Comment: A few commenters recommended CMS use alternative data sources to the ones CMS proposed to use to identify ''first marketed date'' when the first marketed date is missing from ASP data for any NDC–11 associated with any FDA application number ever associated with the billing and payment code. A couple of commenters recommended CMS use the ''market date'' from the Medicaid Drug Rebate Program (MDRP); a commenter suggested using the ''market date'' from MDRP in place of the NDC Directory in instances when ''first marketed date'' is missing from the ASP Data Collection System and another commenter suggested using the ''market date'' from MDRP in place of the Orange Book and Purple Book in instances when ''first marketed date'' is missing from the NDC Directory. Both commenters noted that MDRP's ''market date'' is an established benchmark for determining rebate liability in Medicaid and that using this date would promote consistency across Federal drug pricing programs. Additionally, a commenter recommended that CMS rely on manufacturers to provide the ''first marketed date'' via an attestation of the date the drug was first made commercially available. This commenter expressed concern that CMS' described hierarchy of data sources to determine first marketed date may not always provide an accurate or sufficiently precise indication of when a drug or biological product was first marketed. In particular, the commenter raised that the Orange Book and Purple Book do not include the first marketed date and instead include the marketing status as ''Prescription'' or ''Discontinued,'' adding that a marketing status of ''Prescription'' does not necessarily indicate that commercial sales have occurred. The commenter also noted that the Orange Book and Purple Book are not comprehensive and are not updated daily. Lastly, the commenter stated that if CMS finalizes its definition as proposed, CMS should provide additional guidance regarding the specific data sources, documentation, and procedures that will govern first marketed date determinations, including any potential disputes that manufacturers may have with CMS' determinations, noting that doing so would promote transparency, consistency, and accuracy.

Response: We appreciate commenters recommending alternative data sources to the sources that CMS proposed. With regards to the Orange Book and Purple Book not being accurate or sufficiently precise and up to date, we note that as stated in the proposed rule we generally use the NDC Directory to identify the first marketed date when it is not available in the ASP Data Collection System and that we would use the FDA approval date as listed in the Orange Book or Purple Book only in instances when the first marketed date for a given NDC also is missing from the NDC Directory. Although such instances are infrequent, they do occur and so we proposed to use the FDA approval date in the Orange Book and Purple Book and not the marketing status field, which we do not believe is sufficiently precise, as the commenter noted. The monthly updates that occur for the Orange Book and the Purple Book provide up-to-date information for CMS to calculate quarterly rebate calculations for Part B rebatable drugs. We do not use MDRP data for any other variables in the Part B inflation rebate calculation. Using such data in the infrequent instances when first marketed date is not available in the ASP Data Collection System would be operationally inconsistent with how we have implemented section 1847A(i) of the Act. In contrast, we already use the listed FDA sources for these Part B inflation rebate calculations. Specifically, we use the first marketed date from the NDC Directory to determine whether a drug is sold or marketed during the applicable calendar quarter, and we use the Orange Book to determine if a Part B rebatable drug has become a multiple source drug by reviewing for therapeutic equivalence. Therefore, we decline to use ''market date'' from the MDRP for the calculation of Part B inflation rebates. Further, based on our analysis, the NDC Directory appears to be a more comprehensive resource, compared to MDRP, for determinations of first marketed date when such date is not available in the ASP Data Collection System, such as scenarios when a manufacturer is not subject to sections 1927(b)(3)(A)(iii)(I) or 1847A(f)(2) of the Act and is not required to report ASP data. In this circumstance, such drug or biological may not appear in the MDRP, and then we would need to rely on another source to identify the marketed date. In contrast, we are required by statute to use MDRP data for certain inputs in the Part D inflation rebate calculation. Additionally, establishing an operational process requiring manufacturers to provide and attest to their first marketed date would create administrative burden and demand additional resources for both CMS and manufacturers. Therefore, we decline to implement the commenter's suggestion at this time. Lastly, with regards to the suggestion that CMS provide additional guidance on the specific data sources, documentation, and procedures that will govern first marketed date determinations, we do not believe this is necessary because we will follow the process described in § 427.302(c). That is, we will use the earliest first marketed date (as defined at § 427.20) of any NDC ever marketed under any FDA application under which any NDCs that have ever been assigned to the billing and payment code as of the applicable calendar quarter have been marketed.

Comment: A commenter supported CMS' efforts to clarify ''first marketed date'', and recommended CMS finalize a clear definition that prevents gaming while preserving predictable administration for manufacturers, providers, plans, and CMS. To help avoid ambiguity, prevent gaming, and promote consistent administration across drugs and biological products paid under Part B, the commenter also suggested that CMS include examples addressing acquisition of a previously marketed product, product withdrawal followed by product relaunch, reformulations or packaging changes, transitions from miscellaneous billing and payment codes to product-specific billing and payment codes, and products assigned to new billing and payment codes after an initial period of marketing.

Response: We appreciate the commenter's input. We believe the proposed policy provides a clear definition of ''first marketed date'' in scenarios where a drug is being marketed but the first marketed date is not available in the ASP data. That is, if ''first marketed date'' is unavailable in ASP data, we will identify it using an alternative public source, such as the NDC Directory. If the first marketed date also is missing from such alternative public sources for a given NDC, we will use the FDA approval date listed in the Orange Book or Purple Book. We decline to provide specific examples to address particular gaming scenarios because we will follow the process described in this final rule. With respect to the suggestion to provide examples regarding changes in ownership and market status, we note that when identifying the payment amount benchmark quarter, we will follow the process described in § 427.302(c), which is to use the earliest first marketed date of any NDC ever marketed under any FDA application under which any NDCs that have ever been assigned to the billing and payment code as of the applicable calendar quarter have been marketed.

Comment: A couple of commenters recommended CMS establish a process through which manufacturers can identify and correct errors with the first market date, and one of these commenters suggested this error process should occur before CMS uses the data to conduct rebate calculations.

Response: We thank commenters for this input and note that, as described in § 427.501(b)(1), CMS provides manufacturers with a Preliminary Rebate Report at least 1 month prior to the issuance of the Rebate Report. As described in § 427.503, a manufacturer may submit a Suggestion of Error about the information in their Preliminary Rebate Report to CMS, for its discretionary consideration, if the manufacturer believes that there is a mathematical error or errors to be corrected before the Rebate Report is finalized.

After consideration of public comments, we are finalizing the definition of ''first marketed date'' in § 427.20 as proposed with a non-substantive, technical modification. We are correcting a typographical error in the ''first marketed date'' definition in § 427.20, we revised ''If ASP date are'' to ''If an ASP first marketed date is''.

b. Treatment of Skin Substitutes as a Part B Rebatable Drug Excluded Product Category (§ 427.101(b)(5))

In the CY 2025 PFS final rule (89 FR 98580), we codified skin substitutes (that is, products included within the suite of cellular- and tissue-based products that aid wound healing) as an excluded product category at § 427.101(b)(5) and therefore they are not considered Part B rebatable drugs. We finalized this policy because we aimed to create a consistent coding and payment approach for skin substitute products. Since that policy was finalized, in the CY 2026 PFS final rule (90 FR 49496, 50009), we modified how skin substitutes are paid under Part B. In particular, we finalized our proposal to limit application of the ASP payment methodology under section 1847A of the Act to skin substitutes that are approved as a drug or biological product under section 351 of the PHS Act. Additionally, we modified payment for the provision of certain groups of skin substitutes as incident-to supplies.

To avoid an overly broad exclusion at § 427.101(b)(5), we proposed to clarify that skin substitutes licensed as a drug or biological product under section 351 of the PHS Act would not be excluded from the definition of a Part B rebatable drug, and, as such, would be subject to Part B inflation rebates and subject to the beneficiary coinsurance adjustment under § 427.201. We noted in the proposed rule that currently there are no skin substitute products licensed as a drug or biological product under section 351 of the PHS Act; however, our proposal would make clear that any future skin substitute products that are licensed as a drug or biological product under section 351 of the PHS Act could be rebatable. We proposed to amend § 427.101 by revising paragraph (b)(5), which describes skin substitutes as an excluded product category for Part B rebatable drugs, to state a skin substitute is ''[a] product included within the suite of cellular- and tissue-based products that aid wound healing, other than skin substitute products that are licensed as a drug or biological product under section 351 of the Public Health Service Act''. If finalized, this proposal would not impact Rebate Reports for the fourth quarter of 2026 or earlier.

We received public comments on these proposals. The following is a summary of the comments we received and our responses.

Comment: A commenter stated that CMS' proposal to modify the skin substitutes excluded product category for Part B rebatable drugs has implications on tribally owned products because tribes use section 351 of the PHS Act as a regulatory pathway for such products. The commenter requested CMS consult tribal nations before finalizing this policy.

Response: We appreciate the commenter raising these concerns. CMS' Tribal Technical Advisory Group (TTAG), which provides advice and input to CMS on policy and program issues impacting American Indians and Alaska Natives served by CMS programs, as applicable, did not comment on either the proposed rule or the final rule. As part of our ongoing implementation of the Medicare Prescription Drug Inflation Rebate Program, we will engage with CMS' TTAG.

Comment: A commenter recommended that CMS monitor skin substitute utilization and pricing after any change in rebatable status.

Response: We confirm that we monitor utilization of all drugs and biologicals payable under Part B as well as changes in prices for such drugs and biologicals to assess inflation rebates on drug manufacturers.

After consideration of public comments, we are finalizing § 427.101(b)(5) as proposed.

c. Identification of the Benchmark Period CPI–U and Rebate Period CPI–U (§ 427.302)

Section 1847A(i)(3)(C) of the Act provides that, for each Part B rebatable drug by billing and payment code, CMS will calculate the inflation-adjusted payment amount for each quarter using the benchmark period CPI–U and the rebate period CPI–U, among other inputs, as described at § 427.302(g). For each Part B rebatable drug, we identify the applicable benchmark period CPI–U as described at §§ 427.302(e)(1) and (2), and subject to paragraphs (e)(3) through (5). Specifically, under section 1847A(i)(3)(E) of the Act and as described at § 427.302(e)(1), for a Part B rebatable drug first approved or licensed

by the FDA on or before December 1, 2020, and with a first marketed date on or before December 1, 2020, the benchmark period CPI–U is the CPI–U for January 2021. Additionally, under section 1847A(i)(4)(A) of the Act and as described at § 427.302(e)(2), for a Part B rebatable drug that is a subsequently approved drug, the benchmark period CPI–U is the CPI–U for the first month of the first full calendar quarter after a drug's first marketed date. For the rebate period CPI–U, we will identify and use the greater of the benchmark period CPI–U index level or the CPI–U index level for the first month of the calendar quarter that is 2 calendar quarters before the applicable calendar quarter in which the Part B rebatable drug is furnished, under section 1847A(i)(3)(F) of the Act and as described at § 427.302(f).

As stated in the CY 2025 PFS final rule (89 FR 98247), we will retrieve CPI–U index level information from the Bureau of Labor Statistics (BLS). The BLS did not release CPI–U survey data for October 2025 due to a lapse in appropriations.[221] As a result of the October 2025 CPI–U data being unavailable, multiple interested parties, including drug companies and a pharmaceutical industry trade association, requested that we clarify in a timely manner how we would calculate inflation rebates that would otherwise use the October 2025 CPI–U data. To respond to these inquiries and to promote transparency with regard to the most immediate calculations for the Inflation Rebate Program, including particular Part B beneficiary coinsurance calculations for the second quarter of 2026, we released a Health Plan Management System (HPMS) memo on March 6, 2026,[222] affirming our intent to use November 2025 CPI–U data in place of the missing October 2025 CPI–U data for such calculations. As we explained in that memo, we used the November 2025 CPI–U data issued by the BLS in place of the missing October 2025 CPI–U data because November 2025 was the first month with available CPI–U data in the calendar quarter identified by statute and regulation.

We released this memo in accordance with section 1847A(c)(5)(C) of the Act, which permits CMS to implement, by program instruction or otherwise, any of the provisions of section 1847A of the Act. We also noted that, to complete such calculations, it would have been impracticable to engage in notice-and-comment rulemaking to affirm the policy stated in that memo because the timing of this final rule would be after our deadline to publish the April 2026 Medicare Part B Payment Limit files, including Part B rebatable drugs subject to a coinsurance adjustment. We further noted that the absence of October 2025 CPI–U data also would be relevant to calculating Part B and Part D inflation rebate amounts that will be reported to manufacturers in 2027 and later and stated our intent to address the broader need for a gap-filling methodology as part of future rulemaking through the Physician Fee Schedule.

Currently, our regulations do not address explicitly how the agency should identify the CPI–U, for the purposes discussed previously in this section of the preamble, when the otherwise relevant CPI–U index level information is unavailable from BLS, as occurred for the October 2025 CPI–U. Therefore, we proposed to amend § 427.302 by adding paragraph (e)(6) to ensure that in the event CPI–U data are unavailable, we would use the CPI–U data for the first month for which CPI–U data are available following the month for which CPI–U data are unavailable. This proposal also aligns with the policy and the rationale we provided in the HPMS memo released on March 6, 2026, to address the instance of unavailable CPI–U data for October 2025. Consistent with the reasons we set forth in such memo, this proposed approach most closely aligns with statute because it would result in use of CPI–U data from a month within, and in any event no earlier than the quarter specified by the statute. For the same reasons, we also proposed to amend § 427.302 by adding paragraph (f)(1) to state that when CPI–U data are unavailable, we would use the first month for which CPI–U data are available following the month for which CPI–U data are unavailable.

As an alternative to the proposal at § 427.302(f), we considered using the Department of the Treasury's (''Treasury'') index number according to the index contingency provisions for Treasury Inflation-Protected Securities, which is based on the last available 12-month change in the CPI.[223] This alternative approach does not align with statute, which directs us to use the CPI–U value from the first month of the relevant period and makes no reference to an alternate calculated value. Specifically, section 1847A(i)(3)(F) of the Act defines the rebate period CPI–U as, for the applicable calendar quarter, ''the greater of the benchmark period CPI–U and the consumer price index for all urban consumers (United States city average) for *the first month of the calendar quarter that is two calendar quarters prior* to such described calendar quarter'' (emphasis added). We also considered calculating our own inflation factor rather than using the BLS reported CPI–U data; however, it is impracticable for us to administer a CPI–U survey and calculate an alternate CPI–U index. Finally, we considered using the previous month for which CPI–U data are available, but this approach is less consistent with statute, which as noted previously specifies that we use the CPI–U value from the calendar quarter that is 2 calendar quarters prior to the relevant quarter. We did not propose these alternative options for the reasons described in the proposed rule.

We received public comments on these proposals. The following is a summary of the comments we received and our responses. We note that commenters provided comments and made recommendations for both the Medicare Part B and Part D Drug Inflation Rebate Programs. We have provided responses to these comments in both sections.

Comment: A few commenters stated CMS' proposed approach to use the CPI–U data for the first month for which CPI–U data are available following the month for which CPI–U data are unavailable does not recognize seasonal fluctuations in the U.S. economy. Specifically, the commenters stated that prolonged government shutdowns are more likely to occur in October because the Federal fiscal year ends on September 30, which would increase the likelihood that the October CPI–U may be unpublished. The commenters noted that the November CPI–U, which is the CPI–U that likely would be used in rebate calculations, is often lower than the October CPI–U due to seasonal fluctuations in inflation common in November (for example, holiday discounts and decreasing gasoline prices). A few commenters stated that our proposed approach could have adverse financial consequences for manufacturers by decreasing their ability to predict the financial impact of inflation rebates, impacting future rebate liability when BLS CPI–U data are not available, or systematically underestimating inflation.

[221] BLS, *https://www.bls.gov/cpi/additional-resources/2025-federal-government-shutdown-impact-cpi.htm#:%7E:text=Yes.,in%20appropriations%E2%80%9D%20will%20be%20included*.

[222] CMS, Medicare Prescription Drug Inflation Rebate Program: Impact of Missing October 2025 CPI–U Data on Medicare Part B Inflation Rebate Program in Second Quarter of 2026, *https://www.cms.gov/files/document/cpi-u-gap-filling-memo-final-508.pdf*.

[223] 31 CFR part 356, Appendix B. *https://www.ecfr.gov/current/title-31/subtitle-B/chapter-II/subchapter-A/part-356#ap31.2.356_135.b*.

Response: Section 1847A(i)(3)(F) of the Act specifies that with respect to a calendar quarter, the rebate period CPI–U is the greater of the benchmark period CPI–U and the CPI–U for the first month of the calendar quarter that is two calendar quarters prior to such described calendar quarter. Section 1847A(i)(3)(E) of the Act defines the benchmark period CPI–U as the CPI–U for January 2021. However, section 1847A(i)(4)(A) of the Act provides that for Part B rebatable drugs approved or licensed after December 1, 2020, the benchmark period CPI–U is defined as the CPI–U for the first month of the first full calendar quarter after the day on which the drug was first marketed. The statute does not specify other factors to consider when determining the rebate period or benchmark period CPI–U values to use in rebate calculations, including how such values are impacted by seasonality or how such value impacts rebate liability. Therefore, we believe it is consistent with statute to determine the rebate period and benchmark period CPI–U values using data from within the same calendar quarter as soon as there is CPI–U data available from a month within that specified calendar quarter.

Comment: A few commenters recommended that we consider the CPI–U values for the month prior to and the month following the month(s) with unavailable CPI–U data and then use the higher CPI–U value. Among these commenters, a few also stated that if CMS declines to adopt this recommendation, then CMS should use the average of the CPI–U values for the month prior to and the month following the month(s) with unavailable CPI–U data. A few commenters suggested that CMS adopt the contingency method used by Treasury instead of BLS' CPI–U values for the month following the month in which such data is unavailable. These commenters stated that while statute does not require CMS to use a specific source for determining the CPI–U, the statute does require CMS to apply the CPI–U in a specific month for Part B inflation rebate calculations. Additionally, a commenter stated that CMS did not meaningfully evaluate reasonable alternatives such as options to estimate the CPI–U for the month for which the CPI–U is needed to calculate a Part B inflation rebate, did not consider seasonality of inflation values, did not evaluate relative effects of the proposed approach on payment amounts, coinsurance, and rebate liability, and did not sufficiently explain why the proposed approach is more consistent with statute than using CPI–U from the month prior to the month in which CPI–U is missing. Another commenter stated that CMS' proposed approach raises concerns under the Administrative Procedure Act (APA) because CMS did not adequately address predictable seasonality, financial consequences, uncertainty, and alternative approaches. A few commenters stated that the proposed approach exceeds CMS' statutory authority because the statute requires CMS to use the CPI–U for a specific month but does not specify the source from which the CPI–U value must originate.

Response: As discussed in section III.F.2.c. of this final rule, we considered alternative approaches and why we believe those alternatives are not feasible or appropriate. As noted in that section, we considered an approach in which we would use the previous month for which CPI–U data are available but believe this approach is less consistent with statute than using CPI–U values that are within the same calendar quarter as the month for which CPI–U data is missing. Section 1847A(i) of the Act describes the identification of CPI–U values after a specified time period has elapsed, and using data from a month that is before that time period is inconsistent with statute. For this same reason, we do not believe alternatives to use the average of or the higher of the month prior and the month subsequent to the month for which CPI–U values are missing are supported by statute and we therefore decline to adopt these approaches. We also considered using Treasury's index number according to the index contingency provisions for Treasury Inflation-Protected Securities; however, as we stated, this alternative approach does not align with statute (specifically section 1847A(i)(3)(F) of the Act), which directs CMS to use the CPI–U value from the first month of the relevant period and makes no reference to an alternate calculated value. As such, we decline to adopt the suggestion to use Treasury's contingency method. Lastly, regarding the comment that CMS did not consider options to estimate the CPI–U for the month for which the CPI–U is missing, we considered calculating our own inflation factor rather than using the BLS reported CPI–U data; however, we determined that it is impracticable for us to administer a CPI–U survey and calculate an alternate CPI–U index. Similarly, we determined that was inconsistent with statute to estimate an alternate CPI–U value because statute directs CMS to use the CPI–U for a specific month.

After consideration of public comments, we are finalizing § 427.302(e)(6) and § 427.302(f) as proposed.

d. Clarification of Date of Receipt for Rebate Reports

As stated in the CY 2025 PFS final rule (89 FR 98264) which was effective on January 1, 2025 and appeared in the December 8, 2024 **Federal Register**, § 427.500 defines the date of receipt as the calendar day following the day on which a report of a rebate amount (as set forth in § 427.501(b) through (d) and § 427.502(b) and (c)) is made available to the manufacturer of a Part B rebatable drug by CMS. The ''date of receipt'' starts the clock for calculation of deadlines at multiple points in the rebate reporting process, including for manufacturer submission of a suggestion of error and for payment of rebate amounts owed. For example, as set forth in § 427.505(a), a rebate amount owed is due no later than ''the 30th calendar day after the date of receipt of information regarding the rebate amount[.]''

For clarity and transparency, in the CY 2027 PFS proposed rule (91 FR 44007 through 44008) we made technical corrections to the examples provided in the CY 2025 PFS final rule of the calculation of due dates based on the ''date of receipt''. In the CY 2025 PFS final rule (89 FR 98265), we provided examples of the ''date of receipt'', including: (1) ''if the Preliminary Rebate Report is provided on May 31, 2026, then June 1, 2026, will be the date of receipt and, therefore, day 1 of the 10-calendar-day period to submit a Suggestion of Error. In this example, Suggestions of Error would be due by 11:59 p.m. PT on June 10, 2026[ ]''; and (2) ''if the Rebate Report is provided on June 30, 2026, then July 1, 2026, would be the date of receipt and therefore day 1 of the 30-calendar-day payment period; payment would be due no later than 11:59 p.m. PT on July 30, 2026.'' In the CY 2027 PFS proposed rule (91 FR 44007 through 44008), we corrected these examples to be consistent with the definition of ''date of receipt'' in § 427.500. Specifically, in each example provided, the ''date of receipt'' should be day zero of the relevant calendar period, not day one. Therefore, if the Preliminary Rebate Report is provided on May 31, 2026, then June 1, 2026, will be the ''date of receipt'' and day zero of the 10-calendar-day period to submit a Suggestion of Error, such that Suggestions of Error would be due by 11:59 p.m. PT on June 11, 2026. Likewise, if a Rebate Report is provided

on June 30, 2026, then July 1, 2026, will be the ''date of receipt'' and day zero of the 30-calendar-day payment period, such that payment would be due no later than 11:59 p.m. PT on July 31, 2026.

We did not receive public comments on this clarification.

e. Enforcement of Manufacturer Payment of Rebate Amounts (§ 427.600)

In accordance with section 1847A(i)(1)(B) of the Act, the manufacturer of a Part B rebatable drug is required to provide a rebate equal to the rebate amount specified in section 1847A(i)(3) of the Act for the rebatable drug for the calendar quarter not later than 30 days after receipt of the rebate amount from CMS. Section 1847A(i)(7) of the Act gives us the authority to impose a civil money penalty (CMP) equal to at least 125 percent of the rebate amount for each drug for each applicable calendar quarter on a manufacturer that fails to pay the rebate amount for each rebatable Part B drug. Subpart G implements this section of the Act and establishes the procedures for determining and collecting a CMP.

In the CY 2027 PFS proposed rule (91 FR 44008), we clarified that the imposition of CMPs under section 1847A(i)(7) of the Act, in accordance with § 427.600, is not the exclusive remedy for a manufacturer's failure to comply with its rebate payment obligations described in § 427.505(a), nor the exclusive remedy for other conduct that may impact obligations, such as rebate amounts owed, under the Medicare Part B Drug Inflation Rebate Program. For example, whether imposing CMPs under section 1847A(i)(7) of the Act or not, when warranted, we may refer manufacturers to the Department of Justice, the Department of the Treasury, and/or the Department of Health and Human Services Office of Inspector General for further review and investigation.

We did not receive public comments on this clarification.

3. Medicare Part D Drug Rebates for Certain Drugs and Biologicals With Prices That Increase Faster Than the Rate of Inflation

a. Definitions (§ 428.20)

As stated in the CY 2025 final rule (89 FR 98276), we codified the definition of ''applicable period CPI–U'' at § 428.20 as ''with respect to an applicable period, the CPI–U for the first month of such applicable period (that is, October)'' based on the definition set forth in section 1860D–14B(g)(5) of the Act. The BLS did not release CPI–U survey data for October 2025 due to a lapse in appropriations.[224] As a result of the October 2025 CPI–U data being unavailable, multiple interested parties, including drug companies and a pharmaceutical industry trade association, requested that we clarify in a timely manner how we would calculate inflation rebates that would otherwise use the October 2025 CPI–U data. We acknowledge that the missing October CPI–U data impacts Preliminary Rebate Reports and Rebate Reports for the applicable period that runs from October 2025–September 2026. The current in-effect regulation at § 428.20 does not address our inability to retrieve CPI–U index level information from BLS. To provide clarity on how to gap fill the missing October CPI–U data, we proposed to amend § 428.20 to include, ''in the case where the first month's CPI–U data is unavailable, we will use the first month for which CPI–U data are available following the month for which CPI–U data are unavailable.'' As applied in the case of missing October 2025 CPI–U data, CMS would use November 2025 CPI–U data.

We received public comments on this proposal. Please refer to section III.F.3.b. of this final rule for a summary of comments and our responses.

After consideration of public comments, we are finalizing the definition of ''applicable period CPI–U'' in § 428.20 as proposed.

b. Identification of Benchmark Period CPI–U (§ 428.202(e))

Section 1860D–14B of the Act provides that for each Part D rebatable drug, CMS will identify the benchmark period CPI–U as described at § 428.202(e)(1) and (2) and subject to paragraphs (e)(3) through (5). Specifically, under section 1860D–14B(g)(4) of the Act and as discussed in § 428.202(e)(1), for a Part D rebatable drug first approved or licensed by the FDA on or before October 1, 2021, the benchmark period CPI–U is the CPI–U for January 2021. Additionally, under section 1860D–14B(b)(5)(C) of the Act and as described at § 428.202(e)(2), for a subsequently approved drug, the benchmark period CPI–U is the CPI–U for January of the first calendar year beginning after a drug's first marketed date as stated under section 1860D–14B(b)(5)(A) of the Act. Under section 1860D–14B(b)(5)(C) of the Act and as described at § 428.202(e)(5) when a Part D rebatable drug is no longer considered to be a selected drug, the benchmark period CPI–U is the CPI–U for January of the last calendar year of such price applicability period. Due to the BLS not releasing CPI–U survey data for October 2025, we recognized a need to adopt a gap filling methodology in the event that any future CPI–U data are not released. As a result of the October 2025 CPI–U data being unavailable, multiple interested parties, including drug companies and a pharmaceutical industry trade association, requested that we clarify in a timely manner how we would calculate inflation rebates that would otherwise use the October 2025 CPI–U data. To respond to these inquiries and to promote transparency, as well as to align with the HPMS memo released on March 6, 2026,[225] we proposed to amend § 428.202 by adding paragraph (e)(6) to state, when CPI–U data are unavailable, CMS will use the first month for which CPI–U data are available following the month for which CPI–U data are unavailable. In using the first month of CPI–U data available, this proposed approach most closely aligns with section 1860D–14B(g)(5) of the Act.

As an alternative to the proposal at § 428.202(e)(6), we considered using Treasury's index number according to the index contingency provisions for Treasury Inflation-Protected Securities, which is based on the last available 12-month change in the CPI–U. This alternative approach does not align with statute, which directs CMS to use the CPI–U value from the first month of the relevant period. We also considered calculating our own inflation factor rather than using the BLS reported CPI–U; however, it is impracticable for us to administer a CPI–U survey and calculate an alternate CPI–U index. Finally, we considered using the previous month with available CPI–U data, but this approach is less consistent with statute, which directs CMS to use the CPI–U value from the first month of the relevant period. The previous month's CPI–U data would not fall within the relevant period. We did not propose these alternative options for the reasons described in the proposed rule.

We received public comments on these proposals. We note that commenters provided comments and made recommendations for both the Medicare Part B and Medicare Part D Drug Inflation Rebate Programs. We provided responses to these comments in both sections.

Comment: A few commenters stated CMS' proposed approach to use the CPI–U data for the first month for which

[224] BLS, *https://www.bls.gov/cpi/additional-resources/2025-federal-government-shutdown-impact-cpi.htm#:%7E:text=Yes.,in%20appropriations%E2%80%9D%20will%20be%20included.*

[225] *https://www.cms.gov/files/document/cpi-u-gap-filling-memo-final-508.pdf.*

CPI–U data are available following the month for which CPI–U data are unavailable, does not recognize seasonal fluctuations in the U.S. economy. Specifically, the commenters stated that prolonged government shutdowns are more likely to occur in October because the Federal fiscal year ends on September 30, which would increase the likelihood that the October CPI–U may be unpublished. The commenters noted that the November CPI–U, which is the CPI–U that likely would be used in rebate calculations, is often lower than the October CPI–U due to seasonal fluctuations in inflation common in November (for example, holiday discounts and decreasing gasoline prices). A few commenters stated that our proposed approach could have adverse financial consequences for manufacturers by decreasing their ability to predict the financial impact of inflation rebates, impacting future rebate liability when BLS CPI–U data are not available, or systematically underestimating inflation.

Response: Section 1860D–14B(g)(5) of the Act specifies that with respect to an applicable period, the applicable period CPI–U is the CPI–U for the first month of such applicable period. Section 1860D–14B(g)(7) of the Act defines the applicable period as a 12-month period beginning with October 1 of a year (beginning with October 1, 2022). Under section 1860D–14B(g)(4) of the Act, the benchmark period CPI–U is January 2021 for a Part D rebatable drug first approved or licensed by the FDA on or before October 1, 2021. For a subsequently approved drug, the benchmark period CPI–U is the CPI–U for January of the first calendar year beginning after a drug's first marketed date as stated under section 1860D–14B(b)(5)(A) of the Act. Under section 1860D–14B(b)(5)(C) of the Act, when a Part D rebatable drug is no longer considered to be a selected drug, the benchmark period CPI–U is the CPI–U for January of the last calendar year of such price applicability period. Statute does not specify other factors to consider when determining the applicable period CPI–U value to use in rebate calculations, including how such values are impacted by seasonality or how such values impact rebate liability. Therefore, we believe it is consistent with statute to determine the applicable period and the benchmark period CPI–U values using data from within the same applicable period as soon as there is CPI–U data available from a month within that specified applicable period.

Comment: A few commenters recommended that we consider the CPI–U values for the month prior to and the month following the month(s) with unavailable CPI–U data and then use the higher CPI–U value. Among these commenters, a few also stated that if CMS declines to adopt this recommendation, then CMS should use the average of the CPI–U values for the month prior to and the month following the month(s) with unavailable CPI–U data. A few commenters suggested that CMS adopt the contingency method used by Treasury instead of BLS' CPI–U values for the month following the month in which such data is unavailable. These commenters stated that while statute does not require CMS to use a specific source for determining the CPI–U, the statute does require CMS to apply the CPI–U in a specific month for Part D inflation rebate calculations. Additionally, a commenter stated that CMS did not meaningfully evaluate reasonable alternatives such as options to estimate the CPI–U for the month for which the CPI–U is needed to calculate a Part D inflation rebate, did not consider seasonality of inflation values, did not evaluate relative effects of the proposed approach on rebate liability, and did not sufficiently explain why the proposed approach is more consistent with statute than using CPI–U from the month prior to the month in which CPI–U is missing. Another commenter stated that CMS' proposed approach raises concerns under the APA because CMS did not adequately address predictable seasonality, financial consequences, uncertainty, and alternative approaches. A few commenters stated that the proposed approach exceeds CMS' statutory authority because the statute requires CMS to use the CPI–U for a specific month but does not specify the source from which the CPI–U value must originate.

Response: As discussed in section III.F.3.b. of this final rule, we considered alternative approaches and why we believe those alternatives are not feasible or appropriate. As noted in that section, we considered an approach in which we would use the previous month for which CPI–U data are available but believe this approach is less consistent with statute than using CPI–U values that are within the same applicable period as the month for which CPI–U data is missing. Section 1860D–14B of the Act describes the identification of CPI–U values after a specified time period has elapsed, and using data from a month that is before that time period is inconsistent with statute. For this same reason, we do not believe alternatives to use the average of or the higher of the month prior and the month subsequent to the month for which CPI–U values are missing are supported by statute and we therefore decline to adopt these approaches. We also considered using Treasury's index number according to the index contingency provisions for Treasury Inflation-Protected Securities; however, as we stated, this alternative approach does not align with statute (specifically sections 1860D–14B(b)(5)(C) and 1860D–14B(g)(4) of the Act), which direct CMS to use the CPI–U value from the first month of the relevant period. As such, we decline to adopt the suggestion to use Treasury's contingency method. Lastly, regarding the comment that CMS did not consider options to estimate the CPI–U for the month for which the CPI–U is missing, we considered calculating our own inflation factor rather than using the BLS reported CPI–U data; however, we determined that it is impracticable for us to administer a CPI–U survey and calculate an alternate CPI–U index. Similarly, we determined that was inconsistent with statute to estimate an alternate CPI–U value because statute directs CMS to use the CPI–U for a specific month.

After consideration of public comments, we are finalizing § 428.202(e)(6) as proposed.

c. Exclusion of 340B Acquired Units From Part D Rebatable Drugs (§ 428.203(b)(2) and (c))

Section 1860D–14B(b)(1)(B) of the Act requires that beginning with the plan year 2026, when calculating the total rebate amount to be paid by a manufacturer for a Part D rebatable drug, CMS shall exclude from the total number of units for a Part D rebatable drug, for an applicable period, those units for which a manufacturer provides a discount under the 340B Program. In the CY 2025 PFS final rule (89 FR 98278 through 98279), we finalized the proposal at § 428.201(a) to codify the total rebate amount calculation methodology described in section 40 of the revised Medicare Part D Drug Inflation Rebate Guidance,[226] which provides that the total Part D drug inflation rebate amount is equal to the per unit Part D drug inflation rebate amount, as determined under § 428.202(a), multiplied by the total number of units of a Part D rebatable drug dispensed under Part D and covered by Part D plan sponsors, as determined in accordance with § 428.203. In the CY 2025 PFS final rule (89 FR 98593), we also finalized the

[226] See: *https://www.cms.gov/files/document/medicare-part-d-inflation-rebate-program-revised-guidance.pdf.*

proposal at § 428.203(b)(2)(i), to exclude from the total number of units determined under § 428.203(a), units for which a manufacturer provided a discount under the 340B Program (''340B units''). We also finalized the proposal at § 428.203(b)(2)(ii) to determine the total number of 340B units by using data reflecting the total number of units of a Part D rebatable drug for which a discount was provided under the 340B Program and that were dispensed during the applicable period. As we stated in the CY 2025 PFS final rule (89 FR 98289) and CY 2026 PFS final rule (90 FR 49740), because this exclusion requirement starts after the first quarter of the applicable period that begins on October 1, 2025, the exclusion of 340B units will only apply for the last 3 quarters of such applicable period. That is, we are excluding 340B units from the total number of units for a Part D rebatable drug starting with claims with dates of service on or after January 1, 2026.

As we stated in the CY 2025 PFS final rule (89 FR 98289) and the CY 2026 PFS final rule (90 FR 49740), data on which units dispensed under Part D and covered by Part D plan sponsors were purchased under the 340B Program is unavailable from the data sources specified at section 1860D–14B(d) of the Act (that is, information submitted by manufacturers, States, and Part D plan sponsors), and we do not currently have access to this data through other means. We understand that the 340B status of a Part D drug is usually not known by the dispenser at the point-of-sale, and that 340B covered entities (hereinafter ''covered entities'') typically identify the 340B status of a Part D drug retrospectively. Because the covered entity and CMS do not exchange dispensed Part D drug information confirming the 340B status of a Part D rebatable drug, we are unable to precisely identify 340B units at the claim-level based solely on Part D claims submitted to us by the covered entity (or a contract pharmacy operating on behalf of the covered entity) at this time. For these reasons, in the CY 2026 PFS final rule (90 FR 49747), we adopted a claims-based methodology (described in the CY 2026 PFS final rule and hereinafter as ''Prescriber-Pharmacy Methodology'') that we leverage to exclude 340B units from the total number of units of a Part D rebatable drug dispensed under Part D and covered by Part D plan sponsors during an applicable period, starting on January 1, 2026. Additionally, we adopted our proposal to establish a voluntary Medicare Part D Claims Data 340B Repository (''340B repository'') to collect data about 340B units voluntarily submitted by covered entities (90 FR 49750). The data submitted to the 340B repository will not be used to calculate inflation rebates unless and until we propose and finalize a policy to use such data to exclude 340B units from rebate calculations.

(1) Claims-Based Methodology To Remove 340B Units From Rebate Calculations

As finalized in the CY 2026 PFS final rule (90 FR 49741 through 49749), to implement the exclusion required by section 1860D–14B(b)(1)(B) of the Act and described in § 428.203(b)(2), under the Prescriber-Pharmacy Methodology, beginning on January 1, 2026, we remove 340B units from the Part D inflation rebate calculations by evaluating whether a Prescription Drug Event (PDE) record is potentially 340B-eligible based on (1) the affiliation of the National Provider Identifier (NPI) of the prescriber associated with that PDE record with a registered covered entity, and (2) the designation of the dispensing pharmacy associated with that PDE record as a 340B contract pharmacy. If the NPI of the prescriber associated with the PDE record is affiliated with a registered covered entity for a given month, and the dispensing pharmacy is a contract pharmacy associated with such covered entity for the same month, the PDE record is considered as potentially 340B-eligible, and the units associated with that PDE record are removed from Part D inflation rebate calculations. We refer readers to the CY 2026 PFS final rule for a more detailed explanation of the Prescriber-Pharmacy Methodology (90 FR 49741 through 49749).

In the CY 2026 PFS proposed rule (90 FR 32639 through 32641), we acknowledged that the 340B Office of Pharmacy Affairs Information System (OPAIS) database, which the Prescriber-Pharmacy Methodology relies on, may not list all pharmacies that dispense 340B-eligible drugs, including covered entities that have ''in-house'' pharmacies that are not registered in the 340B OPAIS database or 340B-eligible AIDS Drug Assistance Programs (ADAPs) [227] (also considered covered entities) that collect rebates to receive 340B discounts instead of receiving such discount at the time of purchase from a contract pharmacy registered in the 340B OPAIS database. We solicited comments on whether and how to account for this limitation. Similar to the acknowledgments we made in the proposed rule, we received comments stating that the Prescriber-Pharmacy Methodology may underrepresent 340B claims from Ryan White (RW) clinics and ADAPs. To address this, some commenters recommended that we use an alternative methodology to identify these claims. In the CY 2026 PFS final rule (90 FR 49747), we adopted modifications to the Prescriber-Pharmacy Methodology aimed at improving our ability to identify 340B claims associated with RW clinics, but we did not adopt modifications to the Prescriber-Pharmacy Methodology to address the limitations relating to ADAP claims. Our prior preliminary analyses suggested not modifying the Prescriber-Pharmacy Methodology to address the limitations relating to ADAP claims would have minimal impact. Specifically, the percentage of 340B units identified for drugs commonly covered by ADAPs, such as antiretrovirals, was comparable to the average percentage of 340B units identified overall across all drug classes, indicating no meaningful differential. In the CY 2026 PFS final rule (90 FR 49747), we stated that we may consider methodological refinements in the future to further address commenters' feedback on ADAPs.

Since publishing the CY 2026 PFS final rule, we have reviewed additional evidence relating to the need to adjust the Prescriber-Pharmacy Methodology to sufficiently identify units of drugs for which a manufacturer provided a discount under the 340B Program to account for ADAP clients. Consequently, we have become aware of evidence suggesting that, in contrast to our statement in the CY 2026 PFS final rule, the percentage of 340B units identified for drugs commonly covered by ADAPs, such as antiretrovirals, may be higher than the average percentage of 340B units identified overall. One study found that, using 2012 data from the Walgreens Co. 340B database, (1) antivirals were 10 times more likely to be dispensed through the 340B Program and specialty medications [228] were more

[227] ADAPs are State- and territory-operated Ryan White HIV/AIDS Program grantees that provide FDA-approved medications (including, in some States, medications beyond those used to treat HIV/AIDS) to low-income people living with HIV. Under section 340B(a)(4)(E) of the PHS Act, ADAPs are eligible to be enrolled with the 340B Program as covered entities, and HRSA has affirmed that any individual registered in an ADAP covered entity will be considered to meet the 340B patient definition. See: *https://www.hrsa.gov/sites/default/files/hrsa/opa/patient-entity-eligibility-10-24-96.pdf.*

[228] The authors of the study defined ''specialty drugs'' as those ''generally considered to be high

Continued

than 20 times more likely to be dispensed through the 340B Program compared to all drugs dispensed; and, (2) nearly 80 percent of all specialty medications dispensed under the 340B Program were antiretrovirals indicated for HIV.[229] This study hypothesized that these results can be at least partially explained by the types of covered entities participating in contract pharmacy arrangements with Walgreens in 2012, that is, covered entities that disproportionately treat people with HIV. Additionally, a Congressional Budget Office (CBO) study published September 2025 found that the majority of spending on anti-infective drugs (including HIV treatments) purchased through the 340B Program in 2021 occurred at Federal grantee sites, including ADAPs.[230] In addition to other evidence reviewed, these data points suggest that Federal grantee sites, including ADAPs, may significantly contribute to the percentage of 340B claims for antiretrovirals, that this percentage may be higher than for other drug classes, and that without methodological refinement to fully account for 340B claims dispensed to ADAP clients, the Prescriber-Pharmacy Methodology may under-identify 340B units for drug classes such as antiretrovirals to a greater extent than previously assumed during the CY 2026 rulemaking cycle. Based on this review, we proposed to make methodological refinements to the Prescriber-Pharmacy Methodology. We do not believe that adoption of the Prescriber-Pharmacy Methodology as described in the CY 2026 PFS final rule established significant reliance interests that would prevent us from modifying the Prescriber-Pharmacy Methodology. Given that Rebate Reports impacted by the Prescriber-Pharmacy Methodology (that is, Rebate Reports for applicable periods beginning October 1, 2025) have not yet been issued, CMS believes that any reliance interests that may relate to use of the Prescriber-Pharmacy Methodology would not be outweighed by the need to implement a more accurate methodology. Additionally, as we stated earlier, we provided notice to interested parties in the CY 2026 PFS final rule (90 FR 49747) that we may consider methodological refinements in the future to further address commenters' feedback relating to ADAPs.

As part of this reevaluation, we revisited comments we received on the CY 2026 PFS proposed rule. In particular, we revisited comments that explained the unique nature of ADAPs compared to other covered entity types, and the limitations in the Prescriber-Pharmacy Methodology's ability to identify PDE records for ADAP clients as 340B-eligible. As a commenter explained, the Prescriber-Pharmacy Methodology may under-identify 340B-eligible PDE records for ADAP clients for two reasons. First, PDE records for ADAP clients would typically not meet the first criterion of the Prescriber-Pharmacy Methodology (that is, that the prescriber with the NPI listed on the PDE record provides care at a covered entity). ADAPs are not providers or suppliers as defined under § 400.202, and a patient enrolled in an ADAP is typically prescribed medications by a provider not affiliated with the ADAP. Therefore, for a PDE record for an ADAP client, the prescriber NPI on the PDE record will not be affiliated with the covered entity that claimed the 340B price for such dispense (that is, the ADAP). Second, the majority of ADAPs access 340B pricing via a rebate model.[231] These ADAPs allow their clients to fill medications at a broad network of pharmacies that may not be registered in the OPAIS database as contract pharmacies. A PDE record for an ADAP client will thus not meet the second criterion of the Prescriber-Pharmacy Methodology (that is, that the pharmacy NPI on the PDE record is a contract pharmacy for the same covered entity that the prescriber NPI is affiliated with).

After further review of the additional evidence as discussed previously and revisiting comments we received on the CY 2026 PFS proposed rule, we conducted a more comprehensive analysis to assess whether the existing Prescriber-Pharmacy Methodology adequately identifies 340B-eligible drugs obtained through ADAPs for Medicare Part D enrollees. The analysis was conducted in two parts. The first reexamined the preliminary analyses described in the CY 2026 PFS final rule (90 FR 49747) assessing whether the Prescriber-Pharmacy Methodology systematically under-identifies drugs used in the treatment of HIV as 340B-eligible relative to all other drugs, and it built upon this analysis by examining whether the Prescriber-Pharmacy Methodology under-identifies drugs used in the treatment of HIV as 340B-eligible for ADAP clients specifically. We identified ADAP clients using the Coordination of Benefits (COB)-Other Health Insurance (OHI) file—specifically the COB–OHI Supplemental Record file—using a Supplemental Type Code that flags enrollees that have supplemental ADAP coverage.[232] This analysis reaffirmed our preliminary findings that the Prescriber-Pharmacy Methodology identifies drugs used in the treatment of HIV at a percentage close to the overall Part D average for all drug classes. However, when the analysis was isolated to ADAP clients only, we found that the Prescriber-Pharmacy Methodology identified drugs used in the treatment of HIV as 340B-eligible at a significantly lower percentage than was identified for Part D beneficiaries overall. This finding is contrary to expectations given that ADAPs are eligible to be enrolled with the 340B Program as covered entities, and that HRSA has affirmed that any individual registered in an ADAP will be considered to meet the 340B patient definition (as described earlier in this section). Further, this under-identification of 340B units for ADAP clients could impact the completeness and accuracy of data used for Part D inflation rebate calculations for certain drug classes such as antiretrovirals, if not sufficiently addressed.

The second part of the analysis examined how a modification to the Prescriber-Pharmacy Methodology would identify drugs used in the treatment of HIV as 340B-eligible compared to the existing Prescriber-Pharmacy Methodology. We analyzed the impact on the overall percentage of identified Part D 340B units for both antiretrovirals and all other drug classes if CMS were to consider all Part D units for ADAP clients as 340B-eligible. This analysis of the modification to the Prescriber-Pharmacy Methodology to treat all ADAP units as 340B-eligible determined that: (1) for certain drug

value; high-touch—for example, medications that require temperature control or other special handling, and medications that require ongoing management by a physician or pharmacists specialized in the relevant condition; or complex—for example, biotechnology products or orphan drugs; or some combination of the above.''

[232] As explained in the Plan Communication User Guide for Medicare Advantage Prescription Drug Plans (February 27, 2026), the Supplemental Record file lists other health insurance that is supplemental to, that is, pays after, Part D. The Supplemental Type Code indicates the type of supplemental insurance contained in the record. *https://www.cms.gov/files/document/mapd-plan-communications-user-guide-v19-0-march-2026.pdf.*

classes, specifically antiretroviral medications used in the treatment of HIV, a modification to account for ADAP clients would result in a meaningful increase in the number of rebatable units identified as 340B-eligible, and (2) for all other drug classes, the modification would not have a substantial impact on the percentage of Part D units identified as 340B-eligible. Based on the additional evidence reviewed and subsequent analyses demonstrating the extent to which relevant PDE records for ADAP clients would be under-identified as 340B-eligible, we now concur with comments on the CY 2026 PFS proposed rule that we revisited. We agree with the commenters' assertion that a modification to the Prescriber-Pharmacy Methodology is needed to fully account for 340B-eligible units for ADAP clients. Where the ADAP acts as a payor of the Part D medication, we would consider all Part D units for ADAP clients as 340B-eligible. Such units would be removed from the total number of units and total rebate amount for a Part D rebatable drug as described in the Preliminary Rebate Report and Rebate Report detailed at § 428.401(b) and (c), respectively.

Specifically, we proposed the following modification to the Prescriber-Pharmacy Methodology: CMS would identify PDE records for beneficiaries who have ADAP supplemental coverage as listed in the COB–OHI Supplemental Record file using the Supplemental Type Code that flags enrollees that have supplemental ADAP coverage. CMS would then exclude all units associated with those PDE records from Part D inflation rebate calculations.

If a beneficiary included in the COB–OHI Supplemental Record file is identified as having supplemental insurance from an ADAP at the time a Part D drug was dispensed to such beneficiary during the applicable period, we would designate the units as 340B-eligible and remove the associated units from the inflation rebate calculation. Because State ADAP formularies can vary, and because we will not have State-specific insight regarding an ADAP's formulary coverage for a specific beneficiary's claims dispensed in a specific State, we would treat all PDE records dispensed for a beneficiary identified as having ADAP supplemental insurance on the COB–OHI file as 340B-eligible and remove the units associated with these PDE records. Since some of the ADAP clients identified in the proposed modification to the Prescriber-Pharmacy Methodology may already have Part D units identified as 340B-eligible using the existing Prescriber-Pharmacy Methodology, counting all ADAP clients' units identified under the proposed modification as 340B-eligible could potentially double-count 340B-eligible units. To avoid double-counting, we would identify units that were already flagged as 340B-eligible using the existing Prescriber-Pharmacy Methodology and exclude those from the count of ADAP 340B-eligible units identified under the proposed modification.

CMS acknowledges that this approach may result in an overestimation of 340B-eligible units for ADAP clients. Notwithstanding this limitation, CMS has determined that treating all Part D drugs dispensed to ADAP clients as 340B-eligible is appropriate for the following reasons: (1) the manner in which 340B discounts are realized for 340B-eligible ADAP units varies among State ADAP programs, and (2) variability in drug coverage across State-specific drug formularies presents significant challenges in developing a single, uniformly applicable methodology capable of accurately identifying 340B eligibility on a drug-by-drug or program-by-program basis. Further, in CMS' analysis of the proposed modification to the Prescriber-Pharmacy Methodology, and the corresponding treatment of all ADAP client units as 340B-eligible, CMS determined that: (1) for certain drug classes, specifically antiretroviral medications used in the treatment of HIV, the proposed modification would result in a meaningful increase in the percentage of Part D rebatable units identified as 340B-eligible, and (2) for all other drug classes, the proposed modification would not have a substantial impact on the percentage of units identified as 340B-eligible if all ADAP client units were treated as 340B-eligible. In other words, CMS' analysis indicates, for the majority of drug classes with exception of antiretroviral medications used in the treatment of HIV, treating all ADAP client units as 340B-eligible is expected to have minimal or no impact on the identification of 340B-eligible units from the Prescriber-Pharmacy Methodology. These findings demonstrate that the modification to the Prescriber-Pharmacy Methodology is narrowly and appropriately targeted towards antiretroviral medications used in the treatment of HIV, which aligns with the evidence described earlier in this section suggesting that the percentage of 340B units identified for antiretrovirals may be higher than the average percentage of 340B units identified overall. In light of these considerations, CMS has determined that a broad, programmatic approach to identifying 340B-eligible ADAP units is preferable to a more granular methodology that may yield inconsistent or inaccurate results. If adopted, the modification to the Prescriber-Pharmacy Methodology included in the proposed rule would be effective for Rebate Reports issued for the applicable period that begins October 1, 2025, and subsequent applicable periods.

We solicited comments on this proposal.

We received public comments on these proposals. The following is a summary of the comments we received and our responses.

Comment: Many commenters supported CMS' proposal to modify the Prescriber-Pharmacy Methodology to exclude Part D units dispensed to beneficiaries with ADAP supplemental coverage, as identified through the COB–OHI file, from Part D inflation rebate calculations.

Response: We appreciate the commenters' support.

Comment: A couple of commenters stated that the existing Prescriber-Pharmacy Methodology undercounts ADAP-associated 340B units because ADAPs function as payors rather than prescribers and often access 340B pricing through rebates from drug manufacturers rather than access the 340B discount upfront through registered contract pharmacies and stated that a beneficiary-level identification approach is more workable than a claim-level one because claim-level identification depends on linking a prescriber NPI to a covered entity and matching a dispensing pharmacy to that entity's registered OPAIS contract pharmacy, and it cannot capture ADAP-associated 340B units since ADAPs have neither element. A couple of commenters identified a specific mechanism, distinct from the general overestimation CMS acknowledged, that would further inflate estimates of rebatable claims: ADAP rebate model claims are triggered only when an actual cost-sharing payment occurs, and most ADAP clients reach the Part D out-of-pocket cap early in the plan year, but the proposed methodology would treat all ADAP-associated units as 340B-eligible. One of these commenters recommended that CMS acknowledge this dynamic explicitly in the final rule and also confirm that the COB–OHI file reliably and promptly reflects new ADAP enrollments and disenrollments. Another commenter separately stated

there are over- and under-counting risks in the Prescriber-Pharmacy Methodology generally, stating that in-house dispensing pharmacies and unreported Medicare Provider Numbers to the OPAIS database can cause 340B units to be missed. A commenter stated their concern that the proposed methodological enhancement to the Prescriber-Pharmacy Methodology could reduce 340B savings available to RW clinics and other safety-net providers, with downstream effects on wrap-around services, pharmacy participation, and continuity of HIV treatment. Another commenter recommended that CMS consider an all-payer rebate model as a longer-term solution, stating that following every State's ADAP formulary in real time to identify covered drugs is not feasible under the current Prescriber-Pharmacy Methodology, and that an all-payer model could improve the precision of CMS' Part D inflation rebate calculations without replacing the existing ADAP rebate model.

Response: We appreciate the feedback and suggestions for further improvement to the Prescriber-Pharmacy Methodology to mitigate potential for over- or under-counting ADAP units as 340B-eligible. We acknowledge the broader over- and under-counting risks commenters raised regarding in-house dispensing pharmacies and unreported Medicare Provider Numbers. As finalized in the CY 2026 PFS final rule, we addressed the unreported Medicare Provider Number concern through an augmented prescriber NPI mapping methodology, and we addressed the in-house pharmacy concern by incorporating covered entities' OPAIS-listed ''Shipping Addresses'' as additional dispensing locations. These enhancements do not, however, address the distinct circumstance of ADAP clients. The proposed modification is intended to close that remaining gap. We agree with commenters that the proposal may result in overestimation of 340B-eligible units for ADAP clients. We have determined that treating all Part D claims for ADAP clients as 340B-eligible is nonetheless appropriate for two reasons: (1) the manner in which 340B discounts are realized for ADAP-associated units varies among State ADAPs, and (2) variability across State-specific drug formularies presents significant challenges to developing a single, claim-level methodology capable of accurately identifying 340B eligibility on a drug-by-drug basis. Our analysis of the modification to the Prescriber-Pharmacy Methodology to treat all ADAP units as 340B-eligible determined that: (1) for certain drug classes, specifically antiretroviral medications used in the treatment of HIV, a modification to account for ADAP clients would result in a meaningful increase in the number of rebatable units identified as 340B-eligible, and (2) for all other drug classes, the modification would not have a substantial impact on the percentage of Part D units identified as 340B-eligible. Therefore, a broad, programmatic approach is preferable to a more granular methodology that could yield inconsistent results. Additionally, we are taking steps to minimize overestimation; for example, to avoid double counting 340B units, we will identify units already flagged as 340B-eligible under the existing Prescriber-Pharmacy Methodology and exclude those units from the count of ADAP-associated 340B-eligible units identified under this modification. We also confirm that the COB–OHI Supplemental Type Code is updated monthly to reflect new ADAP enrollments and disenrollments, and we will continue to monitor the reliability of this data source as we implement the methodology. In response to concern that the proposed modification to the Prescriber-Pharmacy Methodology could affect 340B savings available to RW clinics and other safety-net providers, we note that the methodology is designed to account for and exclude 340B units associated with ADAP clients from the Part D inflation rebate calculation and does not alter the underlying 340B Program discounts available to covered entities. Comments recommending that we adopt an all-payer rebate model are out of scope for this final rule. These comments address a broader payment methodology beyond the Medicare Part D Drug Inflation Rebate Program policies addressed in this rule.

After consideration of public comments, we are finalizing the policy as proposed to identify PDE records for beneficiaries who have ADAP supplemental coverage as listed in the COB–OHI Supplemental Record file. If a beneficiary included in the COB–OHI Supplemental Record file is identified as having supplemental insurance from an ADAP at the time a Part D drug was dispensed to such beneficiary during the applicable period, we will designate the units as 340B-eligible and remove the associated units from the inflation rebate calculation.

(2) Medicare Part D Claims Data 340B Repository

In the Medicare Part D Drug Inflation Rebates Paid by Manufacturers: Initial Memorandum, Implementation of Section 1860D–14B of Social Security Act, and Solicitation of Comment (''initial Medicare Part D Drug Inflation Rebate Guidance''),[233] CMS solicited comments on the best mechanism to identify 340B units dispensed under Part D to exclude units from Part D inflation rebate calculations. Interested parties recommended that CMS create a mechanism through which covered entities would retrospectively submit data to CMS identifying 340B-purchased drugs dispensed under Part D and urged that this mechanism allow covered entities to submit these data directly to CMS, rather than through claims that dispensers submit via Part D plan sponsors. In response to these recommendations, we solicited comments in the CY 2025 PFS proposed rule (89 FR 61971 through 61972) on a 340B repository. As highlighted in the CY 2025 final rule (89 FR 98292), interested parties provided different perspectives, including strong support for a 340B repository from many covered entities and drug manufacturers. In the CY 2026 PFS proposed rule (90 FR 32641 through 32644), we proposed to establish a 340B repository, and as described in the CY 2026 PFS final rule (90 FR 49749), many commenters supported this proposal to establish a 340B repository.

In the CY 2026 PFS final rule (90 FR 49750), we established a 340B repository to receive voluntary submissions from covered entities of certain data elements associated with Part D claims for which the covered entity dispensed (directly or indirectly, including via retrospective replenishment and contract pharmacy arrangements) units of a drug for which a manufacturer provides a discount under the 340B Program (''Part D 340B claims''). We established the 340B repository to allow for assessment of such data for potential use in identifying units of Part D rebatable drugs for which a manufacturer provided a discount under the 340B Program in a future applicable period. We established that covered entities will be allowed to submit data on units of Part D 340B claims beginning in 2026 to begin testing the usability of the 340B repository. The 340B repository launched on October 1, 2026, and some covered entities have begun voluntarily

[233] See: *https://www.cms.gov/files/document/medicare-part-d-inflation-rebate-program-initial-guidance.pdf.*

submitting Part D 340B data. Covered entities may now create an account and begin submitting Part D 340B data and can access the 340B repository and technical instructions for creating an account and submitting data via the CMS website.[234] We will use submitted data to begin testing the usability of data voluntarily submitted by covered entities, starting with claims with dates of service in 2026. Covered entities that voluntarily submit data to the 340B repository need to follow the processes and requirements that CMS has established for voluntary reporting starting in 2026 and the associated information collection currently approved under OMB control number 0938–1485.

In the CY 2026 PFS final rule (90 FR 49750), we strongly encouraged all covered entities to submit data elements to the 340B repository during the 2026 testing period, noting that this participation would allow for robust testing of data quality and completeness and provide an opportunity for covered entities to develop and test their data submission processes. We also noted that we would address the possibility of requiring covered entities to report data elements to the 340B repository in future years in future rulemaking and that we were actively considering proposing mandatory reporting to the 340B repository in the near future.

We proposed at § 428.203(c) to require providers and suppliers that are covered entities as defined under § 10.3 (hereinafter collectively ''340B providers'' unless otherwise noted) to submit Part D 340B data to the 340B repository beginning in 2027. Such reporting would fulfill a 340B provider's obligation to provide access to documentation relating to covered Part D drugs written or ordered by such 340B provider to maintain enrollment in Medicare, as we proposed at § 424.516(f)(4). We described these proposals in further detail in sections III.F.3.c.2.a. through III.F.3.c.2.c. of the proposed rule.

(a) Background: Requirement for Physicians, Other Suppliers, and Providers To Maintain and Provide Access to Documentation

Section 1866(j)(1)(A) of the Act requires the Secretary to establish a process for the enrollment of providers and suppliers into the Medicare program. The overarching purpose of the enrollment process is to help confirm that providers seeking to bill Medicare for services and items furnished to Medicare beneficiaries meet all applicable Federal and State requirements to do so. The process is, to an extent, a ''gatekeeper'' that prevents unqualified and potentially fraudulent individuals and entities from entering and inappropriately billing Medicare. Since 2006, we have undertaken rulemaking efforts to implement enrollment procedures. These regulations are generally codified in 42 CFR part 424, subpart P. They address, among other things, requirements that providers must meet to obtain and maintain Medicare billing privileges.

Section 6406(a) of the Patient Protection and Affordable Care Act (ACA) amended section 1842(h) of the Act by adding a new paragraph which establishes that the Secretary may revoke enrollment, for a period of not more than one year for each act, for a physician or supplier if such physician or supplier fails to maintain and, upon request of the Secretary, provide access to documentation relating to written orders or requests for payment for durable medical equipment, certifications for home health services, or referrals for other items or services written or ordered by such physician or supplier under Title XVIII of the Act, as specified by the Secretary.

In addition, section 6406(b)(3) of the ACA amended section 1866(a)(1) of the Act to require that providers maintain and, upon request of the Secretary, provide access to documentation relating to written orders or requests for payment for durable medical equipment, certifications for home health services, or referrals for other items or services written or ordered by the provider, as specified by the Secretary.

To implement section 6406 of the ACA, on May 5, 2010, CMS published an interim final rule titled ''Medicare and Medicaid Programs; Changes in Provider and Supplier Enrollment, Ordering and Referring, and Documentation Requirements; and Changes in Provider Agreements,'' (75 FR 24437) which amended § 424.516(f) to specify requirements for, among other things, documentation and access to documentation related to certain orders and referrals. We clarified in that rulemaking that the documentation includes both written and electronic documentation. CMS also amended § 424.535(a)(10) to establish that CMS may revoke enrollment, for a period of not more than one year for each act of noncompliance, for a provider or a supplier if such provider or supplier fails to meet the requirements of § 424.516(f). CMS finalized the interim final rule in an April 27, 2012 final rule titled ''Medicare and Medicaid Programs; Changes in Provider and Supplier Enrollment, Ordering and Referring, and Documentation Requirements; and Changes in Provider Agreements'' (77 FR 25284).

(b) Proposal To Require Providers and Suppliers That Are Covered Entities To Submit Documentation Relating to Part D 340B Claims (§§ 424.516(f)(4), 424.535(a)(10), and 428.203(c))

To inform policy development for this rulemaking, we reviewed and considered the comments received on the CY 2026 PFS proposed rule. In this feedback, many commenters suggested that we require covered entities and/or their contractors to report data to a 340B repository. We agree. To ensure robust data submissions in 2027 to determine if data submitted to the 340B repository could be used reliably in the future to remove 340B units from Part D inflation rebate calculations in accordance with section 1860D–14B(b)(1)(B) of the Act, we believe it necessary to transition from voluntary submission to requiring 340B provider participation in the 340B repository.

We therefore proposed at § 424.516(f)(4) that a provider or supplier that is a covered entity as defined at § 10.3 would be required to maintain and provide access to documentation as set forth at proposed § 428.203(c). We proposed this requirement in accordance with sections 1866(a)(1)(X) and 1842(h)(9) of the Act. As finalized, CMS would reserve the right to revoke, in accordance with existing § 424.535(a)(10), a currently enrolled provider or supplier's Medicare enrollment and any corresponding provider agreement or supplier agreement for failure to comply with the requirements for maintaining and providing access to documentation specified in proposed § 424.516(f)(4). Although we acknowledged that § 424.516(f) has historically set forth documentation requirements for providers and suppliers for their Part A and Part B services, the statutory authorities underlying that provision, sections 1842(h)(9) and 1866(a)(1)(X) of the Act, do not expressly limit documentation requirements to services furnished under Part A and Part B. Sections 1842(h)(9) and 1866(a)(1)(X) of the Act collectively set forth that providers and suppliers must maintain and provide access to documentation relating to ''items or services written or ordered by the provider *under this title,*

[234] See here to create an account with the 340B repository: *https://medicare340breporting.cms.gov/sec340b/login.* See here to access instructions and technical specifications on the 340B repository: *https://www.cms.gov/initiatives/medicare-prescription-drug-affordability/overview/medicare-inflation-rebate-program.*

as specified by the Secretary'' (emphasis added). Both sections 1842(h)(9) and 1866(a)(1)(X) of the Act fall under Title XVIII (that is, the Medicare statute), which inherently includes Part D. As such, requiring providers and suppliers to maintain and provide access to documentation related to covered Part D drugs written or ordered by a provider or supplier is consistent with sections 1866(a)(1)(X) and 1842(h)(9) of the Act. By transitioning from voluntary submission to mandatory participation in the 340B repository, CMS would be able to ensure more complete and reliable data submissions, thereby improving its ability to accurately assess potential future use of the 340B repository to exclude 340B units from Part D rebate calculations, consistent with its obligations under section 1860D–14B(b)(1)(B) of the Act.

At § 428.203(c), we proposed the documentation to which a 340B provider must provide access, as well as the timeframe within which such access must be provided, for the provider or supplier to fulfill their obligations set forth in the proposed § 424.516(f)(4). Proposed § 428.203(c)(1) would require that, beginning with claims with a date of service on or after January 1, 2027, a provider or supplier that is a covered entity as defined at § 10.3 must submit the data elements associated with each claim for a covered Part D drug billed to Medicare Part D for which such covered entity or its contractor(s) (such as contract pharmacies) dispensed units of a drug for which a manufacturer provides a discount under the 340B Program to such covered entity. This requirement would apply, for example, to claims for units of a drug covered under Part D and dispensed by contract pharmacies that the covered entity, its contractors, or its third-party administrators (TPAs) identify as 340B-eligible and for which the covered entity obtains a 340B discount, including through retrospective replenishment models. This requirement would also apply, for example, to claims for units of a drug covered under Part D and dispensed by the covered entity's in-house pharmacy.[235]

Specifically, we proposed to require that a provider or supplier that is a covered entity as defined at § 10.3 must submit the following data elements associated with each claim for units of a covered Part D drug billed to Medicare by such covered entity or its contractor(s) (such as contract pharmacies) for which a manufacturer provides a discount under the 340B Program to such covered entity: (1) Date of Service (that is, the date the prescription was filled by the pharmacy); (2) Prescription or Service Reference Number; (3) Fill Number (that is, the code indicating whether the prescription is an original or a refill; if a refill, the code indicates the refill number); (4) Dispensing Pharmacy NPI; and (5) NDC–11. Additionally, we proposed at § 428.203(c)(2) that, in addition to submitting the data elements set forth in proposed § 428.203(c)(1), a provider or supplier that is a covered entity as defined at § 10.3 must submit its 340B ID and name as designated in the 340B OPAIS database.

We explained that we understood that reporting the data proposed at § 428.203(c) may impose new operational demands on 340B providers, potentially requiring the development of reporting processes where none currently exist and that 340B providers will need time to develop a process for collecting the 340B data elements to submit to the 340B repository and prepare the data in a form and manner prescribed by CMS. Additionally, given the variety in the scope of provider types and organizations that participate in the 340B Program, we recognized the amount of preparation time to submit data varies. We proposed at § 428.203(c)(3) to require that 340B providers report data on a quarterly basis (though they may choose to submit more frequently) within 1 calendar quarter following the close of the relevant calendar quarter. For example, for claims with dates of service between October 1, 2027, through December 31, 2027, 340B providers would submit the data elements from Part D 340B claims to the 340B repository no later than March 31, 2028. Quarterly submissions are necessary so CMS has timely information to assess the reliability of the data for potential future use in removing 340B units from Part D inflation rebate calculations. In addition, quarterly submissions may minimize the burden on 340B providers by reducing the amount of data in each submission and the amount of quality assurance necessitated for each submission. We received public comments on these proposals. For ease of reference and organization, we summarize comments received and our responses at the end of sections III.F.3.c.2.b. and III.F.3.c.2.c. of this final rule.

Specifically, at § 428.203(c)(3), we proposed that the data elements and information set forth in § 428.203(c)(1) and (c)(2) must be submitted on a quarterly basis and in a form and manner specified by us in accordance with the following timelines: data elements and information associated with claims with dates of service during the first calendar quarter must be submitted by the close of the second calendar quarter; data elements and information associated with claims with dates of service during the second calendar quarter must be submitted by the close of the third calendar quarter; data elements and information associated with claims with dates of service during the third calendar quarter must be submitted by the close of the fourth calendar quarter; and data elements and information associated with claims with dates of service during the fourth calendar quarter must be submitted by the close of the first calendar quarter of the immediately following calendar year.

These are the same data elements, information, and timing requirements that are specified in the CY 2026 PFS final rule (90 FR 49750) establishing the 340B repository with voluntary submission.

We noted in the proposed rule that we are issuing a revised collection of information (0938–1485) titled ''Information Collection Request (ICR) for the Medicare Prescription Drug Inflation Rebate Program under sections 11101 and 11102 of the Inflation Reduction Act (IRA)'' (CMS–10930, OMB 0938–1485) alongside this final rule to reflect the burden associated with a mandatory submission to the 340B repository. We are working to operationalize the 340B repository in a way that minimizes burden on 340B providers and have engaged with a range of interested parties, including covered entities and their staff responsible for pharmacy services management, and 340B TPAs, to consider the technical requirements that would facilitate lower burden for submission to the 340B repository. See section V.B.5. of this final rule for an updated estimate of burden associated with the collection of data for the 340B repository. The ICR contains more details regarding how covered entities would submit data to the 340B repository.

Under this proposal in the CY 2027 PFS proposed rule, the data submitted to the 340B repository would not be used to calculate inflation rebates. We will continue to use the Prescriber-

[235] CMS uses the term ''in-house pharmacy'' as it is defined in the OPAIS 340B Glossary. An ''in-house pharmacy'' is described as a pharmacy that is owned by and is a legal part of a 340B entity. Typically, in-house pharmacies are listed as shipping addresses of the entity and the entity owns the pharmacy license. See: *https://340bregistration.hrsa.gov/help/CoveredEntity/Links/340B_Glossary.htm.*

Pharmacy Methodology to remove 340B units from Part D inflation rebate calculations. Any future proposal to use the data reported to the 340B repository to remove 340B units from Part D inflation rebate calculations would undergo notice-and-comment rulemaking. We described our intention to analyze the data submitted to the 340B repository under this proposal to determine if they could be used reliably in the future to remove 340B units from Part D inflation rebate calculations in accordance with section 1860D–14B(b)(1)(B) of the Act. We would match the stored data elements in the 340B repository to PDE records for each Part D rebatable drug dispensed during the applicable period and would evaluate 340B repository data for: (1) data integrity, and (2) submission frequency and completeness across covered entity types and geographies, including through comparison to claims identified under the Prescriber-Pharmacy Methodology adopted in the CY 2026 PFS final rule to exclude 340B units starting on January 1, 2026, from Part D inflation rebates, including modifications established in this final rule. We noted in the proposed rule, we understand the importance of maintaining the confidentiality of data submitted to the 340B repository, and this data would not be made available to external parties, including manufacturers and Part D plan sponsors.

We solicited comments on the proposal at § 424.516(f)(4) that a provider or supplier that is a covered entity as defined at § 10.3 would be required to submit to CMS the documentation set forth at proposed § 428.203(c)(1) and (2) relating to covered Part D drugs written or ordered by such provider or supplier and comply with the submission requirements set forth at § 428.203(c)(3) and (4). We also solicited comments on the documentation and timing requirements proposed at § 428.203(c) to which a provider or supplier that is a covered entity would be required to adhere to fulfill their obligation at proposed § 424.516(f)(4). We also solicited comments on the scope of Part D 340B claims for which a provider or supplier that is a covered entity as defined at § 10.3 must submit data elements under the proposed regulation text.

We received public comments on these proposals. The following is a summary of the comments we received and our responses.

Comment: Many commenters supported CMS' proposal to require submissions from 340B providers to the 340B repository. Many commenters stated that mandating submissions from 340B providers to the 340B repository is an important step in advancing program integrity, ensuring robust submissions with complete and accurate data, and fulfilling the statutory requirement at section 1860D–14B(b)(1)(B) of the Act to exclude 340B units from Part D inflation rebate calculations.

Response: We thank the commenters for the support.

Comment: Some commenters urged CMS to shift to using data collected through the 340B repository in Part D inflation rebate calculations as soon as possible since, in their view, the 340B repository would provide the most comprehensive and accurate method for identifying and excluding 340B units. A few commenters stated that the 340B repository will provide more accurate data than the Prescriber-Pharmacy Methodology but did not specifically recommend that we use 340B repository data in Part D inflation rebate calculations now or in the future.

Response: We thank the commenters for their feedback. As discussed elsewhere in this final rule, data submitted to the 340B repository will not be used in Part D inflation rebate calculations under this final rule. Before that data can be relied upon for that purpose, CMS must evaluate its completeness and representativeness, which requires the mandatory reporting we are finalizing here. We will continue to rely on the Prescriber-Pharmacy Methodology to exclude 340B units from Part D inflation rebate calculations while this evaluation is underway. Any future proposal to use 340B repository data for that purpose would be subject to separate notice-and-comment rulemaking.

Comment: Some commenters stated that a mandatory reporting requirement is necessary because covered entities lack sufficient incentive to submit data voluntarily, and that a voluntary approach would result in low or unrepresentative participation that would limit CMS' ability to evaluate the repository's suitability for use in Part D inflation rebate calculations.

Response: We appreciate the feedback and agree that requiring mandatory reporting allows us to avoid the methodological limitations that would result from building our evaluation on a data set shaped by which organizations chose to participate. Specifically, continuation of a voluntary reporting approach introduces a confounding factor into the data based on characteristics of organizations that choose to submit or not, which would limit our ability to evaluate the suitability of the data. To mitigate this limitation and support a robust analysis of 340B data submissions, we believe establishing a mandatory reporting requirement is necessary to help ensure sufficient and representative participation.

Comment: A commenter stated that mandatory reporting is particularly important for biosimilar manufacturers, who often lack the market leverage available to reference product manufacturers to protect against duplicate discounts, and mandatory 340B claims reporting is therefore essential to ensuring that the statutory exclusion operates in practice, not merely in principle.

Response: We thank the commenter for this feedback. We reiterate that the 340B repository will not be used in Part D inflation rebate calculations at this time. We will consider this feedback if we propose such a policy in future rulemaking.

Comment: A couple of commenters supported mandatory reporting to the 340B repository because contract pharmacies generally do not know the 340B status of a Part D drug at the point of sale and should not be expected to identify or report 340B status through pharmacy claim submission processes.

Response: We thank the commenters for this feedback and agree that reporting responsibility rests with 340B providers, not contract pharmacies. Sections 428.203(c) and 424.516(f)(4) apply to 340B providers, not to third-party entities such as contract pharmacies and TPAs. We recognize that contract pharmacies generally do not know a claim's 340B status at the point of sale, since that status is typically determined later through a covered entity's or its TPA's retrospective identification process. The reporting obligation therefore falls on the 340B provider, who may rely on data from TPAs and contract pharmacies to compile its submissions but remains responsible for the accuracy and completeness of the data submitted to the 340B repository. A 340B provider may arrange for a TPA or other vendor to submit on its behalf, but this does not shift the underlying reporting responsibility away from the covered entity.

Comment: Some commenters stated that CMS has not provided sufficient explanation as to why it proposed to mandate reporting to the 340B repository even though it has not identified deficiencies with the Prescriber-Pharmacy Methodology. These commenters stated that this policy shift is significant, and CMS must explain why the Prescriber-Pharmacy Methodology finalized last

year is no longer sufficient. Some commenters stated that CMS does not explain why mandatory reporting must begin in 2027 since CMS is not yet using 340B repository data in Part D inflation rebate calculations, and that requiring reporting so soon undermines the purpose of the voluntary reporting period. A commenter recommended that CMS not finalize the proposal unless it can provide a reasoned explanation demonstrating why mandatory reporting is necessary and why less burdensome alternatives are inadequate to avoid arbitrary and capricious challenges under the Administrative Procedure Act. A commenter questioned the necessity of mandatory reporting since CMS already receives Part D claims data through existing PDE reporting mechanisms.

Response: We thank the commenters for the feedback. We first note that, although CMS does receive Part D claims data through existing PDE reporting mechanisms, we do not currently receive information on the 340B status of all Part D claims through PDE reporting. In the current 340B landscape, only the 340B covered entity has visibility into all purchases under the 340B program and dispenses to individuals enrolled in Medicare Part D; thus, CMS believes there are no less burdensome alternative sources to obtain claim-level information on 340B dispenses to Part D enrollees from the 340B covered entity. Indeed, reporting to the 340B repository, whether submitted voluntarily in accordance with the submission periods established under the CY 2026 PFS final rule or, beginning in 2027, as required under this final rule, is structured to be minimally burdensome such that CMS can match the data elements stored in the 340B repository to PDE records for Part D rebatable drugs to test whether the 340B repository data could be used to identify 340B units in the future. The required data elements have not changed between the CY 2026 PFS final rule and the CY 2027 PFS final rule, meaning that the underlying data reporting tasks for the 340B covered entities are identical whether reporting is voluntary or mandatory.

Second, we note that, since publication of the CY 2026 PFS final rule, through engagement with a diverse range of interested parties, a consistent theme has emerged independent of the repository's launch: covered entities lack sufficient incentive to voluntarily report data, citing administrative burden without an offsetting benefit. We believe this feedback provides a reasonable basis for anticipating, prior to formally evaluating repository participation data, that voluntary reporting alone may not yield a data set that is sufficiently complete or representative of all providers and suppliers that are covered entities. We disagree with the commenter that CMS must find the Prescriber-Pharmacy Methodology deficient for CMS to propose mandatory reporting by 340B providers to the 340B repository. This is because mandatory reporting to the 340B repository is separate in authority and serves a distinct and independent purpose from the Prescriber-Pharmacy Methodology, which is to collect Part D 340B claims data from covered entities so that CMS can evaluate whether such data could satisfy the statutory requirement at section 1860D–14B(b)(1)(B) of the Act in the future. Voluntary reporting of 340B claims data to the 340B repository introduces a confounding factor based on the characteristics of the 340B providers that choose to participate, limiting CMS' ability to assess whether 340B repository data are sufficiently complete and representative of all 340B providers for this purpose. CMS is therefore adopting mandatory 340B claims data reporting to test a different data source for potential future use. This effort proceeds independent of whether the Prescriber-Pharmacy Methodology remains adequate for its current use; we will continue relying on that methodology to calculate Part D inflation rebates while this evaluation of 340B repository data is underway.

Third, we note that interested parties representing drug manufacturers and covered entities commented on the revised guidance for the Medicare Part D Drug Inflation Rebate Program and the CY 2025 PFS proposed rule recommending that we create a mechanism, such as a repository or a clearinghouse, through which covered entities would retrospectively submit data to us identifying 340B claims dispensed under Part D, and a couple of these commenters supported mandatory reporting to the 340B repository. Further, in comments on the CY 2026 PFS proposed rule, many commenters requested that we mandate covered entity reporting to the 340B repository so that CMS could—in the commenters' view—more quickly transition away from the Prescriber-Pharmacy Methodology and instead use 340B repository data in Part D inflation rebate calculations. Requiring participation in the 340B repository in this final rule is responsive to this feedback.

CMS has signaled its intent to move toward mandatory reporting over the course of several rulemaking cycles. In the CY 2025 PFS proposed rule (89 FR 61971), we solicited comments on potential authorities to require covered entities to submit data to a 340B repository. In response to comments received in support of such a requirement, we stated in the CY 2026 PFS final rule (89 FR 98293) that we would consider comments received for use in future rulemaking and continue to explore requiring that covered entities and their contracted TPAs report to the 340B repository. In the CY 2026 PFS proposed and final rules (90 FR 32642, 49750), we stated that we were actively considering options for mandatory reporting to the 340B repository in the near future and recommended that covered entities take advantage of the testing period to prepare for future policy development related to 340B repository reporting. Additionally, we noted in the CY 2026 PFS final rule (90 FR 49751) that many commenters requested that CMS make reporting to the repository mandatory for covered entities and their contractors, stating that, without a mandatory requirement for submission to a 340B repository, the 340B repository would not be able to be used to fulfill the legal requirement to remove 340B units from Part D inflation rebate calculations. We agree with these commenters. As discussed earlier in this response, voluntary reporting introduces a confounding factor based on the characteristics of covered entities that choose to participate, which limits CMS' ability to assess whether 340B repository data are sufficiently complete and representative of all covered Part D drugs that are purchased under the 340B Program to support identification of 340B units for purposes of calculating Part D inflation rebates. We believe that continuation of voluntary reporting to the 340B repository could force us to delay our evaluation of the 340B repository data until an undetermined number of covered entities opt in—with no guarantee they ever would—or draw conclusions from an incomplete record of submissions. A mandatory requirement is therefore necessary to produce data of the completeness and representativeness needed to evaluate that use.

Comment: Some commenters stated that CMS has not demonstrated clear statutory authority to compel reporting of Part D 340B data, and that the IRA charged CMS with calculating inflation rebate amounts but did not establish a corresponding requirement for 340B providers to report such data to CMS. These commenters stated that CMS' reliance on sections 1866(a)(1)(X) and 1842(h)(9) of the Act is unpersuasive, and that CMS has not sufficiently

explained how these statutory provisions authorize CMS to compel reporting of Part D 340B claim-level information that are not being used to support accurate processing of Medicare claims and payment. A few of these commenters stated that the most natural reading of section 6406(a) of the ACA is as an audit authority permitting the Secretary to obtain records when necessary, but it does not establish a prospective, permanent, nationwide authority to require routine submissions from 14,000 providers and suppliers. A commenter stated that CMS' proposal conflicts with Executive Order 14192, ''Unleashing Prosperity Through Deregulation,'' and the Unfunded Mandates Reform Act of 1995. A commenter asked CMS to explain how an enrollment documentation authority directed at the services a provider or supplier furnishes and bills reaches claims submitted by a different entity under a different part of the Medicare program (that is, Medicare Part D). By contrast, a couple of commenters stated that the proposed reporting requirement falls within CMS' statutory authority to establish documentation requirements for certain orders and referrals made by Medicare providers, which includes 340B claims. A few commenters asked CMS to confirm that the reporting obligation rests with 340B providers and not with authorized vendors such as contract pharmacies and TPAs, which are not enrolled parties subject to § 424.516(f)(4).

Response: Section 1860D–14B(b)(1)(B) of the Act requires CMS to remove 340B units from Part D inflation rebate calculations beginning with plan year 2026, and we reiterate that data on which units dispensed under Part D and covered by Part D plan sponsors were purchased under the 340B Program is unavailable from the data sources specified at section 1860D–14B(d) of the Act (that is, information submitted by manufacturers, States, and Part D plan sponsors), and we do not currently have access to this data through other means. We believe that requiring 340B provider participation in the 340B repository is necessary to ensure robust data submissions in 2027 to determine if data submitted to the 340B repository could be used reliably in the future to remove 340B units from Part D inflation rebate calculations in accordance with section 1860D–14B(b)(1)(B) of the Act.

We agree with the commenters who stated that the reporting requirement falls within CMS' statutory authority. As we explained in the CY 2027 PFS proposed rule (91 FR 44012), section 6406(a) of the ACA amended section 1842(h) of the Act by adding a new paragraph which establishes that the Secretary may revoke enrollment, for a period of not more than one year for each act, for a physician or supplier if such physician or supplier fails to maintain and, upon request of the Secretary, provide access to documentation relating to written orders or requests for payment for durable medical equipment, certifications for home health services, or referrals for other items or services written or ordered by such physician or supplier under Title XVIII of the Act, as specified by the Secretary. In addition, section 6406(b)(3) of the ACA amended section 1866(a)(1) of the Act to require that providers maintain and, upon request of the Secretary, provide access to documentation relating to written orders or requests for payment for durable medical equipment, certifications for home health services, or referrals for other items or services written or ordered by the provider, as specified by the Secretary. Although we acknowledged that § 424.516(f) has historically set forth documentation requirements for providers and suppliers for their Part A and Part B services, the statutory authorities underlying that provision, sections 1842(h)(9) and 1866(a)(1)(X) of the Act, do not expressly limit documentation requirements to services furnished under Part A and Part B. Sections 1842(h)(9) and 1866(a)(1)(X) of the Act collectively set forth that providers and suppliers must maintain and provide access to documentation relating to ''items or services written or ordered by the provider *under this title,* as specified by the Secretary'' (emphasis added). Both sections 1842(h)(9) and 1866(a)(1)(X) of the Act fall under Title XVIII (that is, the Medicare statute), which inherently includes Part D. As such, requiring providers and suppliers to maintain and provide access to documentation related to covered Part D drugs written or ordered by a provider or supplier is consistent with sections 1866(a)(1)(X) and 1842(h)(9) of the Act. By transitioning from voluntary submission to mandatory participation in the 340B repository, we will be able to ensure more complete and reliable data submissions, thereby improving our ability to accurately assess potential future use of the 340B repository to exclude 340B units from Part D inflation rebate calculations, consistent with our obligations under section 1860D–14B(b)(1)(B) of the Act. Finally, we affirm that the requirements at §§ 428.203(c) and 424.516(f)(4) apply to 340B providers and not to third-party entities such as contract pharmacies and TPAs.

Comment: A few commenters requested that CMS affirm that the 340B repository and the 340B Rebate Model Pilot Program (''340B Rebate Pilot'') serve different purposes, and that the existence of the 340B repository does not diminish the need for a rebate model in the 340B Program. Some commenters stated that an expanded version of the 340B Rebate Pilot would offer the most efficient, accurate, and transparent path to identifying and excluding 340B claims from both the Part B and Part D Drug Inflation Rebate Programs and requested that HHS consider implementing a rebate model for all products.

Response: We acknowledge that HRSA has announced the availability of a 340B Rebate Pilot, which would require covered entities to report an expanded set of data elements for selected drugs under the Medicare Drug Price Negotiation Program for initial price applicability years 2026 and 2027 during their price applicability periods purchased at the 340B price to manufacturers.[236] CMS will coordinate with HRSA to reduce burden on covered entities as feasible. However, the 340B repository mandatory reporting requirement and the 340B Rebate Pilot are distinct in terms of legal basis, scope of drugs, recipient of collected data, and program purpose. The 340B repository mandatory reporting requirement is part of a distinct, comprehensive effort involving claims for all drugs dispensed under Part D and covered by Part D plan sponsors to assess use of the 340B repository to exclude 340B units from Part D inflation rebate calculations, whereas the 340B Rebate Pilot is at this time limited to selected drugs for initial price applicability years 2026 and 2027.

Comment: Many commenters stated that the 340B repository requirement would be largely duplicative of information already being reported through other mechanisms, including the 340B Rebate Pilot, and recommended that CMS track duplicative reporting burdens and consider whether the Part D 340B claims data information needed can be obtained from existing data sources such as manufacturers, payers, or wholesalers. These commenters stated that the duplicative reporting requirements are wasteful, inefficient, and cause financial harm to covered entities. Many commenters stated that HHS should not impose two separate

[236] See: *https://www.federalregister.gov/documents/2026/08/03/2026–15633/notice-regarding-340b-rebate-model-pilot-program.*

and overlapping data submission requirements on covered entities under the 340B repository and the 340B Rebate Pilot and recommended that CMS and HRSA collaborate to unify reporting requirements. A commenter recommended that CMS only move forward with mandating participation in the 340B repository beginning in 2027 if HRSA delays implementation of the 340B Rebate Pilot until after implementation of the 340B repository since, in their view, the 340B repository would obviate the need for the 340B Rebate Pilot.

Response: We disagree that our proposal for mandatory reporting to the 340B repository is largely duplicative of the 340B Rebate Pilot. As explained, there are key differences between these two initiatives to include the purpose of 340B reporting and underlying authority, scope of reported drugs, data elements, frequency of reporting, duration of reporting, and recipient of reported information. Duplication of reporting burden by a covered entity in CY 2027 to both the 340B repository and the 340B Rebate Pilot is limited to those drugs that are a selected drug in initial price applicability year 2026 and initial price applicability year 2027 during their price applicability period.

Comment: Many commenters recommended that CMS use the information submitted to the 340B repository—or an expanded ''neutral claims clearinghouse'' version of the 340B repository that would collect data for Federal programs more broadly—in the administration of other Federal programs, including the Medicare Drug Price Negotiation Program, so that covered entities need not submit data to multiple sources, including to the 340B Rebate Pilot and manufacturers. A commenter recommended that CMS consider how the 340B repository could be expanded to capture Part B 340B claims.

By contrast, some commenters recommended that the 340B repository be used only in the Medicare Part D Drug Inflation Rebate Program and that any expanded use be subject to notice-and-comment rulemaking. A commenter requested clarity on how 340B repository information will interact with other methods of identifying 340B units and asked which source will be used when data conflicts.

Response: At this time, data submitted to the 340B repository will be used to begin testing usability of the data for the purpose of removing 340B units under the Medicare Part D Drug Inflation Rebate Program. As we stated in the revised collection of information (0938–1485) titled ''Information Collection Request (ICR) for the Medicare Prescription Drug Inflation Rebate Program under sections 11101 and 11102 of the Inflation Reduction Act (IRA)'' (CMS–10930, OMB 0938–1485), CMS may also use the information collected by CMS from 340B providers to conduct other internal program analyses, such as those related to the Medicare Drug Price Negotiation Program. We note that this use is distinct from the external disclosure discussed in section III.F.3.c.2.c. of this final rule. Internal program analyses, including those related to the Medicare Drug Price Negotiation Program, are conducted by CMS using data CMS already holds, and do not involve disseminating, distributing, or copying 340B repository data to manufacturers, Part D plan sponsors, or other parties outside the agency. If we were to decide to use data submitted to the 340B repository for purposes other than the Medicare Part D Drug Inflation Rebate Program and internal program analyses, we would undergo notice-and-comment rulemaking and provide interested parties an opportunity to comment before any such policy is finalized. We acknowledge the suggestion that we consider how to capture Part B 340B claims data but do not intend to expand the use of the 340B repository to collect Part B claims data at this time.

Comment: Many commenters recommended that the 340B Rebate Pilot and 340B repository remain distinct but that CMS explore how to use the data collected through the 340B Rebate Pilot to improve accuracy of and reduce burden in the 340B repository, such as using 340B Rebate Pilot data to validate 340B repository data or reduce duplicative reporting burdens on covered entities by establishing a mechanism through which 340B Rebate Pilot data are used to populate the 340B repository for participating drugs.

Response: We appreciate the feedback.

Comment: A few commenters recommended that CMS not move forward with mandatory participation in the 340B repository until the Administration takes action to stop what the commenters deemed to be unlawful denial of 340B pricing to covered entities that decline to submit data directly to drug manufacturers.

Response: We note that the comments recommending CMS delay implementation of a mandatory 340B repository until the Administration ensures that 340B pricing is made available to covered entities is outside the scope of this final rule. We are implementing the reporting requirement at § 428.203(c) consistent with our obligations under section 1860D–14B(b)(1)(B) of the Act.

Comment: A couple commenters stated that the reporting requirement is overinclusive because it would require submission of information relating to drugs that are not subject to Medicare Part D inflation rebates. The commenter stated that requiring 340B providers to report information relating to selected drugs under the Medicare Drug Price Negotiation Program expands the reporting burden beyond what is necessary for the 340B repository's stated purpose.

Response: We do not agree that the reporting requirement is overinclusive. Section 1860D–14B(b)(1)(B) of the Act requires CMS to remove 340B units from inflation rebate calculations for all Part D rebatable drugs. Because the status of a Part D rebatable drug can change over time (for example, a drug or biological may have average annual total costs below the applicable threshold set forth at § 428.101(b) in one applicable period but not another), we believe requiring 340B providers to submit data for all Part D 340B claims is less burdensome and will result in more complete data than if we were to require 340B providers to continually change the scope of drugs for which they are required to submit data. Additionally, we note that this final rule does not implement different or additional data requirements specific to selected drugs under the Medicare Drug Price Negotiation Program. As we stated in the CY 2025 PFS final rule (89 FR 98285), the Medicare Part D Drug Inflation Rebate Program applies to selected drugs notwithstanding the status of the drug as a selected drug. The reporting requirement at § 428.203(c) therefore applies no differently to a Part D rebatable drug that is a selected drug than to a Part D rebatable drug that is not a selected drug.

Comment: Many commenters expressed concern that CMS proposed to enforce the 340B repository reporting requirement through its Medicare enrollment authority, including that CMS would reserve the right to revoke a hospital's Medicare enrollment for noncompliance while simultaneously acknowledging that the data collected has not yet been tested nor would be used to calculate Part D inflation rebates at this time. These commenters stated that this enforcement approach could create substantial financial and patient-access consequences unrelated to the underlying reporting deficiency, and that loss of Medicare enrollment is an extraordinary sanction disproportionate to a reporting process CMS is using only

to evaluate the feasibility of a future alternative methodology. A few of these commenters also expressed concern that what they described as severe penalty could apply even if noncompliance was due to reporting by a TPA or other third-party and stated the challenges of bearing ultimate legal accountability across a multi-vendor ecosystem. A commenter stated that CMS has not built a sufficient record to justify using such a severe enforcement mechanism since, in their view, CMS significantly underestimated the burdens associated with reporting to the 340B repository. A commenter expressed concern that notice and appeal provisions of 42 CFR part 424, subpart P appear designed to accommodate individual, discrete issues rather than an ongoing data reporting program. A commenter stated that CMS has not established a sufficiently clear procedural framework for imposing enforcement consequences.

Response: We do not agree that the enforcement consequence for non-compliance is disproportionate to the reporting requirement. We note that, in accordance with § 424.535(a)(10)(ii), a provider or supplier that meets the revocation criteria specified in § 424.535(a)(10)(i) is subject to revocation for a period of not more than 1 year for each act of noncompliance. As we stated elsewhere in this section, continuation of a voluntary reporting approach, which introduces a confounding factor into the data based on characteristics of organizations which choose to submit or not, would present a methodological limitation in our evaluation of the suitability of the 340B repository data. To mitigate this limitation and avoid constraints on our ability to conduct a robust analysis of 340B data submissions, we believe that establishing a mandatory reporting requirement would help ensure sufficient participation and alleviate these concerns, consistent with our obligations under section 1860D–14B(b)(1)(B) of the Act. In response to the comment that CMS underestimated associated burdens, we refer readers to section V.B.5. of this final rule.

We also do not agree that we have not established a sufficiently clear procedural framework for enforcement. As we stated in the CY 2027 PFS proposed rule (91 FR 44013), we reserve the right to revoke, in accordance with existing § 424.535(a)(10), a currently enrolled provider or supplier's Medicare enrollment and any corresponding provider agreement or supplier agreement for failure to comply with the requirements for maintaining and providing access to documentation specified in proposed and finalized § 424.516(f)(4). The procedural framework previously established at existing § 424.535(a)(10) would apply no differently to failures to comply with the requirements specified in proposed and finalized § 424.516(f)(4).

Comment: Many commenters recommended that, if CMS finalizes a mandatory reporting requirement, CMS establish a graduated compliance pathway—including a corrective-action process, a materiality threshold, technical assistance, a temporary safe harbor period as 340B providers transition systems to align with the requirement, and a permanent safe harbor for good-faith reporting errors, particularly when errors are due to third parties such as TPAs or contract pharmacies—before taking enforcement action, stating these safeguards would prevent disproportionate penalties for technical or inadvertent errors in complex claim-level submissions. Separately, a commenter stated that CMS should not impose Medicare enrollment sanctions without a separate finding of fraud, diversion, duplicate discounts, or improper billing. A commenter recommended that CMS tailor reporting expectations to scale with a hospital's actual capacity to comply, stating that applying a national standard disproportionately impacts small and rural hospitals. A couple of commenters recommended that CMS create a hardship exemption, with a commenter recommending that CMS exclude smaller 340B providers and another commenter recommending that CMS exempt Critical Access Hospitals, Sole Community Hospitals, Medicare Dependent Hospitals, rural referral centers, and low-volume covered entities from the mandatory reporting requirement.

In contrast, a few commenters recommended that CMS couple the mandatory reporting requirement with strong enforcement action, education, and auditing to ensure CMS is receiving complete and accurate data. These commenters stated that CMS should establish clear consequences for noncompliance, including penalties for inaccurate or incomplete reporting. A couple of commenters recommended that CMS suspend covered entities from the 340B Program for failure to comply with the reporting requirements. A commenter requested clarity on the consequences for non-reporting or misreporting but did not express preferences on types of enforcement actions. A commenter recommended that CMS ensure the reporting framework does not permit selective reporting by 340B providers that would reduce manufacturer inflation rebate liability for some products but not others.

Response: We acknowledge commenters' concerns about consequence of non-compliance with the mandatory reporting requirement due to technical or inadvertent errors in claim-level submissions, including errors caused by third parties such as TPAs or contract pharmacies. We believe that allowing 340B providers to make corrections to previously submitted claims as outlined in the Medicare Part D Claims Data 340B Repository Companion Guide,[237] together with the existing enforcement framework at § 424.535(a)(10), distinguishes good-faith, correctable errors from conduct that would warrant enrollment revocation. We therefore do not believe a separate materiality threshold or permanent safe harbor is needed at this time. We also do not agree that revocation under § 424.535(a)(10) requires a separate finding of fraud, diversion, duplicate discounts, or improper billing; that authority addresses documentation failures independently of other violations.

We additionally emphasize our commitment to engaging with 340B providers to provide the education and resources necessary for them to adhere to their reporting obligations to ensure we are receiving complete and accurate data. Several resources related to the 340B repository are available on the CMS website, including Frequently Asked Questions, a Medicare Part D 340B Repository Companion Guide, and Medicare Part D 340B Repository Data Submission Template examples in Excel and CSV formats.[238] The Medicare Part D Claims Data 340B Repository Help Desk is also available to assist 340B providers.[239] The comment recommending that CMS suspend covered entities from the 340B Program for failure to comply with the reporting requirement is out of scope.

Comment: A commenter stated that submitting data to the 340B repository would not be overly burdensome based on the data requirements and guidelines outlined in the CY 2027 PFS proposed rule. Another commenter stated that they perform analogous reporting for manufacturers and therefore have established the internal processes needed to support a Federal reporting

[237] See: *https://www.cms.gov/files/document/cms-medicare-part-d-340b-repository-companion-guide.pdf.*

[239] See: *https://bosc.helpdesk.cms.gov/medicare340breporting/home.*

requirement. A commenter stated that their health system could successfully submit Part D 340B claims data retrospectively on a quarterly basis. A couple of commenters supported the proposal to allow TPAs to transmit data to the 340B repository on behalf of 340B providers.

Conversely, many commenters noted concern that mandatory 340B repository submissions would create significant burdens for 340B providers, stating that implementing the requirement could require fees to software vendors and TPAs, additional staff time, and could divert resources away from patient care. A couple of commenters stated that the requirement would be particularly challenging for small and rural covered entities and recommended a hardship exemption or flexibilities for such entities. A few commenters described challenges of consolidating data and standardizing reporting across multiple contract pharmacies, TPAs and outpatient drug delivery settings (such as outpatient retail pharmacies and child site infusion clinics) with different operational and IT ecosystems.

A few commenters recommended that CMS engage with interested parties to test the 340B repository and identify ways to minimize reporting burdens before the 340B repository becomes mandatory, stating that interested parties' engagement will help identify operational challenges early and improve the accuracy and usability of the 340B repository over time. A commenter recommended that CMS work with interested parties to identify ways to improve the methodology for identifying Part D 340B drug units without adding additional reporting obligations.

Response: We appreciate the commenters who stated that submitting data to the 340B repository would not be overly burdensome given the data requirements and guidelines outlined, that they already perform analogous reporting for manufacturers and have established internal processes that can support a Federal reporting requirement, and that permitting TPAs to transmit data to the 340B repository on behalf of 340B providers would ease compliance.

In developing the data elements for submission and process for voluntary submission to the 340B repository, we considered how to minimize burden on 340B providers. We are collecting the minimal number of data elements necessary to match 340B repository data to PDE records for Part D rebatable drugs, and we are providing quarterly submission deadlines and additional time for 340B providers to submit corrections to their Part D 340B data. We believe these decisions will lower burden on 340B providers to the extent possible. As we stated in the CY 2027 PFS proposed rule (91 FR 44014), we understand covered entities typically contract with vendors, such as TPAs, to determine 340B eligibility of claims using data submitted by covered entities and their contractors. We will allow covered entities that choose to submit data to the 340B repository to arrange for their TPAs or other vendors to submit certain data elements to the 340B repository on their behalf if they would like to do so. We note that there are no hardship exemptions or other reporting flexibilities for 340B providers that are small covered entities, rural covered entities, or both. We believe that permitting covered entities to rely on their TPAs or other vendors for data submission, as previously described, appropriately mitigates burden for all 340B providers, including small and rural covered entities, without the need for a separate exemption based on characteristics of a 340B provider.

Finally, we have engaged extensively with interested parties to develop the 340B repository in ways that minimize burden on 340B providers to the extent possible in an evolving 340B landscape. In addition to meeting with interested parties on specific issues, we have held broad discussions and technical calls open to all 340B entities and related parties to hear feedback and input on ways to minimize burden and share technical specifications in time for interested parties to participate in voluntary submissions this fall. We welcome continued feedback and remain committed to continued engagement with interested parties as we develop and test the 340B repository.

Comment: A couple of commenters appreciated CMS' commitment to seeking public input through rulemaking before relying on 340B repository data for Part D inflation rebate calculations and recommended that CMS continue to seek public input through future rulemaking before adopting any methodology that relies on 340B repository data for such calculations.

Response: We appreciate the support and affirm that any future proposal to use the data reported to the 340B repository to remove 340B units from Part D inflation rebate calculations would undergo notice-and-comment rulemaking, and we will continue to provide interested parties an opportunity to comment before any such policy is finalized.

Comment: Many commenters urged CMS to delay mandatory reporting to the 340B repository, stating that the 340B repository has not yet launched and is not expected to become operational until Fall 2026, leaving insufficient time to identify problems, train staff, and validate submissions before mandatory reporting begins for claims with dates of service on or after January 1, 2027. Many commenters similarly urged CMS not to mandate reporting into an untested system, stating that the 3-month testing period in 2026 is insufficient to support a transition from voluntary to mandatory reporting and will not provide enough time to evaluate the quality and completeness of the data or fully assess the operational burden on covered entities. Many commenters opposed that the proposal to require 340B providers to report data would be used only for testing purposes, stating that the benefits of the proposal do not outweigh the costs to 340B providers since CMS will not yet be using the data in Part D inflation rebate calculations, and that CMS should delay mandatory reporting until it has assessed the feasibility of using voluntarily-reported data.

Many commenters recommended that CMS delay implementation of mandatory reporting by, for example, providing 340B providers a specific minimum period—such as at least 6 months, or sufficient time after publication of final technical specifications—to configure, test, and validate submission systems before mandatory reporting begins. Relatedly, many commenters recommended a phased-in approach rather than a single compliance date, so CMS could assess data quality and refine specifications collaboratively with 340B providers; suggestions included phasing in or simplifying reporting with technical assistance and a hardship exemption for smaller 340B providers and continuing voluntary reporting while evaluating participation and data quality before imposing any mandatory requirement.

Many commenters stated that the proposed compliance date would require covered entities to implement mandatory 340B repository reporting while simultaneously preparing for the 340B Rebate Pilot, also effective January 1, 2027, compounding financial and operational pressures and diverting resources from patient care, and recommended delaying implementation to July 1, 2027, or January 1, 2028 given these concurrent obligations.

Response: We agree that 340B providers need adequate time following the 340B repository's launch to test workflows, train staff, and validate

submissions, and we recognize commenters' concerns that the originally proposed timeline could compress this preparation period, particularly given other data reporting obligations 340B providers face beginning in 2027.

As described in the CY 2027 PFS proposed rule (91 FR 44013), we proposed at § 428.203(c) to require 340B providers to submit Part D 340B data to the 340B repository beginning in 2027, with the data elements and information set forth in proposed paragraphs (c)(1) and (2) of that section submitted on a quarterly basis as required under proposed paragraph (c)(3). Under this proposal, data for a given calendar quarter would be due within 1 calendar quarter following the close of that quarter, meaning that data for claims with dates of service in Q1 2027 would have been due by June 30, 2027. We also noted in the proposed rule that we expected the 340B repository to become operational for voluntary submissions in Fall 2026, consistent with the CY 2026 PFS final rule (90 FR 49748), and we strongly encouraged 340B providers to begin submitting data voluntarily during that period to test operational processes ahead of the 2027 mandatory requirement, should such requirement be finalized. The 340B repository launched on October 1, 2026, and covered entities have begun successfully submitting Part D 340B data.

We also agree delaying the deadline for the first mandatory quarterly submission to the 340B repository would allow 340B providers additional time to configure, test, and validate their submission system. We believe this additional time will provide 340B providers a meaningful opportunity to configure and test their systems, consolidate necessary data, and validate submissions before mandatory reporting begins, while still allowing CMS to begin timely evaluation of the feasibility of using 340B repository data for purposes of the Part D inflation rebate calculation under section 1860D–14B(b)(1)(B) of the Act. We are finalizing a delayed deadline of September 30, 2027, for 340B providers to submit data for claims with dates of service from January 1, 2027 through March 31, 2027. The first mandatory submission will cover two calendar quarters of data (the first and second quarter of 2027) and will be due September 30, 2027. 340B providers may choose to submit data earlier than the September 30, 2027 deadline, including submitting first-quarter data separately before second-quarter data becomes available.

We note that this delay applies only to the deadline for the first mandatory quarterly submission. Beginning with the second reporting period, 340B providers must submit data within 1 calendar quarter following the close of each applicable quarter, consistent with the quarterly submission cadence proposed at § 428.203(c)(3). Because the deadline for the first mandatory submission will cover 2 calendar quarters (Q1 and Q2 2027), the next reporting period will consist of Q3 2027 data, which will be due by the end of the following quarter, December 31, 2027. These deadlines are listed in Table B–F1. After the submission due date for a given quarter, the 340B repository will remain open to receive additional submissions for that quarter in accordance with § 428.203(c)(4), which requires that data elements and information that are either incomplete or contain invalid data must be resubmitted at a later time in a form and manner specified by CMS, consistent with the resubmission process described in the CY 2027 PFS proposed rule (91 FR 44012 through 44015).

TABLE B-F1: Medicare Part D 340B Claims Submission Due Dates for Dates of Service in 2027

Medicare Part D 340B Claims Date of Service Timeframe	Medicare Part D 340B Claims Submission Due Dates
January 1 – March 31, 2027	September 30, 2027
April 1 – June 30, 2027	September 30, 2027
July 1 – September 30, 2027	December 31, 2027
October 1 – December 31, 2027	March 31, 2028

Comment: A few commenters stated that ADAPs are covered entities under 42 CFR 10.3 but are not Medicare-enrolled providers or suppliers, creating ambiguity as to whether the proposed requirement for ''a provider or supplier that is a covered entity'' to submit data to the 340B repository applies to ADAPs. These commenters stated that ADAP eligibility as a covered entity is tied to receipt of RW Part B funding rather than to health care service delivery or Medicare enrollment, and that the proposed enforcement mechanism has no application to an entity that holds no such enrollment. These commenters recommended that CMS clarify in the final rule whether and how ADAPs are required to submit data to the 340B repository and recommended that, if ADAPs are not intended to be subject to the requirement, CMS state so explicitly.

A commenter stated that several operational barriers would prevent ADAPs from complying with 340B repository reporting, even if the requirement were intended to reach them. This commenter stated that ADAP claims processing is often administered through third-party systems that do not capture the specific data elements the 340B repository would require, since the 340B repository data elements are structured around covered entities that directly operate or contract with a registered 340B contract pharmacy rather than the rebate model most ADAPs use. This commenter also stated that ADAPs' rebate claim cycles do not align with the proposed quarterly reporting timeline. This commenter recommended that CMS address this timing mismatch and precede any ADAP reporting requirement with a voluntary testing period of at least 1 year. Another commenter similarly recommended that CMS provide a longer submission timeline for ADAPs, stating that ADAP rebate data often reaches manufacturers up to 12 months after the end of a calendar quarter, and that manufacturers then have 3 months to reconcile and pay rebates, meaning some ADAP rebates may not be reconciled until 15 months after the applicable dispensing quarter.

Response: We appreciate this input. We proposed at § 428.203(c) that providers and suppliers that are covered entities as defined under § 10.3 submit Part D 340B data to the 340B repository beginning in 2027. We recognize that

the documentation requirement we proposed and are finalizing at § 424.516(f)(4), as well as the enforcement mechanism we proposed and are finalizing in accordance with existing § 424.535(a)(10), relies on Medicare enrollment, and that this mechanism has no application to an ADAP that holds no such enrollment. However, we strongly encourage ADAP participation in the 340B repository. ADAPs are covered entities under the 340B Program, and although the mandatory reporting requirement finalized in this rule does not extend to ADAPs because ADAPs are not providers or suppliers enrolled in Medicare, we continue to strongly encourage ADAPs to submit their Part D 340B claims data to the 340B repository on the same basis as other covered entities. We acknowledge commenters' concerns regarding potential mismatches between ADAP rebate cycles and the proposed quarterly reporting timeline. As we outlined in the CY 2027 PFS proposed rule, data submitted to the 340B repository will not be used to exclude 340B units from inflation rebate calculations at this time. If we propose and finalize such a policy in the future, we would provide additional guidance to ADAPs at that time.

Comment: Many commenters supported the data elements CMS proposed for the 340B repository, stating that the five proposed elements (date of service, prescription or service reference number, fill number, dispensing pharmacy NPI, and NDC–11) are appropriate.

Commenters stated that these elements did not present overly burdensome requirements or Protected Health Information (PHI) risks. Many commenters also supported the proposed quarterly submission timeline. These commenters stated that it was more efficient than the more frequent data demands covered entities currently face. Some commenters recommended that CMS instead align the 340B repository's data elements and reporting timeline with those required under the 340B Rebate Pilot. These commenters stated that this would improve efficiency and support future expansion of the 340B Rebate Pilot to the Medicare Part D Drug Inflation Rebate Program. These commenters recommended that CMS expand the data elements collected. Suggested additions included product serial number, prescribed date, quantity dispensed, bank identification number (BIN)/processor control number (PCN), prescriber identification number, and claims adjustment/paid date. These commenters stated that without common data elements, the 340B repository would have limited utility for cross-program validation. A few commenters recommended that CMS require more frequent submissions than the proposed quarterly timeline. These commenters stated that timelier data is critical to identifying 340B claims and administering the Medicare Part D Drug Inflation Rebate Program. A commenter stated that quarterly reporting may be sufficient for calculating Part D inflation rebate liability specifically. This commenter stated that quarterly reporting would not support other use cases requiring more timely identification of 340B claims.

Response: We designed the 340B repository to assess whether covered entity-submitted data can reliably identify units of Part D rebatable drugs for which a manufacturer provided a 340B discount, to determine if such data could be used reliably in the future to remove 340B units from Part D inflation rebate calculations in accordance with section 1860D–14B(b)(1)(B) of the Act. We proposed the five required data elements (date of service, prescription or service reference number, fill number, dispensing pharmacy NPI, and NDC–11) because we determined these elements are necessary and sufficient to identify a unique PDE record. We agree with the commenters that stated requiring additional fields, such as product serial number and prescribed date, is not necessary. Based on our current review, we believe requiring these fields would impose burden on 340B providers without a corresponding benefit to the program.

We do not agree that we should, at this time, expand the required data elements or align them with the data fields required under 340B Rebate Pilot. The 340B repository serves a distinct purpose from 340B Rebate Pilot: the 340B repository exists to allow CMS to assess whether submitted data can support our statutory obligation under section 1860D–14B(b)(1)(B) of the Act to exclude 340B units from Part D inflation rebate calculations, not to facilitate manufacturer-level claims verification or cross-program reconciliation with the 340B Rebate Pilot. We intend to minimize burden on 340B providers while collecting the minimum elements necessary to match a submission to a PDE record to exclude 340B units from inflation rebate calculations, were the 340B repository to be used for such purpose in the future. We do not agree that we should require more frequent than quarterly submission of Part D 340B claims data at this time. Quarterly submissions provide CMS with timely information to assess the reliability of the data for potential future use in removing 340B units from Part D inflation rebate calculations. Quarterly submissions also minimize burden on 340B providers by reducing the amount of data and quality assurance required for each submission. Given the variety in the scope of provider types and organizations that participate in the 340B Program, the amount of preparation time needed to compile, certify, and submit complete and accurate claims data varies. The quarterly timeline provides 340B providers sufficient time to meet these requirements without imposing the additional burden that more frequent reporting would create.

Comment: A couple of commenters recommended that CMS require 340B and non-340B claims indicators on Part D claims. One of these commenters stated that claims indicators would improve the effectiveness of the 340B repository because CMS lacks visibility into the full universe of 340B claims and therefore cannot reliably assess the extent of underreporting or identify gaps in 340B repository data. In contrast, a few commenters re-emphasized points made in their previous comments on the CY 2025 PFS proposed rule (which we summarized and responded to in the CY 2025 PFS final rule (89 FR 98294)) that adding 340B claims indicators to Part D claims would be infeasible due to operational challenges.

Response: We note that 340B claims indicators are not currently required from CMS for Part D 340B claims and acknowledge feedback received on the CY 2025 PFS proposed rule that requiring such a claims indicator has the potential to pose operational challenges and increase pharmacy burden because 340B status may not be known at the point of sale and may not always be accurate. In this final rule, we maintain that reporting of a 340B claims indicator on Part D claims submitted by dispensing entities remains voluntary.

After consideration of the comments received, we are finalizing the proposal at § 428.203(c) to require providers and suppliers that are covered entities, as defined under § 10.3, to submit Part D 340B data to the 340B repository beginning in 2027, with modification. Specifically, at § 428.203(c)(1) we are finalizing without modification the five data elements proposed for each Part D 340B claim submitted to the 340B repository: (1) date of service, (2) prescription or service reference number, (3) fill number, (4) dispensing pharmacy National Provider Identifier (NPI), and (5) National Drug Code (NDC–11). At § 428.203(c)(2), we are finalizing, without modification, that

the 340B provider must submit its 340B ID and name as designated in the 340B OPAIS database. At § 428.203(c)(3), we are finalizing the requirement that 340B providers report data on a quarterly basis (though they may choose to submit more frequently) within 1 calendar quarter following the close of the relevant calendar quarter, with modification at § 428.203(c)(3)(i)(B) to delay the first mandatory reporting deadline by one quarter. We also made a minor technical modification to § 428.203(c)(3) to more precisely describe an applicable quarter as a ''quarter of a calendar year'' rather than a ''calendar quarter.'' We are finalizing § 428.203(c)(4) as proposed and adding new § 428.203(c)(5) to clarify the certification requirement; § 428.203(c)(4) and (5) are described in further detail in section F.3.c.2.c. of this final rule. We are also finalizing, with a conforming modification to reflect new § 428.203(c)(5), our proposal at § 424.516(f)(4) that such reporting would fulfill a 340B provider's obligation to provide access to documentation relating to covered Part D drugs written or ordered by such 340B provider to maintain enrollment in Medicare.

(c) Submitting Part D 340B Claims Data to the 340B Repository (§ 428.203(c))

We stated in the CY 2027 PFS proposed rule that we expect that the 340B repository will be operational by Fall 2026 for voluntary submissions from covered entities, as we adopted in the CY 2026 PFS final rule (90 FR 49748). Since publication of the CY 2027 PFS proposed rule, the 340B repository launched on October 1, 2026, and 340B providers may now create an account and begin submitting Part D 340B data.[240] As we stated in the proposed rule, we proposed to require all 340B providers to submit certain data elements associated with Part D 340B claims beginning in 2027. We strongly encouraged 340B providers to begin submitting data to the 340B repository voluntarily in 2026 to test operational processes, as we proposed here to adopt the requirement that 340B providers submit data elements from their Part D 340B claims starting in 2027. The rest of this section proposed the form and manner by which, starting in 2027, under the proposed § 428.203(c), 340B providers would submit data to the 340B repository.

As stated in section III.F.3.c.b. of this final rule, under the 340B mandatory reporting proposal, the data elements and information set forth in paragraphs (c)(1) and (2) of § 428.203 would be submitted on a quarterly basis. We proposed here that we would rely upon the completeness and accuracy of the data submitted by 340B providers to the 340B repository, consistent with the 340B provider requirement to certify the accuracy of such submissions described later in this section, to consider all data elements received by the 340B repository to be associated with Part D 340B claims. That is, CMS would rely on the accuracy and completeness of the submitted, certified data to the 340B repository to verify the 340B status of a claim.

We solicited comments on this proposal. For ease of reference and organization, we summarize comments received and our responses at the end of this section III.F.3.c.2.c.

We also proposed, as part of every submission, to require 340B providers (or an individual or contractor with the delegated authority as an authorized representative of the 340B provider to perform the certification) to certify that the data elements from all claims submitted to the 340B repository are from verified 340B claims and, to the best of the 340B provider's knowledge, its submissions include all Part D 340B claims for the 340B provider at the time of submission for the relevant period. 340B providers or their authorized representative would be required to certify the completeness and accuracy of the data submitted and to certify that the submitter is authorized to submit on behalf of the 340B provider.

We solicited comments on this proposal. For ease of reference and organization, we summarize comments received and our responses at the end of this section III.F.3.c.2.c of this final rule.

In the CY 2026 PFS final rule (90 FR 49750), describing the proposal for voluntary data submission, we noted that we understand covered entities typically contract with vendors, such as 340B TPAs, to determine 340B-eligibility of claims using data submitted by covered entities and their contract pharmacies. We continue to acknowledge these contracts and, therefore, we proposed that 340B providers could arrange for TPAs or other vendors to submit the required data elements to the 340B repository on their behalf. 340B providers would ultimately be responsible for the accuracy of the data submitted to the 340B repository, even if a 340B provider has an arrangement with a vendor to submit on its behalf.

We solicited comments on this proposal. For ease of reference and organization, we summarize comments received and our responses at the end of this section III.F.3.c.2.c of this final rule.

In section III.F.3.c.b. of the proposed rule, we proposed to require that 340B providers report data on a quarterly basis. We separately proposed that 340B providers would have additional time to submit data to reflect a revision to the 340B determination of claims with dates of service throughout an applicable period. A revision could come in one of two forms: (1) resubmission of data for a claim that the 340B provider previously submitted to the 340B repository in error or with errors in the requested data fields, or (2) new submission of data for a claim for a drug that the 340B provider had previously determined was not purchased under the 340B Program but later identified was purchased under such program. In instances where the 340B provider submits Part D 340B claims data to the repository that is either (1) incomplete or (2) contains invalid data, we may inform the 340B provider of such error and request that the 340B provider resolve and resubmit the Part D 340B claims data to process the submission successfully. As noted in the CY 2026 PFS final rule (90 FR 49754), we will provide details on the process and timing for covered entities to submit revised data to the 340B repository after the end of the reporting period in the future, and we anticipate that this same timing would apply to claims with dates of service in 2027. Specifically, at § 428.203(c)(4), we proposed that data elements and information submitted in accordance with paragraph (c)(3) of such section that is either incomplete or contains invalid data must be resubmitted at a later time in a form and manner specified by CMS.

We solicited comments on this proposal.

We received public comments on these proposals. The following is a summary of the comments we received and our responses.

Comment: Some commenters supported CMS operating the 340B repository directly rather than through a third-party vendor, stating that, from a compliance and data-privacy standpoint, a neutral, government-operated platform is preferable to a vendor with commercial interests. These commenters recommended that CMS develop and operate the 340B repository itself, or, if it engages a contractor, ensure the contractor has no ownership, governance, or financial

[240] See here to create an account with the 340B repository: *https://medicare340breporting.cms.gov/sec340b/login.* See here to access instructions and technical specifications on the 340B repository: *https://www.cms.gov/initiatives/medicare-prescription-drug-affordability/overview/medicare-inflation-rebate-program.*

relationship that could allow, or appear to allow, manufacturers, pharmacy benefit managers (PBMs), Part D plan sponsors, or other interested parties to influence the 340B repository's operation or access its data, since covered entities should not have to submit sensitive claims-level information through systems controlled by parties with a financial interest in the 340B Program.

Some commenters urged CMS to collect only data necessary for Part D inflation rebate calculations and clarify the scope of permissible data use, access, and retention. These commenters recommended that CMS establish transparent policies governing which government agencies and contractors may access submitted data, how long it will be retained, and how it will eventually be destroyed; and limit use of the data to administration of the Medicare Part D Drug Inflation Rebate Program. A commenter recommended that CMS clarify data security and proprietary-information protections for claim-level 340B data, particularly where contract pharmacy relationships are involved.

Some commenters urged CMS to confirm that 340B repository data will not be shared with manufacturers on a claims-level basis and to retain this safeguard if CMS moves forward with the 340B repository. These commenters anticipated that manufacturers would request additional data elements or broader data sharing and urged CMS to reject such requests, stating that CMS has already determined the proposed data elements are sufficient to identify and exclude 340B units without manufacturer data sharing. Where manufacturer access to information is necessary for rebate calculation or verification, these commenters recommended that CMS provide only aggregate or otherwise limited data rather than access to individual claims, and, if CMS shares any data with manufacturers or other interested parties, explicitly conduct notice-and-comment rulemaking before doing so and prohibit its use for purposes unrelated to duplicate-discount prevention and prohibit further redisclosure. A commenter added that claims data submitted to the 340B repository is sensitive and proprietary, and recommended that CMS ensure manufacturers lack access to it and that strong data security standards be clearly set forth in user agreements. A couple of commenters recommended that CMS codify data protections from third parties into regulatory text.

In contrast, many commenters urged CMS to share 340B repository data with manufacturers to support validation of Part D (and, in one case, Part B) inflation rebate calculations, stating that manufacturers currently have no reliable way to confirm whether a claim was 340B-eligible, which limits their ability to verify rebate invoices, creates duplicate-discount risk, and prevents them from catching reporting anomalies, inconsistencies, and missing claims. A few commenters disputed CMS' confidentiality rationale for withholding this data, stating that the data elements do not constitute PHI, manufacturers already receive comparable claim-level data under the Medicare Drug Price Negotiation Program and the 340B Rebate Pilot without it constituting PHI, and drew analogies to the Medicaid Drug Rebate Program and Medicare Drug Price Negotiation Program, where manufacturers receive utilization or claims data—and, in the Medicaid program, a statutory audit right—to validate payment obligations; a commenter urged CMS to extend this approach to Part B inflation rebates as well. A commenter recommended that CMS share 340B repository data with researchers, and a commenter recommended that CMS provide Part D plan sponsors with timely, preferably near real-time, access to 340B repository data related to their beneficiaries and pharmacy claims.

Response: As we stated in the CY 2027 PFS proposed rule (91 FR 44014), we understand the importance of maintaining the confidentiality of data submitted to the 340B repository. Therefore, this data—irrespective of whether it is submitted to CMS directly from the 340B provider or from a vendor submitting on their behalf—will be for official use only and will not be disseminated, distributed, or copied to unauthorized persons, including manufacturers and Part D plan sponsors. We reaffirm our commitment to protecting sensitive and confidential data submitted by 340B providers and continue to acknowledge the importance of data security. The 340B repository will be designed to comply with all applicable Federal security laws, regulations, and HHS policies, including but not limited to those related to data protection and information security. Any third party that CMS engages to support the 340B repository will be required to follow protocols to address conflicts of interest. For example, CMS will implement safeguards such as firewalls or contractual limitations on usage of information to ensure that any third party supporting the 340B repository does not misuse information to which it obtains access in its role supporting the 340B repository. We decline to provide claim-level data, such as 340B repository data, to manufacturers regarding the 340B Program or other statutory exclusions of units from inflation rebate calculations as we do not believe this is necessary to operate the program at this time. First, we disagree with the premise that 340B repository data, if shared by CMS with manufacturers, could or should be used to verify manufacturers' rebate reports because 340B repository data is not relevant to Part D inflation rebate reports at this time since the current purpose of the 340B repository is to evaluate the completeness and accuracy of the data. In addition, section 1860D–14B(f) of the Act, codified at § 428.403(a)(1), precludes administrative or judicial review of the determination of units as set forth at § 428.203, the determination of whether a drug is a Part D rebatable drug as set forth at § 428.101, and the calculation of the rebate amount as set forth at § 428.201(a), inclusive of any reconciled rebate amount. As explained in the CY 2025 final rule (89 FR 98307), the Suggestion of Error process is limited to mathematical steps involved in determining the rebate amount, and the elements precluded from administrative or judicial review will not be considered in-scope for the Suggestion of Error process. Although we affirm that we will not share 340B repository data, we decline the suggestion to incorporate this detail into regulatory text as we do not believe such a step is necessary.

Comment: A commenter stated that CMS has not adequately addressed the Privacy Act implications of the 340B repository and should consider issuing a public notice to members of the public describing its information collection before creating a system of records containing patient data. This commenter also stated that, in their view, the 340B repository constitutes a system of records, and CMS must therefore satisfy the Privacy Act's substantive limitations and notice requirements regarding information collection. The commenter stated that CMS has not demonstrated that the 340B repository satisfies this standard since CMS has stated that the purpose of the 340B repository is to test the data rather than use it in Part D inflation rebate calculations. Additionally, some commenters stated that several of the required data elements constitute PHI under HIPAA's Privacy Rule but did not specify which data elements. A commenter recommended that CMS clearly identify the legal authority supporting the

disclosure of PHI from covered entities to the 340B repository, explain how the proposal interacts with the HIPAA Privacy Rule, and provide 340B providers with operational guidance sufficient to ensure compliant disclosures. A commenter stated that its members have expressed general privacy concerns about submitting data to the 340B repository.

Response: We appreciate this comment and acknowledge some of the required data elements may constitute PHI. In cases where a 340B provider is also a HIPAA covered entity and submits information that constitutes PHI, or is the business associate of a HIPAA covered entity [241] and submits information that constitutes PHI on the covered entity's behalf, disclosure of this PHI to the 340B repository must be for a purpose permitted by an applicable disclosure permission under the HIPAA Privacy Rule (45 CFR part 160 and subparts A and E of part 164). For example, the HIPAA Privacy Rule allows HIPAA covered entities to disclose PHI without an individual's authorization when that disclosure is required by law and the disclosure complies with the requirements of that law (45 CFR 164.512(a)). CMS' use and disclosure of Part D data is governed by the Privacy Act of 1974, requiring that we establish and maintain a System of Records Notice (SORN). Per the Privacy Act of 1974, CMS intends to issue a SORN in the **Federal Register** for the 340B repository. (Currently, CMS does not have a standalone SORN issued specifically for the 340B repository.)

Comment: A few commenters stated that new reporting requirements create a risk of good-faith technical errors arising from TPAs, contract pharmacies, or discrepancies between data sources. These commenters recommended that CMS define all required reporting elements, file specifications, and validation standards sufficiently in advance of the effective date. Many commenters recommended that CMS establish a defined timeline for correcting or revising 340B claims status after the reporting deadline. A few of these commenters recommended a hard cap of 45 to 90 days, stating that additional time would create administrative complexity and inaccurate inflation rebate calculations. By contrast, a few other commenters recommended adequate lead time, practical reconciliation tools, hardship exemptions, and a dispute process instead of fixed time frame for submission of corrections. A commenter noted that a change in 340B status of a Part D claim may occur months or even years after the initial dispense date with a consequence being that a 340B claim's status is never final. Several commenters recommended a reconciliation mechanism to adjust manufacturers' rebate liability whenever a claim's 340B status is revised after an invoice has been issued, stating that manufacturers should not pay inflation rebates on units later determined to be 340B units.

A few commenters recommended that CMS establish validation and audit processes rather than rely solely on self-reported data and that CMS require complete reporting of all Part D 340B claims, including contract pharmacy claims. These commenters stated that the 340B repository will only succeed if all eligible covered entities submit data, including data originating from contract pharmacies, since any covered entity that fails to report would result in an undercount of 340B units and inflated Part D inflation rebate invoices. Some commenters also recommended that CMS be transparent about its process for evaluating the 340B repository, including sharing its assessment results publicly in future rulemaking and consulting interested parties with experience in 340B claims validation, such as manufacturers. A commenter stated that adding another repository risks creating mismatched claim records and additional burden. By contrast, a few other commenters supported the 340B repository's design, which enables covered entities to leverage existing data and TPAs.

Response: As we stated in the proposed rule, our 340B repository instructions already define the required data elements, specifications, and submission process in sufficient detail for 340B providers to prepare for the 2027 start date. Additionally, CMS has published technical specifications for the 340B repository on the CMS website.[242] As proposed, 340B providers would submit Part D 340B claims data quarterly, within one calendar quarter following the close of the applicable quarter (for example, data for the fourth quarter is due by March 31 of the following year). As discussed earlier in this final rule and detailed in Table B–F1, we are finalizing a delayed deadline of September 30, 2027 as the first deadline for mandatory submissions, which applies to data for claims with dates of service from January 1, 2027 through June 30, 2027.

As outlined in this final rule, a 340B provider may submit a revision to the repository in one of two forms: (1) resubmission of data for a claim(s) that the 340B provider previously submitted to the 340B repository in error or with errors in the requested data fields, or (2) new submission of data for a claim for a drug that the 340B provider had previously determined was not purchased under the 340B Program but later identified was purchased under such program. In instances where the 340B provider submits Part D 340B claims data to the repository that is either (1) incomplete or (2) contains invalid data (for example, if the NDC–11 field contains fewer than 11 characters), we will inform the 340B provider of such error and request that the 340B provider resolve and resubmit the Part D 340B claims data to process the submission successfully as soon as practically possible. CMS has provided instructions for how a 340B provider can resubmit a previously submitted claim in the Medicare Part D 340B Repository Companion Guide available to 340B providers on the CMS website. CMS will provide further instruction on the reporting deadline to submit corrections on 340B claims with dates of service in 2027 through future technical instruction. As we have outlined in the CY 2027 PFS proposed rule, data submitted to the 340B repository will not be used to calculate inflation rebates unless and until we propose and finalize a policy to use such data to exclude 340B units from inflation rebate calculations in the future. However, it is necessary that we establish a deadline to receive any and all corrections for submissions of 340B claims with dates of service in 2027, to allow CMS to assess the usability of 340B claims data submitted to the 340B repository. This correction process is separate from the quarterly deadlines for submitting 340B claims data, which are fixed.

[241] HIPAA covered entities are defined as a health plan, a health care clearinghouse, or a health care provider who transmits any health information in electronic form in connection with a transaction covered by the HIPAA administrative simplification regulations (45 CFR parts 160—164). *See* 45 CFR 160.103 (definition of ''Covered entity''). Business associates of HIPAA covered entities include persons that perform certain functions or activities regulated by the HIPAA administrative simplification regulations on behalf of a covered entity that involve creating, receiving, maintaining, or transmitting PHI; or that provide certain services to or for a covered entity involving the disclosure of PHI to that person. A business associate also is any subcontractor that creates, receives, maintains, or transmits PHI on behalf of another business associate. *See* 45 CFR 160.103 (definition of ''Business associate'').

[242] See: *https://www.cms.gov/initiatives/medicare-prescription-drug-affordability/overview/medicare-inflation-rebate-program.*

We will consider all data elements received by the 340B repository to be associated with Part D 340B claims. 340B providers must report all Part D 340B claims, including contract pharmacy claims. The 340B repository does not independently verify the 340B status of a claim but rather serves to store these data. As described in the CY 2027 PFS proposed rule, we intend to analyze the data submitted to the 340B repository to determine if it could be used reliably in the future to remove 340B units from Part D inflation rebate calculations in accordance with section 1860D–14B(b)(1)(B) of the Act. We will evaluate 340B repository data for: (1) data integrity, and (2) submission frequency and completeness across covered entity types and geographies, including through comparison to claims identified under the claims-based methodology adopted in the CY 2026 PFS final rule. In instances where a 340B provider submits data that is incomplete or contains invalid data, we will inform the 340B provider of the error and require resubmission in a form and manner specified by CMS. We intend to leverage existing processes and systems, including submission infrastructure designed to minimize reporting burden, whenever possible. We designed the 340B repository to let covered entities leverage existing data and TPAs, which we expect will minimize discrepancies with other reporting platforms.

Comment: A few commenters supported requiring 340B providers to certify that repository submissions are complete, accurate, and include all Part D 340B claims for the relevant period. Another commenter also supported this certification requirement and recommended that CMS strengthen the policy by clarifying that 340B providers may face False Claims Act risk for improper certifications. A few commenters recommended that CMS qualify this certification standard to reflect reasonable diligence and good-faith reliance on available claims and internal 340B records, rather than an absolute guarantee, stating that 340B status is often refined through retrospective reconciliation and that a stricter standard could create compliance risk even for entities acting in good faith. One of these commenters noted that CMS should establish clear correction procedures and provide notice and opportunity to cure before imposing penalties. Another commenter recommended that CMS allow certification by any authorized representative with delegated oversight of the underlying data rather than limiting the role to a 340B provider's chief executive officer or chief financial officer.

Response: We appreciate commenters' feedback. We would rely upon the completeness and accuracy of the data submitted by 340B providers to the 340B repository, consistent with the 340B provider requirement to certify the accuracy of such submissions and would consider all data elements received by the 340B repository to be associated with Part D 340B claims. That is, CMS would rely on the accuracy and completeness of the submitted, certified data in the 340B repository to verify the 340B status of a claim. We note that 340B providers are required to certify that the data elements from all claims submitted to the 340B repository are from verified 340B claims and, to the best of the 340B provider's knowledge, its submission includes all Part D 340B claims for the 340B provider at the time of submission for the relevant period reflecting a reasonable level of diligence on behalf of the 340B provider. 340B providers may rely in good faith on available claims, TPA, contract pharmacy, and other internal 340B records. Claims data may require correction as additional information becomes available and a revision may take one of two forms: (1) resubmission of data for a claim previously submitted to the 340B repository in error or with errors in the requested data fields, or (2) new submission of data for a claim for a drug the covered entity had previously determined was not purchased under the 340B Program but later identified was purchased under such program. 340B providers may designate TPAs to submit data on their behalf, but the 340B provider remains responsible for the accuracy of that submission. In instances where a 340B provider submits Part D 340B claims data that is either incomplete or contains invalid data, we may inform the 340B provider of such error and request resolution and resubmission in order to process the submission successfully.

Based on the provision we are finalizing at § 428.203(c) to require 340B providers to submit Part D 340B data to the 340B repository beginning in 2027, with the data elements and information set forth in paragraphs (c)(1) and (2) of that section submitted on a quarterly basis as required under paragraph (c)(3), nothing in this provision limits or otherwise affects the applicability of the False Claims Act, 31 U.S.C. 3729–3733. Depending on the facts and circumstances, the knowing submission of false or fraudulent information in connection with this reporting requirement may give rise to liability under the False Claims Act where the statutory requirements for such liability are satisfied.

Certification is not limited to a 340B provider's chief executive officer or chief financial officer and can be executed by an individual or contractor with the delegated authority as an authorized representative of the 340B provider to perform the certification on behalf of the 340B provider. 340B providers may use TPAs to submit data on their behalf, but they remain responsible for its accuracy. Additionally, any individual or contractor with delegated authority as an authorized representative of the 340B provider may provide this certification. In response to the requests that CMS strengthen the certification requirement, as well as the requests for clarity regarding who is able to complete the certification, we are finalizing new § 428.203(c)(5) to specify that the data elements and information submitted in accordance with § 428.203(c)(3) must be certified by one of the following: (1) the CEO of the provider or supplier that is a covered entity; (2) the CFO of the provider or supplier that is a covered entity; (3) an individual other than a CEO or CFO, who has authority equivalent to a CEO or a CFO; or (4) an individual or contractor with the delegated authority as an authorized representative of the provider or supplier that is a covered entity to perform the certification on behalf of one of the individuals mentioned in § 428.203(c)(5)(i) through § 428.203(c)(5)(iii) and is authorized to submit the data elements in this submission on behalf of such provider or supplier. Nothing in new § 428.203(c)(5) modifies the substance of the certification requirement described in the CY 2027 PFS proposed rule but rather serves to improve clarity of this final rule.

Comment: A commenter emphasized challenges in identifying Medicare Part D claims. The commenter explained that 340B providers do not receive complete information from PBMs, including the BIN and PCN, from all TPAs, and therefore would need additional information from some TPAs to reliably identify Medicare claims. Additionally, the commenter stated that Medicare Part D and commercial payer BINs/PCNs can sometimes be identical, making it impossible for 340B providers to distinguish between Medicare and commercial claims based solely on this information. A commenter stated that PBMs frequently alter BINs/PCNs post-adjudication. Similarly, a commenter appreciated that BINs/PCNs are not

required data elements for the 340B repository because 340B providers would be greatly challenged in providing that information.

Response: We believe there are public resources, in addition to the BIN/PCN file available on the CMS website,[243] available to 340B providers to help identify Part D claims. For example, Part D plan sponsors typically publish payer sheets with claims processing instructions which include the BINs/PCNs for the sponsor's Part D plans. We also understand that covered entities already commonly submit BINs/PCNs as a part of other 340B reporting requirements, so we believe BIN/PCN identification for Part D plans is feasible. We also note that any data submitted to the 340B repository that is associated with payors other than Part D plans will not be used by CMS (although any additional data submitted will be subject to relevant CMS data retention policies and legal requirements), and 340B providers will not be penalized for submitting such additional data. We will match the stored data elements in the 340B repository to PDE records for each Part D rebatable drug dispensed during the applicable period, which will allow CMS to test whether data submitted to the 340B repository can be used to accurately identify and exclude Part D 340B units from inflation rebate calculations.

Comment: A few commenters requested that CMS publish finalized technical specifications and facilitate testing environments before launching the 340B repository. A few commenters provided specific operational recommendations and requests for information, such as a recommendation that the 340B repository include a contingency process for system outages and recommendations for rejected submissions.

Response: As previously mentioned, the 340B repository is live as of October 1, 2026, and we have provided technical specifications that are available on the CMS website. The specific technical details are outside the scope of this final rule. We direct readers to technical information about the 340B repository available on the CMS Inflation Rebate website, including information on how to contact the 340B Repository Help Desk for technical assistance.[244]

Comment: A commenter recommended that CMS use 340B repository data to evaluate whether the program is improving patient affordability, access, or services, while avoiding operational changes that disrupt pharmacy access or dispensing.

Response: The purpose of the 340B repository at this time is for the Medicare Part D Drug Inflation Rebate Program. CMS will use the data to assess the usability of the data received and feasibility of CMS removing 340B units from the total number of units used to calculate the total Part D rebate amount in the future based on the data submitted.

Comment: A commenter recommended that CMS articulate a clear preemption principle that prevents State laws from prohibiting, penalizing, or materially interfering with mandatory reporting to the 340B repository.

Response: We are not aware of any State laws that purport to prohibit, penalize, or interfere with the 340B repository.

After consideration of the comments received, we are finalizing at § 428.203(c)(4) the requirement that data elements and information that are incomplete or contain invalid data must be resubmitted at a later time, in a form and manner specified by CMS. We are also finalizing our proposal to require 340B providers (or an individual or contractor with the delegated authority as an authorized representative of the 340B provider to perform the certification) to certify that the data elements from all claims submitted to the 340B repository are from verified 340B claims and, to the best of the 340B provider's knowledge, its submissions include all Part D 340B claims for the 340B provider at the time of submission for the relevant period. As described earlier in this section, we are finalizing new § 428.203(c)(5) detailing this certification requirement. We are adopting our proposal that we would rely upon the completeness and accuracy of the data submitted by 340B providers to the 340B repository, consistent with the 340B provider requirement to certify the accuracy of such submissions. We are also adopting our proposal that 340B providers could arrange for TPAs or other vendors to submit the required data elements to the 340B repository on their behalf. 340B providers would ultimately be responsible for the accuracy of the data submitted to the 340B repository.

d. Clarification of Date of Receipt for Rebate Reports

As stated in the CY 2025 PFS final rule (89 FR 98305) which was effective on January 1, 2025 and appeared in the December 8, 2024 **Federal Register**, § 428.400 defines the date of receipt as the calendar day following the day in which a report of a rebate amount (as set forth in § 428.401(b), (c), and (d) and § 428.402(b) and (c)) is made available to the manufacturer of a Part D rebatable drug by CMS. The date of receipt starts the clock for calculation of deadlines at multiple points in the rebate reporting process, including for manufacturer submission of a suggestion of error and for payment of rebate amounts owed. For example, as set forth in § 428.405(a)(1), a rebate amount owed is due no later than ''the 30th calendar day after the date of receipt of information regarding the rebate amount.''

For clarity and transparency, in the CY 2027 PFS proposed rule (91 FR 44014 through 44015), we made technical corrections to the examples provided in CY 2025 PFS final rule of the calculation of due dates based on the ''date of receipt''. In the CY 2025 PFS final rule (89 FR 98306), we provided examples of the ''date of receipt'', including: (1) ''if the Preliminary Rebate Report is provided on May 31, 2026, then June 1, 2026, will be the date of receipt and, therefore, day one of the 10-calendar-day period to submit a Suggestion of Error; the Suggestion of Error would be due by 11:59 p.m. PT on June 10, 2026[ ]''; and (2) ''if the Rebate Report is provided on June 30, 2026, then July 1, 2026, would be the date of receipt and therefore day one of the 30-calendar-day payment period; payment would be due no later than 11:59 p.m. PT on July 30, 2026.'' In the CY 2027 PFS proposed rule (91 FR 44014 through 44015), we corrected these examples to be consistent with the definition of ''date of receipt'' in § 428.400. Specifically, in each example provided, the ''date of receipt'' should be day 0 of the relevant calendar period, not day one. Therefore, if the Preliminary Rebate Report is provided on May 31, 2026, then June 1, 2026, will be the ''date of receipt'' and day zero of the 10-calendar-day period to submit a Suggestion of Error, such that Suggestions of Error would be due by 11:59 p.m. PT on June 11, 2026. Likewise, if a Rebate Report is provided on June 30, 2026, then July 1, 2026, will be the date of receipt and day zero of the 30-calendar-day payment period, such that payment would be due no later than 11:59 p.m. PT on July 31, 2026.

We did not receive public comments on this clarification.

e. Enforcement of Manufacturer Payment of Rebate Amounts (§ 428.500)

In accordance with section 1860D–14B(a)(2) of the Act, the manufacturer of a Part D rebatable drug is required to

[243] See: *https://www.cms.gov/medicare/coverage/prescription-drug-coverage/part-d-information-pharmaceutical-manufacturers.*

[244] *See: https://www.cms.gov/initiatives/medicare-prescription-drug-affordability/overview/medicare-inflation-rebate-program.*

provide a rebate equal to the rebate amount specified in section 1860D–14B(b) for the rebatable drug for the applicable period within 30 calendar days after receipt of the rebate amount from CMS. Section 1860D–14B(e) of the Act gives us the authority to impose a CMP equal to 125 percent of the rebate amount specified at section 1860D–14B(b) for each drug for each applicable period on a manufacturer that fails to pay the specified rebate amount. Subpart F implements this section of the Act and establishes the procedures for determining and collecting a CMP.

In the CY 2027 PFS proposed rule (91 FR 44015), we clarified that the imposition of CMPs under section 1860D–14B(e) of the Act, in accordance with § 428.500, is not the exclusive remedy for a manufacturer's failure to comply with its rebate payment obligations described in § 428.405(a), nor the exclusive remedy for other conduct that may impact obligations, such as rebate amounts owed, under the Medicare Part D Drug Inflation Rebate Program. For example, whether imposing CMPs under section 1860D–14B(e) of the Act or not, when we deem it appropriate, we may refer manufacturers to the Department of Justice, the Department of the Treasury, and/or the Department of Health and Human Services Office of Inspector General for further review and investigation.

We did not receive public comments on this clarification.

G. Medicare Shared Savings Program

1. Executive Summary and Background

a. Purpose

As of January 1, 2026, the Medicare Shared Savings Program (Shared Savings Program) has 511 accountable care organizations (ACOs) with over 700,000 healthcare providers and organizations providing care to over 12.6 million assigned beneficiaries.[245] Eligible groups of providers and suppliers, such as physicians, hospitals, and other healthcare providers, may participate in the Shared Savings Program by forming or joining an ACO and in so doing agree to become accountable for the total cost and quality of care provided to an assigned population of Medicare FFS beneficiaries[246] (herein also referred to as ''Original Medicare beneficiaries'').

Under the Shared Savings Program, providers and suppliers that participate in an ACO continue to receive Original Medicare (OM) payments under Parts A and B,[247] and the ACO may be eligible to receive a shared savings payment if it meets specified quality and savings requirements, and in some instances may be required to share in losses if it increases healthcare spending.

As part of our effort to align spending and value in OM, we are focused on developing policies that would grow the number of healthcare providers and beneficiaries in accountable care relationships and grow savings to the Medicare Trust Funds. To achieve these goals, we proposed changes to the Shared Savings Program and sought comments on potential future policy developments in several requests for information, informed by the following strategic objectives:

- Strengthen financial incentives to participate and drive savings while minimizing ''gaming'' [248] opportunities in the Shared Savings Program.
- Grow participation in the Shared Savings Program through more meaningful participation and through beneficiary engagement, including beneficiary incentives.
- Simplify Shared Savings Program requirements and reduce participant burden in the Shared Savings Program, including through advancing ACO use of digital quality measures.

More specifically, our changes to the Shared Savings Program's financial methodology will strengthen financial incentives for ACOs to participate in the program while mitigating selection issues and benchmark rebasing concerns. Our changes to the Shared Savings Program's beneficiary assignment methodology are expected to expand the population of Medicare FFS beneficiaries for which ACOs are accountable for quality and cost of care, while minimizing potential gaming opportunities in connection with the assignment methodology. The changes to the Shared Savings Program quality performance standard and other quality reporting requirements will support ACO advancement toward digital quality measurement and reduce participant burden. Our proposal to allow flexibility for Shared Savings Program ACOs to reduce or eliminate Part B cost sharing for eligible beneficiaries, and therefore expand availability of this flexibility beyond ACOs participating in the prepaid shared savings payment option (which we proposed to discontinue), is intended to increase beneficiary engagement. Our changes to simplify the Shared Savings Program Certified Electronic Health Record Technology (CEHRT) use requirements and beneficiary information notice requirements will reduce burden for ACOs. Other modifications to the Shared Savings Program regulations addressed in the CY 2027 PFS proposed rule included: proposed changes to the definition of primary care services for the purpose of determining beneficiary assignment, and proposed modifications to definitions of experienced and inexperienced with performance-based risk Medicare ACO initiatives used in determining an ACO's eligibility for participation options, and proposed changes to the methodology for determining quarterly payment amounts received by eligible ACOs participating under the Advance Investment Payment (AIP) option. Further, through the CY 2027 PFS proposed rule, we sought comment on specialty care in the Shared Savings Program. We provided a more detailed summary of the proposed changes to the Shared Savings Program and the topics on which we sought comment in a Request for Information (RFI) in section III.G.1.c. of the proposed rule.

We received public comments on these proposals. Our summary of the comments we received and our responses can be found in each section of III.G.

b. Statutory and Regulatory Background on the Shared Savings Program

On March 23, 2010, the Patient Protection and Affordable Care Act (Pub. L. 111–148) was enacted, followed by enactment of the Health Care and Education Reconciliation Act of 2010 (Pub. L. 111–152) on March 30, 2010, which amended certain provisions of the Patient Protection and Affordable Care Act (hereinafter collectively referred to as ''the Affordable Care Act''). Section 3022 of the Affordable Care Act amended title XVIII of the Act (42 U.S.C. 1395 et seq.) by adding section 1899 of the Act to establish the Medicare Shared Savings Program to facilitate coordination and cooperation among healthcare providers to improve

[245] See ''Shared Savings Program Fast Facts—As of January 1, 2026'', available at *https://www.cms.gov/files/document/2026-shared-savings-program-fast-facts.pdf*.

[246] ''Medicare fee-for-service beneficiary'' is defined under section 1899(h)(3) of the Act, and a related definition was codified at 42 CFR 425.20.

[247] Over time, in Shared Savings Program rulemaking, we have used various phrases to refer to payments under the original Medicare fee-for-service program. Herein, we sometimes refer to Medicare fee-for-service (FFS) payments under Parts A and B as ''Original Medicare payments.'' More generally, we use the terms ''Traditional Medicare'' and ''Original Medicare'' interchangeably and consider the terms to be synonymous.

[248] For instance, in section III.G.2.a of this final rule, we describe the potential for Shared Savings Program assignment policies to be exploited in a manner that results in differences in outcomes that could advantage the ACO's financial performance.

the quality of care for Medicare FFS beneficiaries and reduce the rate of growth in expenditures under Medicare Parts A and B. (See 42 U.S.C. 1395jjj).

Section 1899 of the Act has been amended through subsequent legislation. The requirements for assignment of Medicare FFS beneficiaries to ACOs participating under the program were amended by the 21st Century Cures Act (Pub. L. 114–255). The Bipartisan Budget Act of 2018 (Pub. L. 115–123), further amended section 1899 of the Act to provide for the following: expanded use of telehealth services by physicians or practitioners participating in an applicable ACO to furnish services to prospectively assigned beneficiaries; greater flexibility in the assignment of Medicare FFS beneficiaries to ACOs by allowing ACOs in tracks under retrospective beneficiary assignment a choice of prospective assignment for the agreement period; permitting Medicare FFS beneficiaries to voluntarily identify an ACO professional as their primary care provider and requiring that such beneficiaries be notified of the ability to make and change such identification, and mandating that any such voluntary identification will supersede claims-based assignment; and allowing ACOs under certain two-sided models to establish CMS-approved beneficiary incentive programs.

The Shared Savings Program regulations are codified at 42 CFR part 425. The final rule establishing the Shared Savings Program appeared in the November 2, 2011, **Federal Register** (Medicare Program; Medicare Shared Savings Program: Accountable Care Organizations; final rule (76 FR 67802) (hereinafter referred to as the ''November 2011 final rule'')). A subsequent update to the program rules appeared in the June 9, 2015, **Federal Register** (Medicare Program; Medicare Shared Savings Program: Accountable Care Organizations final rule (80 FR 32692) (hereinafter referred to as the ''June 2015 final rule'')). The final rule entitled ''Medicare Program; Medicare Shared Savings Program; Accountable Care Organizations—Revised Benchmark Rebasing Methodology, Facilitating Transition to Performance-Based Risk, and Administrative Finality of Financial Calculations,'' which addressed changes related to the program's financial benchmark methodology, appeared in the June 10, 2016, **Federal Register** (81 FR 37950) (hereinafter referred to as the ''June 2016 final rule''). A final rule, ''Medicare Program: Medicare Shared Savings Program; Accountable Care Organizations—Pathways to Success and Extreme and Uncontrollable Circumstances Policies for Performance Year 2017,'' appeared in the December 31, 2018, **Federal Register** ((83 FR 67816) (hereinafter referred to as the ''December 2018 final rule'')).

In the interim final rule with comment period (IFC) entitled ''Medicare and Medicaid Programs; Policy and Regulatory Revisions in Response to the COVID–19 Public Health Emergency,'' which was effective on the March 31, 2020 date of display and appeared in the April 6, 2020, **Federal Register** (85 FR 19230) (hereinafter referred to as the ''March 31, 2020 COVID–19 IFC''), and the IFC entitled ''Medicare and Medicaid Programs; Basic Health Program, and Exchanges; Additional Policy and Regulatory Revisions in Response to the COVID–19 Public Health Emergency and Delay of Certain Reporting Requirements for the Skilled Nursing Facility Quality Reporting Program,'' which was effective on May 8, 2020, and appeared in the May 8, 2020, **Federal Register** (85 FR 27550) (hereinafter referred to as the ''May 8, 2020 COVID–19 IFC''), we updated quality requirements, financial calculations, eligibility requirements, and assignment methodology due to the to the public health emergency (PHE) for coronavirus disease 2019 (COVID–19).

We have also made use of the annual CY PFS rules to address quality reporting for the Shared Savings Program and certain other issues. For summaries of certain policies finalized in prior PFS rules, refer to the CY 2019 PFS final rule (also referred to as the ''November 2018 final rule'') (83 FR 59452), CY 2020 PFS final rule (84 FR 62568), the CY 2021 PFS final rule (85 FR 84717), the CY 2022 PFS final rule (86 FR 65253 and 65254), the CY 2023 PFS final rule (87 FR 69779 and 69780), the CY 2024 PFS final rule (88 FR 79094 and 79095), the CY 2025 PFS final rule (89 FR 98082 and 98083), and the CY 2026 PFS final rule (90 FR 49757 through 49759). In the CY 2026 PFS final rule (90 FR 49757 through 49836), we finalized changes to Shared Savings Program policies, including to: limit participation in a one-sided model to an ACO's first agreement period under the BASIC track's glide path (if eligible), for a maximum of 5 PYs instead of 7 PYs; modify the Shared Savings Program eligibility and financial reconciliation requirements in connection with the statutory requirement that ACOs have at least 5,000 assigned Medicare FFS beneficiaries; make changes to the Shared Savings Program quality performance standard and other quality reporting requirements; expand the application of the Shared Savings Program quality and finance extreme and uncontrollable circumstances (EUC) policies to an ACO that is affected by an EUC due to a cyberattack, including ransomware/malware, as determined by the Quality Payment Program; and to make changes to other programmatic areas, including changes to Shared Savings Program eligibility requirements and change request procedures, updates to the beneficiary assignment methodology to revise the definition of primary care services to align with payment policy changes, and to revise the Shared Savings Program's quality reporting monitoring policies.

Aside from CY PFS rulemaking, we also note that in a final rule entitled ''Medicare Program: Mitigating the Impact of Significant, Anomalous, and Highly Suspect Billing Activity on Medicare Shared Savings Program Financial Calculations in Calendar Year 2023,'' which was effective on October 15, 2024, and appeared in the September 27, 2024, **Federal Register** (89 FR 79152) (hereinafter referred to as the ''SAHS billing activity final rule''), we finalized an approach to address the SAHS billing activity CMS identified for CY 2023 to protect the accuracy, fairness, and integrity of Shared Savings Program financial calculations.

Policies applicable to Shared Savings Program ACOs for purposes of quality reporting for other programs have also continued to evolve based on changes in statute, such as the Medicare Access and CHIP Reauthorization Act of 2015 (MACRA) (Pub. L. 114–10), which established the Quality Payment Program. In the CY 2017 Quality Payment Program final rule with comment period (81 FR 77008), we established regulations for the MIPS and Advanced APMs and related policies applicable to eligible clinicians who participate in APMs, including the Shared Savings Program. We have also made updates to policies under the Quality Payment Program through the annual CY PFS rules.

c. Summary of Shared Savings Program Provisions in This Final Rule

In sections III.G.2. through III.G.9. of this final rule, we summarize and respond to public comments received on the proposed modifications to the Shared Savings Program's policies discussed in section III.G. of the CY 2027 PFS proposed rule (91 FR 44015 through 44134). Some commenters' suggestions for modifications to Shared Savings Program policies went beyond the scope of the proposals discussed in section III.G. of the CY 2027 PFS

proposed rule and will not be addressed in this section of this final rule. As a general summary, we are finalizing the following changes to Shared Savings Program policies to:

• Revise the Shared Savings Program assignment methodology (section III.G.2. of this final rule):

++ Exclude from assignment calculations allowed charges for primary care services billed through a non-ACO Taxpayer Identification Number (TIN) by an ACO professional used in assignment (section III.G.2.a.(2)(a) of this final rule).

++ Modify assignment eligibility criteria and prospective assignment exclusion criteria based on Medicare enrollment status (section III.G.2.a.(2)(b) of this final rule).

++ Revise the definition of primary care services used in Shared Savings Program beneficiary assignment (section III.G.2.b. of this final rule).

• Revise the quality performance standard and other quality reporting requirements, including the following (section III.G.3. of this final rule):

++ Extend the availability of the MIPS CQMs collection type and the MIPS CQM reporting incentive for Shared Savings Program ACOs (section III.G.3.b. of this final rule).

++ Extend the scoring of Shared Savings Program ACOs reporting Medicare CQMs using flat benchmarks (section III.G.3.c. of this final rule).

++ Address Shared Savings Program ACOs' challenges with meeting the MIPS data completeness requirement (section III.G.3.d. of this final rule):

— Revise the Shared Savings Program quality reporting requirements beginning in PY 2026 (section III.G.3.d.(2) of this final rule).

— Establish the Medicare eCQMs Collection Type for Shared Savings Program ACOs (section III.G.3.d.(3) of this final rule).

— Revise the definition of a ''Beneficiary Eligible for Medicare CQMs'' (section III.G.3.d.(4) of this final rule).

++ Revise the Shared Savings Program scoring policy for excluded APP Plus measures and APP Plus measures that lack a benchmark (section III.G.3.e. of this final rule).

++ Update the APP Plus quality measure set (section III.G.3.f. of this final rule).

• Revise Shared Savings Program Certified Electronic Health Record Technology (CEHRT) Use Requirements (section III.G.4. of this final rule).

++ Simplify Shared Savings Program CEHRT use requirements (section III.G.4.b. of this final rule).

— Allow ACOs the option to meet Shared Savings Program CEHRT use requirement by completely reporting at least one ACO-reported measure through the eCQMs or Medicare eCQMs collection types (section III.G.4.b.(1) of this final rule).

— Allow ACOs the option to meet Shared Savings Program CEHRT use requirements by completely reporting at least one measure in the APP Plus quality measure set and meeting the applicable data completeness requirement using CEHRT and attesting to using FHIR capabilities in certified health IT to support reporting of at least one of the five ACO-reported measures (section III.G.4.b.(2) of this final rule).

— Allow ACOs the option to meet Shared Savings Program CEHRT use requirements by attesting to one of three ACO CEHRT use metrics (section III.G.4.b.(3) of this final rule).

— Revise public reporting requirements (section III.G.4.b.(4) of this final rule).

— Require compliance with Shared Savings Program CEHRT use requirements (section III.G.4.b.(5) of this final rule).

• Revise policies for the Shared Savings Program's financial methodology, including the following (section III.G.5. of this final rule):

++ Change the Shared Savings Program financial methodology to encourage additional savings in two-sided risk (section III.G.5.c. of this final rule):

— Increase the sharing rate under Level E of the BASIC track (section III.G.5.c.(1) of this final rule).

— Reduce the maximum weight on the regional adjustment for ACOs under the ENHANCED track (section III.G.5.c.(2) of this final rule) for ACOs that are lower spending compared to their regional service area.

++ Increase the prior savings adjustment by increasing the scaling factor (section III.G.5.d. of this final rule).

++ Risk adjust the 5 percent cap on upward adjustments to the historical benchmark (section III.G.5.e. of this final rule).

++ Incentivize new participation through a growth adjustment to the historical benchmark (section III.G.5.f. of this final rule).

++ Reform the Accountable Care Prospective Trend (ACPT) component of the benchmark update factor (section III.G.5.g. of this final rule).

• Increase beneficiary engagement by allowing ACOs to reduce or eliminate Part B cost sharing for beneficiaries (section III.G.6.a. of this final rule), and discontinue availability of the option for prepaid shared savings (section III.G.6.b. of this final rule).

• Modify the calculation methodology for setting quarterly advance investment payment amounts and revise the terminology on allowable uses of advance investment payments (section III.G.7. of this final rule).

• Revise the approach to determining whether an ACO is experienced or inexperienced with performance-based risk Medicare ACO initiatives (section III.G.8. of this final rule).

• Modify Shared Savings Program beneficiary notification requirements (section III.G.9. of this final rule):

++ Revise distribution timing of standardized written notices (section III.G.9.b.(1) of this final rule).

++ Remove the requirement to provide a beneficiary follow-up notice (section III.G.9.b.(2) of this final rule).

Additionally, in section II.D. of the final rule we are finalizing a policy to replace office/outpatient evaluation and management (O/O E/M) visit complexity add-on code, HCPCS code G2211 with modifiers that would allow for differential payment for ACO participants.

Taken together, the Shared Savings Program policy provisions in this final rule are projected to reduce Trust Fund expenditures by $5.5 billion in total through the end of the 10-year period 2027 through 2036, ranging from approximately $8.9 billion lower spending at the 10th percentile to $2.3 billion lower spending at the 90th percentile, as described in the Regulatory Impact Analysis in section VI. of this final rule.

Certain policies, including both existing policies and finalized policies described in the CY 2027 PFS final rule, rely upon the authority granted in section 1899(i)(3) of the Act to use other payment models that the Secretary determines will improve the quality and efficiency of items and services furnished under the Medicare program, and that do not result in program expenditures greater than those that would result under the statutory payment model. The following policies require the use of our authority under section 1899(i) of the Act: modifications to the ACPT component of the three-way blended benchmark update factor (described in section III.G.5.g. of this final rule); discontinuing availability of the option for prepaid shared savings (described in section III.G.6.b. of this final rule); and changes to the calculation methodology for quarterly advance investment payments (described in section III.G.7. of this final rule). As described in the Regulatory Impact Analysis in section VI. and elsewhere in this final rule, these policy changes to the Shared Savings Program

are expected to improve the quality and efficiency of care under the Medicare program and are not expected to result in a situation in which the payment methodology under the Shared Savings Program, including all policies we have adopted under the authority of section 1899(i) of the Act, results in more spending under the program than would have resulted under the statutory payment methodology in section 1899(d) of the Act.

We will continue to reexamine this projection in the future to ensure that an alternative payment model does not result in additional program expenditures and so continues to satisfy the requirement under section 1899(i)(3)(B) of the Act. If we later determine that the payment model that includes policies established under section 1899(i)(3) of the Act no longer meets this requirement, we will undertake notice and comment rulemaking to adjust the payment model to ensure continued compliance with the statutory requirements.

d. PY 2027 Application Cycle Flexibility

Some of the financial methodology changes described in section III.G. of this final rule may be consequential for ACOs' decisions to enter an agreement period under Level E of the BASIC track or the ENHANCED track. We anticipate a significant number of renewal applications for the January 1, 2027 agreement period start date. There are currently 96 ACOs that entered an agreement period beginning on January 1, 2022, that need to apply to renew to continue their participation in the Shared Savings Program by entering an agreement period beginning on January 1, 2027. Considering the timing of CY PFS rulemaking and the Shared Savings Program application cycle for the January 1, 2027 start date (occurring in CY 2026), ACO applicants received notice of the proposed changes after the deadline for submitting their applications to continue their participation. Additionally, under a previously established timeline for application actions and deadlines, the application cycle required ACO applicants to finalize their selection of track/level of participation by early September 2026,[249] which is before this CY 2027 PFS final rule was issued. ACO applicants had to make their final selection between the BASIC track and ENHANCED track before this CY 2027 PFS final rule was issued. To mitigate the potential impact on ACO applicants in making their final selection of track/level of participation in the Shared Savings Program, we are providing ACOs applying for an agreement start date of January 1, 2027, with a time-limited opportunity to change their final selection between the BASIC track and ENHANCED track (if eligible). We also noted in the CY 2027 PFS proposed rule that an ACO applicant that has not submitted an application for a January 1, 2027 agreement start date as of the date of display of the CY 2027 PFS proposed rule that wishes to enter a new agreement in the Shared Savings Program, may apply to enter a new agreement period beginning on January 1, 2028, during the application cycle occurring in CY 2027.

2. Beneficiary Assignment Methodology

a. Modifications to the Shared Savings Program Assignment Methodology

(1) Background

Under section 1899(b)(2)(A) of the Act, an ACO must ''be willing to become accountable for the quality, cost, and overall care of the Medicare fee-for-service beneficiaries assigned to it.'' As defined in section 1899(h)(3) of the Act and in the Shared Savings Program's regulations at § 425.20, the term ''Medicare fee-for-service beneficiary'' means an individual who is enrolled in the original Medicare FFS program under Parts A and B and is not enrolled in a Medicare Advantage (MA) plan under Part C, an eligible organization under section 1876 of the Act, or a Program of All-Inclusive Care for the Elderly (PACE) program under section 1894 of the Act. Section 1899(c)(1) of the Act, as amended by the 21st Century Cures Act (Pub. L. 114–255) and the Bipartisan Budget Act of 2018 (Pub. L. 115–123), provides that the Secretary shall determine an appropriate method to assign Medicare FFS beneficiaries to an ACO based on their utilization of primary care services provided by physicians in the ACO who are ACO professionals and, in the case of PYs beginning on or after January 1, 2019, services provided by a Federally Qualified Health Center (FQHC) or Rural Health Clinic (RHC). In the context of the Shared Savings Program, ''assignment'' (as defined in § 425.20) refers to an operational process by which we determine whether a beneficiary has chosen to receive a sufficient level of certain primary care services from physicians and other healthcare practitioners associated with a specific ACO so that the ACO may be appropriately designated as exercising basic responsibility for that beneficiary's care during a given benchmark year or PY.[250] We refer to the process by which we determine assignment under section 1899(c)(1) of the Act as ''claims-based assignment''.

Further, under section 1899(c)(2)(B) of the Act, a non-claims-based process for voluntary alignment applies to all Shared Savings Program ACOs and is used to supplement claims-based assignment. In accordance with section 1899(c)(2)(B)(iii) of the Act, voluntary alignment supersedes claims-based assignment.

The regulations governing the assignment methodology under the Shared Savings Program, with provisions on claims-based assignment and voluntary alignment, are in 42 CFR part 425, subpart E. In the sections that follow we provide additional regulatory background about the Shared Savings Program's step-wise claims-based assignment methodology (section III.G.2.a.(1)(a) of this final rule) and criteria based on Medicare enrollment status that we use to determine a beneficiary's eligibility for assignment (section III.G.2.a.(1)(b) of this final rule), provide an overview of assignment-based program operations (section III.G.2.a.(1)(c) of this final rule), and describe beneficiaries excluded from the assigned population under the current assignment methodology (section III.G.2.a.(1)(d) of this final rule).

(a) Background on Step-Wise Assignment Methodology

As we have described in the CY 2024 PFS final rule (88 FR 79136), under claims-based assignment, we determine a Medicare FFS beneficiary is assigned to an ACO if the beneficiary meets the criteria in § 425.401(a) to be eligible for assignment to an ACO, and the beneficiary's utilization of primary care services [251] meets the criteria established under the assignment methodology specified in § 425.402 (specifying the basic assignment methodology) and § 425.404 (specifying special assignment conditions for ACOs including FQHCs and RHCs). Section

[249] See CMS, Medicare Shared Savings Program, ''Key Application Actions and Deadlines For Agreement Periods Beginning on January 1, 2027'', available at *https://www.cms.gov/files/document/key-application-actions-deadlines.pdf https://www.cms.gov/files/document/key-application-actions-deadlines.pdf.*

[250] As we have explained in earlier rulemaking (see 88 FR 79136; see also 76 FR 67851, and 83 FR 67863), the term ''assignment'' for purposes of the Shared Savings Program in no way implies any limits, restrictions, or diminishment of the rights of Medicare FFS beneficiaries to exercise freedom of choice in the physicians and other healthcare practitioners from whom they receive covered services.

[251] As described in section III.G.2.b. of this final rule, we define primary care services for purposes of the Shared Savings Program in § 425.20 as a set of services identified by HCPCS codes and CPT codes, as specified under § 425.400(c).

425.402 specifies a step-wise assignment methodology for determining an ACO's assigned beneficiary population based on beneficiaries' use of primary care services. Section 425.402(b) of the Shared Savings Program regulations specifies the step-wise methodology we use to assign Medicare FFS beneficiaries to an ACO based on available claims information, for PY 2016 and subsequent PYs. In accordance with § 425.404(b), for PYs starting on January 1, 2019, and subsequent PYs, under the assignment methodology in § 425.402, we treat a service reported on an FQHC or RHC claim as a primary care service performed by a primary care physician.

The Shared Savings Program step-wise assignment process is offered in two similar, but distinct, claims-based assignment methodologies: prospective assignment as specified under § 425.400(a)(3); and preliminary prospective assignment with retrospective reconciliation as specified under § 425.400(a)(2). Consistent with the requirements of section 1899(c)(2)(A) of the Act, we offer all Shared Savings Program ACOs the opportunity to select their assignment methodology annually, starting with agreement periods beginning on July 1, 2019, in accordance with §§ 425.400(a)(4)(ii) and 425.226(a)(1). We use the same step-wise assignment methodology under § 425.402 to assign beneficiaries to ACOs under prospective assignment and ACOs under preliminary prospective assignment with retrospective reconciliation.

The step-wise assignment methodology was initially established with the November 2011 final rule and was modified through subsequent rulemaking. For a discussion of the relevant background and related considerations, we refer readers to the November 2011 final rule (76 FR 67853 through 67858), June 2015 final rule (see 80 FR 32699 through 32701, and 32748 through 32755), CY 2023 PFS final rule (87 FR 69825 through 69829), and the CY 2024 PFS final rule (88 FR 79136 through 79163). We have detailed how we perform claims-based assignment in programmatic material, including publicly available specifications documents. See, for example, Medicare Shared Savings Program, ''Shared Savings and Losses, Assignment and Quality Performance Standard Methodology Specifications'' (April 2026, Version #14), available at *https://www.cms.gov/files/document/medicare-shared-savings-program-shared-savings-losses-assignment-methodology-specifications-version.pdf-0* (Section 2.3 Claims-Based Assignment).

In the discussion that follows, we first describe our use of the ACO participant list to identify primary care services billed by ACO professionals and CMS certification numbers (CCNs) used in the assignment methodology, and then we describe the steps of the claims-based assignment process.

(i) Use of ACO Participant List To Identify Primary Care Services Billed by ACO Professionals and CCNs Used in Assignment Calculations

As we described in the CY 2023 PFS final rule (87 FR 69825), under the Shared Savings Program, ACOs are accountable for the quality, cost, and overall care of the Medicare FFS beneficiaries that are assigned to the ACO (§ 425.100(a)). ACOs are formed by one or more ''ACO participants,'' which are responsible for managing and coordinating care for the assigned beneficiary population. The Shared Savings Program regulations define ''ACO participant'' at § 425.20 as an entity identified by a Medicare-enrolled billing Taxpayer Identification Number (TIN) through which one or more ''ACO providers/suppliers'' (as defined at § 425.20) bill Medicare, that alone or together with one or more other ACO participants compose an ACO, and that is included on the list of ACO participants that is required under § 425.118 (herein ''ACO participant list''). An ''ACO provider/supplier'' is an individual or entity that: (1) is a provider (as defined at § 400.202) or supplier (as defined at § 400.202); (2) is enrolled in Medicare; (3) bills for items and services furnished to Medicare FFS beneficiaries during the agreement period under a Medicare billing number assigned to the TIN of an ACO participant in accordance with applicable Medicare regulations; and (4) is included on the list of ACO providers/suppliers that is required under § 425.118 (herein ''ACO provider/supplier list'').[252] We require each ACO to execute contractual agreements with each of its ACO participants (''ACO participant agreements''), to ensure that the ACO participant and each ACO provider/supplier billing through the TIN of the ACO participant agree to the requirements of the Shared Savings Program (see 87 FR 69825, and see also § 425.116).

As we explained in the CY 2023 PFS final rule (87 FR 69825 through 69826), under § 425.118(a), an ACO must maintain, update, and submit to us an accurate and complete list identifying each ACO participant (including its Medicare-enrolled TIN) and each ACO provider/supplier (including its National Provider Identifier (NPI), CCN, or other identifier). More specifically, an ACO must submit a draft ACO participant list before the start of an agreement period and before each performance year thereafter. In accordance with § 425.118(a)(3), the ACO must certify the accuracy of its ACO participant list before the start of its agreement period and before each performance year thereafter. An ACO must maintain and periodically update its ACO participant list. For additional background on development and maintenance of the ACO participant list we refer readers to the CY 2023 PFS final rule at 87 FR 69826, and CY 2026 PFS final rule at 90 FR 49775 through 49778.

More generally, in accordance with § 425.102(a), an ACO may be formed from the following ACO participants or combinations of ACO participants: (1) ACO professionals in group practice arrangements; (2) networks of individual practices of ACO professionals; (3) partnerships or joint venture arrangements between hospitals and ACO professionals; (4) hospitals employing ACO professionals; (5) Critical Access Hospitals (CAHs) that bill under Method II (as described in § 413.70(b)(3)); (6) RHCs; (7) FQHCs; and (8) teaching hospitals that have elected under § 415.160 to receive payment on a reasonable cost basis for the direct medical and surgical services of their physicians (herein referred to as electing teaching amendment (ETA) hospitals).

Under § 425.20, ''ACO professional'' is defined to mean an individual who is Medicare-enrolled and bills for items and services furnished to Medicare FFS beneficiaries under a Medicare billing number assigned to the TIN of an ACO participant in accordance with applicable Medicare regulations and who is either of the following: (1) a physician legally authorized to practice medicine and surgery by the State in which he or she performs such function or action; or (2) a practitioner who is a physician assistant (PA), a nurse practitioner (NP), or a clinical nurse specialist (CNS).[253] As detailed in section III.G.2.a.(1)(ii) of this final rule, the step-wise assignment methodology considers primary care services furnished by the following ACO professionals: primary care physicians

[252] For additional background on development and maintenance of the ACO provider/supplier list, we refer readers to the CY 2023 PFS final rule at 87 FR 69826.

[253] Sometimes we refer to NPs, PAs, and CNSs who are ACO professionals in the ACO as ''non-physician ACO professionals''.

(as defined in § 425.20), physicians with specialty designations included in § 425.402(c), and non-physician ACO professionals (NPs, PAs, CNSs) (herein collectively referred to as ''ACO professionals used in assignment'' for brevity).

Under the claims-based assignment process we identify allowed charges for a beneficiary's primary care services received in an ACO (furnished by ACO professionals used in assignment billing through the TIN of an ACO participant or an FQHC, RHC, Method II CAH, or ETA hospital identified by a CCN enrolled under the TIN of an ACO participant), in any other ACO, or other individual practitioners, or groups of practitioners identified by Medicare-enrolled billing TINs or CCNs that are not participating in the Shared Savings Program. We use the ACO participant list certified by the ACO to identify ACO professionals used in assignment that are billing primary care services, and to identify CCNs enrolled under the TIN of an ACO participant, for purposes of performing claims-based assignment for the PY, and, if applicable, assignment for the ACO's benchmark years in the case of establishing or adjusting the ACO's historical benchmark under subpart G (see § 425.652(a)).

We use different approaches to identifying primary care services furnished by ACO professionals and CCNs enrolled under the TIN of an ACO participant. Because of the billing relationship between an ACO professional and an ACO participant, any claims for primary care services billed by an ACO professional through the TIN of an ACO participant would be used for assignment. We note that operationally we identify an ACO professional based on the physician's or non-physician practitioner's NPI. As we explained in the CY 2023 PFS final rule (87 FR 69826), for purposes of beneficiary assignment, we identify claims for services furnished by Method II CAHs, ETA hospitals, FQHCs, and RHCs using the CCN assigned to the facility. Section 425.402(f) includes provisions on how we identify services furnished by FQHCs, RHCs, Method II CAHs, and ETA hospitals, based on CCNs enrolled under the TIN of an ACO participant, for purposes of beneficiary assignment for PY 2023 and subsequent PYs. Under this approach, we use the Provider Enrollment, Chain, and Ownership System (PECOS) to determine the CCNs for all FQHCs, RHCs, Method II CAHs, and ETA hospitals enrolled under the TIN of an ACO participant prior to the start of performance year, and periodically during the performance year, and account for changes in CCN enrollment status during the PY.[254] We also note that the claims data used for assignment for FQHCs, RHCs, Method II CAHs, and ETA hospitals are limited to outpatient facility claims, and have specified in program specifications additional steps we use to identify data on outpatient facility claims for these four provider types.[255]

As specified in § 425.306, each ACO participant that submits claims for services used to determine the ACO's assigned population under subpart E of part 425 must be exclusive to one Shared Savings Program ACO. In initially establishing exclusivity requirements for ACO participants in the November 2011 final rule (76 FR 67811), we explained that individual NPIs are free to participate in multiple ACOs if they bill under several different TINs. We explained that when providers whose services are the basis of assignment bill under two or more TINs, each TIN would be exclusive to only one ACO, assuming both TINs have both joined as participants, but the provider billing under the TINs would not have to be exclusive to one ACO. In the February 2016 proposed rule (81 FR 5824, 5849), we recognized there may be cases where a beneficiary is receiving primary care services from ACO participants in multiple ACOs or from both ACO participants and non-ACO providers and suppliers. We explained that in such cases, the composition of each ACO is important in determining whether the beneficiary is assigned to an ACO at all, and in determining to which ACO (among several) the beneficiary may be assigned. As we explained in the CY 2023 PFS final rule (87 FR 69828), our policies for accounting for changes in CCN enrollment status, for identifying services furnished by FQHCs, RHCs, Method II CAHs, and ETA hospitals for purposes of beneficiary assignment, reflect our operational approach to treat CCNs in a similar fashion to ACO participant TINs and not allow a CCN to switch between ACOs during the performance year (see § 425.402(f)(3)(iii)). In earlier rulemaking, we have not more generally sought to address the impact on assignment of an ACO professional used in assignment (NPI) billing primary care services for a beneficiary through an ACO participant TIN and non-ACO TIN, and related policy considerations.

(ii) Steps of the Claims-Based Assignment Process

In each step of the claims-based assignment process, we determine whether the allowed charges for a beneficiary's primary care services in an ACO are greater than allowed charges for the beneficiary's primary care services in any other ACO, or other individual practitioners, or groups of practitioners identified by Medicare-enrolled billing TINs or CCNs that are not participating in the Shared Savings Program (that is, a non-ACO individual or group TIN or non-ACO CCN). In doing so, we determine which ACO or non-ACO entity provided a beneficiary's plurality of allowed charges for primary care services for purposes of assignment. Herein, for brevity, we sometimes refer to this stage of the assignment process as ''plurality competition''.[256]

To follow is a summary of the steps used in the claims-based assignment methodology under § 425.402(b):

In accordance with § 425.402(b)(1), as a ''pre-step'' to the first and second step of the claims-based assignment process, CMS identifies all beneficiaries who had at least one primary care service during the applicable assignment window [257] with a physician who is an ACO professional in the ACO and who is a primary care physician as defined under § 425.20 or has one of the primary specialty designations specified in § 425.402(c). This pre-step is designed to satisfy the statutory requirement under section 1899(c)(1) of the Act that beneficiaries be assigned to an ACO based on their use of primary care services furnished by physicians participating in the ACO. Beneficiaries

[254] We refer readers to the discussion in the CY 2023 PFS final rule at 87 FR 69825 through 69829.

[255] See Medicare Shared Savings Program, ''Shared Savings and Losses, Assignment and Quality Performance Standard Methodology Specifications'' (April 2026, Version #14), available at *https://www.cms.gov/files/document/medicare-shared-savings-program-shared-savings-losses-assignment-methodology-specifications-version.pdf-0* (Appendix D: Outpatient Facility Claims Used in Beneficiary Assignment).

[256] We have infrequently made references to ''competition'' in claims-based assignment in earlier rulemaking. See, for example, 85 FR 84790 (in describing observations based on internal analysis of the rate at which beneficiaries are assigned to an ACO and subsequently not assigned to that ACO), and 89 FR 98197 through 98198 (in generally referring to the ACOs included in the claims-based assignment competition).

[257] As defined in § 425.20, ''assignment window'' means the 12-month period used to assign beneficiaries to an ACO, or to identify assignable beneficiaries, or both. As we explained in the CY 2024 PFS final rule (88 FR 79137, see also 83 FR 67860), the assignment window for ACOs under prospective assignment is a 12-month period offset from the calendar year (for example, October through September preceding the calendar year), while for ACOs under preliminary prospective assignment with retrospective reconciliation, the assignment window is the 12-month period based on the calendar year.

who meet the pre-step requirement are then assigned to an ACO through either the first or second step of the assignment methodology specified in § 425.402(b)(3) and (b)(4).

As described in § 425.402(b)(2), for beneficiaries who meet the pre-step requirement under § 425.402(b)(1), CMS identifies all primary care services furnished by ACO professionals of that ACO who are primary care physicians as defined under § 425.20, non-physician ACO professionals, and physicians with specialty designations included in § 425.402(c) during the applicable assignment window. This provision reflects an operational step necessary to identify the sum of allowed charges for primary care services for a beneficiary received in an ACO (furnished by ACO professionals used in assignment billing through the TIN of an ACO participant or CCNs enrolled under the TIN of an ACO participant), as compared to any other ACO, non-ACO CCN, or non-ACO individual or group TIN, for determining the outcome of the plurality competition under step 1 and step 2 of the assignment methodology.

Under the first step of the assignment process, specified at § 425.402(b)(3), a beneficiary who is eligible for assignment and meets the pre-step requirement is assigned to an ACO if the allowed charges for primary care services furnished to the beneficiary during the assignment window by primary care physicians who are ACO professionals and non-physician ACO professionals in the ACO are greater than the allowed charges for primary care services furnished during the assignment window by primary care physicians, NPs, PAs, or CNSs who are ACO professionals in any other ACO, or not affiliated with any ACO and identified by a Medicare-enrolled billing TIN (that is, a non-ACO CCN, or non-ACO individual or group TIN).

