section 1847A(i)(2) of the Act defines a ''Part B rebatable drug,'' as a single source drug or biological product (as defined in section 1847A(c)(6)(D) of the Act), including a biosimilar biological product (as defined in section 1847A(c)(6)(H) of the Act), but excluding a qualifying biosimilar biological product (as defined in section 1847A(b)(8)(B)(iii) of the Act) for which payment is made under Part B, except such term also does not include a drug or biological described in clause (i) and (ii) of such section 1847A(i)(2)(A) of the Act.

Section 11102 of the IRA added section 1860D–14B of the Act, which requires drug manufacturers to pay rebates into the Medicare Prescription Drug Account in the Federal Supplementary Medical Insurance Trust Fund for each 12-month applicable period, starting with the applicable period that began on October 1, 2022, for Part D rebatable drugs if the annual manufacturer price (AnMP) of such drug, which is calculated as set forth in section 1860D–14B(b)(2) of the Act, exceeds the inflation-adjusted payment amount, which is calculated as set forth in section 1860D–14B(b)(3) of the Act. Section 1860D–14B(g)(1)(A) of the Act defines a ''Part D rebatable drug,'' as a drug or biological described at section 1860D–14B(g)(1)(C) of the Act that is a ''covered Part D drug'' as that term is defined in section 1860D–2(e) of the Act, and excludes drugs and biologicals described in subparagraph (B) of such section 1860D–14B(g)(1) of the Act. The definition of a Part D rebatable drug includes drugs approved under a new drug application under section 505(c) of the Federal Food, Drug, and Cosmetic (FD&C) Act, drugs approved under an abbreviated new drug application under section 505(j) of the FD&C Act that meet certain sole source criteria described at sections 1860D–14B(g)(1)(C)(ii)(I) through (IV) of the Act, and biologicals licensed under section 351 of the Public Health Service (PHS) Act, including biosimilars.

The IRA sets forth different parameters for determining rebates under the Medicare Part B Drug Inflation Rebate Program and the Medicare Part D Drug Inflation Rebate Program. In regard to the rebates owed, for each calendar quarter beginning on or after January 1, 2023, the manufacturer of a Part B rebatable drug is required, for such drug, not later than 30 days after the date of receipt of the Rebate Report from us, to pay a rebate into the Federal Supplementary Medical Insurance Trust Fund if the amount specified in section 1847A(i)(3)(A)(ii)(I) of the Act exceeds the inflation-adjusted payment amount (calculated as set forth in section 1847A(i)(3)(C) of the Act) for an applicable calendar quarter. In contrast, for each 12-month applicable period beginning on or after October 1, 2022, the manufacturer of a Part D rebatable drug is required, for such drug, not later than 30 days after the date of receipt of the Rebate Report from us, to pay a rebate into the Medicare Prescription Drug Account in the Federal Supplementary Medical Insurance Trust Fund if the amount of the AnMP (calculated as set forth in section 1860D–14B(b)(2) of the Act) exceeds the inflation-adjusted payment amount (calculated as set forth in section 1860D–14B(b)(3) of the Act). In regard to invoicing manufacturers for the rebate amount owed, under section 1847A(i)(1) of the Act, we must report

rebate amounts to each manufacturer of a Part B rebatable drug no later than 6 months after the end of each calendar quarter, except that for calendar quarters beginning in 2023 and 2024, section 1847A(i)(1)(C) of the Act provides that we had until September 30, 2025, to invoice manufacturers for rebates. In contrast, under section 1860D–14B(a) of the Act, we must report rebate amounts to each manufacturer of a Part D rebatable drug no later than 9 months after the end of each applicable period, except that for the first two applicable periods (that is, October 1, 2022, to September 30, 2023, and October 1, 2023, to September 30, 2024), section 1860D–14B(a)(3) of the Act provides that we had until December 31, 2025, to invoice manufacturers for Part D inflation rebates. Additionally, there are statutory differences in the inputs (that is, data sources) used to calculate the rebate amounts for Part B and Part D.

In the CY 2025 PFS final rule (89 FR 98228 through 98313), to implement sections 11101 and 11102 of the IRA, we codified these requirements and established other policies at parts 427 and 428 under title 42, chapter IV of the Code of Federal Regulations for Part B and Part D, respectively.

b. Summary of Policies for the Medicare Prescription Drug Inflation Rebate Program

We proposed new policies for the Medicare Part B Drug Inflation Rebate Program as follows:

- Section 427.20 will clarify the definition of ''first marketed date'' to clarify the data sources we will use to identify the first marketed date when relevant Average Sales Price (ASP) data is not available.
- Section 427.101(b)(5) will modify the skin substitutes excluded product category for Part B rebatable drugs so that the exclusion applies only to certain skin substitute products.
- Section 427.302(e)(6) and (f)(1) will clarify what Consumer Price Index for All Urban Consumers (CPI–U) data will be used to determine the benchmark period CPI–U in place of the month for which CPI–U data are unavailable.

We also proposed new policies for the Medicare Part D Drug Inflation Rebate Program as follows:

- Section 428.20 will clarify the definition of ''applicable period CPI–U'' when the CPI–U data for the first month of the applicable period are not available.
- Section 428.202(e)(6) will clarify what CPI–U data would be used to determine the benchmark period CPI–U in place of the month for which CPI–U data are unavailable.
- Section 428.203(c) will require providers and suppliers that are covered entities as defined at § 10.3 to submit Part D 340B data to the 340B repository beginning with claims with a date of service on or after January 1, 2027.