The second step of the assignment methodology, specified at § 425.402(b)(4), applies to the remainder of the beneficiaries who are eligible for assignment and meet the pre-step requirement, who have not had a primary care service rendered during the assignment window by any primary care physician, NP, PA, or CNS, either inside or outside the ACO. The beneficiary will be assigned to an ACO if the allowed charges for primary care services furnished to the beneficiary during the assignment window by physicians who are ACO professionals with specialty designations specified in § 425.402(c) are greater than the allowed charges for primary care services furnished during the assignment window by physicians with such specialty designations who are ACO professionals in any other ACO, or who are unaffiliated with an ACO and are identified by a Medicare-enrolled billing TIN (that is, a non-ACO CCN, or non-ACO individual or group TIN).

For PY 2025 and subsequent PYs, as specified in § 425.402(b)(5), we employ a third step to assign eligible Medicare FFS beneficiaries who are not identified by the ''pre-step'' criterion specified under § 425.402(b)(1). In this step, we identify all beneficiaries who had at least one primary care service with a non-physician ACO professional in the ACO during the applicable assignment window, and had at least one primary care service with a physician who is an ACO professional in the ACO and who is a primary care physician or who has one of the primary specialty designations included in § 425.402(c) during the applicable expanded window for assignment (see § 425.402(b)(5)(i) through (ii)).[258] As described in § 425.402(b)(5)(iii), for a beneficiary meeting the aforementioned criteria in § 425.402(b)(5)(ii), we identify all primary care services furnished by ACO professionals in the ACO who are primary care physicians, non-physician ACO professionals, and physicians with specialty designations included in § 425.402(c) during the applicable expanded window for assignment. The identification of primary care services described in § 425.402(b)(5)(iii) serves as an operational step which is similar to the step described in § 425.402(b)(2). This operational step is necessary to identify the sum of allowed charges for primary care services for a beneficiary received in an ACO (furnished by ACO professionals used in assignment billing through the TIN of an ACO participant or CCNs enrolled under the TIN of an ACO participant), as compared to any other ACO, non-ACO CCN, or non-ACO individual or group TIN, for determining the outcome of the plurality competition under step 3.

In accordance with § 425.402(b)(5)(iv), a beneficiary identified in § 425.402(b)(5)(ii) who is eligible for assignment is assigned to an ACO if the allowed charges for primary care services furnished to the beneficiary by ACO professionals in the ACO who are primary care physicians, physicians with specialty designations included in § 425.402(c), or non-physician ACO professionals during the applicable expanded window for assignment are greater than the allowed charges for primary care services furnished by primary care physicians, physicians with specialty designations included in § 425.402(c), NPs, PAs, and CNSs who are ACO professionals in any other ACO, or not affiliated with any ACO and identified by a Medicare-enrolled billing TIN (that is, a non-ACO CCN, or non-ACO individual or group TIN).

As previously described, under § 425.402(b)(3), (b)(4), (b)(5)(iv), the plurality competition which occurs in each step of assignment compares allowed charges for primary care services furnished to a beneficiary by certain ACO professionals in an ACO with allowed charges for primary care services furnished by the same type of healthcare providers who are either (1) ACO professionals in any other ACO, or (2) not affiliated with any ACO and identified by a Medicare-enrolled billing TIN. Under the existing provisions, for purposes of plurality competition, we attribute to a non-ACO TIN the allowed charges for primary care services for a beneficiary furnished by an ACO professional that are billed through the non-ACO TIN. In determining the outcome of plurality competition for a beneficiary we consider both: (1) allowed charges for primary care services for the beneficiary received inside the ACO (furnished by an ACO professional or FQHC, RHC, Method II CAH or ETA hospital that has enrolled under the TIN of an ACO participant), and (2) allowed charges for primary care services for the same beneficiary being billed by the same ACO professional outside the ACO to a non-ACO TIN. As a result, a beneficiary may be identified as receiving the plurality of their primary care services outside an ACO based on a difference in the TIN to which the services are being billed by their healthcare provider who is an ACO professional used in assignment. Under these circumstances, when the plurality of allowed charges for primary care services is attributed to a non-ACO TIN, the ACO whose ACO professionals are furnishing services to the beneficiary would not be held accountable for the beneficiary's quality and cost of care.

(b) Background on Criteria Based on Medicare Enrollment Status Use To Identify Beneficiaries Eligible for Assignment and the Assignable Beneficiary Population

With the June 2015 final rule (see 80 FR 32743 through 32746, 32774 through 32775, and 32840 through 32841), we added § 425.401, establishing criteria for a beneficiary to be assigned to an ACO, which included assignment eligibility

[258] As defined in § 425.20, ''expanded window for assignment'' means the 24-month period used to assign beneficiaries to an ACO, or to identify assignable beneficiaries, or both that includes the applicable 12-month assignment window and the preceding 12 months.

criteria under § 425.401(a), and exclusion criteria for prospectively assigned beneficiaries under § 425.401(b).[259] These criteria included requirements based on a beneficiary's Medicare enrollment status. Additional background on considerations in establishing the assignment eligibility criteria and prospective assignment exclusion criteria based on Medicare enrollment status is provided in section III.G.2.a.(2)(b) of this final rule.

In subsequent rulemaking, we finalized amendments to § 425.401(b) introductory text, to apply the prospective assignment exclusion criteria in determining beneficiaries that would remain prospectively assigned at the end of CY 2019 to an ACO participating in a 6-month PY or performance period during 2019. Refer to the CY 2019 PFS final rule at 83 FR 59946 through 59947, and 60093; and the December 2018 final rule at 83 FR 67951, and 68069. We note that the criteria for determining a beneficiary's eligibility for assignment under § 425.401(a), and the prospective assignment exclusion criteria specified under § 425.401(b)(1) through (3), have remained unchanged since being finalized with the June 2015 final rule.

Currently, in accordance with § 425.401(a), a beneficiary may be assigned to an ACO under the assignment methodology in §§ 425.402 and 425.404, for a performance or benchmark year, if the beneficiary meets all of the following criteria during the assignment window:

(1) Has at least 1 month of Part A and Part B enrollment, and does not have any months of Part A only or Part B only enrollment.

(2) Does not have any months of Medicare group (private) health plan enrollment.

(3) Is not assigned to any other Medicare shared savings initiative.

(4) Lives in the United States (U.S.) or U.S. territories and possessions, based on the most recent available data in our beneficiary records regarding the beneficiary's residence at the end of the assignment window.

If a beneficiary meets the criteria noted previously, and then is assigned to an ACO that is participating under prospective assignment, the beneficiary may be later excluded from the ACO's prospective assignment list if they no longer meet these eligibility criteria. In accordance with § 425.401(b), a beneficiary is excluded from the prospective assignment list of an ACO that is participating under prospective assignment under § 425.400(a)(3) at the end of a performance or benchmark year and quarterly during each PY consistent with § 425.400(a)(3)(ii), if the beneficiary meets any of the following criteria during the performance or benchmark year: [260]

(1) Does not have at least 1 month of Part A and Part B enrollment, and has any months of Part A only or Part B only enrollment.

(2) Has any months of Medicare group (private) health plan enrollment.

(3) Did not live in the U.S. or U.S. territories and possessions, based on the most recent available data in our beneficiary records regarding the beneficiary's residency at the end of the year.

We have also applied the eligibility criteria established at § 425.401(a) and the prospective assignment exclusion criteria at § 425.401(b) in determining whether a beneficiary is eligible to be assigned to an ACO through voluntary alignment. We refer readers to discussions in earlier rulemaking (see 81 FR 80501 through 80510, 83 FR 59959 through 59964, and 89 FR 98097 through 98101), on the establishment of and modifications to these policies. With the CY 2025 PFS final rule (89 FR 98097 through 98101), we finalized the voluntary alignment policies applicable for PY 2025 and subsequent PYs under § 425.402(e)(2)(iii).

In accordance with § 425.402(e)(2)(iii)(A), among other conditions that must be satisfied for a beneficiary to be prospectively assigned to an ACO through voluntary alignment for PY 2025 and subsequent PYs, the beneficiary must meet the eligibility criteria established at § 425.401(a), and must not be excluded by the criteria at § 425.401(b). Further, as specified under § 425.402(e)(2)(iii)(A), the exclusion criteria at § 425.401(b) apply for purposes of determining beneficiary eligibility for voluntary alignment to an ACO based on the beneficiary's designation of an ACO professional as responsible for coordinating their overall care under § 425.402(e), regardless of the ACO's assignment methodology selection under § 425.226(a)(1).

There is currently asymmetry in the requirements used to identify the ACO assigned population under criteria in § 425.401 based on Medicare enrollment status, and the broader ''assignable beneficiary'' population (as defined in § 425.20), used in determining factors based on national and regional Medicare FFS expenditures.[261] As we have explained in earlier rulemaking, the assignable population is a subset of the larger population of Medicare FFS beneficiaries (see, for example, 88 FR 79138). Under our operational approach to identifying the assignable beneficiary population, we require that the beneficiary have at least 1 month of Part A and Part B enrollment and no Medicare group health plan enrollment (including MA) during that same month during the applicable 12-month assignment window. In comparison, for a beneficiary to be eligible to be assigned to an ACO under the criteria in § 425.401(a)(1) through (2) the beneficiary must: (1) have at least 1 month of Part A and Part B enrollment, and not have any months of Part A only or Part B only enrollment during the assignment window; and (2) not have any months of Medicare group (private) health plan enrollment during the assignment window. As a result, beneficiaries with one or more month of Part A only or Part B only enrollment, or Medicare group health plan enrollment during the assignment window could be included in the assignable beneficiary population, while beneficiaries with such Medicare enrollment status are ineligible for assignment to an ACO.

With the June 2016 final rule (see 81 FR 37985 through 37989), we established the use of the assignable population, rather than the broader Medicare FFS population in certain financial calculations based on national and regional FFS expenditures. In the June 2016 final rule (81 FR 37961), we explained that this approach to use the assignable population ensured these calculations were based on beneficiaries that have some chance of being assigned to the ACO. We also clarified that some beneficiaries who meet the definition of ''assignable beneficiary'' will ultimately be excluded from assignment to an ACO for purposes of determining the ACO's benchmark year or PY expenditures because they fail to meet the assignment criteria specified under § 425.401(a). In subsequent rulemaking we have established policies to ensure alignment

[259] We also refer readers to the related discussion in the proposed rule entitled ''Medicare Program; Medicare Shared Savings Program: Accountable Care Organizations'', which appeared in the December 8, 2014 **Federal Register** (79 FR 72760, 72790 through 72792, and 72811).

[260] We note the introductory text of § 425.401(b) includes a reference to applicability of the prospective assignment exclusion criteria for determining assignment to ACOs participating under a 6-month performance year or performance period during CY 2019, under § 425.609(b)(1)(ii) and (c)(1)(ii).

[261] With the June 2016 final rule (see, for example, 81 FR 37985 through 37989, and 38013), we finalized the definition for ''assignable beneficiary'' under § 425.20, which we subsequently amended with the CY 2024 PFS final rule (88 FR 79143 through 79144, and 79162 through 79163).

between the assigned and assignable populations [262] or calculations based on these populations.[263] However, we did not previously seek to address the differences in Medicare enrollment status of beneficiaries in the assignable population and the assigned population.

(c) Overview of Assignment-Based Program Operations

Various Shared Savings Program operations are based on the ACO's assigned population, or consider the size of the ACO's assigned population, as described in prior rulemaking (see, for example, 88 FR 79137 through 79138). To follow is a summary of these policies, including references to changes to Shared Savings Program policies elsewhere in section III.G. of this final rule.

Various aspects of the Shared Savings Program's financial methodology under subpart G depend on the size or composition of the ACO's assigned population, including calculating the ACO's benchmark and performance year expenditures, and adjusting and updating the ACO's benchmark. For each performance year, we determine whether the estimated average per capita Medicare Parts A and B FFS expenditures for Medicare FFS beneficiaries assigned to the ACO are above or below the ACO's updated benchmark, to determine whether the ACO qualifies for a shared savings payment or is responsible for sharing losses with CMS (as applicable) (§§ 425.605(a) and 425.610(a)). In computing an ACO's historical benchmark, we determine the per capita Parts A and B FFS expenditures for beneficiaries that would have been assigned to the ACO in any of the 3 most recent years prior to the start of the ACO's agreement period, in accordance with § 425.652(a) and (c). In benchmark calculations, the assigned population is the basis for determining the ACO's regional service area used in calculating the two-way blend of national and regional growth rates applied in trending and updating the ACO's benchmark (§ 425.652(a)(5)(iv)–(v), and (b)(2)), and the regional adjustment to the benchmark (§ 425.656). The assigned population is also used in calculating a proration factor applied in the prior savings adjustment (§ 425.658(b)(3)), and in determining an ACO's eligibility for and the amount of the population adjustment to the historical benchmark (§ 425.662(b)). The average prospective HCC risk scores for the ACO's assigned beneficiaries are used to risk adjust the ACO's benchmark expenditures (§§ 425.652(a)(3) and (10); 425.605(a)(1); 425.610(a)(2)), and other benchmark calculations (see, for example, § 425.656(b)(3) and (4) on calculating the regional adjustment, and § 425.660(b)(4) on calculating the ACPT component of the three-way blended benchmark update factor). As another example, as described in section III.G.5.e of the CY 2027 PFS proposed rule, we proposed to risk adjust the 5 percent cap on upward adjustments to the benchmark, based on average CMS–HCC risk scores for the ACO's assigned beneficiary population. In addition, we used the size of the ACO's assigned population in other financial calculations, including: determining the MSR/MLR threshold based on the ACO's number of assigned beneficiaries (§§ 425.605(b)(2)(i)(C) and 425.610(b)(1)(iii)); determining the eligibility of a low revenue ACO participating in the BASIC track for an opportunity to share in savings even if it does not meet the MSR (§ 425.605(h)); and determining the applicability of an alternative performance payment limit or loss recoupment limit for an ACO with fewer than 5,000 assigned beneficiaries in any benchmark year (§§ 425.605(i) and 425.610(l)).

The size of the ACO's assigned population is the basis for our determinations related to participation requirements and payment methodologies. For instance, we evaluate whether an ACO meets the requirement to have at least 5,000 assigned beneficiaries to be eligible to participate in the Shared Savings Program (§§ 425.110 and 425.600(h)(3)). We also use the ACO's number of assigned beneficiaries in repayment mechanism amount calculations (§ 425.204(f)), and in determining expenditures based on the ACO's assigned population when identifying if the ACO is a high revenue or low revenue ACO (as defined under § 425.20) for purposes of determining an ACO's eligibility for the Advance Investment Payment option (§ 425.630(b)(4)).

The ACO's assigned population informs the amount of quarterly advance investment payments (§ 425.630(b) and (f)) and prepaid shared savings (§ 425.640(f) and (h)) for eligible ACOs. Elsewhere in this final rule we are amending the quarterly advance investment payment calculation methodology (section III.G.7.) and discontinuing availability of the option for prepaid shared savings (section III.G.6.b.).

The assigned population is central to other programmatic areas, including quality and financial extreme and uncontrollable circumstances policies (see § 425.512(c)(1)(i); see also §§ 425.605(f)(1) through (2) and 425.610(i)(1) through (2)), and CMS's provision of beneficiary-identifiable data and aggregate reports to ACOs under subpart H.

(d) Beneficiaries Excluded From the Assigned Population Under the Current Assignment Methodology Based on the Assignment Calculations and Medicare Enrollment Status

As previously noted in the background discussion in section III.G.2.a.(1) of this final rule, current policies exclude beneficiaries from assignment when, for example, a non-ACO TIN is determined to provide the plurality of a beneficiary's primary care services as a result of ACO professionals billing primary care services for the beneficiary inside and outside the ACO, or when we determine a beneficiary is ineligible for assignment based on Medicare enrollment status. Our estimates, based on simulations using PY 2024 data, suggest the former leads to approximately 97,800 beneficiary person years not being assigned to an ACO due to non-ACO TIN being identified as providing the plurality of the beneficiary's primary care services, and the latter leads to approximately 248,000 beneficiary person years not being assigned due only to their Medicare enrollment status.[264]

We sought approaches to expand the population of Medicare FFS beneficiaries for which ACOs are accountable for quality and cost of care. ACOs provide high-quality care to people with Medicare, and they are a critical tool to help Make America Healthy Again by supporting whole person care that addresses prevention, chronic illness and the root causes of disease, and achieving savings for the

[262] We refer readers to the CY 2024 PFS final rule (88 FR 79136 through 79163), in which we finalized use of an expanded window for assignment in both step 3 of the assignment methodology, and the definition of an assignable beneficiary, which we explained was necessary to maintain symmetry between the two approaches (see, for example, 88 FR 79158).

[263] We refer readers the CY 2023 PFS final rule (87 FR 69929 through 69932), in which we finalized modifications to our methodology for calculating county FFS expenditures to provide for the use of separate assignment windows for ACOs depending on their selected assignment methodology, to address and protect against bias in the calculations.

[264] Person years represents the sum of fractions of the year during which beneficiaries were enrolled in one of four Medicare enrollment types (ESRD, disabled, aged/dual eligible Medicare and Medicaid beneficiaries, and aged/non-dual eligible Medicare and Medicaid beneficiaries). In section III.G.2.a.(2)(b) of this final rule, we describe in greater detail our consideration of Shared Savings Program-eligible months in identifying beneficiaries eligible for assignment.

Medicare Trust Funds.[265] As described in section III.G.1.a. of this final rule, as part of our effort to align spending and value in OM, we are focused on developing policies that would grow the number of Medicare FFS beneficiaries in accountable care relationships and grow savings to the Medicare Trust Funds.

Since PY 2024, we have seen the number of beneficiaries assigned to Shared Savings Program ACOs steadily increase.[266] As of January 1, 2024, 10.8 million beneficiaries were initially assigned to 480 ACOs. As of January 1, 2025, 11.2 million beneficiaries were initially assigned to 477 Shared Savings Program ACOs. As of January 1, 2026, Shared Savings Program ACOs are serving 12.6 million beneficiaries that were initially assigned to 511 ACOs, a 12.3 percent increase from 2025, and the largest number ever served by the Shared Savings Program.[267] However, the number of beneficiaries assigned to Shared Savings Program ACOs remains a fraction of the larger OM population. Based on an internal analysis, for PY 2024, about one-third (10.3 million) of the OM population (30.8 million) was assigned to an ACO participating under the Shared Savings Program.[268] [269]

As noted in the CY 2027 PFS proposed rule (91 FR 44024), our proposals to modify the Shared Savings Program assignment policies on plurality competition and assignment eligibility criteria based on Medicare enrollment status represent an opportunity to make meaningful steps toward achieving our stated goals around growing the number of Medicare FFS beneficiaries involved in accountable care relationships and also to further strengthen Shared Savings Program policies. Regarding the latter, as described further in section III.G.2.a.(2)(a) of this final rule, our proposed changes to assignment calculations would reduce the potential for ACO professionals' billing patterns inside and outside the ACO for the care of the same beneficiaries to result in differences in assignment outcomes that advantage the ACO's financial performance. As described in section III.G.2.a.(2)(b) of this final rule, our changes to the assignment eligibility criteria and prospective assignment exclusion criteria based on Medicare enrollment status to align with the approach to identifying the assignable population would allow for greater symmetry between the ACO assigned population and the assignable population, and help ensure consistency between Shared Savings Program calculations used in determining ACO financial performance.

(2) Revisions

(a) Exclude From Assignment Calculations Allowed Charges for Primary Care Services Billed Through a Non-ACO TIN by an ACO Professional Used in Assignment

As described in section III.G.2.a.(1)(a)(ii) of this final rule, in claims-based assignment calculations for a beneficiary we consider allowed charges for primary care services furnished by an ACO professional billed through an ACO participant TIN (that is, inside the ACO), and allowed charges for primary care services furnished by the same ACO professional billed through a non-ACO TIN (that is, outside the ACO). Under current assignment policies, it is possible that a beneficiary may not be assigned to an ACO, despite choosing to receive care from the same physician or non-physician practitioner, only because of a difference in the TIN through which the services are being billed.

We proposed to amend the Shared Savings Program assignment methodology to address the circumstance under which ACO professionals used in assignment bill primary care services for a beneficiary through an ACO participant TIN and non-ACO TIN. More specifically, we proposed to remove from assignment calculations for purposes of plurality competition in step 1 under § 425.402(b)(3), step 2 under § 425.402(b)(4), and step 3 under § 425.402(b)(5)(iv), allowed charges for a beneficiary's primary care services billed through a non-ACO TIN by an ACO professional used in assignment if that beneficiary also had primary care services billed by an NPI under an ACO TIN.

This change will only impact the determination of assignment under the Shared Savings Program, and will not change how assigned beneficiary expenditures are calculated under the Shared Savings Program's financial methodology, for a benchmark year (in accordance with § 425.652(a)) or performance year (in accordance with §§ 425.605(a) and 425.610(a)). We noted in the CY 2027 PFS proposed rule (91 FR 44025), that under this proposal, assigned beneficiary expenditures for purposes of Shared Savings Program financial calculations would continue to include payment amounts for primary care services furnished to an assigned beneficiary billed through an ACO participant or non-ACO TIN, among other payment amounts.

We also noted in the CY 2027 PFS proposed rule (91 FR 44025) that under this approach, ACO professionals may continue to bill under several different TINs, such as ACO participants in multiple ACOs or both ACO participants and non-ACO providers and suppliers. This change will not impact an ACO professional's ability to receive FFS payment for primary care services billed through an ACO participant or non-ACO TIN.

We provided the following hypothetical examples to illustrate the outcome of plurality competition under the current approach and the revised approach. In these illustrations, for simplicity, we assumed the beneficiary meets the assignment eligibility criteria and therefore could be assigned to an ACO based on the outcome of plurality competition.

As one example, consider a beneficiary for which ACO professionals used in assignment billed primary care services through an ACO participant in ACO A and a non-ACO TIN, and the sum of allowed charges for this beneficiary for these services is greater for the billings through the non-ACO TIN than through the ACO. For instance, ACO professionals billed primary care services through an ACO participant in ACO A, resulting in allowed charges of $100 for each of three services, totaling $300. For this same beneficiary, ACO professionals in

[268] See, for example, Medicare Shared Savings Program, Performance Year Financial and Quality Results, Public Use File for PY 2024, available at *https://data.cms.gov/medicare-shared-savings-program/performance-year-financial-and-quality-results* (including a variable ''Total Assigned Beneficiaries'', specifying number of assigned beneficiaries for PY 2024, which summed across ACOs reconciled for PY 2024 totals 10,326,340).

[269] For purposes of this analysis, the total population of 30.8 million includes all beneficiaries with at least 1 month of Part A and Part B enrollment and no Medicare group (private) health plan enrollment (including MA) in that same month during the year.

ACO A also billed primary care services to a non-ACO TIN, resulting in allowed charges of $100 for each of four services, totaling $400. Under our existing policy, we would determine that the non-ACO TIN provided the plurality of the beneficiary's primary care services, because it provided the greatest amount of allowed charges for the beneficiary, and as a result the beneficiary would not be assigned to ACO A. Under this approach, we will exclude from plurality competition the allowed charges of $400 which the ACO professionals in ACO A billed through the non-ACO TIN. As a result, under this approach, ACO A will be determined to have provided the plurality of allowed charges for primary care services for the beneficiary, and we will assign the beneficiary to ACO A.

As a second example, consider a beneficiary for which ACO professionals used in assignment billed primary care services through ACO participants in two different ACOs (ACO A and ACO B), and a non-ACO TIN, and the sum of allowed charges for this beneficiary for these services is greater for the billings through the non-ACO TIN than through either ACO. For instance, ACO professionals billed primary care services for the beneficiary through an ACO participant in ACO A, resulting in allowed charges of $100 for each of three services, totaling $300. These ACO professionals also billed primary care services for the beneficiary through an ACO participant in ACO B, resulting in allowed charges of $100 for each of two services, totaling $200. These same ACO professionals billed primary care services for the beneficiary to a non-ACO TIN, resulting in allowed charges of $100 for each of four services, totaling $400. Under our existing policy, we would determine that the non-ACO TIN provided the plurality of the beneficiary's primary care services, and as a result the beneficiary would not be assigned to an ACO. Under this approach, we will exclude from plurality competition the allowed charges of $400 which the ACO professionals in ACO A and ACO B billed through the non-ACO TIN. As a result, we will decide the outcome of plurality competition between ACO A ($300 in allowed charges) and ACO B ($200 in allowed charges), and determine that ACO A provided the plurality of allowed charges for primary care services for the beneficiary, and we will assign the beneficiary to ACO A.

As a third example, consider a beneficiary for which an ACO professional used in assignment billed primary care services through an ACO participant in ACO A and a non-ACO TIN, and for which other healthcare providers unaffiliated with an ACO are also billing primary care services for the beneficiary through a non-ACO TIN, and the sum of allowed charges for this beneficiary for these services is greater for the billings through the non-ACO TIN than the ACO. For instance, an ACO professional billed primary care services through an ACO participant in ACO A, resulting in allowed charges of $100 for each of three services, totaling $300. For this same beneficiary, an ACO professional in ACO A also billed primary care services to a non-ACO TIN, resulting in allowed charges of $100 for one service. Additionally, allowed charges of $100 for each of five services, totaling $500, were billed through the non-ACO TIN by a primary care physician who is unaffiliated with any ACO. Under our existing policy, we would determine that the non-ACO TIN provided the plurality of allowed charges for primary care services for the beneficiary, and as a result the beneficiary would not be assigned to ACO A. Under this approach, we will exclude from plurality competition the allowed charges of $100 which the ACO professional billed through the non-ACO TIN. In this hypothetical example, the outcome of plurality competition would not change under the approach, as we will still determine that the non-ACO TIN provided the plurality of allowed charges for primary care services for the beneficiary, and the beneficiary will not be assigned to ACO A.

We noted in the CY 2027 PFS proposed rule that if an ACO professional bills under ACO participants in multiple ACOs, but not to a non-ACO TIN, we do not anticipate the change will impact the outcome of the plurality competition (compared to our current approach).

As illustrated in the examples previously described, this approach will reduce the likelihood that we will determine the beneficiary's plurality of allowed charges for primary care services to be attributed to a non-ACO TIN or non-ACO CCN and increase the likelihood that a beneficiary is assigned to an ACO. Based on our simulations of this approach described in section III.G.2.a.(2)(c) of this final rule, we observed that nearly all ACOs (462 of 476 ACOs or 97 percent) would experience a relatively small increase in their assigned population (less than 1 percent growth). We observed the remaining 3 percent of ACOs would experience growth in their assigned population ranging from 4 percent to 12 percent. We also observed that on average the beneficiaries added to assignment with this proposed change have higher cost and higher risk scores. This latter point highlights that the existing assignment methodology includes vulnerabilities that could lead ACOs, ACO participants or their ACO professionals to avoid at-risk beneficiaries (as defined in § 425.20). We explore related considerations in the discussion that follows.

Shared Savings Program policies include certain safeguards against ACO avoidance of at-risk beneficiaries. Specifically, section 1899(d)(3) of the Act, and related regulations under § 425.316(b), authorize us to monitor for ACO avoidance of at-risk beneficiaries. If we discover that an ACO has engaged in the avoidance of at-risk beneficiaries, we can impose remedial action or terminate the ACO, in accordance with § 425.316(b)(2).

There may be multiple possible pathways for an ACO to engage in strategic patient risk selection.[270] In recent years, we have engaged in monitoring to identify potential patient risk selection behavior by ACOs. Our monitoring and compliance processes for identifying and addressing ACO avoidance of at-risk beneficiaries can be resource intensive. We believe that the change to determining the outcome of plurality competition within the assignment methodology will allow for a more efficient solution to mitigate a mechanism for ACOs, ACO participants, or their ACO professionals to avoid accountability for the quality and cost of care for high-cost at-risk beneficiaries. A pattern of billing by ACO professionals used in assignment resulting in a population of relatively higher costs beneficiaries not being assigned to the ACO could provide a mechanism for the ACO to achieve lower PY expenditures as compared to its historical benchmark, thereby potentially increasing its savings or decreasing its losses. An ACO avoiding assignment of high-cost beneficiaries under the Shared Savings Program reduces the cost effectiveness of coordinated care and shared savings initiatives, limiting savings for the Trust Funds, and potentially limiting improvements in quality of care and outcomes that could result for the patient. We are concerned that the provisions addressing avoidance of at-risk beneficiaries under section 1899(d)(3) of the Act and § 425.316(b), entail an ACO-specific analysis which

[270] See, for example, McWilliams JM, et al. ''Savings or Selection? Initial Spending Reductions in the Medicare Shared Savings Program and Considerations for Reform.'' *Milbank Q.* 2020 Sep;98(3):847–907, available at *https://onlinelibrary.wiley.com/doi/10.1111/1468-0009.12468*.

may not serve as an adequate deterrent against the aforementioned concerns about ACO professionals billing patterns for the care of the same beneficiaries resulting in differences in assignment outcomes that advantage the ACO's financial performance. In comparison, the approach to modifying plurality competition would result in a program-wide change which will be implemented with each assignment run, which we believe will largely resolve our concerns.

We believe the proposal to exclude from assignment calculations allowed charges for primary care services furnished by an ACO professional used in assignment billed through a non-ACO TIN offers a tailored approach to reduce the potential for ACO professionals' billing patterns, inside and outside the ACO for care of the same beneficiaries, to result in differences in assignment outcomes that advantage the ACO's financial performance. We recognize that the approach can result in assignment of beneficiaries for which ACO professionals may be billing a greater amount of primary care services through non-ACO TINs, compared to ACO participant TINs. We recognize there can be appropriate billings by ACO professionals through multiple different TINs (inside and outside the ACO) for services furnished to a beneficiary, such as a result of the physician or non-physician practitioner working in more than one practice location, or reflective of multiple employment arrangements. Nonetheless, we believe it is appropriate to assign the beneficiary to an ACO under such circumstances. We believe that beneficiaries added to ACOs' assigned populations under the proposed changes in assignment would benefit from better care coordination and quality improvement activities through ACOs participating under Shared Savings Program requirements, and the proposed changes to assignment are estimated to result in higher net Federal savings (as described in section III.G.2.a.(2)(c) of this final rule). These potential benefits outweigh potential concerns that this approach minimizes our consideration of billing arrangements of ACO professionals through non-ACO TINs.

We acknowledge a possibility that ACOs, ACO participants, or their ACO professionals, and non-ACO TINs may have relied on the existing program policy to structure arrangements in which ACO professionals bill inside and outside the ACO for the care of the same beneficiary. However, we do not believe any such reliance interests outweigh our concerns about the potential for ACOs and other providers/suppliers to exploit a vulnerability with the existing Shared Savings Program assignment methodology, and the potential benefits for beneficiaries and the Trust Funds of the modifications to the plurality competition, as we describe elsewhere in section III.G.2.a. of this final rule.

We proposed to apply this revised approach to determining assignment for the PY starting on January 1, 2028, and subsequent PYs. We discuss the proposed timing of applicability further in section III.G.2.a.(2)(d) of this final rule, including use of the same assignment rules in determining beneficiary assignment for purposes of benchmark calculations as would apply in the PY.

We proposed to revise and republish § 425.402(b)(3), (b)(4), and (b)(5)(iv), with new provisions added to steps 1, 2, and 3 of the claims-based assignment methodology (respectively). As proposed, these provisions would continue to specify the existing approach to comparing allowed charges for primary care services furnished to a beneficiary by certain ACO professionals in an ACO with allowed charges for primary care services furnished by the same type of healthcare providers who are either (1) ACO professionals in any other ACO, or (2) not affiliated with any ACO and identified by a Medicare-enrolled billing TIN. We proposed to revise these paragraphs to add provisions, applicable for performance year 2028 and subsequent performance years, specifying how we identify and exclude from assignment allowed charges for primary care services billed by an ACO professional used in assignment under a Medicare-enrolled billing TIN unaffiliated with any ACO (for brevity referred to in the proposed regulation as a ''non-ACO TIN'') during the applicable assignment window. To follow is a summary of the amendments to § 425.402(b)(3), (b)(4), and (b)(5)(iv).

We proposed to revise § 425.402(b)(3), specifying assignment step 1 as follows:

- We proposed to specify the existing provisions of assignment step 1 under paragraph (b)(3) in new paragraph (b)(3)(i), and also redesignate existing paragraphs (b)(3)(i) and (ii) as paragraphs (b)(3)(i)(A) and (B) (respectively).
- Under new paragraph (b)(3)(ii), we proposed to specify that for performance year 2028 and subsequent performance years, if an ACO professional for which we identify a primary care service under § 425.402(b)(2) also bills primary care services under a Medicare-enrolled billing TIN unaffiliated with any ACO, then we would exclude from consideration in assignment under proposed new § 425.402(b)(3)(i) the allowed charges for primary care services billed by the ACO professional under the non-ACO TIN during the applicable assignment window.

We proposed to revise § 425.402(b)(4), specifying *assignment* step 2 as follows:

- We proposed to specify the existing provisions of assignment step 2 under paragraph (b)(4) in new paragraph (b)(4)(i), and also redesignate existing paragraphs (b)(4)(i) and (ii) as paragraphs (b)(4)(i)(A) and (B) (respectively).
- Under new paragraph (b)(4)(ii), we proposed to specify that for performance year 2028 and subsequent performance years, if an ACO professional for which we identify a primary care service under § 425.402(b)(2) also bills primary care services under a Medicare-enrolled billing TIN unaffiliated with any ACO, then we would exclude from consideration in assignment under proposed new § 425.402(b)(4)(i) the allowed charges for primary care services billed by the ACO professional under the non-ACO TIN during the applicable assignment window.

We proposed to revise § 425.402(b)(5)(iv), the provision of assignment step 3 in which we determine which ACO or non-ACO entity provided a beneficiary's plurality of allowed charges for primary care services, as follows:

- We proposed to specify the existing provisions of under paragraph (b)(5)(iv) in new paragraph (b)(5)(iv)(A), and also redesignate existing paragraphs (b)(5)(iv)(A) and (B) as paragraphs (b)(5)(iv)(A)(*1*) and (*2*) (respectively).
- Under new paragraph (b)(5)(iv)(B), we proposed to specify that for performance year 2028 and subsequent performance years, if an ACO professional for which we identify a primary care service under § 425.402(b)(5)(iii) also bills primary care services under a Medicare-enrolled billing TIN unaffiliated with any ACO, then we would exclude from consideration in assignment under proposed new § 425.402(b)(5)(iv)(A) the allowed charges for primary care services billed by the ACO professional under the non-ACO TIN during the applicable expanded window for assignment.

As we have described in section III.G.2.a.(1) of this final rule, in determining claims-based assignment, we consider allowed charges for primary care services billed through physicians and non-physician practitioners, as well as FQHCs, RHCs, Method II CAHs, and ETA hospitals (as identified by CCN). The more general

language of the proposed new provisions of the regulations in § 425.402(b)(3), (b)(4), and (b)(5)(iv) describing exclusion from assignment calculations of allowed charges for primary care services billed by an ACO professional (physicians and non-physician practitioners) used in assignment through a non-ACO TIN is inclusive of primary care services billed through a non-ACO CCN enrolled under the non-ACO TIN. To the extent the ACO professional is billing primary care services through an ACO participant TIN and a non-ACO CCN, this approach will also exclude from plurality competition the allowed charges billed through the non-ACO CCN.

We sought comment on the proposed change to the step-wise assignment methodology under which we would exclude allowed charges for primary care services billed through a non-ACO TIN by an ACO professional used in assignment, and related proposed changes to the Shared Savings Program regulations at § 425.402(b)(3) (applicable to step 1), (b)(4) (applicable to step 2), and (b)(5)(iv) (applicable to step 3), as revised and republished. We sought comment on the proposal to apply this approach in determining Shared Savings Program assignment for the PY starting on January 1, 2028, and subsequent PYs.

We received public comments on these proposals. The following is a summary of the comments we received and our responses.

Comment: Many commenters supported our proposed policy to exclude allowable charges to non-ACO TINs by ACO professionals. In addition to the general support received from these commenters, many commenters included specific reasons for their support.

A commenter stated that the proposal will help mitigate unwarranted shared saving payments that result from large changes between ACOs' historical benchmark population and performance year populations. A few commenters noted that the proposed policy could benefit the most vulnerable (highest risk and costliest) beneficiaries that may be excluded from ACO assignment. Many commenters supported the policy citing that it advances the goal of connecting more Medicare beneficiaries with coordinated, accountable care. Many commenters supported the policy because it would ensure that assignment reflects the relationship with the provider responsible for their care. A commenter supported the policy and shared their belief that it protects ACOs from assigning beneficiaries based on care they received at facilities where ACOs do not have oversight. A couple of commenters acknowledged that ACOs may influence assignment to their advantage through billing to unaffiliated TINs and additionally recommend CMS extend the policy by routinely auditing ACOs' participant lists, publishing the amount of participant turn-over, and evaluating savings using fixed provider lists while using the current assignment rules.

Response: We appreciate the comments in support of the proposal and the additional considerations they included. Many of the comments highlighted additional positive impacts that the policy may have on ACOs, providers, and beneficiaries, such as greater benefits for vulnerable populations, more accurate reflections of patient-provider relationships, and fewer unwarranted payments caused by changes between historical benchmark and performance year populations. These additional details provide further support and reasoning for implementing the policy change.

Comment: A few commenters opposed the proposed policy. A commenter opposed being held accountable for beneficiaries that receive care provided by non-ACO TINs, as these non-ACO TINs may not have incentives to control cost and quality of care. Another commenter opposed any policy that disrupts genuine patient-physician relationships and expressed that CMS should provide sufficient assignment data to ACOs to identify and correct unusual results. Another commenter did not support the goal of expanding the number of beneficiaries in ACOs, but did not specify any reasons for this opposition.

Response: We acknowledge the concerns with the proposed policy expressed in comments. CMS agrees with the concern that non-ACO TINs are less likely to control the cost and quality of care provided, however, the policy would only add beneficiaries to an ACO's assignment if the beneficiary also had primary care services billed under the ACO TIN. This proposed policy will work to address vulnerabilities within the current assignment methodology to ensure beneficiaries are not excluded from assignment due to avoidance, ultimately increasing the assigned population. CMS believes that in doing so, ACOs and their professionals that do have an incentive to control costs and quality will be held accountable for these beneficiaries.

With regard to the opposition to increasing the assigned population, we emphasize that the purpose of doing so through this policy is to provide a greater number of beneficiaries with access to the benefits of accountable care via the Shared Savings Program. For commenters concerned about disruption to genuine patient-physician relationships, we note that the policy does not prevent healthcare providers and patients from continuing existing relationships. Beneficiaries assigned to ACOs as a result of this policy would have received services from ACO professionals billing through their ACO TIN. Additionally, in regards for the request to provide sufficient assignment data to ACOs, we note that we will continue to provide ACOs with annual and quarterly reports, such as the Assignment List Report, Assignment Summary Report, and Beneficiary and Expenditure Utilization Report, and monthly Claim and Claim Line Feed Files that provide additional information related to each assigned beneficiary and the services they receive. We will also continue to monitor for opportunities to provide ACOs with additional assignment related data that can assist with better understanding of the relationships between providers and assigned beneficiaries. We believe the potential benefits of implementing the proposed policy on beneficiaries outweigh their concerns regarding adjustments to billing arrangements.

Comment: Some commenters expressed their support for finalizing the policy, but recommended CMS provide continued monitoring and supporting data on expected beneficiary growth and characteristics. Many other commenters urged CMS to conduct further analysis of the policy's impact on participating ACOs prior to finalizing despite supporting the policy's goals in concept. Many commenters requested additional analysis and monitoring due to specific concerns about a negative financial impact based on the type of ACO, geographic location, or patient population, such as rural ACOs, ACOs that serve populations with higher needs, or the circumstances unique to nursing facilities and patients. Specifically, regarding long-term care, a commenter was concerned about situations where billing under different TINs occurs for legitimate purposes, such as for long-stay versus short-say patients in nursing facilities. Another commenter urged CMS to evaluate the impact on long-stay nursing facility patients to ensure they are not being assigned to an ACO based on historical primary care charges that no longer represents the delivery of their care. Some commenters requested analyses prior to finalizing or a delay in the

policy until more impacts were understood.

Response: We appreciate comments with recommendations for further analysis to ensure the implementation of the proposed policy has the intended effect, without negatively impacting certain ACOs, providers, or beneficiary populations.

In updated simulations of PY 2025 data, we found similar results regarding the average number of added beneficiaries, and average impact on aggregate and per capita gross savings and losses as reported in the CY 2027 PFS proposed rule. Specifically, we found that most ACOs (304 of 472 or 64 percent) would experience a small increase in their assigned population (less than 1 percent growth). Additionally, we found that nearly all ACOs (459 of 472 or 97 percent) would experience a relatively small increase in their assigned population (less than 5 percent growth). We observed the remaining 3 percent of ACOs would experience growth in their assigned population ranging from 6 percent to 43 percent.

We also compared financial performance of ACOs by different types of ACO characteristics. In PY 2025 simulations comparing rural ACOs to non-rural ACOs, we found that rural ACOs experienced a $17 lower average per capita gross savings/losses (-4.69 percent), compared to non-rural ACOs that saw $24 lower average per capita gross savings/losses (-4.09 percent). In comparing ACOs with a higher versus lower proportion of beneficiaries with Long-Term Institutionalized (LTI) Status, we found that these ACOs with higher proportion of beneficiaries with LTI status experienced $31 lower average per capita gross savings/losses (-4.56 percent). ACOs with a lower proportion of beneficiaries with LTI Status experienced $21 lower average per capita gross savings/losses (-3.98 percent) as a result of the policy. We also compared financial performance for ACOs that had a higher average Hierarchical Condition Category (HCC) score among their beneficiaries. We found that these ACOs experienced $31 lower average per capita gross savings/losses (-3.71 percent), while ACOs with lower average HCC scores experienced $21 lower average per capita gross savings/losses (-4.42 percent). Although estimated impacts differed across these groups, differences between groups were relatively small and not statistically significant and therefore do not provide evidence that the policy would have different effects across the groups examined.

Given that we do not see statistically significant differences between the different types of ACOs and patient populations examined, and considering the policy's potential to provide safeguards against ACO avoidance of at-risk beneficiaries and the potential to increase beneficiaries assigned to ACOs improving beneficiary care coordination, CMS declines to delay implementation of this policy. CMS will continue to monitor the impact of the proposed policy on ACOs as additional performance data becomes available.

With respect to concerns about billing under multiple TINs for legitimate purposes, we note that the policy only impacts beneficiaries that are already seen at the ACO for primary care services. Therefore, it would only pull beneficiaries billed to the non-ACO TIN if they also had primary care services billed by an ACO professional to the ACO TIN. Similarly, with regards to impacts on long-stay nursing facility patients being assigned to an ACO based on historical primary care charges, we would not expect historical charges to have differing impacts under the existing assignment methodology compared to the proposed policy, and the proposed policy is intended to be incorporated throughout the window used for assignment.

Comment: Many commenters urged CMS to implement guardrails or protections to reduce the possibility of unintended negative consequences. Specifically, some commenters asked for guardrails to protect against negative impacts on gross savings/losses, especially for the small number of ACOs that would experience a larger impact from this policy. Others asked for guardrails to ensure established relationships are not disrupted where billing patterns may reflect legitimate arrangements or needs, such as in rural areas.

Response: We appreciate the concern for ACOs expressed in the comments, but we do not believe guardrails are needed at this time based on the relatively small impact observed in multiple performance years of our analysis which we believe would be outweighed by the potential benefits of this policy to strengthen safeguards against possible ACO avoidance of at-risk beneficiaries. Additionally, based on PY 2025 data we observed that most clinicians do not bill through multiple billing TINs/CCNs (81.9% of NPIs bill primary care services through a single TIN/CCN, and 87.5% of NPIs bill 95% or greater of the primary care services they provide through a single TIN/CCN).

Additionally, providers should continue to provide care for their patients as they normally would, and beneficiaries can continue to see the healthcare providers of their choice. This policy only impacts beneficiaries who receive healthcare from an ACO professional and also received care that was billed by the same ACO professional under a non-ACO TIN. Therefore, care relationships should not be disrupted. As reported previously, differential impacts on financial performance for rural ACOs or ACOs with a higher proportion of beneficiaries with high HCC scores were not statistically significant.

We will continue monitoring the impact of the proposed policy on ACOs for possible unintended consequences as additional performance data becomes available.

Comment: A commenter asked that CMS clarify the existing assignment methodology in which CMS excludes certain primary care services provided during short-term SNF stays (including when billed via FQHCs/RHCs) from the Shared Savings Program's beneficiary assignment calculation, preventing short-term SNF stays from skewing primary care assignment (42 CFR 425.400(c)(1)(v)–(ix)).

Another commenter shared concerns regarding the effect of expanded assignment on independent specialists whose patients are assigned to an ACO. Specifically, the commenter raised concerns that the proposed policy could pull beneficiaries into an ACO's cost and quality measures even when a meaningful part of their care comes from an independent specialist outside the ACO. The commenter noted that these specialists currently have limited ways to coordinate with the ACO or share in savings tied to that care and recommended that CMS establish additional methods to improve specialist integration into ACOs.

A commenter suggested that CMS should provide examples of how this policy might play out for providers with various billing structures, such as academic medical centers, hospital-based primary care, and multi-TIN organizations.

A commenter conducted their own simulation analyses of the policy and found differing results from what CMS outlined in the CY 2027 PFS proposed rule, and therefore asked CMS to clarify how they intend to implement the policy. Based on the commenter's results and comparison to CMS' simulated results in the CY 2027 PFS proposed rule, they suggested that CMS is proposing a broader approach to assignment than the commenter's initial interpretation of the proposal. Specifically, they believed CMS's

simulation results point to excluding a claim billed for any beneficiary to a non-ACO TIN by an ACO provider, even if the beneficiary did not also have care billed to an ACO TIN by the provider.

Response: We appreciate the concerns raised in comments about impacts on different providers and suppliers and the additional analyses that a commenter conducted.

While we recognize there could be a variety of reasons why healthcare provider organizations structure their use of billing TINs and CCNs, we note that the proposed policy would act to ensure beneficiaries are assigned to an ACO if the ACO professionals provide the plurality of the beneficiary's primary care services. The proposed change ensures if an ACO professional's services are billed to external TINs, the external TIN cannot pull otherwise eligible and assignable beneficiaries outside of the ACO. The impact from the proposed policy will primarily impact beneficiaries receiving primary care services from the same set of healthcare providers (NPIs) but through multiple billing TIN/CCNs, and where some of those TINs/CCNs are part of an ACO's participant list and others are not.

We appreciate the comment raised about the potential impact of these proposals on specialists not associated with ACOs. We wish to clarify that for beneficiaries that receive a plurality of their primary care from independent specialists outside of the ACO, the proposed policy would only pull such beneficiaries into the ACO if those independent specialists also bill for those beneficiaries through the ACO's participant TINs. Otherwise, if those independent specialists do *not* bill primary care services for those beneficiaries through the ACO, then no claims from those specialists are excluded during the plurality competition, and those beneficiaries would likely continue to have their care associated with the external specialist TIN and not be assigned to the ACO. Additionally, many ACOs have found methods to efficiently incorporate specialists into their ACO operations which have led to improvements in quality of care and cost reductions, and the proposed policy should not impact the existing methods of ACO specialist integration. However, we also recognize there are opportunities to improve how specialists are incorporated into ACOs, and we will be reviewing the comments we received related to the Request for Information (RFI) for Specialty Care in the Shared Savings Program that was included in the CY 2027 PFS proposed rule.

We appreciate the commenter that conducted their own simulation analysis of the policy, however we believe this commenter may misunderstand how the policy will be implemented. They described their belief that CMS's policy would exclude a claim billed for any beneficiary to a non-ACO TIN by an ACO provider, even if the beneficiary did not also have care billed to an ACO TIN by the provider. This does not accurately reflect the policy, as CMS would only exclude allowed charges for primary care services provided by NPI's billing through non-ACO TINs when those beneficiaries also had primary care services billed by an NPI within an ACO TIN.

With respect to the request for clarification surrounding assignment methodology as it relates to short-stay SNFs, it is not within scope of the current proposed policy. We refer readers to additional information related to the Assignment Methodology and related CPT code exclusions related to SNF stays in Section 2 and Appendix C of the Medicare Shared Savings Program Shared Savings and Losses, and Assignment and Quality Performance Standard Methodology Specifications Version 14.[271]

Comment: A commenter supported the proposal but expressed concern that even with this policy, claims-based assignment would not go far enough to engage enough beneficiaries in accountable care, and that beneficiaries should have an accessible way to choose the provider that they wish to coordinate their care. Additionally, a couple of commenters pointed to the need to improve and expand voluntary alignment and a commenter raised concerns that the voluntary alignment process is challenging to navigate for beneficiaries and suggested CMS provide ACOs the ability to align beneficiaries by paper as an addition to the current electronic voluntary alignment process. These comments did not specifically relate to this proposed policy, but rather more broadly to the assignment methodology.

Response: We appreciate the recommendation made in comments, however this is beyond the scope of the current proposal. We note that beneficiaries are currently able to proactively designate a primary clinician or practice as their main source of care and voluntarily align to an ACO. We are currently researching additional ways CMS can support beneficiary education and enhance the accessibility of voluntary alignment.

After consideration of public comments, we are finalizing our proposal to amend the Shared Savings Program assignment methodology to address the circumstance under which ACO professionals used in assignment bill primary care services for a beneficiary through an ACO participant TIN and non-ACO TIN, and to revise and republish § 425.402(b)(3), (b)(4), and (b)(5)(iv), with new provisions added to steps 1, 2, and 3 of the claims-based assignment methodology (respectively) as proposed.

(b) Modify Assignment Eligibility Criteria and Prospective Assignment Exclusion Criteria Based on Medicare Enrollment Status

In this section, we provide additional background on the development of the Shared Savings Program's assignment eligibility criteria and prospective assignment exclusion criteria; revisit key considerations informing the development of our existing policies, and discuss factors informing our proposal to modify these policies; and describe our proposal to modify the assignment eligibility criteria and prospective assignment exclusion criteria based on Medicare enrollment status.

As we explained in the December 2014 proposed rule (79 FR 72790 through 72791) and June 2015 final rule (80 FR 32743 through 32744), the assignment eligibility criteria we proposed and finalized were consistent with criteria we established to operationalize the Shared Savings Program's assignment methodology finalized with the November 2011 final rule. We referenced a detailed specifications document, which included information regarding the beneficiary assignment process, that we made available to the public on the CMS website.[272] [273]

[271] Please see *https://www.cms.gov/files/document/medicare-shared-savings-program-shared-savings-losses-assignment-methodology-specifications-version.pdf-0.*

[272] Between May 2012 and December 2014, CMS issued and updated the initial versions of the Shared Savings Program's ''Shared Savings and Losses and Assignment Methodology Specifications'', which included specifications for beneficiary assignment and the shared savings and losses calculations under the program. The specifications, and the CMS webpage where the document has been posted, have been updated over time. The earlier versions of the document are maintained in the ACO Management System (ACO–MS) Knowledge Library (accessible to ACOs) at *https://acoms.cms.gov/knowledge-management/view/8320.* The ''Shared Savings and Losses, Assignment and Quality Performance Standard Methodology Specifications'' documents for current years are available on ''Program Guidance & Specifications'' webpage of the Shared Savings Program's website at *https://www.cms.gov/*

In the December 2014 proposed rule (79 FR 72791), we explained that to determine whether a beneficiary is eligible to be assigned to an ACO, we must have information about the beneficiary's Medicare enrollment status. We explained that as required by section 1899(h)(3) of the Act, and consistent with the definition of Medicare FFS beneficiary in § 425.20, only beneficiaries enrolled in traditional Medicare FFS under Parts A and B are eligible to be assigned to an ACO participating in the Shared Savings Program. In the December 2014 proposed rule (79 FR 72791), we proposed that beneficiaries who have coverage under only one of these parts (Part A or Part B) would not be eligible to be assigned to an ACO, because of the statutory definition for Medicare FFS beneficiary and because an important objective of the Shared Savings Program is to help align incentives between Part A and Part B.

Further, in the December 2014 proposed rule (79 FR 72791), we explained that beneficiaries enrolled in a group health plan including beneficiaries enrolled in MA plans under Part C, eligible organizations under section 1876 of the Act, and Programs of All-Inclusive Care for the Elderly (PACE) under section 1894 of the Act are also not eligible to be assigned. In the June 2015 final rule (80 FR 32745), we summarized and responded to comments suggesting that the criterion that a beneficiary not have any months of Medicare group (private) health plan enrollment during the assignment window be revised to not more than 3 to 6 months, to account for certain situations where beneficiaries, such as dual eligible beneficiaries, might change, enroll in or disenroll from plans more frequently. The comments explained that this would allow such beneficiaries to remain attributed to the ACO. In our response we explained that section 1899(c) of the Act requires the Secretary to determine an appropriate method to assign Medicare FFS beneficiaries to an ACO. We then explained that as required by section 1899(c) of the Act, and consistent with the definition of Medicare FFS beneficiary under section 1899(h)(3) of the Act and § 425.20 of the Shared Savings Program regulations, our policy provided that only beneficiaries enrolled in traditional Medicare FFS under Parts A and B are eligible to be assigned to an ACO participating in the Shared Savings Program. We explained our belief that such policy was consistent with these requirements because under such approach only beneficiaries enrolled in traditional Medicare FFS under Parts A and B ''throughout the full performance year'' would be eligible to be assigned to an ACO. At the time, we declined to revise our policy in response to the commenters' concerns, but specified our plan to consider this issue further, and potentially address the issue in future rulemaking. We have not revisited these topics in subsequent rulemaking.

We have continued to consider our approach to determining the eligibility of Medicare FFS beneficiaries for assignment. In considering whether to propose revising our approach, we revisited key considerations informing the development of these policies.

The first consideration informing the development of our eligibility criteria was consistency with the definition of a Medicare FFS beneficiary under section 1899(h)(3) of the Act. While we maintain that our existing policies for determining eligibility for assignment are consistent with such definition, we acknowledge that these eligibility criteria potentially operate to exclude from eligibility for assignment beneficiaries that may satisfy this definition.

Section 1899(h)(3) of the Act defines a ''Medicare fee-for-service beneficiary'' as an individual who is enrolled in the original Medicare FFS program under Parts A and B and is not enrolled in an MA plan under Part C, an eligible organization under section 1876 of the Act, or a PACE program under section 1894 of the Act. In the prior rulemaking discussed previously in this section, we adopted restrictive eligibility criteria under the assignment methodology we established under section 1899(c) of the Act. Under this approach, a beneficiary is eligible for assignment only if, during the 12-month assignment window (as defined under § 425.20, and described in section III.G.2.a.(1) of this final rule), the beneficiary has at least 1 month of Part A and Part B enrollment, but no month of Part A only or Part B only enrollment, and no month of Medicare group health plan enrollment. The requirements excluding from eligibility for assignment Medicare FFS beneficiaries that have a month of Part A only or Part B only enrollment, or Medicare group health plan enrollment during the assignment window are consistent with, but not required by, section 1899(h)(3) of the Act. In our response to comments included in the June 2015 final rule (80 FR 32745), we did not disagree that it could be permissible under section 1899(h)(3) of the Act for beneficiaries with some months of Medicare group health plan enrollment to be eligible for assignment by noting our intention to potentially address this issue in future rulemaking. Moreover, in earlier rulemaking, we did not specify that the more restrictive view we took towards identifying beneficiaries eligible to be assigned based on Medicare enrollment status was the only possible approach to operationalizing identification of a Medicare FFS beneficiary under the definition of section 1899(h)(3) of the Act for assignment under section 1899(c) of the Act.

The second consideration was that an objective of the Shared Savings Program is to help align incentives between Part A and Part B. The Shared Savings Program's financial methodology similarly reflects the alignment of Part A and Part B incentives and the composition of the ACO's assigned population, in that we only consider expenditures for months during which the beneficiary was enrolled under both Parts A and B [274] in determining benchmark year and performance year expenditures. We acknowledge that the existing assignment eligibility criteria based on Medicare enrollment status, in which we require a beneficiary to have at least 1 month of Part A and Part B enrollment, but no month of Part A only or Part B only enrollment, and no month of Medicare group health plan enrollment during the assignment window, is not the only way to further the objective to align incentives between Parts A and B. For instance, this alignment will be achieved under an approach that allows for beneficiaries to be eligible for assignment if they have at least 1 month of Part A and B enrollment during the assignment

medicare/payment/fee-for-service-providers/shared-savings-program-ssp-acos/guidance-regulations.

[273] The Physician Group Practice (PGP) demonstration, authorized under section 1866A of the Act, was implemented by CMS from April 2005 through March 2010, and served as a model for many aspects of the Shared Savings Program (see, for example, 76 FR 67833). Although not expressly stated in earlier rulemaking, the assignment eligibility criteria initially established under the Shared Savings Program closely tracked the parameters for the assignment methodology under the PGP demonstration. See for example, Kautter, J. et al. (RTI International), ''Physician Group Practice Demonstration Bonus Methodology Specifications'' (December 20, 2004), available at *https://www.cms.gov/priorities/innovation/files/x/pgp-payment.pdf* (Section 3.1 Assignment Criteria, pages 9–10).

[274] For a description of how CMS annualizes the assigned beneficiary's expenditures, refer to Medicare Shared Savings Program, ''Shared Savings and Losses, Assignment and Quality Performance Standard Methodology Specifications'' (April 2026, Version #14), available at *https://www.cms.gov/files/document/medicare-shared-savings-program-shared-savings-losses-assignment-methodology-specifications-version.pdf-0* (Section 3.1.2 Annualizing Assigned Beneficiary Expenditures).

window in combination with the existing approach to determining the beneficiary's expenditures for the same month(s) the beneficiary was enrolled in Part A and B.

Based on this reconsideration and to increase the number of Medicare FFS beneficiaries in accountable care relationships, we proposed to expand the criteria for assignment eligibility to permit assignment of a Medicare FFS beneficiary with at least 1 month of Part A and Part B enrollment during the assignment window and no Medicare group health plan enrollment during that same month. We believe this approach will retain consistency with section 1899(h)(3) of the Act and further the Shared Savings Program's stated objective of aligning incentives between Part A and Part B. This modification to the assignment eligibility criteria and prospective assignment exclusion criteria will incrementally increase the assigned population and be aligned with our goal of growing the number of Medicare FFS beneficiaries involved in accountable care relationships (described in section III.G.2.a.(1)(d) of this final rule). Additionally, as we address in the following discussion, this approach to identifying beneficiaries eligible for assignment based on Medicare enrollment status will align with our use of Shared Savings Program-eligible months in identifying beneficiaries eligible for assignment and calculation of assigned beneficiary expenditures using months of Part A and B enrollment, and bring greater symmetry to program calculations based on the assigned and assignable populations.

In determining assignment, we identify a beneficiary's Shared Savings Program-eligible months, in which the beneficiary is alive on the first of the month, enrolled in both Parts A and B, and not enrolled in a Medicare group health plan.[275] This results in assignment of beneficiaries with between 1 and 12 months of Parts A and B enrollment, so long as the remaining criteria under § 425.401(a) are met. There are various reasons for beneficiaries currently eligible for assignment to have fewer than 12 months of Parts A and B enrollment, including the timing of when the beneficiary becomes eligible for Medicare, and if a beneficiary dies during the period. We also use Shared Savings Program-eligible months for assigned beneficiaries in other Shared Savings Program operations, including to assign a monthly enrollment status to the beneficiary according to four Medicare enrollment types (ESRD, disabled, aged/dual eligible Medicare and Medicaid beneficiaries, aged/non-dual eligible Medicare and Medicaid beneficiaries) and to calculate beneficiary person years.[276] [277] The approach to identifying beneficiaries as eligible for assignment if they have at least 1 month of Part A and Part B enrollment and no Medicare group health plan enrollment during that same month during the assignment window, will effectively expand the population of assigned beneficiaries who have fewer than 12 months of Parts A and B enrollment.

Under our existing approach we determine, based on the point in time assignment is run, whether a beneficiary meets the assignment eligibility criteria or must be excluded from the assigned population based on the criteria specified under § 425.401. In doing so we consider the beneficiary's eligibility throughout the applicable assignment window for the assignment run, using the relevant data available on Medicare enrollment status, overlap in assignment with other Medicare shared savings initiatives, and other factors.[278] We will maintain this approach, based on the point in time assignment is run, in implementing the revised assignment eligibility criteria and prospective assignment exclusion criteria.

We also noted in the CY 2027 PFS proposed rule that for beneficiaries assigned under the eligibility criteria based on Medicare enrollment status, we would apply the existing approach to determine expenditures used in benchmark year and performance year expenditure calculations in which we only consider expenditures for months during which the beneficiary was enrolled under both Parts A and B. That is, we would not consider expenditures for months in which the beneficiary was enrolled under Part A only or Part B only. We also noted in the CY 2027 PFS proposed rule that the Shared Savings Program financial calculations do not consider Part C claims data. We believe this modified approach would remain consistent with the program's objective to hold ACOs accountable for the total cost of the beneficiary's care as based in Parts A and B expenditures.

As described in section III.G.2.a.(1)(b) of this final rule, the assignable beneficiary population (as defined in § 425.20) is a subset of the larger population of Medicare FFS beneficiaries, as defined under section 1899(h)(3) of the Act and § 425.20. Operationally, this population includes beneficiaries that have at least 1 month of Part A and Part B enrollment and no Medicare group health plan enrollment during that same month during the applicable 12-month assignment window. This approach to identifying Medicare FFS beneficiaries who meet the criteria for inclusion in the assignable population is less restrictive compared to the existing assignment eligibility criteria and prospective assignment exclusion criteria based on Medicare enrollment status. Applying a similar approach to identifying Medicare FFS beneficiaries eligible for assignment could bring greater symmetry to the composition of the assignable beneficiary population and the assigned population and thereby allow for more comparable calculations between factors based on assignable beneficiary expenditures used in establishing, adjusting and updating the ACO's historical benchmark and factors based on the ACO's assigned population (including benchmark year and performance year expenditures).

As described in the Regulatory Impact Analysis, in section VI of this final rule, as enrollment in MA has grown over recent years,[279] so has the number of beneficiaries switching back to OM from MA.[280] Our current eligibility criteria

[275] In the June 2015 final rule (80 FR 32745), we specified that only beneficiaries enrolled in traditional Medicare FFS under Parts A and B ''throughout the full performance year'' are eligible to be assigned to an ACO. However, this statement from earlier rulemaking does not always accurately reflect the Shared Savings Program's assignment operations in which we allow for an eligible beneficiary who has fewer than 12 months of enrollment in Parts A and B to be assigned to an ACO.

[276] To calculate person years: We sum the number of Shared Savings Program-eligible months for each assigned beneficiary for each Medicare enrollment type; we then divide this number by 12 (the number of months in a calendar year).

[277] See Medicare Shared Savings Program, ''Shared Savings and Losses, Assignment and Quality Performance Standard Methodology Specifications'' (April 2026, Version #14), available at *https://www.cms.gov/files/document/medicare-shared-savings-program-shared-savings-losses-assignment-methodology-specifications-version.pdf-0* (Section 3.1. Calculating ACO-Assigned Beneficiary Expenditures).

[278] The Medicare Shared Savings Program, ''Shared Savings and Losses, Assignment and Quality Performance Standard Methodology Specifications'' (April 2026, Version #14), includes among other information, selected characteristics of Shared Savings Program ACO reports for ACOs under preliminary prospective assignment with retrospective reconciliation and for ACOs under prospective assignment (see Appendix F, Tables 14 and 15.)

[279] See, for example, *Data.CMS.gov*, Medicare Enrollment Dashboard, Medicare Enrollment for March 2026, available at *https://data.cms.gov/tools/medicare-enrollment-dashboard* (showing yearly trend data for MA, FFS, and Total, from 2013 through 2025).

[280] See Xu L, et al. ''Medicare Switching: Patterns Of Enrollment Growth In Medicare Advantage, 2006–22''. *Health Affairs* (September 5, 2023), available at *https://doi.org/10.1377/*

based on Medicare enrollment status restricts and delays the eligibility of such beneficiaries for assignment to ACOs. Allowing beneficiaries with at least one month of Part A and Part B enrollment and no Medicare group health plan enrollment during that same month during the assignment window to be eligible for assignment would allow us to more accurately account for when this population qualifies as Medicare FFS beneficiaries and, in turn, is included in ACO assignment, and encompass various circumstances around the timing of a beneficiary's enrollment in Medicare and changes in enrollment that result in a beneficiary having one or more months of Part A only or Part B only enrollment, or Medicare group health plan enrollment.[281] We also note that the population of beneficiaries transitioning between MA and OM are captured in the assignable beneficiary population. In this respect, the approach to align the assignment eligibility criteria and prospective assignment exclusion criteria with the approach we use to identify the assignable beneficiary population based on Medicare enrollment status serves an important purpose in resolving the asymmetry between the assigned and assignable populations which has grown over time in light of changes to Medicare enrollment trends.

ACOs may rely on programmatic data included in program reports and data files we deliver to ACOs (described in section III.G.2.a.(2)(d) of this final rule) to understand their assigned population, and the reason for beneficiaries' ineligibility for assignment, among other factors. Additionally, ACOs may be accustomed to coordinating care, reporting quality measures, and considering approaches to lowering growth in expenditures for Medicare beneficiaries eligible for assignment, which presently includes beneficiaries with at least 1 month of Part A and Part B enrollment, but no month of Part A only or Part B only enrollment, and no month of Medicare group health plan enrollment during the assignment. As described in section III.G.2.a.(2)(d) of this final rule, we anticipate updating the Shared Savings Program's publicly available specification documents, programmatic resources, and program reports to include information that would help ACOs understand their assigned population and the population of beneficiaries eligible to be assigned under the revised assignment methodology. Although we recognize it may take ACOs time to update their data systems and models for analysis of Shared Savings Program data, we do not believe this potential concern outweighs the reasons for proposing this change described elsewhere in section III.G.2.a of this final rule. We noted in the CY 2027 PFS proposed rule that the proposal to apply the changes to the beneficiary assignment methodology for the PY starting on January 1, 2028, and subsequent PYs, provides time for ACOs to prepare for any related changes.

We proposed to revise the assignment eligibility criteria and prospective assignment exclusion criteria based on Medicare enrollment status under § 425.401, and to apply the revised criteria in determining assignment for the PY starting on January 1, 2028, and subsequent PYs. We discuss the timing of applicability further in section III.G.2.a.(2)(d) of this final rule, including use of the same assignment rules in determining beneficiary assignment for purposes of benchmark calculations as would apply in the PY. The following is a description of the criteria for a beneficiary to be assigned to an ACO for a PY or benchmark year which would apply for the PY starting on January 1, 2028, and subsequent PYs. Later in this section of this final rule, we detail our proposal to revise and republish § 425.401, including to incorporate the following new provisions.

Under new § 425.401(a)(2), we proposed to specify the beneficiary assignment eligibility criteria applicable for the PY starting on January 1, 2028, and subsequent PYs. Accordingly, we proposed a beneficiary may be assigned to an ACO under the assignment methodology in §§ 425.402 and 425.404, for a performance or benchmark year, if the beneficiary meets all of the following criteria during the assignment window:

- Has at least 1 month of Part A and Part B enrollment and does not have Medicare group (private) health plan enrollment during that same month during the assignment window.
- Is not assigned to any other Medicare shared savings initiative.
- Lives in the U.S. or U.S. territories and possessions, based on the most recent available data in our beneficiary records regarding the beneficiary's residence at the end of the assignment window.

We noted in the CY 2027 PFS proposed rule that under the proposed approach to revising the assignment eligibility criteria based on Medicare enrollment status, we would continue to apply the existing criteria which ensure that a beneficiary is not assigned to any other Medicare shared savings initiative (consistent with § 425.401(a)(3)), and lives in the U.S. or U.S. territories and possessions (consistent with § 425.401(a)(4)).

Under new § 425.401(b)(2), we proposed to specify the prospective assignment exclusion criteria applicable for the PY starting on January 1, 2028, and subsequent PYs. Accordingly, we proposed a beneficiary would be excluded from the prospective assignment list of an ACO that is participating under prospective assignment under § 425.400(a)(3) at the end of a performance or benchmark year and quarterly during each PY consistent with § 425.400(a)(3)(ii) if the beneficiary meets any of the following criteria during the performance or benchmark year: [282]

- Does not have at least 1 month of Part A and Part B enrollment without Medicare group (private) health plan enrollment during that same month during the assignment window.
- Did not live in the U.S. or U.S. territories and possessions, based on the most recent available data in our beneficiary records regarding the beneficiary's residency at the end of the year.

We noted in the CY 2027 PFS proposed rule that under the proposed approach to revising the prospective assignment exclusion criteria, we would continue to apply the existing criterion to exclude from prospective assignment a beneficiary that did not live in the

hlthaff.2023.00224 (finding only slightly increasing number of switchers from MA to OM over 2020 to 2023 compared to earlier years, and includes Exhibit 3 indicating higher rates of switching from MA to FFS for disabled beneficiaries, full dual eligible beneficiaries, and beneficiaries with >3 HCC diagnostic codes in 2022). See also, Mackleby G, Liu A, and Trish E. ''Switching Medicare Plans Outside Open Enrollment Was Increasingly Common, Especially Among Sicker Enrollees, 2015–22''. *Health Affairs* (February 2, 2026), available at *https://www.healthaffairs.org/doi/10.1377/hlthaff.2025.00915* (among MA enrollees, finding compared with Medicare open enrollment period switchers, alternative enrollment period switchers tended to have higher risk scores and hospitalization rates before switching).

[281] We note that there are a multitude of factors impacting the timing for when a beneficiary enrolls in OM or a MA plan, and the timing of when a beneficiary may change to a different MA plan or switch back to OM. Information on initial enrollment in OM and timing for when a beneficiary can join, switch, drop or make changes in their MA plan, is included in the Medicare & You Handbook (2026), available at *https://www.medicare.gov/publications/10050-medicare-and-you.pdf.*

[282] We omitted from this description the reference to applicability of the prospective assignment exclusion criteria for determining assignment to ACOs participating under a 6-month PY or performance period during CY 2019, under § 425.609(b)(1)(ii) and (c)(1)(ii) which is otherwise retained for completeness in the introductory text of § 425.401(b) (under the proposed amendments).

U.S. or U.S. territories and possessions (consistent with § 425.401(b)(3)).

More generally, we note that the assignment eligibility criteria and prospective assignment exclusion criteria under § 425.401 apply in determining beneficiaries assigned under claims-based assignment and voluntary alignment. We anticipate the proposed changes in criteria based on Medicare enrollment status would increase the population assigned under both methods.

We proposed to revise and republish § 425.401, to specify the existing criteria for a beneficiary to be assigned to an ACO for a performance or benchmark year apply to PYs starting prior to January 1, 2028 (as applicable), and to specify the proposed criteria applicable for the performance year starting on January 1, 2028, and subsequent performance years. The following list summarizes the proposed amendments to § 425.401:

- We proposed to add subject headings to the introductory text of paragraphs (a) and (b) of § 425.401 to specify the following: paragraph (a) includes provisions with ''Assignment eligibility criteria''; and paragraph (b) includes provisions with ''Prospective assignment exclusion criteria''.
- We proposed to revise § 425.401(a)(1) to specify the provisions with assignment eligibility criteria applicable for PYs starting prior to January 1, 2028 (as applicable), by making the following amendments:

++ Redesignating paragraphs (a)(1)(i) and (ii) as paragraphs (a)(1)(i)(A) and (B) (respectively), and redesignating paragraphs (a)(2) through (a)(4) as paragraphs (a)(1)(ii) through (a)(1)(iv) (respectively).

++ Adding the following heading to introductory text of paragraph (a)(1), specifying the timing of applicability for the provisions: ''For performance years starting prior to January 1, 2028 (as applicable)''.

- We proposed to add new paragraph (a)(2) with the assignment eligibility criteria applicable for the performance year starting on January 1, 2028, and subsequent performance years (previously described in this section of this final rule).
- We proposed to revise § 425.401(b)(1) to specify the provisions with prospective assignment exclusion criteria applicable for performance years starting prior to January 1, 2028 (as applicable), by making the following amendments:

++ Redesignating paragraphs (b)(1)(i) and (ii) as paragraphs (b)(1)(i)(A) and (B) (respectively), and redesignating paragraphs (b)(2) and (b)(3) as paragraphs (b)(1)(ii) and (b)(1)(iii) (respectively).

++ Adding the following heading to introductory text of paragraph (b)(1), specifying the timing of applicability for the provisions: ''For performance years starting prior to January 1, 2028 (as applicable)''.

- We proposed to add new paragraph (b)(2) with the prospective assignment exclusion criteria applicable for the PY starting on January 1, 2028, and subsequent PYs (previously described in this section of this final rule).

We also proposed a technical and conforming change to cross-references to provisions of § 425.401 within § 425.612(a)(1)(iv)(A)(*2*), which describes certain conditions under which we make payments for SNF services furnished to a beneficiary preliminarily prospectively assigned to an ACO for which a waiver of the SNF 3-day rule was approved.

We sought comment on the proposed changes under which we would apply modified assignment eligibility criteria and prospective assignment exclusion criteria based on a beneficiary's Medicare enrollment status in determining assignment to an ACO for the performance year starting on January 1, 2028, and subsequent PYs. Under the proposed approach more beneficiaries would be eligible for assignment, and remain prospectively assigned to ACOs, under both claims-based assignment and voluntary alignment, than under current program policies. We sought comment on the proposed amendments to § 425.401 (as revised and republished), specifying the assignment eligibility criteria and prospective assignment exclusion criteria that would apply by PY, and the proposed technical and conforming change to cross-references to provisions of § 425.401 within § 425.612(a)(1)(iv)(A)(2).

We received public comments on these proposals. The following is a summary of the comments we received and our responses.

Comment: Some commenters expressed general support for the proposed change to assignment eligibility criteria. Many other supporting commenters cited the policy as a means of growing the Shared Savings Program and increasing beneficiaries in accountable care relationships.

A couple of commenters supported the policy emphasizing the importance of ensuring assignment policy accurately reflects beneficiaries that ACOs can manage. Another commenter stated that the proposed changes will contribute towards improved management and quality of care their ACO provides and emphasizes the importance of ensuring the Shared Savings Program beneficiaries are aligned with providers that meet the program goals. Another commenter expressed support, stating that improved consistency and clarity in beneficiary assignment standards will be especially helpful for organizations in long-term value-based payment arrangements.

A couple of commenters expressed their support of the policy and recommended that CMS provide supporting data regarding the expected impacts on assignment growth and beneficiary characteristics.

Response: We appreciate comments in support of the proposed policy, which is intended to increase the Shared Savings Program assigned beneficiary population and improve symmetry between the definitions of the assigned and assignable populations. We appreciate that these comments recognize and support this intent, while also highlighting other potential beneficial impacts of the policy (for example, improving quality of care provided by ACOs, and consistency in assignment standards).

Comment: We received several comments expressing opposition to the proposed assignment methodology. A commenter stated that ACO clinicians should not be required to assume the care, cost, and risk for patients who delay care until they are covered by Medicare. Another commenter does not support the goal of expanding the number of beneficiaries in ACOs.

Many comments expressed conceptual agreement with the policy and CMS' goals but cited various concerns. For example, a commenter warned that the policy could result in fewer beneficiaries in the Shared Savings Program if fewer ACOs decide to participate. Several commenters warned of an influx of hospice patients who transition to Traditional Medicare once they need the hospice benefit. A commenter expressed concern that ACOs do not have time to reach out to beneficiaries or engage them properly in care when they transition to Traditional Medicare mid-year. A commenter urged CMS to assess the impact of the interaction between this policy and recent changes to the enrollment pathways for dually-eligible special needs plans (D–SNPs), due to significant risk of beneficiaries transitioning in and out of Medicare Advantage while remaining assigned to an ACO. A commenter asked CMS to monitor the impact on beneficiaries in long-term care (LTC) who transition between FFS

Medicare and Medicare Advantage for any instability in their assignment population and to ensure that ACO and LTC providers have up-to-date information on these beneficiaries. Some commenters recommended that CMS implement guardrails to mitigate unintended negative consequences and adverse impacts on gross savings/losses, particularly for the small number of ACOs expected to experience larger impacts and those that serve populations with higher cost and higher risk.

Response: We appreciate concerns raised in comments about decreased ACO participation in the Shared Savings Program. We acknowledge the commenter's suggestion that it is possible that a small decrease in the number of participating ACOs could occur, however, as a result of this policy we expect the overall number of assigned beneficiaries to increase, which is expected to increase savings and aligns with program goals, see discussion of program impacts in the Regulatory Impact Analysis in section VI.8.(a) of this final rule. CMS feels that this outweighs the possibility of fewer ACOs participating in the Shared Savings Program. We appreciate the comments concerning being held accountable for beneficiaries who are newly transitioning from Medicare Advantage and the potential complications, including, an influx of patients receiving hospice care, ACOs not having time to engage new beneficiaries in care, and changes to the dually-eligible special needs plans enrollment pathways. With respect to commenters' concerns about an increase in hospice beneficiaries or other special populations with high costs of care, the policy is intended to bring greater symmetry to program calculations between the assigned and assignable populations. This will allow for better comparison between factors based on assignable beneficiary expenditures. In other words, the assignable population already allows for beneficiaries who transition from Medicare Advantage mid-year and includes beneficiaries who joined Traditional Medicare in order to choose Medicare's hospice benefit or for other similar reasons. Therefore, any increases that ACOs see in assigned beneficiary populations under the proposed policy would align with populations already included in the assignable population, which would serve to improve symmetry in comparing expenditures to benchmarks. Additionally, the policy would be implemented in the same manner between benchmark and performance years, making changes as a result of the policy comparable. CMS believes that by improving alignment in the methodology used to determine the ACO-assigned and assignable populations, and symmetry in application of the policy in benchmark and performance years, ACOs will be fairly held accountable for care and expenditures that they have previously not been subject to. Financial impacts to ACOs are expected to be relatively modest, with average change in aggregate gross savings/losses of less than 1% based on PY 2025 simulations.

A similar line of reasoning applies to concerns about having time to reach out to beneficiaries newly transitioned from Medicare Advantage. The policy only brings in beneficiaries who would already be eligible for the assignable population and allows them to enter the assigned population, and some ACOs may already be aware of providing care for these beneficiaries before being assigned. Additionally, ACOs often have beneficiaries assigned to their ACO late in the performance year, and this policy likely only marginally increases this already existing circumstance.

In simulations of the policy using PY 2025 data, we found that ACOs with a higher proportion of beneficiaries with LTI status experienced $11 lower average per capita gross savings/losses (-1.82 percent). ACOs with a lower proportion of beneficiaries with LTI Status that saw $15 lower average per capita gross savings/losses (-3.17 percent) as a result of the policy.

In simulations using PY 2025 data, ACOs with a higher proportion of beneficiaries with hospice status saw a $5 lower average per capita gross savings/losses (−1.05 percent) as an impact of the policy, while other ACOs had $17 lower average per capita gross savings/losses (−3.37 percent). Hospice status was determined by whether a beneficiary began hospice coverage during the benchmark or performance year.

Although estimated impacts of the policy differed across ACOs by proportions of beneficiaries with LTI status or with hospice status, these differences were not statistically significant and therefore do not provide evidence that the policy would have different effects across the groups examined.

With regard to the request that CMS implement guardrails to mitigate unintended negative consequences, while we appreciate the comments concerning the disproportionate impacts on ACOs that serve beneficiaries with higher risk, we believe this would add unnecessary additional complexity relative to the impacts and benefits from the proposed policy. In simulations of PY 2025 data, we compared ACOs whose assigned beneficiaries had higher average Hierarchical Condition Category (HCC) scores. ACOs in the top quartile of HCC scores had a non-statistically significant impact on average gross savings/losses than ACOs with lower average HCC scores. Instead of guardrails we will continue monitoring the impact of the policy on ACOs for possible unintended negative consequences as performance data becomes available.

Comment: Many commenters expressed concerns that the Shared Savings Program risk adjustment isn't built to handle beneficiaries with incomplete or transitional Medicare enrollment histories, causing risk scores to potentially understate true expected costs. As a result, ACOs could be held accountable for higher-cost or higher-risk beneficiaries whose expenditures aren't fully captured in risk-adjusted benchmarks—whether the transition stems from mid-year Medicare Advantage-to-hospice disenrollment or from having under 12 months of traditional Medicare enrollment, such as those newly aging in or coming from Medicare Advantage.

Response: We appreciate concerns raised in comments about risk adjustment not accounting for beneficiaries who have incomplete or transitional Medicare enrollment histories, or who have mid-year transitions from Medicare Advantage (MA). We disagree, however, that the CMS–HCC risk adjustment model, which is used in the Shared Savings Program for risk adjustment, is poorly suited to these populations or that it would systematically understate expected costs for ACOs. The CMS–HCC risk adjustment model is designed for and calibrated on claims and enrollment data taken from a sample of the national Medicare FFS population, including Medicare beneficiaries who are not enrolled in the Shared Savings Program.[283] Additionally, when calculating risk scores, we take all beneficiary data irrespective of the source, so diagnoses captured by MA organizations would still be reflected in the beneficiaries' risk scores for that year. When beneficiaries have 12 months of entitlement to Part A and less than 12 months of Part B enrollment during the data collection period, they do not receive the standard diagnosis-

[283] Details on CMS risk adjustment can be found at *https://www.cms.gov/medicare/payment/medicare-advantage-rates-statistics/risk-adjustment.*

based risk adjustment. Instead, CMS assigns risk using new enrollee's demographic factors, such as age, sex, and original reason for Medicare Entitlement. CMS uses the same model for Medicare Advantage risk adjustment and other Medicare payment purposes. Because the CMS–HCC risk adjustment model already reflects cost variation across the full range of Medicare FFS beneficiaries, the model already accounts for enrollment history and beneficiary transitions. Using one model across Medicare Advantage, the Shared Savings Program, and other Medicare payment contexts allows CMS to risk-adjust based on the same national standard for all beneficiaries. Modifying the model, or applying a different one, solely for ACO-assigned beneficiaries could create inconsistency in how CMS measures expected costs across the Medicare program and may undermine the comparability that a single, nationally calibrated model provides.

Comment: Many commenters recommended that CMS delay implementation until further analysis and monitoring can be conducted to assess the impact of this policy, including distributions of the simulated policy impact by varying ACO characteristics such as revenue or population size.

Response: We acknowledge recommendations made in the comments to delay policy implementation until CMS has conducted further analysis on the expected impact. Additionally, we appreciate the commenters' recommendations for further monitoring to ensure that the implementation of the proposed policy has the intended effect without negatively impacting certain ACOs, providers, or beneficiary populations. CMS declines to delay implementation but will continue monitoring the impact of the policy on ACOs.

In addition to proposed rule simulations, further analysis was conducted to examine the CY 2027 PFS proposed rule's impact on ACOs using simulated data from PY 2025. We found that policy impacts on aggregate savings/losses were very minimal on average, decreasing ACO aggregate shared savings/shared losses by $1,574 (−0.02 percent). Impacts on per capita savings/losses were also relatively small, decreasing average ACO per capita savings/losses by −$14.02 (−2.78 percent). The number of assigned beneficiaries increased by an average of 1,182 (5.07 percent).

In these additional simulations using PY 2025 data, we compared the impact of the policy on financial performance of ACOs with higher average HCC scores. ACOs with higher HCC scores experienced a $54,116 increase in average aggregate gross savings/losses (0.41 percent), while other ACOs had a $20,138 decrease in average per capita gross savings/losses (−0.22 percent). This difference was not statistically significant and therefore does not provide evidence that the policy would have different effects on ACOs by average risk score.

For additional analysis on this proposed policy, CMS directs commenters to the Regulatory Impact Analysis in section VI of the CY 2027 PFS proposed rule (91 FR 44253 through 44258).

After consideration of public comments, we are finalizing revisions to the assignment eligibility criteria and prospective assignment exclusion criteria based on Medicare enrollment status under § 425.401, and to apply the revised criteria in determining assignment for the PY starting on January 1, 2028, and subsequent PYs as proposed. We are also finalizing to revise and republish § 425.401, to specify the existing criteria for a beneficiary to be assigned to an ACO for a performance or benchmark year apply to PYs starting prior to January 1, 2028 (as applicable), and to specify the proposed criteria applicable for the performance year starting on January 1, 2028, and subsequent performance years as proposed. We are also finalizing as proposed a technical and conforming change to cross-references to provisions of § 425.401 within § 425.612(a)(1)(iv)(A)(*2*), which describes certain conditions under which we make payments for SNF services furnished to a beneficiary preliminarily prospectively assigned to an ACO for which a waiver of the SNF 3-day rule was approved.

(c) Simulations To Understand the Potential Effect of Changes

In the CY 2027 proposed rule we performed separate simulations to understand the potential effect for each of the changes to the assignment methodology.

Using PY 2024 data we simulated the impact of the proposed approach to excluding from assignment calculations allowed charges for primary care services billed through a non-ACO TIN by an ACO professional used in assignment (described in section III.G.2.a.(2)(a) of this final rule). The simulation was performed using data for all 476 ACOs reconciled for PY 2024. For purposes of the simulation, we made multiple simplifying assumptions. This included treating all ACOs as if they were under preliminary prospective assignment with retrospective reconciliation for purposes of identifying the impact on assignment and simplicity of simulating benchmark assignment. Since the change is to plurality competition, we would anticipate a comparable impact if we performed the simulation using the off-set assignment window. For simulating financial impacts, we assumed all ACOs to be starting their first agreement period on January 1, 2024, to have benchmark years of BY 2021, 2022 and 2023, and applied an equal weight to each BY in benchmark calculations. In approximating the benchmark calculations under the simulations, we applied the benchmarking methodology applicable for ACOs entering an agreement period beginning on January 1, 2024 under §§ 425.652 through 425.660, with several exceptions. In adjusting the benchmark to account for changes in severity and case mix of the assigned beneficiary between BY3 and PY 2024 under § 425.652(a)(10), we applied the approach to capping positive adjustments at 3 percent in accordance with §§ 425.605(a)(1)(i) and 425.610(a)(2)(i) rather than the demographic plus 3 percent cap specified under §§ 425.605(a)(1)(ii) and 425.610(a)(2)(ii). We also simulated the updated benchmark using a one-third weight for the ACPT component of the three-way blended update factor, although a one-sixth weight was applied in determining financial reconciliation for PY 2024, as described in section III.G.5.g of this final rule. In simulating the updated benchmark calculations we did not apply the existing guardrail policy specified in § 425.652(b)(5), which ensures that the use of the three-way blended update factor will not result in lower benchmarks than the two-way national-regional blended update factor in a way that poses higher financial risk for ACOs under two-sided models, or that could jeopardize an ACO's continued participation in the Shared Savings Program under the financial performance monitoring policy described in § 425.316(d), or both.[284]

Under these simulations, we observed that the change to the plurality competition would add over 97,800 assigned beneficiary person years to Shared Savings Program assignment (nearly 1 percent growth). In simulations, we found that 462 of 476 ACOs (or 97 percent) observed less than 1 percent growth, while the remaining 14 out of 476 ACOs (3 percent) experienced growth greater than 4

[284] See 87 FR 69885.

percent, including one ACO that observed growth as large as 12 percent.

Under simulations of the financial impacts, using PY 2024 data, we calculated ACOs' updated benchmark expenditures minus PY expenditures, to estimate impacts on gross savings/losses; with a resulting reduction in this amount indicating potentially lower shared savings, and greater liability for shared losses. We found that ACOs observed an average 3.90 percent decrease in per capita gross savings/losses ($14 per capita)[285] and an average 3.92 percent decrease in aggregate gross savings/losses. Average reductions in gross savings/losses were driven by two factors: (1) the simulated assignment method tended to add relatively more beneficiaries in the PY (2024) than they added in the benchmark years (2021, 2022, 2023); and (2) the added beneficiaries were substantially higher cost and had higher risk scores than beneficiaries assigned to ACOs under the existing assignment methodology. These two factors combined mean that ACOs' average benchmark expenditures increased by a relatively smaller degree than their PY expenditures increased, resulting in lower gross savings/losses.

Using PY 2024 data in the proposed rule analysis, we simulated the impact of the proposed approach to revising the assignment eligibility criteria and prospective assignment exclusion criteria based on Medicare enrollment status (described in section III.G.2.a.(2)(b) of this final rule). For purposes of simulating the changes to the prospective assignment exclusion criteria based on Medicare enrollment status, it was important to recognize the ACO's selection of assignment methodology, to be able to accurately observe the impact of the change. Therefore, we performed separate simulations for ACOs based on their selection of assignment methodology. For ACOs under preliminary prospective assignment with retrospective reconciliation, we simulated the change to assignment eligibility criteria using a 12-month assignment window that aligned with PY 2024. For ACOs under prospective assignment, we simulated the change to assignment eligibility criteria using an offset assignment window from October 2022 through September 2023. In both cases, we identified beneficiaries with at least 1 month of Part A and Part B enrollment and no Medicare group health plan enrollment (including MA) during that same month during the applicable assignment window as being eligible for assignment. For ACOs under prospective assignment we further simulated application of the modified exclusion criteria applied at the end of PY 2024 based on CY 2024 data (making certain simplifying assumptions). To remain prospectively assigned under the simulated modified Medicare enrollment status criteria, the beneficiary had at least 1 month of Part A and Part B enrollment and no Medicare group health plan enrollment during the same month, during CY 2024. For simulating financial impacts, we made the same assumptions as previously described in this discussion used to simulate the impact of the proposed changes to plurality competition, with respect to identifying benchmark years and related weights for ACOs, as well as the benchmarking methodology that was applied including the approach to adjusting and updating the historical benchmark.

Based on our simulations, across all ACOs for PY 2024, we observe an increase of approximately 248,000 (2.45 percent) assigned beneficiary person years resulting from the proposed modifications to the assignment eligibility criteria and prospective assignment exclusion criteria based on Medicare enrollment status. We observed differing impacts on the assigned population for ACOs under prospective assignment versus preliminary prospective assignment with retrospective reconciliation, with the assigned population (in terms of assigned beneficiary person years) increasing with final assignment by 2.25 percent versus 2.57 percent respectively. This difference is explained by the type of beneficiaries that are being added with use of modified assignment eligibility criteria and prospective assignment exclusion criteria based on Medicare enrollment status. We observed that a larger share of beneficiaries that are initially prospectively assigned were removed from final assignment because they transition to and remain in a Medicare group health plan during the PY.

Under simulations of the financial impacts of modifying assignment criteria based on Medicare enrollment status, using PY 2024 data, we calculated ACOs' updated benchmark expenditures minus PY expenditures, to estimate impacts on gross savings/losses; with a resulting reduction in this amount indicating potentially lower shared savings, and greater liability for shared losses. We found that on average ACOs' PY per capita expenditures increased slightly more (by 0.60 percent) than benchmark per capita expenditures increased (by 0.43 percent), resulting in $20 lower average per capita gross savings/losses (−6.62 percent). Overall impacts on aggregate gross savings/losses were also negative but relatively smaller, decreasing average ACO gross savings/losses and program-wide gross savings/losses by 3.20 percent.

We observed differences in average expenditures and risk scores by Medicare enrollment type (ESRD, disabled, aged/dual eligible Medicare and Medicaid beneficiaries, aged/non-dual eligible Medicare and Medicaid beneficiaries) among the beneficiary population added with the simulated changes in assignment compared to the population already assigned. Related findings are summarized in Table B–G1. Within the ESRD enrollment type, we observed a disproportionately higher number of additional beneficiaries compared to the other enrollment types. The added population of ESRD beneficiaries had, on average, largely similar per capita expenditures and lower average risk scores than already assigned ESRD beneficiaries. Within the disabled and aged/dual eligible enrollment types, the added populations of beneficiaries had, on average, higher per capita expenditures and higher average risk scores than the corresponding populations of already assigned beneficiaries. Within the aged/non-dual eligible enrollment type, the added population of beneficiaries had, on average, slightly lower per capita expenditures and lower average risk scores than already assigned aged/non-dual eligible beneficiaries.

[285] The proposed rule cited an average per capita decrease of $355 under PY 2024 simulations. However, the correct average per capita decrease is $14. The value of $355 refers to the overall average per capita gross savings/losses under the simulated policy.

TABLE B-G1: SIMULATION OF PROPOSED CHANGES TO ASSIGNMENT ELIGIBILITY CRITERIA - NUMBER AND CHARACTERISTICS OF BENEFICIARIES ADDED FOR PY 2024

	Assigned Population under Existing Eligibility Criteria	Assigned Population Added with Proposed Medicare Enrollment Status Criteria	Percent Difference
Mean Assigned Person Years	**21,241.8**	**531.8**	**2.50%**
ESRD	75.6	6.1	8.03%
Disabled	1,448.2	85.9	5.93%
Aged/Dual	1,143.7	88.1	7.70%
Aged/Non-Dual	18,574.3	351.7	1.89%
Mean Per Capita Expenditures	**$13,256**	**$15,433**	**16.42%**
ESRD	$95,405	$92,714	-2.82%
Disabled	$12,657	$16,797	32.71%
Aged/Dual	$19,287	$23,435	21.51%
Aged/Non-Dual	$12,594	$12,570	-0.19%
Mean CMS-HCC Risk Score	**0.993**	**0.899**	**-9.47%**
ESRD	0.969	0.955	-1.38%
Disabled	0.966	1.122	16.15%
Aged/Dual	0.962	1.005	4.50%
Aged/Non-Dual	1.003	0.852	-15.08%

Note: The reported "Percent Difference" may slightly differ from manual recalculation using other values reported in the table due to rounding.

For additional analysis on estimated impacts, we also refer readers to the Regulatory Impact Analysis in section VI of this final rule. In the Regulatory Impact Analysis of this final rule, we describe the estimated financial impact of the change to exclude from assignment calculations for purposes of plurality competition, allowed charges for a beneficiary's primary care services billed through a non-ACO TIN by an ACO professional used in assignment if that beneficiary also had primary care services billed by an NPI under an ACO TIN (described in section III.G.2.a.(2)(a) of this final rule), and the changes to assignment eligibility criteria and prospective assignment exclusion criteria (described in section III.G.2.a.(2)(b) of this final rule). We explain that in combination the proposed changes to assignment would be estimated to result in higher net Federal savings, although the policies may also marginally decrease the number of ACOs participating in the Shared Savings Program as a result of assignment of higher cost beneficiaries to ACOs and reduced gross savings, while also increasing overall the number of beneficiaries assigned to Shared Savings Program ACOs. The collective proposed changes represent an opportunity to grow the number of Medicare FFS beneficiaries involved in accountable care relationships, and drive savings, which would advance us towards our goal to align spending and value in OM, and related strategic objectives (described in section III.G.1.a. of this final rule). The change to assignment calculations (described in section III.G.2.a.(2)(a) of this final rule) would reduce the potential for differences in billing patterns by ACO professionals (inside and outside the ACO), for care of the same beneficiaries, to result in differences in assignment outcomes that advantage the ACO's financial performance, in particular billing that results in non-assignment of higher cost and higher risk beneficiaries. The changes to assignment eligibility criteria and prospective assignment exclusion criteria based on Medicare enrollment status (described in section III.G.2.a.(2)(b) of this final rule), would allow for greater symmetry between the ACO assigned population and the assignable population, and help ensure consistency between Shared Savings Program calculations used in determining ACO financial performance. At this juncture, we believe the considerations outweigh the concern about the potential for attrition from the Shared Savings Program by ACOs unwilling to be held accountable for the quality and cost of care of this population of Medicare beneficiaries.

We also noted in the CY 2027 PFS proposed rule that we did not simulate the potential impact of the proposed changes to the assignment methodology on ACO quality performance. We refer readers to section III.G.3. of this final rule for a discussion of changes to the Shared Savings Program quality performance standard and other quality reporting requirements. Given the relatively small increases in ACOs' assigned populations that are likely to result under the proposed changes to the assignment methodology, we anticipate there would be minimal impact on ACOs' reporting of quality measures for the expanded population of beneficiaries.

We sought comment on the potential effects of the proposed changes to the assignment methodology on the composition of ACOs' assigned populations and ACOs' financial and quality performance. We also sought comment on the potential for these proposed changes to have unintended consequences for participation by ACOs, ACO participants, and ACO professionals, including with respect to their ability to meet Shared Savings Program goals for an expanded population of assigned beneficiaries which would result under the proposed changes to the Shared Savings Program assignment methodology. No comments were received related to quality performance or reporting and other relevant comments were summarized earlier in this section.

(d) Implementation of Revisions to the Beneficiary Assignment Methodology

As described in sections III.G.2.a.(2)(a) and (b) of the CY 2027 PFS proposed rule, we proposed changes to the Shared Savings Program beneficiary assignment methodology that would be applicable to all ACOs for the PY starting on January 1, 2028, and subsequent PYs. In this section of this final rule, we discuss impacts on certain program operations in additional detail, specifically: (1) the timing of applicability for the proposed approach in connection with the timing of the annual application cycle for ACOs to

enter a new agreement period under the Shared Savings Program; (2) applicability of the proposed approach to determining benchmark assignment and relatedly adjustments to historical benchmark calculations for ACOs participating in an existing agreement period; and (3) considerations specific to program reports and data which we make available to ACOs.

Consistent with how we have implemented previous changes to the Shared Savings Program assignment methodology, we would use the revised methodology each time assignment is determined for a given benchmark year or PY and, as applicable, to determine the eligibility of ACOs applying to enter into or renew participation in the Shared Savings Program. Regarding the latter, applicant eligibility for PY 2027 will be determined during CY 2026. As discussed in the proposed rule (91 FR 43855), we stated that we would not be able to review public comments and decide whether to finalize the proposed changes in sufficient time to apply the revised criteria for PY 2027 applications. We use estimates for the ACO's benchmark year assignment in multiple determinations during Phase 1 of the application cycle, which concludes in mid-October 2026, before the CY 2027 PFS final rule will likely be issued.[286] This includes, determining whether an ACO applicant meets the requirement for having at least 5,000 assigned beneficiaries (refer to § 425.110(a)(1) and (a)(3)), determining whether an ACO meets the definition of a low revenue ACO for purposes of eligibility for the Advance Investment Payment option (refer to § 425.630(b)(4)), and calculating the ACO's repayment mechanism amount (refer to § 425.204(f)). Additionally, we anticipate that the proposed revised approach to determining beneficiary assignment described in section III.G.2.a. of this final rule, would require significant operational changes to the Shared Savings Program assignment methodology, which would take time to prepare in advance of initial use of the approach during the application process. For these reasons, we would not be able to apply the revised beneficiary assignment methodology for the PY starting on January 1, 2027, and we proposed to apply this change beginning with the PY starting on January 1, 2028.

Additionally, we would apply the proposed revised approach to determining beneficiary assignment in establishing, adjusting, updating, and resetting historical benchmarks for ACOs entering new agreement periods beginning on January 1, 2028, and in subsequent years. Also consistent with how we have implemented previous changes to the assignment methodology, we would adjust benchmarks at the start of PY 2028 for all ACOs in agreement periods for which PY 2028 is a second or subsequent PY. Accordingly, the ACOs' benchmarks would reflect the use of the same assignment rules as would apply in the PY (refer to § 425.652(a)(9)).

In accordance with the Shared Savings Program regulations under subpart H, we provide ACOs with certain aggregate reports and beneficiary-identifiable claims data on the ACO's assigned beneficiary population, to conduct healthcare operations work. We are committed to maintaining transparency of Shared Savings Program by providing ACOs with data related to the determination of their assigned population, and providing ACOs with data on their assigned population to aid in their operations under the Shared Savings Program. Under § 425.704, we provide ACOs with monthly claim and claim line feed (CCLF) files with beneficiary-identifiable data, which include Parts A, B, and D data.[287] Further, in accordance with § 425.702, we provide ACOs with Shared Savings Program reports which include aggregate and beneficiary-identifiable information on their assigned population near the start of each PY, during each quarter, and in conjunction with annual financial reconciliation.[288] [289] We anticipate updating the Shared Savings Program's publicly available specification documents, programmatic resources, and program reports to include information that would help ACOs understand their assigned population and the population of beneficiaries eligible to be assigned under the revised assignment methodology.

We received no comments on our proposed implementation approach and are finalizing as proposed.

b. Revisions to the Definition of Primary Care Services Used in Shared Savings Program Beneficiary Assignment

(1) Background

Section 1899(c)(1) of the Act, as amended by the 21st Century Cures Act and the Bipartisan Budget Act of 2018, provides that the Secretary shall determine an appropriate method to assign Medicare FFS beneficiaries to an ACO based on their utilization of primary care services provided by physicians in the ACO who are ACO professionals and, in the case of PYs beginning on or after January 1, 2019, services provided by a FQHC or RHC. However, the statute does not specify a list of services considered to be primary care services for purposes of beneficiary assignment.

In the November 2011 final rule (76 FR 67853), we established the initial list of services, identified by Current Procedural Terminology (CPT) and Healthcare Common Procedure Coding System (HCPCS) codes, that we considered to be primary care services. In that final rule, we indicated that we intended to monitor CPT and HCPCS codes and would consider making changes to the definition of primary care services to add or delete codes used to identify primary care services if there were sufficient evidence that revisions were warranted. We have updated the list of primary care service codes in subsequent rulemaking (refer to 80 FR 32746 through 32748; 80 FR 71270 through 71273; 82 FR 53212 and 53213; 83 FR 59964 through 59968; 85 FR 27582 through 27586; 85 FR 84747 through 84756; 85 FR 84785 through 84793; 86 FR 65273 through 65279; 87 FR 69821 through 69825; 88 FR 79163 through 79174; 89 FR 98087 through 98101; 90 FR 49794 through 49797) to reflect additions or modifications to the codes that have been recognized for payment under the PFS and to incorporate other changes to the definition of primary care services for purposes of the Shared Savings Program. For the PY starting on January 1, 2025, and subsequent PYs, we defined primary care services for purposes of assigning beneficiaries to ACOs under § 425.402 at § 425.400(c)(1)(ix).

(2) Revisions

Based on continued review of the HCPCS and CPT codes that are currently

[289] CMS has made publicly available the PY 2026 Shared Savings Program Report templates through the ''Program Guidance & Specifications'' webpage of the Shared Savings Program website, at *https://www.cms.gov/medicare/payment/fee-for-service-providers/shared-savings-program-ssp-acos/guidance-regulations.*

used for payment under the PFS or that we proposed to use for payment under the PFS starting in CY 2027, we have determined it would be appropriate to propose to amend the definition of primary care services used in the Shared Savings Program assignment methodology to include certain additional codes for the PY starting on January 1, 2027, and subsequent PYs, to remain consistent with billing and coding under the PFS.

We proposed (91 FR 44035 through 44036) to specify a revised definition of primary care services used for assignment for the PY starting on January 1, 2027, and subsequent PYs in a new provision of the Shared Savings Program at § 425.400(c)(1)(xi) to include the list of HCPCS and CPT codes specified at § 425.400(c)(1)(x), as well as the following additions: Screening, Brief Intervention, and Referral to Treatment (SBIRT) (HCPCS codes G2011, G0396, and G0397), Vaccine Adverse Effects Management (HCPCS code GADV1), Advance Care Planning (HCPCS codes GACP1 and GACP2), under OM payment policy.

We proposed to use the new provision at § 425.400(c)(1)(xi) for determining beneficiary assignment for the PY starting on January 1, 2027, and in subsequent PYs.

The following provides additional information about the CPT and HCPCS codes that we proposed to add to the definition of primary care services used for purposes of beneficiary assignment:

- *Screening, Brief Intervention, and Referral to Treatment (HCPCS G2011, G0396, and G0397):* The purpose of the SBIRT program is to implement the screening, brief intervention, and referral to treatment public health model for children, adolescents, and/or adults in primary care and community health settings (for example, health centers, hospital systems, health maintenance organizations (HMOs), preferred-provider organizations (PPOs) health plans, Federally Qualified Health Centers (FQHC), behavioral health centers, pediatric healthcare providers, children's hospitals, etc.) and schools with a focus on screening for underage drinking, opioid use, and other substance use.[290] SBIRT [291] has three major components:

(1) Screening: Screen or assess a patient for risky substance use behaviors with standardized assessment tools (known as Medicare Structured Assessment) to identify the appropriate level of care. Screening quickly assesses a patient's substance use severity and identifies the appropriate treatment level;

(2) Brief Intervention: Brief intervention increases substance use insight and awareness and motivates behavioral change. Engage the patient in a short conversation to increase their awareness of risky substance use behaviors and provide feedback, motivation, and advice; and

(3) Referral to Treatment: Refer patients whose assessment or screening shows a need for additional services to specialty care treatment using specific tools such as Alcohol Use Disorders Identification Test (AUDIT) Manual or Drug Abuse Screening Test (DAST).

These three codes include screening and counseling services similar to counseling and other evaluation and management services already included in the definition of primary care services used for purposes of assignment. In the CY 2019 PFS final rule (83 FR 59965 through 59969), we finalized the addition of HCPCS G0442 (*Annual alcohol misuse screening, 15 minutes*) and G0443 (*Alcohol misuse counseling*) to the definition of primary care services used for purposes of assignment. In the CY 2024 PFS final rule (88 FR 79163 through 79175) we finalized the addition of CPT codes 99406 and 99407 for smoking and tobacco-use cessation counseling services. We also finalized the inclusion of G2086, G2087, and G2088 for office-based opioid use disorder services in the definition of primary care services used for purposes of assignment. Since HCPCS codes G2011, G0396, and G0397 include screening and documentation related to alcohol misuse, similar to G0442 and G0443, we believe this supports the inclusion of these HCPCS codes in the definition of primary care services.

- *Vaccine Adverse Effects Management* (HCPCS code GADV1): In section II.E. of the CY 2027 PFS proposed rule (91 FR 43905 through 43906), we proposed an add-on payment for diagnosis and management of a suspected vaccine adverse reaction for services going above and beyond those captured in an E/M visit. These services entail listening to patient concerns, answering questions, and building trust; selecting diagnosis strategies and conveying information in a manner specific to the clinical situation and individual patient needs; providing patients with appropriate resources; and planning with patients the treatment of symptoms of vaccine adverse effects. We proposed that this add-on code, HCPCS code GADV1 (*Office or other outpatient evaluation and management service(s) for the diagnosis and treatment of vaccine adverse effects, new or established patient; each 15 minutes personally performed by the physician or qualified healthcare professional (list separately in addition to CPT codes 99202, 99203, 99204, 99205, 99211, 99212, 99213, 99214, 99215, 99341, 99342, 99344, 99345, 99347, 99348, 99349, 99350*)), would be payable when a physician or NPP: (1) establishes and documents a temporal relationship to vaccination, and (2) performs a medically appropriate assessment to rule out alternative causes. Since, as proposed, this service is an add-on payment for diagnosis and management of a suspected vaccine adverse reaction for services going above and beyond those captured in an evaluation and management (E/M) visit we believe these services will likely be provided by the clinician that is responsible for the overall care of the beneficiary and should, therefore, be included in the definition of primary care services used for purposes of assignment.

We have, over time, proposed separate payment and coding in instances where E/M codes may not reflect all the services and resources required to furnish comprehensive, coordinated care management for certain categories of beneficiaries which were then incorporated into the definition of primary care services used for purposes of assignment (see, for example: Transitional Care Management (77 FR 68978 through 68994), Chronic Care Management (78 FR 43337 through 43343), Advance Care Planning (80 FR 70955 through 70959)). Similarly, we believe that the inclusion of GADV1 for the assessment and treatment of vaccine adverse effects represents services and resources supportive of the furnishing of comprehensive, coordinated care management that are not reflected in E/M codes and therefore should be included in the definition of primary care services used for purposes of assignment. Further, the valuation of this service is cross walked to HCPCS code G2212, which is included in the definition of primary care services used for purposes of assignment.

- *Advance Care Planning* (HCPCS codes GACP1 and GACP2): As discussed in section II.G. of the CY 2027 PFS proposed rule (91 FR 43947 through 43949), we proposed to create two new HCPCS codes to describe advance care planning services furnished by clinical staff under the direct supervision of the billing physician or other practitioner: HCPCS

[290] See Medicare Shared Savings Program, Key Application Actions and Deadlines For Agreement Periods Beginning on January 1, 2027, avaliable at *https://www.cms.gov/files/document/key-application-actions-deadlines.pdf.*

[291]

G-code GACP1 (*Advance care planning including the explanation and discussion of advance directives such as standard forms (with completion of such forms, when performed), first 20 minutes of clinical staff time with the patient, family member(s), surrogate directed by a treating physician or other treating qualified health care professional*) and GACP2 (*Advance care planning including the explanation and discussion of advance directives such as standard forms (with completion of such forms, when performed), each additional 20 minutes with the patient, family member(s), surrogate directed by a treating physician or other treating qualified health care professional (List separately in addition to code for primary procedure)*) and proposing that the existing CPT codes 99497 and 99498 would only be used to report time personally spent by the billing practitioner. We believe that this new coding would more accurately distinguish and value the work of the billing practitioners, from time that is spent by their clinical staff in the provision of advance care planning services. As discussed in section II.G of this final rule, CMS emphasizes that clinicians must not, under any circumstances, attempt to influence their patients' decisions with respect to ACP.

In the CY 2019 PFS final rule (83 FR 59965 through 59968), we finalized the inclusion of advance care planning CPT codes 99497 and 99498 in the definition of primary care services under the Shared Savings Program because the services provided as part of advance care planning include counseling and other E/M codes similar to the services included in Annual Wellness Visits and other E/M codes that are already included in the list of primary care services used for purposes of assignment. We continue to believe that the care billed under advance care planning CPT and HCPCS codes would be considered primary care, and as such, believe that the new HCPCS that represent clinical time provided under direct supervision should be included in the definition of primary care services used for purposes of assignment.

As part of this revised definition of primary care services used for assigning beneficiaries at § 425.402, we proposed to incorporate a provision at § 425.400(c)(1)(xi)(C), specifying that the primary care service codes for purposes of assigning beneficiaries include a CPT code identified by CMS that directly replaces a CPT code specified at § 425.400(c)(1)(xi)(A) or a HCPCS code specified at § 425.400(c)(1)(xi)(B), when the assignment window or expanded window for assignment (as defined at § 425.20) for a benchmark year or PY includes any day on or after the effective date of the replacement code for payment purposes under FFS Medicare.

We also proposed a technical modification to the introductory text in § 425.400(c)(1)(x), to limit the applicability of that provision to the PY starting on January 1, 2026. This change is necessary so that we can effectuate § 425.400(c)(1)(xi) as explained in this section of this final rule to apply for the PY starting on January 1, 2027, and subsequent PYs.

We sought comments on these proposed changes to the definition of primary care services used for assigning beneficiaries at § 425.400(c)(1)(xi) to Shared Savings Program ACOs for the PY starting on January 1, 2027, and subsequent PYs, and related technical change. We also sought comments on any other existing or new HCPCS or CPT codes proposed in the CY 2027 PFS proposed rule that we should consider adding to the definition of primary care services for purposes of assignment in future rulemaking.

We received public comments on these proposals. The following is a summary of the comments we received and our responses.

Comment: Many commenters supported expanding the definition of primary care services used for beneficiary assignment. Commenters supported adding Screening, Brief Intervention, and Referral to Treatment (SBIRT) services, Advance Care Planning (ACP) services, and Vaccine Adverse Effects Management, with several commenters expressly supporting the proposed HCPCS codes and recommending finalization for PY 2027 where the underlying codes are finalized for payment. Commenters stated that these services reflect prevention, care planning, behavioral health, patient engagement, care coordination, chronic disease intervention, and other longitudinal, relationship-based activities that are fundamental to comprehensive primary care. Several commenters stated that including these services would more accurately align beneficiary assignment with the clinicians and ACO participants furnishing meaningful primary care and would keep the assignment methodology aligned with Medicare billing codes and PFS policy. Some commenters noted that the descriptors for the proposed services are similar to services already included in the assignment methodology.

Commenters offered service-specific rationales. Several commenters stated that ACP is a core component of longitudinal primary care, particularly for seriously ill and medically complex beneficiaries, and that primary care's longitudinal relationships make it well suited for discussions of goals of care, advance directives, end-of-life preferences, and surrogate decision-making. Commenters also noted the roles of nurses, APRNs, clinical staff, family members, and surrogates in ACP and stated that ACP can help ensure that patients' care preferences are honored. Commenters supporting SBIRT stated that screening, brief intervention, and referral are core primary care and population health activities and can promote earlier identification and treatment of substance use disorders before more serious consequences occur. A commenter supporting Vaccine Adverse Effects Management stated that primary care is often the first and most consistent point of contact for patients with suspected vaccine adverse events and may provide symptom management, counseling, risk-benefit discussions, follow-up, and guidance regarding future immunizations.

Response: We appreciate the comments in support of adding advance care planning; screening, brief intervention, and referral to treatment; and vaccine adverse effects management codes to the definition of primary care services used for Shared Savings Program beneficiary assignment beginning in 2027, and agree that these services reflect prevention, care planning, behavioral health, patient engagement, care coordination, chronic disease intervention, and other longitudinal, relationship-based activities that are fundamental to comprehensive primary care which would keep the assignment methodology aligned with Medicare billing codes and PFS policy. We also agree that the proposed codes are similar to many already included in the definition of primary care services used for purposes of assignment. We also appreciate the service-specific rationale provided by commenters to support the inclusion of these services in the definition of primary care services used for purposes of assignment.

Comment: A commenter generally supported the expanded definition but recommended delaying use of the Advanced Care Planning codes, GACP1 and GACP2, for assignment for at least one year to obtain claims experience and evaluate whether the codes strengthen assignment or inadvertently shift attribution away from established primary care relationships. Another

commenter urged CMS to review the assignment code set annually as coding and care delivery evolve, including consideration of remote therapeutic monitoring and advanced primary care management. Another commenter recommended monitoring the acuity and expenditure patterns of beneficiaries newly assigned through the added services and ensuring that benchmark and risk-adjustment methodologies reflect expected cost of care. Another commenter recommended monitoring whether the new service codes appropriately identify longitudinal primary care relationships and their effects on FQHCs and RHCs. A commenter supported the three proposed service categories but made clear that they recognize that CMS did not propose the addition of similar therapy evaluation codes because statutory practitioner classifications limit CMS's ability to add those services under current law. Another commenter supported G2011, G0396, GADV1, GACP1, and GACP2 but opposed adding G0397 stating that G0397 is more frequently associated with specialty care.

Response: We acknowledge feedback in the comments. It is important for the definition of primary care services used for purposes of beneficiary assignment to remain in sync with billing and coding updates and changes and include appropriate new CPT and HCPCS codes as they are implemented. We believe that delaying the inclusion of new assignment codes or conducting multi-year testing of codes could result in beneficiaries not being assigned to an ACO based on primary care services that are provided by their primary care provider as utilization of these services is implemented. Implementing billing and coding updates and changes as they are finalized under the PFS is important for purposes of assignment to ensure that beneficiaries are assigned appropriately as services billed shifts from already existing CPT/HCPCS codes to new CPT/HCPCS codes. If the Shared Savings Program is out of sync with coding changes and updates, assignment of beneficiaries could be inaccurate. We also note that the step-wise assignment methodology maintains the statutory requirement to conduct claims-based beneficiary assignment based on beneficiaries' utilization of physician primary care services, recognizing the necessary and appropriate role of certain specialists in providing primary care services so we are not persuaded to delay implementation of these services.

We acknowledge the concerns about potential impact of unknown utilization and the suggestion to delay the addition of GACP1 and GACP2. Advance care planning (ACP) is a voluntary, face-to-face discussion between a practitioner and patient or their family member, caregiver, or surrogate (as appropriate) to discuss the patient's healthcare wishes if they become unable to make their own medical decisions.[292] The ACP HCPCS codes being finalized in this rule (see section II.G) are used to describe ACP services furnished by clinical staff under the direct supervision of the billing physician or other practitioner (and incidental to their professional services) and the existing CPT codes 99497 and 99498 would only be used to report time personally spent by the billing practitioner. Additionally, as explained in section II.G of this final rule, ACP services are a voluntary component of the annual wellness visit and can be billed together with CPT codes 99497 and 99498, if time thresholds by the billing practitioner and clinical staff are each met. Because annual wellness visits and other ACP services are currently included in the definition of primary care services used for purposes of assignment, we believe including the proposed ACP services (finalized as HCPCS codes G0572 and G0573) is critical to maintain consistency in the regulatory definition of primary care services used for purposes of assignment under § 425.400 regardless of future utilization.

We agree that monitoring the billing and utilization of the primary care service codes used for purposes of beneficiary assignment, and other codes, to ensure that the Shared Savings Program considers appropriate billing codes for purposes of beneficiary assignment is an important step in maintaining an accurate and effective assignment methodology. As we described in the CY 2025 PFS final rule (89 FR 98095), we will monitor the billing and utilization of the current primary care service codes used for purposes of beneficiary assignment, and other codes, to ensure that the Shared Savings Program considers appropriate billing codes for purposes of beneficiary assignment. If monitoring shows that the inclusion of service codes in the definition of primary care services used for beneficiary assignment is not appropriate, we will address that issue as needed.

With regard to the comment on statutory practitioner classifications, we confirm that therapy services are not included in the definition of primary care services used in assignment because therapists are not providers upon which assignment can be determined.

Regarding G0397 being more frequently furnished by specialists, we are not persuaded that this is a reason not to include this code for purposes of assignment in the Shared Savings Program. As we have previously explained in rulemaking (see, for example, 76 FR 67853 through 67855; see also 80 FR 32748 and 32754 and 89 FR 98095), the step-wise assignment methodology maintains the statutory requirement to conduct claims-based beneficiary assignment based on beneficiaries' utilization of physician primary care services, recognizing the necessary and appropriate role of certain specialists in providing primary care services, such as in areas with primary care physician shortages. Additionally, we noted in the June 2015 final rule (80 FR 32750), that we expect that specialist physicians often take the role of primary care physicians in the overall treatment of beneficiaries with certain chronic conditions, and such patterns are captured in step 2 in the current assignment methodology. Further, if services billed under these codes are provided by specialists not considered for purposes of beneficiary assignment, then the services will not be considered in beneficiary assignment.

Comment: Another commenter supported CMS's proposed beneficiary assignment changes but stated that claims-based assignment alone has limitations in expanding accountable care relationships. The commenter recommended that Medicare beneficiaries also have a practical and accessible mechanism to affirmatively designate the clinician they trust to coordinate their care. The commenter viewed such a mechanism as complementary to CMS's efforts to expand beneficiary access to coordinated, accountable care in Original Medicare.

Response: We believe this comment is referring to voluntary alignment and agree it is complementary to CMS's efforts to expand beneficiary access to coordinated, accountable care in Original Medicare. Under § 425.402(e) beneficiaries may voluntarily align themselves to an ACO at any time by logging into Medicare.gov and designating a provider or supplier who they believe to be responsible for coordinating their overall care. We are currently researching additional ways CMS can support beneficiary education

[292] See for example, CMS, ''Accountable Care Organization—Operational System (ACO-OS), Claimaim and Claim Line Feed (CCLF) Information Packet (IP)'' (version 43.0 , 5/13/2026), available at *https://www.cms.gov/files/document/cclf-information-packet.pdf*.

and enhance the accessibility of voluntary alignment.

After consideration of public comments, we are finalizing as proposed the revised definition of primary care services used for assignment for the performance year starting on January 1, 2027, and subsequent performance years in a new provision of the Shared Savings Program at § 425.400(c)(1)(xi) to include the list of HCPCS and CPT codes specified at § 425.400(c)(1)(ix), as well as the following additions: Screening, Brief Intervention, and Referral to Treatment (SBIRT) (HCPCS codes G2011, G0396, and G0397), Vaccine Adverse Effects Management (HCPCS code GADV1, which is finalized as G0576), Advance Care Planning (HCPCS codes GACP1 and GACP2, which are finalized as G0572 and G0573, respectively), as finalized under OM payment policy.

Additionally, we received no comments on our proposal regarding the incorporation of a provision at § 425.400(c)(1)(xi)(C), specifying that primary care service codes used for purposes of assigning beneficiaries include a CPT code identified by CMS that directly replaces a CPT code specified at § 425.400(c)(1)(xi)(A) or a HCPCS code specified at § 425.400(c)(1)(xi)(B), when the assignment window or expanded window for assignment (as defined at § 425.20) for a benchmark or performance year includes any day on or after the effective date of the replacement code for payment purposes under Medicare FFS and are finalizing as proposed.

Further, the text of the proposed regulations in the CY 2027 PFS CY 2027 PFS proposed rule (91 FR 44035) included a proposed technical modification to the introductory text in § 425.400(c)(1)(x), to limit the applicability of that provision to the performance year starting on January 1, 2026. This change is necessary so that we can effectuate § 425.400(c)(1)(xi) as explained in the CY 2027 PFS proposed rule and its regulatory text: to apply for the performance year starting on January 1, 2027, and subsequent performance years. We received no comments addressing the proposed technical modification to § 425.400(c)(1)(xi), and we are finalizing this change without modification.

3. Quality Performance Standard and Other Quality Reporting Requirements

a. Overview

Section 1899(b)(3)(C) of the Act states that the Secretary shall establish quality performance standards to assess the quality of care furnished by Shared Savings Program ACOs and seek to improve the quality of care furnished by Shared Savings Program ACOs over time by specifying higher standards, new measures, or both for purposes of assessing such quality of care. As we stated in the November 2011 final rule establishing the Shared Savings Program (76 FR 67872), our principal goal in selecting quality measures for Shared Savings Program ACOs has been to identify measures of success in the delivery of high-quality healthcare at the individual and population levels. In the November 2011 final rule, we established a quality measure set spanning four domains: patient experience of care, and wherever practicable, caregiver experience of care; care coordination/patient safety; preventative health; and at-risk population (76 FR 67872 through 67891). We have subsequently updated the measures that comprise the quality measure set for the Shared Savings Program through rulemaking in the CY 2015, 2016, 2017, 2019, 2021, 2023, 2024, 2025, and 2026 PFS final rules (79 FR 67907 through 67921, 80 FR 71263 through 71269, 81 FR 80484 through 80489, 83 FR 59708 through 59715, 85 FR 84733 through 84734, 87 FR 69860 through 69863, 88 FR 79112 through 79114, 89 FR 98124 through 98132, and 90 FR 49797 through 90 FR 49822, respectively).

b. Extending the Availability of the MIPS CQMs Collection Type and the MIPS CQM Reporting Incentive for Shared Savings Program ACOs

(1) Background

In the CY 2027 PFS proposed rule (91 FR 44036 and 44037), we stated that, in the CY 2025 PFS proposed rule, we proposed to streamline the collection types available for Shared Savings Program ACOs reporting the APM Performance Pathway (APP) Plus quality measure set to the eCQMs and Medicare CQMs collection types for PY 2025 and subsequent PYs (89 FR 61856 and 61857). We also stated that our proposal to establish the APP Plus quality measure set to align with the Adult Universal Foundation measure set should aim to prioritize the eCQMs collection type—the gold standard collection type that underlies the Digital Quality Measurement Strategic Roadmap (available at *https://ecqi.healthit.gov/sites/default/files/CMSdQMStrategicRoadmap_032822.pdf*)—and use Medicare CQMs as the transition step on our building-block approach for Shared Savings Program ACOs' progress to adopt digital quality measurement (89 FR 61838). As stated in the CY 2025 PFS final rule (89 FR 98107), many commenters expressed concern with the proposal to eliminate the MIPS CQMs collection type for Shared Savings Program ACOs beginning in PY 2025. These commenters stated that eliminating the MIPS CQMs collection type would cause administrative burden due to Shared Savings Program ACOs having disparate electronic health records (EHRs) and experiencing reporting challenges with the submission of the eCQMs collection type. Several commenters noted that their efforts and resources would need to focus on determining the best reporting approaches at the expense of innovations that support patients. Some commenters stressed the challenges related to prior investments made in MIPS CQM reporting infrastructure that would be wasted following the elimination of the MIPS CQM collection type. Several of these commenters stated that having limited notice from CMS that the MIPS CQMs collection type would not be available to Shared Savings Program ACOs reporting the APP Plus quality measure set provides Shared Savings Program ACOs with only a few months to pivot to another option if the proposal not to include MIPS CQMs in the APP Plus quality measure set was finalized. A commenter objected to the exclusion of the MIPS CQMs collection type from the APP Plus quality measure set and stated MIPS CQMs allow Shared Savings Program ACOs to leverage multiple data sources beyond just electronic medical record (EMR) data, including claims data, as an important component to ensuring the accuracy and completeness of data reported. Lastly, many commenters encouraged us to consider extending the availability of the MIPS CQMs collection type for Shared Savings Program ACOs and requested that the collection type remain available for an additional 1 to 3 years (89 FR 98107).

In response to these comments, we stated in the CY 2025 PFS final rule (89 FR 98107) that we acknowledged commenters' feedback regarding the challenges associated with not having MIPS CQM available to Shared Savings Program ACOs as a collection type for reporting the APP Plus quality measure set. We agreed with commenters that additional time was needed for Shared Savings Program ACOs that have invested in MIPS CQMs to transition to eCQMs and that having MIPS CQMs as a reporting option would allow Shared Savings Program ACOs to gain

experience with all payer quality measure data collection and reporting before MIPS CQMs are phased out as a collection type for Shared Savings Program ACOs. We also stated that we were aware that some Shared Savings Program ACOs had already contracted with vendors for the MIPS CQMs collection type at their own expense, and that for these Shared Savings Program ACOs, additional time to transition to the eCQMs collection type was desirable. In addition, we expressed our understanding that the MIPS CQMs collection type allows Shared Savings Program ACOs to leverage multiple data sources beyond just EMR data, thereby allowing for improved accuracy and completeness of data submitted with this collection type. For these reasons, we finalized in the CY 2025 PFS final rule that we would provide Shared Savings Program ACOs with the option to use the MIPS CQMs collection type for 2 additional PYs (that is, PYs 2025 and 2026) when reporting the APP Plus quality measure set. We stated that we believed making the MIPS CQMs collection type available for Shared Savings Program ACOs for 2 additional PYs would fairly balance investments Shared Savings Program ACOs have already made with the MIPS CQMs collection type and CMS' long-term goals of adopting digital quality measurement. As finalized in the CY 2025 PFS final rule, the collection types available to Shared Savings Program ACOs reporting the APP Plus quality measure set for PY 2025 and subsequent years recognized the need for some Shared Savings Program ACOs to build the infrastructure, skills, knowledge, and expertise necessary to report all payer/all patient measures while incentivizing Shared Savings Program ACOs to transition to eCQMs (89 FR 98107). We also stated that MIPS CQMs would no longer be available starting in PY 2027 and that we would continue to monitor the uptake of collection types by Shared Savings Program ACOs in the coming years (89 FR 98107).

In the CY 2023 PFS final rule, we extended the incentive for reporting eCQMs/MIPS CQMs through PY 2024 to align with the timeline for sunsetting of the CMS Web Interface reporting option and to allow Shared Savings Program ACOs an additional year to gauge their performance on the eCQMs/MIPS CQMs before full reporting of the measures were required beginning in PY 2025 (87 FR 69836 through 69838 and 89 FR 98121). We originally adopted this incentive in the CY 2022 PFS final rule to encourage Shared Savings Program ACOs to begin the transition to eCQM/MIPS CQM reporting in PYs 2022 and 2023 (86 FR 65269).

To continue to align the reporting incentive with the MIPS CQMs collection type, in the CY 2025 PFS final rule (89 FR 98123 and 98124), we extended the reporting incentive to Shared Savings Program ACOs reporting MIPS CQMs in PYs 2025 and 2026 to further support Shared Savings Program ACOs in meeting the Shared Savings Program quality performance standard for sharing in savings at the maximum rate under its track.

Specifically, we finalized that for PYs 2025 and 2026, a Shared Savings Program ACO will meet the quality performance standard used to determine eligibility for maximum shared savings and to avoid maximum shared losses, if applicable:

- If the Shared Savings Program ACO reports all of the eCQMs/MIPS CQMs in the APP Plus quality measure set applicable for a PY, meeting the data completeness requirement at § 414.1340 for all eCQMs/MIPS CQMs, and;
- Achieves a quality performance score equivalent to or higher than the 10th percentile of the performance benchmark on at least one of the outcome measures in the APP Plus quality measure set, and;
- Achieves a quality performance score equivalent to or higher than the 40th percentile of the performance benchmark on at least one of the remaining measures in the APP Plus quality measure set.

In the CY 2027 PFS proposed rule (91 FR 44037), we stated that over the past 2 years, we have developed a greater understanding of the challenges Shared Savings Program ACOs face in reporting eCQMs and transitioning to digital quality measurement. Comments stated in the CY 2025 PFS final rule (89 FR 98107), responses to the RFI on deregulation and other forums, and feedback from Shared Savings Program ACOs and other interested parties expressed concerns about increased administrative burden and Shared Savings ACO's prior investments in MIPS CQM reporting infrastructure that would be wasted if the MIPS CQMs collection type was eliminated and encouraged CMS to preserve the MIPS CQMs collection type and the corresponding MIPS CQM reporting incentive during the transition to digital quality measurement. By extending the MIPS CQMs collection type and the corresponding MIPS CQM reporting incentive, Shared Savings Program ACOs could continue to utilize investments already made in MIPS CQM reporting infrastructure while taking steps towards making the full transition to digital quality measurement. After considering the feedback we received, we believe that the widespread adoption of the all payer/all patient collection types will require further time and support.

In the CY 2025 PFS final rule, we stated that we intend to fully transition to digital quality measurement in CMS quality reporting and value-based purchasing programs (89 FR 98106). We also reiterated the numerous benefits to using eCQMs, including their use of electronic standards that reduce the burden of manual extraction and reporting for measured entities, their use of clinical data to assess the outcomes of treatment by measured entities, and their fostering of access to real-time data for point of care quality improvement and decision support (89 FR 98106).

In the CY 2027 PFS proposed rule (91 FR 44037), we referred readers to the Fast Healthcare Interoperability Resources® (FHIR®)-Based Digital Quality Measurement in the Quality Payment Program and other CMS Quality Programs—RFI in the CY 2027 PFS proposed rule (91 FR 44151). In that section, we stated that we are advancing quality measurement by transitioning existing quality measures and reporting processes to FHIR-based digital approaches and requesting public comment on the timeline for transitioning to FHIR-based quality measurement. We also stated that we requested input from interested parties, ahead of future policy decisions, on developing a phased transition to FHIR-based digital quality reporting for applicable measures (that is, the 5 eCQMs and Medicare eCQMs in the APP Plus quality measure set as proposed in the CY 2027 PFS proposed rule (91 FR 44152) under which we would introduce a 2-year transition period beginning with PY 2028. During the transition period, existing quality reporting options for Shared Savings Program ACOs (that is, eCQMs, MIPS CQMs, Medicare CQMs, and the proposed Medicare eCQMs), would continue to be available while FHIR-based digital quality measure (dQM) options are introduced for selected measures. For Shared Savings Program ACOs, the transition to FHIR-based dQMs builds upon the existing eCQM reporting infrastructure used for the APP Plus quality measure set (including APP/APP Plus measure alignment and current electronic reporting approaches) while introducing FHIR-based specifications for dQMs and related software tools, such as the Measure Authoring Development Integrated Environment (MADiE), so that Shared

Savings Program ACOs would have a feasible pathway to adopt FHIR-based quality measurement. Following this transition period, beginning with PY 2030, FHIR-based reporting would be required for those applicable measures that were available as FHIR-based dQM reporting options during the transition period. As discussed in the CY 2027 PFS proposed rule (91 FR 44152 and 44153), by PY 2030, Shared Savings Program ACOs would need to be prepared to report each applicable APP Plus measure via FHIR-based digital quality reporting where a FHIR-based dQM specification exists for that measure. For APP Plus measures that do not have FHIR-based dQM specifications following the transition period, Shared Savings Program ACOs would continue to use applicable existing reporting mechanisms (for example, MIPS CQMs, Medicare CQMs, eCQM reporting via QRDA files, and proposed Medicare eCQMs) until FHIR-based dQM options are developed and adopted through future rulemaking.

Table B–G2 of the CY 2027 PFS proposed rule (91 FR 44038) is the same as Table B–G2 in this section of this final rule (with the Medicare eCQMs collection type and flat benchmarks for Medicare CQMs and Medicare eCQMs no longer shown as ''proposed'') and illustrates the timeline for the transition to FHIR-based quality reporting for Shared Savings Program ACOs, as described in the CY 2027 PFS proposed rule (91 FR 44153), as well as potential future quality performance scoring considerations subject to future notice and comment rulemaking. We noted in the CY 2027 PFS proposed rule (91 FR 44038) that between January 21, 2026, and February 23, 2026, CMS posted and sought public comment on draft FHIR-based digital specifications for 49 eligible clinician dQMs. This posting of draft specifications included specifications for the 5 measures in the APP Plus quality measure set that currently are available under the eCQMs, MIPS CQMs, and Medicare CQMs collection types (*https://ecqi.healthit.gov/sites/default/files/FHIR-Public-Comment-Webinar-CMS-20260121.pdf*).

TABLE B-G2: IMPLEMENTATION TIMELINE AND MILESTONES FOR TRANSITION TO FHIR-BASED DIGITAL QUALITY MEASUREMENT FOR SHARED SAVINGS PROGRAM ACOS

Phase	Timeframe	Collection Types Available for Quality Reporting	Potential Future Scoring Considerations
Transition Period with FHIR-Based Reporting Options (Year 1)	PY 2028	**FHIR-based dQM reporting options:** • dQMs • Medicare dQMs **Non-FHIR-based reporting options:** • eCQMs • MIPS CQMs • Medicare CQMs • Medicare eCQMs	**FHIR-based dQM reporting options:** Benchmarking policies and reporting incentives would be established through future notice and comment rulemaking **Medicare CQMs and Medicare eCQMs:** Flat benchmarks **All other non-FHIR-based reporting options:** Consistent with MIPS benchmarking policies at § 414.1380(b)(1)(ii) Anticipate sunsetting the current MIPS CQM reporting incentives
Transition Period with FHIR-Based Reporting Options (Year 2)	PY 2029	**FHIR-based dQM reporting options:** • dQMs • Medicare dQMs **Non-FHIR-based reporting options:** • eCQMs • MIPS CQMs • Medicare CQMs Medicare eCQMs	**FHIR-based dQM reporting options:** Benchmarking policies and reporting incentives would be established through future notice and comment rulemaking **Medicare CQMs and Medicare eCQMs:** Flat benchmarks **All other non-FHIR-based reporting options:** Consistent with MIPS benchmarking policies at § 414.1380(b)(1)(ii)
Mandatory FHIR-Based Reporting	PY 2030 and subsequent PYs	**FHIR-based dQM reporting options:** • dQMs • Medicare dQMs	Benchmarking policies would be established through future notice and comment rulemaking

(2) Revisions

In the CY 2027 PFS proposed rule (91 FR 44038 and 44039), we stated that in light of the concerns raised by Shared Savings Program ACOs and other interested parties, and our commitment to supporting Shared Savings Program ACOs in the transition to dQM reporting, we proposed to extend the availability of the MIPS CQMs collection type for Shared Savings Program ACOs reporting the APP Plus quality measure set for PY 2027 and subsequent PYs. We believe that the removal of the MIPS CQMs collection type for ACOs during this transition would be disruptive considering there was a significant increase in the number of Shared Savings Program ACOs that reported MIPS CQMs in PY 2025 compared to PYs 2023 and 2024. Based on initial PY 2025 MIPS quality submission data, Shared Savings Program ACOs are continuing to report the APP Plus quality measure set using the MIPS CQMs collection type, where 140 out of 472 financially reconciled ACOs reported at least one MIPS CQM; whereas 33 out of 453 financially reconciled Shared Savings Program ACOs in PY 2023 and 36 out of 476 financially reconciled Shared Savings Program ACOs in PY 2024 reported at least one MIPS CQM.

We stated in the CY 2027 PFS proposed rule (91 FR 44039) that maintaining the availability of the MIPS CQMs collection type for PY 2027 and subsequent PYs would eliminate the administrative burden associated with Shared Savings Program ACOs changing their current quality reporting collection type to another collection type after PY 2026 when the MIPS CQMs collection type would no longer be available under the policy finalized in the CY 2025 PFS final rule (89 FR 98123) and would also allow Shared Savings Program ACOs to focus their resources and efforts on the transition to dQM reporting instead.

In the CY 2027 PFS proposed rule (91 FR 44039), we stated that subject to future notice and comment rulemaking we anticipate sunsetting the MIPS CQMs collection type beginning in PY 2030, when FHIR-based reporting becomes mandatory for all the eCQMs and the proposed Medicare eCQMs in the APP Plus quality measure set, and we requested feedback on the phased timeline for FHIR-based reporting which starts with a 2-year transition period followed by required FHIR-based reporting for applicable measures.

In the CY 2027 PFS proposed rule (91 FR 44039), we stated that to continue to align the reporting incentive with the MIPS CQMs collection type, we proposed to extend the reporting

incentive to Shared Savings Program ACOs reporting MIPS CQMs for PY 2027 and subsequent PYs to further support Shared Savings Program ACOs in meeting the Shared Savings Program quality performance standard for sharing in savings at the maximum rate under its track. Specifically, we proposed that for PY 2027 and subsequent PYs, a Shared Savings Program ACO will meet the quality performance standard used to determine eligibility for maximum shared savings and to avoid maximum shared losses, if applicable:

- If the Shared Savings Program ACO reports all of the eCQMs/MIPS CQMs in the APP Plus quality measure set applicable for a PY, meeting the data completeness requirement at § 414.1340 for all eCQMs/MIPS CQMs, and;
- Achieves a quality performance score equivalent to or higher than the 10th percentile

of the performance benchmark on at least one of the outcome measures in the APP Plus quality measure set, and;

- Achieves a quality performance score equivalent to or higher than the 40th percentile

of the performance benchmark on at least one of the remaining measures in the APP Plus quality measure set.

In the CY 2027 PFS proposed rule (91 FR 44039), we stated that based on a CMS analysis of PY 2024 Shared Savings Program ACO quality results, 26 Shared Savings Program ACOs reported MIPS CQMs and met the Shared Savings Program quality performance standard by meeting the criteria for the MIPS CQM reporting incentive, through which they were eligible to receive maximum shared savings and avoid maximum shared losses (if applicable) for their track regardless of their quality score. These 26 Shared Savings Program ACOs did not achieve a quality score at or above the 40th percentile MIPS quality performance category score value, which is one of the pathways for meeting the quality performance standard, and therefore, would not have met the quality performance standard without the MIPS CQM reporting incentive.

We stated in the CY 2027 PFS proposed rule (91 FR 44039) that we would continue to assess the appropriateness of having the MIPS CQMs collection type being an available collection type for Shared Savings Program ACOs along with the associated MIPS CQM reporting incentive. Subject to future notice and comment rulemaking, we anticipate sunsetting the MIPS CQM reporting incentive when we introduce the 2-year transition period beginning with PY 2028 during which the existing quality reporting options for Shared Savings Program ACOs (that is, eCQMs, MIPS CQMs, Medicare CQMs, and the proposed Medicare eCQMs) would continue to be available while FHIR-based dQM reporting options are introduced for selected measures (that is, the 5 eCQMs and the proposed Medicare eCQMs in the APP Plus quality measure set as proposed in the CY 2027 PFS proposed (91 FR 44039)).

In the CY 2027 PFS proposed rule (91 FR 44039), we noted that we proposed to create the Medicare eCQMs collection type, which would be a new collection type for PY 2027 and subsequent PYs. In the CY 2027 PFS proposed rule (91 FR 44039), we stated that, as part of our proposal to extend the availability of the MIPS CQMs collection type and the MIPS CQM reporting incentive for PY 2027 and subsequent PYs, § 425.512(a) would contain the following information:

- Under paragraph (a)(2)(iv), we would specify that the paragraph applies to eCQMs/MIPS CQMs/Medicare CQMs/Medicare eCQMs.
- Under paragraph (a)(5)(i)(B), we would specify that the paragraph applies to PY 2025 and subsequent PYs.
- We would remove paragraph (a)(5)(i)(C).
- We would revise paragraph (a)(5)(iii)(C) to specify that it applies to eCQMs/MIPS CQMs/Medicare CQMs/Medicare eCQMs.

We sought public comments on our proposals to extend the availability of the MIPS CQMs collection type for Shared Savings Program ACOs and the MIPS CQM reporting incentive for PY 2027 and subsequent PYs.

We received public comments on these proposals. The following is a summary of the comments we received and our responses.

Comment: All commenters supported our proposals to extend the availability of the MIPS CQMs collection type for Shared Savings Program ACOs and the MIPS CQM reporting incentive for PY 2027 and subsequent PYs. Many of these supportive commenters cited ongoing interoperability, health IT, data aggregation and digital reporting challenges, and the need to reduce administrative and technical burden during the transition to digital quality measurement and FHIR-based reporting as reasons to extend the MIPS CQMs collection type and associated reporting incentive. Many supportive commenters further cited the importance of maintaining flexibility, stability, predictability, and consistent reporting options throughout the transition to mandatory FHIR-based reporting.

Several of these commenters supported the proposal and noted that retaining the MIPS CQMs collection type reduces burden for ACOs that have invested significant resources in this collection type and helps organizations serving complex beneficiary populations address ongoing reporting challenges. Several supportive commenters noted that availability of the MIPS CQMs collection type supports continued participation in the Shared Savings Program. Several other supportive commenters noted that the extension of the MIPS CQMs collection type through PY 2029 provides a realistic transition period for adopting FHIR-based reporting.

A couple commenters supported the proposal and noted that extending the MIPS CQM reporting incentive through PY 2027 and subsequent years recognizes the scoring challenges when reporting on all payers and all patients, and when serving complex, homebound, and facility-based beneficiaries.

Response: We appreciate comments that support our proposals to extend the availability of the MIPS CQMs collection type for Shared Savings Program ACOs and the MIPS CQM reporting incentive for PY 2027 and subsequent PYs.

Comment: A commenter requested that CMS clarify whether the MIPS CQM reporting incentive would persist through the full duration of the availability of the MIPS CQMs collection type.

Response: We are finalizing as proposed to extend the reporting incentive to Shared Savings Program ACOs reporting MIPS CQMs for PY 2027 and subsequent PYs. The sunsetting of the MIPS CQM reporting incentive would be subject to future notice and comment rulemaking. In the CY 2027 PFS proposed rule (91 FR 44039), we stated that (subject to future rulemaking), we anticipate sunsetting the MIPS CQM reporting incentive when the 2-year FHIR-based reporting transition period begins in PY 2028 (which is before the anticipated sunsetting of the MIPS CQM collection type (PY 2030)).

Comment: A commenter recommended that CMS continue to extend the MIPS CQMs collection type and reporting incentives until organizations have demonstrated that adopting FHIR-based reporting is feasible within various EHRs and registry environments.

Response: The sunsetting of the MIPS CQMs collection type and MIPS CQM reporting incentive would be subject to future notice and comment rulemaking,

at which time feasibility and functionality of FHIR-based reporting may be considered.

After consideration of public comments, we are finalizing as proposed to extend the availability of the MIPS CQMs collection type for Shared Savings Program ACOs reporting the APP Plus quality measure set for PY 2027 and subsequent PYs. We are also finalizing as proposed to extend the reporting incentive to Shared Savings Program ACOs reporting MIPS CQMs for PY 2027 and subsequent PYs to further support Shared Savings Program ACOs in meeting the Shared Savings Program quality performance standard for sharing in savings at the maximum rate under its track. Specifically, we are finalizing that for PY 2027 and subsequent PYs, a Shared Savings Program ACO will meet the quality performance standard used to determine eligibility for maximum shared savings and to avoid maximum shared losses, if applicable:

- If the Shared Savings Program ACO reports all of the eCQMs/MIPS CQMs in the APP Plus quality measure set applicable for a PY, meeting the data completeness requirement at § 414.1340 for all eCQMs/MIPS CQMs, and;
- Achieves a quality performance score equivalent to or higher than the 10th percentile of the performance benchmark on at least one of the outcome measures in the APP Plus quality measure set, and;
- Achieves a quality performance score equivalent to or higher than the 40th percentile of the performance benchmark on at least one of the remaining measures in the APP Plus quality measure set.

We note that, in section III.G.3.d.(3) of this final rule, we are finalizing our proposal to create the Medicare eCQMs collection type, which will be a new collection type for PY 2027 and subsequent PYs. As part of our final policies to extend the availability of the MIPS CQMs collection type and the MIPS CQM reporting incentive for PY 2027 and subsequent PYs, § 425.512(a) would contain the following information:

- Under paragraph (a)(2)(iv), we are specifying that the paragraph applies to eCQMs/MIPS CQMs/Medicare CQMs/Medicare eCQMs.
- Under paragraph (a)(5)(i)(B), we are specifying that the paragraph applies to PY 2025 and subsequent PYs.
- We are removing paragraph (a)(5)(i)(C).
- We are revising paragraph (a)(5)(iii)(C) to specify that it applies to eCQMs/MIPS CQMs/Medicare CQMs/Medicare eCQMs.

c. Extending the Scoring of Shared Savings Program ACOs Reporting Medicare CQMs Using Flat Benchmarks

(1) Background

In the CY 2027 PFS proposed rule (91 FR 44039 and 44040), we stated that in the CY 2024 PFS final rule (88 FR 79110), we finalized our proposal to establish Medicare CQMs and new benchmarks for scoring Shared Savings Program ACOs on the Medicare CQMs under MIPS in alignment with MIPS benchmarking policies. Because historical Medicare CQM data would not be available, we finalized that for PYs 2024 and 2025, we would score Medicare CQMs using performance period benchmarks. We also finalized that, for PY 2026 and subsequent PYs, when baseline period data became available to establish historical benchmarks in a manner that is consistent with the MIPS benchmarking policies at § 414.1380(b)(1)(ii), we would score Medicare CQMs using historical benchmarks.

As stated in the CY 2024 PFS final rule (88 FR 79109 and 79110), a few commenters expressed concern about Shared Savings Program ACOs being compared only to other Shared Savings Program ACOs that report Medicare CQMs. As part of their concern, they referenced that Medicare CQMs would be available only to Shared Savings Program ACOs. A commenter stated their preference to have their quality performance compared to all other participants on these measures, while another commenter stated that CMS should stop measuring Shared Savings Program ACOs against each other and instead measure Shared Savings Program ACOs on a national standard so that all ACOs can pass and do not lose out on savings due to arbitrary quality decile cut points. In our response to these comments, we stated that given that benchmarks are specific to each collection type and that since we proposed to establish Medicare CQMs as a new collection type for only Shared Savings Program ACOs, only Shared Savings Program ACO data will be available to benchmark Medicare CQMs. For these reasons, we stated that it was appropriate to establish benchmarks for Medicare CQMs that were consistent with MIPS benchmarking policies (88 FR 79110). We also stated that Shared Savings Program ACOs that prefer to be compared to clinicians at large could do so by reporting eCQMs or MIPS CQMs, for which CMS calculates a benchmark using data reported by MIPS eligible clinicians reporting under the chosen collection type.

In the CY 2025 PFS final rule (89 FR 98117), we stated that in PY 2022, Shared Savings Program ACOs had a higher average performance on quality measures they were required to report to share in savings compared to other similarly sized clinician groups not in the Shared Savings Program. This included statistically significant higher performance for quality measures related to diabetes and blood pressure control; breast cancer and colorectal cancer screening; tobacco screening and smoking cessation; and depression screening and follow-up. We further stated that in shifting to Medicare CQMs, Shared Savings Program ACOs' quality performance would be benchmarked against other Shared Savings Program ACOs only reporting Medicare CQMs. We explained that since Shared Savings Program ACOs are high performers relative to comparably sized MIPS groups, benchmarking Medicare CQMs using only Shared Savings Program ACO data would lower some Shared Savings Program ACOs' MIPS measure achievement points on those measures. In other words, high-performing Shared Savings Program ACOs could earn lower measure achievement points relative to comparable MIPS groups because the Medicare CQM benchmarking pool is comprised of higher-than-average performance data. This would, in effect, create a ''tournament approach'' to scoring Medicare CQMs wherein Shared Savings Program ACOs must compete with other Shared Savings Program ACOs to earn measure achievement points.

In the CY 2025 PFS final rule, we finalized our proposal to add § 414.1380(b)(1)(ii)(F) to state that beginning in the CY 2025 performance period/2027 MIPS payment year, measures of the Medicare CQMs collection type would be scored using flat benchmarks for their first 2 performance periods in MIPS (89 FR 98120). We further stated that the use of flat benchmarks would allow Shared Savings Program ACOs with high scores to earn maximum or near maximum achievement points while allowing room for quality improvement and rewarding that improvement in subsequent years (89 FR 98118). Use of flat benchmarks also helps to ensure that Shared Savings Program ACOs with high quality performance on a measure are not penalized as low performers (89 FR 98118).

As stated in the CY 2025 PFS final rule, many commenters supported the proposal to score Shared Savings Program ACOs reporting Medicare CQMs using flat benchmarks (89 FR

98119). A commenter stated that it will be a difficult transition for ACOs to progress from the CMS Web Interface attestation method to CQM/eCQM reporting and that Medicare CQM flat benchmarking will remove uncertainty from Shared Savings Program ACO attestation to Medicare CQMs as they will no longer have to rely on benchmarking based upon the PY (89 FR 98119). Additionally, many commenters recommended that flat benchmarks for Medicare CQM be made permanent rather than for 2 years and noted that flat benchmarks make Medicare CQM scoring more predictable (89 FR 98120). A commenter recommended that CMS consider extending the flat benchmark scoring policies for Medicare CQMs beyond each measure's first 2 performance periods and some commenters recommended that CMS retroactively apply the flat benchmark policy for the 2024 performance period (89 FR 98120).

In response to comments on the proposals in the CY 2026 PFS final rule (90 FR 49812) related to removing the population and income adjustment applied to a Shared Savings Program ACO's quality score beginning in PY 2025, another commenter stated that flat benchmarks are temporary and are not a lasting offset to the unique challenges faced by Shared Savings Program ACOs that serve high Area Deprivation Index (ADI), Medicare Part D Low Income Subsidy (LIS), and dual eligible populations. We stated that should we consider extending flat benchmarks for Medicare CQMs, we would do so through notice and comment rulemaking (90 FR 49813).

(2) Revisions

In the CY 2027 PFS proposed rule (91 FR 44040 through 44044), we stated that through responses to the RFI on deregulation and other forums, Shared Savings Program ACOs and other interested parties expressed support for policies that promote continuity while Shared Savings Program ACOs transition to digital quality measurement. In response to ACOs' concerns and to support Shared Savings Program ACOs in the transition to dQM reporting, for PY 2027 and subsequent years, in the CY 2027 PFS proposed rule (91 FR 44040 through 44044, 44205), we proposed that all measures of the Medicare CQMs collection type would be scored using flat benchmarks. We also proposed that for PY 2026, the following measures reported via the Medicare CQMs collection type for PY 2026 are scored using flat benchmarks instead of using historical benchmarks as finalized in the CY 2025 PFS final rule (89 FR 98120): Diabetes: Glycemic Status Assessment Greater Than 9% (Quality ID: 001), Preventive Care and Screening: Screening for Depression and Follow-up Plan (Quality ID: 134), and Controlling High Blood Pressure (Quality ID: 236). These three Medicare CQMs, under the policy finalized in the CY 2025 PFS final rule (89 FR 98120), would have historical benchmarks for PY 2026, consistent with MIPS benchmarking policies at § 414.1380(b)(1)(ii), because these measures would be in their third performance period in MIPS. We proposed that Quality IDs: 001, 134, and 236, if reported via the Medicare CQMs collection type for PY 2026 (and subsequent years), would be scored using flat benchmarks (91 FR 44205). As discussed in the CY 2027 PFS proposed rule (91 FR 44042), failure to apply this change retroactively would be contrary to the public interest. We noted that Breast Cancer Screening (Quality ID: 112) and Colorectal Cancer Screening (Quality ID: 113) reported via the Medicare CQMs collection type would be scored using flat benchmarks for PY 2026 under the policy finalized in the CY 2025 PFS final rule (89 FR 98120), which is consistent with CMS' intent to score all measures reported via Medicare CQMs collection type using flat benchmarks.

We also stated in the CY 2027 PFS proposed rule (91 FR 44040 and 44041) that in response to commenters who requested that we make Medicare CQMs a permanent collection type in the CY 2025 PFS final rule (89 FR 98108), we stated that from the inception of the Medicare CQMs collection type beginning in PY 2024, that we intended for the Medicare CQMs collection type to serve as a transition collection type to help ACOs build the infrastructure, skills, knowledge, and expertise necessary to report all payer/all patient measures (88 FR 79097 and 79098). In addition, as we stated in the CY 2025 PFS proposed rule, we believed that our policy to establish the APP Plus quality measure set to align with the Adult Universal Foundation measure set should also aim to prioritize the eCQMs collection type and the use of the Medicare CQMs collection type is a transition step on our building-block approach for ACOs to adopt digital quality measurement (89 FR 61838). We noted in the CY 2025 PFS final rule that the sunsetting of Medicare CQMs would take place no sooner than 5 years from the time the rule was written, when we anticipated there would be widespread uptake of FHIR API technology (89 FR 98108). While FHIR technology is employed in other components of digital health information, we noted that we would assess the uptake of FHIR API technology for quality reporting in alignment with the CMS Digital Quality Measurement Strategic Roadmap, specifically, Domain 3: Optimize Data Aggregation. In particular, we would assess whether Shared Savings Program ACOs broadly have developed capabilities to efficiently leverage FHIR API technology to aggregate quality reporting data and patient-centered measurement and are reporting eCQMs.

We stated in the CY 2027 PFS proposed rule (91 FR 44041) that, as of PY 2026, FHIR-based reporting of quality measures to CMS is not yet available to Shared Savings Program ACOs. As discussed in the CY 2027 PFS proposed rule (91 FR 44152), we intend to introduce a 2-year transition period to FHIR-based reporting beginning with PY 2028. During the transition period, existing quality reporting options for Shared Savings Program ACOs (that is, eCQMs, MIPS CQMs, Medicare CQMs, and the proposed Medicare eCQMs) would continue to be available while FHIR-based dQM options are introduced for selected measures (that is, the 5 eCQMs and the proposed Medicare eCQMs in the APP Plus quality measure set as proposed in the CY 2027 PFS proposed rule (91 FR 44150)). Following this transition period, beginning with PY 2030, FHIR-based reporting would be required for those applicable measures that were available as FHIR-based dQM reporting options during the transition period. The timing of this transition would influence our proposals related to the collection types available to Shared Savings Program ACOs and the associated scoring policies. We anticipate sunsetting the Medicare CQMs collection type and the use of flat benchmarks to score Medicare CQMs beginning in PY 2030, when FHIR-based reporting becomes mandatory for all the eCQMs and proposed Medicare eCQMs in the APP Plus quality measure set. As discussed in the CY 2027 PFS proposed rule (91 FR 44151 through 44154), we requested feedback on the phased timeline for FHIR-based reporting which starts with a 2-year transition period followed by required FHIR-based reporting for applicable measures. We noted that we expect the policies associated with this timeline would be proposed through future rulemaking.

In response to commenters who requested that we extend or make permanent flat benchmarks for Medicare CQMs, we stated in the CY 2025 PFS final rule (89 FR 98120) that we believed that the baseline period data,

which would be available to establish historical benchmarks is consistent with MIPS benchmarking policies at § 414.1380(b)(1)(ii). As we stated in the CY 2025 PFS proposed rule (89 FR 61860), the use of historical benchmarks, when data are available, allows Shared Savings Program ACOs to know benchmarks prior to start of the PY and create opportunities for improvement. Also, as discussed in the CY 2024 PFS final rule, since Medicare CQMs would be subject to MIPS scoring policies, the application of MIPS benchmarking policies to Medicare CQMs is both logical and necessary for implementation of the new collection type (88 FR 79180). We believe it is no longer logical to apply this benchmark methodology to Medicare CQMs due to Shared Savings Program ACOs' concerns that quality-related changes are disruptive to the transition to digital quality measurement as well as due to the sunsetting of the population and income adjustment as finalized in the CY 2026 PFS final rule, each described in further detail in the CY 2027 PFS proposed rule (91 FR 44041 and 44042).

We stated in the CY 2027 PFS proposed rule (91 FR 44041) that, in 2025, we conducted interviews with a sample of Shared Savings Program ACOs who reported Medicare CQMs for PY 2024, the first year of the Medicare CQMs collection type.[293] Interviewed Shared Savings Program ACOs reported continued challenges with the transition to digital quality measurement. Some Shared Savings Program ACOs shared that uncertainty regarding digital reporting standards have led them to restrict or pause adding new practices to their organization. These new restrictions limit practice access to the Shared Savings Program and beneficiary access to value-based care. To support the transition to digital quality measurement, Shared Savings Program ACOs and other interested parties that responded to the RFI on deregulation demonstrated support for policies that promote continuity and recommended against further alignment of Shared Savings Program quality reporting policies with MIPS. Given the challenges and concerns that Shared Savings Program ACOs have shared regarding navigating additional Shared Savings Program policy changes in a time of larger quality reporting transition, coupled with Shared Savings Program ACO patient data privacy concerns and lack of capability to report other measure collection types such as eCQMs, as discussed in the CY 2027 PFS proposed rule (91 FR 44039 through 44044), we proposed to extend the use of flat benchmarks to score all Medicare CQMs for PY 2027 and subsequent PYs, and for Quality IDs 001, 134, and 236 for PY 2026. This proposal would continue to support Shared Savings Program ACOs that choose to report via that collection type during the transition to reporting and would be consistent with the goals of the deregulatory RFI (90 FR 15481 and 15482).

We stated in the CY 2027 PFS proposed rule (91 FR 44041) that, under current policy, flat benchmarks for Medicare CQMs are only used in a measure's first two years in MIPS. Thus, the number of Medicare CQMs in the APP Plus quality measure set that will use flat benchmarks will decline over time. For PY 2025, all four Medicare CQMs (Quality IDs 001, 112, 134, and 236) in the APP Plus quality measure set were scored using flat benchmarks; however, this number decreased to two (Quality IDs 112 and 113) of five Medicare CQMs for PY 2026.

In the CY 2026 PFS final rule (90 FR 49807), we stated that we conducted an internal analysis of the PY 2024 Shared Savings Program ACO quality results to better understand the potential impact of the proposed removal of the population and income adjustment on 13 ACOs that earned the population and income adjustment bonus points and reported only Medicare CQMs. Specifically, we simulated the application of flat benchmarks for Medicare CQMs (as described at § 414.1380(b)(1)(ii)(F)), which was in effect starting in PY 2025. Had flat benchmarks been applied to the three Medicare CQMs in the APP quality measure set in PY 2024, the average MIPS quality performance category score earned by these 13 Shared Savings Program ACOs would have been on average 14 percentage points higher compared to an average increase of 4 percentage points that these Shared Savings Program ACOs earned from the population and income adjustment in PY 2024, a difference of 10 percentage points. This would thus increase the likelihood that these Shared Savings Program ACOs would meet the quality performance standard by achieving a quality score that is equivalent to or higher than the 40th percentile across all MIPS quality performance category scores, excluding entities/providers eligible for facility-based scoring or the alternative quality performance standard. We also stated that, while we anticipate that Shared Savings Program ACOs that choose to report Medicare CQMs would not be eligible for the eCQM/MIPS CQM reporting incentive or the Complex Organization Adjustment, these Shared Savings Program ACOs would likely sufficiently benefit from our policy to score Medicare CQMs using flat benchmarks as described at § 414.1380(b)(1)(ii)(F). Specifically, we anticipated that these Shared Savings Program ACOs would receive a positive scoring impact under flat benchmarks for Medicare CQMs, that would be greater than the current positive scoring impact these Shared Savings Program ACOs received under the population and income adjustment. This analysis further reflected the substantial impact of flat benchmarks on Shared Savings Program ACOs' quality scores. Since the population and income adjustment is no longer applicable beginning in PY 2026, as finalized in the CY 2026 PFS final rule (90 FR 49815), using flat benchmarks to score Quality IDs 001, 134, and 236 if reported via the Medicare CQMs collection type for PY 2026, and scoring all Medicare CQMs using flat benchmarks in PY 2027 and subsequent PYs, would further support Shared Savings Program ACOs that will no longer have access to the population and income adjustment and help ensure that Shared Savings Program ACOs with high quality performance on a measure are not penalized as low performers. Additionally, Shared Savings Program ACOs that report quality measures using the eCQMs or MIPS CQMs collection type may qualify for the collection type's respective reporting incentive or may be eligible to receive the Complex Organization Adjustment (if reporting using the eCQMs collection type). This proposed policy would also support Shared Savings Program ACOs that do not yet report or cannot report eCQMs or MIPS CQMs.

In the CY 2027 PFS proposed rule (91 FR 44042), we stated that section 1871(e)(1)(A) of the Act prohibits the Secretary from applying substantive changes in regulations retroactively before the effective date of the change except where the Secretary determines, as relevant here, that failure to apply the change retroactively would be contrary to the public interest. It is in the public interest to apply our proposed change to score Diabetes: Glycemic Status Assessment Greater Than 9% (Quality ID: 001), Preventive Care and Screening: Screening for Depression and Follow-up Plan (Quality ID: 134), and Controlling High Blood Pressure (Quality ID: 236) when reported via the Medicare CQMs collection type for PY 2026 using flat benchmarks. The evaluation of Shared

[293] aimaim and Claim Line Feed (CCLF) Information Packet (IP)'' (version 43.0, 5/13/2026), available at *https://www.cms.gov/files/document/cclf-information-packet.pdf*.

Savings Program ACOs' PY 2026 quality performance, including the use of measure benchmarks to calculate quality scores, will occur in PY 2027. Retroactive application of flat benchmarks for Medicare CQMs for PY 2026 would enable the Shared Savings Program to better recognize the quality of care provided in PY 2026 and incentivize future improvements based on the evaluation of that care. We analyzed PY 2024 data on Shared Savings Program ACOs that reported all three Medicare CQMs in the APP quality measure set, which had performance-based benchmarks, and compared PY 2024 quality scores to simulated quality scores using flat benchmarks for the three Medicare CQMs. Flat benchmarks were estimated to increase average quality scores by 11 percentage points in this analysis.[294] Higher percentage points would increase the likelihood that these Shared Savings Program ACOs would meet the quality performance standard for sharing in savings at the maximum rate under its track by achieving a quality score that is equivalent to or higher than the 40th percentile across all MIPS quality performance category scores, excluding entities/providers eligible for facility-based scoring or the alternative quality performance standard to be eligible to share in savings at a lower rate that is scaled based on the ACO's quality performance. The quality performance standard helps hold Shared Savings Program ACOs accountable for the quality of care their providers furnish to their beneficiaries and further encourages ACOs to demonstrate consistently that they are providing high quality of care to their beneficiary populations year over year (90 FR 49836). This analysis also illustrated that the use of performance-based benchmarks could lead to Shared Savings Program ACOs forgoing shared savings that might otherwise have been available for reinvestment. Based on the Shared Savings Program ACO public reporting requirements § 425.308(b)(4)(ii), Shared Savings Program ACOs that generate shared savings must publicly report the total proportion of shared savings invested in infrastructure, redesigned care processes, and other resources required to support the triple aim of better health for populations, better care for individuals, and lower growth in expenditures, including the proportion distributed among Share Savings Program ACO participants. As such, the proposed change would afford the Shared Savings Program ACOs with increased shared savings the opportunity to devote greater resources to providing better quality of care to Medicare beneficiaries over time and improving care coordination that benefits the Medicare beneficiaries served by the Shared Savings Program ACOs.

Additionally, Shared Savings Program ACOs that participated in the interviews discussed in the CY 2027 PFS proposed rule (91 FR 44042) also shared that some practices have closed due to financial challenges associated with the transition to digital quality measurement. Furthermore, some Shared Savings Program ACOs have begun to remove practices that cannot meet digital reporting requirements from their organization.[295] For practices experiencing financial and organizational instability, the loss of shared savings would compound these challenges and may cause them to close or negatively affect their ability to provide continuity of care, coordination of care, preventive care initiatives, and quality improvement initiatives for Medicare beneficiaries they serve. As a result, beneficiaries may experience challenges with accessing care, ineffective utilization of services, fragmented care, or duplicative tests or services, and ACOs may be slower to adopt digital quality measurement as a result.

As discussed in the CY 2027 PFS proposed rule (91 FR 44042 and 44043), our proposal to remove Initiation and Engagement of Substance Use Disorder Treatment (Quality ID: 305) and Adult Immunization Status (Quality ID: 493) from the APP Plus quality measure set beginning in PY 2027, would result in the APP Plus quality measure set to have five Medicare CQMs for PY 2027 and subsequent PYs. These are the same Medicare CQMs that are in the APP Plus quality measure set for PY 2026. Under the proposals described in the CY 2027 PFS proposed rule (91 FR 44040 through 44044), all Medicare CQMs in the APP Plus measure set (Quality IDs: 001, 112, 113, 134, and 236) would be scored using flat benchmarks for PY 2026 and subsequent PYs. The proposed APP Plus quality measure set for PY 2027 and subsequent PYs is displayed in Table B–G5 of the CY 2027 PFS proposed rule (91 FR 44055). The APP Plus quality measure set for PY 2026 is displayed in Table 40 of the CY 2025 PFS final rule (89 FR 98129).

As discussed in the CY 2025 PFS final rule, a quality performance benchmark is the performance rate a Shared Savings Program ACO must achieve to earn the corresponding quality points for each measure (89 FR 98118). Flat benchmarks assign a performance rate range to each decile. In flat benchmarks for non-inverse measures, any performance rate at or above 90 percent is treated as the top decile; any performance rate between 80 percent and 89.99 percent would be treated as the second highest decile, and so on. For inverse measures, this would be reversed—any performance rate at or below 10 percent would be treated as the top decile; any performance rate between 10.01 percent and 20 percent would be treated as the second highest decile, and so on. The number of measure achievement points received for each measure is determined based on where a Shared Savings Program ACO's performance rate is within the benchmark decile categories.

For non-inverse measures, better quality performance is indicated by a higher performance rate. For example, Controlling High Blood Pressure (Quality ID: 236) is a non-inverse measure that measures the percentage of patients 18 to 85 years of age who had a diagnosis of hypertension and whose blood pressure was adequately controlled (<140/90 mmHg) during the measurement period. Better quality performance on this measure is demonstrated by having a higher percentage of patients whose blood pressure was adequately controlled. Table B–G3 of the CY 2027 PFS proposed rule lists the flat benchmarks for a non-inverse Medicare CQM under our proposals in the CY 2027 PFS proposed rule (91 FR 44043). For example, if a Shared Savings Program ACO reports a non-inverse Medicare CQM in PY 2026 or a subsequent PY and earns a performance rate of 55.25 percent, then the Shared Savings Program ACO would score in the 6th decile on that measure.

For inverse measures, better quality performance is indicated by a lower performance rate. This is reflected in flat benchmark such that lower quality performance rates are found in higher deciles. For example, Diabetes: Glycemic Status Assessment Greater Than 9% (Quality ID: 001) is an inverse quality measure that measures the percentage of patients 18–75 years of age with diabetes who had a glycemic status assessment (hemoglobin A1c [HbA1c] or glucose management indicator [GMI]) greater than 9.0 percent

[294] See, for example, Medicare Share dd Savings Program, ''Shared Savings and Losses, Assignment and Quality Performance Standard Methodology Specifications'' (April 2026, Version #14), available at *https://www.cms.gov/files/document/medicare-shared-savings-program-shared-savings-losses-assignment-methodology-specifications-version.pdf-0.* (Appendix F: Report Descriptions).

[295]

during the measurement period. Better quality performance on this measure is demonstrated by having a lower percentage of patients whose glycemic status assessment was greater than 9.0 percent. Table B–G4 of the CY 2027 PFS proposed rule lists the flat benchmarks for an inverse Medicare CQM under our proposals discussed in the CY 2027 PFS proposed rule (91 FR 44044). For example, if a Shared Savings Program ACO reports an inverse Medicare CQM in PY 2026 or subsequent year and earns a performance rate of 12.25 percent, then the Shared Savings Program ACO would score in the 9th decile on that measure. Diabetes: Glycemic Status Assessment Greater Than 9% (Quality ID: 001) is the only inverse Medicare CQM in the APP Plus quality measure set.

There are scoring scenarios in which Shared Savings Program ACOs would earn higher measure achievement points under flat benchmarks compared to those they would earn under performance period benchmarks. Most notable are scenarios in which Shared Savings Program ACOs have a tight distribution of performance rates on a measure. For example, a non-inverse measure for which a performance rate of 90.00 percent is in the 8th decile. In this example, a Shared Savings Program ACO that reported a performance rate of 90.00 percent would be scored in the 8th decile when the hypothetical performance period benchmark is applied. Using the flat benchmarks described in Table B–G3 of the CY 2027 PFS proposed rule (91 FR 44043), a Shared Savings Program ACO that reported a performance rate of 90.00 percent would be scored in the 10th decile, resulting in greater measure achievement points than under the hypothetical performance period benchmarks described in this example. For more details on the calculation of measure achievement points, we refer readers to the ''APM Performance Pathway (APP) Toolkit'' which is updated for each PY and posted in the QPP Resource Library.

As described in the CY 2027 PFS proposed rule (91 FR 44040 and 91 FR 44205) and in § 414.1380(b)(1)(ii)(F)(2), we proposed that beginning with the CY 2026 performance period/2028 MIPS payment year, measures of the Medicare CQMs collection type would use flat benchmarks.

We sought public comment on our proposals to score Shared Savings Program ACOs reporting Medicare CQMs using flat benchmarks for PY 2027 and subsequent years and to retroactively apply the flat benchmarks for Quality IDs: 001, 134, and 236 when reported via the Medicare CQMs collection type for PY 2026.

We received public comments on these proposals. The following is a summary of the comments we received and our responses.

Comment: All commenters supported our proposal to score Medicare CQMs using flat benchmarks for PY 2027 and subsequent years. Many commenters stated that extending the use of flat benchmarks to score Medicare CQMs provides increased predictability, transparency, and stability, and noted the advantage of consistency in a time of evolving quality reporting requirements and during the transition to digital quality measurement. A commenter supported the proposal and recommended that CMS maintain stable quality scoring methodologies during the transition to digital quality measurements. A commenter also noted that flat benchmarks appropriately reward high-quality performance while preserving opportunities for continued improvement.

Many commenters highlighted the limitations of performance-based or historical benchmarks for measures only used in the Shared Savings Program. Several commenters noted that performance-based or historical benchmarks can distort performance results when based only on Shared Savings Program ACOs. Another commenter stated that flat benchmarks prevent Shared Savings Program ACOs from being penalized due to comparisons to prior high performance and encourage participation from new ACOs. A commenter stated that flat benchmarks protect high performers from being scored against a moving target.

Several commenters stated that flat benchmarks enable ACOs to focus on improving quality of care and data infrastructure modernization rather than focusing on reporting infrastructure and its associated administrative burden. A commenter noted administrative burden when measures within the same measure set use different benchmark methodologies. A commenter stated that flat benchmarks better recognize long-term investments in care management, clinical integration, quality improvement programs, and population health capabilities.

Several comments noted that flat benchmarks can prevent scoring results that reflect methodology differences rather than actual changes in clinical performance. A commenter stated that flat benchmarks can address challenges that can arise when benchmark distributions produce counterintuitive results.

A few comments supported the proposal to extend the use of flat benchmarks and stated that, in the absence of flat benchmarks, Shared Savings Program ACOs that reported via the Medicare CQMs collection type would be evaluated using MIPS benchmarks.

Response: We appreciate comments that support our proposal to score Medicare CQMs using flat benchmarks for PY 2027 and subsequent PYs.

Comment: Some commenters supported our proposal to score Medicare CQMs using flat benchmarks and suggested that CMS should periodically reassess the appropriateness of flat benchmarks and evaluate whether observed performance changes reflect improvements in care or differences in data capture and reporting methods. A commenter encouraged CMS to monitor benchmark performance to ensure that benchmarks appropriately distinguish high performers while avoiding unintended consequences for organizations serving medically complex, rural, or socially at-risk populations.

Response: We appreciate the supportive comments. We will continue to monitor ACOs' uptake of Medicare CQMs, the appropriateness of the flat benchmarks and how to assess quality of care improvements and differences as a result of using flat benchmarks.

Comment: A commenter supported our proposals to score Medicare CQMs using flat benchmarks for PY 2027 and subsequent PYs and also retroactively for PY 2026 when Quality IDs 001, 134, and 236 are reported as Medicare CQMs, but requested that CMS ensure that high-performing organizations are not disadvantaged by changes in scoring methodology.

Response: We appreciate the supportive comment. We stated in the CY 2027 PFS proposed rule (91 FR 44042) that we analyzed PY 2024 data on Shared Savings Program ACOs that reported all three Medicare CQMs in the APP quality measure set, which had performance-based benchmarks, and compared PY 2024 quality scores to simulated quality scores using flat benchmarks for the three Medicare CQMs. Flat benchmarks were estimated to increase average quality scores by 11 percentage points in this analysis. Higher percentage points would increase the likelihood that these Shared Savings Program ACOs would meet the quality performance standard for sharing in savings at the maximum rate under its track by achieving a quality score that is equivalent to or higher than the 40th percentile across all MIPS quality performance category

scores, excluding entities/providers eligible for facility-based scoring or the alternative quality performance standard to be eligible to share in savings at a lower rate that is scaled based on the ACO's quality performance. The quality performance standard helps hold Shared Savings Program ACOs accountable for the quality of care furnished by the ACO and further encourages ACOs to demonstrate consistently that they are providing high quality of care to their beneficiary populations year over year (90 FR 49836). This analysis also illustrated that the use of performance-based benchmarks could lead to Shared Savings Program ACOs forgoing shared savings that might otherwise have been available for reinvestment. We will continue evaluating the use of flat benchmarks.

Comment: A commenter supported the use of flat benchmarks to score Medicare CQMs and recommended that CMS maintain separate benchmarks for Medicare CQMs and Medicare eCQMs, stating that separate benchmarks better account for differences in data collection methodologies and support more appropriate performance assessment across collection types.

Response: We agree with the commenter's suggestion to maintain separate benchmarks for Medicare CQMs and Medicare eCQMs as performance distributions may differ between collection types and note that, as stated at § 414.1380(b)(1)(ii), benchmarks are specific to each collection type. As such, Medicare CQMs and Medicare eCQMs will have separate benchmarks. Table B–G3 and Table B–G4 in this section of the final rule list the flat benchmarks for a non-inverse and an inverse Medicare CQM, respectively, for PY 2026 and subsequent PYs. As discussed in section III.G.3.d.(3) of this final rule, we are finalizing our proposal to score Medicare eCQMs using flat benchmarks beginning in PY 2027, and we believe that it is appropriate to use the same scales for both Medicare CQMs and Medicare eCQMs while ACOs gain experience with reporting these collection types and because Medicare eCQMs are a new collection type. The scales for the flat benchmarks for Medicare eCQMs are the same scales that were established for the flat benchmarks for Medicare CQMs when they were established in the CY 2025 PFS final rule (89 FR 98118 and 98119). We will continue to evaluate the appropriateness of the scales used for the flat benchmarks for Medicare CQMs and Medicare eCQMs.

Comment: Most commenters supported our proposal to retroactively apply the flat benchmarks to score Quality IDs: 001, 134, and 236 when reported via the Medicare CQMs collection type for PY 2026. Several commenters stated that the retroactive application of flat benchmarks improves benchmarking transparency, reduces reporting uncertainty, and promotes scoring consistency. Many of these commenters also noted that use of flat benchmarks provides the same scoring benefit to Shared Savings Program ACOs when reporting Shared Savings Program-specific measures. A few of these comments also stated that the retroactive application of the policy will reduce burden for ACOs.

A few commenters reported that maintaining consistent benchmarks is particularly important during the transition to digital quality measurement and other quality reporting transitions. A commenter also stated that this change enables ACOs to focus resources on quality improvement and that flat benchmarks support predictability by preventing scoring changes due to benchmark fluctuations.

Response: We appreciate the support for our proposal to retroactively apply the flat benchmarks to score Quality IDs: 001, 134, and 236 when reported via the Medicare CQMs collection type for PY 2026.

Comment: A commenter suggested that CMS provide additional justification regarding the retroactive use of flat benchmarks rather than the planned historical benchmarks for PY 2026. A commenter, while supportive of the proposal to use flat benchmarks to score Medicare CQMs, opposed the retroactive application of flat benchmarks to PY 2026. The commenter stated that the retroactive provision creates unpredictability and that Shared Savings Program ACOs should know the measure benchmarks prior to the start of the PY so that they can incorporate those standards into quality improvement strategies and appropriately direct clinical and operational resources.

Response: We proposed that Quality IDs: 001, 134, and 236, if reported via the Medicare CQMs collection type for PY 2026 would be scored using flat benchmarks. We discussed in the CY 2027 PFS proposed rule (91 FR 44042) that failure to apply this change retroactively would be contrary to the public interest and provided a detailed rationale to support our proposal in the CY 2027 PFS proposed rule. We stated in the CY 2027 PFS proposed rule that the evaluation of Shared Savings Program ACOs' PY 2026 quality performance, including the use of measure benchmarks to calculate quality scores, will occur in PY 2027. Retroactive application of flat benchmarks for Medicare CQMs for PY 2026 would enable the Shared Savings Program to better recognize the quality of care provided in PY 2026 and incentivize future improvements based on the evaluation of that care. We described that our simulated analysis of PY 2024 data showed that flat benchmarks were estimated to increase average quality scores by 11 percentage points, thus increasing the likelihood that Shared Savings Program ACOs would meet the quality performance standard for sharing in savings at the maximum rate under its track. This analysis also illustrated that the use of performance-based benchmarks, if flat benchmarks are not used, could lead to Shared Savings Program ACOs forgoing shared savings that might otherwise have been available for reinvestment. As such, applying flat benchmarks would afford the Shared Savings Program ACOs with increased shared savings the opportunity to devote greater resources to providing better quality of care to Medicare beneficiaries over time and improving care coordination that benefits the Medicare beneficiaries served by the Shared Savings Program ACOs. Additionally, we stated in the CY 2027 PFS proposed rule (91 FR 44042) that for practices experiencing financial and organizational instability, such as due to financial challenges associated with the transition to digital quality measurement, the loss of shared savings would compound these challenges and may cause them to close or negatively affect their ability to provide continuity of care, coordination of care, preventive care initiatives, and quality improvement initiatives for Medicare beneficiaries they serve.

In response to the commenter's concern that the retroactive application of flat benchmarks to score the three Medicare CQMs in PY 2026 would create unpredictability and that Shared Savings Program ACOs should know the measure benchmarks prior to the start of the PY, we acknowledge the preference for Shared Savings Program ACOs to know the measure benchmarks prior to the start of the PY but note that the policy as finalized will ensure that Shared Savings Program ACOs know the measure benchmarks prior to the end of the PY 2026 and before the Shared Savings Program ACO is required to submit quality data for PY 2026. We also note that these benchmarks are the same as the flat benchmarks used to score Medicare CQMs for PY 2025.

Specifically, the PY 2026 flat benchmarks we are finalizing for Diabetes: Glycemic Status Assessment Greater Than 9% (Quality ID: 001), Preventive Care and Screening: Screening for Depression and Follow-up Plan (Quality ID: 134), and Controlling High Blood Pressure (Quality ID: 236) are the same flat benchmarks used to score these measures for PY 2025, as established in the CY 2025 PFS final rule (89 FR 98118 and 98119). We believe that this will enable Shared Savings Program ACOs to incorporate those standards into quality improvement strategies and appropriately direct clinical and operational resources.

As described in section IV.B.1.c.(1) of this final rule and in § 414.1380(b)(1)(ii)(F)(2), we are finalizing as proposed that beginning with the CY 2026 performance period/2028 MIPS payment year, measures of the Medicare CQMs collection type would use flat benchmarks. After consideration of the public comments, we are finalizing as proposed that, for PY 2027 and subsequent PYs, all measures of the Medicare CQMs collection type would be scored using flat benchmarks.

We are also finalizing as proposed that the following measures reported via the Medicare CQMs collection type for PY 2026 are scored using flat benchmarks: Diabetes: Glycemic Status Assessment Greater Than 9% (Quality ID: 001), Preventive Care and Screening: Screening for Depression and Follow-up Plan (Quality ID: 134), and Controlling High Blood Pressure (Quality ID: 236).

As discussed in section IV.A.4.b.(2) of this final rule, we are finalizing our proposal to remove Initiation and Engagement of Substance Use Disorder Treatment (Quality ID: 305) and Adult Immunization Status (Quality ID: 493) from the APP Plus quality measure set beginning in PY 2027, which will result in the APP Plus quality measure set having five Medicare CQMs for PY 2027 and subsequent PYs. These are the same Medicare CQMs that are in the APP Plus quality measure set for PY 2026. Under the policies we are finalizing in this section, all Medicare CQMs in the APP Plus measure set (Quality IDs: 001, 112, 113, 134, and 236) would be scored using flat benchmarks for PY 2026 and subsequent PYs. The final APP Plus quality measure set for PY 2027 and subsequent PYs is displayed in Table B–G7 of this final rule. The APP Plus quality measure set for PY 2026 is displayed in Table 40 of the CY 2025 PFS final rule (89 FR 98129).

Table B–G3 lists the flat benchmarks for a non-inverse Medicare CQM. This is the same as Table B–G3 of the CY 2027 PFS proposed rule (91 FR 44043).

TABLE B-G3: FLAT BENCHMARKS FOR A NON-INVERSE MEDICARE CQM IN PY 2026 AND SUBSEQUENT PYs

Decile	Performance Rate Range
1	< 10.00
2	10.00 – 19.99
3	20.00 – 29.99
4	30.00 – 39.99
5	40.00 – 49.99
6	50.00 – 59.99
7	60.00 – 69.99
8	70.00 – 79.99
9	80.00 – 89.99
10	>= 90.00

Table B–G4 lists the flat benchmarks for an inverse Medicare CQM. This is the same as Table B–G4 of the CY 2027 PFS proposed rule (91 FR 44044).

TABLE B-G4: FLAT BENCHMARKS FOR AN INVERSE MEDICARE CQM IN PY 2026 AND SUBSEQUENT PYs

Decile	Performance Rate Range
1	99.00 – 90.01

d. Addressing Shared Savings Program ACOs' Challenges With Meeting the MIPS Data Completeness Requirement

(1) Background

In the CY 2027 PFS proposed rule (91 FR 44044) we stated that requirements for data completeness are essential to ensure that data submitted on quality measures are sufficiently complete to accurately assess each Shared Savings Program ACO's quality performance. The data completeness requirement means that a Shared Savings Program ACO participant submitting measure data on a quality measure must submit data on at least a specific percentage of their patients that meet the measure's denominator criteria. Meeting the data completeness requirement ensures that the measure represents an appropriate percentage of the patient population applicable for a given quality measure. Robust data completeness requirements ensure the most accurate assessment of the performance of Shared Savings Program ACO participants.

In the CY 2017 Medicare Program; Merit-Based Incentive Payment System (MIPS) and Alternative Payment Model (APM) Incentive Under the Physician Fee Schedule, and Criteria for Physician-Focused Payment Models (81 FR 77125), we established a data completeness threshold to ensure that data submitted on quality measures are complete enough to accurately assess each MIPS eligible clinician's quality performance. Additionally, in the CY 2020 PFS final rule (84 FR 62568, 62953), we added a requirement at § 414.1340 that quality data would not be considered true, complete, or accurate if such data are submitted selectively such that the data are unrepresentative of a MIPS eligible clinician or group's performance. In the CY 2024 PFS final rule, we finalized that we would maintain the data completeness criteria threshold of 75 percent (88 FR 79337). Specifically, as finalized, the data completeness criteria for the quality performance category (§ 414.1340) state that MIPS eligible clinicians, groups, virtual groups, subgroups, and APM Entities submitting quality measure data on QCDR measures, MIPS CQMs, or eCQMs must submit data on at least 75 percent of the MIPS eligible clinician, group, virtual group, subgroup, and APM Entity's patients that meet the measure's denominator criteria, regardless of payer for MIPS payment years 2026 through 2030. In the CY 2024 PFS final rule, for APM Entities, specifically Shared Savings Program ACOs, we likewise established the data completeness criteria threshold of at least 75 percent for the Medicare CQMs aligned with the data completeness criteria threshold established for the eCQMs and MIPS CQMs collection types (88 FR 79337).

In the CY 2021 PFS final rule, we finalized modifications to the Shared Savings Program quality reporting requirements and quality performance standard for PY 2021 and subsequent PYs (85 FR 84720 through 84743) requiring Shared Savings Program ACOs to report quality data via the APP codified at § 414.1367. In the CY 2025 PFS final rule, we finalized that for PYs beginning on or after January 1, 2025, Shared Savings Program ACOs must submit quality data via the APP on the quality measures contained in the APP Plus quality measure set to satisfactorily report on behalf of the eligible clinicians who bill under the TIN of a Shared Savings Program ACO participant for purposes of the MIPS quality performance category of the Quality Payment Program (89 FR 98568).

For data completeness criteria pertaining to the quality performance category, we finalized in the CY 2025 PFS final rule that an APM Entity, specifically a Shared Savings Program ACO that meets reporting requirements under the APP, must meet the data completeness requirements established at § 414.1340(d)(1). Shared Savings Program ACOs reporting quality data on the APP Plus quality measure set meet the quality performance standard if they achieve a quality score that is equivalent to or higher than the 40th percentile across all MIPS quality performance category scores. If a Shared Savings Program ACO fails to meet data completeness on a measure in the APP Plus quality measure set, it will receive a 0/10 for the affected quality measure(s), resulting in a lower quality score used to determine eligibility for shared savings. For a Shared Savings Program ACO in the first PY of the ACO's first agreement period, the Shared Savings Program ACO must meet the MIPS data completeness requirement on all eCQMs/MIPS CQMs/Medicare CQMs in the APP Plus quality measure set and receive a MIPS quality performance category score. Shared Savings Program ACOs are eligible for the eCQM/MIPS CQM reporting incentive if they report all eCQMs/MIPS CQMs in the APP Plus quality measure set and meet data completeness requirements for all measures. Lastly, under the Complex Organization Adjustment, Shared Savings Program ACOs may receive one measure achievement point for each submitted eCQM that meets case minimum and data completeness requirements.

Shared Savings Program ACOs continue to express concerns related to the transition to dQM reporting including challenges with data aggregation, engagement of specialty practices, and patient matching. Shared Savings Program ACOs have shared with CMS that specialty electronic health record (EHR) systems are not designed to support the APP Plus quality measure set and that certain specialties may not be able to collect the needed data elements for quality reporting. Shared Savings Program ACOs noted that patients that are not managed by the Shared Savings Program ACO or do not have a primary care relationship with the Shared Savings Program ACO present data aggregation and patient deduplication challenges because specialists may not have quality reporting capabilities for the measures in the APP Plus quality measure set, which may not be part of specialists' clinical workflows. These challenges complicate a Shared Savings Program ACO's ability to meet the data completeness requirement. We have also received feedback that the MIPS data completeness requirement is a deterrent to specialist participation in Shared Savings Program ACOs. In the CY 2025 PFS final rule, some commenters stated that small independent practices and specialty practices are often unable to participate or continue to participate in the Shared Savings Program due to the technical and financial burden associated with the adoption of new technologies needed to meet reporting requirements (89 FR 98105). Several commenters requested that we consider adding exceptions or exclusions for small practices and certain specialties and/or altering data completeness requirements to address ongoing challenges and allow for Shared Savings Program ACOs to be successful in reporting eCQMs, MIPS CQMs, and Medicare CQMs (89 FR 98105).

With the sunset of the CMS Web Interface beginning in PY 2025 as finalized in the CY 2022 PFS final rule (86 FR 65440), Shared Savings Program ACOs are now required to report MIPS CQMs, eCQMs and/or Medicare CQMs and have reported difficulties with meeting the MIPS data completeness requirement. Shared Savings Program quality reporting data in PYs 2023 and 2024 indicates that Shared Savings Program ACOs have been slow to report eCQMs.

Since the CY 2021 PFS final rule was issued, Shared Savings Program ACOs and other interested parties have continued to express concerns about requiring Shared Savings Program ACOs to report all payer/all patient eCQMs/MIPS CQMs due to the cost of purchasing and implementing a system-wide infrastructure to aggregate data from multiple ACO participant taxpayer identification numbers (TINs) and varying electronic health record (EHR) systems (86 FR 65257). In the CY 2022 PFS final rule, commenters supported our acknowledgement of the complexity of the transition to all payer/all patient eCQMs/MIPS CQMs (86 FR 65259). In the CY 2023 PFS final rule, commenters expressed concerns regarding the requirement to report all payer/all patient eCQMs/MIPS CQMs beginning in PY 2025, such as issues related to meeting all payer data requirements, data completeness requirements, data aggregation and deduplication issues, and interoperability issues among different EHRs (87 FR 69837).

In light of these concerns, we proposed in the CY 2024 PFS proposed rule to establish the Medicare CQMs as a new collection type for Shared Savings Program ACOs to help ACOs build the infrastructure, skills, knowledge, and expertise necessary to aggregate patient data. We established the data completeness criteria threshold of at least 75 percent for the Medicare CQMs aligned with the data completeness criteria threshold established for eCQM and MIPS CQM collection types. We believed that the Medicare CQM collection type would address the concerns from ACOs regarding the capability of meeting the data completeness requirement for all payer data.

In the CY 2024 PFS final rule, many commenters also raised questions and concerns regarding how CMS will determine the appropriate Medicare CQM population for these measures (88 FR 79102). Some commenters noted that the proposed denominator eligibility criteria are similar to, but differ in timeline from, the current assignment methodology and this creates unnecessary complexity. Additionally, while the availability of the Medicare CQMs as a collection type assists with the transition from reporting eCQMs and/or MIPS CQMs to reporting dQMs, some commenters noted that reporting through the Medicare CQMs collection type will not inherently advance their capabilities to report on eCQMs. For instance, the commenters noted that the Medicare CQMs collection type does not address the adoption of CEHRT across Shared Savings Program ACO participants, processes to enable aggregation of quality measurement data across all Shared Savings Program ACO participants, the ability to assess data completeness, efficiently calculate quality measures outcomes, and the generation of a QRDA–III file (88 FR 79103 and 79104). To address these concerns, in the CY 2026 PFS final rule, we revised the definition of a ''beneficiary eligible for Medicare CQM'' to align with our modifications to the stepwise assignment methodology and the approach to identifying the beneficiaries assignable to a Shared Savings Program ACO. We intended for the revised definition to reduce Shared Savings Program ACOs' burden in the patient matching necessary to report Medicare CQMs because the list of ''beneficiaries eligible for Medicare CQMs'' would have greater overlap with the list of beneficiaries that are assignable to a Shared Savings Program ACO.

The Shared Savings Program continues to hear from Shared Savings Program ACOs and other interested parties about the challenges with reporting on all payer/all patient measures and meeting data management requirements given their muti-practice/multi EHR structure, the challenges to aggregate data with the health IT infrastructure in use by Shared Savings Program ACOs and current state of interoperability (89 FR 98122).

In the CY 2027 PFS proposed rule (91 FR 44044 through 44052), we described several proposals to address data completeness challenges for ACOs, in recognition of the heterogeneity in Shared Savings Program ACO composition, with many Shared Savings Program ACOs being made up of numerous TINs of varying specialties. The proposals were intended to support Shared Savings Program ACOs' success in meeting the MIPS data completeness requirement by allowing for flexibility on the universe of beneficiaries that the Shared Savings Program ACO would be required to report quality data on, while still requiring the Shared Savings Program ACOs to collect meaningful data on their quality performance (that is, allowing ACOs to exclude some clinicians from their quality reporting and/or alignment with the Shared Savings Program ACO's list of assigned beneficiaries).

(2) Revising the Shared Savings Program Quality Reporting Requirements Beginning in PY 2026

As we stated in the CY 2027 PFS proposed rule (91 FR 44046), current Shared Savings Program quality reporting requirements at § 425.508(c) require that, for PYs beginning on or after January 1, 2025, Shared Savings Program ACOs must submit quality data on the APP Plus quality measure set to satisfactorily report on behalf of the

eligible clinicians who bill under the TIN of a Shared Savings Program ACO participant for purposes of the MIPS quality performance category. Shared Savings Program ACOs have raised concerns about meeting reporting requirements in situations where they are unable to obtain data from a Shared Savings Program ACO participant TIN. This situation may occur due to unforeseen circumstances such as the retirement of a provider in a solo practice or a practice closure. Additionally, Shared Savings Program ACOs have noted that specialty EHRs are not designed to support the APP Plus quality measure set and that certain specialties (for example, ophthalmology) provide little or no usable data.

In light of the concerns raised by Shared Savings Program ACOs regarding challenges meeting the Shared Savings Program quality reporting requirements, we proposed to revise the quality reporting requirements at § 425.508(c), to include that for PYs beginning on or after January 1, 2026, Shared Savings Program ACOs may exclude one or more Shared Savings Program ACO participant TINs from a Shared Savings Program ACO's submission of eCQM/MIPS CQM/Medicare CQM/Medicare eCQM (if finalized) data (as applicable) for each measure (91 FR 44046 through 44048). As discussed in the CY 2027 PFS proposed rule (91 FR 44048 through 44050), we proposed to create the Medicare eCQMs collection type, which would be a new collection type for PY 2027 and subsequent PYs. We proposed in § 425.508(c)(1)(i) through (iii) that a Shared Savings Program ACO may choose to exclude a Shared Savings Program ACO participant TIN from its submission of eCQM/MIPS CQM/Medicare CQM/Medicare eCQM data for each measure. Applicable exclusions may include: (i) unforeseen circumstance(s) that are outside of the control of the Shared Savings Program ACO such as the unexpected closure of a group or individual's practice that bills under the ACO participant TIN (for example, closure of the group or individual's practice in the middle of the PY due to an unforeseen reason (such as the retirement of a provider) and the Shared Savings Program ACO is unable to access quality data for the closed practice); (ii) the ACO participant TIN has a CEHRT that is intended for specialty use and does not support the measure(s) included in the APP Plus quality measure set (for example, an ophthalmology practice may provide little to no usable data because it utilizes a specialty-focused EHR that does not collect the necessary data elements for reporting on the primary care-focused APP Plus quality measure set; in this instance, the ACO would be unable to aggregate the ACO participant TIN's data); and (iii) other circumstances as determined by CMS. We further proposed in § 425.508(c)(2)(i) through (iii) that Shared Savings Program ACOs may not exclude a Shared Savings Program ACO participant TIN from the Shared Savings Program ACO's quality data submission for each measure based on the demographics or health status of the beneficiaries who had an encounter during the performance year with an ACO participant TIN or based on the estimated impact of the ACO participant TIN on the ACO's quality performance.

In addition, we proposed in § 425.508(c)(3) that, after the exclusion of Shared Savings Program ACO participant TINs, the Shared Savings Program ACO's submission of eCQM/MIPS CQM/Medicare CQM/Medicare eCQM data (as applicable) for each measure must include Shared Savings Program ACO participant TINs that represent at least 95 percent of the beneficiaries assigned to the Shared Savings Program ACO prior to the application of the measure specifications. Since a Shared Savings Program ACO may encounter an unforeseen circumstance that may be specific to reporting a clinical quality measure(s), the Shared Savings Program ACO may exclude one or more Shared Savings Program ACO participant TINs from the quality data submitted for only the impacted measure(s) for the applicable PY. As such, a Shared Savings Program ACO would be required to meet the 95 percent requirement for each measure at the measure level. This means that the quality data submitted by the Shared Savings Program ACO for each measure in the APP Plus quality measure set must meet this requirement independent of the other measures in the APP Plus quality measure set. We noted in the CY 2027 PFS proposed rule that, due to each measure's inclusion and exclusion criteria as specified in the measure specification, a Shared Savings Program ACO's submission of eCQM/MIPS CQM/Medicare CQM/Medicare eCQM data for each measure may not include 95 percent of the beneficiaries assigned to the Shared Savings Program ACO (91 FR 44046). However, under our proposal, the data submitted for each measure must include ACO participant TINs that represent at least 95 percent of the beneficiaries assigned to the Shared Savings Program ACO prior to the application of the measure specifications. This 95 percent requirement would allow Shared Savings Program ACOs to exclude one or more Shared Savings Program ACO participant TINs from a measure submission based on applicable circumstances defined by CMS under the regulation text at § 425.508(c)(1) and discussed later in this section, while ensuring CMS still receives sufficient data to assess Shared Savings Program ACO quality in the applicable PY and over time.

We noted in the CY 2027 PFS proposed rule that our proposal to require that the Shared Savings Program ACO's submission of eCQM/MIPS CQM/Medicare CQM/Medicare eCQM data (as applicable) for each measure must include Shared Savings Program ACO participant TINs that represent at least 95 percent of the beneficiaries assigned to the Shared Savings Program ACO prior to the application of the measure specifications is different than the MIPS data completeness requirement for the MIPS quality performance category described at § 414.1340(a) and (d) and proposed (e) (91 FR 44046). Under our proposal, Shared Savings Program ACOs would still be required to meet the MIPS data completeness requirement (that is, the Shared Savings Program ACO must report on at least 75 percent of the APM Entity's applicable beneficiaries who meet the measure's denominator criteria for PY 2027) for each eCQM/MIPS CQM/Medicare CQM/Medicare eCQM the Shared Savings Program ACO submits data for (91 FR 44046 through 44047). MIPS data completeness is calculated based on the quality data submitted by a Shared Savings Program ACO and is assessed at the Shared Savings Program ACO-level; whereas, our proposal to allow a Shared Savings Program ACO to exclude one or more Shared Savings Program ACO participant TINs from a Shared Savings Program ACO's submission of eCQM/MIPS CQM/Medicare CQM/Medicare eCQM data (as applicable) for each measure would be applied by the Shared Savings Program ACO prior to its submission of quality data to MIPS. Under our proposal, a Shared Savings Program ACO would determine the denominator for a measure by applying the measure specifications using data from the participant TINs included in its quality data submission. MIPS data completeness would then be calculated based on that reported denominator (91 FR 44047).

In the CY 2027 PFS proposed rule, we stated that to facilitate population-based

activities related to improving health or reducing growth in healthcare costs, protocol development, case management, and care coordination under the existing § 425.702(c)(1)(ii) and to support Shared Savings Program ACOs in aggregating data for the Shared Savings Program ACO's submission of eCQM/MIPS CQM/Medicare CQM/Medicare eCQM data (as applicable) for each measure under the proposed § 425.508(c)(3), we would provide Shared Savings Program ACOs with a new aggregate report that would contain the data necessary to determine how many beneficiaries would be represented by the TINs the ACO plans to report on (91 FR 44047). Specifically, the report would be at the beneficiary-TIN level and contain the number of beneficiaries that will be assigned to the ACO and demonstrate how the assigned beneficiaries are matched to the TIN(s). This report would be provided in Quarter 3 and Quarter 4 of each applicable performance year beginning with PY 2026. This would allow the Shared Savings Program ACO to have access to the data that is necessary to determine if the ACO's submission of eCQM/MIPS CQM/Medicare CQM/Medicare eCQM data for each measure includes Shared Savings Program ACO participant TINs sufficient to represent at least 95 percent of the beneficiaries assigned to the Shared Savings Program ACO prior to the application of the measure specifications. This new aggregate report would be delivered to Shared Savings Program ACOs via the Data Hub in the Shared Savings Program ACO Management System (*https://acoms.cms.gov*). We noted in the CY 2027 PFS proposed rule that if this proposal is finalized, we would provide instructions to Shared Savings Program ACOs in future education and outreach materials on how to use the new aggregate report to determine the Shared Savings Program ACO participant TINs that represent at least 95 percent of the beneficiaries assigned to the Shared Savings Program ACO prior to the application of the measure specifications as required by the proposed § 425.508(c)(3) for purposes of submission of eCQM/MIPS CQM/Medicare CQM/Medicare eCQM data (91 FR 44047). The Quarter 3 report would be intended to provide Shared Savings Program ACOs with a preview of the necessary data, while the Quarter 4 report would be the definitive source for ACOs to determine whether the Shared Savings Program ACO meets the proposed Shared Savings Program requirement that the data submitted for each measure must include Shared Savings Program ACO participant TINs that represent at least 95 percent of the beneficiaries assigned to the Shared Savings Program ACO prior to the application of the measure specifications. We noted in the CY 2027 PFS proposed rule that if our proposal is finalized, we would begin to provide ACOs with this report for Quarter 3 of PY 2026. For PY 2026 and subsequent PYs, Shared Savings Program ACOs must use the new Quarter 4 aggregate report to make the determination under the proposed § 425.508(c)(3) (91 FR 44047). We further noted in the CY 2027 PFS proposed rule that if this proposal is not finalized, we would not share the new aggregate reports (91 FR 44047).

Since we cannot align a beneficiary to a Shared Savings Program ACO participant TIN without eligible primary care claims, an ACO should not count beneficiaries without eligible primary care claims during the performance year when calculating the 95 percent of beneficiaries needed to meet the requirement proposed at § 425.508(c)(3). Moreover, beneficiaries that do not have at least one eligible primary care encounter during the performance year would not be included on the list of beneficiaries shared with ACOs in Quarter 3 and Quarter 4 during that performance year as noted earlier in this section. For example, if a beneficiary is voluntarily aligned to the ACO but did not have an eligible primary care claim with a Shared Savings Program ACO participant during the performance year, that beneficiary would not be included on the list of beneficiaries shared with that ACO in Quarter 3 and Quarter 4 of the applicable performance year and the ACO would not include that beneficiary when calculating the numerator used to determine whether the ACO was compliant with the 95 percent requirement proposed at § 425.508(c)(3). For purposes of calculating the 95 percent requirement, the denominator would be the Shared Savings Program ACO's total number of assigned beneficiaries, inclusive of beneficiaries that did not have an eligible primary care claim during the reporting period with a Shared Savings Program ACO participant.

We noted in the CY 2027 PFS proposed rule that, under the current definition of a ''beneficiary eligible for Medicare CQMs'' at § 425.20, beneficiaries eligible for Medicare CQMs for PY 2026 are closely aligned with the Shared Savings Program ACO's assignable population rather than the ACO's assigned population (as proposed in section III.G.3.d.(4) of the CY 2027 PFS proposed rule for PY 2027 and subsequent PYs) (91 FR 44047). Shared Savings Program ACOs that choose to report Medicare CQMs for PY 2026 would have the option to exclude Shared Savings Program ACO participant TINs from their submission of Medicare CQM data provided that the remaining Shared Savings Program ACO participant TINs represent at least 95 percent of the beneficiaries assigned to the ACO prior to the application of the measure specifications.

In addition, in § 425.508(c)(4), we proposed that we would retain the right to audit and validate eCQM/MIPS CQM/Medicare CQM/Medicare eCQM data for each measure reported by a Shared Savings Program ACO and may request documentation from the Shared Savings Program ACO related to the exclusion of Shared Savings Program ACO participant TINs from the Shared Savings Program ACO's quality data submission (91 FR 44047). We also proposed that failure to report quality measure data accurately, completely, and timely may result in compliance actions as described in §§ 425.216 and 425.218 (91 FR 44047).

Section 1871(e)(1)(A) of the Act prohibits the Secretary from applying substantive changes in regulations retroactively before the effective date of the change except where the Secretary determines, as relevant here, that failure to apply the change retroactively would be contrary to the public interest. It is in the public interest to apply our proposed changes to § 425.508 ''Incorporating quality reporting requirements related to the Quality Payment Program Beneficiary'' beginning in PY 2026 because, absent the proposed changes, Shared Savings Program ACOs that generated savings while maintaining or improving quality of care may have difficulty meeting the quality reporting requirements at § 425.508(c). Based on the Shared Savings Program ACO public reporting requirements at § 425.308(b)(4)(ii), Shared Savings Program ACOs that generate shared savings must publicly report the total proportion of shared savings invested in infrastructure, redesigned care processes, and other resources required to support the triple aim of better health for populations, better care for individuals, and lower growth in expenditures, including the proportion distributed among Shared Savings Program ACO participants. If a Shared Savings Program ACO does not meet the quality reporting requirements, then that Shared Savings Program ACO would not be eligible to share in savings that could be used for quality improvement initiatives for the Medicare beneficiaries.

The evaluation of Shared Savings Program ACOs' PY 2026 quality performance, including evaluation of MIPS data completeness, occurs in 2027. As such, retroactive application of the proposed reporting requirement for PY 2026 would be in the public interest and would afford Shared Savings Program ACOs that earn shared savings the opportunity to devote greater resources to providing better quality of care to Medicare beneficiaries over time and improving care coordination that benefits the Medicare beneficiaries served by Shared Savings Program ACOs, in accordance with ACO public reporting requirements at § 425.308(b)(4)(ii).

Additionally, Shared Savings Program ACOs that participated in the interviews discussed in section III.G.3.c of this final rule have also shared that some practices have closed due to financial challenges associated with the transition to digital quality measurement and have begun to remove practices that cannot meet digital reporting requirements from their organization. Practices that do not meet the quality reporting requirements and, therefore, do not earn shared savings, could experience financial instability. For these practices, the loss of shared savings would compound these challenges and may cause them to close or may negatively affect their ability to provide continuity of care, coordination of care, preventive care initiatives, and quality improvement initiatives for Medicare beneficiaries they serve. As a result, beneficiaries may experience challenges with accessing care, ineffective utilization of services, fragmented care, or duplicative tests or services, and ACOs may be slower to adopt digital quality measurement as a result. The proposed changes would allow Shared Savings Program ACOs to devote greater resources to improving care coordination so that they are better positioned to deliver the right care at the right time, all to the benefit of Medicare beneficiaries served by the Shared Savings Program ACO and Medicare Trust Funds.

We believe the proposed changes would have minimal impact on Shared Savings Program ACOs' existing processes because the Shared Savings Program ACO would continue to aggregate quality data and apply the measure specifications prior to the submission of quality data. Additionally, Shared Savings Program ACOs would benefit from the ability to meet the MIPS data completeness requirement, in the event they are unable to acquire data from a subset of their participant TINs, which may enable them to achieve a quality score equivalent to the 40th percentile MIPS quality performance category score to be eligible to earn maximum shared savings and, for ENHANCED track Shared Savings Program ACOs, avoid shared losses.

In alignment with the proposals described in this section, we proposed to revise the regulation text at § 425.508 as follows:

- Under new paragraph (c)(1), we would specify that, for PYs beginning on or after January 1, 2026, ACOs may exclude one or more TINs of ACO participants from an ACO's submission of eCQM/MIPS CQM/Medicare CQM/Medicare eCQM data (as applicable) for each measure. We would specify that applicable exclusions may include:
  - ++ Unforeseen circumstance(s) that are outside of the control of the ACO, such as the unexpected closure of a group or individual's practice that bills under the ACO participant TIN.
  - ++ An ACO participant TIN has a CEHRT that is intended for specialty use and does not support the measure(s) included in the APP Plus quality measure set.
  - ++ Other circumstances as determined by CMS.
- Under new paragraph (c)(2), we would specify that ACOs may not exclude an ACO participant TIN from the ACO's quality data submission for each measure based on the following:
  - ++ The demographics status of the beneficiaries who had an encounter during the performance year with an ACO participant TIN.
  - ++ The health status of the beneficiaries who had an encounter during the performance year with an ACO participant TIN.
  - ++ The estimated impact of the ACO participant TIN on the ACO's quality performance.
- Under new paragraph (c)(3), we would specify that the ACO's submission of eCQM/MIPS CQM/Medicare CQM/Medicare eCQM data (as applicable) for each measure must include ACO participant TINs that represent at least 95 percent of the beneficiaries assigned to the ACO prior to the application of the measure specifications.
- Under new paragraph (c)(4), we would specify that CMS retains the right to audit and validate eCQM/MIPS CQM/Medicare CQM/Medicare eCQM data reported by an ACO and may request documentation from the ACO related to the exclusion of ACO participant TINs under paragraph § 425.508(c)(1). We would further note that failure to report quality measure data accurately, completely, and timely may result in compliance actions as described at §§ 425.216 and 425.218.

We sought public comments on our proposals to revise the Shared Savings Program quality reporting requirements at § 425.508 beginning in PY 2026. We also sought comment on other circumstances we should consider that would allow ACOs to exclude one or more TINs of ACO participants from their submission of eCQM/MIPS CQM/Medicare CQM/Medicare eCQM data for a measure.

We received public comments on these proposals. The following is a summary of the comments we received and our responses.

Comment: Most commenters supported our proposals to revise the Shared Savings Program quality reporting requirements beginning in PY 2026. Many of these commenters noted that the policies address significant challenges and operational realities faced by ACOs. A commenter noted the policies acknowledge difficulties of obtaining quality data from all participant TINs, particularly in multi-specialty, multi-EHR environments while another noted that they recognize the variability of quality reporting capabilities among heterogeneous healthcare providers. Many commenters stated the policies will reduce burden and provide necessary flexibility while maintaining a meaningful MIPS data completeness threshold and while preserving accountability and the integrity of ACO-level quality results. A couple of commenters noted that the policies will reduce unnecessary reporting failures and protect ACOs against adverse reporting outcomes. A couple of commenters noted the policies will prevent them from being penalized for any future reporting issues outside their control. A commenter noted that this policy ensures health system-led ACOs that integrate information across multiple EHR platforms, provider/supplier organizations, and care settings have reasonable flexibility. The commenter noted that, in combination with other quality proposals, the policies will allow for investments in infrastructure needed to transition to dQMs and allow ACOs who report on behalf of a wide variety of EHRs to be successful. A commenter noted the policies will support practitioner participation and decrease the likelihood of practices being excluded from accountable care arrangements solely because of technology or data limitations. This commenter also stated that the policies would allow them to work toward more interoperable reporting options such as the eCQMs collection type instead of manual

options like the Medicare CQMs collection types.

A few commenters noted the flexibilities of the policies are particularly helpful to small and rural ACOs, that have limited resources and fewer administrative staff, and the policies avoid penalizing and help secure continued participation of these providers and suppliers. A commenter also noted the policies are important for physician-led ACOs that include independent practices using different EHR systems and another stated they protect independent, low-revenue practices from being penalized or forced into premature consolidation due to vendor EHR incompatibility or unexpected practice closures. A commenter noted the policies will support participating health centers who do not always have control over whether individual practitioners can report specific measures.

A few commenters supported the proposed exclusion criteria, including prohibiting exclusions based on beneficiary demographics, health status or potential impact on quality performance. A commenter agreed with the application of these exclusions at the TIN and individual-measure level and noted that the proposed safeguards ensure that exclusions address legitimate data-access and reporting barriers rather than being used to improve performance results selectively. Another commenter noted the safeguards appropriately protect program integrity. A couple of commenters agreed that reported data should continue to reflect the vast majority of ACO's' assigned beneficiaries.

Several commenters also supported applying the policies retroactively for PY 2026 to reduce burden and confusion during the upcoming reporting cycle. Lastly, some commenters were in support of the proposed quarterly reports, stating these reports will provide transparent and definitive data to ACOs to support implementation of these new flexibilities. Several comments supported the threshold but recommended that CMS monitor to ensure the threshold remains sufficient as implementation progresses, especially when measures shift to a fully digital environment. A comment appreciated the flexibility and encouraged CMS to avoid increases to the threshold that in their belief could create additional reporting burden for participating providers and suppliers.

Response: We appreciate comments that support our proposal to revise the Shared Savings Program Quality reporting requirements beginning in PY 2026. We note that we will monitor the appropriateness of the 95 percent threshold throughout the implementation process.

Comment: A commenter opposed the proposals to revise the Shared Savings Program quality reporting requirements and shared their belief that it is a new restriction for ACOs that is redundant, burdensome, and harmful to the participating practices that most need protection and encouragement. The commenter noted that the proposals are more restrictive than the 75 percent MIPS data completeness requirement and will disadvantage ACOs.

Response: We believe the comment may be misinterpreting the proposed Shared Savings Program quality reporting requirement revision, and we wish to clarify our proposal. As stated in the CY 2027 PFS proposed rule (91 FR 44046), current Shared Savings Program quality reporting requirements at § 425.508(c) require that, for PYs beginning on or after January 1, 2025, Shared Savings Program ACOs must submit quality data on the APP Plus quality measure set to satisfactorily report on behalf of the eligible clinicians who bill under the TIN of a Shared Savings Program ACO participant for purposes of the MIPS quality performance category. In other words, Shared Savings Program ACOs must submit quality reporting data on all of their eligible clinicians who bill under a TIN of an ACO participant. Our proposals to revise the Shared Savings Program quality reporting requirements are intended to address concerns raised by Shared Savings Program ACOs regarding challenges meeting these requirements in situations where they are unable to obtain data from a Shared Savings Program ACO participant TIN. The proposals would allow ACOs the flexibility to exclude ACO participant TINs from their quality submission data based on the proposed criteria and still meet Shared Savings Program quality reporting requirements, rather than impose additional restrictions or burden.

We stated in the CY 2027 PFS proposed rule (91 FR 44046) that our proposal to require that the Shared Savings Program ACO's submission of eCQM/MIPS CQM/Medicare CQM/Medicare eCQM data (as applicable) for each measure must include Shared Savings Program ACO participant TINs that represent at least 95 percent of the beneficiaries assigned to the Shared Savings Program ACO prior to the application of the measure specifications is different than the MIPS data completeness requirement for the MIPS quality performance category described at § 414.1340(a) and (d) and proposed (e) (91 FR 44046). To further clarify the sequence of how the proposed 95 percent threshold interacts with the MIPS data completeness requirement, we note that the TIN exclusion would be applied by Shared Savings Program ACOs prior to the evaluation of the MIPS data completeness requirement. Under our proposal, a Shared Savings Program ACO would be able to exclude one or more Shared Savings Program ACO participant TINs from a Shared Savings Program ACO's submission of eCQM/MIPS CQM/Medicare CQM/Medicare eCQM data (as applicable) for each measure prior to its submission of quality data to MIPS.

A Shared Savings Program ACO then would determine the denominator for a measure by applying the measure specifications using data from the remaining ACO participant TINs after the application of the TIN exclusion policy. MIPS data completeness would then be calculated based on that reported denominator. Additionally, Shared Savings Program ACOs would be required to meet the MIPS data completeness requirement (that is, the Shared Savings Program ACO must report on at least 75 percent of the APM Entity's applicable beneficiaries who meet the measure's denominator criteria for the respective PY) for each eCQM/MIPS CQM/Medicare CQM/Medicare eCQM for which the Shared Savings Program ACO submits data. MIPS data completeness is calculated based on the quality data submitted by a Shared Savings Program ACO and is assessed at the Shared Savings Program ACO-level.

Comment: Many commenters suggested that CMS broaden the proposed second exclusion, which permits the exclusion of an ACO participant TIN that has CEHRT that is intended for specialty use and does not support the measure(s) included in the APP Plus quality measure set. Commenters recommended expanding this criterion to include an ACO participant TIN that has a CEHRT that does not support the measure(s) included in the APP Plus quality measure set, regardless of whether the CEHRT is intended for specialty use. The comment recommended that CMS broaden the proposed exclusion beyond ''specialty-focused'' EHR vendors to include any EHR vendor that is unable or unwilling to support required measures. Another commenter encouraged CMS to recognize ongoing interoperability challenges and continue investing in technical assistance, standardized data exchange, and

certified health IT capabilities so providers and suppliers can fully participate in quality reporting without relying on exclusion policies over the long term.

Response: We appreciate the suggestions from comments but continue to believe the second exclusion should remain limited to the scenario described in the CY 2027 PFS proposed rule in which an ACO participant TIN has a CEHRT that is intended for specialty use and, because of that focus, does not capture the data elements needed to report the APP Plus quality measure set. In the CY 2027 PFS proposed rule, we provided an example of an ophthalmology practice using an ophthalmology-focused EHR (90 FR 44046). In this case, the Shared Savings Program ACO cannot aggregate that participant TIN's data because the technology was never designed to capture the data elements needed to report the APP Plus quality measure set.

The suggestion to broaden this exclusion criterion is different in that it would extend the exclusion to any CEHRT, specialty-focused or not, that currently does not support the APP Plus quality measure set, for any reason, including business choices that are within the ACO's control, not an inherent mismatch between a specialty tool and the measure set. We disagree with broadening the exclusion on this basis. As described in section III.G.4. of this final rule, Shared Savings Program ACOs are required to have and use EHR technology that meets the definition of CEHRT (as defined at § 425.20) in one of the ways we are finalizing in § 425.507. Shared Savings Program ACOs also have multiple collection types available from which to choose and should choose the collection type that matches their data collection and reporting capabilities. Expanding the exclusion to cover any instance of vendor's non-support of the APP Plus quality measure set would allow Shared Savings Program ACOs to exclude data based on business choices within a Shared Savings Program ACO's control rather than genuine technical limitations and could reduce the completeness and comparability of quality data across ACOs.

We recognize, as another comment noted, that interoperability challenges persist. We note that interoperability is outside of the scope of our proposal and, as such, we are not addressing the comment's recommendations in this response. We are, therefore, finalizing the second exclusion criterion as proposed.

Comment: Many commenters suggested revisions to the proposed third exclusion, which permits the exclusion of an ACO participant TIN based on other circumstances as determined by CMS. Several commenters requested that CMS clearly define the scope of this criterion and establish a transparent process for ACOs to request exclusions under this category. One of these commenters also recommended a defined review timeline. Another commenter recommended CMS expand the proposed third exclusion to include small practices whose EHR and/or billing vendors charge restrictive fees for data transmission. A couple of commenters recommended that CMS expand the third exclusion to allow CMS to change the 95 percent assigned beneficiary threshold on a case-by-case basis.

Response: We note that the use of the proposed third exclusion described as ''other circumstances as determined by CMS'' is intended to address unforeseen circumstances that emerge during the PY. We would monitor implementation for recurring or systemic issues that are not adequately addressed by the specified exclusions and use those trends to inform ACOs when additional circumstances may warrant recognition under this provision ahead of the ACOs' quality reporting period.

We did not propose to establish a process for ACOs to request exclusions (*i.e.,* via the ACO–MS helpdesk, CMS regional office, or other means) or a review timeline under which an ACO may inform CMS of additional circumstances that may warrant an exclusion. We further clarify that there is no expectation that Shared Savings Program ACOs would need to submit a request to CMS to consider exclusions under § 425.508(c)(1)(iii) or that CMS will review such requests. Rather, CMS would identify and determine qualifying circumstances and communicate those determinations to ACOs, as appropriate. We are finalizing in this section of this final rule that CMS retains the right to audit and validate quality data for each measure reported by a Shared Savings Program ACO and may request documentation from the Shared Savings Program ACO related to the exclusion of Shared Savings Program ACO participant TINs from the Shared Savings Program ACO's quality data submission. Shared Savings Program ACOs are required to maintain documentation on TIN exclusions for the purposes of auditing and validation. Shared Savings Program ACOs should review the descriptions of the applicable exclusions at § 425.508(c)(1) as finalized in this section of this final rule and are responsible for determining whether any of these exclusions apply and what documentation they need to maintain to substantiate an applicable exclusion.

We are also rejecting the recommendation to expand the third exclusion to include small practices whose EHR and/or billing vendors charge restrictive fees and note that ACOs can choose vendors that best meet their needs. We further note that we are not allowing ACOs to meet a threshold that is lower than the 95 percent threshold through this third exclusion as suggested in the comment since we are finalizing that the 95 percent threshold would apply to all ACOs. We refer readers to our responses later in this section of this final rule where we discuss our belief that the 95 percent beneficiary threshold remains appropriate as this policy is intended to address limited and unusual circumstances in which the ACO is unable to obtain data from an ACO participant TIN.

Comment: A couple of commenters incorrectly stated that our proposed revisions to the Shared Savings Program quality reporting requirements allow Shared Savings Program ACOs to exclude low-volume TINs or those incapable of producing a QRDA file. A commenter requested that CMS add an exclusion for special-status (small volume) ACOs to align with the exclusions of the CEHRT use metrics. Another commenter stated that CMS should consider adding Promoting Interoperability exclusions and hardship exemptions to the applicable exclusions, as challenges with CEHRT can impede a TIN's ability to produce the necessary files for CQM reporting.

Response: We appreciate suggestions on other circumstances that would allow ACOs to exclude one or more TINs of ACO participants from their submission of quality measure data. We clarify that the current criteria allow for the exclusion of these TINs if they meet applicable criteria. Specifically, in the CY 2027 PFS proposed rule (91 FR 44046), we stated that applicable exclusions may include the following: (i) unforeseen circumstance(s) that are outside of the control of the ACO, such as the unexpected closure of a group or individual's practice that bills under the ACO participant TIN; (ii) an ACO participant TIN has a CEHRT that is intended for specialty use and does not support the measure(s) included in the APP Plus quality measure set; and (iii) other circumstances as determined by CMS. We also stated that ACOs may not exclude an ACO participant TIN from the ACO's quality data submission for each measure based on the

demographics or health status of the beneficiaries who had an encounter during the performance year with an ACO participant TIN or based on the estimated impact of the ACO participant TIN on the ACO's quality performance.

Regarding the comment that our proposed revisions to the Shared Savings Program quality reporting requirements allow Shared Savings Program ACOs to exclude low-volume TINs or those incapable of producing a QRDA file, we note that under the proposed exclusions as described at § 425.508(c)(1) we did not propose to permit ACO participant TINs to be excluded solely based on volume or inability to produce a QRDA file. Low volume does not satisfy the applicable exclusion criteria at § 425.508(c)(1) as ACOs are expected to report on participant TINs, regardless of size. We did not propose to align an applicable exclusion with the criteria for the MIPS low volume threshold (as described at 42 CFR 414.1310(b)(1)(iii)) and instead proposed to allow ACOs to exclude an ACO Participant TIN based on that TIN's contributions to the ACO's assigned beneficiary population. We believe that this approach more appropriately reflects the basis and scope of the Shared Savings Program quality reporting requirements. With respect to the suggestion that we allow Shared Savings Program ACOs to exclude TINs incapable of producing QRDA files, we encourage ACOs to evaluate all quality reporting options to determine which collection type is most appropriate based on the ACO's unique composition and technical infrastructure and note that QRDA files are not necessarily required for all reporting options. We are, therefore, not adding a new exclusion to permit ACOs participant TINs to be excluded solely based on volume or inability to produce a QRDA file.

Regarding the request that we add an exclusion for special-status (small volume) ACO to align with the exclusions of the CEHRT use metrics, we believe the comment may be referring to the MIPS Promoting Interoperability exclusion for small practices. We note that as discussed in paragraph (3) of the definition of ''Small practice'' at 42 CFR 414.1305, beginning with the 2021 MIPS payment year, a small practice means a TIN consisting of 15 or fewer eligible clinicians during the MIPS determination period. We did not propose to include an exclusion for small practice because a small practice, as defined by MIPS, may contribute meaningfully to an ACO's assigned beneficiary population and, as such, should be included in an ACO's quality data submission, unless the small practice meets one of the other applicable exclusions as finalized in this section of this final rule. We do not believe a small practice exclusion is appropriate as ACOs are expected to aggregate data across TINs regardless of their practice size unless there are other circumstances outside the ACO's control.

Regarding the suggestion that we should consider adding Promoting Interoperability exclusions and hardship exemptions to the applicable exclusions at § 425.508(c)(1), we note that as described in section III.G.4. of this final rule, Shared Savings Program ACOs are required to have and use EHR technology that meets the definition of CEHRT (as defined at § 425.20) in one of the ways we are finalizing at § 425.507. We did not propose and are not finalizing a small practice exemption for the Shared Savings Program ACO CEHRT use metrics.

Comment: Several commenters requested CMS to clarify how Shared Savings Program ACOs and vendors would determine whether the submission of eCQM/MIPS CQM/Medicare CQM/Medicare eCQM data (as applicable) for each measure includes Shared Savings Program ACO participant TINs that represent at least 95 percent of the beneficiaries assigned to the Shared Savings Program ACO prior to the application of the measure specifications. A commenter asked if ACOs can exclude different TINs for different measures. Another commenter asked if threshold determination made earlier in the PY is treated as final, or whether an ACO must reassess and potentially adjust its TIN exclusions if beneficiary assignment changes between Quarter 3 and Quarter 4. A commenter suggested that CMS provide a specific list of the types of TINs that qualify for the proposed exclusions, which would allow ACOs to determine eligibility prospectively and reduce uncertainty and administrative burden during implementation. A commenter requested detailed reports by TIN to assist in the beneficiary and participant inventory process. Another requested information on data sources which could be used to identify beneficiaries and guidance on aggregation.

Response: In the CY 2027 PFS proposed rule (91 FR 44047), we stated that, for Quarter 3 and Quarter 4 of each applicable PY beginning with PY 2026, we would provide Shared Savings Program ACOs with a new aggregate report that would contain the data necessary to determine how many beneficiaries would be represented by the TINs the ACO plans to report on. Specifically, the report would be at the beneficiary-TIN level and contain the number of beneficiaries that will be assigned to the ACO and demonstrate how the assigned beneficiaries are matched to the TIN(s). This would allow the Shared Savings Program ACO to have access to the data that is necessary to determine if the ACO's submission of eCQM/MIPS CQM/Medicare CQM/Medicare eCQM data for each measure includes Shared Savings Program ACO participant TINs sufficient to represent at least 95 percent of the beneficiaries assigned to the Shared Savings Program ACO prior to the application of the measure specifications.

We also stated that the Quarter 3 report would be intended to provide Shared Savings Program ACOs with a preview of the necessary data, while the Quarter 4 report would be the definitive source for ACOs to determine whether the Shared Savings Program ACO meets the requirement that the data submitted for each measure must include Shared Savings Program ACO participant TINs that represent at least 95 percent of the beneficiaries assigned to the Shared Savings Program ACO prior to the application of the measure specifications. Regarding the recommendation that CMS provide a specific list of the types of TINs that qualify for the proposed exclusions, we note that ACOs must evaluate the ACO participant TINs based on the applicable exclusions to determine if any ACO participant TINs can be excluded while meeting the quality reporting requirements of § 422.508(c).

We stated in the CY 2027 PFS proposed rule (91 FR 40446) that since a Shared Savings Program ACO may encounter an unforeseen circumstance that may be specific to reporting a clinical quality measure(s), the Shared Savings Program ACO may exclude one or more Shared Savings Program ACO participant TINs from the quality data submitted for only the impacted measure(s) for the applicable PY; specifically, if all requirements are met, Shared Savings Program ACOs could potentially exclude different ACO participant TINs for different impacted measures. A Shared Savings Program ACO would be required to meet the 95 percent requirement for each measure at the measure level. This means that the quality data submitted by the Shared Savings Program ACO for each measure in the APP Plus quality measure set must meet this requirement independent of the other measures in the APP Plus quality measure set.

As stated in this section of this final rule, we are finalizing our proposed revisions to the Shared Savings Program

quality reporting requirements beginning in PY 2026. After the release of this final rule, we will provide instructions to Shared Savings Program ACOs in future education and outreach materials on how to use the new aggregate report to determine the Shared Savings Program ACO participant TINs that represent at least 95 percent of the beneficiaries assigned to the Shared Savings Program ACO prior to the application of the measure specifications. These materials will also include examples of the 95 percent threshold calculations. We also encourage ACOs and their vendors to participate in our monthly QCDR and Qualified Registry support calls, Learning System Webinars and to submit questions to the QPP Service Center, as needed.

Comment: Several commenters requested that CMS provide Shared Savings Program ACOs with the new aggregate reports that would contain the data necessary to determine how many beneficiaries would be represented by the TINs the ACO plans to report on early enough for ACOs to make informed decisions. A commenter stated that large ACOs require sufficient time to identify data gaps, determine TIN exclusions, implement corrective actions, and validate compliance with completeness requirements. This commenter recommended at least 90 days between release of the final report and quality reporting deadlines.

Response: In the CY 2027 PFS proposed rule (91 FR 44047), we stated that we would provide ACOs with the new aggregate reports for Quarter 3 and Quarter 4 of each applicable PY beginning with PY 2026. We also stated that the Quarter 3 report would be intended to provide Shared Savings Program ACOs with a preview of the necessary data, while the Quarter 4 report would be the definitive source for ACOs to determine whether the Shared Savings Program ACO meets the requirement that the data submitted for each measure must include Shared Savings Program ACO participant TINs that represent at least 95 percent of the beneficiaries assigned to the Shared Savings Program ACO prior to the application of the measure specifications. We intend to provide this new information in the Quarter 3 and Quarter 4 reports package. For PY 2026, the Quarter 3 reports package is scheduled to be issued to ACOs in November 2026, and the Quarter 4 reports package is scheduled to be issued to ACOs in February 2027 after the conclusion of the applicable performance year. While the Quarter 4 report would not be issued within 90 days of the quality reporting deadline, we believe this timing is sufficient as this policy is intended to address limited and unusual circumstances in which the ACO is unable to obtain data from an ACO participant TIN. ACOs, regardless of size, should attempt to report data from all TINs, and this policy is intended to be a safeguard for situations outside an ACO's control.

Comment: A few commenters suggested that the 95 percent requirement be revised to other thresholds, such as 80 percent, 85 percent, and 90 percent. A couple of the commenters noted that the 95 percent threshold is too narrow to accommodate the range of data-access failures, specialty CEHRT limitations, and other circumstances. Another commenter noted the 95 percent threshold creates operational challenges and recommends a 90 percent threshold with an attestation-based approach where Shared Savings Program ACOs would attest to reporting the full APP Plus quality measure set, for the participant TINs included in the quality submission, that the submitted data satisfies requirements and that the excluded TINs have been identified and documented per CMS requirements. A commenter recommended CMS consider a lower threshold or phase in approach for ACOs below a defined size. Another commenter recommended that particularly in the context of large multispecialty TINs, where it may be challenging to meet the 95 percent threshold criteria based on TIN-level exclusions, that CMS allow practice-, specialty-, or NPI-level exclusions or exceptions if the 95 percent threshold is met at the applicable level.

Response: Regarding the proposed revisions to the Shared Savings Program quality reporting requirements, we believe that the 95 percent beneficiary threshold remains appropriate as this policy is intended to address limited and unusual circumstances in which the ACO is unable to obtain data from an ACO participant TIN. Additionally, the 95 percent threshold ensures CMS still receives sufficient data to assess Shared Savings Program ACO quality in the applicable PY and over time. For these reasons, we also believe the 95 percent threshold is appropriate for ACOs of all sizes and reject the commenter's suggestion to consider a lower threshold or phase-in approach for ACOs below a defined size. Regarding the suggestion for an attestation-based approach, we refer to the section of this final rule where we finalize requirements for documentation on TIN exclusions for the purposes of auditing and validation (§ 422.508(c)(4)), which we believe minimize administrative burden compared to an attestation process. We are therefore rejecting the suggestion to add an attestation process. Regarding the suggestion to allow practice-, specialty-, or NPI-level exclusions, we did not propose to apply exclusions at these levels as the Shared Savings Program is a whole TIN program. For these reasons, we reject the suggestion to add practice-, specialty- and NPI-level exclusions.

Comment: Several commenters expressed concern regarding the calculation of the 95 percent threshold for ACOs that select prospective beneficiary assignment and ACOs with more voluntarily aligned beneficiaries. Commenters stated the proposed approach would disadvantage ACOs under prospective assignment since the assignment window does not align with the PY. The commenters also shared their belief that the approach would also disadvantage ACOs with more voluntarily aligned beneficiaries who may not have a qualifying primary care encounter in the PY. These commenters noted ACOs could fall below the 95 percent threshold without excluding any TINs. These commenters recommended that CMS calculate the threshold by using the ACO's final assigned beneficiary population as the basis for both the numerator and denominator to acknowledge the beneficiaries ACOs are financially responsible for and create fairness across ACOs.

A commenter recommended calculating the threshold against the subset of assigned beneficiaries who have an eligible primary care encounter during the PY. Another commenter recommended proportional reductions to the assigned beneficiary percentage after TIN exclusions are applied. Another commenter noted that CMS should consider whether the 95 percent assigned-beneficiary threshold provides sufficient flexibility for large, multispecialty ACOs and suggested CMS should establish appropriate safe harbors for documented EHR and vendor limitations.

Response: We appreciate the concerns expressed in the comments about how the 95 percent threshold calculation affects ACOs under prospective assignment and ACOs with higher shares of voluntarily aligned beneficiaries. We note that it is possible that ACOs may fall below the threshold without excluding data from any participant TINs. This scenario may be more likely to occur for prospective ACOs who may not be seeing some of their assigned beneficiaries in an eligible primary care encounter during

the PY. We further clarify that the 95 percent threshold requirement is only applicable if Shared Savings Program ACOs choose to exclude participant TINs under one of the applicable exclusions finalized in this section of this final rule. Shared Savings Program ACOs that choose not to exclude TINs would still meet the existing quality reporting requirements at § 425.508(c). However, ACOs have the option to choose their assignment type and can take into consideration these options weighed against the various Shared Savings Program requirements and how they want to operate as an ACO. Additionally, Shared Savings Program ACOs are expected to be accountable for the quality of care they provide to their assigned beneficiaries, so we believe the 95 percent threshold provides important flexibility to exclude participant TINs in limited circumstances, while otherwise ensuring that ACOs report quality data that reflect the care they provide. For these reasons, we also believe the current calculation of the threshold is appropriate and reject suggestions for alternative calculation methods.

Comment: A few commenters requested clarity on the audit process such as timing and documentation needs. A commenter asked how the ACO is supposed to track, document and substantiate a TIN exclusion and whether CMS intends to review TIN exclusions prior to application and suggested that CMS provide a standard template or structured data fields for documenting each exclusion.

Response: In the CY 2027 PFS proposed rule (91 FR 44047), we proposed to retain the right to audit and validate eCQM/MIPS CQM/Medicare CQM/Medicare eCQM data for each measure reported by a Shared Savings Program ACO. We further proposed that CMS may request documentation from the Shared Savings Program ACO related to the exclusion of Shared Savings Program ACO participant TINs from the Shared Savings Program ACO's quality data submission. We also proposed that failure to report quality measure data accurately, completely, and timely may result in compliance actions as described in §§ 425.216 and 425.218. We clarify that, to streamline implementation and minimize operational burden, we will not review TIN exclusions prior to their application and instead require the ACOs to maintain documentation on TIN exclusions for the purposes of auditing and validation. We clarify that we defer to Shared Savings Program ACOs to maintain the necessary documentation that would substantiate an applicable exclusion. Therefore, Shared Savings Program ACOs should review the descriptions of the applicable exclusions at § 425.508(c)(1) finalized in this section of this final rule and are responsible for determining whether any of these exclusions apply.

Comment: A commenter expressed concern that the TIN exclusion policy does not address the PY 2026 mismatch between the Medicare CQM reporting population and the ACO's assigned population.

Response: In the CY 2027 PFS proposed rule (91 FR 44047), we noted that, under the current definition of a ''beneficiary eligible for Medicare CQMs'' at § 425.20, beneficiaries eligible for Medicare CQMs for PY 2026 are closely aligned with the Shared Savings Program ACO's assignable population rather than the ACO's assigned population (as finalized in section III.G.3.d.(4) of this final rule for PY 2027 and subsequent PYs). Since the TIN exclusion policy can be used by ACOs reporting the Medicare CQMs collection type, we believe the policy remains appropriate. For example, an ACO that chooses to report Medicare CQMs for PY 2026 could exclude ACO participant TIN(s) from the ACO's quality reporting as discussed in section III.G.3.d.(4) of this final rule prior to the application of the applicable measure specifications. This approach may address concerns that some ACOs have expressed about data aggregation and patient deduplication challenges for beneficiaries that do not have a primary care relationship with the ACO (91 FR 44045). We direct readers to section III.G.3.d.(4) of this final rule for further discussion of the revised definition of a beneficiary eligible for Medicare CQM for PY 2027 and subsequent PYs.

In section II.G.3.d.(3) of this final rule, we are finalizing our proposal to create the Medicare eCQMs collection type, which would be a new collection type for PY 2027 and subsequent PYs. After consideration of public comments, we are finalizing as proposed the revisions to the Shared Savings Program quality reporting requirements at § 425.508(c), to include that for PYs beginning on or after January 1, 2026, Shared Savings Program ACOs may exclude one or more Shared Savings Program ACO participant TINs from a Shared Savings Program ACO's submission of eCQM/MIPS CQM/Medicare CQM/Medicare eCQM data (as applicable) for each measure.

We are also finalizing as proposed in § 425.508(c)(1)(i) through (iii) that applicable exclusions may include: (i) unforeseen circumstance(s) that are outside of the control of the Shared Savings Program ACO such as the unexpected closure of a group or individual's practice that bills under the ACO participant TIN; (ii) the ACO participant TIN has a CEHRT that is intended for specialty use and does not support the measure(s) included in the APP Plus quality measure set; and (iii) other circumstances as determined by CMS.

We are further finalizing as proposed in § 425.508(c)(2)(i) through (iii) that Shared Savings Program ACOs may not exclude a Shared Savings Program ACO participant TIN from the Shared Savings Program ACO's quality data submission for each measure based on the demographics or health status of the beneficiaries who had an encounter during the PY with an ACO participant TIN or based on the estimated impact of the ACO participant TIN on the ACO's quality performance.

In addition, we are finalizing as proposed in § 425.508(c)(3) that, after the exclusion of Shared Savings Program ACO participant TINs, the Shared Savings Program ACO's submission of eCQM/MIPS CQM/Medicare CQM/Medicare eCQM data (as applicable) for each measure must include Shared Savings Program ACO participant TINs that represent at least 95 percent of the beneficiaries assigned to the Shared Savings Program ACO prior to the application of the measure specifications.

Shared Savings Program ACOs would still be required to meet the MIPS data completeness requirement (that is, the Shared Savings Program ACO must report on at least 75 percent of the APM Entity's applicable beneficiaries who meet the measure's denominator criteria for the respective PY) for each eCQM/MIPSCQM/Medicare CQM/Medicare eCQM for which the Shared Savings Program ACO submits data.

We will provide Shared Savings Program ACOs with a new aggregate report that will contain the data necessary to determine how many beneficiaries will be represented by the TINs the ACO plans to report on. Specifically, the report will be at the beneficiary-TIN level and contain the number of beneficiaries that will be assigned to the ACO and demonstrate how the assigned beneficiaries are matched to the TIN(s). This report will be provided in Quarter 3 and Quarter 4 of each applicable PY beginning with PY 2026.

This new aggregate report will be delivered to Shared Savings Program ACOs via the Data Hub in the Shared Savings Program ACO Management System (*https://acoms.cms.gov*). We will provide instructions to Shared Savings Program ACOs in future

education and outreach materials on how to use the new aggregate report to determine the Shared Savings Program ACO participant TINs that represent at least 95 percent of the beneficiaries assigned to the Shared Savings Program ACO prior to the application of the measure specifications. These materials will also include examples of the 95 percent threshold calculations.

As discussed in the CY 2027 PFS proposed rule, the Quarter 3 report is intended to provide Shared Savings Program ACOs with a preview of the necessary data, while the Quarter 4 report is the definitive source for ACOs to determine whether the Shared Savings Program ACO meets requirement that the data submitted for each measure must include Shared Savings Program ACO participant TINs that represent at least 95 percent of the beneficiaries assigned to the Shared Savings Program ACO prior to the application of the measure specifications (91 FR 44047). We stated in the CY 2027 proposed rule that for PY 2026 and subsequent PYs, Shared Savings Program ACOs must use the new Quarter 4 aggregate report to make the determination under the proposed § 425.508(c)(3) (91 FR 44047), and clarify that ACOs must use the Quarter 4 report discussed in this section of this final rule to calculate that the TINs included in the ACO's quality data submission reflect 95 percent of the beneficiaries assigned to the Shared Savings Program ACO prior to the application of the measure specifications.

In addition, we are finalizing our proposal at § 425.508(c)(4) that we would retain the right to audit and validate eCQM/MIPS CQM/Medicare CQM/Medicare eCQM data for each measure reported by a Shared Savings Program ACO. CMS may request documentation from the Shared Savings Program ACO related to the exclusion of Shared Savings Program ACO participant TINs from the Shared Savings Program ACO's quality data submission. We are also finalizing our proposal that failure to report quality measure data accurately, completely, and timely may result in compliance actions as described in §§ 425.216 and 425.218.

In alignment with the proposals we are finalizing in this section, we are finalizing the revisions to the regulation text at § 425.508 as follows:

- Under new paragraph (c)(1), we are specifying that, for PYs beginning on or after January 1, 2026, ACOs may exclude one or more TINs of ACO participants from an ACO's submission of eCQM/MIPS CQM/Medicare CQM/Medicare eCQM data (as applicable) for each measure. We are specifying that applicable exclusions may include:

++ Unforeseen circumstance(s) that are outside of the control of the ACO, such as the unexpected closure of a group or individual's practice that bills under the ACO participant TIN.

++ An ACO participant TIN has a CEHRT that is intended for specialty use and does not support the measure(s) included in the APP Plus quality measure set.

++ Other circumstances as determined by CMS.

- Under new paragraph (c)(2), we are specifying that ACOs may not exclude an ACO participant TIN from the ACO's quality data submission for each measure based on the following:

++ The demographics status of the beneficiaries who had an encounter during the performance year with an ACO participant TIN.

++ The health status of the beneficiaries who had an encounter during the performance year with an ACO participant TIN.

++ The estimated impact of the ACO participant TIN on the ACO's quality performance.

- Under new paragraph (c)(3), we are specifying that the ACO's submission of eCQM/MIPS CQM/Medicare CQM/Medicare eCQM data (as applicable) for each measure must include ACO participant TINs that represent at least 95 percent of the beneficiaries assigned to the ACO prior to the application of the measure specifications.

- Under new paragraph (c)(4), we are specifying that CMS retains the right to audit and validate eCQM/MIPS CQM/Medicare CQM/Medicare eCQM data reported by an ACO and may request documentation from the ACO related to the exclusion of ACO participant TINs under paragraph § 425.508(c)(1). We are also finalizing that failure to report quality measure data accurately, completely, and timely may result in compliance actions as described at §§ 425.216 and 425.218.

(3) Shared Savings Program ACOs To Report Using the Medicare eCQMs Collection Type

In the CY 2027 PFS proposed rule (91 FR 44048), we stated that Shared Savings Program ACOs have expressed concerns regarding the difficulty for multi-TIN Shared Savings Program ACOs to aggregate and deduplicate patient-level data. Additional challenges persist with integration across multiple EHRs, and these challenges can be an impediment for some Shared Savings Program ACOs. In light of the concerns raised by Shared Savings Program ACOs and other interested parties related to reporting quality measures using the eCQMs collection type and our commitment to supporting Shared Savings Program ACOs in the transition to dQM reporting, for PY 2027 and subsequent PYs, we proposed to establish the Medicare eCQMs for Accountable Care Organizations Participating in the Medicare Shared Savings Program (Medicare eCQMs) as a new collection type for Shared Savings Program ACOs reporting on the Medicare eCQMs (reporting quality data on beneficiaries eligible for Medicare eCQMs as proposed to be defined at § 425.20) within the APP Plus quality measure set. A Medicare eCQM is essentially an eCQM that is part of the APP Plus quality measure set and reported by a Shared Savings Program ACO on only the Shared Savings Program ACO's assigned beneficiaries, instead of its all payer/all patient population. That is, the Medicare eCQMs will generally follow the eCQM measure specifications; however, they will be reported on a different population and use a different identifier to distinguish that the submission is for a Medicare eCQM rather than for an eCQM.

In the CY 2025 PFS final rule, we noted the numerous benefits to using eCQMs, including their use of electronic standards that reduce reporting burden, and expressed intent to fully transition to digital quality measurement in CMS quality reporting and value-based purchasing programs (89 FR 98106). We stated in the CY 2027 PFS proposed rule (91 FR 44049) that we believe the addition of Medicare eCQMs would support our efforts to transition to dQMs by supporting Shared Savings Program ACOs that want to report eCQMs but are not able to operationally report on all patient/all payer data due to data aggregation challenges.

We stated in the CY 2027 PFS proposed rule (91 FR 44049) that Medicare eCQMs would serve to address concerns which are discussed in the CY 2027 PFS proposed rule (91 FR 44044 through 44046) by defining a population of beneficiaries that exists within the all payer/all patient eCQM specifications and tethering that population to a Shared Savings Program ACO's assigned beneficiary population. Shared Savings Program ACOs have expressed challenges with quality data reporting as their list of eligible beneficiaries has often contained beneficiaries for whom the Shared Savings Program ACO is unable to identify a primary care relationship. Specifically, Medicare eCQMs would address the concern raised by Shared

Savings Program ACOs that for Shared Savings Program ACOs with a higher proportion of specialty practices and/or multiple EHRs, the broader all payer/all patient eligible population would capture beneficiaries with no primary care relationship to the Shared Savings Program ACO. We intend to allow Shared Savings Program ACOs to continue to report using the existing collection types to maintain stability of collection types during the transition to dQMs. If finalized, Medicare eCQMs would provide an additional optional collection type for reporting quality data for Shared Savings Program ACOs. Medicare eCQMs would provide ACOs the option to report electronically only on their assigned beneficiary population, easing the operational considerations as outlined in this section, and support those Shared Savings Program ACOs with the transition to dQMs. For these reasons, we believe that it is appropriate to establish Medicare eCQMs as a new collection type for Shared Savings Program ACOs only. We also anticipate that in the future, when FHIR-based reporting becomes mandatory, Shared Savings Program ACOs would be able to continue to use the FHIR-based digital specifications to report only on their assigned beneficiary population.

In the CY 2027 PFS proposed rule (91 FR 44049), we encouraged ACOs to evaluate all quality reporting options to determine which collection type is most appropriate based on the ACO's unique composition and technical infrastructure. In addition to our proposal to allow ACOs the option to report quality data using the Medicare eCQMs collection type, for PY 2027 and subsequent PYs, ACOs would have the option to report quality data using the all payer/all patient eCQMs/MIPS CQMs, and/or the Medicare CQMs collection types. Our long-term goal continues to be to support ACOs in the adoption of dQMs. We would monitor the reporting of quality data using the Medicare eCQMs collection type. To facilitate the reporting of Medicare eCQMs, in the CY 2027 PFS proposed rule (91 FR 44155), we proposed to amend the definition of ''collection type'' in § 414.1305 to include Medicare eCQMs as an available collection type in MIPS for ACOs that participate in the Shared Savings Program. Additionally, in the CY 2027 PFS proposed rule (44049 and 44050), we proposed to establish MIPS data submission and data completeness criteria, in §§ 414.1335(a)(5) and 414.1340(e), respectively, pertaining to the Medicare eCQMs collection type for the MIPS quality performance category. We also proposed to define a ''beneficiary eligible for Medicare eCQMs'' at § 425.20 as a beneficiary identified for purposes of reporting Medicare eCQMs for Shared Savings Program ACOs participating in the Medicare Shared Savings Program (Medicare eCQMs), who is a beneficiary that is assigned to the Shared Savings Program ACO under subpart E, in the CY 2027 PFS proposed rule (91 FR 44049).

In the CY 2027 PFS proposed rule (91 FR 44049), we proposed to revise § 414.1340(e) to establish the MIPS data completeness criteria threshold for the Medicare eCQMs collection type, in which Shared Savings Program ACOs that meet reporting requirements under the APP submitting quality measure data on Medicare eCQMs must submit data on at least 75 percent of the ACO's applicable beneficiaries eligible for the Medicare eCQM, as proposed to be defined at § 425.20, who meet the measure's denominator criteria for MIPS payment year 2029 and future MIPS payment years (PY 2027 and subsequent PYs).

We stated in the CY 2027 PFS proposed rule that to facilitate population-based activities related to improving health under the existing § 425.702(c)(1)(ii) and to aid Shared Savings Program ACOs in the process of patient matching and data aggregation necessary to report Medicare eCQMs, we would provide Shared Savings Program ACOs with a list of beneficiaries that are assigned to the Shared Savings Program ACO and thus are eligible for Medicare eCQM reporting within the Shared Savings Program ACO (91 FR 44049). We anticipate that the list of beneficiaries eligible for Medicare eCQMs would be shared with Shared Savings Program ACOs on a quarterly basis, beginning with Quarter 1 of PY 2027. We anticipate that the list of beneficiaries eligible for Medicare eCQMs would be in the same format and delivery schedule as the list of beneficiaries eligible for Medicare CQMs that Shared Savings Program ACOs currently receive on a quarterly basis. The list of beneficiaries eligible for Medicare eCQMs would differ from the list of beneficiaries eligible for Medicare CQMs in that we would apply the eCQM specifications to generate the measure-specific indicators for the list of beneficiaries eligible for Medicare eCQMs (unlike the list of beneficiaries eligible for Medicare CQMs which uses the Medicare CQM specifications to generate the measure-specific indicators). This new report would be delivered to Shared Savings Program ACOs via the Data Hub in the Shared Savings Program ACO Management System (*https://acoms.cms.gov*), but would not be included in the Shared Savings Program ACO's Quarterly Reports Package. The Quarter 4 list would include all beneficiaries eligible for Medicare eCQMs based on available claims data for encounters with dates of service from January 1 through December 31 and may be used as the final list for quality reporting. Like eCQMs, Medicare eCQMs would be reported end-to-end electronically. As such, we recognize that Shared Savings Program ACOs may have other technologically feasible means to identify beneficiaries eligible for Medicare eCQMs within the Shared Savings Program ACO or Shared Savings Program ACO participant TIN CEHRT. For this reason, we did not propose to require that Shared Savings Program ACOs use the list of beneficiaries eligible for Medicare eCQMs to identify the universe of beneficiaries upon which the Shared Savings Program ACO would report Medicare eCQMs for an applicable PY; rather, the Quarter 4 list can be used as a resource to help Shared Savings Program ACOs identify beneficiaries eligible for Medicare eCQM reporting.

In the CY 2027 PFS proposed rule (91 FR 44054 through 44055), we proposed that there would be five eCQMs/MIPS CQMs/Medicare CQMs/Medicare eCQMs in the APP Plus quality measure set for Shared Savings Program ACOs for PY 2027 and subsequent PYs.

- Diabetes: Glycemic Status Assessment Greater Than 9% (Quality ID: 001);
- Breast Cancer Screening (Quality ID: 112);
- Colorectal Cancer Screening (Quality ID: 113);
- Preventive Care and Screening: Screening for Depression and Follow-Up Plan (Quality ID: 134); and
- Controlling High Blood Pressure (Quality ID: 236).

ACOs would have the option to report the five Medicare eCQMs, or a combination of eCQMs/MIPS CQMs/Medicare CQMs/Medicare eCQMs, to meet the Shared Savings Program quality reporting requirement at § 425.510(b) and the quality performance standard at § 425.512(a)(5).

To operationalize the reporting of the Medicare eCQMs collection type, if finalized, specifically to distinguish between the submission of data for a Medicare eCQM from the submission of data for an eCQM to CMS, we will create unique identifiers that are associated with each Medicare eCQM. These identifiers must be included in

the submission files when reporting Medicare eCQMs beginning in PY 2027. Additional information on reporting Medicare eCQMs, if finalized, will be provided after the release of the CY 2027 PFS final rule.

We did not propose to add Medicare eCQMs to the eCQM/MIPS CQM reporting incentive described at § 425.512(a)(5)(i)(B)(2) for PY 2027 and subsequent PYs. The eCQM/MIPS CQM reporting incentive intends to provide an incentive to ACOs to report the all payer/all patient eCQMs/MIPS CQMs while allowing them time to gauge their performance on the all payer/all patient eCQMs/MIPS CQMs. We also did not propose to add Medicare eCQMs to the Complex Organization Adjustment described at § 414.1380(b)(1)(vii)(C) for PY 2027 and subsequent PYs. We reiterate that the Complex Organization Adjustment intends to account for the organizational complexities Shared Savings Program ACOs face when reporting all payer/all patient eCQMs (89 FR 98116).

In the CY 2027 PFS proposed rule (91 FR 44050) and in the regulations at § 414.1380(b)(1)(ii)(G)(*1*), we proposed that, beginning with the CY 2027 performance period/2029 MIPS payment year, measures of the Medicare eCQMs collection type use flat benchmarks. As stated in the CY 2025 PFS final rule (89 FR 98118), the use of flat benchmarks may allow Shared Savings Program ACOs with high scores to earn maximum or near maximum measure achievement points while allowing room for quality improvement and rewarding that improvement in subsequent years. Use of flat benchmarks also helps to ensure that Shared Savings Program ACOs with high quality performance on a measure are not penalized as low performers.

As part of our proposals for Shared Savings Program ACOs to report the Medicare eCQMs collection type for PY 2027 and subsequent PYs, we proposed to revise the regulation text at §§ 425.20 and 425.512 as follows:

Under a new paragraph at § 425.20, we would define a beneficiary eligible for Medicare eCQMs as a beneficiary identified for purposes of reporting Medicare eCQMs for Shared Savings Program ACOs participating in the Medicare Shared Savings Program (Medicare eCQMs), who is a beneficiary that is assigned to the Shared Savings Program ACO under subpart E of part 425.

Under § 425.512(a)(2)(iv), we would incorporate Medicare eCQMs into the existing quality performance standard policies for new Shared Savings Program ACOs. Under paragraph (a)(5)(iii)(C), we would also incorporate Medicare eCQMs into the existing policies that describe when a Shared Savings Program ACO would not meet the quality performance standard or the alternative quality performance standard.

We sought public comments on our proposals for Shared Savings Program ACOs to report the Medicare eCQMs collection type for PY 2027 and subsequent PYs.

We received public comments on these proposals. The following is a summary of the comments we received and our responses.

Comment: Many commenters supported our proposal to establish Medicare eCQMs as a new collection type for Shared Savings Program ACOs for PY 2027 and subsequent PYs.

Commenters stated that they appreciated CMS' responsiveness to the challenges of multi-TIN data aggregation and all-payer population reporting. Many comments supported the additional flexibility a new collection type would provide and the reduction of burden provided by focusing on the ACOs' assigned beneficiary populations. A couple of comments expressed that the creation of the Medicare eCQMs collection type is an important interim step toward the transition to digital quality measurement and future all-payer models. A comment supported the Medicare eCQMs collection type as an option for ACOs that cannot readily aggregate data and encouraged CMS to treat this collection type as a foundation for outcome-based measures going forward and not only as a data aggregation solution.

Response: We appreciate comments that support our proposal to establish Medicare eCQMs as a new collection type for Shared Savings Program ACOs for PY 2027 and subsequent PYs.

Comment: A few commenters opposed the proposed effective date of the Medicare eCQMs collection type. A couple commenters stated that CMS should retain the existing three collection types and not add Medicare eCQMs as a fourth collection type for PY 2027. The comments noted that future inclusion of Medicare eCQMs should be done with appropriate lead time for implementation within EHRs. Another comment recommended that CMS delay implementation of the Medicare eCQMs collection type until the CY 2028 performance period to align the introduction of the Medicare eCQMs collection type with the start of the dQM transition period, or alternatively, prioritize finalizing and publishing dQM specifications rather than introducing an additional short-lived collection type for a single PY. A comment suggested CMS implement the Medicare eCQMs collection type after the necessary electronic workflows have been developed, tested, and made available.

Response: We stated in the CY 2027 PFS proposed rule (91 FR 44048 and 44049) that the Medicare eCQMs collection type was created to address concerns raised by Shared Savings Program ACOs and other interested parties related to reporting quality measures using the eCQMs collection type. We also stated that we believe the addition of Medicare eCQMs would support our efforts to transition to dQMs by supporting Shared Savings Program ACOs that want to report eCQMs but are not able to operationally report on all patient/all payer data due to data aggregation challenges.

We stated that we intend to allow Shared Savings Program ACOs to continue to report using the existing collection types to maintain stability of collection types during the transition to dQMs. Therefore, in addition to allowing ACOs the option to report quality data using the Medicare eCQMs collection type, for PY 2027 and subsequent PYs, ACOs would have the option to report quality data using the all payer/all patient eCQMs/MIPS CQMs, and/or the Medicare CQMs collection types. Therefore, we believe that it is appropriate to establish the Medicare eCQMs collection type for Shared Savings Program ACOs beginning in PY 2027 for those ACOs that could be ready and choose to report their quality data using this new collection type. We recognize that the Medicare eCQMs collection type may not be a suitable collection type for some ACOs at this time. Therefore, we encourage ACOs to evaluate all quality reporting options to determine which collection type is most appropriate based on the ACO's unique composition and technical infrastructure.

Regarding the comment that the Medicare eCQMs collection type would exist for a single PY, we note that we stated in the CY 2027 PFS proposed rule (91 FR 44038) that all quality reporting options for Shared Savings Program ACOs (that is, eCQMs, MIPS CQMs, Medicare CQMs, and Medicare eCQMs) would continue to be available during the 2-year transition period with FHIR-based reporting options that would begin in PY 2028. Therefore, at minimum, the Medicare eCQMs collection type would be available through PY 2029. Any changes to the availability of collection type quality reporting options would go through notice and comment rulemaking.

Comment: A commenter suggested CMS should ensure that adoption of Medicare eCQMs remains voluntary until health IT infrastructure, interoperability and data exchange capabilities are sufficiently mature. A commenter stated CMS should maintain multiple reporting pathways until digital quality measurement and interoperability are demonstrably mature across practice environments. Another comment encouraged CMS to implement Medicare eCQMs in a manner that minimizes additional requirements and provides sufficient flexibility for ACOs to select the reporting pathway that best aligns with their existing infrastructure.

Response: We stated in the CY 2027 PFS proposed rule (91 FR 44049) that we intend to allow Shared Savings Program ACOs to continue to report using the existing collection types to maintain stability of collection types during the transition to dQMs. Therefore, in addition to allowing ACOs the option to report quality data using the Medicare eCQMs collection type, for PY 2027 and subsequent PYs, ACOs would have the flexibility and option to report quality data using the all payer/all patient eCQMs/MIPS CQMs, and/or the Medicare CQMs collection types.

Comment: A few commenters had concerns regarding the attribution methodology. A comment stated that attribution has been a source of some ambiguity for CMS quality measurement and that rules or standards that address attribution directly would be valuable. Another comment asked that CMS clarify whether the CMS-provided Quarter 4 beneficiary list will be considered the authoritative reporting population, whether CMS intends to publish specifications describing acceptable alternative methodologies, and how CMS will address discrepancies between ACO's derived beneficiary population and the CMS-provided list.

Response: In the CY 2027 PFS proposed rule (91 FR 44049), we stated that a Medicare eCQM is essentially an eCQM that is part of the APP Plus quality measure set and reported by a Shared Savings Program ACO on only the Shared Savings Program ACO's assigned beneficiaries, instead of its all payer/all patient population. That is, the Medicare eCQMs will follow the eCQM measure specifications; however, they will be reported on a different population and use a different identifier to distinguish that the submission is for a Medicare eCQM rather than for an eCQM. We proposed to define a ''beneficiary eligible for Medicare eCQMs'' at § 425.20 as a beneficiary identified for purposes of reporting Medicare eCQMs for Shared Savings Program ACOs participating in the Medicare Shared Savings Program (Medicare eCQMs), who is a beneficiary that is assigned to the Shared Savings Program ACO under subpart E of part 425.

We stated that the Quarter 4 list would include all beneficiaries eligible for Medicare eCQMs based on available claims data for encounters with dates of service from January 1 through December 31 and may be used as the final list for quality reporting. We also stated that we recognize that Shared Savings Program ACOs may have other technologically feasible means to identify beneficiaries eligible for Medicare eCQMs within the Shared Savings Program ACO or Shared Savings Program ACO participant TIN CEHRT, thus, we did not propose to require that Shared Savings Program ACOs use the list of beneficiaries eligible for Medicare eCQMs to identify the universe of beneficiaries upon which the Shared Savings Program ACO would report Medicare eCQMs. We clarify, however, that the Assignment List Report (ALR) which we already provide to ACOs quarterly is the source for assignment related-information. ACOs may choose whether to use the Quarter 4 ALR we provide or the Quarter 4 Medicare eCQM list which will contain the beneficiaries listed in the ALR along with the additional variables that CMS will provide ACOs to identify beneficiaries that are assigned to the ACO for the applicable PY for purposes of quality reporting.

Regarding the commenter's question about addressing any potential discrepancies between the ACO's derived beneficiary population and the CMS-provided list, per 42 CFR 414.1390(b), all ACOs that submit data and information to CMS for purposes of MIPS must certify to the best of their knowledge that the data submitted to CMS is true, accurate, and complete. As such, it is incumbent upon ACOs to confirm the accuracy of the data being submitted. CMS retains the right to audit. More information on that process can be found in the QPP Resource Library at *https://qpp.cms.gov/content-management/resources/document/b624d0b4-fc05-4ee6-89a4-00aebdbc0511/download/file.*

Comment: A commenter requested that CMS ensure that beneficiaries assigned to ACOs for Medicare eCQMs do not change throughout the year as this causes unnecessary administrative burden and workflow burden. A commenter suggested that CMS should provide ACOs with advance data identifying assigned beneficiaries so they can effectively plan care management and quality improvement activities.

Response: Under 42 CFR part 425, subpart E, for ACOs under prospective assignment, claims-based beneficiary assignment is determined prospectively at the beginning of each benchmark and performance year based on the beneficiary's use of primary care services during the specified 12-month assignment window or specified 24-month expanded window for assignment for which data are available. Near the start of the performance year, ACOs receive an assignment list that includes beneficiaries prospectively assigned via claims-based assignment and beneficiaries prospectively assigned as a result of voluntary alignment based on most recent available data. If a Shared Savings Program ACO wants to ensure that beneficiaries are not added to the ACO's assignment lists throughout the year, they have the option to elect prospective assignment during the application cycle. Note that prospectively assigned beneficiaries may be removed from an ACO's assignment list as a result of meeting select assignment exclusion criteria.

Regardless of the assignment methodology selected by an ACO, as stated in the CY 2027 PFS proposed rule (91 FR 44049), we would provide Shared Savings Program ACOs with a list of beneficiaries that are assigned to the Shared Savings Program ACO and thus are eligible for Medicare eCQM reporting within the Shared Savings Program ACO. We anticipate that the list of beneficiaries eligible for Medicare eCQMs would be shared with Shared Savings Program ACOs on a quarterly basis, beginning with Quarter 1 of PY 2027. The Quarter 4 list would include all beneficiaries eligible for Medicare eCQMs based on available claims data for encounters with dates of service from January 1 through December 31 and may be used as the final list for quality reporting. Regarding the commenter's request to provide data in advance, we note that for PY 2027, we anticipate providing the Quarter 1 list in May 2027, the Quarter 2 list in August 2027, the Quarter 3 list in November 2027, and the Quarter 4 list in February 2028. We also noted that, like eCQMs, Medicare eCQMs would be reported end-to-end electronically. As such, we recognize that Shared Savings Program ACOs may have other technologically feasible means to identify beneficiaries eligible for Medicare eCQMs within the Shared Savings Program ACO or Shared Savings Program ACO participant TIN CEHRT. The Quarter 4 list can be used

as a resource to help Shared Savings Program ACOs identify beneficiaries eligible for Medicare eCQM reporting.

Comment: A few commenters requested that CMS provide guidance in advance of when the Medicare eCQMs collection type becomes available. A commenter requested that CMS release updated QRDA III Implementation Guide specifications as early as possible to ensure vendors have sufficient development lead time. Another comment suggested CMS finalize quality specifications early enough for EHRs, registries, and ACOs to build and test before the PY. A commenter requested clarification regarding operational specifications for Medicare eCQMs, including whether they will differ from existing eCQM specifications, specifically regarding data extraction requirements, submission expectations, validation requirements, and audit processes.

Another commenter recommended that CMS identify, or commit to publishing, the specific technical specifications that will define the Medicare beneficiary-limited denominator for the Medicare eCQMs collection type. The commenter also asked for clarification on which entity is responsible for maintaining and updating the specifications. A commenter requested that CMS provide the mechanism and format by which the assigned-beneficiary roster reaches the calculation system and that CMS specify the calculation approach.

A couple of commenters noted concerns with QRDA I files and stated that without the ability to filter QRDA I files to a defined population, ACOs would need to extract large volumes of data and then filter down to an assigned beneficiary population. These commenters suggested that CMS work with the vendor community to ensure CEHRT products support Medicare eCQM reporting. A commenter encouraged CMS to ensure the new pathway has interoperability with specialty registries and other established infrastructure.

Response: We acknowledge concerns related to the technical limitations of reporting Medicare eCQMs and recognize ACOs will have to develop these capabilities either in-house or through vendors. The Medicare eCQMs will follow the eCQM measure specifications; however, they will be reported on a different population. We will not be providing separate Medicare eCQM measure specifications. ACOs should use the eCQM measure specifications and report data on their assigned beneficiaries. The eCQM measure specifications for PY 2027 are available on the eCQI Resource Center website at *https://ecqi.healthit.gov/.* We also refer readers to *https://ecqi.healthit.gov/ecqm-lifecycle* for an overview of the processes for measure use, continuing evaluation, and maintenance. The updated QRDA III Implementation Guide will be available after the release of this final rule.

ACOs will need to work in-house or with their vendors to determine the mechanism for identifying the beneficiary-limited denominator and any mechanism for which the CMS-provided beneficiary list is appropriately included in the ACO's application of the applicable measure specifications. If interoperability with specialty registries and infrastructure to filter QRDA I files is desired, ACOs will need to address this in-house or through vendors. Additional information on reporting Medicare eCQMs will be provided after the release of this final rule.

Comment: A commenter noted that if CMS finalizes its proposal to introduce a distinguishing identifier for Medicare eCQM submissions, then implementing that identifier may require some development effort on the part of health IT vendors. The commenter noted that while they do not consider this to be a substantial burden, it is not without operational cost.

Response: We appreciate the comment's concern. As stated in the CY 2027 PFS proposed rule (91 FR 44050), to operationalize the reporting of the Medicare eCQMs collection type, specifically to distinguish between the submission of data for a Medicare eCQM from the submission of data for an eCQM to CMS, we will create and provide unique identifiers that are associated with each Medicare eCQM. These identifiers must be included in the submission files when reporting Medicare eCQMs beginning in PY 2027. Additional information on reporting Medicare eCQMs will be provided after the release of this final rule. We recognize that the Medicare eCQMs collection type may not be a suitable collection type for some ACOs at this time, and ACOs will have to develop capabilities either in-house or through vendors to report using the Medicare eCQMs collection type. Therefore, we encourage ACOs to evaluate all quality reporting options to determine which collection type is most appropriate based on the ACO's unique composition and technical infrastructure.

Comment: A few comments recommended that CMS include Medicare eCQMs in the reporting incentive available for eCQMs and MIPS CQMs. A comment felt withholding the incentive from ACOs will slow uptake of the new collection type and the transition to digital quality measurement.

Response: As stated in the CY 2027 PFS proposed rule (91 FR 44050), we did not propose to add Medicare eCQMs to the eCQM/MIPS CQM reporting incentive described at § 425.512(a)(5)(i)(B)(2) for PY 2027 and subsequent PYs. We stated that the eCQM/MIPS CQM reporting incentive intends to provide an incentive to ACOs to report all payer/all patient eCQMs/MIPS CQMs while allowing them time to gauge their performance on the all payer/all patient eCQMs/MIPS CQMs. A Medicare eCQM is essentially an eCQM that is reported by a Shared Savings Program ACO on only the ACO's assigned beneficiaries, instead of its all payer/all patient population. Since Medicare eCQMs would include only the ACO's assigned beneficiaries, Medicare eCQMs are not a form of all payer/all patient reporting. As such, they are not included in the eCQM/MIPS CQM reporting incentive. In the CY 2025 PFS final rule (88 FR 79105), we declined to extend the reporting incentive to Medicare CQMs for the same reasons. We note that the alternative quality performance standard, which we finalized in the CY 2023 PFS final rule (88 FR 69831), would be applicable to ACOs that report Medicare eCQMs when those ACOs are otherwise eligible for scaled savings/losses.

Comment: A commenter encouraged CMS to reconsider excluding Medicare eCQMs from the Complex Organization Adjustment noting that although Medicare eCQMs reduce the reporting population, they do not eliminate the complexity associated with electronic quality reporting, validation, submission, and ongoing quality improvement activities.

Response: In the CY 2027 PFS proposed rule (91 FR 44049 and 44050), we stated that the Complex Organization Adjustment intends to account for the organizational complexities Shared Savings Program ACOs face when reporting all payer/all patient eCQMs. A Medicare eCQM is essentially an eCQM that is reported by a Shared Savings Program ACO on only the ACO's assigned beneficiaries, instead of its all payer/all patient population. Therefore, we believe that it is appropriate to not add Medicare eCQMs to the Complex Organization Adjustment.

Comment: A couple of commenters encouraged CMS to maintain separate benchmarks for Medicare CQMs and Medicare eCQMs and noted that

separate benchmarks would better account for differences in data collections methodologies and support more appropriate performance assessment across reporting types. A commenter expressed concern that flat benchmarks would result in lower quality scores for Medicare eCQMs compared to Medicare CQMs and suggested that CMS use performance-period benchmarks for Medicare eCQMs until sufficient historical benchmark data are available to establish reliable historical benchmarks.

Response: In the CY 2025 PFS final rule (89 FR 98118) regarding the use of flat benchmarks to score Medicare CQMs, we stated that flat benchmarks would allow ACOs with high scores to earn maximum or near maximum achievement points while allowing room for quality improvement and rewarding that improvement in subsequent years. Use of flat benchmarks also helps to ensure that ACOs with high-quality performance on a measure are not penalized as low performers. Like Medicare CQMs, the use of flat benchmarks to score Medicare eCQMs would also allow room for quality improvement while allowing ACOs with high scores to earn maximum or near maximum achievement points. Flat benchmarks would also mitigate the risk that MIPS would not be able to calculate performance period benchmarks for these measures in the APP Plus quality measure set, as MIPS benchmarking requires 20 submissions of at least 20 cases as the minimum standard for establishing a benchmark to reliably score measures (81 FR 77277). As stated at § 414.1380(b)(1)(ii), benchmarks are specific to each collection type. As such, Medicare CQMs and Medicare eCQMs will have separate flat benchmarks.

We are clarifying in this final rule that, for PY 2027 and subsequent PYs, Table B–G5 lists the flat benchmarks for a non-inverse Medicare eCQM and Table B–G6 lists the flat benchmarks for an inverse Medicare eCQM. We believe the scales we are finalizing for Medicare CQMs in section III.G.3.c. of this final rule would also be appropriate for Medicare eCQMs since Medicare eCQMs will be a new collection type available to Shared Savings Program ACOs beginning in PY 2027 and, therefore, would not have data available to establish historical benchmarks and may not have enough submissions to establish a performance period benchmark.

TABLE B-G5: FLAT BENCHMARKS FOR A NON-INVERSE MEDICARE eCQM IN PY 2027 AND SUBSEQUENT PYs

Decile	Performance Rate Range
1	< 10.00
2	10.00 – 19.99
3	20.00 – 29.99
4	30.00 – 39.99
5	40.00 – 49.99
6	50.00 – 59.99
7	60.00 – 69.99
8	70.00 – 79.99
9	80.00 – 89.99
10	>= 90.00

TABLE B-G6: FLAT BENCHMARKS FOR AN INVERSE MEDICARE eCQM IN PY 2027 AND SUBSEQUENT PYs

Decile	Performance Rate Range
1	99.00 – 90.01
2	90.00 – 80.01
3	80.00 – 70.01
4	70.00 – 60.01
5	60.00 – 50.01
6	50.00 – 40.01
7	40.00 – 30.01
8	30.00 – 20.01
9	20.00 – 10.01
10	<= 10.00

We note that section 1899(b)(3)(C) of the Act directs that the Secretary shall establish quality performance standards to assess the quality of care furnished by ACOs and seek to improve the quality of care furnished by ACOs over time by specifying higher standards, new measures, or both for purposes of assessing such quality of care. Applying

flat benchmarks for a new collection type is consistent with our intent to improve quality of care furnished by ACOs over time. Medicare eCQMs are an optional collection type. Beginning in PY 2027, ACOs have the option to report quality data using multiple collection types, such as, eCQMs/MIPS CQMs/Medicare CQMs/Medicare eCQMs. We recognize that Medicare eCQMs may not be a suitable collection type for some ACOs. Therefore, we encourage ACOs to evaluate all quality reporting options to determine which collection type is most appropriate based on the ACO's unique composition and technical infrastructure. As stated in the CY 2027 PFS proposed rule (91 FR 44049), we will monitor the reporting of quality data using the Medicare eCQMs collection type.

Comment: A commenter recommended that CMS apply benchmark changes prospectively rather than retroactively.

Response: In the CY 2027 PFS proposed rule (91 FR 44048 through 44050), we proposed to establish the Medicare eCQMs as a new collection type for Shared Savings Program ACOs reporting the APP Plus quality measure set for PY 2027 and subsequent PYs, and we also proposed that beginning with PY 2027, Medicare eCQMs would be scored using flat benchmarks. We are finalizing these policies as proposed, thus none of these policies will be applied retroactively.

Comment: A commenter requested that Medicare eCQMs include a MIPS data completeness provision and that ACOs be required to submit data on at least 75 percent of applicable beneficiaries eligible for the measures.

Response: In the CY 2027 PFS proposed rule (91 FR 44049), we proposed to revise § 414.1340(e) to establish the MIPS data completeness criteria threshold for the Medicare eCQMs collection type, in which Shared Savings Program ACOs that meet reporting requirements under the APP submitting quality measure data on Medicare eCQMs must submit data on at least 75 percent of the ACO's applicable beneficiaries eligible for the Medicare eCQM, as defined at § 425.20, who meet the measure's denominator criteria for MIPS payment year 2029 and future MIPS payment years (PY 2027 and subsequent PYs). We are finalizing the revisions to § 414.1340(e) as proposed in section IV.A.4.d.(1)(d)(ii) of this final rule.

After consideration of public comments, in section IV.A.4.d.(1)(b) of this final rule, we are finalizing our proposal to establish Medicare eCQMs as a new collection type for Shared Savings Program ACOs reporting on the Medicare eCQMs (reporting quality data on beneficiaries eligible for Medicare eCQMs as finalized to be defined at § 425.20) within the APP Plus quality measure set.

To facilitate the reporting of Medicare eCQMs, in section IV.A.4.d.(1)(b) of this final rule, we are finalizing our proposal to amend the definition of ''collection type'' in § 414.1305 to include Medicare eCQMs as an available collection type in MIPS for ACOs that participate in the Shared Savings Program.

Additionally, we are finalizing our proposal to establish MIPS data submission and data completeness criteria, in §§ 414.1335(a)(5) and 414.1340(e), respectively, pertaining to the Medicare eCQMs collection type for the MIPS quality performance category, as discussed in sections IV.A.4.d.(1)(c)(v) and IV.A.4.d.(1)(d)(ii), respectively, of this final rule.

We are also finalizing our proposal to define a ''beneficiary eligible for Medicare eCQMs'' at § 425.20 as a beneficiary identified for purposes of reporting Medicare eCQMs for Shared Savings Program ACOs participating in the Medicare Shared Savings Program (Medicare eCQMs), who is a beneficiary that is assigned to the Shared Savings Program ACO under subpart E, in part 425.

In section IV.A.4.d.(1)(d)(ii) of this final rule, we are finalizing our proposal to revise § 414.1340(e) to establish the MIPS data completeness criteria threshold for the Medicare eCQMs collection type, in which Shared Savings Program ACOs that meet reporting requirements under the APP submitting quality measure data on Medicare eCQMs must submit data on at least 75 percent of the ACO's applicable beneficiaries eligible for the Medicare eCQM, as proposed to be defined at § 425.20, who meet the measure's denominator criteria for MIPS payment year 2029 and future MIPS payment years (PY 2027 and subsequent PYs).

We are finalizing in III.G.3.f of this final rule that, as proposed, there would be five eCQMs/MIPS CQMs/Medicare CQMs/Medicare eCQMs in the APP Plus quality measure set for Shared Savings Program ACOs for PY 2027 and subsequent PYs.

- Diabetes: Glycemic Status Assessment Greater Than 9% (Quality ID: 001);
- Breast Cancer Screening (Quality ID: 112);
- Colorectal Cancer Screening (Quality ID: 113);
- Preventive Care and Screening: Screening for Depression and Follow-Up Plan (Quality ID: 134); and
- Controlling High Blood Pressure (Quality ID: 236).

ACOs would have the option to report the five Medicare eCQMs, or a combination of eCQMs/MIPS CQMs/Medicare CQMs/Medicare eCQMs, to meet the Shared Savings Program quality reporting requirement at § 425.510(b) and the quality performance standard at § 425.512(a)(5).

In section IV.B.1.c.(2) of this final rule and in the regulations at § 414.1380(b)(1)(ii)(G)(1), we are finalizing, as proposed, that beginning with the CY 2027 performance period/2029 MIPS payment year, measures of the Medicare eCQMs collection type use flat benchmarks.

As part of finalizing our proposals for Shared Savings Program ACOs to report the Medicare eCQMs collection type for PY 2027 and subsequent PYs, we are finalizing the proposed revisions to the regulation text at §§ 425.20 and 425.512 as follows:

Under a new paragraph at § 425.20, we are defining a beneficiary eligible for Medicare eCQMs as a beneficiary identified for purposes of reporting Medicare eCQMs for Shared Savings Program ACOs participating in the Medicare Shared Savings Program (Medicare eCQMs), who is a beneficiary that is assigned to the Shared Savings Program ACO under subpart E of this part.

Under § 425.512(a)(2)(iv), we are incorporating Medicare eCQMs into the existing quality performance standard policies for new Shared Savings Program ACOs. Under paragraph (a)(5)(iii)(C), we would also incorporate Medicare eCQMs into the existing policies that describe when a Shared Savings Program ACO would not meet the quality performance standard or the alternative quality performance standard.

After consideration of public comments, we are finalizing as proposed for Shared Savings Program ACOs to report the Medicare eCQMs collection type for PY 2027 and subsequent PYs.

(4) Revising the Definition of a ''Beneficiary Eligible for Medicare CQMs''

In the CY 2027 PFS proposed rule (91 FR 44050), we stated that in the CY 2026 PFS final rule (90 FR 49797 through 49803), we finalized the revisions to the definition of a ''beneficiary eligible for Medicare CQMs'' at § 425.20 effective January 1, 2025. Specifically, beginning with PY 2025 and subsequent PYs, we revised the definition to require, in (1)(ii)(B) of the definition, ''at least one primary care

service with a date of service during the applicable performance year from a Shared Savings Program ACO professional who is a primary care physician or who has one of the specialty designations included in § 425.402(c), or who is a physician assistant, nurse practitioner, or clinical nurse specialist.'' We stated that the revised definition of a ''beneficiary eligible for Medicare CQMs'' would reduce Shared Savings Program ACOs' burden in the patient matching necessary to report Medicare CQMs because the list of ''beneficiaries eligible for Medicare CQMs'' would have greater overlap with the list of beneficiaries that are assignable to a Shared Savings Program ACO. We stated that we believed our revised definition of a ''beneficiary eligible for Medicare CQMs'' would substantially address Shared Savings Program ACOs' and interested parties' concerns by better aligning the definitions and clarifying which beneficiaries' data to use for quality data reporting through Medicare CQMs. In the CY 2026 PFS final rule, some commenters suggested that CMS require Medicare CQMs be reported for ''attributed'' beneficiaries only (90 FR 49800). In response, CMS noted that Medicare CQMs are designed to help Shared Savings Program ACOs address challenges with aggregating patient data required to report the all payer/all patient MIPS CQMs and eCQMs by defining a population of beneficiaries that is broader than the assigned population but exists within the all payer/all patient MIPS CQM specification.

We also stated in the CY 2027 PFS proposed rule (91 FR 44050) that since the publication of the CY 2026 PFS final rule and implementation of the revised definition aligning with assignable beneficiaries, we have heard from Shared Savings Program ACOs and other interested parties that the current definition of a ''beneficiary eligible for Medicare CQMs'' continues to cause confusion regarding which beneficiaries to use for quality data reporting. Specifically, Shared Savings Program ACOs have inquired about the differences between the current list of beneficiaries eligible for Medicare CQMs (which is broader than an ACO's assigned population) and the Shared Savings Program ACO's assigned and assignable populations. As discussed in the CY 2026 final rule, an analysis using PY 2024 data noted an average 85 percent overlap between a Shared Savings Program ACO's list of beneficiaries eligible for Medicare CQMs and the list of beneficiaries assignable to the Shared Savings Program ACO (90 FR 49799). Moreover, we have heard from Shared Savings Program ACOs that the current definition aligning with assignable beneficiaries continues to create burden in patient matching, data aggregation and quality reporting for Shared Savings Program ACOs that elect to report Medicare CQMs. Lastly, Shared Savings Program ACOs have expressed that the current definition of ''beneficiaries eligible for Medicare CQMs'' that aligns with assignable beneficiaries includes beneficiaries for whom the Shared Savings Program ACO does not readily have data.

Considering the concerns raised by Shared Savings Program ACOs and other interested parties with reporting Medicare CQMs, in the CY 2027 PFS proposed rule (91 FR 44051), we proposed to revise the definition of a ''beneficiary eligible for Medicare CQMs'' at § 425.20 for PY 2027 and subsequent PYs, to align with the population of beneficiaries assigned to the ACO.

We also stated that we implemented Medicare CQMs in PY 2024 to help some Shared Savings Program ACOs build the infrastructure, skills, knowledge and expertise necessary to report all payer/all patient MIPS CQMs and eCQMs (91 FR 44051). The confusion that Shared Savings Program ACOs have expressed about the differences between the list of beneficiaries eligible for Medicare CQMs and a Shared Savings Program ACO's assigned populations have complicated the process for Shared Savings Program ACOs to meaningfully implement Medicare CQMs for this purpose. Our proposed revision would build upon the revisions finalized in the CY 2026 PFS final rule and further refine and align the definition of a ''beneficiary eligible for Medicare CQMs'' to correspond to a Shared Savings Program ACO's assigned beneficiary list to continue to address Shared Savings Program ACOs' challenges with patient data aggregation. The proposed change to the definition of a ''beneficiary eligible for Medicare CQMs'' for PY 2027 and subsequent PYs intends to better support these Shared Savings Program ACOs in the transition to digital quality measurement and to eliminate an unintended barrier that Shared Savings Program ACOs have experienced in reporting Medicare CQMs, which have persisted after the revision of the definition in the CY 2026 PFS final rule to align with assignable beneficiaries.

In the CY 2027 PFS proposed rule (91 FR 44051), we stated that the Shared Savings Program relies on primary care-based assignment, and the APP Plus quality measure set is primary care-based. Our proposals to use the Shared Savings Program ACO's assigned beneficiary population for the Medicare CQMs collection type beginning in PY 2027 would hold Shared Savings Program ACOs accountable for the quality of care for only the beneficiaries assigned to them and align with the voluntary risk they have undertaken to coordinate beneficiaries' care. Also, focusing on care provided by primary care providers would be a reasonable approach that addresses concerns with data aggregation and specialist participation. Similarly, we have heard from Shared Savings Program ACOs that the current definition of a ''beneficiary eligible for Medicare CQMs'' is a detriment to Shared Savings Program ACOs meeting the MIPS data completeness requirement described at § 414.1340. As such, the proposed change aims to support Shared Savings Program ACOs in meeting the MIPS data completeness requirement by tethering the universe of beneficiaries that a Shared Savings Program ACO is required to report on for Medicare CQMs to the universe of beneficiaries that have a primary care relationship with the Shared Savings Program ACO as demonstrated through the beneficiaries' assignment to the Shared Savings Program ACO. We anticipate that Shared Savings Program ACOs that choose to report Medicare CQMs would experience fewer barriers in aggregating the applicable numerator and denominator data for beneficiaries that are assigned to the Shared Savings Program ACO and, as a result, would be better positioned to meet the MIPS data completeness requirement described at § 414.1340.

As stated in the CY 2027 PFS proposed rule (91 FR 44051), in the CY 2024 PFS final rule, we finalized a new paragraph at § 425.702(c)(1)(iii) to share aggregate reports with Shared Savings Program ACOs with the aim of facilitating population-based activities related to the improvement of health through quality measurement using Medicare CQMs and to aid Shared Savings Program ACOs in the process of patient matching and data aggregation necessary to report Medicare CQMs (88 FR 79099). It was necessary at that time to revise the regulation text at § 425.702 because the list of beneficiaries eligible for Medicare CQMs, as finalized for PY 2024, was broader than the universe of beneficiaries assigned to the Shared Savings Program ACO. As discussed in the CY 2027 PFS proposed rule (91 FR

44050 through 44052), we proposed to align the definition of a ''beneficiary eligible for Medicare CQMs'' with the universe of beneficiaries assigned to the Shared Savings Program ACO. The sharing of aggregate reports for beneficiaries assigned to the Shared Savings Program ACO is regulated at § 425.702(c)(1)(ii). As such, since the list of beneficiaries eligible for Medicare CQMs would align with the universe of beneficiaries assigned to the Shared Savings Program ACO under this proposal, it is appropriate to also propose to sunset the regulation at § 425.702(c)(1)(iii) beginning in PY 2027. As we noted in the CY 2027 PFS proposed rule (91 FR 44051), if finalized, we would provide Shared Savings Program ACOs with a quarterly list of beneficiaries eligible for Medicare CQMs, starting with PY 2027, that aligns with an ACO's list of assigned beneficiaries under the existing regulation at § 425.702(c)(1)(ii).

We stated in the CY 2027 PFS proposed rule (91 FR 44051) that as part of our proposal to revise the definition of a ''beneficiary eligible for Medicare CQMs'' for PY 2027 and subsequent PYs, we would revise and republish the definition of a ''beneficiary eligible for Medicare CQMs'' at § 425.20 to include the following:

We would note that a beneficiary *eligible for Medicare CQMs* means a beneficiary identified for purposes of reporting Medicare CQMs for ACOs participating in the Medicare Shared Savings Program (Medicare CQMs), who meets the following requirements (as applicable):

• For performance years 2024 through 2026, the beneficiary is either of the following:

++ A Medicare fee-for-service beneficiary (as defined at § 425.20) who—

—Meets the criteria for a beneficiary to be assigned to an ACO described at § 425.401(a); and

—For performance year 2024, had at least one claim with a date of service during the measurement period from an ACO professional who is a primary care physician or who has one of the specialty designations included in § 425.402(c), or who is a physician assistant, nurse practitioner, or clinical nurse specialist.

—For performance years 2025 and 2026, had at least one primary care service with a date of service during the applicable performance year from an ACO professional who is a primary care physician or who has one of the specialty designations included in § 425.402(c), or who is a physician assistant, nurse practitioner, or clinical nurse specialist.

++ A Medicare fee-for-service beneficiary who is assigned to an ACO in accordance with § 425.402(e) because the beneficiary designated an ACO professional participating in an ACO as responsible for coordinating their overall care.

• For performance years 2027 and subsequent performance years, a beneficiary that is assigned to the ACO under subpart E of this part.

We also stated in the CY 2027 PFS proposed rule (91 FR 44052) that we would also revise the regulation text at § 425.702 to specify that paragraph (c)(1)(iii) applies for performance years 2024 through 2026. We sought public comments on our proposal to revise the definition of a ''beneficiary Eligible for Medicare CQMs''.

We received public comments on these proposals. The following is a summary of the comments we received and our responses.

Comment: All commenters were supportive of our proposal to revise the definition of a ''beneficiary eligible for Medicare CQMs'' to align with the population of beneficiaries assigned to the ACO. A couple of commenters thanked CMS for being responsive to concerns from interested parties. A couple of commenters noted that the policy helps address ACOs' challenges with meeting the MIPS data completeness requirements by addressing long-standing quality reporting issues, alleviating the reporting burden, encouraging ACOs to remain in the program and addressing ACO concerns with data aggregation.

Some commenters noted that the policy focuses quality measurement on the population for whom the ACO is actually accountable which directly addresses previous concerns with assessing ACOs' quality based on patients not managed by the ACO for purposes of determining shared savings and losses and stated the policy aligns with the beneficiaries for whom ACOs are responsible under shared savings and shared loss calculations. Commenters noted that the revised definition would better reflect primary care relationships and is more clinically coherent. A commenter noted that the revised definition more accurately reflects ACO performance, strengthens the alignment between quality measurement and accountability, and reduces unnecessary reporting burden relative to measuring performance among beneficiaries outside of the ACO's attributed population which may introduce factors beyond the ACO's ability to influence. Another commenter noted that the requirement for all-patient, all-payer reporting penalizes specialist participants in ACOs who CMS holds accountable for primary care measures that are not clinically appropriate and artificially lowers quality scores for ACOs with a higher proportion of specialists and thanked CMS for incorporating their feedback in this policy. Another commenter noted the revised definition as important for academic medical centers where primary care TINs are embedded in broader systems with specialty and hospital populations not directly accountable under the ACO and that CMS should continue aligning quality accountability with the population for which the ACO is responsible.

A commenter noted the policy eliminates unnecessary burdens associated with identifying a separate population and ensures performance results more accurately reflect care delivered by ACO providers and suppliers. A couple of commenters also noted the revision would match the proposed patient population for the newly proposed Medicare eCQMs collection type. A commenter supported the proposal's burden reduction improvements, including refinements to Medicare CQM reporting and proposals to align the reporting population with assigned beneficiaries, which would reduce reporting complexity and help ACOs meet existing MIPS data completeness requirements. Further, another commenter noted that the technical change addresses problems with identifying which Medicare fee-for service beneficiaries must be included in Medicare CQM.

Response: We appreciate comments in support of the proposal to revise the definition of a ''beneficiary eligible for Medicare CQMs'' for PY 2027 and subsequent PYs.

Comment: Several commenters recommended that beneficiaries' address (street, city, state, and zip code) be added to the Medicare CQM quarterly lists to increase the accuracy of patient matching.

Response: We appreciate the comments and may take it into consideration for future updates to the Medicare CQM quarterly lists.

Comment: Several commenters were supportive of our proposal to revise the definition of a ''beneficiary eligible for Medicare CQMs'' and encouraged CMS to finalize the definition for PY 2026 instead of PY 2027. A commenter stated that retroactive implementation would add certainty and reduce reporting burden sooner.

Response: Section 1871(e)(1)(A)(ii) of the Act prohibits the Secretary from

applying substantive changes in regulations retroactively before the effective date of the change except where the Secretary determines that failure to apply the change retroactively would be contrary to the public interest. In the CY 2026 PFS final rule (90 FR 49797 through 49803)), we revised the definition of a ''beneficiary eligible for Medicare CQMs'' at § 425.20 for PY 2025 and subsequent PYs so that the population identified for reporting within the Medicare CQM collection type would have greater overlap with the beneficiaries that are assignable to an ACO. The benefits of revising the definition a second time for PY 2026 to align with assigned beneficiaries would be outweighed by the risk of changing the population when PY 2026 is underway. ACOs have already made decisions regarding which collection type they would report on for PY 2026 based on the definition of a ''beneficiary eligible for Medicare CQMs'' currently in effect for PY 2026, and the retroactive change of this definition would create unnecessary disruption and confusion, increase burden for existing ACOs' operations, and cause uncertainty for ACOs. Therefore, we decline to finalize the definition for PY 2026.

Comment: A commenter urged CMS to investigate whether CMS' Medicare CQM proposal would disadvantage ACOs that prospectively assign beneficiaries, preventing these ACOs from meeting the 95% voluntarily aligned beneficiaries' requirement.

Response: We refer the commenter to our discussion on the impact of the revised Shared Savings Program quality reporting requirements on ACOs using prospective assignment in section III.G.3.d.(2) in this final rule. Regarding the commenter's concern whether our proposal to revise the definition of a ''beneficiary eligible for Medicare CQMs'' would disadvantage ACOs with prospective assignment, we note that our proposed revised definition of a ''beneficiary eligible for Medicare CQMs'' is the same for ACOs under preliminary prospective assignment with retrospective reconciliation and ACOs under prospective assignment. As stated in the CY 2024 PFS final rule (88 FR 79098), a Medicare CQM is essentially a MIPS CQM reported by an ACO under the APP on only the ACO's Medicare FFS beneficiaries, instead of its all payer/all patient population. In a manner that is identical to the MIPS CQM specifications, the Medicare CQM specifications will be applied in the same way regardless of the ACO's assignment election. We encourage ACOs to evaluate all quality reporting options to determine which collection type is most appropriate based on the ACO's unique composition and technical infrastructure.

After consideration of public comments, we are finalizing our proposal to revise the definition of a ''beneficiary eligible for Medicare CQMs'' at § 425.20 for PY 2027 and subsequent PYs, to align with the population of beneficiaries assigned to the Shared Savings Program ACO. We are also finalizing that we would provide Shared Savings Program ACOs with a quarterly list of beneficiaries eligible for Medicare CQMs, starting with PY 2027, that aligns with an ACO's list of assigned beneficiaries under the existing regulation at § 425.702(c)(1)(ii).

As part of our finalized proposal to revise the definition of a ''beneficiary eligible for Medicare CQMs'' for PY 2027 and subsequent PYs, we are revising and republishing the definition of a ''beneficiary eligible for Medicare CQMs'' at § 425.20 to include the following:

We are noting that a *beneficiary eligible for Medicare CQMs* means a beneficiary identified for purposes of reporting Medicare CQMs for ACOs participating in the Medicare Shared Savings Program (Medicare CQMs), who meets the following requirements (as applicable):

- For performance years 2024 through 2026, the beneficiary is either of the following:

++ A Medicare fee-for-service beneficiary (as defined at § 425.20) who—

—Meets the criteria for a beneficiary to be assigned to an ACO described at § 425.401(a); and

—For performance year 2024, had at least one claim with a date of service during the measurement period from an ACO professional who is a primary care physician or who has one of the specialty designations included in § 425.402(c), or who is a physician assistant, nurse practitioner, or clinical nurse specialist.

—For performance years 2025 and 2026, had at least one primary care service with a date of service during the applicable performance year from an ACO professional who is a primary care physician or who has one of the specialty designations included in § 425.402(c), or who is a physician assistant, nurse practitioner, or clinical nurse specialist.

++ A Medicare fee-for-service beneficiary who is assigned to an ACO in accordance with § 425.402(e) because the beneficiary designated an ACO professional participating in an ACO as responsible for coordinating their overall care.

- For performance years 2027 and subsequent performance years, a beneficiary that is assigned to the ACO under subpart E of this part.

We are also revising the regulation text at § 425.702 to specify that paragraph (c)(1)(iii) applies for performance years 2024 through 2026.

e. Revising the Shared Savings Program Scoring Policy for Excluded APP Plus Measures and APP Plus Measures That Lack a Benchmark

(1) Background

In the CY 2027 PFS proposed rule (91 FR 44052 and 44053), we stated that in the CY 2024 PFS final rule given that the Shared Savings Program does not determine which quality measures are excluded and lack a benchmark and that Shared Savings Program ACOs do not have a choice of measures that they can report under the APP, we do not want to adversely impact shared savings determinations for events outside the Shared Savings Program ACOs' control, such as in the event a measure is excluded or does not have a benchmark (88 FR 79122 and 79123). Therefore, we finalized a scoring policy for excluded APP measures and APP measures that lack a benchmark at § 425.512(a)(7). Specifically, we finalized that, to determine whether the Shared Savings Program ACO meets the quality performance standard required to share in savings at the maximum rate under its track (or payment model within a track), for PY 2024 and subsequent PYs, if a Shared Savings Program ACO reports all of the required measures, meeting the MIPS data completeness requirement at § 414.1340 of this subchapter for each measure in the APP measure set and receiving a MIPS quality performance category score as described at § 414.1380(b)(1) of this subchapter, we will use the higher of the Shared Savings Program ACO's quality score or the equivalent of the 40th percentile MIPS quality performance category score across all MIPS quality performance category scores, excluding entities/providers eligible for facility-based scoring, for the relevant performance year when the Shared Savings Program ACO meets either of the following:

- The ACO's total available measure achievement points used to calculate the ACO's MIPS quality performance category score is reduced under § 414.1380(b)(1)(vii)(A) of this subchapter.
- At least one of the eCQMs/MIPS CQMs/Medicare CQMs does not have a benchmark as described at § 414.1380(b)(1)(i)(A) of this subchapter.

Shared Savings Program ACOs that qualify for this existing policy at § 425.512(a)(7) can meet the quality performance standard if one measure in the APP Plus quality measure set is excluded or lacks a benchmark, and the Shared Savings Program ACO will not be evaluated on their quality performance on the remaining quality measures reported by the Shared Savings Program ACO.

(2) Revisions

In the CY 2027 PFS proposed rule (91 FR 44052 and 44053), we stated that when our scoring policy for excluded APP measures and APP measures that lack a benchmark was finalized in the CY 2024 PFS final rule, there were six total measures in the APP quality measure set, and Shared Savings Program ACOs were required to report only three eCQMs/MIPS CQMs (in addition to administering the CAHPS for MIPS survey) for PY 2024 and subsequent PYs (88 FR 79113). In the CY 2025 PFS final rule, we finalized that, for PY 2025 and subsequent PYs, Shared Savings Program ACOs will be required to report the APP Plus quality measure set (89 FR 98105). In the CY 2027 PFS proposed rule (91 FR 44052), we proposed that, for PY 2027 and subsequent PYs, Shared Savings Program ACOs would be required to report on eight measures in the APP Plus quality measure set: five eCQMs/MIPS CQMs/Medicare CQMs/Medicare eCQMs, the CAHPS for MIPS survey, and two administrative claims-based measures that would be calculated by CMS. We stated in the CY 2027 PFS proposed rule (91 FR 44052 and 44053) that when CMS established the policy in the CY 2024 PFS final rule, we noted that there were two eCQMs in the legacy APP quality measure set that were suppressed by MIPS in PY 2022 (88 FR 79122). Since these two eCQMs were excluded, the growth in the number of quality measures Shared Savings Program ACOs are required to report increases the likelihood that a Shared Savings Program ACO's quality score would be based on a broader range of quality performance metrics than it would have been in PY 2022. This reduces the impact of measure exclusion on a Shared Savings Program ACO's MIPS quality performance category score. Applying the existing scoring policy at § 425.512(a)(7) when a single measure is excluded from MIPS would allow a Shared Savings Program ACO to meet the quality performance standard without an evaluation of the Shared Savings Program ACO's quality performance on the remaining measures in the APP Plus quality measure set.

Additionally, we stated in the CY 2027 PFS proposed rule (91 FR 44052 and 44053) that section 1899(b)(3)(C) of the Act states that the Secretary shall establish quality performance standards to assess the quality of care furnished by Shared Savings Program ACOs and shall seek to improve the quality of care furnished by Shared Savings Program ACOs over time by specifying higher standards, new measures, or both for purposes of assessing such quality of care. We believe that revising the scoring policy at § 425.512(a)(7) such that it would only be applied when there are four or more excluded measures in PY 2027 would ensure that Shared Savings Program ACOs are fairly assessed on their quality performance in our determination of whether they meet the quality performance standard to be eligible to share in savings at the maximum rate available for the Shared Savings Program ACO's track and, for ACOs participating in the ENHANCED track, to avoid maximum shared losses. Specifically, we proposed to revise the scoring policy at § 425.512(a)(7) for PY 2027 and subsequent PYs, such that it would apply only if the Shared Savings Program ACO's MIPS quality performance category score is calculated on less than five measures for a given PY. In other words, if there are four or more measures in the APP Plus quality measure set that are excluded from MIPS under § 414.1380(b)(1)(vii)(A) in PY 2027 or a subsequent PY, then the proposed scoring policy at § 425.512(a)(7)(iii) would apply.

We stated that we believe that our proposed revisions to § 425.512(a)(7) would result in a more accurate assessment of Shared Savings Program ACOs' quality performance, as each measure in the five-measure minimum threshold would contribute a reasonable weight (20 percent) to the Shared Savings Program ACO's MIPS quality performance category score. However, if there are fewer than five measures available in a given PY, Shared Savings Program ACOs would not risk losing the ability to meet the quality performance standard to be eligible to earn maximum shared savings, and for Shared Savings Program ACOs in the ENHANCED track, avoid maximum shared losses, due to issues with the measures outside of their control.

As discussed in the CY 2027 PFS proposed rule (91 FR 44053), we proposed that the current scoring policy at § 425.512(a)(7) would no longer apply when at least one of the required measures in the APP Plus quality measure set does not have a benchmark for PY 2027 and subsequent PYs. Excluded measures do not contribute to the calculation of a Shared Savings Program ACO's MIPS quality performance category score for that PY. In the CY 2027 PFS proposed rule, we proposed that the APP Plus quality measure set would have eight measures in total for PY 2027 and subsequent PYs. Thus, we would calculate a Shared Savings Program ACO's MIPS quality performance category score if there are five or more measures in the APP Plus quality measure set that have not been excluded from MIPS. We noted in the CY 2027 PFS proposed rule that this policy would only apply if a Shared Savings Program ACO's MIPS quality performance category score is impacted by measure exclusion under MIPS. We also clarify that the policy would not apply for other reasons based on which a measure may be unscored. Specifically, it would not apply if the Shared Savings Program ACO does not meet the MIPS case minimum requirement at § 414.1380 on any measure in the APP Plus quality measure set. Our proposal would allow us to better evaluate Shared Savings Program ACOs' quality performance and appropriately determine shared savings eligibility based on quality of care.

Therefore, we proposed that, for PY 2027 and subsequent PYs, if the Shared Savings Program ACO's MIPS quality performance category score is calculated on less than five measures due to measure exclusion under MIPS and the Shared Savings Program ACO meets the other quality reporting requirements as described in the proposed § 425.512(a)(7)(iii), then we would use the higher of the Shared Savings Program ACO's quality score or the equivalent of the 40th percentile MIPS Quality performance category score across all MIPS Quality performance category scores, excluding entities/providers eligible for facility-based scoring.

In the CY 2027 PFS proposed rule (91 FR 44052 and 44053), we provided two hypothetical examples of the application of this proposed policy for illustrative purposes. Hypothetical example 1: for PY 2027, a Shared Savings Program ACO reports three eCQMs (Quality IDs: 001, 112, and 236), one Medicare CQM (Quality ID: 134), and one MIPS CQM (Quality ID: 113) in the APP Plus quality measure set, meets the MIPS data completeness requirement at § 414.1340 on all of these five measures, and receives a MIPS quality performance category score. The Shared Savings Program ACO also administers the CAHPS for MIPS survey and has the two administrative claims-based measures in the APP Plus quality measure set calculated by CMS.

Hypothetically, if Quality IDs 001, 112, 113, and 236 are excluded from MIPS under § 414.1380(b)(1)(vii)(A) for PY 2027, then the Shared Savings Program ACO's MIPS quality performance category score would be based on four measures: the two administrative claims-based measures, the CAHPS for MIPS survey, and Quality ID: 134. The proposed scoring policy at § 425.512(a)(7)(iii) would apply in this scenario since the Shared Savings Program ACO's MIPS quality performance category score would be based on less than five measures. Therefore, the Shared Savings Program ACO would receive the higher of the Shared Savings Program ACO's quality score or the equivalent of the 40th percentile MIPS Quality performance category score across all MIPS quality performance category scores. This would allow the Shared Savings Program ACO to meet the quality performance standard and be eligible to share in savings at the maximum rate available for their track and, for ENHANCED track Shared Savings Program ACOs, to avoid maximum shared losses.

Hypothetical example 2: for PY 2027, a Shared Savings Program ACO reports all five eCQMs in the APP Plus quality measure set, meets the MIPS data completeness requirement at § 414.1340 on all five eCQMs (Quality IDs: 001, 112, 113, 134, and 236), administers the CAHPS for MIPS survey, receives a MIPS quality performance category score, and has the two administrative claims-based measures calculated by CMS. Under this scenario, the eCQM version of Quality ID: 001 was excluded from MIPS under § 414.1380(b)(1)(vii)(A). Our proposed scoring policy would not apply in this case since the Shared Savings Program ACO's MIPS quality performance category score would be based on more than five measures: the two administrative claims-based measures, the CAHPS for MIPS survey, and four eCQMs.

In the CY 2027 PFS proposed rule (91 FR 44052 and 44053), we referred to the CY 2024 PFS final rule which stated that given the Shared Savings Program does not determine which quality measures do not have a benchmark and that Shared Savings Program ACOs do not have a choice of measures they can report under the APP, we do not want to adversely impact shared savings determinations for events outside the Shared Savings Program ACOs' control, such as in the event a measure does not have a benchmark (88 FR 79123). Therefore, we finalized at § 425.512(a)(7) to include eCQMs, MIPS CQMs, and Medicare CQMs within the APP measure set that do not have a benchmark as described at § 414.1380(b)(1)(i)(A). In the CY 2025 PFS final rule (89 FR 98120), we finalized that beginning in the CY 2025 performance period/2027 MIPS payment year, measures of the Medicare CQMs collection type would be scored using flat benchmarks for their first two performance periods in MIPS. Also, in the CY 2027 PFS proposed rule (91 FR 40444 and 44050), we proposed that Medicare CQMs and Medicare eCQMs would be scored using flat benchmarks for PY 2027 and subsequent PYs. The use of flat benchmarks to score Medicare CQMs and Medicare eCQMs would mitigate the risk that MIPS would not be able to calculate benchmarks for these measures in the APP Plus quality measure set. Additionally, we note that none of the eCQMs, MIPS CQMs, or Medicare CQMs that Shared Savings Program ACOs have reported over the past four PYs lacked benchmarks. Therefore, we proposed that the scoring policy at § 425.512(a)(7) would no longer apply when at least one of the required measures in the APP Plus quality set does not have a benchmark for PY 2027 and subsequent PYs.

In the CY 2027 PFS proposed rule (91 FR 44052 and 44053), we proposed to revise the regulation text at § 425.512(a)(7) as follows:

- We are revising paragraph (a)(7)(ii) to specify that it applies for performance years 2025 and 2026.
- Under new paragraph (a)(7)(iii), we would specify that, for performance year 2027 and subsequent performance years, if an ACO reports all of the required measures in the APP Plus quality measure set, meeting the data completeness requirement at § 414.1340 for each measure in the APP Plus quality measure set, and receiving a MIPS Quality performance category score as described at § 414.1380(b)(1), for the relevant performance year, and the ACO meets the following-

++ The ACO's MIPS Quality performance category score is calculated on less than five measures; and

++ Any unscored measure(s) must meet all of the following-

—The ACO's total available measure achievement points used to calculate the ACO's MIPS Quality performance category score are reduced under § 414.1380(b)(1)(vii)(A).

—The ACO's total measure achievement points used to calculate the ACO's MIPS Quality performance category score are not reduced under § 414.1380(b)(1)(iii).

We sought public comments on our proposed revisions to the Shared Savings Program scoring policy at § 425.512(a)(7).

We received public comments on these proposals. The following is a summary of the comments we received and our responses.

Comment: A couple of comments supported our proposal to revise the scoring policy for excluded APP Plus measures and APP Plus measures that lack a benchmark. Specifically, comments supported our proposal to increase the number of measures from one measure to four or more measures that would need to be excluded from MIPS in a given performance year for the policy to apply. A comment noted how the revisions create a more balanced and predictable approach to quality scoring while reducing unnecessary complexity within the APP Plus quality measure set. The comment noted that these changes should improve consistency, reduce administrative burden, and allow ACOs to focus resources on quality improvement activities that directly benefit patients. A comment noted that the use of flat benchmarks to score Medicare CQMs and Medicare eCQMs mitigate the need for the scoring policy.

Response: We appreciate comments that support our proposed revisions to the Shared Savings Program scoring policy at § 425.512(a)(7) for PY 2027 and subsequent PYs, such that it would apply only if the Shared Savings Program ACO's MIPS quality performance category score is calculated on less than five measures for a given PY. We also appreciate comments that support our proposal that the current scoring policy at § 425.512(a)(7) would no longer apply when at least one of the required measures in the APP Plus quality measure set does not have a benchmark for PY 2027 and subsequent PYs.

In response to the comment that the use of flat benchmarks to score Medicare CQMs and Medicare eCQMs mitigates the need for the scoring policy, we note that there are still circumstances when a Medicare CQM or Medicare eCQM could be excluded, such as a measure that is submitted, if applicable, and impacted by significant changes or errors prior to the applicable data submission deadline as described at § 414.1380(b)(1)(vii)(A).

Comment: A comment opposed the proposed revisions to the scoring policy for excluded APP Plus measures; specifically, the proposal to increase the measure threshold. The comment noted that reducing the APP Plus quality measure set to eight measures would increase the weight of each individual measure in an ACO's quality score.

Other comments conceptually agreed with the proposal but provided alternative suggestions for the measure threshold. Several comments expressed concerns that ACOs could lose scoring policy protections when one, two, or three ACO-reported measures are excluded, despite such exclusions being outside the ACO's control. The comments noted that, as proposed, a Shared Savings Program ACO could have three of five ACO-reported measures excluded and be scored based on the two administrative claims-based measures, CAHPS for MIPS survey, and the two remaining ACO-reported measures. A few comments further noted that ACO members have expressed challenges with the administrative claims' measures and the CAHPS for MIPS survey given ACOs do not receive performance data on them during the performance year to conduct improvement efforts in a timely fashion. The comments expressed it would not be appropriate to assess an ACO's quality score in this scenario.

Several comments suggested that CMS modify the proposal such that the measure exclusion component of the current policy would apply when three or more of the ACO-reported measures in the APP Plus quality measure set are excluded for a given performance year. A comment recommended CMS retain the existing one-measure trigger at § 425.512(a)(7) rather than raising it to four, citing that with a smaller measure set each measure carries proportionally more weight in an ACO's quality score.

Response: Regarding comments that express concerns with potentially having the two administrative claims-based measures (Quality ID: 479 Hospital-Wide, 30-day, All Cause Unplanned Readmission (HWR) Rate for MIPS Eligible Clinician Groups, and Quality ID: 484 Clinician and Clinician Group Risk-standardized Hospital Admission Rates for Patients with Multiple Chronic Conditions) and Quality ID: 321 CAHPS for MIPS survey comprise additional weight in their quality scores and the challenges the comments expressed with these measures, we note that these measures are well-established aspects of assessing a Shared Savings Program ACO's quality performance. Specifically, in the CY 2021 PFS final rule (85 FR 84726), when establishing the APP quality measure set for Shared Savings Program ACOs, we explained that the measures included in the APP were selected because they align with the Meaningful Measures framework, focus on management of chronic health conditions that are high priority and highly prevalent among Medicare beneficiaries assigned to ACOs, and are broadly applicable to the primary care population and population health goals associated with the Shared Savings Program. We explained that the administrative claims-based measures promote effective communication and coordination of care and are appropriate measures of ACO quality performance (85 FR 84726). In addition, we stated that we continue to value the patient voice and believe it should play a significant role in quality scoring, and that inclusion of the CAHPS for MIPS survey measure preserves the relevance of patient experience in the assessment of ACO quality performance.

Accordingly, we continue to believe that the two administrative claims-based measures in the APP Plus quality measure set and the CAHPS for MIPS survey measure are well-established quality metrics that are appropriate to assess ACO's quality of care; therefore, these measures, along with the remaining two ACO-reported measures in the comments' scenario, would capture sufficient data to represent the ACO's quality performance. Furthermore, the scenarios described in the comments would be very rare and would necessitate that a large number of measures be excluded from MIPS in a given PY.

We stated in the CY 2027 PFS proposed rule (91 FR 44052) that we believe that our proposed revisions to § 425.512(a)(7) would result in a more accurate assessment of Shared Savings Program ACOs' quality performance, as each measure in the five-measure minimum threshold would contribute a reasonable weight (20 percent) to the Shared Savings Program ACO's MIPS quality performance category score. However, if there are fewer than five measures available in a given PY, Shared Savings Program ACOs would not risk losing the ability to meet the quality performance standard to be eligible to earn maximum shared savings, and for Shared Savings Program ACOs in the ENHANCED track, avoid maximum shared losses, due to issues with the measures outside of their control, while allowing CMS to better evaluate ACOs' quality performance and appropriately determine shared savings eligibility based on quality of care.

In response to the suggestion from the comments that the exclusion component of the current policy be applied when three or more of the ACO-reported measures in the APP Plus quality measure set are excluded for a given performance year, we note that—while there are eight measures included in the APP Plus quality measure set for PY 2027 and subsequent PYs (as finalized in section III.G.f. of this final rule), we continue to believe that the less than five measure threshold for the application of this policy remains appropriate since it ensures that the ACO is otherwise scored on a sufficient number of quality measures that accurately reflect the ACO's quality performance. We further note that our intent is for this policy to function as a relief mechanism to address rare circumstances when four or more measures are excluded from the APP Plus quality measure set by MIPS. We disagree with, and are rejecting, the comments' suggestions to lower the threshold for the application of this policy to three or more measures since we do not believe that this suggestion would result in a more accurate assessment of the Shared Savings Program ACOs' quality performance.

Comment: A comment incorrectly stated that the proposed regulatory text amendments for the policy are stricter than the preamble narrative suggests, citing how under proposed § 425.512(a)(7)(iii), the policy would be available ''only if all unscored measures are excluded under § 414.1380(b)(1)(vii)(A).''

Response: In the CY 2027 PFS proposed rule (91 FR 44053), we stated that we propose that, for PY 2027 and subsequent PYs, if the Shared Savings Program ACO's MIPS quality performance category score is calculated on less than five measures due to measure exclusion under MIPS and the Shared Savings Program ACO meets the other quality reporting requirements as described in the proposed § 425.512(a)(7)(iii), then we would use the higher of the Shared Savings Program ACO's quality score or the equivalent of the 40th percentile MIPS Quality performance category score across all MIPS Quality performance category scores, excluding entities/providers eligible for facility-based scoring. This proposal was correctly described under the proposed new paragraph (a)(7)(iii) at § 425.512(a)(7) (91 FR 44053).

Comment: A comment recommended that CMS retain the existing protection for measures that lack a benchmark or apply the same four-or-more threshold to be inclusive of both excluded measures and measures that lack a benchmark. The comment noted how if even a single required measure lacks a benchmark, the ACO loses the floor entirely, no matter how many other measures are excluded or how the ACO performs on the measures that remain.

Response: The MIPS benchmarks for eCQMs and MIPS CQMs that are based on historical data are available prior to the start of the PY. Additionally, we are finalizing our proposals that Medicare

CQMs and Medicare eCQMs would be scored using flat benchmarks for PY 2027 and subsequent PYs, in sections III.G.3.c. and III.G.3.d.(3) of this final rule, respectively. In the CY 2027 PFS proposed rule (91 FR 44053), we noted that none of the eCQMs or MIPS CQMs that Shared Savings Program ACOs have reported over the past four PYs lacked benchmarks, and that the use of flat benchmarks to score Medicare CQMs and Medicare eCQMs would mitigate the risk that MIPS would not be able to calculate benchmarks for these measures in the APP Plus quality measure set. Thus, we believe our proposal that the current scoring policy at § 425.512(a)(7) would no longer apply when at least one of the required measures in the APP Plus quality set does not have a benchmark for PY 2027 and subsequent PYs is appropriate. ACOs would have advance awareness of which measures in the APP Plus quality measure set have historical benchmarks and may choose which collection type to report accordingly.

After consideration of public comments, we are finalizing the proposed revisions to the scoring policy at § 425.512(a)(7) for PY 2027 and subsequent PYs, such that it would apply only if the Shared Savings Program ACO's MIPS quality performance category score is calculated on less than five measures for a given PY. In other words, if there are four or more measures in the APP Plus quality measure set that are excluded from MIPS under § 414.1380(b)(1)(vii)(A) in PY 2027 or a subsequent PY, then the proposed scoring policy at § 425.512(a)(7)(iii) would apply. In section IV.A.4.b.(2) of this final rule, we are finalizing that, for PY 2027 and subsequent PYs, Shared Savings Program ACOs will be required to report on eight measures in the APP Plus quality measure set: five eCQMs/MIPS CQMs/Medicare CQMs/Medicare eCQMs, the CAHPS for MIPS survey, and two administrative claims-based measures that would be calculated by CMS. Thus, we would calculate a Shared Savings Program ACO's MIPS quality performance category score if there are five or more measures in the APP Plus quality measure set that have not been excluded from MIPS.

Specifically, we are finalizing that, for PY 2027 and subsequent PYs, if the Shared Savings Program ACO's MIPS quality performance category score is calculated on less than five measures due to measure exclusion under MIPS and the Shared Savings Program ACO meets the other quality reporting requirements as described in the proposed § 425.512(a)(7)(iii), then we would use the higher of the Shared Savings Program ACO's quality score or the equivalent of the 40th percentile MIPS Quality performance category score across all MIPS Quality performance category scores, excluding entities/providers eligible for facility-based scoring. We are also finalizing that the current scoring policy at § 425.512(a)(7) would no longer apply when at least one of the required measures in the APP Plus quality set does not have a benchmark for PY 2027 and subsequent PYs.

We are finalizing the revisions to the regulation text at § 425.512(a)(7) as proposed and as follows:

- We are revising paragraph (a)(7)(ii) to specify that it applies for performance years 2025 and 2026.
- Under new paragraph (a)(7)(iii), we are specifying that, for performance year 2027 and subsequent performance years, if an ACO reports all of the required measures in the APP Plus quality measure set, meeting the data completeness requirement at § 414.1340 for each measure in the APP Plus quality measure set, and receiving a MIPS Quality performance category score as described at § 414.1380(b)(1), for the relevant performance year, and the ACO meets the following—

++ The ACO's MIPS Quality performance category score is calculated on less than five measures; and

++ Any unscored measure(s) must meet all of the following—

—The ACO's total available measure achievement points used to calculate the ACO's MIPS Quality performance category score are reduced under § 414.1380(b)(1)(vii)(A).

—The ACO's total measure achievement points used to calculate the ACO's MIPS Quality performance category score are not reduced under § 414.1380(b)(1)(iii).

f. Updating the APP Plus Quality Measure Set

(1) Background

In the CY 2027 PFS proposed rule (91 FR 44150 and 44151), we referred to the CY 2025 PFS final rule (89 FR 98104), which stated that for PY 2025 and subsequent PYs, Shared Savings Program ACOs will be required to report the APP Plus quality measure set. We also finalized that Shared Savings Program ACOs will be required to report and be scored on all applicable quality measures in the APP Plus quality measure set according to the phase-in schedule for incorporating measures into the APP Plus quality measure set (89 FR 98105). We also stated in the CY 2025 PFS final rule (89 FR 98116 and 98117) that the APP Plus quality measure set for Shared Savings Program ACOs will include 11 measures (eight eCQMs/Medicare CQMs, two administrative claims-based measures, and the CAHPS for MIPS Survey measure) beginning with PY 2028 or the PY that is one year after the eCQM specifications become available for the Screening for Social Drivers of Health (Quality ID: 487) and Adult Immunization Status (Quality ID: 493) measures, whichever is later, and Shared Savings Program ACOs will be scored on the required 11 measures. The final APP Plus quality measure set for Shared Savings Program ACOs, for PY 2025 and subsequent PYs, was specified in Tables 39 through 42 of the CY 2025 PFS final rule (89 FR 98128 through 98132).

In the CY 2025 PFS final rule (89 FR 98130 through 98132), we finalized that Diabetes: Glycemic Status Assessment Greater Than 9% (Quality ID: 001), Preventive Care and Screening: Screening for Depression and Follow-up Plan (Quality ID: 134), and Hospital-Wide, 30-day, All-Cause Unplanned Readmission (HWR) Rate for MIPS Eligible Clinician Groups (Quality ID: 479) would be incorporated into the APP Plus quality measure set for PY 2025. Additionally, we finalized that Initiation and Engagement of Substance Use Disorder Treatment (Quality ID: 305) will be incorporated into the APP Plus quality measure set for PY 2027 and Adult Immunization Status (Quality ID: 493) will be incorporated into the APP Plus quality measure set beginning with PY 2028 or the PY that is 1 year after the eCQM specification becomes available for Quality ID: 493, whichever is later.

In the CY 2026 PFS final rule (90 FR 49818), we finalized the removal of Screening for Social Drivers of Health (Quality ID: 487) from the APP Plus quality measure set (90 FR 49817 and 50311). With the removal of Quality ID: 487, the APP Plus quality measure set for Shared Savings Program ACOs will include ten measures (seven eCQMs/Medicare CQMs, two administrative claims-based measures, and the CAHPS for MIPS Survey measure) beginning with PY 2028 or the PY that is 1 year after the eCQM specification becomes available for Adult Immunization Status (Quality ID: 493), whichever is later (90 FR 49817). We stated that Shared Savings Program ACOs will be scored on the required ten measures (90 FR 49817). The final APP Plus quality measure set for Shared Savings Program ACOs, for PY 2028 or the PY that is 1 year after the eCQM specification becomes available for Quality ID: 493,

whichever is later, was specified in Table B–G5 of the CY 2026 PFS final rule (90 FR 49818).

Shared Savings Program ACOs expressed concerns with increasing the number of measures in the APP Plus quality measure set each year. Shared Savings Program ACOs have suggested maintaining a stable measure set as they transition to digital quality reporting. In response to the CY 2026 PFS Digital Quality Measurement RFI, many commenters recommended that CMS maintain the APP Plus quality measure set as finalized without adding new measures to preserve resources for the transition to digital quality measurement and to consider challenges Shared Savings Program ACOs face in data aggregations for eCQM/MIPS CQM/Medicare CQM reporting (90 FR 49855 and 49856).

(2) Revisions

As discussed in the CY 2027 PFS proposed rule (91 FR 44150 and 44422), we proposed to adopt measure specification changes to the following measures that are included in the APP Plus quality measure set:

- *Diabetes:* Glycemic Status Assessment Greater Than 9% (Quality ID: 001) (eCQMs collection type only)
- *Preventive Care and Screening:* Screening for Depression and Follow-up Plan (Quality ID: 134)
- Hospital-Wide, 30-day, All-Cause Unplanned Readmission (HWR) Rate for MIPS Eligible Clinician Groups (Quality ID: 479)

As discussed in section IV.A.4.b.(2) and Table Group D, in Appendix 1 of this final rule, we are finalizing the measure specification changes to these measures as proposed.

With the removal of Initiation and Engagement of Substance Use Disorder Treatment (Quality ID: 305) and Adult Immunization Status (Quality ID: 493) from the APP Plus quality measure set as described in section IV.A.4.b.(2) of this final rule, the APP Plus quality measure set for Shared Savings Program ACOs would include eight measures (five eCQMs/MIPS CQMs/Medicare CQMs/Medicare eCQMs, two administrative claims-based measures, and the CAHPS for MIPS Survey measure) beginning with PY 2027. Shared Savings Program ACOs would be scored on the required eight measures. We believe that these policies would lessen the burden associated with implementing new quality measures as Shared Savings Program ACOs move toward digital quality measurement. The final APP Plus quality measure set for Shared Savings Program ACOs, for PY 2027 and subsequent PYs is specified in Table B–G7. This table also reflects the creation of the new Medicare eCQMs collection type for Shared Savings Program ACOs reporting the APP Plus quality measure set for PY 2027 and subsequent PYs, as discussed in section III.G.3.d.(3) and Table Groups D and DD, in Appendix 1, of this final rule. Table B–G7 of this final rule is the same as Table B–G5 of the CY 2027 PFS proposed rule (91 FR 44055).

TABLE B-G7: MEASURES INCLUDED IN THE APP PLUS QUALITY MEASURE SET FOR SHARED SAVINGS PROGRAM ACOS FOR PY 2027 AND SUBSEQUENT PYs

Quality #	Measure Title	Collection Type	Submitter Type	Measure Type
321	CAHPS for MIPS	CAHPS for MIPS Survey	Third Party Intermediary	Patient Engagement/ Experience
479	Hospital-Wide, 30-day, All-Cause Unplanned Readmission (HWR) Rate for MIPS Eligible Clinician Groups	Administrative Claims	N/A	Outcome^
484	Clinician and Clinician Group Risk-standardized Hospital Admission Rates for Patients with Multiple Chronic Conditions	Administrative Claims	N/A	Outcome^
001	Diabetes: Glycemic Status Assessment Greater Than 9%	eCQMs/MIPS CQMs/Medicare CQMs/Medicare eCQMs	APM Entity/Third Party Intermediary	Intermediate Outcome^
134	Preventive Care and Screening: Screening for Depression and Follow-up Plan	eCQMs/MIPS CQMs/Medicare CQMs/Medicare eCQMs	APM Entity/Third Party Intermediary	Process
236	Controlling High Blood Pressure	eCQMs/MIPS CQMs/Medicare CQMs/Medicare eCQMs	APM Entity/Third Party Intermediary	Intermediate Outcome^
112	Breast Cancer Screening	eCQMs/MIPS CQMs/Medicare CQMs/Medicare eCQMs	APM Entity/Third Party Intermediary	Process
113	Colorectal Cancer Screening	eCQMs/MIPS CQMs/Medicare CQMs/Medicare eCQMs	APM Entity/Third Party Intermediary	Process

^ Indicates this is an outcome measure for purposes of qualifying for the eCQM/MIPS CQM reporting incentive and the alternative quality performance standard.

g. Summary of Final Policies

In Table B–G8 of this final rule, we summarize the quality reporting requirements and quality performance standard policies for PY 2027 and subsequent PYs, including the policies we are finalizing in this final rule. This table also reflects the creation of the new Medicare eCQMs collection type and removal of Initiation and Engagement of Substance Use Disorder Treatment (Quality ID: 305) and Adult Immunization Status (Quality ID: 493) from the APP Plus quality measure set for Shared Savings Program ACOs, as discussed in sections III.G.3.d.(3) and III.G.3.f.(2), respectively, of this final rule. Table B–G8 of this final rule is the same as Table B–G6 of the CY 2027 PFS proposed rule (91 FR 44056). The quality reporting requirements and quality performance standard policies for PY 2026 were summarized in Table B–G6 of the CY 2026 PFS final rule (90 FR 49819 and 49820).

BILLING CODE 4169–69–P

TABLE B-G8: APP PLUS QUALITY MEASURE SET REPORTING REQUIREMENTS AND QUALITY PERFORMANCE STANDARD POLICIES FOR SHARED SAVINGS PROGRAM ACOS FOR PY 2027 AND SUBSEQUENT PYS

	PY 2027 and Subsequent PYs
Shared Savings Program ACO Quality Reporting Requirements	ACOs are required to report **5** eCQMs/MIPS CQMs/Medicare CQMs/Medicare eCQMs in the APP Plus quality measure set and administer the CAHPS for MIPS survey (except if the ACO does not meet the minimum beneficiary sampling requirements specified at § 414.1380(b)(1)(vii)(B)). CMS will calculate 2 administrative claims-based measures.
Shared Savings Program ACO Quality Performance Standard and Alternative Quality Performance Standard*	**ACOs that report the APP Plus quality measure set can meet the quality performance standard used to determine eligibility for maximum shared savings and to avoid maximum shared losses (if applicable) via one of the three pathways:** **1**. ***For all ACOs:*** Achieve a quality score that is equivalent to or higher than the **40th** percentile across all MIPS quality performance category scores, excluding entities/providers eligible for facility-based scoring, or **2.** ***For ACOs that report the 5 eCQMs/MIPS CQMs in the APP Plus quality measure set and meet the MIPS data completeness requirement at § 414.1340 for all 5 eCQMs/MIPS CQMs:*** Meet the eCQM/MIPS CQM reporting incentive by achieving a quality performance score equivalent to or higher than the **10th** percentile of the performance benchmark on at least 1 of the 4 outcome measures in the APP Plus quality measure set and a quality performance score equivalent to or higher than the **40th** percentile of the performance benchmark on at least 1 of the remaining 7 measures in the APP Plus quality measure set. ***3. For ACOs in their first PY of their first agreement period under the Shared Savings Program***: Report the APP Plus quality measure set and meet the MIPS data completeness requirement at 414.1340 on the 5 eCQMs/MIPS CQMs/Medicare CQMs/Medicare eCQMs in the APP Plus quality measure set, administer the CAHPS for MIPS survey (except if the ACO does not meet the minimum beneficiary sampling requirements specified at § 414.1380(b)(1)(vii)(B)), and receive a MIPS quality performance category score. **Alternative quality performance standard used to determine shared savings using the sliding scale methodology:** ACOs that do not meet the quality performance standard based on the criteria noted previously can meet the alternative quality performance by reporting quality data on the APP Plus quality measure set and achieving a quality performance score equivalent to or higher than the **10th** percentile of the performance benchmark on at least 1 of the 4 outcome measures in the APP Plus quality measure set will share in savings (if otherwise eligible) at a lower rate that is scaled by the ACO's quality score. If an ACO (1) does not report any of the 5 eCQMs /MIPS CQMs/Medicare CQMs/Medicare eCQMs in the APP Plus quality measure set and (2) does not administer a CAHPS for MIPS survey, unless the ACO does not meet the minimum beneficiary sampling requirements specified at § 414.1380(b)(1)(vii)(B), the ACO will not meet the quality performance standard or the alternative quality performance standard. This ACO will be ineligible for shared savings and will owe maximum shared losses, if applicable.

*The quality performance standard policies described in this table apply to ACOs that are not subject to the extreme and uncontrollable circumstances policies at § 425.512(c).

BILLING CODE 4169–69–C

4. Shared Savings Program Certified Electronic Health Record Technology (CEHRT) Use Requirements

a. Background

Section 1899(b)(3)(D) of the Act authorizes the Secretary to incorporate reporting requirements and incentive payments from section 1848 of the Act into the Shared Savings Program, such as requirements and incentive payments related to electronic prescribing and electronic health records. The statute also authorizes the Secretary to use alternative criteria for determining whether to make such incentive payments.

Section 1833(z)(2)(C)(iii)(II)(bb) of the Act (as amended by the Medicare Access and CHIP Reauthorization Act of 2015 (MACRA)) generally requires Advanced Alternative Payment Models (Advanced APMs) to require the use of CEHRT. Under this authority, we have codified Advanced APM CEHRT use criteria at 42 CFR 414.1415(a). We have incorporated requirements related to the adoption and use of CEHRT in the Shared Savings Program regulations. We have adopted a definition of CEHRT in § 425.20 that cross references the

Quality Payment Program's definition of CEHRT (§ 414.1305).

For the Shared Savings Program, CMS updated the CEHRT definition in the CY 2024 PFS final rule (88 FR 79309). Under paragraph (3) of the CEHRT definition in § 414.1305, CEHRT currently means EHR technology (which could include multiple technologies) certified by the Office of the National Coordinator for Health Information Technology (ONC) under the ONC Health IT Certification Program as meeting the 2015 Edition Base EHR definition, or subsequent Base EHR definition (set forth at 45 CFR 170.102), and a designated set of health IT certification criteria adopted or updated in 45 CFR 170.315 that are determined applicable for the APM.

In the context of health IT, the secure exchange, access, and use of electronic health information supports better informed decision making and a more efficient healthcare system.[296] Interoperability (as defined at 45 CFR 170.102) enables this secure exchange and access. To this end, CMS intends to utilize approaches based on the HL7® (Health Level 7) Fast Healthcare Interoperability Resources® (FHIR) [297] standard to support the exchange of quality information, consistent with CMS' digital quality measurement initiatives, as described in the FHIR RFI in the CY 2026 PFS proposed rule (90 FR 32710 through 32715). FHIR is a widely used application program interface (API)-focused standard used to represent and exchange health information maintained by the standards development organization HL7. ONC adopts the FHIR standard (currently FHIR R4) as well as FHIR implementation guides for different API use cases in 45 CFR 170.215, and incorporates these standards into certification criteria for health IT.

In the CY 2019 PFS final rule (83 FR 59982 through 59988), we adopted requirements related to ACOs' use of CEHRT, beginning with PY 2019, and in subsequent years. In that final rule, we revised the Shared Savings Program annual certification requirements at 42 CFR 425.302(a)(3)(iii) to require ACOs to certify at the end of each PY that the percentage of eligible clinicians participating in the ACO who used CEHRT to document and communicate clinical care to their patients or other healthcare providers met or exceeded the applicable percentage specified in the requirements established in § 425.506(f) (83 FR 60092). Specifically, we codified that beginning with PY 2019, and in subsequent years, for ACOs in a track that did not meet the financial risk standard to be an Advanced APM (for example, ACOs participating under BASIC track Levels A through D), the ACO was required to certify that 50 percent of the ACO's eligible clinicians used CEHRT to document and communicate clinical care to their patients or other healthcare providers. For ACOs in a track that met the financial risk standard to be an Advanced APM (for example, ACOs participating under BASIC track Level E or the ENHANCED track), the ACO was required to certify that the percentage of eligible clinicians participating in the ACO that use CEHRT to document and communicate clinical care to their patients or other healthcare providers met or exceeded the threshold established under the Quality Payment Program at § 414.1415(a)(1). Under this requirement (§ 425.506(f)(2)), for PY 2019 through PY 2024, 75 percent of eligible clinicians were required to use CEHRT to document and communicate clinical care to their patients or healthcare providers (§ 414.1415(a)(1)(i)). In the same final rule, we updated our regulations at § 425.20 to incorporate the definition of CEHRT at § 414.1305 that applies under the Quality Payment Program (83 FR 60092).

In the CY 2024 PFS proposed rule (88 FR 52435), we stated our belief that aligning Shared Savings Program CEHRT use requirements with Merit-Based Incentive Payment System (MIPS) Promoting Interoperability performance category requirements would reduce burden on ACOs, because they would no longer have to meet distinct Shared Savings Program attestation requirements and MIPS Promoting Interoperability requirements. We also referred back to our statements in the CY 2019 PFS rule where we conveyed our desire to continue to promote and encourage CEHRT use by ACOs and their ACO participants and ACO providers/suppliers, and our desire to better align with the goals of the Quality Payment Program and the criteria for participation in certain alternative payment models tested by the CMS Innovation Center. We expressed our belief that our proposal to end the CEHRT attestation requirements and align the Shared Savings Program with the MIPS Promoting Interoperability performance category requirements would allow ACOs to focus on a unified set of program requirements for the use of CEHRT and reduce the administrative burden of managing compliance with a different set of program requirements with the same aim (88 FR 52435).

In the CY 2024 PFS final rule (88 FR 79124 through 79132), we modified the Shared Savings Program CEHRT requirements to end the CEHRT attestation requirements and align the Shared Savings Program with MIPS' Promoting Interoperability performance category requirements. We modified § 425.302(a)(3)(iii) to make the Shared Savings Program Annual CEHRT Certification requirement applicable only for PYs 2019 through 2024. This effectively sunset the Shared Savings Program CEHRT requirement that ACOs certify that the percentage of eligible clinicians participating in the ACO that used CEHRT to document and communicate clinical care to their patients or other healthcare providers met or exceeded the applicable percentage specified at § 425.506(f). We also revised the CEHRT reporting policy at § 425.507(a) for PYs beginning on or after January 1, 2025, to require, unless otherwise excluded, that ACO participants, ACO provider/suppliers, and ACO professionals who are MIPS eligible clinicians, Qualifying APM Participants (QP), or Partial QPs (each as defined at § 414.1305), regardless of track, must (88 FR 79131):

- Report the MIPS Promoting Interoperability performance category measures and requirements to MIPS according to 42 CFR part 414, subpart O at the individual, group, virtual group, or APM entity level; and
- Earn a MIPS performance category score for the MIPS Promoting Interoperability performance category at the individual, group, virtual group, or APM entity level.

In the CY 2024 PFS final rule, we also finalized § 425.507(b), under which ACO participants, ACO providers/suppliers, or ACO professionals are excluded from the requirements specified in § 425.507(a) based on applicable policies that exclude or exempt eligible clinicians from reporting the MIPS Promoting Interoperability performance category as set forth in 42 CFR part 414, subpart O. We included in that provision the qualifier that an ACO participant, ACO provider/supplier, or ACO professional cannot be excluded from the requirements specified at § 425.507(a) solely on the basis of being a QP or

296

297 CMS has made publicly available the PY 2026 Shared Savings Program Report templates through the ''Program Guidance & Specifications'' webpage of the Shared Savings Program website, at *https://www.cms.gov/medicare/payment/fee-for-service-providers/shared-savings-program-ssp-acos/guidance-regulations*.erit-based Incentive Payment Systems (MIPS) Promoting Interoperability Performance Category FAQ (*https://www.cms.gov/files/document/frequently-asked-questions-shared-savings-program-requirement-report-objectives-measures-mips.pdf*.)

Partial QP (88 FR 79131). We finalized that applicable exclusions may apply to ACO participants, ACO providers/suppliers, or ACO professionals that meet the low volume threshold as set forth at § 414.1310(b)(1)(iii), are non-MIPS eligible clinicians [eligible clinician as defined at § 414.1305; who is not a MIPS eligible clinician as set forth in § 414.1310(b)(2)], or have a reweighted MIPS Promoting Interoperability performance category to zero percent of the final score in accordance with applicable policies set forth at § 414.1380(c)(2).

In the CY 2024 PFS final rule, we updated public reporting requirements at § 425.308(b)(9) to reflect the MIPS Promoting Interoperability performance category measures and activities (88 FR 79132). We required ACOs to publicly report the number of MIPS eligible clinicians, QPs, and Partial QPs (each as defined at § 414.1305) participating in the ACO who earned a MIPS Promoting Interoperability performance category score at the individual, group, virtual group, or APM entity level, as set forth in § 425.507. This includes:

- The number of ACO participants, ACO providers/suppliers, and ACO professionals that meet the requirements of § 425.507(a) and are not excluded under § 425.507(b) for the applicable PY; and
- The number of ACO participants, ACO providers/suppliers, and ACO professionals that are excluded under § 425.507(b) that voluntarily reported and received a MIPS Promoting Interoperability performance category score for the applicable PY.

For PY 2025, we exercised enforcement discretion for the Shared Savings Program CEHRT requirements and will not take compliance actions under §§ 425.216 or 425.218 for PY 2025 if an ACO does not meet the requirements of §§ 425.507 and 425.308(b)(9). There will also be no impact on the ACO's ability to earn or receive shared savings for PY 2025.[298] In the Frequently Asked Questions document where we provided notice that we were exercising enforcement discretion for PY 2025, we also stated that we would release additional information regarding Shared Savings Program Promoting Interoperability requirements for PY 2026.

In the CY 2027 PFS proposed rule, we provided ACOs with notice that we have extended the enforcement discretion that applied for PY 2025 to PY 2026 (91 FR 44058). We will not take compliance actions under §§ 425.216 or 425.218 for PY 2026 if an ACO does not meet the requirements of §§ 425.507 and 425.308(b)(9). There will also be no impact on the ACO's ability to earn or receive shared savings for PYs 2025 or 2026.

As we stated in the CY 2027 PFS proposed rule, Shared Savings Program ACOs, professional associations, and vendors reporting quality on behalf of ACOs have expressed concern with the burden of the Shared Savings Program requirement that all Shared Savings Program ACO participants report all MIPS Promoting Interoperability performance category measures and activities. Most Shared Savings Program ACOs (74 percent) are in tracks that qualify as Advanced APMs (BASIC level E and ENHANCED) [299] (91 FR 44058). Qualifying APM participants in these ACOs are exempt from Promoting Interoperability performance category reporting for the purposes of MIPS under § 414.1310(b)(i). Therefore, they were only being required to report MIPS Promoting Interoperability performance category measures and activities by the Shared Savings Program. ACOs have expressed confusion about MIPS Promoting Interoperability performance category reporting requirements, exclusions, and exceptions. Specifically, ACOs have requested clarification about how to aggregate and report across their organizations, especially when their practices use different EHRs or when ACOs have some practices that qualify for applicable exclusions.

We also stated in the CY 2027 PFS proposed rule that we recognized that ACOs are often comprised of many ACO professionals who serve large patient populations and that such ACOs may need to aggregate data across multiple EHR systems (91 FR 44058). We noted that an internal CMS analysis described in the CY 2025 PFS final rule that analyzed PY 2022 data indicates that Shared Savings Program ACOs reported substantially higher numbers of denominator-eligible patients for certain eCQM measures than other MIPS reporters, including 33 times more denominator eligible patients for eCQM 001—Diabetes: Hemoglobin A1c (HbA1c) Poor Control (≤9%), 53 times more denominator eligible patients for eCQM 134—Preventative Care and Screening: Screening for Depression and Follow-Up Plan, and 25 times more denominator eligible patients for eCQM 236—Controlling High Blood Pressure. CMS data analysis also showed that ACOs provide a high volume of services, particularly those related to preventative screening measures; for example, in PY 2022, one ACO reported on over 700,000 denominator eligible beneficiaries for a single eCQM (89 FR 98436). Additionally, ACOs and related interested parties have shared that relatively few ACOs use one EHR, while a greater share use two to ten.[300] These data underscore the operational scale and complexity associated with this reporting (91 FR 44058).

We explained our belief that providing additional flexibility to ACOs would be helpful in light of the complex populations they serve, the high volume of data they process, and the necessity of aggregating data across multiple EHRs. We further noted that changes to simplify the Shared Savings Program requirement for ACOs to fulfill CEHRT use requirements would also be consistent with the Administration's interest, as expressed in the ''Request for Information: Deregulation'' (90 FR 15481 and15482), in identifying proposals to rescind or replace regulations that burden American businesses. In response to that RFI, several commenters asked that CMS reduce burdensome requirements for ACOs to report MIPS Promoting Interoperability performance category measures and activities, including a few specific suggestions that we reverse the Shared Savings Program's MIPS Promoting Interoperability performance category reporting requirement due to the increased burden on ACOs without adding any value. Others suggested that we revert to an attestation requirement, revise the definition of CEHRT, re-evaluate numerator and denominator requirements for CEHRT use reporting, or recognize CMS Innovation Center model participation, use of FHIR, or participation in health information exchanges as evidence of interoperability without the need for additional reporting or attestation.

In the CY 2027 PFS proposed rule, we explained that from commenters' responses to a CMS RFI on digital quality measurement included in the CY 2026 PFS proposed rule (90 FR 32710 through 32715), we learned that interested parties broadly supported CMS' efforts to move toward FHIR-based digital quality measurement. Commenters noted that the use of interoperable sources that are available at the point of care would ultimately increase efficiency, reduce administrative burden, and empower patients and healthcare providers to make informed care decisions. We noted that many commenters also stated that

[299] See Shared Savings Program Fast Facts as of January 1, 2026 (*https://www.cms.gov/files/document/2026-shared-savings-program-fast-facts.pdf*).

[300] See *https://www.naacos.com/ecqms-for-acos-recommendations-from-the-naacos-digital-quality-measurement-task-force/*.

significant technical and operational work remains to be completed before implementation of FHIR-based digital quality measurement, to ensure there is sufficient infrastructure to support the migration to and execution of FHIR. We further noted that several commenters described that the phased adoption, technical assistance, and incentives for use of EHR data would promote a successful transition to FHIR-based digital quality measurement. Some commenters opposed movement to FHIR-based digital quality measurement, with noted concerns including the ability of small practices to transition, potential performance issues with technology, need for clarity around exclusions, and difficulty with aggregating across large organizations (91 FR 44058 and 59).

b. Simplifying Shared Savings Program CEHRT Use Requirements

As we stated in the CY 2027 PFS proposed rule, we believe that reducing burden for reporting CEHRT use will free ACO resources to focus on meaningful advancement toward digital exchange of health information, including digital quality measurement. As noted previously in this section, commenters on the Request for Information: Deregulation asked that we recognize ACO use of FHIR technologies and that we simplify Shared Savings Program CEHRT use requirements. We believe that these suggestions would advance FHIR-based digital quality reporting by giving credit for incremental advances toward digital quality reporting (91 FR 44059).

We explained in the CY 2027 PFS proposed rule that, in response to the concerns and suggestions detailed previously in this section and in line with CMS' priorities to reduce burden and promote FHIR-based digital quality reporting and exchange of health information, we were proposing to sunset, beginning with PY 2027, the requirements at § 425.507(a) for Shared Savings Program ACO participants, ACO provider/suppliers, and ACO professionals that are MIPS eligible clinicians, Qualifying APM Participants, or Partial Qualifying APM Participants to report all MIPS Promoting Interoperability performance category measures and requirements and to earn a performance category score for the MIPS Promoting Interoperability performance category at the individual, group, virtual group, or APM entity level (91 FR 44059). Accordingly, we also proposed to sunset the associated exclusions that complement this requirement at § 425.507(b) (91 FR 44059). We proposed to replace the requirement in § 425.507(a) with different options for ACOs to meet CEHRT use requirements for the Shared Savings Program, described in further detail in the CY 2027 PFS proposed rule (91 FR 44059).

We stated in the CY 2027 PFS proposed rule that, as Shared Savings Program ACOs cover 12.6 million beneficiaries, served by over 700,000 participating clinicians and facilities,[301] we believe that a shift to FHIR-based digital quality reporting and exchange of health information at this scale would meaningfully advance care coordination and quality improvement. We expressed our further belief that reducing the burden of Shared Savings Program participation could lead to increased program participation from ACOs and ACO professionals, which would magnify the impact, moving even more clinicians toward meaningful use of EHR technology to improve care for beneficiaries (91 FR 44059).

We explained in the CY 2027 PFS proposed rule that, to encourage widespread adoption of FHIR-based transmission of clinical data, enable bi-directional exchange of clinical data across practices within ACOs, and support the capture of robust clinical quality information, we were proposing, in § 425.507(c), that for PY 2027 and subsequent PYs, to meet the Shared Savings Program CEHRT use requirement, ACOs would be required to perform at least one of three allowable activities (91 FR 44059). In summary, they are:

(1) Completely report at least one of the five ACO-reported measures in the APP Plus quality measure set through the eCQMs collection type or the proposed Medicare eCQMs collection type (discussed in section III.G.3.d.(3) of this final rule) using CEHRT; OR

(2) Attest to the ACO's use of FHIR capabilities to support reporting of at least one of the five ACO-reported measures in the APP Plus quality measure set using CEHRT (section IV.A.4.b.(2) of this final rule contains measures in the APP Plus quality measure set that are reportable by ACOs in PY 2027); OR

(3) Select and attest to one of the proposed Shared Savings Program CEHRT use metrics, which are based on a subset of MIPS Promoting Interoperability performance category measures, and which may be updated annually if there are changes.

We also proposed to sunset existing public reporting requirements at § 425.308(b)(9) and proposed to add a new section at § 425.308(b)(11), which would require ACOs to publicly report which of the allowable CEHRT use options proposed previously in this section they elected to perform to meet CEHRT use requirements for the Shared Savings Program for PY 2027 and subsequent PYs (91 FR 44059).

(1) Meeting Shared Savings Program CEHRT Use Requirement by Reporting at Least One ACO-Reported Measure Through the eCQMs or Medicare eCQMs Collection Types

As discussed earlier in this section, previous commenters have asked that CMS recognize efforts that ACOs are already undertaking to advance CEHRT use, without the need for additional reporting or attestation. Accordingly, we proposed to recognize ACO reporting of eCQMs without additional reporting requirements, for the purpose of satisfying the Shared Savings Program CEHRT use requirements (91 FR 44059). We explained that, because reporting of eCQMs or the proposed Medicare eCQMs would require the use of CEHRT and submission of CMS EHR Certification IDs (also referred to as CEHRT IDs) [302] to communicate care quality to CMS, we believe that an ACO's reporting of measures using the eCQM collection type or the proposed Medicare eCQM collection type (see section III.G.3.d.(3) of this final rule for discussion of the Medicare eCQM collection type) is a concrete example of ACO CEHRT use that supports improved patient care. Clinical quality measure reporting helps identify areas for potential care improvement, and use of CEHRT to report quality of care is a step toward bi-directional exchange of health information and digital quality measurement.

We proposed, in § 425.507(c)(1), that one option ACOs could select to meet the Shared Savings Program CEHRT use requirement would be to use EHR technology that meets the requirements in paragraph (3) of the CEHRT definition at § 414.1305 (91 FR 44059) and supports the recording, calculation, and reporting of clinical quality measures by being certified to the ONC Health IT Certification Program certification criteria at 45 CFR 170.315(c)(1) (included in the Base EHR definition in 45 CFR 170.102), (c)(2), and (c)(3)) to completely report at least one measure in the APP Plus quality measure set, through the eCQMs or the

[301] See Shared Savings Program Fast Facts as of January 1, 2026 (*https://www.cms.gov/files/document/2026-shared-savings-program-fast-facts.pdf*).

[302] For more information, please find the MIPS Data Submission User Guide on the QPP Resource Library: *https://qpp.cms.gov/resources/resource-library*.

proposed Medicare eCQMs collection type. Paragraph (3) of the CEHRT definition at 42 CFR 414.1305 is the paragraph applicable to Advanced APMs. The requirement that Shared Savings program ACOs use CEHRT that is certified to the ONC Health IT Certification Program certification criteria at 45 CFR 170.315(c)(2) and (c)(3) would be consistent with CEHRT use requirements under MIPS, as specified in paragraph (2)(ii)(B) of the CEHRT definition at 42 CFR 414.1305, which includes a specific requirement for use of EHR technology certified to the ONC health IT certification criteria that support the calculation and reporting of clinical quality measures at 45 CFR 170.315(c)(2) and (c)(3).

We explained that to ''completely report,'' as we use that phrase in the proposed regulatory text, for the purpose of using this option to satisfy Shared Savings Program CEHRT use requirements, would mean that the ACO meets the Shared Savings Program quality reporting requirements we proposed at 42 CFR 425.508(c)(1) to (c)(4) and as discussed in section III.G.4.b.(2) of this final rule as well as the MIPS data completeness requirements at § 414.1340 for the measure submission. The measure must be completely reported as part of annual quality reporting. Under this proposal, ACOs that completely report at least one quality measure through the eCQMs or the Medicare eCQMs collection type, which we are finalizing in section III.G.3.d.(3) of this final rule, as determined by MIPS, would not be required to complete an attestation to meet Shared Savings Program CEHRT use requirements. In section III.G.4.c of this final rule, we are finalizing changes to the Shared Savings Program quality reporting requirements at § 425.508, which may alter the universe of patients used to determine compliance with the MIPS data completeness requirements at § 414.1340 and would be applicable to the proposed changes for the Shared Savings Program CEHRT use requirement, in that completely reporting a measure in the APP Plus quality measure set through the eCQMs or Medicare eCQMs collection type means the ACO must meet the revised Shared Savings Program quality reporting requirements we are finalizing at § 425.508(c)(1) to (c)(4) and MIPS data completeness requirements at § 414.1340 for that eCQM or the proposed Medicare eCQM measure submission.

We understand that ACOs may still face challenges in aggregating data. As discussed more fully in section III.G.3.d. of this final rule, we believe that the proposed data completeness requirement changes would help to mitigate some of the issues ACOs face in aggregating data for eCQM or proposed Medicare eCQM reporting. We also note that eCQM or proposed Medicare eCQM reporting is just one of three proposed ways an ACO could meet the Shared Savings Program CEHRT use requirement. We received public comments on these proposals. We summarize and respond to comments related to Shared Savings Program CEHRT proposals in section III.G.4.c. of this final rule.

(2) Meeting Shared Savings Program CEHRT Use Requirements by Attesting to Using FHIR Capabilities in Certified Health IT To Support Reporting of At Least One of the Five ACO-Reported Measures in the APP Plus Measure Set

We proposed, in § 425.507(c)(2), that another option ACOs could select for PY 2027 and subsequent PYs, to meet the Shared Savings Program CEHRT use requirement, is to completely report at least one of five ACO-reported measures in the APP Plus quality measure set, meet the data completeness requirement under § 414.1340 (91 FR 44060), and attest that it used technology certified to ONC Certification Criteria for Health IT (45 CFR 170.315) supporting FHIR-based exchange to meet paragraph (3) of the CEHRT definition at § 414.1305 to support measure data collection. Specifically, we proposed that the ACO would be required to attest that it used a Health IT Module (as defined in 45 CFR 170.102) certified to an unexpired criterion or criteria in 45 CFR 170.315 to make information in the U.S. Core Data for Interoperability (USCDI) available through a FHIR-based API (currently USCDI version 3; 45 CFR 170.213(b)), to support the complete reporting of at least one measure in the APP Plus quality measure set. Data represented by the USCDI can be used to support meeting the data requirements for measures in the APP Plus quality measure set. By mapping data elements in USCDI to measure specifications, users could leverage this functionality in their CEHRT to obtain data needed to calculate measures in the APP plus measure set.

We noted that eligible clinicians and APM entities already have the flexibility to use data obtained via Health IT Modules certified to certification criteria in 45 CFR 170.315 to report MIPS CQMs and Medicare CQMs, as CMS does not specify how eligible clinicians and APM entities must collect data for MIPS CQMs and Medicare CQMs, and no further updates are needed to our quality reporting policies to permit use of this technology. Rather, we stated that our proposed policy aimed to encourage Shared Savings Program ACOs to use this approach to obtain data for quality measure reporting. Using standardized data from FHIR APIs can support more seamless aggregation of data across different EHR systems used by ACO participants. To meet the Promoting Interoperability requirement for the Shared Savings Program at the APM entity level as presently required in 42 CFR 425.507(a), ACOs are already required to demonstrate use of CEHRT through the MIPS requirement to use CEHRT at § 414.1375(b)(1). Specifically, current policy requires that ACOs use EHR technology that is certified to certification criteria in 45 CFR 170.315(g)(10), as it is a part of the ''Base EHR'' definition at 45 CFR 170.102. The Base EHR definition is included in paragraph (3) of the ''Certified Electronic Health Record Technology (CEHRT)'' definition at 42 CFR 414.1305 used by the Shared Savings Program. For the purpose of meeting this option, an ACO electing to attest would attest that it used data collected from a FHIR-based API to support data collection using a Health IT Module certified to an unexpired criterion or criteria in 45 CFR 170.315 supporting standardized API access, to support reporting a measure in the APP Plus measure set.

We proposed to require ACOs to attest because, for the MIPS CQMs or Medicare CQMs collection types we cannot ascertain (absent attestation) whether an ACO used FHIR technology to support collection of data used to report these measures (91 FR 44060). For the CEHRT use activity option in 42 CFR 425.507(c)(1), discussed previously in this section, we will be able to identify the ACOs that met that CEHRT use activity from quality reporting submission data; however, attestation would be required for an ACO electing to meet Shared Savings Program CEHRT use requirements by using standardized data from FHIR APIs to support collection of data for reporting at least one measure in the APP Plus measure set. We note that, while the option to meet Shared Savings Program CEHRT use requirements by attesting to use of a FHIR-based API to support complete reporting of at least one measure in the APP Plus measure set could conceivably be used for any available measure collection type, it would not be necessary for ACOs electing to report eCQMs or Medicare eCQMs collection types. This is because those ACOs electing to report eCQMs or Medicare eCQMs collection types would receive

automatic credit for reporting through those collection types, as CMS would be able to ascertain based on quality data submissions that ACOs completely reported a measure in the APP Plus measure set using the eCQMs or Medicare CQMs collection type, and that is one option that would satisfy the Shared Savings Program CEHRT use requirement. Accordingly, the discussion here focuses only on the MIPS CQMs and Medicare CQMs collection types. For ACOs electing to meet Shared Savings Program CEHRT use requirements by attesting to use of data collected from a FHIR-based API to support complete reporting using a Health IT Module certified to an unexpired criterion or criteria that supports standardized API access, for at least one measure through the MIPS CQMs or Medicare CQMs collection types, the measure must be completely reported as part of annual quality reporting. We proposed that ACOs would attest to meeting this requirement through ACO–MS, after the conclusion of annual quality reporting, which occurs in the first quarter of the year following the PY. For example, we anticipate that the attestation would be available in ACO–MS in the second quarter of 2028, after the conclusion of quality reporting for PY 2027. This proposed option for meeting Shared Savings Program CEHRT use requirements through the use of standardized data from FHIR APIs to report MIPS CQMs or Medicare CQMs would serve to recognize efforts underway by ACOs taking an interim step in the transition to FHIR-based digital quality reporting.

CMS described a parallel goal to implement FHIR reporting for eCQMs in an RFI posted in the CY 2026 proposed rule (90 FR 32710 through 32715), and requested comment on a timeline for transitioning to FHIR-based digital quality measurement in section IV.A.4.c. of the CY 2027 PFS proposed rule (91 FR 44152 through 44154). In the RFI regarding the timeline to transition to FHIR-based reporting in the CY 2027 PFS proposed rule, we indicated that following this transition period, FHIR-based reporting would be required for those applicable measures that were available as FHIR-based dQM reporting options during the transition period, beginning with the 2030 performance period (91 FR 44152 through 44154). These Shared Savings Program CEHRT use proposals aligned with our efforts to recognize ACO movement toward FHIR-based digital quality measurement and take into consideration comments received on the Request for Information: Deregulation, where a few commenters noted that leveraging FHIR technology supports multidisciplinary collaboration and efficient information sharing without additional attestations. While we disagree that use of FHIR technology alone obviates the need for an attestation, since we are presently not able to discern whether an ACO has utilized a certified Health IT Module (for example, a 45 CFR 170.315(g)(10)-certified Health IT Module) to obtain standardized data from a FHIR-based API to aggregate data for quality reporting without an attestation, we acknowledge the value in use of FHIR technology. In response to commenters' concerns about reporting burden, we stated in the CY 2027 PFS proposed rule that we believe that this attestation would represent a significantly reduced burden in comparison to the current requirement in 42 CFR 425.507(a) that all ACO participants report all MIPS Promoting Interoperability performance category measures and activities. Another commenter responded that CMS should incorporate FHIR-based capabilities as a fundamental requirement in the Shared Savings Program. We believe that an ACO's use of a Health IT Module certified to an unexpired criterion or criteria within 45 CFR 170.315 to obtain standardized data from FHIR APIs to support collecting data is a concrete step toward interoperability that will enable both digital quality reporting and bi-directional exchange of health information (91 FR 44061).

Under this proposed option for meeting the Shared Savings Program CEHRT use requirement, we proposed that ACOs choosing to attest that they used a Health IT Module certified to an unexpired criterion or criteria within 45 CFR 170.315 to obtain standardized data from a FHIR API to support collection of data for reporting at least one measure in the APP Plus measure set would also need to have completely reported that measure, according to data completeness requirements detailed earlier in the CY 2027 PFS proposed rule (91 FR 44061). We received public comments on these proposals. We summarize and respond to comments related to Shared Savings Program CEHRT proposals in section III.G.4.b. of this final rule.

(3) Meeting Shared Savings Program CEHRT Use Requirements by Attesting to One of the Three ACO CEHRT Use Metrics

We proposed, in 42 CFR 425.507(c)(3), that another option ACOs could select to meet the Shared Savings Program CEHRT use requirement would be to attest to at least one of the Shared Savings Program CEHRT use metrics from the list of metrics established for the applicable performance year (91 FR 44061). We proposed three Shared Savings Program ACO CEHRT use metrics for PY 2027, listed in Table B–G7 of the CY 2027 PFS proposed rule. Like similar measures that are included in the MIPS Promoting Interoperability performance category, these three Shared Savings Program ACO CEHRT use metrics represent meaningful ACO use of CEHRT for improved patient care (91 FR 44061). We proposed to allow ACOs to attest that the ACO meets one of these three metrics to satisfy the Shared Savings Program CEHRT use requirement (91 FR 44061). We noted this proposal was responsive to public comments on the deregulatory RFI (90 FR 15481 and 15482). Responses to the RFI included several comments asking that CMS permit attestation for meaningful use of CEHRT and exchange of health information, to ease reporting burdens and encourage small practices to participate in the Shared Savings Program. A commenter also suggested CMS incentivize organizations to utilize real-time data exchange. We stated our belief that allowing ACOs to attest to the use of bi-directional exchange of health information as one of the three options would promote ACOs engaging in this valuable activity while representing a significantly reduced burden as compared to our current Shared Savings Program CEHRT requirement that ACOs report on all MIPS Promoting Interoperability performance category measures and activities.

We stated that we would update the list of allowable metrics through notice and comment rulemaking if there are any changes for future years.

The ACO CEHRT use metrics we proposed (91 FR 44061) are based on the following parallel MIPS Promoting Interoperability performance category measures: Electronic Prescribing,[303] Health Information Exchange (HIE) Bi-Directional Exchange,[304] and Provide Patients Electronic Access to Their Health Information.[305] The parallel MIPS Promoting Interoperability performance category measures provide instructions on how MIPS eligible clinicians can report the measures, with

[303] *https://qpp.cms.gov/docs/pi_specifications/Measure%20Specifications/2026-MIPS-Promoting-Interoperability-e-Prescribing-Measure.pdf.*

[304] *https://qpp.cms.gov/docs/pi_specifications/Measure%20Specifications/2026-MIPS-Promoting-Interoperability-HIE-Bi-Directional-Exchange-Measure.pdf.*

[305] *https://qpp.cms.gov/docs/pi_specifications/Measure%20Specifications/2026-MIPS-Promoting-Interoperability-Provide-Patients-E-Access-to-Their-Health-Info-Measure.pdf.*

instructions to aggregate across all MIPS eligible clinicians for group and APM-level reporting in each of the measure specification documents. We did not propose, however, that ACOs would be required to report Shared Savings Program ACO CEHRT use metrics for every ACO provider/supplier in the ACO, as is required under the MIPS measure specifications, because we understand that this level of information may be difficult or burdensome for ACOs to aggregate (91 FR 44061 and 44062). To recognize the varying capacities for ACO participants to report on CEHRT use and for ACOs to report on CEHRT use for all of their ACO participants, we proposed that ACOs would be allowed to attest ''Yes'' if at least one ACO provider or supplier in each of the ACO's participating TINs performed the action described in the Shared Savings Program ACO CEHRT use metric using EHR technology certified to the ONC Certification Criteria for Health IT (45 CFR 170.315) necessary to meet paragraph (3) of the CEHRT definition at 42 CFR 414.1305 to complete the action described in each metric (91 FR 44062).