We received public comments on the proposed provisions, comments on the Medicare Prescription Drug Inflation Rebate Program, and comments related to policies for which we did not make proposals. The following is a summary of the comments received on the Medicare Prescription Drug Inflation Rebate Program. We summarize comments on specific proposed provisions and provide responses in the relevant sections.

Comment: Some commenters wrote in support of the Medicare Prescription Drug Inflation Rebate Program, and some of these commenters also wrote that any savings realized through the Medicare Prescription Drug Inflation Rebate Program should be made available to people with Medicare.

Response: We appreciate the commenters' feedback. We note that Part B and Part D inflation rebates paid by drug manufacturers are deposited into the Federal Supplementary Medical Insurance Trust fund in accordance with sections 11101(a) and 11102(a) of the IRA. Additionally, under the Medicare Part B Drug Inflation Rebate Program, beneficiary coinsurance is 20 percent of the inflation-adjusted payment amount, which is less than what the beneficiary would pay in coinsurance otherwise.

Comment: A commenter suggested that CMS provide information on estimating savings realized through the Medicare Prescription Drug Inflation Rebate Program, including information on the collection of rebates, drugs subject to the Medicare Prescription Drug Inflation Rebate Program, and the impact on people with Medicare.

Response: For further information on how Part B rebatable drugs and Part D rebatable drugs are identified, please refer to §§ 427.101 and 428.101, respectively. We publish information, including annual aggregate rebate amounts by rebatable drug, on the Medicare Part B Drug Inflation Rebate Program and the Medicare Part D Drug Inflation Rebate Program on our website at *https://www.cms.gov/initiatives/medicare-prescription-drug-affordability/overview/medicare-inflation-rebate-program* under ''Medicare Part B Inflation Rebate Reports'' and ''Medicare Part D Inflation Rebate Reports.'' We note that people with Original Medicare and Medicare Advantage who use Part B rebatable drugs that have an adjusted coinsurance rate based on the inflation-adjusted payment amount may pay a reduced amount for their coinsurance during a specific quarter. Sections 11101 and 11102 of the IRA do not direct CMS to publish a report evaluating the Medicare Prescription Drug Inflation Rebate Program's impact on people with Medicare. CMS does publish related materials, such as Trustees Reports,[220] which discuss the Medicare Prescription Drug Inflation Rebate Program's financial effects.

Comment: A commenter stated that CMS should ensure that changes to the Medicare Prescription Drug Inflation Rebate Program do not unintentionally reduce access to essential drugs. This commenter did not reference specific proposed policies of concern.

Response: We generally monitor the Medicare Prescription Drug Inflation Rebate Program, including using CMS' formulary review process to assess any practices that may undermine beneficiary access to certain drugs and ensuring that Part D plan sponsors comply with existing statutory and regulatory restrictions on formulary design.

Comment: A couple of commenters opposed CMS' proposals for the Medicare Prescription Drug Inflation Rebate Program but did not provide more information.

Response: We thank the commenters for providing input.

2. Medicare Part B Drug Rebates for Single Source Drugs and Biological Products With Prices That Increase Faster Than the Rate of Inflation

a. Definitions (§ 427.20)

In the CY 2025 PFS final rule (89 FR 98579), we codified at § 427.20 the definition of ''first marketed date'' to mean the earliest date of first sale of any NDC–11 within a billing and payment code among all products and package sizes under the same FDA application. In that definition, we specify that the first marketed date will be identified using ASP data reported by NDC–11 to CMS by a manufacturer as required under sections 1927(b)(3)(A)(iii)(I) and 1847A(f)(2) of the Act, if available. We noted in the proposed rule that we use ''date of first sale'' as reported in the ASP Data Collection System for the first marketed date as specified at § 427.20. There may be scenarios where a drug is being marketed but the first marketed date is not available in the ASP data such as when a manufacturer is not subject to sections 1927(b)(3)(A)(iii)(I) or

1847A(f)(2) of the Act and is not required to report ASP data. In this example, ASP units sold also would be unavailable in the ASP Data Collection System. Currently we generally use the NDC Directory to identify the first marketed date when it is not available in the ASP Data Collection System. In the proposed rule, to improve transparency of operations to address instances when first marketed date is missing from ASP data, we proposed to amend § 427.20 for the definition of the term ''first marketed date'' to clarify the data sources we would use to identify the first marketed date when ASP data are not available. Specifically, when the first marketed date is missing from ASP data for any NDC–11 associated with any FDA application number ever associated with the billing and payment code, we proposed to identify the first marketed date from an alternative public source, such as from the NDC Directory. For example, when the first marketed date is missing from ASP data for a given NDC, we would identify the first marketed date for the NDC–11 from the NDC Directory; and if the first marketed date also is missing from the NDC Directory for a given NDC, we would default to using the FDA approval date as listed in the Orange Book or Purple Book. We noted in the proposed rule that we believe data in the NDC Directory are accurate, reliable, and up to date. The Food and Drug Administration (FDA) updates the NDC Directory daily with information submitted to FDA by labelers. A labeler may be a manufacturer, including a repackager or relabeler, or the entity named on the product label that is required to list their products with FDA under 21 CFR part 207. The FDA also requires that labelers update their drug product listing data twice a year or certify that there were no changes to such data.

We received public comments on these proposals. The following is a summary of the comments we received and our responses.