As discussed in the CY 2027 PFS proposed rule (91 FR 44062), ACOs have faced challenges in reporting a high volume of participant data involving multiple EHRs for MIPS Promoting Interoperability measures and activities. We also noted that an additional source of confusion is the requirement to report on behalf of all participants when an ACO reports at the APM entity level, including participants who would have been excluded or have received special status for reporting purposes when reporting at the individual or group level. We explained that, similarly, because QPs do not receive MIPS scores or payment adjustments, the requirement that QPs report the MIPS Promoting Interoperability performance category and earn a performance category score is a burden unique to the Shared Savings Program Promoting Interoperability requirements. ACOs have also reported incidents of practices included on the ACO's Participant Agreement closing throughout the year, which requires the ACO to report on behalf of groups with whom contact may be difficult. We noted that given this identified challenge, we no longer believe it is reasonable to require ACOs to report on every ACO provider and supplier in the ACO. We stated that we recognize and have been reminded by interested parties that participation in an ACO itself represents a commitment to coordinating care. ACOs in the Advanced APM tracks of the Shared Savings Program (BASIC track Level E and ENHANCED track) whose qualifying participants are exempt from MIPS have taken on financial risk for providing coordinated, efficient care. We stated our belief that, in addition to that undertaking, our proposal to allow ACOs to attest that one ACO provider or supplier from each of the ACO's participating TINs has completed the action required under one of the ACO CEHRT use metrics we proposed would be sufficient to demonstrate CEHRT use. We noted that healthcare providers and suppliers who are MIPS eligible clinicians and who participate in ACOs in Shared Savings Program tracks that do not meet the definition of an Advanced APM (BASIC track levels A–D) and those in Advanced APM tracks who are not QPs will still be required to report MIPS Promoting Interoperability performance category measures (unless they are otherwise excluded under MIPS) to earn a score for the Promoting Interoperability performance category.

In the CY 2027 PFS proposed rule, we provided summary level information of the three proposed ACO CEHRT use metrics (91 FR 44062). These details generally align with the measure specifications for the respective MIPS Promoting Interoperability measures; however, they reflect ACO-level attestation. From these, ACOs would be allowed to select one metric to which the ACO would be able to attest ''Yes,'' to meet Shared Savings Program ACO CEHRT use requirements. Following the discussion of the three proposed metrics, we describe proposed allowable exclusions from ACO attestation. For each of these proposed activities, to attest ''Yes,'' the ACO's participant TINs must use EHR technology certified to the ONC Certification Criteria for Health IT (45 CFR 170.315) necessary to meet paragraph (3) of the CEHRT definition at § 414.1305. We further describe the specific certified Health IT Modules that must be used to complete the action in the measure, consistent with information provided by the MIPS program for corresponding measures. We stated that, if finalized, we would make public on our website more detailed information on each of these metrics.

(i) ACO Electronic Prescribing: An ACO could attest ''Yes,'' if, during the PY, at least one permissible prescription was written by at least one ACO provider or supplier in each of the ACO's participant TINs, and the prescription was transmitted electronically using CEHRT. In addition to the allowable exclusions from Shared Savings Program CEHRT use attestation discussed later in this section, ACOs choosing to attest to this metric would be permitted to exclude from their assessment any ACO participant TIN whose ACO providers and suppliers wrote fewer than 100 total permissible prescriptions during the PY. This exclusion would align with a similar exclusion in the parallel MIPS Promoting Interoperability e-Prescribing measure, which provides an exclusion for any MIPS eligible clinician who writes fewer than 100 permissible prescriptions during the performance period. This would mean that an ACO could attest that it met this metric even if no electronic prescription was written by any ACO provider or supplier in one of the ACO's ACO participant TINs, where all of the ACO's participants TINs were composed of ACO providers and suppliers who wrote fewer than 100 total permissible prescriptions. Similar to the MIPS e-Prescribing measure, a prescription would be defined as the authorization by an ACO provider or supplier to a pharmacist to dispense a drug that the pharmacist wouldn't dispense to the patient without such authorization. A permissible prescription is a prescription, as described in the preceding sentence, including electronic prescription of controlled substances, where creation of an electronic prescription for the medication is feasible using CEHRT and where allowable by state and local law. An ACO electing to attest to this metric to meet the Shared Savings Program CEHRT use requirement would be required to attest that at least one ACO provider or supplier in each of its ACO participant TINs used CEHRT, including health IT certified to the ''electronic prescribing'' criterion in 45 CFR 170.315(b)(3) to complete the actions of this Shared Savings Program CEHRT use metric.

(ii) ACO Health Information Exchange (HIE) Bi-Directional Exchange: An ACO could attest ''Yes'' if, during the PY, at least one ACO provider or supplier from each of the ACO's participant TINs has, for at least one patient seen by the ACO provider or supplier used EHR technology certified to the ONC Certification Criteria for Health IT (45 CFR 170.315) necessary to meet paragraph (3) of the CEHRT definition at § 414.1305 to support bi-directional exchange with an HIE that: enables secure, bi-directional exchange to occur for every patient encounter, transition or referral, and record stored or maintained in the ACO provider or supplier's EHR during the PY in accordance with applicable law and policy; and that the

HIE is capable of exchanging information across a broad network of unaffiliated exchange partners including those using disparate EHRs and does not engage in exclusionary behavior when determining exchange partners. These elements of this Shared Savings Program ACO CEHRT use metric align with those in the parallel MIPS Promoting Interoperability measure. An ACO electing to attest to this metric to meet the Shared Savings Program CEHRT use requirement would not be required to attest that at least one ACO provider or supplier from each ACO participant TIN used CEHRT functionality to perform bi-directional exchange for every patient throughout the PY. Rather, attesting ''yes'' to the measure requires that at least one ACO provider or supplier from each of the ACO's participant TINs used CEHRT functionality to perform bi-directional exchange for at least one patient with an HIE that has the capability to enable secure, bi-directional exchange for all patients, without excluding exchange partners. We noted that we recognize that an ACO provider or supplier may have different options with respect to the certified health IT that it uses to connect to an HIE. Health IT certified to criteria including, but not limited to, the ''transitions of care'' criterion in 45 CFR 170.315(b)(1), the ''Clinical information reconciliation and incorporation'' criterion in 45 CFR 170.315(b)(2), and the ''Standardized API for patient and population services'' 45 CFR 170.315(g)(10), could be utilized to support bi-directional exchange through an HIE. An ACO attesting to this metric, for the purpose of meeting the Shared Savings Program CEHRT use requirement, would be required to attest that at least one ACO provider or supplier in each of its ACO participant TINs used CEHRT, including health IT certified to but not limited to the criteria previously discussed, to complete the actions of this Shared Savings Program CEHRT use metric.

We noted that the MIPS Promoting Interoperability performance category includes a corresponding measure under the HIE objective entitled ''Enabling Exchange Under TEFCA,'' which enables eligible clinicians to earn credit for the HIE Objective if they participate as a signatory to a Framework Agreement (as that term is defined by the Common Agreement for Nationwide Health Information Interoperability) to enable secure, bi-directional exchange of information for every patient encounter, transition of care or referral, and record stored or maintained in the EHR during the performance period, using CEHRT. We expressed that, while we had not proposed this measure for the proposed ACO CEHRT use requirements, ACO providers or suppliers who are able to attest ''Yes'' to the ''Enabling Exchange Under TEFCA'' measure under the MIPS Promoting Interoperability performance category would meet the requirement to have used CEHRT to perform bi-directional exchange for at least one patient. Accordingly, an ACO choosing to attest to having met this metric could consider an ACO provider or supplier who could attest to the MIPS Promoting Interoperability measure, ''Enabling Exchange Under TEFCA'' for a particular performance year to count as having met the requirement for their ACO participant TIN when determining whether one ACO provider or supplier from each of its ACO participant TINs has met the requirement for the proposed ACO Health Information Exchange (HIE) Bi-Directional Exchange metric.

(iii) ACO Provider to Patient Exchange: An ACO could attest ''Yes'' to this metric if, during the PY, at least one ACO provider or supplier from each of the ACO's participant TINs has, for at least one patient seen by the ACO provider or supplier (or the patient-authorized representative): provided timely access to view online, download, and transmit his or her health information; and ensured the patient's health information is available for the patient (or the patient's personal representative) to access using any application of their choice that is configured to meet the technical specifications of the Application Programming Interface (API) in the clinician's CEHRT. Similar to the MIPS Promoting Interoperability performance category measure, ''Provide Patients Electronic Access to Their Health Information,'' for the ACO to attest ''Yes,'' the patient would need to be able to access this information on demand, such as through a patient portal or personal health record (PHR) or by other online electronic means.

As detailed in the measure specifications for the parallel MIPS measure, specific rights and privacy protections apply to the provision of protected health information (PHI) to individuals. While a covered entity may be able to fully satisfy a patient's request to access the patient's information through view, download, or transmit functionality, the metric would not replace a covered entity's responsibilities to meet the right of access requirements under the Health Insurance Portability and Accountability Act of 1996 (HIPAA) Privacy Rule (45 CFR part 160 and subparts A and E of part 164) to provide an individual, upon request, with access to PHI in a designated record set. There may be patients who can't access their health information electronically because of a disability. In these cases, ACO providers or suppliers who are covered by civil rights laws are required to provide individuals with disabilities equal access to information and appropriate auxiliary aids and services as provided in the applicable statutes and regulations.

An ACO electing to attest to this metric to meet the Shared Savings Program CEHRT use requirement would be required to attest that at least one ACO provider or supplier in each of its ACO participant TINs used health IT certified to the ''view, download, and transmit to 3rd party'' criterion in 45 CFR 170.315(e)(1) to provide view, download, or transmit capabilities to at least one patient. The ACO participant would also be required to use health IT certified to the ''application access—patient selection'' criterion in 45 CFR 170.315(g)(7), the ''application access—all data request'' criterion in 45 CFR 170.315(g)(9), and the ''standardized API for patient and population services'' criterion in 45 CFR 170.315(g)(10) to support information access through an API to their patients. We noted, however, ONC proposed to remove the criteria in 45 CFR 170.315(g)(7) and (g)(9) as of January 1, 2027 in the Health Data, Technology, and Interoperability: ASTP/ONC Deregulatory Actions to Unleash Prosperity (HTI–5) Proposed Rule (90 FR 60998). We stated in the CY 2027 PFS Proposed Rule that, if ONC finalized these proposals, we would no longer require ACOs to use health IT certified to the removed criteria to meet the measure and rather, the ACO would be required to attest to having used health IT certified to the ''view, download, and transmit to third party'' criterion in 45 CFR 170.315(e)(1) to provide view, download, or transmit capabilities to patients and to the ''standardized API for patient and population services'' criterion in 45 CFR 170.315(g)(10), to meet the requirements of this Shared Savings Program ACO CEHRT use metric. ACOs electing to attest to any one of the three ACO CEHRT use metrics, including this one, would also still be required to attest that their participating ACO providers and suppliers used EHR technology necessary to meet paragraph (3) of the CEHRT definition at 42 CFR 414.1305, as described previously. Patient health information would need to be made available to the patient to view,

download, or transmit within 4 business days of the information being available to the ACO provider or supplier for every time that information is generated. Also, in alignment with the MIPS Promoting Interoperability performance category measure, for ''view, download, or transmit'' functionality, the required content would be: an unexpired version of the USCDI adopted at 45 CFR 170.213; healthcare Provider's name and office contact information; Laboratory test report(s); Diagnostic image report(s), and for API functionality, the required data set is the USCDI.

(iv) Allowable ACO exclusions from Shared Savings Program CEHRT use metrics: Based on feedback we received from the RFIs discussed earlier in this section and questions we have received from ACOs on the existing Shared Savings Program CEHRT use requirements that we to sunset and replace, we understand that ACOs may face difficulties in determining whether an ACO provider or supplier from each of its ACO participant TINs has performed the required action for a given proposed Shared Savings Program ACO CEHRT use metric (91 FR 44064). We, therefore, proposed to allow certain exclusions for ACOs electing to meet the Shared Savings Program CEHRT use requirement by attesting to one of the available Shared Savings Program CEHRT use metrics (91 FR 44064). By ''exclusion,'' we mean that an ACO would be able to attest to having performed the activity required by the metric, even if one or more of the ACO's participant TINs did not have at least one ACO provider or supplier that performed the activity, if that TIN or TINs meets one of the exclusions described later in this section.

We proposed that ACOs would be permitted to apply exclusions for similar circumstances as the exclusions and exceptions under MIPS, when ACOs choose to report one of the three proposed Shared Savings Program ACO CEHRT use metrics for purposes of satisfying the Shared Savings Program CEHRT use requirement in PY 2027 and future years (91 FR 44064). In the CY 2027 PFS proposed rule, we mistakenly stated that, under MIPS, special statuses result in automatic reweighting of the Promoting Interoperability performance category to zero (91 FR 44064) which, as discussed further later is this section, is not true for the special statuses of ''rural'' or ''located in a health professional shortage area (HPSA).'' We explained in the CY 2027 PFS proposed rule that, for hardship circumstances, MIPS eligible clinicians or groups may be required to submit a hardship exception application that is subject to CMS approval. However, for the purposes of the Shared Savings Program CEHRT use requirement, we proposed that an ACO may exclude from their Shared Savings Program CEHRT attestation an ACO participant TIN that meets certain exclusion criteria outlined later in this section without requesting approval from CMS (91 FR 44064). This means that the ACO may still attest to having performed the action required by the metric, without consideration of whether at least one ACO provider or supplier from a TIN meeting these criteria performed the required action, when at least one ACO provider or supplier in each of the ACO's other participant TINs (that are not permitted to be excluded) performed the required action. The criteria under which an ACO would be permitted to exclude an ACO participant TIN are that the ACO determines the TIN is comprised solely of ACO providers and/or suppliers who:

- Would meet the definition of ''special status''; or
- Are facing hardship circumstances that would qualify for MIPS Promoting Interoperability hardship exception requests, had such requests been submitted by a MIPS eligible clinician.

For Shared Savings Program CEHRT use metric exception purposes, we proposed the following would be considered special statuses. We noted that the definitions of these special statuses would be similar to the MIPS definitions at § 414.1305 except that they would not be limited to MIPS ECs, for the purpose of Shared Savings Program CEHRT use metric exceptions. For Shared Savings Program CEHRT use metric exclusion purposes, ACOs would be permitted to exclude an ACO participant TIN if the ACO determines that the TIN is comprised solely of ACO providers and suppliers meeting the following special statuses:

- ASC-based-ACO providers or suppliers who furnish 75 percent or more of their covered professional services during the performance period in sites of service identified by the POS codes used in the HIPAA standard transaction [306] as an ambulatory surgical center setting based on claims.
- Facility-based-ACO providers or suppliers who:

++ Furnish 75 percent or more of their covered professional services in sites of service identified by the place of service codes used in the HIPAA standard transaction as an inpatient hospital, on-campus outpatient hospital, or emergency room setting based on claims for a 12-month segment beginning on October 1 of the calendar year 2 years prior to the applicable performance period and ending on September 30 of the calendar year preceding the performance period with a 30-day claims run out; and

++ Furnish at least 1 covered professional service in sites of service identified by the place of service codes used in the HIPAA standard transaction as an inpatient hospital, or emergency room setting; and

++ Can be assigned to a facility with a value-based purchasing score, determined under the methodology specified in § 414.1380(e)(5), for the applicable period.

- Hospital-based-ACO providers or suppliers who provide 75 percent or more of their covered professional services during the PY in sites of service identified by the POS codes used in the HIPAA standard transaction as an inpatient hospital, on-campus outpatient hospital, off campus outpatient hospital, or emergency room setting based on claims.
- Non-patient facing-ACO providers or suppliers who billed 100 or fewer patient-facing encounters (including Medicare telehealth services defined in section 1834(m) of the Act) during the performance year. A patient-facing encounter is an instance in which the ACO provider/supplier bills for items and services furnished such as general office visits, outpatient visits, and procedure codes under the PFS, as specified by CMS.
- Located in a health professional shortage area (HPSA)-ACO providers and suppliers are located in areas as designated under section 332(a)(1)(A) of the Public Health Service Act.
- Rural area-ACO providers or suppliers that are in a ZIP code designated as rural by the Federal Office of Rural Health Policy (FORHP), using the most recent FORHP Eligible ZIP Code file available as described in the definition of ''Rural area'' at § 414.1305.

As noted earlier in this section, the special status definition for the Shared Savings Program CEHRT use metric exclusions would be similar to the one used for MIPS eligible clinicians at § 414.1305. We noted that in contrast to the MIPS special status definition, however, small practices would not be considered a special status for the purpose of exclusion from ACO CEHRT use metric attestation because we believe that joining an ACO should be a way for small practices to receive assistance with care coordination and quality improvement efforts such as use of CEHRT.

[306] For more information on HIPAA transactions, please see the CMS HIPAA and Administrative Simplification webpage: *https://www.cms.gov/priorities/key-initiatives/burden-reduction/administrative-simplification/hipaa.*

The hardship circumstances that would qualify an ACO participant TIN for exclusion from Shared Savings Program CEHRT use metric attestation would parallel those described in § 414.1380(c)(2)(i)(C), except that neither the ACO nor the ACO provider or supplier would need to submit an application to CMS. An ACO could exclude, for purposes of determining whether the ACO can attest ''yes'' to a Shared Savings Program CEHRT use metric, ACO participant TINs comprised solely of ACO providers/suppliers meeting any of the following conditions:

- The ACO providers or suppliers lacked sufficient internet access during the performance period, and insurmountable barriers prevented them from obtaining sufficient internet access.
- The ACO providers or suppliers were subject to extreme and uncontrollable circumstances that caused their CEHRT to be unavailable.
- The ACO providers or suppliers were located in an area affected by extreme and uncontrollable circumstances as identified by CMS.
- 50 percent or more of the ACO providers' or suppliers' outpatient encounters occurred in practice locations where they had no control over the availability of CEHRT.
- The ACO providers' or suppliers' CEHRT was decertified under the Office of the National Coordinator for Health IT (ONC) Health IT Certification Program) either during the PY, or decertified during the calendar year preceding the performance year and the ACO providers or suppliers made a good faith effort to adopt and implement another CEHRT in advance of the performance year.

We proposed that an ACO may exclude ACO participant TINs composed entirely of ACO providers or suppliers who meet these criteria from their determination as to whether at least one ACO provider or supplier from each of its ACO participant TINs has completed the action required by the ACO CEHRT use metric and still attest that the metric is met. We explained our rationale was that ACO participant TINs comprised solely of MIPS eligible clinicians meeting the definition of ''special status'' under MIPS would be exempt from reporting MIPS Promoting interoperability and those facing circumstances that would qualify for a MIPS Promoting Interoperability hardship may be granted an exception under MIPS (91 FR 44065). As noted previously in this section and discussed more fully later in this section, we want to clarify that not all of the MIPS special statuses defined at § 414.1305 would actually result in automatic reweighting of the Promoting Interoperability performance category under MIPS; the special statuses of ''rural'' and ''located in an HPSA'' would not. We expressed that we recognize ACO providers and suppliers in Shared Savings Program ACO participant TINs would face challenges in these situations. We proposed that ACOs be allowed to determine whether any of their ACO participant TINs meet the criteria without requesting an exception from CMS because those ACO providers or suppliers who are QPs in an ACO that is in an Advanced APM track are exempt from MIPS and therefore cannot request MIPS hardship exceptions (91 FR 44065). They also cannot qualify for automatic reweighting due to special status. We expressed that we therefore believe it would be appropriate to allow ACOs to exclude such ACO participant TINs from the ACO's assessment of whether at least one ACO provider or supplier from each of the ACO's participant TINs met the requirement of the Shared Savings Program CEHRT use metric and still attest that the metric has been met. For example, similar to the non-patient facing exclusion, an ACO participant whose ACO providers or suppliers have fewer than 100 patient-facing encounters in a PY may not have engaged in e-Prescribing, exchange of health information, or provider to patient exchange of health information, so the ACO can make the determination to exclude the ACO participant for the purposes of attesting to one of the proposed metrics. In another example, an ACO may not be able to ascertain whether at least one ACO provider or supplier in an ACO participant TIN comprised of hospital-based physicians who are employed at a hospital that does not participate in the ACO have participated in an HIE. This ACO participant and its suppliers would be exempt from MIPS Promoting Interoperability reporting, so we believe it would be appropriate to recognize and account for these situations under the Shared Savings Program.

In the CY 2027 PFS proposed rule (91 FR 44065), we proposed that ACOs would be required to maintain documentation of excluded ACO participant TINs, including evidence that the TINs met one of the criteria for exclusion from the ACO's attestation to Shared Savings Program CEHRT use metrics, in the event of a CMS audit. We stated that ACOs that fail to maintain adequate documentation may be subject to compliance actions, as discussed in further detail in the Compliance with Shared Savings Program CEHRT Use Requirements paragraph of this final rule. We received public comments on these proposals. We summarize and respond to comments related to Shared Savings Program CEHRT proposals in section III.G.4.b. of this final rule.

(4) New Public Reporting Requirements

In the CY 2027 PFS proposed rule, we proposed to sunset the requirement at § 425.308(b)(9) that ACOs must publicly report the total number of ACO participants, ACO providers/suppliers, and ACO professionals that are MIPS eligible clinicians, QPs, or Partial QPs (each as defined at § 414.1305) that earn a MIPS performance category score for the MIPS Promoting Interoperability performance category beginning with PY 2027 (91 FR 44065). We proposed to revise § 425.308(b)(9) by sunsetting its applicability after PY 2026 (91 FR 44065). We proposed to replace this reporting requirement, beginning with PY 2027, with a new requirement in proposed § 425.308(b)(11) that ACOs must publicly report which of the allowable CEHRT use activities in proposed § 425.507(c) the ACO has selected to perform to meet CEHRT use requirements for the Shared Savings Program (91 FR 44065). We stated our belief that one important aspect of patient-centered care is patient engagement and transparency, which can be achieved by the public reporting of ACO quality and cost performance. Public reporting helps to hold ACOs accountable and may improve a beneficiary's ability to make informed healthcare choices as well as facilitate an ACO's ability to improve the quality and efficiency of its care. We received public comments on these proposals. We summarize and respond to them in section III.G.4.b. of this final rule.

(5) Compliance With Shared Savings Program CEHRT Use Requirements

In the CY 2027 PFS proposed rule, we stated that we reserve the right to audit an ACO's compliance with the Shared Savings Program CEHRT use requirements proposed at § 425.507(c). Our audit, under § 425.314(a), could include, for example, requesting documentation from an ACO regarding its attestation to having used a Health IT Module certified to a criterion or criteria in 45 CFR 170.315 to obtain standardized data from a FHIR-based API to support collection of measure data to completely report at least one measure in the APP Plus quality measure set, as proposed at 42 CFR 425.507(c)(2), for ACOs electing that option to satisfy Shared Savings Program CEHRT use requirements. As a further example, an audit could also

include requesting documentation from an ACO regarding any ACO participant TINs excluded for purposes of the ACO attesting to any of the CEHRT use metrics, for ACOs electing the option proposed at § 425.507(c)(3) to report one of three allowable ACO Shared Savings Program CEHRT use metrics for the purpose of meeting Shared Savings Program CEHRT use requirements. We noted that as part of an audit, CMS may also require that ACOs produce the CEHRT IDs [307] for the EHRs used by ACOs to meet ACO CEHRT use requirements. For ACOs reporting via the eCQMs or Medicare eCQMs collection types, they would be required to produce this information at the time of submission when using that collection type, but for ACOs electing one of the other two Shared Savings Program CEHRT use options, the ACO would be required to maintain documentation of the CEHRT ID from the Certified Health IT Product List (CHPL). This would mean ACOs attesting they used a Health IT Module certified to an unexpired criterion or criteria within 45 CFR 170.315 to obtain standardized data from a FHIR-based API to support collection of data for reporting at least one measure in the APP Plus measure set would need to provide, on request, the CEHRT ID for the certified technology used. Similarly, for ACOs electing to attest to one of the three proposed ACO CEHRT use metrics, ACOs would need to provide, on request, the CEHRT ID for each of its participant TINs from which it attested at least one ACO provider or supplier utilized CEHRT to meet the requirements of the metric. ACOs are required under 42 CFR 425.314(b)(1) to maintain and give CMS, DHHS, the Comptroller General, the Federal Government or their designees access to records sufficient to enable the audit, evaluation, investigation, and inspection of the ACO's compliance with program requirements. Furthermore, we proposed that, if ACOs fail to meet Shared Savings Program CEHRT use requirements, lack adequate documentation to demonstrate that TIN exclusions applied for an ACO's Shared Savings Program CEHRT use metric were appropriate, or fail to provide such adequate documentation upon request, we may apply compliance actions under §§ 425.216 or 425.218 (91 FR 44066). Such actions could include providing a warning notice, requesting a corrective action plan from the ACO, or placing the ACO on a special monitoring plan (91 FR 44065).

(6) No Impact on Current Shared Savings Program Quality or MIPS Scoring Policies or Process

In the CY 2027 PFS proposed rule, we stated that the proposed options for Shared Savings Program ACOs to meet the Shared Savings Program CEHRT use requirement will not change the existing scoring methodology for the MIPS Promoting Interoperability performance category. This means that, regardless of which of the three activities (or which option within their selected activity) ACOs choose to meet the Shared Savings Program CEHRT requirement, the MIPS Promoting Interoperability performance category reporting requirements for MIPS eligible clinicians participating in an ACO will remain unaffected. Additionally, an ACO performing any of the three CEHRT use requirement activities will not impact an ACO's quality score for purposes of determining the quality performance standard. For example, an ACO may choose to report an eCQM to meet the Shared Savings Program's ACO CEHRT use requirement; however, the eCQM will not necessarily be included in the MIPS quality performance category score as determined under § 414.1380. If an ACO reports multiple collection types for a given measure, including eCQMs, scoring is based on the highest scoring collection type which may not be eCQMs. Therefore, reporting the eCQM to meet the CEHRT use requirement may or may not contribute to the final quality performance score. In this example, even if the eCQM submission was not included in the ACO's MIPS quality performance category score as determined under § 414.1380, the ACO's complete reporting of the measure using the eCQMs collection type would satisfy the Shared Savings Program's CEHRT use requirement. Similarly, if an ACO uses FHIR technology to completely report a measure in the APP Plus measure set and attests to having done so, for the purpose of meeting the Shared Savings Program CEHRT use requirement, the requirement will be met, regardless of whether that measure submission is used to calculate the ACO's MIPS quality performance category score under § 414.1380. By extension, in this example, an ACO's quality score for the purposes of determining shared savings as calculated under § 425.512 would be unaffected. The ACO's MIPS quality performance category score is an aggregate of the highest measure-level scores submitted by the ACO. However, submissions that do not contribute to an ACO's final MIPS quality performance category score are still eligible for purposes of meeting the Shared Savings Program CEHRT use requirement (91 FR 44066).

(7) Regulatory Changes

We proposed the following revisions to the regulatory text at § 425.308(b) (91 FR 44066):

- Revising paragraph (b)(9) to remove the introductory phrase that made the subsequent requirements applicable to performance year 2025 and subsequent performance years, and limiting them to performance years 2025 and 2026.
- Adding new paragraph (b)(11) to specify that for performance year 2027 and subsequent PYs, the ACO must publicly report the CEHRT use activity selected by the ACO for the purpose of meeting the ACO CEHRT use requirement at § 425.507(c).

We proposed the following revisions to the regulation text at § 425.507 (91 FR 44066):

- Revising paragraph (a) to remove the introductory phrase that made the paragraph applicable to performance years beginning on or after January 1, 2025 and adding in its place an introductory phrase that would limit its applicability to performance years 2025 and 2026.
- Revising paragraph (b) by adding an introductory phrase that would limit its applicability to performance years 2025 and 2026,
- Adding new paragraph (c) to specify that, for PYs beginning on or after January 1, 2027, an ACO would be required to demonstrate the use of CEHRT as defined at § 425.20 in one of the following manners—

++ Use CEHRT (as defined in paragraph (3) of the CEHRT definition at § 414.1305) that also supports the calculation and reporting of clinical quality measures by being certified to the ONC health IT certification criteria at 45 CFR 170.315(c)(2) and (c)(3) to completely report at least one of the measures in the APP Plus quality measure set using the eCQMs or Medicare eCQMs collection types and meets the data completeness requirement at § 414.1340 of this chapter for the applicable PY; or

++ Completely report at least one measure in the APP Plus quality measure set and meet the data completeness requirement at 42 CFR 414.1340 of this chapter for the applicable performance year using EHR technology that meets paragraph (3) of the CEHRT definition at § 414.1305 and attests that it used data collected from

[307] The Office of the National Coordinator of Technology (ONC) maintains a searchable database of Certified Electronic Health Record Technology (CEHRT) IDs at CHPL Search (*https://chpl.healthit.gov/#/search*).

an HL7® Fast Healthcare Interoperability Resources (FHIR®)-based API to support quality measurement using a Health IT Module (as defined in 45 CFR 170.102) that has been certified to an unexpired criterion or criteria in 45 CFR 170.315 supporting standardized API access.

++ Attest to at least one of the Shared Savings Program CEHRT use metrics from the list of metrics established for the applicable PY.

We requested public comment on these proposed changes to the policy at 42 CFR 425.308(b) and 425.507.

c. Request for Information on Applying Electronic Prior Authorization Measures to Shared Savings Program ACOs

In section IV.A.4.d.(4) of the CY 2027 PFS proposed rule, we included proposals on the use of electronic prior authorization measures in the MIPS Promoting Interoperability performance category. Specifically, in that section of the CY 2027 PFS proposed rule, for the MIPS Promoting Interoperability performance category, we proposed to (1) change the Electronic Prior Authorization measure from a required measure to a bonus measure for the CY 2027 performance period/2029 MIPS payment year and a required measure beginning with the CY 2028 performance period/2030 MIPS payment year and (2) require a new measure, Electronic Prior Authorization for Prescription Drugs, that requires requesting prior authorization for at least one prescription drug electronically using CEHRT (91 FR 44066). This measure would be required for the MIPS Promoting Interoperability performance category beginning with the CY 2028 performance period/2030 MIPS payment year.

We sought feedback on the use of electronic prior authorization by ACOs that participate in the Shared Savings Program. Specifically, we sought comment on the following potential future changes:

- Requiring the use of specific FHIR-enabled Health IT Modules within CEHRT to complete at least one prior authorization request and determination for at least one medical item or service during the performance period or allowing it to be an option for meeting Shared Savings Program CEHRT use requirements beginning with the CY 2028 performance year.
- Creating a new, ACO-specific electronic prior authorization measure to require use of specific FHIR-enabled health IT modules within CEHRT to complete at least one prior authorization request and determination for at least one prescription drug during the performance period, beginning with the CY 2028 performance year.
- Considerations CMS should take into account, in developing electronic prior authorization measures to apply to Shared Savings Program ACOs.

We received public comments in response to our request for comment related to potential future policies for ACO use of electronic prior authorization and will take them into consideration for potential future rulemaking on this topic.

The following is a summary of the comments we received on our proposals related to Shared Savings Program CEHRT use and our responses.

Comment: Most commenters expressed support for the three proposed new options for ACOs to meet CEHRT use requirements, and several of these commenters expressed strong support. Commenters stated that the proposals would simplify CEHRT requirements, provide ACOs with greater flexibility to meet those requirements, and reduce unnecessary burden on ACOs and their healthcare providers. Of the commenters who stated the proposals would reduce burden, several noted that the proposals account for operational complexities such as those related to having multiple participating health centers, diverse EHR environments, multiple TINs, or large clinically integrated networks. One of those commenters indicated that the proposed CEHRT requirements would reduce burden without weakening accountability, and several added that the simplified requirements would account for these complexities while maintaining an expectation for electronic health information exchange or meaningful connection to electronic quality measurement. A commenter praised the proposals as a meaningful step away from development of EHRs for measurement and reporting rather than clinician and patient needs, and several supported the proposed Shared Savings Program CEHRT use options' alignment with quality measurement initiatives and progress toward digital quality measurement.

A few commenters supported that two of the proposed policies allow ACO-level attestation instead of requiring ACOs to satisfy requirements they stated were designed primarily for individual clinicians or groups.

Some commenters specifically supported the proposed availability of multiple options to meet the Shared Savings Program CEHRT use requirements, citing their belief that these varied pathways would accommodate different types of organizations or those with differing levels of technical readiness. Several commenters also expressed support for specific proposed options within those we proposed for ACOs to meet Shared Savings Program CEHRT use requirements. Several of these supported the option to leverage quality reporting through eCQMs or Medicare eCQMs collection types to also satisfy Shared Savings Program CEHRT use requirements, and some commenters specifically expressed support for the FHIR attestation option.

A commenter supported the proposed CEHRT use metrics, stating their belief that bi-directional exchange across the practices and systems responsible for a population can improve coordination while reducing duplicative reporting. A commenter supported the inclusion of the Health Information Exchange attestation option as one of the three ACO CEHRT use metrics.

Several commenters also supported the proposed exclusions for Shared Savings Program ACO CEHRT use metrics, which would allow qualifying participant TINs to be excluded under applicable special-status or hardship criteria without requiring advance CMS approval.

Several commenters specifically expressed support for the proposal to retire the current requirement that ACOs report the full set of MIPS Promoting Interoperability measures and activities, citing that they are burdensome, pose challenges for ACOs with differing compositions, systems, or capabilities, or that they served as a barrier to Shared Savings Program participation. Some of these commenters specifically expressed support for CMS' efforts to ensure that small, independent, or rural practices can participate in the Shared Savings Program, with one stating that the proposals restore trust, and another expressing appreciation for proposed movement away from requiring all Shared Savings Program ACO providers and suppliers to report MIPS promoting interoperability, including those in advanced APM tracks who would be otherwise exempt from MIPS.

Response: We appreciate the statements in support of our proposals. We agree with commenters that the proposed options recognize operational complexities and the various compositions of ACOs and would reduce burden for ACO providers and suppliers and ACOs, align with the movement toward digital quality measurement, and promote better use of EHRs to meet provider and patient needs. We appreciate comments that the proposals remove an administrative obstacle for small practices to join ACOs.

Comment: Several commenters who supported the proposals added recommendations about future implementation. Several of these commenters suggested that we align future CEHRT use requirements with other federal programs, including Innovation Center models such as ACO REACH, with one of these suggesting that ONC be the enforcement authority. The commenter suggested that alignment across programs would benefit organizations transitioning between value-based care models. A couple of commenters requested that CMS retain multiple pathways as proposed rather than narrowing them in the future or requiring ACOs to perform all three of the proposed pathways. These commenters suggested narrowing options or creating a cumulative requirement would preclude some organizations that exchange information interoperably from being able to meet the requirements or would recreate burden similar to our existing requirements.

A commenter suggested that future expansion of FHIR-based requirements should depend on demonstrated real-world readiness and reasonable implementation cost, and another recommended that CMS continue developing standards that integrate necessary data with appropriate safeguards. A couple of commenters addressed the future of the proposed FHIR attestation pathway, with one expressing hope that the FHIR attestation pathway would be ''genuinely available'' in practice and another encouraging CMS to keep the FHIR attestation pathway available on an ongoing basis.

A couple of commenters requested that CMS make the option for ACOs to attest that one ACO provider or supplier per participant TIN completed the activity required by the proposed CEHRT use metrics an initial requirement, rather than the endpoint.

Response: We appreciate comments regarding future implementation of Shared Savings Program CEHRT use policies. With regard to the suggestion that we align future Shared Savings Program CEHRT use requirements with other federal reporting programs or Innovation Center models, with ONC serving as the enforcement authority, we agree with the value in alignment and note that we coordinate with ONC, which oversees the ONC Health IT Certification Program. We note that ONC directly regulates certified health IT and health IT developers as part of the ONC Health IT Certification Program rather than healthcare providers (unless the healthcare provider is also a developer of certified health IT). The Shared Savings Program currently aligns quality reporting requirements with MIPS, and we intend to maintain that alignment to the extent it is practicable. As we explained the CY 2021 PFS proposed rule, using a single methodology to measure quality performance under both the Shared Savings Program and MIPS would allow ACOs to better focus on increasing the value of healthcare, improving care, and engaging patients (85 FR 50231). We acknowledge that our proposed CEHRT use requirements do not fully align with MIPS. This is intentional and is based on our experience with ACO challenges in ensuring that all of their applicable ACO participants reported MIPS Promoting Interoperability performance category requirements. The proposed ACO CEHRT use metric attestation option includes three metrics that align with three of the MIPS Promoting Interoperability performance category measures. We do not believe that aligning with Innovation Center models' CEHRT use requirements is necessarily appropriate for the Shared Savings Program, as these models are testing innovative approaches to reducing costs and improving or maintaining quality for a time-limited period. We proposed CEHRT use options that we believe reflect concrete steps toward broader FHIR-based digital quality measurement and health information exchange. We believe that our proposals will meaningfully advance FHIR based exchange of health information with minimal burden to ACOs.

With regard to comments suggesting we retain multiple pathways for ACOs to meet CEHRT use requirements, we proposed three options to give ACOs more opportunities and flexibility to meet CEHRT requirements. Should we consider changes to this approach in the future, we would make any potential future changes to Shared Savings Program CEHRT use policies through notice and comment rulemaking.

We will continue to consider opportunities to align Shared Savings Program CEHRT use requirements with other CMS programs and implementation timelines and consider how best to preserve flexibility in implementation. With regard to the suggestions that future expansion of CEHRT use requirements be dependent on real world readiness and that we continue to integrate necessary data with safeguards, we appreciate the comments and will continue to monitor CEHRT use uptake and advancements to progress ACO CEHRT use along with broader CMS efforts.

With regard to the comments on the FHIR attestation option, as discussed in more detail later in this section, we are finalizing this option as proposed. The option will be available to ACOs in PY 2027. As we advance efforts and requirements for digital quality reporting via FHIR, we would propose any changes to available CEHRT use options through future notice and comment rulemaking to ensure these options align with other requirements for the Shared Savings Program. We will provide additional instructions for ACOs that choose to utilize that option in advance of the CEHRT use reporting period, which we stated we anticipate would follow the quality reporting window in the first quarter after the performance year (91 FR 44061). We will continue to consider opportunities to align Shared Savings Program CEHRT use requirements with other CMS programs and implementation timelines and consider how best to preserve flexibility in implementation.

With regard to the recommendation that the option for ACOs to attest that at least one ACO provider or supplier billing under each ACO participant TIN completed the action required by the proposed CEHRT use metrics serve as an initial threshold rather than the endpoint, we believe the requirements we are finalizing establish an appropriate standard for demonstrating ACO use of CEHRT at this time, while maintaining flexibility and limiting additional reporting and implementation burden. We are not adopting additional exchange or participation thresholds at this time.

Comment: A commenter encouraged CMS to remove the Promoting Interoperability requirement altogether, stating that it creates administrative burden without added value, particularly for small practices that may choose to leave the program, and is unnecessary given ACOs' ongoing efforts to modernize and integrate EHR technology into their workflows.

Response: We believe the commenter is referring to Shared Savings Program CEHRT use requirement. We disagree with the commenter's assertion that CEHRT use requirements are unnecessary for the Shared Savings Program. As stated in the CY 2027 PFS proposed rule, section 1833(z)(2)(C)(iii)(II)(bb) of the Act (as amended by the Medicare Access and CHIP Reauthorization Act of 2015 (MACRA)) generally requires Advanced Alternative Payment Models (Advanced APMs) to require the use of CEHRT (91 FR 44056). In order for certain participation tracks of the Shared Savings Program (that is, BASIC Level E

and ENHANCED) to be Advanced APMs, they must require CEHRT use, and eliminating the CEHRT use requirement for the remainder of the Shared Savings Program would result in inconsistent CEHRT use requirements across Shared Savings Program participation tracks. We believe maintaining consistent CEHRT use requirements across tracks supports the program's goals of improving the quality and coordination of care for Medicare beneficiaries. Further, we believe that removing CEHRT use requirements from any track of the Shared Savings Program would not be consistent with our belief in the value of advancing interoperability to improve patient care. We believe, as we noted in the CY 2027 PFS proposed rule (91 FR 44056), the secure exchange, access, and use of electronic health information supports better informed decision making and a more efficient healthcare system and that interoperability enables this secure exchange and access. For these reasons, we believe it is appropriate to retain CEHRT use requirements.

We recognize the commenter's concern regarding administrative burden associated with the existing requirements, particularly for small practices. We believe that the Shared Savings Program CEHRT use requirements we are finalizing will reduce burden for ACOs, including those with small practices. We proposed multiple options for ACO-level reporting or attestation to meet Shared Savings Program CEHRT use requirements. Additionally, for ACOs electing to attest to Shared Savings Program ACO CEHRT use metrics, the allowable exceptions for TINs comprised of ACO providers and suppliers with Shared Savings Program special statuses or those facing hardships are intended to provide greater flexibility for ACOs to meet the CEHRT use requirements. We believe these options appropriately balance the importance of CEHRT use in supporting coordinated, high-quality care with the need to reduce unnecessary reporting burden.

Comment: Several commenters expressed concern regarding ACOs' ability to comply with new Shared Savings Program CEHRT use requirements. A commenter recommended that CMS minimize documentation and audit burdens associated with CEHRT attestations. Another commenter recommended that minor documentation errors not threaten an ACO's shared savings eligibility if the ACO can otherwise demonstrate ''substantive compliance.'' Additionally, a commenter requested that we provide opportunities for CMS to cure isolated deficiencies of TINs that may impact an entire ACO's ability to meet the CEHRT use requirements. Some commenters requested that ACOs not be held accountable for ACO operational occurrences that may cause them to be out of compliance with the proposed changes. Similarly, a commenter recommended CMS ensure ACOs are not held accountable for technology infrastructure failure beyond their control.

Response: We appreciate commenters' concerns regarding documentation burden and isolated deficiencies or circumstances outside an ACO's control that may affect its ability to comply with the Shared Savings Program CEHRT use requirements. We agree that compliance expectations should be clear and that ACOs should not be subject to unnecessary administrative burden. However, we are not establishing a separate cure process for individual TINs or adopting a blanket exception for minor documentation errors or operational circumstances. We do not believe such policies are necessary in light of the policies we are finalizing. We proposed multiple CEHRT use options for ACOs to meet Shared Savings Program requirements and included TIN-specific exclusions of which ACOs electing the ACO CEHRT use attestation option could avail themselves as appropriate. We would address any instances of noncompliance through the existing compliance framework at §§ 425.216 and 425.218 as appropriate. With regard to ACOs being found out of compliance due to circumstances beyond their control, we note that ACOs may elect the CEHRT use option among the three choices that best meets their ACO's needs to satisfy Shared Savings Program requirements. Further, for those electing to attest to one of three proposed ACO CEHRT use metrics, they may exclude certain participant TINs that meet specified special status criteria or experience circumstances that would allow them to request a MIPS Promoting Interoperability hardship exception (91 FR 44064). We believe these exclusions, together with the multiple options for meeting the CEHRT use requirements, provide appropriate flexibility for ACOs while maintaining accountability for meeting Shared Savings Program CEHRT use requirements and mitigating the negative impact of circumstances outside of an ACO's control on Shared Savings Program CEHRT use compliance.

Comment: Many commenters requested guidance, additional information, technical assistance, or clarification from CMS. Several commenters requested that CMS confirm the documentation expectations clearly and in advance. Of these, a couple commenters expressed their belief that ACOs need to use this guidance to determine the best path for them. A commenter suggested CMS clarify in the final rule that the attestation is related to ACO CEHRT use and not a separate certification requirement for ACOs or their ACO participants. A commenter requested clear guidance on acceptable evidence of FHIR-enabled data exchange and quality reporting to promote consistent implementation across ACOs. A couple of commenters suggested CMS couple this proposal with ACO-level technical assistance, shared services models, and financial support, and a couple of commenters recommended that CMS clearly define the circumstances that qualify for exclusion. One of these commenters requested details about the documentation ACOs should maintain to support exclusion determinations, while the other stated that exclusion processes should be clear, objective, and administratively simple.

Response: We appreciate the commenters' recommendations regarding clear implementation expectations, documentation, technical assistance and financial support. We believe that the requirements described in this final rule provide ACOs with sufficient information to understand the available Shared Savings Program CEHRT use options, including applicable exclusions for ACOs electing the CEHRT use metric attestation option under § 425.507(c)(3), as discussed in the CY 2027 PFS proposed rule (91 FR 44064 and 44065). We fully described exclusions available to ACOs electing to attest to one of the three Shared Savings Program ACO CEHRT use metrics in the CY 2027 PFS proposed rule (91 FR 44064 and 44065). In response to comments, we have also provided a summary table of certification criterion requirements for these Shared Savings Program CEHRT use metrics (Table B–G10). We intend to provide additional instructions for completing Shared Savings Program CEHRT use attestations in the ACO–MS system, for ACOs electing to attest that they used a Health IT Module certified to an unexpired criterion or criteria within 45 CFR 170.315 to obtain standardized data from a FHIR-based API to support their complete reporting of at least one measure in the APP Plus and ACOs electing to attest to one of the three proposed ACO CEHRT use metrics. We intend to provide summary or

illustrative materials to assist ACOs in complying with Shared Savings Program CEHRT use requirements and will continue to provide ACOs with technical assistance through existing channels.

With respect to documentation, we disagree that additional guidance is required related to documentation requirements. Existing policy at § 425.314(b)(1) includes the requirement that ACOs retain evidence sufficient to enable the audit, evaluation, investigation, and inspection of the ACO's compliance with program requirements. As discussed in the CY 2027 PFS proposed rule, ACOs electing to attest that they used a Health IT Module certified to an unexpired criterion or criteria within 45 CFR 170.315 to obtain standardized data from a FHIR-based API to support their complete reporting of at least one measure in the APP Plus measure set would need to provide, on request, the CEHRT ID for the certified technology used, and ACOs electing to attest to one of the three proposed ACO CEHRT use metrics would need to provide, on request, the CEHRT ID for each of its participant TINs from which it attested that at least one ACO provider or supplier utilized CEHRT to meet the requirements of the metric. If ACOs electing to attest to one of the three Shared Savings Program ACO CEHRT use metrics exclude a TIN based on the TIN meeting Shared Savings Program definition of ''special status'' or hardship, the ACO would be required maintain and provide on request adequate documentation to demonstrate that any TIN exclusions applied were appropriate (91 FR 44065 and 66). We believe these existing documentation requirements, together with the requirements and clarifications provided in this final rule, sufficiently establish CMS's expectations for demonstrating compliance.

We do not intend to provide financial support or establish shared services models for ACOs to implement the new Shared Savings Program CEHRT use options because the options are significantly less burdensome than our current CEHRT use policies. We confirm that the proposed CEHRT use option at § 425.507(c)(2), for ACOs to attest using FHIR to support reporting of a quality measure described in detail in section III.G.4.b.(2) of this final rule, is one option an ACO could select in order to meet Shared Savings Program CEHRT use requirements and is not an additional certification requirement for ACOs or their ACO participants. We agree that the processes should be clear and as simple as possible.

Comment: A commenter stated that ACOs should be free to select the pathway best suited to their circumstances and to change pathways between performance years without penalty.

Response: We agree that ACOs should have the flexibility to select the pathway that best suits their circumstances and to change pathways between performance years. We did not propose limiting an ACO's ability to change its selected pathway between performance years to meet the CEHRT use requirements, nor are we finalizing any such limitation at this time.

Comment: A couple of commenters requested clarification related to documentation of CEHRT identifiers. One of these commenters requested clarification in the final rule that the proposed Shared Savings Program CEHRT use options are an alternative, rather than an addition, to what they stated was the current practice of ACOs documenting that their practices are using CEHRT and another commenter requested that CMS confirm that, in addition to the three proposed CEHRT use options, direct verification using the CHPL would be considered to satisfy technology use verification requirements.

Response: We appreciate comments requesting clarification. We wish to clarify that an ACO documenting that its practices use CEHRT would not meet or have met current Shared Saving Program CEHRT use requirements in § 425.507(a) and (b) or the proposed requirements in (c). The proposed Shared Savings Program CEHRT use requirements described at section III.G.4.b. and that we are finalizing at section III.G.4.c. in this rule will replace existing Shared Savings Program CEHRT use requirements, beginning with PY 2027.

Regarding the comment asking for confirmation that verification of CEHRT using the CHPL would satisfy Shared Savings Program CEHRT use requirements, it would not. We are unsure whether the commenter may have been referring to existing MIPS requirements for documenting a CMS EHR Certification ID (also referred to as a CEHRT ID) obtained from the CHPL as part of MIPS Promoting Interoperability performance category reporting. As we stated in the CY 2027 PFS proposed rule, our proposed options for Shared Savings Program ACOs to meet the Shared Savings Program CEHRT use requirement will not change the existing scoring methodology for the MIPS Promoting Interoperability performance category (91 FR 44066). The Shared Savings Program CEHRT use requirements are separate from and in addition to any MIPS requirements for documentation of CEHRT IDs.

We did not propose that verification or documentation of a CEHRT ID using the CHPL alone would satisfy Shared Savings Program CEHRT use requirements, as it would not. ACOs may continue to use the CHPL to verify the certification status of health IT used by their ACO participant TINs. ACOs electing the option to attest to having used a Health IT Module certified to an unexpired criterion or criteria within 45 CFR 170.315 to obtain standardized data from a FHIR-based API to support the complete reporting of at least one measure in the APP Plus quality measure set (§ 425.507(c)(2)), or to attest to one of the three ACO CEHRT use metrics (§ 425.507(c)(3)) (that at least one ACO provider or supplier in each of the ACO's participating TINs performed the action described in the metric using EHR technology certified to the ONC Certification Criteria for Health IT (45 CFR 170.315) necessary to meet paragraph (3) of the CEHRT definition at 42 CFR 414.1305) would be required to maintain documentation that the EHR technology meets the requirements of the CEHRT definition and other requirements in § 425.507(c)(1)–(3) as applicable and provide such documentation to CMS upon request. Likewise, ACOs that use CEHRT (as defined in paragraph (3) of the CEHRT definition at § 414.1305) that also supports the calculation and reporting of clinical quality measures by being certified to the ONC health IT certification criteria at 45 CFR 170.315(c)(2) and (c)(3), to completely report at least one of the measures in the APP Plus quality measure set using the eCQMs or Medicare eCQMs collection types and meets the data completeness requirement at 42 CFR 414.1340 of this chapter for the applicable performance year (§ 425.507(c)(1)) would also be required to maintain documentation that the EHR technology meets the requirements of the CEHRT definition and other requirements in § 425.507(c)(1)–(3) as applicable and provide such documentation to CMS upon request.

Comment: A commenter stated that they supported our proposal to eliminate the Promoting Interoperability measure category for ACOs.

Response: We wish to clarify that we did not propose to eliminate the Promoting Interoperability Performance category, which is a part of MIPS. Rather, we proposed to sunset the *Shared Savings Program* requirement (§ 425.507(a)) that ACO providers and suppliers report all MIPS Promoting

Interoperability measures and requirements and publicly report on the number of MIPS eligible clinicians, QPs, and Partial QPs in the ACO who earned a MIPS Promoting Interoperability performance category score (§ 425.308(b)(9)). As we stated in the CY 2027 PFS proposed rule, regardless of which of the three proposed activities (or which option within their selected activity) ACOs choose to meet the Shared Savings Program CEHRT use requirement, the MIPS Promoting Interoperability performance category reporting requirements for MIPS eligible clinicians participating in an ACO would remain unaffected (91 FR 44066).

Comment: A couple of commenters requested clarification regarding the proposed option for ACOs to meet Shared Savings Program CEHRT use requirements through attesting to having used a FHIR-based API available in CEHRT to support measure data collection for complete reporting of a measure in the APP plus measure set. A commenter asked that CMS clarify that the FHIR-based attestation option is intended to become viable only once FHIR-based quality reporting capabilities are more broadly available and consider whether it is necessary to include this option for the CY 2027 performance period specifically, given that it is not currently operational for any ACO. Another commenter recommended we enumerate in the final rule which certification criteria other than 45 CFR 170.315(g)(10) satisfy the attestation pathway at § 425.507(c)(2) and state what an ACO must be able to demonstrate for a Health IT Module to qualify as ''supporting standardized API access.''

Response: We wish to clarify commenters' potential misunderstanding of our proposal at § 425.507(c)(2). Under that provision, one option an ACO could elect in order to meet the Shared Savings Program's CEHRT use requirements would be for the ACO to completely report at least one measure in the APP Plus quality measure set and meet the data completeness requirement at § 414.1340 of this chapter for the applicable performance year using EHR technology that meets paragraph (3) of the CEHRT definition at § 414.1305 and attest that it used data collected from a FHIR-based API to support quality measurement using a Health IT module certified to an unexpired criterion or criteria in 45 CFR 170.315 supporting standardized API access. Meeting these requirements is separate from any future reporting of FHIR-based digital quality measures and so could be implemented by ACOs electing that option for PY 2027. ACOs would attest to meeting this requirement through ACO–MS, after the conclusion of annual quality reporting (91 FR 44060 and 44061). We appreciate the request for clarification on which criteria other than 45 CFR 170.315(g)(10) would satisfy the requirement that the health IT module be certified to an unexpired criterion supporting standardized API access. At this time, 45 CFR 170.315(g)(10) is the only unexpired criterion that would meet this requirement. The language was intended to preserve flexibility for ACOs to utilize any future ONC Health IT certification criteria that may support standardized API access or a potential future situation where 45 CFR 170.315(g)(10) becomes expired and is replaced by a different criterion.

Comment: A commenter requested clarification as to whether ACOs with a significant share of small-practice participants may satisfy the requirement at the ACO level rather than requiring uniform compliance across every participant TIN.

Response: We appreciate the request for clarification. We believe the commenter may have been referring to the option for ACOs to attest that at least one ACO provider or supplier in each of its participant TINs completed a certain action. For ACOs electing this attestation option for the purpose of meeting Shared Savings Program CEHRT use requirements, in order to attest ''Yes,'' those with a large proportion of small practices would still be required to ensure that at least one ACO provider or supplier in each of the ACO's participating TINs performed the action described in the Shared Savings Program ACO CEHRT use metric using EHR technology certified to the ONC Certification Criteria for Health IT (45 CFR 170.315) necessary to meet paragraph (3) of the CEHRT definition at § 414.1305 to complete the action described in each metric.

Comment: Many commenters recommended that CMS provide a transition period to ACOs or hold them harmless from compliance actions based on their not meeting the proposed CEHRT use requirements. Of these, several requested an extension of the enforcement discretion for at least one additional performance year, with most expressing concern that the timing for our proposal to replace existing Shared Savings Program CEHRT use requirements in PY 2027 does not allow ACOs sufficient development and/or implementation time. A couple of commenters requested CMS to treat every ACO as compliant in the first year, while another commenter requested a minimum 1–2-year transition for compliance.

Response: We acknowledge the recommendations regarding a transition period. As discussed in section III.G.4.b. of this final rule, we are providing multiple options for ACOs to meet the CEHRT use requirements, allowing ACOs to select the option that best accommodates their organizational structure and technical capabilities. We believe these options significantly reduce burden on ACOs compared to our current CEHRT use requirements, while advancing ACOs toward digital quality measurement and health information exchange. We do not believe that an additional transition period is warranted because the proposed Shared Savings Program CEHRT use options at 42 CFR 425.507(c) overlap with activities the ACO will already be doing to participate in the Shared Savings Program in PY 2027, including quality reporting. We are also finalizing an option for ACOs to attest to one of three Shared Savings Program ACO CEHRT use metrics that are a subset of the MIPS Promoting Interoperability measures that ACOs are required to report for every ACO participant, ACO provider/supplier, and ACO professional under the current Shared Savings Program regulations at § 425.507(a). This subset of currently required MIPS Promoting Interoperability measures have also been simplified so that ACOs will only be required to attest that one ACO provider or supplier from each of the ACO's participant TINs has completed the action required by the metric. As the options under 425.507(c) allow ACOs to choose from multiple activities, including attesting to one of three simplified and lower-burden version of existing MIPS Promoting Interoperability measures, on which Shared Savings Program ACOs are currently required to report at 425.507(a), any ACO meeting the existing requirements should be able to attest that it met at least one of the proposed Shared Savings Program CEHRT use metrics.

We disagree with comments that we should utilize our enforcement discretion for an additional year or guarantee compliance in the first year, in light of finalizing new options through which ACOs can meet CEHRT use requirements for PY 2027. We note that we finalized existing CEHRT use requirements in the CY 2024 PFS final rule (88 FR 79124 through 79132), issued on November 2, 2023. Under the current policies, unless otherwise excluded, ACO participants, ACO provider/suppliers, and ACO

professionals who are MIPS eligible clinicians, Qualifying APM Participants (QP), or Partial QPs regardless of track, must report the MIPS Promoting Interoperability performance category measures and requirements to MIPS. We have exercised enforcement discretion for this requirement, for PY 2025 and PY 2026, due to challenges faced by ACOs including understanding the CEHRT requirements, determining which of their participants are excluded from the requirement, and aggregating data across providers. In contrast to the proposed policy at § 425.507(c), ACO providers/suppliers were required, under existing regulations at § 425.507(a), to report the full set of MIPS Promoting Interoperability measures and activities in PY 2025 and PY 2026. We believe the CEHRT use policies proposed to begin in PY 2027 allow for significantly greater flexibility, including for ACOs to choose to report one of three metrics that are parallel to three measures from the larger MIPS Promoting Interoperability performance category activities currently required under existing Shared Savings Program CEHRT use requirements at § 425.507(a). ACOs electing to attest to one of these metrics would complete ACO-level attestations as finalized in section III.G.4.c. of this final rule. In addition, we proposed to allow ACOs electing to attest to one of the proposed metrics to exclude from their determination of whether one ACO provider or supplier from each of their participating TINs completed the action under a list of circumstances. Due to the simplification of the proposed CEHRT requirements, the multiple options for ACOs to meet CEHRT requirement for the Shared Savings Program, and the overlap between the proposed CEHRT use requirements and quality reporting, we believe that the need for enforcement discretion in PY 2027 is diminished. Accordingly, after consideration of the comments, we are not extending the period of enforcement discretion, nor delaying the effective date for retiring the existing CEHRT use requirements or for implementing the ones we are finalizing at section III.G.4.c. of this final rule beginning with PY 2027.

Comment: Several commenters requested that CMS recognize standards and pathways outside of those we proposed. A commenter provided additional suggestions for CMS to include as options for ACOs to meet Shared Savings Program CEHRT use requirements, including recognition of standards-based health information exchange of health information with post-acute care, long-term care, or community partners, including for those that do not have CEHRT or that operate outside of a qualified health information network, making allowances for any technical failures these partners might experience. Another commenter recommended that we clarify that a contracted healthcare provider's technology status would not preclude an ACO from selecting any proposed CEHRT-use pathway, and another requested we add an option for meeting CEHRT requirements for the Shared Savings Program by reporting objective results for FHIR API performance for ACOs electing to report the Medicare eCQM pathway. A commenter also requested that CMS allow ACOs to meet Shared Savings Program CEHRT use requirements by documenting efforts to exchange with partners that lack needed technology or connectivity.

Response: We acknowledge the recommendations regarding additional options for meeting the Shared Savings Program CEHRT use requirements. We recognize the importance of supporting interoperability across the care continuum, including with post-acute care, long-term care, community-based and contracted healthcare providers that may face challenges adopting or using CEHRT. However, we believe the multiple options for meeting the CEHRT use requirements as finalized in section III.G.4.c. of this final rule provide ACOs with flexibility to accommodate differences in their organizational structures, existing health IT infrastructure and technical capabilities. Accordingly, we are not adopting additional options for meeting Shared Savings Program CEHRT use requirements at this time.

In response to commenters' concerns regarding exchange of health information with partners that may lack CEHRT, we believe that our Shared Savings Program CEHRT use options provide choices that do not require all of the healthcare providers with whom ACOs or ACO providers and suppliers exchange health information to have CEHRT. For example, for ACOs electing the option at § 425.507(c)(1), to use CEHRT meeting the requirements described in that section to completely report at least one of the measures in the APP Plus quality measure set using the eCQMs or Medicare eCQMs collection types and meet the data completeness requirement at § 414.1340 of this chapter for the applicable PY, it is the submitting EHR system that must be certified to ONC's regulations by the time eCQM data is generated for submission.[308] For ACOs electing the option at § 425.507(c)(2), to use EHR technology that meets paragraph (3) of the CEHRT definition at § 414.1305 and attest that they used data collected from FHIR-based API to support quality measurement using a Health IT module that has been certified to an unexpired criterion or criteria in 45 CFR 170.315 to support complete reporting of at least one of the five ACO-reported measures in the APP Plus quality measure set, there is also not a requirement that every system or organization with which the ACO exchanges health information must use CEHRT. Similarly, for ACOs electing the option in § 425.507(c)(3) to select and attest to the bi-directional HIE Shared Savings Program CEHRT use metric, attesting to that metric does not require that every system or organization with which the ACO provider or supplier exchanges information use certified health IT. Long-term and post-acute care settings can connect to a wide range of health information exchange entities that use a variety of methods to exchange information with ACO providers and suppliers in ACO participant TINs. As we explained in the CY 2027 PFS proposed rule, an ACO electing to attest to one of the three proposed CEHRT use metrics could consider an ACO provider or supplier in its participant TIN to have met the bi-directional HIE ACO CEHRT use metric's requirement if the ACO provider or supplier has, for at least one patient seen by the ACO provider or supplier, used EHR technology certified to the ONC Certification Criteria for Health IT (45 CFR 170.315) necessary to meet paragraph (3) of the CEHRT definition at § 414.1305 to support bi-directional exchange with an HIE that has the required functionality (91 FR 44062).

With regard to the suggestion that ACO documentation of efforts to exchange information with partners with limited technological capacity should be considered to meet Shared Savings Program CEHRT use requirements, we disagree. We note that CMS does not require that every system or organization with which the ACO provider or supplier exchanges information must use certified health IT. We believe the options we are finalizing in section III.G.4.c. of this final rule appropriately balance these considerations by providing ACOs with options to satisfy the CEHRT use requirement, which allow ACOs to select the option that best reflects their health IT infrastructure and capabilities.

[308] Please see *https://qpp.cms.gov/data-management/ehr.*

We also note that, while we did not propose to allow ACOs to meet Shared Savings Program CEHRT use requirements by documenting or reporting FHIR API performance, we did propose in 42 CFR 425.507(c)(2) that ACOs could elect to meet Shared Savings Program CEHRT use requirements by completely reporting at least one of the five ACO-reported measures in the APP Plus quality measure set and attesting to using CEHRT to support quality reporting using data collected from a FHIR-based API using a certified Health IT Module. While we do not believe that documentation of the FHIR-based API's performance should suffice as a demonstration of ACO CEHRT use, this option would allow an ACO that used a FHIR-based API to support complete reporting of an APP Plus quality measure using a Health IT Module that has been certified to an unexpired criterion or criteria in 45 CFR 170.315 supporting standardized API access to attest that it did so, in order to meet Shared Savings Program CEHRT use requirements.

Comment: A couple of commenters requested that CMS retain a public health data exchange option—for example, Immunization Registry Reporting or Electronic Case Reporting attestation, as one of the qualifying CEHRT-use activities under the revised Shared Savings Program requirement. These commenters noted this would align with the existing MIPS framework and support essential public health data exchange infrastructure.

Response: We appreciate the recommendation to include public health data exchange, such as Immunization Registry Reporting or Electronic Case Reporting, as one of the ACO CEHRT use metrics that ACOs can use to meet the requirement under § 425.507(c)(3). While we agree that electronic public health data exchange supports broader interoperability goals and recognize the role of CEHRT in facilitating the electronic exchange of public health data, we believe that the multiple options we are finalizing provide ACOs sufficient flexibility to demonstrate CEHRT use while advancing interoperability. For example, consider an ACO provider or supplier that is a signatory to a Framework Agreement under the Trusted Exchange Framework and Common Agreement (TEFCA),[309] and exchanges immunization data with public health agencies for patients using TEFCA. That ACO could count that activity as part of meeting the requirement for that ACO provider or supplier's ACO participant TIN when determining whether one ACO provider or supplier from each of its ACO participant TINs has met the requirement for the proposed ACO Health Information Exchange (HIE) Bi-Directional Exchange metric. We discussed how a TEFCA Framework Agreement can help ACOs meet the requirement for the HIE metric in the CY 2027 PFS proposed rule (91 FR 44063). Additionally, we note that public health agencies are potential participants in HIEs.[310] Accordingly, we are not adopting the recommendation to include public health data exchange as an additional qualifying CEHRT use activity at this time. However, we will consider including public health data exchanged as part of bidirectional exchange via a health information network as an example, in future instructions, of an activity that could contribute to satisfying the requirements of the bi-directional HIE metric, for ACOs that elect to attest to it, to meet the Shared Savings Program CEHRT use requirement in 42 CFR 425.507(c)(3).

Comment: A commenter recommended we add the MIPS Electronic Prior Authorization measure to the list of available metrics for Shared Savings Program CEHRT Use attestation for PY 2028 because omitting electronic prior authorization from the ACO CEHRT use metric list risks creating misalignment between payer obligations that take effect in 2027 and the incentives for ACOs to adopt ePA.

Response: We appreciate the recommendation to add an ACO CEHRT use metric related to the MIPS Promoting Interoperability performance category Electronic Prior Authorization measure to the list of metrics available for CEHRT use attestation for PY 2028. We disagree that not proposing or finalizing an electronic prior authorization CEHRT use metric for Shared Savings Program ACOs for PY 2028 creates misalignment with MIPS. In section IV.B.1.d. of this final rule, MIPS is finalizing, as proposed, modifications to the Electronic Prior Authorization measure that make the measure optional for the CY 2027 performance period and required starting with the CY 2028 performance period. Additionally, in section IV.A.4.d.(4) of this final rule, MIPS is finalizing, as proposed, the adoption of the new Electronic Prior Authorization for Prescription Drug measure, which will be a required measure starting with the CY2028 performance period. Further, the three Shared Savings Program ACO CEHRT use metrics, of which ACOs could choose to attest to one in order to meet Shared Savings Program CEHRT use requirements for PY 2027, align conceptually with the MIPS Promoting Interoperability performance category measures but have been revised to apply to ACOs. We proposed that we would make any future changes to the ACO CEHRT use metrics through notice and comment rulemaking. As we did not propose to include a metric around electronic prior authorization beginning with PY 2027, we are not accepting this suggestion but will consider it for potential future rulemaking.

Comment: A couple of commenters requested that CMS monitor the uptake and results of these proposed requirements. Of these, a commenter requested monitoring of the FHIR attestation pathway specifically, and the other requested monitoring of whether the one provider or supplier participant TIN requirement in the CEHRT use metrics leads to meaningful exchange at scale.

Response: We appreciate the suggestions and agree that there would be value in monitoring use of the FHIR attestation pathway as proposed in 42 CFR 425.507(c)(2). We intend to monitor ACOs' use of the available Shared Savings Program CEHRT use options including the FHIR attestation pathway. We appreciate the value in analyzing what activities lead to meaningful exchange of health information at scale, though we note that this option within the Shared Savings Program is only one factor in promoting increase in meaningful exchange of health information at scale. We do, however, believe that allowing ACOs to meet Shared Savings Program CEHRT use requirements through our recognition of ACOs' concrete steps toward FHIR-based digital quality measurement and health information exchange, such as through the proposed attestation to using FHIR-based exchange to support quality measure data collection, provides a low-burden incentive for ACOs to invest in infrastructure and redesigned care processes to improve care for the beneficiaries they serve.

Comment: We received several comments regarding movement toward interoperability in general, including ensuring our policies are meaningful and support ACOs' needs. Several

[309] TEFCA is a national framework for health information sharing created to remove barriers to sharing health records electronically among healthcare providers, patients, public health agencies, and payers. For more information on TEFCA and the Framework Agreement, please see *https://healthit.gov/policy/tefca/*.

[310] Please see *https://publichealth.jmir.org/2024/1/e64969.*

commenters recommended that CMS make sure our proposed Shared Savings Program CEHRT use requirements support interoperability specific to the operations and needs of ACOs and their partners, including nursing facilities.

A few commenters addressed the proposed policies' specific requirements that ACOs use CEHRT, expressing concern about potential CEHRT cost and reliance on a particular vendor or other proprietary input.

A few commenters requested that CMS ensure that the CEHRT use requirements meaningfully lead to increased interoperability, with a commenter expressing their belief that the increased flexibility alone would not create interoperability and another recommending we ensure that the HIE CEHRT use metric assesses meaningful capability to exchange actionable data.

Several commenters addressed advancement of interoperability and digital reporting requirements across CMS programs and models, with one supporting CMS's efforts to advance interoperability, FHIR-based exchange, and digital quality measurement and reduce reporting burden but cautioning against creating a lower interoperability standard for value-based care programs that could conflict with Medicare's long-term interoperability goals.

Response: We appreciate recommendations regarding meaningfulness and feasibility of the options for meeting Shared Savings Program CEHRT use requirements. We agree that the policies should support ACOs' ability to coordinate care and improve care quality for their assigned beneficiaries, including through interoperability, and address ACOs' needs, and we believe that the additional flexibilities and exclusions we proposed address a redesign of care processes for high quality and efficient service delivery across the wide variety of ACO compositions and capabilities. With regard to supporting interoperability with partners including nursing facilities, we agree and believe that the flexibilities and the clarification, as discussed previously in this section, that the proposals do not require that every system or organization with which the ACO provider or supplier exchanges information must use certified health IT, in order to meet Shared Savings Program CEHRT use requirements.

The proposed options do not require an ACO to use a specific EHR vendor or other proprietary input, and we believe that providing multiple options affords greater flexibility for ACOs and ACO participants with differing levels of health IT capabilities and resources. With regard to the comments suggesting we ensure the CEHRT use requirements are meaningful and that a lower bar is not set for interoperability in value-based care, we agree. We believe that the proposed options allow ACOs to demonstrate activities they have undertaken to use CEHRT to improve quality of care and service efficiency. We will continue to work to ensure advancement of interoperability within the Shared Savings Program, as interoperability advances in the larger Medicare program.

Comment: Many commenters requested that CMS add or modify an exception for certain types of healthcare providers. Of these, many requested a small practice exception, a few suggested exceptions or additional support for rural practices or expansion of the types of facility-based providers eligible for exclusion, and a commenter suggested an exclusion for specialists. Several commenters noted that the CY 2027 PFS proposed rule will be finalized after ACOs will have had to make participation decisions for PY 2027, which some stated would limit ACOs' ability to comply, based on their inclusion of small practices. A commenter noted that small practices build capacity over time and should receive additional support from CMS, and several expressed their belief that a small practice exception would better align with our intent to increase small and independent practice participation in ACOs. Several commenters expressed their belief that a small practice exclusion would be more in line with the MIPS framework, with one stating our proposed policy would create a new CEHRT reporting requirement for practices that are currently excluded from MIPS Promoting Interoperability performance category reporting.

Another commenter suggested that we add a time-limited exception for CEHRT use requirements for rural, small, or long-term/post-acute care when organizations demonstrate lack of access to technology or connectivity, and some commenters requested a rural health exemption, noting that adopting CEHRT for the first time may be prohibitive for them.

A few commenters expressed concern with ACOs' ability to influence facility-based practices' EHRs, and some of these requested we exclude additional types of facility-based practices from CEHRT use requirements, including for clinicians providing services in nursing facilities and assisted living facilities, who face similar challenges to those currently applicable for the exclusion.

Response: We acknowledge the recommendations to add additional exclusions for Shared Savings Program CEHRT use requirements. We wish to clarify that the exceptions we proposed are applicable to the option for ACOs to elect to attest to one of the Shared Savings Program ACO CEHRT use metrics as proposed for 42 CFR 425.507(c)(3). We believe an additional small practice exclusion is unnecessary because ACO participation enables participating practices to leverage shared infrastructure, technology, data and care management capabilities that may be difficult for individual practices to develop or maintain on their own. Accordingly, small practices participating in an ACO should generally be positioned to meet the revised, less burdensome options for the Shared Savings Program CEHRT use requirement through the ACO's broader infrastructure and support.

The proposed policy also provides multiple options for ACOs to demonstrate CEHRT use, including the option at § 425.507(c)(2) to completely report at least one measure in the APP Plus quality measure set and meet the data completeness requirement at § 414.1340 for the applicable performance year using EHR technology that meets paragraph (3) of the CEHRT definition at § 414.1305 and attests that it used data collected from a FHIR-based API to support quality measurement using a Health IT Module certified to an unexpired criterion or criteria in 45 CFR 170.315 supporting standardized API access, if an ACO would prefer that option over attesting that each of its participating practices performed a certain CEHRT use activity. We recognize that small practices may face resource and implementation challenges and that some may currently qualify for flexibility under MIPS. We do not believe, however, that practice size alone warrants exclusion from the Shared Savings Program CEHRT use requirements. Unlike the MIPS' Promoting Interoperability performance category, the CEHRT use policies proposed for the Shared Savings Program would not require practice-level reporting of Promoting Interoperability measures and activities (or the equivalent Shared Savings Program ACO CEHRT use metrics). ACOs could alternatively elect to: (1) Use CEHRT (as defined in paragraph (3) of the CEHRT definition at § 414.1305) that also supports the calculation and reporting of clinical quality measures by being certified to the ONC health IT certification criteria at 45 CFR 170.315(c)(2) and (c)(3) to completely report at least one of the measures in the APP Plus quality measure set using the

eCQMs or Medicare eCQMs collection types and meet the data completeness requirement at § 414.1340 of this chapter for the applicable PY; or (2) Completely report at least one measure in the APP Plus quality measure set and meet the data completeness requirement at § 414.1340 of this chapter for the applicable performance year using EHR technology that meets paragraph (3) of the CEHRT definition at § 414.1305 and attests that it used data collected from FHIR-based API to support quality measurement using a Health IT Module certified to an unexpired criterion or criteria in 45 CFR 170.315 supporting standardized API access, to satisfy the proposed Shared Savings Program CEHRT use requirements in § 425.507(c). We have also proposed to allow ACOs electing to attest to one of the three ACO-level CEHRT use metrics to exclude, from their assessment as to whether one ACO provider or supplier from each of their participating TINs met the metric, TINs comprised of ACO providers and suppliers meeting certain special statuses as well as hardships. ACO participant TINs that are small practices comprised of ACO providers and suppliers who meet the proposed hardship circumstances could be excluded by ACOs electing to attest to one of these metrics. We note that we have proposed multiple options for ACOs to satisfy Shared Savings Program CEHRT use requirements and have proposed exceptions to facilitate the ability of ACOs to meet them. Overall, the proposed requirements in § 425.507(c) result in a decreased burden for ACOs to meet the Shared Savings Program CEHRT use requirements compared to existing requirements under § 425.507(a). After consideration of these comments, we are not finalizing an exception for small practices.

We acknowledge the concerns regarding the timing of these requirements and their potential effect on ACO participation decisions and the inclusion of small and independent practices. However, we believe the options for demonstrating CEHRT use finalized in this rule provide ACOs flexibility in meeting the requirement while maintaining an appropriate minimum expectation for CEHRT use among ACO participants. We also believe that they represent a significant decrease in burden for ACOs as compared to the existing CEHRT use requirements.

With regard to the suggestion that specialists be excluded from the requirements, we disagree because we believe that specialists are an integral part of ACOs and that excluding them would decrease ACOs' ability to exchange health information to coordinate and improve care for the beneficiaries they serve.

Regarding the recommendation to expand CEHRT use exclusions to additional facility-based provider types, we did not propose to expand exclusions for ACOs electing to attest to one of three ACO CEHRT use metrics beyond those described in the CY 2027 PFS proposed rule (91 FR 44062), which align with those available under MIPS. We will consider this suggestion for future rulemaking.

Regarding the suggestion that we add an additional exception for rural ACOs or practices, we believe ACOs that include participant TINs serving rural populations can meet the proposed CEHRT use requirements given the multiple options available and the exclusions for ACO participant TINs comprised solely of ACO providers and suppliers in rural and/or Health Professional Shortage Area (HPSA) circumstances available for ACOs electing to attest to one of the CEHRT use metrics. Specifically, in the CY 2027 PFS proposed rule, we discussed that ACOs would be permitted to apply exclusions for similar circumstances as the exclusions and exceptions under MIPS (91 FR 44064). We noted that an ACO would be permitted to exclude an ACO participant TIN that the ACO determines is comprised solely of ACO providers and/or suppliers who meet the Shared Savings Program definition of ''special status'' (91 FR 44064). We explained that the Shared Savings Program definitions of special statuses would be similar to the MIPS definitions at § 414.1305 except that they would not be limited to MIPS ECs, for the purpose of Shared Savings Program CEHRT use metric exceptions. We proposed to include as special statuses being located in a HPSA, defined as areas designated under section 332(a)(1)(A) of the Public Health Service Act or being located in a rural area, defined as ZIP codes designated as rural by the Federal Office of Rural Health Policy (FORHP) using the most recent FORHP Eligible ZIP Code file available as described in the definition of ''Rural area'' at § 414.1305.

Additionally, we want to clarify that, while most of the special statuses defined at § 414.1305 are aligned with the MIPS Promoting Interoperability performance category framework, this is not true for the statuses of ''Located in a health professional shortage area (HPSA)'' or ''Rural area.'' While these two statuses convey differential scoring under MIPS for the Improvement Activities domain, they do not have an impact on scoring for or qualify for reweighting of the MIPS Promoting Interoperability performance category.[311] We proposed to allow ACOs electing to attest to one of the proposed metrics to exclude from their determination of whether one ACO provider or supplier from each of their participating TINs completed the action if the TIN is comprised entirely of ACO providers and suppliers meeting certain special statuses, including being located in a HPSA or rural area (as we further defined those in the CY 2027 PFS proposed rule). Because we have not received comments opposing the HPSA and rural areas as special statuses as they relate to the Shared Savings Program CEHRT use metric attestation exclusions, and these exclusions are consistent with commenters' request that we offer special consideration for small or rural practices, we are finalizing these exclusions as proposed.

Overall, we believe the new proposed requirements and exclusions represent a decrease in burden for ACOs to meet the Shared Savings Program CEHRT use requirements, and we will not be finalizing additional exclusions for § 425.507(c) at this time.

Comment: Several commenters mentioned exceptions to Shared Savings Program CEHRT use requirements related to hardships or other situations. A commenter recommended that we maintain reasonable exclusions for variables outside the ACO's control, including technology limitations, vendor issues, cybersecurity incidents, and other circumstances. A commenter suggested hardship exclusions be aligned with MIPS, and another recommended that hardship and special-status exclusions should be simple and, wherever feasible, automatic.

Response: We acknowledge the request for additional exclusions. We agree that providing certain exclusions is important, but we believe that additional exclusions are not necessary because the proposed policy provides multiple pathways for ACOs to demonstrate CEHRT use, enabling flexibility for a variety of ACOs to meet CEHRT requirements for the Shared Savings Program.

Regarding the suggestion that exceptions should be simple and automatic, we proposed that ACOs electing the option to attest to a Shared Savings Program CEHRT use metric would not be required to request

[311] Please refer to the PY 2026 Traditional MIPS Scoring Guide: *https://qpp.cms.gov/content-management/resources/document/6051c5a1-fb0b-463c-a863-00fb769629e8/download/file.*

hardship exceptions for Shared Savings Program CEHRT use requirements but would be required to maintain documentation substantiating them to provide to CMS in the event of an audit. Similarly, ACOs would determine whether a participant TIN is comprised solely of ACO providers and suppliers meeting special status.

Regarding the suggestion that hardship exclusions align with MIPS, we note that we proposed to allow ACOs to exclude from CEHRT use metric attestation any TIN comprised solely of ACO providers and suppliers meeting hardship circumstances that parallel those available by request from MIPS (91 FR 44064 and 44065). We did not propose that ACOs or their ACO providers and suppliers would be required to request a hardship approval but rather, that they would need to maintain documentation to provide to CMS in the event of an audit.

Comment: A commenter suggested we allow an ACO-level exclusion if a threshold proportion of its participating providers or suppliers meet an existing exclusion or reweighting criteria for the MIPS Promoting Interoperability performance category.

Response: We appreciate the recommendation regarding additional exclusions, but we do not agree that an ACO should be excluded from Shared Savings Program CEHRT use requirements if some proportion of its ACO providers or suppliers meet an existing exclusion or reweighting criteria. Unlike MIPS, which requires individual or group practice-level Promoting Interoperability performance category reporting, the proposed Shared Savings Program CEHRT use options would leverage eCQM or Medicare eCQM quality measure reporting or permit ACO-level attestation. Under our proposed policy, ACOs electing to attest to CEHRT use metrics would only need to attest that a single ACO provider or supplier in each ACO participant TIN performed the activity required by the metric.

Comment: A couple of commenters expressed concerns about what they perceive to be unnecessary administrative burden and duplicative reporting.

Response: We appreciate the input. We disagree that the proposed Shared Savings Program CEHRT use options would create duplicative reporting requirements. We proposed that Shared Savings Program CEHRT use requirements would be applicable at the ACO level. ACOs are not required to report Promoting Interoperability at the ACO level to MIPS, and the proposed Shared Savings Program CEHRT requirements do not require practice-level reporting. Therefore, we do not believe the Shared Savings Program CEHRT use requirements impose a duplicate reporting requirement as compared to MIPS. We also wish to clarify that, for ACOs electing the option at § 425.507(c)(1), to meet Shared Savings Program CEHRT use requirements by using CEHRT that meets the requirements described in that section to completely report at least one of the measures in the APP Plus quality measure set using the eCQMs or Medicare eCQMs collection types and meet the data completeness requirement at § 414.1340 of this chapter for the applicable PY, would simultaneously contribute to the ACO's compliance with the CEHRT use requirement and the ACO's compliance with the requirements under §§ 425.508 and 425.510 to report quality data on the APP Plus quality measure set established under § 414.1367. This is intended to reduce administrative burden.

Comment: A commenter requested that we ensure that the proposed CEHRT use changes would not adversely affect or weaken the data quality used for quality reporting requirements.

Response: We appreciate the comment and agree that the new CEHRT use requirements should not diminish quality measurement data. The Shared Savings Program CEHRT use options we proposed would not impact quality measure reporting requirements. ACOs would still be required to capture data required to meet Shared Savings Program quality measure reporting requirements, regardless of which of the proposed Shared Savings Program CEHRT use options they elect.

Comment: A commenter requested that CMS simplify the CEHRT use framework where possible, expressing their belief that multiple options create complexity.

Response: We acknowledge the feedback. The multiple options are intended to give ACOs flexibility in being able to demonstrate use of CEHRT, and that may help them choose an option that takes into account their organizational structure, how they aggregate information across their ACOs and other ACO characteristics. Because we believe we have appropriately balanced any added complexity with the flexibility we believe to be beneficial to ACOs, we are not considering narrowing the proposed options at this time because this would limit flexibility for ACOs to demonstrate CEHRT use.

Comment: Several commenters agreed with the proposed public reporting requirements and suggest finalizing as proposed. Some commenters specifically expressed support for sunsetting the current public reporting requirements and replacing them with reporting on the allowable CEHRT use activities attested to or performed. A commenter supported the straightforward public reporting requirement as proposed because it does not impose unnecessary reporting friction.

Response: We appreciate the support. We agree that the proposed public reporting requirements (91 FR 44065 and 44066) are intended to simplify ACOs reporting to publicly demonstrate CEHRT use.

Comment: A few commenters requested additional clarification regarding public reporting expectations, and one of these also suggested we evaluate whether CEHRT utilization data would provide meaningful information to beneficiaries.

Response: We appreciate the recommendations. We agree that clear documentation and public reporting expectations are important and direct commenters to the proposed requirement in section III.G.4.b.(4) of this final rule, where we state our proposal for § 425.308 to require ACOs to publicly report which allowable CEHRT use activity in proposed § 425.507(c) the ACO has selected to perform to meet CEHRT use requirements for the Shared Savings Program. The Shared Savings Program will continue to provide public reporting guidance, including a template for ACOs to provide information they are required to report with ACOs, to facilitate their compliance with this public reporting requirement. We note that while one purpose for publicly reported information is to inform beneficiary choice and understanding, we also believe such information can be helpful to potential ACO participants. Beneficiaries and potential ACO participants may have an interest in how an ACO is advancing FHIR-based digital quality measurement and health information exchange. We also believe that public reporting can support program transparency and oversight by making information about how the program is executed in practice available to beneficiaries, participants, and other interested parties. We will continue to consider the benefit of public reporting of Shared Savings Program CEHRT use.

After considering public comments, we are finalizing the Shared Savings Program CEHRT use requirements as proposed and are finalizing the public

reporting requirement as proposed. Specifically, we are finalizing as proposed our requirements for meeting Medicare Shared Savings Program CEHRT use requirements at § 425.507 as follows:

- Revise paragraph (a) to remove the introductory phrase that made the paragraph applicable to performance years beginning on or after January 1, 2025 and adding in its place an introductory phrase that would limit its applicability to performance years 2025 and 2026.
- Revise paragraph (b) by adding an introductory phrase that would limit its applicability to performance years 2025 and 2026.
- Add new paragraph (c) to specify that, for PYs beginning on or after January 1, 2027, an ACO would be required to demonstrate the use of CEHRT as defined at paragraph (3) of the CEHRT definition at § 414.1305 in one of the following manners:

++ Use CEHRT (as defined in paragraph (3) of the CEHRT definition at § 414.1305) that also supports the calculation and reporting of clinical quality measures by being certified to the ONC health IT certification criteria at 45 CFR 170.315(c)(2) and (c)(3) to completely report at least one of the measures in the APP Plus quality measure set using the eCQMs or Medicare eCQMs collection types and meets the data completeness requirement at § 414.1340 of this chapter for the applicable PY.

++ Completely report at least one measure in the APP Plus quality measure set and meets the data completeness requirement at § 414.1340 of this chapter for the applicable performance year using EHR technology that meets paragraph (3) of the CEHRT definition at § 414.1305 and attests that it used data collected from an HL7® Fast Healthcare Interoperability Resources (FHIR®)-based API to support quality measurement using a Health IT module (as defined in 45 CFR 170.102) that has been certified to an unexpired criterion or criteria in 45 CFR 170.315 supporting standardized API access.

++ Attest to at least one of the Shared Savings Program CEHRT use metrics from the list of metrics established for the applicable PY.

We are also finalizing as proposed our policy to revise the public reporting requirements, at § 425.308(b) as follows:

- Revise paragraph (b)(9) to remove the introductory phrase that made the subsequent requirements applicable to performance year 2025 and subsequent performance years, and limiting them to performance years 2025 and 2026.
- Add new paragraph (b)(11) to specify that for performance year 2027 and subsequent PYs, the ACO must publicly report the CEHRT use activity selected by the ACO for the purpose of meeting the ACO CEHRT use requirement at § 425.507(c).

We are finalizing the following three CEHRT use metrics which would be available for PY 2027, for ACOs electing to attest to at least one of the Shared Savings Program CEHRT use metrics from the list of metrics established for the applicable performance year:

TABLE B-G9: PY 2027 AVAILABLE METRICS FOR SHARED SAVINGS PROGRAM ACO CEHRT USE ATTESTATION

MIPS Promoting Interoperability Performance Category Objective	Shared Savings Program ACO CEHRT Use Metric and Description
A. Electronic Prescribing	ACO Electronic Prescribing: At least one permissible prescription was written by an ACO provider or supplier in each of the ACO's participating TINs (except any TIN that had fewer than 100 permissible prescriptions in the performance period) and the prescription was transmitted electronically using CEHRT.
B. Health Information Exchange	ACO Health Information Exchange Bi-Directional Exchange: At least one ACO provider or supplier from each of the ACO's participating TINs participated in HIE bi-directional exchange for at least one patient with an HIE that has the capability to enable secure, bi-directional exchange for all patients, without excluding exchange partners, using CEHRT.
C. Provider to Patient Exchange	ACO Provider to Patient Exchange: At least one ACO provider or supplier from each of the ACO's participant TINs provided at least one patient electronic access to their health information using CEHRT.

As mentioned previously in this section, ONC proposed in the HTI–5 Proposed Rule (90 FR 60998), to remove the criteria in 45 CFR 170.315(g)(7) and (g)(9) as of January 1, 2027. We stated in the CY 2027 PFS proposed rule that if ONC finalized these proposals, we would no longer require ACOs to use health IT certified to the removed criteria to meet the measure (91 FR 44063). We note that ONC did finalize the removal of the criteria in 45 CFR 170.315(g)(7) and (g)(9) as of January 1, 2027, in their HTI–5 final rule (91 FR 67963 through 67965). Accordingly, we are not finalizing that ACOs electing to attest to the ACO Provider to Patient Exchange metric would need to attest to having used health IT certified to the removed criteria to meet the measure. As we stated we would, in the event that the criteria at 45 CFR 170.315(g)(7) and (g)(9) were finalized for removal, we are finalizing instead that an ACO electing to attest to the ACO Provider to Patient Exchange metric will be required to attest to having used health IT certified to the ''view, download, and transmit to third party'' criterion in 45 CFR 170.315(e)(1) to provide view, download, or transmit capabilities to patients and to the ''standardized API for patient and population services'' criterion in 45 CFR 170.315(g)(10), to meet the requirements of this Shared Savings Program ACO CEHRT use metric. We summarize the required certification criteria to complete the actions of each Shared Savings Program CEHRT use metric in Table B–G10: For ACOs electing to attest to one of the three available ACO CEHRT use metrics,

they would be required to attest that they used CEHRT that meets the requirements in paragraph (3) of the CEHRT definition at § 414.1305 (which includes the 45 CFR 170.102 *Base EHR* definition that includes 45 CFR 170.315 (g)(10)—*Standardized API for patient and population services*), in addition to the following criteria:

TABLE B-G10: CEHRT CERTIFICATION CRITERIA FOR SHARED SAVINGS PROGRAM ACO CEHRT USE METRICS

Metric	Certification Criteria
ACO Electronic Prescribing	"Electronic prescribing" criterion in 45 CFR 170.315(b)(3)
ACO Provider-to-Patient Exchange	"View, download, and transmit to third party" criterion in 45 CFR 170.315(e)(1)
ACO HIE Bi-Directional Exchange	Criterion supporting connection to an HIE, which could include but is not limited to: - "Transitions of care" criterion in 45 CFR 170.315(b)(1) (part of Base EHR definition); - "Clinical information reconciliation and incorporation" criterion in 45 CFR 170.315(b)(2); or - "Standardized API for patient and population services" criterion at 45 CFR 170.315(g)(10) (part of Base EHR definition).

5. Financial Methodology

a. Overview

As explained in the CY 2027 PFS proposed rule, the Shared Savings Program has demonstrated a strong track record of generating savings for Medicare while achieving high quality care for beneficiaries assigned to ACOs (91 FR 44067). For example, the Shared Savings Program has had eight consecutive years of generating savings for Medicare relative to benchmarks, with over $12 billion in total savings and a trend of increasing savings year-over-year between 2017 and 2024. As described in the CY 2026 PFS final rule Regulatory Impact Analysis (90 FR 49975 through 49976) and in the regulatory impact section of the CY 2027 PFS proposed rule, the Shared Savings Program has maintained a net savings percentage on total FFS spending of 0.5 percent (91 FR 44067). At the same time, ACOs in the Shared Savings Program have demonstrated higher quality relative to other physician groups, indicating that the Shared Savings Program is achieving savings while improving quality of care. For example, in PY 2024, Shared Savings Program ACOs helped more patients improve markers of good health, such as controlled blood pressure, hemoglobin A1c control (an indicator for diabetes), and depression screening with a follow-up plan, compared to 2023.[312] In PY 2024, nearly all ACOs outperformed similar types of physician groups on quality measures. As described in the CY 2027 PFS proposed rule, based on an internal CMS analysis of 87 ACOs that participated continuously in the Shared Savings Program between 2014 and 2023, Shared Savings Program ACOs showed statistically significant and substantial improvement across 7 comparable CMS Web Interface quality measures used during that period where quality performance improved across a wide range of clinical practice areas including screening and preventive measures, control of health conditions such as hypertension and diabetes (91 FR 44067). ACOs have performed consistently better than comparable physician groups on the patient experience survey measure, Getting Timely Care, Appointments, and Information, for every year that the survey has been fielded since 2019 (91 FR 44067).

Based on the experience of the Shared Savings Program and as part of our effort to align spending and value in OM, we are focused on developing policies that would grow the number of healthcare providers and beneficiaries in accountable care relationships and grow savings to the Medicare Trust Funds while improving the quality of care for beneficiaries. To achieve these goals, in the CY 2027 PFS proposed rule, we proposed several complementary modifications to the benchmarking and financial methodology under the Shared Savings Program to encourage new and sustained participation by ACOs in the program (91 FR 44067). Specifically, we proposed to: (1) increase the sharing rate under BASIC track Level E (91 FR 44068 through 44072), (2) reduce the weight on the regional adjustment for ACOs in the ENHANCED track (91 FR 44072 through 44076), (3) modify the prior savings adjustment to increase the scaling factor (91 FR 44076 through 44082), (4) risk adjust the 5 percent cap on upward adjustments to the historical benchmark (91 FR 44082 through 44087), (5) incentivize new participation through a growth adjustment (91 FR 44091 through 44103), and (6) reform the Accountable Care Prospective Trend (ACPT) component of the benchmark update factor to address projection error and allow for greater consistency in the calculations across agreement periods (91 FR 44103 through 44114).

Across the financial methodology proposals described in the CY 2027 PFS proposed rule, 91 FR 44068 through 44072 (proposal to increase the sharing rate under BASIC track Level E), 91 FR 44072 through 44076 (proposal to reduce the weight on the regional adjustment for ENHANCED track ACOs), and 91 FR 44076 through 44082 (proposal to modify the prior savings adjustment scaling factor), we described our observations of recurring patterns, that ENHANCED track ACOs receive larger positive regional adjustments than BASIC track ACOs, which inflate benchmarks and increases the probability of generating gross savings independent of operational efficiencies. At the same time, as discussed in the CY 2027 PFS proposed rule (91 FR 44068 through 44072), BASIC track Level E ACOs generate higher net savings for the Trust Funds despite lower gross savings, as the 75 percent shared savings rate under the ENHANCED track requires

[312] Medicare Shared Savings Program Performance Year 2024 Financial and Quality Results Fact Sheet, *https://www.cms.gov/files/document/fact-sheet-ssp-py24-financial-quality-results.pdf.*

disproportionately higher gross savings to achieve equivalent net outcomes for the Trust Funds. Combined analyses described in the CY 2027 PFS proposed rule (91 FR 44072 through 44076; 91 FR 44076 through 44082) further show that the interaction of regional adjustment weighting, prior savings scaling, and track—specific sharing rates may incentivize ACOs to progress into the ENHANCED track based on benchmark generosity rather than demonstrated capacity to reduce expenditures. Together, these overlapping findings support the recalibration of incentives reflected in our proposals discussed in these sections—namely increasing the BASIC track Level E sharing rate, lowering the positive regional adjustment weight applied to ENHANCED track ACOs, and strengthening the prior savings adjustment methodology—to better align benchmark dynamics with underlying efficiency, reduce distortions driven by regional cost variation, and reinforce long—term net savings objectives for the Shared Savings Program.

b. Summary of Statutory and Regulatory Background on Adjusting the Historical Benchmark

As discussed in the CY 2027 PFS proposed rule, section 1899(d)(1)(B)(ii) of the Act addresses how ACO benchmarks are to be established, updated, and reset at the start of each agreement period under the Shared Savings Program (91 FR 44067). This provision specifies that the Secretary shall estimate a benchmark for each agreement period for each ACO using the most recent available 3 years of per beneficiary expenditures for Parts A and B services for OM beneficiaries assigned to the ACO. The benchmark shall be reset at the start of each agreement period. Section 1899(d)(1)(B)(ii) of the Act also provides the Secretary with discretion to adjust the historical benchmark by ''such other factors as the Secretary determines appropriate.'' Under this authority, over time we have adopted a variety of methods to adjust the historical benchmark to meet certain policy goals.

Benchmarking policies applicable to all ACOs in agreement periods beginning on January 1, 2024, and in subsequent years, are specified at § 425.652. We refer readers to discussions of the benchmark calculations in earlier rulemaking for details on the development of the current policies (see November 2011 final rule, 76 FR 67909 through 67927; June 2015 final rule, 80 FR 32785 through 32796; June 2016 final rule, 81 FR 37953 through 37991; December 2018 final rule, 83 FR 68005 through 68030; CY 2023 PFS final rule, 87 FR 69875 through 69928; CY 2024 PFS final rule, 88 FR 79174 through 79208; CY 2025 PFS final rule, 89 FR 98155 through 98203; and CY 2026 PFS final rule, 90 FR 49831 through 49835).

In the CY 2023 PFS final rule, we adopted policies to modify the regional adjustment under § 425.656 (87 FR 69915 through 69923) and to reinstate a prior savings adjustment under § 425.658 (87 FR 69898 through 69915). The modifications to the regional adjustment were designed to limit the impact of negative regional adjustments on ACO historical benchmarks and further incentivize program participation among ACOs serving high-cost beneficiaries (87 FR 69916). We also reinstated the prior savings adjustment policy, such that a renewing or re-entering ACO may be eligible to receive an adjustment to its benchmark to account for savings generated in performance years that correspond to the benchmark years of its new agreement period (87 FR 69898 through 69915).

In the CY 2024 PFS final rule (88 FR 79185 through 79196), we modified the regional adjustment policy further to prevent any ACO from receiving an adjustment that would cause its benchmark to be lower than it would have been in the absence of a regional adjustment. We modified the prior savings adjustment policy further to account for the following: a change in savings earned by the ACO in a benchmark year due to compliance action taken to address avoidance of at-risk beneficiaries or a change in the amount of savings or losses for a benchmark year as a result of a reopening of a prior determination of ACO shared savings or shared losses and the issuance of a revised initial determination under § 425.315 (88 FR 79196 through 79200).

In the CY 2025 PFS final rule (89 FR 98155 through 98167), we finalized a health equity benchmark adjustment (HEBA) (revised to the ''population adjustment'' in the CY 2026 PFS final rule (90 FR 49831 through 49835)) that adjusts upward some ACOs' historical benchmarks based on the number of beneficiaries the ACO serves who are dually eligible or enrolled in the Medicare Part D and receive the Low-Income Subsidy (LIS).

c. Changes to the Shared Savings Program Financial Methodology To Encourage Additional Savings in Two-Sided Risk

(1) Increase the Sharing Rate Under Level E of the BASIC Track

(a) Background

As finalized in the December 2018 final rule (83 FR 67831 through 67841), for agreement periods beginning on July 1, 2019, and in subsequent years, eligible ACOs enter into an agreement period of not less than 5 years under one of two tracks of the Shared Savings Program, either the BASIC track (see §§ 425.600(a)(4) and 425.605) or the ENHANCED track (see §§ 425.600(a)(3) and 425.610).

As finalized in the December 2018 final rule (83 FR 67841 through 67857), the BASIC track includes a glide path from one-sided model Levels A and B to incrementally higher levels of performance-based risk under Levels C, D, and E. The ENHANCED track offers the highest level of risk and potential reward under the Shared Savings Program. Level E of the BASIC track and the ENHANCED track each qualify as an Advanced APM under the Quality Payment Program. In rulemaking following the December 2018 final rule, we modified the approach for determining an ACO's eligibility for participation options in the BASIC track and ENHANCED track, along with the number of performance years an ACO may remain under a one-sided model of the BASIC track's glide path.[313] In the CY 2027 PFS proposed rule we discussed that we provide select regulatory background on our establishment of the BASIC track's glide path, and relatedly the level of risk and potential reward under the glide path, as well as our considerations for ACOs' progression from participation in BASIC track Level E to the ENHANCED track (91 FR 44068).

With the December 2018 final rule (83 FR 67863 through 67922), we established an approach for determining an ACO's eligibility for participation options in the BASIC track and ENHANCED track, based on a combination of factors: ACO participants' Medicare FFS revenue (low revenue ACOs versus high revenue

[313] We refer readers to discussions in earlier rulemaking, including: December 2018 final rule (83 FR 67863 through 67922); May 8, 2020 COVID–19 IFC (85 FR 27575 and 27576) and CY 2021 PFS final rule (85 FR 84767 through 84769); Fiscal Year (FY) 2022 Medicare Hospital Inpatient Prospective Payment System (IPPS) and Long-Term Care Hospital (LTCH) Prospective Payment System (PPS) final rule (86 FR 45502 through 45506); CY 2023 PFS final rule (87 FR 69805 through 69821); and CY 2026 PFS final rule (90 FR 49760 through 49775).

ACOs) and the experience of the ACO legal entity and its ACO participants with performance-based risk Medicare ACO initiatives. We finalized an approach under § 425.600(d) where ACOs eligible for the BASIC track's glide path that are inexperienced with performance-based risk Medicare ACO initiatives would have the flexibility to enter the glide path at any one of the five levels, with a limited exception under § 425.600(a)(4)(i)(B)(*1*) (see, for example, 83 FR 67904 through 67905). With the December 2018 final rule, we finalized provisions on the progression of ACOs along the BASIC track's glide path under § 425.600(a)(4)(i)(B), and finalized an approach to allow ACOs in the BASIC track's glide path to take on higher risk and potential reward within their current agreement period by more rapidly progressing along the glide path (see 83 FR 67844, and 67858 through 67859; and § 425.226(a)(2)). We also finalized that the BASIC track's highest Level of risk and potential reward (Level E) may be elected for any performance year by ACOs that enter the BASIC track's glide path, but it will be required no later than the ACO's fifth performance year of the glide path (83 FR 67844; 67850).[314]

To provide incentives for ACOs to move towards higher levels of performance-based risk, we limited the amount of potential shared savings under the one-sided model of the BASIC track (Levels A and B), while offering higher potential reward in relation to each level of higher risk as ACOs under the two-sided model levels of the BASIC track (Levels C, D and E) (see, for example, 83 FR 67848 and 67849). We explained in the December 2018 final rule that ACOs have reduced incentives to enter or remain in a one-sided model of the BASIC track's glide path if they are prepared to take on risk, and we anticipated that ACOs would seek to accept greater performance-based risk in exchange for the chance to earn greater reward (see 83 FR 67844).

In the December 2018 final rule, we stated that the approach to determining the maximum amount of shared losses under BASIC track Level E strikes a balance between (1) placing ACOs under a higher Level of risk to recognize the greater potential reward under this financial model and the additional tools and flexibilities available to BASIC track ACOs under performance-based risk and (2) establishing an approach to help ensure the maximum Level of risk under the BASIC track remains moderate (83 FR 67845). Further, this approach recognizes that eligible ACOs in Level E have the opportunity to earn the greatest share of savings under the BASIC track, and should therefore be accountable for a higher share of losses, particularly in light of their access to tools for care coordination and beneficiary engagement. We finalized higher maximum sharing rates for ACOs participating in two-sided levels of the BASIC track as a means of encouraging participation in the program and potentially providing greater resources to ACOs to support their transition to performance-based risk (87 FR 69951).

In the CY 2023 PFS final rule (87 FR 69819 through 69821), we removed the cap on the number of performance years an ACO was allowed to participate in BASIC track Level E, allowing ACOs to continue to participate in BASIC track Level E in future agreement periods and not requiring ACOs to advance to the ENHANCED track. We explained that, in our implementation of the Shared Savings Program, we intend to achieve larger programmatic goals by encouraging ACO participation and thereby promoting high quality, value-based care for OM beneficiaries (87 FR 69819). We continuously seek to balance creating sufficient incentives for participation in a voluntary program with ensuring that our policies achieve program goals to increase quality of care for Medicare beneficiaries and reduce expenditure growth to protect the Trust Funds. Accordingly, we discussed our belief that it would be in the best interest of the program and OM beneficiaries to permit eligible ACOs to continue participating under BASIC track Level E, rather than risk significant numbers of experienced, successful ACOs terminating their participation in the program instead of progressing to the higher level of risk and potential reward under the ENHANCED track (87 FR 69819). Our experience as of the CY 2023 PFS final rule showed that ACOs in BASIC track Level E and ACOs in the ENHANCED track had similar performance results (we have since gained additional experience as discussed later in this section, that shows ACOs in BASIC track Level E produce greater net savings for CMS compared to ACOs in the ENHANCED track). We noted our belief that it is important to offer the option to remain in BASIC track Level E, to encourage ACOs that may be ready to take on the higher level of risk and potential reward under the ENHANCED track to progress to that participation option, secure in the knowledge that the more moderate level of risk and potential reward under BASIC track Level E would be available to the ACO in the future if the ACO concludes based on experience that that participation option is more appropriate for the ACO than the ENHANCED track (87 FR 69819).

We refer readers to the provisions of BASIC track under § 425.605, and the ENHANCED track under § 425.610, for policies on the calculation of shared savings and losses under each track/level (as applicable). With the CY 2026 PFS final rule (90 FR 49782 through 49783), we provided a summary of the level of risk and potential reward under Levels A through E of the BASIC track and ENHANCED track. In the following discussion we provide a consolidated summary.

In general, an ACO that meets or exceeds its minimum savings rate (MSR), and otherwise qualifies for a shared savings payment, shares in savings at a sharing rate specified by the ACO's participation track (and level, if applicable), not to exceed a performance payment limit (a percentage of the ACO's updated historical benchmark).[315] [316] An ACO under a two-sided model that meets or exceeds its minimum loss rate (MLR) shares in losses at a shared loss rate [317] specified by the ACO's participation track (and level, if applicable), not to exceed a loss recoupment limit (a percentage of the ACO's updated historical benchmark).

Under Levels A and B of the BASIC track (§ 425.605(d)(1)(i) and (ii)), ACOs may share in savings at a sharing rate of up to 40 percent, not to exceed 10 percent of the updated benchmark. Levels C, D, and E of the BASIC track (§ 425.605(d)(1)(iii), (iv) and (v)) each offer a sharing rate of up to 50 percent capped at 10 percent of the updated benchmark, with a fixed 30 percent loss sharing rate in each level's two-sided model. The loss recoupment limits increase across these levels. Under Level C (§ 425.605(d)(1)(iii)(D)), an ACO's shared losses may not exceed 2 percent of total Medicare Parts A and B

[314] In in the December 2018 Final Rule (83 FR 67844 through 67846) we also described advancing to Level E would be required for ACOs in their fourth performance year if they previously participated in Track 1, or new ACOs identified as re-entering ACOs because more than 50 percent of their ACO participants have recent prior experience in a Track 1 ACO.

[315] We note that provisions of §§ 425.605(d)(1) and 425.610(d) refer to the applicable ''final sharing rate'', which we sometimes refer to as the ''sharing rate'' (for brevity), or alternatively the ''shared savings rate''. We consider these terms synonymous.

[316] There is a limited exception for eligible low revenue ACOs participating under the BASIC track, under which an ACO that does not meet the MSR requirement but meets other criteria may qualify for a shared savings payment, at a lower sharing rate, in accordance with § 425.605(h).

[317] We note that the ''shared loss rate'' is also referred to as the ''loss sharing rate''.

FFS revenue of the ACO participants in the ACO capped at 1 percent of updated benchmark. Under Level D (§ 425.605(d)(1)(iv)(D)), an ACO's shared losses may not exceed 4 percent of total Medicare Parts A and B FFS revenue of the ACO participants in the ACO capped at 2 percent of updated benchmark. Under Level E (§ 425.605(d)(1)(v)(D)), an ACO's shared losses may not exceed 8 percent of total Medicare Parts A and B FFS revenue of the ACO participants in the ACO capped at 4 percent of updated benchmark. Under Level E, the loss recoupment limit is the percentage of revenue specified in the revenue-based nominal amount standard under the Quality Payment Program (QPP) (42 CFR 414.1415(c)(3)(i)(A)) capped at 1 percentage point higher than the expenditure-based nominal risk amount (§ 414.1415(c)(3)(i)(B)). Under the ENHANCED track (§ 425.610), ACOs may share in savings at up to 75 percent (§ 425.610(d)), not to exceed 20 percent of the updated benchmark (§ 425.610(e)), and share in losses at a rate of 40 to 75 percent (§ 425.610(f)), capped at 15 percent of the updated benchmark (§ 425.610(g)). Since the establishment of the ENHANCED track (formerly named Track 3) with the June 2015 final rule (see 80 FR 32778 through 32779), and the BASIC track's glide path with the December 2018 final rule (as previously described in this section), we have not modified the maximum upside potential reward with the final sharing rates or downside potential risk with the loss sharing rates under each track/level (as applicable).

(b) Revisions

In the CY 2027 PFS proposed rule we stated that in 2020, the first full performance year under the glide path, 13.5 percent of ACOs in the Medicare Shared Savings Program participated under BASIC track Level E (91 FR 44069). As ACOs became more experienced and progressed through the glide path, participation in BASIC track Level E experienced modest increases, which peaked in PY 2023 at 27.2 percent. As of PY 2026, participation in BASIC track Level E decreased to 16 percent.

We discussed in the CY 2027 PFS proposed rule that the disparity in sharing rates between the highest risk option under the BASIC track (BASIC track Level E) and the next highest risk option (ENHANCED track) has potentially disproportionately driven ACOs to take on the maximum risk allowed (91 FR 44069). For PY 2026, 58 percent of ACOs are participating in the ENHANCED track. This in part is likely a result of the 40 percent sharing rate in Levels A and B of the BASIC track and 50 percent sharing rate in Levels C, D, and E of the BASIC track, compared to the 75 percent sharing rate in the ENHANCED track. We noted that, based on current participation trends across the various risk tracks, we anticipate that the participation in BASIC track Level E may continue a downward trend as a percentage of total participation unless some action is taken (91 FR 44070). We stated that we believe that some ACOs cease longer term program participation in BASIC track Level E before they otherwise would because they transition to the ENHANCED track based on the incentives of the higher sharing rate, and this transition occurs before they're ready for the increased demands associated with the higher risk track (91 FR 44070). We added that decreased Shared Savings Program retention rates of ACOs that transition too quickly to the ENHANCED track, in combination with the decreased net savings rates associated with the ENHANCED track, ultimately result in decreased savings for the Medicare Trust Fund (91 FR 44070). Table B–G11 summarizes the distribution of ACO participation across the various risk tracks for PY 2022 through CY 2026.

TABLE B-G11: COUNT OF ACOS PARTICIPATING IN BASIC TRACK LEVELS AND ENHANCED TRACK FOR PYS 2022 THROUGH 2026

Performance Year	Total	BASIC Track			ENHANCED Track
		Levels A and B	Levels C and D	Level E	
PY 2022	483	199 (41%)	40 (8%)	98 (21%)	146 (30%)
PY 2023	456	151 (33%)	19 (4%)	125 (28%)	161 (35%)
PY 2024	480	159 (33%)	10 (2%)	104 (22%)	207 (43%)
PY 2025	476	137 (29%)	5 (1%)	81 (17%)	253 (53%)
PY 2026	511	121 (24%)	12 (2%)	82 (16%)	296 (58%)

As discussed in the CY 2027 PFS proposed rule, while we still have the goal of ACOs transitioning to performance-based risk, we want to be conscious of long-term impacts to the Shared Savings Program related to participation, success, and growth (91 FR 44070). We stated that participation in the ENHANCED track is a positive, but we believe that some ACOs may be taking on additional risk more quickly than they otherwise would because the ENHANCED track offers a 50 percent increase in savings compared to BASIC track Level E, while both tracks include two-sided risk (91 FR 44070). We noted that, if ACOs progress to higher levels of risk before they are adequately prepared, they may take on too much risk with higher shared losses rates in the ENHANCED track, potentially resulting in program termination and a subsequent reduction in both program participation and care coordination for beneficiaries (91 FR 44070). We stated our belief that by reducing the savings percentage gap between BASIC track Level E and the ENHANCED track, we may increase participation in BASIC track Level E as well as the Shared Savings Program and increase long-term success of ACOs, particularly those with less experience, with unique patient or provider populations, and low revenue ACOs (which tend to be small, rural and physician-only ACOs) (91 FR 44070).

Additionally, in the CY 2027 PFS proposed rule we shared a data analysis from the CMS Office of the Actuary of benchmark performance for cohorts of ACOs that participated in both PY 2022 and PY 2023 indicates that ACOs participating in the BASIC track generated 42 percent higher net savings for CMS as a percentage of their benchmark than ACOs transitioning to or continuing participation in the ENHANCED track, despite favorable regional adjustments likely inflating gross savings for ACOs under the ENHANCED track (91 FR 44070). We noted that an analysis of PY 2024 financial performance also indicated that net savings for the Trust Funds

remained higher on average for BASIC track ACOs (91 FR 44070). We stated that this is also largely due to the 50 percent differential in sharing rate currently present between BASIC track Level E and the ENHANCED track, which resulted in ENHANCED track ACOs needing to generate twice the gross savings to equal the same net savings for the Trust Funds as ACOs participating under BASIC track Level E (91 FR 44070). We stated, for example, if an ACO participated in BASIC track Level E and generated $2,000,000 in gross savings, and the ACO received the maximum sharing rate of 50 percent, the ACO would receive a $1,000,000 shared savings payment and net savings for the Trust Funds would be $1,000,000 (91 FR 44070). We noted that if this same ACO participated in the ENHANCED track and generated $2,000,000 in gross savings, and the ACO received the maximum sharing rate of 75 percent, the ACO would receive a $1,500,000 shared savings payment and net savings for the Trust Funds would be $500,000 (91 FR 44070). We concluded that to generate the same net savings for the Trust Funds, the ENHANCED track ACO would need to have generated twice the gross savings, $4,000,000, to have generated $1,000,000 ($4,000,000 × 25 percent) net savings for the Trust Funds (91 FR 44070). We stated that, for PY 2024, gross savings was higher for the ENHANCED track ACOs, but net savings as a percentage of gross savings and per capita net savings are higher for ACOs participating in BASIC track Level E, as shown in Table B–G12 (91 FR 44070).

TABLE B-G12: PY 2024 GROSS AND NET SAVINGS FOR BASIC TRACK LEVEL E AND ENHANCED TRACK

Risk Track	Aggregate Gross Savings/Losses	Aggregate Net Savings/Losses	Per Capita Net Savings/Losses	Net Savings as a percent of Gross Savings
BASIC Track Level E	$1,114,104,073	$555,399,727	$286	50%
ENHANCED Track	$4,224,728,667	$1,129,061,411	$206	27%

We stated in the CY 2027 PFS proposed rule that, as we seek to increase the percentage of Medicare beneficiaries in accountable care arrangements, we are balancing incentives and participation options to serve the dual purposes of sustaining participation by existing ACOs and increasing program growth, recognizing that ACOs vary in their composition of providers/suppliers, the needs of the populations they serve, and have varying degrees of efficiency relative to their region and experience with accountable care initiatives (91 FR 44071). We also reiterated our intention to achieve larger programmatic goals by encouraging ACO participation and thereby promoting high quality, value-based care for OM beneficiaries (91 FR 44071). We stated that we continuously seek to balance creating sufficient incentives for participation in a voluntary program while ensuring that our policies achieve program goals to increase quality of care for Medicare beneficiaries and reduce expenditure growth to protect the Trust Funds (91 FR 44071).

In the CY 2027 PFS proposed rule, we stated that trends in recent performance years indicate ACOs participating in BASIC track Level E have roughly one-third fewer assigned beneficiaries and participating providers than ACOs participating in the ENHANCED track (91 FR 44071). Understanding that ACOs participating in BASIC track Level E face additional obstacles to success given their different compositions and experience, we stated our belief that narrowing the gap in sharing rates between these two tracks will encourage long-term participation and growth in the Shared Savings Program by encouraging less experienced ACOs to only progress to the ENHANCED track when they're adequately prepared to do so (91 FR 44071).

In the CY 2027 PFS proposed rule, we stated that increasing the sharing rate for BASIC track Level E presents an opportunity to reverse the decreased participation in the BASIC track, increase net savings opportunities for the Trust Funds, and increase program participation (91 FR 44071). We noted, however, that before considering whether to propose changes, we analyzed what change to the sharing rate was needed to ensure our goals were met without unintended consequences (91 FR 44071).

We noted, as we did when we established the BASIC track in the December 2018 final rule, we considered many sharing rates before arriving at our proposal (91 FR 44071). With the current sharing rate for BASIC track Level E set at 50 percent and ENHANCED track set at 75 percent, we analyzed in the CY 2027 PFS proposed rule alternative sharing rates for BASIC track Level E between 55 percent and 65 percent (41 FR 44071).

In the CY 2027 PFS proposed rule we noted that, for the 104 ACOs entering an agreement period beginning on January 1, 2024 that participated in BASIC track Level E, we found that if all else is equal, the increase in shared savings payments under the alternative sharing rates we considered for BASIC track Level E ranged between 9.1 percent and 22.8 percent (91 FR 44071). After considering other policy changes proposed in the CY 2027 PFS proposed rule , such as the proposal to reduce the weight on regional adjustment for ACOs under the ENHANCED track (91 FR 44072 through 44076) and the proposal to modify the prior savings adjustment to increase the scaling factor (91 FR 44076 through 44082), we determined a 65 percent sharing rate was too high to maintain a sufficient gap in incentives between the two tracks and a 55 percent sharing rate was an inadequate incentive to achieve our goals of increasing participation in the program and increasing savings to the Trust Funds (91 FR 44071).

In the CY 2027 PFS proposed rule, we stated that we believe that increasing the sharing rate to 60 percent for BASIC track Level E appropriately balances creating sufficient incentive to increase program participation and savings to the Trust Funds (91 FR 44071). We also stated that we believe that there would still be sufficient benefits for ACOs to take on the higher risk and reward offered under the ENHANCED track, so that ACOs would continue to progress the ENHANCED track when they're ready to take on those higher levels of risk and reward (91 FR 44071).

We proposed to increase the savings rate for BASIC track Level E from 50

percent to 60 percent for agreement periods beginning on or after January 1, 2027 (91 FR 44071). The proposal to apply a modified sharing rate for agreement periods beginning on or after January 1, 2027 would ensure we maintain a consistent sharing rate for Level E throughout the duration of an ACO's an agreement period under the BASIC track, in accordance with § 425.212(a).[318] We stated in the CY 2027 PFS proposed rule that closing the gap in the sharing rates between BASIC track Level E and the ENHANCED track would likely increase savings for the Trust Funds, while striking a better balance among incentivizing robust participation in the Shared Savings Program, incentivizing ACOs' move to two-sided risk, and offering a lower risk option than is offered under the ENHANCED track (91 FR 44071).

We shared in the CY 2027 PFS proposed rule an analysis of the PY 2024 financial results which indicates that the average impact of increasing the sharing rate for BASIC track Level E from 50 percent to 60 percent was an increase in shared savings payments of $1,348,867 and a total increase of $110,607,059 in shared savings payments for the 104 ACOs that participated in BASIC track Level E (91 FR 44071). We stated that, while the total shared savings payments for BASIC track Level E would increase under this proposal, we anticipate net savings to the Trust Funds to increase because of increased participation in the Shared Savings Program, higher retention of ACOs, and some ACOs opting to delay transition into the ENHANCED track (91 FR 44071).

We stated that under our approach, the current maximum 50 percent sharing rate under BASIC track Level E specified in § 425.605(d)(1)(v)(A)(*4*) (which is applicable for PYs beginning on or after January 1, 2024) would continue to apply to ACOs completing existing agreement periods in the BASIC track (91 FR 44071). Specifically, the maximum 50 percent sharing rate would apply in determining financial performance for a BASIC track ACO participating in an agreement period beginning on January 1, 2022, 2023, 2024, 2025, and 2026, that is participating in Level E for PY 2025 or any subsequent PY of the ACO's existing agreement period.

[318] In accordance with § 425.212(a), an ACO is subject to all regulatory changes that become effective during the agreement period, with the exception of the following program areas, unless required by statute: (1) eligibility requirements concerning the structure and governance of ACOs, and (2) calculation of the sharing rate.

We proposed to specify in a new paragraph (d)(1)(v)(A)(*5*) added to § 425.605 the sharing rate for BASIC track Level E, applicable for agreement periods beginning on or after January 1, 2027, for performance years beginning on or after January 1, 2027 (91 FR 44071 through 44072). Accordingly, we stated that this new paragraph would specify that an ACO that meets all the requirements for receiving shared savings payments under the BASIC track, Level E, receives a shared savings payment equal to a percentage of all the savings under the updated benchmark (up to the performance payment limit described in § 425.605(d)(1)(v)(B)) (91 FR 44072). Except as provided in § 425.605(h) (which specifies an additional opportunity for an eligible low revenue BASIC track ACO to share in savings even if it does not meet the MSR requirement), the percentage would be as follows:

(1) 60 percent for an ACO that that meets the quality performance standard by meeting the criteria specified in § 425.512(a)(2) or (a)(5)(i).

(2) 60 percent multiplied by the ACO's quality score calculated according to § 425.512 for an ACO that meets the alternative quality performance standard by meeting the criteria specified in § 425.512(a)(5)(ii).

We also proposed technical and conforming changes to other provisions of § 425.605 (91 FR 44072). We proposed to revise the heading text in the first sentence of § 425.605(d)(1)(v)(A)(*4*) introductory text, to specify the provisions are applicable for ACOs in agreement periods beginning July 1, 2019, through January 1, 2026, for performance years beginning on or after January 1, 2024 (91 FR 44072). For completeness and clarity, we stated that this proposed heading text would be inclusive of ACOs participating in agreement periods beginning on July 1, 2019 and January 1, 2020, which were previously reconciled for participation in BASIC track Level E for the performance year beginning on January 1, 2024 (91 FR 44072). We noted that agreement periods of 5 years and 6 months beginning on July 1, 2019, and 5-year agreement periods beginning on January 1, 2020, concluded on December 31, 2024 (91 FR 44072). As we explained previously in this section of this final rule, the final sharing rate provisions specified under § 425.605(d)(1)(v)(A)(*4*) would continue to apply to ACOs participating in agreement periods beginning on January 1, 2022, 2023, 2024, 2025 and January 1, 2026, that would be reconciled for participation in BASIC track Level E for PY 2025 and any remaining PY of their agreement period (91 FR 44072). We also proposed to amend § 425.605(h)(2), describing calculation of the sharing rate applied to a low revenue BASIC track ACO eligible for the expanded opportunity to share in savings if it does not meet the MSR, to revise the existing list of cross-references to include a reference to new paragraph § 425.605(d)(1)(v)(A)(*5*) (91 FR 44072).

We also proposed several technical corrections to the regulations in § 425.605 (91 FR 44072). With the CY 2026 PFS final rule (see 90 FR 49816 through 49817, and 50018), we finalized amendments to phrasing in § 425.605, including in paragraphs (d)(1)(v)(A)(*3*)(*ii*) and (d)(1)(v)(A)(*4*)(*ii*) (describing the sharing rate applied under BASIC track Level E, by PY, for an ACO that meets the alternative quality performance standard). There were technical errors in the implementation of these finalized changes in the Code of Federal Regulations (CFR). We proposed the following technical corrections (91 FR 44072):

- To revise § 425.605(d)(1)(v)(A)(*3*)(*ii*) to read, 50 percent multiplied by the ACO's quality score calculated according to § 425.512 for an ACO that meets the alternative quality performance standard by meeting the criteria specified in § 425.512(a)(4)(ii).
- To revise § 425.605(d)(1)(v)(A)(*4*)(*ii*) to read, 50 percent multiplied by the ACO's quality score calculated according to § 425.512 for an ACO that meets the alternative quality performance standard by meeting the criteria specified in § 425.512(a)(5)(ii).

We solicited comment on the proposal to increase the sharing rate under BASIC track Level E from 50 percent to 60 percent, applicable for ACOs in agreement periods beginning on or after January 1, 2027, for performance years beginning on or after January 1, 2027, and the proposal to specify related provisions in the Shared Savings Program regulations under new § 425.605(d)(1)(v)(A)(*5*), as well as proposed technical and conforming changes to § 425.605(d)(1)(v)(A)(*4*) introductory text and § 425.605(h)(2). We also sought comment on our proposed technical corrections to § 425.605(d)(1)(v)(A)(*3*)(*ii*) and (d)(1)(v)(A)(*4*)(*ii*). The following is a summary of the comments we received and our responses.

Comment: Most commenters supported our proposal to increase the BASIC track Level E shared savings rate from 50 percent to 60 percent. A commenter conditionally supported the proposal, provided that the increase

meaningfully helps organizations, particularly those serving rural and low-resourced communities, sustain the substantial investments required for accountable care, including care coordination, workforce capacity, health information technology, data analytics, quality improvement, and population health management. Many supportive commenters shared their beliefs that the higher sharing rate would better align rewards with the accountability required under value-based payment arrangements, narrow the incentive gap between BASIC track Level E and the ENHANCED track, and improve returns on the substantial infrastructure and operational investments needed to accept two-sided risk. Several commenters also stated that the proposal would make BASIC track Level E a more viable participation option for rural, low-revenue, and other ACOs that need additional time to build capacity before assuming the higher level of risk associated with the ENHANCED track, thereby supporting retention and continued participation. A few commenters further observed that smaller and physician-led ACOs can generate Medicare savings that increase over time, while another commenter stated that attracting high-cost ACOs to BASIC track Level E would preserve greater opportunities for Medicare to share in savings.

Response: We appreciate the support. We agree that increasing the shared savings rate for BASIC track Level E may better align financial rewards with the accountability associated with two-sided risk, narrow the incentive gap between BASIC track Level E and the ENHANCED track, and strengthen incentives for continued participation in the Shared Savings Program. We appreciate comments regarding the potential benefits for rural, low-revenue, and other ACOs, as well as the opportunity for ACOs to reinvest additional shared savings in care management, health equity, data and digital infrastructure, patient outreach, and clinician engagement. We recognize that ACOs may make substantial infrastructure and operational investments to participate in two-sided risk arrangements and that the increased sharing rate may strengthen the potential return on those investments.

Comment: A couple of commenters opposed increasing the BASIC track Level E shared savings rate, arguing that larger shared savings payments based on potentially flawed benchmarks could increase participation and payouts without increasing gross savings, thereby reducing or reversing net Medicare savings.

Response: We appreciate the comments regarding the potential effects of increasing the BASIC track Level E shared savings rate on the distinction between BASIC track Level E and the ENHANCED track. We agree that the Shared Savings Program should maintain incentives for ACOs to progress to higher levels of downside risk. We believe that increasing the maximum shared savings rate for BASIC track Level E from 50 percent to 60 percent appropriately strengthens incentives for ACOs participating under two-sided risk while preserving a meaningful distinction from the ENHANCED track, which retains a higher shared savings rate and requires a greater level of downside risk.

Comment: Many supportive commenters encouraged CMS to implement the proposed increase in the sharing rate alongside related benchmark reforms, stating that the combined changes would improve the financial return on the substantial infrastructure and organizational investments needed to accept two-sided risk. A commenter stated that the sharing rate increase and related changes could attract higher-cost ACOs to BASIC track Level E and preserve greater opportunities for Medicare to share in savings. Another commenter cautioned that CMS should preserve a meaningful financial advantage for ACOs that progress to the ENHANCED track and accept the highest level of downside risk, while maintaining incentives for organizations beginning the transition to value-based care.

Separately, a commenter remained neutral on the proposed changes to the BASIC track and regional adjustment, stating that the changes may meaningfully affect decisions between BASIC track Level E and the ENHANCED track for lower-spending, community-based ACOs but would have limited effect on higher-spending ACOs whose per-beneficiary costs exceed their benchmarks. Another commenter requested that CMS finalize benchmark rebasing changes and balance the incentives between the BASIC Level E and ENHANCED tracks to avoid penalizing ACOs serving higher-risk populations.

Response: We appreciate the recommendations regarding the interaction between the proposed increase in the BASIC track Level E shared savings rate and related benchmarking and track incentive policies. We agree that these policies should work together to provide appropriate incentives for ACOs to participate in two-sided risk arrangements while accounting for differences in organizational capacity and the populations they serve. As discussed elsewhere in section III.G. of this final rule, we are finalizing all proposed benchmarking policies after considering the comments received. We believe that the benchmarking policies we are finalizing are designed to ensure that shared savings payments reflect measurable performance against applicable benchmarks, and we will continue to monitor these benchmarking policies' effects on net Medicare savings. We also believe that increasing the maximum shared savings rate for BASIC track Level E from 50 percent to 60 percent improves the balance of incentives between BASIC track Level E and the ENHANCED track, while preserving the ENHANCED track's higher shared savings rate for ACOs that assume greater downside risk.

Comment: Several supportive commenters requested flexibility for ACOs applying for a January 1, 2027 start date to revise their BASIC Level E or ENHANCED track selection after publication of the final rule. Collectively, the commenters explained that proposed changes to benchmarking, risk adjustment, and shared savings policies could invalidate actuarial analyses completed before the final rule and materially affect participation decisions. They offered several recommendations to support informed decision-making, including that CMS communicate the flexibility period promptly, provide at least 60 days for ACOs to reevaluate their track selections, incorporate complete 2025 reconciliation data, allow sufficient time for updated forecasting, avoid penalizing ACOs that need additional evaluation time, and provide technical guidance, data files, and modeling assumptions as early as possible. Another supportive commenter encouraged CMS to provide sufficient implementation timelines, information, and policy stability to allow ACOs to effectively plan for and implement the proposals. Rural ACOs in particular may face a disproportionate burden from needing to conduct additional actuarial analysis after key contracting activities have begun, according to a commenter, who argued that ACOs should not be expected to make significant risk-bearing decisions before the policies governing those decisions are finalized.

Response: We appreciate comments regarding concerns around the timing of the final rule and the potential need for ACOs applying for a January 1, 2027 start date to update their actuarial analyses and reassess their track selections in light of finalized benchmarking, risk adjustment, and

shared savings policies. We recognize the importance of providing ACOs with timely information and sufficient opportunity to make informed participation decisions, particularly when those decisions involve assuming downside risk. CMS intends to offer ACOs an additional opportunity to update their risk track selection during the Phase 2 RFI period (November 12, 2026–November 17, 2026 at 12:00 p.m. Eastern Time). CMS will communicate applicable procedures for revising track selections through established program guidance and application processes. We are unable to provide additional time for ACOs to reevaluate their track selection that would otherwise extend the Shared Savings Program application cycle and delay downstream program operations but will continue to provide relevant technical guidance, data, and modeling information, as appropriate, to support ACO decision-making. These operational considerations do not alter our determination that increasing the maximum shared savings rate for BASIC track Level E from 50 percent to 60 percent is appropriate.

Comment: A few supportive commenters offered additional implementation considerations. A commenter requested that the 60 percent shared savings rate apply to all ACOs already in BASIC Level E agreements. Ongoing CMS transparency and monitoring of effects on participation, net savings, and the Medicare Trust Fund were also recommended. Commenters further encouraged us to continue evaluating whether rewards appropriately reflect the level of financial risk assumed. Regarding other participation options, a commenter recommended strengthening incentives in one-sided BASIC track Levels A and B to encourage ACO entry. Another supportive commenter requested that the increased rate apply to participation agreements beginning on or after January 1, 2024, suggesting that early renewal would force rebasing and loss of accumulated savings history for these ACOs.

Response: We appreciate comments with recommendations regarding the scope and implementation of the policy. Section 1871(e)(1)(A) of the Act prohibits substantive regulatory changes from being applied retroactively unless the Secretary determines that failing to apply the changes retroactively would be contrary to the public interest. For purposes of the BASIC track Level E sharing rate policy, we do not believe that the policy rises to a level to satisfy the requirements for retroactive application of the rule. Maintaining that rate does not create comparable unanticipated harm or program disruption and therefore does not satisfy the public interest standard for retroactive application. Accordingly, the 60 percent maximum shared savings rate will apply only to ACOs participating in BASIC track Level E for agreement periods beginning on or after January 1, 2027. We agree that continued monitoring and transparency are important and will assess the policy's effects on program participation, net savings, and the Medicare Trust Fund as additional performance data become available. We will also continue to evaluate whether the Shared Savings Program appropriately aligns potential rewards with the level of financial risk assumed across participation options.

After consideration of public comments, we are finalizing our proposal to increase the sharing rate under BASIC track Level E from 50 percent to 60 percent, applicable for ACOs in agreement periods beginning on or after January 1, 2027, for performance years beginning on or after January 1, 2027, and the proposal to specify related provisions in the Shared Savings Program regulations under new § 425.605(d)(1)(v)(A)(*5*), as well as proposed technical and conforming changes to § 425.605(d)(1)(v)(A)(*4*) introductory text and § 425.605(h)(2).

We received no public comments on our proposed technical corrections at § 425.605. Specifically, with the CY 2026 PFS final rule (see 90 FR 49816 through 49817, and 50018), we finalized amendments to phrasing in § 425.605, including in paragraphs (d)(1)(v)(A)(*3*)(*ii*) and (d)(1)(v)(A)(*4*)(*ii*) (describing the sharing rate applied under BASIC track Level E, by PY, for an ACO that meets the alternative quality performance standard). There were technical errors in the implementation of these finalized changes in the Code of Federal Regulations (CFR). As such, we are finalizing as proposed the following technical corrections at § 425.605:

- § 425.605(d)(1)(v)(A)(3)(ii) to read, 50 percent multiplied by the ACO's quality score calculated according to § 425.512 for an ACO that meets the alternative quality performance standard by meeting the criteria specified in § 425.512(a)(4)(ii).
- § 425.605(d)(1)(v)(A)(4)(ii) to read, 50 percent multiplied by the ACO's quality score calculated according to § 425.512 for an ACO that meets the alternative quality performance standard by meeting the criteria specified in § 425.512(a)(5)(ii).

(2) Reduce the Maximum Weight on the Regional Adjustment for ACOs Under the ENHANCED Track

(a) Background

In the June 2016 final rule (81 FR 37962 through 37974), we introduced a regional adjustment to ACOs' historical benchmarks to increase participation in the Shared Savings Program and recognize efficiency of providers/suppliers in their regional service area. To implement the regional adjustment, we also established a methodology for defining regional Medicare spending. We defined an ACO's ''regional service area'' at § 425.20 as the counties in which its assigned beneficiaries reside and calculated regional costs using county-Level Medicare fee-for-service expenditures for assignable beneficiaries in those counties (81 FR 37958). These county expenditures were then aggregated to estimate average per-capita spending in the ACO's region, which served as the basis for the regional adjustment applied when benchmarks were rebased (81 FR 37957 and 37958).

In the June 2016 final rule (81 FR 37954 through 37991), we finalized a Shared Savings Program benchmark rebasing methodology to include a regional adjustment to the historical benchmark. More specifically, we finalized that the regional adjustment would be calculated as a percentage of the difference between risk-adjusted average per capita expenditures in the ACO's regional service area and the ACO's rebased historical expenditures (81 FR 37966). We finalized that the regional adjustment would be applied for second or subsequent agreement periods, while benchmarks for an ACO's first agreement period would continue to be based solely on the ACO's historical spending and were not adjusted for regional expenditures (81 FR 37973).

To provide time for ACOs to anticipate and adapt to the regional adjustment being applied to historical benchmarks, we implemented a phased approach that gradually increased the weight applied to regional spending. The first time an ACO's benchmark was rebased using the regional adjustment, we applied 35 percent of the difference between regional spending and the ACO's rebased historical benchmark if the ACO's spending was below the regional average, and 25 percent if the ACO's spending was above the regional average. The second time the benchmark was rebased, CMS increased the weight to 70 percent for ACOs with spending below their regional average and 50 percent for those with spending

above the regional average. Beginning with the third rebasing and in subsequent agreement periods, the adjustment was set at 70 percent of the difference between regional and ACO spending for all ACOs, unless CMS established a different weight through future rulemaking (81 FR 37971 through 37973).

In the 2016 final rule, we also finalized that if we adjust an ACO's benchmark during the term of the agreement period due to changes in participating providers/suppliers, the agency would reassess whether the ACO's spending was above or below the regional average to determine the appropriate adjustment percentage (81 FR 37964). Together, these provisions increased the role of regional spending in benchmark calculations while providing a transition period intended to limit abrupt benchmark reductions for higher-spending ACOs.

In the December 2018 final rule (83 FR 68018), we revised the methodology to address concerns that the 2016 regional adjustment could inadvertently inflate benchmarks for low-spending ACOs while discouraging participation by high-spending ACOs relative to their region. Under the revised rule, we also applied the regional adjustment starting with the first agreement period. By design, the regional adjustment results in more generous benchmarks for ACOs that spend below their regions. In the December 2018 final rule (83 FR 68018), we noted that our initial experience with the regional adjustment found that 80 percent of ACOs that renewed for a second agreement period starting in 2017 received a positive adjustment. These ACOs saw their benchmarks increase by 1.8 percent, on average, when the adjustment was applied with the 35 percent weight, with several ACOs seeing increases of over 5 percent, and one over 7 percent. We also noted that for ACOs that renewed for a second agreement period starting in 2018, they showed a similar share of ACOs receiving a positive adjustment and one ACO seeing an adjustment of over 10 percent. We noted our concern that as the weight applied to the regional adjustment increases, benchmarks for the ACOs with the lowest spending relative to their region would become overly inflated to the point where they would need to do little to change their care practices to generate savings, which could reduce incentives for these ACOs to improve the efficiency of care provided to beneficiaries. To limit the influence of regional cost disparities, we reduced the maximum weight that could be applied to the regional adjustment in any agreement period from 70 percent to 50 percent. Additionally, we capped the total dollar impact of the regional adjustment at ±5 percent of national OM per capita expenditures for each beneficiary category (83 FR 68017 through 68024, and 42 CFR 425.603).

In the CY 2023 PFS final rule (87 FR 69915 through 69923), we finalized additional policies to modify the regional adjustment to further support participation by high-cost or high-risk ACOs. We implemented a set of policies designed to mitigate the impact of negative regional adjustments on ACOs' benchmarks. First, we reduced the maximum negative adjustment from −5 percent to −1.5 percent of national OM per capita expenditures for Parts A and B services (based on benchmark year 3 for assignable beneficiaries). Second, we established an approach that gradually decreased the size of the negative regional adjustment for ACOs that have a higher proportion of dually eligible Medicare and Medicaid beneficiaries or a higher weighted—average prospective Hierarchical Condition Category (HCC) risk score (87 FR 69923). In the CY 2023 PFS final rule (87 FR 69919), we expressed our belief that by reducing the impact of negative regional adjustments, these policies would incentivize ACOs that serve high-cost beneficiaries to join or continue to participate in the Shared Savings Program.

Most recently, in the CY 2024 PFS final rule (88 FR 79185 through 79196), we modified the regional adjustment policy further to prevent any ACO from receiving an adjustment that would cause its benchmark to be lower than it would have been in the absence of a regional adjustment.

In the CY 2027 PFS proposed rule we stated, as part of CMS's effort to align spending and value in OM, we are focused on developing policies that would accelerate accountable care service delivery across a spectrum of risk-bearing options (91 FR 44073). To achieve this vision, we stated that our proposed change to the regional adjustment is informed by strategic objectives focused on strengthening financial incentives for ACOs to participate in the Shared Savings Program and driving savings for ACOs and the Trust Funds (91 FR 44073).

(b) Revisions

For the reasons discussed in the CY 2027 PFS proposed rule, we proposed to reduce the maximum weight used in calculating the positive regional adjustment for lower-spending ACOs participating in agreement periods under the ENHANCED track from 50 percent to 35 percent, while leaving the weights for ACOs with a higher spending than the regional average unchanged (91 FR 44073).

In the CY 2027 PFS proposed rule, we discussed that under the Shared Savings Program, an ACO's historical benchmark is adjusted to reflect differences between its own historical spending and average spending in its region—the regional adjustment (91 FR 44073). For ACOs with expenditures below their regional average, this adjustment is positive, increasing the ACO's benchmark and expanding savings opportunities available to the ACO. In the CY 2027 PFS proposed rule we shared an analysis of PY 2024 financial reconciliation data which indicates that ACOs in the ENHANCED track receive substantially larger positive regional adjustments on average than ACOs in BASIC track Level E ($304 versus $166 per beneficiary) (91 FR 44073). We stated that, taken together with observed differences in gross savings—where ENHANCED track ACOs achieve higher gross savings [319] per beneficiary than BASIC track Level E ACOs ($961 versus $714 in CY 2024)—this pattern suggests that more favorable benchmark adjustments may be contributing to the higher levels of observed gross savings for ENHANCED track ACOs (91 FR 44073). To assess whether the magnitude of the regional adjustment is associated with ACO performance, we calculated Pearson's correlations [320] between regional adjustment size and gross savings for ACOs reconciled in PY 2024.[321] Within the ENHANCED track, we noted that the larger regional adjustments are strongly associated with higher gross savings performance (r=0.691, n=59), a relationship that is not observed among BASIC track Level E ACOs (r=0.09, n=17) (91 FR 44073). We stated that the contrast between tracks raises the possibility that the scale of positive regional adjustments to the benchmark are partly driving performance rather than genuine efficiency gains (91 FR 44073). We noted that, while this is a descriptive finding, it is consistent with

[319] Gross savings were calculated as the ACO's total savings amount divided by the total assigned beneficiary person years.

[320] Pearson's correlation coefficient is a statistical measure that summarizes the strength and direction of the linear relationship between two variables, taking values from −1 (perfect negative relationship) to +1 (perfect positive relationship), with 0 indicating no linear relationship.

[321] Internal analysis of financial performance according to track/level of participation of Medicare Shared Savings Program ACOs that participated in PY2024, including assessment of whether the magnitude of regional adjustment is associated with ACO performance.

our concern motivating the proposed reduction in the positive regional adjustment weight from 50 percent to 35 percent (91 FR 44073). Moreover, the average size of the adjustment has gone up—from $206 in PY 2020 to $344 in PY 2025, while the share of ACOs receiving a positive regional adjustment has remained mostly stable within a range between 70 and 86 percent over the same time period. We stated that this pattern suggests that, while the prevalence of regional adjustments has remained broadly unchanged, the financial impact of those adjustments has increased over time, amplifying the influence of regional adjustments on ACO benchmark calculations (91 FR 44073).

As discussed in the CY 2027 PFS proposed rule, there is limited evidence suggesting that the ENHANCED track is generating additional Trust Funds savings relative to the BASIC track (91 FR 44073). First, the size of the regional adjustment may be contributing to higher gross savings performance in the ENHANCED track, which causes us to question whether those savings reflect genuine cost reduction. Second, lower spending ACOs (defined as those with historical expenditures below their regional average) in the ENHANCED track currently benefit from both a higher shared savings rate and larger regional adjustments on average. We stated that together these advantages may incentivize selection into the ENHANCED track independent of an ACO's capacity to achieve genuine cost savings to Medicare (91 FR 44074). We proposed to reduce the positive regional adjustment weight for these ACOs, paired with an increase in the shared savings rate for BASIC track Level E, which is designed to rebalance financial incentives across tracks and encourage ACOs to select their tracks based on their actual capacity to reduce costs rather than differences in financial advantages embedded in track design, thereby potentially improving Trust Funds net savings (91 FR 44074). We referred readers to the discussion in the CY 2027 PFS proposed rule (91 FR 44067) and the data analysis described in the CY 2027 PFS proposed rule (91 FR 44068 through 44072) for additional details.

We stated that we believe that a 35 percent positive regional adjustment would maintain consistency with the current schedule of weights used to calculate the regional adjustment, a structure with which ACOs are already familiar (91 FR 44074). We also stated that we believe this approach would minimize complexity by maintaining a single weight for lower-spending ENHANCED track ACOs for all participation years (91 FR 44074). We noted that, at the same time, it would preserve an appropriate balance between rewarding regional efficiencies demonstrated at the start of the agreement period and rewarding improvement relative to an ACO's past historical performance over time (91 FR 44074).

TABLE B-G13: PROPOSED PERCENTAGE WEIGHT APPLIED IN CALCULATING THE REGIONAL ADJUSTMENT

Agreement Period When ACO is Subject to Regional Adjustment	Weight Used to Calculate Regional Adjustment for BASIC Track ACOs that are Lower Spending Compared to Their Region	Weight Used to Calculate Regional Adjustment for ENHANCED Track ACOs that are Lower Spending Compared to Their Region	Weight Used to Calculate Regional Adjustment for ACOs that are Higher Spending Compared to Their Region
First	35%	35%	15%
Second	50%		25%
Third			35%
Fourth and subsequent			50%

NOTE: Refer to § 425.601(e)(2)(ii) and (f), and § 425.656(e) and (f). Refer to the December 2018 final rule (83 FR 67908–67909) Table 6 for examples of existing phase-in of regional adjustment weights based on agreement start date and applicant type.

We proposed this change to be effective for agreement periods beginning on January 1, 2027, and in subsequent years (91 FR 44074). We stated that reducing the weight used in calculating the regional adjustment applied to ACOs considering participation in the ENHANCED track would reduce the contribution of baseline regional efficiency on historical benchmark calculations (91 FR 44074). And we stated that, as a result, it would put a stronger emphasis on rewarding improvement in the provision of coordinated care and lowering costs rather than baseline efficiency at entry to the agreement period (91 FR 44074). We stated that the focus on improvement is accentuated when paired with the proposed higher prior savings adjustment weighting, discussed in the CY 2027 PFS proposed rule (91 FR 44076 through 44082). We stated that one goal of this proposal—reducing the regional adjustment weight—is to encourage ACOs to select a diverse cross-section of participants so that ACOs' success is driven by operational efficiencies and clinical performance rather than passive capture of ACO participants with pre-existing regional efficiencies (91 FR 44074). We added that more modest regional adjustment amounts could also result in ACOs opting for participation in BASIC track Level E instead of the ENHANCED track, and therefore result in the Trust Funds retaining a greater share of savings while still offering ACOs a long-term incentive for creating savings because of the proposed higher prior savings adjustments in future agreement periods (91 FR 44074).

In the CY 2027 PFS proposed rule, we stated that under this proposal, the phase-in of weights used in the regional adjustment calculation for agreement periods beginning on January 1, 2027, and in subsequent years, as determined by an ACO's expenditures relative to their region, would change for ENHANCED track ACOs (91 FR 44074). We did not propose to modify the negative regional adjustment weights, so the negative regional adjustment would remain unchanged (91 FR 44074). We proposed that the maximum weight used to calculate the regional adjustment for ENHANCED track ACOs that are lower spending relative to their region would be set at 35 percent for all agreement periods, replacing the current

phase-in schedule (91 FR 44074). We noted that the weights used for ACOs that are higher spending relative to their region, and for BASIC track ACOs that are lower spending would remain unchanged (91 FR 44074).

As discussed in the CY 2027 PFS proposed rule, to assess the impact of the proposed policy change, we conducted a simulation [322] using PY 2024 historical benchmarks, in which the maximum positive regional adjustment weight was reduced from 50 percent to 35 percent for lower spending ACOs,[323] all other parameters, including the prior savings adjustment, were held constant. ACOs with an agreement start date prior to January 1, 2024 (n=53) experience larger percentage reductions in historical benchmarks (-0.87 percent) than ACOs with agreement start dates of January 1, 2024 (n=48, -0.69 percent) (91 FR 44074). The difference reflects the benchmark methodology applicable to ACOs with agreement period start dates of January 1, 2024, under which ACOs are eligible for multiple upward adjustments and CMS applies the highest for which an ACO qualifies. In this simulation, we noted that ACOs that transition from receiving a regional adjustment to receiving the prior savings adjustment (because the regional adjustment has decreased to below the prior savings adjustment) experience smaller decreases in historical benchmarks than ACOs that remain subject to the regional adjustment (91 FR 44074 through 44075). We stated that for lower spending ACOs, the prior savings adjustment can partially offset reductions to the benchmark when the weight of the regional adjustment is reduced (91 FR 44075). ACOs with agreement period start dates prior to January 1, 2024, do not have prior savings adjustments included in historical benchmark calculations, so they would be more impacted by our proposal to reduce the maximum weight of the regional adjustment.

Our proposal to reduce the maximum weight used in calculating the positive regional adjustment for lower-spending ACOs participating in agreement periods under the ENHANCED track is consistent with our authority under section 1899(d)(1)(B)(ii) of the Act, which we have consistently relied on to make regional adjustments to the historical benchmark (81 FR 37962). In the CY 2027 PFS proposed rule, we stated that under this framework, ACO benchmarks are adjusted for beneficiary characteristics and other factors deemed appropriate by the Secretary, updated to reflect the projected absolute growth in national per capita expenditures for the original Medicare fee-for-service program, and reset at the commencement of each agreement period (91 FR 44075).

We proposed to amend § 425.656 to specify the phase-in of weights used in calculating the regional adjustment as applicable by agreement period start date (91 FR 44075). We proposed to amend the introductory text of paragraph (e) of § 425.656 to specify the paragraph includes the phase-in of weights used in the regional adjustment calculation for agreement periods beginning on or after January 1, 2024 and before January 1, 2027 (91 FR 44075). We proposed to redesignate paragraph (f) of § 425.656 as paragraph (g) (91 FR 44075). We proposed to add a new paragraph (f) to specify the phase-in of weights used in the regional adjustment calculation for agreement periods beginning on January 1, 2027, and in subsequent years (91 FR 44075). Accordingly, in the CY 2027 PFS proposed rule (91 FR 44075) we proposed to specify the following under new proposed § 425.656(f)(1) through (4):

- Under new paragraph (f)(1) we would specify that the first time that an ACO's benchmark is adjusted based on the ACO's regional service area expenditures, we would calculate the regional adjustment as follows:

++ Using 35 percent of the difference between the average per capita amount of expenditures for the ACO's regional service area and the average per capita amount of the ACO's initial or rebased historical benchmark, if the ACO is determined to have lower spending than the ACO's regional service area.

++ Using 15 percent of the difference between the average per capita amount of expenditures for the ACO's regional service area and the average per capita amount of the ACO's initial or rebased historical benchmark, if the ACO is determined to have higher spending than the ACO's regional service area.

- Under new paragraph (f)(2) we would specify that the second time that an ACO's benchmark is adjusted based on the ACO's regional service area expenditures, we would calculate the regional adjustment as follows:

++ For an ACO participating under the BASIC track—

—Using 50 percent of the difference between the average per capita amount of expenditures for the ACO's regional service area and the average per capita amount of the ACO's rebased historical benchmark if the ACO is determined to have lower spending than the ACO's regional service area; or

—Using 25 percent of the difference between the average per capita amount of expenditures for the ACO's regional service area and the average per capita amount of the ACO's rebased historical benchmark if the ACO is determined to have higher spending than the ACO's regional service area.

++ For an ACO participating under the ENHANCED track—

—Using 35 percent of the difference between the average per capita amount of expenditures for the ACO's regional service area and the average per capita amount of the ACO's rebased historical benchmark if the ACO is determined to have lower spending than the ACO's regional service area; or

—Using 25 percent of the difference between the average per capita amount of expenditures for the ACO's regional service area and the average per capita amount of the ACO's rebased historical benchmark if the ACO is determined to have higher spending than the ACO's regional service area.

- Under new paragraph (f)(3) we would specify that the third time that an ACO's benchmark is adjusted based on the ACO's regional service area expenditures, we would calculate the regional adjustment as follows:

++ For an ACO participating under the BASIC track—

—Using 50 percent of the difference between the average per capita amount of expenditures for the ACO's regional service area and the average per capita amount of the ACO's rebased historical benchmark if the ACO is determined to have lower spending than the ACO's regional service area; or

—Using 35 percent of the difference between the average per capita amount of expenditures for the ACO's regional service area and the average per capita amount of the ACO's rebased historical benchmark if the ACO is determined to have higher spending than the ACO's regional service area.

++ For an ACO participating under the ENHANCED track—

—Using 35 percent of the difference between the average per capita amount of expenditures for the ACO's regional service area and the average per capita amount of the ACO's rebased historical benchmark if the ACO is determined to have lower spending than the ACO's regional service area; or

[322] Internal simulation analysis using PY2024 historical benchmarks, in which the positive regional adjustment weight was reduced from 50 percent to 35 percent for lower spending ACOs to assess the impact of the proposed policy change. This analysis did not stratify by agreement period; all ACOs with the same start date (before or after January 1, 2024) were treated as a single cohort.

[323] Defined as ACOs with historical expenditures below their regional service area average.

—Using 35 percent of the difference between the average per capita amount of expenditures for the ACO's regional service area and the average per capita amount of the ACO's rebased historical benchmark if the ACO is determined to have higher spending than the ACO's regional service area.

• Under new paragraph (f)(4) we would specify that the fourth or subsequent time that an ACO's benchmark is adjusted based on the ACO's regional service area expenditures, we would calculate the regional adjustment as follows:

++ For an ACO participating under the BASIC track, using 50 percent of the difference between the average per capita amount of expenditures for the ACO's regional service area and the average per capita amount of the ACO's rebased historical benchmark.

++ For an ACO participating under the ENHANCED track—

—Using 35 percent of the difference between the average per capita amount of expenditures for the ACO's regional service area and the average per capita amount of the ACO's rebased historical benchmark if the ACO is determined to have lower spending than the ACO's regional service area; or

—Using 50 percent of the difference between the average per capita amount of expenditures for the ACO's regional service area and the average per capita amount of the ACO's rebased historical benchmark if the ACO is determined to have higher spending than the ACO's regional service area.

We proposed to specify under new § 425.656(f)(5) the approach we would use to determine if an ACO has lower or higher spending compared to the ACO's regional service area, which would be identical to the existing approach for making this determination as specified under § 425.656(e)(5), except to include updated cross-references to provisions within the proposed new paragraphs (f)(1) through (4) rather than paragraphs (e)(1) through (3) (91 FR 44075 through 44076).

In the CY 2027 PFS proposed rule (91 FR 44076), we also proposed the following technical and conforming changes to the Shared Savings Program regulations, for completeness and clarity:

• In § 425.656(a), describing (generally) the purpose of the section on calculating the regional adjustment to the historical benchmark and the timing of applicability, we proposed to revise the last sentence to denote the section ''applies to regional adjustment calculations for agreement periods beginning on January 1, 2024, and in subsequent years, *except as specified otherwise*'' (emphasis added to reflect revised text).

• In § 425.656(c)(2), describing percentage weight applied in the calculation of the regional adjustment, we proposed to amend the existing cross-reference to § 425.656(e) to include cross-references to both § 425.656(e) and the proposed new § 425.656(f).

• Redesignating § 425.656(f) as § 425.656(g), and in redesignated § 425.656(g) introductory text, describing special rules for determining the weights used in the regional adjustment calculation for a re-entering ACO, we proposed to replace the existing cross-references to § 425.656(b) through (e) with cross-references to § 425.656(b) through (f), to include proposed new § 425.656(f) in the cross-references.

• In § 425.600(f)(4)(ii), describing the program requirements that phase in over multiple agreement periods, and specifically the weight used in calculating the regional adjustment to the ACO's historical benchmark, we proposed replacing the existing cross-references to §§ 425.601(f) and 425.656(e), with cross-references §§ 425.601(f), § 425.656(e), and § 425.656(f), to include proposed new § 425.656(f) in the cross-references.

We sought comment on the proposal to reduce the maximum weight on the regional adjustment for lower-spending ACOs under the ENHANCED track to a weight of 35 percent for agreement periods beginning on January 1, 2027, and in subsequent years. We stated that under this proposal, the weight for higher-spending ACOs, and for BASIC track ACOs that are lower spending would remain unchanged (91 FR 44076). We also sought comment on proposed technical and conforming changes to other provisions of § 425.656, and § 425.600.

The following is a summary of the comments we received and our responses.

Comment: Some commenters supported the proposal to reduce the maximum weight of the positive regional adjustment. A commenter stated that increasing the shared savings rate under BASIC track Level E while reducing the weight of the positive regional adjustment in the ENHANCED track may help attract more high-cost ACOs to the BASIC track, where Medicare has greater opportunities to share in savings. A commenter supported both the regional adjustment and prior savings adjustment proposals and recommended that the policies be considered in tandem rather than approved separately. Another commenter supported the changes if it helps community health centers (CHCs) enter, remain in, and succeed under the Shared Savings Program.

Response: We appreciate the support of our proposal to reduce the maximum weight used in calculating the positive regional adjustment for lower-spending ACOs participating under the ENHANCED track from 50 percent to 35 percent. The policy we are finalizing is limited in scope. It only applies to ENHANCED track ACOs that have lower spending than their regional service area, beginning with the second agreement period, where the ACO's benchmark is adjusted based on regional service area expenditures. It does not change the weights used for the regional adjustment for BASIC track ACOs, for ENHANCED track ACOs in their first agreement period (which weight remains at 35 percent), or for ACOs with higher spending than their region. It also does not change the negative regional adjustment or the cap on the regional adjustment. We agree with commenters that the interaction of benchmark policies and shared savings opportunities can influence ACO participation decisions. As a commenter observed, increasing the shared savings rate under BASIC track Level E while reducing the maximum weight of the positive regional adjustment for lower-spending ACOs under the ENHANCED track may improve the relative appeal of BASIC track Level E for certain ACOs. We believe these changes, when considered together, will better balance participation incentives across tracks and more closely align the financial opportunities available under each track with an ACO's capacity to reduce expenditures and assume performance-based risk. We also agree that moderating the magnitude of the positive regional adjustment under the ENHANCED track advances our goal of reducing differences in benchmark advantages that may influence ACO participation and track selection. While we agree with the commenter that described the revisions to the regional adjustment and the prior savings adjustment as complementing one another, we do not believe they are inextricably linked or that they must be adopted together. Each independently furthers program goals: the reduced maximum weight applied to the positive regional adjustment moderates benchmark advantages for lower-spending ENHANCED track ACOs, and the increased prior savings adjustment scaling factor mitigates the effects of rebasing for ACOs that have generated savings.

We appreciate comments in support of the proposal on the basis that it may support the participation of community health centers in the Shared Savings Program. We also appreciate comments supporting the proposal on the basis that it would improve the alignment of financial incentives within the Shared Savings Program and moderate benchmark advantages that may result from differences in spending relative to an ACO's regional service area. We continue to believe that regional expenditures are an important component of benchmarking methodology while recognizing the need to ensure that the magnitude of the regional adjustment does not create unintended participation incentives.

Comment: A couple of commenters supported the proposal because it is consistent with their prior-year recommendations to mitigate selection effects and improve benchmark calculation but urged CMS to phase out the regional adjustment entirely to more fully address the effects of selective participation, noting this would also remove its influence on the prior savings adjustment and reduce program complexity. Some commenters further urged CMS to continue monitoring the selection effects of the regional adjustment, including its impact on the prior shared savings adjustment, as part of a broader effort to understand how the Shared Savings Program affects Medicare spending prior to applying risk adjustment and upward benchmark adjustments. Similarly, a commenter stated that regional benchmarks can reward preexisting efficiency without inducing additional savings and can attract already low-spending providers, and recommended that CMS reduce reliance on regional adjustments and evaluate changes in ACO composition as a program cost rather than as savings.

A couple of commenters supported the proposed reduction in the maximum weight of the positive regional adjustment for ENHANCED track ACOs but urged CMS to eliminate the regional adjustment across all tracks rather than reducing its weight for the ENHANCED track alone, stating the adjustment is asymmetrical because the benchmark increase for low-cost providers exceeds the reduction for high-cost providers and therefore rewards recruiting low-cost providers and beneficiaries over improving care. One of these commenters cited that 382 of 476 ACOs participating in 2024 received a positive regional adjustment and that the adjustment alone accounted for 2.1 percent of benchmark growth for ACOs beginning in 2024, and stated that higher benchmarks did not produce meaningful program growth. The commenter recommended that if CMS concludes additional support is needed to sustain rural and safety-net participation, it should provide that support directly rather than through a benchmark mechanism that rewards the exclusion of high-cost providers.

A commenter supported the proposed modifications, recognizing CMS's effort to place greater emphasis on an ACO's own performance and value-creation activities. The commenter recommended, however, that CMS consider a phased transition to the new methodology rather than an immediate change. The commenter stated that a gradual reduction of the regional adjustment factor would give organizations a predictable pathway to adapt their financial planning and care management strategies; and that a transition period would help maintain confidence in long-term program participation.

Response: We thank commenters for their support and recommendations. Several commenters recommended that we go beyond the proposed reduction and phase out or eliminate the regional adjustment, either for the ENHANCED track or across all tracks. The positive regional adjustment accounts for regional cost variation by making an ACO's benchmark less dependent on its own historical expenditures and more reflective of spending in its regional service area, which reduces disincentives for ACOs that are already efficient relative to their region to participate and continue lowering spending (91 FR 44081). Based on our experience with the program, we believe it is appropriate to rebalance rather than eliminate the adjustment by moderating the extent to which regional efficiency is reflected in benchmarks for lower-spending ENHANCED track ACOs.

Specifically, as discussed in the CY 2027 PFS proposed rule (91 FR 44073 through 44074), ENHANCED track ACOs on average receive larger positive regional adjustments than BASIC track ACOs while also benefiting from a higher shared savings rate. We noted that the proposed reduction in the positive regional adjustment weight for these ACOs, paired with an increase in the shared savings rate for BASIC track Level E, is intended to rebalance financial incentives across tracks and encourage ACOs to select their tracks based on their actual capacity to reduce costs rather than differences in financial advantages embedded in track design, thereby potentially improving Trust Funds net savings (91 FR 44074). We believe that reducing the maximum weight used in calculating the positive regional adjustment from 50 percent to 35 percent for lower-spending ENHANCED track ACOs, beginning in the second agreement period, meets the needs of the program by continuing to account for regional cost variation for these ACOs while better balancing financial incentives across tracks. We will monitor the impact of this change.

We appreciate the considerations commenters raised in support of a broader change, including the observation that the adjustment may influence the prior savings adjustment, that reliance on regional comparisons adds complexity to the benchmarking methodology, and that a substantial majority of ACOs participating in 2024 received a positive regional adjustment. We also acknowledge the concern that a regional comparison may recognize spending levels established before an ACO's participation in the program. As we explained in the December 2018 final rule, ''by design, the regional adjustment results in more generous benchmarks for ACOs that spend below their regions,'' and we stated at that time that we had concerns that the regional adjustment could have unintended consequences and adverse effects on ACO incentives and we would continue to monitor the regional adjustment for changes that may be needed in the future (83 FR 68018). The reduction we are finalizing moderates the magnitude of the positive regional adjustment for lower-spending ACOs in the track where it is largest, and it does not rest on the conclusion that the adjustment lacks continuing value. Additionally, we are not in this rule substituting a direct form of support for rural or safety net ACOs in place of the regional adjustment.

We agree with commenters who urged us to continue monitoring the selection effects of the regional adjustment, including its interaction with the prior savings adjustment. Consistent with the commitments we made when the adjustment was established and refined (81 FR 37962; 83 FR 68023), we will continue to monitor the effects of the regional adjustment on ACO participation, benchmark calculations, and expenditures, and will address any necessary refinements through future rulemaking. As part of that monitoring, we will consider the recommendation that we account for changes in ACO composition in assessing program savings. A commenter recommended that we phase in the reduced weight rather than apply it immediately. We address this recommendation together with other comments on implementation timing under section III.G.5.c.(2) of this final rule.

Comment: Most commenters opposed the proposal to reduce the maximum weight of the positive regional adjustment from 50 percent to 35 percent, stating it would reduce the recognition provided to ACOs that maintain expenditures below those of their regional service areas. These commenters stated that reducing the maximum weight would weaken incentives for ACOs to enter or remain in the ENHANCED track, accept greater levels of performance-based risk, and continue investing in activities intended to improve quality and reduce expenditures. Several commenters stated that the proposal is inconsistent with the Shared Savings Program's objective of encouraging ACOs to assume greater risk and could discourage efficient, high-performing ACOs from continuing their participation under the ENHANCED track.

A few of these commenters also stated that reducing the adjustment could reduce resources available for reinvestment in care coordination, population health infrastructure, analytics, workforce, information technology, and other activities that support quality improvement and expenditure reductions. Among commenters who opposed this proposal, some expressed particular concern about the effects on smaller ACOs, including those with benchmarks that are more heavily weighted toward regional expenditure trends. A couple of commenters added that the change could undermine the longer-term transition toward regional, sustainable benchmarking.

Some commenters stated that reducing the maximum weight in the Shared Savings Program while the CMS Innovation Center's Long-term Enhanced ACO Design (LEAD) Model retains a 50 percent positive regional adjustment would create inconsistent incentives across CMS accountable care programs and that efficient ENHANCED track ACOs might move to LEAD rather than remain in the Shared Savings Program. Some other commenters raised concerns about inconsistency across models, or about effects on continued participation, without predicting movement between programs. Commenters raising these concerns noted that CMS adopted the 50 percent positive regional adjustment in LEAD based on its application in the Shared Savings Program, that changing the adjustment is not a feature LEAD was intended to test, and that LEAD eliminates periodic rebasing during its 10-year performance period to provide a predictable opportunity to sustain savings and investment.

Response: We appreciate comments expressing concerns that reducing the maximum weight of the positive regional adjustment could diminish the incentive provided to ACOs that maintain expenditures below those of their regional service areas, weaken incentives to accept greater levels of performance-based risk, or discourage participation in the ENHANCED track. We continue to believe that regional expenditures are an important component of the benchmarking methodology. The policy we are finalizing does not eliminate the positive regional adjustment or alter its fundamental role. Instead, it moderates the maximum weight applied to the positive regional adjustment for lower-spending ENHANCED track ACOs, beginning in the second agreement period when the ACO's benchmark is adjusted based on regional service area expenditures. ACOs with higher spending than their region, and all BASIC track ACOs, are unaffected by this policy change. Lower-spending ENHANCED track ACOs will continue to be eligible to receive a positive regional adjustment.

We recognize commenters' concerns that a reduced regional adjustment may lessen the financial benefit available to certain ACOs and could affect participation decisions, particularly for ACOs considering whether to participate under the ENHANCED track. We also recognize commenters' concerns that shared savings payments support continued investments in care coordination, population health management, analytics, workforce, and other activities intended to improve quality and reduce expenditures. In evaluating this proposal, we considered the importance of maintaining incentives for participation and performance while also ensuring that the financial opportunities available under the Shared Savings Program remain appropriately balanced across participation options. We believe that under the finalized policy, affected ACOs will continue to have ample opportunities to generate shared savings and to use these resources to continue to improve quality and reduce expenditures in future years.

As discussed elsewhere in sections III.G.5.c.(1) and III.G.5.d of this final rule, we are simultaneously increasing the shared savings rate under BASIC track Level E and increasing the prior savings adjustment scaling factor. Considered together, these policies will better align the financial opportunities available under the program with an ACO's capacity to reduce expenditures and assume performance-based risk. These changes will support continued participation in the Shared Savings Program while preserving greater potential rewards for ACOs that accept the higher levels of risk associated with participation under the ENHANCED track.

Using PY 2025 simulation data, we estimate that 144 of 249 ENHANCED-track ACOs (58 percent) would be impacted by the proposed reduction in the maximum positive regional adjustment weight (0.50 to 0.35). Of those, 141 experienced a benchmark reduction, with an average decrease of approximately $96 per beneficiary per year (0.82 percent of the historical benchmark). Individual benchmark reductions ranged from about $0.26 to $193 (0 percent to 1.79 percent of the historical benchmark). Three ACOs benefitted from this proposed reduction as it reduced the negative impact of enrollment groups that were higher spending than their region while the positive impact of other enrollment groups was subject to the cap under both weightings (0.50 and 0.35). We note, however, that these estimated benchmark reductions should be considered in the context of the rule as a whole, including other financial provisions that are expected to offset or mitigate these impacts for many ACOs.

We acknowledge commenters' concerns regarding the possible effects of the policy on smaller ACOs and other ACOs whose benchmarks may be more affected by regional expenditures. The revised maximum weight applies prospectively to agreement periods beginning on or after January 1, 2027, and does not alter the weights applicable to agreement periods already underway. As discussed in the CY 2027 PFS proposed rule, we are not modifying the negative regional adjustment weights, which will remain unchanged (91 FR 44074). In addition, the revised maximum positive regional adjustment weight applies only to lower-spending ENHANCED track ACOs beginning the second agreement period and no impact on BASIC track ACOs, ENHANCED track ACOs with higher spending than their region, or ENHANCED track ACOs in their first agreement period. We will continue to monitor participation, track selection, and program outcomes following implementation, including among smaller ACOs and ACOs currently participating under the ENHANCED track, and may consider refinements through future rulemaking.

We recognize the commenters' concerns that different maximum

weights for the positive regional adjustment in the Shared Savings Program and the LEAD Model could affect how ACOs consider participation in each. The Shared Savings Program and LEAD are distinct initiatives with different structures, participation requirements and purposes, financial calculations, and methods to assess financial and quality performance and we do not believe that every benchmarking parameter should be identical across them. The Shared Savings Program is a permanent program established under section 1899 of the Act, and the LEAD Model is being tested under separate authority with a distinct design, including a longer performance period and different rebasing provisions. The adoption of a program parameter in an Innovation Center model does not preclude CMS from reconsidering that parameter for the Shared Savings Program and potentially implementing it through notice-and-comment rulemaking. The weights we are finalizing continue to provide a meaningful positive regional adjustment for lower-spending ENHANCED track ACOs, alongside the higher shared savings rate. We believe that ACOs choosing among accountable care options consider many factors, including the full set of benchmark and financial features. We nonetheless take seriously the concern that differences across our accountable care initiatives may create incentives that participants find difficult to navigate, and we will consider the interaction between the Shared Savings Program benchmarking methodology and our accountable care models as we continue to evaluate both. We will monitor participation in the program and the ENHANCED track and movement between the Shared Savings Program and other accountable care initiatives.

Comment: Some commenters who opposed this proposal stated that CMS has not provided sufficient analysis to support reducing the maximum weight of the positive regional adjustment from 50 percent to 35 percent. These commenters stated that CMS relied primarily on descriptive observations rather than rigorous analysis and asserted that the receipt of positive regional adjustment by efficient, long-standing ACOs reflected the intended operation of the policy rather than a problem with the existing weight. A commenter specifically recommended that CMS conduct and publish additional modeling of the effects of the proposal and obtain additional public input before making the change.

Some commenters recommended that CMS conduct further analysis before reversing a longstanding policy central to Shared Savings Program benchmark design, including causal analysis and simulation testing of current and higher caps accounting for ACO longevity across CMS ACO programs, size, rurality, physician versus hospital or health-system leadership, and patient complexity, and an examination of whether ACO participation generates market-level spillover effects that reduce spending among non-ACO-attributed beneficiaries and create an additional ratchet effect for successful ACOs.

Response: We appreciate comments with concerns regarding the analytic basis for the proposal. We disagree that this policy reverses a longstanding policy. The positive regional adjustment remains in place for all eligible ACOs, and the 35 percent weight we are finalizing for lower-spending ENHANCED track ACOs is the same weight that applies for ACOs in the first agreement period. The policy applies only to lower-spending ENHANCED track ACOs, beginning in the second agreement period, and ACOs with higher spending than their region and all BASIC track ACOs are unaffected. In developing this policy, we considered both program experience and quantitative analyses, including the size and distribution of the positive regional adjustment, changes in the average size of the adjustment over time, gross and net savings across participation options and the experience of ACOs participating in BASIC track Level E and the ENHANCED track. To further inform this final rule, we also examined performance under alternative benchmark scenarios, as described in our response to the following comment.

We appreciate comments suggesting a need for additional analysis, including causal and simulation analyses accounting for ACO longevity, size, rurality, leadership structure, and patient complexity, and an examination of market-level spillover effects. We will continue to evaluate these and other analytic approaches as we continue to monitor the program and consider future modifications to the program's financial methodology through notice-and-comment rulemaking.

Comment: A commenter stated that CMS's comparison of ACOs that moved from BASIC track Level E to the ENHANCED track with ACOs that remained in BASIC track Level E did not adequately account for benchmark rebasing. This commenter further stated that the 38 ACOs identified by CMS in the CY 2027 PFS proposed rule were, by its calculations, twice as likely to have undergone rebasing as BASIC track ACOs, and that the observed reduction in their net savings rate from 2.5 percent to 1.7 percent reflects the effects of rebasing more than any change in ACO performance. This commenter also stated that CMS measured savings relative to administratively established benchmarks rather than a counterfactual estimate of expenditures in the absence of ACO participation.

A commenter also stated that the observed correlation between the positive regional adjustment and gross savings partly reflects the inclusion of the adjustment in the benchmark used to calculate gross savings. The commenter reported that an alternative calculation intended to remove the adjustment from gross savings produced a substantially lower association, which the commenter cited as evidence that the result is sensitive to the savings measure used.

Response: In response to the comment that CMS measured savings relative to administratively established benchmarks rather than a counterfactual estimate, we agree that benchmark-measured savings are not, by themselves, causal estimates of expenditure reductions. However, the benchmark establishes a basis to determine shared savings payments, and the size of the regional adjustment directly affects shared savings payments and Trust Fund net savings. We also considered commenters' concerns that reducing the maximum regional-adjustment weight could weaken incentives to generate additional savings or affect the allocation of measured savings between Medicare and ACOs. A positive regional adjustment increases an ACO's benchmark and may increase the shared savings payment. The shared savings associated with that adjustment are measured relative to the adjusted benchmark and do not, by themselves, establish the amount by which Medicare expenditures were reduced relative to what expenditures would have been in the absence of ACO participation. We therefore considered both the role of benchmark adjustments in supporting continued participation and expenditure-reduction efforts and their effects on the calculation of gross savings, net savings, and shared savings payments. The analyses presented in our response to comments in section III.G.5.c.(2) of this final rule are comparisons under alternative benchmark scenarios and should not be interpreted as causal estimates of Medicare expenditure reductions relative to a counterfactual without ACO participation.

To further inform this final rule and respond to commenters' concerns

regarding the effects of rebasing and benchmark adjustments on comparisons across participation options, we examined performance for PY 2024 and PY 2025 under alternative benchmark scenarios in which benchmark adjustments (including the regional adjustment, prior savings adjustment, and population adjustment) were removed from the historical benchmark calculation. For PY 2024, BASIC track Level E ACOs generated $576 and $293 in gross and net per capita savings, respectively, compared with $767 and $205 for lower-spending ENHANCED track ACOs. When benchmark adjustments were removed, gross and net per capita savings were $418 and $205 for BASIC track Level E ACOs and $423 and $107 for lower-spending ENHANCED track ACOs. For PY 2025, BASIC track Level E ACOs generated $491 and $249 in gross and net per capita savings, respectively, compared with $756 and $203 for lower-spending ENHANCED track ACOs.[324] When benchmark adjustments were removed, gross and net per capita savings were $294 and $144 for BASIC track Level E ACOs and $361 and $98 for lower-spending ENHANCED track ACOs.

These analyses provide additional information regarding the contribution of benchmark adjustments to measured savings under the two participation options. The percentages and dollar amounts in this paragraph represent the reduction in gross per capita savings when all benchmark adjustments are removed from the historical benchmark; they do not represent estimated changes in shared savings payments under the finalized policy. Although lower-spending ENHANCED track ACOs generated higher gross per capita savings in both performance years, they also generated lower net per capita savings. As these scenarios remove all benchmark adjustments together, they do not isolate the effect of the regional adjustment. Removing benchmark adjustments reduced measured gross savings for both groups, with a larger reduction for lower-spending ENHANCED track ACOs (45 percent (-$344) in PY 2024 and 52 percent (-$395 in PY 2025)) compared to BASIC track Level E ACOs (-27 percent (-$158) and 40 percent (-$197)), respectively). In other words, roughly half of the measured gross savings for lower-spending ENHANCED track ACOs was attributable to benchmark adjustments, compared with roughly one-quarter to two-fifths for BASIC track Level E ACOs. Although these findings are descriptive and should not be interpreted as establishing a causal relationship, they do provide context for concerns that the observed relationship between positive regional adjustments and gross savings may partly reflect the effect of benchmark adjustments on the calculation of savings. They also suggest that lower-spending ENHANCED Track ACOs are more dependent on their benchmark adjustments, most often the regional adjustment, to generate their higher measured gross savings. As these ACOs also share in savings at a higher rate, a larger portion of their shared savings payments may reflect pre-existing efficiency relative to their region rather than reductions in expenditures during the performance year. At the same time, both groups continued to generate positive gross savings after benchmark adjustments were removed, indicating that ACOs in both tracks are achieving savings beyond what benchmark adjustments alone would produce. For these reasons, we believe moderating, rather than eliminating, the maximum positive regional adjustment weight for lower-spending ENHANCED track ACOs will better protect Trust Fund net savings while continuing to account for regional cost variation.

We also examined how the positive regional adjustment changed over time, further exploring the topic we described in the CY 2027 PFS proposed rule (91 FR 44073) that the financial impact of the regional adjustment has increased over time and may influence ACO track participation decisions. We analyzed historical benchmark data for all ACOs from PY 2022 through PY 2025 and identified 213 ACOs across all tracks that received a positive regional adjustment in every performance year of that period. Of those 213 ACOs, 92 entered a new agreement period in which their maximum positive regional adjustment weight increased from 35 percent to 50 percent, 28 entered a new agreement period in which the maximum weight was already 50 percent, and 93 did not enter a new agreement period, of which 51 ACOs were subject to a maximum weight of 35% and 42 ACOs were subject to a maximum weight of 50%. For the 92 ACOs whose maximum weight increased, the regional adjustment rose from an average of 2.2 percent to 3.7 percent of the historical benchmark; for the 28 ACOs whose maximum weight was already 50 percent, the regional adjustment rose from an average of 3.1 percent to 3.9 percent of the historical benchmark; for the 93 ACOs that did not enter a new agreement period, the regional adjustment remained relatively stable (2.8 percent to 2.6 percent of the historical benchmark). For both groups that entered a new agreement period, the difference between the ACO's historical spending and risk-adjusted regional spending also widened, from approximately 6 percent to approximately 8 percent of regional spending, indicating that the increases in the regional adjustment were accompanied by increases in the underlying differences in regional spending and did not reflect the higher weight alone.[325] This matters because the increase occurs regardless of whether an ACO is actually ready to generate the additional gross savings needed to offset the ENHANCED track's higher sharing rate. This indicates the agreement-period transition, and the accompanying weight increase may influence track participation decisions, separate from any change in the ACO's own performance in continuing to improve quality and decrease costs. Reducing the maximum positive regional adjustment weight to 35 percent for lower-spending ENHANCED track ACOs, beginning with the second agreement period, limits CMS's exposure to this effect, and better ensures the adjustment reflects an ACO's demonstrated readiness to generate the savings needed to preserve net savings under ENHANCED's higher sharing rate.

We conducted these additional analyses in response to comments and to consider all important aspects of the issue. Our proposal rested on the analyses described in the CY 2027 PFS proposed rule, including the larger average positive regional adjustment for ENHANCED track ACOs than ACOs in BASIC track Level E ($304 versus $166 per beneficiary), the association between regional adjustment size and gross savings (r=0.691 versus r=0.09), and the growth in the average adjustment from $206 to $344 while the share of ACOs receiving a positive adjustment remained between 70 and 86

[324] Please note, at the time of this final rule publishing, performance year 2025 financial reconciliation results have not yet been released to ACOs. We anticipate embargoed and unembargoed performance year 2025 financial reconciliation results to be shared with ACOs shortly after the finalization of this final rule.

[325] These analyses are descriptive, limited to a selected subset of ACOs with consistently positive regional adjustments. The analyses do not identify the causes of the observed changes in regional adjustment amounts or the underlying differences between ACO and regional spending, and they do not isolate the effects of renewal, benchmark rebasing, participant composition, or other concurrent factors. Accordingly, these results should not be interpreted as estimates of the effect of the policy finalized in this rule, and should not be interpreted as estimates of this rule's policy effects.

percent (91 FR 44073). These additional findings are consistent with, and further support, our conclusion to finalize the policy and should be interpreted as descriptive rather than causal evidence.

We also considered the comment that the observed reduction in net savings among ACOs that moved from BASIC track Level E to the ENHANCED track may reflect the effects of rebasing more than differences in underlying performance. We agree that savings measured relative to an ACO's benchmark are affected by the timing of rebasing and are not, by themselves, estimates of the reduction in expenditures relative to what would have occurred without ACO participation, although benchmarks are designed to approximate expected expenditures for the ACO's assigned population. Our decision therefore does not rest on that comparison alone. Rather, we considered that comparison together with the analyses described in the CY 2027 PFS proposed rule, the analyses described previously in this section, and the size and distribution of positive regional adjustments over time. Differences in net savings across participation options may also reflect differences in the applicable shared savings rates. We discuss the comparison of gross and net savings across tracks, including our consideration of rebasing among ACOs that changed tracks, in the Regulatory Impact Analysis in section VI.F.7. of this final rule. That section includes additional analytical evidence including the observation that per capita spending growth was similar for PY 2022 ACOs remaining in BASIC through PY 2024 versus the BASIC ACOs that migrated to ENHANCED by PY 2024, yet gross savings grew by a larger margin for the latter group and net savings fell sharply notwithstanding the favorable effect of regional adjustments on rebased benchmarks. That observation that ACO participation in the ENHANCED track has sharply increased both the average gross savings and average payment to ACOs migrating from the BASIC track without demonstrating lower average underlying spending growth relative to ACOs that remained in the BASIC track lends additional support to the finalized policy to marginally reduce the maximum weighting on the regional adjustment for lower-spending ENHANCED track ACOs.

Comment: Some commenters stated that the proposal appears to respond to a subset of organizations that may selectively recruit already efficient providers or passively capture efficient populations, and that a broad reduction in the maximum weight would reduce rewards for all lower-spending ENHANCED track ACOs, including those that achieved lower spending through sustained investment. These commenters recommended that CMS instead develop targeted policies addressing selective provider aggregation. A commenter acknowledged that participant selection may contribute to an ACO's observed regional efficiency at baseline in some cases but stated that it is not the only explanation: observed efficiency may also reflect efforts made before participation in the Shared Savings Program, such as performance improvements achieved in ACO REACH, for which no prior savings adjustment is available under the Shared Savings Program. Another commenter recommended that, if CMS's concern relates to newly formed ACOs or newly participating TINs receiving favorable regional adjustments before demonstrating performance, CMS should develop a more targeted policy, such as one based on length of participation in the program.

Response: We recognize that an ACO's composition, including the recruitment of ACO providers and suppliers whose assigned beneficiaries have relatively low spending, may contribute to the ACO's measured spending relative to its region. Because the positive regional adjustment is based on an ACO's spending position relative to its regional service area when the benchmark is established, changes in ACO composition can affect the size of the adjustment regardless of whether expenditures are subsequently reduced.

We also considered commenters' recommendation that we develop targeted policies to address selective provider aggregation or passive capture of efficient populations, rather than applying the reduced maximum weight to all lower-spending ENHANCED track ACOs. We are concerned that a policy targeted to a subset of ACOs could be difficult to administer consistently and could be avoided through changes to ACO structure or participant lists. Applying the reduced maximum weight to all lower-spending ENHANCED track ACOs, beginning with the second agreement period, addresses the magnitude of the positive regional adjustment regardless of the source of an ACO's regional efficiency. We will continue to monitor changes in ACO composition and their relationship to the regional adjustment and may consider additional refinements through future rulemaking.

We agree with commenters that participant selection is not the only explanation for an ACO's regional efficiency. Many ACOs have achieved lower spending through sustained efforts to improve care and manage expenditures, including efforts undertaken before entering the Shared Savings Program or through participation in other accountable care initiatives. The regional adjustment does not distinguish among the different factors that may contribute to an ACO's spending relative to its region. We also considered commenters' recommendations to adopt more targeted approaches, such as policies based on the length of program participation or the tenure of participating TINs. However, such approaches would introduce additional complexity and operational considerations into the benchmarking methodology that would likely outweigh the benefits. For example, a tenure-based approach would require us to determine how tenure is measured as ACO participant lists, legal entities, and TIN composition change, and to consider cross participation in other initiatives. It could also create incentives to restructure ACOs or ACO participant lists to qualify. These approaches were also not proposed, so other interested parties have not had an opportunity to comment on them. Rather than attempting to distinguish among the various sources of regional efficiency, we believe that reducing the maximum weight of the positive regional adjustment for lower-spending ENHANCED track ACOs, in the second agreement periods, provides a more straightforward approach to moderating the magnitude of the adjustment while continuing to account for regional cost variation in the benchmark.

Comment: Several commenters stated that the regional adjustment is a longstanding component of the Shared Savings Program benchmarking methodology and that ACOs have made participation, investment, and track-selection decisions in reliance on the current weights. Commenters requested additional transition time or other accommodations to account for those reliance interests. Some commenters asked CMS to allow ACOs to select their track after the final rule is published for ACOs applying for a January 1, 2027 start to allow them to review the changes and act in the best interests of their organization. These commenters also recommended that CMS phase-in the change, or delay implementation until 2028. Another commenter stated that the proposal was issued after the application cycle for PY 2027 had closed and would be finalized shortly before agreement periods beginning

January 1, 2027. The commenter added that ACOs entering a second agreement period on that date may have incurred considerable expenses in order to reach and make that decision based on the increase in the maximum weight from 35 percent to 50 percent between the first and subsequent agreement periods under the current policy and that ACOs made early renewal and application decisions during the PY 2027 application cycle, before the proposal was issued.

Response: We recognize that ACOs consider benchmarking policies when making participation and investment decisions, and that stability and predictability of our policies are important. We have repeatedly updated the benchmarking methodology in past rulemaking cycles. It is not a static, longstanding methodology, and when we propose updates to the benchmarking methodology, we consider the impacts those proposed policies would have on the full range of ACOs participating in the program, including transition times ACOs could need under the proposed policies and associated participation planning efforts ACOs may need to undertake should we finalize proposals. Regarding the comment recommending CMS delay the application of the policy, we do not agree that a delay to 2028 is warranted. We recognize that some ACOs incurred costs in making participation decisions for a January 1, 2027 start date. However, we do not believe these costs warrant delay. First, for lower-spending ACOs entering a second agreement period, the finalized 35 percent weight is the same weight that applied the first time their benchmark was adjusted; the policy forgoes an anticipated increase rather than reducing an existing adjustment. Second, ACOs entering agreement periods beginning January 1, 2027, may benefit from the increased prior savings adjustment scaling factor, the risk-adjusted 5 percent benchmark cap, and the growth adjustment finalized in this rule, and these policy changes may mitigate or outweigh a reduction in the regional adjustment. Finally, because weights are established at the start of an agreement period, delaying until 2028 would apply the 50 percent weight for the full duration of agreement periods beginning in 2027, prolonging the benchmark effects described in this section.

We agree, however, that applicants should have an opportunity to consider the final policy in making their track selection, including lower-spending ACOs entering a second agreement period under the ENHANCED track that may have anticipated the maximum weight available under current policy. Given the timing of CY 2027 PFS rulemaking and the Shared Savings Program application cycle for the January 1, 2027 start date, we are providing additional flexibility to applicants in making their final selection of track and level of participation. Following issuance of this final rule, ACOs applying for an agreement period start date of January 1, 2027 will have a time-limited opportunity to change their final selection between the BASIC track and the ENHANCED track, if eligible. This will be available during the Phase 2 RFI period, which will run November 12, 2026 to November 17, 2026 at 12:00 p.m. Eastern Time. We will communicate the applicable process through program guidance. We believe these approaches balance commenters' reliance interests with the policy objectives supporting this change.

Comment: Several commenters including a commenter that otherwise supported the proposal, disagreed with the characterization that ACOs may passively earn shared savings based solely on baseline regional efficiency. Some commenters stated that maintaining expenditures below those of the regional service area requires continuing investments in care coordination, population health management, analytics, workforce, information technology, beneficiary engagement, and other infrastructure, much of which is not separately billable. A few other commenters stated that these efforts must be sustained as assigned beneficiaries change over time. A commenter similarly stated that an ACO must continue managing utilization and expenditures to remain efficient relative to its region.

Many commenters stated that successful ACOs already face benchmark-ratchet effects because expenditure reductions achieved during one agreement period may be reflected in the benchmark established for a subsequent agreement period. These commenters stated that reducing the maximum weight of the positive regional adjustment could intensify the effects of rebasing and weaken incentives for ACOs to generate additional savings. Some commenters separately noted that CMS previously described the regional adjustment as making an ACO's benchmark more independent of its historical expenditures and more reflective of fee-for-service spending in its region.

Some commenters also stated that the regional adjustment and the prior savings adjustment serve distinct purposes and therefore are not interchangeable. These commenters stated that increasing the prior savings adjustment scaling factor would not fully offset a reduction in the regional adjustment because the prior savings adjustment recognizes savings generated during a prior agreement period, whereas the regional adjustment recognizes an ACO's sustained spending position relative to its regional service area. Some of these commenters stated that the net effect for many long-term participants would be limited or negative, citing CMS's own analysis showing continued net benchmark reductions for some ACOs and the fact that the prior savings adjustment considers only the final three years of an agreement period. Another commenter stated, however, that the proposed increase in the prior savings adjustment scaling factor would offset the effect of the reduced regional-adjustment weight for its ACOs. Some of these commenters stated that ACO activities may reduce expenditures for beneficiaries who are not assigned to the ACO and that these market-level spillover effects could create an additional benchmark-ratchet effect.

Response: We appreciate the comments expressing concerns, and we acknowledge the continuing effort required for many ACOs to maintain expenditures below those of an ACO's regional service area, and concerns that many ACOs are not passively benefitting from baseline regional efficiency. We recognize that maintaining expenditures below regional levels may require sustained investments in care coordination, population health management, analytics, information technology, workforce, beneficiary engagement, and other infrastructure, much of which may not be separately billable. We also recognize that these efforts must continue as an ACO's assigned beneficiary population changes over time.

We acknowledge maintaining spending below regional expenditures requires continuing effort and investment, and the amount of the positive regional adjustment is determined by the ACO's spending position relative to its regional service. Additionally, for some ACOs there is an opportunity to favorably select regionally efficient ACO participants that may be one factor contributing to the larger positive regional adjustments observed among some ENHANCED track ACOs. As the positive regional adjustment weight increases, it comprises a larger portion of an ACO's historical benchmark and of any resulting shared savings payment. For

some ACOs, the current maximum weight may therefore increase benchmarks and result in increased shared savings payments that can be driven in part based on selection of participants with regional efficiencies, which can be known and acted on by ACOs prior to the start of the performance year. This scenario is one consideration supporting our conclusion that the regional adjustment can be influenced by ACOs and the current maximum weight under the ENHANCED track is higher than warranted, balanced with a continued incentive of actual improvements that are made by many ACOs to sustain and increase regional efficiency.

We also acknowledge commenters' concerns regarding the benchmark ratchet effect and its potential effect on incentives to generate additional savings. When an ACO begins a new agreement period, its historical benchmark is rebased using more recent expenditure experience, including expenditure reductions achieved in earlier periods. As a result, savings generated by an ACO in a prior agreement period may lower the benchmark against which its performance is measured in a subsequent agreement period. The prior savings adjustment and the regional adjustment are among the policies intended to mitigate this effect; the regional adjustment does so in part by making an ACO's benchmark less dependent on its own historical expenditures and more reflective of expenditures in its regional service area. We agree that rebasing may lower benchmarks for successful ACOs, but we do not believe the finalized policy materially undermines the mitigation of that effect. Lower-spending ENHANCED track ACOs continue to receive a positive regional adjustment, and the increased prior savings adjustment scaling factor returns a larger share of prior savings to the rebased benchmark. The ACPT also continues to insulate a portion of the annual benchmark update from savings generated by ACOs (87 FR 69882).

We also acknowledge that the regional adjustment and the prior savings adjustment address related, but distinct, features of the benchmarking methodology. The regional adjustment reflects the relationship between an ACO's spending and spending in its regional service area, and it reduces the benchmark's dependence on the ACO's historical expenditures. Whereas the regional adjustment depends on the ACO's spending relative to its region regardless of whether the ACO generated savings, the prior savings adjustment is tied directly to savings the ACO generated against its benchmark during a prior agreement period. We therefore do not view the prior savings adjustment and the regional adjustment as interchangeable, and we did not propose to increase the prior savings adjustment scaling factor as a substitute for a higher regional adjustment weight or expect that it would offset the revised weight for every ACO. In our simulations, the increase offset or mitigated the reduced weight for some ACOs (9 of 37 in the 2024 cohort and 42 of 107 in the 2025 cohort) but not for others (91 FR 44078). Rather, we intentionally preserved the regional adjustment, albeit at a lower weight, and are increasing the scaling factor to the prior savings adjustment to continue both types of incentives for ACOs across the program while providing an additional incentive to generate savings, because a larger share of savings generated during the current agreement period will be reflected in the ACO's benchmark for its next agreement period. As discussed in sections III.G.5.c.(2) of this final rule, we considered the interaction across the program between the maximum regional-adjustment weight and the increase in the prior savings adjustment scaling factor policies in developing the final provisions. We recognize that their combined effect will vary across ACOs based on their historical expenditures, regional spending position, prior savings, agreement-period timing, and other features of the benchmark calculation.

Finally, we acknowledge commenters' concerns that ACO activities may affect expenditures for beneficiaries who are not assigned to the ACO and these spillover effects may therefore contribute to changes in regional expenditures. Such spillover effects could influence regional expenditure comparisons, and we will continue to monitor the related interaction among ACO performance, regional expenditure trends, rebasing, and benchmark adjustments.

Comment: A couple of commenters urged CMS to ensure that reducing the ENHANCED track positive regional adjustment weight does not inadvertently disadvantage ACOs whose market characteristics shape their measured performance, stating that both rural and higher-cost-market ACOs may be affected differently than the proposal contemplates. One of these commenters stated that its ACO has demonstrated strong performance relative to its region but that a lower weight would make it more difficult for ACOs in higher-cost markets to demonstrate savings when compared with lower-cost regions and encouraged CMS to carefully consider geographic variation in spending when finalizing the proposal.

A few commenters suggested that CMS consider applying different benchmark policies based on an ACO's tenure in the program or the length of time participating TINs have been engaged in accountable care models. These commenters stated that such an approach would address CMS's stated concerns without reducing incentives for ACOs that have demonstrated long-term success. A commenter also recommended that CMS retain the 50 percent maximum weight and make it available to ACOs returning to the Shared Savings Program in their second or subsequent agreement period, regardless of whether they previously received a regional adjustment.

A commenter recommended that CMS retain the 50 percent maximum weight for the positive regional adjustment under the ENHANCED track and also raise the 5 percent cap on upward benchmark adjustments (currently 5 percent of national per capita expenditures for assignable beneficiaries) which is distinct from the maximum weight. The commenter stated that the 5 percent cap limits the extent to which these adjustments mitigate the effects of rebasing and constrains the long-term savings opportunity available to ACOs.

Response: We appreciate the comments expressing concerns and making recommendations and have considered each of the alternatives suggested.

We appreciate comments with concern that market characteristics shape measured performance. The policy we are finalizing is limited in scope: it applies only to the maximum weight used in calculating the positive regional adjustment for ACOs participating under the ENHANCED track. It does not change the weights applicable to the BASIC track, the calculation of the negative regional adjustment, or the cap on the adjustment. An ACO that spends more than its region is unaffected by this change, as is an ACO participating at any level of the BASIC track. The reduction also does not eliminate the incentive of regional efficiency; it moderates the maximum weight at which that efficiency is reflected in the benchmark for the track in which the adjustment has been largest. We will monitor participation among rural ACOs and among ACOs in higher-cost markets following implementation.

Commenters suggested that we differentiate benchmark policies based

on an ACO's tenure in the program, the length of time participating TINs have been engaged in accountable care initiatives, or the risk profile of an ACO's assigned population. We disagree with commenters who advocated that we adopt different benchmark policies as described in this section of this final rule. These suggestions go beyond the scope of our proposal, and other commenters have not had an opportunity to review and comment on such potential policies. Additionally, a differentiated structure of the kind a commenter suggested would introduce additional complexity into the benchmarking methodology. For example, such a structure would require us to determine how tenure would be measured across changes in ACO composition, legal entity, and participation across initiatives. The recommendation to make the 50 percent maximum weight available to returning ACOs that have not previously received a regional adjustment would increase, rather than moderate, the magnitude of the positive regional adjustment under the ENHANCED track and is therefore inconsistent with the policy we are finalizing.

We also considered the recommendation to raise the 5 percent cap applicable to positive benchmark adjustments. Because this recommendation concerns the level and calculation of the cap, we address it in section III.G.5.e of this final rule.

Accordingly, we are finalizing the amendments to § 425.656 as proposed, including the addition of new § 425.656(f) specifying the phase-in of weights used in the regional adjustment calculation for agreement periods beginning on January 1, 2027, and in subsequent years, together with the conforming changes to § 425.656(a), § 425.656(c)(2), redesignated § 425.656(g), and § 425.600(f)(4)(ii). We are also providing the additional flexibility for applicants described in this section.

After consideration of public comments, we are finalizing our proposal as follows: we are finalizing, without modification, our proposal at § 425.656 to reduce the maximum weight used to calculate the positive regional adjustment for ENHANCED track ACOs from 50 percent to 35 percent. We are also finalizing, without modification, our proposed revisions at § 425.600(f)(4)(ii) to replace the existing cross-references to §§ 425.601(f) and 425.656(e), with cross-references to §§ 425.601(f), § 425.656(e), and § 425.656(f), to include new § 425.656(f) in the cross-references. This change rebalances the role of regional and historical expenditures in establishing benchmarks, while continuing to recognize ACOs that spend less than their region. Together with the increase to the BASIC track Level E shared savings rate and the revisions to the prior savings adjustment finalized in sections III.G.5.c.(1) and III.G.5.d of this final rule, this policy better aligns each track's financial opportunity with an ACO's capacity to reduce expenditures. Consistent with our prior commitments (81 FR 37962; 83 FR 68018), we will monitor how this policy affects ACO participation, track selection, and program savings, and will address any needed changes through future rulemaking.

d. Increase the Prior Savings Adjustment by Increasing the Scaling Factor

(1) Background

As discussed in the CY 2027 PFS proposed rule, under section 1899(d)(1)(B)(ii) of the Act, an ACO's benchmark must be reset at the start of each agreement period (91 FR 44076). Section 1899(d)(1)(B)(ii) of the Act provides the Secretary with discretion to adjust the historical benchmark by ''such other factors as the Secretary determines appropriate.'' Under this authority, as described in the June 2015 final rule (80 FR 32785 through 32791), we established a prior savings adjustment [326] that applied when establishing the benchmark for ACOs entering a second agreement period beginning on January 1, 2016, to account for the average per capita amount of savings generated during the ACO's prior agreement period (79 FR 72838). The prior savings adjustment was originally designed to adjust an ACO's benchmark for its second agreement period to account for the average per capita amount of savings generated by the ACO across the 3 performance years of its first agreement period. This average per capita amount also accounted for the ACO's quality performance in each performance year under its first agreement period. We limited the adjustment to the benchmark for the second agreement period to the average number of assigned beneficiaries in the prior agreement period (80 FR 32789).

We removed the prior savings adjustment introduced as part of the June 2015 final rule and replaced it with the existing regional adjustment as part of the June 2016 final rule (81 FR 37954 through 37992). We reintroduced the prior savings adjustment as an ongoing component of the Shared Savings Program as part of the CY 2023 PFS final rule (87 FR 69898 through 69915).

In the CY 2023 PFS final rule, we established the methodology, codified at § 425.658 of the regulations, for the prior savings adjustment that applied in the establishment of benchmarks for renewing ACOs and re-entering ACOs entering an agreement period beginning on January 1, 2024, and in subsequent years. We describe the steps for calculating the prior savings adjustment in the CY 2023 PFS final rule (87 FR 69898). We finalized revisions to § 425.656 that specify how we express the regional adjustment as a single value and use this value in determining whether a regional adjustment or prior savings adjustment will be applied to the ACO's benchmark.

In the CY 2024 PFS final rule (88 FR 79185 through 79196), in response to concerns that negative regional adjustments may make it more difficult for ACOs to succeed in the Shared Savings Program financially, we finalized revisions to § 425.652 to specify that if the regional adjustment, when expressed as a single value, is negative then no regional adjustment will be applied to an ACO's historical benchmark. We also finalized revisions to § 425.658 to specify that we will calculate the per capita prior savings adjustment as the lesser of 50 percent of the prorated average per capita savings amount (computed as described in § 425.658(b)(3)(ii)) and the cap equal to 5 percent of national per capita OM expenditures for assignable beneficiaries for BY3, expressed as a single value.

In the CY 2024 PFS final rule we also finalized modifications to the approach to calculate and apply the regional adjustment, or the regional adjustment in combination with the prior savings adjustment, if applicable, for ACOs in agreement periods starting on January 1, 2024, or the regional adjustment, prior savings adjustment, or population adjustment, if applicable, for ACOs in agreement periods starting on January 1, 2025, and in subsequent years. Specifically, we finalized revisions to § 425.652 that specify how we will determine and apply the adjustment to an ACO's benchmark depending on whether the ACO is eligible for a prior savings adjustment, whether the ACO is eligible for the population adjustment, and whether the ACO's regional adjustment, expressed as a single value, is positive or negative. An ACO will receive the most favorable of the adjustments, as applicable, with each

[326] In the June 2015 final rule (80 FR 32788), we referred to this policy as accounting for shared savings payments when resetting the benchmark, after which we refer to it as the prior savings adjustment.

adjustment capped at 5 percent of BY3 national assignable expenditures.

In the CY 2024 PFS proposed rule (88 FR 52494 through 52495), we requested information on potential changes to the 50 percent scaling factor used in determining the prior savings adjustment. Most commenters supported increasing the prior savings adjustment, with several commenters recommending using the maximum shared savings rate the ACO was eligible to receive during the benchmark years. For the full summary of comments, refer to the CY 2024 PFS final rule (88 FR 79228).

(2) Revisions

In the CY 2023 PFS final rule (87 FR 69910), we stated that we believed that a 50 percent scaling factor used to calculate the prior savings adjustment would be appropriate because it represents a middle ground between the maximum sharing rate of 75 percent under the ENHANCED track and the lower sharing rates available under the BASIC track. In the CY 2027 PFS proposed rule, we stated that, after further analysis of this policy and gaining additional years of experience with the current policy, we believe changing the prior savings adjustment scaling factor from 50 percent to 75 percent is warranted because the current methodology may not provide sufficiently strong or consistent incentives for ACOs to generate and sustain savings (91 FR 44076 through 44077). We likewise stated that we believe that the current methodology may not provide sufficient incentives for ACOs to continue participation in future agreement periods when the ACOs are compared against benchmarks that include their own previous success in reducing expenditures (91 FR 44077). As noted in the CY 2023 PFS final rule (87 FR 69909), in an analysis estimating how the prior savings adjustment may impact ACOs participating in the Shared Savings Program if the prior savings adjustment would have been in place at that time, among 123 ACOs entering a new agreement period in PY 2020 and reconciled in one or more benchmark years, only 27 (22 percent) would have received a final adjustment that included prior savings. Among 153 ACOs entering a new agreement period in PY 2022 and reconciled in one or more benchmark years, only 43 (28.1 percent) would have received such an adjustment. These findings suggested that relatively few ACOs would benefit from the prior savings adjustment under the methodology that included the 50 percent scaling factor. Furthermore, we stated in the CY 2027 PFS proposed rule that after gaining initial experience with the prior savings adjustment applicable to agreement periods beginning on January 1, 2024, and in subsequent years, we have seen a relatively small number of ACOs receiving the prior savings adjustment with 82 (17 percent) of ACOs in CY 2025 receiving a prior savings adjustment and 18 (4 percent) of ACOs in PY 2024 receiving a prior savings adjustment (91 FR 44077).

In the CY 2023 PFS final rule (87 FR 69904), we also described scenarios in which ACOs with strong prior savings may not receive the prior savings adjustment. For example, as illustrated in Table 68 (87 FR 69907), pro-rating and scaling of prior savings using the 50 percent scaling factor can result in the final prior savings adjustment being smaller than the regional adjustment, even when the ACO's prior savings adjustment prior to applying the scaling factor exceeds the regional adjustment. In the CY 2027 PFS proposed rule, we stated that this dynamic may weaken incentives for ACOs to generate and sustain savings over time (91 FR 44077).

In the CY 2027 PFS proposed rule, we noted that we conducted a simulation limited to ACOs participating in the ENHANCED track with lower spending than their regional service area, because these ACOs would be directly impacted by the proposed change to the weight of the regional adjustment (91 FR 44077). The simulation applied both the proposed reduction of the regional adjustment weight from 50 percent to 35 percent and increasing the prior savings adjustment scaling factor from 50 percent to 75 percent. See the CY 2027 PFS proposed rule (91 FR 44072 through 44076) for a description of the proposed change to the regional adjustment weight. The simulation was conducted on two cohorts: 37 ENHANCED track ACOs that began an agreement period on January 1, 2024, and 107 ENHANCED track ACOs that began an agreement period on January 1, 2025. We stated that, for both cohorts, we focused on PY1 of the agreement period; 2024 and 2025, respectively (91 FR 44077). Table B–G11 of the CY 2027 PFS proposed rule reports the results for five mutually exclusive groups of ACOs (91 FR 44078). We described that: *Group 1 (had regional adjustment and still would have it, no benchmark change due to 5 percent cap)* includes ACOs that remain at the existing 5 percent cap, leaving benchmarks unchanged, as the reduction in the regional adjustment weight did not decrease the regional adjustment below the 5 percent cap. *Group 2 (had regional adjustment, now would have prior savings adjustment)* consists of ACOs that currently receive a regional adjustment and for which the proposed increase in the prior savings adjustment scaling factor is large enough to either fully offset the reduced regional adjustment, resulting in benchmarks that do not decline and may increase, or to mitigate the effect of the reduced regional adjustment to some degree as the applicable adjustment to the benchmark would change as a result of the proposed policy changes. *Group 3 (had regional adjustment and still would have it, net benchmark decrease)* includes ACOs that receive the full proposed reduction to the weight of the regional adjustment and for which the prior savings adjustment, even at the proposed 75 percent scaling factor, remains smaller than the regional adjustment. For these ACOs, the final adjustment category would remain the regional adjustment both before and after the changes, resulting in a net decrease to the benchmark. *Group 4 (subject to the current 50 percent prior savings adjustment scaling factor)* includes ACOs for which the prior savings adjustment calculated under the current 50 percent scaling factor was already the applicable adjustment prior to the proposed policy change to the regional adjustment weight; because the prior savings adjustment remains the applicable adjustment, any benchmark change for these ACOs reflects the effect of the proposed increase in the prior savings adjustment scaling factor. *Group 5 (not subject to the proposed regional adjustment weight change)* includes ACOs that are not exposed to the regional adjustment weight adjustment—either because they are higher spending or already subject to the 35 percent positive weight—but that received the increased prior savings adjustment (see footnote on Table B–G11 of the CY 2027 PFS proposed rule at 91 FR 44078). We noted in the CY 2027 PFS proposed rule that one ACO in the 2025 cohort had the population adjustment as their applicable adjustment and would continue to have it with any of the proposed changes (91 FR 44077).

TABLE B-G14: ESTIMATED BENCHMARK IMPACT OF PROPOSED REDUCTION IN REGIONAL ADJUSTMENT WEIGHT AND INCREASING PRIOR SAVINGS ADJUSTMENT

	ACOs beginning an Agreement Period on January 1, 2024			ACOs beginning an Agreement Period on January 1, 2025		
Group	Number of ACOs (N=37)*	Percent of ACOs (%)	Mean Change Per Capita Benchmark ($)	Number of ACOs (N=107)*	Percent of ACOs (%)	Mean Change Per Capita Benchmark ($)
(1) Regional Adjustment retained (no benchmark change)	0	0.0%	$0.00	0	0.0%	$0.00
(2) Had regional adjustment would transition to prior savings adjustment	9	24.3%	$29.79	42	39.3%	$16.70
(3) Had regional adjustment and would continue to have it	21	56.8%	-$113.31	31	29.0%	-$85.36
(4) Subject to the current percent prior savings adjustment	7	18.9%	$105.98	33	30.8%	$110.30
(5) Not subject to the proposed regional weight change**	21	36.2% of total (n=58)	$15.98	24	18.3% of total (n=131)	$27.71

Table notes:
* Number of ACOs subject to the proposed policy changes.
** ACOs in this group are not subject to the regional adjustment weight reduction, but where applicable, the proposed 75 percent prior savings adjustment scaling factor was applied.

As discussed in the CY 2027 PFS proposed rule, for ACOs that began an agreement period on January 1, 2025, the proposed policies would produce no meaningful net aggregate impact on benchmarks for ACOs in group 1 (91 FR 44078). After applying the reduced regional adjustment weight, no ACO remains constrained by the 5 percent cap. Of the 107 ACOs, 42 (39.3 percent) fall in Group 2, with benchmarks increasing by a mean of $16.70, 33 (30.8 percent) fall in Group 4, where the prior savings adjustment was already dominant, and 31 ACOs (29.0 percent) fall in Group 3 with benchmark decreases averaging $85.36 in magnitude. For the 2025 cohort, the increase in the scaling of the prior savings adjustment more than offsets the reduction in the weight of the regional adjustment in aggregate, producing a modest net benchmark increase concentrated among ACOs with proven savings records. The larger share of ACOs in this cohort for which the prior savings adjustment is the applicable adjustment (70.1 percent; Groups 2 and 4) reflects, in part, cohort-specific differences in benchmark composition and adjustment eligibility—specifically, a greater prevalence of ACOs with prior savings large enough that the prior savings adjustment exceeds the regional adjustment and therefore determines the final benchmark adjustment.

We noted in the CY 2027 PFS proposed rule that, for ACOs that began an agreement period on January 1, 2024, the combined effect of the two proposed policies produces a net downward aggregate impact on benchmarks (91 FR

44078 through 44079). No ACO in this cohort is constrained by the 5 percent cap, leaving most directly affected by the proposed regional adjustment weight reduction, with limited offset from the increase in the prior savings adjustment scaling factor. As a result, 21 ACOs (56.8 percent of those impacted) would experience benchmark decreases. A smaller share of ACOs hold the prior savings adjustment as their applicable adjustment (43.2 percent). Prior savings amounts are generally insufficient to exceed regional adjustments, and for these ACOs, the net effect of the two policies is a downward adjustment, consistent with the intended effect for ACOs whose benchmarks might have been inflated by the generous regional adjustment. As ACOs have additional incentives to focus on increasing savings in the future, prior savings amounts may continue to grow, resulting in different impacts than what are initially observed in these analyses.

As discussed in the CY 2027 PFS proposed rule, we extended this analysis by re-running the simulation and incorporating the proposed risk adjustments to the 5 percent cap on positive regional adjustments and to the prior savings adjustment cap (Table B–G12 at 91 FR 44079) as outlined the CY 2027 PFS proposed rule (91 FR 44082 through 44087).

TABLE B-G15: ESTIMATED IMPACT OF PROPOSED REGIONAL ADJUSTMENT WEIGHT REDUCTION, INCREASING PRIOR SAVINGS ADJUSTMENT, AND RISK-ADJUSTED CAPS ON ACO BENCHMARK ADJUSTMENTS

	ACOs beginning an Agreement Period on January 1, 2024			ACOs beginning an Agreement Period on January 1, 2025		
Group	**Number of ACOs (N=37)***	**Percent of ACOs (%)**	**Mean Change Per Capita Benchmark ($)**	**Number of ACOs (N=107)***	**Percent of ACOs (%)**	**Mean Change Per Capita Benchmark ($)**
(1) Regional Adjustment retained (no benchmark change)	0	0.0%	0.00	0	0.0%	0.00
(2) Had regional adjustment, would transition to prior savings adjustment	9	24.3%	13.97	41	38.3%	7.22
(3) Had regional adjustment and would continue to have it	21	56.8%	-115.91	32	29.9%	-93.72
(4) Subject to the current percent prior savings adjustment	7	18.9%	107.03	33	30.8%	121.36
(5) Subject to the population adjustment and would transition to regional adjustment	0	0	0	1	0.9	11.03

Table notes:

* Number of ACOs subject to the proposed policy changes.

We discussed in the CY 2027 PFS proposed rule that the results in Table B–G12 (91 FR 44079) under the proposed risk-adjusted 5 percent cap are largely consistent with those in Table B–G11 (91 FR 44078) (91 FR 44079 through 44080). The distribution of ACOs across Groups 2 through 4 remains largely unchanged, and the reduction in the weight of the regional adjustment continues to be the primary driver of benchmark changes in both cohorts. The similar results between both analyses are a result of three factors. First, weighted mean risk scores in this sample are clustered near 1.0 (approximately 0.94 to 0.99 across enrollment statuses and cohorts), so risk-adjusting the caps changes their values only modestly (between 1 to 6 percent) and generally does not

materially affect ACOs' effective regional or prior savings adjustments. Second, for most ACOs eligible for the prior savings adjustment, the scaling factor is the applicable constraint rather than the cap; therefore, modifying a non-binding cap has little or no effect on the adjustment. Third, the reduction in the weight of the regional adjustment from 0.50 to 0.35 produces benchmark impacts substantially larger than those associated with risk-adjusting the caps, making it an important driver of changes to the benchmark under both analyses.

We stated that, to strengthen incentives and mitigate impacts from ACOs' past performance on future agreement periods, we proposed increasing the prior savings adjustment scaling factor, program-wide, from 50 percent to 75 percent, beginning with agreement periods starting January 1, 2027, and subsequent agreement periods (91 FR 44080). We noted that we have heard from interested parties that the prior savings adjustment scaling factor should be 100 percent to encourage further savings and address rebasing concerns (91 FR 44080). However, we stated that we believe that increasing the prior savings adjustment scaling factor above 75 percent would limit incentives for ACOs to continue to decrease spending in second and subsequent agreement periods, since they would be rewarded largely for previously demonstrated savings and would not be incentivized to continue to decrease costs (approaching 100 percent reward if the prior savings adjustment scaling factor is above 75 percent) (91 FR 44080). We stated that without a sufficient incentive level to decrease spending, this would jeopardize the ability of the Shared Savings Program to generate future savings to the Trust Funds (91 FR 44080). We also stated that we believe that a prior savings adjustment scaling factor of 75 percent strikes the appropriate balance between encouraging long-term participation in the program and encouraging ACOs to save, while also supporting savings to the Trust Funds (91 FR 44080).

Table B–G13 of the CY 2027 PFS proposed rule (91 FR 44081) shows simulated results of the proposal to increase the prior savings adjustment scaling factor to 75 percent while holding the weight on the regional adjustment constant. Table B–G13 of the CY 2027 PFS proposed rule (91 FR 44081) is divided into several sections that correspond to the various criteria ACOs would be required to meet to receive the proposed prior savings adjustment. The first segment of the Table (rows [A] and [B]) identifies the total number of ACOs entering a new agreement period in the respective performance year (PY 2024 or PY 2025) and what proportion of all ACOs starting an agreement period in that performance year were reconciled in one or more benchmark years. This is the first eligibility criterion ACOs must meet to receive the prior savings adjustment. The second segment of the Table (row [C]) identifies the proportion of ACOs, among those reconciled in one or more benchmark years, that had positive prorated average prior savings, which is the second criterion of the CMS methodology. All ACOs that do not receive a regional adjustment and have positive prorated average prior savings would receive some benefit from the prior savings adjustment. However, ACOs that receive a positive regional adjustment and have positive prorated average prior savings would only receive a benefit if the prior savings adjustment is greater than the positive regional adjustment the ACO otherwise would have received. The third section in Table B–G13 (row [D]) identifies the proportion of ACOs that were simulated to actually receive the prior savings adjustment among ACOs that were reconciled in one or more benchmark years. The fourth segment in Table B–G13 (row [E]) summarizes the positive impact of the prior savings adjustment relative to the regional adjustment the ACO would otherwise have received for ACOs that were simulated to receive the prior savings adjustment. We stated that this table demonstrates that more ACOs could receive the prior savings adjustment instead of the regional adjustment in later agreement periods when increasing the scaling factor for the prior savings adjustment to 75 percent (91 FR 44080).

TABLE B-G16: MODELED IMPACT OF 50 PERCENT AND 75 PERCENT PRIOR SAVINGS ADJUSTMENT SCALING FACTORS ON PY 2025 BENCHMARKS FOR 2024 AND 2025 STARTERS

	50% Prior Savings Adjustment Scaling Factor	75% Prior Savings Adjustment Scaling Factor
[A] ACOs Entering a New Agreement Period in 2024 or 2025	336	336
[B] ACOs Reconciled in One or More Benchmark Years	256	256
Percent of ACOs in [B] out of total in [A]	76%	76%
[C] ACOs with Positive Pro-rated Average Prior Savings Among ACOs Reconciled in One or More Benchmark Years	223	223
Percent of ACOs in [C] out of total in [B]	87%	87%
[D] ACOs Whose Final Adjustment Includes Adjustment for Prior Savings Among ACOs Reconciled in One of More Benchmark Years	82	137
Percent of ACOs in [D] out of total in [C]	37%	61%
[E1] Net Benefit to Benchmarks from Prior Savings Adjustment Relative to Regional Adjustment Otherwise Received ($) Under 50% Prior Savings Adjustment Scaling Factor (Calculated Among ACOs in [D] that began an agreement period on January 1, 2024)		
Minimum		$0.85
Average		$45.72
Maximum		$113.87
[E2] Net Benefit to Benchmarks from Prior Savings Adjustment Relative to Regional Adjustment Otherwise Received ($) Under 75% Prior Savings Adjustment Scaling Factor (Calculated Among ACOs in [D] that began an agreement period on January 1, 2025)		
Minimum		$0.52
Average		$62.01
Maximum		$157.53

In the CY 2023 PFS final rule (87 FR 69907), we explained our belief that incorporating an adjustment for prior savings—when more advantageous for ACOs than the regional adjustment—would help limit the negative ratchet effects of benchmark rebasing. Under the existing benchmarking methodology, savings an ACO achieves in one agreement period can reduce its rebased benchmark for a subsequent agreement period by lowering the historical spending that forms the basis for that benchmark. To illustrate the effect of the proposed scaling factor increase in reducing the impacts from rebasing: if an ACO reduces per capita expenditures by $1,000 relative to a $10,000 benchmark, its rebased benchmark would otherwise decrease to $9,000. Under the current 50 percent scaling factor, the prior savings adjustment restores $500, yielding a benchmark of $9,500. Under the proposed 75 percent scaling factor, $750 would be restored, resulting in a benchmark of $9,750 and a smaller effective downward adjustment of the benchmark.

As discussed in the CY 2027 PFS proposed rule, the proposed increase to the prior savings adjustment scaling factor from 50 percent to 75 percent would provide additional relief from rebasing while continuing to incentivize ACOs to achieve further savings in future agreement periods (91 FR 44081). We stated that this change would shift a subset of ACOs from receiving the regional adjustment to receiving the prior savings adjustment, as the larger prior savings adjustment becomes more likely to exceed the regional adjustment (91 FR 44081). We noted that ACOs with higher regional or population adjustments would remain largely unaffected, while those with moderate to high levels of prior savings would particularly benefit (91 FR 44081).

We stated in the CY 2027 PFS proposed rule that, although MedPAC has previously urged CMS to use the prior savings adjustment to phase out the regional adjustment entirely,[327] we continue to disagree that a full phase-out is appropriate (91 FR 44081). We stated that we believe that the regional adjustment continues to provide valuable incentives, and that ACOs that are efficient relative to their regions should continue to receive a benchmark adjustment that recognizes that efficiency, consistent with our longstanding goal of reducing disincentives for high-performing ACOs that successfully lower spending (91 FR 44081). We added that we also proposed to reduce the maximum weight applied to the regional adjustment for lower-

[327] Medicare Payment Advisory Commission (MedPAC) comment on the CY 2023 PFS proposed rule. *https://www.medpac.gov/wp-content/uploads/2022/09/09022022_Part_B_2023_CMS1770P_MedPAC_COMMENT_v2_SEC.pdf.*

spending ENHANCED track ACOs (91 FR 44081). That taken together, these proposals are intended to better balance incentives between regionally efficient ACOs and those that have demonstrated program success, through a history of earning shared savings, while further mitigating the ratcheting effects that may occur when prior savings are incorporated into future benchmarks (see the CY 2027 PFS proposed rule at 91 FR 44072 through 44076 for details on the proposed regional adjustment changes) (91 FR 44081 and 44082).

We proposed that this policy would apply for agreement periods beginning on January 1, 2027, and in subsequent years (91 FR 44082).

We proposed to revise § 425.658(c), describing calculation of the per capita prior savings adjustment, to include proposed revised paragraph (c)(2), with the calculation methodology applicable for agreement periods beginning on January 1, 2027, and in subsequent years. Currently paragraph (c)(2) of § 425.658 is reserved (91 FR 44082). We stated in the CY 2027 PFS proposed rule that under proposed § 425.658(c)(2), we would specify the use of a scaling factor of 75 percent (91 FR 44076 through 44082), and a risk adjusted 5 percent cap (91 FR 44085 through 44087) in determining the amount of the prior savings adjustment an ACO may receive (if eligible) (91 FR 44082). Specifically, for agreement periods beginning on January 1, 2027, and in subsequent years, if an ACO is eligible for the prior savings adjustment as determined in § 425.658(b)(3), the prior savings adjustment would equal the lesser of the following: (i) 75 percent of the pro-rated average per capita amount computed in § 425.658(b)(3)(ii); or (ii) a single per capita value that would be the result of risk adjusting the 5 percent cap (91 FR 44085 through 44087).

We also proposed the following technical and conforming changes to other provisions of § 425.658, for completeness and clarity (91 FR 44082):

- In § 425.658(c)(1) introductory text, we proposed to add a new first sentence to specify the existing provisions on calculation of the per capita prior savings adjustment apply for agreement periods beginning on or after January 1, 2024 and before January 1, 2027.
- In § 425.658(d), describing CMS' comparison of the per capita prior savings adjustment with the regional adjustment and the population adjustment, in determining which (if any) adjustment applies to an ACO's benchmark, we proposed to amend the existing cross-reference to § 425.658(c)(1) to refer instead more generally to § 425.658(c).

We sought comment on our proposal to increase the prior savings adjustment scaling factor from 50 percent to 75 percent for agreement periods beginning on January 1, 2027, and in subsequent years, and the proposal to specify related provisions in the Shared Savings Program regulations in § 425.658(c)(2), as well as proposed technical and conforming changes to other provisions of § 425.658.

The following is a summary of the comments we received and our responses.

Comment: Many commenters supported the proposal to increase the prior savings adjustment scaling factor, stating that it would help mitigate the ''ratchet effect'' and provide incentives for ACOs to generate and sustain savings. A few commenters appreciated CMS's proposal to address rebasing concerns, stating that ACOs that have successfully generated savings should not be penalized in future agreement periods, and allowing ACOs to retain a greater portion of savings generated would strengthen financial incentives to remain in the Shared Savings Program over time. A commenter stated that a stronger prior savings adjustment would help incentivize long-term participation and continued improvement, especially for rural ACOs with limited opportunities to add new beneficiaries or organizations. Another commenter stated that this proposal was especially important for organizations serving high-needs patients, who require more resource-intensive interventions to achieve savings.

Response: We thank commenters for their support and agree that this proposal would help to mitigate the ratchet effect by returning to an ACO's benchmark an amount that reflects a greater portion of its success in lowering growth in expenditures. We agree that this would encourage ACOs to generate additional savings and provide incentives for ACOs to sustain savings in the Shared Savings Program.

We also agree with commenters that increasing the prior savings adjustment would help incentivize long-term participation and continued improvement, including for rural ACOs and those serving high-needs patients. We acknowledge the commenter's emphasis on the importance of this proposal for organizations serving high-needs patients whose care may be more resource intensive, and we believe the proposed modification to the prior savings adjustment scaling factor would better align benchmark adjustments with true clinical complexity and encourage participation among organizations engaged in providing high-needs care.

Comment: Some commenters supported the proposal and encouraged CMS to expand the prior savings adjustment to recognize savings generated across other CMS accountable care models. These commenters cited that accounting for savings across all models would allow ACOs to carry forward their historical savings into Shared Savings Program benchmarks, ensuring protection against benchmark decay regardless of the specific model.

Response: We appreciate the recommendation to expand the calculation of the prior savings adjustment to include savings generated across other CMS accountable care models. CMS accountable care models, such as those available through the CMS Innovation Center, have different methods to make determinations of shared savings and losses, creating challenges in comparing the results of these models to the results in the Shared Savings Program. There are also other differences, such as organizational and participation list configurations, that may not be comparable between models and the Shared Savings Program. Shared Savings Program policies designed to take into account these methodological considerations would benefit from public feedback solicited through notice and comment rulemaking, so we will take these suggestions under consideration and continue to monitor savings and losses in other models and how this relates to considerations for future proposed changes to the prior savings adjustment.

Comment: A couple of commenters recommended that the regional adjustment and prior savings adjustment changes be considered in tandem rather than approving one but not the other. A couple of commenters recommended that CMS allow ACOs to apply the prior savings adjustment and the regional efficiency adjustment together instead of receiving whichever adjustment is highest. Another commenter supported the proposal and recommended that CMS use the greater of 75 percent of the prorated average per capita prior savings amount or a single per capita value that would be the result of risk adjusting the 5 percent cap, rather than the lesser of the two.

Response: While we believe the revisions to the regional adjustment and the prior savings adjustment complement one another, we do not believe they are inextricably linked such that either depends on the other or that they must be adopted together. Each independently furthers program goals: the reduced maximum weight applied

to the positive regional adjustment moderates benchmark advantages for lower-spending ENHANCED track ACOs, and the increased prior savings adjustment scaling factor mitigates the effects of rebasing for ACOs that have generated savings.

As discussed in section III.G.5.c.(2) of this final rule, we are finalizing the reduction in the maximum positive regional adjustment weight for lower spending ACOs, entering their second agreement period, in the ENHANCED track.

Regarding the recommendation to apply the prior savings adjustment and the regional adjustment together, we do not agree that these adjustments should be combined. Including both of these adjustments would potentially overly inflate historical benchmarks to the point where ACOs would need to do little to collaborate and coordinate care for beneficiaries to generate savings. This would limit incentives for ACOs to continue to generate savings in second and subsequent agreement periods, and risk program savings that ACOs generate for the Trust Funds.

With regard to the commenter recommending that CMS use the greater of 75 percent of the prorated average per capita prior savings amount or a single per capita value that would be the result of risk adjusting the 5 percent cap, we continue to believe that the proposed methodology (for example, the prior savings adjustment would equal the lesser of the following: (i) 75 percent of the pro-rated average per capita amount; or (ii) a single per capita value that would be the result of risk adjusting the 5 percent cap) appropriately balances the goals of encouraging long-term participation, recognizing prior savings, maintaining consistency with the broader benchmark framework, and protecting program integrity. We are not adopting the commenter's suggestion to use the greater of' 75 percent of the prorated average per capita prior savings amount or a single per capita value that would be the result of risk adjusting the 5 percent cap because the cap functions to ensure that the adjustment does not exceed a ceiling. Using the greater of the two values would convert the cap into a floor, in which ACOs with prorated prior savings above the cap would receive an adjustment with no upper limit, while ACOs with prorated prior savings below the cap would receive the full capped amount regardless of the savings they generated. The 5 percent cap protects the Medicare Trust Funds against extreme or outlier positive adjustments that could inflate an ACO's benchmark to the point where the ACO could generate shared savings without decreasing expenditures.

Comment: A few commenters supported CMS's efforts to reduce the benchmark ratchet effect but were concerned that a 75 percent scaling factor may not fully address the issue. A few commenters recommended increasing the prior savings adjustment scaling factor more than we proposed, for example, increasing it from 50 percent to 95 percent. These commenters stated that a 95 percent scaling factor would eliminate most of the penalty for early success, allowing ACOs to invest in the first agreement period. Another commenter recommended that CMS continue evaluating additional refinements that recognize historical savings generated by ACOs and preserve strong incentives for sustained investment in care transformation, care coordination, and population health management.

Another commenter supported CMS's efforts to reduce the ratchet effect but was concerned that the proposal would not effectively address the issue for ACOs that have participated in the Shared Savings Program for many years. This commenter was concerned that the proposed change, in combination with the proposed reduction to the regional adjustment, would disproportionately negatively affect ACOs that achieved regional efficiency early in their participation. This commenter stated that these ACOs may have fewer opportunities to generate additional savings, because the prior savings adjustment considers only the final three years of an agreement period rather than an ACO's complete savings history. This commenter was concerned that the proposal may have the unintended consequence of further reducing incentives for long-term ACOs to maintain investments in care transformation.

Response: As we stated in the CY 2027 PFS proposed rule (91 FR 44080), we believe increasing the prior savings adjustment scaling factor above 75 percent would limit incentives for ACOs to continue to decrease spending in subsequent agreement periods, since they would be rewarded for previously demonstrated savings and would not be incentivized to continue to decrease costs (approaching 100 percent reward if the prior savings adjustment scaling factor is above 75 percent). Increasing the prior savings adjustment scaling factor to 95 percent would not provide a sufficient incentive level to decrease spending, and this could jeopardize the ability of the Shared Savings Program to generate future savings to the Trust Funds. We believe that a prior savings adjustment scaling factor of 75 percent strikes the appropriate balance between encouraging long-term participation in the program and encouraging ACOs to save, while also supporting savings to the Trust Funds.

A few commenters described their concerns related to the ''benchmark ratchet effect,'' and we describe similar impacts as a result of ''rebasing'' a historical benchmark. When an ACO begins a new agreement period, its historical benchmark is rebased using more recent expenditure experience, including expenditure reductions the ACO achieved in earlier periods. As a result, savings generated by an ACO in a prior agreement period may lower the benchmark against which its performance is measured in a subsequent agreement period. As described in the CY 2027 proposed rule (91 FR 44081), ACOs with higher regional or population adjustments would remain largely unaffected, while those with moderate to high levels of prior savings would particularly benefit. The prior savings adjustment and the regional adjustment are both intended to mitigate what the commenters described as the benchmark ''ratchet'' effect, but they do so differently. The regional adjustment reduces the benchmark's dependence on an ACO's own historical expenditures by reflecting its spending relative to its regional service area; it does not directly account for savings the ACO generated. The prior savings adjustment, by contrast, adds back to the rebased benchmark a portion of the savings the ACO generated in its prior agreement period, directly offsetting the downward effect of rebasing on that ACO. Because an ACO receives the higher of the positive regional adjustment or the prior savings adjustment, the reduced regional adjustment weight combined with the increased prior savings adjustment scaling factor means that, for a subset of ACOs with prior savings, the prior savings adjustment will become the applicable adjustment. For these ACOs, the benchmark adjustment will be tied more directly to the savings they generated, which is the specific source of what the commenter describes as the ratchet effect. We acknowledge that the prior savings adjustment considers savings from only the final 3 years of an agreement period and will not fully offset rebasing for all ACOs; however, we believe the increased scaling factor provides more targeted relief from rebasing while preserving incentives for ACOs to achieve further savings.

We do not believe that mitigating the effects of benchmark rebasing is inconsistent with maintaining

incentives for ongoing efficiency improvements. We also do not agree that ACOs should financially benefit from early-agreement period efficiency gains in perpetuity; using the most recent 3 years of performance provides up-to-date information on prior savings performance while maintaining accountability for continued improvement. Additionally, we use the most recent year prior to the start of the agreement period (benchmark year 3) to establish the regional adjustment. This provides a similar method based on recency of information, to compare the highest performance in the ACO's regional efficiency and prior agreement period savings, which allows CMS to include the highest recent performance in the ACOs applicable historical benchmark adjustment.

Comment: A commenter recommended that existing ACOs be allowed to gain the benefit of the prior savings adjustment during the next reconciliation process rather than just renewal. This commenter suggested that ACOs be given the opportunity to renew early or a mid-agreement adjustment during the reconciliation period.

Response: We acknowledge the commenter's suggestion to allow existing ACOs to benefit more quickly from an increase in the prior savings adjustment scaling factor. However, we do not believe it would be appropriate to make mid-agreement period modifications to an ACO's benchmark through the annual financial reconciliation process. Because the adjustment is tied to the establishment of a benchmark for a new agreement period, applying it during an ongoing agreement period would be inconsistent with the current benchmarking methodology framework. Also, as the commenter requested, there are presently options to early renew during the annual application cycle for ACOs that do not want to wait until the end of their agreement period to be eligible to receive the 75 percent prior savings adjustment scaling factor.

Comment: Several commenters supported increasing the prior savings adjustment scaling factor but were concerned that it would not effectively mitigate benchmark ratcheting unless the benchmark cap was also raised from 5 percent to at least 7 percent. One of these commenters stated that because the prior savings adjustment is bound by that cap, the combined proposed policies could reduce the value of investments in care coordination and delivery transformation.

Response: We appreciate comments describing concerns about the interaction of the proposal to increase the prior savings adjustment scaling factor and the benchmark cap. We discuss our response to comments about the benchmark cap in section III.G.5.e. of this final rule.

Comment: We received a few comments in opposition to the proposal to increase the prior savings adjustment scaling factor from 50 to 75 percent. These comments expressed concerns that restoring prior savings to later benchmarks allows an ACO to receive repeated rewards for a change achieved once and could reduce the likelihood that incentive payments will eventually translate into lower Medicare spending. A few commenters stated there would be a fundamental problem with a voluntary program incentivizing participation in the program through overly generous approaches that mitigate the ratchet effect, rather than focusing on approaches that maintain generated savings. These commenters did not believe that continued participation in the program should require CMS to return past savings through higher future benchmarks.

Response: We acknowledge the commenters' concerns about the proposal to increase the prior savings adjustment scaling factor. We disagree that the prior savings adjustment provides repeated rewards for a change achieved only once. Rather, increasing the prior savings adjustment scaling factor from 50 percent to 75 percent provides relief from the effects of rebasing while still preserving incentives for ACOs to achieve further savings and high-quality care in future agreement periods. With regard to the commenter's statement that ACOs leaving the program in response to the benchmark ''ratchet'' effect indicates a fundamental flaw in voluntary ACO models, we continue to believe that appropriately balanced benchmark policies, such as the proposed revisions to the prior savings adjustment scaling factor and the regional adjustment in sections III.G.5.d and III.G.5.c.(2) of this final rule, can reward successful performance while maintaining accountability for continued improvement. Increasing the prior savings adjustment scaling factor from 50 percent to 75 percent provides relief from the effects of rebasing while still preserving incentives for ACOs to achieve further savings and high-quality care in future agreement periods. Our analyses indicate that increasing the scaling factor would strengthen incentives for continued participation among successful ACOs while maintaining accountability for ongoing performance improvement.

After consideration of public comments, we are finalizing our proposal to increase the prior savings adjustment scaling factor from 50 percent to 75 percent, for agreement periods beginning on January 1, 2027, and in subsequent years.

We did not receive public comments on our proposal to specify related provisions in the Shared Savings Program regulations in § 425.658(c)(2), as well as proposed technical and conforming changes to other provisions of § 425.658, and therefore, we are finalizing those as proposed.

e. Risk Adjust the 5 percent Cap on Upward Adjustments to the Historical Benchmark

(1) Background

For agreement periods beginning on January 1, 2025, and in subsequent years, in calculating the historical benchmark, CMS applies the highest of three upward adjustments for which the ACO is eligible: a positive regional adjustment, prior savings adjustment, or population adjustment, as described at § 425.652(a)(8)(ii)(B)(*1*). Each of these adjustments is subject to a cap of 5 percent of national per capita OM expenditures for the assignable beneficiary population, a limit first established in the CY 2018 PFS final rule (83 FR 68072).

In the June 2016 final rule (81 FR 37973), we introduced a regional adjustment to the ACO's historical benchmark. In the CY 2023 PFS final rule (87 FR 69915 through 69923), we finalized the application of a cap on the negative regional adjustment at negative 1.5 percent of national per capita expenditures for Parts A and B services and further modified the adjustment to limit its negative impact on ACO historical benchmarks. In the CY 2024 PFS final rule (88 FR 79185 through 79196), we further modified the regional adjustment to prevent any ACO from receiving an adjustment that would cause its benchmark to be lower than it would have been in the absence of a regional adjustment.

In the June 2015 final rule (80 FR 32785 through 32791), we established a prior savings adjustment to account for the average per capita amount of savings generated during an ACO's prior agreement period. We removed the adjustment in the June 2016 final rule (81 FR 37954 through 37992) and then reinstated it in the CY 2023 PFS final rule (87 FR 69898 through 69915), for renewing and re-entering ACOs beginning January 1, 2024. In the CY 2024 PFS final rule (88 FR 79196 through 79200), we modified the prior

savings adjustment to account for changes in savings due to compliance actions or reopenings of prior determinations.

In the CY 2025 PFS final rule (89 FR 61887 through 61892), we introduced the health equity benchmark adjustment (HEBA), which adjusts upward an ACO's historical benchmark based on the number of dually eligible or Low-Income Subsidy (LIS)-enrolled beneficiaries served. With the CY 2026 PFS final rule (90 FR 49831 through 49834), we renamed the HEBA to the ''population adjustment'' to more accurately reflect the nature of the adjustment.

In the CY 2027 PFS proposed rule we stated that the positive regional adjustment, prior savings adjustment, and population adjustment are all capped at 5 percent of national per capita OM expenditures for the assignable beneficiary population (91 FR 44082). Further, we stated that the population adjustment calculation considers the difference between the 5 percent cap and the higher of regional adjustment, prior savings adjustment, or no adjustment (in the case where the regional adjustment is negative or the ACO is not eligible for the prior savings adjustment) (91 FR 44082)[328]. We noted that, more generally, the 5 percent cap mitigates the potential risk of CMS paying ACOs shared savings payments that are the result of extreme or outlier positive adjustments to the benchmark (91 FR 44082).

(2) Revisions

We stated in the CY 2027 PFS proposed rule that ACOs serving medically complex populations with higher CMS–HCC risk scores (relative to the national assignable population) have expressed concern that the current 5 percent cap applied to the three upward adjustments to the historical benchmark (regional adjustment, prior savings adjustment, and population adjustment) is too restrictive (91 FR 44082). Specifically, when the cap is applied as a flat percentage without accounting for the degree to which the ACO serves a medically complex population, it imposes a hard ceiling that suppresses the historical benchmark. Rather than allowing the benchmark adjustments to reflect the actual higher costs required to care for these complex patients, the flat 5 percent cap limits the three upward adjustments. These ACOs have requested that the higher clinical complexity, higher CMS–HCC risk scores, and higher cost of providing care to their assigned beneficiary populations be considered when establishing a cap for adjustments to the historical benchmark. Risk adjusting the 5 percent caps accounts for the severity and case mix of each ACO's assigned beneficiary population, allowing a higher positive adjustment ceiling for ACOs serving medically complex populations while still fulfilling the cap's original purpose of safeguarding CMS against extreme or outlier positive benchmark adjustments. Beyond addressing ACO concerns, risk adjusting the 5 percent cap would encourage ACOs to enroll and manage higher acuity, higher cost beneficiaries, who stand to benefit most from coordinated care, by allowing the cap to scale upwards with the average CMS–HCC risk scores of their populations relative to the national average.

We added that, to better align benchmark adjustments with true clinical complexity and encourage participation among organizations engaged in providing high-needs care, we proposed to risk adjust the 5 percent cap on each of the upward adjustments to the historical benchmark: the positive regional adjustment, the prior savings adjustment, and the population adjustment (91 FR 44082).

(a) Proposal To Risk Adjust the 5 percent Cap on Positive Regional Adjustments to the Historical Benchmark

As discussed in the CY 2027 PFS proposed rule, we proposed to risk adjust the 5 percent cap on positive adjustments to the national per capita dollar amount for each Medicare enrollment type (ESRD, Disabled, Aged/Dual, and Aged/non-dual), used to calculate the regional adjustment to the historical benchmark, according to the following steps (91 FR 44083):

- Step 1—Identify the national per capita expenditure amount for the enrollment type for BY3.
- Step 2—Identify the ACO's weighted average CMS–HCC risk score for the enrollment type for BY3.[329]
- Step 3—By enrollment type, calculate the product of the amounts identified in Step 1 and Step 2.
- Step 4—By enrollment type, calculate the cap for the enrollment type at 5 percent of the product derived in Step 3.
- Step 5—Apply the risk-adjusted 5 percent cap calculated in Step 4 to the ACO's preliminary regional adjustment for the enrollment type. The preliminary regional adjustment refers to the regional adjustment amount for the enrollment type (that is, the per capita dollar amount) before any caps are applied.[330]

++ Step 5(i)—Identify the ACO's preliminary regional adjustment for the enrollment type.

++ Step 5(ii)—Evaluate whether the value identified in Step 5(i) is greater than the risk-adjusted 5 percent cap determined in Step 4. If yes, set regional adjustment for the enrollment type at the risk-adjusted 5 percent cap calculated in Step 4. If no, set the regional adjustment for the enrollment type as the value identified in Step 5(i).

In the CY 2027 PFS proposed rule, we illustrated how the proposed calculation methodology would be applied, considering the following hypothetical example in which positive adjustments are applied to the regional adjustment for all enrollment types for the ACO (91 FR 44083 through 44084).

TABLE B-G17: HYPOTHETICAL EXAMPLE OF STEPS FOR RISK ADJUSTING THE 5 percent CAPS ON POSITIVE REGIONAL ADJUSTMENTS TO HISTORICAL BENCHMARKS

	Amount Under Current Policy (No Risk Adjustment Applied to 5 percent Caps)	Amount Under Proposed Policy (Risk Adjustment Applied to 5 percent Caps)
Step 1: Identify the national per capita expenditure amount for the enrollment type for BY3.		
ESRD	$121,092.11	$121,092.11
Disabled	$18,266.87	$18,266.87
Aged/dual	$30,290.30	$30,290.30
Aged/non-dual	$15,943.88	$15,943.88
Step 2: Identify the ACO's weighted average CMS-HCC mean risk score for the enrollment type for BY3.		
ESRD	NA	1.1022
Disabled	NA	0.9249
Aged/dual	NA	1.0648
Aged/non-dual	NA	1.0366
Step 3: By enrollment type, calculate the product of the amounts identified in Step 1 and Step 2.		
ESRD	NA	$133,467.72
Disabled	NA	$16,895.03
Aged/dual	NA	$32,253.11
Aged/non-dual	NA	$16,527.43
Step 4: By enrollment type, calculate the cap for the enrollment type as 5 percent of the product derived in Step 3. (Under current policy, the cap is calculated as 5 percent of the amount identified in Step 1.)		
ESRD	$6,054.61	$6,673.39
Disabled	$913.34	$844.75
Aged/dual	$1,514.51	$1,612.66
Aged/non-dual	$797.19	$826.37
Step 5: Apply the risk-adjusted 5 percent cap calculated in Step 4 to the ACO's preliminary regional adjustment for the enrollment type.		
Step 5(i) Identify the ACO's preliminary regional adjustment for the enrollment type.*		
ESRD	$376.91	$376.91
Disabled	$905.00	$905.00
Aged/dual	$3,036.48	$3,036.48
Aged/non-dual	$883.08	$883.08

TABLE B-G18: HYPOTHETICAL EXAMPLE OF STEPS FOR RISK ADJUSTING THE 5 percent CAPS ON THE PRIOR SAVINGS ADJUSTMENT TO HISTORICAL BENCHMARKS

	Amount Under Current Policy (No Risk Adjustment Applied to 5 percent Caps)	Amount Under Proposed Policy (Risk Adjustment Applied to 5 percent Caps)
Step 1: Identify the national per capita expenditure amount for the enrollment type for BY3.		
ESRD	$100,000.00	$100,000.00
Disabled	$12,000.00	$12,000.00
Aged/dual	$20,000.00	$20,000.00
Aged/non-dual	$12,000.00	$12,000.00
Step 2: Identify the ACO's weighted average CMS-HCC risk score by enrollment type for BY3.		
ESRD	NA	1.1022
Disabled	NA	0.9249
Aged/dual	NA	1.0648
Aged/non-dual	NA	1.0366
Step 3: By enrollment type, calculate the product of the amounts identified in Step 1 and Step 2.		
ESRD	NA	$110,222.22
Disabled	NA	$11,098.52
Aged/dual	NA	$21,296.18
Aged/non-dual	NA	$12,439.56
Step 4: By enrollment type, calculate 5 percent of the product derived in Step 3. (For the calculation under current policy, calculate 5 percent of the values identified in Step 1.)		
ESRD	$5,000.00	$5,511.11
Disabled	$600.00	$554.93
Aged/dual	$1,000.00	$1,064.81
Aged/non-dual	$600.00	$621.98
Step 5: Identify the proportion of the ACO's assigned beneficiaries within each enrollment type.		
ESRD	0.007	0.007
Disabled	0.052	0.052
Aged/dual	0.055	0.055
Aged/non-dual	0.886	0.886
Step 6: To calculate the final risk-adjusted 5 percent national expenditure value by enrollment type, multiply the risk-adjusted 5 percent amounts from Step 4 by the enrollment proportions from Step 5.		
ESRD	$35.00	$38.58
Disabled	$31.20	$28.86
Aged/dual	$55.00	$58.56
Aged/non-dual	$531.60	$551.07
Step 7: Create a single prior savings cap value by summing the products from Step 6 across enrollment types.		
Prior savings cap	$652.80	$677.07
Step 8: Multiply the prorated average per capita prior savings by the 75 percent scaling factor.*		
Prorated average per capita savings from BY1, BY2, and BY3	$900.00	$900.00
Proposed 75 percent scaling factor (Under current policy, use 50 percent scaling factor)	50%	75%
Weighted prorated average prior savings	$450.00	$675.00
Step 9: If the ACO is eligible for a prior savings adjustment, set the prior savings adjustment as the lesser of: [A] the prior savings cap calculated in Step 7, and [B] the weighted prorated average prior savings calculated in Step 8.		
Prior savings adjustment	$450.00	$675.00

* For more information on the calculation of the prorated average per capita prior savings, we refer readers to step 6c of section 4.1.2 of the Shared Savings and Losses, Assignment and Quality Performance Standard Methodology Specifications Version 14.

BILLING CODE 4169–69–C

We stated that an average CMS–HCC risk score of 1.000 indicates that the ACO's population risk aligns with the national assignable population average, while scores above 1.000 identify populations with higher-than-average risk and scores below 1.000 identify populations with lower-than-average risk (91 FR 44084). By risk-adjusting the 5 percent caps for each enrollment group, the caps would become tailored

to each ACO's specific risk profile for BY3. In this hypothetical example, the caps for the ESRD, Aged/Dual, and Aged/Non-Dual groups increase to reflect elevated risk levels, while the cap for the Disabled group decreases to reflect a lower risk profile for that group. This hypothetical example provided in the CY 2027 PFS proposed rule illustrated how a single ACO may experience both increased and decreased 5 percent caps across enrollment types, depending on each enrollment type's average risk relative to the national assignable population (91 FR 44084). Notably, the proposed risk adjustment policy applies exclusively to the 5 percent caps on positive adjustments; caps for negative adjustments remain unchanged under the proposed policy (91 FR 44084).

We proposed to revise and republish § 425.656(c)(3), to include the proposed approach to calculating the caps on regional adjustment amounts applicable for agreement periods beginning on January 1, 2027, and in subsequent years, as well as the existing calculation of the caps on the regional adjustment amounts that would apply for agreement periods beginning on or after January 1, 2024, and before January 1, 2027 (91 FR 44084).

Under new § 425.656(c)(3)(ii), we proposed to specify the approach to calculating the cap on regional adjustment amounts, applicable for agreement periods beginning on January 1, 2027, and in subsequent years (91 FR 44084). Accordingly, we proposed to specify that CMS caps the per capita dollar amount for each Medicare enrollment type (ESRD, disabled, aged/dual eligible Medicare and Medicaid beneficiaries, aged/non-dual eligible Medicare and Medicaid beneficiaries) calculated under § 425.656(c)(2) at a dollar amount as described in the provisions that follow in subparagraphs (A) and (B), inclusive of the provisions included thereunder (91 FR 44084 through 44085).

Under new § 425.656(c)(3)(ii)(A), we proposed to specify that, for positive adjustments, the per capita dollar amount for a Medicare enrollment type would be capped at a dollar amount calculated as follows (91 FR 44085):

- As specified in proposed § 425.656(c)(3)(ii)(A)(*1*), we would calculate the product of the following: (i) the amount of national per capita expenditures for Parts A and B services under the OM fee-for-service program in BY3 for assignable beneficiaries in that enrollment type identified for the 12-month calendar year corresponding to BY3 using data from the CMS Office of the Actuary; and (ii) the ACO's weighted average risk score for the enrollment group for BY3.[332]
- As specified in proposed § 425.656(c)(3)(ii)(A)(*2*), we would calculate 5 percent of the enrollment type-specific product determined in § 425.656(c)(3)(ii)(A)(*1*).

Under new § 425.656(c)(3)(ii)(B), we proposed to specify that, for negative adjustments, the per capita dollar amount for a Medicare enrollment type would be capped at a dollar amount equal to negative 1.5 percent of national per capita expenditures for Parts A and B services under the OM program in BY3 for assignable beneficiaries in that enrollment type identified for the 12-month calendar year corresponding to BY3 using data from the CMS Office of the Actuary (91 FR 44085).

The provided the following list to summarize the proposed amendments to the structure and organization of § 425.656(c)(3) (as revised and republished) in the CY 2027 PFS proposed rule (91 FR 44085):

- We proposed to specify the existing provisions of § 425.656(c)(3), describing the caps on regional adjustment amounts based on a percentage of national per capita expenditures for the assignable beneficiary population for BY3, under new § 425.656(c)(3)(i). Accordingly, we proposed to:

++ Add a sentence at the start of the introductory text of new § 425.656(c)(3)(i) specifying the applicability of the calculation for agreement periods beginning on or after January 1, 2024, and before January 1, 2027.

++ Redesignate existing paragraphs (c)(3)(i) and (ii) of § 425.656 (specifying the cap on positive adjustments and negative adjustments, respectively) as paragraphs (c)(3)(i)(A) and (B).

- We proposed to specify the proposed caps on regional adjustment amounts, applicable for agreement periods beginning on January 1, 2027, and in subsequent years, in new § 425.656(c)(3)(ii) (previously described in this section).

We sought comment on the proposal to risk adjust the 5 percent caps on positive regional adjustment amounts, applicable for agreement periods beginning on January 1, 2027, and in subsequent years, and related proposed changes to the Shared Savings Program regulations at § 425.656(c)(3) (as revised and republished). Since commenters generally addressed this proposal in conjunction with the proposals in section III.G.5.e.(2)(b) and (c) of the CY 2027 PFS proposed rule, please refer to section III.G.5.e.(2).(c) of this final rule, where we summarize and respond to comments on all three sections.

(b) Proposal to Risk Adjust the 5 Percent Cap on the Prior Savings Adjustment to the Historical Benchmark

In the CY 2027 PFS proposed rule, we proposed to risk adjust the 5 percent cap on national per capita dollar amount for each Medicare enrollment type (ESRD, Disabled, Aged/dual, and Aged/non-dual), used in determining the prior savings adjustment to the historical benchmark, according to the following steps (91 FR 44085):

- Step 1—Identify the national per capita expenditure amount for the enrollment type for BY3.
- Step 2—Identify the ACO's weighted average CMS–HCC risk score by enrollment type for BY3.
- Step 3—By enrollment type, calculate the product of the amounts identified in Steps 1 and 2.
- Step 4—By enrollment type, calculate 5 percent of the product derived in Step 3.
- Step 5—Identify the proportion of the ACO's assigned beneficiaries within each enrollment type by dividing the number of assigned beneficiaries within each enrollment type by the total number of assigned beneficiaries.
- Step 6—To calculate the final risk-adjusted 5 percent national expenditure value by enrollment type, multiply the risk-adjusted 5 percent amounts from Step 4 by the enrollment proportions from Step 5.
- Step 7—Create a single prior savings cap value by summing the products from Step 6 across enrollment types.
- Step 8—Multiply the prorated average per capita prior savings by the 75 percent scaling factor.[333]
- Step 9—If the ACO is eligible for a prior savings adjustment, set the prior savings adjustment as the lesser of: the prior savings cap calculated in Step 7,

[331] Refer to the Medicare Shared Savings Program, ''Shared Savings and Losses, Assignment and Quality Performance Standard Methodology Specifications'' (April 2026, Version #14), available at *https://www.cms.gov/files/document/medicare-shared-savings-program-shared-savings-losses-assignment-methodology-specifications-version.pdf-0* (herein for brevity ''Shared Savings and Losses, Assignment and Quality Performance Standard Methodology Specifications Version 14'').

[332] For more information on the calculation of the weighted average risk score we refer readers to section 3.2 of the Shared Savings and Losses, Assignment and Quality Performance Standard Methodology Specifications Version 14.

[333] For more information on the calculation of the prorated average per capita prior savings, we refer readers to step 6c of section 4.1.2 of the Shared Savings and Losses, Assignment and Quality Performance Standard Methodology Specifications Version 14.

and the weighted prorated average prior savings calculated in Step 8.

In the CY 2027 PFS proposed rule, we illustrated how the proposed calculation methodology would be applied, considering the following hypothetical example in which the prior savings adjustment is applied for the ACO (91 FR 44085 through 44086).

BILLING CODE 4169–69–P

TABLE B-G18: HYPOTHETICAL EXAMPLE OF STEPS FOR RISK ADJUSTING THE 5 percent CAPS ON THE PRIOR SAVINGS ADJUSTMENT TO HISTORICAL BENCHMARKS

	Amount Under Current Policy (No Risk Adjustment Applied to 5 percent Caps)	Amount Under Proposed Policy (Risk Adjustment Applied to 5 percent Caps)
Step 1: Identify the national per capita expenditure amount for the enrollment type for BY3.		
ESRD	$100,000.00	$100,000.00
Disabled	$12,000.00	$12,000.00
Aged/dual	$20,000.00	$20,000.00
Aged/non-dual	$12,000.00	$12,000.00
Step 2: Identify the ACO's weighted average CMS-HCC risk score by enrollment type for BY3.		
ESRD	NA	1.1022
Disabled	NA	0.9249
Aged/dual	NA	1.0648
Aged/non-dual	NA	1.0366
Step 3: By enrollment type, calculate the product of the amounts identified in Step 1 and Step 2.		
ESRD	NA	$110,222.22
Disabled	NA	$11,098.52
Aged/dual	NA	$21,296.18
Aged/non-dual	NA	$12,439.56
Step 4: By enrollment type, calculate 5 percent of the product derived in Step 3. (For the calculation under current policy, calculate 5 percent of the values identified in Step 1.)		
ESRD	$5,000.00	$5,511.11
Disabled	$600.00	$554.93
Aged/dual	$1,000.00	$1,064.81
Aged/non-dual	$600.00	$621.98
Step 5: Identify the proportion of the ACO's assigned beneficiaries within each enrollment type.		
ESRD	0.007	0.007
Disabled	0.052	0.052
Aged/dual	0.055	0.055
Aged/non-dual	0.886	0.886
Step 6: To calculate the final risk-adjusted 5 percent national expenditure value by enrollment type, multiply the risk-adjusted 5 percent amounts from Step 4 by the enrollment proportions from Step 5.		
ESRD	$35.00	$38.58
Disabled	$31.20	$28.86
Aged/dual	$55.00	$58.56
Aged/non-dual	$531.60	$551.07
Step 7: Create a single prior savings cap value by summing the products from Step 6 across enrollment types.		
Prior savings cap	$652.80	$677.07
Step 8: Multiply the prorated average per capita prior savings by the 75 percent scaling factor.*		
Prorated average per capita savings from BY1, BY2, and BY3	$900.00	$900.00
Proposed 75 percent scaling factor (Under current policy, use 50 percent scaling factor)	50%	75%
Weighted prorated average prior savings	$450.00	$675.00
Step 9: If the ACO is eligible for a prior savings adjustment, set the prior savings adjustment as the lesser of: [A] the prior savings cap calculated in Step 7, and [B] the weighted prorated average prior savings calculated in Step 8.		
Prior savings adjustment	$450.00	$675.00

* For more information on the calculation of the prorated average per capita prior savings, we refer readers to step 6c of section 4.1.2 of the Shared Savings and Losses, Assignment and Quality Performance Standard Methodology Specifications Version 14.

BILLING CODE 4169–69–C

As discussed in the CY 2027 PFS proposed rule, in this scenario, the ACO's prior savings adjustment would be higher under the proposed risk-adjusted caps than under current policy, driven by two key changes (91 FR 44086 through 44087). First, the risk-adjusted prior savings cap in Step 7 is higher than the non-risk-adjusted cap, reflecting the ACO's higher-than-average risk profile and allowing the ACO to retain a larger share of its prior savings before being capped. Second, the proposed increase to the prior savings adjustment scaling factor from 50 percent to 75 percent further raises the available adjustment amount. We noted that, together these updates ensure that the prior savings adjustment reflects recent patient complexity (91 FR 44087).

As described in the CY 2027 PFS proposed rule (91 FR 44076 through 44082), we proposed to specify in revised § 425.658(c)(2) the methodology for calculating the per capita prior savings adjustment applicable for agreement periods beginning on January 1, 2027, and in subsequent years. Under proposed § 425.658(c)(2) (as revised), we would specify the use of a scaling factor of 75 percent (91 FR 44076 through 44082), and the proposed risk adjusted 5 percent cap (91 FR 44082 through 44087) in determining the amount of the prior savings adjustment an ACO may receive (if eligible). Specifically, for agreement periods beginning on January 1, 2027, and in subsequent years, if an ACO is eligible for the prior savings adjustment as determined in § 425.658(b)(3), the prior savings adjustment would equal the lesser of the following: (i) 75 percent of the pro-rated average per capita amount computed in § 425.658(b)(3)(ii); or (ii) a single per capita value that would be the result of risk adjusting the 5 percent cap.

With respect to risk adjusting the 5 percent cap, we proposed to specify related provisions in revised § 425.658(c)(2)(ii) (91 FR 44087). Specifically, we proposed that, for agreement periods beginning on January 1, 2027, and in subsequent agreement periods, CMS calculates a single per capita value as follows (91 FR 44087):

Under § 425.658(c)(2)(ii)(A), we proposed to specify that CMS would calculate the product of the following for each Medicare enrollment type (ESRD, disabled, aged/dual eligible Medicare and Medicaid beneficiaries, aged/non-dual eligible Medicare and Medicaid beneficiaries) (91 FR 44087)—

- The national per capita expenditures for Parts A and B services under the original OM FFS program in BY3 for assignable beneficiaries in that enrollment type identified for the 12-month calendar year corresponding to BY3 using data from the CMS Office of the Actuary; and
- The ACO's weighted average CMS–HCC risk score for that enrollment type for BY3.[334]

Under § 425.658(c)(2)(ii)(B), we proposed that CMS would calculate 5 percent of each enrollment type-specific product determined in § 425.658(c)(2)(ii)(A). And that, under § 425.658(c)(2)(ii)(C), CMS would calculate the single per capita value as a person-year weighted average[335] by multiplying each of these enrollment type-specific values (determined in accordance with § 425.658(c)(2)(ii)(B)) by the proportion of the ACO's assigned beneficiaries within that particular enrollment type and then summing the results (91 FR 44087).

We also proposed a technical and conforming change in § 425.672(c)(2)(iv), describing adjustment of calculation of national per capita OM expenditures for assignable beneficiaries for purposes of capping the prior savings adjustment (among other factors) for SAHS billing activity occurring in CY 2024 or subsequent calendar years (91 FR 44087). More specifically, in § 425.672(c)(2)(iv), we proposed to amend the existing reference to § 425.658(c)(1)(ii), to refer instead to § 425.658(c)(1)(ii) and (c)(2)(ii) (as we proposed) (91 FR 44087).

We sought comment on the proposal to risk adjust the 5 percent cap used in calculating the value of the prior savings adjustment to the historical benchmark for agreement periods beginning on January 1, 2027, and in subsequent years. We also sought comment on the proposed calculation of the risk adjusted 5 percent cap as specified in proposed revisions to § 425.658, in paragraph (c)(2)(ii), as well as a proposed technical and conforming change to § 425.672(c)(2)(iv). Since commenters generally addressed this proposal in conjunction with the proposals in section III.G.5.e.(2)(a) and (c) of the CY 2027 PFS proposed rule, please refer to section III.G.5.e.(2).(c) of this final rule, where we summarize and respond to comments on all three sections.

(c) Proposal To Risk Adjust the 5 Percent Cap on the Population Adjustment to the Historical Benchmark

We proposed to risk adjust the 5 percent cap on national per capita expenditures for each Medicare enrollment type (ESRD, Disabled, Aged/dual, Aged/non-dual), used to calculate the population adjustment, according to the following steps (91 FR 44087):

- Step 1—Identify the proportion of the ACO's assigned beneficiaries for the performance year who are enrolled in the Medicare Part D Low-Income Subsidy (LIS) or are dually eligible for Medicare and Medicaid. Under existing policy, which we do not propose to change, an ACO with a proportion less than 15 percent is ineligible to receive the population adjustment.
- Step 2—Calculate risk-adjusted 5 percent of the national per capita expenditures for assignable beneficiaries as a single value by employing the following steps:

++ Step 2(i)—Identify the national per capita expenditures for assignable beneficiaries by enrollment type in BY3.

++ Step 2(ii)—Identify the ACO's weighted average CMS–HCC risk score by enrollment type for BY3.[336]

++ Step 2(iii)—By enrollment type, calculate the product of the amounts identified in Step 2(i) and Step 2(ii).

++ Step 2(iv)—By enrollment type, calculate the risk-adjusted, capped national per capita expenditures as 5 percent of the product derived in Step 2(iii).

++ Step 2(v)—Identify the proportion of the ACO's assigned beneficiaries within each enrollment type.

++ Step 2(vi)—To calculate the final risk-adjusted 5 percent national expenditure by enrollment type, multiply the amount from step 2(iv) by the enrollment proportions from Step 2(v).

++ Step 2(vii)—Sum the values in Step 2(vi) to express the risk-adjusted 5 percent of the national per capita expenditures for assignable beneficiaries as a single value.

- Step 3—Calculate population adjustment scaler by employing the following steps:

[334] For more information on the calculation of the weighted average CMS–HCC risk score we refer readers to section 3.2 of the Shared Savings and Losses, Assignment and Quality Performance Standard Methodology Specifications Version 14. *https://www.cms.gov/files/document/medicare-shared-savings-program-shared-savings-losses-assignment-methodology-specifications-version.pdf-0.*

[335] For more information on the calculation of the person-year weighted average we refer readers to section 3.2 of the Shared Savings and Losses, Assignment and Quality Performance Standard Methodology Specifications Version 14. *https://www.cms.gov/files/document/medicare-shared-savings-program-shared-savings-losses-assignment-methodology-specifications-version.pdf-0.*

[336] For more information on the calculation of the weighted average CMS–HCC risk score, we refer readers to section 3.2 of the Shared Savings and Losses, Assignment and Quality Performance Standard Methodology Specifications Version 14.

++ Step 3(i)—Identify the regional adjustment (expressed as a single value) and the prior savings adjustment.[337]

++ Step 3(ii)—Calculate the scaler as the difference between the values in Step 2(vii) and the higher of the regional adjustment and prior savings adjustment identified in Step 3(i).

[337] For more information on the calculation of the regional adjustment (expressed as a single value) and prior savings adjustment, we refer readers to sections 5 and 6 of the Shared Savings and Losses, Assignment and Quality Performance Standard Methodology Specifications Version 14.

• Step 4—Calculate the population adjustment as the product of the values derived in Step 1 and Step 3(ii), for an ACO eligible for the population adjustment.

In the CY 2027 PFS proposed rule, we illustrated how the calculation methodology would be applied, considering the following hypothetical example in which the population adjustment is calculated for an ACO with generally higher risk beneficiaries than the national assignable population (91 FR 44088). We also noted in the CY 2027 PFS proposed rule that by proposing to risk adjust the caps for the regional adjustment and prior savings adjustment, this directly influences the population adjustment an ACO receives (91 FR 44088); we included a hypothetical example (Table B–G16 of the CY 2027 PFS proposed rule at 91 FR 44089) that assumed increased regional and prior savings adjustment amounts under the policy.

BILLING CODE 4169–69–p

TABLE B-G19: HYPOTHETICAL EXAMPLE OF STEPS FOR RISK ADJUSTING THE 5 percent CAPS ON THE POPULATION ADJUSTMENT TO HISTORICAL BENCHMARKS

	Amount Under Current Policy (No Risk Adjustment Applied to 5 percent Caps)	Amount Under Proposed Policy (Risk Adjustment Applied to 5 percent Caps)
Step 1: Identify the proportion of assigned beneficiaries with LIS or dual status.		
Proportion of LIS or dual beneficiaries for the performance year (if less than 15 percent, ACO is ineligible to receive population adjustment)	0.20	0.20
Step 2: Calculate risk-adjusted 5 percent of the national per capita expenditures for assignable beneficiaries as a single value		
Step 2(i): Identify the national per capita expenditures for assignable beneficiaries by enrollment type in BY3.		
ESRD	$100,000.00	$100,000.00
Disabled	$12,000.00	$12,000.00
Aged/dual	$20,000.00	$20,000.00
Aged/non-dual	$12,000.00	$12,000.00
Step 2(ii): Identify the ACO's weighted average CMS-HCC risk score by enrollment type for BY3.		
ESRD	NA	1.1022
Disabled	NA	0.9249
Aged/dual	NA	1.0648
Aged/non-dual	NA	1.0366
Step 2(iii): By enrollment type, calculate the product of the amounts identified in Step 2(i) and Step 2(ii).		
ESRD	$100,000.00	$110,222.22
Disabled	$12,000.00	$11,098.52
Aged/dual	$20,000.00	$21,296.18
Aged/non-dual	$12,000.00	$12,439.56
Step 2(iv): By enrollment type, calculate the risk-adjusted, capped national per capita values as 5 percent of the product derived in Step 2(iii).		
ESRD	$5,000.00	$5,511.11
Disabled	$600.00	$554.93
Aged/dual	$1,000.00	$1,064.81
Aged/non-dual	$600.00	$621.98
Step 2(v): Identify the proportion of the ACO's assigned beneficiaries within each enrollment type.		
ESRD	0.007	0.007
Disabled	0.052	0.052
Aged/dual	0.055	0.055
Aged/non-dual	0.886	0.886
Step 2(vi): To calculate the final risk-adjusted 5 percent national expenditure by enrollment type, multiply the amount from Step 2(iv) by the enrollment proportions from Step 2(v)		

	Amount Under Current Policy (No Risk Adjustment Applied to 5 percent Caps)	Amount Under Proposed Policy (Risk Adjustment Applied to 5 percent Caps)
ESRD	$35.00	$38.58
Disabled	$31.20	$28.86
Aged/dual	$55.00	$58.56
Aged/non-dual	$531.60	$551.07
Step 2(vii): Sum the values in Step 2(vi) to express the risk-adjusted 5 percent of the national per capita expenditures for assignable beneficiaries as a single value.		
Summed, capped BY3 national assignable expenditures.	$652.80	$677.07
Step 3: Calculate the population adjustment scaler.		
Step 3(i): Identify the regional adjustment (expressed as a single value) and the prior savings adjustment.		
Regional adjustment	$375.00	$400.00
Prior savings adjustment	$335.00	$350.00
Step 3(ii): Calculate the scaler as the difference between the values in Step 2(vii) and the higher of the regional adjustment or prior savings adjustment in Step 3(i).		
Population adjustment scaler	$277.80	$277.07
Step 4: Calculate the population adjustment as the product of the values derived in Step 1 and Step 3(ii).		
Population adjustment	$55.56	$55.41

BILLING CODE 4169–69–c

In the CY 2027 PFS proposed rule we stated that, because the population adjustment scales based on the difference between 5 percent of risk-adjusted national assignable expenditures and the greater of the regional adjustment or prior savings adjustment, the proposed risk adjustments to the regional adjustment and prior savings adjustment caps would directly influence the final adjustment value an ACO receives (91 FR 44089 through 44090).

For ACOs with higher-risk populations, the regional adjustment and prior savings adjustment will likely increase under the proposed policy, as expressed in the hypothetical example (Table B–G15 of the CY 2027 PFS proposed rule at 91 FR 44086). We noted that, on the one hand, these increases reduce the available margin for the population adjustment by increasing the amount being subtracted from the scaler (for example, Steps 3(i) and 3(ii)) (91 FR 44090). On the other hand, the risk-adjusted 5 percent cap for the population adjustment also increases for these ACOs with higher-risk populations, expanding the ceiling for the population adjustment amount (for example, Step 2(vii)) (91 FR 44090). We concluded that, consequently, the mechanisms of the CY 2027 PFS proposed rule ensure that whichever adjustment an ACO ultimately receives is not limited by a flat 5 percent capped ceiling (91 FR 44090).

In the CY 2027 PFS proposed rule we stated that, based on an internal analysis simulating PY 2025 performance for 228 ACOs that entered new agreement periods beginning on January 1, 2025, risk adjusting the 5 percent cap on the regional adjustment, prior savings adjustment, and population adjustment would have the effect of increasing ACO benchmarks by an average of $2.98 (a 0.02 percent aggregate increase) (91 FR 44090).[338] We noted that among ACOs seeing a higher adjustment under this approach, benchmarks increased by an average of $84.18 (0.30 percent), while those ACOs with lower adjustments saw an average decrease of $27.66 (-0.22 percent) (91 FR 44090). About half of ACOs (111 of 228, or 49 percent) had no change in their benchmark value under a risk-adjusted 5 percent cap for all three adjustments. While some ACOs (82 of 228, or 36 percent) had lower benchmarks under this approach, the magnitude of change for these ACOs was smaller than the gains made for ACOs that had an increase in their benchmarks (35 of 228, or 15 percent).

We discussed that, among 91 ACOs receiving the regional adjustment as their adjustment category, these ACOs would have an average final adjustment that is $16.69 lower or 2.58 percent lower under the proposed policies compared to the current policy (91 FR 44090). And noted that, conversely, for the 8 ACOs that received the prior savings adjustment as their adjustment category, these ACOs would have an average final adjustment that is $142.21 higher or 14.42 percent higher, and 16 ACOs receiving the population adjustment would have an adjustment that is $69.10 higher or 12.61 percent higher (91 FR 44090). We stated that an additional 111 ACOs would see no change to their final adjustment under the proposed policy, 98 ACOs would have changes small enough that they ultimately would not impact benchmarks, and 2 ACOs changed the adjustment type received under the proposed policy (one with increased benchmarks and the other with decreased benchmarks as a result of the proposed policy and resultant change in adjustment type) (91 FR 44090).

We concluded that the simulation suggests that risk adjusting the caps will result in higher caps on positive

[338] Internal analysis simulating PY 2025 performance for 228 ACOs that entered new agreement periods beginning on January 1, 2025, applying the proposed policy to risk adjust the 5 percent caps on the regional adjustment, prior savings adjustment, and population adjustment. Simulation results were compared to PY 2025 performance on PY 2025 final historical benchmarks to determine the impact of the proposed policies.

adjustments for ACOs with above-average risk, which we believe may attract ACOs that serve more clinically complex populations with higher CMS–HCC risk scores or encourage existing ACOs to expand to include ACO providers and suppliers who serve such clinically complex populations (91 FR 44090).

We proposed to revise and republish § 425.662(b)(2), to include the proposed approach to calculating the population adjustment applicable for agreement periods beginning on January 1, 2027, and in subsequent years, as well as the existing calculation of the population adjustment which would apply for agreement periods beginning on January 1, 2025, or January 1, 2026 (91 FR 44090).

We proposed to specify the existing provisions of § 425.662(b)(2), describing the calculation of the population adjustment, under new paragraph § 425.662(b)(2)(i). Accordingly, we proposed to add a sentence at the start of the introductory text of new § 425.662(b)(2)(i) specifying the applicability of the calculation for agreement periods beginning on January 1, 2025, or January 1, 2026 (91 FR 44090).

Under new § 425.662(b)(2)(ii), we proposed to specify the calculation of the population adjustment scaler applicable for agreement periods beginning on January 1, 2027, and in subsequent years (91 FR 44090). We proposed to calculate a scaler as the difference between: § 425.662(b)(2)(ii)(A), specifying a single per capita value that is the risk adjusted 5 percent cap, and § 425.662(b)(2)(ii)(B), specifying the highest among the regional adjustment (expressed as a single value), the per capita prior savings adjustment, or no adjustment (in the case where the regional adjustment is negative and the ACO is not eligible for the prior savings adjustment) (specified in new § 425.662(b)(2)(ii)(B)) (91 FR 44090).

We proposed the following provisions to state how we would calculate the single per capita value reflecting the risk adjusted 5 percent cap (91 FR 44090). Under § 425.662(b)(2)(ii)(A)(*1*), we proposed to calculate the product of the following bulleted items for each Medicare enrollment type (ESRD, disabled, aged/dual eligible Medicare and Medicaid beneficiaries, aged/non-dual eligible Medicare and Medicaid beneficiaries) (91 FR 44090)—

- The national per capita expenditures for Parts A and B services under the original Medicare fee-for-service program in BY3 for assignable beneficiaries in that enrollment type identified for the 12-month calendar year corresponding to BY3 using data from the CMS Office of the Actuary; [339] and
- The ACO's weighted average CMS–HCC risk score for that enrollment type for BY3.[340]

Under proposed § 425.662(b)(2)(ii)(A)(*2*), we proposed that CMS would calculate 5 percent of each enrollment type-specific product determined in § 425.662(b)(2)(ii)(A)(*1*). Under § 425.662(b)(2)(ii)(A)(*3*), CMS would calculate a single per capita value as a person-year weighted average [341] by multiplying each of these enrollment type-specific products (determined in accordance with § 425.662(b)(2)(ii)(A)(*2*)) by the proportion of the ACO's assigned beneficiaries within that particular enrollment type, then summing the results (91 FR 44090).

We sought comment on the proposal to risk adjust the 5 percent cap used for calculating the population adjustment to the benchmark applicable for agreement periods beginning on January 1, 2027, and in subsequent years, and related proposed changes to the Shared Savings Program regulations at § 425.662(b)(2) (as revised and republished).

The following is a summary of the comments we received on sections III.G.5.e.(2).(a), (b), and (c) of the CY 2027 PFS proposed rule and our responses:

Comment: Many commenters supported our proposals to risk adjust the five percent cap on upward adjustments to the historical benchmark. Some commenters expressed that risk adjusting the five percent cap to the historical benchmark would increase the fairness and accuracy of calculations for those serving medically complex and higher risk populations.

Response: We thank commenters for their support and agree that risk adjusting the 5 percent cap will result in higher caps on positive adjustments for ACOs with above-average risk, which we believe may attract ACOs that serve more clinically complex populations with higher CMS–HCC risk scores or encourage existing ACOs to expand to include ACO providers and suppliers who serve such clinically complex populations.

Based on updated internal analysis simulating PY 2025 performance for 225 ACOs that entered new agreement periods beginning on January 1, 2025 and had their financial performance reconciled for that performance year, risk adjusting the 5 percent cap on upwards adjustments would have the effect of increasing ACO benchmarks by an average of $1.97 (a 0.01 percent aggregate increase).[342] By risk-adjusting the 5 percent cap, 34 ACOs would have seen benchmarks increase by an average of $79.76 (0.31 percent), 81 ACOs would have seen benchmarks decrease by an average of $27.99 (-0.09 percent), and half of ACOs (111 of 225, or 49 percent) would have had no change in their benchmarks.

The proposed policy would have increased the final adjustment amount for 8 ACOs receiving the Prior Savings Adjustment ($142.37 or 14.46 percent higher with risk-adjusted cap) and 14 ACOs receiving the Population Adjustment ($62.17 or 9.73 percent higher with risk-adjusted cap). For 90 ACOs with decreased final adjustment amounts as a result of the policy, the average change (-$16.90 or -2.63 percent) would have been of smaller absolute magnitude than the changes for ACOs positively impacted by the policy. Under the updated simulation, 111 ACOs either had no material change in their final adjustment amount or received no adjustment. As in the initial simulation, 2 ACOs would have changed the adjustment type received under the proposed policy.

Comment: Some commenters opposed our proposal to risk adjust the five percent cap on upward adjustments to the historical benchmark citing general concerns around increased complexity and reduced predictability.

Response: We appreciate the comments expressing concerns. We believe the inclusion of risk adjustment as part of the calculation of the 5 percent cap on upward adjustments to the historical benchmark helps properly account for the differences in populations that ACOs serve. Any additional complexity that results from this risk adjustment is outweighed by the benefits for ACOs serving high-risk

[339] We note that in the CY 2025 PFS final rule (89 FR 98158), we explained in detail how we calculate the national assignable expenditure amount used in this calculation, although the provision codified in § 425.662(b)(1) is more general.

[340] For more information on the calculation of the weighted average risk score we refer readers to section 3.2 of the Shared Savings and Losses, Assignment and Quality Performance Standard Methodology Specifications Version 14.

[341] For more information on the calculation of the person-year weighted average we refer readers to section 3.2 of the Shared Savings and Losses, Assignment and Quality Performance Standard Methodology Specifications Version 14.

[342] Please note, at the time of this final rule publishing performance year 2025 financial reconciliation results have not yet been released to ACOs. We anticipate embargoed and unembargoed performance year 2025 financial reconciliation results to be shared with ACOs shortly after the finalization of this final rule.

medically complex populations and the incentive the risk adjustment will create for additional ACOs to care for a broad beneficiary population. Additionally, the 5 percent cap risk adjustment is based on the ACO's population assigned at the end of the performance year, which is summarized in the information provided to ACOs in quarterly reports, so the ACO will have an understanding of what the risk adjustment to the 5 percent cap will be prior to it being finalized during financial reconciliation.

Comment: Commenters suggested we change the five percent cap on upward adjustments, with many commenters suggesting raising the cap from five percent to seven percent, creating a tiered cap structure, or establishing a floor to the risk adjustment. Most commenters urged CMS to ensure that this policy does not negatively impact ACOs and encouraged CMS to increase the cap on upward adjustments to the historical benchmark. Many commenters also suggested that CMS consider a tiered cap structure where benchmark adjustments increase based on the duration of an ACO's or its participant TINs participation in the program so that CHCs and other providers are not disadvantaged because their ACO has successfully reduced expenditures over multiple agreement periods.

Several supportive commenters suggested establishing a floor to the risk adjustment to mitigate any negative impacts to ACOs and to avoid penalizing ACOs with healthier patient populations. Many commenters urged CMS to ensure that the cap only has a positive effect on ACOs and to not allow for a downward cap adjustment for ACOs with average risk scores below 1.0.

Another commenter stated that the 5 percent ceiling remains the single largest financial limitation preventing the Shared Savings Program from reaching its full potential and the failure to address this financial obstacle has contributed to the lack of progress on CMS priorities such as increasing specialist integration in ACOs and improving ACO coordination with community-based organizations for addressing patient social needs.

Response: We appreciate comments describing concerns and recommendations regarding the 5 percent cap to the historical benchmark. We considered many similar comments when we established the 5 percent cap in the December 2018 final rule (83 FR 68022 and 68023). We recognize that there are tradeoffs in adopting any cap and that limiting the magnitude of positive adjustments could reduce incentives for participation or further cost reduction efforts among ACOs that have low costs, whether due to efficiency, patient mix, or limited patient access to services. We also considered commenters' recommendations to increase the cap. However, we remain concerned that a higher cap could result in larger upward benchmark adjustments that may substantially reduce savings to Medicare, and may reduce the incentives for ACOs to continue to increase savings and performance, particularly given the other benchmark methodology changes finalized in this rule, the effects of which we will continue to monitor. Accordingly, we continue to believe that a risk-adjusted 5 percent cap on the benchmark adjustments will protect the Medicare Trust Funds from excessive positive adjustments that may limit savings to Medicare and improve incentives for participation among higher-cost ACOs, particularly in combination with the increased prior savings adjustment scaling factor adopted in this rule. We also believe that risk adjusting the 5 percent cap will improve the fairness and accuracy of the cap calculation since it will scale to account for how ACO populations relate to the national population. By risk adjusting the 5 percent cap, ACOs caring for beneficiaries that are higher risk and more medically complex than the national population will receive an increase to their cap, while ACOs caring for beneficiaries that are lower risk and less medically complex than the national average would experience a decrease to account for differing beneficiary populations. Both the CY 2027 PFS proposed rule (91 FR 44090) and our updated analysis, discussed previously, indicate that about half of ACOs had no change in their benchmark value under a risk-adjusted 5 percent cap for all three adjustments. While some ACOs under both analyses had lower benchmarks under this approach, the magnitude of change for these ACOs was smaller than the gains made for ACOs that had an increase in their benchmarks. We note that the policy preserves the cap as a limit on excessive upward benchmark adjustments while reducing unintended constraints on ACOs that serve higher-risk, higher-cost populations, and ensuring that the amount of the adjustment does not inflate an ACO's benchmark to the point where the ACO is likely to generate shared savings without decreasing expenditures.

Comment: Commenters had suggestions for additional protections and monitoring for FQHCs and complex patient populations because of the impact risk adjusting the five percent cap on upward adjustments will have on their patient population. Another commenter encouraged CMS to continue monitoring changes in risk-score benchmark adjustments to ensure they reflect differences in patient health status and clinical complexity. Some commenters encouraged CMS to continue evaluating whether the 5 percent cap is appropriately calculated to account for the needs and complexity of populations served by essential hospital ACOs. A commenter who opposed risk adjusting the 5 percent cap on the benchmark adjustments suggested that CMS reconsider implementing this proposal until CMS can demonstrate that this change does not disproportionately disadvantage safety-net and FQHC-serving ACOs.

Response: We appreciate the comments describing concerns and recommendations. Risk adjusting the 5 percent cap accounts for the severity and case mix of each ACO's assigned beneficiary population, allowing a higher positive adjustment ceiling for ACOs serving medically complex populations while still fulfilling the cap's original purpose of safeguarding CMS against extreme or outlier positive benchmark adjustments. We acknowledge commenters' concerns that FQHCs and other safety-net providers may face challenges in fully capturing diagnoses, such that CMS–HCC risk scores may not fully reflect the clinical complexity of the populations they serve. We will continue to evaluate the effect of this policy on ACOs that include FQHCs and other safety-net healthcare providers and will consider whether refinements are warranted for future rulemaking.

Comment: Several commenters offered alternatives to risk adjusting the 5 percent cap in ways they felt would better reflect an ACO's actual population. A commenter proposed that CMS calculate the cap on a base capturing the ACO's full case mix—applying the ACO's prospective risk profile to the national per capita expenditure base so the ceiling scales with the population served. Multiple commenters worried the change would reward diagnostic coding over efficient care delivery. They urged CMS to base any accommodation for health-status changes on measures resistant to discretionary coding and cautioned against using risk adjustment to further expand what a commenter viewed as an already-generous set of upward benchmark adjustments. Another commenter, wary of tying the cap to

HCC scores, suggested CMS instead adjust for an ACO's demographic risk score.

Commenters who appreciated the proposal's intent nonetheless cautioned that it would add complexity while still relying on outdated data, and that introducing another risk-based component could reduce benchmark predictability. Another commenter asked CMS to retain the existing cap until it can show the proposed methodology improves benchmark accuracy without creating unnecessary volatility or complexity.

Response: We appreciate comments with recommendations regarding ACO risk profiles, including the recommendation to use demographic risk scores in place of CMS–HCC risk scores and support for scaling the adjustment ceiling using the ACO's risk profile. We believe our proposal to risk-adjust the 5 percent cap directly achieves the goal of scaling the benchmark ceiling to reflect beneficiary clinical complexity, while continuing to utilize the CMS–HCC model as the most technically precise method to capture case mix and severity. While we acknowledge concerns regarding diagnostic coding intensity when using CMS–HCC risk scores to determine an ACO's risk profile, we believe that relying strictly on demographic risk scores would fail to capture true patient acuity and could disadvantage ACOs with populations that are sicker than the national demographic baseline, and this may incentivize ACOs to select patients with healthier demographic baselines. Demographic risk scores, which reflect only beneficiary characteristics such as age, sex, Medicare eligibility, and original reason for Medicare entitlement, would not fully capture patient acuity relative to what is further accounted for with CMS–HCC risk scores that also incorporate beneficiaries' diagnoses, which are stronger predictors of expected expenditures and of the resources required to care for a given population. On balance, we believe the benefits of more accurately aligning the cap with an ACO's underlying beneficiary risk profile outweigh concerns regarding potential coding incentives, particularly given the fact that the 5 percent cap remains in place to limit excessive upward benchmark adjustments.

After considering public comments, we are finalizing our proposals to risk adjust the 5 percent cap on each of the upward adjustments to the historical benchmark: the positive regional adjustment, the prior savings adjustment, and the population adjustment, for agreement periods beginning on January 1, 2027, and in subsequent years. Specifically, we are finalizing, without modification, our proposal to revise and republish § 425.656(c)(3) to include the proposed approach to calculating the caps on regional adjustment amounts applicable for agreement periods beginning on January 1, 2027, and in subsequent years, as well as the existing calculation of the caps on the regional adjustment amounts that would apply for agreement periods beginning on or after January 1, 2024, and before January 1, 2027. As described in section III.G.5.d.(2) of this final rule, we are finalizing, without modification, to specify in revised § 425.658(c)(2) the methodology for calculating the per capita prior savings adjustment applicable for agreement periods beginning on January 1, 2027, and in subsequent years. With respect to risk adjusting the 5 percent cap, we are finalizing as proposed to specify related provisions in revised § 425.658(c)(2)(ii). Lastly, we are finalizing, without modification, our proposal to revise and republish § 425.662(b)(2) to include the finalized approach to calculating the population adjustment applicable for agreement periods beginning on January 1, 2027, and in subsequent years, as well as the existing calculation of the population adjustment which would apply for agreement periods beginning on January 1, 2025, or January 1, 2026.

We are finalizing, without modification, a technical and conforming change in § 425.672(c)(2)(iv), describing adjustment of calculation of national per capita OM expenditures for assignable beneficiaries for purposes of capping the prior savings adjustment (among other factors) for SAHS billing activity occurring in CY 2024 or subsequent calendar years. More specifically, in § 425.672(c)(2)(iv), we are finalizing as proposed amendments to the existing reference to § 425.658(c)(1)(ii), to refer instead to § 425.658(c)(1)(ii) and (c)(2)(ii).

f. Incentivize New Participation Through a Growth Adjustment to the Historical Benchmark

(1) Background

(a) Background on Adjusting the Historical Benchmark

Section 1899(d)(1)(B)(ii) of the Act addresses how ACO benchmarks are to be established, updated, and reset at the start of each agreement period under the Shared Savings Program. This provision specifies that the Secretary shall estimate a benchmark for each agreement period for each ACO using the most recent available 3 years of per beneficiary expenditures for Parts A and B services for OM beneficiaries assigned to the ACO. The benchmark shall be reset at the start of each agreement period. Section 1899(d)(1)(B)(ii) of the Act also provides the Secretary with discretion to adjust the historical benchmark by ''such other factors as the Secretary determines appropriate.'' Under this authority, over time we have adopted a variety of methods to adjust the historical benchmark to meet certain policy goals.

Relying on our authority under section 1899(d)(1)(B)(ii) of the Act, we codified benchmarking policies applicable to all ACOs in agreement periods beginning on January 1, 2024, and in subsequent years at § 425.652 (88 FR 79174 through 79208). We referred readers to discussions of the benchmark calculations in earlier rulemaking for details on the development of the current policies (November 2011 final rule, 76 FR 67909 through 67927; June 2015 final rule, 80 FR 32785 through 32796; June 2016 final rule, 81 FR 37953 through 37991; December 2018 final rule, 83 FR 68005 through 68030; CY 2023 PFS final rule, 87 FR 69875 through 69928; CY 2024 PFS final rule, 88 FR 79174 through 79208; CY 2025 PFS final rule, 89 FR 98155 through 98166; and CY 2026 PFS final rule, 90 FR 32690 through 32692).

In the CY 2023 PFS final rule, we adopted policies to modify the regional adjustment under § 425.656 (87 FR 69915 through 69923) and to reinstate a prior savings adjustment under § 425.658 (87 FR 69898 through 69915). The prior savings adjustment policy permitted some renewing or re-entering ACOs to receive an adjustment to their benchmarks to account for savings generated in performance years that correspond to the benchmark years of their new agreement periods. The modifications to the regional adjustment limited the impact of negative regional adjustments on ACO historical benchmarks and further incentivized program participation among ACOs serving high-cost beneficiaries.

In the CY 2024 PFS final rule (88 FR 79185 through 79196), we modified the regional adjustment policy further to prevent any ACO from receiving an adjustment that would cause its benchmark to be lower than it would have been in the absence of a regional adjustment. In the CY 2024 PFS final rule (88 FR 79196 through 79200), we also modified the prior savings adjustment policy further to account for the following: a change in savings earned by the ACO in a benchmark year due to compliance action taken to address avoidance of at-risk

beneficiaries; or a change in the amount of savings or losses for a benchmark year as a result of a reopening of a prior determination of ACO shared savings or shared losses and the issuance of a revised initial determination under § 425.315.

In the CY 2025 PFS final rule, we finalized provisions in §§ 425.652(a)(8) and 425.662 specifying the methodology for calculating the health equity benchmark adjustment (HEBA) to the historical benchmark, determining an ACO's eligibility for the adjustment, and the applicability of the adjustment (89 FR 61890 and 61891). In the CY 2025 PFS final rule, we noted the limitations of benchmarks based on historically observed spending, as they could be set too low if they are based on the spending of a population of underserved communities. The HEBA was finalized to provide additional financial resources to ACOs serving these populations, and to encourage those ACOs to attract and retain beneficiaries from communities that have faced challenges related to accessing care (89 FR 61887). The adjustment is calculated based on the number of beneficiaries an ACO serves who are either enrolled in the Medicare Part D Low-Income Subsidy (LIS) program or are dually eligible for Medicare and Medicaid, offering a targeted mechanism to reflect the needs of higher-risk populations.

In the CY 2026 PFS final rule, we renamed the HEBA as the ''population adjustment'' for clarity under § 425.662 (90 FR 32683 through 32685). This finalized revision more accurately reflects the nature of the adjustment, which accounts for the proportion of the ACO's assigned beneficiaries who are enrolled in the Medicare Part D LIS program or dually eligible for Medicare and Medicaid.

(b) Methodology for Determining the Applicability of a Regional Adjustment, Prior Savings Adjustment, or Population Adjustment to the ACO's Historical Benchmark, for Agreement Periods Beginning on or After January 1, 2025

In the CY 2027 PFS proposed rule, we discussed that we calculate three adjustments to the historical benchmark under the benchmarking methodology for agreement periods beginning on January 1, 2025, and in subsequent years (91 FR 44091). We noted that these adjustments are a regional adjustment (§ 425.656), prior savings adjustment (§ 425.658), and the population adjustment (§ 425.662) (91 FR 44091). We stated that we then determine whether to apply one of the three adjustments or no adjustment to the ACO's historical benchmark (§ 425.652(a)(8)(ii)) (91 FR 44091).

In the CY 2027 PFS proposed rule, we discussed the following overview of how, under this methodology, we currently calculate the adjustment to apply when establishing benchmarks for ACOs entering an agreement period beginning on January 1, 2025, and in subsequent years (91 FR 44091 through 44092):

- *Step 1:* We calculate the capped regional adjustment expressed as a single dollar value as specified in § 425.656. We calculate the regional adjustment to the historical benchmark based on the ACO's regional service area expenditures, making separate calculations for the following populations of beneficiaries: ESRD, disabled, aged/dual eligible Medicare and Medicaid beneficiaries, and aged/non-dual eligible Medicare and Medicaid beneficiaries.

++ Under § 425.656(c)(3), we cap the per capita dollar amount for each Medicare enrollment type at a dollar amount equal to a percentage of national per capita expenditures for Parts A and B services under the OM program in BY3 for assignable beneficiaries in that enrollment type identified for the 12-month calendar year corresponding to BY3 using data from the CMS Office of the Actuary.

—Under § 425.656(c)(3)(i), for positive adjustments, the per capita dollar amount for a Medicare enrollment type is capped at 5 percent of the national per capita expenditure amount for the enrollment type for BY3.

—Under § 425.656(c)(3)(ii), for negative adjustments, the per capita dollar amount for a Medicare enrollment type is capped at negative 1.5 percent of the national per capita expenditure amount for the enrollment type for BY3.

++ Under § 425.656(d)(1), we express the regional adjustment as a single value by taking a person year[343] weighted average of the Medicare enrollment type-specific regional adjustment values.

- *Step 2:* For eligible ACOs, we calculate the capped prior savings adjustment as specified in § 425.658. Under § 425.658(c)(1), we calculate an adjustment to the historical benchmark to account for savings an ACO generated in the 3 years prior to the start of the ACO's current agreement period for renewing or re-entering ACOs that were reconciled for one or more PYs in the Shared Savings Program during this period.
- *Step 3:* For eligible ACOs, we calculate the capped population adjustment as specified in § 425.662. Under § 425.662(b), we calculate an adjustment to the historical benchmark to offer a targeted mechanism to reflect the needs of higher-risk populations and account for ACOs with 15 percent or more assigned beneficiaries enrolled in LIS or dually eligible for Medicare and Medicaid during the PY.
- *Step 4:* We determine the final adjustment to the benchmark, as specified in § 425.652(a)(8)(ii). We compare the regional adjustment calculated in accordance with § 425.656, the prior savings adjustment calculated in accordance with § 425.658, and the population adjustment calculated in accordance with § 425.662.

++ Under § 425.652(a)(8)(ii), the ACO receives the highest of the positive adjustments for which it is eligible. The adjustments are calculated as described in § 425.656(c), § 425.658(c), or § 425.662(b), respectively, and applied separately to the following populations of beneficiaries: ESRD, disabled, aged/dual eligible Medicare and Medicaid beneficiaries, and aged/non-dual eligible Medicare and Medicaid beneficiaries. If an ACO is not eligible to receive a prior savings adjustment under § 425.658(b)(3)(i) or the population adjustment under § 425.662(b)(3), and the regional adjustment, expressed as a single value as described in § 425.656(d), is negative or zero, the ACO does not receive an adjustment to its benchmark.

(c) Background on Incentivizing Growth in the Shared Savings Program

In the proposed rule we noted that, in recent years, we have repeatedly emphasized our interest in promoting growth in the Shared Savings Program through the policies we have established (91 FR 44092). In the CY 2024 PFS final rule, we stated, ''This rulemaking also seeks to further advance Medicare's overall value-based care strategy of growth [. . .] through the Medicare Shared Savings Program'' (88 FR 78819). We reiterated this aim in the CY 2025 PFS final rule (89 FR 97711) and CY 2026 PFS final rule (90

[343] To calculate person years: We sum the number of Shared Savings Program-eligible months (beneficiaries are only assigned a monthly enrollment status for months in which they are alive on 1st of the month, enrolled in both Parts A and B, and not enrolled in a Medicare Group Health Plan for the month) for each assigned beneficiary for each Medicare enrollment type; we then divide this number by 12 (the number of months in a calendar year). Refer to the Shared Savings and Losses, Assignment and Quality Performance Standard Methodology Specifications Version 14, Section 3.1 Calculating ACO-Assigned Beneficiary Expenditures.

FR 49768). Many of the Shared Savings Program policies finalized through past rulemaking have either directly or indirectly focused on increasing ACO participants in the program and increasing the number of beneficiaries receiving care from ACOs. For example, in the CY 2024 PFS final rule (88 FR 79139 through 79163) we modified the step-wise beneficiary assignment methodology by adding a new third step that uses an expanded period of time to identify if a beneficiary has received at least one primary care service from an ACO professional. This change, taken with all other changes in the CY 2024 PFS final rule, was designed to enhance program growth (88 FR 78819), making more than 331,000 additional beneficiaries eligible for assignment, and increasing overall participation in the Shared Savings Program. Based on an internal analysis of CY 2024 primary care services, nearly 300,000 active individual practitioners with specialties used in assignment and billing assignment eligible services had not participated in a Shared Savings Program ACO or CMS Innovation Center model initiative involving shared savings during the 6-year period from 2019 through 2024.

In the proposed rule we discussed that we have seen increasing participation in the Shared Savings Program since the start of the program in 2012, with 3 million beneficiaries assigned to Shared Savings Program ACOs in the program's first year and over 12 million beneficiaries assigned to Shared Savings Program ACOs as of January 2026 (91 FR 44092). We also stated that we have observed that when participation in the program increases, we see increases in both quality improvements for beneficiaries and increased savings to the Trust Funds (91 FR 44092). The Shared Savings Program has had 8 consecutive years of generating savings for Medicare relative to benchmarks, with over $12 billion in total savings,[344] and with an upward trend in savings year over year.[345] Additionally, we have observed that Shared Savings Program ACOs have demonstrated improved quality performance over time and higher quality performance relative to other physician groups, suggesting that the Shared Savings Program is achieving savings while improving quality of care. In the proposed rule we stated that, based on an internal CMS analysis of 87 Shared Savings Program ACOs that participated continuously in the Shared Savings Program between 2014 and 2023, Shared Savings Program ACOs showed statistically significant and substantial improvement across seven comparable CMS Web Interface quality measures used during that period, where quality performance improved across a wide range of clinical practice areas including screening and preventive measures and control of health conditions such as hypertension and diabetes (91 FR 44092). We referred readers to Table B–G17 in the proposed rule (91 FR 440093) for details on the quality performance of these 87 Shared Savings Program ACOs. As discussed further in the CY 2027 PFS proposed rule (91 FR 44046 through 44059) Shared Savings Program ACOs have been transitioning to new quality measure collection types over the last several years and are now being assessed on the APP Plus quality measure set, that can pose limitations on comparing Shared Savings Program ACOs' most recent quality performance to their historical performance. We noted specifically that Shared Savings Program ACOs have transitioned from reporting on a sampling methodology (for example, web interface) to reporting on a broader patient population, which could impact comparisons on quality performance (91 FR 44092).

We noted, however, that there is evidence that Shared Savings Program ACOs perform better than their MIPS counterparts under the new quality reporting collection types. In PY 2024, Shared Savings Program ACOs scored better than comparable MIPS groups on all three electronic clinical quality measures (eCQMs) in the APP Plus quality measure set, with the difference being statistically significant for two of those measures (Quality ID: 134 Preventive Care and Screening: Screening for Depression and Follow-Up Plan ($p < .001$) and Quality ID: 236 Controlling High Blood Pressure ($p < .01$) (90 FR 50002)) (91 FR 44092). We stated that Shared Savings Program ACOs also performed better than comparable MIPS groups on two of the three MIPS CQMs in the APP Plus quality measure set and the difference was statistically significant for one measure (Quality ID: 236 Controlling High Blood Pressure ($p < .01$) (90 FR 50002)) (91 FR 44092). We referred readers to Table B–G17 of the proposed rule (91 FR 44093) for an overview of Shared Savings Program ACOs' PY 2024 quality performance relative to comparable MIPS Groups. We stated that, informed by the historical performance of the Shared Savings Program on savings and quality improvement by healthcare providers and for beneficiaries assigned to a Shared Savings Program ACO, we are interested in identifying additional incentives to grow participation in the Shared Savings Program and expand the reach of cost savings and improved quality of care (91 FR 44093).

[344] Additional information on past years Shared Savings Program Performance Year Finance and Quality Results is available at: *https://data.cms.gov/medicare-shared-savings-program/performance-year-financial-and-quality-results*

[345] The Regulatory Impact Analysis reviews evidence that aggregate savings measured by benchmarks have been supported by observation of lower (higher) per capita spending trends in markets with earlier (later) ACO adoption.

TABLE B-G20: QUALITY PERFORMANCE AMONG 87 ACOS WHO PARTICIPATED IN THE SHARED SAVINGS PROGRAM CONTINOUSLY FROM PY 2014 to 2013

Quality #	Measure Title (CMS Web Interface)	PY 2014 Mean	PY 2023 Mean	Difference
001	Diabetes: Glycemic Status Assessment Greater Than 9% (Inverse measure)**	20.47	9.21	–11.25*
110	Preventive Care and Screening: Influenza Immunization	58.66	71.64	+12.98*
112	Breast Cancer Screening	62.51	81.53	+19.03*
113	Colorectal Cancer Screening	56.74	78.53	+21.79*
134	Preventive Care and Screening: Screening for Depression and Follow-Up Plan	37.34	82.06	+44.73*
238	Controlling High Blood Pressure	67.32	80.20	+12.88*
318	Falls: Screening for Future Fall Risk	46.80	91.43	+44.62*

*Indicates statistically significant differences between ACOs in PY 2014 and 2023 ($p < .05$). The Difference column represents the mean PY 2023 ACO performance rate minus the mean PY 2014 ACO performance rate.
** This is an inverse measure, and a lower number indicates better quality performance.
Long–participating ACOs N=87.

TABLE B-G21: PY 2024 QUALITY MEASURES THAT SHARED SAVINGS PROGRAM ACOs PERFORMED BETTER ON THAN COMPARABLE MIPS GROUPS

Quality #	Measure Title	Difference in Mean ACO and MIPS Group Performance Rates for PY 2024 (%)*
	eCQMs	
001	Diabetes: Hemoglobin A1c (HbA1c) Poor Control (>9%)	-3.75**
134	Preventive Care and Screening: Screening for Depression and Follow-up Plan	9.11****
236	Controlling High Blood Pressure	3.39***
	MIPS CQMs	
001	Diabetes: Hemoglobin A1c (HbA1c) Poor Control (>9%)	-7.63**
236	Controlling High Blood Pressure	8.59***

*The numbers in this column represent the mean ACO performance rate minus the mean MIPS group performance rate for each measure.
**This is an inverse measure, and a lower number indicates better quality performance.
***Indicates statistically significant differences between ACOs and comparable MIPS groups ($p < 0.01$).
****Indicates statistically significant differences between ACOs and comparable MIPS groups ($p < 0.001$).

In the proposed rule we noted, as described previously, we have observed substantial evidence that the Shared Savings Program both generates savings and improves quality of care for beneficiaries (91 FR 44093). We also have observed there are still healthcare providers and beneficiaries not yet in accountable care relationships, and there is additional potential to increase participation in the Shared Savings Program and thereby continue to grow savings to the Medicare Trust Funds while improving the quality of care for beneficiaries. We stated that, although the number of primary care practitioners participating in a Shared Savings Program ACO has steadily grown over

time, a targeted incentive that encourages ACOs to recruit new practitioners and the beneficiaries they serve may help offset some of the initial investment costs associated with first time participation (91 FR 44093). We added that, as of PY 2024, there were 12.3 million beneficiaries that were eligible to be assigned to a Shared Savings Program ACO but were not assigned to an ACO (91 FR 44093). Approximately 11.1 million of these beneficiaries were not part of any shared savings initiative in PY 2023 or PY 2024, 6.7 million of which were primarily served by one of the aforementioned 300,000 practitioners who had no shared savings experience during the 6-year period from 2019 through 2024. We stated that ACOs may seek to recruit these practitioners and in turn provide care for their beneficiary populations if a well-designed incentive could help reduce certain financial barriers to recruitment and initial participation (91 FR 44093).

(d) Background on Determining Risk Experience

In the December 2018 final rule (83 FR 67894 through 67899), we finalized the definitions of performance-based risk Medicare ACO initiative, and what it means for an ACO to be deemed experienced and inexperienced with performance-based risk Medicare ACO initiatives under § 425.20. Under paragraph (1) of the definition of ''experienced with performance-based risk Medicare ACO initiatives,'' an ACO is considered experienced if the ACO (or a plurality of its ACO participants) has participated in a CMS initiative that requires an ACO to participate under a two-sided model (with shared savings and losses) such as Level E of the BASIC track and the ENHANCED track of the Shared Savings Program or other Innovation Center ACO models such as ACO REACH.[346] Under paragraph (2) of the definition, an ACO is also considered experienced if forty percent or more of the ACO's participants participated in a performance-based risk Medicare ACO initiative in any of the 5 most recent performance years. This means either the ACO itself (as a legal entity) has participated in such a program, or 40 percent or more of its participating provider groups (TINs) participated in such a program during any of the five performance years prior to the start of the ACO's agreement period. An ACO is considered inexperienced with performance-based risk Medicare ACO initiatives if its legal entity has never participated in a Medicare program with shared savings and shared losses and if less than 40 percent of its participating provider groups (TINs) participated in such programs during each of the 5 performance years prior to the start of the ACOs agreement period. ACOs that are inexperienced with performance-based risk Medicare ACO initiatives can typically qualify for certain participation options in the Shared Savings Program that are not otherwise available.

(2) Growth Adjustment to the Historical Benchmark

Relying on our authority under section 1899(d)(1)(B)(ii) of the Act, we proposed a growth adjustment to the historical benchmark applicable to ACOs in agreement periods beginning on January 1, 2027, and in subsequent years (91 FR 44094). We proposed a growth adjustment to offer a method of upwardly adjusting an ACO's historical benchmark that is applied in addition to the existing regional adjustment, prior savings adjustment, and population adjustment, up to the proposed cap of 5 percent of ACO risk-adjusted national per capita expenditures. The growth adjustment directly targets those ACOs that are actively engaged in expanding their beneficiary population and provide a financial incentive to reward growth above what we typically observe. To promote growth in the Shared Savings Program, this upward adjustment to the historical benchmark is designed to reward ACOs for recruiting ACO professionals inexperienced with value-based care arrangements who are also serving beneficiaries new to value-based care. Through the growth adjustment, we intend to provide a greater financial incentive for ACOs to recruit ACO professionals who are inexperienced with value-based care arrangements and serve more beneficiaries new to value-based care by increasing the likelihood that an ACO would earn shared savings and by potentially increasing the amount of shared savings earned.

We stated that under proposed § 425.652(a)(8)(iii), an ACO receives a growth adjustment, if applicable, in addition to the highest of the positive adjustments for which it is eligible, either the regional adjustment, prior savings adjustment, or population adjustment to the benchmark (91 FR 44094). As discussed in the proposed rule, an ACO is required to meet the eligibility criteria as described elsewhere in this section of this final rule to receive the growth adjustment to the historical benchmark (91 FR 44094). We noted that the proposed risk-adjustment of the 5 percent cap (91 FR 44082 through 44087), would operate synergistically with the growth adjustment, in that ACOs that are eligible for a growth adjustment may receive a greater adjustment with a risk-adjusted cap if the beneficiaries newly assigned to their ACO through newly recruited ACO professionals are also medically complex and high-risk beneficiaries (91 FR 44094).

Additionally, we noted that the proposed modifications to the prior savings adjustment to increase the scaling factor (91 FR 44076 through 44082) would complement the growth adjustment (91 FR 44094). Specifically, we noted that ACOs that receive a growth adjustment may generate larger performance year gross savings that would be accounted for in the calculation of future prior savings adjustments, thereby carrying a portion of the growth adjustment forward to a subsequent agreement period (91 FR 44094). Additionally, we noted that increasing the prior savings adjustment scaling factor from 50 percent to 75 percent, ACOs that receive a growth adjustment and generate gross savings would then be able to carry a larger portion of that growth adjustment forward to the subsequent agreement period through the larger prior savings adjustment (91 FR 44094). We stated that the use of a proration factor, which is not subject to modifications under this proposed rule, to calculate the prior savings adjustment based on changes in the assigned beneficiary population size also helps ensure that growth adjustments that might be awarded in the prior agreement period are only carried forward to the subsequent agreement period if the ACO maintains its overall size (91 FR 44094). If the ACO were to decrease in size, the ACO would receive a smaller prior savings adjustment and thus carry forward a smaller portion of the growth adjustment from the prior agreement period.

We proposed to calculate the growth adjustment as the product of the ACO's ''new growth'' share described in the proposed rule (91 FR 44094 through 44099) and the incentive factor described in the proposed rule (91 FR 44099 and 44100).

(a) Determine the ACO's ''New Growth'' Share of Assigned Beneficiary Person Years

As discussed in the proposed rule, to identify the ACO's new growth share of assigned beneficiary person years, CMS

[346] Refer to the Participation Options Report available to applicant ACOs on the Accountable Care Organization-Management System (ACO–MS) for other Innovation Center ACO models including ACO REACH.

would first need to identify the ACO's new growth (91 FR 44094). By new growth, we stated that we mean the number of beneficiaries (in person year terms) that are new to the Shared Savings Program that are brought into the program by ACO professionals who are inexperienced in shared savings initiatives (91 FR 44094). We proposed to identify shared savings initiatives for the purpose of determining the growth adjustment (as defined at § 425.664(b)(1)) as an initiative implemented by CMS, including the Shared Savings Program (as defined at § 425.664(b)(1)(i)), the Innovation Center ACO models ((as defined at § 425.664(b)(1)(ii)) (for example, ACO REACH, LEAD, etc.), or other initiatives that may be specified by CMS ((as defined at § 425.664(b)(1)(ii)) (91 FR 44094).[347]

In the proposed rule, we specified the criteria to meet this proposed definition throughout this section of this final rule under § 425.664 (91 FR 44094 through 44095). We stated that, to identify the ACO's new growth, we must first identify the ACO professionals who are inexperienced in shared savings initiatives (91 FR 44095). We added that the second step is then to determine the number of beneficiaries (in person year terms) that are new to the Shared Savings Program that are brought into the program by these inexperienced ACO professionals (91 FR 44095).

Therefore, we first proposed to define ACO professionals inexperienced with shared savings initiatives under § 425.664(b)(2) similar to the way we define how ACOs are ''experienced with performance-based risk Medicare ACO initiatives'' and ''inexperienced with performance-based risk Medicare ACO initiatives'' in § 425.20 (91 FR 44095). Under § 425.664(b)(2), we proposed that for an ACO professional to be considered inexperienced in a shared savings initiative for the growth adjustment (as defined at § 425.664(b)(1)), the ACO professional must not have billed primary care services through a participant in the Shared Savings Program, or participated in an Innovation Center ACO model, or other initiative specified by CMS for one or more performance years in any of the 5 performance years directly preceding the start of the ACO's current agreement period (91 FR 44095). We stated that, in other words, for an ACO professional to be considered experienced in a shared savings initiative, described as follows, the ACO professional must have billed primary care services through a participant in the Shared Savings Program, or participated in an Innovation Center ACO model, or other initiative specified by CMS, for one or more performance years of any of the 5 performance years directly preceding the start of the ACO's current agreement period (91 FR 44095).

We discussed in the proposed rule that, among the ACO professionals who we determine to be inexperienced in a shared savings initiative under § 425.664(b)(2), we then determine the number of beneficiaries (in person year terms) that are new to the Shared Savings Program that are brought into the program by these inexperienced ACO professionals under § 425.664(b)(3) (91 FR 44095). To determine the number of these beneficiaries (in person year terms), we first need to determine an assigned beneficiary's experience in shared savings initiatives. To do so, we proposed applying a similar definition as used to identify inexperienced ACO professionals to determine beneficiary experience in shared savings initiatives under § 425.664(b)(2) (91 FR 44095). Thus, under § 425.664(b)(3) we proposed that for an ACO assigned beneficiary to be considered inexperienced with a shared savings initiative, the ACO assigned beneficiary was not included in assignment in financial reconciliation to a Shared Savings Program ACO, Innovation Center ACO model, or other initiative specified by CMS in the performance year that corresponds to the ACO's BY3[348] under § 425.664(b)(3) (91 FR 44095). We stated that, in other words, for an ACO assigned beneficiary to be considered experienced with a shared savings initiative, the beneficiary would have to have been assigned to a Shared Savings Program ACO, Innovation Center ACO model, or other initiative specified by CMS and included in financial reconciliation for the performance year that corresponds to the ACO's BY3 (91 FR 44095).

Under § 425.664(b)(4), we proposed to measure new growth for each ACO in a given performance year as: (1) the number of assigned beneficiary person years inexperienced with a shared savings initiative; that (2) have an ACO professional who is inexperienced with a shared savings initiative as the ACO professional who provided the highest number of primary care services (as defined at § 425.20) at the ACO within the assignment window, or to whom the beneficiary was voluntarily aligned (91 FR 44095). We stated that, to qualify as new growth, both characteristics must be present (91 FR 44095). Under § 425.664(b)(4), we proposed to determine which ACO professional provided the highest number of primary care services (as defined at § 425.20) included in assignment for each assigned beneficiary at the ACO during the assignment window for the relevant performance year, or to whom the beneficiary voluntarily aligned. Refer to the example provided in Step 1 (91 FR 44095).

TABLE B-G22: HYPOTHETICAL ACO GROWTH ADJUSTMENT CALCULATION FOR PY1, STEP 1

Step 1: Calculate an ACO's new growth for the applicable performance year	New Growth = Number of assigned beneficiary person years inexperienced with a shared savings initiative that have an ACO professional inexperienced with shared savings initiatives as the primary ACO professional that provided the highest count of primary care services. New Growth = 3,000 assigned beneficiary person years.

[347] We will monitor for other similar models and initiatives in the future.

[348] Throughout this section, the assignment associated with the performance year that corresponds to the ACO's BY3 refers to the point in time from which to determine growth in assigned beneficiaries. For example, for an ACO that may begin an agreement period on January 1, 2027, we mean the final assignment list for PY 2026; we do not mean the benchmark year assignment list for BY 2026, which is the ACO's BY3. We use this as the point of comparison, so that we can determine the growth in assignment that occurred prior to the start of the agreement period relative to the applicable performance year, which will not be as clearly reflected if we used the current agreement period's participant list and BY3 assignment.

We proposed as a guardrail to ensure that measured new growth is contributing to overall growth in the program, only ACOs that grow and maintain their size, as measured by the count of assigned beneficiary person years, are eligible to receive an incentive, we proposed to cap new growth (91 FR 44095). We proposed to cap new growth to ensure ACOs are not only recruiting inexperienced ACO professionals and beneficiaries but additionally are maintaining their existing practitioner and beneficiary populations over the course of their agreement period, thus contributing to overall growth in the program (91 FR 44095). We stated that under § 425.664(c), the first step to determine whether the cap on new growth applies, is to determine the overall growth as the difference between the number of beneficiary person years assigned to the ACO during final assignment in the performance year and the number of beneficiary person years assigned to the ACO during final assignment in the PY that corresponds to the ACO's BY3 (91 FR 44095). We proposed that, if the ACO is a new entrant or re-entering ACO, the overall growth is equal to the number of assigned beneficiary person years in the performance year (91 FR 44095).

As discussed in the proposed rule. for re-entering ACOs, defined under § 425.20, overall growth will also be set equal to the number of assigned beneficiaries in the performance year (91 FR 44095). We proposed to handle re-entering ACOs in this way because they may have had a multi-year gap in participation since their prior participation agreement, be heavily comprised of ACO participants from multiple prior ACOs, or may have split off from another ACO (91 FR 44095 through 44096). Therefore, for ACOs that are new or re-entering, we would not have a comparable way to measure overall growth as we do for ACOs that are not new or re-entering (for example, using the performance year that corresponds to the ACO's BY3 from which to calculate the ACO's overall growth for the performance year). In an analysis of all re-entering ACOs between PY 2022 and PY 2026, two-thirds of re-entering ACOs had a smaller assigned beneficiary population than in their prior participation agreement. The complex nature of re-entering ACOs' composition makes it difficult to determine a fair and accurate beneficiary count to be used in determining a baseline for capped new growth. Only providing the incentive to inexperienced ACO professionals and beneficiary who have not been assigned to an ACO in the final assignment for the PY that corresponds to the ACO's BY3 ensures that only the new growth is counted toward the incentive and acts as a guardrail to mitigate any unintended incentives created by the treatment of re-entering ACOs as new entrants. For example, any currently participating ACOs that terminate and immediately re-enter, or that split into multiple new re-entering ACOs would still need to add additional inexperienced ACO professionals and beneficiaries to their organization to receive the growth adjustment. We noted that ACO professionals and beneficiaries added during the previous agreement period, prior to terminating and re-entering would not be considered inexperienced, and therefore would not count towards the incentive (91 FR 44096). We added that this mitigates against the possibility that an ACO might terminate and re-enter to set their baseline count of beneficiaries to zero (91 FR 44096).

TABLE B-G23: HYPOTHETICAL ACO GROWTH ADJUSTMENT CALCULATION FOR PY1, STEP 2

Step 2: Determine overall growth	overall growth = Number of assigned beneficiary person years in the PY minus the number of assigned beneficiary person years in the PY that corresponds to the ACO's BY3 (if applicable). If the ACO is a new entrant or re-entering, the overall growth is equal to the number of assigned beneficiary person years in the PY Continuing ACO Example: Number of assigned beneficiary person years in the PY = 11,000 Number of assigned beneficiary person years in the PY that corresponds to the ACO's BY3 = 5,000 overall growth = 11,000 - 5,000 = 6,000 assigned beneficiary person years New Entrant or Re-Entering ACO Example: Number of assigned beneficiary person years in the PY = 11,000 Number of assigned beneficiary person years in the PY that corresponds to the ACO's BY3 = 0 overall growth = 11,000 - 0 = 11,000 assigned beneficiary person years

We discussed in the proposed rule that the third step to determine the cap on the new growth is to take the lesser of the new growth and the overall growth under § 425.664(d) (we referred to Example Tables 1 through 4 of the proposed rule for examples of this calculation) (91 FR 44096). We noted that, for new entrant ACOs that did not participate prior to the current agreement period, assuming zero assigned beneficiary person years for the performance year corresponding to the ACO's BY3, the overall growth in the number of assigned beneficiary person years, which will determine the cap on the new growth, will be equivalent to the total number of assigned beneficiary person years in the current performance period (91 FR 44096). As described elsewhere in the proposed rule, we proposed to treat re-entering ACOs the same as new entrant ACOs for the purposes of this calculation as well (91 FR 44096). We noted in the proposed rule that the cap effectively would not apply for new entrant ACOs and re-

entering ACOs because new growth and the total number of assigned beneficiaries in a performance year will always be the same (91 FR 44096). We referred readers to the example provided in Step 3 of the proposed rule (91 FR 44096).

TABLE B-G24: HYPOTHETICAL ACO GROWTH ADJUSTMENT CALCULATION FOR PY1, STEP 3

Step 3: Determine capped new growth	Capped new growth = the lesser of the new growth determined in Step 1 and the overall growth determined in Step 2. overall growth = 6,000 assigned beneficiary person years new growth = 3,000 assigned beneficiary person years capped new growth = 3,000 assigned beneficiary person years

We recognized that there are typically new ACO professionals who join Shared Savings Program ACOs annually, as well as new beneficiaries assigned to Shared Savings Program ACOs annually (91 FR 44096). We stated that the intent of the growth adjustment is to provide a financial incentive to reward growth above what we typically observe (91 FR 44096). Accordingly, under § 425.664(e), we proposed to apply the minimum new growth thresholds in Table B–G22 for each performance year of an agreement period above which the ACO would need to grow with ACO professionals that have not previously participated in shared savings initiatives and beneficiaries that have not previously been assigned to an ACO to receive the growth adjustment (91 FR 44096).

Under § 425.664(e), we proposed determining the minimum new growth threshold on a relative basis, defined as the person years of the minimum new growth divided by total assigned beneficiary person years, and on an absolute basis, defined as the number of person years of the minimum new growth for the PY according to Table B–G22 of the proposed rule at 91 FR 44097 (91 FR 44096 through 44097). We proposed to determine the threshold on both an absolute and relative basis to ensure parity and equal opportunity for ACOs of various sizes to receive the incentive (91 FR 44097). We noted that for example the relative threshold creates an incentive for ACOs that are smaller, in which small additions in assigned beneficiaries would substantially impact the ACO's relative size (91 FR 44097). Whereas, the absolute threshold creates an incentive for ACOs that are larger to recruit practices that may not otherwise substantially impact the relative size of those ACOs. We proposed the following absolute and relative minimum new growth thresholds for PY1 through PY5 (91 FR 44097):

TABLE B-G25: ABSOLUTE AND RELATIVE MINIMUM "NEW GROWTH" THRESHOLDS OVER AN AGREEMENT PERIOD

	PY 1	PY 2	PY 3	PY 4	PY 5
Absolute Minimum New Growth Threshold	100	300	600	900	1200
Relative Minimum New Growth Threshold	0.5%	1.5%	3.5%	5.5%	7.5%

In the proposed rule, we identified these minimum thresholds by analyzing Shared Savings Program ACO program data from 2017 through 2026 (91 FR 44097). We stated that to identify a proposed minimum threshold for each performance year, we looked at ACOs that began their second or subsequent agreement period (that is, not new or re-entering ACOs) on or before January 1, 2022 that were still participating through the start of 2026 and experienced new growth (as we now propose to define it) (91 FR 44097). CMS then set the threshold at the 25th percentile of new growth, based on the observed inflection point in the distribution of new growth for each performance year. We noted that, while we understand that many ACOs experience some natural growth, we intend the growth adjustment as an incentive for ACOs to actively engage in expanding their beneficiary population that is inexperienced and expand their ACO participants who are inexperienced (91 FR 44097). We determined that setting the threshold at the 25th percentile [349] was sufficient to make the distinction between natural population variation and those ACOs that were actively recruiting new participants and growing their ACOs, while maintaining reasonable growth rates for ACOs of all sizes, as demonstrated by ACOs in this analysis. We proposed that only ACOs that exceed this threshold in a given year would qualify for the growth adjustment (91 FR 44097).

We stated that this analysis showed that new growth steadily increased among ACOs in this sample in each year relative to the PY that corresponds to the ACO's BY3, but the rate of increase was not consistent or linear (91 FR 44097). As discussed in the proposed rule, the thresholds approximately matched observed rates of growth year to year among the ACOs in this sample (91 FR 44097). We stated that the thresholds increase in each subsequent performance year to account for natural changes in the assigned beneficiary and ACO professional populations (91 FR

[349] The absolute and relative distribution of new growth among all ACOs *and* ACOs experiencing growth was a right-skewed L-shaped distribution with many ACOs experiencing little to no growth, a few experiencing extreme growth, and the middle set experiencing some growth. The first slope change (that is, inflection point) distinguished the majority of ACOs who experienced little to no new growth as defined in this proposed rule and in § 425.664(b)(4) from those who may have made composition changes to increase their ACO size. Among ACOs who participated for a full agreement period and experienced new growth, the first inflection point occurred at approximately the 25th percentile.

44097).[350] Thus we proposed to measure new growth relative to the performance year that corresponds to the ACO's BY3 (91 FR 44097). The larger thresholds in later performance years ensures that measured new growth is primarily the result of ACOs targeting intentional growth and not natural composition changes. We proposed that we will periodically re-evaluate the determined thresholds, and if changes to these thresholds are needed we would expect the updates to be on a performance year basis (rather than agreement period basis) (91 FR 44097). We noted that we would propose changes to the minimum new growth thresholds in rulemaking (91 FR 44097). And that we expect that updates to these thresholds will be infrequent to provide additional predictability in the proposed growth adjustment (91 FR 44097).

Under § 425.664(e), we proposed to determine which minimum new growth threshold is applied to an ACO by taking the lesser of the absolute and relative thresholds after we convert the relative threshold to beneficiary person years by multiplying the relative threshold by the ACO's total assigned beneficiary person years in the PY (91 FR 44097). We referred readers to the example provided in Step 4 of the proposed rule (91 FR 44097).

TABLE B-G26: HYPOTHETICAL ACO GROWTH ADJUSTMENT CALCULATION FOR PY1, STEP 4

Step 4: Determine which minimum new growth threshold is applied	Minimum new growth threshold applied = the lesser of the relative minimum new growth threshold and the absolute minimum new growth threshold. Absolute minimum new growth threshold = 100 assigned beneficiary person years. Relative minimum new growth threshold = 0.5% assigned beneficiary person years x total assigned beneficiary person years (11,000) = 55 assigned beneficiary person years. Minimum new growth threshold applied = 55 assigned beneficiary person years.

As discussed in the proposed rule, the new growth above the minimum and below the cap is the amount of newly assigned beneficiary person year growth eligible for the growth incentive (91 FR 44098). Under § 425.664(f), we proposed to calculate new growth above the minimum and below the cap, which is the portion of new growth for which ACOs may be eligible to receive a growth adjustment, as the difference between the new growth and the minimum new growth threshold, or 0, if negative (91 FR 44098). We proposed to calculate new growth above the minimum and below the cap in this way so that ACOs are rewarded for contributing to overall growth in the Shared Savings Program (91 FR 44098). We stated that the minimum thresholds in conjunction with the cap ensures CMS is rewarding ACOs engaged in actively expanding their assigned population with beneficiaries not currently in an accountable care relationship (91 FR 44098). We referred readers to the example provided in Step 5 of the proposed rule (91 FR 44098).

TABLE B-G27: HYPOTHETICAL ACO GROWTH ADJUSTMENT CALCULATION FOR PY1, STEP 5

Step 5: Determine new growth above minimum and below the cap	New growth above the minimum and below the cap = the difference of capped new growth determined in Step 3 and the minimum new growth threshold applied in Step 4. Capped New Growth = 3,000 assigned beneficiary person years Minimum new growth threshold applied = 55 assigned beneficiary person years New growth above the minimum and below the cap = 3,000 - 55 = 2,945 assigned beneficiary person years.

We said that to facilitate the calculation of a per capita growth adjustment to be applied to the historical benchmark, we must first calculate this new growth as a proportion of the ACO's total assigned beneficiary person years (91 FR 44098). Therefore, we proposed to determine an ACO's new growth share (91 FR 44098). Under § 425.664(g), we proposed to determine the new growth share as the ratio of the new growth above the minimum and below the cap divided by the ACOs number of assigned beneficiary person years for the PY (91 FR 44098). This value will be multiplied by the incentive factor to determine the growth adjustment to the historical benchmark. We referred readers to the example provided in Step 6 of the proposed rule (91 FR 44098).

[350] In other words, the composition of ACOs' beneficiary and ACO professional populations are not static. ACOs experience population changes as time passes. As more time passes, more changes will occur. These changes are the natural result of employment changes among ACO professionals, and changes in care patterns among beneficiaries—both of which occur even in organizations not engaged in actively expanding. Since growth is measured against a fixed time period, and the number of changes increases over time, the thresholds need to increase as the time relative to the PY corresponding to the ACO's BY3 increases.

TABLE B-G28: HYPOTHETICAL ACO GROWTH ADJUSTMENT CALCULATION FOR PY1, STEP 6

Step 6: Calculate new growth share	New Growth Share = new growth above the minimum and below the cap determined in Step 5 divided by the number of assigned beneficiary person years in the PY. New growth above the minimum and below the cap = 2,945 Number of assigned beneficiary person years in the PY = 11,000 New growth share = 2,945 / 11,000 = 0.268.

We provided four example scenarios for determining the new growth share for hypothetical ACOs over an agreement period to illustrate the multiple steps of the calculation, using the minimum new growth thresholds established in Table B–G22 of the proposed rule at 91 FR 44097 (91 FR 44098).

BILLING CODE 4169–69–P

EXAMPLE 1: NEW GROWTH CAPPED BY OVERALL GROWTH OVER AN AGREEMENT PERIOD

		Base	PY1	PY2	PY3	PY4	PY5
	Total assigned person years	5000	11000	11000	12000	13000	7000
Step 1	New growth person years		3000	1500	2000	2500	3000
Step 2	Overall growth [Total assigned person years in PY - Base]		6000	6000	7000	8000	2000
Step 3	Capped new growth [Step 1 ≤ Step 2]		3000	1500	2000	2500	2000
Step 4	Minimum new growth threshold applied		55	165	420	715	490
Step 5	New growth above the minimum and below the cap [Step 3 – Step 4]		2945	1335	1580	1785	1510
Step 6	New growth share [Step 5 ÷ Total assigned person years in PY]		0.268	0.121	0.132	0.137	0.216

EXAMPLE 2: LARGE ACO WITH ABSOLUTE THRESHOLD APPLIED OVER AN AGREEMENT PERIOD

		Base	PY1	PY2	PY3	PY4	PY5
	Total assigned person years	50000	55000	56000	57000	58000	56000
Step 1	New growth person years		1000	1500	2000	2500	3000
Step 2	Overall growth [Total assigned person years in PY - Base]		5000	6000	7000	8000	6000
Step 3	Capped new growth [Step 1 ≤ Step 2]		1000	1500	2000	2500	3000
Step 4	Minimum new growth threshold applied		100	300	600	900	1200
Step 5	New growth above the minimum and below the cap [Step 3 – Step 4]		900	1200	1400	1600	1800
Step 6	New growth share [Step 5 ÷ Total assigned person years in PY]		0.016	0.021	0.025	0.028	0.032

EXAMPLE 3: NEW ENTRANT OR RE-ENTERING ACO WHERE BASE EQUALS ZERO OVER AN AGREEMENT PERIOD

		Base	PY1	PY2	PY3	PY4	PY5
	Total assigned person years	0	10000	11000	12000	13000	11000
Step 1	New growth person years		1000	1500	2000	2500	3000
Step 2	Overall growth [Total assigned person years in PY - Base]		10000	11000	12000	13000	11000
Step 3	Capped new growth [Step 1 ≤ Step 2]		1000	1500	2000	2500	3000
Step 4	Minimum new growth threshold applied		50	165	420	715	770
Step 5	New growth above the minimum and below the cap [Step 3 – Step 4]		950	1335	1580	1785	2230
Step 6	New growth share [Step 5 ÷ Total assigned person years in PY]		0.095	0.121	0.132	0.137	0.203

EXAMPLE 4: SLOW "NEW GROWTH" AND GROWTH DECLINED IN LATER PY OVER AN AGREEMENT PERIOD

		Base	PY1	PY2	PY3	PY4	PY5
	Total assigned person years	5000	5000	6000	7000	8000	6000
Step 1	New growth person years		100	150	250	50	0
Step 2	Overall growth [Total assigned person years in PY - Base]		0	1000	2000	3000	1000
Step 3	Capped new growth [Step 1 ≤ Step 2]		0	150	250	50	0
Step 4	Minimum new growth threshold applied		25	90	245	440	420
Step 5	New growth above the minimum and below the cap [Step 3 – Step 4]		0	60	5	0	0
Step 6	New growth share [Step 5 ÷ Total assigned person years in PY]		0	0.01	0.001	0	0

BILLING CODE 4169–69–C

(b) Determine the ACO's Incentive Factor

To determine a dollar amount for the proposed adjustment to the historical benchmark, under § 425.664(h), we proposed to establish an incentive factor, which would be the per capita dollar amount that would convert the new growth share into dollar terms (91 FR 44099). The proposed incentive factor would be based on a percentage of the ACO's per capita historical benchmark and when multiplied against the new growth share will determine the dollar amount added to an ACO's historical benchmark (91 FR 44099). We proposed to determine an ACO's incentive factor as an ACO-specific per capita dollar amount (91 FR 44099). We proposed to calculate this per capita dollar amount as 5 percent of the per capita historical benchmark before the regional adjustment, prior savings adjustment, or population adjustment is applied, expressed as a single value (91 FR 44099). The CMS Office of the Actuary (OACT) provided information to support that 5 percent of the ACO's unadjusted historical benchmark is sufficient to incentivize recruitment of inexperienced ACO professionals while balancing savings in the program, and is described in the Regulatory Impact Analysis, in section VI. of this final rule. We stated that calculating the incentive factor as a percentage of the ACO's unique historical benchmark ensures the adjustment is specific to the ACO and provides a greater incentive, especially for ACOs caring for medically complex high-cost beneficiaries, than just a flat dollar for all ACOs (91 FR 44099). We referred to the example of the determination of the Incentive Factor provided in Step 7 in the proposed rule (91 FR 44099).

TABLE B-G29: HYPOTHETICAL ACO GROWTH ADJUSTMENT CALCULATION FOR PY1, STEP 7

Step 7: Determine the incentive factor	Incentive factor = 5% of historical benchmark before adjustment is applied historical benchmark before adjustment is applied = $13,000 incentive factor = $13,000 x 5% = $650

Table B–G27 of the proposed rule is an example scenario of determining the ACO's incentive factor for a hypothetical ACO over an agreement period (91 FR 44100).

TABLE B-G30: CALCULATION OF THE INCENTIVE FACTOR OVER AN AGREEMENT PERIOD

		PY1	PY2	PY3	PY4	PY5
	Historical Benchmark before Adjustments are Applied ($)	13,000	15,500	14,500	16,000	15,750
	Percentage Applied to the Historical Benchmark	5%	5%	5%	5%	5%
Step 7	Incentive Factor ($)	650.00	775.00	725.00	800.00	787.50

(c) Determine the ACO's Growth Adjustment to the Historical Benchmark

Under § 425.664(I)(1), we proposed to calculate the growth adjustment as the product of the ACO's new growth share, defined in the proposed rule (91 FR 44094 through 44099), and the ACO's incentive factor, defined in the proposed rule (91 FR 44099 and 44100). Refer to the example provided in Step 8 of the proposed rule (91 FR 44100).

TABLE B-G31: HYPOTHETICAL ACO GROWTH ADJUSTMENT CALCULATION FOR PY1, STEP 8

Step 8: Determine the growth adjustment to the historical benchmark	Determine the growth adjustment to the historical benchmark = new growth share determined in Step 6 and the incentive factor determined in Step 7 new growth share = 0.268 incentive factor = $650 growth adjustment to the historical benchmark = $174.02

Under § 425.652(a)(8)(iii), we proposed that the growth adjustment amount would be added to the highest of the positive regional adjustment, prior savings adjustment, and population adjustment, or no adjustment, and the total amount could not exceed 5 percent of national per capita OM expenditures, adjusted for risk (if finalized), as discussed in the proposed rule (91 FR 44082 through 44090), otherwise if not finalized, the total amount could not exceed the existing 5 percent of national per capita OM expenditures, not adjusted for risk. Refer to the example provided in Step 9 of the proposed rule (91 FR 44100).

TABLE B-G32: HYPOTHETICAL ACO GROWTH ADJUSTMENT CALCULATION FOR PY1, STEP 9

Step 9: Determine the final adjustment to the historical benchmark	Final adjustment to the historical benchmark = sum of the growth adjustment to the historical benchmark determined in Step 8 and the highest of the regional adjustment, prior savings adjustment, and the population adjustment, not to exceed 5% of the risk-adjusted national assignable FFS expenditures expressed as a single value; otherwise, the existing 5% of national per capital OM expenditures, not adjusted for risk. growth adjustment to the historical benchmark = $174.02 highest of the regional, prior savings, or population adjustment if applicable = $125 5% of the national FFS expenditures expressed as a single value = $350 final adjustment to the historical benchmark = $299.02

As discussed in the proposed rule, to follow is an example scenario of determining an ACO's growth adjustment and Final Adjustment to the Historical Benchmark (91 FR 44100 through 44101).

TABLE B-G33: DETERMINATION OF THE GROWTH ADJUSTMENT AND FINAL ADJUSTMENT TO THE BENCHMARK OVER AN AGREEMENT PERIOD

		PY1	PY2	PY3	PY4	PY5
Step 6	"New Growth" Share	0.268	0.121	0.132	0.137	0.216
Step 7	Incentive Factor ($)	650.00	775.00	725.00	800.00	787.50
Step 8	Growth Adjustment ($)	174.02	94.06	95.46	109.85	169.88
	Regional, Prior Savings, or Population Adjustment, if Applicable ($)	125.00	230.00	75.00	350.00	410.00
	Growth Adjustment + Highest Applicable Adjustment ($)	299.02	324.06	170.46	459.85	579.88
	Risk-Adjusted Cap on Adjustments to the Benchmark, not to exceed 5% of National Assignable FFS Expenditures, expressed as a Single Value, if finalized. Otherwise, the Existing 5% National Assignable FFS Expenditures, expressed as a Single Value Not Adjusted for Risk. ($)	350.00	400.00	475.00	500.00	500.00
Step 9	Final Adjustment to the Benchmark ($)	299.02	324.06	170.46	459.85	500.00

TABLE B-G34: HYPOTHETICAL ACO GROWTH ADJUSTMENT CALCULATION FOR PY1

Step 1: Calculate an ACO's new growth for the applicable performance year	new growth = number of assigned beneficiary person years inexperienced with a shared savings initiative that have an ACO professional inexperienced with shared savings initiatives as the primary ACO professional that provided the highest count of primary care services new growth = 3,000 assigned beneficiary person years
Step 2: Determine overall growth	overall growth = number of assigned beneficiary person years in the PY minus the number of assigned beneficiary person years in the PY that corresponds to the ACO's BY3 (if applicable). If the ACO is a new entrant or re-entering, the overall growth is equal to the number of assigned beneficiary person years in the PY Continuing ACO Example: Number of assigned beneficiary person years in the PY = 11,000 Number of assigned beneficiary person years in the PY that corresponds to the ACO's BY3 = 5,000 overall growth = 11,000 - 5,000 = 6,000 assigned beneficiary person years New Entrant or Re-Entering ACO Example: Number of assigned beneficiary person years in the PY = 11,000 Number of assigned beneficiary person years in the PY that corresponds to the ACO's BY3 = 0 overall growth = 11,000 - 0 = 11,000 assigned beneficiary person years
Step 3: Determine capped new growth	Capped new growth = the lesser of the new growth determined in Step 1 and the overall growth determined in Step 2. overall growth = 6,000 assigned beneficiary person years new growth = 3,000 assigned beneficiary person years capped new growth = 3,000 assigned beneficiary person years
Step 4: Determine which minimum new growth threshold is applied	Minimum new growth threshold applied = the lesser of the relative minimum new growth threshold and the absolute minimum new growth threshold absolute minimum new growth threshold = 100 assigned beneficiary person years relative minimum new growth threshold = 0.5% assigned beneficiary person years x total assigned beneficiary person years (11,000) = 55 assigned beneficiary person years minimum new growth threshold applied = 55 assigned beneficiary person years
Step 5: Determine new growth above minimum and below the cap	New growth above the minimum and below the cap = the difference of capped new growth determined in Step 3 and the minimum new growth threshold applied in Step 4 capped new growth = 3,000 assigned beneficiary person years minimum new growth threshold applied = 55 assigned beneficiary person years

We summarized the proposed steps of the calculation of the growth adjustment as follows in Table B–G31 of the proposed rule (91 FR 44101 through 44103).

BILLING CODE 4169–69–P

	new growth above the minimum and below the cap = 3,000 - 55 = 2,945 assigned beneficiary person years
Step 6: Calculate new growth share	New growth share = new growth above the minimum and below the cap determined in Step 5 divided by the number of assigned beneficiary person years in the PY new growth above the minimum and below the cap = 2,945 number of assigned beneficiary person years in the PY = 11,000 new growth share = 2,945 / 11,000 = 0.268
Step 7: Determine the incentive factor	Incentive factor = 5% of historical benchmark before adjustment is applied historical benchmark before adjustment is applied = $13,000 incentive factor = $13,000 x 5% = $650
Step 8: Determine the growth adjustment to the historical benchmark	Determine the growth adjustment to the historical benchmark = new growth share determined in Step 6 and the incentive factor determined in Step 7 new growth share = 0.268 incentive factor = $650 growth adjustment to the historical benchmark = $174.02
Step 9: Determine the final adjustment to the historical benchmark	Final adjustment to the historical benchmark = sum of the growth adjustment to the historical benchmark determined in Step 8 and the highest of the regional adjustment, prior savings adjustment, and the population adjustment, not to exceed 5% of the risk-adjusted national assignable FFS expenditures expressed as a single value; otherwise, the existing 5% of national per capital OM expenditures, not adjusted for risk. growth adjustment to the historical benchmark = $174.02 highest of the regional, prior savings, or population adjustment if applicable = $125 5% of the national FFS expenditures expressed as a single value = $350 final adjustment to the historical benchmark = $299.02

BILLING CODE 4169–69–C

We sought comment on the proposal to apply a growth adjustment to the historical benchmark in addition to the existing regional, prior savings and population adjustments, up to the existing 5 percent cap on upward adjustments to the historical benchmark, or if finalized, the risk-adjusted 5 percent cap described in section III.G.5.e. of this final rule for agreement periods beginning on January 1, 2027, and in subsequent years. See section III.G.5.f.(3) of this final rule for a summary of the comments and out responses.

(3) Timing of Applicability

We proposed to apply the growth adjustment proposal for agreement periods beginning on January 1, 2027, and in subsequent years (91 FR 44103). We stated that, if finalized, for ACOs with agreement periods beginning on January 1, 2027, we would use CY 2022 through CY 2026 as the 5-year period used to determine whether ACO professionals are inexperienced with shared savings initiatives (91 FR 44103). We stated that for ACOs with agreement periods beginning on January 1, 2027, we would use CY 2026 as the 1-year period to determine whether beneficiaries are inexperienced with shared savings initiatives for ACOs (91 FR 44103).

We received public comments on these proposals. The following is a summary of the comments we received and our responses.

Comment: Most comments supported the proposed growth adjustment, citing that a direct financial incentive to recruit inexperienced ACO professionals would encourage ACOs to increase the number of clinicians and beneficiaries in value-based care. A comment applauded the incentives for ACOs to serve beneficiaries new to value-based care and noted that promoting and ensuring patients receive longitudinal relationship-based care

improves health outcomes. Another comment commended CMS for proposing the growth adjustment to be applied on top of the highest baseline adjustment (prior savings, regional, or population adjustments). They believe this ensures ACO's are incentivized to recruit inexperienced clinicians and take on the financial costs.

Response: We appreciate these comments supporting our proposals. The growth adjustment methodology is designed to target growth above expected levels and adjust the benchmark based on the expected net savings associated with newly aligned beneficiaries.

Comment: A comment was opposed to the proposal because the commenter was concerned the growth adjustment would incentivize inequitable financial advantages based on provider or beneficiary growth rather than performance. Another comment had concerns about the proposed magnitude of the incentive factor, which was proposed as 5 percent of the per capita historical benchmark (before the regional adjustment, prior savings adjustment, or population adjustment is applied). The comment noted that at 5 percent, the growth adjustment may exceed the level of savings reasonably expected from new participants and referenced CMS evaluations and MedPAC findings as the basis of their concerns, indicating that historical ACO gross savings have generally been around 2 percent rather than the proposed 5 percent adjustment.

Response: We appreciate comments describing concerns and recommendations. The growth adjustment methodology is designed to target growth above expected levels through the application of a minimum new growth threshold that is equal to normal ACO growth. In response to a commenter's concern, the application of a minimum new growth threshold limits the potential for inequitable financial advantages based on provider or beneficiary growth.

Additionally, in response to another commenter's concern regarding the magnitude of the incentive factor, the adjustment is calibrated based on the expected net savings associated with newly assigned beneficiaries, thereby linking the magnitude of the incentive to expected program value. Additionally, as noted in the proposed rule, the CMS Office of the Actuary (OACT) provided information to support that 5 percent of the ACO's unadjusted historical benchmark is likely to incentivize recruitment of inexperienced ACO professionals while balancing savings in the program (further information is also described in the Regulatory Impact Analysis of this rule, in section VI. of this final rule). Regarding the comment that historical ACO gross savings have generally been around 2 percent rather than the proposed 5 percent adjustment, CMS has found in the 3 most recently reconciled performance years, gross savings have been near 5 percent of the ACOs benchmark (PY 2023 4.0 percent, PY 2024 4.7 percent, and PY 2025 4.7 percent), suggesting that additional savings payments ACOs may receive because of the growth adjustment would likely be offset by additional savings generated from the new beneficiaries cared for by the ACOs receiving the adjustment.[351]

We will monitor the relationship between the amount of the growth adjustment to benchmarks, Shared Savings Program participation growth and realized savings and consider whether additional refinements are needed if experience indicates that incentive payments are not commensurate with program savings.

Comment: A couple of comments strongly opposed the proposed growth adjustment. These comments cited that increased benchmarks could carry on into later agreement periods and directly reward changes in organizational composition and create incentives to recruit TINs or NPIs that maximize the benchmark. One of these comments suggested CMS should treat provider participant list changes as a source of selection and require analyses that hold provider composition constant. Similarly, a comment cautioned that the policy could incentivize large ACOs to expand primarily for financial gain and recommended CMS monitor for excessive growth and implement safeguards for ACOs whose enrollment growth substantially exceeds regional norms. A couple of comments encouraged CMS to evaluate the growth adjustment policy over time to measure its effectiveness and ensure that mature ACOs with limited growth opportunities are not disadvantaged compared to expanding ACOs.

Response: We appreciate the comments expressing concerns regarding potential incentives associated with changes in ACO participation composition. The proposed policy was designed to create incentives that naturally phase out over time, since as more providers, suppliers and beneficiaries join ACOs there would be fewer providers, suppliers and beneficiaries that would qualify as ''new.'' This design helps support the goals of bringing new providers and suppliers inexperienced with value-based care into a Shared Savings Program ACO and mitigates long-term incentives for ACOs to maximize benchmarks. We will continue to monitor the methodology, including patterns of ACO growth and changes in ACO participation composition, to ensure the policy is achieving its intended goal of encouraging appropriate participation in the Shared Savings Program and is not creating unintended incentives or opportunities for benchmark manipulation.

Comment: A comment opposed the proposed growth adjustment. This comment cited that it would add complexity to the benchmark methodology. Another comment supported CMS's growth adjustment proposal, but the commenter recommended more comprehensive benchmark reforms that avoid the need to layer an additional adjustment because it can further complicate benchmarking.

Response: We appreciate the comments' concerns regarding the additional complexity associated with the growth adjustment. We acknowledge that incorporating a growth adjustment adds complexity to the benchmark methodology. However, we believe the added growth adjustment is warranted because the adjustment is intended to encourage targeted growth in participation of providers, suppliers, and beneficiaries who are new to value-based care arrangements, consistent with the Shared Saving Program's goals of expanding participation and encouraging organizations to bring new healthcare providers into accountable care. Without this adjustment, ACOs may have fewer incentives to include such providers, suppliers, and beneficiaries, which could limit the Program's ability to expand value-based care and the related benefits of improving quality of care and reducing cost. To help ACOs understand and operationalize the growth adjustment, CMS is currently developing resources to support ACOs' understanding of which ACO professionals would be counted as new growth for future performance years as well as further describing the growth adjustment in the Shared Savings and Losses, Assignment and Quality Performance Standard Methodology Specifications.

[351] Please note, at the time this rule is being finalized, performance year 2025 financial reconciliation results have not yet been released to ACOs. We anticipate embargoed and unembargoed performance year 2025 financial reconciliation results to be shared with ACOs shortly after the finalization of this final rule.

We also appreciate the comment recommending broader benchmark reforms. CMS continually evaluates the Shared Savings Program benchmarking methodology and considers potential improvements that promote participation, maintain incentives for coordinated, high-quality care, and ensure program integrity. At this time, we believe the growth adjustment is an important and targeted refinement that addresses a specific concern regarding the treatment of growth in ACO provider, supplier, and beneficiary populations, and we will continue to evaluate for possible future benchmark reforms.

Comment: A comment suggested that CMS pursue participation incentives that do not increase ACO historical benchmarks. The comment suggested a temporary per-beneficiary-per-month payment for beneficiaries newly brought into ACOs, which could be phased out as providers gain experience in accountable care. Another comment suggested CMS pursue prospective payments that function like true capitation, paying predictable amounts up front without retrospective reconciliation.

Response: We thank the commenters for their recommendations. We recognize the potential value of alternative incentives, including per-beneficiary-per-month or prospective payment approaches. We continue to evaluate these options, for example, through the Request for Information on Developing Prospective Payment in the Shared Savings Program (see 91 FR 43935 through 43946). However, we believe the growth adjustment represents a targeted refinement to the existing benchmark methodology that advances similar goals by encouraging participation among ACO providers, suppliers, and beneficiaries new to value-based care. As discussed previously, the adjustment is designed to provide a temporary benefit that naturally phases out over time as fewer providers, suppliers, and beneficiaries qualify as ''new.''

Comment: Some comments recommended that CMS broaden eligibility for the growth adjustment by counting all beneficiary growth, regardless of whether newly assigned beneficiaries are associated with a new or existing ACO professional or have prior experience with shared savings initiatives. These comments generally agreed with CMS's goal of increasing the number of beneficiaries in accountable care relationships but expressed concern that the proposed growth adjustment restrictions would reduce the incentive for ACOs to grow their beneficiary populations, particularly when growth occurs through existing ACO professionals. Other comments recommended removing the requirement that ACO professionals be new to value-based care, arguing that the policy may not recognize growth resulting from practices that expand their Medicare fee-for-service beneficiary populations or add healthcare professionals. Another commenter recommended basing the adjustment solely on beneficiaries new to value-based care rather than ACO professionals, citing concerns that facility-focused ACOs may have relatively few inexperienced providers and therefore may be less likely to benefit from the adjustment. A comment also encouraged CMS to ensure that the adjustment appropriately accounts for the costs associated with onboarding and supporting ACO professionals and beneficiaries who are new to value-based care.

Response: We appreciate the comments' recommendations. The methodology is intended to encourage participation by ACO professionals and their beneficiaries who are new to value-based care, rather than to incentivize all beneficiary growth regardless of its source. Financially incentivizing all beneficiary growth regardless of its source could inappropriately account for growth that would have already occurred absent the growth adjustment incentives. For this reason, we decline to remove the requirement that newly assigned beneficiaries be associated with ACO professionals who are new to value-based care or to otherwise expand the adjustment to include all beneficiary growth. While such policies may increase the number of beneficiaries eligible for the adjustment, they would broaden the incentive beyond the specific participation growth that the policy is intended to encourage.

Similarly, we decline to remove the requirement that ACO professionals be new to value-based care or to base the adjustment solely on beneficiaries. The methodology is designed to incentivize growth in accountable care participation among both ACO providers/suppliers and beneficiaries and to calibrate the adjustment based on the expected savings associated with newly assigned beneficiaries. We believe this approach appropriately balances incentives for participation growth with stewardship of Trust Fund resources and appropriately accounts for the expected value associated with bringing new ACO professionals and beneficiaries into accountable care arrangements.

Comment: Many comments expressed support for the growth adjustment and noted that its ability to encourage participation may be strengthened by raising the current 5 percent cap on upward adjustments to the historical benchmark.

Response: We appreciate the comments' recommendations. We direct commenters to section III.G.5.e. of this final rule, where we discuss our finalized policy to risk adjust the 5 percent cap on upward adjustments to the historical benchmark used in calculating benchmark adjustments. As discussed in that section, we believe risk adjusting the 5 percent cap appropriately addresses concerns regarding the cap's application while maintaining an appropriate balance between encouraging participation and safeguarding Trust Fund resources. Therefore, we decline at this time to further raise or remove the cap.

Comment: Some comments encouraged CMS to publish the growth adjustment incentive factor methodology and projected ACO level impacts in the final rule so ACOs can evaluate before participation decisions. Likewise, a couple of comments encouraged CMS to provide meaningful implementation support, including education, data resources, and clear operational guidance, to help organizations new to accountable care be successful in their participation.

Response: We appreciate the comments' recommendations. In addition to the methodology provided in the proposed rule, where we provided a step-by-step methodology and calculation example (91 FR 44101 through 44103), CMS is currently developing resources to support ACOs' understanding of ACO professionals that would be counted as new growth for future performance years as well as further describing the growth adjustment in the Shared Savings and Losses, Assignment and Quality Performance Standard Methodology Specifications.

Comment: A couple of comments generally supported CMS's efforts to address benchmarking concerns in the Shared Savings Program but encouraged CMS to evaluate if these proposed changes meaningfully reduce barriers for independent, Nurse Practitioner-led ACOS that often lack the historical claims volume the methodology favors.

Response: We appreciate the comments supporting our efforts and that included recommendations. We will continue to assess whether the methodology is achieving its intended goal of encouraging broader participation in the Shared Savings

Program, including among smaller and independent organizations.

Comment: A comment supported the growth adjustment policy if the adjustment rewards new accountable care and not ACO consolidation. They stated the adjustment should reward ACOs for increasing access to high-quality care and producing measurable outcomes. A couple of comments suggested enhancing the proposed growth adjustment for ACOs in rural or medically underserved communities through an additional benchmark adjustment or multiplier. This addition would recognize the unique challenges rural organizations encounter in initiating and sustaining ACO participation.

Response: We appreciate the comments in support and for emphasizing the importance of rewarding new accountable care participation from a broad group of organizations, including independent practices and rural healthcare providers. We note that for organizations that have not previously participated in an ACO, many of which are rural and provide care in underserved communities, the growth adjustment may provide the financial incentives and support needed for these organizations to overcome previous barriers that may have prevented participation. We also agree that the growth adjustment participation incentives should promote increased access to high-quality care for beneficiaries. We note that we previously finalized policies for the Shared Savings Program that may directly or indirectly support rural ACOs, including the option to receive advance investment payments (AIP) as described at § 425.630 and policies that benefit low revenue ACOs (which tend to be small, rural, and physician-only ACOs) as described at § 425.600 (*Selection of risk model*) and § 425.605(h) (*Calculation of shared savings for BASIC track ACOs not meeting MSR requirements*). Additionally, as discussed in section III.G.7 of this final rule, we are finalizing as proposed our policy to modify the methodology and use description for Advanced Investment Payments to encourage low-revenue ACOs that are inexperienced with risk to participate in the Shared Savings Program, including rural ACOs. We will monitor the implementation of the growth adjustment and its impact on ACO participation.

After considering public comments, we are finalizing the growth adjustment as proposed. Specifically, we are finalizing, without modification, our proposal to add new § 425.664 to codify calculating the growth adjustment to the historical benchmark. Additionally, we are finalizing as proposed revisions to § 425.652(a)(8)(iii) to codify that the growth adjustment amount will be added to the highest of the positive regional adjustment, prior savings adjustment, and population adjustment, or no adjustment, and the total amount cannot exceed 5 percent of national per capita OM expenditures, adjusted for risk as discussed in section III.G.5.e of this final rule. We are also finalizing as proposed our amendment to § 425.650 is amended in paragraph (a) by removing the references ''§§ 425.652 through 425.662'' and adding in their place the references ''§§ 425.652 through 425.664''.

g. Reform the Accountable Care Prospective Trend (ACPT) Component of the Benchmark Update Factor

(1) Background

As finalized in the December 2018 final rule (83 FR 68024 through 68030), we used our statutory authority under section 1899(i)(3) of the Act to adopt the policy under which we update the historical benchmark using a blend of national and regional growth rates, rather than the projected absolute amount of growth in national per capita expenditures for Parts A and B services under the original Medicare FFS program as required under section 1899(d)(1)(B)(ii) of the Act. In accordance with § 425.601(b), applicable for agreement periods beginning on or after July 1, 2019, and before January 1, 2024,[352] we update the historical benchmark for an ACO for each performance year using a blend of national and regional growth rates between BY3 and the performance year. To update the benchmark, we make separate calculations for expenditure categories for each of the following populations of beneficiaries based on Medicare enrollment type: ESRD, disabled, aged/dual eligible for Medicare and Medicaid, aged/non-dual eligible for Medicare and Medicaid (§ 425.601(b)(1)).

The national-regional blend is a weighted average of national FFS and regional growth rates between BY3 and the performance year for the applicable Medicare enrollment type (§ 425.601(b)(4)). The national growth rates are computed using CMS Office of the Actuary national Medicare expenditure data for BY3 and the performance year for assignable beneficiaries (as defined at § 425.20) identified for the 12-month calendar year corresponding to each year (§ 425.601(b)(2)). Regional growth rates are computed using expenditures for the ACO's regional service area for BY3 and the performance year (§ 425.601(b)(3)). To calculate regional expenditures, we determine the counties included in the ACO's regional service area based on the ACO's assigned beneficiary population for the year and determine the ACO's regional expenditures as specified under § 425.601(c) and (d) and § 425.601(b)(3)(i) and (ii).

As noted, the national and regional growth rates are blended together by taking a weighted average of the two. The weight assigned to the national component of the national-regional blend for a given Medicare enrollment type is calculated as the share of assignable beneficiaries in the ACO's regional service area that are assigned to the ACO for the applicable performance year (as calculated in § 425.601(a)(5)(v) and § 425.601(b)(4)(i)). The weight assigned to the regional component of the national-regional blend for a given Medicare enrollment type is equal to 1 minus the weight applied to the national growth rate (§ 425.601(b)(4)(ii)). Under this approach, as an ACO's penetration in its regional service area increases, the weight applied to the national component of the national-regional blend increases and the weight applied to the regional component decreases.

The national and regional growth rates are blended together by taking a weighted average of the two. Specifically, for each Medicare enrollment type, the national-regional blended growth rate is equal to the sum of the following: (1) the growth rate for national assignable FFS expenditures for BY3 to the performance year multiplied by the weight assigned to the national component; and (2) the average growth rate for regional FFS expenditures for BY3 to the performance year based on the ACO's regional service area multiplied by the weight assigned to the regional component (87 FR 69881). In accordance with § 425.601(a)(5), we also use blended national-regional growth rates to trend forward expenditures for each benchmark year (BY1 and BY2) to BY3 dollars, making separate calculations for each Medicare enrollment type.

We summarized commenters' concerns about using the blended national-regional growth rates for benchmarking in the CY 2023 PFS final

[352] § 425.652 applies to ACOs that started agreement periods in 2025 and 2026. However, for simplicity, we have cited the provisions in § 425.601 in this background section to describe how the ACPT fits into the bigger picture of benchmark adjustments, and the same policies apply to ACOs to which § 425.652 applies.

rule (87 FR 69879 through 69881). Specifically, ACOs and other interested parties expressed concerns regarding the dynamic under which an ACO that reduces costs for its own assigned beneficiaries also reduces its average regional costs, resulting in a relatively lower benchmark for the ACO under the blended national-regional growth rates used to trend and update the ACO's historical benchmark. As summarized in the CY 2022 PFS final rule, ACOs and other interested parties also have suggested that this dynamic particularly disadvantages ACOs with high market penetration in their regional service areas, which may tend to be ACOs operating in rural areas (86 FR 65296 through 65299).

In the CY 2023 PFS final rule, we implemented new policies effective beginning with performance year 2024 to address these concerns by incorporating a prospectively set projected administrative growth factor, a variant of the modified United States Per Capita Cost (USPCC) called the Accountable Care Prospective Trend (ACPT), into a three-way blend with national and regional growth rates to update an ACO's historical benchmark for each performance year in the ACO's agreement period (87 FR 69882 through 69898). Incorporating this prospective trend in the update to the benchmark insulates a portion of the annual update from any savings occurring as a result of the actions of ACOs participating in the Shared Savings Program and helps to address the impact of increasing market penetration by ACOs in a regional service area on a growth factor that only uses blended national-regional rates. Under that methodology, because the ACPT is set prospectively at the outset of an agreement period, any savings generated by ACOs during the agreement period are not reflected in the ACPT. Accordingly, incorporation of the ACPT allows for benchmarks to increase beyond actual spending growth rates as ACOs slow spending growth. We noted that the use of the three-way blend to update ACOs' benchmarks should incentivize both greater savings by ACOs and greater program participation. We also noted that we believed that because incorporating the ACPT into the update would reduce the degree to which an ACO's savings negatively impact its benchmark through the regional trend component of the update, the ACPT would help to address the disproportionate impact of an ACO's savings on the benchmark update for ACOs with a high market share (87 FR 69882).

In addition, as discussed in the Regulatory Impact Analysis for the CY 2023 PFS proposed rule (87 FR 46427), we projected that this approach for use of an ACPT/national- regional three-way blended update factor, in combination with other proposed changes to the statutory payment model in the CY 2023 PFS proposed rule, as well as then-current policies established using the authority of section 1899(i)(3) of the Act (87 FR 46403 through 46404), would not increase program expenditures relative to those under the statutory payment model. Since we have established the three-way blended update factor, we have continued to reexamine this projection to ensure that the requirement under section 1899(i)(3)(B) of the Act that an alternative payment model not result in additional program expenditures continues to be satisfied, and we have found continued compliance with section 1899(i)(3)(B) of the Act.

Under § 425.660, the three-way blend is calculated as the weighted average of the ACPT (one-third) and the existing national-regional blend (two-thirds) for use in updating an ACO's historical benchmark between BY3 and the performance year. As we described in the CY 2023 PFS final rule, we calculate the ACPT component of the blended annual update using an annualized growth rate based on 5-year projections in per capita spending as of the start of an ACO's agreement period as specified in § 425.660(b)(2)(ii). We use an annualized growth rate based on 5-year projections in per capita spending as of the start of an ACO's agreement period to align the ACPT with the 5-year agreement periods used under the Shared Savings Program. The CMS Office of the Actuary projects the ACPT, which is a modification of the FFS United States Per Capita Cost (USPCC) growth trend projections used annually for establishing Medicare Advantage rates. We set the ACPT growth factors for an ACO's entire 5-year agreement period near the start of the agreement period (87 FR 46163). The ACPT factors remain unchanged throughout the ACO's agreement period, providing a degree of certainty to ACOs.

Similar to the production of FFS USPCCs, for a given agreement period cohort (that is, ACOs with the same agreement period start date) and performance year, OACT produces two separate, modified USPCC values for ESRD and non-ESRD aged/disabled populations (as described in § 425.660(b)(2)). In the CY 2023 PFS final rule (87 FR 69882), we described the modified USPCC values as reflecting an exclusion of payments for indirect medical education (IME), disproportionate share hospitals (DSH), and supplemental payment for IHS/Tribal Hospitals and hospitals located in Puerto Rico, and including payments associated with hospice claims (87 FR 69882). Subsequently, for a given ACO and performance year, the two modified USPCCs serve as inputs into the calculation of four separate ACPT values, one for each of four Medicare enrollment types: ESRD, disabled, aged/dual eligible for Medicare and Medicaid, and aged/non-dual eligible for Medicare and Medicaid (87 FR 69882). In turn, each of these enrollment-type specific ACPT values is used to calculate an ACO's four enrollment-type specific three-way blended update factors (as described in § 425.652(b)(4)).

As we have previously noted (87 FR 69896), we expect in any year the ACPT could overestimate or underestimate the actual growth rate of expenditures of the national assignable population. In the CY 2023 PFS final rule (87 FR 69882–69888), we included the following factors in the design of the three-way blended update factor to mitigate impacts in differences between the ACPT and the actual growth rate of expenditures for the national assignable population:

- The ACPT is one-third of the three-way blended update factor; the remaining two-thirds of the blend are based on the national-regional trend, which reflects actual national and regional spending growth.
- As part of the ACPT calculation, the ACPT is expressed as a flat dollar amount and is risk-adjusted, which may benefit low growth/low spending ACOs and ACOs serving medically complex populations.
- We established a guardrail policy where, if an ACO generates losses for a performance year that meet or exceed its minimum loss rate (MLR) (for two-sided model ACOs) or negative minimum savings rate (MSR) (for one-sided model ACOs) under the three-way blended update factor, we will recalculate the ACO's updated benchmark using the two-way national-regional blended update factor. If the ACO generates a smaller amount of losses using the two-way blend, we will use this smaller amount to determine the ACO's responsibility for shared losses, if applicable.
- If we determine that expenditure growth has differed significantly from projections made at the start of the agreement period due to unforeseen circumstances, such as an economic recession, pandemic, or other factors, a reduction in the weight placed on the ACPT may be considered. We have sole discretion to determine whether an

unforeseen circumstance exists that warrants a reduction to the weight of the ACPT and the reduced weight that will apply to the ACPT.

The CY 2024 modified USPCC cumulative growth rates (2023 to 2024) that were corrected and posted in July 2026 and used to calculate ACPT values for ACOs with an agreement period starting on January 1, 2024, were 5.5 percent for the aged/disabled population and 5.1 percent for the ESRD population.[353] [354] However, the CY 2024 actual cumulative growth rate of expenditures for the national assignable population was 8.4 percent for the aged/disabled population (2.9 percentage points higher than projected) and 6.9 percent for the ESRD population (1.8 percentage points higher than projected).[355] When the ACPT is lower than the actual national FFS expenditure growth, it could reduce or eliminate shared savings for ACOs. For CY 2024, we determined that unforeseen circumstances occurred, as it was observed that there were unanticipated billing patterns and unexpectedly high increases in multiple categories of Part A and B spending, most notably Part B drugs. This represented a substantial discrepancy between projected and actual growth rates for CY 2024, and it materialized in the context of the COVID–19 Public Health Emergency that imparted material and complex effects on Medicare trend experience over a multi-year period extending into the first half of 2023. This difference between the projected and actual growth rates for CY 2024 represented a material impact across the Shared Savings Program and led to our decision to reduce the ACPT's weight in the three-way blend from one-third (⅓) to one-sixth (⅙) in CY 2024. In CY 2024, the three-way blend for the growth factor was based on 5/6th weight of the national-regional trend and 1/6th weight on the ACPT.[356] [357]

(2) Revisions

(a) Performance Year-Specific Modified USPCC Annualized Growth Rates Used To Construct ACPT Values

As discussed in the proposed rule, for agreement periods beginning on or after January 1, 2027, we proposed to establish performance year-specific modified USPCC annualized (year-over-year) growth rates used to construct ACPT values that would apply to the performance year regardless of an ACO's agreement period start date (91 FR 44105). We stated that this would replace the current approach under which the modified USPCC annualized growth rates used to construct ACPT values are established on an agreement period-specific basis, as illustrated in Table B–G32 of the proposed rule (91 FR 44105). We noted that this proposal would not change the methodology by which CMS would calculate the modified USPCC annualized growth rates for any given performance year (91 FR 44105). We also noted that this proposal would only change the timing of the calculation and publicly reporting of modified USPCC annualized growth rates (91 FR 44105).

TABLE B-G35: STATUS QUO AND PROPOSED BASES FOR CALCULATING ANNUALIZED GROWTH RATES

Approach	Agreement Period Start Year	Basis for Calculating Modified USPCC Annualized Growth Rates
Status Quo	2024	Agreement Period
	2025	
	2026	
Proposed	2027	Performance Year
	2028	
	2029	

Specifically, for agreement periods beginning on or after January 1, 2027, and in subsequent years, we proposed that CMS would no longer calculate a fixed five-year schedule of annualized growth rates at the start of an ACO's agreement period (91 FR 44105). We stated that instead in the summer of the year preceding a given performance year, CMS would calculate and publicly report the modified USPCC annualized growth rates applicable to that performance year (91 FR 44105). This means that, although ACOs would no longer receive a five-year set of enrollment type-specific ACPT values near the beginning of the agreement period, they would still receive advance notice of the modified USPCC annualized growth rate used to calculate enrollment type-specific ACPT values for a given performance year in the year preceding that performance year. As illustrated in Table B–G33 of the proposed rule, in the late spring or early summer preceding the start of the first performance year of an agreement

[353] Shared Savings and Losses, Assignment and Quality Performance Standard Methodology: Specifications of the Accountable Care Prospective Trend (ACPT) and Three-Way Blended Benchmark Update Factor (Version 5). [2026 Announcement]. *https://www.cms.gov/medicare/payment/medicare-advantage-rates-statistics/announcements-and-documents/2026*.

[355] Observed cumulative growth in national assignable expenditures for the aged/disabled population and ESRD populations applicable to financial reconciliation for PY 2024 were determined in an internal analysis conducted by CMS.

[356] Information regarding the announcement for the CY 2024 actual cumulative growth rates and the determination that unforeseen circumstance occurred resulting in the decision to reduce ACPT's weight in the three-way blend was disseminated to Accountable Care Organizations via the June 30, 2025, Issue 7 Spotlight Article, an internal communication distributed by the Centers for Medicare & Medicaid Services (CMS) to ACOs.

[357] CY 2024 Projected ESRD Modified USPCC Annualized Growth Rates and Aged/Disabled Modified USPCC Annualized Growth Rates are available at: Shared Savings and Losses, Assignment and Quality Performance Standard Methodology: Specifications of the Accountable Care Prospective Trend (ACPT) and Three-Way Blended Benchmark Update Factor. Pages 6–7. *https://www.cms.gov/files/document/medicare-ssp-acpt-specifications.pdf*. Centers for Medicare and Medicaid Services (2025).

period, an ACO would be able to review the performance year-specific modified USPCC annualized growth rates publicly reported, applicable to the first performance year (91 FR 44105 through 44106). For example, CMS will publicly report the PY 2027 modified USPCC annualized growth rates used to calculate ACO-level ACPT values in conjunction with the release of this final rule. Then, during each subsequent performance year through the remainder of the agreement period, the ACO would receive a newly calculated set of ACPT values based on the performance year-specific modified USPCC annualized growth rates calculated and published in the summer preceding that performance year. For example, CMS will publicly report the PY 2028 ESRD and aged/disabled modified USPCC annualized growth rates in late spring or early summer 2027. These rates will be used to calculate PY 2028 enrollment type-specific ACO-level ACPT values (that is, PY1 values for ACOs entering agreement periods on January 1, 2028, and PY2 values for ACOs entering agreement periods on January 1, 2027). These ACO-level ACPT values will be provided to ACOs during PY 2028.

TABLE B-G36: APPLICATION OF PERFORMANCE YEAR-SPECIFIC MODIFIED USPCC ANNUALIZED GROWTH RATES FOR ACOS ENTERING AGREEMENT PERIODS BEGINNING ON JANUARY 1, 2027, AND IN SUBSEQUENT YEARS

Year rate is published[2]	Performance year to which rate applies	ACOs entering agreement periods in 2027	ACOs entering agreement periods in 2028	ACOs entering agreement periods in 2029
2026	CY 2027: Values based on 2027 modified USPCC annualized growth rates	Receives PY1 ACPT	-	-
2027	CY 2028: Values based on 2028 modified USPCC annualized growth rates	Receives PY2 ACPT	Receives PY1 ACPT	-
2028	CY 2029: Values based on 2029 modified USPCC annualized growth rates	Receives PY3 ACPT	Receives PY2 ACPT	Receives PY1 ACPT
Under this approach, overlapping agreement period cohorts would use the same modified USPCC annualized growth rate for the same calendar year corresponding to a performance year. Note 1: In this table, ACPT refers to the PY-specific ESRD and aged/disabled modified USPCC annualized growth rates used to calculate enrollment type-specific ACO-level ACPT values, which are provided to ACOs during the applicable performance year. Note 2: CMS will publicly report the PY 2027 modified USPCC annualized growth rates in conjunction with the release of this final rule. For subsequent performance years, CMS will publicly report the rates in late spring or early summer of the preceding calendar year.				

As illustrated in Table B–G34 of the proposed rule, under the current approach, modified USPCC annualized growth rates calculated on an agreement period basis may differ across agreement period cohorts (91 FR 44106).

TABLE B-G37: SUMMARY OF PROJECTED ESRD AND AGED/DISABLED MODIFIED USPCC ANNUALIZED GROWTH RATES, CORRESPONDING TO AGREEMENT PERIODS BEGINNING ON JANUARY 1, 2024, AND JANUARY 1, 2025

Population	Agreement Period Start Year	PY1	PY2	PY3	PY4	PY5
ESRD	2024	5.1%	7.5%	5.5%	5.5%	8.0%
	2025	7.5%	5.7%	5.5%	5.2%	5.6%
Aged/Disabled	2024	5.5%	4.8%	5.7%	5.8%	4.3%
	2025	5.6%	5.7%	6.0%	5.0%	6.1%

Notes: The projected ESRD and Aged/Disabled modified USPCC annualized growth rates as of July 2026.

As discussed in the proposed rule, establishing performance year-specific modified USPCC annualized growth rates would improve consistency across agreement periods by ensuring that, for a given performance year, the same modified USPCC annualized growth rates for that year would apply to all ACOs regardless of agreement period start date (91 FR 44106). For example, at reconciliation for PY 2028, the same modified USPCC annualized growth rates would apply to ACOs that entered agreement periods on January 1, 2027, and January 1, 2028. We noted that neither cohort of ACOs would face different modified USPCC annualized growth rates for that performance year solely because their agreement periods began in different years (91 FR 44106).

We stated that we continue to believe that the prospective character of the ACPT is an important feature that benefits ACOs by providing a degree of certainty regarding their annual benchmark updates (91 FR 44106). However, as we acknowledged in the

CY 2023 PFS final rule, establishing modified USPCC annualized growth rates at the start of an ACO's agreement period means that ACOs entering agreement periods in different years could be subject to higher or lower updates based on how projections differ across agreement periods. Thus, the current approach poses a tradeoff between long-term predictability (over a five-year agreement period) and inconsistency across agreement period cohorts. Under this approach, our goal is to thoughtfully recalibrate the balance of that tradeoff by forgoing some predictability in favor of greater consistency and, in turn, fairness across agreement period cohorts. Specifically, we noted that although ACOs would no longer receive a fixed five-year schedule of modified USPCC annualized growth rates near the beginning of the agreement period, they would receive advance notice of the modified USPCC annualized growth rates in the late spring or early summer of the year preceding a given performance year, thus preserving the ACPT's core design as a prospectively-set external factor that provides ACOs with a degree of certainty regarding their annual benchmark update, as originally intended, albeit on a shorter time horizon (1 year rather than 5 years) (91 FR 44106). We stated that, at the same time, applying a consistent modified USPCC annualized growth rate to all ACOs reconciled for a given performance year, regardless of their agreement period start date, would promote greater fairness by reducing the disparities that currently arise when different start dates result in different growth rates, which can advantage or disadvantage certain ACOs (91 FR 44106). Lastly, we noted that the approach may reduce operational complexity by ensuring that, in a given performance year, there is a single set of underlying modified USPCC annualized growth rates used to calculate ACPT values, rather than a unique set of modified USPCC annualized growth rates that are specific to each agreement period cohort of ACOs being reconciled for that performance year (91 FR 44106 through 44107).

We sought comment on this proposal. Because commenters generally addressed this proposal in conjunction with the proposals in sections III.G.5.g.(2)(b), (c), and (e), and the notice in section III.G.5.g.(2)(d), please see section III.G.5.g.(2)(e) where we summarize and respond to comments on all III.G.5.g.(2) sections.

(b) Guardrail on the Difference Between the Modified USPCC Cumulative Growth Rate and the Actual Cumulative Growth Rate of Expenditures for the National Assignable Population for Agreement Periods Beginning on or After January 1, 2027

As discussed in the proposed rule, for agreement periods beginning on or after January 1, 2027, we proposed to establish a guardrail on instances in which the modified USPCC cumulative growth rates used to construct ACPT values differ substantially from observed cumulative growth in national assignable expenditures (91 FR 44107). Specifically, we proposed to establish a guardrail that would not allow the modified USPCC cumulative growth rate for each of the ESRD population and the Aged/Disabled population to be more than 1.0 percentage point below or 1.5 percentage points above the corresponding observed cumulative growth in national assignable expenditures for that population, respectively (where the percentage point thresholds are rounded to the nearest tenth of a percentage point) (91 FR 44107). We stated that we would apply the guardrail at reconciliation for a given performance year. Hereafter, we refer to the difference between the modified USPCC cumulative growth rate and observed cumulative growth in national assignable expenditures as ''delta modified USPCC'' (91 FR 44107).

We stated that establishing guardrail thresholds that are fixed over an agreement period, rather than thresholds that widen or narrow, acknowledges that the realized path of delta modified USPCC over an agreement period cannot be known in advance with sufficient certainty (91 FR 44107). That is, the extent to which delta modified USPCC widens or narrows over an agreement period depends on the extent to which projection errors in a given year offset the projection error that's accumulated over prior years. This is an outcome that can only be known at financial reconciliation for a given performance year. Therefore, whereas establishing thresholds that widen or narrow reflects a prospective assumption about the trajectory that delta modified USPCC will take over an agreement period, establishing fixed thresholds applies a consistent tolerance for delta modified USPCC to each performance year in recognition of the fact that delta modified USPCC may widen or narrow over an agreement period.

We stated that proposing to set the guardrail threshold levels asymmetrically at −1.0 percentage point and +1.5 percentage points, as opposed to a tighter, wider, or symmetrical guardrail range, primarily reflects a policy judgment about the appropriate approach to limit the effects of unusually large delta modified USPCC at financial reconciliation for a given performance year (91 FR 44107). The proposed threshold levels are not based on predictions of the path that delta modified USPCC will take over an agreement period (91 FR 44107). Rather, they establish the bounds within which delta modified USPCC would be addressed (91 FR 44107). In proposing these levels, we stated that we aim to balance several considerations: protection of ACOs from the financial consequences of unusually large cumulative under-projection (substantially negative delta modified USPCC); protection of the Medicare Trust Funds from the financial consequences of unusually large cumulative over-projection (substantially positive delta modified USPCC); and preservation of the original policy aims of the ACPT (that is, to allow for benchmarks to increase beyond actual spending growth even as ACOs slow spending growth) (91 FR 44107).

In proposing these levels, we stated that we also considered alternative approaches (91 FR 44107). For example, a tighter guardrail threshold would provide greater protection to ACOs and the Medicare Trust Funds from delta modified USPCC. However, we stated that it could also undermine the prospective design of the ACPT if it results in the frequent application of the guardrail (91 FR 44107). Conversely, we noted that a wider guardrail was also considered and such a guardrail could be applied less frequently than a tighter guardrail and, in turn, may preserve the prospective design of the ACPT to a greater degree, but the wider guardrail could also potentially expose the Medicare Trust Funds and ACOs to harms associated with substantially positive or substantially negative delta modified USPCC (91 FR 44107). We also considered a symmetrical guardrail that would apply equally in cases of both substantially positive and substantially negative delta modified USPCC (91 FR 44107). However, we noted that we believe that an asymmetric guardrail that imposes a tighter bound on substantially negative delta modified USPCC and a wider bound on substantially positive delta modified USPCC would more directly protect ACOs from the harms associated with substantially negative delta modified USPCC while still allowing ACOs to

benefit from modestly positive delta modified USPCC, consistent with the prospective design of the ACPT (91 FR 44107). Lastly, we stated that, while historical delta modified USPCC values have informed the reasonableness of the proposed thresholds, they have not determined the threshold levels themselves, as the path that delta modified USPCC takes over any agreement period cannot be known in advance and may differ across agreement periods (91 FR 44107). Taken together, the proposed threshold levels of −1.0 percentage point and +1.5 percentage points are best understood as reasonable policy calibrations that, we believe, strike an acceptable balance of the considerations discussed previously. We stated that we also believe that the guardrail as proposed would be consistent with the original policy aims of the ACPT, as well as program goals of predictability, fairness, and administrative feasibility (91 FR 44107). We sought comment on the proposed threshold levels, including whether a tighter guardrail, a wider guardrail, or a modification of any of the approaches discussed in this paragraph, would represent a better balance of the considerations discussed previously.

As discussed in the proposed rule, the following steps illustrate how the proposed guardrail on delta modified USPCC would operate in practice at reconciliation for a given performance year for agreement periods beginning on or after January 1, 2027 (91 FR 44107 through 44109):

Step 1: Calculate the applicable delta modified USPCC values.

As illustrated in Table B–G35 of the proposed rule (91 FR 44108), at reconciliation for a given performance year, CMS would calculate two delta modified USPCC values for each agreement period cohort: one for the ESRD population, and one for the Aged/Disabled population. For a given population, delta modified USPCC would be equal to the modified USPCC cumulative growth rate minus the observed cumulative growth in national assignable expenditures. Because delta modified USPCC values are constructed at the agreement period cohort, performance year, and population levels, they apply uniformly to all ACOs within a given cohort for a given performance year.

TABLE B-G38: HYPOTHETICAL EXAMPLE OF STEP 1 (CALCULATE THE APPLICABLE DELTA MODIFIED USPCC VALUES)

Population	Modified USPCC Cumulative[1] Growth Rate	Observed Cumulative[1] Growth in National Assignable Expenditures	Delta Modified USPCC[2]
ESRD	4.0%	4.5%	-0.5 percentage points
Aged / Disabled	3.0%	5.0%	-2.0 percentage points

Notes:
[1] – "Cumulative" reflects the period from a given ACO's BY3 to the applicable performance year.
[2] – At reconciliation for a given performance year, delta modified USPCC for each population and agreement period cohort equals the modified USPCC cumulative growth rate minus observed cumulative growth in national assignable expenditures.

Step 2: Determine whether each delta modified USPCC falls outside the guardrails.

As illustrated in Table B–G36 of the proposed rule (91 FR 44108), once calculated, each population-specific delta modified USPCC value would then be compared with the previously mentioned guardrail thresholds (−1.0 percentage point and +1.5 percentage points). If delta modified USPCC for either population falls within the guardrail thresholds (that is, greater than or equal to −1.0 percentage point and less than or equal to +1.5 percentage points), no guardrail adjustment would apply for a population, and the corresponding enrollment type-specific ACPT values initially calculated for that performance year would remain unchanged. If delta modified USPCC falls outside the guardrail thresholds (that is, less than −1.0 percentage point or greater than +1.5 percentage points) for one or both of the populations, a guardrail adjustment would apply.

TABLE B-G39: HYPOTHETICAL EXAMPLE OF STEP 2 (DETERMINE WHETHER EACH DELTA MODIFIED USPCC FALLS OUTSIDE THE GUARDRAILS)

Population	Delta Modified USPCC	Guardrails[1]		Does Guardrail Adjustment Apply?
		Lower Bound	Upper Bound	
ESRD	-0.5 percentage points	-1.0 percentage point	+1.5 percentage points	No (delta modified USPCC falls inside bounds)
Aged / Disabled	-2.0 percentage points	-1.0 percentage point	+1.5 percentage points	Yes (delta modified USPCC falls outside bounds)

Notes:
[1] - The lower and upper bounds shown here reflect fixed thresholds of -1.0 percentage point (lower bound) and +1.5 percentage points (upper bound) applied to both the ESRD delta modified USPCC and the Aged/Disabled delta modified USPCC.

Step 3. Calculate the guardrail-adjusted modified USPCC cumulative growth rate, as applicable.

As illustrated in Table B–G37 of the proposed rule (91 FR 44108), for a given population, if delta modified USPCC falls below the lower guardrail threshold, the applicable modified USPCC cumulative growth rate would be replaced with a guardrail-adjusted value equal to the observed cumulative growth in national assignable expenditures minus 1.0 percentage points. If delta modified USPCC falls above the upper guardrail threshold, the applicable modified USPCC cumulative growth rate would be replaced with a guardrail-adjusted value equal to the observed cumulative growth in national assignable expenditures plus 1.5 percentage points.

TABLE B-G40: HYPOTHETICAL EXAMPLE OF STEP 3 (CALCULATE THE GUARDRAIL-ADJUSTED MODIFIED USPCC CUMULATIVE GROWTH RATE)

Population	Delta Modified USPCC (Step 1)	Applicable Guardrail (Step 2)	Observed Cumulative Growth in National Assignable Expenditures	Original Modified USPCC Cumulative Growth Rate	Guardrail-Adjusted Modified USPCC Cumulative Growth Rate
ESRD[1]	-0.5 percentage points	Not Applicable	4.5%	4.0%	No adjustment (4.0% used)
Aged / Disabled[2]	-2.0 percentage points	-1.0 percentage point	5.0%	3.0%	4.0%

Notes:

1 – For the ESRD population, there would be no guardrail adjustment because the ESRD delta modified USPCC calculated in Step 1 would have been determined to fall within the guardrail thresholds in Step 2. Therefore, the ESRD-specific ACPT values initially calculated for that performance year would still apply.

2 – For the Aged/Disabled population, the guardrail-adjusted modified USPCC cumulative growth rate would equal 4.0 percent, or the observed cumulative growth in national assignable expenditures minus 1.0 percentage points because the Aged/Disabled delta modified USPCC calculated in Step 1 would have been determined to fall below the lower guardrail threshold in Step 2. In turn, the ACPT values for the Disabled, Aged/Dual, and Aged/Non-Dual populations initially calculated for that performance year would be recomputed in Step 4 using the guardrail-adjusted modified USPCC cumulative growth rate.

Step 4. Recompute ACPT values, as applicable.

If a guardrail adjustment applies (as determined in Step 2), the corresponding enrollment type-specific ACPT values initially calculated for that performance year would be recomputed using the guardrail-adjusted modified USPCC cumulative growth rate (calculated in Step 3) rather than the original modified USPCC cumulative growth rate. For the ESRD population, the guardrail-adjusted modified USPCC cumulative growth rate would be used to recompute ACPT values applicable to the ESRD enrollment type. For the Aged/Disabled population, the guardrail-adjusted modified USPCC cumulative growth rate would be used to recompute ACPT values applicable to the Disabled, Aged/Dual-Eligible, and Aged/Non-Dual-Eligible enrollment types. The recomputed ACPT values would then be used to construct the three-way blended update factors, updated historical benchmarks, and, in turn, shared savings and losses calculations for the applicable performance year.

The procedures described in the proposed rule would be applied at financial reconciliation for each performance year of an ACO's agreement period (91 FR 44109). The application of a guardrail on delta modified USPCC in a given performance year would affect only the ACO-level ACPT values and downstream shared savings and losses calculations applicable to that performance year. This is appropriate because delta modified USPCC is, by definition, a comparison of the cumulative modified USPCC growth rate to the cumulative observed growth in national assignable expenditures. Thus, the guardrail calculation of each performance year already accounts for projection error accumulated through prior years by construction. For example, in Table B–G38 of the proposed rule (91 FR 44109), the delta modified USPCC for PY3 reflects cumulative projection error through PY3. As a result, any guardrail adjustment applied in PY1 or PY2 would not need to be carried forward into PY3 because the cumulative structure of the guardrail calculation for PY3 would have incorporated the cumulative effect of projection errors from PY1 and PY2.

TABLE B-G41: ILLUSTRATIVE APPLICATION OF THE PY-SPECIFIC GUARDRAIL APPLICATION (EFFECTS IN ONE PY DO NOT CARRY OVER TO SUBSEQUENT PYS)

Performance Year	Modified USPCC Annualized Growth Rate	Modified USPCC Cumulative Growth Rate	Observed Cumulative Growth in National Assignable Expenditures	Delta Modified USPCC	Does Guardrail Adjustment Apply?	Guardrail-Adjusted Modified USPCC Cumulative Growth Rate Used to Recompute PY ACPT
PY1	5.7%	5.7%	6.8%	-1.1%	Yes, lower bound	5.8%
PY2	5.4%	11.4%	12.3%	-0.9%	No	No adjustment (11.4% used)
PY3	5.4%	17.4%	14.0%	3.4%	Yes, upper bound	15.5%

Notes:
The guardrail applies in PY1 and PY3, but not in PY2. The PY1 adjustment affects only the PY1 ACPT and does not carry forward into PY2. Instead, the guardrail is reassessed independently in each performance year using the delta modified USPCC applicable to that performance year.

We sought comment on this proposal. Because commenters generally addressed this proposal in conjunction with the proposals in sections III.G.5.g.(2)(a), (c), and (e), and the notice in section III.G.5.g.(2)(d), please see section III.G.5.g.(2)(e) where we summarize and respond to comments on all III.G.5.g.(2) sections.

(c) Retroactive Guardrail on Substantially Negative Delta Modified USPCC for Agreement Periods Beginning on January 1, 2024, and Before January 1, 2027

As discussed in the proposed rule, for agreement periods beginning on or after January 1, 2024, and before January 1, 2027, we proposed to establish a guardrail on instances in which the modified USPCC cumulative growth rates used to construct ACPT values are substantially lower than observed cumulative growth in national assignable expenditures (91 FR 44110). Specifically, beginning at reconciliation for PY 2025 for ACOs currently in an agreement period, and for future performance years in their agreement periods, we proposed to establish a guardrail that would not allow the modified USPCC cumulative growth rate to be more than 1.0 percentage point below the corresponding observed cumulative growth in national assignable expenditures (where the percentage point threshold is rounded to the nearest tenth of a percentage point) (91 FR 44110). In other words, this proposed retroactive guardrail would be applied at reconciliation for any remaining performance years for agreement periods that began on January 1, 2024 (that is, PY 2025 through 2028), January 1, 2025 (that is, PY 2025 through 2029), and January 1, 2026 (that is, PY 2026 through 2030) (91 FR 44110).

We proposed to apply this proposal retroactively because it adjusts the methodology used in determining shared savings and losses for a performance year and for agreement periods that have already started (91 FR 44110). We stated that applying this proposal retroactively would either have no effect or a positive effect on an ACO's determinations of shared savings and losses, and no ACOs would be harmed by retroactively applying this proposed policy (91 FR 44110). Section 1871(e)(1)(A) of the Act prohibits substantive changes in regulations, manual instructions, interpretive rules, statements of policy, or guidelines of general applicability under Title XVIII of the Act from being applied retroactively to items and services furnished before the effective date of the change unless, as permitted under paragraph (ii), the Secretary determines that failing to apply the change retroactively would be contrary to the public interest. We stated that we believe it is appropriate to extend this retroactive applicability to PY 2025 for consistency with future performance years and for the reasons described in the subsequent paragraph (91 FR 44110).

As discussed in the proposed rule, failing to apply this proposed policy retroactively for agreement periods beginning on January 1, 2024, and before January 1, 2027, would be contrary to the public interest (91 FR 44110). We acknowledged that some ACOs may feel unfairly punished by forcing them to assume financial risk when the modified USPCC is a substantial under-projection compared to actual growth, and no ACO would experience reduced shared savings or increased shared losses by retroactively applying this proposed policy (91 FR 44110). We stated that this is especially the case in comparison to ACOs with agreement periods beginning on or after January 1, 2027, that would be protected from financial risk if the delta modified USPCC is substantially negative simply because their agreement period would start after the potential implementation date of the proposed policy (91 FR 44110). A substantially negative delta modified USPCC would cause greater harm to ACOs with agreements starting January 1, 2024, January 1, 2025, or January 1, 2026, than for ACOs with agreement periods beginning on or after January 1, 2027, especially because of the potential for these negative projection and mis-estimation errors to compound over multiple years. Specifically, for a given ACO, substantially negative delta modified USPCC would result in corresponding lower ACPT values, which would, in turn, potentially result in lower shared savings or greater shared losses than would occur for a similar ACO with an agreement period beginning on or after January 1, 2027. Such a consequence would be outside an ACO's control, potentially undermining both participation in and the sustainability of the Shared Savings Program and the public's faith in CMS as a fair partner. We noted that we are compelled to propose a retroactive remedy for a substantially negative delta modified USPCC because all ACOs covered by this proposed policy will either benefit from it or will be unaffected by it (91 FR 44110). Also, we stated that the proposed policy likely will not place additional administrative burden upon ACOs, CMS, or other interested parties (91 FR 44110).

We stated that ACOs participating in the Shared Savings Program and other ACOs that may be considering joining the Shared Savings Program may be less likely to join or continue to participate

in a program where applications of policy based on agreement period start date, which such ACOs may perceive to be arbitrary, can reduce shared savings or increase shared losses (91 FR 44110). Having more ACOs than what is typical terminating their participation in the Shared Savings Program could negatively affect the sustainability of the program. The Shared Savings Program financial methodology and the procedures we have utilized in the past to address projection errors in the ACPT provide a means to account for instances of substantially negative delta modified USPCC. However, we noted that these remedies to address projection errors under our current policies can only be used if an unforeseen circumstance occurs and we determine the negative effects of an under-projected delta modified USPCC to be substantial enough to affect ACOs (91 FR 44110). As a result, this can create uncertainty for ACOs on whether CMS would address projection errors with delta modified USPCC. The delta modified USPCC is a factor that directly affects whether an ACO receives shared savings, and ACOs can easily measure the impact of the delta modified USPCC on their shared savings. In recognition of the differing circumstances that could warrant accounting for errors, we have not established a set amount of difference between the modified USPCC and national expenditure trends that we consider to be a substantial enough under-projection to implement a remedy. This uncertainty can create challenges for ACOs to be able to plan what their benchmark could be and how they will achieve savings against such benchmark.

As discussed in the proposed rule, for some ACOs, the uncertainty in the difference between the modified USPCC and national expenditure trends may either discourage new ACOs from joining the Shared Savings Program or cause some ACOs to leave the program, which goes against our goal to encourage more ACOs to participate in the Shared Savings Program (91 FR 44110). We stated that if we do not remedy projection errors in update factors that directly affect the amount of shared savings earned by ACOs, this could cause a loss of faith by ACOs, healthcare providers, and the public in CMS's ability to effectively administer the Shared Savings Program, substantially reducing ACO and healthcare provider participation in the program (91 FR 44110). Reduced participation, in turn, would significantly diminish the savings to the Medicare Trust Funds, the quality of care improvements for Medicare beneficiaries resulting from ACO participants in the Shared Savings Program, and reduce the coordination of care performed for Medicare beneficiaries when obtaining items and services from ACO providers and suppliers. For these reasons, we stated that it would be contrary to the public interest for CMS to fail to retroactively apply our proposed policy mitigating this issue (91 FR 44110). With our proposed policy, we noted that ACOs will know the lower-bound limit on the difference between the modified USPCC and national expenditure trends for the duration of their entire agreement period and have more confidence participating in the Shared Savings Program (91 FR 44110 through 44111).

As discussed in the proposed rule, the following steps illustrate how the proposed guardrail on substantially negative delta modified USPCC would operate in practice at reconciliation for a given performance year, beginning with reconciliation for PY 2025, for agreement periods beginning on or after January 1, 2024, and before January 1, 2027 (91 FR 44111 through 44113). We noted that Step 1 and Step 4 (with the exception of calculating benchmark-based loss sharing limits for ACOs participating in a two-sided risk track) would be operationally identical to those applied to agreement periods beginning on or after January 1, 2027 (91 FR 44111). Moreover, in Steps 2 and 3, we stated that the only methodological difference relative to Steps 2 and 3 applied to agreement periods beginning on or after January 1, 2027, is that we would not apply an upper guardrail threshold of 1.5 percentage points on delta modified USPCC for agreement periods beginning on or after January 1, 2024, and before January 1, 2027 (91 FR 44111).

For completeness and clarity, all four steps were illustrated in the proposed rule (91 FR 44111).

Additionally, we stated that similar to the two-sided guardrail on delta modified USPCC in a given performance year for agreement periods beginning on or after January 1, 2027, the application of a guardrail on substantially negative delta modified USPCC in a given performance year for agreement periods beginning on or after January 1, 2024, and before January 1, 2027, would only impact the ACPT values and downstream shared savings and losses calculations applicable to that performance year (91 FR 44111). We stated that the effects of applying a guardrail on substantially negative delta modified USPCC in one performance year would not carry over into subsequent performance years (91 FR 44111).

Step 1: Calculate the applicable delta modified USPCC values.

As illustrated in Table B–G39 of the proposed rule (91 FR 44111), at reconciliation for a given performance year, beginning with PY 2025, CMS would calculate two delta modified USPCC values for each agreement period cohort: one for the ESRD population, and one for the Aged/Disabled population. For a given population, the delta modified USPCC would be equal to the modified USPCC cumulative growth rate minus the observed cumulative growth in national assignable expenditures. Because delta modified USPCC values are constructed at the agreement period cohort, performance year, and population levels, they apply uniformly to all ACOs within a given cohort for a given performance year.

Step 2: Determine whether each delta modified USPCC is less than -1.0 percentage point.

TABLE B-G42: HYPOTHETICAL EXAMPLE OF STEP 1 (CALCULATE THE APPLICABLE DELTA MODIFIED USPCC VALUES)

Population	Modified USPCC Cumulative[1] Growth Rate	Observed Cumulative[1] Growth in National Assignable Expenditures	Delta Modified USPCC[2]
ESRD	6.5%	4.5%	+2.0 percentage points
Aged / Disabled	3.0%	5.0%	-2.0 percentage points

Notes:
[1] – "Cumulative" reflects the period from a given ACO's BY3 to the applicable performance year.
[2] – At reconciliation for a given performance year, delta modified USPCC for each population and agreement period cohort equals the modified USPCC cumulative growth rate minus observed cumulative growth in national assignable expenditures.

As illustrated in Table B–G40 of the proposed rule (91 FR 44111), once calculated, each population-specific delta modified USPCC value would then be compared with the previously mentioned guardrail threshold (- 1.0 percentage point). If delta modified USPCC is greater than or equal to -1.0 percentage point, no guardrail adjustment would apply, and the corresponding enrollment type-specific ACPT values initially calculated for that performance year would remain unchanged. If delta modified USPCC is less than -1.0 percentage point, a guardrail adjustment would apply.

TABLE B-G43: HYPOTHETICAL EXAMPLE OF STEP 2 (DETERMINE WHETHER EACH DELTA MODIFIED USPCC IS LESS THAN -1.0 PERCENTAGE POINT)

Population	Delta Modified USPCC	Guardrails[1]		Does Guardrail Adjustment Apply?
		Lower Bound	Upper Bound	
ESRD	+2.0 percentage points	-1.0 percentage point	None	No (Upper bound guardrail does not apply for ACOs that began an agreement period prior to January 1, 2027)
Aged / Disabled	-2.0 percentage points	-1.0 percentage point	None	Yes (delta modified USPCC less than lower bound)

Notes:
1 - The lower and upper bounds shown here reflect a fixed threshold of -1.0 percentage point applied to both the ESRD delta modified USPCC and the Aged/Disabled delta modified USPCC.

Although the ESRD delta modified USPCC of +2.0 percentage points is greater than the upper guardrail threshold of +1.5 percentage points for agreement periods beginning on or after January 1, 2027, this threshold would not apply for ACOs in agreement periods beginning on or after January 1, 2024, and before January 1, 2027.

Step 3. Calculate the guardrail-adjusted modified USPCC cumulative growth rate, as applicable.

As illustrated in Table B–G41 of the proposed rule (91 FR 44112), for a given population, if delta modified USPCC is less than the lower guardrail threshold, the applicable modified USPCC cumulative growth rate would be replaced with a guardrail-adjusted value equal to the observed cumulative growth in national assignable expenditures minus 1.0 percentage point.

TABLE B-G44: HYPOTHETICAL EXAMPLE OF STEP 3 (CALCULATE THE GUARDRAIL-ADJUSTED CUMULATIVE GROWTH RATE)

Population	Delta Modified USPCC (Step 1)	Applicable Guardrail (Step 2)	Observed Cumulative Growth in National Assignable Expenditures	Original Modified USPCC Cumulative Growth Rate	Guardrail-Adjusted Modified USPCC Cumulative Growth Rate
ESRD[1]	+2.0 percentage points	Not Applicable	4.5%	6.5%	No adjustment (6.5% used)
Aged / Disabled[2]	-2.0 percentage points	-1.0 percentage points	5.0%	3.0%	4.0%

Notes:
1 - For the ESRD population, there would be no guardrail adjustment because the ESRD delta modified USPCC calculated in Step 1 would have been determined to fall above the guardrail threshold in Step 2. Therefore, the ESRD-specific ACPT values initially calculated for that performance year would still apply.
2 - For the Aged/Disabled population, the guardrail-adjusted modified USPCC cumulative growth rate would equal 4.0 percent, or the observed cumulative growth in national assignable expenditures minus 1.0 percentage points because the Aged/Disabled delta modified USPCC calculated in Step 1 would have been determined to fall below the guardrail threshold in Step 2. In turn, the ACPT values for the Disabled, Aged/Dual, and Aged/Non-Dual populations initially calculated for that performance year would be recomputed in Step 4 using the guardrail-adjusted modified USPCC cumulative growth rate.

Step 4. Recompute ACPT values, as applicable.

If a guardrail adjustment applies (as determined in Step 2), the corresponding enrollment type-specific ACPT values initially calculated for that performance year would be recomputed using the guardrail-adjusted modified USPCC cumulative growth rate (calculated in Step 3) rather than the original modified USPCC cumulative growth rate. For the ESRD population, the guardrail-adjusted modified USPCC cumulative growth rate would be used to recompute ACPT values applicable to the ESRD enrollment type. For the Aged/Disabled population, the guardrail-adjusted modified USPCC cumulative growth rate would be used to recompute ACPT values applicable to the Disabled, Aged/Dual-Eligible, and Aged/Non-Dual-Eligible enrollment types.

As discussed in the proposed rule, the recomputed ACPT values would then be used to construct the three-way blended update factors, updated historical benchmarks, and, in turn, shared savings and losses calculations for the applicable performance year (91 FR 44112). However, in calculating the benchmark-based loss recoupment limit for a given ACO participating in a two-sided risk track, we would use as its basis the lesser of the two updated benchmarks calculated before and after application of the retroactive guardrail. This would be done to account for the unlikely scenario in which an ACO's benchmark-based loss recoupment limit increases under the retroactive guardrail and, as a result of that increase, the ACO is rendered liable for greater shared losses than would otherwise occur in the absence of the retroactive guardrail. This would ensure that no ACO could be harmed as a result of implementing this proposed policy.

We sought comment on this proposal. Because commenters generally addressed this proposal in conjunction with the proposals in sections III.G.5.g.(2)(a), (b), and (e), and the notice in section III.G.5.g.(2)(d), please see section III.G.5.g.(2)(e) where we summarize and respond to comments on all III.G.5.g.(2) sections.

(d) Delay in Financial Reconciliation for Performance Year 2025

As discussed in the proposed rule, proposing to implement this guardrail to take effect starting with PY 2025, including PY 2025 financial reconciliation, will result in a delay in PY 2025 financial reconciliation and delay providing financial results and shared savings payments to ACOs, pending the issuance of the CY 2027 PFS final rule and confirmation that we ultimately finalize the proposal for the lower bound guardrail policy (91 FR 44112). We stated that CMS plans to issue PY 2025 financial results and distribute shared savings payments in November 2026 and December 2026, respectively, in accordance with the finalized policy (91 FR 44112). This is necessary because, to complete the reconciliation process, we need to have a final value established for the ACPT for PY 2025.

Under our proposed retroactive, lower-bound guardrail policy, the ACPT for ACOs with agreement periods starting in PY 2024 would be 15.3 percent for ESRD beneficiaries and 14.7 percent for Aged/Disabled beneficiaries (91 FR 44112). We stated that for ACOs with agreement periods starting in PY 2025 under our proposed policy, the ACPT would be 7.7 percent for ESRD beneficiaries and 5.7 percent for Aged/Disabled beneficiaries (91 FR 44112). As described in the proposed rule (91 FR 44110 through 44112), all of the ACOs covered by our proposed policy for PY 2025 financial reconciliation would either benefit from it or would be unaffected by it (91 FR 44112).

We stated in the proposed rule that if our policy is not implemented and no other action is taken to adjust the ACPT, the unadjusted ACPT for ACOs with agreement periods starting in PY 2024 would be 13.0 percent for ESRD beneficiaries and 10.6 percent for Aged/Disabled beneficiaries (91 FR 44112). We noted that for ACOs with agreement periods starting in PY 2025 if the ACPT is not changed, the unadjusted ACPT would be 7.5 percent for ESRD beneficiaries and 5.6 percent for Aged/Disabled beneficiaries (91 FR 44112). We stated that if we do not implement our policy, ACOs with agreement periods starting in either 2024 or 2025 would otherwise receive less shared savings or have no change in their shared savings payments (91 FR 44112).

As discussed in the proposed rule, the goal of this policy is to address the under-estimate of the modified USPCC compared to national expenditure trends (91 FR 44112). We stated that the proposal also would ensure that as soon as PY 2025 financial reconciliation occurs, ACOs would not be subject to the risk of modified USPCC values being

included in the three-way blended growth factor that are substantially lower than the national assignable expenditure trends solely because of the starting date of an ACO's agreement period (91 FR 44112). We noted that the proposed ACPT lower bound policy also can be applied in the same manner for ACOs with agreement periods starting either January 1, 2024, or January 1, 2025, which would lead to a consistent ACPT lower bound policy regarding the relationship between the ACPT and the national assignable expenditures, if we finalize our proposal to establish a guardrail as described in the proposed rule (91 FR 44112 through 44113). For the reasons noted in this section, stated that we believe that a delay to financial reconciliation is necessary so that ACOs that participated in PY 2025 can immediately benefit if this proposed lower bound guardrail policy is finalized (91 FR 44113).

We sought comment on this proposal. Because commenters generally addressed this proposal in conjunction with the proposals in sections III.G.5.g.(2)(a), (b), (c), and (e), and the notice in section III.G.5.g.(2)(d), please see section III.G.5.g.(2)(e) where we summarize and respond to comments on all III.G.5.g.(2) sections.

(e) Amendments to Shared Savings Program Regulations

We proposed the following amendments to § 425.605 (91 FR 44113):

- Revise paragraph (i)(2)(i) introductory text to remove the phrase ''paragraph (i)(2)(ii) of this section'' and add in its place the phrase ''paragraph (i)(2)(ii) or (i)(2)(iii) of this section, as applicable''.
- Add new paragraph (i)(2)(iii) to specify that for agreement periods beginning on or after January 1, 2024, and before January 1, 2027, applicable to performance years 2025 and subsequent performance years remaining in these agreement periods, CMS calculates the benchmark-based loss recoupment limit as follows:

++ Calculates the value for total benchmark expenditures as the product of an ACO's per capita updated benchmark expenditures for the performance year prior to the recomputation of the ACPT as specified in § 425.660(c)(1) and an ACO's assigned beneficiary person years for the performance year.

++ Calculates the value for total benchmark expenditures as the product of an ACO's per capita updated benchmark expenditures for the performance year after the recomputation of the ACPT as specified in § 425.660(c)(1) and an ACO's assigned beneficiary person years for the performance year.

++ Calculates the product of the percentage specified in paragraph (d)(1)(iii)(D)(2), (d)(1)(iv)(D)(2), and (d)(1)(v)(D)(2) of this section, as applicable, and the lesser of the ACO's total benchmark expenditures calculated according to paragraphs (i)(2)(iii)(A) and (i)(2)(iii)(B) of this section.

We proposed the following amendments to § 425.610 (91 FR 44113):

- In paragraph (l)(2) introductory text, remove the phrase ''paragraph (l)(3) of this section'' and add in its place the phrase ''paragraphs (l)(3) or (l)(4) of this section, as applicable'';
- Add new paragraph (l)(4) to specify that for agreement periods beginning on or after January 1, 2024, and before January 1, 2027, applicable to performance years 2025 and subsequent performance years remaining in these agreement periods, the amount of shared losses for which an eligible ACO is liable may not exceed 15 percent of the lesser of the following:

++ Total benchmark expenditures calculated as the product of an ACO's per capita updated benchmark expenditures for the performance year prior to the recomputation of the ACPT as specified in § 425.660(c)(1) and an ACO's assigned beneficiary person years for the performance year.

++ Total benchmark expenditures calculated as the product of an ACO's per capita updated benchmark expenditures for the performance year after the recomputation of the ACPT as specified in § 425.660(c)(1) and an ACO's assigned beneficiary person years for the performance year.

We proposed to revise the entirety of § 425.660 with provisions on the ACPT. In summary, we proposed the following amendments to § 425.660 (91 FR 44113):

Revise paragraph (a) to provide a general explanation of the ACPT and specify that the methodology by which CMS calculates and adjusts a projected growth rate called the Accountable Care Prospective Trend (ACPT) is described in § 425.660. We stated that we would also specify that CMS incorporates the ACPT into the blended update factor described in § 425.652(b) when updating an ACO's benchmark for each performance year of the agreement period, for agreement periods beginning on January 1, 2024, and in subsequent years (91 FR 44113).

Revise paragraph (b) on the determination of the ACPT to specify in the introductory text that an ACPT is a flat dollar amount calculated using one or more annualized growth rates based on national FFS Medicare expenditures projected by the CMS Office of the Actuary. We stated that we would specify in paragraphs (b)(1) through (b)(6), the provisions on CMS' determination of the ACPT for a Medicare enrollment type for each performance year, as follows (91 FR 44113):

As discussed in the proposed rule, paragraph (b)(1) of § 425.660 specifies provisions on CMS' calculation of annualized projected growth rates (91 FR 44113). We stated that this provision explains that the annualized projected growth rates are calculated as an annual rate of growth in projected expenditures relative to the prior year (91 FR 44113). Further, we stated that CMS projects annualized per capita growth in Parts A and B FFS expenditures for each performance year of the ACO's agreement period. In calculating the annualized projected growth rates, CMS would do all of the following (91 FR 44113):

- Exclude IME and DSH payments, and the supplemental payment for IHS/Tribal hospitals and Puerto Rico hospitals;
- Make separate expenditure calculations for the ESRD and Aged/Disabled populations; and
- Calculate one or more annualized projected growth rates for the ESRD population of beneficiaries, and one or more annualized growth rates for the Aged/Disabled population of beneficiaries, as follows:

++ Using a uniform annualized projected rate of growth over each of the 5 performance years of the 5-year agreement period (for agreement periods beginning on or after January 1, 2024, and before January 1, 2027), or for each performance year (for agreement periods beginning on January 1, 2027, and in subsequent years), as applicable; or

++ If using a uniform annualized projected rate of growth is determined not to reasonably fit the anticipated growth curve (for example, if growth is expected to be above- or below-average in the short-run and return to more typical levels later in the agreement period), we stated that we would apply an alternative annualization technique using two or more annualized growth rates reflecting the projected rates of growth during the 5 performance years comprising the 5-year agreement period (for agreement periods beginning on or after January 1, 2024, and before January 1, 2027), or for each performance year (for agreement periods beginning on January 1, 2027, and in subsequent years), as applicable (91 FR 44114).

Proposed paragraph (b)(2) of § 425.660 specifies that, for each performance year, CMS calculates cumulative

projected growth rates relative to the ACO's benchmark year (BY) 3, using the annualized projected growth rates, determined in accordance with proposed paragraph (b)(1) of § 425.660, for each population of beneficiaries: the ESRD population and the Aged/Disabled population.

Proposed paragraph (b)(3) of § 425.660 specifies provisions on CMS' calculations to express a cumulative projected growth rate as a flat dollar amount. Accordingly, for each performance year, we stated that CMS would multiply the applicable cumulative projected growth rate described in proposed paragraph (b)(2) of § 425.660 by BY3 truncated national per capita FFS Medicare expenditures for assignable beneficiaries for each Medicare enrollment type (ESRD, disabled, aged/dual eligible Medicare and Medicaid beneficiaries, and aged/non-dual eligible Medicare and Medicaid beneficiaries) identified for the 12-month calendar year corresponding to BY3 to express the cumulative projected growth rate as a flat dollar amount as follows (91 FR 44113 through 44114):

- The ESRD cumulative projected growth rate would be used for the ESRD population.
- The Aged/Disabled cumulative projected growth rate would be used for the following populations: disabled, aged/dual eligible Medicare and Medicaid beneficiaries, and aged/non-dual eligible Medicare and Medicaid beneficiaries.

Under proposed paragraph (b)(4) of § 425.660, we stated that we would maintain the existing provision on risk adjusting the flat dollar amount but add a related description to serve as a heading for clarity and consistency (91 FR 44114).

Under proposed paragraph (b)(5) of § 425.660, we stated that we would maintain the existing provision on calculating ACO-specific ACPT growth rates but add a related description to serve as a heading and make other revisions for clarity and consistency (91 FR 44114).

Under proposed new paragraph (b)(6) of § 425.660, we stated that we would specify provisions on the timing of calculations, which include the following (91 FR 44114):

- Under new paragraph (b)(6)(i), with provisions applicable for agreement periods beginning on or after January 1, 2024, and before January 1, 2027, we stated that we would specify the following (91 FR 44114):

++ At the beginning of the ACO's agreement period, we stated that CMS calculates the annualized projected growth rates for all performance years of the ACO's agreement period in accordance with proposed paragraph (b)(1) of § 425.660. These annualized projected growth rates remain fixed over the ACO's agreement period (91 FR 44114).

++ For a given performance year, we stated that CMS calculates an ACO-specific ACPT value, in accordance with proposed paragraphs (b)(2) through (b)(5) of § 425.660, using the annualized projected growth rates calculated at the beginning of the ACO's agreement period (91 FR 44114).

- Under new paragraph (b)(6)(ii), with provisions applicable for agreement periods beginning on January 1, 2027, and in subsequent years, we specified the following (91 FR 44114):

++ In the calendar year preceding a given performance year, CMS calculates the annualized projected growth rates in accordance with proposed paragraph (b)(1) of § 425.660 for that performance year.

++ For a given performance year, CMS calculates an ACO-specific ACPT value, in accordance with proposed paragraphs (b)(2) through (b)(5) of § 425.660, using the annualized projected growth rates calculated in the preceding calendar year.

Under new paragraph (c) of § 425.660, we stated that we would specify provisions on the recomputation of the ACPT based on the guardrail policies described in the proposed rule (91 FR 44114). Specifically, at financial reconciliation for a given performance year, we stated that CMS may recompute the ACO-specific ACPT value for a Medicare enrollment type initially determined at paragraph (b)(5) of § 425.660 for that performance year, to address under-projection or over-projection of the ACPT (as applicable), as follows (91 FR 44114):

- In paragraph (c)(1), for agreement periods beginning on or after January 1, 2024, and before January 1, 2027.

++ For performance year 2025, and any subsequent performance years of the ACO's agreement period, CMS separately calculates for the ESRD and Aged/Disabled populations the difference between the cumulative projected growth rates calculated in proposed paragraph (b)(2) of § 425.660 and the cumulative observed growth in per capita expenditures for the national assignable FFS population.

++ For the ESRD and Aged/Disabled populations separately, if this difference is less (more negative) than −1.0 percentage point (for example, −1.5, −2.0, −3.0), we stated that CMS would recompute the ACO-specific ACPT value for the corresponding enrollment type(s) initially determined at proposed paragraph (b)(5) of § 425.660. CMS would calculate an ACO-specific ACPT value for the corresponding enrollment type(s), in accordance with proposed paragraphs (b)(3) through (b)(5) of § 425.660, using the cumulative observed growth in expenditures for the national assignable FFS population minus 1.0 percentage point (91 FR 44114).

++ If this difference is greater than (less negative) or equal to −1.0 percentage point (for example, −0.9, −0.5, 0.5), we stated that CMS would not recompute the ACO-specific ACPT value for the corresponding enrollment type(s) initially determined at proposed paragraph (b)(5) of § 425.660 (91 FR 44114).

- In paragraph (c)(2) of § 425.660, for agreement periods beginning on January 1, 2027, and in subsequent years.

++ CMS separately calculates for the ESRD and Aged/Disabled populations the difference between the cumulative projected growth rates calculated in proposed paragraph (b)(2) of § 425.660 and the cumulative observed growth in per capita expenditures for the national assignable FFS population.

++ For the ESRD and Aged/Disabled populations separately, if this difference is less (more negative) than −1.0 percentage point (for example, −1.5, −2.0, −3.0), CMS would recompute the ACO-specific ACPT value for the corresponding enrollment type(s) initially determined at proposed paragraph (b)(5) of § 425.660. We stated that CMS would calculate an ACO-specific ACPT value for the corresponding enrollment type(s), in accordance with proposed paragraphs (b)(3) through (b)(5) of § 425.660, using the cumulative observed growth in expenditures for the national assignable FFS population minus 1.0 percentage point (91 FR 44114).

++ If this difference is greater than or equal to +1.5 percentage points, we stated that CMS would recompute the ACO-specific ACPT value for the corresponding enrollment type(s) initially determined at proposed paragraph (b)(5) of § 425.660 (91 FR 44114). We stated that CMS would calculate an ACO-specific ACPT value for the corresponding enrollment type(s), in accordance with proposed paragraphs (b)(3) through (b)(5) of § 425.660, using the cumulative observed growth in expenditures for the national assignable FFS population plus 1.5 percentage point (91 FR 44114).

++ If this difference is greater than (less negative) or equal to −1.0 percentage point and less than or equal to +1.5 percentage points (for example,

between −1.0 and +1.5, inclusive), CMS would not recompute the ACO-specific ACPT value for the corresponding enrollment type(s) initially determined at proposed paragraph (b)(5) of § 425.660.

We sought public comment on the proposed reforms to the ACPT component of the benchmark update factor, described in section II.G.5.g of the CY 2027 PFS proposed rule. The following is a summary of the comments we received on each of the proposals described in II.G.5.g.(2).(a), (b), (c), and (e), as well as the notice described in II.G.5.g.(2).(d) that reconciliation for PY 2025 will be delayed until after the release of the CY 2027 PFS final rule, and our responses.

Comment: Many commenters broadly supported one or more of the proposed ACPT reforms. Commenters emphasized their support due to the potential for greater benchmark accuracy and predictability; protection from projection error outside an ACO's control; greater consistency and fairness across agreement-period cohorts; improved financial planning and investment certainty; and support for continued or expanded Shared Savings Program participation. Some commenters highlighted the value of these protections particularly for smaller, rural, physician-led, safety-net, and high-needs ACOs. Many commenters recommended finalizing the package of annual performance-year rates, prospective guardrails, and retroactive downside protection; the specific combinations discussed varied by commenter.

Response: We thank commenters for their support. We agree that the three ACPT reforms described previously operate together to preserve an external prospective trend while improving consistency across cohorts and limiting the consequences of substantial projection error for both ACOs and CMS.

Comment: Many commenters supported calculating performance-year-specific modified USPCC annualized growth rates and applying the same rates for a given performance year regardless of agreement-period start date. These commenters stated that this approach would reduce differences attributable to agreement start dates, avoid reliance on projections that may become obsolete over a five-year period, improve operational simplicity and transparency, and reduce inequities across cohorts or incentives to time agreement entry. Some commenters also expected rates calculated closer to the performance year to better reflect current spending conditions.

A commenter noted that setting ACPT growth factors at the start of a five-year agreement period had provided certainty, while also emphasizing that subsequent divergence between projected and actual growth materially harmed ACOs. Other commenters favored annual, performance-year-specific rates because they would better reflect current conditions and apply consistently across agreement-period cohorts. Some commenters also recommended releasing the applicable ACPT rate before the beginning of each performance year, including through a summer release schedule, so that ACOs would have the rate in time for financial and operational planning. These comments distinguished advance publication from annual calculation because an annually determined rate would not provide the same planning value if it were not made available sufficiently before the performance year.

Response: We thank commenters for their support for performance year-specific modified USPCC annualized growth rates. As described previously, CMS will publicly report the PY 2027 modified USPCC annualized growth rates in conjunction with the release of this final rule. For subsequent performance years, CMS will calculate and publicly report the modified USPCC annualized growth rates in late spring or early summer of the preceding calendar year. Our proposal will maintain the prospective character of the ACPT, which will provide ACOs with a degree of certainty regarding their annual benchmark updates, promote greater fairness among ACOs by having a consistent modified USPCC annualized growth rate apply to all ACOs reconciled for a given performance year, and reduce some of the operational complexity of calculating and applying the ACPT as part of the three-way blended growth factor. It is understandable that some ACOs may want additional advance knowledge of the prospective ACPT trend for a performance year, while others may find the advance notice prior to performance years (relative to how the ACPT was provided after the start of Performance Year 1 in agreement periods that started January 1, 2024 and 2025) may be useful to assist ACOs with their financial planning. Again, our goal is to recalibrate the balance of that tradeoff by forgoing some predictability in favor of greater consistency and, in turn, fairness across agreement period cohorts and eliminating disparate effects on the growth rates of historical benchmarks for ACOs because of when an ACO started its agreement period.

Comment: Many commenters supported limiting the effect of divergence between projected and observed expenditure growth for agreement periods beginning in 2027. These commenters described the guardrails as preventing shared savings or losses from being driven by forecasting error unrelated to ACO performance, improving financial stability, and restoring confidence in the benchmarking methodology. Several commenters characterized the guardrails as a more durable response to under-projection than temporary adjustments to the ACPT's weight. Some specifically supported the asymmetric design because it could allow ACOs to share in more savings than losses while preserving room for the ACPT to mitigate benchmark ratcheting. Some commenters viewed the proposed approach as preserving a meaningful role for prospective trends while protecting ACOs and CMS from substantial projection errors.

Multiple commenters referenced estimates of substantial financial effects from under-projection. These estimates reflected different periods and formulations. Commenters cited estimated reductions in total ACO revenue of $154 million for PY 2024 and exceeding $700 million for PY 2025 as evidence of the need for a durable corrective mechanism.

Response: We thank commenters for their support for our proposals to apply guardrails on delta modified USPCC. Regarding the asymmetric design, we previously stated that we believe that an asymmetric guardrail that imposes a tighter bound on substantially negative delta modified USPCC and a wider bound on substantially positive delta modified USPCC would more directly protect ACOs from the harms associated with substantially negative delta modified USPCC while still allowing ACOs to benefit from modestly positive delta modified USPCC, consistent with the prospective design of the ACPT. We believe that the proposed threshold levels are reasonable policy calibrations that strike an appropriate balance and are consistent with the original policy aims of the ACPT, as well as program goals of predictability, fairness, and administrative feasibility.

Comment: Many commenters supported retroactive application of the lower-bound guardrail for eligible existing agreement-period cohorts. These commenters viewed retroactivity as correcting under-projection outside ACOs' control, preserving shared savings that otherwise could be reduced or eliminated, improving fairness and confidence in CMS as a program

partner, and supporting continued ACO participation and investment. A commenter supported CMS's stated approach to retroactive rulemaking, stating that significant risks from non-retroactive application can justify a retroactive remedy and strongly supporting application of the revised ACPT methodology to all agreement periods that include the ACPT.

Some commenters emphasized that smaller, rural, safety-net, independent-practice, and high-needs ACOs may be particularly vulnerable to benchmark volatility, citing factors such as smaller populations, concentrated costs, local market variation, and limited financial reserves. These commenters stated that protection against excessive under-projection could create a more stable environment for participation and investment.

Response: We thank commenters for their support for the retroactive guardrail on substantially negative delta modified USPCC. We agree that applying this policy retroactively for agreement periods beginning on January 1, 2024, and before January 1, 2027, would be appropriate to mitigate the effects of substantially negative delta modified USPCC outside an ACO's control, including undermining participation in and the sustainability of the Shared Savings Program, which would limit ACOs' ability to continue to provide coordinated care and improve the quality of care provided to assigned beneficiaries and weaken the public's faith in CMS as a fair partner. Accordingly, we believe it is appropriate to implement this policy retroactively, because not doing so would be contrary to the public interest.

Further, as we stated in the proposed rule (91 FR 44110), the retroactive guardrail is designed to ensure that ACOs in agreement periods beginning on or after January 1, 2024, and before January 1, 2027, would either benefit or be unaffected by its application. Preliminary analyses of PY 2025 financial reconciliation calculations indicate that applying the retroactive guardrail would produce favorable or unchanged financial outcomes across affected ACOs, consistent with the policy's design. At the program level, the analysis indicates that the guardrail would increase aggregate shared savings, modestly reduce aggregate shared losses, and result in favorable financial performance category transitions for some ACOs.

Comment: A commenter acknowledged that establishing performance year-specific modified USPCC annualized growth rates could simplify the methodology, apply the same annual rates to all ACOs regardless of start date, and improve accuracy of projections by calculating them closer to the performance year. However, the commenter expressed concern that the approach would reduce predictability and make calculations more susceptible to annual abnormalities in expenditure growth. Accordingly, the commenter recommended that CMS not finalize the performance-year-specific growth-rate proposal pending additional analysis of the impacts and public comment, while strongly supporting guardrails if CMS proceeds. Another commenter stated that the proposal's financial effects and implementation were difficult to assess without clarification as to whether the ACPT adjustment would apply to all ACOs at once or only as ACOs renew their benchmarks. That commenter recommended delaying implementation until CMS provides additional analysis of financial effects across geographic regions for stakeholder review and engagement.

Response: We appreciate commenters' recognition of our objective of improving benchmark predictability and limiting forecasting inaccuracies. While commenters requested additional analysis, clarification, or safeguards before we implement the performance-year-specific growth-rate proposal, we disagree that further delay is warranted. This policy addresses a structural inconsistency and operational complexity under the current methodology. Absent this policy, ACOs reconciled for the same performance year may receive different modified USPCC annualized growth rates solely because their agreement periods began in different years. A performance year-specific rate will eliminate that as a source of cross-cohort inconsistency. This policy will apply to agreement periods beginning on January 1, 2027, and in subsequent years. ACOs in existing agreement periods will continue to use agreement-period-specific rates, subject to the retroactive guardrail on substantially negative delta modified USPCC described previously.

We recognize that establishing performance year-specific modified USPCC annualized growth rates may produce different ACPT values, and therefore different financial effects, than retaining agreement period-specific rates. However, we do not believe that delaying finalization of the policy pending additional modeling is warranted. The primary purpose of the policy is to eliminate a structural source of cross-cohort inconsistency under the current methodology, in which the ACPT values applicable to ACOs being reconciled for the same performance year may be based on different modified USPCC annualized growth rates solely because their agreement periods began in different years. This policy will ensure that all ACOs covered by the policy that are being reconciled for the same performance year will receive adjustments based on the same modified USPCC annualized growth rates.

We also do not believe that calculating modified USPCC annualized growth rates on a performance-year-specific basis would necessarily make the ACPT more vulnerable to annual abnormalities in expenditure growth. Under either approach to calculating modified USPCC annualized growth rates (that is, on a performance year-specific basis or an agreement period-specific basis) the ACPT relies on projected annual expenditure growth and therefore may overestimate or underestimate observed growth. The principal difference between the existing methodology and our proposal for performance year-specific modified USPCC annualized growth rates is timing: under the current methodology, projected annualized growth rates may be established up to five years before the applicable performance year, whereas the proposed policy uses projections calculated closer to the year in which they apply. Calculating modified USPCC annualized growth rates on a performance year-specific basis may incorporate more current information, but timing alone does not necessarily establish or alter the trajectory of delta modified USPCC for a given ACO, and the guardrails separately limit the financial effects of substantial cumulative under- or over-projection at reconciliation. We will monitor the implementation effects of this policy across geographic regions, ACO types, and beneficiary populations and will consider future refinements if warranted.

Comment: A commenter welcomed CMS's responsiveness to stakeholder concerns about the ACPT but cautioned against over-correcting the methodology and eliminating the gap between projected and observed spending growth that can preserve savings incentives. The commenter argued that an effective administrative benchmark should remain below counterfactual spending growth while exceeding actual spending growth, thereby retaining incentives for ACO participation. The commenter noted that this principle is recognized in the LEAD Model. The commenter did not recommend alternative numerical thresholds.

Response: We appreciate the commenter's concern about preserving the wedge between projected and

observed spending growth to maintain savings opportunities and participation incentives. We interpret this concern as being related to whether the upper bound of the two-sided guardrail could constrain over-projection too much and diminish the ACPT's ability to mitigate the benchmark ratchet effect. As discussed previously, we selected an asymmetric guardrail with a wider upper bound to preserve greater room for modestly positive delta modified USPCC while limiting unusually large over-projection. We believe the +1.5 percentage point upper threshold balances protection of the Medicare Trust Funds from the financial consequences of unusually large cumulative over-projection and preservation of the core design feature of the ACPT as a prospectively-set external factor that allows benchmarks to increase beyond actual spending growth even as ACOs slow spending growth. We will monitor whether and the extent to which the finalized upper threshold constrains the wedge between projected and observed expenditure growth in a manner that materially weakens savings incentives. Based on our evaluation of implementation experience, we may consider future refinements if warranted, including additional adjustments or safeguards.

Comment: Some commenters supported the proposed reforms while identifying remaining limitations in the ACPT's underlying design. These commenters identified several distinct limitations. Some commenters stated that under-projection could leave benchmarks below actual expenditure growth. A commenter estimated that the proposed 1.0 percentage point lower guardrail would provide less relief than reducing the ACPT's weight to zero. Other commenters cautioned that national trends may not reflect local spending or utilization patterns. These qualifications generally did not alter commenters' support for finalizing the proposed guardrails as an immediate improvement.

Commenters offered several longer-term methodological alternatives. Some commenters recommended replacing national trends with regional trends, particularly for smaller ACOs concentrated in one market; excluding ACO beneficiaries from reference trends to more directly address national and regional ratcheting; and explicitly accounting for major shifts in technology, policy, or clinical pricing that may affect ACOs unevenly. Other commenters supported the guardrails as an interim improvement but recommended eliminating the ACPT, returning to the prior benchmark trend methodology, or developing a more transparent and operationally straightforward alternative. These commenters viewed the need for guardrails, retrospective corrections, annual recalculation, and reconciliation adjustments as evidence of limitations in the ACPT's underlying design.

A commenter additionally requested alternatives that would allow rural providers with small Medicare Part B populations or limited financial reserves to continue transitioning from fee-for-service to advanced payment models without mandatory downside risk. The commenter linked this recommendation to rural providers' financial instability and to fragmented payment arrangements across Medicare and other payers. Although broader than the proposed ACPT mechanics, the recommendation reflects a distinct concern about whether benchmark reforms alone are sufficient to sustain rural participation.

Response: We thank commenters who expressed support for the proposed reforms while identifying purported limitations in the ACPT's underlying design. As we developed the proposed reforms, we assessed whether reducing the weight of the ACPT component of the three-way blended update factor from one-third to zero would be preferable to implementing a retroactive guardrail on substantially negative delta modified USPCC. Based on that assessment, we determined that, from a harm-reduction standpoint, the retroactive guardrail is preferable because it is designed to have exclusively beneficial or neutral effects for all ACOs (increased or unchanged shared savings or decreased or unchanged shared losses), whereas eliminating the ACPT can potentially have harmful effects (increased shared losses or decreased shared savings). We arrived at this determination after comparing outcomes of both approaches (down-weighting to zero versus a retroactive guardrail) against the same status quo baseline; that is, one-third weight applied to the ACPT component of the three-way blended update factor and no guardrail on delta modified USPCC, independent of the performance year in question.

Relative to that baseline, eliminating the ACPT would mean that an ACO's updated benchmark would be based entirely on the two-way national-regional blended update factor rather than the three-way blended update factor. For many ACOs, this can result in higher benchmarks and therefore can be potentially beneficial. However, for ACOs where regional growth may be sufficiently below national growth, substituting the two-way national-regional blended update factor for the three-way blended update factor could result in lower benchmarks even in the presence of substantially negative delta modified USPCC. Stated another way, when a given ACO's ACPT is greater than its two-way national-regional blended update factor, eliminating the ACPT is not necessarily beneficial and could be harmful to the ACO's financial reconciliation results.

By contrast, compared to the same baseline, in the presence of substantially negative delta modified USPCC, the retroactive guardrail can only result in an increased benchmark, by construction. This is because, in the presence of substantially negative delta modified USPCC, the only component of the three-way blended update factor that can change is the ACPT, and it can only be made larger than it would otherwise be in the absence of the guardrail. Furthermore, because the retroactive guardrail design incorporates a benchmark-based loss-recoupment limit protection feature (as discussed regarding ''Step 4. Recompute ACPT Values, as Applicable'' in CY 2027 PFS proposed rule (91 FR 44112)), there is no scenario in which an ACO could be rendered liable for greater shared losses than would otherwise occur in the absence of the retroactive guardrail. This benchmark-based loss recoupment limit protection feature will apply only to the retroactive guardrail on substantially negative delta modified USPCC for ACOs in agreement periods that began on or after January 1, 2024, and before January 1, 2027, beginning with reconciliation for PY 2025. It will not apply to agreement periods beginning on or after January 1, 2027.

More broadly, while we appreciate some commenters' views that the need for guardrails, retrospective corrections, annual recalculation, and reconciliation adjustments justifies the elimination of the ACPT entirely from the Shared Savings Program's financial reconciliation methodology, we disagree. Rather, for the reasons we discussed when we incorporated it into the financial methodology (87 FR 69881 through 69899), we continue to view the ACPT as an important tool for mitigating benchmark ratcheting and being a prospective measure of expenditure growth that makes benchmark updates more predictable. We view recent experience as evidence that the ACPT would benefit from refinement rather than elimination. Such refinements include safeguards against substantial delta modified USPCC, which may reflect projection error rather than ACO spending

performance, as well as performance year-specific modified USPCC annualized growth rates that ensure an ACO's agreement period start date does not determine the rate applicable at financial reconciliation for a given performance year.

Regarding other longer-term methodological alternatives, we appreciate commenters' suggestions to lengthen agreement periods, derive benchmarks from county rates, replace national trends with regional trends, exclude ACO beneficiaries from reference trends, and more explicitly account for major shifts in technology, policy, or clinical pricing that may affect ACOs unevenly. These recommendations would materially redesign the ACPT methodology or other aspects of the Shared Savings Program benchmark methodology beyond the scope of the proposed reforms. We will continue to monitor and consider whether implementation of these suggestions could be appropriate in the future, and we remain open to considering additional refinements through future rulemaking, if warranted.

We also appreciate the separate recommendation that CMS provide participation alternatives that would allow rural providers with small Medicare Part B populations or limited financial reserves to continue transitioning to advanced payment models without mandatory downside risk. That recommendation concerns Shared Savings Program participation and financial risk requirements more broadly than the ACPT methodology addressed by these proposals. Therefore, while we are not adopting such an alternative as part of these proposals, we will continue to consider the circumstances of rural providers, including the effects of beneficiary volume and participation requirements, in evaluating potential future program policies.

Comment: A commenter supported the guardrail concept but recommended applying the methodology consistently across agreement periods. Specifically, the commenter recommended extending both the upper and lower guardrails to existing agreement periods rather than applying the two-sided guardrail only to agreement periods beginning in 2027 and applying only the lower guardrail retroactively. The commenter stated that this approach would treat similarly situated ACOs equitably and provide consistent protection against trend misestimation.

Separately, some commenters proposed different refinements to the guardrail design, including symmetrical guardrails, tighter thresholds, or alignment with approaches used in the LEAD model. These recommendations reflected differing views and did not establish consensus on a specific alternative.

Response: We appreciate commenters' recommendations for consistent guardrails across agreement periods. We proposed a retroactive guardrail on substantially negative delta modified USPCC to protect ACOs in existing agreement periods from assuming financial risk when the modified USPCC is a substantial under-projection compared to actual growth, based on our observation of substantially negative delta modified USPCC occurring in both PY 2024 and PY 2025, affecting ACOs that entered agreement periods that began on January 1, 2024, and January 1, 2025. For those ACOs, failing to implement the retroactive guardrail at reconciliation for the remaining performance years of existing agreement periods, beginning with reconciliation for PY 2025, would potentially result in ACOs earning lower shared savings or incurring greater shared losses than would otherwise occur if the retroactive guardrail were applied and substantially negative delta modified USPCC were to persist.

Such consequences would be largely outside any given ACO's control and could potentially undermine both participation in and the sustainability of the Shared Savings Program and the public's faith in CMS as a fair partner. Specifically, over the course of an agreement period, if substantially negative delta modified USPCC persists and remains unconstrained, the adverse financial effects could either discourage new ACOs from joining the Shared Savings Program or cause some ACOs to leave the program. Reduced participation could significantly diminish savings to the Medicare Trust Funds, limit improvements in the quality of care provided to Medicare beneficiaries, and reduce the coordination of care for Medicare beneficiaries when obtaining items and services from ACO providers and suppliers. For these reasons, we believe it would be contrary to the public interest for CMS to fail to apply retroactively our proposed policy mitigating this issue. This rationale does not equivalently apply to a retroactive upper guardrail on substantially positive delta modified USPCC for existing agreement periods, which is effectively what the commenter is suggesting with the stated interest of treating ACOs across agreement periods equitably and providing consistent protection against trend misestimation. Thus, at this time, we do not believe that there is sufficient basis to apply a retroactive guardrail on substantially positive delta modified USPCC.

Separately, we appreciate commenters' suggestion that we consider other refinements to the guardrail design, such as symmetrical guardrails, tighter thresholds, or alignment with approaches used in other accountable care models (for example, the LEAD model). We have stated that the thresholds we have proposed represent a reasonable policy calibration that balances protecting ACOs and the Medicare Trust Funds from substantial misestimation of national expenditure growth on the one hand and preserving the prospective design objectives of the ACPT on the other. We remain open to considering future refinements to guardrail design features through rulemaking if warranted.

Comment: Some commenters expressed concern about delaying PY 2025 financial reconciliation results or shared savings payments. These commenters linked the delay to clinician compensation, practice cash flow, provider distributions, vendor commitments, care-management staffing, and investments in population health and care transformation. A commenter also requested clarification as to whether the later reconciliation cadence would be limited to PY 2025.

Commenters proposed several distinct approaches to reducing disruption from delayed PY 2025 reconciliation. Some requested provisional payments on the original timeline, potentially with a withhold to protect CMS against overpayment, followed by supplemental payments or a true-up after final guardrail values are available. Others requested provisional reconciliation results without necessarily requesting an interim payment. Additional commenters requested interim ACO-specific financial reports, including results under the existing and proposed methodologies, or early confirmation of the revised timeline to support cash-flow planning. Separately, commenters recommended that CMS avoid delaying reconciliation for ACOs whose results are not affected by the guardrail.

Commenters additionally requested transparent annual calculations, timely ACO-specific information explaining how the ACPT and guardrails affect each benchmark, disclosure of the assumptions underlying annual updates, and early confirmation of reconciliation timelines. Commenters stated that these approaches would preserve the benefit of retroactive protection while reducing disruption to

practice cash flow, provider compensation, staffing, and care-transformation investments; improve financial planning; allow ACOs to validate results; and support communication with participating providers.

Response: We thank commenters for raising concerns about the delayed PY 2025 financial reconciliation process and the potential effects on clinician compensation, provider distributions, cash flow, staffing, vendor commitments, and investments in care management and population health. Although we recognize these concerns, we continue to believe that it is appropriate to delay PY 2025 financial reconciliation until after the release of the CY 2027 PFS final rule. We made this decision based on a careful consideration of several factors unique to PY 2025, principally the observation of substantially negative delta modified USPCC affecting both the 2024 and 2025 agreement period cohorts for PY 2025, our determination that the proposed retroactive guardrail on substantially negative delta modified USPCC would be the most effective tool with which to protect affected ACOs from otherwise adverse financial consequences, and the practical need to finalize the retroactive guardrail in the CY 2027 PFS final rule before it could be implemented at reconciliation for PY 2025. In the CY 2027 PFS proposed rule, we provided ACOs with notice about our decision to delay PY 2025 financial reconciliation to allow them to plan accordingly as needed.

We also considered commenters' recommendations regarding provisional payments, provisional reconciliation results, and similar interim approaches, and suggestions that ACOs unaffected by the retroactive guardrail be reconciled separately and on an earlier schedule. While we appreciate the intent of these recommendations, we do not believe such approaches are operationally feasible under the circumstances, and the significant additional complexity these approaches would create would substantially increase the risk of creating errors in financial reconciliation calculations. Given the limited interval between finalization of this policy and completion of PY 2025 financial reconciliation, we do not believe that establishing provisional payment or interim reporting processes or conducting separate reconciliation cycles for different groups of ACOs, would provide sufficient additional benefit to justify the substantial added operational complexity, risk, and administrative burden associated with implementing them. As a result, CMS balanced these multiple perspectives and will be providing PY 2025 financial reconciliation and dissemination of Financial Reconciliation Settlement Reports shortly after the CY 2027 PFS final rule is released.

We also appreciate commenters' requests for timely information regarding ACPT calculations, guardrail implementation, and benchmark updates. Through published program specifications, CMS already publicly reports the methodologies used to calculate the ACPT. Further, with the finalization of performance year-specific modified USPCC annualized growth rates in this final rule, the published program specification will publicly report performance-year-specific modified USPCC annualized growth rates in the calendar year preceding the applicable performance year, beginning with the rates applicable to PY 2027. In addition, ACO-specific benchmark and reconciliation reports provide detailed information regarding benchmark calculations, including the components used to construct enrollment type-specific ACPT values. We believe these materials provide transparency regarding the calculation and application of the ACPT and associated guardrail policies and will continue to support ACOs' financial planning and operational decision-making.

Finally, we do not currently expect to delay financial reconciliation for future performance years. As stated previously, the circumstances that necessitated delaying PY 2025 financial reconciliation arose because the retroactive guardrail had not yet been finalized and therefore could not be incorporated into reconciliation calculations until finalization in the CY 2027 PFS final rule. With finalization of this policy, we expect the retroactive guardrail to be available for application in future performance years without requiring a similar delay, although CMS retains discretion to make operational decisions as warranted by future circumstances.

Comment: Some commenters requested continued evaluation of the reforms, including monitoring whether the ACPT remains aligned with actual expenditure growth, whether the guardrails adequately address projection error, and whether effects vary across ACO types, geographic markets, or patient populations. These commenters recommended revisiting the methodology or guardrail parameters in future rulemaking if experience shows continued benchmark suppression or unintended effects. Commenters also recommended that CMS evaluate whether the proposed thresholds remain sufficiently protective during periods of unusually rapid medical cost inflation and whether the upper threshold preserves sufficient room for the ACPT to mitigate benchmark ratcheting.

A commenter cautioned that guardrails tied to national expenditure growth may not reflect the spending patterns of ACOs serving medically complex populations. The commenter stated that such a guardrail could limit an ACO's benchmark update when higher expenditure growth reflects legitimate changes in the needs of its assigned population rather than inefficient care. The commenter recommended that CMS evaluate whether additional adjustments or safeguards are necessary for ACOs serving high need populations.

Other commenters also urged CMS to monitor whether the guardrails protect ACOs from artificially low benchmarks without unduly insulating them from meaningful accountability for spending or unfavorable expenditure trends. Lastly, a couple of commenters cautioned against combining guardrails with other upward benchmark adjustments in a manner that could systematically insulate ACOs from unfavorable trends and requested separate reporting of budgetary consequences.

Response: As discussed previously, we intend to monitor the delta modified USPCC, the application of guardrails on delta modified USPCC, and the combined effects of these guardrails and other policies on program-relevant metrics related to the commenters' concerns. We remain open, in principle, to reconsidering these thresholds in future rulemaking if implementation experience indicates that refinement is warranted. Lastly, we appreciate the recommendation related to budgetary consequences of the guardrails, and we will continue to work with the OACT to ensure our program policies continue to produce savings to the Trust Funds.

After careful consideration of public comments, we are finalizing the proposed reforms of the ACPT component of the benchmark update factor with a correction at § 425.660 to clarify that the guardrail will be ''greater than +1.5'' (as discussed in the example at 91 FR 44108 of the CY 2027 PFS proposed rule) rather than ''greater than or equal to +1.5'' (which was drafted in error at 91 FR 44114 of the CY 2027 PFS proposed rule). Specifically, we are finalizing the following policies as follows:

- For agreement periods beginning on January 1, 2027, and in subsequent years, we are finalizing, without

modification, our proposal to establish performance year-specific modified USPCC annualized growth rates to construct ACPT values.

- For agreement periods beginning on January 1, 2027, and in subsequent years, we are finalizing, without modification, our proposal to establish a guardrail that would not allow the modified USPCC cumulative growth rate for each of the ESRD population and the Aged/Disabled population to be more than 1.0 percentage point below or 1.5 percentage points above the corresponding observed cumulative growth in national assignable expenditures for that population, respectively, where the percentage-point thresholds are rounded to the nearest tenth of a percentage point.
- For agreement periods beginning on or after January 1, 2024, and before January 1, 2027, we are finalizing, without modification, our proposal to establish a retroactive guardrail that would not allow the modified USPCC cumulative growth rate to be more than 1.0 percentage point below the corresponding observed cumulative growth in national assignable expenditures, where the percentage-point threshold is rounded to the nearest tenth of a percentage point. This retroactive lower guardrail will apply beginning at reconciliation for PY 2025, where applicable, and for the remaining performance years of agreement periods that began on January 1, 2024 (that is, PYs 2025 through 2028), January 1, 2025 (that is, PYs 2025 through 2029), and January 1, 2026 (that is, PYs 2026 through 2030).

We are also finalizing, without modification, our proposed revisions to § 425.605. Specifically, we are finalizing as proposed, the following amendments to § 425.605:

- Revise paragraph (i)(2)(i) introductory text to remove the phrase ''paragraph (i)(2)(ii) of this section'' and add in its place the phrase ''paragraph (i)(2)(ii) or (i)(2)(iii) of this section, as applicable''.
- Add new paragraph (i)(2)(iii) to specify that for agreement periods beginning on or after January 1, 2024, and before January 1, 2027, applicable to performance years 2025 and subsequent performance years remaining in these agreement periods, CMS calculates the benchmark-based loss recoupment limit.

We are also finalizing, without modification, our proposed revisions to § 425.610. Specifically, we are finalizing as proposed, the following amendments to § 425.610:

- In paragraph (l)(2) introductory text, remove the phrase ''paragraph (l)(3) of this section'' and add in its place the phrase ''paragraphs (l)(3) or (l)(4) of this section, as applicable''.
- Add new paragraph (l)(4) to specify that for agreement periods beginning on or after January 1, 2024, and before January 1, 2027, applicable to performance years 2025 and subsequent performance years remaining in these agreement periods, the amount of shared losses for which an eligible ACO is liable may not exceed 15 percent of the lesser of the following:

++ Total benchmark expenditures calculated as the product of an ACO's per capita updated benchmark expenditures for the performance year prior to the recomputation of the ACPT as specified in § 425.660(c)(1) and an ACO's assigned beneficiary person years for the performance year.

++ Total benchmark expenditures calculated as the product of an ACO's per capita updated benchmark expenditures for the performance year after the recomputation of the ACPT as specified in § 425.660(c)(1) and an ACO's assigned beneficiary person years for the performance year.

6. Beneficiary Engagement

a. Proposal To Allow ACOs To Reduce or Eliminate Part B Cost Sharing

(1) Background

We believe that ACOs play a key role in strengthening beneficiary engagement in their care; accordingly, we intend to continue expanding the tools available to ACOs to support this work. Improving beneficiary engagement allows the benefits of receiving care from healthcare providers who are part of an ACO to be more tangible and may ultimately result in improved quality and efficiency of care for beneficiaries, helping us meet our goals of improving beneficiary outcomes and reducing unnecessary spending.

As part of the effort to strengthen beneficiary engagement, in the CY 2025 Physician Fee Schedule final rule, CMS finalized the prepaid shared savings option (89 FR 98132). This payment option is available to current Shared Savings Program ACOs with a history of earning shared savings and is intended to expand access to performance year savings that encourages investment in staffing, healthcare infrastructure, and additional services for beneficiaries. Under § 425.640(e)(1), ACOs participating in the prepaid shared savings option are required to spend a specific portion of the prepaid shared savings amount on direct beneficiary services, improving the quality of care beneficiaries receive. As discussed in section III.G.6. of the CY 2027 PFS proposed rule, ACO interest in receiving prepaid shared savings has been limited, and we proposed to discontinue the participation option in future years. However, we believed a component of prepaid shared savings, providing ACOs the ability to reduce or eliminate cost sharing for certain Part B items and services, is a valuable tool to offer eligible ACOs. Cost sharing support for Part B items and services was offered in the ACO REACH model and allows ACO participants not to collect cost sharing amounts (in whole or in part) from eligible beneficiaries for eligible Part B items and services. In the ACO REACH model, ACOs and ACO participants enter into cost sharing support arrangements for the ACO to reimburse the ACO participant for beneficiary cost sharing amounts not collected. In the ACO REACH model, ACOs have wide flexibility to determine the beneficiaries and items and services that will be eligible for cost sharing support, but ACOs are prohibited from waiving Part B cost sharing support for items that may have a higher risk of fraud, waste, or abuse, such as durable medical equipment, prosthetics, orthotics, prescription drugs or supplies.

Part B cost sharing support is the third most used Beneficiary Engagement Incentive in the ACO REACH model with 41 percent of ACOs reporting that they had implemented it by 2025 or were planning to implement in 2026.[358] Additionally, interested parties have identified Part B cost sharing support as a valuable tool for ACOs to engage beneficiaries in their care.[359]

In 2026, the standard Medicare Part B monthly premium is $202.90, with a $283 annual deductible.[360] After the deductible is met, beneficiaries generally pay 20 percent of the Medicare-approved amount for items and services, such as doctor visits and durable medical equipment, with no limit on out-of-pocket costs. While most beneficiaries have supplemental insurance that covers the 20 percent cost sharing, including Medigap plans, employer sponsored plans, and Medicaid, some beneficiaries do not. In 2023, 3.5 million Medicare FFS

[360] 2026 Medicare Parts A & B Premiums and Deductibles, Fact Sheet, November 14, 2025. Available at *https://www.cms.gov/newsroom/fact-sheets/2026-medicare-parts-b-premiums-deductibles.*

beneficiaries (13 percent) lacked additional supplemental coverage.[361] These beneficiaries were more likely to have modest incomes (between $20,000 and $40,000 per person) compared to all Medicare FFS beneficiaries in 2023.[362] Beneficiaries with higher out of pocket costs receive less medical care than those with supplemental coverage.[363] While not all of this difference in care may be due to financial concerns, higher out of pocket costs may cause patients to skip or postpone necessary care and result in worsening health outcomes.[364] Offering Part B cost sharing support would allow ACOs to remove cost barriers for beneficiaries to receive items and services that will positively impact their health, which is consistent with the goals of the Shared Savings Program of improved quality and efficiency of care for beneficiaries.

While only one Shared Savings Program ACO receiving prepaid shared savings chose to reduce or eliminate Part B cost sharing support in the first year, that experience may not reflect future demand for this flexibility, given that only four ACOs elected to receive prepaid shared savings. Based on the ACO REACH model experience and the number of Medicare FFS beneficiaries without supplemental insurance, Shared Savings Program ACOs may be very interested in using this flexibility, were it available, simple to administer, and easy to implement. Additionally, we think providing ACOs the ability to reduce or eliminate Part B cost sharing support will better enable them to bill the new modifiers where appropriate as finalized in section II.D of this final rule, without increasing costs for ACO beneficiaries. These modifiers are intended to better account for the complexity of visits in the ACO context, including the cognitive work of providing longitudinal care and accountability for a beneficiary's total cost of care.

As discussed in section III.G.6.a.(2)(f) of the CY 2027 PFS proposed rule, CMS expects to make a determination that the anti-kickback statute safe harbor for CMS-sponsored model arrangements and CMS-sponsored model patient incentives (§§ 1001.952(ii)(1) and (2) of this title) is available to protect remuneration exchanged under Part B cost sharing support arrangements and patient incentives in the form of Part B cost sharing support furnished to beneficiaries under the Shared Savings Program that meets the requirements of this section and the anti-kickback statute safe harbor requirements set forth at § 1001.952(ii) of this title.

(2) Revisions

(a) Eligibility, Application Procedure and Contents

To establish the ability for ACOs to offer Part B cost sharing support, we proposed in § 425.304(e)(1) that eligible ACOs may, subject to certain conditions and safeguards, enter into Part B cost sharing support agreements with ACO participants, under which ACO participants reduce or eliminate cost sharing for those categories of eligible Part B items and services and eligible beneficiaries identified by the ACO. This cost sharing support could include both Medicare FFS deductible and coinsurance amounts, or either of the two.

To help ensure that only ACOs capable of complying with program requirements have the ability to offer cost sharing support, we proposed to limit the ability to reduce or eliminate Part B cost sharing to those eligible ACOs that have submitted a Part B cost sharing support application and for which CMS has approved their application to participate for that agreement period or the remainder of that agreement period.

In addition to the eligibility requirement, CMS would design application criteria to collect information important for determining ACO compliance with the requirements of new § 425.304(e) while minimizing administrative burden to ACOs. ACOs would be required to submit an implementation plan in their application to provide Part B cost sharing support. ACOs will have substantial flexibility to design a Part B cost sharing support implementation plan that will be operationally and financially feasible for the ACO. As long as ACOs follow CMS procedures and accurate information is submitted to CMS, ACOs may independently determine the categories of beneficiaries and items and services for which they will reduce or eliminate Part B cost sharing.

We proposed to establish the application procedures in § 425.304(e)(3)(i). An ACO must submit a Part B cost sharing support implementation plan in the form and manner and by a deadline specified by CMS. The implementation plan must include the following:

- The categories of eligible beneficiaries for which the ACO plans to make Part B cost sharing support available.
- The categories of eligible Part B items and services for which the ACO plans to make Part B cost sharing support available.
- A description of how the ACO's planned Part B cost sharing support strategy meets at least one of the clinical goals in § 425.304(e)(4)(iii).
- The procedures the ACO will implement to ensure that ACO participants that have entered into a Part B cost sharing support arrangement with the ACO have access to the most current list of beneficiaries eligible to receive Part B cost sharing support.
- A requirement for the ACO to submit to CMS a complete and accurate list of ACO participants that have entered into a Part B cost sharing support arrangement according to paragraph (e)(5)(i) of this section.
- An attestation that, in any marketing or communications regarding the availability of Part B cost-sharing support, the ACO and its ACO participants will not represent such support as a substitute for supplemental insurance coverage or encourage beneficiaries to reduce or terminate such coverage. Of note, this requirement would not prohibit ACOs from communicating the availability of Part B cost-sharing support, provided such communication complies with this limitation and those outlined at § 425.310.
- Such other information as may be specified by CMS.

We intend this application process to ensure that ACOs have a fully developed strategy that complies with § 425.304(e) prior to implementing a strategy for reducing or eliminating Part B cost sharing support for eligible beneficiaries.

We proposed at § 425.304(e)(3)(ii) that CMS would evaluate an ACO's application to determine whether the ACO satisfies the requirements of § 425.304 and would approve or deny the application. CMS could reject the ACO's application to reduce or eliminate Part B cost sharing on the basis of one or more of the following:

- The ACO's and the ACO participant's history of noncompliance in the Shared Savings Program.

- The ACO's history of noncompliance in CMS Innovation Center ACO models.
- Whether the implementation plan complies with the requirements of § 425.304.
- Such other factors as we deem reasonable to protect the integrity of the Shared Savings Program, including concerns that the use of Part B cost sharing support may contribute to fraud, waste or abuse.

Part B cost sharing support can impact beneficiaries and ACO participants financially and therefore requires an ACO to maintain compliance with the requirements and guardrails laid out in this section to protect beneficiaries and ACO participants. We believe historical compliance with Shared Savings Program requirements and CMS Innovation Center model requirements is important for establishing experience that suggests the ACO is capable of providing Part B cost sharing support in alignment with program requirements. For example, if an ACO or an ACO participant has a history of noncompliance and we therefore issued pre-termination actions under § 425.216, we would want to review the facts of those actions to determine whether the ACO's application to provide Part B cost sharing support should be approved. Additionally, if CMS receives additional information through claims analysis or other avenues that suggest that particular usage patterns of the Part B cost sharing support may be contributing to fraud, waste or abuse, CMS may not accept an ACO's application that proposes similar strategies.

In the event that an ACO wants to make a change to its implementation plan, we proposed at § 425.304(e)(3)(iii) that the ACO must submit a description of the change to CMS in a form and manner and by a deadline or deadlines specified by CMS. CMS would evaluate the proposed change and either approve or reject it based on whether it complies with the factors outlined at proposed § 425.304(e)(3)(ii). CMS intends to provide further information regarding the process for updating the implementation plan through subregulatory guidance.

We sought comments on these proposals.

We received public comments on these proposals. The following is a summary of the comments we received and our responses.

Comment: Many commenters supported this proposal and thought that giving ACOs the ability to reduce or eliminate Part B cost sharing would reduce financial barriers, increase beneficiary access to care coordination services, and improve beneficiary care especially for beneficiaries facing chronic health conditions.

Response: We appreciate the supportive comments and agree that giving ACOs the ability to offer Part B cost sharing support will improve beneficiary care.

Comment: A commenter requested that CMS provide additional information regarding implementation of Part B cost sharing in ACO REACH, to help ACOs evaluate the potential financial and operational impact of participation.

Response: We appreciate the interest in the implementation of Part B cost sharing support in ACO REACH; however, this is outside the scope of this proposal. CMS has shared the available data through the ACO REACH evaluation reports available at the ACO REACH webpage.[365]

Comment: A few comments opposed this proposal because not all ACOs will have the same financial resources available to invest in Part B cost sharing support, which may result in unequal support for beneficiaries and may steer beneficiaries towards clinicians who are able to participate in cost sharing support. A comment recommended that CMS develop an incentive for smaller, independent and rural practitioners to assist them with offering Part B cost sharing support. Some comments also requested mechanisms for CMS to fund cost sharing support so the financial burden does not fall on ACOs and their ACO participants.

Response: We appreciate the comments expressing concerns regarding ACOs' ability to offer Part B cost sharing support. We understand that not all ACOs will have the ability to make the same investment in Part B cost sharing support. Participation in Part B cost sharing support is optional, and we hope that the significant flexibilities ACOs have in designing their Part B cost sharing support strategies will allow many ACOs to develop strategies that work for their ACOs. While we understand that not all ACOs will feel capable of offering Part B cost sharing support, we believe that it is important to increase the number of tools ACOs have available to improve beneficiary access to healthcare as a means of better coordinating beneficiaries' receipt of healthcare items and services and fostering high quality and efficient care. CMS will continue to monitor the impact of Part B cost sharing support in the program to understand if it significantly impacts beneficiary healthcare provider choice. At this time, CMS is not able to financially assist ACOs with funding for Part B cost sharing support but will continue to review the potential impacts of this flexibility to understand the impact on total cost of care for beneficiaries and potential future initiatives in this area.

Comment: Commenters requested CMS ensure that the program requirements do not become overly burdensome for ACOs. Another commenter requested additional application flexibility for ACOs, including the ability to apply multiple times throughout the performance year. A commenter noted they supported the policy but expressed concern about the burden of operationalizing it.

Response: We appreciate comments expressing concerns about administrative burden and intend to minimize burden where possible to help ensure that ACOs can focus on implementing Part B cost sharing support and better serving beneficiaries. To make Part B cost sharing support available earlier, we intend to offer a one-time, off-cycle application opportunity in 2027, rather than waiting until the annual application cycle for implementation in 2028 or later. While we recognize that multiple application opportunities would provide additional flexibility for ACOs, at this time, after the planned 2027 off-cycle application opportunity, we intend to use the regular application cycle and do not plan to offer multiple application opportunities each calendar year, as this would increase operational complexity and administrative burden for CMS. We will evaluate the experience and implementation of the Part B cost sharing option. We continue to be interested in receiving feedback on ways to reduce burden and may propose future adjustments to program requirements through rulemaking and provide additional subregulatory guidance once this flexibility is available to ACOs.

Comment: Several commenters requested that ACOs be offered additional flexibilities, like the post-discharge home visit waiver or care management home visit waiver, currently offered under the CMS Innovation Center ACO models, or the ability to offer an annual wellness visit once per performance year, instead of every 12 months. Commenters also requested that CMS remove cost sharing for a variety of services, including for APCM services. Commenters also requested a cost sharing waiver be

[365] *https://www.cms.gov/priorities/innovation/innovation-models/aco-reach.*

available to healthcare providers outside of the ACO for various services.

Response: We appreciate comments expressing interest in additional flexibilities for ACOs, including those flexibilities offered under ACO models offered by the CMS Innovation Center. These suggestions are beyond the scope of the Part B cost sharing support proposals we are finalizing in this final rule, however we are looking into additional flexibilities that could benefit ACOs, healthcare providers and beneficiaries. We hope to expand the options available to ACOs participating in the Shared Savings Program in future years.

After consideration of public comments, we are finalizing the eligibility, application, and implementation plan requirements for Part B cost sharing without modification as follows:

Section 425.304(e) establishes that ACOs, subject to certain conditions and safeguards, may apply for and if approved enter into Part B cost sharing support arrangements with ACO participants, under which the ACO participants reduce or eliminate cost sharing for those categories of eligible Part B items and services and eligible beneficiaries identified by the ACO. This cost sharing support could include both or either of Medicare FFS deductible and coinsurance amounts.

To allow ACOs to participate as quickly as possible, CMS will collect applications in early 2027 and approve participation by the second quarter of 2027, with a target date of April 1, 2027. This will allow ACOs to begin offering cost sharing support for services furnished on or after April 1, 2027. After the first application review period, CMS will conduct the application cycle for ACOs to reduce or eliminate Part B cost sharing as part of, and in conjunction with, the Shared Savings Program application process under § 425.202, with instructions and timelines published on the Shared Savings Program's website.[366] We will provide further information regarding the process, including the application format and specific requirements, such as the deadline for submitting applications, through subregulatory guidance. The Part B cost sharing support application review process will provide an ACO with feedback and an opportunity to clarify or revise its application. In conjunction with the application process laid out at § 425.202, ACOs will have their next opportunity (after the first application review period) to apply to provide beneficiaries with Part B cost sharing support in the summer of 2027 with an effective start date of January 1, 2028.

(b) Part B Cost Sharing Support Requirements

We proposed in § 425.304(e)(4) to specify the program requirements for reducing or eliminating Part B cost sharing. We intend our proposal to allow ACOs to reduce or eliminate Part B cost sharing to improve the quality and efficiency of items and services furnished to Medicare beneficiaries by giving ACOs additional tools to encourage beneficiaries to utilize high value care. We recognize that there are a multitude of strategies that could be successful when reducing or eliminating Part B cost sharing for beneficiaries, and these strategies will likely differ by ACO. Our goal with this proposal was to provide ACOs with significant flexibility to design a strategy that works for their organization while still maintaining safeguards for beneficiaries, healthcare providers, and CMS.

In § 425.304(e)(4)(i), we proposed the basic eligibility requirements for a beneficiary to receive Part B cost sharing support for a specific item or service. An eligible beneficiary must be an assignable beneficiary as defined at § 425.20 and must not have secondary insurance that covers the associated Part B cost sharing support obligation. Examples of secondary insurance could include a Medigap plan, Medicaid coverage, or other supplemental coverage through a beneficiary's employer or union. A beneficiary's eligibility may vary based on the item or service for which the ACO intends to reduce or eliminate cost sharing, based on their secondary insurance coverage. If a beneficiary's secondary insurance covers cost sharing support for some items and services but not all, ACOs may reduce or eliminate cost sharing support reductions for items and services that are not covered by the secondary insurance. This requirement would ensure the beneficiaries receive the benefits of reducing or eliminating cost sharing, and not insurers. To ensure that Part B cost sharing support is focused on improving the quality and efficiency of items and services beneficiaries receive, ACOs may only reduce or eliminate Part B cost sharing for beneficiaries whose overall health is expected to be improved or maintained by receiving the associated Part B item or service. This requirement is in place to reiterate that ACOs and ACO participants may not reduce or eliminate Part B cost sharing simply to increase reimbursements to healthcare providers through the provision of unnecessary items and services to beneficiaries.

Proposed § 425.304(e)(4)(ii) would allow ACOs to reduce or eliminate beneficiary cost sharing for all Medicare FFS Part B items and services except durable medical equipment, prosthetics, orthotics, supplies, and prescription drugs. We believe these excluded items have a higher risk potential for fraud, waste and abuse related to reducing or eliminating cost sharing, and this proposed policy aligns with the excluded items in the ACO REACH model. We intend to continue monitoring potential high-risk items and services and may add or remove items and services from this list in future years through notice and comment rulemaking.

While ACOs would have significant flexibility to determine the groups of beneficiaries and items and services for which they intend to reduce or eliminate Part B cost sharing, we proposed in § 425.304(e)(4)(iii) that an ACO's Part B cost sharing support must meet one or more of the following clinical goals for each beneficiary:

- Adherence to a treatment regime.
- Adherence to a drug regime.
- Adherence to a follow-up care plan.
- Management of a chronic disease or condition.

This is intended to focus ACO use of cost sharing support on goals that will improve or maintain the overall health of eligible beneficiaries. While ACOs would have substantial flexibility to design their strategy for reducing or eliminating Part B cost sharing, CMS believes it is important that these strategies focus on a clear theory of action for meeting certain clinical goals.

Additionally, we sought comment on whether CMS should make information regarding beneficiaries' supplemental health insurance coverage available to ACOs to assist them with determining beneficiary eligibility for and implementing Part B costs sharing support in accordance with the proposed requirements discussed previously in this section. We also sought comment on the specific data elements ACOs would need for this purpose, how frequently such information should be provided and any appropriate limitations or safeguards governing its use.

CMS currently shares certain beneficiary-identifiable data with ACOs under our regulations at 42 CFR part 425, subpart H. We believe the disclosure of this additional information would be consistent with our existing data sharing framework, which is based

[366] *https://www.cms.gov/medicare/payment/fee-for-service-providers/shared-savings-program-ssp-acos.*

on HIPAA Privacy Rule provisions governing disclosures for ''health care operations'' provided the relevant regulatory conditions are satisfied. Under 45 CFR 164.506(c)(4), a covered entity may disclose protected health information to another covered entity for the recipient's health care operations when each entity has or had a relationship with the individual who is the subject of the information, the information pertains to that relationship, and the disclosure is for a health care operations activity described in paragraphs (1) or (2) of the definition of ''health care operations'' at 45 CFR 164.501. Those activities include quality assessment and improvement activities, population-based activities relating to improving health or reducing healthcare costs, and evaluating healthcare provider performance. CMS will offer only the information reasonably necessary to support implementation of Part B cost-sharing support and would establish appropriate limitations and safeguards governing its use and redisclosure.

We sought comment on whether supplemental coverage information would help enable ACOs to administer Part B cost-sharing support effectively; the particular data elements, level of detail and frequency of updates needed; and whether additional data would be necessary for ACOs to operationalize this flexibility. After consideration of comments on this topic, CMS may finalize policy to share supplemental coverage information with ACOs.

We proposed to add § 425.304(e)(4), to establish standards for the implementation of Part B cost sharing support. We sought comments on these proposals.

We received public comments on these proposals. The following is a summary of the comments we received and our responses.

Comment: Some commenters requested that CMS allow eligibility for Part B cost sharing support for a variety of specific beneficiaries and services, including offering cost sharing support to beneficiaries not assigned to an ACO, beneficiaries receiving services through community health centers or Federally Qualified Health Centers (FQHCs), beneficiaries experiencing financial hardship, beneficiaries with supplemental coverage, offering it for durable medical equipment, prosthetics, orthotics, supplies, prescription drugs, behavioral health, remote monitoring services, care coordination services, behavioral health integration services, collaborative care model services, care related to opioid use disorder, advanced primary care management, transitional care management, advance care planning services, and principal illness navigation.

Response: We appreciate comments expressing interest in offering Part B cost sharing support for a wide range of beneficiaries and services. We have attempted to provide significant flexibility to ACOs in designing their plans to implement Part B cost sharing support. In order to be eligible for Part B cost sharing, beneficiaries must be either assigned or assignable, depending on the ACO's selection of assignment methodology, must not have secondary insurance that covers the associated Part B cost sharing obligation, and their overall health must be expected to be improved or maintained by receiving the associated Part B item or service. Assuming they meet other requirements, beneficiaries experiencing financial hardship or receiving services through community health centers or FQHCs on the list of ACO participants that have entered into a Part B cost sharing support arrangement will be eligible to receive cost sharing support. While FQHC and community health centers bill institutional claims, they are ultimately paid through the Part B Trust Fund and are eligible to reduce or eliminate Part B cost sharing for beneficiaries if they are participating in a Shared Savings Program ACO. Additionally, beneficiaries with supplemental coverage may also be eligible for cost sharing support if their supplemental insurance does not cover cost sharing for the specific service for which an ACO offers cost sharing support. CMS will not permit ACOs to cover cost sharing for a service when a beneficiary has supplemental insurance that will also cover cost sharing for that service, as none of the financial benefit would reach the beneficiary in that situation.

In terms of covered services, ACOs are permitted to provide Part B cost sharing support for all Part B items and services except durable medical equipment, prosthetics, orthotics, supplies and prescription drugs. This includes most of the items and services commenters requested, including care coordination, behavioral health and remote monitoring services. We appreciate concerns regarding the exclusion of durable medical equipment, prosthetics, orthotics, supplies and prescription drugs, and understands many beneficiaries may face challenges with cost sharing related to these items and services. To protect program integrity and consistent with how the cost sharing waiver was implemented in the CMS Innovation Center's ACO models, we do not believe they are appropriate to include at this time. We also do not believe it is appropriate to include beneficiaries who are not assigned or assignable to the ACO as the ACOs are not at least potentially financially accountable for these beneficiaries, which generates additional financial risk to CMS if a beneficiary is encouraged to receive unnecessary services when cost sharing is reduced. CMS will continue to review the exclusion of these items and services and may propose to add or remove items and services from the exclusion list through notice and comment rulemaking in future years.

Comment: Some commenters requested that CMS require or encourage ACOs to explain how they will focus on beneficiaries with cost-related barriers to care, keep eligibility information current, avoid burdensome processes for beneficiaries to receive cost sharing support, avoid restrictions on care, offer accessible information, provide prompt assistance, and connect beneficiaries to additional financial resources.

Response: We appreciate comments expressing interest in implementation requirements for Part B cost sharing support. At this time, ACOs will need to include the information detailed in new § 425.304(e)(3)(i) in their implementation plan. This includes information regarding the beneficiaries and items and services the ACOs identify for Part B cost sharing support; information on how the ACO intends to meet advance beneficiary adherence to a treatment regime, drug regime, follow-up care plan or management of a chronic disease or condition; and information on how the ACO will ensure ACO participants have access to the most current list of eligible beneficiaries, among other requirements. While many of the additional requirements noted by the commenters are worthy goals, and in some cases already required or incentivized by the Shared Savings Program, including requirements to promote patient engagement and coordinate care, CMS declines to add additional implementation requirements to Part B cost sharing support at this time. ACOs are expending their own resources to implement Part B cost sharing support, and we decline at this time to add additional requirements that could increase administrative burden and discourage ACO participation. We will continue to monitor the implementation of Part B cost sharing support to determine if additional requirements are appropriate to add in the future.

Comment: A commenter suggested that CMS allow two-sided ACOs to use reductions in beneficiaries' Part B coinsurance and deductible costs as a managed care tool to reward beneficiaries for receiving their care at preferred healthcare providers selected by the ACO. The commenter also suggested allowing two-sided ACOs to provide Part B premium rebates and supplemental services (for example, non-medical emergency transportation, nutrition, vision, hearing, and dental services) to beneficiaries in the future.

Response: We appreciate these suggestions, however, we believe it is important that Part B cost sharing support be focused on removing financial barriers to improve beneficiary health. While many beneficiaries may find value in seeing ACO participants who offer cost sharing support and continue to see those healthcare providers, the purpose of the Part B cost sharing support must be to meet one or more of the following clinical goals: adherence to a treatment regime, adherence to a drug regime, adherence to a follow-up care plan, or management of a chronic disease or condition. It must not be intended to reward beneficiaries for seeing specific healthcare providers. ACOs are already permitted to provide in-kind services to beneficiaries if they comply with the requirements in § 425.304(b); these must also not be distributed as a reward for seeing specific healthcare providers. We will continue to review additional flexibilities to extend to ACOs and appreciate the feedback regarding the ability to offer Part B premium rebates.

Comment: A commenter requested CMS ensure that the cost sharing arrangements do not create incentives for beneficiaries to drop supplemental coverage, as they may not be able to obtain comparable coverage later.

Response: We appreciate this concern and agree that the potential for Part B cost sharing support from ACOs is not a replacement for supplemental coverage. For ACOs that offer the cost sharing reduction option, ACOs will be required to attest that, in any marketing or communications regarding the availability of Part B cost-sharing support, the ACO and its ACO participants will not be allowed to represent such support as a substitute for supplemental insurance coverage or encourage beneficiaries to reduce or terminate such coverage as outlined in § 425.304(e)(3)(i)(F).

Comment: A commenter requested that CMS provide ACOs with a list of beneficiaries by attributed physician who are eligible for cost sharing support. Commenters also requested data on beneficiary secondary insurance coverage.

Response: We appreciate the interest in data to support ACOs in implementing Part B cost sharing support. In terms of helping ACOs to identify beneficiaries who could potentially be eligible for the Part B cost sharing support, we already distribute a list of assigned or assignable beneficiaries to all ACOs, depending on their selection of assignment methodology, prior to the start of each performance year and on a quarterly basis. The Shared Savings Program primarily attributes beneficiaries based on where they receive the plurality of their primary care, when considering the ACO participants as a group, and does not assign beneficiaries through individual clinicians outside of the voluntary alignment process. However, in assignment list reports, CMS identifies the three NPIs which provided the most primary care services to beneficiaries during the 12 month assignment window. Additionally, CMS makes available to ACOs claims data that would allow ACOs to identify the healthcare provider or providers where the beneficiaries receive the majority of their care, which could assist ACOs in identifying where eligible beneficiaries are likely to receive eligible services. Leveraging the quarterly assignment list report information, we are also working towards sharing additional data on beneficiary secondary insurance coverage with ACOs who are approved to offer Part B cost sharing support and will share additional information via subregulatory guidance.

Comment: A commenter raised concerns that the restriction limiting cost-sharing support to beneficiaries ''whose overall health is expected to be improved or maintained by receiving the associated Part B item or service'' may make such relief inaccessible to those who need it. The commenter stated that this restriction could be interpreted in various ways by ACOs and applied unfairly to exclude some patients, citing as an example that individuals may benefit from a service or item that is diagnostic or alleviates pain or enhances well-being, even if it is uncertain whether it will improve or maintain their health.

Response: We appreciate the concern. CMS interprets improving or maintaining a beneficiary's overall health broadly in the context of § 425.304(e)(4)(i)(C), and services that are diagnostic or improve quality of life would qualify. Each ACO will develop their own implementation plan as their resources permit that also meets some of the needs of their beneficiary population. Once these plans are submitted to CMS with the application, we will be able to review and provide determinations on individual scenarios.

Comment: A commenter asked CMS to clarify that the Part B cost-sharing elimination and reduction cannot directly be used to pay beneficiaries for achieving certain health outcomes or behaviors.

Response: We appreciate this request and are making clear that the purpose of the Part B cost sharing support must not be to reward beneficiaries for achieving certain health outcomes or behaviors. It must be used to advance at least one of the following clinical goals: adherence to a treatment regime, drug regime or follow-up care plan or management of a chronic disease or condition, and must only be offered for services expected to improve or maintain a beneficiary's overall health.

Comment: A commenter requested that as CMS expands options for covering beneficiary cost sharing, that CMS explore options to mitigate the negative effects of the ''lesser of'' policy and prohibit ACO participants from using Medicaid enrollment information shared for purposes of cost-sharing coverage to discriminate against dually eligible individuals.

Response: We believe this commenter is partially referencing policies that allow state Medicaid programs to pay healthcare providers less than the full Medicare cost-sharing amount if the Medicare payment rate for the service exceeds the Medicaid state plan rate for the service. Healthcare providers are prohibited from billing beneficiaries for the difference in these reimbursement rates. We appreciate the concern, however Medicaid reimbursement of cost-sharing amounts is outside the scope of this proposal. Regarding the concern about discrimination against dually eligible individuals, many beneficiaries with Medicaid coverage do not have to pay cost sharing for many Part B items and services because Medicaid covers the cost sharing amount, and it would be inappropriate to offer to cost sharing support to a beneficiary who does not pay cost sharing. Some beneficiaries with Medicaid coverage may have some cost sharing obligation for Medicare Part B items and services, so ACOs would be permitted to cover any cost sharing obligation for cost sharing not covered by Medicaid.

After considering public comments, we are finalizing this policy as proposed. Specifically, we are establishing § 425.304(e)(4), which details Part B cost sharing support requirements establishing beneficiary

eligibility requirements and prohibiting providing cost sharing support for DMEPOS and prescription drugs, as well as establishing that cost sharing support must be used to advance at least one of the following clinical goals, adherence to a treatment regime, drug regime or follow-up care plan or management of a chronic disease or condition, and must only be offered for services expected to improve or maintain a beneficiary's overall health.

(c) Part B Cost Sharing Support Arrangements

When an ACO chooses to reduce or eliminate Part B cost sharing, it must partner with ACO participants to implement this reduction or elimination of cost sharing for beneficiaries. In practice, the ACO would reduce or eliminate the cost sharing for an eligible beneficiary in partnership with the ACO participant, which would not collect cost sharing amounts (in whole or in part) from eligible beneficiaries for certain eligible Part B items and services. As this may have significant financial implications for practitioners, ACOs may only establish Part B cost sharing support arrangements with their ACO participants on a voluntary basis, as described later is this section. ACOs must also communicate the relevant implementation information, including how ACO participants will be reimbursed for reduced or waived Part B cost sharing, prior to ACO participants agreeing to participate. In § 425.304(e)(5)(i), we proposed that ACOs must have a written agreement with each ACO participant that has agreed to reduce or eliminate Part B cost sharing for eligible beneficiaries under a Part B cost sharing support arrangement with the ACO. The terms of the cost sharing support agreement must include all of the following:

- The categories of eligible beneficiaries and eligible Part B items and services for which the ACO participant may reduce or eliminate cost sharing.
- A requirement that the ACO participant reduce or eliminate cost sharing in accordance with the ACO's approved implementation plan.
- The amount and frequency with which the ACO will reimburse the ACO participant for the cost sharing amounts not collected.
- A requirement for ACO participants to maintain copies of records that identify each beneficiary who received a reduction or elimination of Part B cost sharing, the type and date of service for which cost sharing support was provided, and the dollar amount of the cost sharing support.
- The ability for the ACO or ACO participant to terminate the Part B cost sharing support agreement if the ACO or ACO participant fails to comply with the requirements of this section.
- A requirement that the ACO or ACO participants will not market to beneficiaries the availability of the Part B cost sharing support as a substitute for their supplemental insurance coverage.

All cost sharing support provided to beneficiaries must be provided in accordance with the ACO's implementation plan and the cost sharing support agreement between the ACO and ACO participant. We proposed in § 425.304(e)(5)(ii)(A) and (B) that an ACO participant cannot be required by an ACO to participate in an ACO's Part B cost sharing support arrangement and, an ACO can participate in Part B cost sharing support, under an approved implementation plan, even if not all of its ACO participants agree to participate. While we believe reducing or eliminating Part B cost sharing is an important tool to offer ACOs, ACOs must not pressure their ACO participants into providing Part B cost sharing support. ACOs would be required to permit ACO participants to choose whether they wish to participate. CMS expects that some ACO participants would decide not to participate and that ACOs would be able to implement a reduction or elimination of Part B cost sharing for eligible beneficiaries if only a portion of their ACO participants were to opt in.

Additionally, to avoid inappropriate conflicts of interest, we proposed in § 425.304(e)(5)(iii) that the ACO would be required to finance all payments made to ACO participants under the cost sharing support agreements from the ACO's own funds. For example, ACOs may not partner with local businesses outside the ACO to fund cost sharing reimbursements to healthcare providers.

We proposed to add § 425.304(e)(5) to establish the standards discussed previously in this section for the cost sharing support agreements ACOs must develop for ACO participants that choose to reduce or eliminate Part B cost sharing. We sought comments on these proposals.

We received public comments on these proposals. The following is a summary of the comments we received and our responses.

Comment: Rather than requiring the ACO to fund or reimburse waived cost-sharing amounts, a commenter recommended that CMS allow flexibility for the individual ACO participants to determine whether to reduce or eliminate Part B coinsurance for care management services, citing variation in patient populations, financial resources, and operational structures across ACO participants.

Response: We believe this comment indicates a potential misunderstanding of the proposal. Participation in Part B cost sharing support is voluntary at the ACO level; an ACO must affirmatively apply and be approved by CMS to offer Part B cost sharing support. Nothing mandates that an ACO adopt Part B cost sharing support. ACO participant-level participation is also voluntary—proposed § 425.304(e)(5)(ii)(A) explicitly states an ACO participant cannot be required by the ACO to participate in a cost sharing support arrangement, and proposed § 425.304(e)(5)(ii)(B) states the ACO can participate with only some ACO participants opting in. We anticipate ACOs and ACO participants would strategize together to develop the Implementation Plan in order to discuss and plan for the unique variations in patient populations. This commenter's requested ''flexibility'' appears to be consistent with what CMS proposed.

Comment: Some commenters supported the ability of ACOs to reduce or eliminate cost sharing but believed healthcare providers, including safety-net providers like FQHCs or Registered Nurses, should not experience a reduction in compensation.

Response: We appreciate these concerns, but we believe it is important to give ACOs and ACO participants flexibility to negotiate their own cost-sharing reimbursement arrangements. Participation in Part B cost sharing support is voluntary for both ACOs and individual ACO participants, so if the ACO and ACO participant cannot agree on an appropriate reimbursement arrangement, the ACO participant can choose not to participate and continue to receive full cost sharing from beneficiaries.

Comment: A commenter suggested that CMS allow Medicare Bad Debt Claims for Part B cost sharing amounts that are not reimbursed to ACO participants in accordance with the Cost Sharing Support Arrangements.

Response: We appreciate this suggestion, however, Medicare bad debts are derived from unpaid coinsurance and deductible amounts for covered services and are only allowable when the criteria at 42 CFR 413.89 are met. A breach in the Part B Cost Sharing Support Arrangement between the ACO and ACO participant would not qualify as allowable Medicare bad debts. Additionally, the ACO participant should not revert to billing a beneficiary who was offered cost-sharing support if

an ACO fails to reimburse the ACO participant under the Part B Cost Sharing Support Arrangement.

After consideration of public comments, we are finalizing this policy as proposed. Specifically, we are finalizing § 425.304(e)(5), which details the required elements of the Part B cost sharing support arrangements ACOs must establish between the ACO and their ACO participants.

(d) Record Retention

To maintain the ability for CMS to monitor the implementation of the reduction or elimination of Part B cost sharing and resolve any identified compliance issues, we proposed to require that ACOs must keep detailed records on the reduction or elimination of Part B cost sharing for beneficiaries. We proposed in § 425.304(e)(6)(i) that the ACO must maintain copies of the written Part B cost sharing support agreements with ACO participants, as well as the following records.

- Records that identify each beneficiary who received a reduction or elimination of Part B cost sharing.
- Records that document the type and date of the Part B item or service for which Part B cost sharing was reduced or eliminated.
- Records that document the dollar amount of Part B cost sharing that was reduced or eliminated; and
- Records that document the ACO participant that furnished the item or service for which cost sharing support was reduced or eliminated.

Additionally, we proposed at § 425.304(e)(6)(ii) that the ACO must provide the records specified in paragraph (e)(6)(i) upon CMS' request. For example, CMS may request these records if disputes arise that are elevated to CMS or if CMS has any reason to believe there may be non-compliance with a cost sharing support requirement. We may also conduct periodic audits to ensure compliance with this requirement.

We proposed to add § 425.304(e)(6) to establish the standards discussed previously in this section for the record retention related to the reduction or elimination of Part B cost sharing. We sought comments on these proposals.

We received public comments on these proposals. The following is a summary of the comments we received and our responses.

Comment: Commenters requested public reporting of the use of Part B cost sharing support, including that ACOs be required to publicly report their cost sharing strategies and that CMS report on its use. Commenters also suggested CMS evaluate uptake and outcomes of the cost sharing support.

Response: We appreciate comments expressing interest in public reporting on the use of Part B cost sharing support. We are still considering how to balance minimizing burden for ACOs and ACO participants and the transparency value that public reporting requirements provides. While we are not currently planning to require ACOs to publicly report their use of Part B cost sharing support, primarily because they are using their own resources to support beneficiaries, we may consider for future rulemaking whether to propose to revise these requirements. We will continue to internally evaluate the uptake and outcomes of this flexibility.

After consideration of public comments, we are finalizing this policy as proposed. Specifically, we are adding § 425.304(e)(6) to mandate that the ACO maintain copies of the written Part B cost sharing support agreement with ACO participants, as well as records documenting specific details about the beneficiaries and the items and services which received cost sharing support.

(e) Addressing Compliance Problems

To protect both beneficiaries and healthcare providers, CMS proposes in § 425.304(e)(7) that at any time, CMS may suspend or prohibit the ACO or any ACO participant from participating in a Part B cost sharing support arrangement if CMS determines that the ACO or ACO participant has failed to comply with any of the requirements of Part 425. This suspension or prohibition will be effective, in CMS's discretion, regardless of whether the ACO has corrected or otherwise resolved the noncompliance.

We proposed to add § 425.304(e)(7) to establish the standards discussed previously in this section for compliance and enforcement policies related to the reduction or elimination of Part B cost sharing. We sought comments on these proposals.

We did not receive public comments on this provision, and therefore, we are finalizing it as proposed.

(f) OIG Safe Harbor Authority

In section III.G.6.a.(2)(f) of the CY 2027 PFS proposed rule, starting at 91 FR 44118, we stated that should the proposed policies be finalized, we expect to make a determination that the Federal anti-kickback statute safe harbor for CMS-sponsored model arrangements and CMS-sponsored model patient incentives (§§ 1001.952(ii)(1) and (2) of this title) is available to protect remuneration exchanged under certain financial arrangements and patient incentives that may be permitted under the final rule. Specifically, we stated that we expect to determine that the CMS-sponsored models safe harbor would be available to protect the following: remuneration exchanged under Part B cost sharing support arrangements between the ACO and ACO participant and patient incentives in the form of Part B cost sharing support furnished to eligible beneficiaries.

We proposed to add new § 425.304(e)(2) that notes that CMS has determined that the Federal anti-kickback statute safe harbor for CMS-sponsored model arrangements and CMS-sponsored model patient incentives (§§ 1001.952(ii)(1) and (2) of this title) is available to protect remuneration exchanged under Part B cost sharing support arrangements between ACOs and ACO participants, and patient incentives in the form of Part B cost sharing support furnished to eligible beneficiaries under the Shared Savings Program that meet all of the requirements of this section and the anti-kickback statute safe harbor requirements set forth at § 1001.952(ii) of this title.

We sought comments on this proposal to allow ACOs to reduce or eliminate Part B cost sharing beginning in 2027, with a target date of April 1, noting that the application process for this first performance year will occur during early 2027.

We received public comments on these proposals. The following is a summary of the comments we received and our responses.

Comment: A commenter requested clarity on how the anti-kickback safe harbor and physician self-referral law (commonly referred to as the ''Stark Law'') apply to this proposal.

Response: CMS has determined that the Federal anti-kickback statute safe harbor for CMS-sponsored model arrangements and CMS-sponsored model patient incentives (§ 1001.952(ii)(1) and (2) of this title) is available to protect remuneration exchanged under Part B cost sharing support arrangements between ACOs and ACO participants, and patient incentives in the form of Part B cost sharing support furnished to eligible beneficiaries under the Shared Savings Program that meet all of the requirements of this section and the anti-kickback statute safe harbor requirements set forth at § 1001.952(ii) of this title.

Shared Savings Program that meet all of the requirements of this section and the anti-kickback statute safe harbor requirements set forth at § 1001.952(ii) of this title.

Section 1877 of the Act, also known as the physician self-referral law: (1) prohibits a physician from making referrals for certain designated health services payable by Medicare to an entity with which he or she (or an immediate family member) has a financial relationship, unless the requirements of an applicable exception are satisfied; and (2) prohibits the entity from filing claims with Medicare (or billing another individual, entity, or third-party payor) for any improperly referred designated health services. Exceptions to the physician self-referral law are codified at 42 CFR part 411, subpart J.[367] In addition, for ACOs participating in the Shared Savings Program, the Office of the Inspector General and CMS jointly published Medicare program waivers for participating ACOs.[368] Additional information regarding the physician self-referral law is available on the CMS website.[369]

After consideration of public comments, we are finalizing this policy as proposed. Specifically, we are adding new § 425.304(e)(2) that notes that CMS has determined that the Federal anti-kickback statute safe harbor for CMS-sponsored model arrangements and CMS-sponsored model patient incentives (§§ 1001.952(ii)(1) and (2) of this title) is available to protect remuneration exchanged under Part B cost sharing support arrangements between ACOs and ACO participants, and patient incentives in the form of Part B cost sharing support furnished to eligible beneficiaries under the Shared Savings Program that meet all of the requirements of this section and the anti-kickback statute safe harbor requirements set forth at § 1001.952(ii) of this title.

b. Proposal To Discontinue Availability of the Option for Prepaid Shared Savings

(1) Background

In the CY 2025 PFS final rule (89 FR 97710), CMS finalized prepaid shared savings, a payment option for ACOs that meet the eligibility criteria under § 425.640 (89 FR 98134). This new payment option provides prepaid shared savings to ACOs with a history of earning shared savings while participating in the Shared Savings Program (89 FR 98134). These payments would be distributed on a quarterly basis and would be recouped from shared savings CMS determines the ACO to have earned during the annual financial reconciliation cycle (89 FR 98134). Prepaid shared savings are the advanced payment of shared savings that are expected to be earned by the ACO and are covered under the Shared Savings Distribution Waiver (89 FR 98134 referencing 80 FR 66726).

In the CY 2025 PFS final rule, certain policies, including both existing policies and new policies adopted in the final rule, relied upon the authority granted in section 1899(i)(3) of the Act to use other payment models that the Secretary determined would improve the quality and efficiency of items and services furnished under the Medicare program, and that would not result in program expenditures greater than those that would result under the statutory payment model (89 FR 98085). This included allowing eligible ACOs to receive prepaid shared savings, as described in the final rule (89 FR 98085). Such a change to our payment methodology for prepaid shared savings was expected to improve the quality and efficiency of care and was not expected to result in a situation in which the payment methodology resulted in more spending under the program than would have resulted under the statutory payment methodology in section 1899(d) of the Act (89 FR 98085). As described in the Regulatory Impact Analysis in the CY 2025 PFS final rule, the impact of prepaid shared savings alone was projected to be nominal. Both at the mean and at the 90th percentile the projected net impacts on Medicare spending rounded to zero (89 FR 98526). We noted at the time that there was a high degree of uncertainty regarding whether (a) a meaningful number of ACOs would choose this option given the requirements for how prepayments must be spent, and (b) the potential impact (if any) that participation in this option would have on the cost of care (89 FR 98525).

Uptake of this payment option has been very low. Only four ACOs participated in prepaid shared savings in 2026, the first year the payment option was available. This is likely due to a number of factors, many of which were raised by commenters during CY 2025 PFS rulemaking (89 FR 98136).

As part of the prepaid shared savings option under § 425.640(e)(1)(ii), ACOs participating in prepaid shared savings must spend at least 50 percent of prepaid shared savings on direct beneficiary services in each performance year. These include, but are not limited to: cost-sharing support for Part B beneficiaries; certain vision, hearing and dental services; beneficiary meals; nutrition support; tenancy support and sustaining services, housing assistance, utility support, caregiver support services; services to address social isolation, home visits; and transportation services.[370] Under § 425.640(e)(1)(i), ACOs may also elect to spend up to 50 percent of their prepaid shared savings on staffing (for example, hiring physicians or mid-level healthcare providers or staff education) and healthcare infrastructure investments (for example, improving practice management or electronic health record systems) in each performance year. ACOs participating in prepaid shared savings are prohibited from using prepaid shared savings for any expense other than those allowed under § 425.640(e)(1), including but not limited to the following: management company or parent company profit; performance bonuses; provision of medical services covered by Medicare; cash or cash equivalent payments to patients; and items or activities unrelated to ACO management and operations of an ACO or beneficiary care (§ 425.640(e)(2)). In the CY 2025 PFS final rule (89 FR 98141), we stated that the prepaid shared savings policy was developed to improve the quality and efficiency of items and services furnished to Medicare beneficiaries. We explained that the requirement that ACOs spend at least 50 percent of their prepaid shared savings on direct beneficiary services is important for meeting those goals. Direct beneficiary services like vision, hearing and dental, and other services that are evidence-based and medically appropriate for the beneficiary based on clinical risk factors, have the potential to improve beneficiary health outcomes, reduce costs, and improve beneficiary engagement and willingness to receive care from a healthcare provider affiliated with an ACO. We believed financially successful ACOs are likely to have already made significant investments in staffing and healthcare infrastructure, as they are necessary for the functioning of an ACO. We also noted the restriction on using prepaid shared savings for expenses like healthcare provider bonuses is important for ensuring that prepaid shared savings are used for expenses that directly improve beneficiary care (89 FR 98141).

Additionally, to monitor compliance with ACO use of the prepaid shared

savings, CMS requires ACOs to submit an annual spend plan under § 425.640(d) detailing their planned use of prepaid shared savings to CMS as well as publicly report the total amount of prepaid shared savings received, investments made, beneficiary groups served, changes to ACO's spend plan, and an itemization of how prepaid shared savings were spent during the performance year (§ 425.308(b)(10) and § 425.640(i)). In the CY 2025 PFS final rule (89 FR 98138), we noted that we understood that submitting a detailed spend plan on the use of prepaid shared savings requires administrative work for participating ACOs. However, detailed spend plans which include information on (1) direct beneficiary services that would be provided to ACO beneficiaries; and (2) investments that would be made in the ACO with prepaid shared savings are important for monitoring that ACOs use prepaid shared savings consistent with the requirements for use and management of prepaid shared savings under § 425.640(e) (89 FR 98138). CMS expressed that it was particularly important for us to ensure ACOs use prepaid shared savings consistent with those use and management requirements because prepaid shared savings are advances of shared savings to ACOs prior to ACOs actually earning the shared savings, and must be focused on improving beneficiary outcomes and quality of care, reducing costs, improving ACO efficiency, and improving beneficiary engagement and willingness to receive care from a healthcare provider affiliated with an ACO. Those requirements also promote transparency in how ACOs are using prepaid shared savings. That transparency improves the coordination and quality of care provided by participating ACOs by facilitating their efforts to share information with each other, CMS, and the public about how they effectively used prepaid shared savings to improve the quality and efficiency of the care they provided to their beneficiaries (89 FR 98138).

In the CY 2025 PFS final rule (89 FR 98141), commenters noted that the restrictions on use of prepaid shared savings and the amount of documentation required would create significant administrative burden beyond what is already required by the Shared Savings Program. Many commenters asserted that the restrictions on the use of prepaid shared savings are unnecessary and likely to negatively impact ACO participation in prepaid shared savings (89 FR 98141). Most of the commenters disagreed with the requirement that ACOs spend at least 50 percent of prepaid shared savings on direct beneficiary services (89 FR 98141). They also commented that providing written spend plans would generate additional burden for ACOs (89 FR 98138). CMS acknowledged commenter concerns but implemented the policy largely as proposed. CMS subsequently heard similar feedback from ACOs during the first application period for prepaid shared savings, PY 2026, including that the requirement to spend at least 50 percent of prepaid shared savings on direct beneficiary services is unrealistic as there is a lack of evidence that services identified as ''direct beneficiary services'' generates sufficient return on investment for ACOs.

We continue to believe that these guardrails on the use and reporting of prepaid shared savings are important for ensuring ACOs direct these funds in a way that improves the quality and efficiency of items and services furnished to Medicare beneficiaries; however, we believe that commenters were also correct that these guardrails significantly limited participation. In CY 2025 PFS final rule (89 FR 98141), CMS anticipated that the restrictions in prepaid shared savings could reduce the number of ACOs that ultimately decide to participate in prepaid shared savings. During the PY 2026 application cycle, 23 ACOs submitted an application for prepaid shared savings and only 4 were ultimately approved to participate. The majority of applicants withdrew from consideration or were denied participation due to deficiencies with their applications. Examples of the deficiencies included submitted spend plans that did not align with the requirement that 50 percent of the funding be spent on direct beneficiary services. We believe the low participation rate reflects the administrative burden and limited financial incentive of the prepaid shared savings option for ACOs. At this time, we believe we can achieve similar outcomes with less burden and less financial risk to CMS through an alternative approach that offers ACOs the ability to reduce or eliminate Part B cost sharing as described in section III.G.6.a. of this final rule, as ACOs are already permitted to use their earned shared savings to invest in staffing and healthcare infrastructure.

(2) Revisions

Based on our experience with the prepaid shared savings option to date, we proposed to remove the prepaid shared savings option from the Medicare Shared Savings Program. Although our prior analysis assumed up to 30 ACOs per year might elect the option,[371] actual uptake has been significantly lower with only four ACOs currently participating.

We believe this limited uptake constrains the option's ability to meaningfully advance the goals for which it was established, including improving beneficiary engagement and outcomes and reducing unnecessary expenditures. At the same time, maintaining the option requires CMS to maintain annual application cycles for the prepaid shared savings option, monitor ACO participation under prepaid shared savings, distribute payments, and assume the risk of unpaid debt.

Furthermore, based on early experience with the program with few ACOs opting to participate and feedback from eligible ACOs, we anticipate that participation in the prepaid shared savings option as currently written is likely to remain limited, as we do not believe we can resolve the ACOs' concerns with the payment option while meeting the option's original goals and safeguards. For example, the requirement that ACOs spend at least 50 percent of the funding on direct beneficiary services is necessary for impacting beneficiary health outcomes and reducing costs. Similarly, spend plan requirements are necessary for monitoring and transparency purposes. Removing or substantially weakening these requirements would materially change the purpose and expected effects of the option. Given the very limited participation to date as well as limited anticipated future participation, we do not believe continuing to maintain this option is an effective and efficient use of CMS program resources.

As such, we proposed to sunset the prepaid shared savings option over the course of currently participating ACOs' agreement periods.

We proposed to revise § 425.640(b) to end ACO eligibility for prepaid shared savings beginning on January 1, 2027. Section 425.640(b)(1)(i) will be revised to read, the ACO is a renewing ACO as defined under § 425.20 entering an agreement period beginning on January 1, 2026 or January 1, 2027. We proposed to accept one final cohort of ACOs during the PY 2027 application cycle but will no longer accept applications for this prepaid shared savings payment option after this year. We proposed to revise § 425.640(c)(1) to read, ''For an ACO renewing to enter into an agreement period beginning on January 1, 2026 or January 1, 2027, to obtain a

[371] 89 FR 98525.

determination regarding whether the ACO may receive prepaid shared savings, the ACO must submit a complete supplemental application with its application to renew for a new agreement period in the Shared Savings Program (submitted under § 425.224) in the form and manner and by a deadline specified by CMS.''

Additionally, we proposed to revise § 425.640(f)(1) to no longer distribute prepaid shared savings to ACOs after December 31, 2027. Section 425.640(f)(1)(i) will be revised to state, ''An eligible ACO entering an agreement period beginning on January 1, 2026, or January 1, 2027 will receive quarterly prepaid shared savings payments through December 31, 2027, unless the payment is withheld or terminated under paragraph (h) of this section.'' A similar change will be made to § 425.640(f)(1)(ii), which will be revised to read, ''An eligible ACO participating in an agreement period beginning on January 1, 2025, will receive quarterly prepaid shared savings payments starting with the performance year beginning on January 1, 2026, through December 31, 2027, unless the payment is withheld or terminated under paragraph (h) of this section. The ACO will not receive additional or catch-up payments for performance year 2025.'' Currently participating ACOs who receive payments for 2026 and 2027 will not receive prepaid shared savings payments beginning in 2028. Any ACO who begins participating in 2027 will receive one year of payments in 2027 and will not receive payments beginning in 2028. We intend to provide further information regarding the timing of final quarterly payments through subregulatory guidance.

We did not anticipate significant disruption among ACOs participating in the option or their beneficiaries due to (1) the low number of participants, (2) the ample notice we proposed giving ACOs to plan for the sunsetting of the prepaid shared savings option and (3) the ability of ACOs to continue to provide any ''direct beneficiary services'' through their earned shared savings. With the exception of beneficiary cost sharing support, ACOs are currently permitted to use their earned shared savings to pay for anything that is currently being covered by prepaid shared savings as both funding sources qualify for protection under the Shared Savings Program ACO Final Waivers (80 FR 66726). As discussed in section III.G.6.a. of the CY 2027 PFS proposed rule, we proposed to allow ACOs to offer beneficiary cost sharing support outside of prepaid shared savings in early 2027 so there will be no gap in an ACO's ability to offer beneficiary cost sharing support if they opt to offer it under earned prepaid shared savings.

Those ACOs who participate in the prepaid shared savings participation option in 2026 or 2027 will not see changes to the requirements of the program for the prepaid shared savings they receive. Specifically, ACOs that receive prepaid shared savings in 2026 or 2027 will continue to be able to spend the funding as outlined in § 425.640(e). ACOs are required to continue to participate in the monitoring and reporting requirements of prepaid shared savings until all prepaid shared savings have been repaid to CMS.

We still believe there is value in encouraging ACOs to engage beneficiaries with strategies and tools designed to support their health and believe there is value in supporting cash flow mechanisms for ACOs. However, the combination of these two goals in prepaid shared savings does not appear viable. We proposed under § 425.304(e) to allow all eligible ACOs to offer cost sharing support to beneficiaries beginning early 2027 as noted previously in this section. We were interested in feedback on tools ACOs would find valuable for engaging beneficiaries in hopes to expand policies in this area in future years. We were also interested in additional ways to support ACO cash flow and in feedback on the topic as outlined in the Request for Information on primary care capitation in section II.E. of the CY 2027 PFS proposed rule.

We sought comments on the proposal to eliminate the prepaid shared savings option as of January 1, 2028, noting that the last opportunity for a cohort to elect to participate in the option will be for PY 2027.

We received public comments on these proposals. The following is a summary of the comments we received and our responses.

Comment: A commenter supported CMS's proposal to discontinue the prepaid shared savings payment option. The commenter stated that the option has experienced limited participation and that alternative approaches may provide ACOs with greater flexibility to support beneficiary engagement. The commenter stated that simplifying the number of available payment options may reduce program complexity and allow CMS to focus resources on approaches that demonstrate stronger ACO participation and beneficiary impact.

Response: We appreciate the feedback on the proposal to discontinue the prepaid shared savings option under § 425.640. We note that prepaid shared savings was available only to eligible renewing ACOs with an established history of successfully earned shared savings, and that these payments were advances on shared savings ACOs were expected to earn, ultimately recouped through actual earned shared savings. We agree that the prepaid shared savings option has experienced limited participation and believe removing it will allow CMS to allocate program resources more efficiently to more effectively support beneficiary engagement.

Additionally, as discussed in section III.G.6.a. of this final rule, we are finalizing a new Part B cost-sharing support flexibility under § 425.304(e) that allows eligible ACOs to reduce or eliminate beneficiary cost-sharing without requiring participation in the prepaid shared savings option.

Comment: Several commenters opposed CMS's proposal to discontinue the prepaid shared savings option after the PY 2027 cohort and recommended that CMS retain the option. Commenters generally stated that prepaid shared savings could provide important upfront funding or cash flow for ACOs to invest in care transformation, infrastructure, staffing, and beneficiary services, particularly for organizations with limited access to capital, including independent, physician-led, rural, safety-net, high-needs, and other resource-constrained organizations. Commenters stated that the option has been available for too little time to determine its success based on early uptake and that low participation may reflect the option's design and administrative requirements rather than a lack of interest among ACOs. Several commenters specifically identified restrictions on allowable uses of funds, the requirement that at least 50 percent of prepaid shared savings be spent on direct beneficiary services, detailed spend-plan or documentation requirements, requirement to opt into prepaid shared savings at the start of an agreement period, payments that are not received early enough in a performance year, and other reporting, monitoring, and compliance requirements as barriers to participation.

A commenter also recommended expanded education for ACOs regarding the option and encouraging repeat applications from organizations that previously applied. Commenters stated that these modifications could make prepaid shared savings a more effective source of upfront capital for care management, clinical staffing, health information technology, data analytics,

beneficiary engagement, behavioral health integration, infrastructure, in-kind benefits like transportation, and other care transformation activities and discouraged CMS from narrowing our commitment to mechanisms that allow ACOs to build capacity and address barriers for beneficiaries.

A commenter acknowledged the limited uptake of prepaid shared savings and that programs with minimal participation may cease to be an effective use of program resources, but nevertheless recommended that CMS identify new approaches to reduce or remove resource-related barriers to entry for physician-led, rural, high-needs, and specialty-oriented ACOs.

Response: We appreciate the feedback on the proposal to discontinue the prepaid shared savings payment option. We continue to believe that the very low uptake of this option, with only four ACOs participating in PY 2026, and the high rate of denial or withdrawal applications during the PY 2026 cycle, demonstrates that the option as designed is neither achieving the intended goals nor the scale to justify the continued administrative resources CMS must devote to maintaining annual application cycles, monitoring spend plans, distributing payments, and addressing unpaid debt. We also believe that participation is unlikely to meaningfully increase over time as currently structured due to a number of issues identified by commenters.

Prepaid shared savings was specifically designed to address two issues, cash flow for ACOs as well as to encourage investments that would aid beneficiaries, such as investments in direct beneficiary services, staffing, or healthcare infrastructure. We agree with commenters that restrictions on the allowable uses of prepaid shared savings, the requirement that ACOs spend at least 50 percent of prepaid shared savings on direct beneficiary services, and the associated spend plan, documentation, and reporting requirements likely contributed to limited uptake. However, this requirement is also part of the foundation of prepaid shared savings to directly encourage investment into aid for beneficiaries. As noted in the CY 2025 PFS final rule, prepaid shared savings are only available for financially successful ACOs, who are likely to have already made significant investments in areas like staffing and infrastructure that are required for ACOs to function, and encouraging significant investment in direct beneficiary services was intended to improve beneficiary outcomes, reduce costs, and improve beneficiary engagement with an ACO. Relaxing the requirements that ACOs spend a minimum percentage of prepaid shared savings towards direct beneficiary services undermines the original intent of this policy. Additionally, we continue to believe that these requirements were important safeguards because the prepaid shared savings option involved advancing ACOs funds that they had not yet earned. We do not believe we can sufficiently relax these requirements as commenters have expressed and continue to meet the original goals of this policy.

CMS is offering ACOs the ability to provide beneficiaries with Part B cost-sharing support outside of prepaid shared savings, in order to meet some of the original goals of prepaid shared savings, including improving beneficiary outcomes, reducing costs and improving beneficiary engagement with an ACO. Outside of prepaid shared savings, ACOs are also permitted to spend on direct beneficiary services, including Part B cost sharing support, out of their own funding and we do not believe that removing prepaid shared savings will result in meaningful reductions in spending on direct beneficiary services. We believe some of the cash flow goals are being met through the Advance Investment Payment (AIP) option, described at § 425.630. Eligible ACOs receive a one-time fixed payment of $250,000, plus per-beneficiary quarterly payments for the first two performance years of their agreement period. AIP is designed to reduce upfront costs that prevent providers/suppliers from forming ACOs, caring for beneficiaries in underserved communities, and achieving long-term success in the program.

We understand that there is strong interest in additional options to support cash flow for currently participating ACOs, and we continue to explore options to meet this need, including in response to the comments provided to this proposal and through the feedback received in response to the primary care capitation RFI that was included in the CY 2027 PFS proposed rule. At this time, we do not believe that modifications to the prepaid shared savings option would sufficiently address the barriers to participation while meeting our goals to provide direct beneficiary services, support ACO cash flow and maintain appropriate safeguards. We believe the separate mechanisms discussed previously in this section could be more attractive to ACOs and help support CMS' goals.

Eligible ACOs entering an agreement period beginning on January 1, 2027 can still apply for prepaid shared savings and, if approved, would receive quarterly prepaid shared savings payments through December 31, 2027, unless the payment is withheld or terminated under paragraph (h) of § 425.640.

After consideration of public comments, we are finalizing as proposed and decline to retain or redesign the prepaid shared savings option at this time. Specifically, we are amending § 425.640 to discontinue the prepaid shared savings option as follows:

Section 425.640(b) is revised to end ACO eligibility for prepaid shared savings beginning January 1, 2027. Section 425.640(b)(1)(i) is revised to read, the ACO is a renewing ACO as defined under § 425.20 entering an agreement period beginning on ''January 1, 2026 or January 1, 2027.''

Section 425.640(c)(1) is revised to read that for an ACO renewing to enter into an agreement period beginning on ''January 1, 2026 or January 1, 2027'', to obtain a determination regarding whether the ACO may receive prepaid shared savings, the ACO must submit a complete supplemental application with its application to renew for a new agreement period in the Shared Savings Program (submitted under § 425.224) in the form and manner and by a deadline specified by CMS.

Section 425.640(f)(1) is revised to no longer distribute prepaid shared savings to ACOs after December 31, 2027.

Specifically, section 425.640(f)(1)(i) is revised to state that an eligible ACO entering an agreement period beginning on January 1, 2026 or January 1, 2027 will receive quarterly prepaid shared savings payments through December 31, 2027, unless the payment is withheld or terminated under paragraph (h) of this section.

Section 425.640(f)(1)(ii) is similarly revised to state that an eligible ACO participating in an agreement period beginning on January 1, 2025 will receive quarterly prepaid shared savings payments starting with the performance year on January 1, 2026, through December 31, 2027, unless the payment is withheld or terminated under paragraph (h). The ACO will not receive additional or catch-up payments for performance year 2025.

7. Modify the Methodology and Use Description for Advance Investment Payments

(a) Background

In the CY 2023 PFS final rule (87 FR 69782 through 87 FR 69805), we finalized the availability of the advance investment payment option, beginning on January 1, 2024. Advance investment

payments are available to eligible low revenue ACOs inexperienced with performance-based risk Medicare ACO initiatives and that are new to the Shared Savings Program. These ACOs may receive an up-front, one-time fixed payment of $250,000 and per beneficiary quarterly payments for the first two performance years of their agreement period. Eligible ACOs that apply for and receive advance investment payments receive payments determined under the methodology described in § 425.630(f)(2). Furthermore, ACOs' use of advance investment payments is subject to the requirements set forth in § 425.630(e). ACOs are permitted to use the advance investment payments to invest in increased staffing, healthcare infrastructure, and the provision of accountable care for underserved beneficiaries. Advance investment payments are intended to reduce upfront costs that prevent providers and suppliers from forming ACOs, caring for beneficiaries in underserved communities, and achieving long-term success in the Shared Savings Program. For more information about the history and development of the advance investment payment option and goals for the program, refer to the CY 2023 PFS final rule (87 FR 69782 through 87 FR 69805).

(1) Area Deprivation Index

In the CY 2023 PFS final rule (87 FR 69792 through 69800), we finalized that the amount of advance investment payments that eligible ACOs can receive over the two years of quarterly payments was based on assigned beneficiaries' area deprivation index (ADI) score, Medicare Part D Low Income Subsidy (LIS) status, and dual eligibility for Medicare and Medicaid. The maximum amount was finalized as $45 per eligible beneficiary per quarter and there was a 10,000-beneficiary cap for the calculation of quarterly payments. LIS/dual eligibility grants an ACO the maximum $45 per eligible beneficiary, whereas ADI scores provide a range of payment amounts for beneficiaries without LIS/dual eligibility.

The quarterly advance investment payment calculation methodology finalized in the CY 2023 PFS final rule (87 FR 69792 through 69800) results in an increase in payments when more beneficiaries who are LIS/dually eligible or who live in areas with high deprivation (measured by ADI), or both, are assigned to the ACO. Regarding ADI, the risk factors-based score was set to the ADI national percentile rank of the census block group in which the beneficiary resides, and higher risk factors-based scores resulted in ACOs receiving higher payment amounts for assigned beneficiaries (87 FR 69794 and 69795). ADI scores range in payment amounts from $0 for those with a risk factors-based score between 1 and 24 to the maximum $45 for those with a risk factors-based score between 85 and 100 (§ 425.630(f)(2)(iii)). The quarterly payments intend to compensate for variable ongoing operating costs that are related to the provision of care for the ACO's assigned beneficiaries.

We stated in the CY 2023 PFS final rule (87 FR 69793 and 69794) that we believed using ADI was a method for indicating beneficiaries with high needs, specifically to capture local socioeconomic factors correlated with medical disparities and underservice. We stated that the inclusion of ADI as a criterion for quarterly advance investment payments furthered CMS's goal to reduce financial barriers for new, low revenue, and inexperienced ACOs. Since the option became available January 1, 2024, we have reviewed the characteristics of ACOs electing to participate in the advance investment payment option and how ADI as well as LIS/dual eligibility are impacting ACOs' quarterly advance investment payments.

(2) Advance Investment Payment Program Post-Implementation

In PY 2024, 19 newly formed ACOs in the Shared Savings Program were participating in the new advance investment payment option, receiving more than $25.7 million in advance investment payments in their first performance year.[372] Analysis of ACOs receiving advance investment payments shows that the payment option is encouraging ACOs to form in areas where ACOs may not have otherwise formed and where other Medicare payment and delivery innovations were less likely to be present. In its first year of implementation, the advance investment payment option appeared to attract new ACOs in these communities. Compared to non-advance investment payment ACO starters in 2024, the advance investment payment ACOs were caring for more beneficiaries residing in a health provider shortage area (51.2 percent versus 34 percent) and residing in a rural location (42.1 percent versus 27.0 percent).[373] Our analysis of the advance investment payments made in PYs 2025 and 2026 also investigated which beneficiary characteristics were impacting the quarterly payment amount received by ACOs receiving advance investment payments. This analysis showed that the average share of quarterly payments attributed to ADI beneficiaries, as opposed to LIS/dual eligible beneficiaries, fluctuated by 13 percentage points between PY 2025 and PY 2026.[374]

After publication of the CY 2023 PFS final rule for the advance investment payment option, we were made aware of concerns with the lack of standardization of ADI: Scores were heavily influenced by the median home value indicator, which is one out of the 17 indicators included in the calculation of ADI.[4] The 17 indicators are combined directly and, as such, the median home value indicator, which, because it is expressed in large dollar units and has large variance, impacts ADI scores more than other indicators, in particular, the percent-based indicators (for example, percent living in poverty). Cost-of-living when primarily captured by a region's median home value is incomplete and not perfectly aligned with area deprivation, as current research testing ADI indicates. For example, analyses have shown that many regions with high median home values were flagged as low deprivation based on their ADI scores, but these areas were experiencing deprivation when looking at other ADI variables such as poverty and unemployment rates.[375] [376] We do not believe it is appropriate to continue using an indicator that is not meeting its stated goals of identifying area deprivation, and propose to revise the advance investment payment methodology to simplify and refocus on the intended outcome of reducing upfront costs that prevent providers and suppliers from forming ACOs, caring for beneficiaries in underserved communities, and achieving long-term success in the Shared Savings Program.

(b) Revisions

(1) Removal of the Area Deprivation Index From the Advance Investment Payment Methodology

We proposed to remove ADI from the advance investment payments methodology at § 425.630(f)(2). Our proposal to remove ADI from the quarterly payment amount methodology and remove the risk factors-based score (as described in section III.G.7.2.b) necessitates adjustments to § 425.630(f)(2)(ii) and is intended to better meet the objectives of the advance investment payment option policy.

(2) Addition of the Rural Criterion to the Advance Investment Payment Methodology

While we proposed to remove ADI, we wanted to continue to encourage low-revenue ACOs that are inexperienced with risk to participate in the Shared Savings Program, including rural ACOs as noted previously in the proposed rule. Rural ACOs are currently underrepresented in the Shared Savings Program, with only 14.5 percent of TINs participating in Shared Savings Program ACOs located in rural areas in comparison to 20 percent of non-Shared Savings Program TINs.[377] This analysis of FY 2024 assigned beneficiaries, provided in section III.G.7.1.b. of the proposed rule, highlights a smaller proportion of these beneficiaries live in rural communities. We proposed adding a rural component to the payment amount calculation for determining quarterly advance investment payments and believe this addition, in conjunction with the current components targeting beneficiaries enrolled in the Medicare Part D LIS or dually eligible for Medicare and Medicaid, will contribute to the advance investment payment option's goal of increasing ACOs' population health management capabilities, including the provision of accountable care for underserved beneficiaries, while simplifying the calculation (87 FR 69788). This also aligns with work CMS is carrying out through the Rural Health Transformation Program that was authorized by section 71401 of the Working Families Tax Cut legislation (Pub. L. 119–21, July 4, 2025).

Through the Rural Health Transformation Program, CMS is working to strengthen rural communities across America by improving healthcare access, quality, and outcomes by transforming healthcare delivery. Encouraging ACO formation in rural areas directly supports these goals.[378] Primary residence in rural areas can be associated with barriers to accessing care, including geographic isolation, provider shortages, transportation challenges, limited broadband or technology infrastructure, and fewer locally available healthcare resources. We had hoped to address some of these access-related challenges through the inclusion of ADI in the advance investment payments methodology. However, rural residence captures a distinct set of geographic and infrastructure-related barriers.

Our internal analysis of ACO beneficiaries indicates there is limited overlap between LIS/dual eligibility and beneficiaries living in a rural area. As a result, adding a rural residence component would allow the methodology to better identify and direct the maximum quarterly payment amount to additional underserved beneficiaries who may face access-related barriers that are not otherwise captured by LIS/dual eligibility status.

As noted, we believe rurality is an appropriate geographic proxy for access-related challenges, including differences in healthcare infrastructure and workforce availability. These factors may affect an ACO's ability to form, participate, and succeed in rural areas and therefore ACOs may need a higher amount of advance investment payments to consider participating. We sought to encourage formation of ACOs in areas experiencing medical disparities and underservice and have recognized through internal analysis of assigned beneficiary characteristics that the LIS/dual eligibility statuses do not fully capture rural beneficiaries. Therefore, we proposed introducing a rural component to the advance investment payments methodology.

To calculate the advance investment payment for an eligible ACO based on the number of their rural assigned beneficiaries, we proposed establishing a beneficiary's rural residence from their latest mailing address in the CMS data systems at the time of determining advance investment payments. Furthermore, we proposed using the most recently available version of the United States Census Bureau Delineation File to determine whether a beneficiary resides in a rural county.[379] The Office of Management and Budget (OMB) makes the delineation file publicly available on the *Census.gov* website. OMB provides the delineation file and other reference files as a reliable standard for academic research and public policy development. The delineation file defines an area as micropolitan or metropolitan as having a population of 10,000 to 50,000 individuals or a population greater than 50,000 individuals, respectively. Areas where the population is less than 10,000 are considered noncore. Noncore areas are defined by identifying Federal Information Processing Standards State and County codes that are not included in the delineation file. OMB does not characterize counties as rural or urban, and we proposed to use the Federal Office of Rural Health Policy (FORHP), in the Health Resources and Services Administration, interpretation of these county designations, which considers all non-metro counties as rural.[380] We proposed that beneficiaries will be considered to be residing in a rural county for the purposes of the advance investment quarterly payment calculation, if they are non-metro, that is residing in a micropolitan or noncore area. As of July 2023, 13.8 percent of the U.S. population is living in the micropolitan or noncore areas.[381]

For the purpose of implementing changes to the advance investment payments, the use of county level data would allow for timelier implementation and sharing of data with ACOs since the delineation file is readily available and already used by CMS for internal analyses of ACOs by region. Counties are also well understood by healthcare providers and stable over time, which reduces complexity and burden for ACOs working to understand the methodology. We believe that this rural definition, in combination with the maximum payments based on beneficiary LIS/dual eligibility status, will support ACOs in caring for beneficiaries in underserved communities.

(3) Amount for All Beneficiaries to the Advance Investment Payment Methodology

We intended for these changes to the advance investment payments methodology to encourage the formation of new ACOs in underserved

communities and described the proposed rural criteria for determining advance investment payments. However, as we stated in the CY 2023 PFS final rule (87 FR 69785), we do not believe in limiting advance investment payment option eligibility only to ACOs serving rural areas or areas with a high proportion of beneficiaries dually eligible for Medicaid and Medicare or Part D LIS is in line with the policy's goals. We recognize that there are beneficiaries who reside in other areas who could also benefit from the high-quality coordinated care an ACO provides. With the removal of ADI and its tiered scoring structure using risk factors-based scores, we proposed an alternative payment methodology that also accounts for non-rural beneficiaries who are not LIS/dually eligible and whose assignment may have resulted in some payment under the current advance investment payments methodology. Our experience implementing the advance investment payment option over the last few years leads us to believe ACO participation in the payment option could be more attractive with the addition of a lower flat payment amount for all beneficiaries assigned to the ACO, up to the 10,000-beneficiary cap. Therefore, we proposed that all non-rural beneficiaries who are not LIS/dually eligible beneficiaries would result in ACOs receiving a flat rate of $25 per beneficiary as part of setting each ACO's quarterly payments.

We anticipate that the change to remove ADI and add rurality as well as a payment amount for all beneficiaries not identified as LIS/dual eligible or rural will provide similar aggregate quarterly payment amounts to new advance investment payment option participants and, in keeping in line with the intent of the advance investment payment option, any new methodology developed should encourage ACOs serving populations that need financial support to begin participation in value-based care. We conducted an analysis that compared the quarterly advance investment payments for PY 2024 using the existing methodology utilizing ADI and the proposed methodology using a rural component. Results indicated that, compared to the current methodology, the proposed methodology will provide the vast majority (89.5 percent) of advance investment payment ACOs with slightly higher payments (totaling about $889,000 more per quarter or $3.6 million more per year distributed among all ACOs), which align with payment goals outlined previously in this section.[382] While we believe these proposed policy adjustments will increase support for ACO formation in rural areas, this analysis demonstrates that our proposed policies maintain support for ACOs regardless of location.

Section 1899(i)(3)(A) of the Act requires CMS to determine that advance investment payments would improve the quality and efficiency of items and services furnished to Medicare to make such payments. We believe that the updated methodology will meet this standard and improve our ability to target the populations that CMS seeks to support. Section 1899(i)(3)(B) of the Act requires CMS to determine that advance investment payments, when implemented in combination with existing modifications made to the Shared Savings Program specified in section 1899(d) of the Act, will not result in additional program expenditures. In evaluation of current program performance, the structure of advance investment payment program is successful in not increasing program expenditures, and the changes to the methodology will not affect this outcome as the overarching structure the advance investment payment option remains the same. In accordance with section 1899(i)(3) of the Act authorizing the use of alternative payment models, we proposed to update the steps at § 425.630(f)(2) to allow ACOs participating in the advance investment payment option will receive a maximum payment of $45 if the assigned beneficiary is enrolled in the Medicare Part D LIS or is dually eligible for Medicare and Medicaid or is residing in a Micropolitan or ''Noncore'' Census Status (henceforth ''rural''). Additionally, for beneficiaries outside of these categories, ACOs will receive a flat rate of $25 per beneficiary as part of setting each ACO's quarterly payments.

(4) Implementation Timeline for Revisions to the Advance Investment Payments Methodology

We proposed that changes to remove ADI and to add rurality to the quarterly payment methodology would be implemented for ACOs who apply for the advance investment payment option with an effective date of January 1, 2028, as well as for the second year of payments for ACOs who began receiving advance investment payments in 2027. This timeline allows ACOs planning to apply to the Shared Savings Program to understand the proposed methodology for the advance investment payment option prior to applying to the program in the summer of 2027.We believed that as the vast majority of the ACOs will receive slightly higher payments under the new methodology, it is a more efficient use of agency resources to move to using the updated methodology for all ACOs at the same time, instead of running two separate methodologies simultaneously.

We sought public comment on the proposed timeline for implementing changes to the advance investment payments methodology effective January 1, 2028. Specifically, we sought public comment on the following proposed revisions to the regulation text at § 425.630:

- At paragraph (f)(2)(ii) add the introductory phrase ''For performance years 2023 through 2027.''
- At paragraph (f)(2)(iii), we proposed to specify how CMS determines the amount each assigned beneficiary adds to an ACOs quarterly payment amount. At new paragraph (f)(2)(iii)(A), we describe the existing requirements on how we determine the payment amount that corresponds to the beneficiary's risk factors-based score, and related table, which we proposed to specify would be applicable for PYs 2023 through 2027. In new paragraph (f)(2)(iii)(B), we proposed to specify how we would determine the quarterly payment amount for PY 2028 and subsequent PYs. For each beneficiary in the assigned population identified in paragraph (f)(2)(i) of this section, CMS determines the quarterly payment amount for two categories of beneficiaries. First, an ACO will receive a quarterly payment of $45 for each beneficiary that meets any of the following criteria:
  - Is enrolled in the LIS.
  - Is dually eligible for Medicare and Medicaid.
  - Is residing in a county with rural census status (as defined at § 425.20). CMS determines the county of residence for the beneficiary based on the beneficiary's mailing address.

  Then, an ACO will receive a quarterly payment of $25 for each beneficiary who does not meet any of the criteria listed in paragraph (f)(2)(iii)(B)(1) of this section.
- At paragraph (f)(2)(iv), we proposed to specify how CMS calculates an ACO's quarterly payment amount. In new paragraph (f)(2)(iv)(A), we describe the existing process that the quarterly payment amount is the sum of the beneficiary payment amounts corresponding to each assigned beneficiary's risk factors-based score, capped at 10,000 beneficiaries, which we proposed to specify would be

[382] Based on internal analysis of ACOs participating in the Advance Investment Payment model in PY 2024.

applicable for PYs 2023 through 2027. In new paragraph (f)(2)(iv)(B), we proposed a new methodology for PY 2028 and subsequent PYs. We proposed that the ACO's quarterly payment amount will be the sum of the beneficiary payment amounts corresponding to the quarterly payments specified in paragraph (f)(2)(iii)(B) of this section. If the ACO has more than 10,000 assigned beneficiaries according to paragraph (f)(2)(i) of this section, we will calculate the quarterly payment amount based on the 10,000 assigned beneficiaries with the highest quarterly payment determined according to paragraph (f)(2)(iii)(B) of this section.

We also sought public comment on the proposed revisions to the regulation text at § 425.20:

Add new definition for the term ''Rural County Status'' to mean beneficiary residence in a mailing address with United States county status of Micropolitan (population of 10,000 to 50,000 individuals) or Noncore (population less than 10,000 individuals) per the Federal Office of Rural Health Policy (FORHP) county designation using the most recently available version of the United States Census Bureau Delineation File.

We received public comments on these proposals. The following is a summary of the comments we received and our responses.

Comment: Many commenters supported the proposed policy to modify the advance investment payment methodology. Commenters believed it would support the development of new ACOs including those with rural, medically underserved or socioeconomically disadvantaged beneficiaries and would be simpler for ACOs to understand.

Response: We appreciate the supportive comments and agree that this change will simplify the policy and improve understanding while continuing to support ACOs.

Comment: Several commenters supported the addition of the rurality measure but disagreed with the removal of ADI without an alternative to preserve some recognition of area-level social or economic deprivation in the methodology. Commenters suggested additional metrics for the AIP quarterly payment calculation, including ones that account for socioeconomic or access-related barriers, including in suburban or urban areas, or other measures of beneficiary vulnerability. A commenter suggested adding a fourth criterion tied to food insecurity or nutrition risk directly. Commenters also suggested that CMS consider other targeted participation incentives to support entry into value-based care arrangements for healthcare providers that face significant barriers to participation.

Response: We appreciate comments that stated an interest in ensuring vulnerable or underserved beneficiaries have support from an ACO. We believe that this updated policy will be sufficient to support ACO formation in a variety of underserved areas and balances providing ACOs with a simpler and easier to understand methodology to calculate AIP payments. As described previously in this section, we proposed to replace the complex, tiered ADI payment scale with a straightforward two-tiered structure that provides a flat $25 quarterly payment for each beneficiary not identified as LIS, dually eligible, or rural dwelling. By providing a quarterly payment amount for all beneficiaries, capped at 10,000 assigned beneficiaries, the updated policy provides ACOs with payments for assigned beneficiaries across a range of socioeconomic circumstances while minimizing methodological complexity. We will continue to evaluate the effectiveness of advance investment payment policy and determine if future adjustments are necessary.

Comment: Several commenters recommended ongoing monitoring of the impact of advance investment payments, including monitoring the impact of the revised methodology on rural healthcare provider participation, evaluating whether it effectively reaches healthcare providers in rural and low resourced areas, reaches the same population as ADI, and revisiting the methodology if gaps are revealed.

Response: We appreciate the recommendations to evaluate the impact of advance investment payments and we intend to continue monitoring the impact of advance investment payment policy to ensure it is meeting CMS goals of supporting ACO formation and growing participation in the Shared Savings Program.

Comment: A commenter requested that CMS ask ACOs receiving advance investment payments to describe publicly how those resources are used.

Response: We appreciate the request for transparency. ACOs receiving advance investment payments are required to publicly report their use of the funding each year. CMS makes this data available at *https://data.cms.gov/medicare-shared-savings-program/advance-investment-payment-spend-plan.*

Comment: Several commenters had suggestions for other changes to the Advance Investment Payment policy, including requests to allow ACOs to keep a portion of shared savings prior to repaying AIP, or allowing high-revenue ACOs to be eligible for AIP.

Response: While we believe these suggestions are out of scope for this proposal, we continue to review AIP policy to ensure it is meeting CMS goals, and we appreciate the feedback.

After consideration of public comments, we are finalizing this policy as proposed. Specifically, we are finalizing under § 425.630(f)(2)(iii)(B) that for PY 2028 and subsequent PYs, CMS will determine the quarterly payment amount as follows:

(1) an ACO will receive a quarterly payment of $45 for each beneficiary that meets any of the following criteria:

(i) Is enrolled in the LIS.

(ii) Is dually eligible for Medicare and Medicaid.

(iii) Is residing in a county with rural census status (as defined at § 425.20). CMS determines the county of residence for the beneficiary based on the beneficiary's mailing address.

(2) an ACO will receive a quarterly payment of $25 for each beneficiary who does not meet any of the criteria listed in paragraph (f)(2)(iii)(B)(1) of this section.

Under section 425.630(f)(2)(iv)(A), for PYs 2023 through 2027, the ACO's quarterly payment amount is the sum of the beneficiary payment amounts corresponding to each assigned beneficiary's risk factors-based score, specified in paragraph (f)(2)(iii)(A) § 425.630, capped at 10,000 beneficiaries. If the ACO has more than 10,000 assigned beneficiaries according to paragraph (f)(2)(i) of this section, CMS will calculate the quarterly payment amount based on the 10,000 assigned beneficiaries with the highest risk factors-based scores determined according to paragraph (f)(2)(ii).

In new paragraph (f)(2)(iv)(B), for PY 2028 and subsequent PYs, the ACO's quarterly payment amount is the sum of the beneficiary payment amounts corresponding to the quarterly payments specified in paragraph (f)(2)(iii)(B) of this section. If the ACO has more than 10,000 assigned beneficiaries according to paragraph (f)(2)(i) of this section, CMS will calculate the quarterly payment amount based on the 10,000 assigned beneficiaries with the highest quarterly payment determined according to paragraph (f)(2)(iii)(B) of this section.

We are also finalizing revisions to the regulation text at § 425.20 to add new definition for the term ''Rural County Status'' to mean beneficiary residence in a mailing address with United States county status of Micropolitan (population of 10,000 to 50,000

individuals) or Noncore (population less than 10,000 individuals) per the Federal Office of Rural Health Policy (FORHP) county designation using the most recently available version of the United States Census Bureau Delineation File.

(5) Revisions to the Terminology of Allowable Uses

At § 425.630(e)(1), we state that an ACO must use an advance investment payment to improve the quality and efficiency of items and services furnished to beneficiaries by investing in increased staffing, healthcare infrastructure, and the provision of accountable care for underserved beneficiaries, which may include addressing social determinants of health. We believe that the term ''social determinants of health'' is not as precise as we would prefer, and propose to replace the term with ''upstream drivers of health.'' Specifically, while the terms are similar in describing non-medical factors that can shape beneficiaries' health, ''upstream drivers of health'' more clearly describes the focus on the upstream or root causes of health outcomes. This framing does not change the types of investments that advance investment payments can be spent on, but instead more clearly identifies these investments, which include, but are not limited to, transportation, utilities and housing-related assistance, as well as services to encourage improved fitness and nutrition and promote a healthy environment. Specifically, we proposed to revise § 425.630(e)(1) to read: ''Allowable uses. An ACO must use an advance investment payment to improve the quality and efficiency of items and services furnished to beneficiaries by investing in increased staffing, healthcare infrastructure, and the provision of accountable care for underserved beneficiaries, which may include addressing upstream drivers of health. Expenditures of advance investment payments must comply with the beneficiary incentive provision at § 425.304, paragraph (e)(2) of this section, and all other applicable laws and regulations.'' We sought comments on this proposal.

We received public comments on these proposals. The following is a summary of the comments we received and our responses.

Comment: A commenter supported this proposal and thought the revised AIP terminology was clearer and would make it easier for ACOs to use AIP funding:

Response: We appreciate the comments in support of the proposal and agree that the new term should be clearer for ACOs.

Comment: A commenter disagreed with the change and believes the original term ''social determinants of health'' was clearer for ACOs. They requested more guidance on the use of AIP funds related to this change.

Response: We appreciate the concern raised by the comment and intend to update the subregulatory guidance related to the use of AIP to ensure ACOs understand appropriate uses for the funding. The permitted uses of AIP funding are not changing because of this change in terms.

After consideration of public comments, we are finalizing this policy as proposed. Specifically, we are revising § 425.630(e)(1) to read: ''Allowable uses. An ACO must use an advance investment payment to improve the quality and efficiency of items and services furnished to beneficiaries by investing in increased staffing, healthcare infrastructure, and the provision of accountable care for underserved beneficiaries, which may include addressing upstream drivers of health. Expenditures of advance investment payments must comply with the beneficiary incentive provision at § 425.304, paragraph (e)(2) of this section, and all other applicable laws and regulations.''

8. Identifying ACOs Experienced With Performance-Based Risk Medicare ACO Initiatives

a. Background

In the December 31, 2018 Shared Savings Program final rule (83 FR 67816), referred to as the Pathways to Success, CMS finalized the definition of the term, ''performance-based risk Medicare ACO initiative,'' to mean an initiative implemented by CMS that requires an ACO to participate under a two-sided model during its agreement period (83 FR 67904). This includes Levels C, D, and E of the BASIC track, and the ENHANCED track of the Shared Savings Program. This definition also includes other Medicare ACO initiatives involving two-sided risk, such as two-sided risk CMS Innovation Center ACO Models, as may be specified by CMS (83 FR 67904).

In the December 2018 final rule, we explained that the risk experience of ACOs and their ACO participants in Medicare ACO initiatives is considered in determining which agreement track (BASIC or ENHANCED) the ACO is eligible to enter as well as the applicability of policies that phase in over time, namely the equal weighting of benchmark year expenditures, the policy of adjusting the benchmark based on regional FFS expenditures, and the phase-in of pay-for-performance under the program's quality performance standards (83 FR 67904–67907). As a factor in determining an ACO's participation options, we established requirements for evaluating whether an ACO is inexperienced with performance-based risk Medicare ACO initiatives such that the ACO would be eligible to enter into an agreement period under the BASIC track's glide path or whether the ACO is experienced with performance-based risk Medicare ACO initiatives and therefore limited to participating under the higher-risk tracks of the Shared Savings Program (either an agreement period under the maximum level of risk and potential reward for Level E of the BASIC track or the ENHANCED track) (83 FR 67894).

In the CY 2024 PFS final rule, published on November 16, 2023, we clarified our approach to identifying ACOs experienced with risk based on an ACO Participant TIN's prior participation by adding the following language to the definitions of ''experienced with performance-based risk Medicare ACO initiatives'' and ''inexperienced with performance-based risk Medicare ACO initiatives'' under § 425.20 (88 FR 79219 through 79220; 79543 through 79544), ''an ACO participant is considered to have participated in a performance-based risk Medicare ACO initiative if the ACO participant TIN was or will be included in financial reconciliation for one or more performance years under such initiative during any of the 5 most recent performance years.'' This was not a policy change, but an attempt to more clearly communicate ongoing operational policy.

Accordingly, as codified under § 425.20, we defined ''experienced with performance-based risk Medicare ACO initiatives'' to mean an ACO that CMS determines meets either of the following criteria:

(1) The ACO is the same legal entity as a current or previous ACO that is participating in, or has participated in, a performance-based risk Medicare ACO initiative as defined under this section, or that deferred its entry into a second Shared Savings Program agreement period under a two-sided model under § 425.200(e).

(2) Forty percent or more of the ACO's ACO participants participated in a performance-based risk Medicare ACO initiative, or in an ACO that deferred its entry into a second Shared Savings Program agreement period under a two-sided model under § 425.200(e), in any of the 5 most recent performance years. An ACO participant is considered to have participated in a performance-

based risk Medicare ACO initiative if the ACO participant TIN was or will be included in financial reconciliation for one or more performance years under such initiative during any of the 5 most recent performance years.

We defined ''inexperienced with performance-based risk Medicare ACO initiatives'' to mean an ACO that CMS determines meets both of the following criteria:

(1) The ACO is a legal entity that has not participated in any performance-based risk Medicare ACO initiative as defined under this section, and has not deferred its entry into a second Shared Savings Program agreement period under a two-sided model under § 425.200(e).

(2) Less than 40 percent of the ACO's ACO participants participated in a performance-based risk Medicare ACO initiative, or in an ACO that deferred its entry into a second Shared Savings Program agreement period under a two-sided model under § 425.200(e), in each of the 5 most recent performance years. An ACO participant is considered to have participated in a performance-based risk Medicare ACO initiative if the ACO participant TIN was or will be included in financial reconciliation for one or more performance years under such initiative during any of the 5 most recent performance years.

The established definitions of ''experienced with performance-based risk initiatives'' and ''inexperienced with performance-based risk Medicare ACO initiatives'' were intended to support both determinations of participation options and the phase-in of requirements over time by considering ACOs' prior participation in the program (83 FR 67906).

Under § 425.20, the second prong of the ''experienced with performance-based risk initiatives'' definition relies on whether 40 percent or more of the ACO's ACO participants participated in a performance-based risk Medicare ACO initiative in any of the 5 most recent performance years. For this purpose, an ACO participant is treated as having participated when the ACO participant TIN ''was or will be included in financial reconciliation'' for one or more performance years under a qualifying two-sided initiative during the 5-year lookback. This means the ''experience'' determination is sensitive to the ACO's participant composition at the TIN level. If an ACO's participant list includes a substantial number of TINs that were recently reconciled under two-sided risk (for example, under a prior ENHANCED track or another qualifying CMS initiative), those TINs count toward the 40 percent threshold. Conversely, if an ACO's participant TINs lack such recent two-sided reconciliation history, the ACO may be treated as inexperienced for purposes of participation options.

Consistent with our TIN-based approach to evaluating prior participation, these policies rely on the financial reconciliation history associated with specific billing TINs. These policies were intended to capture TINs that at least partially participated in a performance-based risk initiative, as TINs that participate in a full or partial year are generally still included in financial reconciliation. However, we identified a category of TINs that are included in financial reconciliation for performance based-risk initiatives, but that do not have a written agreement to participate in the performance-based risk ACO initiative and thus are ineligible for the benefits of being in an ACO (such as shared savings). In ACO REACH, and other CMS Innovation Center ACO Models, a ''Legacy TIN or CCN'' means a TIN or CCN that a Participant Provider or Preferred Provider previously used for billing Medicare Parts A and B services but no longer uses to bill for those services, and includes a ''sunsetted'' Legacy TIN or CCN (a TIN or CCN that is no longer used for billing for Medicare Parts A and B services by any Medicare-enrolled provider or supplier) or an ''active'' Legacy TIN or CCN (a TIN or CCN that may be in use by a Medicare-enrolled provider or supplier that is not a Participant Provider or Preferred Provider).[383] The purpose of Legacy TINs or CCNs is to allow a provider/supplier who used to practice under an old TIN, but has begun practicing under a new TIN, to use the historical claims information to help establish an ACO's benchmark. Legacy TINs or CCNs are not considered to be ''Participant Providers'' in ACO REACH, as they do not have a written agreement to participate in the performance-based risk ACO initiative.[384] These TINs or CCNs do not receive any benefits of ACO participation, including ACO financial arrangements or use of model waivers and are not required to comply with ACO policies. Their claims history is solely used for financial reconciliation for the ACO.

However, given the current definitions of ''Experienced with performance-based risk Medicare ACO initiatives'' and ''Inexperienced with performance-based risk Medicare ACO initiatives,'' Legacy TINs or CCNs are currently included in the calculation of whether 40 percent of ACO participants have prior experience with a performance-based risk Medicare ACO initiative, as they are included in financial reconciliation for the ACO REACH model ACO. The current or prior presence of a Legacy TIN or CCN on an ACO REACH model ACO's Participant Provider List can determine whether an ACO applying to the Shared Savings Program is eligible for entry into the BASIC track glide path or is instead limited to BASIC track Level E (if low revenue) or the ENHANCED track. CMS did not anticipate the interaction between the use of Legacy TINs in CMS Innovation Center ACO models and the definitions of experienced and inexperienced with performance-based Medicare ACO initiatives when these policies were developed. We identified this interaction when it impacted a few ACOs applying to the Shared Savings Program in recent years, limiting the participation options available to the ACOs.

We believe that the inclusion of Legacy TINs and CCNs in the definitions of experienced or inexperienced with performance-based risk is overly broad and not in line with the original goals of the definition, and we proposed to amend the current regulation to exclude such TINs and CCNs from the calculation.

b. Revisions

Under the existing regulations codified in the December 2018 final rule, the definition of an ACO experienced or inexperienced with performance-based risk Medicare ACO initiatives includes consideration of ACO participant TINs in determining whether an ACO has prior experience under performance-based risk. Specifically, an ACO participant TIN is considered to have such experience if it was or will be included in the financial reconciliation of a Medicare ACO for any of the 5 most recent performance years under a qualifying two-sided model (83 FR 67895). For purposes of this determination, an ACO participant is treated as having participated in a performance-based risk initiative when its TIN was or will be included in financial reconciliation for one or more performance years during the applicable 5-year lookback period (83 FR 67895; § 425.20). As a result, the determination of whether an ACO is experienced or inexperienced with performance-based

[383] *ACO REACH Model Third Amended and Restated Participation Agreement.* Refer to page 12 under Article II Definitions for the definition of ''Legacy TIN or CCN''.

[384] *ACO REACH Model PY 2026 Participant and Preferred Provider Management Guide: https://www.cms.gov/files/document/aco-reach-py26-part-pref-provider-mgmt-guide.pdf.*

risk can depend on the composition of the ACO participant list at the TIN level.

To ensure TINs that have only been used as Legacy TINs or CCNs in CMS Innovation Center models would not be considered as experienced with risk, we proposed to exclude ACO participant TINs that did not have a written agreement to participate in a performance-based risk Medicare ACO initiative from our consideration of whether the ACO participant TIN participated in a performance-based risk Medicare ACO initiative. This consideration ultimately impacts an ACO's designation as experienced or inexperienced with performance-based risk within the Shared Savings Program. Because determining an ACO's experience with performance-based risk is based on the experience of the ACO participant TIN, we proposed to modify the regulations at § 425.20 to exclude Legacy TINs or CCNs from the definition of ''experienced with performance-based risk Medicare ACO initiatives'' and ''inexperienced with performance-based risk Medicare ACO initiatives.'' As future CMS Innovation Center models may not use the term ''Legacy TIN or CCN'' to identify these TINs or CCNs, we proposed to exclude these and similarly situated ACO participant TINs and CCNs by excluding those that did not have a written agreement to participate with the performance-based risk Medicare ACO.

We proposed revising the definition of experienced with performance-based risk Medicare ACO initiatives under § 425.20 by adding to paragraph (2), '', unless the ACO participant TIN did not have a written agreement to participate in the performance-based risk Medicare ACO initiative.'' Similarly, we proposed revising the definition of inexperienced with performance-based risk Medicare ACO initiatives under § 425.20 by adding to paragraph (2), '', unless the ACO participant TIN did not have a written agreement to participate in the performance-based risk Medicare ACO initiative.''

These proposed additions would permit CMS to exclude Legacy TINs or CCNs that did not have a written agreement to participate in the performance-based risk Medicare ACO initiative from this calculation.

We proposed that these modifications would be effective and applicable on January 1, 2027.

We sought comment on these proposals.

We received public comments on these proposals. The following is a summary of the comments we received and our responses.

Comment: All commenters supported these proposals, noting that the proposed changes would provide a more accurate way of determining which participants were experienced or inexperienced with performance-based risk.

Response: We appreciate the supportive comments and agree that this policy will improve the accuracy of determining which ACOs should be considered to be experienced or inexperienced with performance-based risk.

After consideration of public comments, we are finalizing our proposals without modification beginning January 1, 2027. Specifically, we are revising the definition of experienced with performance-based risk Medicare ACO initiatives under § 425.20 by adding to paragraph (2), '', unless the ACO participant TIN did not have a written agreement to participate in the performance-based risk Medicare ACO initiative.'' Similarly, we are revising the definition of inexperienced with performance-based risk Medicare ACO initiatives under § 425.20 by adding to paragraph (2), '', unless the ACO participant TIN did not have a written agreement to participate in the performance-based risk Medicare ACO initiative.''

Considering when this final rule will be issued, and the Shared Savings Program application cycle for the January 1, 2027 start date (occurring in CY 2026), ACO applicants will have notice of this change after the deadline for submitting their applications to participate in the Shared Savings Program. Additionally, under a previously established timeline for application actions and deadlines, the application cycle required CMS to deem an applicant ACO experienced with performance-based risk in October 2026,[385] which is before this CY 2027 PFS final rule is issued.

We are committed to accurately identifying ACOs' experience with performance-based risk consistent with the policy finalized in this rule, and recognize that we are currently in an ACO application cycle for a January 1, 2027 start date. Accordingly, to mitigate the potential impact of this finalized policy on ACO applicants, following issuance of the CY 2027 PFS final rule, we will communicate to ACO applicants their status as an ACO experienced or inexperienced with performance-based risk in accordance with the policy finalized in this rule and provide them with the opportunity to change their track/level of participation based on that determination. We believe it is appropriate to accommodate this modification during the application cycle for the January 1, 2027 start date (occurring in CY 2026) to apply the most accurate definition for determining experience with performance-based risk.

9. Beneficiary Notification Requirements

a. Background

The November 2011 final rule established requirements at § 425.312 for how a Shared Savings Program ACO must notify Medicare FFS beneficiaries receiving primary care services at the point of care that the physician, hospital, or other provider/supplier is participating in a Shared Savings Program ACO (76 FR 67945 through 67946). Since then, the regulations at § 425.312 have been updated through subsequent rulemaking. Presently, under § 425.312(a)(1), an ACO is required to ensure that Medicare FFS beneficiaries are notified of the following: (i) each ACO participant and its ACO providers/suppliers are participating in the Shared Savings Program; (ii) the beneficiary's opportunity to decline claims data sharing; and (iii) the ability to, and process by which, the beneficiary may identify or change identification of a primary care provider for purposes of voluntary alignment.[386]

Section 425.312(a)(2) sets forth the manners in which ACOs or ACO participants are required to notify beneficiaries of this information. ACO participants must post signs in their facilities and, in settings in which beneficiaries receive primary care services, make standardized written notices available upon request (§ 425.312(a)(2)(i) and (ii)). In addition, ACOs must furnish standardized written notices to certain beneficiaries, with timing depending on the ACO's assignment methodology. For ACOs that have selected preliminary prospective assignment with retrospective reconciliation, the ACO or ACO participant must provide each FFS beneficiary who received at least one primary care service from certain ACO professionals in the ACO during the assignment window (or expanded window) with a standardized written

[385] Medicare Shared Savings Program, Key Application Actions and Deadlines For Agreement Periods Beginning on January 1, 2027, available at *https://www.cms.gov/files/document/key-application-actions-deadlines.pdf.*

[386] *See generally* Shared Savings Program Guidance & Specifications, Beneficiary Information section, *https://www.cms.gov/medicare/payment/fee-for-service-providers/shared-savings-program-ssp-acos/guidance-regulations#Beneficiary_Information.*

notice at least once per agreement period. The ACO or ACO participant must provide this notice prior to or at the first primary care visit of the performance year (§ 425.312(a)(2)(iii)). For ACOs that have selected prospective assignment, the ACO or ACO participant must provide the standardized written notice to each prospectively assigned beneficiary at least once per agreement period, during the performance year for which the beneficiary is prospectively assigned to the ACO (§ 425.312(a)(2)(iv)). Additionally, in the CY 2023 PFS final rule (87 FR 69404), we finalized that the ACO or ACO participant must provide a verbal or written follow-up communication to the beneficiary no later than 180 days from the date the standardized written notice was provided and maintain record of such notice (§ 425.312(a)(2)(v)).

Over the years, the Shared Savings Program has received ongoing feedback that these beneficiary communication requirements can be operationally burdensome and may confuse beneficiaries, including causing some beneficiaries to believe they are being targeted by a fraudulent actor or have been enrolled in a managed care plan,[387] which ACOs then must work to address. Interested parties have identified that the beneficiary notice requirements implemented in some CMS Innovation Center models may be less burdensome for ACOs to implement. For example, under the ACO REACH model, ACOs must distribute beneficiary information notices by CMS-specified dates, including for beneficiaries aligned to the ACO at the start of the performance year and for beneficiaries who become aligned during the performance year.[388] Specifically, ACOs that participate in the ACO REACH model are required to distribute a beneficiary information notice by May 30 for beneficiaries who start the year aligned to the ACO and remain aligned by April 1.[389] By contrast, under the Shared Savings Program, ACOs that have selected preliminary prospective assignment with retrospective reconciliation must provide the beneficiary information notice either at or before a beneficiary's first primary care visit. Additionally, while ACOs that have selected prospective assignment are required to provide the standardized written notice in the form and manner set by CMS, we have historically required them to align with the same timing of at or before the beneficiary's first primary care visit.

We believe that fixed deadlines allow ACOs to better prepare for the distribution of the beneficiary notice, as they will have several months after the start of the year to organize their staff and resources, whereas the Shared Savings Program requirement tied to a beneficiary's first primary care visit, which could occur as early as the very beginning of the performance year, requires the ACO to be prepared to distribute the notice immediately at the start of the performance year.

b. Revisions

(1) Distribution Timing of Standardized Written Notices

We continue to believe that requiring ACOs to provide periodic beneficiary notifications affords ACOs and ACO participants an opportunity for direct engagement with beneficiaries, thereby serving to strengthen the beneficiary's relationship with the ACO and ACO participants from whom the beneficiary may receive care. The requirement to provide beneficiary notifications promotes transparency about ACO participants and their ACO providers/suppliers participating in the Shared Savings Program and educates beneficiaries on how ACO participation could improve their care experience.

At the same time, distributing these notices to beneficiaries imposes operational burden on ACOs and ACO participants. ACOs must accurately identify beneficiaries who require notification, operationalize workflows to distribute the notifications, and prepare for beneficiary questions and concerns.

We recognize that current operational timeframes can further contribute to implementation challenges. Operationally, CMS generally makes available the first beneficiary assignment list report for each PY in the month of December. We recognize this can be a very tight turnaround for ACOs to prepare beneficiary outreach processes for beneficiaries who begin receiving primary care services in the following month.

We recognize that ACOs have developed processes, workflows, or materials to meet the requirement for the timing for distributing the beneficiary notice by a deadline individualized by each beneficiary's first primary care visit. We proposed that ACOs would no longer be required to maintain those processes solely for purposes of complying with this requirement, which we believe will reduce ongoing administrative burden and expense. Nothing in this policy prohibits an ACO from continuing similar activities that it determines are beneficial, such as other beneficiary communications and marketing efforts, provided those activities comply with all otherwise applicable program requirements. We continue seeking policies that balance the benefits of beneficiary education and engagement with the burden placed on ACOs to maximize Shared Savings Program ACO participation and therefore the broad availability of ACOs and the benefits they can offer for beneficiaries. In the interest of an overall reduction in administrative burden, we proposed to modify § 425.312(a)(2)(iii) and § 425.312(a)(2)(iv) with the following changes.

First, we proposed to revise the requirement at § 425.312(a)(2)(iii) that ''[t]he standardized written notice must be furnished to all of these beneficiaries prior to or at the first primary care service visit during the first performance year in which the beneficiary receives a primary care service from an ACO participant.'' We proposed that the revised language would read, ''The standardized written notice must be furnished to all of these beneficiaries by May 30, unless CMS specifies a later date during the performance year.'' We also proposed a similar change to § 425.312(a)(2)(iv) to add a new sentence to that paragraph which states, ''The standardized written notice must be furnished to all of these beneficiaries by May 30, unless CMS specifies a later date during the performance year.'' These deadlines align with those used in the ACO REACH model. Beneficiaries must still receive the notice, but we believe this would allow ACOs to better prepare to distribute the notices and better prepare to answer the subsequent beneficiary questions they typically receive. We also believe that better aligning with CMS Innovation Center policies in this area would reduce burden for ACOs that compare policies across programs and models to determine the best fit for their organization. We do not believe this revised timing requirement impacts beneficiary engagement with the ACO or ACO participant. Beneficiaries would still receive the notification, and the

[387] Reimagining Beneficiary Engagement in Accountable Care Models, A Resource Published by HCTTF and NAACOS. *https://hcttf.org/wp-content/uploads/2026/03/HCTTF-NAACOS-2026-Resource-1.pdf.*

[388] ACO REACH Model Third Amended and Restated Participation Agreement (2023 Starters), Section 5.05 Beneficiary Notifications, Centers for Medicare & Medicaid Services, Center for Medicare and Medicaid Innovation, Last Modified: December 5, 2025.

[389] ACO REACH Model PY2025 Beneficiary Notification Process p. 2, Centers for Medicare & Medicaid Services, Center for Medicare and Medicaid Innovation.

ACO participants will have posted signs displayed in their facilities designed to alert beneficiaries to their practitioner's participation in an ACO (§ 425.312(a)(2)(i)) and allow the beneficiaries the opportunity to engage with the practitioner further. We remind interested parties that, irrespective of the policies finalized in this final rule, ACOs will continue to be permitted to communicate more frequently or thoroughly with beneficiaries if they wish to do so, as long as they comply with the marketing requirements detailed at § 425.310(a). This includes sharing supplemental ACO marketing materials alongside the beneficiary notification.

We proposed that the change would have an effective date of January 1, 2027 and stated that we anticipated this approach would reduce the net burden to ACOs and ACO participants of providing the beneficiary notification.

We sought comments on these proposals.

We received public comments on these proposals. The following is a summary of the comments we received and our responses.

Comment: Most commenters expressed broad support or general support with additional recommendations for the proposal to change the timeline for providing the standardized written notice to require that the notice be issued by May 30 during the performance year and believe it would increase flexibility and reduce burden for participating ACOs. A few commenters requested that CMS provide the final standardized written notice and related guidance with sufficient lead time for ACOs to prepare for PY 2027.

Response: We appreciate the comments in support of the proposed revisions to § 425.312(a)(2)(iii) and (iv) and agree that the changes will increase flexibility and reduce burden for ACOs. We intend to make the final standardized written notice and related guidance available with sufficient lead time for ACOs to prepare for PY 2027.

Comment: A few commenters opposed the proposed revision to change the timeline for providing the standardized written notice to require that the notice be issued by May 30 during the performance year, noting that they believed beneficiaries should have more timely notification of a healthcare provider's ACO affiliation so that beneficiaries may decline to share their claims data or choose a new healthcare provider.

Response: We agree with the commenters that timely notification of a healthcare professional's or practice's ACO affiliation is essential for beneficiaries to make informed decisions. This policy establishes a fixed deadline of May 30 of each performance year by which beneficiaries must be notified of their healthcare provider's affiliation with an ACO, which gives ACOs the predictability to plan to send beneficiary notifications. It does not necessarily mean that the beneficiary notification would be delayed compared to the current policy, which was based on a beneficiary's first primary care visit, which could happen after the May 30 deadline. We acknowledge that, for beneficiaries whose first primary care visit occurs before May 30, the revised deadline could result in those beneficiaries receiving the notice later than under the current policy. However, we do not expect this change to meaningfully diminish beneficiaries' opportunities to learn about their healthcare provider's participation in an ACO, as beneficiaries will continue to have access to information through other mechanisms, including required signage at ACO participant's healthcare facilities (§ 425.312(a)(2)(i)), which is especially valuable for beneficiaries who have not yet received the notification. We are also considering additional ways to improve beneficiaries' general understanding about ACOs and anticipate making additional beneficiary educational resources available soon through its website. Additionally, we have shared with ACOs an updated Beneficiary Notification and Education Guidance document [390] that more clearly communicates the requirements concerning ACO marketing to beneficiaries. This guidance will also be updated to reflect the policies finalized in this rule. We are utilizing the feedback we have received to improve CMS' beneficiary-focused education and outreach efforts and believe this policy fits in the overall strategy; however, we may continue to modify these policies in future rulemaking.

Comment: Some commenters asked for clarification regarding the impact of this policy on ACOs that have selected preliminary prospective assignment with retrospective reconciliation. Specifically, commenters are seeking clarification on the interaction with this assignment selection and the timing of the beneficiary information notice deadline, as these ACOs receive several refreshes of ''assignable beneficiary'' data during the performance year.

Response: ACOs that select preliminary prospective assignment with retrospective reconciliation will be required to send a beneficiary information notice to all the beneficiaries indicated in § 425.312(a)(2)(iii), also called ''assignable beneficiaries'' (as defined in § 425.20), by May 30 of each performance year. To operationalize this requirement, ACOs should use the list of assignable beneficiaries included in the initial assignment report package delivered before the start of the performance year to identify beneficiaries who must receive the standardized written notice by May 30. While ACOs receive updates to the list of assignable beneficiaries during the performance year, generally, none of those lists arrive with sufficient time for ACOs to prepare and notify beneficiaries prior to the May 30 deadline of that performance year. ACOs receive updates to the list of assignable beneficiaries to account for beneficiaries newly receiving services from their ACO or otherwise changing eligibility for assignment to the ACO throughout the course of the year. ACOs will need to notify beneficiaries identified as ''assignable beneficiaries'' after the initial assignment report by May 30 of the subsequent year if the beneficiaries remain on the list of ''assignable beneficiaries'' included in the quarter 4 report package delivered to ACOs early in the calendar year that follows the performance year.

Comment: A commenter had an alternative suggestion on the timing of distribution of the beneficiary information notice, suggesting that (1) the ACO be required to distribute the notice within 30 days before or after the patient's first primary care visit when that visit occurs December 2; and (2) requiring notification within 7 days if the first primary care visit occurs after December 2. The commenter stated that this approach would provide greater flexibility and allow beneficiaries who did not have a primary care visit earlier in the year to receive notification closer to their actual primary care visit.

Response: We appreciate this suggestion, but we believe that establishing a singular deadline to provide the beneficiary notification will result in a greater reduction in burden for ACOs, without a significant impact on beneficiary understanding. Under the existing requirement, the ACO could provide the notice months before the beneficiary's first visit and still satisfy the requirement that the notice be provided ''prior to . . . the first primary care visit during the performance year'' (§ 425.312(a)(2)(iii)). The May 30

[390] CMS Medicare Shared Savings Program Beneficiary Notification and Education Guidance, Version 4, September 2026.

deadline provides added flexibility for ACOs without requiring notices to be distributed on a schedule tied to each beneficiary's first primary care visit. As discussed elsewhere in this section, ACOs may continue to provide additional educational information and conduct outreach to beneficiaries, including through communications tailored to their beneficiary populations, consistent with applicable program requirements. We also believe that the commenter's suggestion could be more operationally difficult for ACOs to track based on feedback we have received from ACOs regarding mapping the timing of beneficiary visits and beneficiary notices accordingly.

Comment: A commenter suggested that CMS distribute the beneficiary notice to all beneficiaries, instead of requiring ACOs to distribute a beneficiary notice, in order to further reduce burden to ACOs and participating practices.

Response: While we appreciate the suggestion that CMS' distribution of beneficiary notices would further reduce burden for ACOs, we believe there is utility in beneficiaries receiving notifications from the ACO they are assigned to, in order to build the relationship between the beneficiary and the ACO and increase the likelihood that the beneficiary understands the types of support offered by the specific ACO. It would be impractical and administratively infeasible for CMS to collect individualized information about every ACO of the sort that ACOs often distribute in conjunction with the beneficiary notice and then distribute that information to each respective ACO's assigned beneficiaries.

Comment: A few commenters recommended that CMS provide ACOs flexibility in the methods used to furnish the notice, including electronic delivery options.

Response: ACOs are currently permitted to distribute the beneficiary notice in-person at the point of care, through mail, and through electronic delivery methods, as long as it aligns with the standard written format (§ 425.312(a)(2)). We appreciate this suggestion and understand there may be confusion among ACOs regarding implementation of beneficiary information notice policy. CMS intends to release more detailed subregulatory guidance to assist ACOs with understanding the flexibilities they have in distributing the notice.

After consideration of public comments, we are finalizing this policy as proposed beginning January 1, 2027. Specifically, we are revising § 425.312(a)(2)(iii) to read, ''The standardized written notice must be furnished to all of these beneficiaries by May 30, unless CMS specifies a later date during the performance year.'' We are also adding a new sentence to § 425.312(a)(2)(iv) to read, ''The standardized written notice must be furnished to all of these beneficiaries by May 30, unless CMS specifies a later date during the performance year.''

(2) Removal of Beneficiary Follow-Up Communication

In the CY 2023 PFS final rule (87 FR 70233), CMS finalized the requirement at § 425.312(a)(2)(v) that ACOs or ACO participants provide a verbal or written follow-up communication to the beneficiary no later than 180 days from the date the standardized written notice was provided. Currently, under § 425.312(a)(2)(v)(A), ''The follow-up communication must occur no later than 180 days from the date the standardized written notice was provided.'' Section 425.312(a)(2)(v)(B) requires ACOs to retain a record of the follow-up communication and that all beneficiaries receive the follow-up communication, and to make the records available to CMS upon request.

In comments summarized in the CY 2023 PFS final rule (87 FR 69961–69963), most commenters opposed the requirement to provide beneficiary follow-up communications, expressing concern that the follow-up communication would increase administrative and operational burden for ACOs without creating meaningful additional beneficiary benefit. Commenters noted that follow-up communications may require substantial resources to operationalize, including workflows to identify beneficiaries requiring outreach, conduct and document communications, respond to beneficiary questions and maintain records demonstrating compliance. Some commenters indicated that these activities could create competing demands during clinical encounters, requiring healthcare providers to devote visit time to explaining ACO participation and value-based care concepts rather than focusing on the beneficiary's immediate clinical needs. Commenters also raised concerns that repeated communications on similar materials could contribute to beneficiary confusion rather than improve understanding. Commenters suggested we explore other strategies and work with ACOs to promote beneficiary education and engagement.

While we considered the commenters' concerns when finalizing the follow-up communication requirement in the CY 2023 PFS rule, we adopted it with the expectation that it would improve beneficiary understanding of the Shared Savings Program and give beneficiaries the opportunity to ask questions. Since its implementation, however, we have not seen evidence that the follow-up communication improves beneficiaries' understanding of ACO assignment, value-based care, or the benefits of being in an ACO. Although we proposed to eliminate the follow-up communication requirement, we remain committed to improving beneficiary education about the Shared Savings Program. We are currently researching additional ways CMS can support beneficiary education, but we do not believe the 180-day follow-up communication requirement is helping achieve that goal. As noted earlier, we recognize that ACOs have developed processes and incurred expenses to meet these requirements. While we believe removing the requirement would relieve an ongoing burden and expense, ACOs are free to continue to utilize those processes to communicate with beneficiaries if they believe they provide a benefit, as long as such processes are consistent with any other applicable program requirements.

To be responsive to interested parties' feedback, prevent potential beneficiary confusion and reduce administrative burden to ACOs and ACO participants, we proposed to remove the requirement that ACOs must provide a follow up communication as specified in § 425.312(a)(2)(v). Specifically, we proposed to remove § 425.312(a)(2)(v) in its entirety.

We proposed that this change would be effective beginning January 1, 2027.

We sought comments on this proposal.

We received public comments on this proposal. The following is a summary of the comments we received and our responses.

Comment: Most commenters supported the proposed policy and believe it would reduce burden for participating ACOs, as ACOs are already in frequent communication with their beneficiaries to help manage their care. A commenter noted that an ACO spent $12,000 last year to meet the current requirements. A few commenters encouraged CMS to continue its broader work to improve beneficiary engagement in accountable care through personalized communications.

Response: We appreciate the supportive comments and agree that the changes will reduce financial and administrative burden for participating ACOs. We continue to actively work

towards improving beneficiary engagement and education.

Comment: A few commenters opposed the removal of the beneficiary follow-up notification. A commenter stated that beneficiaries should have additional opportunities to review the notice and ask questions about the ACO. Another commenter expressed concern about eliminating this requirement absent alternative efforts to educate beneficiaries about the benefits of value-based care. Another commenter stated that instead of eliminating the follow-up notification, ACOs should be encouraged to strengthen the clarity and effectiveness of the information they provide.

Response: While we agree it is important to educate beneficiaries about ACOs and the benefits of value-based care, we do not believe the beneficiary follow-up notification is meeting these goals. Since we implemented the requirement, we have not seen evidence that the follow-up communication improves beneficiaries' understanding of ACO assignment, value-based care, or the benefits of being in an ACO. Commenters did not clarify why they believe this notice specifically accomplishes these goals. At the same time, we have heard multiple reports of beneficiary confusion and administrative burden stemming from these communications.

We continue to believe that beneficiaries should have opportunities to learn about ACOs. As discussed previously, ACO participants remain required to post signs in their facilities informing beneficiaries of their participation in an ACO, and ACOs may continue to provide additional marketing, educational information and outreach tailored to their beneficiary populations, consistent with applicable program requirements. To support this, as discussed, we have shared with ACOs an updated Beneficiary Notification and Education Guidance document, which more clearly communicates the requirements concerning ACO marketing to beneficiaries.[391] This guidance will also be updated to reflect the policies finalized in this rule. CMS is also exploring additional ways to improve beneficiary education and engagement, including through educational resources and in partnership with ACOs to help ensure that beneficiaries receive clear and effective information. We believe these approaches, together with the standardized written notice requirement, can support beneficiary understanding without the additional administrative burden associated with the required follow-up communication.

After consideration of public comments, we are finalizing this policy as proposed beginning January 1, 2027. Specifically, we are removing § 425.312(a)(2)(v) in its entirety.

10. Request for Information: Specialty Care in the Shared Savings Program

We received public comments in response to this Request for Information: Specialty Care in the Shared Savings Program, and we appreciate the thoughtful input. We will consider the comments received for future rulemaking, technical assistance, and policy development.

H. Changes to the Regulations Associated With the Ambulance Fee Schedule

1. Ambulance Fee Schedule Background

Section 1861(s)(7) of the Act establishes an ambulance service as a Medicare Part B service where the use of other methods of transportation is contraindicated by the individual's condition, but only to the extent provided in regulations. Our regulations relating to coverage for ambulance services are set forth at 42 CFR part 410, subpart B. Since April 1, 2002, payment for ambulance services has been made under the ambulance fee schedule (AFS), which the Secretary established, as required by section 1834(l) of the Act, in 42 CFR part 414, subpart H. Payment for an ambulance service is made at the lesser of the actual billed amount or the AFS amount, which consists of a base rate for the level of service, a separate payment for mileage to the nearest appropriate facility, a geographic adjustment factor (GAF), and other applicable adjustment factors as set forth at section 1834(l) of the Act and § 414.610.

In accordance with section 1834(l)(3) of the Act and § 414.610(f), the AFS rates are adjusted annually based on an inflation factor. (For a discussion about the ambulance inflation factor (AIF), please see CY 2011 PFS final rule (75 FR 73397)). We stated in the CY 2011 PFS final rule that the AIF will be announced by instruction and on the CMS website. AIF transmittals are available on CMS' website: *https://www.cms.gov/medicare/payment/fee-schedules/ambulance/afs-regulations-and-notices* and in the Medicare Claims Processing Manual, Chapter 15, section 20.4). The AFS also incorporates two permanent add-on payments at § 414.610(c)(5)(i) and three temporary add-on payments at § 414.610(c)(1)(ii) and (c)(5)(ii) to the base rate and/or mileage rate.

2. Ambulance Extender Provisions

a. Amendment to Section 1834(l)(13) of the Act

Section 146(a) of the Medicare Improvements for Patients and Providers Act of 2008 (MIPPA) (Pub. L. 110–275, enacted July 15, 2008), amended section 1834(l)(13) of the Act to specify that, effective for ground ambulance services furnished on or after July 1, 2008, and before January 1, 2010, the ambulance fee schedule amounts for ground ambulance services shall be increased as follows:

- For covered ground ambulance transports that originate in a rural area or in a rural census tract of a metropolitan statistical area, the fee schedule amounts shall be increased by 3 percent.
- For covered ground ambulance transports that do not originate in a rural area or in a rural census tract of a metropolitan statistical area, the fee schedule amounts shall be increased by 2 percent.

The payment add-ons under section 1834(l)(13) of the Act have been extended several times. Most recently, section 6203 of the Consolidated Appropriations Act, 2026 (Pub. L. 119–75, February 3, 2026) amended section 1834(l)(13) of the Act to extend the payment add-ons through December 31, 2027. Thus, these payment add-ons apply to covered ground ambulance transports furnished before January 1, 2028.

We proposed to revise § 414.610(c)(1)(ii) to conform the regulations to this statutory requirement. (For a discussion of past legislation extending section 1834(l)(13) of the Act, please see the CY 2014 PFS final rule with comment period (78 FR 74438 through 74439), the CY 2015 PFS final rule with comment period (79 FR 67743), the CY 2016 PFS final rule with comment period (80 FR 71071 through 71072), the CY 2019 PFS final rule with comment period (83 FR 59681 through 59682), the CY 2024 PFS final rule with comment period (88 FR 79292 through 79293), and the CY 2026 PFS final rule with comment period (90 FR 49837)).

This statutory requirement is self-implementing. A plain reading of the statute requires only a ministerial application of the mandated rate increase and does not require any substantive exercise of discretion on the part of the Secretary.

We received public comments regarding this proposal. The following is

[391] CMS Medicare Shared Savings Program Beneficiary Notification and Education Guidance, Version 4, September 2026.

the summary of the comments we received and our response.

Comment: Several commenters supported the proposal and agreed with CMS that the statutory provision is self-implementing and that these provisions are critically important to protect access to ground ambulance services.

Response: We appreciate the commenters' support of these provisions. After consideration of the public comment that we received, we are finalizing our proposal to revise 414.610(c)(1)(ii) to conform the regulations to this statutory requirement.

b. Amendment to Section 1834(l)(12) of the Act

Section 414(c) of the Medicare Prescription Drug, Improvement and Modernization Act of 2003 (MMA) (Pub. L. 108–173, December 8, 2003) added section 1834(l)(12) to the Act, which specified that, in the case of ground ambulance services furnished on or after July 1, 2004, and before January 1, 2010, for which transportation originates in a qualified rural area (as described in the statute), the Secretary shall provide for a percent increase in the base rate of the fee schedule for such transports. The statute requires this percent increase to be based on the Secretary's estimate of the average cost per trip for such services (not taking into account mileage) in the lowest quartile of all rural county populations as compared to the average cost per trip for such services (not taking into account mileage) in the highest quartile of rural county populations.

Using the methodology specified in the July 1, 2004, interim final rule (69 FR 40288), we determined that this percent increase was equal to 22.6 percent. As required by the MMA, this payment increase was applied to ground ambulance transports that originated in a ''qualified rural area,'' that is, to transports that originated in a rural area comprising the lowest 25th percentile of all rural populations arrayed by population density. For this purpose, rural areas included Goldsmith areas (a type of rural census tract). This rural bonus is sometimes referred to as the ''Super Rural Bonus'' and the qualified rural areas (also known as ''super rural'' areas) are identified during the claims process via the use of a data field included in the CMS—supplied ZIP code file.

The Super Rural Bonus under section 1834(l)(12) of the Act has been extended several times. Most recently, section 6203 of the Consolidated Appropriations Act, 2026 (Pub. L. 119–75, February 3, 2026) amended section 1834(l)(12)(A) of the Act to extend this rural bonus through December 31, 2027. Therefore, we are continuing to apply the 22.6 percent rural bonus described in this section (in the same manner as in previous years) to ground ambulance services with dates of service before January 1, 2028, where transportation originates in a qualified rural area.

Accordingly, we proposed to revise § 414.610(c)(5)(ii) to conform the regulations to this statutory requirement. (For a discussion of past legislation extending section 1834(l)(12) of the Act, please see the CY 2014 PFS final rule with comment period (78 FR 74439 through 74440), CY 2015 PFS final rule with comment period (79 FR 67743 through 67744), the CY 2016 PFS final rule with comment period (80 FR 71072), the CY 2019 PFS final rule with comment period (83 FR 59682), the CY 2024 PFS final rule with comment period (88 FR 79293), and the CY 2026 PFS final rule with comment period (90 FR 49837 through 49838)).

This statutory provision is self-implementing. It requires an extension of this rural bonus (which was previously established by the Secretary) through December 31, 2027, and does not require any substantive exercise of discretion on the part of the Secretary.

We received public comments regarding this proposal. The following is the summary of the comments we received and our response.

Comment: Several commenters supported the proposal and agreed with CMS that the statutory provision is self-implementing and that these provisions are critically important to protect access to ground ambulance services.

Response: We appreciate the commenters' support of these provisions.

After consideration of the public comment that we received, we are finalizing our proposal to revise § 414.610(c)(5)(ii) to conform the regulations to this statutory requirement.

3. Ongoing Data Collection Requirements for the Medicare Ground Ambulance Data Collection System

In the CY 2027 PFS proposed rule (91 FR 44135) we provided an announcement that we expect to address the ongoing data collection requirements for the Medicare Ground Ambulance Data Collection System in the CY 2028 PFS rulemaking to include the Medicare Payment Advisory Commission (MedPAC)'s June 15, 2026, Report to the Congress's findings: *https://www.medpac.gov/document/june-2026-report-to-the-congress-medicare-and-the-health-care-delivery-system/*.

4. Changes in Geographic Delineations for Ambulance Payment

Under section 1834(l)(2)(C) of the Act, the Secretary is required to consider appropriate regional and operational differences in establishing the AFS. Historically, the AFS has used the same geographic area designations as the acute care hospital inpatient prospective payment system (IPPS) and other Medicare payment systems to account for appropriate regional (urban and rural differences). The use of consistent geographic standards for Medicare payment provides for consistency across the Medicare program.

The current geographic areas used under the AFS effective CY 2015 are based on OMB standards published on June 28, 2010 (75 FR 37246 through 37252) and Census 2010 Bureau data (OMB Bulletin No. 13–01). For a discussion of OMB's delineation of Core-Based Statistical Areas (CBSAs) and our implementation of the CBSA definitions under the AFS, we refer readers to the preamble of the CY 2007 AFS proposed rule (71 FR 30358 through 30361), the CY 2007 PFS final rule with comment period (71 FR 69712 through 69716), CY 2015 PFS proposed rule (79 FR 40372 through 40376), CY 2015 PFS final rule with comment period (79 FR 67744 through 67750), CY 2015 PFS final rule correction notice (79 FR 78716 through 78719), CY 2016 PFS proposed rule (80 FR 41788 through 41792), and the CY 2016 PFS final rule with comment period (80 FR 71072 through 71078).

In the July 16, 2021, **Federal Register** (86 FR 37777), OMB finalized a schedule for future updates based on results of the decennial Census updates to commuting patterns from the American Commuting Survey (ACS). In accordance with that schedule, on July 21, 2023, OMB released Bulletin No. 23–01. A copy of OMB Bulletin No. 23–01 may be obtained at: *https://www.whitehouse.gov/wp-content/uploads/2023/07/OMB-Bulletin-23-01.pdf.* According to OMB, the delineations reflect the 2020 Standards for Delineating Core Based Statistical Areas (''the 2020 Standards''), which appeared in the **Federal Register** on July 16, 2021 (86 FR 37770 through 37778), and the application of those standards to Census Bureau population and journey-to-work data (that is, 2020 Decennial Census, American Community Survey, and Census Population Estimates Program data).

OMB's 2020 Standards for Delineating Core Based Statistical Areas (86 FR

37778) defines a CBSA as a geographic entity with at least one core of at least 10,000 population, where there are two types of CBSAs. A metropolitan statistical area (MSA) is one type, with populations greater than 50,000 and a micropolitan statistical area (referred to in this discussion as a Micropolitan Area) is the other type as a CBSA associated with at least one core that has a population of at least 10,000 but less than 50,000. Counties that do not qualify for inclusion in a CBSA are deemed ''outside of a CBSA.''

The July 21, 2023 OMB Bulletin No. 23–01 contains a number of significant changes to the statistical areas in the United States and Puerto Rico. For example, our analysis shows that a total of 53 counties that were once considered part of a CBSA would be considered to be located outside of a CBSA whereas a total of 54 counties that were located outside of a CBSA would be located in a CBSA under the revised OMB delineations. We believe it is important for the ambulance fee schedule to use the latest labor market area delineations available as soon as reasonably possible in order to maintain a more accurate and up-to-date payment system that reflects the reality of population shifts.

Additionally, in the FY 2025 IPPS final rule with comment period (89 FR 69253), we finalized our proposal to adopt OMB's revised delineations based on OMB Bulletin No. 23–01 to delineate areas for purposes of applying the IPPS wage index. Given that ambulance services is a transport benefit where payment is based on the ZIP code of the ambulance point of pickup and in response to industry requests to update the geographic delineations and the statutory requirement at sections 1834(l)(9), (l)(12)(B)(iv), (l)(13)(A)(i), and (l)(14)(C) of the Act that require that we use the most recent version of the Goldsmith Modification to determine rural census tracts within MSAs, we proposed to update the geographic delineations, consistent with historical practice, rather than proposed to continue to use the current geographic delineations.

We believe it would be appropriate to adopt the same geographic area delineations for use under the AFS as are used under the IPPS and other Medicare payment systems. Thus, we proposed to make use of the new OMB delineations as described in the July 21, 2023, OMB Bulletin No. 23–01 beginning in CY 2027, along with the geographic areas based on the most version of the Goldsmith Modification, to more accurately identify urban and rural areas for AFS payment purposes.

We believe that combining the updated OMB delineations with the Goldsmith Modification's Rural-Urban Commuting Area (RUCA) codes more realistically reflect rural and urban populations, and that the use of such delineations and codes under the AFS would result in more accurate payment. Under the AFS, consistent with our current definitions of urban and rural areas (42 CFR 414.605), MSAs would continue to be recognized as urban areas, while Micropolitan Areas and other areas outside MSAs, and rural census tracts within MSAs (as discussed later in this section), would be recognized as rural areas.

In addition to the OMB's statistical area delineations, the current geographic areas used in the AFS are, as just stated, based on the most recent version of the Goldsmith Modification. Sections 1834(l)(9), (l)(12)(B)(iv), (l)(13)(A)(i), and (l)(14)(C) of the Act require that we use the most recent version of the Goldsmith Modification to determine rural census tracts within MSAs. These rural census tracts are considered rural areas under the AFS (see § 414.605). In the CY 2015 PFS final rule with comment period (79 FR 67744 through 67750), we adopted the most recent (at that time) version of the Goldsmith Modification, designated as RUCA codes.

RUCA codes use urbanization, population density, and daily commuting data to categorize every census tract in the country. For a discussion about RUCA codes, we refer the reader to the CY 2007 PFS final rule with comment period (71 FR 69714 through 69716), the CY 2015 PFS final rule with comment period (79 FR 67745 and 67746), CY 2015 PFS final rule correction notice (79 FR 78716 through 78719), and the CY 2016 PFS final rule with comment period (80 FR 71073 through 71074).

As stated previously, on July 21, 2023, OMB issued Bulletin No. 23–01, which established revised delineations for Metropolitan Statistical Areas, Micropolitan Statistical Areas, and Combined Statistical Areas, and provided guidance on the use of the delineations of these statistical areas. Several modifications of the RUCA codes were necessary to take into account updated commuting data and the revised OMB delineations. We refer readers to the U.S. Department of Agriculture's Economic Research Service website for a detailed listing of updated RUCA codes found at: *https://www.ers.usda.gov/data-products/rural-urban-commuting-area-codes.aspx.*

The updated RUCA code definitions were introduced on July 31, 2025, and are based on data from the U.S. Bureau of the Census, Department of Commerce, 2020 Census of Population and Housing and the 2017–21 Census Transportation Planning Package (CTPP) special tabulation for the Department of Transportation and the American Association of State Highway and Transportation Officials. We proposed to adopt the most recent modifications of the RUCA codes beginning in CY 2027, to recognize levels of rurality in census tracts located in every county across the nation, for purposes of payment under the AFS. If we adopt the most recent RUCA codes, many counties that are designated as urban at the county level based on population would have rural census tracts within them that would be recognized as rural areas through our use of RUCA codes.

The 2020 Primary RUCA codes are as follows:

- Metropolitan core: primary commuting flow is within an urban area (UA) of 50,000 or more people (metro UA).
- Metropolitan high commuting: primary commuting flow is 30 percent or more to a metro UA.
- Metropolitan low commuting: primary commuting flow is 10 percent to 30 percent to a metro UA.
- Micropolitan core: primary flow is within an urban area of 10,000 to 49,999 people (micro UA).
- Micropolitan high commuting: primary commuting flow is 30 percent or more to a micro UA.
- Micropolitan low commuting: primary commuting flow is 10 percent to 30 percent to a micro UA.
- Small town core: primary commuting flow is within an urban area of 9,999 or fewer people (small town UA).
- Small town high commuting: primary commuting flow is 30 percent or more to a small town UA.
- Small town low commuting: primary commuting flow is 10 percent to 30 percent to a small town UA.
- Rural areas: primary commuting flow is to a tract outside an UA.

Based on this classification, and consistent with our current policy as set forth in the CY 2015 PFS final rule with comment period (79 FR 67745), we proposed to designate any census tracts falling at or above RUCA level 4.0 as rural areas for purposes of payment for ambulance services under the AFS. As discussed in the CY 2015 PFS final rule with comment period (79 FR 67745), the Federal Office of Rural Health Policy (formerly the Office of Rural Health Policy) within the Health Resources and Services Administration (HRSA) determines eligibility for its rural grant

programs through the use of the RUCA code methodology. Under this methodology, HRSA designates any census tract that falls at RUCA level 4.0 or higher as a rural census tract. In addition to designating any census tracts falling at or above RUCA level 4.0 as rural areas, under the updated RUCA code definitions, HRSA has also designated as rural census tracts those census tracts with RUCA codes 2 or 3 that are at least 400 square miles in area with a population density of no more than 35 people.

We refer readers to HRSA's website at: *https://www.hrsa.gov/rural-health/about-us/what-is-rural* for additional information. Consistent with the HRSA guidelines discussed previously and the policy we adopted in the CY 2015 PFS final rule with comment period (79 FR 67750), we proposed for CY 2027 to designate as rural areas those census tracts that fall at or above RUCA level 4.0. We continue to believe that this HRSA guideline accurately identifies rural census tracts throughout the country, and thus would be appropriate to apply for AFS payment purposes.

Also, consistent with the policy we finalized in the CY 2015 PFS final rule with comment period (79 FR 67749), we would not designate as rural areas those census tracts that fall at RUCA levels 2 or 3 that are at least 400 square miles in area with a population density of no more than 35 people. We have determined that it is not feasible to implement this guideline due to the complexities of identifying these areas at the ZIP code level. We do not have sufficient information available to identify the ZIP codes that fall in these specific census tracts.

Also, payment under the AFS is based on the ZIP codes; therefore, if the ZIP code is predominantly metropolitan but has some rural census tracts, we do not split the ZIP code areas to distinguish further granularity to provide different payments within the same ZIP code. We believe that payment for all ambulance transportation services at the ZIP code level provides for a more consistent and administratively feasible payment system.

For example, if we were to pay based on ZIP codes for some areas and counties or census tracts for other areas, there are circumstances where ZIP codes cross county or census tract borders and where counties or census tracts cross ZIP code borders. Such overlaps in geographic designations would overly complicate our ability to appropriately assign ambulance transportation services to geographic areas for payment under the AFS. Therefore, under the AFS, we would not designate as rural areas those census tracts that fall at RUCA levels 2 or 3 that are at least 400 square miles in area with a population density of no more than 35 people. We invited comments on this proposal.

As we stated in the CY 2015 PFS final rule with comment period (79 FR 67746), the adoption of the most current OMB delineations and the updated RUCA codes would affect whether certain areas are recognized as rural or urban. The distinction between urban and rural is important for ambulance payment purposes because urban and rural transports are paid differently. The determination of whether a transport is urban or rural is based on the point of pick-up for the transport, and thus a transport is paid differently depending on whether the point of pick-up is in an urban or a rural area. During claims processing, geographic designation of urban, rural, or super rural is assigned to each claim for an ambulance transport based on the point of pick-up ZIP code that is indicated on the claim.

Currently, section 1834(l)(12) of the Act (as amended by section 6203 of the Consolidated Appropriations Act, 2026) specifies that, for services furnished during the period July 1, 2004 through December 31, 2027, the payment amount for the ground ambulance base rate is increased by a ''percent increase'' (Super Rural Bonus) where the ambulance transport originates in a ''qualified rural area,'' which is a rural area that we determine to be in the lowest 25th percentile of all rural populations arrayed by population density (also known as a ''super rural area''). We implement this Super Rural Bonus in § 414.610(c)(5)(ii). Adoption of the revised OMB delineations and the updated RUCA codes would have no negative impact on ambulance transports in super rural areas, as none of the current super rural areas would lose their status due to the revised OMB delineations and the updated RUCA codes.

The adoption of the new OMB delineations and the updated RUCA codes would affect whether transports are eligible for other rural adjustments under the AFS statute and regulations. For ground ambulance transports where the point of pick-up is in a rural area, the mileage rate is increased by 50 percent for each of the first 17 miles (§ 414.610(c)(5)(i)). For air ambulance services where the point of pick-up is in a rural area, the total payment (base rate and mileage rate) is increased by 50 percent (§ 414.610(c)(5)(i)). Furthermore, under section 1834(l)(13) of the Act (as amended by section 6203 of the Consolidated Appropriations Act, 2026) for ground ambulance transports furnished through December 31, 2027, transports originating in rural areas are paid based on a rate (both base rate and mileage rate) that is 3 percent higher than otherwise is applicable. (See also § 414.610(c)(1)(ii)).

If we adopt OMB's revised delineations and the updated RUCA codes, ambulance providers and suppliers that pick up Medicare beneficiaries in areas that would be Micropolitan or otherwise outside of MSAs based on OMB's revised delineations or in a rural census tract of an MSA based on the updated RUCA codes (but are currently within urban areas) may experience increases in payment for such transports because they may become eligible for the rural adjustment factors discussed previously, while those ambulance providers and suppliers that pick up Medicare beneficiaries in areas that would be urban based on OMB's revised delineations and the updated RUCA codes (but are currently in Micropolitan Areas or otherwise outside of MSAs, or in a rural census tract of an MSA) may experience decreases in payment for such transports because they would no longer be eligible for the rural adjustment factors discussed previously. The use of the revised OMB delineations and the updated RUCA codes would mean the recognition of new urban and rural boundaries based on the population migration that occurred over a 10-year period, between 2010 and 2020. As discussed previously in this section, we proposed to use the updated 2020 RUCA codes to identify rural census tracts within MSAs, such that the census tracts falling at or above RUCA level 4.0 would continue to be designated as rural areas. To determine which ZIP codes are included in each such rural census tract, we proposed to use the ZIP code approximation file developed by HRSA. This file includes the 2020 RUCA code designation for each ZIP code and can be found at: *https://www.ers.usda.gov/data-products/rural-urban-commuting-area-codes.* If ZIP codes are added over time to the USPS ZIP code file (and thus are not included in the 2020 ZIP code approximation file provided to us by HRSA) or if ZIP codes are revised over time, we would determine the appropriate urban/rural designation for such ZIP code based on any updates provided on the HRSA and OMB websites located at: *https://www.ers.usda.gov/data-products/rural-urban-commuting-area-codes.aspx* and *https://www.whitehouse.gov/wp-*

content/uploads/2023/07/OMB-Bulletin-23–01.pdf.

Based on the April 2026 United States Postal Service (USPS) ZIP code file that we used in the proposed rule (91 FR 44137) to assess the impacts of the revised geographic designations; there are a total of 42,956 ZIP codes in the U.S. Table B–H1 sets forth an analysis of the number of ZIP codes that changed urban/rural status in each U.S. State and territory using the April 2026 USPS ZIP code file, the revised OMB delineations (OMB Bulletin No. 23–01), and the updated 2020 RUCA codes. Based on this data, the geographic designations for approximately 95.87 percent of ZIP codes would be unchanged by OMB's revised delineations and the updated RUCA codes. As reflected in Table B–H1, more ZIP codes would change from urban to rural (1,172, or 2.73 percent) than rural to urban (602, or 1.40 percent).

In general, it is expected that ambulance providers and suppliers in 1,172 ZIP codes within 47 States and Puerto Rico may experience payment increases if we adopt the revised OMB delineations and the updated RUCA codes, as these areas would be redesignated from urban to rural. The State of Maryland would have the highest percentage of ZIP codes changing from urban to rural with a total of 49, or 7.78 percent. Ambulance providers and suppliers in 602 ZIP codes within 43 States may experience payment decreases if we adopt the revised OMB delineations and the updated RUCA codes, as these areas would be redesignated from rural to urban. The State of South Carolina would have the highest percentage of ZIP codes changing from rural to urban (20, or 3.68 percent). Our findings are illustrated in Table B–H1.

TABLE B-H1: ZIP CODES ANALYSIS BASED ON OMB'S REVISED DELINEATIONS AND UPDATED RUCA CODES

State/ Territory*	Total ZIP Codes	Total ZIP Codes Changed Rural to Urban	Percentage of Total ZIP Codes	Total ZIP Codes Changed Urban to Rural	Percentage of Total ZIP Codes	Total ZIP Codes Not Changed	Percentage of Total ZIP Codes Not Changed

* ZIP code analysis includes U.S. States and Territories (FM—Federated States of Micronesia, GU—Guam, MH—Marshall Islands, MP—Northern Mariana Islands, PW—Palau, AS—American Samoa; VI—Virgin Islands; PR—Puerto Rico). Missouri is divided into east and west regions due to work distribution of the Medicare Administrative Contractors (MACs): EM—East Missouri, WM—West Missouri. Johnson and Wyandotte counties in Kansas were changed as of January 2010 to East Kansas (EK), and the rest of the state is West Kansas (WK).

For more detail on the impact of our proposals, in addition to Table B–H1, the following files are available through the Internet on the Ambulances Services Center website at: *https://www.cms.gov/medicare/coverage/ambulances-services-center;* ZIP Codes By State Changed From Urban To Rural: ZIP Codes By State Changed From Rural To Urban: List of ZIP Codes With RUCA Code Designations: and Complete List of ZIP Codes.

We invited public comments on our proposals to make use of the revised OMB delineations as set forth in the July 21, 2023 OMB Bulletin No. 23–01 and the most recent modifications of the RUCA codes as discussed previously for CY 2027 for purposes of payment under the AFS.

We received public comments on these proposals. The following is a summary of the comments we received and our responses.

Comment: Several commenters supported the proposed update of the geographic delineations used for ambulance payment and also supported that the adoption of the revised OMB delineations and the updated RUCA codes would have no negative impacts on ambulance transports in super rural areas, as none of the current super rural areas would lose their status due to the proposed changes.

Response: We appreciate the commenters' support.

Comment: An initial commenter stated that it may be the case that some ZIP codes should have a more favorable geographic designation in this round, as well as in future modifications. To address this concern raised by the initial commenter, the initial commenter and some other commenters recommended CMS adopt two additional safeguards to protect beneficiary access to ground ambulance services. The first safeguard that the commenters suggested is to maintain current geographic designation

if there are 1,000 people per square mile or fewer in the ZIP code that would be redesignated. Those commenters stated that this safeguard would protect patients in low-population-density areas from potential access problems by ensuring their ZIP code's status remains unchanged.

The second safeguard that the commenters recommended is an appeals process where an ambulance provider or supplier could ask CMS for reconsideration of a ZIP code designation within a 1-year period after the changes in geographic delineations have been finalized.

Response: None of the commenters provided specific examples of what ZIP codes should have a more favorable geographic designation. Further, we did not propose an additional methodology to preserve the current geographic designations for ZIP codes with a population density of 1,000 people per square mile or fewer. Implementing such a methodology would not be feasible given the complexities of identifying these areas at the ZIP code level. For instance, it is unclear how to account for ZIP codes that span multiple counties.

We believe that the most current OMB delineations, coupled with the updated RUCA codes more accurately reflect the urban and rural nature of areas across the county, and thus, we believe the use of the most current OMB delineations and RUCA codes under the AFS enhances the accuracy of AFS payments. Further, as discussed previously, we believe that our methodology of designating rural geographic areas by using OMB's delineations, and by using RUCA codes 4.0 and above to identify rural census tracts within MSAs, is appropriate for AFS payment purposes because it rectifies the limitations of broad county-level data, ensuring that isolated areas receive necessary higher reimbursement rates to cover higher structural operating costs.

We did not propose an appeals process where an ambulance provider or supplier could ask CMS for reconsideration of a ZIP code designation within a one-year period after the changes in geographic delineations have been finalized. If an ambulance provider or supplier has concerns about a ZIP code's delineation, they should contact OMB. If they have concerns about a ZIP code's RUCA code designation, they should contact HRSA.

Comment: Some commenters urged CMS to reconsider designating as rural areas those census tracts that fall at RUCA levels 2 or 3 that are at least 400 square miles in area with a population density of no more than 35 people. A commenter recommended a reconsideration appeal process for ZIP codes containing census tracts that qualify as rural under RUCA 2 or 3 but do not receive a corresponding ZIP-level designation. The commenter further stated that they understand CMS's concern that it lacks an administrable method for translating tract-level RUCA 2 and 3 classifications into ZIP code designations. However, the commenter does not believe that concern is insurmountable. The commenter suggested that CMS allow a supplier or provider to petition for reconsideration by demonstrating, using HRSA's published criteria, that a majority of the census tracts or population within the ZIP code meets the RUCA 2 or 3 large-area or low-density rural criteria. Under this approach, the petitioner would provide the tract-to-ZIP crosswalk, and CMS would verify the analysis against the criteria already in use.

Response: As we stated previously, we would not designate as rural areas those census tracts that fall at RUCA levels 2 or 3 that are at least 400 square miles in area with a population density of no more than 35 people. We have determined that it is not feasible to implement this guideline due to the complexities of identifying these areas at the ZIP code level. We do not have sufficient information available to identify the ZIP codes that fall in these specific census tracts.

Also, payment under the AFS is based on the ZIP codes; therefore, if the ZIP code is predominantly metropolitan but has some rural census tracts, we do not split the ZIP code areas to distinguish further granularity to provide different payments within the same ZIP code. We believe that payment for all ambulance transportation services at the ZIP code level provides for a more consistent and administratively feasible payment system. For example, if we were to pay based on ZIP codes for some areas and counties or census tracts for other areas, there are circumstances where ZIP codes cross county or census tract borders and where counties or census tracts cross ZIP code borders. Such overlaps in geographic designations would overly complicate our ability to appropriately assign ambulance transportation services to geographic areas for payment under the AFS.

Comment: A commenter supports our proposal to classify census tracts with RUCA codes of 4.0 or higher as rural for AFS payment purposes. The commenter stated that this more granular methodology can identify rural communities that might otherwise be absorbed into a broader urban classification. However, the commenter stated that the RUCA methodology may not identify every ambulance operation that performs a predominantly rural function and recommends that CMS consider additional criteria for circumstances in which a pickup ZIP code's geographic classification does not accurately reflect the rural role of the ambulance provider or supplier or healthcare facility. The commenter stated that the potential criteria should include all of the following:

- An ambulance provider or supplier -location standard that recognizes operations for which a majority of Medicare transports serve rural communities.
- Recognition of hospitals and facilities holding a federal rural-related designation, even when their pickup ZIP codes are classified as urban.
- Consideration of low transport volumes, extended travel distances, limited hospital access, and regional referral patterns.
- Protection for air and ground medical bases serving broad rural, frontier, or medically underserved areas.
- A defined process through which ambulance providers may request review of a classification that does not accurately reflect their service responsibilities.

According to the commenter, these additional criteria would complement, not replace, the proposed RUCA methodology. The commenter stated that this additional methodology would give CMS a way to address documented circumstances in which ZIP-code classification alone does not fully capture the rural nature of an ambulance operation or the population it serves. The commenter further recommended: (1). a predominantly rural provider-supplier location standard for air ambulance bases where at least 50% of Medicare transports originate in rural or super-rural pickup ZIP codes. (2). Qualifying bases should receive the rural ground and air ambulance adjustment for all Medicare transports. Alternatively, the commenter recommended CMS should establish a review process through which a provider or supplier may demonstrate that an operation functions as a predominantly rural regional resource.

The commenter also recommended a rural base exception for a ground and air ambulance transport originating from an urban-classified hospital or other pickup location when the responding aircraft is assigned to a rural or super-rural base where the transport should receive the rural air ambulance adjustment applicable to the base, recognizing that the base must maintain

the air and ground vehicles, clinical crews, equipment, communications systems, and 24/7 readiness required to serve its rural service area.

Response: We did not propose an additional methodology or rural base exception. We believe that the most current OMB delineations, coupled with the updated RUCA codes more accurately reflect the urban and rural nature of areas across the county, and thus, we believe the use of the most current OMB delineations and RUCA codes under the AFS sufficiently enhances the accuracy of AFS payments. The payment for an ambulance transport is based on the ZIP code of the point of the ambulance pick-up.

Comment: A commenter recommended that CMS establish a five-year transition for ZIP codes that move from rural to urban under the new classifications. For these ZIP codes, the commenter stated that CMS should apply a five-year blended payment rate. According to the commenter, this approach would provide providers and suppliers and communities with a reasonable period to adjust to the payment changes and would be consistent with transition approaches CMS has used when other Medicare payment systems have adopted updated OMB delineations.

Response: We did not propose a 5-year transition period for ZIP codes that move from rural to urban (1.40 percent of ZIP codes). We believe that it is important to use the most updated OMB delineations and updated RUCA codes based on the latest census data for AFS payment purposes because it directly impacts the accuracy, fairness, and statutory compliance of health care payment and funding allocation.

Comment: A commenter supported the proposal to redesignate 12 ZIP codes in Puerto Rico from urban to rural and stated that these changes better reflect the operational reality of ambulance in the affected communities, where mountainous or coastal geography, limited road alternatives, extended response and transport times, and uneven access to appropriate receiving facilities materially increase the cost and complexity of service.

However, the commenter opposed the proposal to redesignate two ZIP codes, 00707 (Maunabo) and 00742 (Roosevelt Roads/Ceiba) from rural to urban. The commenter stated that these areas continue to present the access, travel-time, infrastructure, and destination constraints commonly associated with rural ambulance operations. The commenter further stated that the classification based on commuting patterns or broad statistical boundaries may not adequately capture prehospital realities. The commenter requested that these two ZIP codes: retain their rural designation pending an operational-access review that considers ambulance travel time, road connectivity, receiving facility capability, and unit cycle time.

Response: ZIP codes 00707 and 00742 are listed under the San Juan-Bayamón-Caguas, PR CBSA with a RUCA code of 1, Metropolitan core: primary commuting flow is within an urban area (UA) of 50,000 or more people (metro UA). We designate rural census tracts in a Metropolitan Statistical Area (MSA) falling at or above RUCA level 4.0 as rural areas. HRSA also uses this methodology. We continue to believe that this HRSA guideline accurately identifies rural census tracts throughout the country and thus would be appropriate to apply for AFS payment purposes.

Comment: A commenter supports the proposal to redesignate the 14 ZIP codes in Maine that will change their designation from urban to rural. However, the commenter opposes the proposal to redesignate the 15 ZIP codes that will change from rural to urban. The commenter also recommended that CMS reclassify the entirety of Penobscot County outside of the direct Bangor MSA as rural.

Response: The 15 ZIP codes in Maine met the criteria to change their designations from rural to urban. Penobscot County is located in the Bangor MSA according to OMB's revised delineations. If an ambulance provider or supplier has an issue with a ZIP code's delineation, they should contact OMB. If an ambulance provider or supplier has an issue with a RUCA code designation of a ZIP code, they should contact HRSA.

After consideration of public comments, we are finalizing our proposed changes to make use of the new OMB's revised delineations and the most recent modification of the RUCA codes to recognize levels of rurality in census tracts falling at or above RUCA code level 4.0 as rural areas for purposes of payment under the AFS.

I. Request for Information (RFI) on Duplicate Laboratory Testing, Imaging, and Result Sharing and Interoperability

1. Overview

Diagnostic imaging and laboratory testing are critical to determining a patient's course of treatment. Imaging data and test results are often siloed within the acquiring systems' electronic health record and inaccessible outside of those systems. Treating health care providers often do not even know of the existence of these siloed results. The inaccessibility of laboratory and imaging data due to siloing results in incomplete or delayed care management and duplicative testing, with concomitant increased costs (and in the case of duplicative diagnostic imaging, unnecessary radiation exposure).

2. Purpose of the RFI

In the CY 2027 PFS proposed rule (91 FR 44139 through 44141), we issued an RFI to gather input from interested parties—including clinicians, laboratories, imaging health care providers, health systems, payers, health IT developers, and other interested parties—to inform potential actions aimed at addressing the interoperability and duplicate testing concerns described earlier in this section.

3. Potential Mechanisms for Addressing Duplicative Payment

In the CY 2027 PFS proposed rule (91 FR 44139), we described several mechanisms we are exploring to address duplicate payment for diagnostic laboratory and image testing:

- Clarifications to billing instructions to laboratories and imaging centers on parameters of duplicate laboratory or imaging tests;
- Local Medicare Administrative Contractor (MAC) edits that would result in non-payment or reductions in payment as applicable for duplicate laboratory or imaging tests;
- Use of payment integrity levers to recoup payments from health care providers and suppliers who performed duplicate laboratory or imaging tests; and
- Application of frequency limitations to certain tests where clinically appropriate.

We noted that frequency limitations are already in use in certain contexts. For example, a Local Coverage Decision (LCD) from a MAC limits testing for Vitamin D levels (L33996—Vitamin D Assay Testing), providing that once a beneficiary has been shown to be Vitamin D deficient, further testing is medically necessary only to ensure adequate replacement has been accomplished, with annual testing thereafter being appropriate depending on the indication and other mitigating factors. We stated that we believe there are likely other diagnostic laboratory tests that should similarly be subject to frequency limitations.

We also recognized that in some cases more frequent testing is clinically justified and therefore asked for input not only on which laboratory and

imaging tests should be subject to frequency limitations, but also on what exceptions should be permitted to ensure beneficiary access is not inappropriately restricted.

We asked how CMS can enforce these limitations without restricting beneficiary access to necessary care. Specifically, we asked how practitioners can communicate clinical justification for repeat testing in specific circumstances—for example, in cases of trauma, stroke, or evolving emergencies where repeat imaging may be clinically appropriate.

We also asked for input on the following questions:

- Should CMS consider possible changes to payment policies when diagnostic tests are billed duplicatively; that is, additional imaging or diagnostic laboratory tests for the same condition? For example, is there a time period during which an image or laboratory test should automatically be considered ''duplicate'' and therefore subject to payment consequences? To which kinds of tests or subsets of tests should such policies apply?
- We asked clinicians and payors, who have likely addressed or considered these or similar issues, to share their experience and perspective.

4. Laboratory and Imaging Interoperability

Section 4003 of the 21st Century Cures Act (Pub. L. 114–255) amended section 3000 of the PHSA to add a new paragraph (10) to include a statutory definition of ''interoperability.'' Interoperability is defined to mean, with respect to health information technology, such health information technology that—(A) enables the secure exchange of electronic health information with, and use of electronic health information from, other health information technology without special effort on the part of the user; (B) allows for complete access, exchange, and use of all electronically accessible health information for authorized use under applicable State or Federal law; and (C) does not constitute information blocking as defined in section 3022(a) of the Public Health Service Act.

In the CY 2027 PFS proposed rule (91 FR 44140 through 44141), we described how several agencies within HHS have sought public input on interoperability for various health programs. We noted that CMS views duplicate imaging and laboratory testing as one of several use cases in which the lack of clinical interoperability causes non-trivial beneficiary harm and program integrity concerns. In recognition of that perspective, the broader department, and the Office of the National Coordinator for Health Information Technology (ONC) in particular, adopts standards that facilitate easier exchange of diagnostic clinical information and includes criteria in the ONC Health IT Certification Program that address the certification of health IT to exchange this information. In the January 30, 2026 **Federal Register** (91 FR 4054), ONC published an RFI titled, ''Request for Information: Diagnostic Imaging Interoperability Standards and Certification''. A summary of the efforts described in the January 2026 RFI (91 FR 4055), to build diagnostic imaging requirements into health IT certification, is available in the CY 2027 PFS proposed rule (91 FR 44140).

Another example of HHS seeking public input on interoperability was in the Request for Information; Health Technology Ecosystem'' which appeared in the May 16, 2025 **Federal Register** (90 FR 21034) (hereinafter ''Health Technology Ecosystem RFI''). The comments in response to the Health Technology Ecosystem RFI stated that the imaging exchange environment remains fragmented and unreliable, with ongoing dependence on CDs and DVDs and limited availability of modern, API-enabled tools that would allow patients and health care providers to access and share images seamlessly. Interested parties also raised privacy and security considerations that must be accounted for as exchange capabilities evolve. Other public feedback highlighted support for building on existing standards rather than creating entirely new exchange paradigms. Commenters explained that laboratory interoperability had similar patterns regarding data exchange, where challenges frequently stem from differing ordering workflows, variations in result reporting practices, local coding conventions, and inconsistent implementation of standards. These issues mirror broader interoperability challenges and reinforce the need for coordinated, standards-based approaches across diagnostic domains.

Other key information received in response to the Health Technology Ecosystem RFI:

- The current system of fragmented patient portals is unworkable.
- A unified, ''one-stop shop'' for health records is the universal goal.
- API access must go beyond the USCDI data set to the full electronic health information (EHI).
- Existing data access tools are insufficient.

In the CY 2027 PFS proposed rule (91 FR 44141) we explained that based on this input, we believe CMS can help improve interoperability between laboratories and physicians, hospitals, and other care delivery organizations. Specifically, participation in a national interoperability network for exchanging diagnostic imaging and laboratory results in a standardized format remains top of mind for the Department. Such participation would allow physicians, hospitals, laboratories, and other care delivery organizations to more easily access relevant clinical data to prevent the duplicate imaging and testing discussed previously in this section. We noted that network participation alone may not solve the problem. Networks must resolve fundamental technical issues like authentication (for example, are you who you say you are?); authorization (for example, are you allowed to access the data?); and patient matching (for example, what records are associated with the individual in question?). Without a reliable way to match records across systems, even well-connected networks would return incomplete or incorrect results.

We also explained that we considered building on the existing Electronic Notifications Condition of Participation (CoP) at 42 CFR 482.24(d) to require hospitals to participate in a national interoperability network. We stated that we believe that the relationship to patient health and safety is clear: timely and accurate information leads to coordinated, safer care and treatment decisions for patients. While we believe a CoP, for Medicare and Medicaid participating hospitals, would be an appropriate mechanism to drive interoperability, we also recognize that unlike other provider types the only statutorily available penalty for noncompliance with the hospital CoPs is termination from the Medicare program, as provided under section 1866(b)(2)(A) and (B) of the Act. We believe this would be overly burdensome. However, we stated that we will continue to monitor hospital advances in interoperability and may consider future rulemaking or look to other programs like the Medicare Promoting Interoperability Program or the Hospital Inpatient Quality Reporting program (IQR) or both.

Building upon the RFIs noted previously, we asked for input on the following questions specific to diagnostic laboratory and imaging interoperability:

- Because image exchange can involve substantial technical and operational costs, should HHS or CMS consider incentives to support adoption and implementation, and if so, what form should those incentives take?

- Given variability in conformance to existing laboratory and imaging exchange standards, would interested parties find value in expanded conformance testing tools, certification approaches, or implementation guidance?
- How should CMS account for cases in which repeat imaging occurs because prior imaging results were not available for timely, standards-based reuse? Should CMS consider payment, quality, or participation policies that create accountability for the initial imaging provider, furnishing entity, or facility when failure to make results reusable contributes to avoidable repeat imaging? Are there penalties or disincentives for non-compliance we should consider?
- For laboratory interoperability specifically, what barriers continue to impede exchange despite the availability of established standards, and what policy levers could help address those barriers? Should we consider incentives to support laboratory adoption and implementation of health data standards?
- Should CMS establish a minimum data standard for result shareability, for example, a United States Core Data for Interoperability (USCDI+) supplement for imaging and laboratory results, requiring all participating entities to deliver both a structured Fast Healthcare Interoperability Resources (FHIR) R4 Diagnostic Report resource and a human-readable Portable Document Format/Archive (PDF/A) rendition to the ordering health care provider's designated endpoint as a condition of Medicare payment? How should CMS address health care providers who have not yet implemented FHIR-native workflows, especially in rural areas?

We received public comment on this RFI. Commenters from a variety of interested parties, including professional organizations, hospitals, physician offices and the public provided feedback.

Comment: In general, commenters support CMS efforts to reduce costs associated with duplicative testing and imaging. However, some commenters do not support CMS denying Medicare payment for duplicative testing. These commenters noted that often times duplicate testing may be clinically necessary, and health care providers should not be penalized if access to prior results is not readily available. Some commenters expressed that improving laboratory and digital imaging interoperability should be addressed and recommend CMS work with interested parties and solicit feedback.

Response: We thank the commenters for their feedback.

IV. Updates to the Quality Payment Program

A. CY 2027 Modifications to the Quality Payment Program Reporting and Data Submission

1. Executive Summary

a. Overview

This section of this final rule outlines changes to the Quality Payment Program starting January 1, 2027, except as otherwise noted for specific provisions. We continue to move the Quality Payment Program forward, including focusing on alignment between the Merit-based Incentive Payment System (MIPS) and Advanced Alternative Payment Model (Advanced APM) tracks of participation, alignment with broader CMS initiatives, and new options for clinicians to participate in more meaningful ways. We aim to achieve continuous improvement in the quality of health care services provided to Medicare beneficiaries and other patients through MIPS and Advanced APMs for the CY 2027 performance period/2029 payment year.

Authorized by the Medicare Access and CHIP Reauthorization Act of 2015 (MACRA) (Pub. L. 114–10, April 16, 2015), the Quality Payment Program is a value-based payment program, by which clinicians are rewarded for providing high-value, high-quality care to their patients in a cost-efficient manner. There are two ways for clinicians who provide services under the Medicare program to participate in the Quality Payment Program: MIPS and Advanced APMs. The statutory requirements for the Quality Payment Program are set forth in section 1848(q) and (r) of the Act for MIPS and section 1833(z) of the Act for Advanced APMs.

For the MIPS participation track, MIPS eligible clinicians (defined at § 414.1305) [392] are subject to a MIPS payment adjustment (positive, neutral, or negative) based on their performance in four performance categories: quality, cost, improvement activities, and Promoting Interoperability. We assess each MIPS eligible clinician's performance according to established performance standards for the applicable measures and activities specified in each of these four performance categories during a performance period to compute a final composite performance score (a ''final score'' as defined at § 414.1305). In calculating the final score, we must apply different weights for the four performance categories, subject to certain exceptions, as set forth in section 1848(q)(5) of the Act and at 42 CFR 414.1380(c)(1). The weights of the performance categories in the final score for the CY 2027 performance period/2029 MIPS payment year are as follows, unless a different scoring weight is assigned under 42 CFR 414.1380(c)(2): 30 percent for the quality performance category; 30 percent for the cost performance category; 25 percent for the Promoting Interoperability performance category; and 15 percent for the improvement activities performance category.

Once calculated, each MIPS eligible clinician's final score is compared to the performance threshold established in prior rulemaking for that performance period to calculate the MIPS payment adjustment as specified in section 1848(q)(6) of the Act, such that the MIPS eligible clinician will receive in the applicable MIPS payment year: (1) a positive adjustment, if their final score exceeds the performance threshold; (2) a neutral adjustment, if their final score meets the performance threshold; or (3) a negative adjustment, if their final score is below the performance threshold. In calculating the MIPS payment adjustment for a MIPS eligible clinician, we account for the scaling factor and budget neutrality requirements, as further specified in section 1848(q)(6) of the Act. We then apply the MIPS payment adjustment to amounts otherwise paid under Medicare Part B for covered professional services for the MIPS eligible clinician for the applicable MIPS payment year and payments for covered professional services could be increased, decreased, or not adjusted based on the MIPS eligible clinician's final score relative to the performance threshold.

Section 1848(q) of the Act sets forth other requirements applicable to MIPS, including opportunities for feedback, targeted review, and public reporting of MIPS-eligible clinicians' performance. Section 1848(r) of the Act sets forth more specific requirements for development of measures for the cost performance category under MIPS.

For the Advanced APM participation track, if an eligible clinician participates in an Advanced APM and achieves Qualifying APM Participant (QP) or Partial QP status, they are excluded from the MIPS reporting requirements and payment adjustment (though eligible clinicians who are Partial QPs

[392] We note that the term MIPS eligible clinician is defined at § 414.1305 as including a group of at least one MIPS eligible clinician billing under a single tax identification number. We refer readers to our policies governing group reporting and scoring under MIPS as set forth at § 414.1310(e).

may elect to participate in MIPS and be subject to the MIPS reporting requirements and payment adjustment). In alignment with the application of QPP eligibility determinations, we are finalizing our proposal with modification to apply QP and Partial QP status to the TIN/NPI level. For eligible clinicians with QP and partial QP status at the individual level, we will apply partial QP status to all TIN reassignments for the NPI as codified at § 414.1425(d). Under current law, eligible clinicians who are QPs for the 2024 performance year/2026 payment year and beyond will receive an increased physician fee schedule update of 0.75 percent qualifying APM conversion factor. We note that, historically, QPs received a lump sum APM Incentive Payment in the corresponding payment year, calculated as a specified percentage of the QP's paid claims for covered professional services from the base year. Only legislation enacted by Congress can make changes to either the enhanced QP conversion factor updates or the APM Incentive Payment.

We plan to continue developing policies for the Quality Payment Program that more effectively reward high-quality of care for patients and increase opportunities for Advanced APM participation. We continue to implement MIPS Value Pathways (MVPs) to allow for a more cohesive participation experience by connecting activities and measures from the four MIPS performance categories that are relevant to a specialty, medical condition, or a particular population.

As we move into the 10th year of the Quality Payment Program, we will be implementing the updates set forth in this section of this final rule, encouraging continued improvement in clinicians' performance with each performance year and driving improved quality of health care through payment policy.

b. Summary of Major Proposals

(1) Transforming the Quality Payment Program

The Making America Healthy Again (MAHA) initiative (*https://www.hhs.gov/maha/index.html*) represents a shift from the focus on chronic disease management and moves toward prevention and restoring foundational wellness. This initiative aims to address the root causes of poor health outcomes by reducing chronic disease rates, improving nutrition, promoting preventative care, and increasing transparency in health systems. This vision is supported by aligning policies in MIPS and APMs within the Quality Payment Program with the foundational pillars of MAHA. We are expanding the MVP portfolio to include Diabetic Disease and Hypertension MVPs that address the prevention of chronic illnesses and aim to reduce the incidence and impact of long-term conditions. In alignment with the goal of promoting preventive care and fostering a more proactive and holistic approach to health management, we are finalizing new improvement activities under the ''Advancing Health and Wellness'' subcategory within the improvement activities performance category. The improvement activities integrate concepts that address nutrition, implement lifestyle approaches to disease management, and support patient wellness to ensure a healthier future.

Through the policies described in this final rule, we intend to transform and simplify MIPS, promote the use of connected measures and activities, continue rewarding clinicians for providing high value care, and use data-driven information to help all clinicians improve care and engage patients. We are finalizing, with modification, our proposal to sunset the traditional MIPS reporting option. Specifically, we are delaying the sunset of traditional MIPS by two years until the CY 2031 performance period/2033 MIPS payment year. Therefore, beginning with the CY 2029 performance period/2031 MIPS payment year, MVPs would be the only reporting option for MIPS eligible clinicians who do not participate in a MIPS APM. Traditional MIPS will remain available through the CY 2030 performance period/2032 MIPS payment year.

(a) Transforming MIPS: MVP Strategy

MVPs will improve value, reduce burden, and inform patient choice in selecting clinicians. To support our goal of phasing out traditional MIPS and transitioning eligible clinicians to MVP reporting, we are finalizing with modification policies supporting MVP only reporting for MIPS. The MVP reporting option offers aligned measures and activities across quality, cost, improvement activities, and Promoting Interoperability performance categories, focusing on specific specialties, conditions, or patient populations to make reporting more meaningful. Specifically, we proposed that beginning in the CY 2029 performance period/2031 MIPS payment year, MIPS eligible clinicians not reporting the APM Performance Pathway(APP), would be required to report the measures and activities in a selected MVP for MIPS. However, we have reconsidered the timeline for the full transition to MVP reporting and are delaying the sunset of traditional MIPS reporting by two years to allow us to further refine MVP policies and provide additional time for clinicians to prepare for full MVP implementation.

Specifically, we are finalizing a policy to require that beginning in the CY 2031 performance period/2033 MIPS payment year, MIPS eligible clinicians not reporting the APP would be required to report the measures and activities in a selected MVP to meet MIPS reporting requirements. We are finalizing our proposal as proposed to include virtual groups in MVP reporting beginning with the CY 2029 performance period/2031 MIPS payment year to ensure all eligible clinicians can report MVPs.

(b) MIPS Value Pathways Development and Maintenance

To continue moving the healthcare community toward value-based, high-quality, safe, and cost-efficient care, we are finalizing as proposed three new MVPs around the following topics: Diabetic Disease, Hypertension, and Hospitalist.

We are also finalizing as proposed MVP maintenance updates to our MVP inventory that are aligned with the MVP development criteria and take into consideration feedback from interested parties we have received through the maintenance process. Additionally, we updated all the MVPs to include MIPS core measures. Finally, we are renaming the Rehabilitative Support for Musculoskeletal Care MVP to Rehabilitative Support MVP to better represent the measures and activities included in the MVP.

(c) APM Performance Pathway

We are finalizing our proposal as proposed to align quality measures in the APP, original quality measure set and the APP Plus quality measure set to reflect our proposed changes to measures specified for the quality performance category as discussed in section IV.A.4.b.(2) of this final rule.

(d) Fast Healthcare Interoperability Resources (FHIR) Request for Information

We are advancing quality measurement by transitioning existing quality measures and reporting processes to Fast Healthcare Interoperability Resources® (FHIR®)-based digital reporting options. In the CY 2027 PFS proposed rule, we sought input on the anticipated transition

timeline, key milestones, and implementation considerations for FHIR-based quality reporting in the Quality Payment Program and other CMS quality reporting programs (91 FR 44143)).

(e) MIPS Quality Performance Category

For the CY 2027 performance period/2029 MIPS payment year, we are finalizing our proposal, as proposed, to establish a measure set inventory of 180 MIPS quality measures, of which 177 are available in traditional MIPS and three are available only for use in MVPs. Finalized changes to the measure set inventory include 20 measure removals, 10 measure additions for CY 2027, one measure addition for CY 2028, and 43 substantive changes to existing measures.

The finalized measure removals focus on low bar process measures, measures reaching extremely topped-out status or the end of the topped-out measure lifecycle, measures that are duplicative of new or current measures, measures with limited adoption and therefore no benchmark, measures lacking robustness, and measures the steward will no longer maintain. The finalized measure additions focus on measuring patient-reported outcomes and chronic disease management. Finalized substantive changes to existing measures will ensure the measures included in MIPS continue to be meaningful and drive improvements in quality of care.

Beginning with the CY 2027 performance period/2029 MIPS payment year, we are finalizing, as proposed, the implementation of the MIPS core measure designation in traditional MIPS and MVPs. We are also finalizing, as proposed, our proposal to remove the high priority designation from MIPS quality measures and the MVP inventory. Additionally, we are finalizing our proposal, as proposed, to no longer use the high priority designation as one of the retention criteria for MIPS quality measures and the MVP inventory.

Furthermore, beginning with the CY 2027 performance period/2029 MIPS payment year, we are finalizing, as proposed, the removal of the current quality measure data submission requirement of one outcome (or one high priority measure if an outcome measure is not available) for traditional MIPS and MVP reporting and replacing it with the requirement that eligible clinicians must report at least one MIPS core measure (or, if an applicable MIPS core measure is not available, report one other MIPS non-core measure). We are also finalizing, as proposed, that if a MIPS eligible clinician does not have an available and applicable MIPS core measure, they must attest during the data submission period that a MIPS core measure is not available and applicable for them to report. The clinician will then be required to choose another measure to report instead of the MIPS core measure.

Also, we are finalizing, as proposed, that clinicians in small practices will be exempt from the proposed MIPS core measure requirement and will not need to submit an attestation if a MIPS core measure is not available and applicable to them.

Lastly, we are finalizing, as proposed, the proposals that expand the definition of the collection type to include Medicare Electronic Clinical Quality Measures for Accountable Care Organizations Participating in the Medicare Shared Savings Program (Medicare eCQMs); establish the data submission criteria for Medicare eCQMs; and establish the data completeness criteria for Medicare eCQMs.

(f) MIPS Cost Performance Category

We are finalizing our proposal as proposed to update the operational list of care episodes and patient condition groups and codes to reflect coding changes identified through our annual maintenance process for MIPS cost measures.

(g) MIPS Improvement Activities Performance Category

We are finalizing the following updates to the MIPS Improvement Activity Inventory beginning with the CY 2027 performance period/2029 MIPS payment year. First, we are finalizing the addition of six new improvement activities into two subcategories: (1) Care Coordination and (2) Advancing Health and Wellness, our newest subcategory. Second, we are finalizing modifications to five existing improvement activities. Third, we are finalizing the removal of eleven improvement activities currently specified for the performance category.

(h) MIPS Promoting Interoperability Performance Category

We are finalizing, as proposed, proposals pertaining to the Office of the National Coordinator for Health Information Technology (ONC) Direct Review attestation, ONC-Authorized Certification Bodies (ONC–ACB) Surveillance attestation, definition of Certified Electronic Health Record Technology (CEHRT), Security Risk Analysis measure, Electronic Prior Authorization measure, and Electronic Prior Authorization for Prescription Drugs measure.

- Starting with the CY 2026 performance period/2028 MIPS payment year, we are finalizing, as proposed, the proposal to remove the ONC Direct Review attestation and the ONC–ACB Surveillance attestation.
- Starting with the CY 2027 performance period/2029 MIPS payment year, we are finalizing, as proposed, the following proposals:
  - ++ Modification to the definition of CEHRT to align with the applicable ONC proposals to remove certain certification criteria from the ONC Health IT Certification Program as outlined in the Health Data, Technology, and Interoperability: ONC Deregulatory Actions to Unleash Prosperity (HTI–5) final rule;
  - ++ Modification to the Electronic Prior Authorization measure by updating the measure description, and for the CY 2027 performance period, changing the measure from being a required measure to being an optional measure; and
  - ++ Removal of the Security Risk Analysis measure.
- Starting with the CY 2028 performance period/2030 MIPS payment year, we are finalizing, as proposed, the following proposal:
  - ++ Modification to the Electronic Prior Authorization measure by updating the measure description to account for additional requirements pertaining to the measure, and changing the measure to being a required measure; and
  - ++ Add a new measure, Electronic Prior Authorization for Prescription Drugs, as a required measure under the Health Information Exchange objective.

(i) MIPS Scoring

We are finalizing our proposed scoring policies consistent with the finalized MIPS core measure requirement for MIPS eligible clinicians beginning in the CY 2027 performance period/2029 MIPS payment year. Specifically, we are finalizing our proposal to assign zero measure achievement points for one quality measure for clinicians reporting data under traditional MIPS and MVP reporting, if they do not submit a MIPS core measure and do not attest during data submission that they do not have an available and applicable MIPS core measure.

We are finalizing as proposed the list of topped out measures impacted by limited measure choice in specialty measure sets and MVPs to be subject to the defined topped out measure benchmark for the CY 2027 performance

period/2029 MIPS payment year. We are finalizing our proposal to modify the publishing location of topped out measures impacted by limited measure choice and scored according to the defined topped out benchmark. We are also finalizing our proposal to apply the defined topped out benchmark for MIPS core measures that are topped out for 2 or more consecutive years.

Lastly, we are finalizing, as proposed, the following proposed modifications: The benchmarking methodology for the Medicare CQMs collection type by extending the use of flat benchmarks; establishment of a flat benchmarking methodology for the proposed Medicare eCQMs collection type; and modification of the Electronic Prior Authorization measure from being a required measure to being an optional measure worth 10 bonus points under the MIPS Promoting Interoperability performance category for the CY 2027 performance period/2029 MIPS payment year.

(j) Third-Party Intermediaries

In this final rule, we update our requirements for third-party intermediaries related to the conditions for approval of Qualified Clinical Data Registries (QCDRs) and qualified registries, remove the additional requirements for health IT vendors, and revise our remedial action and termination policies. At a high level, we are finalizing the following as proposed:

- Clarification that the additional requirements for health IT vendors no longer apply beginning with the CY 2025 performance period/2027 MIPS payment year, as health IT vendors are no longer permitted to submit MIPS data as a third-party intermediary starting in that year;
- Making minor revisions to the audit requirements;
- Modification to our policy so that third-party intermediaries that do not submit data for 1 year would be terminated;
- Revision to existing policies to specify a QCDR or a qualified registry must be able to submit to CMS data for at least six quality measures including at least one MIPS core measure to align with the finalized proposal to removal of high priority designation from MIPS quality measures and the MIPS core measure reporting requirements in section IV.A.4.d.(1)(c)(i) of this final rule; and
- Modification to the qualified postings' policy in which changes to the information submitted should not be done after the qualified posting is publicly posted on the Quality Payment Program website (*https://qpp.cms.gov/*).

(k) Calculating MIPS Final Score

In this final rule, we are finalizing our proposal that beginning with the CY 2027 performance period/2029 MIPS payment year we will use whatever data is most current and reliable to determine if an individual MIPS eligible clinician is located in an area that has been identified as being affected by an extreme and uncontrollable circumstance (EUC). We are also finalizing, as proposed, our proposal to adjust the deadline by which clinicians will be able to submit reweighting requests for the quality, improvement activities, and Promoting Interoperability performance categories due to scenarios where a third-party intermediary did not submit data on their behalf in accordance with the applicable data submission deadlines. Specifically, we are finalizing our proposal that beginning with the CY 2025 performance period/2027 MIPS payment year, MIPS eligible clinicians will be able to submit reweighting requests on or before December 31st of the year preceding the relevant MIPS payment year.

(l) Public Reporting

The public reporting section of this final rule contains a policy and RFI for improvements to the CMS Compare Tools hosted by the U.S. Department of Health and Human Services (HHS) available on clinician profile pages at *https://www.medicare.gov/care-compare/* and in the Medicare Provider Data Catalog available at *https://data.cms.gov/provider-data/topics/doctors-clinicians.*

We are finalizing, as proposed, our proposal to remove the requirement preventing public reporting of any performance data reported through an MVP on new improvement activity or Promoting Interoperability (PI) measure, objective, or activity during the first year in which it is included in such MVP. Under the removal of this requirement, performance information for new improvement activities and PI measures will be publicly reported on CMS Compare Tools during the first year in which the measures and activities are included in the program, regardless of reporting option.

We also solicited feedback on improvements to the current star rating assignment methodology for quality measure scores collected under the administrative claims collection type. With more information, we can determine whether an alternative methodology for star rating assignments is more appropriate for administrative claims quality measures prior to the public reporting of these scores on clinicians' profile pages on the *Medicare.gov* Compare Tool.

(2) Advanced APM Proposals

We are finalizing the policy with modification to apply QP status, and Partial QP status, at the TIN/NPI level. For eligible clinicians with QP and partial QP status at the individual level, we will apply partial QP status to all TIN reassignments for the NPI as codified at § 414.1425(d).

We are finalizing, as proposed, our proposal to clarify language at § 414.1425(c)(5) pertaining to when QP status is lost as a result of an APM Entity terminating participation from an Advanced APM.

We are finalizing that for certain APMs where a participation list is not practicable, the APM will not provide a participation list for as a MIPS APM or APM participation for QPP purposes.

We are finalizing, as proposed, modifications to the conditions by which we award credit for Improvement Activities specified at § 414.1355 to ensure that participants receive credit.

We are finalizing modifications to the thresholds established at § 414.1430 in accordance with the Consolidated Appropriations Act, 2026.

2. Definitions

At § 414.1305, we are finalizing revisions to the definitions of the following terms:

- APM Incentive Payment
- Collection type
- High priority measure
- MVP Participant
- Participation List

These terms and definitions are discussed in detail in the relevant sections of this final rule.

3. Transforming MIPS: MIPS Value Pathway (MVP) Strategy

We play a leading role in transitioning the Federal health care system from Original Medicare payment toward value-based payment, incentivizing higher quality of care over higher quantity of care. The Merit-based Incentive Payment System (MIPS) aims to drive value through the collection, assessment, and public reporting of data that informs and rewards the delivery of high-value care. We continue to focus on transforming health care delivery, driving higher value care, and increasing alignment with other CMS programs and initiatives to reduce burden. We intend to continue our efforts to align the Quality Payment Program with the broader aims of CMS to ensure patients receive the care they want and deserve by promoting

prevention, wellness, and chronic disease management. We are focused on achieving the best outcomes and safest care across the full care journey through innovation and collaboration. We are implementing meaningful improvements designed to strengthen healthcare delivery and advance patient outcomes. Through these efforts, we strive to create a healthcare system that not only responds to chronic disease but works proactively to prevent it.

In the CY 2022 PFS proposed rule and CY 2025 PFS final rule, we stated our intent to transform MIPS and obtain more meaningful, comparable performance data, and drive higher value care through MVPs (86 FR 39356 and 89 FR 98346) and that we intended to propose a full transition to MVP reporting along with the Alternative Payment Model (APM) Performance Pathway (APP) reporting to support movement towards value-based payment (86 FR 65394 through 65396, 87 FR 70034, and 89 FR 98346). As noted in the CY 2025 PFS proposed rule (89 FR 62012), robust MVP availability and clinician coverage would be a precursor to sunsetting traditional MIPS. Through this final rule and future rulemaking, we acknowledge that we will need to develop policies to support MVP reporting for all MIPS eligible clinicians by the CY 2031 performance period/2033 MIPS payment year. We will continue engaging with interested parties, including specialists and specialty societies, to identify gaps and opportunities, and leveraging additional policy options, as needed.

In this section, we are finalizing with modification on our proposal to sunset traditional MIPS reporting. Specifically, we are finalizing with modification to require that beginning in the CY 2031 performance period/2033 MIPS payment year, MIPS eligible clinicians, not participating in a MIPS Alternative Payment Model (APM), would be required to report the measures and activities in a selected MVP. The MVP reporting option offers aligned measures and activities across the quality, cost, improvement activities, and Promoting Interoperability performance categories. MVPs focus on specific specialties, conditions, or patient populations to make reporting more meaningful. With increased MIPS eligible clinicians reporting MVPs, MVP comparative performance data may become valuable to patients and caregivers in evaluating clinician performance and making choices about their care. We are finalizing that MIPS eligible clinicians, not participating in a MIPS APM, would be required to report the measures and activities in a selected MVP beginning in the CY 2031 performance period/2033 MIPS payment year. We are also finalizing to include virtual groups in MVP reporting beginning in the CY 2029 performance period/2031 MIPS payment year to ensure all MIPS eligible clinicians can report MVPs.

a. Overview

In the CY 2022 PFS final rule, we finalized the MVP reporting option for MIPS eligible clinicians beginning in the CY 2023 performance period/2025 MIPS payment year to serve as an additional reporting option (86 FR 65391 through 65394). Currently there are three reporting options: MVPs, traditional MIPS, and the APM Performance Pathway (APP). We noted that we created the MVP reporting option to improve value, reduce burden, and inform patient choice in selecting clinicians. We also stated the MVP framework will move MIPS forward on the path to value by offering a reporting option that connects measures and activities across MIPS performance categories, better informing and empowering patients to make decisions about their healthcare, and by helping clinicians to achieve better outcomes using robust and accessible healthcare data and interoperability (86 FR 65392).

In the CY 2027 PFS proposed rule (91 FR 44145 through 44147), we discussed our intent to propose to transform MIPS through a full transition to MVP reporting to allow reporting of both MVPs and the APP to support movement towards value-based payment. We stated that if the proposal to phase out traditional MIPS reporting for MIPS eligible clinicians not participating in a MIPS APM is finalized, there would be two reporting options for MIPS: MVPs and the APP. The transition from clinicians selecting from a large inventory of measures and activities in traditional MIPS to reporting more clinically relevant measures and activities in MVPs represents a necessary progression in MIPS if we are to achieve our intended goals of connecting measures and activities across MIPS and providing meaningful data to inform and empower patients to make decisions about their healthcare. We refer readers to the CY 2020 PFS final rule (84 FR 62946), the CY 2021 PFS final rule (85 FR 84845 through 84849), the CY 2022 PFS final rule (86 FR 65419 through 65422 and 86 FR 65396), and the CY 2023 PFS final rule (87 FR 70035) for discussion of previously finalized MVP policies and MVP-related Requests for Information (RFIs). We have made continued and substantial progress in developing an MVP inventory offering MIPS eligible clinicians the ability to report an MVP with clinically relevant measures. As discussed in section IV.A.4.a of this final rule, we previously finalized 27 MVPs and are finalizing three additional MVPs for the CY 2027 performance period/2029 MIPS payment year. Our MVP inventory will increase to 30, potentially resulting in coverage of approximately 98 percent of specialties for MIPS eligible clinicians based upon self-reported specialty designations data and MVP topic. Please see section IV.A.4.a of this final rule for more information on MVP development. Phasing out traditional MIPS reporting and advancing full implementation of MVPs will move MIPS away from a fragmented reporting approach toward a more meaningful, specialty-aligned framework. Further, MVPs will continue to advance the overall goals of MIPS to align quality and payment, foster accountability, and improve care and outcomes for people served by Medicare.

b. Background on Full MVP Implementation

The MVP framework was introduced in the CY 2020 PFS final rule (84 FR 62946 through 62948). In the CY 2022 PFS proposed rule, we noted our intent to sunset traditional MIPS in a future performance period and solicited public comments on: (1) the length of time MVP reporting should be voluntary; (2) the timing for when we should fully implement MVPs; and (3) sunsetting the traditional MIPS reporting option (86 FR 39356). Responding interested parties supported a transparent, gradual transition to MVPs with voluntary MVP reporting and adequate time to prepare for reporting an MVP (86 FR 65391 through 65396). In the CY 2022 PFS final rule, we finalized that voluntary reporting of MVPs would start in the CY 2023 performance period/2025 MIPS payment year to allow time for MVP participants and third-party intermediaries to adapt to changes in policy, reporting requirements, and updates to their technology systems (86 FR 65394 to 65396).

In the CY 2025 PFS proposed rule, we issued a Request for Information (RFI) on the development of a timeline for the full transition to MVPs beginning in the CY 2029 performance period/2031 MIPS payment year (89 FR 62011 and 62012). We noted that MVPs would support value-based payment, reduce reporting burden through more targeted and aligned measures and activities, improve comparisons among similar clinicians, and provide better information for patients. In response to the RFIs on full MVP implementation,

commenters identified several policies and activities that could support adoption, including concerns about clinicians having less flexibility to choose quality measures within an MVP. We recognize that full MVP implementation may limit the choice of measures and activities compared to those currently afforded by policies in traditional MIPS. However, MVPs include a set of clinically relevant measures and activities that provide an opportunity for MIPS performance data to better reflect clinicians' scope of care.

With the full implementation of MVPs, clinicians who are not participating in a MIPS APM would be required to select an MVP relevant to their scope of care and further choose the quality measures and improvement activities within the selected MVP that reflect the care provided. Widescale adoption of MVPs, using a standardized connected set of measures and activities for a specialty or medical condition, may generate important and meaningful information for patients to be able to compare the performance of clinicians on the same or similar sets of measures. Additionally, we refer readers to section IV.A.4.d.(1)(c)(i) of this final rule for details on the finalized MIPS core measure requirement for traditional MIPS and MVP reporting. The MIPS core measure requirement would further clarify how MVPs would emphasize and increase reporting on select quality measures that are most important to clinicians and patients and reflect the care that is central to an applicable specialty, medical condition, or episode of care. In response to feedback from interested parties that full implementation of MVPs requires the ability of all specialties to participate, we finalized six new MVPs and updated 21 previously finalized MVPs in the CY 2026 PFS final rule. (90 FR 49847). We refer readers to section IV.A.4.a.(1) of this final rule regarding the three new MVPs we are finalizing for the CY 2027 performance period/2029 MIPS payment year.

In response to the RFIs that sought feedback on full MVP implementation (89 FR 62011 through 62016), some interested parties voiced concerns that full implementation of MVPs and subgroup policies would result in increased reporting burden, particularly for multispecialty groups required to participate as subgroups for reporting an MVP beginning in the CY 2026 performance period/2028 MIPS payment year. We note that we have modified our MVP and subgroup reporting policies to address some of these concerns. Our current MVP and subgroup reporting policies are aligned with the goal for full MVP implementation and would encourage increased participation from specialists. As we have greater MVP adoption and subgroup reporting, we anticipate specialist reporting through MVPs would increase the amount of performance data available to patients when selecting a clinician (89 FR 62012). In the CY 2022 PFS final rule (86 FR 65397), we finalized the subgroup reporting option for clinicians participating in MVP reporting in response to concerns from interested parties over the prior years that large multispecialty groups often submit data that is not necessarily representative of all the clinicians that make up that group. To address concerns from interested parties on the MVP subgroup reporting burden, we finalized policies in the CY 2026 PFS final rule (90 FR 49842 through 49846) allowing a group practice to self-attest and identify the need to divide into subgroups based on the scope of care provided by clinicians in their group. We believe the potential increase in the reporting burden for larger groups to divide into subgroups is outweighed by the benefit of additional information clinicians and patients will receive through increased specialist reporting data (86 FR 65393 and 65394). We will continue to monitor subgroup participation in MVP reporting to determine potential policy changes in the future as we transition to full MVP implementation for MIPS eligible clinicians not participating in the APP.

Historically, we have received feedback from MIPS eligible clinicians in small group practices, defined at § 414.1305 as a TIN consisting of 15 or fewer eligible clinicians during the MIPS determination period, about the lack of adequate resources to successfully meet MIPS reporting requirements. To provide flexibility and to prevent additional burden for small groups we finalized a policy to maintain the MVP group reporting option for small practices, without the need for small practices to form subgroups (90 FR 49842 to 49843). We also note that MVP policies continue to offer the same scoring flexibilities for small group practices available to such practices reporting traditional MIPS finalized at § 414.1380(b)(1) (86 FR 65419 through 65422). We refer readers to sections IV.A.4.d.(1)(c)(iii) and IV.B.1.b.(1) of this final rule for details on the proposed exemption of small practices from the MIPS core measure reporting requirements and proposed scoring flexibilities for small practices.

Finally, in response to the RFI (89 FR 62011 through 62016) interested parties voiced concerns about quality measures within MVPs that cannot be scored for reasons beyond the clinician's control, such as measures without benchmarks, and the potential for some topped out measures to have a scoring cap. As noted previously, the existing scoring policies established in traditional MIPS at § 414.1380(b)(1), specific to small group practices and the scoring policies related to measures without benchmarks, measures that do not meet case minimum, and measures that do not meet data completeness requirements also apply to MVP scoring (86 FR 65419 through 65420). We acknowledge concerns from clinicians with limited choice of measures, and in the CY 2026 PFS final rule, we finalized expansion of our approach for identifying measures impacted by limited choice and subject to topped-out measure benchmarks to MVPs (90 FR 49903 through 49908). Additionally, we refer readers to section IV.B.1.b. of this final rule for newly finalized policies on the scoring of topped out measures included in MVPs, which address concerns that interested parties raised with respect to those clinicians with limited measure choice and scoring caps for topped out measures. Commenters responding to the RFI also requested that we develop scoring policies to ensure scoring between MVPs is equitable. Therefore, we solicited feedback on the future direction of MVP scoring in an RFI in the CY 2027 PFS proposed rule (91 FR 44207) seeking input on potential scoring policies to ensure fairness across MVPs.

c. Update to the Timeline for Full MVP Implementation

As discussed previously in section IV.A.3.a. of this final rule, MVP reporting became available for clinicians beginning in the CY 2023 performance period/2025 MIPS payment year (86 FR 65394 to 65396). In previous PFS rules, we stated our intention to fully transition to MVPs and to sunset traditional MIPS (85 FR 50279 and 50284, 86 FR 65394 through 65396).

We are concerned that continuing to maintain the traditional MIPS reporting option may impede MVP adoption for MIPS eligible clinicians. Additionally, it may cause slow adoption which may delay the intended benefits of MVPs, including simplification of MIPS and improving comparable clinician performance data that helps to drive value and inform clinician selection by patients. In addition, the availability of two MIPS reporting options, MVPs and traditional MIPS, creates challenges for developing and refining MVP policies over time due to limited MVP reporting resulting from continued clinician

reliance on the traditional MIPS reporting option. However, in establishing the sunset date we are also cognizant of the need to provide ample time for clinicians to prepare for full MVP reporting. Therefore, in the CY 2027 PFS proposed rule (91 FR 44147), we proposed to phase out traditional MIPS reporting for MIPS eligible clinicians not participating in a MIPS APM beginning in the CY 2029 performance year/2031 MIPS payment year. Transitioning to MVP implementation alongside the option for MIPS APM participants to participate in MIPS through the APP would support efforts to transform MIPS for clinicians and patients who rely on program performance information. We noted that traditional MIPS reporting would be available to clinicians through the CY 2028 performance period/2030 MIPS payment year. This proposed timeline would have provided a period of 6 years for voluntary MVP reporting, allowing clinicians time to engage in the development of the MVP inventory, update their systems and work processes to prepare for MVP reporting, and gain experience with MVP reporting. Clinicians would continue to be able to report through either traditional MIPS or via MVPs through the CY 2028 performance year/2030 MIPS payment year.

In the CY 2027 PFS proposed rule (91 FR 44147), we proposed that beginning in the CY 2029 performance period/2031 MIPS payment year, all MIPS eligible clinicians, with the exception of clinicians reporting through the APP, would report through an MVP. Specifically, we proposed to add under § 414.1365(a)(2) that beginning in the CY 2029 performance period/2031 MIPS payment year, except for clinicians reporting under the APP pursuant to § 414.1367, all MIPS eligible clinicians must report through an MVP. We believed that the CY 2029 performance year/2031 MIPS payment year would be an appropriate timeline for full implementation of MVPs and would offer sufficient time for MIPS eligible clinicians and groups to prepare for required MVP reporting. However, we have reconsidered the timeline and determined that additional time is needed for us to further refine the MVP policies. For example, we require additional time to increase MVP availability and transition to digital reporting. The additional time would further allow eligible clinicians to successfully transition to full MVP implementation. Therefore, as noted in section IV.A.3.c. of this final rule, we are delaying the sunset of traditional MIPS until the CY 2031 performance period/2033 MIPS payment year. We considered setting a date for the sunset of traditional MIPS that is more than five years in the future but we are concerned that delaying the sunset of traditional MIPS that far would discourage clinicians and groups from undertaking the changes necessary to successfully report MVPs. Therefore, we believe that our finalized timeline of sunsetting traditional MIPS beginning with the CY 2031 performance period/2033 MIPS payment year strikes an appropriate balance between providing additional time for clinicians to prepare for the transition to full MVP implementation and setting a timeline for the transition that offers strong encouragement for clinicians and groups to begin reporting MVPs.

As discussed in section IV.A.4.a.(1) of this final rule, we continue developing new MVPs that are relevant and meaningful for MIPS eligible clinicians. We intend to explore a range of strategies for transitioning to full MVP reporting, including, but not limited to, proposing additional MVPs. We recognize that clinicians may currently lack applicable measures and may not have an applicable MVP or may be unable to report a sufficient number of measures in an MVP. However, for subspecialists without many applicable and available measures in the MIPS measure inventory, we are aware of the need to develop reporting options or explore alternatives to reporting MVPs by the CY 2031 performance period/2033 MIPS payment year. For example, we may consider developing a process for clinicians to indicate at the time of MVP registration that no available MVP in the MVP inventory includes applicable and available measures and activities. Alternatively, we could consider expanding measure denominators as applicable to strengthen specialty coverage for clinicians with limited applicable measures. We could also consider policies that allow us to review available and applicable measures for clinicians in the selected MVP to reduce the denominator of the quality performance category to score the quality performance category with fewer than four measures.

We received public comments on this proposal to transition to MVP reporting beginning in the CY 2029 performance period/2031 MIPS payment year, except for clinicians reporting under the APP. The following is a summary of the comments we received and our responses.

Comment: Many commenters supported the proposal to sunset traditional MIPS beginning with the CY 2029 performance period/2031 MIPS payment year. Several commenters stated that the transition to MVP reporting would move the program to better accountability and improved reporting of meaningful quality data. Several commenters stated that CMS's proposed timeline would provide adequate time for clinicians to transition to MVP reporting.

Response: We thank commenters for their support and agree that the full transition to MVP reporting will result in improved reporting of meaningful quality data. We note that we have reconsidered the timeline for the full transition to MVP reporting and are delaying the sunset of traditional MIPS reporting by two years to allow us to further time to refine MVP policies. For example, we require additional time to increase MVP availability and transition to digital reporting. The additional time would further allow eligible clinicians to successfully transition to full MVP implementation. Therefore, traditional MIPS reporting will be available to clinicians through the CY 2030 performance period/2032 MIPS payment year. We considered a delay of one year, but as discussed in section IV.A.4.c. of this final rule we anticipate mandatory reporting of available FHIR-based digital quality measures (dQMs) would begin in the CY 2030 performance period/2032 MIPS payment year. Therefore, we decided that allowing an additional year of voluntary MVP reporting beyond the start of mandatory FHIR-based reporting of digital measures would better support clinicians who will be transitioning to FHIR-based digital reporting. Beginning in the CY 2031 performance period/2033 MIPS payment year, clinicians will need to participate in MIPS through an MVP or the APP.

Comment: Several commenters supported the proposal to sunset traditional MIPS beginning in the CY 2029 performance period/2031 MIPS payment year and offered recommendations for ensuring a smooth transition. A few commenters recommended that CMS provide support by working with clinicians and other interested parties to monitor negative unintended consequences and providing technical assistance to clinicians, EHR vendors, and third-party intermediaries. A few commenters recommended that CMS focus on the health IT infrastructure necessary for reporting MVPs. A commenter urged CMS to maintain stability in the MVP framework during the transition.

Response: We thank commenters for their support. We will consider the

recommendations for providing educational support as we plan communications and outreach activities to support the full transition to MVPs. We will continue to work with EHR vendors and third-party intermediaries and consider guidance for development of the health IT infrastructure necessary for reporting MVPs. We agree that it will be desirable to maintain stability in the MVP framework to the extent feasible as the transition to full MVP implementation proceeds and will take that goal into account in future rulemaking.

Comment: Several commenters encouraged CMS to offer additional flexibility in MVP reporting. A few commenters recommended that CMS closely monitor participation and performance during the transition to mandatory reporting. A commenter recommended that CMS offer fiscal leniency in the first few years of mandatory MVP reporting similar to the flexibility offered during the initial implementation of MIPS.

Response: We thank the commenters for these recommendations. We recognize that transitioning to mandatory MVP reporting may be a change for some eligible clinicians. We will monitor participation and performance data and may consider options in the future to provide flexibility in reporting requirements and scoring policies as feasible, consistent with the goals of full MVP implementation.

Comment: Many commenters expressed opposition to the sunset of traditional MIPS and stated that MVPs should remain voluntary to maintain clinician flexibility to choose the measures and activities that are most relevant to their practice. A commenter suggested that if MVPs demonstrate greater value and better alignment with clinical practice, clinicians and groups will migrate toward them, decreasing the need for traditional MIPS.

Response: We disagree with the commenters. We are concerned that maintaining traditional MIPS as a reporting option may hinder adoption of MVPs, delaying the benefits of simplification of MIPS and improving comparable clinician performance data. Although we agree that more clinicians and groups will begin reporting MVPs as they better understand the value of MVP participation, unless we establish a date for sunsetting traditional MIPS, clinicians will continue to rely on traditional MIPS, either instead of or in addition to MVPs. Maintaining both reporting options indefinitely would continue complexity in policies and operations and create challenges for evaluating the MVP performance and reporting experience and developing and refining MVP policies over time.

Comment: A few commenters expressed concern that MVPs incorporate the fundamental flaws of MIPS, including siloed performance categories, comparison of unlike clinicians, and lack of linkage between quality and cost measures. A few commenters stated that MVPs cannot accurately assess clinician performance because they are based on certain specialties or are overly broad, instead of focusing on a specific health condition, procedure, or episode of care that would be treated by the same clinician.

Response: We note that the MVP framework is built upon the statutory framework described in section 1848(q) of the Act, which requires us to include the four MIPS performance categories. However, because an MVP consists of a connected set of quality measures, cost measures, and improvement activities that are relevant to the MVP topic, clinicians would be able to choose measures and activities that are closely related. Furthermore, MVPs strengthen the relationship between the quality performance category and the cost performance category by scoring an MVP participant only on the cost measures in the MVP, which were selected because of their relevance to the MVP topic and the included quality measures. We anticipate that as more clinicians report MVPs and the measures and activities that are relevant to their scope of practice, scores will increasingly reflect comparisons of performance between similar clinicians. We note, however, that the statute requires that we compare all MIPS eligible clinicians to a single performance threshold. Regarding the commenters' concern that MVPs cannot accurately assess clinician performance because they are overly broad, we note that clinicians may choose the quality measures within an MVP that are most relevant to their scope of care provided. The MVP inventory finalized in Appendix 2 of this final rule does include several condition-focused MVPs such as Advancing Care for Heart Disease and Optimal Care for Kidney Health. However, it is not feasible to develop an MVP for every health condition, procedure or episode of care.

Comment: A few commenters opposed the sunset of traditional MIPS and expressed concern that requiring MVP reporting would create burden for small, independent, and rural practices. A commenter expressed concern that requiring MVP reporting would accelerate practice closure and decrease patient access to local clinicians.

Response: We note that MVP reporting requires clinicians in small, independent, and rural practices to report fewer quality measures when compared to the six quality measures that these clinicians are currently required to report in traditional MIPS. We are cognizant of the challenges small practices have faced in participating in MIPS and will continue to maintain existing flexibilities for small practices when MVPs are fully implemented.

Comment: Many commenters recommended that CMS maintain the traditional MIPS reporting option because the existing inventory of available MVPs is not sufficiently aligned with the care furnished by specialists and subspecialists. The commenters stated that, at a minimum, the MVP inventory should include measures relevant to 100 percent of specialties. Several commenters disagreed with CMS' estimate that the current MVP inventory provides coverage for approximately 98 percent of specialists, citing specialties such as allergy and immunology and radiation oncology as lacking a relevant MVP. A commenter compared existing and proposed MVPs to existing specialty measure sets and stated that there were gaps in specialty coverage and clinical relevance. The commenters further noted that the existence of an MVP for a given specialty (for example, ophthalmology) does not necessarily ensure meaningful quality measurement for all clinicians within that specialty. The commenters shared their concern that due to the lack of relevant measure options, clinicians may be required to report measures that are not clinically relevant to their practice in order to satisfy reporting requirements. In addition, many commenters urged CMS to ensure that MVPs include adequate measure sets for subspecialties. Many commenters expressed concern that broad specialty-based or condition-based MVPs may not fairly assess highly subspecialized clinicians, and that gaps in cost and quality measures applicable to subspecialty care and nonphysician care reduce the clinical relevance of MVPs for some clinicians, including interventional cardiologists, neuro-ophthalmologists, orthopedic sports medicine specialists, otolaryngologists, and physical therapists. A commenter stated that low MVP adoption may indicate that MVPs do not yet provide sufficient clinical relevance or flexibility to replace traditional MIPS. A few commenters recommended that CMS should retain traditional MIPS until appropriate specialty pathways are

developed, tested, and shown not to create inequitable scoring or participation barriers.

Response: We acknowledge the commenters' feedback and understand the concerns raised regarding the current availability and clinical relevance of MVPs for specialists, subspecialists, and other clinician types. The estimate that the current MVP inventory provides coverage for approximately 98 percent of clinicians reflects an assessment of the proportion of MIPS clinicians who self-reported a specialty designation that aligns with an MVP's identified target specialties. We acknowledge, however, that such alignment does not necessarily mean that the measures included in an MVP can be reported by every clinician within a specialty or subspecialty, nor does it ensure that all clinicians can meaningfully participate in a particular MVP. We will continue to work with interested parties to improve the clinical relevance, fairness, and usability of MVPs and to support clinicians in selecting the reporting option that is most appropriate for their practice. We encourage interested parties to submit potential new measures that will align with current goals and priorities during the annual Call for Measures which generally occurs in the spring of each year to fill identified gaps allowing meaningful and complete assessment of MIPS eligible clinician's performance within MIPS. To allow additional time for refinement of the MVP framework, as discussed in section IV.A.3.c. of this final rule, we are delaying the sunset of traditional MIPS by two years, so that the traditional MIPS reporting option is available for clinicians through the CY 2030 performance period/2032 MIPS payment year.

Comment: Many commenters expressed concern that the majority of the MVPs do not include a sufficient number of quality measures available through each collection type, limiting flexibility for clinicians to select and report measures within an MVP. The commenters recommended that MVPs include at least four quality measures under each collection type so that clinicians and group practices would not need to contract with multiple vendors to report an MVP. A few commenters noted that availability of a sufficient number of measures for each collection type would reduce reliance on QCDR measures. A few commenters also noted that including at least four measures for every collection type would enable third-party intermediaries and EHR vendors to support an MVP without being required to support every measure included in an MVP.

Response: While we acknowledge the recommendation that each MVP include at least four quality measures under each collection type, we do not believe it is appropriate to establish a universal minimum across all collection types for every MVP at this time, as measure availability and feasibility may vary by specialty, clinical topic, and reporting mechanism. However, we will continue to consider opportunities to increase the number of measures available across collection types, as appropriate, in future MVP development and maintenance to ensure flexibility and choice of measures within MVPs. We will also continue to work with measure developers, third-party intermediaries, and EHR vendors to support more flexible reporting options over time.

Comment: Many commenters recommended that CMS expand the MVP measures menu to include a sufficient number of eCQMs or dQMs to submit an MVP exclusively using an EHR. The commenters expressed concern that when an MVP does not include a sufficient number of eCQMs, it would add substantial burden to the practices because they must contract with thirdparty vendors to report other collection types. The commenters stated that electronic reporting options would help maintain existing workflows, reduce the burden of transitioning to MVPs and support broader efforts to advance digital health.

Response: As discussed in section IV.A.4.c. of this final rule, it is our intent to transition to digital quality measurement across all CMS quality reporting programs. At the same time, we do not want to increase burden by requiring clinicians currently reporting eCQMs to report using multiple collection types. We note that we are delaying the sunset of traditional MIPS reporting by two years, so that traditional MIPS reporting is available to clinicians through the CY 2030 performance period/2032 MIPS payment year. This additional time will allow us to continue to work with measure developers and interested parties to support the transition to more interoperable, digitally enabled reporting over time. As more eCQMs and dQMs become available, we will incorporate these into MVP measure sets, as appropriate, which would improve dQM alignment across CMS quality programs.

Comment: Several commenters expressed concerns that clinicians who could not report all four required quality measures would be unfairly penalized in an MVP-only reporting environment. A few commenters recommended that CMS establish a clear pathway for clinicians without an applicable MVP or who cannot meet the quality reporting requirement in an MVP. A few commenters recommended using the eligible measure applicability (EMA) process or a similar approach within the MVP framework to create a process that offered protections to clinicians from penalties and the right to appeal or request a reconsideration through processes such as targeted review. A few commenters also recommended automatic exemptions or exceptions for clinicians who do not have an applicable MVP available to report.

Response: We acknowledge the commenters' concerns regarding clinicians who may be unable to report all four required quality measures in an MVP-only reporting environment, including clinicians for whom there may not be an applicable MVP. We will consider these comments as we continue to refine MVP policies and evaluate ways to support clinicians who may face limitations in meeting MVP reporting requirements. We will also take these recommendations into account as we consider future policy development related to measure applicability, exceptions, and other flexibilities, as appropriate.

Comment: Many commenters expressed concern that the transition to MVP reporting would increase the operational burden for multispecialty groups with more than 15 clinicians as these groups would need to form subgroups and report multiple MVPs. The commenters noted that moving away from traditional MIPS reporting would significantly increase the number of quality measures required to be reported across subgroups within a group. A few commenters shared their concern that subgroup reporting would add operational complexity because they would need to configure and aggregate data at the subgroup level.

Response: In the CY 2022 PFS final rule, we finalized a policy allowing MIPS eligible clinicians to participate as subgroups when reporting MVPs beginning with the CY 2023 performance period/2025 MIPS payment year (86 FR 65392 through 65394). We stated that the intent of these policies was to move away from large multispecialty groups reporting on a single set of measures that may not be relevant or meaningful to all specialists within the group. We have also heard consistently from interested parties over the prior years that data submitted at the large group level is not always representative of the clinicians who comprise the group. We note that our subgroup policies are flexible, including

no restrictions on the composition of subgroups other than the requirement that each subgroup include one clinician who is MIPS eligible at the individual level. We also did not establish a minimum number of subgroups that must be formed because we intend for groups to form subgroups and select MVPs in the manner that best represents the scope of care the group provides. We refer readers to regulations at §§ 414.1305, 414.1318, and 414.1365 and the CY 2022 PFS final rule (86 FR 65398 through 65405), the CY 2023 PFS final rule (87 FR 70038 through 70045), the CY 2024 PFS final rule (88 FR 79323 through 79328, and CY 2026 PFS final rule (90 FR 49842 through 49846) for additional details on previously finalized subgroup policies.

Comment: Many commenters expressed concern that the transition would require groups to make significant changes to data collection, EHRs, clinician training, and workflows, and to monitor across multiple specialties billing under a single TIN. The commenters recommended that CMS maintain voluntary MVP participation and delay the sunset of traditional MIPS to give groups greater flexibility to update their infrastructure until the MVP framework is more fully developed and concerns related to specialty coverage and subgroup reporting burden for multispecialty group practices have been resolved.

Response: We recognize that the transition from traditional MIPS to MVP reporting may present operational challenges for some practices, particularly those with multiple specialties and more complex reporting structures. We thank the commenters for the feedback regarding allowing practices additional time to update their infrastructure and workflows, and their recommendation that the sunset of traditional MIPS be delayed until the MVP framework is more fully developed, including with respect to specialty coverage and subgroup-related burden. As discussed previously in this section, we are delaying the sunset of traditional MIPS, with MVP reporting required for clinicians not participating in a MIPS APM, beginning in the CY 2031 performance period/2033 MIPS payment year. We will continue to consider these concerns, including the readiness of multispecialty groups and the operational implications of subgroup reporting, in future rulemaking as we further develop and refine the MVP framework.

Comment: A few commenters requested guidance on how multispecialty groups should select the most appropriate MVPs such as those MVPs representing the highest volume of services provided by clinicians within the group or those applicable to the largest number of clinician specialty types in the group. A few commenters recommended that CMS provide guidance on the maximum number of MVPs a group would be required to report, stating that such guidance would reduce burden and help ensure that MVP reporting is operationally feasible for multispecialty group practices. A commenter recommended that CMS publish information on subgroup participation, measure applicability, and scoring before transitioning to MVP reporting so that group practices and third-party intermediaries would have sufficient time to configure their systems in advance of an MVP-only reporting environment.

Response: Regarding the commenters' request for guidance on the maximum number of MVPs a multispecialty group may need to report, we are not establishing a policy at this time because reporting needs may vary based on the size, composition, and specialty mix of the group. As we continue to refine MVP policies, we will consider providing additional subregulatory education and guidance to support the understanding of subgroup participation, MVP selection, and scoring methodologies for clinicians, groups, and third-party intermediaries.

Comment: A few commenters recommended that CMS establish a pathway for multispecialty groups to report on a single set of measures that appropriately captures multidisciplinary care, rather than requiring the formation of subgroups. A commenter recommended that CMS establish a group-level score so that clinicians who cannot be assigned to a subgroup would automatically receive the weighted average score of the subgroups within the group.

Response: We acknowledge the commenters' recommendations to allow multispecialty groups to report on a single set of measures or establish a group-level score for clinicians who cannot readily be assigned to a subgroup. Although we recognize the potential benefit of these approaches in reducing administrative burden, we have concerns that such policies could undermine the relevance of reported measures for certain clinicians and specialties and introduce additional operational and methodological complexities. Therefore, we are not adopting these policies at this time.

Comment: Many commenters stated that the transition to MVPs will require more time for practices to understand new requirements, develop their reporting infrastructure, and train clinicians. A few commenters stated that the low uptake of MVPs to date suggests there are significant barriers to MVP participation which cannot be addressed under the proposed timeframe. A few commenters expressed concern that transitioning to full MVP implementation on the proposed timeline would create administrative and technical burden. A few commenters stated that it is difficult for organizations to develop their internal processes when program requirements change frequently and that small rural practices are especially challenged. A few commenters recommended that CMS conduct pilot studies with small rural practices. A commenter expressed concern that CMS is expecting clinicians to prepare for MVPs, core measures, and modified scoring methodologies all at the same time.

Response: We recognize that clinicians and groups will need sufficient time to develop and implement the processes needed to transition from traditional MIPS reporting to MVP reporting and appreciate the challenges and burden clinicians and groups may face in implementing the MVP-related policies being finalized in this final rule. Although we acknowledge that low uptake of MVPs to date may, to some extent, reflect barriers to participation, we believe the more significant factor is the continued availability of the traditional MIPS reporting option and, therefore, are finalizing a date for sunsetting traditional MIPS. We appreciate commenters' observations about the complexity for large, multi-specialty organizations in reporting multiple MVPs and note that our subgroup policies provide significant flexibility for a multispecialty group to implement MVP reporting in the manner that best fits its clinicians and scope of care. Similarly, we note that the flexibilities in place under traditional MIPS to assist small practices in participating will remain when the transition to full MVP reporting is accomplished. As discussed previously in this section, we are delaying the sunset of traditional MIPS by two years, with required MVP reporting beginning in the CY 2031 performance period/2033 MIPS payment year, partially to provide clinicians with additional time to prepare for an MVP only reporting environment.

Comment: Many commenters urged CMS to continue traditional MIPS until measure and MVP gaps are filled and MVPs are improved. A few commenters stated that additional time is needed for

CMS, specialty societies, and registries to collaborate on measure and MVP development and testing. A commenter stated that CMS should develop a measure development plan for specialties that lack an applicable MVP and for subspecialties, clinical conditions and procedures that existing MVPs do not address. A commenter recommended that CMS delay the sunset of traditional MIPS until MVPs fully reflect the scope of patient care for large multispecialty groups. A commenter recommended that CMS consider delaying the sunset of traditional MIPS until scoring disparities between MVPs are resolved. A commenter stated that even if an Obesity Medicine MVP were developed and finalized for the CY 2028 performance period/2030 MIPS payment year, there would be only one year of voluntary reporting of the MVP before it was mandatory under the proposed timeline.

Response: We are committed to continued collaboration with specialty societies and other interested parties to develop additional MVPs, refine existing MVPs and fill measure gaps. We refer readers to the CMS Quality Measure Development Plan and the Measure Development Plan Annual Report at *https://www.cms.gov/medicare/quality/value-based-programs/quality-payment-program/measure-development* for more information on measure development priorities. With respect to the concern expressed about having only one year of voluntary reporting for a new MVP introduced in the CY 2028 performance period/2030 MIPS payment year, we note that our revised timeline for sunsetting traditional MIPS will provide three years of voluntary reporting for any new MVPs proposed and finalized for the CY 2028 performance period/2030 MIPS payment year. With respect to delaying the sunset of traditional MIPS until MVPs fully reflect the scope of care for large multispecialty groups, we note that the MVPs in our inventory offer robust measure sets addressing top health priorities and the care provided to Medicare patients and provide clinicians with a method to report more specialty-specific, condition-based or more broad-based measures. We will continue to work with interested parties to improve the clinical relevance, fairness, and usability of MVPs and to support clinicians in selecting the reporting option that is most appropriate for their practice. We encourage interested parties to submit potential new measures that will align with current goals and priorities during the annual Call for Measures to fill identified gaps allowing meaningful and complete assessment of MIPS eligible clinician's performance within MIPS. Regarding scoring disparities between MVPs, in the CY 2027 PFS proposed rule we solicited feedback on MVP scoring issues in an RFI, including ensuring scoring fairness across MVPs (91 FR 44206). We may consider the feedback received in response to the MVP Scoring RFI in future rulemaking.

Comment: Several commenters stated that EHR vendors, registries, and other technology partners need more time to develop, test, and deploy MVP reporting infrastructure. A commenter stated that developing and testing automated reporting capabilities across multiple specialty-specific pathways requires substantial vendor investment and time.

Response: We agree with the commenters that EHR vendors, registries, and other technology partners who support clinicians participating in the Quality Payment Program need sufficient time to develop and deploy the MVP reporting infrastructure. We anticipate the modified timeline we are finalizing in this final rule will provide sufficient time for technology partners to prepare for required MVP reporting.

Comment: Many commenters urged CMS to prioritize the transition to digital quality measurement, ensuring a successful transition to dQM reporting and sufficient availability of dQMs for all MVPs and the Ambulatory Specialty Model before sunsetting traditional MIPS. A commenter stated that CMS should delay the sunset of traditional MIPS until FHIR-based dQM infrastructure is available, operational, broadly supported across CEHRT products, and tested for most MIPS measures.

Response: We thank commenters for their feedback regarding prioritization of a successful transition to dQM reporting. We believe the modified timeline for sunsetting traditional MIPS that we are finalizing in this rule will allow clinicians and their technology partners to focus on the digital reporting transition and provide time for dQM infrastructure to become more widely available before MVP reporting requirements take effect. We note, however, conversion of existing quality measures to dQMs will require collaboration and active engagement with all measure stewards and interested parties.

Comment: Many commenters recommended that CMS delay the transition to required MVP reporting. A few commenters recommended specific timelines of three to five years beyond the proposed timeline of sunsetting traditional MIPS beginning with the CY 2029 performance period/2031 MIPS payment year. A few commenters noted that providers already face significant regulatory demands, including the transition to digital quality measures. A commenter requested a delay in the sunset of traditional MIPS for small and independent practices.

Response: We acknowledge the significant challenges clinician practices, including small and independent practices, may face in simultaneously navigating the transition to full MVP implementation and the transition to FHIR-based digital quality measures. We are therefore modifying our proposal to sunset traditional MIPS such that instead of beginning with the CY 2029 performance period/2031 MIPS payment year, it will begin with the CY 2031 performance period/2033 MIPS payment year, adding two more years of voluntary MVP reporting for all clinicians, including those in small and independent practices. With respect to commenters' recommendations to delay the sunset of traditional MIPS by three to five years, we believe that our finalized timeline of sunsetting traditional MIPS beginning with the CY 2031 performance period/2033 MIPS payment year strikes an appropriate balance between providing additional time for clinicians to prepare for the transition to full MVP implementation and setting a timeline for the transition that offers strong encouragement for clinicians and groups to begin reporting MVPs. We are concerned that setting a date for the sunset of traditional MIPS that is more than five years in the future will discourage clinicians and groups from undertaking the changes necessary to successfully report MVPs.

Comment: Several commenters stated that CMS needs more time to evaluate MVPs and the MVP reporting experience in order to demonstrate that MVPs are valid and beneficial before mandating MVP reporting. A few commenters recommended that the transition timeline should be based on readiness benchmarks instead of a predetermined date.

Response: We thank commenters for their recommendations regarding readiness criteria and will consider the feedback as we further refine the MVP inventory and MVP reporting and scoring policies. We also urge clinicians to participate in voluntary MVP reporting prior to the transition to required MVP reporting beginning in the CY 2031 performance period/2033 MIPS payment year. Voluntary MVP reporting, while traditional MIPS reporting is also available, would help clinicians gain experience and

determine any changes to their current workflows. Increased participation in MVP reporting would also provide us with additional data to further evaluate MVP performance and MVP reporting to allow us to further refine MVP policies before the transition to required MVP reporting beginning in the CY 2031 performance period/2033 MIPS payment year.

Comment: A few commenters expressed concerns regarding the MVP registration timeline, specifically noting that the current timeline to register ends before clinicians are aware of their final MIPS eligibility status. The commenters stated that this timeline could create unintended consequences as the clinicians who become subsequently MIPS eligible due to changes in licensure status or switching group practices may be unable to report an MVP. The commenters recommended that CMS align the MVP registration timeline with the timeline for release of final MIPS eligibility determinations. A commenter stated that extending the MVP registration deadline to December 31 of the applicable performance period would align with the timeframe for submitting MIPS Hardship Exception applications. Another commenter recommended that CMS establish an additional registration opportunity or an exception process for such clinicians. Another commenter questioned whether an MVP registration process would remain necessary in an MVP-only environment.

Response: As we stated in the CY 2022 PFS final rule (86 FR 65416), we established the MVP registration process to enable MVP participants and us to accurately capture the MVP selection and determine subgroup participation ahead of MIPS data submission. We recognize that the registration requirement may involve additional nuances where final MIPS eligibility determinations change for reasons outside the control of the clinician or group practice. In light of our decision to delay the sunset of traditional MIPS by two years and transition to required MVP reporting beginning in the CY 2031 performance period/2033 MIPS payment year, we will continue to consider feedback on these issues, including clinician experience with the MVP registration process and the role of registration as we move toward MVP-only reporting, in future rulemaking.

Comment: Several commenters expressed concern that sunsetting traditional MIPS could result in removal of relevant MIPS quality measures that are not currently included in the existing MVPs. The commenters further noted that removing these measures would reduce the MIPS inventory of available quality measures, limit meaningful reporting options for specialists and discourage continued investment in quality measure development. A few commenters requested additional CMS guidance regarding the future of quality measures under the QCDR and MIPS CQM collection types that are currently not included in any MVP. A commenter recommended that CMS maintain the specialty-specific measurement infrastructure to support expansion of relevant quality measures for specialists and to enable meaningful participation in MVP reporting.

Response: We acknowledge the concerns raised regarding the potential effect of sunsetting traditional MIPS on the continued availability of relevant quality measures, particularly for specialists. We recognize the importance of maintaining a robust inventory of quality measures that supports meaningful participation across specialties and encourages continued investment in quality measure development. We also recognize the value of specialty-specific measurement infrastructure, including measures reported through the QCDR and MIPS CQM collection types, in supporting clinically relevant quality reporting. As we continue to implement and refine MVP policies, we intend to consider the availability of relevant quality measures for specialists and the role of currently available MIPS quality measures that are not yet included in an MVP. We will also consider feedback on the QCDR and MIPS CQM measures as we consider future development of MVPs and related policies.

After consideration of public comments, we are finalizing with modification that beginning in the CY 2031 performance period/2033 MIPS payment year, all MIPS eligible clinicians, with the exception of clinicians reporting through the APP, would report through an MVP. Specifically, we are finalizing to add under § 414.1365(a)(2) that beginning in the CY 2031 performance period/2033 MIPS payment year, except for clinicians reporting through the APP pursuant to § 414.1367, all MIPS eligible clinicians must report through an MVP.

d. Include Virtual Groups in MVP Reporting

Section 1848(q)(5)(I) of the Act establishes the use of voluntary virtual groups for certain assessment purposes. The statute requires the establishment and implementation of a process that allows an individual MIPS eligible clinician or a group consisting of not more than 10 MIPS eligible clinicians to elect to form a virtual group with at least one other such individual MIPS eligible clinician for a performance period. As determined in statute, individual MIPS eligible clinicians and groups forming virtual groups are required to make such election prior to the start of the applicable performance period under MIPS and cannot change their election during the performance period.

In the CY 2022 PFS final rule (86 FR 65394), we finalized a delay in the availability of MVP reporting for virtual groups. We noted that there are several considerations, such as implementation burden for interested parties and us, value of MVP reporting for these clinicians versus burden, scoring policies, and other issues that must be addressed prior to allowing clinicians in virtual groups to participate in MVP reporting. Therefore, we did not include virtual groups in the previously finalized definition of an MVP participant at § 414.1305 (86 FR 65392 through 65394). However, to comply with the statute, full implementation of MVPs must include a pathway for virtual groups to participate. For this reason, in the CY 2027 PFS proposed rule (91 FR 44148), we proposed to allow virtual groups to participate in MVP reporting beginning in the CY 2029 performance period/2031 MIPS payment year. This approach would allow time for us to further refine participation criteria and address potential barriers for virtual groups to participate in MVP reporting.

To include virtual groups in MVP reporting, we proposed to revise the definition of an MVP participant at § 414.1305 to provide that, beginning in the CY 2029 performance period/2031 MIPS payment year, MVP participant means an individual MIPS eligible clinician, single specialty group, multispecialty group that meets the requirements of a small practice, virtual group, subgroup, or APM Entity that is assessed on an MVP in accordance with § 414.1365 for all MIPS performance categories.

We considered including virtual groups in MVP reporting beginning in the CY 2028 performance period/2030 MIPS payment year. We recognize that we would need to evaluate additional related policies before including virtual groups in MVP reporting. Under the current policy at § 414.1365(b), MVP participants must register during the performance period. We recognize that the inclusion of virtual groups in MVP reporting would therefore require these groups to register for MVP reporting, which would be an addition to the

existing registration requirement to form a virtual group prior to the performance period. We are exploring options to mitigate the need for virtual groups to register a second time for MVP reporting. Additionally, we noted that even with the proposed inclusion of virtual groups in MVP reporting, clinicians in virtual groups would be unable to participate as subgroups because the definition of a subgroup at § 414.1305 is limited to clinicians within a single TIN and therefore excludes virtual groups, which, by definition, are composed of clinicians across two or more TINs. Under § 414.1305, a subgroup is a subset of a group that includes at least one MIPS eligible clinician and is identified by the group TIN, a subgroup identifier, and each eligible clinician's NPI.

We received public comments on this proposal. The following is a summary of the comments we received and our responses.

Comment: Several commenters supported the proposal to allow virtual groups to report MVPs beginning with the CY 2029 performance period/2031 MIPS payment year.

Response: We thank the commenters for their support.

Comment: Several commenters urged CMS to take steps to minimize administrative burdens for virtual groups participating in MVP reporting. A few commenters recommended that CMS provide technical support and clear guidance on MVP reporting to virtual groups. A few commenters stated that CMS could streamline the registration process by combining virtual group registration and MVP registration.

Response: We agree that clinicians interested in participating in MIPS as a virtual group may need additional guidance on MVP reporting and we will explore opportunities to provide appropriate communications and education materials. We may consider the suggestion to streamline the registration process as we further develop the process for MVP reporting by virtual groups.

Comment: Several commenters expressed concerns that virtual groups will need more time to prepare for MVP reporting and recommended that CMS should make MVP reporting available to virtual groups in the CY 2028 performance period/2030 MIPS payment year or delay mandatory MVP reporting for virtual groups until they have at least one year of voluntary MVP reporting experience.

Response: We thank the commenters for their feedback regarding virtual groups' readiness to report MVPs. We agree that virtual groups would likely benefit from an opportunity to report MVPs on a voluntary basis prior to the sunset of traditional MIPS. As noted in section IV.A.3.c. of this final rule, we are delaying the sunset of traditional MIPS until the CY 2031 performance period/2033 MIPS payment year. We note that allowing virtual groups to report MVPs beginning with the CY 2029 performance period/2031 MIPS payment year will provide two years for virtual groups to report MVPs on a voluntary basis and will allow us to further develop policies and operational details necessary to implement MVP reporting for virtual groups.

After consideration of public comments, we are finalizing our proposal to allow virtual groups to report MVPs beginning with the CY 2029 performance period/2031 MIPS payment year. Specifically, we are finalizing to revise the definition of an MVP participant at § 414.1305 to provide that, beginning in the CY 2029 performance period/2031 MIPS payment year, MVP participant means an individual MIPS eligible clinician, single specialty group, multispecialty group that meets the requirements of a small practice, virtual group, subgroup, or APM Entity that is assessed on an MVP in accordance with § 414.1365 for all MIPS performance categories.

4. QPP Reporting and Data Submission

a. CY 2027 MVP Development and Maintenance

(1) Development of New MIPS Value Pathways (MVPs)

The development of MVPs is informed by the framework established in prior rulemaking (85 FR 84849 through 84856). In the CY 2023 PFS final rule (87 FR 70035 through 70037), we expanded the MVP development process to provide interested parties more opportunities to submit feedback on new candidate MVPs prior to the notice and comment rulemaking process. Consistent with these policies, we posted three MVP candidates for interested parties to review and provide feedback for consideration in the proposed rule. We refer readers to the Quality Payment Program website to review public feedback for each 2027 MVP candidate (*https://qpp.cms.gov/mips/candidate-feedback*).

In alignment with the MVP development process (85 FR 84849 through 84856; 87 FR 70035 through 70037) and feedback received from interested parties, in the CY 2027 PFS proposed rule (91 FR 44475 through 44487) we proposed adopting three new MVPs:

- Diabetic Disease;
- Hospitalist; and
- Hypertension.

We aim to continue developing new MVPs that are relevant and meaningful for MIPS eligible clinicians. The Diabetic Disease and Hypertension MVPs are specifically designed to address the prevention of chronic illnesses by including measures and activities aimed at reducing the incidence and impact of long-term conditions. Disease-specific MVPs allow for more targeted interventions, improved measurement accuracy, and support clinicians in delivering evidence-based care for high—risk populations.

We refer readers to Appendix 3: MVP Inventory, of this final rule for discussion of the proposed new MVPs, the public comments received, and our responses.

We continue to encourage interested parties to use our established pre-rulemaking processes to develop and submit candidate quality and cost measures relevant to their specialty. Furthermore, we continue to develop MVPs based on needs and priorities, as described in the MVP Needs and Priorities document (*https://qpp-cm-prod-content.s3.amazonaws.com/uploads/1803/MIPS%20Value%20Pathways%20(MVPs)%20Development%20Resources.zip*).

(2) MVP Maintenance Updates to Previously Finalized MVPs

Beginning with the CY 2022 PFS final rule (86 FR 65998 through 66031) and continuing through the CY 2026 PFS final rule (90 FR 50376 through 50405), we have expanded the MVP inventory to include the following 27 MVPs:

- Adopting Best Practices and Promoting Patient Safety within Emergency Medicine;
- Advancing Cancer Care;
- Advancing Care for Heart Disease;
- Advancing Rheumatology Patient Care;
- Complete Ophthalmologic Care;
- Coordinating Stroke Care to Promote Prevention and Cultivate Positive Outcomes;
- Dermatological Care;
- Diagnostic Radiology;
- Focusing on Women's Health;
- Gastroenterology Care;
- Improving Care for Lower Extremity Joint Repair;
- Interventional Radiology;
- Neuropsychology;
- Optimizing Chronic Disease Management;
- Optimal Care for Kidney Health;
- Pathology;

- Patient Safety and Support of Positive Experiences with Anesthesia;
- Podiatry; and
- Prevention and Treatment of Infectious Disorders Including Hepatitis C and Human Immunodeficiency Virus (HIV);
- Pulmonology Care;
- Quality Care for Patients with Neurological Conditions MVP;
- Quality Care for the Treatment of Ear, Nose, and Throat Disorders;
- Quality Care in Mental Health and Substance Use Disorder; and
- Rehabilitative Support for Musculoskeletal Care;
- Surgical Care;
- Value in Primary Care; and
- Vascular Surgery.

In the CY 2027 PFS proposed rule (91 FR 44487 through 44557), we proposed modifications to 23 previously finalized MVPs with the addition and removal of measures and improvement activities based on the MVP development criteria (85 FR 84849 through 84854). Through these modifications, we can expand upon clinical concepts, advance health and wellness, address maintenance requests from interested parties, and remove measures and activities that would either be replaced by more robust measures or activities or are finalized for removal from their respective MIPS inventory. We also proposed renaming the Rehabilitative Support for Musculoskeletal Care MVP to Rehabilitative Support MVP to better reflect the measures and activities it includes.

Additionally, we proposed modifications to all 27 previously finalized MVPs in alignment with the proposed implementation of MIPS core measures. In the CY 2027 PFS proposed rule (91 FR 44155 through 44159), we proposed modifications to the current MVP quality reporting requirements at § 414.1365 to replace the current requirement for an outcome/high priority measure with one MIPS core measure included in the MVP. We revised the format of the MVP tables in Appendix 3: MVP Inventory to include MIPS core measures for all MVPs.

We refer readers to sections IV.A.4.d.(1) and IV.B.1.b. of this final rule for the proposed policies for MIPS core measures, the public comments received, and our responses. In addition, we refer readers to Appendix 3: MVP Inventory of this final rule for the proposed modifications to the previously finalized MVPs, the public comments received, and our responses.

b. APM Performance Pathway (APP)

(1) Overview

In the CY 2021 PFS final rule (85 FR 84859 through 84866), we finalized the APM Performance Pathway (APP) at § 414.1367 beginning with the CY 2021 performance period/CY 2023 MIPS payment year. The APP was designed as a reporting and scoring pathway available only to MIPS eligible clinicians identified on the Participation List or Affiliated Practitioner List of an APM Entity participating in a MIPS APM as defined in § 414.1305 (MIPS APM participants) (§ 414.1367(a)). The APP provides a predictable and consistent MIPS reporting option to reduce reporting burden for, and encourage continued APM participation by, these clinicians. We also established in the APP for Shared Savings Program ACOs providing that, beginning with the Shared Savings Program performance year 2021 (CY 2021 performance period/CY 2023 MIPS payment year), ACOs were required to report quality data for purposes of the Shared Savings Program via the APP (42 CFR 425.512(a)(3); 85 FR 84722).

In that same rule, we finalized a quality measure set (85 FR 84860 and 84861) for purposes of quality performance category scoring for the APP. For those MIPS eligible clinicians, groups, or APM Entities for whom a given measure is unavailable due to the size of the available patient population or who are otherwise unable to meet the minimum case threshold for a measure, we established that such measure would be removed from the quality performance category score for such MIPS eligible clinician, group, or APM Entity (85 FR 84861).

In the CY 2025 PFS final rule (89 FR 98562), we finalized a second, optional quality measure set within the APP, called the APP Plus quality measure set, to align with the Universal Foundation measure set. The measure set for CY 2026 performance year includes the current APP quality measures and two additional quality measures from the Adult Universal Foundation measure set. As discussed in the CY 2025 PFS final rule, we intended to incrementally add the remaining three Adult Universal Foundation measures by the CY 2028 performance period/2030 MIPS payment year. We also finalized a 1-year delay to the CY 2026 performance year/CY 2027 MIPS payment year in the incorporation of the Clinician and Clinician Group Risk-standardized Hospital Admission Rates for Patients with Multiple Chronic Conditions (Quality ID: 484) measure.

Further, for MIPS eligible clinicians, groups, and APM Entities reporting through the APP, we established in the CY 2021 PFS final rule (85 FR 84907) that we would not apply the quality measure scoring cap at § 414.1380(b)(1)(iv) in the event that a measure in the APP quality measure set is determined to be topped out. Because the APP quality measure set is fixed, we noted that it would not be appropriate to limit the maximum quality performance category score available to APP reporters. Should an APP quality measure be determined to be topped out, we would at that time consider amending the APP quality measure set through future rulemaking, if appropriate.

In the CY 2024 PFS final rule (88 FR 79329), we established the Medicare Clinical Quality Measures for Accountable Care Organizations Participating in the Medicare Shared Savings Program (Medicare CQMs) collection type in the APP quality measure set and finalized that the Medicare CQMs collection type would be available to only ACOs participating in the Shared Savings Program.

In the CY 2026 PFS final rule (90 FR 49849 through 49856) we updated quality measures in the original quality measure set and the APP Plus quality measure set, to reflect measures updates specified for the quality performance category.

(2) Updates to Quality Measures in the APP and APP Plus Quality Measure Set

In the CY 2021 PFS final rule, we adopted the original APP quality measure set (85 FR 84860 and 84861). In the CY 2025 PFS final rule, we finalized a phased approach to establish the APP Plus quality measure set over 4 years (89 FR 62024), including by incorporating into the APP Plus quality measure set the measures from the original APP quality measure set.

In the CY 2025 PFS final rule, we finalized a phased approach to establish the APP Plus quality measure set over 4 years (89 FR 62024). As finalized, the APP Plus quality measure set consisted of all the measures that were within the APP quality measure set (five Adult Universal Foundation measures and a separate quality measure) plus one additional measure from the Adult Universal Foundation measure set, with the intention of incrementally incorporating the remaining measures from the Adult Universal Foundation measure set by the CY 2028 performance year/CY 2030 MIPS payment year. We finalized this incremental approach in part to allow for both the eCQM and, for Shared

Savings Program ACOs, Medicare CQM collection types to be developed and become available.

Because the APP is a feature within MIPS and therefore the quality measures used within the APP and APP Plus quality measure sets are all MIPS measures, any proposed updates we apply to MIPS measures also are incorporated into the APP and APP Plus quality measure sets, here accordingly.

As discussed in Table Group D, in Appendix 1, of this final rule, we are finalizing as proposed the adoption of measure specification changes to the following measures that are part of the APP and APP Plus quality measure sets:

- Diabetes: Glycemic Status Assessment Greater Than 9% (Quality ID: 001) (eCQMs collection type)
- Preventive Care and Screening: Screening for Depression and Follow-up Plan (Quality ID: 134)
- Hospital-Wide, 30-day, All-Cause Unplanned Readmission (HWR) Rate for MIPS Eligible Clinician Groups (Quality ID: 479)

In addition, we are finalizing as proposed the removal of the following measures that, under the policies finalized in the CY 2025 PFS final rule (89 FR 98369 through 98371) had been scheduled to be added to the APP Plus quality measure set for the CY 2027 performance period and for the CY 2028 performance period or the performance period that is 1 year after the eCQM specification becomes available, whichever is later, respectively:

- Initiation and Engagement of Alcohol and Other Drug Dependence Treatment measures (Quality ID: 305)
- Adult Immunization Status (Quality ID: 493)

We proposed the removal of these two measures from the APP Plus quality measure set due to operational issues impacting the development of the collection types that were finalized in the CY 2025 PFS final rule for these two measures. Our policies will address concerns expressed by ACOs with increasing the number of measures in the APP Plus quality measure set each year. ACOs have suggested maintaining a stable measure set as they transition to digital quality measurement. In the CY 2026 PFS dQM RFI, many commenters recommended that we maintain the APP Plus quality measure set as finalized without adding new measures to preserve resources for the transition to digital quality measurement and to consider challenges ACOs face in data aggregations for eCQM/MIPS CQM/Medicare CQM reporting (90 FR 49856).

These changes have been reflected in Table C–BC2. Table C–BC2 also reflects the creation of the new Medicare eCQMs collection type for Shared Savings Program ACOs reporting the APP Plus Quality measure set for performance year 2027 and subsequent performance years, as discussed in section III.G.3.d.(3) of this final rule and Table Group D and DD, in Appendix 1, of this final rule.

We received public comments on these proposals. The following is a summary of the comments we received and our responses.

Comment: Commenters recommended several refinements to APP and APP Plus quality measure specifications. With respect to the Screening for Depression and Follow-up Plan measure, commenters supported adding a numerator/denominator exception for patients already screened within the same performance year, and urged CMS to apply this exception across both the CQM and eCQM collection types, noting that repeated screenings across providers within a practice distort performance metrics and create unnecessary documentation burden. Separately, a commenter recommended that CMS revise Medicare CQM specifications to permit clinically appropriate value ranges, rather than requiring a single exact value, for measures assessing attainment of a clinical threshold—consistent with existing eCQM flexibility, such as that used in the Controlling High Blood Pressure measure. Commenters characterized these changes as supporting coordinated, practice-wide care and improved alignment between collection types, while reducing administrative burden and preserving measure integrity.

Response: We appreciate commenters' support for reducing redundant reporting burden associated with the Screening for Depression and Follow-up Plan measures. However, the numerator/denominator exception commenters requested is not within the scope of the changes included in the proposed rule where our proposal considered removal of measures. With respect to the recommendation to permit clinically appropriate value ranges within Medicare CQM specifications, we recognize the goal of aligning Medicare CQM logic with existing eCQM flexibility. We note that Medicare CQM specifications are developed in coordination with measure stewards and are not modified through this rulemaking.

Comment: Several commenters addressed CMS' proposed adoption of measure specification changes to the measures that are part of the APP and APP Plus quality measure sets as discussed in Table Group D, in Appendix 1, of this final rule.

Response: We thank commenters for their feedback and refer readers to Table Group D, in Appendix 1, of this final rule for our full response.

Comment: Several commenters were supportive of the proposal to remove Initiation and Engagement of Substance Use Disorder Treatment (Quality ID: 305) and Adult Immunization Status (Quality ID: 493) from the APP Plus quality measure set. Most commenters cited that the proposal reduces administrative burden, stabilizes the quality measure set during the transition to digital quality measurement and addresses the technical and operational challenges associated with the transition.

Response: We thank the commenters for supporting the removal of these two planned measures from the APP Plus quality measure set.

Comment: Several commenters supported the proposal to remove Initiation and Engagement of Substance Use Disorder Treatment (Quality ID: 305) and Adult Immunization Status (Quality ID: 493) from the APP Plus measure set, but requested clarification to confirm whether these measures would be permanently removed or, and what the future of the APP Plus quality measure set and the long-term quality measure strategy looks like to assist ACOs in planning quality improvement initiatives, clinical workflows, and technology investments.

Response: We thank the commenters for their feedback. CMS would address any future consideration of these measures through future notice and comment rulemaking.

Comment: A few commenters opposed the proposal to remove both Initiation and Engagement of Substance Use Disorder Treatment (Quality ID: 305) and Adult Immunization Status (Quality ID: 493) from the APP Plus measure set citing that these two measures are clinically important and address population health and preventative care domains that should be included. A commenter noted both measures should be included until CMS demonstrates an alternative reporting mechanism that provides a sufficiently actionable signal for substance use treatment engagement and adult immunization, which remain central to Medicare population health. A couple of commenters cited the importance of finding other methods of maintaining accountability for vaccination and substance use treatment if these measures are not retained. Some commenters specifically opposed the removal of Initiation and Engagement of

Substance Use Disorder Treatment (Quality ID: 305) citing removing this measure leaves an important clinical gap for substance use disorder treatment, eliminates a payment incentive to start and retain people in substance use disorder treatment, and works against CMS's behavioral-health and chronic-disease objectives along with reducing accountability for ACOs to provide this care. Some commenters specifically opposed the removal of Adult Immunization Status (Quality ID: 493) citing adult vaccination is an important component of preventive care and population health, and removing the measure eliminates an important incentive for ACOs to assess and improve vaccination coverage. A commenter stated CMS should delay implementation or modify the measure if technical or implementation issues make the previously established date impractical.

Response: We thank the commenters for their feedback. As stated in the CY27 PFS proposed rule (91 FR 44151), we proposed the removal of these two measures from the APP Plus quality measure set due to operational issues impacting the development of the collection types that were finalized in the CY 2025 PFS final rule for these two measures. CMS agrees the clinical concepts of these two measures are important to quality care, their removal from the APP Plus quality measure set does not preclude the quality actions from continuing and they should still continue to be assessed as deemed appropriate by the clinician. CMS believes that this policy would lessen the burden associated with implementing new quality measures as Shared Savings Program ACOs move toward digital quality measurement and FHIR-based reporting.

After consideration of public comments, we are finalizing as proposed the adoption of measure specification changes to the following measures that are part of the APP and APP Plus quality measure sets:

- Diabetes: Glycemic Status Assessment Greater Than 9% (Quality ID: 001) (eCQMs collection type)
- Preventive Care and Screening: Screening for Depression and Follow-up Plan (Quality ID: 134)
- Hospital-Wide, 30-day, All-Cause Unplanned Readmission (HWR) Rate for MIPS Eligible Clinician Groups (Quality ID: 479)

We are finalizing our policy to the remove the following measures that, under the policies finalized in the CY 2025 PFS final rule (89 FR 98369 through 98371) had been scheduled to be added to the APP Plus quality measure set for the CY 2027 performance period and for the CY 2028 performance period or the performance period that is 1 year after the eCQM specification becomes available, whichever is later, respectively:

- Initiation and Engagement of Alcohol and Other Drug Dependence Treatment measures (Quality ID: 305)
- Adult Immunization Status (Quality ID: 493)

We are finalizing our proposal to remove these two measures from the APP Plus quality measure set as well, as reflected in Table C–BC2.

BILLING CODE 4169–69–C

a. Fast Healthcare Interoperability Resources®-Based Digital Quality Measurement in the Quality Payment Program and Other CMS Quality Programs—Request for Information

We are advancing quality measurement by transitioning existing quality measures and reporting processes to Fast Healthcare Interoperability Resources® (FHIR®)-based digital approaches. Digital quality measures [393] (dQMs) use standardized, interoperable digital data from multiple sources, including electronic health records (EHRs), to enable more comprehensive and timely assessment of care while reducing reporting burden. We continue to collaborate with Federal partners to advance health information technology and digital quality measurement policy, interoperability standards, and quality measurement infrastructure to support the transition to FHIR-based digital quality reporting.

In the CY 2027 PFS proposed rule (91 FR 44143), we discussed a phased transition to FHIR-based digital quality measurement across the Quality Payment Program and other clinician and hospital programs. Figure C–C1 reflects the phased 2-year transition timeline currently under consideration. The 2-year transition would begin in CY/FY 2028 when FHIR-based dQM reporting would coexist with existing CQM/eCQM options, followed by mandatory FHIR-based reporting for transitioned measures starting in CY/FY 2030. To support a seamless transition and implementation, we requested feedback on implementation timelines, readiness barriers, scoring and reporting requirements, and the technical assistance or flexibility needed, particularly for small and rural practices, and operationally complex organizations such as Accountable Care Organizations (ACOs).

Figure C-C1: TIMELINE FOR TRANSITION TO FHIR-BASED QUALITY REPORTING IN CMS QUALITY REPORTING PROGRAMS*

*We note that more specific adoption timelines may vary by measure and program based on feasibility, implementation complexity, and readiness of interested parties. Existing quality collection types for CQMs and eCQMs may include the following, as applicable by program: MIPS CQMs, Medicare CQMs, eCQM reporting via QRDA files, and proposed Medicare eCQMs. An additional timeline, titled "Transition Timeline for FHIR-based Digital Quality Measurement and Reporting," is also available on the QPP Resource Library at https://qpp.cms.gov/resources/resource-library for more context.

We received many comments on this request for information (RFI) and appreciate the feedback which may inform future rulemaking. We did not propose any policies regarding the FHIR-based approaches in the CY 2027 PFS proposed rule, and we are not finalizing any policies regarding the FHIR-based approaches in this final rule; however, we are providing additional details on expected changes under a future transition to FHIR-based quality reporting. For example, in a FHIR-based reporting environment, a FHIR-based dQM may be reported using a measure specification and data requirements that differs from those used under existing CQM or eCQMs. This would be in addition to a change in the submission format that is used to submit an existing CQM or eCQM (for example, replacing Quality Reporting Document Architecture (QRDA) with FHIR). During the transition period, where we may have both dQM and existing CQM and eCQM versions of the same measures available, we intend to establish policies that address the fact that there are various specifications and data elements associated with each method of reporting. Part of these policy considerations would include addressing scoring and public reporting implications.

Additionally, the certification criteria and reporting specifications for FHIR-based dQM requirements may be different than those associated with current eCQM reporting. Any changes to certification criteria and associated changes to digital reporting of quality measures would need to go through notice-and-comment rulemaking by the Office of the National Coordinator for Health IT (ONC) and/or CMS as applicable. Depending on future policy and technical requirements, FHIR-based reporting could impact third-party

[393] Read more about the dQM transition in the Electronic Clinical Quality Improvement (eCQI) Resource Center here: *https://ecqi.healthit.gov/dqm/about-dqms.*

intermediaries, such as Qualified Clinical Data Registries (QCDRs) or qualified registries. However, we would continue to consider standards and other requirements applicable to such reporting options, including the extent to which ONC certification would be required and whether a third-party intermediary may transform data from other systems into the required FHIR-based specification.

Finally, we continue to focus on the broader objective of the digital transition and intend for all future reporting options, including those involving third-party intermediaries, to promote further adoption of FHIR-based standards rather than functioning solely as a conversion of existing measures into a FHIR format. We will continue to further clarify in future rulemaking the requirements applicable to clinicians, QCDRs, qualified registries, and others that may not use certified health IT.

d. MIPS Performance Category Measures and Activities

(1) Quality Performance Category

(a) Background

Section 1848(q)(1)(A)(i) and (ii) of the Act requires the Secretary to develop a methodology for assessing the total performance of each MIPS eligible clinician according to certain specified performance standards and, using such methodology, to provide for a final score for each MIPS eligible clinician. Section 1848(q)(2)(A)(i) of the Act provides that the Secretary must use the quality performance category in determining each MIPS eligible clinician's final score, and section 1848(q)(2)(B)(i) of the Act describes the measures that must be specified under the quality performance category.

We refer readers to §§ 414.1330 through 414.1340, the CY 2017 and CY 2018 Quality Payment Program final rules (81 FR 77097 through 77162 and 82 FR 53626 through 53641, respectively), and the CY 2019 through CY 2026 PFS final rules (83 FR 59754 through 59765, 84 FR 63949 through 62959, 85 FR 84866 through 84877, 86 FR 65431 through 65445, 87 FR 70047 through 70055, 88 FR 79329 through 79338, and 89 FR 98381 through 98390, and 90 FR 49856 through 49859, respectively) for a description of previously established policies and the statutory basis for policies regarding the quality performance category. In the CY 2027 PFS proposed rule (91 FR 44154), we proposed to:

- Amend the definition of the term ''collection type'' to include the Medicare Electronic Clinical Quality Measures for Accountable Care Organizations Participating in the Medicare Shared Savings Program (Medicare eCQMs).
- Implement the MIPS core measure designations for quality measures in traditional MIPS and MVPs.
- Remove the high priority designation from MIPS quality measures.
- Remove the high priority designation from quality measure retention consideration.
- Replace the requirement to report a high priority measure with the requirement to report a MIPS core measure; and require an attestation process for cases in which a MIPS core measure is not available and applicable.
- Exempt clinicians in small practices from the MIPS core measure requirement and the attestation process.
- Amend the quality performance category data submission criteria at § 414.1335 and § 414.1365 to require MIPS core measure reporting with an attestation process.
- Amend the data submission criteria for the Medicare CQMs collection type.
- Establish the data submission criteria for the Medicare eCQMs collection type.
- Amend the data completeness criteria for the Medicare CQMs collection type.
- Establish data completeness criteria for the Medicare eCQMs collection type.
- Modify the MIPS quality measure set as described in Appendix 1 of this final rule, including the addition of new measures, updates to specialty sets, removal of existing measures, and substantive changes to existing measures.

(b) Updating the Definition of Collection Type

In the CY 2027 PFS proposed rule (91 FR 44154 and 44155), we proposed the establishment of a new collection type, the Medicare Electronic Clinical Quality Measures for Accountable Care Organizations (ACOs) Participating in the Medicare Shared Savings Program (Medicare eCQMs) specific to the APM Performance Pathway (APP); and subsequently, we proposed to amend the definition of the term ''collection type'' to include Medicare eCQMs to account for the new collection type available only to Medicare Shared Savings Program ACOs meeting the reporting requirements of the APP. Specifically, starting with the CY 2027 performance period/2029 MIPS payment year, we proposed to amend the definition of the term ''collection type'' in § 414.1305 to mean a set of quality measures with comparable specifications and data completeness criteria, as applicable, including, but not limited to: Electronic clinical quality measures (eCQMs); MIPS clinical quality measures (MIPS CQMs); Qualified Clinical Data Registry (QCDR) measures; Medicare Part B claims measures; CMS Web Interface measures (except as provided in paragraph (1) of this definition, for the CY 2017 through CY 2022 performance periods/2019 through 2024 MIPS payment years); the CAHPS for MIPS survey measure; administrative claims measures; Medicare Clinical Quality Measures for Accountable Care Organizations Participating in the Medicare Shared Savings Program (Medicare CQMs); and Medicare Electronic Clinical Quality Measures for Accountable Care Organizations Participating in the Medicare Shared Savings Program (Medicare eCQMs).

We requested public comment on this proposal.

We received public comment on the proposal. The following is a summary of the comments we received and our response.

Comment: A few commenters supported the proposal to amend the definition of the term ''collection type'' to include the newly established Medicare eCQMs collection type.

Response: We appreciate the support from commenters.

After consideration of public comments, we are finalizing the proposal, as proposed, to amend the definition of the term ''collection type'' in § 414.1305 to mean a set of quality measures with comparable specifications and data completeness criteria, as applicable, including, but not limited to: Electronic clinical quality measures (eCQMs); MIPS clinical quality measures (MIPS CQMs); Qualified Clinical Data Registry (QCDR) measures; Medicare Part B claims measures; CMS Web Interface measures (except as provided in paragraph (1) of this definition, for the CY 2017 through CY 2022 performance periods/2019 through 2024 MIPS payment years); the CAHPS for MIPS survey measure; administrative claims measures; Medicare Clinical Quality Measures for Accountable Care Organizations Participating in the Medicare Shared Savings Program (Medicare CQMs); and Medicare Electronic Clinical Quality Measures for Accountable Care Organizations Participating in the Medicare Shared Savings Program (Medicare eCQMs).

(c) Modifying Quality Data Submission Criteria

(i) Designating MIPS Core Measures

In the CY 2026 PFS proposed rule (90 FR 32702), we published a Core Elements Request for Information (RFI) soliciting feedback on how to encourage MVP reporting on key quality measures, or ''core'' measures, that reflect the essential components of care. One goal of MIPS reporting, particularly with the transition to MVPs, is to provide patients with comparative clinician performance data so they can make the most informed decisions about their care. The number of MIPS quality measures available for clinicians to choose from in traditional MIPS reduces the standardization of performance data. While MVPs reduce the number of quality measures for clinicians to choose from, MVPs still provide a degree of measure choice that may not produce sufficient comparative performance data on standardized measures to support patient choice of care. In the Core Elements RFI in the CY 2026 PFS proposed rule (90 FR 37021 and 37022), we sought feedback on a potential reporting requirement in which clinicians reporting an MVP would be required to select and report one quality measure from a subset of ''core'' quality measures in each MVP, which would count as one of the four quality measures required in MVP reporting. MVP reporting requirements for the other performance categories would be unchanged. MIPS core measures would be limited to measures that are most reflective of the care that is unique to each MVP's specialty or medical condition. In response to the Core Elements RFI in the CY 2026 PFS proposed rule (90 FR 32702), commenters shared concerns that MIPS core measures may not be applicable to their scope of care and that a MIPS core measure reporting requirement could add complexity to MVP reporting. We took this commenter feedback into consideration, as discussed in the CY 2027 PFS proposed rule, in our proposal of the MIPS core measures policy and in our proposed modifications to the quality performance category data submission criteria for traditional MIPS and MVPs. Specifically, we proposed to designate certain measures as MIPS core measures. Traditional MIPS reporters would be required to report one MIPS core measure as one of their six required quality measures. MVP reporters would be required to report one MIPS core measure as one of their four required quality measures. Small practices would be exempt from this requirement.

As stated in the CY 2027 PFS proposed rule, one of the goals of implementing MIPS core measures is to provide patients with comparative clinician performance data. This will enable patients to make better assessments of the quality of care provided by requiring clinicians within a given specialty to report on a narrower group of measures. This will also emphasize and increase reporting on select quality measures that are the most reflective of the care central to an applicable specialty, medical condition, or episode of care. In developing the MIPS core measures policy, we evaluated several alternative approaches. First, when considering how to procure more robust comparative performance data, we considered mandating clinicians reporting an MVP be required to report the same MIPS quality measure. This approach was not consistent with section 1848(q)(2)(D)(i) of the Act, nor did it achieve intended policy goals of generating more comparative clinician performance data on key quality measures, since what matters most for high-quality care in one specialty may differ from another. Additionally, cross-cutting quality measures, while applicable to the majority of MIPS eligible clinicians, may not be applicable to all, especially bearing in mind subgroup reporting. Expanding upon this idea, we also examined the possibility of a uniform subset of quality measures that would be consistent across all MVPs, and from which clinicians would be required to report one to two quality measures. While having the same subset of measures provides better coverage of the variety of scopes of care provided by MIPS eligible clinicians, we remain concerned that a uniform subset of quality measures will not sufficiently account for the variety of MIPS eligible clinicians' scopes of care while meaningfully assessing quality performance.

In focusing on the goal of providing patients and clinicians with ''comparative performance data,'' particularly among clinicians practicing within the same clinical specialty or providing care to patients with a specific medical condition, we considered whether to use existing population health measures or to develop new administrative claims-based measures. While these approaches will allow for automatic capture of data, there are still constraints in applicability across MIPS eligible clinicians in addition to resources and feasibility. Given these findings, we determined that the most prudent way to capture meaningful comparative data and provide patients with better insight into the quality of care provided was to create a curated set of core quality measures for each MVP. The list of MIPS core measures was selected because we determined these measures were most reflective of the care central to a clinical specialty or medical condition and will be the measures that the MIPS eligible clinician will be required to report from within that MVP.

For each MVP, we proposed that from the list of MIPS quality measures already assigned to the MVP, we would designate at least one as a MIPS core measure that an MVP reporting clinician would be required to report as one of their four required quality measures because the quality measures within each MVP are measures that are clinically relevant to the MVP's specialty or medical condition, and the proposed MIPS core measures are intended to be most reflective of the care that is central to the MVP's specialty or medical condition. The selection process focused on existing MIPS quality measures and newly proposed quality measures for the CY 2027 performance period/2029 MIPS payment year.

In determining which of the quality measures set forth in an MVP should be designated as a MIPS core measure, we proposed to select a minimum of three MIPS core measures per MVP and proposed to designate more than three measures as MIPS core measures if we determined more than three measures must be selected to reflect the care central to the subspecialties within that MVP.

We proposed that for CY 2027 and future years, selection of the MIPS core measures would be based on the following factors:

- Whether the measure is an outcome-based measure;
- Measure collection type availability and the clinician's ability to meet reporting requirements to the extent practicable. Qualified Clinical Data Registry (QCDR) measures were not considered for MIPS core measure selection to ensure MIPS core measures are broadly available and accessible for all eligible clinicians;
- Measure adoption and current and historic performance rates for each measure, to be in alignment with section 1848(q)(3) of the Act, which states that the Secretary shall consider historical performance standards and opportunity for continued improvement in establishing performance standards; and
- Whether the measure is most reflective of the care that is central to

the clinical focus of the selected MVP, represents best practices essential to the MVP's specialty or medical condition, or addresses important areas for improving care.

We proposed that the MIPS core measure designation would apply to quality measures in both traditional MIPS and MVPs. Establishing a set of unified key quality measures across both reporting pathways promotes alignment, reduced reporting complexity for clinicians reporting both traditional MIPS and MVPs, and is operationally feasible. The proposed MIPS core measure inventory, in other words, the list of all measures from each MVP designated as a MIPS core measure in accordance with the above-mentioned factors, includes over 70 quality measures. These measures represent key aspects of care across a variety of specialties and medical conditions. The MIPS core measure inventory also overlaps with the MIPS quality measures currently designated as high priority measures. Given the proposed removal of the high priority designation for MIPS quality measures, the MIPS core measure inventory will not only support reporting within MVPs but will also be applicable to clinicians reporting via traditional MIPS. Additionally, it would provide sufficient data for benchmarking for the MIPS core measures once we phase out traditional MIPS reporting and transition to full implementation of MVP reporting, as detailed in section IV.A.3.c. of this final rule.

As detailed in section IV.A.4.d.(1)(c)(iii)(B) of this final rule, we proposed that clinicians reporting through the traditional MIPS reporting option would select from the complete inventory of available MIPS core measures for the performance period. Whereas clinicians reporting through the MVP reporting option will select the applicable MIPS core measures from the core measures identified within their chosen MVP. As discussed in section IV.A.4.a.(2) of this final rule, we proposed to revise the format of the MVP tables in Appendix 3: MVP Inventory of this final rule to include MIPS core measures for each previously finalized MVP. We also added a MIPS core measure table to the newly proposed MVPs. Further, we proposed beginning with the CY 2027 performance period/2029 MIPS payment year, to establish a MIPS core measure designation applicable to selected quality measures contained in the MIPS quality measure inventory and the MVP inventory found in the Appendices of this final rule.

We received public comments on these proposals. The following is a summary of the comments we received and our responses.

Comment: Several commenters supported the MIPS core measure proposals. A commenter stated that the MIPS core measure requirement is an improvement over the current outcome/high priority requirement for meeting the quality performance category.

Response: We thank the commenters for supporting the MIPS core measure proposals.

Comment: A commenter favored a small, clinically meaningful MIPS core measure inventory over a large menu of optional measures and urged CMS to ensure each specialty's MIPS core measures can be reported using data clinicians already captured (including remote monitoring and patient-reported outcomes), without requiring a separate abstraction workflow. A few commenters indicated that CMS should ensure that every MVP includes at least one broadly applicable and clinically relevant MIPS core measure. A commenter recommended expanding the MIPS core measure inventory or retaining a traditional reporting pathway, working with measure stewards to increase relevant measures, and providing a clear crosswalk between current high priority and proposed MIPS core measures. The commenter also requested that CMS explain the rationale for new MIPS core measures, clearly define core measure criteria, ensure appropriateness across specialties and subspecialties, and monitor implementation to support meaningful participation.

Response: We thank the commenters for their feedback. As the goal of MIPS core measures is to focus clinician reporting on more relevant measures, we intentionally kept the MIPS core measure inventory smaller. The MIPS core measures we identified are a subset of measures within each MVP that represents care central to the MVP's clinical specialty or medical condition, and in many cases align with previously identified high-priority measures. These core measures represent the specific central care unique to and aligned with the clinical focus of an MVP. We did not prioritize selecting broadly applicable measures as MIPS core measures because they often do not meet these criteria for a core measure. In accordance with section 1848(q)(3) of the Act and as discussed in section IV.A.4.d.(1)(c)(i) of this final rule, we focused selection of the MIPS core measures on several factors, including whether the measure is an outcome-based measure, measure collection type availability and the clinician's ability to meet reporting requirements to the extent practicable, measure adoption and current and historic performance rates for each measure, and whether the measure is most reflective of the care that is central to the clinical focus of the selected MVP, represents best practices essential to the MVP's specialty or medical condition, or addresses important areas for improving care.

However, not all MIPS core measures will be applicable to all clinicians reporting an MVP; therefore, we established an attestation process if a clinician does not have a MIPS core measure to report. Additionally, many of the selected MIPS core measures are available for reporting in more than one collection type, allowing clinicians to collect and submit quality measure data in the way that best suits their available health technology and clinical documentation processes. The capturing, reporting, and submission of MIPS core measure data is the same as other quality measures and doesn't require separate workflows. Clinicians can choose the most appropriate MIPS core measure for their scope of care and workflow. For MVPs that represent multiple clinician types, settings, or care scopes, we identified additional MIPS core measures ensuring measure availability for those clinicians who choose to report the MVP. We encourage commenters to reach out to measure developers/stewards to develop new measures that will align with current CMS goals and priorities, and fill identified gaps allowing meaningful and complete assessment of MIPS eligible clinician's performance within MIPS for submission during the annual Call for Measures (*https://mmshub-impl.cms.gov/sites/default/files/2026-MIPS-Annual-Call-for-Quality-Measures-Fact-Sheet.pdf*). We welcome feedback on all MIPS core measures and encourage commenters to submit this during the annual MVP maintenance review process (*https://qpp.cms.gov/resources/mvp-development-maintenance/maintenance-process*). For more information on MIPS core measures, see section IV.A.4.d.(1)(c)(i) of this final rule.

Comment: A commenter supported the MIPS core measure policy and recommended that CMS align the MIPS core measures with the Core Quality Measures Collaborative (CQMC) and select measures that are consistent with CQMC Core Sets wherever possible to promote alignment with private sector efforts and reduce clinician burden. The commenter requested that CMS work with the Office of the National Coordinator for Health Information

Technology (ONC) and health plans to ensure MIPS core measures are usable across public and private payers and to select MIPS core measures that are patient-centered and meaningful to all interested parties.

Response: We thank the commenter for their support and feedback. We appreciate the feedback on the importance of alignment across programs for consistency and workflow efficiency and note that many of the MIPS core measures are found within CQMC Core Sets. However, there may be programmatic nuances or priorities that do not allow for complete alignment with other programs. We encourage interested parties to submit MIPS core measure suggestions to the MVP maintenance process for future consideration. We also encourage interested parties to engage with measure developers/stewards on further alignment across program measure sets because measure stewards are responsible for measure specification changes and updates. For more details on the MVP Maintenance process, see section IV.A.4.a. of this final rule.

Comment: A commenter supported the MIPS core measures proposal but is concerned that allowing multiple MIPS core measures within an MVP could create variation in reporting and limit meaningful performance comparisons. The commenter also noted this approach might unintentionally exclude sub-specialists whose care is not reflected in the broader MIPS core measures. The commenter asked CMS to monitor the MIPS core measures to ensure they support meaningful performance comparisons and subspecialty engagement. For future policy, the commenter urged CMS to work toward a single MIPS core measure per MVP that is meaningful for all participating specialties and subspecialties.

Response: We thank the commenter for supporting the MIPS core measure proposals and for the suggestions to refine MIPS core measure implementation as we move forward. MVPs are structured in a manner that would not easily allow for identification of a single MIPS core measure, as while MVPs are more narrowly targeted than traditional MIPS, an individual MVP may also span multiple specialties or areas of care related to the MVP's clinical theme. Therefore, we identified a small subset of measures within each MVP that represents care central to the MVP's intent. Not all MIPS core measures will be applicable to all clinicians reporting an MVP; however, to the extent possible, we considered implementation factors such as collection type and setting/clinician type applicability. The intent of the selected set of MIPS core measures is to give a comparable data point for each of the represented specialties or subspecialties that will allow for improved comparison and monitoring across clinician specialties. We will incorporate this new monitoring opportunity in addition to the monitoring and performance comparisons which we already conduct within MIPS. While some MVPs, due to inventory constraints, include broadly applicable measures to ensure adequate coverage and reporting options for clinicians without a specialty specific measure, it is expected that clinicians that are able to report the specialty-specific MIPS core measures would do so, as appropriate, allowing for comparison across that measure's performance.

Comment: A few commenters supported the MIPS core measures policy but were concerned about the new mandatory reporting burdens or costs, stating that MIPS core measures should come from existing MVP measures, be easily reportable, and preserve clinician flexibility. Commenters stated that MVPs should have enough relevant, reportable measures so attestation is rarely needed, instead of relying on attestation to cover measure gaps.

Response: We thank the commenters for their support for MIPS core measures policy. MIPS core measures will be selected from measures available within each MVP. For finalized MVPs, we will designate MIPS core measures from the list of measures previously finalized within the MVP or proposed and finalized within this final rule. For MVPs proposed and finalized in this year's rulemaking, we will designate MIPS core measures from the list of measures proposed and finalized. Four new measures finalized under Table Group A of Appendix 1 of this final rule are being added as MIPS core measures within the applicable MVP (see Tables A.1, A.4, A.7, and A.9 of Appendix 1: MIPS Quality Measures). The norm will be to ensure appropriate coverage of all clinicians reporting the MVP, leading to a more complete data set of quality performance measures across clinicians reporting an MVP; therefore, multiple measures were selected for each MVP to allow flexibility in clinician choice and reduce the need for attestation. We encourage interested parties to submit potential new measures during the annual Call for Measures that will align with current CMS goals and priorities and fill any identified gaps, particularly for those subspecialties with limited measures, allowing meaningful and complete assessment of MIPS eligible clinicians' performance within MVPs.

Comment: A commenter believes that there may be benefit in the MVP transition phase to selecting more Medicare Part B claim measures in the MIPS core measure set until vendors are able to support the Medicare CQMs that are included.

Response: We thank the commenter for their feedback about the transition to MVPs and the data collection types considered for MIPS core measures. We do not believe that it was necessary to prioritize quality measures available for reporting through the Medicare Part B claims collection type for designation as MIPS core measures. This collection type is only available to small practices (83 FR 59752),[394] which would be exempt from MIPS core measure requirements. Moreover, the Medicare CQM collection type is only available to ACOs participating in the Medicare Shared Savings Program and will not be available as a collection type for all the MIPS-eligible clinicians (88 FR 79330 through 79332).

Comment: A few commenters expressed that as CMS develops MVPs and MIPS core measures, the agency should rely on established, standardized, nationally recognized eCQMs and digital quality measures (dQMs) already integrated into clinician workflows. The commenters stated that CMS should continue aligning MIPS core measures with the Universal Foundation and avoid excluding clinically meaningful measures based solely on collection type. Another commenter recommended CMS design required MIPS core measures to rely on standardized United States Core Data for Interoperability (USCDI) and USCDI+ (program-specific extensions of USCDI) data elements, minimizing manual data abstraction or creation, which is especially important as CMS considers transitioning to dQM FHIR.

Response: We thank the commenters for their feedback and appreciate the feedback on the transition to dQM FHIR. Currently, the measure steward, as the proprietor of the measure, determines which collection types will be available for each of their measures without specific requirements for digital measure data element abstraction. Therefore, utilizing criteria, that require an eCQM or dQM collection type, at this time would circumstantially benefit or diminish a measure's inclusion as a

[394] *https://www.federalregister.gov/documents/2018/11/23/2018-24170/medicare-program-revisions-to-payment-policies-under-the-physician-fee-schedule-and-other-revisions#page-59752.*

MIPS core measure based on criteria that are not currently required for MIPS quality measures. Additionally, these added requirements for MIPS core measure selection, such as a specific collection type, would further constrain selection options and create a barrier for reporting that is not a MIPS requirement until more measures are converted to dQMs and FHIR-based reporting is mandatory. We accounted for collection type availability for measures selected; however, the final selected measures represent a balance between clinical topic alignment, availability, and applicability, as we can't require use of specific submission criteria.

Comment: Many commenters expressed general concerns about the MIPS core measures policy. Of these commenters, a commenter stated a measure should not be designated as a MIPS core measure merely because it appears broadly relevant at the MVP level. The commenter stated that CMS should confirm that the measure: applies to the clinician's actual scope of practice; is reportable by the intended clinician type; has a benchmark with equitable scoring opportunity; can reasonably meet case minimum; and represents a meaningful aspect of care for the designated specialty or subspecialty. Another commenter stated that a quality measure must possess a benchmark to be classified as a MIPS core measure in an MVP.

Response: We thank the commenters for their feedback. In designating core measures, we balanced choosing measures that most closely represent care central to the MVP topic, while ensuring the availability of the measure collection type and applicability of the setting/clinician type for clinicians that choose to report the MVP, in accordance with the factors we proposed for designation of MIPS core measures. We disagree that only measures with benchmarks should be considered, especially given the current ability to report as multi-specialty groups. Many critical quality actions are represented by specialty specific quality measures which may show low adoption as multispecialty groups focus on capturing data for the more broadly applicable measures. Additionally, we believe that as a designated MIPS core measure, there will be an increase in adoption for the selected measures, allowing for meaningful benchmark creation for quality measures that historically didn't meet reporting requirements. We appreciate the commenters' concern regarding reporting requirements and scoring opportunity and will continue to evaluate measure reporting and policies for future proposals, in addition to the 7-point cap removal policy for MIPS core measures finalized in section IV.B.1.b.(3)(c) of this final rule.

Comment: A few commenters were concerned that the MIPS core measures policy would reduce flexibility and further restrict clinician's ability to select measures that meaningfully reflect their practice. The commenters were further concerned this policy will create a one-size-fits-all model and urged CMS to preserve measure choice, keep core requirements limited, and use broadly applicable measures within physicians' control. A commenter expressed that adding MIPS core measures would add another layer of complexity at a time when CMS is trying to streamline the program and added that physicians should have the flexibility to choose measures that are most relevant to their unique practice. Another commenter stated that MIPS core measures must be clinically relevant, feasible, and applicable across diverse practice settings and requested CMS maintain flexibility when no applicable MIPS core measure exists and regularly reevaluate MIPS core measures to reflect evolving clinical practice. Another commenter stated that surgeons must retain flexibility to select measures relevant to their practices and rather than requiring MIPS core measures, CMS should encourage development of additional measures for specific specialties.

Response: We thank the commenters for their feedback that this change in policy will modify reporting requirements. We note that clinicians will maintain the flexibility to choose the quality measures they report. The MIPS core measures policy will decrease complexity while also increasing flexibility. Reporting a MIPS core measure replaces the requirement to report an outcome/high priority measure, which may not be always best aligned with the MVP topic. For each MVP, we identified a small subset of measures that represent care central to the MVP's specialty or medical condition to continue to allow for flexibility and clinician choice. For some MVPs, such as the Surgical Care MVP, we determined more than three measures must be selected to reflect the care central to the subspecialties able to report the MVP. Additionally, the policy includes an option for self-attestation when the MIPS core measures are not appropriate or applicable to their scope of care, allowing clinicians to choose an alternate measure that is more relevant. We welcome feedback on all MIPS core measures and encourage commenters to submit this during the annual MVP maintenance review process. We also encourage interested parties to submit potential new measures that will align with current CMS goals and priorities and fill these identified gaps to allow meaningful and complete assessment of MIPS eligible clinician's performance within MIPS during the annual Call for Measures.

Comment: Several commenters requested CMS permit QCDR measures to be designated as MIPS core measures.

Response: When developing criteria for selecting MIPS core measures, it was determined that QCDR measures would not be included as MIPS core measures to ensure MIPS core measures are accessible for all eligible clinicians. QCDR measures require additional resources for reporting and therefore may not be a feasible reporting option for some clinicians. As reporting a MIPS core measure is a criterion for meeting quality performance requirements, all measures need to be publicly available and free to use.

Comment: A commenter urged CMS to publish, in the final rule, a complete and clearly identified list of all proposed MIPS core measures, and to establish a transparent process for designating MIPS core measures that include meaningful consultation with the relevant clinical specialty interested parties and the consequence for physician scoring should not be made without the input of the specialties they affect. Similarly, a few commenters requested that CMS publish the list of MIPS core measures each year in rulemaking and seek interested parties' feedback before the list is published. Many specialty societies asked for closer collaboration with CMS on MIPS core measure development and the ability to provide interested parties' feedback. Another commenter requested CMS define a MIPS core measure continuity process before finalizing the designation, noting that high priority status will no longer function as a reason to prevent a measure from being removed. The commenter also stated that the proposed rule did not describe a replacement process for the specialty or MVP that loses its MIPS core measure as a result.

Response: We welcome feedback on all MIPS core measures and encourage commenters to submit this during the annual MVP maintenance review process for consideration in future rulemaking. For more details on the MVP maintenance process, see section IV.A.4.a. of this final rule. MIPS core measure designation factors are outlined in section IV.A.4.d.(1)(c)(i) of this final rule and set the base for consideration criteria during review of each MVP.

While we completed the initial designation of MIPS core measures, this is an element that will be reviewed annually with interested parties' feedback to determine if revisions are warranted. Understanding that some clinicians may not be able to report the selected MIPS core measures, we do allow attestation if a MIPS core measure is not available and applicable. While high priority was a consideration for retaining measures that met removal criteria, many of the other criteria found within 42 CFR 414.1330(c)(2) would be applicable to MIPS core measures as they represent priority areas for quality measure performance data that drives positive outcomes in patients. However, if a MIPS core measure is removed from MIPS for other reasons, such as the measure steward decides to no longer maintain it, another MIPS core measure would be selected as a replacement through the MVP maintenance process and rulemaking.

Comment: Several commenters requested CMS further test the concept of MIPS core measures and urged CMS to delay finalizing MIPS core measures until clinicians have had sufficient time to transition to and gain experience with mandatory MVP reporting. Several commenters requested delaying the MIPS core measures requirement until the CY 2028 MIPS performance period to allow CMS time to refine the MIPS core measure definition and selection process and ensure EHR and registry vendors are ready to support MIPS core measures. Another commenter requested CMS test the MIPS core measures policy through a 2-year informational-only period before applying payment consequences to allow for an adequate transition time and ensure that safeguards are adopted to prevent unnecessary burden. A few clinicians indicated that they need more time to transition to and gain experience with mandatory MVP reporting.

Response: As the MIPS core measures were chosen from quality measures already in MIPS, we do not agree that delaying implementation a year or two would result in meaningful information to change the MIPS core measures policy. Note that although we are finalizing our MIPS core measures policy for the CY 2027 performance period, we are delaying the sunsetting of traditional MIPS by 2 years, which means that MVP-only reporting will begin in the CY 2031 performance/2033 MIPS payment year period instead of the CY 2029 performance period as indicated under section IV.A.3.c. of this final rule. This extra time will allow clinicians more opportunity to begin planning for and reporting MIPS core measures before MVP reporting is required.

Comment: A commenter stated it is critical that at least one of the MIPS core measures in an MVP be considered in relation to one or more of the cost measures.

Response: During identification of MIPS core measures, we considered current and historical submission data to guide applicability and decision-making, working to include appropriate and available measures. Currently there are more specialty specific quality measures available, which are needed to cover as many specialties/subspecialties as possible, and there may not be a complimentary episode-based cost measure available. However, as the goal of MIPS core measures is to target performance data for specific quality actions central to the MVP intent, the link to cost is addressed at the MVP level, rather than to individual quality measures.

Comment: Several commenters expressed concern for limited core measures available for specific specialties. Commenters stated that MIPS core measures add little value when a specialty already has a small, defined set of measures. A commenter stated the primary purpose of an MVP is to measure specialty-specific quality. The commenter stated that if there is only one MIPS core measure available, it does not help with the adoption of the use of MVPs for MIPS reporting. Another commenter stated that the current core set of measures does not meet CMS' stated goal of identifying measures ''most reflective of the care that is unique to each MVP's specialty or medical condition.'' Another commenter said that instead of mandating the reporting of MIPS core measures, CMS should focus its efforts on ensuring that each MVP offers a sufficient number of meaningful measures, including QCDR measures, that appropriately reflect the care delivered by the specialty or subspecialty. A commenter recommended that specialties with few available measures should be exempt from the MIPS core measure requirements. CMS should categorize each measure and report scores by category, which would be more meaningful to patients and avoid incomplete comparisons between clinicians.

Response: We thank the commenters for their comment. In designating MIPS core measures, we balanced alignment of the measure with care central to the MVP topic, while ensuring measure availability for those clinicians who choose to report the MVP. The purpose of MIPS core measures is to capture data that best represents the care unique to the MVP topic, allowing for a targeted set of data that directly compares quality performance for essential care components that patients can readily understand and access for making care provider decisions. While MVPs allow for more meaningful comparisons of performance and connection of quality with cost, varied measure selection for reporting within the MVP leads to varied measure submissions across the MVP, even in MVPs with fewer measures and in cases where new measures are still being developed and may be added to MVPs that have fewer measures in the future. MIPS core measures will provide a more focused performance comparison point across those reporting the MVP. Alignment of MIPS core measures across MVPs was a secondary consideration as appropriate and applicable. MIPS core measures replace the outcome/high priority quality measure requirement while adding flexibility and designating more meaningful measures. Understanding that some clinicians, such as cardiovascular subspecialists, may be unable to report the selected MIPS core measures, we do allow attestation for cases in which a MIPS core measure is not available and applicable. We encourage interested parties to submit potential new measures that will align with current CMS goals and priorities, allowing MIPS eligible clinicians to maximize their potential performance within MIPS during the annual Call for Measures.

Currently, the measures within the MVP are bucketed into clinical groupings, which helps to guide measure reporting choice; however, these also do not always capture all clinicians' individual scope of care. Some MIPS core measures are broadly applicable, seeming to go against the goal of designating measures ''most reflective of the care that is unique to each MVP's specialty or medical condition;'' however, these are not mutually exclusive as the measure may represent a fundamental aspect of care that is unique and unifying across specialties and clinical care topics, such as shared decision-making and risk communication. Additionally, there are certain administration priorities aligned with such unifying concepts, representing important aspects of care that are widely comparable and an important data point for patients deciding on clinicians.

After consideration of public comments, we are finalizing that the measures we proposed to be designated as a MIPS core measure in Appendices

1 and 3 of the CY 2027 PFS proposed rule, in accordance with the methodology we proposed for designating a measure as a MIPS core measure, are finalized as proposed. Finalized designations may be found in the MIPS quality measure inventory and the MVP inventory found in Appendices 1 and 3, respectively, of this final rule. We are also finalizing our considerations for designating a quality measure as a MIPS core measure as proposed. As discussed above, interested parties may submit recommendations for quality measures set forth in an MVP to be designated as a MIPS core measure in accordance with the MVP maintenance process for CMS to consider in future rulemaking. CMS will propose quality measures that meet the factors for a MIPS core measure to be designated as such through rulemaking. We are also finalizing our policy that will designate at least three measures in each MVP as a MIPS core measure.

For the discussion on the policies relating to reporting MIPS core measures for traditional MIPS, specialty measure sets, and the MVP reporting option, please see section IV.A.4.d.(1)(c)(iii)(B) of this final rule.

(ii) Removing High Priority Measure Designation and High Priority Quality Measure Retention Consideration

In the CY 2019 PFS final rule (83 FR 59761), we finalized that beginning with the CY 2019 performance period/2021 MIPS payment year, the term ''high priority measure'' is defined at § 414.1305 as an outcome (including intermediate-outcome and patient-reported outcome), appropriate use, patient safety, efficiency, patient experience, care coordination, or opioid-related quality measure. In the CY 2023 PFS final rule (87 FR 70047 through 70049), we finalized an amended definition of the term ''high priority measure'' to include quality measurement pertaining to health equity. In the CY 2026 PFS final rule (90 FR 49857), we finalized at § 414.1305 an amended definition of the term ''high priority measure'' to mean an outcome (including intermediate-outcome and patient-reported outcome), appropriate use, patient safety, efficiency, patient experience, care coordination, or opioid-related quality measure, beginning with the CY 2026 performance period/2028 MIPS payment year.

In the CY 2017 Quality Payment Program final rule (81 FR 77558 through 77785) and subsequent Quality Payment Program and PFS rules (82 FR 53965 through 54174, 83 FR 60097 through 60285, 84 FR 63205 through 63513, 85 FR 85045 through 85368, 86 FR 65686 through 65968, 87 FR 70250 through 70633, 88 FR 79556 through 79964, 89 FR 98599 through 98957, and 90 FR 50036 through 50353), we designated certain quality measures as high priority in the MIPS quality measure inventory found in the Appendices of the rules for the applicable performance period to allow MIPS eligible clinicians to easily identify which measures meet the definition of a high priority measure at § 414.1305 and satisfy the reporting requirement. Additionally, in the CY 2022 PFS final rule (86 FR 65998 through 66031) and subsequent PFS rules, we designated high priority quality measures in the MVP inventory found in the Appendices. The Explore Measures and Activities Tool on the QPP website (*https://qpp.cms.gov/reporting-requirements/measures-activities/explore*) also indicates which quality measures are designated as high priority in traditional MIPS and MVP reporting.

Given the implementation of the MIPS core measure designation in section IV.A.4.d.(1)(c)(i) of this final rule, which identifies a subset of measures that reflect the essential components of care specific to a given specialty, medical condition, or episode of care, we proposed to remove the high priority designation from the MIPS quality measure inventory and the MVP inventory. The new MIPS core measures intend to increase reporting on select quality measures that are most reflective of the care central to a particular specialty, medical condition or episode of care, while providing patients with more comparative clinician performance data. We considered maintaining the high priority designation since many of the new MIPS core measures are high priority measures. However, the high priority designation does not appropriately capture a measure's relevance to a specific clinical specialty, medical condition or episode of care. We identify and designate quality measures that reflect agency-wide priorities as high priority in our programs through a myriad of ways such as using the MIPS high priority definition, developing the Universal Foundation, and implementing the Core Quality Measures Collaborative (CQMC). However, the new MIPS core measure designations specifically represent key quality measures that reflect the measure's relevance to a specific clinical specialty, medical condition or episode of care for clinicians and patients for each MVP and essential best practices to the MVP's clinical topic. The significant overlap in the new MIPS core measures with the MIPS high priority measures means we will still largely capture agency-wide priorities but with a greater emphasis on supporting intended MIPS policy goals of providing robust quality measure data relevant to the scope of care for a specialty or medical condition. Additionally, maintaining the high priority measure designation can add complexity and confusion for clinicians given the overlap of the existing high priority measures and the new MIPS core measures. While we acknowledge the overlap in intended goals for high priority measures and MIPS core measures, we anticipate that the new MIPS core measures, with a selection emphasis on outcome-based measures, will provide a more targeted set of measures, focused on more meaningful improvement in the quality of care related to each MVP specialty or medical condition. Therefore, to implement the new MIPS core measure designation as described in section IV.A.4.d.(1)(c)(i) of this final rule, we proposed to remove the high priority designation from the MIPS quality measure and the MVP inventory in Appendices 1 and 3 of this final rule.

Additionally, in the CY 2019 PFS final rule (83 FR 59765) at § 414.1330(c)(2), we revised the approach to remove quality measures to include considerations for retaining MIPS quality measures that otherwise meet the criteria for removal, including ''whether the MIPS quality measure is designated as high priority or not.'' To align with the removal of high priority designation from MIPS quality measures, we will no longer include the use of a high priority measure designation as one of the considerations for retaining a MIPS quality measure. Therefore, we proposed to update the existing quality measure retention consideration at § 414.1330(c)(2)(iv) to state that we will consider whether the quality measure is designated as high priority or not through the CY 2026 performance period/2028 MIPS payment year.

We received public comments on these proposals. The following is a summary of the comments we received and our responses.

Comment: Several commenters supported the proposal to remove the high priority designation for quality measures. A commenter added that it should be assumed that all measures remaining would be considered high priority and supported replacing outcome measures with MIPS core measures.

Response: We thank the commenters for supporting the proposal to remove the high priority measure designation. As we move to a robust, streamlined quality measure inventory, we expect that each measure maintained would meet standards and criteria once associated with high priority measures, essentially resulting in a quality measure inventory that consists of high priority and MIPS core measures.

Comment: A commenter believes that eliminating the high priority designation does not justify replacing it with a MIPS core measure requirement.

Response: We thank the commenter for their comment but disagree. The overall goal of MVPs is to create a small, streamlined set of measures that are reflective of the care given. Identifying MIPS core measures allows for continued choice in measure selection while also supporting the goal of capturing comparable data across clinicians for patient use in care decision making. While we acknowledge the overlap in intended goals for high priority measures and MIPS core measures, we anticipate that the new MIPS core measures, with a selection emphasis on outcome-based measures, will provide a more targeted set of measures, focused on more meaningful improvement in the quality of care related to each MVP specialty or medical condition.

Comment: A few commenters asked CMS to maintain the high priority/outcome designations. A commenter requested maintaining the requirement alongside the core measure designations and allow reporting of either a MIPS core measure or outcome/high priority measure to provide the flexibility needed for subspecialists to report on measures germane to their practice. A commenter believes the three MIPS core measures for its specialty were not a complete representation of the care provided by this specialty and asked for the high priority designation to remain. Another commenter expressed that eliminating these designations would devalue true patient outcome measures and conflict with CMS' goal of clinically relevant, evidence—based performance assessment. Another commenter stated that the high priority designation highlights core quality areas (patient outcomes, care coordination, safety, experience, and appropriate use) that are essential to primary care and expressed concern that removing this designation and its role in measure retention could lead to loss of important primary care measures.

Response: The importance given to patient outcome measures remains regardless of the high priority designation. Currently, over 50 percent of the outcome and patient experience quality measures are designated as MIPS core measures, allowing for the continued reporting of previously selected measures. However, the distribution of outcome and patient experience quality measures across MVPs and within MVPs isn't consistent, leading to potential reporting inequities and inability to meet requirements, but more importantly, potentially missing key aspects of care unique to clinicians reporting an MVP. MIPS core measures, however, are specifically chosen from the MVP measure set to represent these key aspects of care, as opposed to choosing from a set of measures using a historical designation that does not serve the same purpose. While high priority was a consideration for retaining measures that met removal criteria, many of the other criteria found within 42 CFR 414.1330(c)(2) would be applicable to MIPS core measures as they represent priority areas for quality measure performance data that drives positive outcomes in patients. In addition, having adequate coverage for clinicians reporting MVPs is a critical factor taken into consideration when reviewing the measure inventory, and measures would not be removed to the detriment of a specialty (for example, primary care) based on the change in measure designations. All MIPS quality and QCDR measures will continue to be reviewed and assessed for meeting the fully developed and tested criteria, allowing for consistent and reliable implementation in MIPS. We encourage interested parties to develop, or work with measure developers, to submit potential new measures that will align with current CMS goals and priorities and fill these identified gaps allowing meaningful and complete assessment of MIPS eligible clinician's performance within MIPS during the annual Call for Measures.

Comment: A commenter recommended that CMS confirm in the final rule that the MIPS core measure designations as finalized in Appendix 1 and Appendix 3 of this final rule are the operative designations for the CY 2027 performance period, and that a measure's core or non-core designation will not be added, removed, or revised through the Explore Measures and Activities Tool or other sub-regulatory channels after the final rule publishes. The rule notes that the high priority designation policy replacement has been communicated through the Explore Measures and Activities Tool in addition to the rule appendices. The commenter asked CMS to state that the core designation will not follow that pattern.

Response: We thank the commenter for this comment. The MIPS core measures list finalized under this final rule are the final designations for the CY 2027 performance period. There will be no further changes to MIPS core measures in CY 2027; however, any resources requiring corrections to align with the CY 2027 finalized MIPS core measures would be allowed to ensure the most accurate information is conveyed. There will be no substantive changes made to the Explore Measures and Activities Tool or other sub-regulatory channels outside of this final rule for CY 2027. Any future updates to MIPS core measures policy, or the list of MIPS core measures, will go through notice-and-comment rulemaking.

After consideration of public comments, we are finalizing the removal of the high priority designation from the MIPS quality measure inventory and the MVP inventory in Appendices 1 and 3 of this final rule, given the implementation of the MIPS core measure designation, as proposed. We are also finalizing updates to the existing quality measure retention consideration at § 414.1330(c)(2)(iv) to state that we would consider whether the quality measure is designated as high priority or not through the CY 2026 performance period/2028 MIPS payment year.

(iii) Implementing Data Submission Requirement for MIPS Core Measures

(A) Background

In the CY 2017 Quality Payment Program final rule (81 FR 77114), we finalized at § 414.1335(a)(1) that for the performance period, a MIPS eligible clinician will report at least six measures including at least one outcome measure. If an applicable outcome measure is not available, a MIPS eligible clinician will be required to report a high priority measure instead. Additionally, in the CY 2022 PFS final rule (86 FR 65412), we finalized at § 414.1365(c)(1), that except as provided in paragraph § 414.1365(c)(1)(i), an MVP participant must select and report, if applicable, 4 quality measures, including 1 outcome measure (or, if an outcome measure is not available, 1 high priority measure), included in the MVP, excluding the population health measure required under paragraph (c)(4)(ii). We were concerned that small practices do not have the same resources to meet the quality reporting requirement of four measures if the MVP does not include four Medicare Part B claims measures. Therefore, we

finalized at § 414.1365(c)(1)(i) that paragraph § 414.1365(c)(1) does not apply to a small practice that reports on an MVP that includes fewer than four Medicare Part B claims measures, provided that the small practice reports each such measure that is applicable.

(B) Update for MIPS Core Measure Data Submission Requirements With Self-Attestation

In conjunction with the removal of the high priority designation for MIPS quality measures, and the new designation of MIPS core measures beginning with the CY 2027 performance period/2029 MIPS payment year, we proposed to remove the current quality measure data submission requirement of one outcome measure (or, if an outcome measure is not available, one high priority measure) for traditional MIPS and MVPs and replace the requirement with a MIPS core measure data submission requirement to emphasize the reporting on the new MIPS core measures. In the CY 2027 PFS proposed rule, we stated the requirement to report an outcome measure (or, if an outcome measure is not available, one high priority measure) would no longer be necessary if the MIPS core measure selection policies were finalized, as the goals of that policy would be met by the new MIPS core measure reporting requirement. Specifically, we proposed that MIPS eligible clinicians reporting via traditional MIPS must submit data on at least six measures, including at least one MIPS core measure. Clinicians reporting a specialty measure set in traditional MIPS must report at least six measures and choose an applicable MIPS core measure, if available, within that specialty measure set. If the set contains fewer than six measures or fewer than six measures within the set apply, they must report on each measure that is applicable. Additionally, to be consistent with the existing reporting requirements for clinicians reporting a specialty measure set, as finalized in the CY 2017 Quality Payment Program final rule (81 FR 77114), if a specialty measure set does not contain a MIPS core measure, clinicians must still report on at least six measures within the specialty set. If the specialty set does not contain a MIPS core measure and contains fewer than six measures, or fewer than six measures within the set apply, they must report on each measure that is applicable within the specialty measure set. An MVP participant must select and report, if applicable, four quality measures, including at least one MIPS core measure. We noted in the proposed rule that clinicians submitting data for the quality performance category in traditional MIPS reporting would choose an applicable MIPS core measure from the full inventory of available MIPS core measures for the performance period. Clinicians reporting an MVP will choose an applicable MIPS core measure from those available in the selected MVP. Each MVP will include a minimum of three MIPS core measures for a clinician to select from. MVPs that encompass multiple specialties or subspecialties may include more than three MIPS core measures to ensure comprehensive coverage for the variety of clinicians reporting that MVP.

Since the new MIPS core measures are identified to reflect the care most central to a clinician specialty, medical condition, or episode of care within each MVP for clinicians and patients, we anticipated that clinicians can report the new MIPS core measures in the selected MVP. We acknowledged that due to the variety of clinician practices, specialties, and subspecialties reporting each MVP, there may be instances in which a clinician does not have an available and applicable MIPS core measure due to the limited inventory of the new MIPS core measures. If an individual eligible clinician, group, subgroup, or APM Entity does not have an available and applicable MIPS core measure that meets the numerator and denominator criteria as specified in the MIPS quality measure inventory for the applicable performance period, either in traditional MIPS or MVP reporting, we proposed to establish a MIPS core measure self-attestation process. Under this process, the clinician would be required in good faith to attest during the data submission period that there was not an available and applicable MIPS core measure for them to report. The clinician would then be required to choose another measure to report in place of the MIPS core measure. A clinician reporting via traditional MIPS can report any other applicable quality measure in the MIPS quality measure inventory. In MVP reporting, a clinician can report any other quality measure in the selected MVP. There may be instances in which a clinician attested to not having an applicable and available MIPS core measure, but new information or changing circumstances later made it so that the clinician does have an applicable and available MIPS core measure to report. To account for these cases, we would allow a clinician to attest that they do not have an applicable and available MIPS core measure and then submit a MIPS core measure. While we considered requiring clinicians without an available and applicable MIPS core measure to report an outcome or high priority measure, we determined that such a requirement would increase complexity for clinicians and would be unnecessary given that MVPs are already a collection of the key quality measures for a specialty, medical condition, or episode of care. We proposed that we would not penalize a MIPS eligible clinician who provides a self-attestation to not having a MIPS core measure to report. We noted in the proposed rule that we may monitor attestations received for the MIPS core measure requirement and may, in future years, conduct random reviews to verify that there were no available and applicable MIPS core measures for reporting. We refer readers to section IV.B.1.b.(1) of this final rule for details on the scoring policies for MIPS core measures.

For traditional MIPS reporting, we proposed at § 414.1335(a)(1)(i) that beginning in the CY 2027 performance period/2029 MIPS payment year, MIPS eligible clinicians, except as provided in paragraphs (a)(1)(ii) and (a)(1)(iii) of this section, submit data on at least six quality measures, including at least one MIPS core measure. If there is not an available and applicable MIPS core measure, a MIPS eligible clinician must attest to not having an available and applicable MIPS core measure and submit data on a separate MIPS quality measure. If fewer than six measures apply, then the MIPS eligible clinician, group, virtual group, or APM Entity must report on each measure that is applicable.

Additionally, we proposed at § 414.1335(a)(1)(ii) that beginning in the CY 2027 performance period/2029 MIPS payment year, except as provided in paragraph (a)(1)(iii) of this section, a MIPS eligible clinician that reports on a specialty or subspecialty measure set, as designated in the MIPS final list of quality measures established by CMS through rulemaking, must submit data on at least six measures within that set, including at least one MIPS core measure. If there is not an available and applicable MIPS core measure, a MIPS eligible clinician must attest to not having an available and applicable MIPS core measure and submit data on a separate MIPS quality measure within that set. If the set contains fewer than six measures or if fewer than six measures within the set apply to the MIPS eligible clinician, report on each measure that is applicable.

For MVP reporting, we proposed at § 414.1365(c)(1) that, beginning in the CY 2027 performance period/2029 MIPS

payment year, except as provided in paragraphs (c)(1)(i) and (c)(1)(ii) of this section, an MVP participant must select and report, if applicable, four quality measures, including one MIPS core measure available in the MVP, excluding the population health measure required under paragraph (c)(4)(ii). If there is not an available and applicable MIPS core measure, an MVP participant must attest to not having an available and applicable MIPS core measure and submit data on a separate MIPS quality measure within the MVP.

We received public comments on these proposals. The following is a summary of the comments we received and our responses.

Comment: Several commenters supported the proposal to remove the requirement to report one outcome or high priority measure for traditional MIPS and MVP reporting. A commenter indicated this requirement has been problematic in mandatory MVPs where physicians have fewer measures to choose from and may be unable to identify a relevant outcome or high priority measure. A commenter expressed that replacing the outcome measure requirement with MIPS core measures will solve the issues with established quality measures not receiving benchmarks due to low participation, and clinicians unwilling to elect administrative claims measures (outside of the population health measures) that are available under certain MVPs because they are outcome measures. Another commenter agreed that many clinicians struggle to report outcome measures. Another commenter stated that removing the outcome measure requirement allows clinicians more flexibility to select measures relevant to their practice.

Response: We thank the commenters for supporting the proposal to remove the requirement to report on one outcome or high priority measure for traditional MIPS and MVP reporting.

Comment: Several commenters supported the attestation process for clinicians who have no applicable MIPS core measure to report. A commenter expressed that those with limited measures will also need to use eligible measure applicability (EMA) evaluation. The commenter recommended automatically linking attestation of no MIPS core measure with EMA evaluation to avoid separate processes. Another commenter strongly supported including a straightforward, transparent self-attestation process for physicians who cannot identify an applicable MIPS core measure, emphasizing that it should not create scoring disadvantages or added administrative burden. Another commenter urged CMS to expand flexibility in the attestation process, reduce administrative burden, closely monitor impacts before increasing reliance on MIPS core measures, and use high attestation rates to identify and fix gaps in the MIPS core measure set. Another commenter encouraged CMS to develop adequate guidance on the self-attestation and exemption processes associated with MIPS core measure reporting.

Response: We thank the commenters for supporting the proposed attestation process. We appreciate the commenters' concerns and request for further flexibilities to requirements, such as linking EMA evaluation with the MIPS core measure attestation process or expanding the use of an attestation process for clinicians who are not able to meet program requirements and will continue to monitor the use of the MIPS core measure attestation pathway, MVP measure reporting trends, and interested parties' feedback to determine potential future refinements as we move toward the sunsetting of traditional MIPS. The self-attestation process is completed at the time of submission and is intended to replace the more involved processes associated with current outcome/high priority reporting requirements.

Comment: A commenter requested CMS clarify whether an alternative measure selected, when there is not an available and applicable MIPS core measure, must come from the same MVP, from the broader MIPS quality inventory, or meet specific criteria such as eCQM availability, specialty relevance, denominator applicability, or alignment with the clinician's patient population. Another commenter requested that CMS finalize the MIPS core measure requirement with an exception of permitting an outcome measure of any collection type to satisfy the requirement within an MVP.

Response: We thank the commenters for their suggestions. Clinicians who are unable to report one of the designated MIPS core measures may attest that an applicable core measure was not available to them and then select any other quality measure included within the MVP being reported. In selecting an alternative measure to meet the MIPS core measures requirement, the clinician would need to meet all reporting requirements, and it would be expected that the alternative measure be meaningful to their scope of care. We decline to allow an exception to report any outcome measure. Broadening the requirement to include additional outcome measures than originally identified would be counterintuitive to the goal of establishing a set of unified key quality measures.

Comment: A few commenters requested clarification on the definition of ''available and applicable'' MIPS core measures. A commenter requested CMS define ''applicable'' for purposes of the MIPS core measure self-attestation so that a clinician whose relevant measures are all QCDR outcome measures may attest that no applicable MIPS core measure exists and report an outcome measure in its place. Another commenter requested CMS confirm in sub-regulatory guidance how ''no applicable MIPS core measure'' will be determined and audited for each MVP and specialty measure set.

Response: Clinicians who are unable to report one of the designated MIPS core measures may attest that an applicable MIPS core measure was not available to them and then may select any other quality measure included within the MVP or specialty measure set being reported. There are no specific requirements for this alternative measure beyond current quality measure reporting requirements. As stated in the proposed rule clinicians, in good faith, can attest that they do not have a measure that is available or applicable to them. Additionally, as noted in the proposed rule, we may, in future years, conduct random reviews to verify that there were no available and applicable MIPS core measures for reporting. Measures that are available and applicable would be determined by the alignment of the measure with the clinician's case-mix, scope of care, and ability to implement. See section IV.A.4.d.(1)(c)(i) of this final rule for details on the MIPS core measurement requirement for traditional MIPS and MVP reporting.

Comment: A commenter opposed replacing the outcome/high priority measure requirement with a new MIPS core measure requirement. The commenter stated that practices have already built clinical workflows and EHR reporting modules around the outcome/high priority framework. Adding an entirely new structural requirement introduces administrative confusion and software re-engineering costs without providing a clear benefit to clinical quality or patient outcomes. Another commenter expressed concerned that mandatory MIPS core measure data submission will increase administrative burden and program volatility, contradicting CMS' goal of simplifying MIPS. The commenter urged CMS to avoid rigid requirements and prioritize stability, flexibility, and specialty—specific relevance in MIPS reporting. A commenter stated that

some MVPs do not have enough eCQMs to support full electronic measure submission, much less MIPS core measure reporting. Requiring CQMs or QCDR measures would create significant burden for organizations that currently report only eCQMs.

Response: We thank the commenters for their feedback. The overall goal of MVPs is to create a small, streamlined set of measures that are reflective of the care given. Identifying MIPS core measures allows for continued choice in measure selection while also supporting the goal of capturing comparable data across clinicians for patient use in care decision making. We appreciate the feedback that this change in policy will modify reporting requirements, potentially requiring updates in systems and workflows. However, as the MIPS quality measure inventory is refined annually, this is an inherent circumstance required each year as applicable. Overall, the MIPS core measures policy will decrease complexity while also increasing flexibility. Reporting a MIPS core measure replaces the requirement to report an outcome/high priority measure, which is not always best aligned with the MVP topic. We recognize that the availability and applicability of MIPS core measures may vary, such as when no eCQM MIPS core measures are available in an MVP, which is why we are allowing for self-attestation in these circumstances. We are not requiring a clinician to report a MIPS core measure that is not available or applicable to the clinician. Clinicians who are unable to report one of the designated MIPS core measures may attest that an applicable MIPS core measure was not available to them and then select any other quality measure included within the MVP being reported. Additionally, we will continue to monitor the use of the MIPS core measure attestation pathway, MVP measure reporting trends, and feedback to determine potential future refinements as we move toward the sunsetting of traditional MIPS in the CY 2031 performance period/2033 MIPS payment year as indicated under section IV.A.3.c. of this final rule.

After consideration of public comments, we are finalizing to remove the current quality measure data submission requirement of one outcome measure (or, if an outcome measure is not available, one high priority measure) for traditional MIPS and MVPs and replace the requirement with a MIPS core measure data submission requirement to emphasize the reporting on the finalized MIPS core measures, as proposed.

For traditional MIPS reporting, we are finalizing at § 414.1335(a)(1)(i) as proposed, that beginning in the CY 2027 performance period/2029 MIPS payment year, MIPS eligible clinicians, except as provided in paragraphs (a)(1)(ii) and (a)(1)(iii) of this section, submit data on at least six quality measures, including at least one MIPS core measure. If there is not an available and applicable MIPS core measure, a MIPS eligible clinician must attest to not having an available and applicable MIPS core measure and submit data on a separate MIPS quality measure. If fewer than six measures apply, then the MIPS eligible clinician, group, virtual group, or APM Entity must report on each measure that is applicable.

Additionally, we are finalizing at § 414.1335(a)(1)(ii) that, as proposed, beginning in the CY 2027 performance period/2029 MIPS payment year, except as provided in paragraph (a)(1)(iii) of this section, a MIPS eligible clinician that reports on a specialty or subspecialty measure set, as designated in the MIPS final list of quality measures established by CMS through rulemaking, must submit data on at least six measures within that set, including at least one MIPS core measure. If there is not an available and applicable MIPS core measure, a MIPS eligible clinician must attest to not having an available and applicable MIPS core measure and submit data on a separate MIPS quality measure within that set. If the set contains fewer than six measures or if fewer than six measures within the set apply to the MIPS eligible clinician, report on each measure that is applicable.

For MVP reporting, we are finalizing at § 414.1365(c)(1) that, as proposed, beginning in the CY 2027 performance period/2029 MIPS payment year, except as provided in paragraphs (c)(1)(i) and (c)(1)(ii) of this section, an MVP participant must select and report, if applicable, four quality measures, including one MIPS core measure available in the MVP, excluding the population health measure required under paragraph (c)(4)(ii). If there is not an available and applicable MIPS core measure, an MVP participant must attest to not having an available and applicable MIPS core measure and submit data on a separate MIPS quality measure within the MVP. We note the sunsetting of traditional MIPS is delayed to the CY 2031 performance period/2033 MIPS payment year, as indicated under section IV.A.3.c. of this final rule.

(C) Exempting Small Practices From MIPS Core Measure Reporting Requirement

We recognized that clinicians in small practices often face challenges in successfully participating in MIPS and MVP reporting due to limited financial, administrative, and health IT resources, when compared to medium and large practices. Historically, we have received feedback from small practices expressing concerns that meeting the MIPS reporting requirements can be challenging due to the limited resources of small practices, and we have implemented policies in MIPS to support clinicians in small practices to address these concerns. For example, in the CY 2022 PFS final rule (86 FR 65412), we finalized at § 414.1365(c)(1)(i) that the requirement to report four quality measures in an MVP does not apply to small practice clinicians reporting under the Medicare Part B claims collection type when the selected MVP contains fewer than four Medicare Part B claims-based quality measures. In addition, in MVPs, small practices reporting via Medicare Part B claims measures are currently exempt from the outcome/high priority reporting requirement if the MVP does not contain at least four Medicare Part B claims measures.

We considered several policy options for small practices with respect to reporting MIPS core measures. Initially, we considered whether to align the reporting requirements for small practices with the new MIPS core measure reporting requirements for clinicians in medium and large practices participating in traditional MIPS and MVP reporting. However, we anticipate that clinicians in small practices may continue to experience challenges with meeting the proposed MIPS core measure reporting requirement due to limited resources, difficulty reaching the case minimum requirement, and the limited inventory of MIPS core measures, particularly the limited inventory of new MIPS core measures available via the Medicare Part B claims collection type, which is only available to small practices. While we also considered exempting small practices from the proposed MIPS core measure reporting requirement only if the selected MVP does not contain at least one MIPS core measure available via the Medicare Part B claims collection type, we remained concerned that such a policy will further limit measure choice for clinicians in small practices and could lead to confusion and unfairness if some MVPs contained Medicare Part B claims MIPS core

measures and other MVPs did not. In recognition of these ongoing challenges, and to streamline reporting requirements for small practices while continuing to support clinicians in small practices, we wanted to provide flexibilities for clinicians in small practices to successfully report the MIPS quality performance category. Therefore, in both traditional MIPS and MVP reporting, we proposed that small practices, as defined under § 414.1305, be exempt from the MIPS core measure data submission requirement. Under this provision, clinicians in small practices will continue to report six quality measures for traditional MIPS or four quality measures as currently required for MVPs. It is important to note that while small practices are not required to report a MIPS core measure, they may choose to do so on a voluntary basis.

Specifically, we proposed at § 414.1335(a)(1)(iii) that beginning with the CY 2027 performance period/2029 MIPS payment year, MIPS eligible clinicians in small practices are not required to submit at least one MIPS core measure or attest to not having an available and applicable MIPS core measure. MIPS eligible clinicians in small practices must submit data on at least six measures, if applicable. Additionally, we proposed at § 414.1365(c)(1)(ii) that beginning with the CY 2027 performance period/2029 MIPS payment year, an MVP participant that meets the requirements of a small practice is not required to submit at least one MIPS core measure or attest to not having an available and applicable MIPS core measure. Except as provided in paragraph (c)(1)(i) of this section, an MVP participant that meets the requirements of a small practice must select and report, if applicable, at least four quality measures included in the MVP, excluding the population health measure required under paragraph (c)(4)(ii) of this section.

We received public comments on these proposals. The following is a summary of the comments we received and our responses.

Comment: Many commenters supported the small practice exemption from MIPS core measures. One of these commenters cited that practices with fewer than 15 clinicians have fewer administrative and technical resources. The commenter requested this protection be extended to other new reporting mandates. Another commenter encouraged CMS to continue evaluating policies that support successful participation by small practices as reporting requirements evolve. Another commenter supported exempting small practices from the MIPS core measure requirement and asked that CMS consider the unique needs of small and rural anesthesia practices. Another commenter emphasized that small and solo practices still face disproportionate administrative burden and penalty risk under MIPS. An additional commenter requested CMS maintain flexibility for small practices in future years and to monitor whether persistent measure applicability challenges suggest the need for broader refinements to the MIPS core measure framework.

Response: We thank the commenters for supporting the small practice exemption proposal from MIPS core measures. As we develop future MIPS policies, we will continue to consider the impact of these proposals on small practices. We also appreciate the commenter's request for further flexibilities for small practices. We will continue to monitor the use of the MIPS core measure attestation pathway, MVP reporting trends, and feedback to determine potential future policy refinements.

Comment: A commenter stated that the small practice exemption does not address insufficient case volume. Many oncology measures apply only to narrow populations, so small and subspecialized practices often cannot reach benchmarked scores. The commenter recommended that CMS expand MVP measure inventories and confirm the exemption does not disadvantage those practices in scoring or feedback.

Response: We thank the commenter for this comment and note that we will continue to take scoring constraints into consideration as we move forward with MIPS core measures. There may be measures that assess a very limited patient population where it is difficult to produce a benchmark. We believe creating smaller sets of quality measures from which to choose will increase adoption; however, we will continue to monitor this aspect of quality measure scoring for potential policy revisions. For further information about quality measure selection and the MIPS quality measure inventory, please see Appendix 1: MIPS Quality Measures of this final rule. For additional information on quality benchmarks and scoring of MIPS core measures for small practices, please reference section IV.B.1.b.(2) of this final rule.

After consideration of public comments, we are finalizing our proposals to exempt small practices from MIPS core measure reporting requirements. Specifically, we are finalizing at § 414.1335(a)(1)(iii) that, as proposed, beginning with the CY 2027 performance period/2029 MIPS payment year, MIPS eligible clinicians in small practices are not required to submit at least one MIPS core measure or attest to not having an available and applicable MIPS core measure. MIPS eligible clinicians in small practices must submit data on at least six measures, if applicable. Additionally, we are finalizing at § 414.1365(c)(1)(ii) that, as proposed, beginning with the CY 2027 performance period/2029 MIPS payment year, an MVP participant that meets the requirements of a small practice is not required to submit at least one MIPS core measure or attest to not having an available and applicable MIPS core measure. Except as provided in paragraph (c)(1)(i) of this section, an MVP participant that meets the requirements of a small practice must select and report, if applicable, at least four quality measures included in the MVP, excluding the population health measure required under paragraph (c)(4)(ii) of this section.

(iv) Modifying the Data Submission Criteria for Medicare CQMs

In the CY 2027 PFS proposed rule (91 FR 44159), we proposed an amendment to the data submission criteria for the Medicare CQMs collection type in § 414.1335(a)(4) by including the availability of Medicare CQMs within the APP Plus measure set, as applicable. Specifically, in § 414.1335(a)(4)(i), we proposed that the data submission criteria pertaining to Medicare CQMs would be met by a MIPS eligible clinician, group, and APM Entity reporting on the Medicare CQMs (reporting quality data on beneficiaries eligible for Medicare CQMs as defined at § 425.20) within the APP measure set or APP Plus measure set (as applicable) and administering the CAHPS for MIPS Survey as required under the APP.

We are including the availability of Medicare CQMs under the APP Plus measure set to provide various options that would assist Medicare Shared Savings Program ACOs with reporting quality data and transition to the adoption of digital quality measures (dQMs). We encourage Medicare Shared Savings Program ACOs to evaluate all quality reporting options to determine which collection type is most appropriate based on their unique composition and technical infrastructure.

We requested public comment on this proposal.

We received public comment on the proposal. The following is a summary of the comment we received and our response.

Comment: A commenter supported the proposal to amend the data submission criteria for the Medicare CQMs collection type by including the availability of Medicare CQMs within the APP Plus measure set, as applicable.

Response: We appreciate the support from the commenter.

After consideration of public comment, we are finalizing, as proposed, the amendment to the data submission criteria for the Medicare CQMs collection type in § 414.1335(a)(4) by including the availability of Medicare CQMs within the APP Plus measure set, as applicable. Specifically, in § 414.1335(a)(4)(i), the data submission criteria pertaining to Medicare CQMs will be met by a MIPS eligible clinician, group, and APM Entity reporting on the Medicare CQMs (reporting quality data on beneficiaries eligible for Medicare CQMs as defined at § 425.20) within the APP measure set or APP Plus measure set (as applicable) and administering the CAHPS for MIPS Survey as required under the APP.

(v) Implementing the Data Submission Criteria for Medicare eCQMs

In the CY 2027 PFS proposed rule (91 FR 44159), we proposed to establish the data submission criteria for the Medicare eCQMs collection type (as proposed under the APP) in § 414.1335(a)(5). Specifically, in § 414.1335(a)(5)(i), we proposed that the data submission criteria pertaining to Medicare eCQMs would be met by a MIPS eligible clinician, group, and APM Entity reporting on the Medicare eCQMs (reporting quality data on beneficiaries eligible for Medicare eCQMs as defined at § 425.20) within the APP Plus measure set (as applicable) and administering the CAHPS for MIPS Survey as required under the APP.

Medicare eCQMs would serve to address concerns discussed in the CY 2027 PFS proposed rule (91 FR 44044 through 44046) by defining a population of beneficiaries that exists within the all payer/all patient eCQM specifications and tethering that population to a Medicare Shared Savings Program ACO's assigned beneficiary population. Medicare Shared Savings Program ACOs have noted challenges with quality data reporting as their list of eligible beneficiaries has often contained beneficiaries for whom the Medicare Shared Savings Program ACO is unable to identify a primary care relationship. Specifically, Medicare eCQMs would address the concern raised by Medicare Shared Savings Program ACOs with a higher proportion of specialty practices and/or multiple EHRs, the broader all payer/all patient eligible population would capture beneficiaries with no primary care relationship to the Medicare Shared Savings Program ACO. Medicare eCQMs would provide an additional optional collection type for reporting quality data and assist with the transition and adoption of dQMs. Also, we anticipate in future years when FHIR-based reporting becomes mandatory that Medicare Shared Savings Program ACOs would be able to continue to use the FHIR-based digital specifications to report only on their assigned beneficiary population. We encourage Medicare Shared Savings Program ACOs to evaluate all quality reporting options to determine which collection type is most appropriate based on their unique composition and technical infrastructure.

We requested public comment on this proposal.

We received public comment on the proposal. The following is a summary of the comments we received and our responses.

Comment: A few commenters supported the proposal to establish the data submission criteria for the Medicare eCQMs collection type.

Response: We appreciate the support from commenters.

After consideration of public comment, we are finalizing the proposal, as proposed, to establish the data submission criteria for the Medicare eCQMs collection type (under the APP as described in section III.G.3.d.(3) of this final rule) in § 414.1335(a)(5). Specifically, in § 414.1335(a)(5)(i), the data submission criteria pertaining to Medicare eCQMs must be met by a MIPS eligible clinician, group, and APM Entity reporting on the Medicare eCQMs (reporting quality data on beneficiaries eligible for Medicare eCQMs as defined at § 425.20) within the APP Plus measure set (as applicable) and administering the CAHPS for MIPS Survey as required under the APP.

(d) Modifying the Data Completeness Criteria

(i) Modifying the Data Completeness Criteria for Medicare CQMs

As described in the CY 2027 PFS proposed rule (91 FR 44039 through 44044), we are extending the availability of the Medicare CQMs collection type and anticipating the sunsetting of the Medicare CQMs collection type starting with the CY 2030 performance period/2032 MIPS payment year when FHIR-based reporting becomes mandatory. In the CY 2027 PFS proposed rule (91 FR 44159), we proposed an amendment to the data completeness criteria for the Medicare CQMs collection type in § 414.1340(d)(1) by modifying the duration of availability for the Medicare CQMs collection type as a means for meeting data completeness criteria requirements, which would eliminate the specific duration of availability (from the CY 2024 performance period/2026 MIPS payment year to the CY 2028 performance period/2030 MIPS payment year) and extend the duration of the availability of the Medicare CQMs collection type. Such modification would extend the availability of the Medicare CQMs collection type for meeting the data completeness criteria threshold requirements under the APP until CMS identifies the sunsetting of the Medicare CQMs collection type in future rulemaking.

Specifically, in § 414.1340(d), respectively, we proposed the following modification to the data completeness criteria threshold pertaining to the Medicare CQMs collection type:

At paragraph (d)(1), starting with the CY 2024 performance period/2026 MIPS payment year, an APM Entity, specifically a Medicare Shared Savings Program ACO that meets the reporting requirements under the APP, submitting quality measure data on Medicare CQMs must submit data on at least 75 percent of the APM Entity's applicable beneficiaries eligible for the Medicare CQM, as defined at § 425.20, who meet the measure's denominator criteria.

We requested public comment on this proposal.

We received public comment on the proposal. The following is a summary of the comments we received and our responses.

Comment: A few commenters expressed support of the proposal to amend the data completeness criteria for the Medicare CQMs collection type by extending the availability of the Medicare CQMs collection type.

Response: We appreciate the support from commenters.

Comment: A few commenters expressed concerns regarding difficulties in meeting the data completeness criteria for the Medicare CQMs collection type. They conveyed that there are implementation, interoperability, and data exchange challenges; and requested that CMS continue to monitor the operational impact of meeting the data completeness criteria threshold of at least 75 percent of the APM Entity's applicable beneficiaries eligible for the Medicare CQM, as defined at § 425.20, who meet the measure's denominator criteria.

Response: We recognize that there may be operational complexities in

meeting the data completeness criteria threshold for the Medicare CQMs collection type. We will continue to assess the data completeness criteria threshold for all collection types, including the Medicare CQMs collection type, as we consider future modifications.

After consideration of public comment, we are finalizing the proposal, as proposed, to amend the data completeness criteria for the Medicare CQMs collection type in § 414.1340(d)(1) by modifying the duration of availability for the Medicare CQMs collection type as a means for meeting data completeness criteria requirements, which will eliminate the specific duration of availability (from the CY 2024 performance period/2026 MIPS payment year to the CY 2028 performance period/2030 MIPS payment year) and extend the duration of the availability of the Medicare CQMs collection type.

Specifically, in § 414.1340(d), the data completeness criteria threshold pertaining to the Medicare CQMs collection type will be as follows:

At paragraph (d)(1), starting with the CY 2024 performance period/2026 MIPS payment year, an APM Entity, specifically a Medicare Shared Savings Program ACO that meets the reporting requirements under the APP, submitting quality measure data on Medicare CQMs must submit data on at least 75 percent of the APM Entity's applicable beneficiaries eligible for the Medicare CQM, as defined at § 425.20, who meet the measure's denominator criteria.

(ii) Implementing the Data Completeness Criteria for Medicare eCQMs

As we proposed to establish a new collection type, Medicare eCQMs specific to the APP (91 FR 44048 through 44050) in the CY 2027 PFS proposed rule, we also proposed to establish the data completeness criteria threshold for the Medicare eCQMs collection type (91 FR 44159 and 44160). Specifically, in § 414.1340(e), respectively, we proposed the following data completeness criteria threshold pertaining to the Medicare eCQMs collection type:

At paragraph (e)(1), starting with the CY 2027 performance period/2029 MIPS payment year, an APM Entity, specifically a Medicare Shared Savings Program ACO that meets the reporting requirements under the APP, submitting quality measure data on Medicare eCQMs must submit data on at least 75 percent of the APM Entity's applicable beneficiaries eligible for the Medicare eCQM, as defined at § 425.20, who meet the measure's denominator criteria.

Also, for the data completeness criteria pertaining to the quality performance category, we proposed a technical amendment to recognize the former paragraph (e) as new paragraph (f) due to the provision that establishes the data completeness criteria for the new collection type, Medicare eCQMs, in § 414.1340(e) as discussed in the CY 2027 PFS proposed rule (91 FR 44160).

We requested public comment on these proposals.

We received public comments on the proposal pertaining to the establishment of the data completeness criteria threshold for the Medicare eCQMs collection type. The following is a summary of the comments we received and our responses.

Comment: A few commenters supported the proposal to establish the data completeness criteria threshold for the Medicare eCQMs collection type.

Response: We appreciate the support from commenters.

Comment: A commenter expressed concerns regarding difficulties in meeting the data completeness criteria for the Medicare eCQMs collection type. The commenter conveyed that there are implementation, interoperability, and data exchange challenges; and requested that CMS monitor the operational impact of the data completeness criteria threshold of at least 75 percent of the APM Entity's applicable beneficiaries eligible for the Medicare eCQM, as defined at § 425.20, who meet the measure's denominator criteria.

Response: We recognize that there may be operational complexities in meeting the data completeness criteria threshold for the Medicare eCQMs collection type. We will continue to assess the data completeness criteria threshold for all collection types, including the Medicare eCQMs collection type, as we consider future modifications.

After consideration of public comment, we are finalizing the proposal, as proposed, to establish the data completeness criteria threshold for the Medicare eCQMs collection type. Specifically, in § 414.1340(e), respectively, the data completeness criteria threshold pertaining to the Medicare eCQMs collection type is as follows:

At paragraph (e)(1), starting with the CY 2027 performance period/2029 MIPS payment year, an APM Entity, specifically a Medicare Shared Savings Program ACO that meets the reporting requirements under the APP, submitting quality measure data on Medicare eCQMs must submit data on at least 75 percent of the APM Entity's applicable beneficiaries eligible for the Medicare eCQM, as defined at § 425.20, who meet the measure's denominator criteria.

Also, we did not receive public comment on the proposal regarding a technical amendment to the quality performance category data completeness criteria that recognizes the former paragraph (e) as new paragraph (f) due to the provision that establishes the data completeness criteria for the new collection type, Medicare eCQMs, in § 414.1340(e). Therefore, we are finalizing the proposal as proposed.

(e) Addition of New Quality Measures

(i) Pre-Rulemaking Process

Prior to introducing a new MIPS quality measure in a proposed rule, we received public input on measures through the pre-rulemaking process (referred to as the Pre-Rulemaking Measure Review (PRMR)) established in accordance with section 1890A of the Act. Although section 1848(q)(2)(D)(viii) of the Act provides that the pre-rulemaking process under section 1890A of the Act is not required to apply to the selection of MIPS quality measures, we have found that the pre-rulemaking process provides a comprehensive review of measures from multi-interested party workgroups and have accordingly elected for such measures to be reviewed utilizing the PRMR process (87 FR 70048). Under the established PRMR process (additional information regarding the PRMR process is available at *https://p4qm.org/PRMR*), CMS has contracted with a Consensus-Based Entity (CBE), which is responsible for convening a multi-interested party panel comprised of clinicians, patients, measure experts, and health information technology specialists to provide input on measures CMS is considering for use in Medicare.

The PRMR process begins with CMS' publication of measures under consideration for use in Medicare (the Measures Under Consideration (MUC) List). Each measure on the MUC List is reviewed by one of several committees convened by the CBE for the purpose of providing multi-interested party input to the Secretary. The PRMR process includes opportunities for public comments through a 21-day public comment period, as well as public listening sessions. The CBE posts the compiled comments and listening session inputs received during the public comment period and the listening sessions within 5 days of the close of the public comment period. More details regarding the PRMR process may be found in the PQM

Guidebook of Policies and Procedures for Pre-Rulemaking Measure Review and Measure Set Review (available at *https://p4qm.org/sites/default/files/2025-07/OP2-PRMR-MSR-Final-Multi-Stakeholder-Group-Guidebook-of-Policies-and-Procedures-508_1.pdf*).

Per the PQM Guidebook, the final vote of the multi-interested party committee convened by the CBE may result in the following disposition of a measure: The committee recommends that this measure be added to the CMS program or the committee does not recommend that this measure be added to the CMS program. A ''does not recommend'' voting result signals continued disagreement among the committee despite being presented with perspectives from public comments and committee member feedback and discussion and highlights the multi-faceted assessments of quality measures. There may be cases in which the CBE does not recommend a measure to move forward to the rulemaking process and eventual implementation but we go forth with proposing a measure. We note that section 1848(q)(2)(D)(iii)(v)(III) of the Act does not preclude the Secretary from proposing and implementing measures that are not endorsed by a CBE as long as the measure is evidence-based.

Quality measures considered for potential implementation in MIPS starting with CY 2027 performance period/2029 MIPS payment year were informed, in part, by the measures included on the 2025 MUC List (available at *https://mmshub.cms.gov/sites/default/files/2025-MUC-List.xlsx*). We refer readers to Table Group A of Appendix 1: MIPS Quality Measures of this final rule for detailed descriptions of the new MIPS quality measures finalized. We noted that we are advancing quality measurement by transitioning existing quality measures and reporting processes to Fast Healthcare Interoperability Resources® (FHIR®)-based digital approaches. We refer readers to section IV.A.4.c. of this final rule, where we sought input on the anticipated transition timeline, key milestones, and implementation considerations for FHIR-based quality reporting.

(ii) Removal of Quality Measures

In the CY 2025 PFS final rule, we codified previously established criteria for the removal of MIPS quality measures from the MIPS quality measure inventory at § 414.1330. In the CY 2017 Quality Payment Program final rule (81 FR 77136 through 77137), we established the following criteria for measure removal to include: If the Secretary determines that the MIPS quality measure is no longer meaningful, such as MIPS quality measures that are topped out; and, if a measure steward is no longer able to maintain the quality measure. In the CY 2019 PFS final rule (83 FR 59763), we expanded the criteria for measure removal to include MIPS quality measures that reached an extremely topped-out status (for example, a measure with an average mean performance within the 98th to 100th percentile range). The MIPS quality measure may be proposed for removal in the next rulemaking cycle, regardless of whether or not it is in the midst of the topped-out measure lifecycle, due to the extremely high and unvarying performance where meaningful distinctions and improvement in performance can no longer be made, after taking into account any other relevant factors.

Also, in the CY 2019 PFS final rule (83 FR 59764), we established other criteria for measure removal, specifically MIPS quality measures that are: duplicative; not maintained or updated to reflect current clinical guidelines, which are not reflective of a clinician's scope of practice; and low-bar, standard of care process measures. As described in the CY 2019 PFS final rule (83 FR 59765), we established an approach to incrementally remove process measures where prior to removal, consideration will be given to, but will not be limited to, the following:

- Whether the removal of the process measure impacts the number of measures available for a specific specialty.
- Whether the MIPS quality measure addresses a priority area highlighted in the Measure Development Plan: *https://www.cms.gov/medicare/quality/value-based-programs/quality-payment-program/measure-development.*
- Whether the MIPS quality measure promotes positive outcomes in patients.
- Considerations and evaluation of the measure's performance data.
- Whether the MIPS quality measure is designated as high priority or not.
- Whether the MIPS quality measure has reached extremely topped-out status within the 98th to 100th percentile range, due to the extremely high and unvarying performance where meaningful distinctions and improvement in performance can no longer be made.

In the CY 2020 PFS final rule (84 FR 62958 through 62959), we expanded the criteria for measure removal to include MIPS quality measures that do not meet case minimum and reporting volumes required for benchmarking after being in the program for 2 consecutive CY performance periods and are not available for MIPS quality reporting by or on behalf of all MIPS eligible clinicians. For MIPS quality measures that do not meet case minimum and reporting volumes required for benchmarking after being in the program for 2 consecutive CY performance periods, we noted that we will factor in other considerations (such as, but not limited to, the robustness of the measure; whether it addresses a measurement gap; if the measure is a patient-reported outcome; and consideration of the MIPS quality measure in developing MVPs) prior to determining whether to remove the MIPS quality measure. We refer readers to section IV.A.4.d.(1)(c)(ii) of this final rule for our provisions regarding removing references to the high priority measure designation from MIPS quality measures and MIPS quality measure retention consideration.

(iii) Inventory of Quality Measures

Section 1848(q)(2)(D)(i) of the Act requires the Secretary, through notice and comment rulemaking, to establish an annual final list of quality measures from which MIPS eligible clinicians may choose for the purpose of assessment under MIPS. Section 1848(q)(2)(D)(i)(II) of the Act requires that the Secretary annually update the list by removing measures from the list, as appropriate; adding new measures to the list, as appropriate; and determining whether measures that have undergone substantive changes should be included on the updated list.

Previously finalized MIPS quality measures can be found in the CY 2017 and CY 2018 Quality Payment Program final rules (81 FR 77558 through 77816 and 82 FR 53966 through 54174, respectively), and the CY 2019 through CY 2026 PFS final rules (83 FR 60097 through 60285, 84 FR 63205 through 63513, 85 FR 85045 through 85369, 86 FR 65687 through 65968, 87 FR 70250 through 70633, 88 FR 79556 through 79964, 89 FR 98599 through 98957, and 90 FR 50036 through 50353, respectively). We are finalizing changes to the MIPS quality measure inventory, as outlined in Appendix 1 of this final rule, including the following: the addition of new measures; updates to specialty sets (that is, creation of new specialty sets; addition and/or removal of measures; and substantive changes to existing measures within specialty sets, as appropriate); removal of existing measures; and substantive changes to existing measures. For the CY 2027 performance period/2029 MIPS

payment year, we are finalizing an inventory of 180 MIPS quality measures.

The new MIPS quality measures that we are finalizing to include in MIPS for the CY 2027 performance period/2029 MIPS payment year and future years can be found in Table Group A of Appendix 1 of this final rule. For the CY 2027 performance period/2029 MIPS payment year, we are finalizing 10 new MIPS quality measures, which include measures focused on patient-reported outcomes and chronic disease management.

On January 14, 2026, we solicited recommendations for potential new specialty measure sets or revisions to existing specialty measure sets for the CY 2027 performance period/2029 MIPS payment year.[395] The recommendations we received were based on the MIPS quality measures finalized in the CY 2026 PFS final rule and the 2025 MUC List. The recommendations included the addition or removal of current MIPS quality measures from existing specialty sets, and/or the creation of new specialty sets. All specialty set recommendations submitted for consideration were assessed and vetted, and as a result, the recommendations that we agreed with are finalized in this final rule.

We are finalizing modifications to existing specialty sets as described in Table Group B of Appendix 1 of this final rule. Modifications to specialty sets include the addition of new measures and/or existing measures within the MIPS quality measure inventory, removal of measures, and/or substantive changes to previously finalized measures. Specialty and subspecialty sets are not inclusive of every specialty or subspecialty. We develop and maintain specialty measure sets to assist MIPS eligible clinicians with selecting quality measures that are most relevant to their scope of practice.

In addition to establishing new individual MIPS quality measures and modifying existing specialty sets as described in Tables Group A and Group B of Appendix 1 of this final rule, we refer readers to Table Group C of Appendix 1 of this final rule for a list of MIPS quality measures finalized for removal and detailed discussion of our rationale for each measure. Of the 20 MIPS quality measures finalized for removal, two MIPS quality measures are extremely topped out, four MIPS quality measures have reached the end of the topped-out lifecycle, three MIPS quality measures are no longer being maintained by the measure steward, eight MIPS quality measures are duplicative of new or current measures, one MIPS quality measure has limited adoption and therefore no benchmark, one MIPS quality measure is a low bar process measure, and one MIPS quality measure lacks robustness. The provision to remove the MIPS quality measures described in Table Group C of Appendix 1 of this final rule will lead to a more parsimonious inventory of meaningful, robust measures in the program.

Further, in Appendix 1 of this final rule, we are finalizing substantive changes to 43 MIPS quality measures, which can be found in Table Group D and Table Group DD of Appendix 1 of this final rule. Of the finalized substantive changes to the 43 MIPS quality measures, two MIPS quality measures are only available for use in relevant MVPs, which can be found in Table Group DD of Appendix 1 of this final rule. We have previously established criteria that will apply when we are considering making substantive changes to a quality measure (81 FR 77137 and 86 FR 65441 through 65442). On an annual basis, we review the established MIPS quality measure inventory to consider updates to the measures. Possible updates to measures may be minor or substantive. The finalized inventory of 180 MIPS quality measures for the CY 2027 performance period/2029 MIPS payment year includes 177 MIPS quality measure available for utilization in traditional MIPS and MVPs, and 3 MIPS quality measures available only for utilization in MVPs (as finalized in the CY 2024 PFS final rule (88 FR 79897 through 77902)).

In summary, in the CY 2027 PFS proposed rule, we proposed to modify the quality performance category measure inventory to include a set of 180 MIPS quality measures for the CY 2027 performance period/2029 MIPS payment year, which includes the following:

- Implementation of 10 new MIPS quality measures including measures focused on patient-reported outcomes and chronic disease management;
- Removal of 20 MIPS quality measures: Two MIPS quality measures that are extremely topped out, four MIPS quality measures that have reached the end of the topped-out measure lifecycle, three MIPS quality measures that are no longer being maintained by the measure steward, eight MIPS quality measures that are duplicative of new or current measures, one MIPS quality measure that has limited adoption and therefore no benchmark, one MIPS quality measure that is a low bar process measure, and one MIPS quality measure lacking robustness, and;
- Substantive changes to 43 current MIPS quality measures.

We refer readers to Table Groups A through DD of Appendix 1 of this final rule for a summary of the new measures finalized, the measures finalized for removal, and the finalized substantive changes, as well as finalized specialty set changes. We received public comments on these proposals. The comments and responses may be found in Appendix 1 of this final rule.

(2) Cost Performance Category

(a) Background

Section 1848(q)(2)(A)(ii) of the Act includes resource use as a performance category under MIPS. We refer to this performance category as the cost performance category. As required by sections 1848(q)(2) and (5) of the Act, the four performance categories of MIPS are used in determining the MIPS final score for each MIPS eligible clinician. In general, MIPS eligible clinicians are evaluated under all four of the MIPS performance categories, including the cost performance category.

Section 1848(q)(2)(B)(ii) of the Act provides that, for the cost performance category, the measurement of resource use (that is, cost) for such period must be in accordance with section 1848(p)(3) of the Act, using the methodology under section 1848(r) of the Act as appropriate, and, as feasible and applicable, accounting for the cost of drugs under Medicare Part D. Section 1848(p)(3) of the Act provides that costs shall be evaluated, to the extent practicable, based on a composite of appropriate measures of costs established by the Secretary that eliminate the effect of geographic adjustments in payment rates, and take into account risk factors (such as socioeconomic and demographic characteristics, ethnicity, and health status of individuals) and other factors determined appropriate by the Secretary. Section 1848(r) of the Act specifies a series of steps and activities for the Secretary to undertake to involve physicians, practitioners, and other interested parties in enhancing the infrastructure for cost measurement, including for purposes of MIPS and Advanced APMs under section 1833(z) of the Act. Specifically, section 1848(r)(2)(H) of the Act provides that, not later than November 1 of each year

[395] Message to the Quality Payment Program listserv on January 14, 2026, entitled ''The Centers for Medicare & Medicaid Services (CMS) is Soliciting Interested Party Recommendations for Potential Consideration of New Specialty Measure Sets and/or Revisions to the Existing Specialty Measure Sets for the 2027 Performance Year of the Merit-based Incentive Payment System (MIPS).''

(beginning with 2018), the Secretary shall, through rulemaking, make revisions to the operational lists of care episode and patient condition codes as the Secretary determines may be appropriate.

We are finalizing the following update to the cost performance category beginning with the CY 2027 performance period/2029 MIPS payment year:

- Update the operational list of care episode and patient condition groups and codes to reflect changes to service and diagnosis codes that define care episodes and patient condition groups, as identified through the annual maintenance of episode-based measures.

For a description of the statutory authority for and existing policies pertaining to the cost performance category, we refer readers to §§ 414.1350 and 414.1380(b)(2) and the CY 2017 Quality Payment Program final rule (81 FR 77162 through 77177), CY 2018 Quality Payment Program final rule (82 FR 53641 through 53648), CY 2019 PFS final rule (83 FR 59765 through 59776), CY 2020 PFS final rule (84 FR 62959 through 62979), CY 2021 PFS final rule (85 FR 84877 through 84881), CY 2022 PFS final rule (86 FR 65445 through 65461), CY 2023 PFS final rule (87 FR 70055 through 70057), CY 2024 PFS final rule (88 FR 79339 through 79349), CY 2025 PFS final rule (89 FR 98390 through 98408), and CY 2026 PFS final rule (90 FR 49859 through 49864).

More details on the provisions in this section, which we invited comments on, are provided in section IV.A.4.d.(2)(b) through section IV.A.4.d.(2)(d) of this final rule.

(b) Selection of Cost Measures

In accordance with our statutory authority as described in section IV.A.4.d.(2)(a) of this final rule and our regulation at § 414.1350(a), we specify cost measures for a performance period to assess the performance of MIPS eligible clinicians on the cost performance category.

We consider adoption of cost measures to capture new clinical areas, which furthers our goals to transition from traditional MIPS to MVPs and expands the Medicare spending that is captured by the cost performance category assessment. MVPs require the inclusion of at least one cost measure, so adoption of cost measures for new clinical areas allows us to create new MVPs for clinical areas that do not yet have MVPs or to increase the amount of applicable cost measures in existing MVPs. Additionally, adopting cost measures that assess new clinical areas moves us closer towards the statutory goal of covering 50 percent of costs under Medicare Parts A and B, as specified under section 1848(r)(2)(D)(i)(I) of the Act.

In the CY 2022 PFS final rule (86 FR 65455 through 65459), we established common standards for potential episode-based measures to ensure consistency across episode-based measures being considered for potential use in MIPS. Specifically, the CY 2022 PFS final rule requires that any episode-based measure for the cost performance category include the following: (1) episode definition based on trigger codes that determine the patient cohort; (2) attribution; (3) service assignment; (4) exclusions; and (5) risk adjustment.

Additionally, in the CY 2025 PFS final rule (89 FR 98405), we codified criteria that must be met for a cost measure to be removed from the MIPS cost measure inventory at § 414.1350. Under the criteria, we may remove a cost measure from MIPS based on one or more of the following factors; provided, however, that we may retain a cost measure that meets one or more of the following factors if we determine the benefit of retaining the measure outweighs the benefit of removing it.

- It is not feasible to implement the measure specifications.
- A measure steward is no longer able to maintain the cost measure.
- The implementation costs or negative unintended consequences associated with a cost measure outweigh the benefit of its continued use in the MIPS cost performance category.
- The measure specifications do not reflect current clinical practice or guidelines.
- The availability of a more applicable measure, including a measure that applies across settings, applies across populations, or is more proximal in time to desired patient outcomes for the particular topic.

We did not propose to adopt any new measures for the CY 2027 performance period/2029 MIPS payment year. We also did not propose to remove any measures for the CY 2027 performance period/2029 MIPS payment year.

(c) Inventory of Cost Measures

As discussed previously, we specify cost measures for a performance period to assess the performance of MIPS eligible clinicians on the cost performance category. There are currently 35 cost measures in the cost performance category for the CY 2026 performance period/2028 MIPS payment year, comprising 33 episode-based measures covering a range of conditions and procedures and 2 population-based measures. Previously finalized MIPS cost measures can be found in the CY 2018 Quality Payment Program final rule (82 FR 53641 through 53648), CY 2019 PFS final rule (83 FR 59765 through 59776), CY 2020 PFS final rule (84 FR 62959 through 62979), CY 2021 PFS final rule (85 FR 84877 through 84881), CY 2022 PFS final rule (86 FR 65445 through 65461), CY 2023 PFS final rule (87 FR 70055 through 70057), CY 2024 PFS final rule (88 FR 79339 through 79349), and CY 2025 PFS final rule (89 FR 98390 through 98408). We refer readers to the CY 2026 PFS proposed rule (90 FR 32718 through 32719) for more context on how we establish the inventory of cost measures, including the pre-rulemaking requirements.

We neither proposed any new MIPS cost measures nor proposed to remove any MIPS cost measures for the CY 2027 performance period/2029 MIPS payment year. We also did not propose substantive changes to any existing MIPS cost measures for the CY 2027 performance period/2029 MIPS payment year.

(d) Provision To Update the Operational List of Care Episode and Patient Condition Groups and Codes

Generally, to calculate MIPS eligible clinicians' performance on cost measures, we use codes from claims data to identify and apply the applicable cost measure's specifications, which govern the attribution, scope, and calculation of the cost measure. We are finalizing our proposed revisions the operational list of care episode and patient condition groups and codes to reflect coding changes that are identified during the annual measure maintenance of implemented cost measures. This section of this final rule provides context on the statutory requirements for care episode and patient condition groups and changes to the operational list.

Section 1848(r) of the Act specifies a series of steps and activities for the Secretary to undertake to involve physicians, practitioners, and other interested parties in enhancing the infrastructure for cost measurement, including for purposes of MIPS and Advanced APMs under section 1833(z) of the Act. Section 1848(r)(2) of the Act requires the development of care episode and patient condition groups, and classification codes for such groups, and provides for care episode and patient condition groups to account for a target of an estimated one-half of expenditures under Medicare Parts A and B (with this target increasing over time as appropriate). Sections 1848(r)(2)(E) through (G) of the Act

require the Secretary to post on the CMS website a draft list of care episode and patient condition groups and codes for solicitation of input from interested parties, and subsequently, post an operational list of such groups and codes. Section 1848(r)(2)(H) of the Act requires that not later than November 1 of each year (beginning with 2018), the Secretary shall, through rulemaking, revise the operational list of care episode and patient condition codes as the Secretary determines may be appropriate, and that these revisions may be based on experience, new information developed under section 1848(n)(9)(A) of the Act, and input from physician specialty societies and other interested parties.

For more information about past revisions to the operational list that we made as we developed, proposed, and finalized episode-based measures, we refer readers to the CY 2023 PFS final rule (87 FR 70056 and 70057), CY 2024 PFS final rule (88 FR 79348), and CY 2025 PFS final rule (89 FR 98404). Prior operational lists are available at the QPP Cost Measure Information page at *https://www.cms.gov/medicare/quality/value-based-programs/cost-measures/about.*

In accordance with section 1848(r)(2)(H) of the Act, we are revising the operational list beginning with the CY 2027 performance period/2029 MIPS payment year to reflect changes to codes used to identify existing care episode and patient condition groups, based on new information gathered during annual maintenance of MIPS cost measures. We conduct annual maintenance for measures implemented in MIPS to ensure that the codes used for the measure specifications remain up to date. For example, we may update the service or diagnosis codes associated with a cost measure's specifications to retain the intent of the measure when these codes are changed in, added to, or deleted from the applicable code sets. During our annual maintenance review process for MIPS cost measures, we work with the measure developer to identify non-substantive changes to service and diagnosis codes that should be reflected in the operational list of care episode and patient condition groups so that, to the extent feasible, there is alignment between the operational list and measure specifications. More information on the annual maintenance process is available at the CMS Measures Management System (MMS) page at *https://mmshub.cms.gov/measure-lifecycle/measure-use/maintenance/annual-update.*

Our revisions to the operational list are available for review on our QPP Cost Measure Information page at *https://www.cms.gov/medicare/quality/value-based-programs/cost-measures/about.* We sought interested party feedback on the service and diagnosis codes used in MIPS care episode and patient condition groups to inform any non-substantive changes to the operational list in tandem with CMS's annual maintenance efforts for the CY 2027 performance period/2029 MIPS payment year.

We received public comments on these proposals. The following is a summary of the comments we received and our responses.

Comment: Commenters supported the proposed updates to the operational list to ensure that the codes are accurate and relevant. The commenters expressed support for our maintenance approach and for our efforts to promote alignment between the operational list with current measure specifications.

Response: We appreciate the commenters support for the updates to the operational list. We agree with the commenters that these revisions encourage accuracy and consistency with the current cost measure specifications.

After consideration of public comments, we are finalizing as proposed to update the operational list of care episode and patient condition groups and codes.

(3) Improvement Activities Performance Category

(a) Background

Section 1848(q)(2)(A)(iii) of the Act includes clinical practice improvement activities as a performance category under MIPS. We refer to this performance category as the improvement activities performance category. As required by section 1848(q)(2) and (5) of the Act, the four performance categories of MIPS are used in determining the MIPS final score for each MIPS eligible clinician. In general, MIPS eligible clinicians are evaluated under all four of the MIPS performance categories, including the improvement activities performance category.

Section 1848(q)(2)(C)(v)(III) defines the term ''clinical practice improvement activities'' as activities that relevant eligible professional organizations and other relevant interested parties identify as improving clinical practice or care delivery and that the Secretary determines, when effectively executed, is likely to result in improved outcomes.

Section 1848(q)(2)(B)(iii) of the Act provides that, for the improvement activities category, the Secretary shall specify subcategories of clinical practice improvement activities, including at least six subcategories as specified in section 1848(q)(2)(B)(iii)(I) through (VI) of the Act. These statutorily enumerated subcategories are: (1) expanded practice access (such as same day appointments for urgent needs and afterhours access to clinician advice); (2) population management (such as monitoring health conditions of individuals to provide timely health care interventions or participation in a qualified clinical data registry); (3) care coordination (such as timely communication of test results, timely exchange of clinical information to patients and other providers, and use of remote monitoring or telehealth); (4) beneficiary engagement (such as the establishment of care plans for individuals with complex care needs, beneficiary self-management assessment and training, and using shared decision-making mechanisms); (5) patient safety and practice assessment (such as through use of clinical or surgical checklists and practice assessments related to maintaining certification); and (6) participation in an alternative payment model, as defined in section 1833(z)(3)(C) of the Act (section 1848(q)(2)(B)(iii)(I) through (VI) of the Act).

For previous discussions on the general background of the improvement activities performance category, we refer readers to the CY 2017 Quality Payment Program final rule (81 FR 77177 and 77178), the CY 2018 Quality Payment Program final rule (82 FR 53648 through 53661), the CY 2019 Physician Fee Schedule (PFS) final rule (83 FR 59776 and 59777), the CY 2020 PFS final rule (84 FR 62980 through 62990), CY 2021 PFS final rule (85 FR 84881 through 84886), the CY 2022 PFS final rule (86 FR 65462 through 65466), the CY 2023 PFS final rule (87 FR 70057 through 70061), the CY 2024 PFS final rule (88 FR 79350 and 88 FR 79351), CY 2025 PFS final rule (89 FR 98408 through 98413), and CY 2026 PFS final rule (90 FR 49846 through 49868). We also refer readers to § 414.1305 for the relevant definitions of improvement activities and attestation, § 414.1320 for standards establishing the performance period, § 414.1325 for the data submission requirements, § 414.1355 for standards related to the improvement activity performance category generally, § 414.1360 for data submission criteria for the improvement activity performance category, and § 414.1380(b)(3) for improvement activities performance category scoring.

We are finalizing various updates to the Improvement Activities Inventory

(the Inventory) beginning with the CY 2027 performance period/2029 MIPS payment year, as described further in section IV.A.4.d.(3)(b)(ii) of this final rule. First, we are finalizing adding six new improvement activities in two performance categories: (1) Care Coordination and (2) Advancing Health and Wellness, our newest subcategory. Second, we are finalizing the modification of five existing improvement activities currently specified for the performance category. Third, we are finalizing the removal of 11 improvement activities currently specified for the performance category.

(b) Improvement Activities Inventory

(i) Annual Call for Activities Background

In the CY 2017 Quality Payment Program final rule (81 FR 77190), for the first year of MIPS, we implemented the initial Inventory consisting of approximately 95 activities (81 FR 77817 through 77831). We took several steps to ensure the Inventory was inclusive of activities aligned with statutory and program requirements. As part of this process, we conducted numerous interviews with high performing organizations of all sizes and conducted an environmental scan to identify existing models, activities, or measures that met all or part of the improvement activities performance category.

Beginning with the CY 2018 performance period/2020 MIPS payment year (82 FR 53656 through 53659), we introduced an informal process for interested parties to submit new improvement activities or modifications for our consideration and potential inclusion in the comprehensive Inventory. In the CY 2018 Quality Payment Program final rule (82 FR 53656 through 53659), beginning with the CY 2019 performance period/2021 MIPS payment year, we finalized a formal Annual Call for Activities process for the addition of possible new activities and for possible modifications to current activities in the Inventory. This process requires interested parties to submit a nomination form similar to the one we used for the CY 2018 performance period/2020 MIPS payment year (82 FR 53656 through 53659). In order to submit a request for a new activity or a modification to an existing activity, the interested party must submit a nomination form (OMB control # 0938–1314) available at *https://qpp.cms.gov/resources/resource-library* during the Annual Call for Activities.

(ii) Updating the Improvement Activities Inventory

In the CY 2018 Quality Payment Program final rule (82 FR 53660), we finalized that we would establish improvement activities through notice-and-comment rulemaking. For our previously finalized Improvement Activities Inventories, we refer readers to Table H in the CY 2017 Quality Payment Program final rule (81 FR 77817) Appendix, Tables F and G in the CY 2018 Quality Payment Program final rule (82 FR 54175 through 54229) Appendix, Tables A and B in the CY 2019 PFS final rule (83 FR 60286 through 60303) Appendix 2, Tables A, B, and C in the CY 2020 PFS final rule (84 FR 63514 through 63538) Appendix 2, Tables A, B, and C in the CY 2021 PFS final rule (85 FR 85370 through 85377) Appendix 2, Tables A, B, and C in the CY 2022 PFS final rule (86 FR 65969 through 65997) Appendix 2, Tables A, B, and C in the CY 2023 PFS final rule (87 FR 70633 through 70650) Appendix 2, Tables A, B, and C in the CY 2024 PFS final rule (88 FR 79965 and 88 FR 79977) Appendix 2, Tables A, B, and C in the CY 2025 PFS final rule (89 FR 98958 through 98971) Appendix 2, and Tables A, B, and C in the CY 2026 PFS final rule (90 FR 50354 through 50369) Appendix 2. We also refer readers to the Quality Payment Program website at *https://qpp.cms.gov/* and the Explore Measures and Activities tool at *https://qpp.cms.gov/reporting-requirements/measures-activities/explore?tab=improvementActivities&py=2026for* a complete list of the current improvement activities.

(iii) Adopting New Improvement Activities

We are finalizing our proposal to add six new improvement activities beginning with the CY 2027 performance period/2029 MIPS payment year. We are finalizing our proposal that IA_CC_20 (Use of Data to Improve Practice Workflows) and IA_CC_21 (Understand and Improve Diagnostic Performance) be included in the Care Coordination subcategory. We propose that IA_AHW_2 (Systematic Screening and Intervention for Nutrition and other Health-Impacting, Non-Clinical Issues), IA_AHW_3 (Advance Care Planning Conversations to Support Patient Wellness and Care Preferences), IA_AHW_4 (Clinician Use of Artificial Intelligence (AI) to Improve Patient Care), and IA_AHW_5 (Lifestyle Approaches to Diabetes Remediation) would be included in the Advancing Health and Wellness subcategory.

The first new improvement activity, IA_CC_20, titled ''Use of Data to Improve Practice Workflows,'' would allow MIPS-eligible clinicians to improve integration of evidence-based guidelines into care by developing and refining clinical pathways and workflows. If gaps are identified through data, clinicians will update and implement changes, monitor adoption and outcomes, and reassess performance regularly.

The second new improvement activity, IA_CC_21, titled ''Understand and Improve Diagnostic Performance,'' supports clinicians in improving patient safety by reducing diagnostic safety events and miscommunication through standardized processes for tracking discrepancies, near-misses, and data accuracy. If issues are identified, teams would conduct root-cause analyses, implement corrective actions such as workflow changes or training, and monitor performance regularly to ensure improvement.

The third new improvement activity, IA_AHW_2, titled ''Systematic Screening and Intervention for Nutrition and other Health-Impacting, Non-Clinical Issues,'' would allow MIPS-eligible clinicians to implement standardized screening tools for nutrition, housing, transportation, and financial strain within clinical workflows. If needs are identified, clinicians would initiate referrals to appropriate community resources, track follow-up and resolution, and reassess screening processes and outcomes regularly to improve effectiveness. The fourth new improvement activity, IA_AHW_3, titled ''Advance Care Planning Conversations to Support Patient Wellness and Care Preferences,'' will allow MIPS-eligible clinicians to engage patients and caregivers in advance care planning and end-of-life discussions using structured communication tools while documenting goals of care, symptom management, and patient priorities. If care preferences or needs change, clinicians will update care preferences, coordinate across specialties, and reassess regularly to ensure alignment with the patient's goals and clinical status.

The fifth new activity, IA_AHW_4, titled ''Clinician Use of Artificial Intelligence (AI) to Improve Patient Care,'' would allow MIPS-eligible clinicians to implement and participate in organizational initiatives that improve patient care through the responsible and transparent use of artificial intelligence (AI) in clinical and operational workflows. Clinicians will establish policies for evaluating and monitoring AI tools or participate in

developing and refining AI-enabled resources, such as predictive analytics, clinical decision support, and risk-stratification models, to improve patient outcomes, care-team efficiency, and population health management. Examples may include using AI tools to summarize medical literature for clinical decision-making, assist with documentation (*e.g.,* AI-generated notes with clinician review), support population health management by identifying care gaps, determine patient eligibility for clinical trials, or generate draft responses to patient questions for clinician review.

The sixth new activity, IA_AHW_5, titled ''Lifestyle Approaches to Diabetes Remediation,'' engages clinicians in delivering structured, evidence-based lifestyle interventions for diabetes management, addressing nutrition, physical activity, sleep, stress, and behavior change through programs such as; Lifestyle Empowerment Approach for Diabetes Remission (LEADR) or the Diabetes Self-Management Education and Support (DSMES). Clinicians provide education and coaching, track patient progress, and adjust interventions as needed to improve health outcomes.

See Table F–B1 in Appendix 2 for more information regarding each of these proposed new improvement activities.

We sought public comments on our proposals to add each of these activities to the Inventory beginning with the CY 2027 performance period/2029 MIPS payment year.

We received public comments on these proposals. The following is a summary of the comments we received and our responses.

Comment: We received several comments in support of finalizing the following new activities: IA_CC_20: Use of Data to Improve Practice Workflows, IA_CC_21: Understand and Improve Diagnostic Performance, IA_AHW_2: Systematic Screening and Intervention for Nutrition and other Health-Impacting, Non-Clinical Issues.

Response: We thank commenters for their support of these new activities.

After consideration of public comments, we are finalizing the four above-listed activities as proposed.

Comment: We received several comments in support of finalizing the IA_AHW_3: Advance Care Planning Conversations to Support Patient Wellness and Care Preferences activity. One commenter recommended encouraging clinicians to assess existing advance care planning (ACP) documents, verifying that patient preferences remain current, and promoting availability and exchange of ACP information across care settings.

Response: We thank commenters for sharing their support and suggestions for this new activity. We appreciate the recommendations; we believe these aspects are already incorporated into the proposed activity description by requiring ''[r]egular review and updates of advance directives or care preferences.''

After consideration of public comments, we are finalizing the IA_AHW_3: Advance Care Planning Conversations to Support Patient Wellness and Care Preferences activity as proposed.

Comment: We received many comments related to the new IA_AHW_4: Clinician Use of Artificial Intelligence (AI) to Improve Patient Care activity. The majority of comments shared support for finalizing the new activity with some offering suggestions on additional protections and/or technologies to include within the activity. Suggestions included more specific requirements for clinical validation and error detection beyond establishing policy and inclusion of specific tools such as digital therapeutics within the activity description. Some commenters opposed the activity and AI in medicine generally. These comments asked to delay the integration of AI into the Improvement Activities Inventory.

Response: We thank commenters for expressing their support, concerns, and suggestions for this activity. At this time of rapid AI development, our goal is to keep this activity broadly applicable. We will revisit these suggestions in the future as we continue to track the progression of AI technology and tools, best practices, and safeguards. We note that the activity requires participating clinicians and organizations to: ''Establish and maintain organizational policies and procedures for AI use in healthcare settings that guide the evaluation, deployment, and monitoring of AI—enabled tools''. We will continue to make modifications and additions to the Improvement Activities Inventory as needed. We note that we offer a range of improvement activities for clinicians to choose from. Additionally, the creation of a new improvement activity does not compel MIPS-eligible clinicians to participate in any particular improvement activity. As AI technology continues to progress and be adopted in healthcare settings, this activity will enable us to encourage its responsible use, while allowing clinicians to attest to policies that include appropriate safeguards. We welcome collaboration with interested parties on this topic as this technology continues to develop and clinicians and facilities develop policies and best practices for its use.

After consideration of public comments, we are finalizing IA_AHW_4: Clinician Use of Artificial Intelligence (AI) to Improve Patient Care activity as proposed.

Comment: Several commenters expressed support for finalizing the new IA_AHW_5: Lifestyle Approaches to Diabetes Remediation activity. Commenters shared how this activity aligns with evidence-based approaches to managing diabetes. Some comments suggested adding more information to the activity description to explain how each resource should be used.

Response: We thank commenters for sharing their support and suggestions for the new IA_AHW_5: Lifestyle Approaches to Diabetes Remediation activity. We have made minor edits to this activity description in response to the comments and will be otherwise finalizing it as proposed.

(iv) Modifying Existing Improvement Activities

We are finalizing our proposal to modify five existing improvement activities beginning with the CY 2027 performance period/2029 MIPS payment year. Taken together, these modifications and removals will reduce duplicative improvement activities and remove activities that are obsolete, in an effort to reduce administrative effort and strengthen the Inventory overall. First, IA_BMH_4 ''Depression screening,'' IA_CC_8 ''Implementation of documentation improvements for practice/process improvements,'' IA_CC_9 ''Implementation of practices/processes for developing regular individual care plans,'' and IA_PM_4 ''Glycemic management services'' will be combined with elements of similar improvement activities in the Inventory to make their descriptions more robust. IA_BMH_4 will be combined with elements from IA_BMH_5 ''Major depressive disorder (MDD) prevention and treatment interventions.'' The description modification involves clinicians using a coordinated, team-based approach to screen for depression, assess suicide risk, and provide evidence-based follow-up care, with ongoing monitoring and documentation to support safe, effective management of patients.

IA_CC_8 will be combined with elements from IA_CC_10 ''Care transition documentation practice improvements,'' IA_CC_11 ''Care transition standard operational improvements,'' and IA_CC_12 ''Care

coordination agreements that promote improvements in patient tracking across settings.'' The description modification promotes proactive, patient-centered care coordination across all settings by improving communication, tracking referrals and transitions, and documenting actions to ensure continuity, reduce fragmentation, and support better outcomes.

IA_CC_9 will be combined with elements from IA_BE_15 ''Engagement of Patients, Family, and Caregivers in Developing a Plan of Care.'' The description modification highlights creating and regularly updating individualized care plans for at-risk patients in collaboration with the patient and their family and/or caregivers. It emphasizes aligning care with the patient's goals, priorities, and desired outcomes while ensuring clear communication and shared understanding.

IA_PM_4 will be combined with elements from IA_PM_19 ''Glycemic Screening Services'' and IA_PM_20 ''Glycemic Referring Services.'' The description modification requires clinicians to attest to screening for abnormal blood glucose, referring eligible patients to prevention programs, and setting individualized glycemic goals that are regularly reassessed. Screening documentation must be at 60 percent of medical records in the first year and 75 percent thereafter.

Second, IA_PSPA_16 ''Use decision support—ideally platform-agnostic, interoperable clinical decision support (CDS) tools, including AI-enabled predictive decision-support interventions—and standardized treatment protocols to manage workflow on the care team to meet patient needs,'' will be modified to explicitly incorporate AI-enabled decision support and strengthen oversight requirements, including monitoring, root cause analysis, and mitigation of AI-related risks. The description modification specifies that MIPS-eligible clinicians use interoperable, AI-enabled clinical decision support tools to guide care-team workflows and support evidence-based, patient-centered care, while also implementing safeguards for safe use, ongoing monitoring, and evaluation of tool performance and patient safety.

See Table F–B2 in Appendix 2 for more information regarding each of these proposed modifications to existing improvement activities.

We are sought public comments on our proposals to modify each of these activities currently specified for the Inventory beginning with the CY 2027 performance period/2029 MIPS payment year.

We received public comments on these proposals. The following is a summary of the comments we received and our responses.

Comments: We received some comments related to the modification of IA_BMH_4. One comment shared support for finalizing the modification and suggested adding ''evidence-based depression treatment'' to the activity. Another comment shared concern that the combination of two depression-related improvement activities could diminish the visibility of depression management.

Response: We thank commenters for expressing their support, concern, and suggestions for the modification on IA_BMH_4. We believe that language relating to evidence-based depression treatment is already incorporated into the activity description sufficiently through references to the ''[u]se of validated depression screening tools'' and the ''[d]evelopment and execution of evidence—based follow—up plans'' within the activity description. The combination of depression-related improvement activities will not lessen the focus on depression management because the number of improvement activities included in the Inventory does not correlate to the importance of or focus on a particular topic. This modification is aimed at reducing duplicative activities to reduce administrative effort.

After consideration of public comments, we are finalizing this activity modification as proposed.

Comment: We received some comments related to the modification of IA_CC_9. One commenter supports the modification of this activity and its consolidation with IA_BE_15. However, a commenter also expressed concern that beneficiary-engagement activities previously recognized under IA_BE_15 will be excluded if the modification is finalized. Another commenter requested that this activity retain references to family and caregivers.

Response: We thank commenters for expressing their support and concern regarding this activity removal. We do not believe that beneficiary-engagement activities will be diminished under the proposed activity removal. The removal is intended to reduce redundancy in the Inventory and administrative effort for clinicians. Beneficiary engagement remains an important element of the Inventory through multiple activities, including the activity that IA_BE_15 is being combined with, IA_CC_9. IA_CC_9 requires that individualized care plans are ''developed and shared with the beneficiary and family and/or caregiver(s)'' and include their ''goals and priorities, as well as desired outcomes of care.'' Also, fifteen activities will remain in the Inventory in the Beneficiary Engagement subcategory.

After consideration of public comments, we are finalizing this activity modification as proposed.

Comment: We received several comments related to the modification of IA_PSPA_16. All comments shared support for finalizing the modification with some suggesting additional requirements to include within the activity concerning the use of AI in healthcare settings. Suggestions included adding specific tools, documentation, and monitoring requirements to the activity description.

Response: We thank commenters for expressing their support and suggestions for the modification of IA_PSPA_16. We will continue to track the progression of AI technology and tools, best practices, and safeguards. We will propose further modifications to this activity as needed in the future. We welcome collaboration with interested parties on this topic.

After consideration of public comments, we are finalizing this activity modification as proposed.

Comment: We received some comments related to the modification of IA_PM_4, including expressions of support. A specific comment suggested recognizing nutrition-risk and food-access assessments, coordinating glycemic and nutrition intervention, engaging in longitudinal follow up, and making referrals within this activity.

Response: We thank commenters for expressing their support and providing suggestions for this activity modification. We believe that this activity as modified already includes follow up and referral. We will continue to monitor the implementation of this activity, and make further modifications to this activity as needed. We welcome collaboration with interested parties on this topic. We are finalizing this activity as proposed, and will carefully monitor its implementation.

After consideration of public comments, we are finalizing this activity modification as proposed.

We did not receive public comments specifically on the proposed modification to IA_CC_8, and we are finalizing these modifications as proposed.

(v) Removing Existing Improvement Activities

Additionally, we are finalizing our proposal to remove eleven previously finalized improvement activities beginning with the CY 2027

performance period/2029 MIPS payment year: IA_BMH_5 ''MDD prevention and treatment interventions,'' IA_CC_10 ''Care transition documentation practice improvements,'' IA_CC_11 ''Care transition standard operational improvements,'' IA_CC_12 ''Care coordination agreements that promote improvements in patient tracking across settings,'' IA_PSPA_2 ''Participation in MOC Part IV,'' IA_CC_16 ''Primary Care Physician and Behavioral Health Bilateral Electronic Exchange of Information for Shared Patients,'' IA_BE_15 ''Engagement of Patients, Family, and Caregivers in Developing a Plan of Care,'' IA_PM_19 ''Glycemic Screening Services,'' IA_PM_20 ''Glycemic Referring Services,'' IA_EPA_4 ''Additional improvements in access as a result of QIN/QIO TA,'' and IA_PM_2 ''Anticoagulant management improvements.'' We are finalizing the removal of these improvement activities in accordance with our activity removal policy set forth at § 414.1355(d). Specifically, we are finalizing our proposal to remove each of these eleven improvement activities under Removal Factor(s) 1 or 7, which provides that we may remove an improvement activity if we determine it is duplicative of another activity (§ 414.1355(d)(1)) or the activity is obsolete (§ 414.1355(d)(7)).

Our plan to remove IA_BMH_5, IA_CC_10, IA_CC_11, IA_CC_12, IA_BE_15, IA_PM_19, and IA_PM_20 will align with Removal Factor 1, as these activities are similar to other improvement activities in the Inventory and can be considered duplicative. Additionally, our plan to remove IA_PSPA_2, IA_CC_16, IA_EPA_4, and IA_PM_2 will align with Removal Factor 7, as the activities are no longer highly relevant or useful in current clinical practice or policy and can be considered obsolete. Lastly, our plan to remove IA_EPA_4 is also supported by removal Factor 2, as this activity is one of several focused on improvements that can be supported and/or driven by QIN/QIOs. See Table F–B3 in Appendix 2 for more information regarding our plan to remove each of these existing improvement activities.

We are sought public comments on our proposals to remove these activities from the improvement activities performance category beginning with the CY 2027 performance period/2029 MIPS payment year.

We received public comments on these proposals. The following is a summary of the comments we received and our responses.

Comments: We received some comments related to the removal of IA_BMH_5. One comment shared support for finalizing the removal. Another comment shared concern that the combination of two depression-related improvement activities could diminish the visibility of depression management.

Response: We thank commenters for expressing their support and concerns regarding the removal of IA_BMH_5. We believe that the combination of depression-related improvement activities will not lessen focus on depression management because the number of improvement activities included in the Inventory does not correlate to the importance of or focus on a particular topic. This removal is aimed at reducing duplicative activities to reduce administrative effort.

After consideration of public comments, we are finalizing this activity removal as proposed.

Comment: We received some comments related to the removal of IA_CC_10, IA_CC_11, and IA_CC_12. One comment shared concern that removing IA_CC_10, IA_CC_11, and IA_CC_12 could inadvertently reduce recognition of the care transition and coordination activities performed by clinicians, particularly infectious disease physicians whose patients regularly move across care settings.

Response: We thank commenters for sharing their concern and emphasizing the importance of care transitions and care coordination for patients with complex conditions. The proposed removals are aimed at reducing duplication within the Inventory while maintaining recognition of the importance of care transitions and care coordination. (See the following existing and modified improvement activities: IA_CC_7, Regular training in care coordination; IA_CC_8, Implementation of Documentation and/or Operational Improvements for Practice/Process Improvements; IA_CC_9, Implementation of Practices/Processes for Developing Regular Individual Care Plans; IA_CC_13, Practice improvements to align with OpenNotes principles; IA_CC_15, PSH Care Coordination; IA_CC_17, Patient Navigator Program; IA_CC_18, Relationship-Centered Communication; and IA_CC_19, Tracking of clinician's relationship to and responsibility for a patient by reporting MACRA patient relationship codes. There are also two new activities being finalized for the CY 2027 performance period/2029 MIPS payment year and beyond in this subcategory: IA_CC_20, Use of Data to Improve Practice Workflows; and IA_CC_21, Understand and Improve Diagnostic Performance.) The Improvement Activities Inventory will continue to recognize care transitions, care coordination, and information-sharing practices and give clinicians credit for this work.

After consideration of public comments, we are finalizing this activity removal as proposed.

Comment: We received one comment specifically opposing the removal of IA_PSPA_2, stating that this MOC Part IV activity incentivizes clinician education and practical quality improvement.

Response: We thank the commenter for sharing their opposition of this activity removal. We believe that participating in MOC Part IV is standard and/or required practice and is therefore unlikely to be driving additional meaningful clinical care improvement.

After consideration of public comments, we are finalizing this activity removal as proposed.

Comment: We received some comments specifically related to the removal of IA_CC_16. One comment opposed the removal of this improvement activity, stating that information exchange between primary care and behavioral health providers remains inconsistent and that this activity would continue to incentivize information exchange.

Response: We thank commenters for sharing their concern and emphasizing the importance of information exchange between primary care and behavioral health providers. We agree that information exchange is important, but believe this activity is unlikely to drive additional meaningful clinical care improvement because EHR adoption and data sharing has advanced significantly since the creation of this activity. (Also, please see existing IA_CC_13, Practice improvements to align with OpenNotes principles; and IA_BE_4, Engagement of Patients through Implementation of New Patient Portal.)

After consideration of public comments, we are finalizing this activity removal as proposed.

Comment: We received comments related to the removal of IA_BE_15. One commenter expressed support for the removal of IA_BE_15 and also expressed concern that beneficiary-engagement activities previously recognized under IA_BE_15 may be excluded if the removal is finalized.

Response: We thank commenters for expressing their support and concern regarding this activity removal. We do not believe that beneficiary-engagement activities will be diminished under the proposed activity removal. The removal is intended to reduce redundancy in the Inventory and administrative effort for clinicians. Beneficiary engagement remains an important element of the

Inventory through multiple activities, including the activity that IA_BE_15 is being combined with, IA_CC_9. IA_CC_9 requires that individualized care plans are ''developed and shared with the beneficiary and family and/or caregiver(s)'' and include their ''goals and priorities, as well as desired outcomes of care.'' Also, fifteen activities will remain in the Inventory in the Beneficiary Engagement subcategory.

After consideration of public comments, we are finalizing this activity removal as proposed.

Comment: We received some comments related to the removal of IA_PM_2. One commenter opposed the removal of IA_PM_2 and recommended maintaining the activity within the inventory.

Response: We thank commenters for their feedback. However, this activity no longer reflects most common current anticoagulation practice. To ensure improvement activities remain broadly clinically relevant, we will finalize the removal of this activity. We will continue to consider opportunities to develop future activities that reflect current approaches to anticoagulation management.

After consideration of public comments, we are finalizing the removal of IA_PM_2 as proposed.

We did not receive public comments specifically on the removal of IA_PM_19, IA_PM_20, or IA_EPA_4; we are finalizing these removals as proposed.

(4) MIPS Promoting Interoperability Performance Category

(a) Background

Section 1848(q)(2)(A)(iv) of the Act includes the meaningful use of certified electronic health record (EHR) technology (CEHRT) as a performance category under MIPS. We refer to this performance category as the MIPS Promoting Interoperability performance category (formerly the advancing care information performance category).

Section 1848(q)(2)(B)(iv) of the Act provides that the requirements established under section 1848(o)(2) of the Act for determining whether a MIPS eligible clinician is a meaningful EHR user also applies to our assessment of a MIPS eligible clinician's performance on measures and activities with respect to the MIPS Promoting Interoperability performance category. Section 1848(o)(2)(D) of the Act generally provides that the requirements for being a meaningful EHR user under section 1848(o)(2) of the Act continue to apply for purposes of MIPS.

Under section 1848(o)(2)(A) of the Act, a MIPS eligible clinician must meet three requirements related to the meaningful use of CEHRT during a performance period for a MIPS payment year. Specifically, under section 1848(o)(2)(A) of the Act, the MIPS eligible clinician must: (1) demonstrate to the satisfaction of the Secretary the use of CEHRT in a meaningful manner, which shall include the use of electronic prescribing as determined to be appropriate by the Secretary; (2) demonstrate to the satisfaction of the Secretary that their CEHRT is connected in a manner that provides, in accordance with law and standards applicable to the exchange of information, for electronic exchange of health information to improve the quality of care, such as promoting care coordination, and demonstrates (through a process specified by the Secretary), that they have not knowingly and willfully taken action (such as to disable functionality) to limit or restrict the compatibility or interoperability of the CEHRT; and (3) use CEHRT to submit information on clinical quality measures and such other measures as selected by the Secretary.

For previously established policies regarding the MIPS Promoting Interoperability performance category, we refer readers to §§ 414.1305 (includes definitions pertaining to the MIPS Promoting Interoperability performance category), 414.1375 (MIPS Promoting Interoperability performance category provisions), and 414.1380(b)(4) (includes scoring provisions pertaining to the MIPS Promoting Interoperability performance category); and the CY 2017 Quality Payment Program final rule (81 FR 77199 through 77245), CY 2018 Quality Payment Program final rule (82 FR 53663 through 53688), CY 2019 PFS final rule (83 FR 59785 through 59820), CY 2020 PFS final rule (84 FR 62991 through 63006), CY 2021 PFS final rule (85 FR 84886 through 84895), CY 2022 PFS final rule (86 FR 65466 through 65490), CY 2023 PFS final rule (87 FR 70060 through 70087), CY 2024 PFS final rule (88 FR 79307 through 79312 and 79351 through 79365), the 21st Century Cures Act: Establishment of Disincentives for Health Care Providers That Have Committed Information Blocking final rule (89 FR 54662 through 54718), CY 2025 PFS final rule (89 FR 98413 through 98427), and CY 2026 PFS final rule (90 FR 49868 through 49902).

In the CY 2027 PFS proposed rule, we proposed to—

- Modify the definition of CEHRT to align with ONC Health IT Certification Program proposed updates relevant to the MIPS Promoting Interoperability performance category;
- Remove the ONC Direct Review and ONC-Authorized Certification Bodies (ACB) Surveillance attestations;
- Remove the Security Risk Analysis measure;
- Adopt the Electronic Prior Authorization for Prescription Drugs measure; and
- Modify the previously adopted Electronic Prior Authorization measure.

(b) Modifying the Definition of Certified Electronic Health Record Technology in the MIPS Promoting Interoperability Performance Category

(i) Background

In accordance with § 414.1375(b)(1), to earn a performance category score for the MIPS Promoting Interoperability performance category, a MIPS eligible clinician must be a meaningful EHR user for MIPS and use CEHRT during the performance period, as both terms are defined in § 414.1305. In the CY 2025 PFS final rule, we discussed previously finalized modifications related to the definition of CEHRT for the Quality Payment Program, including for the MIPS Promoting Interoperability performance category at § 414.1305 (89 FR 98414 and 98415). Currently, we define CEHRT, for purposes of MIPS, as EHR technology (which could include multiple technologies) certified under the Office of National Coordinator for Health Information Technology's (ONC) Health Information Technology (IT) Certification Program that meets the Base EHR definition at 45 CFR 170.102 and certified as meeting additional ONC health IT certification criteria as adopted and updated in 45 CFR 170.315 as enumerated in paragraph (2)(i) of the definition of CEHRT at § 414.1305, including as necessary to report on applicable measures specified for the MIPS Promoting Interoperability performance category. In the CY 2027 PFS proposed rule, Table C–G 8 (91 FR 44197 and 44198) outlined the measures for the MIPS Promoting Interoperability performance category for the CY 2027 performance period/2029 MIPS payment year and the associated ONC health IT certification criteria set forth at 45 CFR 170.315 impacting the definition of CEHRT, as applicable.

In the Health Data, Technology, and Interoperability: ASTP/ONC Deregulatory Actions to Unleash Prosperity (HTI–5) proposed rule (90 FR 60970 through 61034) published in the **Federal Register** [396] on December 29,

[396] ASTP/ONC is now referred to as ONC, pursuant to a notice published in the **Federal Register** on April 1, 2026 (91 FR 16204). Although, at the time of specific references noted herein, ONC

Continued

2025, ONC proposed a wide-ranging set of updates to the ONC Health IT Certification Program. The HTI–5 proposed rule focuses on deregulatory actions in 45 CFR part 170 (Health Information Technology Standards, Implementation Specifications, and Certification Criteria and Certification Programs for Health Information Technology) and 45 CFR part 171 (Information Blocking). The HTI–5 proposed rule seeks to reduce burden, offer flexibility to developers and providers, and support innovation through the removal and revision of certain certification criteria and regulatory provisions. The following summarizes proposals in the HTI–5 proposed rule that are relevant to MIPS eligible clinicians.

was either referenced as ASTP/ONC or as ONC; for clarity, all references in this final rule are noted as ONC.

In the HTI–5 proposed rule, ONC identified 34 certification criteria for removal and 7 certification criteria for revision. ONC stated that removing or revising these criteria would reduce burden and costs for health IT developers and clinicians, partly due to the decreased necessity to maintain ongoing conformance with certification requirements (90 FR 60973).

In the CY 2027 PFS proposed rule, Table C–G 1 (91 FR 44168) summarized the impact the proposed modifications to remove and revise the ONC health IT certification criteria may have on MIPS eligible clinicians reporting the MIPS Promoting Interoperability performance category. Also, Table C–G 1 described how the criteria subject to HTI–5 proposals are incorporated into the definition of CEHRT in § 414.1305. In addition to the ONC health IT certification criteria included in the definition of CEHRT in § 414.1305, the definition includes EHR technology certified under the ONC Health IT Certification Program that meets the Base EHR definition at 45 CFR 170.102 and technology certified to the health IT certification criteria necessary to report on applicable measures specified for the MIPS Promoting Interoperability performance category.

In this final rule, we updated Table C–G 1 to reflect policies subsequently finalized in the Health Data, Technology, and Interoperability: ONC Deregulatory Actions to Unleash Prosperity (HTI–5) final rule (91 FR 67916 through 67998),[397] which was published in the **Federal Register** on October 28, 2026.

BILLING CODE 4169–69–P

[397] The Health Data, Technology, and Interoperability: ONC Deregulatory Actions to Unleash Prosperity (HTI–5) final rule was published in the **Federal Register** on October 28, 2026, *see: https://www.govinfo.gov/content/pkg/FR-2026-10-28/pdf/2026-21943.pdf*.

TABLE C-G 1 HTI-5 PROPOSED AND FINALIZED POLICIES TO REMOVE AND REVISE ONC HEALTH IT CERTIFICATION CRITERIA THAT IMPACT THE CEHRT DEFINITION FOR THE MIPS PROMOTING INTEROPERABILITY PERFORMANCE CATEGORY

ONC Health IT Certification Criteria as Defined in the Following Sections of Title 45 CFR 170.315	HTI-5 Proposed Rule Action	HTI-5 Final Rule Action	Effective Date	Relevance to the CEHRT Definition for the MIPS Promoting Interoperability Performance Category
Patient Demographics and Observations - (a)(5)	Revise	Revision Not Finalized*	N/A	Specified in Base EHR definition.
Implantable Device List - (a)(14)	Remove	Removal Not Finalized**	N/A	Specified in Base EHR definition.
Decision Support Interventions - (b)(11)	Revise	Revised	Effective date of HTI-5 final rule.	Specified in Base EHR definition.
Direct Project - (h)(1)	Remove	Removed	Effective date of HTI-5 final rule.	Specified in Base EHR definition.
Direct Project, Edge Protocol, and XDR/XDM - (h)(2)	Remove	Removed	Effective date of HTI-5 final rule.	Specified in Base EHR definition.
Family Health History - (a)(12)	Remove	Removed	Effective January 1, 2027.	Specified in CEHRT definition.
Patient Health Information Capture - (e)(3)	Remove	Removed	Effective January 1, 2027.	Specified in CEHRT definition.
Automated Numerator Recording - (g)(1)	Remove	Removed	Effective January 1, 2027.	Specified in CEHRT definition.
Automated Measure Calculation – (g)(2)	Remove	Removed	Effective January 1, 2027.	Specified in CEHRT definition.
Clinical Quality Measures – Report – (c)(3)	Revise	Revised	Effective January 1, 2027.	Specified in CEHRT definition.
Clinical Quality Measures – Filter – (c)(4)	Remove	Removed	Effective January 1, 2027	Specified in CEHRT definition
Transitions of Care - (b)(1)	Revise	Finalized with Modification - Revised***	Effective January 1, 2030.	Specified criterion for the Support Electronic Referral Loops by Sending Health Information, Support Electronic Referral Loops by Receiving and Reconciling Health Information, Health Information Exchange Bi-Directional Exchange, and Enabling Exchange Under TEFCA measures.
Clinical Information Reconciliation and Incorporation - (b)(2)	Remove	Removal Not Finalized - Revised**	Effective date of HTI-5 final rule.	Specified criterion for the Support Electronic Referral Loops by Receiving and Reconciling Health Information measure.
View, Download, and Transmit to 3rd Party - (e)(1)	Revise	Revised	Effective date of HTI-5 final rule.	Specified criterion for the Provide Patients Electronic Access to Their Health Information measure.
Transmission to cancer registries – (f)(4)	Remove	Removal Not Finalized**	N/A	Specified criterion for the Public Health Registry Reporting measure.
Transmission to public health agencies – Electronic Case Reporting - (f)(5)	Revise	Revision Not Finalized**	N/A	Specified criterion for the Electronic Case Reporting measure.
Transmission to public health agencies – Health Care Surveys - (f)(7)	Remove	Removal Not Finalized**	N/A	Specified criterion for the Public Health Registry Reporting measure.

ONC Health IT Certification Criteria as Defined in the Following Sections of Title 45 CFR 170.315	HTI-5 Proposed Rule Action	HTI-5 Final Rule Action	Effective Date	Relevance to the CEHRT Definition for the MIPS Promoting Interoperability Performance Category
Application access — patient selection - (g)(7)	Remove	Removed	Effective January 1, 2027.	Specified criterion for the Provide Patients Electronic Access to Their Health Information and Health Information Exchange Bi-Directional Exchange measures.
Application Access – All Data Request - (g)(9)	Remove	Removed	Effective January 1, 2027.	Specified criterion for the Provide Patients Electronic Access to Their Health Information and Health Information Exchange Bi-Directional Exchange measures.

* Please note that such policy proposal from the HTI-5 proposed rule was not discussed in the HTI-5 final rule and may, in the future, be included in a subsequent final rule or as a revised proposal in a subsequent proposed rule.

** Such policy proposal was not finalized in the HTI-5 final rule.

*** Such policy proposal was finalized with modification in the HTI-5 final rule.

BILLING CODE 4169–69–C

In the CY 2027 PFS proposed rule (91 FR 44168), we noted that proposed changes in the HTI–5 proposed rule would affect ONC health IT certification criteria included in the definition of CEHRT in 42 CFR 414.1305, which applies to the MIPS Promoting Interoperability performance category in several ways. First, several ONC proposals either revise or remove certain ONC Health IT Certification Program certification criteria included within the Base EHR definition at 45 CFR 170.102, which is incorporated into the definition of CEHRT at § 414.1305. Removal of these criteria from the ONC Health IT Certification Program and the Base EHR definition would therefore remove the requirement that a MIPS eligible clinician must use CEHRT that includes health IT certified to the removed criteria. Specifically, ONC proposed to remove the following ONC health IT certification criteria from the Base EHR definition at: 45 CFR 170.315(a)(14)—''implantable device list'' (90 FR 60983 through 60984), 45 CFR 170.315(h)(1)—''transport methods and other protocols—direct project'' (90 FR 60998 and 60999), and 45 CFR 170.315(h)(2)—''transport methods and other protocols—Direct Project, Edge Protocol, and XDR/XDM'' (90 FR 60999). ONC also proposed to revise the following criteria referenced in the Base EHR definition: 45 CFR 170.315(b)(1)—''transitions of care'' (90 FR 60984), 45 CFR 170.315(a)(5)—''patient demographics and observations'' (90 FR 60980 through 60982) and 45 CFR 170.315(b)(11)—''decision support interventions'' (90 FR 60986 through 60987).

Also, ONC proposed to remove the following five ONC health IT certification criteria specified in the text of the definition of CEHRT at § 414.1305. Specifically, ONC proposed to remove: 45 CFR 170.315(a)(12)—''family health history,'' 45 CFR 170.315(e)(3)—''patient health information capture,'' 45 CFR 170.315(g)(1)—''automated numerator recording,'' 45 CFR 170.315(g)(2)—''automated measure calculation,'' and 45 CFR 170.315(c)(4)—''clinical quality measures—filter'' (90 FR 60982 and 60983; 60991 and 60992; 60994 and 60995; and 60988, respectively). Also, ONC proposed to revise 45 CFR 170.315(c)(3)—''clinical quality measures—report'' (90 FR 60988). Such ONC health IT certification criteria are discussed further in section IV.A.4.d.(4)(b)(ii) of this final rule.

In addition, in the CY 2027 PFS proposed rule (91 FR 44169), we noted that ONC proposed to remove and/or revise other ONC health IT certification criteria that directly support certain MIPS Promoting Interoperability performance category measures. For example, ONC proposed to revise the ''transitions of care'' criterion in 45 CFR 170.315(b)(1), which supports the Support Electronic Referral Loops by Sending Health Information and Support Electronic Referral Loops by Receiving and Reconciling Health Information measures and remove the ''clinical information reconciliation and incorporation'' criterion in 45 CFR 170.315(b)(2), which supports the Support Electronic Referral Loops by Receiving and Reconciling Health Information measure (90 FR 60984). In addition, of the four ONC health IT certification criteria that are identified as supporting the Provide Patients Electronic Access to Their Health Information measure: 45 CFR 170.315(e)(1), 45 CFR 170.315(g)(7), 45 CFR 170.315(g)(9), and 45 CFR 170.315(g)(10), we noted that three were impacted by the proposals in the HTI–5 proposed rule. ONC proposed to revise 45 CFR 170.315(e)(1) (90 FR 60990 through 60991) and remove 45 CFR 170.315(g)(7) and 45 CFR 170.315(g)(9) (90 FR 60997 and 60998). In the CY 2027 PFS proposed rule (91 FR 44169), we noted that MIPS eligible clinicians would only need to implement the remaining heath IT certification criteria identified for the Provide Patients Electronic Access to Their Health Information measure (the revised 45 CFR 170.315(e)(1) and unaltered 45 CFR 170.315(g)(10)), if ONC finalizes such proposals. In the CY 2027 PFS proposed rule (91 FR 44169), we noted that similarly, for the Support Electronic Referral Loops by Sending Health Information and Support Electronic Referral Loops by Receiving and Reconciling Health Information measures, MIPS eligible clinicians would only need to implement the remaining ONC health IT certification criteria if applicable ONC health IT certification criteria proposed for removal in the HTI–5 proposed rule are finalized as proposed. In the CY 2027 PFS proposed rule, Table C–G 8 (91 FR 44197 and 44198) contained a complete list of the MIPS Promoting Interoperability performance category measures, and the applicable ONC health IT certification criteria, including the impact to individual ONC health IT certification criteria if the proposals in the HTI–5 proposed rule are finalized.

Regarding the Public Health Registry Reporting measure, ONC proposed to remove both ONC health IT certification criteria that support the measure: 45 CFR 170.315(f)(4)—''transmission to cancer registries'' and 45 CFR 170.315(f)(7)—''transmission to public health agencies—health care surveys''

(90 FR 60992 through 60994). In the CY 2027 PFS proposed rule (91 FR 44169), we noted that if the proposed removal of the ONC health IT certification criteria is finalized as proposed in the HTI–5 proposed rule, there would be no specific ONC health IT certification criteria identified for this measure. Consistent with existing policy, a MIPS eligible clinician would still be able to use any available data exchange standard specified in 45 CFR part 170 subpart B to meet the measure requirements. For example, the transmission could be in the form of a Consolidated Clinical Document Architecture (C–CDA) as adopted in 45 CFR 170.205(a)(4), or Quality Reporting Document Architecture (QRDA) as adopted in 45 CFR 170.205(h)(2).

Regarding the Electronic Case Reporting measure, ONC proposed to revise the following health IT certification criterion that supports the measure: at 45 CFR 170.315(f)(5)—''transmission to public health agencies—electronic case reporting'' (90 FR 60992 through 60993). Such ONC proposal would update the ONC health IT certification criterion to focus on functional, rather than standards-based requirements. While ONC's proposal, if finalized, would revise the requirements for health IT products certified to this ONC health IT certification criterion, MIPS eligible clinicians would continue to need to use health IT certified to this criterion to report the Electronic Case Reporting measure.

Also, in the CY 2027 PFS proposed rule (91 FR 44169), we noted that ONC proposed to remove certain ONC health IT certification criteria such as 45 CFR 170.315(g)(3)—''safety-enhanced design,'' 45 CFR 170.315(g)(4)—''quality management system,'' (90 FR 60995 through 60997), and a series of criteria related to privacy and security functionality in 45 CFR 170.315(d)(1) through (13) (90 FR 60988 through 60990), most of which are included in the Health IT Module certification requirements at 45 CFR 170.550. Such ONC health IT certification criteria represent capabilities commonly found in certified health IT products used by MIPS eligible clinicians. Furthermore, in the CY 2027 PFS proposed rule (91 FR 44169), we noted that the ONC proposed removal of such health IT certification criteria from the ONC Health IT Certification Program would not affect a MIPS eligible clinician's obligation to ensure the privacy and safety of patient electronic health information under the Health Insurance Portability and Accountability Act of 1996 and other applicable laws. In the CY 2027 PFS proposed rule, we referred readers to Table C–G 8 (91 FR 44197 and 44198) for a complete list of ONC health IT certification criteria that support each MIPS Promoting Interoperability performance category measure, including ONC health IT certification criteria ONC proposed to remove and/or revise. We noted that, in most cases, the ONC health IT certification criteria that support measure reporting would remain part of the ONC Health IT Certification Program. For additional information regarding ONC's proposals in the HTI–5 proposed rule, we referred readers to the HTI–5 proposed rule (90 FR 60970 through 61034).

The HTI–5 final rule (91 FR 67916 through 67998) was published in the **Federal Register** on October 28, 2026. Some of the proposals in the HTI–5 proposed rule were not finalized or were finalized with modification in the HTI–5 final rule. Specifically, the following proposals were not finalized or were finalized with modification in the HTI–5 final rule.

- ''Patient demographics and observations''—45 CFR 170.315(a)(5): The proposal to revise such criterion was not finalized. Please note that such proposal from the HTI–5 proposal rule was not discussed in the HTI–5 final rule and may, in the future, be included in a subsequent final rule or as a revised proposal in a subsequent proposed rule.
- ''Implantable device list''—45 CFR 170.315(a)(14): The proposal to remove such criterion was not finalized (91 FR 67930).
- ''Transitions of care''—45 CFR 170.315(b)(1): The proposal to revise such criterion was finalized with modification (91 FR 67931).
- ''Clinical information reconciliation and incorporation''—45 CFR 170.315(b)(2): The proposal to remove such criterion was not finalized, and the criterion was revised (91 FR 67934).
- ''Decision support interventions''—45 CFR 170.315 (b)(11): The proposal to revise such criterion was finalized with modification (91 FR 67941).
- ''Transmission to cancer registries''—45 CFR 170.315(f)(4): The proposal to remove such criterion was not (91 FR 67951).
- ''Transmission to public health agencies—Electronic Case Reporting''—45 CFR 170.315(f)(5): The proposal to revise such criterion was not finalized (91 FR 67953).
- ''Transmission to public health agencies—Health Care Surveys''—45 CFR 170.315(f)(7): The proposal to remove such criterion was not finalized (91 FR 67956).

(ii) Modifying the Definition of Certified Electronic Health Record Technology in the MIPS Promoting Interoperability Performance Category

Beginning with the CY 2019 performance period and subsequent performance periods, the definition of CEHRT for the MIPS Promoting Interoperability performance category in § 414.1305 requires the use of EHR technology certified under the ONC Health IT Certification Program that meets the 2015 Edition Base EHR definition or subsequent Base EHR definition (as defined at 45 CFR 170.102) and has been certified to specific ONC health IT certification criteria as adopted and updated in 45 CFR 170.315. In paragraph (2)(i) of the definition of CEHRT, the definition further specifies that EHR technology must be certified to criteria for ''family health history'' (45 CFR 170.315(a)(12)) and ''patient health information capture'' (45 CFR 170.315(e)(3)). In paragraph (2)(ii) of the definition of CEHRT, the definition specifies that EHR technology must be certified to ONC health IT certification criteria that are necessary to report on applicable objectives and measures specified for the MIPS Promoting Interoperability performance category. Paragraph (2)(ii)(A) of the definition of CEHRT includes the applicable measure calculation certification criteria at 45 CFR 170.315(g)(1) or (2) for all ONC health IT certification criteria that support an objective with a percentage-based measure. Paragraph (2)(ii)(B) includes clinical quality measure certification criteria that support the calculation and reporting of clinical quality measures at 45 CFR 170.315(c)(2) and (c)(3)(i) and (ii) and optionally (c)(4).

In the CY 2027 PFS proposed rule (91 FR 44169 through 44171), we proposed to amend the definition of CEHRT (specified as ''Certified electronic health record technology (CEHRT)'') in § 414.1305, by modifying paragraphs (2)(i), (2)(ii)(A), and (2)(ii)(B) to align with the applicable ONC proposals to remove and revise certain ONC health IT certification criteria as proposed in the HTI–5 proposed rule. Specifically, we proposed to remove references to the following ONC health IT certification criteria for the CY 2027 performance period/2029 MIPS payment year:

- ''Family health history''—45 CFR 170.315(a)(12);
- ''Patient health information capture''—45 CFR 170.315(e)(3);
- ''Automated numerator recording''—45 CFR 170.315(g)(1);

• ''Automated measure calculation''—45 CFR 170.315(g)(2); and

• ''Clinical quality measures—filter''—45 CFR 170.315(c)(4) (91 FR 44169 through 44171).

We noted that if the ONC proposals to remove such ONC health IT certification criteria are finalized as proposed, the ONC health IT certification criteria at 45 CFR 170.315(a)(12), 45 CFR 170.315(e)(3), 45 CFR 170.315(g)(1), and 45 CFR 170.315(g)(2) would no longer be required and ONC health IT certification criteria at 45 CFR 170.315(c)(4) would no longer be included as an optional criterion to meet the definition of CEHRT, effective January 1, 2027. As part of the proposed modification to the definition of CEHRT, in the CY 2027 PFS proposed rule (91 FR 44170), we also specified a limited timeframe, from CY 2019 through CY 2026, for the following ONC health IT certification criteria to be included in the definition of CEHRT; ''family health history'' (45 CFR 170.315(a)(12)), ''patient health information capture'' (45 CFR 170.315(e)(3)), ''automated numerator recording'' (45 CFR 170.315(g)(1)), ''automated measure calculation'' (45 CFR 170.315(g)(2), and ''clinical quality measures'' (45 CFR 170.315(c)(4)). Additionally, as part of the proposed modification to the definition of CEHRT, we noted in the CY 2027 PFS proposed rule (91 FR 44170) that we would modify the reference to the ''clinical quality measures—report'' (45 CFR 170.315(c)(3)) ONC health IT certification criterion from ''(c)(3)(i) and (ii)'' to (c)(3), which would align with the proposed revisions in the HTI–5 proposed rule to modify (c)(3) to include the provision of (c)(3)(i), and remove subparagraphs (c)(3)(i) and (c)(3)(ii). Lastly, we proposed to amend the definition of CEHRT in § 414.1305 by modifying paragraphs 2(i), (2)(i)(A), and (2)(i)(B) (91 FR 44169 through 44171).

We noted in the CY 2027 PFS proposed rule (91 FR 44170) that while such proposed modifications are consistent with the proposals in the HTI–5 proposed rule (90 FR 60970 through 61034), the proposal to modify the definition of CEHRT is not contingent upon the final actions from ONC regarding its proposals to remove and revise ONC health IT certification criteria as proposed in the HTI–5 proposed rule.

In the CY 2027 PFS proposed rule (91 FR 44170), we noted that the longstanding presence of the ONC health IT certification criteria for ''family health history'' at 45 CFR 170.315(a)(12) and ''patient health information capture'' at 45 CFR 170.315(e)(3) in the ONC Health IT Certification Program (adopted in 2015 at 80 FR 62624 and 80 FR 62661 and 62662, respectively) and the incorporation of such criteria into the MIPS Promoting Interoperability performance category requirements mean functionality reflected in such ONC health IT certification criteria is likely to be fully embedded in certified health IT and is widely available for use by MIPS eligible clinicians. Furthermore, ONC anticipates that health IT developers would continue to retain such capabilities in their Health IT Modules despite the absence of ONC health IT certification criteria for such functionalities (90 FR 60982 and 60991). Such ONC health IT certification criteria are not identified as supporting any specific measures within the MIPS Promoting Interoperability performance category and as a result, we do not anticipate any modifications to the measure specifications due to the removal of such ONC health IT certification criteria from the definition.

We further noted that if the ONC health IT certification criteria needed for measure calculation (''automated numerator recording'' and ''automated measure calculation'' ONC health IT certification criteria in 45 CFR 170.315(g)(1) and 45 CFR 170.315(g)(2)) are finalized for removal, then EHR technology used by MIPS eligible clinicians would not need to be certified to such two ONC health IT certification criteria in order to meet the requirement for MIPS eligible clinicians to use CEHRT; however, we anticipate that health IT developers seeking to support customers participating in the MIPS Promoting Interoperability performance category will continue to support the functionality of these criteria by reporting of numerators and denominators for certain MIPS Promoting Interoperability performance category measures, including the e-Prescribing measure and Provide Patients Electronic Access to Their Health Information measure. Removing the requirements for ONC health IT certification criteria at 45 CFR 170.315(g)(1) and 45 CFR 170.315(g)(2) from the definition of CEHRT in § 414.1305 would reduce administrative burden for health IT developers associated with testing and certifying to such functionality without impacting reporting requirements for the MIPS Promoting Interoperability performance category.

Additionally, for the optional ONC health IT certification criterion pertaining to ''clinical quality measures—filter'' in 45 CFR 170.315(c)(4), we indicated in the CY 2027 PFS proposed rule (91 FR 44170) that we do not believe that such ONC health IT certification criterion is a meaningful addition to the definition of CEHRT for health care providers. The optional designation for such ONC health IT certification criterion has led to limited uptake of health IT certified to the criterion, while health care providers and health IT developers have indicated that this functionality is available in EHRs without relying on a regulatory requirement. Also, ONC stated that it anticipates that health IT systems would continue to retain the clinical quality measure filtering functionality despite the absence of the ONC health IT certification criterion for such functionality (90 FR 60988).

As described in the CY 2027 PFS proposed rule, we proposed to amend the definition of CEHRT, specified as ''Certified electronic health record technology (CEHRT)'' in § 414.1305, by modifying paragraphs (2)(i), (2)(i)(A), and (2)(i)(B) (91 FR 44170 through 44171). Specifically:

• In paragraph (2)(i), we proposed to remove for CY 2027 and subsequent years, the certification criteria for ''family health history'' (as adopted and updated at 45 CFR 170.315(a)(12)) and ''patient health information capture'' (as adopted and updated at 45 CFR 170.315(e)(3));

• In paragraph (2)(ii)(A), we proposed to remove for CY 2027 and subsequent years, the ONC health IT certification criteria for ''automated numerator recording'' (as adopted and updated at 45 CFR 170.315(g)(1)) and ''automated measure calculation'' (as adopted and updated at 45 CFR 170.315(g)(2)); and

• In paragraph (2)(ii)(B), we proposed to remove for CY 2027 and subsequent years, the ONC health IT certification criterion for ''clinical quality measures—filter'' (as adopted and updated at 45 CFR 170.315(c)(4)) (91 FR 44169 through 44172).

The proposed revised text would read as follows:

''Certified electronic health record technology (CEHRT) [. . .]

(2) For 2019 and subsequent years, EHR technology (which could include multiple technologies) certified under the ONC Health IT Certification Program that meets the 2015 Edition Base EHR definition, or subsequent Base EHR definition (as defined at 45 CFR 170.102) and has been certified to the ONC health IT certification criteria, as adopted and updated in 45 CFR 170.315-

(i) For CY 2019 through CY 2026, at 45 CFR 170.315(a)(12) (family health history) and 45 CFR 170.315(e)(3)

(patient health information capture); and

(ii) Necessary to report on applicable objectives and measures specified for MIPS including the following:

(A) For CY 2019 through CY 2026, the applicable measure calculation certification criterion at 45 CFR 170.315(g)(1) or (2) for all certification criteria that support a meaningful use objective with a percentage-based measure.

(B) Clinical quality measure certification criteria that support the calculation and reporting of clinical quality measures at 45 CFR 170.315(c)(2) and (c)(3), and for CY 2019 through CY 2026, optionally (c)(4), and can be electronically accepted by CMS.''

In the CY 2027 PFS proposed rule (91 FR 44171), we noted that the proposed modifications would be effective on January 1, 2027, which aligns with the effective date of ONC's proposal to remove such ONC health IT certification criteria from the Code of Federal Regulations as proposed in the HTI–5 proposed rule. With the proposed modifications to the definition of CEHRT, a MIPS eligible clinician's EHR technology would no longer be required to meet the ONC health IT certification criteria at 45 CFR 170.315(a)(12), (e)(3), (g)(1), or (g)(2), the ONC health IT certification criteria at 45 CFR 170.315(c)(4) would no longer be included as optional in paragraph (2)(ii)(B), and paragraph (2)(ii)(B) would reference the entirety of the certification criterion at 45 CFR 170.315(c)(3) in the definition of CEHRT at 42 CFR 414.1305. All other remaining ONC health IT certification criteria included in the definition of CEHRT would continue to be a requirement for a MIPS eligible clinician's EHR technology. In the CY 2027 PFS proposed rule (91 FR 44171), we noted that there is a similar proposal to remove certain ONC health IT certification criteria from the definition of CEHRT for the Medicare Promoting Interoperability Program for eligible hospitals and critical access hospitals (CAHs) in the ''Medicare Program; Hospital Inpatient Prospective Payment Systems for Acute Care Hospitals (IPPS) and the Long-Term Care Hospital Prospective Payment System and Policy Changes and Fiscal Year (FY) 2027 Rates; Requirements for Quality Programs; and Other Policy Changes'' (FY 2027 IPPS/LTCH PPS) proposed rule (91 FR 19620 through 19621).

We requested public comment on the proposal to modify the definition of CEHRT.

We received public comment on the proposal. The following is a summary of the comments we received and our responses.

Comment: Many commenters supported the proposal to modify the definition of CEHRT in the MIPS Promoting Interoperability performance category to align with the applicable ONC health IT certification criteria proposed for removal and revisions in the HTI–5 proposed rule. Several of such commenters supported that the modifications to the definition of CEHRT would ensure consistency and alignment between agencies. A few commenters supported that these modifications would remove outdated or duplicative requirements when functionalities have become embedded in the health IT infrastructure. A commenter indicated that streamlining the definition of CEHRT can reduce administrative burden while allowing CMS and ONC to focus certification requirements on capabilities that meaningfully advance interoperability and patient care.

Response: We appreciate the support from commenters.

Comment: Several commenters did not support the proposal to modify the definition of CEHRT in the MIPS Promoting Interoperability performance category to align with the applicable ONC health IT certification criteria that are proposed to be removed and revised in the HTI–5 proposed rule. A few commenters did not support the proposal to remove the references in the definition of CEHRT to the health IT certification criteria for ''automated numerator recording'' at 45 CFR 170.315(g)(1) and ''automated measure calculation'' at 45 CFR 170.315(g)(2) from the definition of CEHRT. A few commenters opposed removing such health IT certification criteria because CMS still requires measures (such as ''Provide Patients Electronic Access'') that depend on the capabilities associated with the health IT certification criteria. A few commenters stated that removal of these criteria without a clearly defined plan for measure calculation may introduce inconsistency, data errors, inaccurate scores, cost and administrative burden, and increased audit risk for MIPS eligible clinicians, particularly smaller and less resourced practices. A commenter requested that CMS coordinate closely with ONC to develop standardized calculation guidance, updated specifications, and a cohesive transition strategy. A commenter recommended that if CMS were to finalize removal of such health IT certification criteria, CMS should also remove the corresponding mandatory reporting requirements for MIPS eligible clinicians. Another commenter recommended that CMS should commit to not establishing future measures requiring numerator and denominator data.

Response: Health IT developers seeking to support customers participating in the MIPS Promoting Interoperability performance category will still need to support reporting of numerators and denominators for certain measures, including the Electronic Prescribing measure and Providing Patients Electronic Access to Their Health Information measure. However, ONC has stated that removing the health IT certification criteria at 45 CFR 170.315(g)(1) and 45 CFR 170.315(g)(2) would reduce administrative burden for health IT developers associated with testing and certifying such functionality without impacting reporting requirements for the MIPS Promoting Interoperability performance category. Thus, we do not agree with the concerns from commenters regarding potential burden from CMS continuing to require measures that require the capabilities associated with the ''automated numerator recording'' and ''automated measure calculation'' certification criteria.

In regard to concerns from commenters pertaining to calculation errors and accountability, we note that the proposed revisions to the definition of CEHRT do not affect current functionality; we have not proposed changes to measures with numerator and denominator calculations that would prompt configuration changes. Therefore, we recommend that MIPS eligible clinicians work closely with their vendors to ensure that current functionality is retained. Also, we note that MIPS eligible clinicians already have a responsibility to ensure the accuracy of their reported values. Using EHR technology certified to particular ONC health IT certification criteria is not sufficient to meet the responsibility to ensure accuracy of reported values due to the risk of local configuration errors.

Additionally, we note that while this functionality originally helped to ensure standardized approaches to reporting, health IT developers have gained time and experience with measures under the program since the certification criteria in § 170.315(g)(1) and § 170.315(g)(2) were added to the definition of CEHRT. We believe that health IT developers will continue to ensure that patients or actions included in a measure's numerator are recorded in a fashion that supports accurate calculation to meet CMS requirements without needing to

certify their health IT products to § 170.315(g)(1) or § 170.315(g)(2). MIPS eligible clinicians may continue to use a separate, non-certified system such as when supported by a qualified registry, a QCDR, or other third-party intermediary to calculate numerators and denominators and to generate reports on the measures. We will continue to work closely with ONC to ensure consistency in specifications and accuracy in reporting methodologies, and we intend to include details in this respect in future measure specification documents.

Lastly, we do not agree with commenters requesting CMS to remove measures that require numerator and denominator data or limit the addition of such measures in the future given that such measures assess important aspects of interoperability.

Comment: A few commenters did not support the proposal to remove the ''family health history,'' ''patient health information capture,'' and ''clinical quality measures—filter'' ONC health IT certification criteria from the definition of CEHRT; the commenters indicated that there is no guarantee such functionalities would continue to be offered within health IT products. The commenters expressed concern that the removal of such ONC health IT certification criteria supporting such measures or reporting requirements could potentially result in inconsistent CEHRT performance or risks to patient safety.

Response: We believe that the longstanding presence of the ''family health history'' health IT certification criterion at 45 CFR 170.315(a)(12) and ''patient health information capture'' health IT certification criterion at 45 CFR 170.315(e)(3) in the ONC Health IT Certification Program and their incorporation into the MIPS Promoting Interoperability performance category requirements means that the functionality reflected in these criteria is already embedded in certified health IT and is widely available and used by MIPS eligible clinicians. In conjunction with ONC, we believe that the functionality associated with the ''clinical quality measures—filter'' health IT certification criterion at 45 CFR 170.315(c)(4) is not likely to be removed from health IT systems (90 FR 60988).

In conjunction with ONC, we anticipate that removing the ''family health history'' ONC health IT certification criterion will have minimal impact on data consistency or patient safety because, as noted by ONC, it is expected that many developers of certified health IT will continue to conform to the Systematized Nomenclature of Medicine—Clinical Terms® (SNOMED CT) US Edition standard and the functionality to code family health history with such standard would likely remain in certified health IT adopted by hospitals and physicians (90 FR 60982). Moreover, we believe that updates to the United States Core Data for Interoperability (USCDI) in USCDI v6 demonstrate ONC's commitment to the exchange of family health history information using the SNOMED CT US Edition standard.[398] We note that while USCDI v6 has not been adopted in regulation at this time, it may be considered for adoption in future rulemaking. Of note, USCDI v6 has been approved by the National Coordinator for use under the Standards Version Advancement Process (SVAP), which means health IT developers may voluntarily incorporate this standard into Certified Health IT Modules.[399]

Regarding the patient health information capture criterion, the capabilities described in the criterion are widely implemented and used in health IT at this time, as noted by ONC (90 FR 60991) and we believe these capabilities will remain in health IT products even if the corresponding criterion is removed from the definition of CEHRT. ONC noted that removing the criterion from the Certification Program could spur greater development and innovation in this area and specified that there are other certification criteria that support patient engagement, such as the ''view, download, and transmit to 3rd party'' and ''standardized API for patient and population services'' ONC health IT certification criteria (90 FR 60991). ONC has seen developers integrate the functionality in the patient health information capture certification criterion as part of other patient engagement features, such as patient portals.

Regarding the ''clinical quality measures—filter'' ONC health IT certification criterion, the optional designation within the definition of CEHRT for the MIPS Promoting Interoperability performance category has led to limited ONC certification to the health IT certification criterion. However, as noted by ONC (91 FR 60988), health IT systems have widely adopted these capabilities and we believe that systems will continue to retain the functionality without the ONC health IT certification criterion for such functionality and without the optional designation within the definition of CEHRT.

Accordingly, we anticipate that the functionalities of the ''family health history data,'' ''patient health information capture,'' and ''clinical quality measures—filter'' ONC health IT certification criteria will remain available to clinicians through their health IT without the presence of health IT certification criteria in the definition of CEHRT; and thus, we believe that the definition of CEHRT does not need to include such ONC health IT certification criteria. We will continue to monitor and analyze feedback from clinician users to ascertain whether health IT developers are continuing to support these capabilities within their products.

Comment: A few commenters recommended that CMS delay the modification of the definition of CEHRT. A few other commenters recommended that CMS wait until ONC finalizes the HTI–5 proposed rule prior to modifying the definition of CEHRT to support consistency and predictability in compliance across HHS programs. A few commenters recommended that CMS coordinate with ONC to ensure providers have sufficient time to implement changes (including workflow redesign, testing, and implementation) and recommended that both CMS and ONC provide 24 months for transitioning certification criteria after updates are made.

Response: We thank commenters for their recommendations; however, we do not agree with commenters regarding a delay in modifying the definition of CEHRT. The proposed modifications are consistent with the timelines outlined in the HTI–5 proposed rule and HTI–5 final rule (90 FR 60970 through 61034; and 91 FR 67916 through 67998). In the CY 2027 PFS proposed rule (91 FR 44170), we stated that we do not believe that finalizing, as proposed, the modifications to the definition of CEHRT are contingent upon the final actions from ONC regarding its proposals to remove and revise health IT certification criteria as proposed in the HTI–5 proposed rule. As identified in Table C–G 1 of this final rule, ONC finalized, as proposed, its proposals in the HTI–5 final rule with respect to health IT certification criteria in 45 CFR 170.315(a)(12), (e)(3), (g)(1), (g)(2), (c)(3), and (c)(4) (91 FR 67928, 91 FR 67950, 91 FR 67957, 91 FR 67958, 91 FR 67944, and 91 FR 67945, respectively). Regarding concerns that MIPS eligible clinicians would not have sufficient time for implementation, we reiterate

[398] *See https://isp.healthit.gov/sites/default/files/2026-07/2026%20Standards%20for%20Approval_508.pdf.*

[399] *See https://isp.healthit.gov/united-states-core-data-interoperability-uscdi#uscdi-v6.*

that the proposed modifications to the definition of CEHRT have the effect of removing, rather than adding, requirements with respect to the definition of CEHRT. Therefore, we do not expect any new implementation requirements to arise from these proposed removals that would require additional time for health IT developers and their customers to achieve compliance.

Comment: A commenter requested additional clarification from CMS regarding which certification requirements are expected to change, the anticipated timeline for implementation, and which actions eligible clinicians and organizations will need to take to remain compliant.

Response: For a summary of the changes to the ONC health IT certification criteria proposed in the HTI–5 proposed rule and policies finalized in the HTI–5 final rule, we refer readers to Table C–G 1 of this final rule. The modifications to the definition of CEHRT for the MIPS Promoting Interoperability performance category will be effective as of the published date of this final rule. We encourage MIPS eligible clinicians to work closely with their vendors to ensure that the necessary functionalities are retained to meet remaining MIPS requirements.

Comment: A commenter requested for CMS to ensure that the proposed modifications to the definition of CEHRT would not shift new implementation burden onto MIPS eligible clinicians in rural and low-resourced areas.

Response: We recognize the potential challenges that may be faced by smaller and under-resourced MIPS eligible clinicians and are committed to continuing to receive feedback and explore ways to offer support where possible. We will continue to work closely with ONC to ensure consistency, flexibility, and stability of our policies, and to closely monitor for any unintended consequences to MIPS eligible clinicians participating in the MIPS Promoting Interoperability performance category.

Comment: A few commenters requested CMS to coordinate with ONC on implementation of ONC health IT certification criteria. A few commenters encouraged coordination to ensure certified EHR technology can facilitate the transition to digital quality measurement. Because some practices may still need to support the underlying functionality of the certification criteria, a few commenters recommended coordination across CMS programs and with ONC so that MIPS eligible clinicians and health IT developers receive consistent and clear guidance on what functionalities remain necessary for MIPS reporting as well as to ensure standardized calculation guidance, updated specifications, and a cohesive transition strategy.

Response: We will continue to work closely with ONC and across CMS programs to ensure consistency in specifications and accuracy in reporting methodologies, to identify opportunities for technical support that will facilitate the transition away from ONC certification of these functionalities, and to help ensure that any changes to CEHRT-related requirements are clearly communicated in a manner that supports readiness among health IT developers and MIPS eligible clinicians. We will also continue to work closely with ONC to align health IT regulations where applicable, reduce administrative burden when feasible, incentivize the reliable exchange of data, and minimize any unintentional consequences of these changes.

Comment: A few commenters recommended that CMS and ONC establish ongoing monitoring to identify whether health IT developers discontinue the functions associated with the removed certification criteria, impose new costs, or shift implementation and workflow burden to MIPS eligible clinicians in other ways. A commenter only supported the removal of the ''family health history'' and ''patient health information capture'' health IT certification criteria from the definition of CEHRT if CMS and ONC first establish enforceable safeguards ensuring the capabilities remain available to MIPS eligible clinicians.

Response: We note that ONC expects that health IT developers will continue to retain these capabilities in their Health IT Modules despite the absence of certification criteria (90 FR 60982, 60988, 60991,60994, 60995) as the functionalities are already fully embedded in certified health IT and are widely available and used by MIPS eligible clinicians. We understand commenters' concerns regarding the potential for health IT vendors to monetize or reduce support for these important capabilities and encourage MIPS eligible clinicians to consider these capabilities when reviewing their EHR technology purchase options with health IT vendors and during contract negotiations. Also, we note that if the main effect of the policy is to decrease the certification and testing burden of health IT developers, the removal of the references to these criteria in the definition of CEHRT by itself should not cause health IT developers to make changes to their products or otherwise expend development resources that could result in added costs for customers. Nevertheless, we agree that ongoing monitoring of the effects of the removal of these criteria is necessary, and we will continue to work with ONC to do so.

Regarding concerns pertaining to the modifications to the definition of CEHRT that may shift burden to MIPS eligible clinicians, we note that the removal of health IT certification criteria from the definition of CEHRT decreases CEHRT requirements for MIPS eligible clinicians. We believe that the underlying functionalities of the removed health IT certification criteria will continue to exist within EHR systems.

After consideration of public comment, we are finalizing, as proposed, the proposal to amend the definition of CEHRT, specified as ''Certified electronic health record technology (CEHRT)'' in § 414.1305, by modifying paragraphs (2)(i), (2)(i)(A), and (2)(i)(B). The finalized, as proposed, revised text will read as follows:

''Certified electronic health record technology (CEHRT) [. . .]

(2) For 2019 and subsequent years, EHR technology (which could include multiple technologies) certified under the ONC Health IT Certification Program that meets the 2015 Edition Base EHR definition, or subsequent Base EHR definition (as defined at 45 CFR 170.102) and has been certified to the ONC health IT certification criteria, as adopted and updated in 45 CFR 170.315-

(i) For CY 2019 through CY 2026, at 45 CFR 170.315(a)(12) (family health history) and 45 CFR 170.315(e)(3) (patient health information capture); and

(ii) Necessary to report on applicable objectives and measures specified for MIPS including the following:

(A) For CY 2019 through CY 2026, the applicable measure calculation certification criterion at 45 CFR 170.315(g)(1) or (2) for all certification criteria that support a meaningful use objective with a percentage-based measure.

(B) Clinical quality measure certification criteria that support the calculation and reporting of clinical quality measures at 45 CFR 170.315(c)(2) and (c)(3), and for CY 2019 through CY 2026, optionally (c)(4), and can be electronically accepted by CMS.''

We note that there is a similar finalized, as proposed, policy to remove certain ONC health IT certification criteria from the definition of CEHRT for the Medicare Promoting Interoperability

Program for eligible hospitals and critical access hospitals (CAHs) in the FY 2027 IPPS/LTCH PPS final rule (91 FR 50029 through 50035).

(c) Removing ONC Direct Review and ONC-Authorized Certification Bodies (ACB) Surveillance Attestations

(i) Background

In the CY 2017 Quality Payment Program final rule, we finalized policies to support MIPS eligible clinicians in ONC health IT surveillance and direct review activities through requiring two attestations, specifically, the ONC Direct Review attestation and the ONC-Authorized Certification Bodies (ACB) Surveillance attestation (81 FR 77019 through 77028). The purpose of ONC surveillance and direct review is to provide greater assurance that health IT meets certification requirements not only in a controlled testing environment, but also when used by health care providers in actual production environments (80 FR 62707). When such attestations were finalized as requirements for the MIPS Promoting Interoperability performance category (formerly the advancing care information performance category) in the CY 2017 Quality Payment Program final rule, we intended for the attestations to complement and strengthen recent updates to ONC's ability to perform surveillance and direct review activities.

Specifically, in October 2015, ONC finalized the 2015 Edition Health Information Technology (Health IT) Certification Criteria, 2015 Edition Base Electronic Health Record (EHR) Definition, and ONC Health IT Certification Program Modifications final rule, which added requirements for ONC–ACBs to conduct more frequent and more rigorous surveillance of certified technology and capabilities in the field (80 FR 62707). Additionally, in October 2016, ONC published the ONC Health IT Certification Program: Enhanced Oversight and Accountability final rule, which established regulatory processes to facilitate ONC's direct review and evaluation of the performance of certified health IT in certain circumstances (81 FR 72406 through 72407). In the CY 2017 Quality Payment Program final rule, we determined that surveillance and direct review activities provided greater assurance to health care providers that their certified EHR technology would perform in a manner that meets their expectations, but that such surveillance and direct review would not be effective unless health care providers cooperated with such activities, including by granting access to and assisting ONC–ACBs and ONC to observe the performance of production systems (81 FR 77020).

In § 414.1375(b)(3)(i)(A), we require an attestation that acknowledges the requirement to cooperate in good faith with ONC direct review of his or her health IT certified under the ONC Health IT Certification Program if a request to assist in ONC direct review is received. A MIPS eligible clinician must attest that he or she, if requested, cooperated in good faith with ONC direct review of his or her health IT certified under the ONC Health IT Certification Program as authorized by 45 CFR part 170, subpart E, to the extent that such technology meets (or can be used to meet) the definition of CEHRT, including by permitting timely access to such technology and demonstrating its capabilities as implemented and used by the MIPS eligible clinician in the field. Also, we specified at § 414.1375(b)(3)(i)(B) an optional attestation that acknowledges the option to cooperate in good faith with ONC–ACB surveillance of his or her health IT certified under the ONC Health IT Certification Program if a request to assist in ONC–ACB surveillance is received. A MIPS eligible clinician may attest that he or she, if requested, cooperated in good faith with ONC–ACB surveillance of his or her health IT certified under the ONC Health IT Certification Program as authorized by 45 CFR part 170, subpart E, to the extent that such technology meets (or can be used to meet) the definition of CEHRT, including by permitting timely access to such technology and demonstrating its capabilities as implemented and used by the MIPS eligible clinician in the field.

The ONC Direct Review attestation is a required element of the MIPS Promoting Interoperability performance category. Submitting a ''Yes'' response is the only means to fulfill the requirement of the attestation. If a MIPS eligible clinician submits a ''No'' response or does not submit any attestation for the ONC Direct Review attestation, the MIPS eligible clinician will receive a score of zero for the MIPS Promoting Interoperability performance category. The ONC–ACB Surveillance attestation is optional. A MIPS eligible clinician can submit a ''Yes'' or ''No'' response or not submit any attestation for the ONC–ACB Surveillance attestation, which would not impact a MIPS eligible clinician's score for the MIPS Promoting Interoperability performance category. In the CY 2027 PFS proposed rule, we referred readers to the discussion regarding the scoring implications for the proposal to remove the required ONC Direct Review attestation and optional ONC–ACB Surveillance attestation (91 FR 44191).

(ii) Removing the ONC Direct Review and ONC–ACB Surveillance Attestations Beginning With the CY 2026 Performance Period/2028 MIPS Payment Year

In the CY 2027 PFS proposed rule, we proposed to remove the required ONC Direct Review attestation and the optional ONC–ACB Surveillance attestation in § 414.1375(b)(3)(i)(A) and (B), respectively, beginning with the CY 2026 performance period/2028 MIPS payment year to reduce administrative burden (91 FR 44172). For the CY 2026 performance period, we noted in the CY 2027 PFS proposed rule that MIPS eligible clinicians would not be reporting on such attestations until the applicable submission period, which starts on January 1, 2027 (91 FR 44172). Given that the two attestations are reported during the applicable submission period, we determined that it would be feasible for CMS to implement and operationalize such modifications to the MIPS Promoting Interoperability performance category requirements prior to the start of the submission period associated with the CY 2026 performance period. As noted in the CY 2027 PFS proposed rule, we continue to recognize the importance of ONC direct review and ONC–ACB surveillance activities and consider such mechanisms important for mitigating issues with health IT products that may pose serious risks to public health or safety, and we continue to collaborate with ONC to support the ONC Health IT Certification Program (91 FR 44172). As stated in the CY 2017 Quality Payment Program final rule (81 FR 77020), efforts to strengthen surveillance and direct review of certified health IT are critical to the success of HHS programs and initiatives that require the use of certified health IT to improve health care quality and the efficient delivery of care. In the CY 2027 PFS proposed rule, we noted that we do not anticipate a change in commitment from ONC and the ONC–ACBs toward such goals (91 FR 44172).

While ONC–ACB surveillance and ONC direct review activities remain important to being a user of certified health IT, we no longer consider the administrative step of attesting to cooperating and/or participating in such activities to be necessary. Since 2016 (1 year prior to the enactment of MACRA, in which the MIPS Promoting Interoperability performance category replaced the Medicare EHR Incentive

Program for eligible professionals), the ONC–ACB surveillance and ONC direct review activities and processes have become known to MIPS eligible clinicians and as a result, the value of participation has become evident without dependence on an ongoing need to conduct annual attestations. Therefore, the administrative burden associated with such attestations outweighs their value compared to when they were originally adopted.

The proposal to remove the required ONC Direct Review attestation and optional ONC–ACB Surveillance attestation aligns with the goals of reducing administrative burden while simultaneously focusing on high-value, outcome-oriented measures. Specifically, the removal of such attestations from the MIPS Promoting Interoperability performance category requirements provides an opportunity to reduce the number of discrete manual steps and reporting fields required for successful adherence to reporting requirements without diminishing the integrity or central goals of the MIPS Promoting Interoperability performance category. Although we proposed to remove such attestations, we strongly encouraged MIPS eligible clinicians to continue participating in the surveillance and direct review processes when assistance is requested by ONC or an ONC–ACB. In the CY 2027 PFS proposed rule, we noted that CMS would continue to support surveillance and direct review activities, as appropriate (91 FR 44172).

In the CY 2027 PFS proposed rule, we proposed to amend § 414.1375(b)(3)(i) by modifying the requirements to include a specific allotted timeframe (CY 2017 performance period/2019 MIPS payment year through CY 2025 performance period/2027 MIPS payment year) for requiring the reporting of attestations pertaining to the ONC Direct Review attestation and ONC–ACB Surveillance attestation (91 FR 44172). Specifically, we proposed to amend § 414.1375(b)(3)(i) as follows: ''Supporting providers with the performance of CEHRT (SPPC). To engage in activities related to supporting providers with the performance of CEHRT beginning with the 2019 MIPS payment year through the 2027 MIPS payment year, the MIPS eligible clinician—. . .'' We proposed to remove the required ONC Direct Review attestation and the optional ONC–ACB Surveillance attestation beginning with the CY 2026 performance period/2028 MIPS payment year to reduce burden. Additionally, in the CY 2027 PFS proposed rule (91 FR 44172) we noted that if the proposal to remove the ONC Direct Review attestation and ONC–ACB Surveillance attestation is finalized as proposed, for the CY 2026 performance period/2028 MIPS payment year, MIPS eligible clinicians would not, in the case of the ONC Direct Review attestation, be required to report on such attestation, and in the case of the ONC–ACB Surveillance attestation, have the option of reporting on such attestation during the applicable submission period (January 1, 2027, through March 1, 2027). We noted that the removal of such attestations would not affect a MIPS eligible clinician's score for the MIPS Promoting Interoperability performance category for the CY 2026 performance period/2028 MIPS payment year, respectively. In the CY 2027 PFS proposed rule (91 FR 44172), we noted that the proposals to remove the ONC Direct Review attestation and optional ONC–ACB Surveillance attestation align with the same policies for the Medicare Promoting Interoperability Program as proposed in the FY 2027 IPPS/LTCH PPS proposed rule (91 FR 19621 through 19622).

We requested public comment on this proposal.

We received public comment on this proposal. The following is a summary of the comments we received and our responses.

Comment: Many commenters supported the proposal to remove the required ONC Direct Review attestation and the optional ONC–ACB Surveillance attestation beginning with the CY 2026 performance period/2028 MIPS payment year. Many of these commenters suggested that removal of these attestations would reduce burden and eliminate measures of limited value, and a few commenters noted that this reduced burden will allow more time and resources for MIPS eligible clinicians to dedicate to patient care and meaningful interoperability efforts. A commenter noted that this removal would align with the same finalized policy in the FY 2027 IPPS/LTCH PPS final rule.

Response: We appreciate the support from commenters.

Comment: A few commenters provided recommendations about the removal of the required ONC Direct Review attestation and the optional ONC–ACB Surveillance attestation beginning with the CY 2026 performance period/2028 MIPS payment year. A few commenters recommended CMS maintain strong interoperability oversight, encourage voluntary cooperation with ONC review activities, give vendors time to update scoring tools, and clarify how third-party intermediaries should handle attestations already collected for the CY 2026 performance period/2028 MIPS payment year without requiring retroactive changes.

Response: We will continue to work with ONC to support direct review and surveillance activities. Please note that although we proposed to remove these attestations, we strongly encourage MIPS eligible clinicians to continue participating in these activities when requested. We recognize that MIPS eligible clinicians may have already been preparing to submit data for the MIPS Promoting Interoperability performance category for the CY 2026 performance period/2028 MIPS payment year, which previously included the submission of an attestation for the required ONC Direct Review attestation and the optional ONC–ACB Surveillance attestation. Also, we recognize that the proposal to removal the required ONC Direct Review attestation and the optional ONC–ACB Surveillance attestation for the CY 2026 performance period/2028 MIPS payment year conflicts with the previously established policy that required MIPS eligible clinicians to submit an attestation for the required ONC Direct Review attestation and when applicable, the submission of an attestation for the optional ONC–ACB Surveillance attestation. However, we believe that the removal of the required ONC Direct Review attestation and the optional ONC–ACB Surveillance attestation starting with the CY 2026 performance period/2028 MIPS payment year reduces the requirements and burden under MIPS Promoting Interoperability performance category. To facilitate understanding and minimize potential confusion regarding the requirements for the MIPS Promoting Interoperability performance category for the CY 2026 performance period/2028 MIPS payment year, we intend to update the CY 2026 MIPS Promoting Interoperability performance category, disseminate a listserv announcing the reduction in requirements, and implement a technical function in the Quality Payment Program system alerting submitters that attestations pertaining to the ONC Direct Review attestation and ONC–ACB Surveillance attestation cannot be included in a submitted file for the CY 2026 performance period/2028 MIPS payment year if the submission includes such attestations.

As finalized, these attestations would no longer be required for the CY 2026 performance period/2028 MIPS payment year. We believe that the removal of the ONC Direct Review attestation and ONC–ACB Surveillance

attestation would not cause any harm or create undue burden for MIPS eligible clinicians who have already prepared for the submission of such attestations or already collected data for such attestations for the CY 2026 performance period/2028 MIPS payment year. To prepare the submission file for the CY 2026 performance period/2028 MIPS payment year that will be submitted to meet the reporting requirements, the file will need to exclude the ONC Direct Review attestation and ONC–ACB Surveillance attestation; otherwise, an alert will be prompted by the Quality Payment Program system indicating that a file submission cannot include the ONC Direct Review attestation and the ONC–ACB Surveillance attestation, in which the file will need to be resubmitted without such attestations. For MIPS eligible clinicians who manually report data in the Quality Payment Program System, they will not be able to submit a response for the ONC Direct Review attestation or the ONC–ACB Surveillance attestation given that the Quality Payment Program system will not include options to select the ONC Direct Review attestation or the ONC–ACB Surveillance attestation.

Comment: A commenter, while noting their support for removal, also shared their belief that removal will not meaningfully reduce compliance obligations and would require updating infrastructure to align with updated requirements.

Response: CMS acknowledges there is burden in meeting these reporting requirements, and as a result, CMS decided to remove the burden associated with the MIPS Promoting Interoperability performance category measures. However, we recognize that some MIPS eligible clinicians may have already prepared for the submission of such attestations or already collected data for such attestations. To prepare the submission file for the CY 2026 performance period/2028 MIPS payment year that will be submitted to meet the reporting requirements, the file will need to exclude the ONC Direct Review attestation and ONC–ACB Surveillance attestation; otherwise, an alert will be prompted by the Quality Payment Program system indicating that a file submission cannot include the ONC Direct Review attestation and the ONC–ACB Surveillance attestation, in which the file will need to be resubmitted without such attestations. For MIPS eligible clinicians who manually report data in the Quality Payment Program System, they will not be able to submit a response for the ONC Direct Review attestation or the ONC–ACB Surveillance attestation given that the Quality Payment Program system will not include options to select the ONC Direct Review attestation or the ONC–ACB Surveillance attestation.

Comment: A commenter noted their support for the proposed removal of the ONC Direct Review and ONC–ACB Surveillance attestations but requested that CMS state the effective date for removal of the attestations, including identifying both the performance period affected and the submission period in which the change takes effect.

Response: We appreciate the support from the commenter. We note that the effective date for removal of the ONC Direct Review and ONC–ACB Surveillance attestations would be the date of publication of the CY 2027 PFS final rule, and would be in effect for the remaining portion of the CY 2026 performance period/2028 MIPS payment year. The data submission period for the CY 2026 performance period/2028 MIPS payment year is January 1, 2027, through March 31, 2027.

After consideration of public comment, we are finalizing, as proposed, the proposal to remove the required ONC Direct Review attestation and the optional ONC–ACB Surveillance attestation in § 414.1375(b)(3)(i)(A) and (B), respectively, beginning with the CY 2026 performance period/2028 MIPS payment year. We note that the finalized, as proposed, policy to remove the ONC Direct Review attestation and optional ONC–ACB Surveillance attestation aligns with the same finalized, as proposed, policy for the Medicare Promoting Interoperability Program as proposed in the FY 2027 IPPS/LTCH PPS final rule (91 FR 50036).

We refer readers to Table C–G 2, Table C–G 3, and Table C–G 6 in sections IV.A.4.d.(4)(g)(i) and IV.A.4.d.(4)(g)(ii)(D) of this final rule for information regarding the reporting requirements and scoring methodology of the MIPS Promoting Interoperability performance category for the CY 2026 performance period/2028 MIPS payment year. The CY 2025 performance period/2027 MIPS payment year will be the last performance period/MIPS payment year in which the ONC required Direct Review attestation and optional ONC–ACB Surveillance attestation will be included under the MIPS Promoting Interoperability performance category.

(d) Removing Security Risk Analysis Measure

(i) Background

The HIPAA Security Rule [400] (45 CFR part 160 and subparts A and C of part 164) contains, among other things, the administrative safeguards that covered entities and business associates (45 CFR 164.308) must implement, such as the standard and implementation specifications for security management processes. Among such safeguards are implementation specifications that require covered entities and business associates to conduct an accurate and thorough assessment of the potential risks and vulnerabilities to the confidentiality, integrity, and availability of electronic protected health information (ePHI) that is created, received, used or maintained by a covered entity or its business associate (45 CFR 164.308(a)(1)(ii)(A)). Safeguards also include implementing security measures sufficient to reduce risks and vulnerabilities to a reasonable and appropriate level to comply with the general requirements of the HIPAA Security Rule at 45 CFR 164.306(a).

Ensuring the privacy and security of ePHI is essential for demonstrating meaningful use of CEHRT (90 FR 49871). Since 2010, we adopted and maintained the Security Risk Analysis measure based on the HIPAA Security Rule risk analysis requirement in 45 CFR 164.308(a)(1)(ii)(A) for the Medicare EHR Incentive Program for Eligible Professionals,[401] the predecessor to the MIPS Promoting Interoperability performance category.[402] In the CY 2017 Quality Payment Program final rule (81 FR 77219 through 77220), we adopted the Protect Patient Health Information objective for the MIPS Promoting Interoperability performance category and included the Security Risk Analysis measure within this objective. We

[400] On January 6, 2025, the U.S. Department of Health and Human Services published the HIPAA Security Rule to Strengthen the Cybersecurity of Electronic Protected Health Information proposed rule (90 FR 898). The proposed rule has not been finalized as of the publication of this final rule.

[401] Medicare and Medicaid Programs: Electronic Health Record Incentive Program final rule (75 FR 44368 and 44369); established at 42 CFR 495.6(d)(15)(ii).

[402] Section 101(b) of the Medicare Access and CHIP Reauthorization Act of 2015 (MACRA) sunset the Medicare EHR Incentive Program for Eligible Professionals, set forth at section 1848(o) of the Act. As discussed previously, section 1848(o)(2) of the Act has been incorporated into the MIPS Promoting Interoperability performance category's requirements via section 1848(q)(2)(B)(iv) of the Act. *See* CY 2017 Quality Payment Program final rule (81 FR 77018 and 77019) for more information regarding the sunsetting of the Medicare EHR Incentive Program for Eligible Professionals.

subsequently modified this measure in the CY 2019 PFS final rule (83 FR 59789 through 59790) and the CY 2026 PFS final rule (90 FR 49870 through 49874).

As described in the CY 2026 PFS final rule, the MIPS Promoting Interoperability Security Risk Analysis measure requires MIPS eligible clinicians to attest ''Yes'' to having conducted security risk management and attest ''Yes'' to having conducted or reviewed a security risk analysis as required by the HIPAA Security Rule (90 FR 49870 through 49874).

(ii) Removing the Security Risk Analysis Measure Beginning With the CY 2027 Performance Period/2029 MIPS Payment Year

In the CY 2027 PFS proposed rule, we proposed to remove the Security Risk Analysis measure beginning with the CY 2027 performance period/2029 MIPS payment year to reduce reporting burden (91 FR 44172 through 44174). The HIPAA Security Rule (45 CFR part 160 and subparts A and C of part 164) contains, among other requirements, the administrative safeguards that covered entities and business associates (45 CFR 164.308) must implement, such as the standard and implementation specifications for security risk analysis and risk management processes. The administrative safeguards also require implementation of security measures sufficient to reduce risks and vulnerabilities to a reasonable and appropriate level to comply with the general requirements of the HIPAA Security Rule at 45 CFR 164.306.

Given that MIPS eligible clinicians are covered entities under the HIPAA Security Rule and the requirements of the Security Risk Analysis measure derive from the HIPAA Security Rule requirements, removal of the Security Risk Analysis measure will not weaken any cybersecurity requirements for MIPS eligible clinicians. When the Security Risk Analysis measure was adopted in the CY 2017 Quality Payment Program final rule, we determined that requiring an attestation regarding certain HIPAA Security Rule requirements promoted awareness of these requirements among MIPS eligible clinicians (81 FR 77219 through 77220).

However, as discussed in the CY 2027 PFS proposed rule (91 FR 44172 through 44174), we considered the ongoing applicability of the measure given its longstanding presence in the MIPS Promoting Interoperability performance category and the established awareness of HIPAA Security Rule requirements among MIPS eligible clinicians. In the assessment of whether it remained appropriate to maintain the Security Risk Analysis measure in the MIPS Promoting Interoperability performance category, we considered the extent to which the measure continues to advance the measure's intended goals relative to the costs associated with the continued use of the measure. As asserted in the CY 2027 PFS proposed rule (91 FR 44173), we believe that such costs include not only the burden associated with reporting the requisite attestations, but also the costs associated with administering and maintaining the measure within the MIPS Promoting Interoperability performance category. Such costs may include, but are not limited to the following: clinician burden associated with information collection and submission; clinician burden associated with complying with overlapping programmatic and regulatory requirements, including the HIPAA Security Rule; and CMS resources associated with oversight, maintenance, education, and operational support for the measure. In the case of the Security Risk Analysis measure, due to the underlying security risk analysis and risk management activities are already required under the HIPAA Security Rule, we noted in the CY 2027 PFS proposed rule (91 FR 44173) that it may be unnecessarily costly and of limited incremental benefit to retain this measure where its continued inclusion no longer meaningfully advances the objectives of the MIPS Promoting Interoperability performance category beyond the separate regulatory requirements that already apply. For such reasons, we believe removal of the Security Risk Analysis measure at this juncture would balance the goals of reducing unnecessary administrative burden, maintaining a parsimonious and meaningful measure set, and preserving the focus of the MIPS Promoting Interoperability performance category on high-value measures that more directly support program objectives. We rely on our federal partner, the HHS Office for Civil Rights, to administer and enforce compliance with the HIPAA Security Rule requirements that MIPS eligible clinicians may otherwise be subject to.

The proposal aligns with our goals of reducing administrative burden while simultaneously focusing on high-value, outcome-oriented measures. Specifically, the removal of the Security Risk Analysis measure from the MIPS Promoting Interoperability performance category provides an opportunity to reduce the number of discrete manual steps and reporting fields required for successful adherence to reporting requirements without diminishing the integrity or central goals of the MIPS Promoting Interoperability performance category. Although we proposed to remove the Security Risk Analysis measure, we reminded MIPS eligible clinicians to continue to conduct security risk analysis and security risk management to safeguard ePHI as required under the HIPAA Security Rule (91 FR 44173). We anticipate that MIPS eligible clinicians will continue to conduct security risk analysis and security risk management activities to comply with the requirements pertaining to the security of ePHI that is created, received, used, or maintained by a covered entity or its business associate in accordance with the HIPAA Security Rule.

Retirement of the Security Risk Analysis measure from the MIPS Promoting Interoperability performance category beginning with the CY 2027 performance period/2029 MIPS payment year would reduce burden by removing the attestation requirement and supporting a more parsimonious and outcomes-oriented measure set. Specifically, in the CY 2027 PFS proposed rule, we proposed at § 414.1375(b)(2)(ii)(A) to specify a limited timeframe, through the 2028 MIPS payment year for which a MIPS eligible clinician would be required to report that they completed the actions included in the Security Risk Analysis measure during the year in which the performance period occurs (91 FR 44174).

We requested public comment on this proposal.

We received public comment on the proposal. The following is a summary of the comments we received and our responses.

Comment: Many commenters supported the proposal to remove the Security Risk Analysis measure beginning with the CY 2027 performance period/2029 MIPS payment year. Many of these commenters supported removal of the Security Risk Analysis measure because they believed it would reduce administrative burden and remove duplicative requirements as MIPS eligible clinicians are already bound by other privacy and security statutes and regulations such as the HIPAA Security Rule to perform security risk analysis. A few commenters also believed that removal of the Security Risk Analysis measure would allow providers to have more time and resources to focus on patient care and meaningful interoperability efforts. A commenter recommended that CMS continue

providing the 'reminder' in QPP educational materials that MIPS eligible clinicians must safeguard electronic patient health information as required under the HIPAA Security Rule.

Response: We appreciate the support from commenters. We will consider the feedback on communicating MIPS eligible clinicians' obligations to safeguard electronic patient health information.

Comment: A few commenters recommended the removal of the Security Risk Analysis measure to be sooner than the proposed CY2027 performance period/2029 MIPS payment year, but starting with the CY 2026 performance period/2028 MIPS payment year to accelerate reduction of burden and program simplification.

Response: We do not agree with the commenters suggestion to remove the Security Risk Analysis measure starting with the CY 2026 performance period/ 2028 MIPS payment year. With the CY 2026 performance period already underway, MIPS eligible clinicians are currently completing or have completed the actions required for the Security Risk Analysis measure given that requirements must be completed during the year in which the performance period occurs, unlike the ONC Direct Review and ONC–ACB Surveillance attestations, which do not always require specific actions to have already been completed during the performance period when attesting to participate in applicable ONC-related activities. Thus, we believe that removing the Security Risk Analysis measure starting with the CY 2027 performance period/2029 MIPS payment year is appropriate.

Comment: Many commenters requested clarification and confirmation that removing the Security Risk Analysis measure and relying on use of CEHRT does not remove clinicians' obligations to perform security risk analysis and risk management activities to support strong cybersecurity practices and meet obligations under the HIPAA Security Rule on emerging generative AI technologies. A commenter expressed the opinion that removing the measure does not meaningfully reduce MIPS eligible clinicians' burden.

Response: We acknowledge that MIPS eligible clinicians will still need to meet the requirements in the HIPAA Security Rule. However, requiring MIPS eligible clinicians to report the Security Risk Analysis measure provides little incremental benefit compared to the associated costs and, therefore, we have decided to remove the requirement that MIPS eligible clinicians report the Security Risk Analysis measure. While MIPS eligible clinicians will continue to have the underlying obligation to assess security risk based on the requirements in the HIPAA Security Rule, we believe that removing the Security Risk Analysis measure from the MIPS Promoting Interoperability performance category reduces burden by eliminating MIPS-specific reporting and attestation requirements.

Comment: A few commenters requested that CMS align requirements across other programs, coordinate with other agencies on security risk analysis including U.S. Department of Health and Human Services, Office for Civil Rights and ONC, and monitor requirements of the HIPAA Security Rule.

Response: We strive to align program requirements across applicable federal programs, if appropriate. Also, we intend to continue our efforts to coordinate with other CMS programs and federal offices and agencies involved in cybersecurity and security risk assessment and mitigation.

Comment: A few commenters expressed the view that CMS should limit the year-to-year measure changes, which may create confusion and add administrative burden, and provide sufficient advance notice before changing or removing a security measure to allow MIPS eligible clinicians time to adjust their processes.

Response: While we agree that minimizing annual measures updates provides stability to MIPS eligible clinicians, we must also balance stability with being responsive to emerging technologies, including generative AI and agentic tools integrated into EHRs that process ePHI, are posing new security concerns and must be continuously monitored. We will continue to work across federal programs and with other federal agencies and will, to the best of our ability, provide as much advance notice as possible before changes take effect.

Comment: A few commenters opposed the proposal to remove the Security Risk Analysis measure due to increasing cybersecurity incidents in the healthcare industry, the delay in finalizing the new HIPAA Security Rule, and the lack of specificity in the HIPAA requirements around the frequency of performing a security risk analysis. A commenter shared a belief that the benefits of maintaining the Security Risk Analysis measure outweigh the burdens of reporting. Another commenter recommended revisiting removal once the HIPAA Security Rule is finalized and considering working with ONC to develop an alternative mechanism for MIPS eligible clinicians to report variations in expected operations of CEHRT to perform secure health information exchange, especially in the absence of ONC health IT certification criteria that validate functionality critical to CEHRT.

Response: We are aware of emerging cybersecurity concerns and will rely on MIPS eligible clinicians meeting the requirements of the HIPAA Security Rule, without the additional MIPS Promoting Interoperability performance category security analysis measure. Removal of the Security Risk Analysis measure from the MIPS Promoting Interoperability performance category does not remove the underlying security obligations applicable to MIPS eligible clinicians under the HIPAA Security Rule and such requirements continue to apply independent of MIPS requirements, regardless of whether updates to the HIPAA Security Rule are finalized. Additionally, while some commenters expressed concern that HIPAA does not provide specificity around the frequency of performing a security risk analysis, we note that risk analysis is an ongoing process and that retaining the MIPS measure would not address frequency as the measure is a simple annual attestation. We continue to believe that removing the measure reduces unnecessary MIPS reporting, documentation, and audit burden while preserving existing security obligations under HIPAA. We will continue to monitor to determine if additional requirements in this area are needed to supplement other federal regulatory requirements, and if necessary, will discuss in future rulemaking.

After consideration of public comment, we are finalizing, as proposed, the proposal to remove the Security Risk Analysis measure beginning with the CY 2027 performance period/2029 MIPS payment year.

We refer readers to Table C–G 2, Table C–G 4, Table C–G 6, and Table C–G 8 in sections IV.A.4.d.(4)(g)(i), IV.A.4.d.(4)(g)(ii)(D), and IV.A.4.d.(4)(g)(iv) of this final rule for more information regarding the reporting requirements and scoring methodology of the MIPS Promoting Interoperability performance category beginning with the CY 2027 performance period/2029 MIPS payment year, which includes the finalization of the proposal as proposed to remove the Security Risk Analysis measure.

Also, we refer readers to section IV.A.4.d.(4)(g)(ii)(B) of this final rule for the discussion regarding the scoring implications associated with the removal of the Security Risk Analysis measure.

(e) Adopting a New Electronic Prior Authorization for Prescription Drugs Measure Beginning With the CY 2028 Performance Period/2030 MIPS Payment Year

(i) Background

Under section 1848(o)(2)(A) of the Act, the MIPS Promoting Interoperability performance category assesses whether MIPS eligible clinicians use CEHRT in a meaningful manner. By statute, such demonstration includes the use of electronic prescribing as determined to be appropriate by the Secretary. The MIPS Promoting Interoperability performance category has therefore included measures related to electronic prescribing since its inception (75 FR 44337; and 81 FR 77229 through 77237). Separately from the MIPS Promoting Interoperability performance category, we have also advanced the adoption of electronic prescribing through authority under section 1860D–4(e) of the Act, which requires that prescriptions for covered Medicare Part D drugs transmitted electronically comply with a uniform transaction standard specified by CMS. Under the same authority under section 1860D–4(e) of the Act, we also generally require that Schedule II, III, IV, and V controlled substances under Medicare Part D and Medicare Advantage prescription drug plans be prescribed electronically in accordance with an electronic prescription drug program. That required standard includes transactions for the electronic prior authorization of Part D-covered drugs prescribed to Part D-eligible individuals (85 FR 86827 through 86832 and 89 FR 51242 through 51247).

Historically, the ONC Health IT Certification Program and the Part D Program have maintained complementary policies of aligning ONC health IT certification criteria and associated standards related to electronic prescribing, medication history, and electronic prior authorization for prescriptions (89 FR 51257). In successive rules supporting the ONC Health IT Certification Program, ONC has adopted the National Council for Prescription Drugs Program (NCPDP) SCRIPT standard as the required exchange standard for the electronic prescribing certification criterion at 45 CFR 170.315(b)(3). In the ''Medicare Program; Medicare Prescription Drug Benefit Program; Health Information Technology Standards and Implementation Specifications'' final rule (89 FR 51242 through 51247), the Part D Program finalized at § 423.160(b)(1) the requirement that Part D sponsors, prescribers and dispensers, when electronically transmitting prescriptions and prescription-related information for covered Part D drugs for Part D eligible individuals, must comply with the standard in 45 CFR 170.205(b). Taken in conjunction with the standards and expiration date adopted by ONC in the same rule (89 FR 51258 through 51259), § 423.160(b)(1) will require Part D sponsors, prescribers and dispensers to use NCPDP SCRIPT standard version 2023011, which ONC adopted at 45 CFR 170.205(b)(2), beginning January 1, 2028, and expire NCPDP SCRIPT standard version 2017071, which ONC previously adopted at 45 CFR 170.205(b)(1) as of January 1, 2028. The NCPDP SCRIPT standard version 2023011 includes enhancements to support electronic prescribing and transmission of prescription-related and electronic prior authorization information.

On April 14, 2026, the ''Medicare and Medicaid Programs; Patient Protection and Affordable Care Act; Interoperability Standards and Prior Authorization for Drugs for Medicare Advantage Organizations, Medicaid Managed Care Plans, State Medicaid Agencies, Children's Health Insurance Program (CHIP) Agencies and CHIP Managed Care Entities, and Issuers of Qualified Health Plans on the Federally-Facilitated Exchanges'' (2026 CMS Interoperability Standards and Prior Authorization for Drugs) proposed rule was published and introduced proposals that require Medicare Advantage organizations, state Medicaid and CHIP FFS programs, Medicaid managed care plans, CHIP managed care entities, and Qualified Health Plans offered on the Federally-facilitated Exchanges (collectively ''impacted payers'') to support certain exchange standards for the electronic prior authorization of prescription drugs (91 FR 19890 through 20062). We proposed that, beginning on October 1, 2027, impacted payers be required to support electronic prior authorization for all drugs that require prior authorization. Two separate sets of standards were proposed for payers to facilitate electronic prior authorization for drugs: three NCPDP standards (NCPDP SCRIPT Standard,© NCPDP Formulary and Benefit (F&B) Standard,© and NCPDP Real-Time Prescription Benefit (RTPB) Standard©) for prescription drugs covered under a pharmacy benefit; and six Fast Healthcare Interoperability Resources® (FHIR®) standards including the HL7 FHIR Da Vinci—Coverage Requirements Discovery (CRD) Implementation Guide (IG), the HL7 FHIR Da Vinci—Documentation Templates and Rules (DTR) IG, the HL7 FHIR Da Vinci—Prior Authorization Support (PAS) IG) for prescription drugs covered under a medical benefit.

Concurrent with other CMS efforts to promote standards-based electronic prior authorization, the MIPS Promoting Interoperability performance category has placed increasing emphasis on prior authorization through its adoption of the Electronic Prior Authorization measure (89 FR 8909 through 8927) as established in the ''Medicare and Medicaid Programs; Patient Protection and Affordable Care Act; Advancing Interoperability and Improving Prior Authorization Processes for Medicare Advantage Organizations, Medicaid Managed Care Plans, State Medicaid Agencies, Children's Health Insurance Program (CHIP) Agencies and CHIP Managed Care Entities, Issuers of Qualified Health Plans on the Federally-Facilitated Exchanges, Merit-Based Incentive Payment System (MIPS) Eligible Clinicians, and Eligible Hospitals and Critical Access Hospitals in the Medicare Promoting Interoperability Program'' (2024 CMS Interoperability and Prior Authorization) final rule. In the CY 2027 PFS proposed rule, we noted that the Electronic Prior Authorization measure assesses MIPS eligible clinicians on the use of a Prior Authorization application programming interface (API) to request prior authorization for medical items and services (91 FR 44174 and 44175). However, we noted that the measure does not assess the use of electronic prior authorization for prescription drugs, in part because the Prior Authorization API requirements finalized in the 2024 CMS Interoperability and Prior Authorization final rule excluded prescription drugs (89 FR 8918).

(ii) Adopting Electronic Prior Authorization for Prescription Drugs Measure

Across the healthcare industry, a majority of prior authorizations for prescription drugs covered under a pharmacy benefit remain a separate manual process outside of the EHR workflow, not connected to e-prescribing, and could cause major points of friction and delay in the prescribing and prior authorization workflow. In 2023, approximately 38 percent of prescription drug prior authorizations were fully electronic and 15 percent were fully manual, indicating continuing capacity for

improvement in the domain.[403] This current level of adoption of electronic prior authorization for prescription drugs contributes to a reliance on payer portals and manual processes, including processes based on phone, or fax, which are entirely outside the EHR and that may delay patients' access to needed medications, increase administrative complexity for clinicians and staff, and undermine the efficiency and clinical value of electronic prescribing. As more payers support standardized electronic prior authorization, we have determined that measuring the use of prior authorization for prescription drugs will be a valuable addition to our assessment of meaningful use of CEHRT under the MIPS Promoting Interoperability performance category. Standards-based electronic prior authorization should improve timeliness and transparency of medication access by facilitating information-gathering and tracking of prior authorization status within clinician EHR workflows to support care coordination and help close the prescriber-to-dispenser loop. Thus, we believe that incorporating electronic prior authorization for prescription drugs is an appropriate aspect of demonstrating meaningful use of CEHRT by MIPS eligible clinicians.

Action in this area is further supported by longstanding efforts to promote standards adoption for prescription-related transactions under the Part D Program and the ONC Health IT Certification Program. As previously noted, CMS and ONC have maintained complementary policies aligning electronic prescribing and prescription-related standards at 42 CFR 423.160(b)(1) for Part D transactions and 45 CFR 170.315(b)(3) for the ONC Health IT Certification Program. Health IT developers also have experience with the underlying transaction standards because of their use in Part D transactions. Therefore, we believe that MIPS eligible clinicians and their health IT vendors have a foundation to implement the functionality for a new measure and thus, we proposed the adoption of a new measure, Electronic Prior Authorization for Prescription Drugs, in the CY 2027 PFS proposed rule (91 FR 44174 through 44176).

We proposed to adopt the new measure, Electronic Prior Authorization for Prescription Drugs, for the MIPS Promoting Interoperability performance category beginning with the CY 2028 performance period/2030 MIPS payment year (91 FR 44176). As noted in the CY 2027 PFS proposed rule, we intend for the new Electronic Prior Authorization for Prescription Drugs measure to be included in the Health Information Exchange objective for the MIPS Promoting Interoperability performance category to emphasize the role of prior authorization in promoting care coordination and collocate the new measure in the same objective as the previously adopted Electronic Prior Authorization measure (91 FR 44175). The new Electronic Prior Authorization for Prescription Drugs measure aims to assess a MIPS eligible clinician's utilization of standards-based electronic prior authorization. In the CY 2027 PFS proposed rule, we proposed for the specifications of the Electronic Prior Authorization for Prescription Drugs measure to be as follows (91 FR 44175):

- *Measure Description:* For at least one prescription drug ordered by the MIPS eligible clinician during the performance period for which prior authorization is required, the prior authorization is requested electronically using CEHRT.
- *Reporting Requirements:* ''Yes''/''No'' response.
- *Exclusion:* Any MIPS eligible clinician who—

++ Does not prescribe drugs that require prior authorization during the applicable performance period;

++ Only prescribes drugs requiring prior authorization where the payer does not support the specified electronic prior authorization standard during the applicable performance period; or

++ Prescribes fewer than 100 permissible prescription drugs during the performance period.

We noted in the CY 2027 PFS proposed rule that the last exclusion matches an exclusion in the Electronic Prescribing measure (91 FR 44175). For this exclusion, ''permissible prescriptions'' means all drugs that meet the current definition of a prescription as ordered by a MIPS eligible clinician to dispense a drug that would not be dispensed without such order. ''Permissible prescriptions'' may include electronic prescriptions of controlled substances where creation of an electronic prescription for the medication is feasible using CEHRT and where allowable by state and local law. Additionally, for purposes of this exclusion, permissible prescriptions include any prescription, not only those requiring prior authorization. To successfully report this measure, MIPS eligible clinicians must submit a ''Yes'' response, in which they are affirmatively attesting to having requested prior authorization electronically using CEHRT for at least one prescription drug ordered by the MIPS eligible clinician during the performance period or (if applicable) claim an exclusion. We expect that once a MIPS eligible clinician has the capability of requesting prior authorization electronically, MIPS eligible clinician will do so more frequently, though we did not propose to measure frequency of use at this time with this initial version of the measure. The new measure will apply to prescription drugs covered under a pharmacy benefit, as functionally defined by whether prior authorization can be requested for the drug can be authorized using the NCPDP SCRIPT standard.

The proposal to use CEHRT for the measure would require use of health IT certified to the ONC health IT certification criteria at 45 CFR 170.315(b)(3)—''Electronic prescribing'' and at 45 CFR 170.315(b)(4)—''Real-time prescription benefit'' to support any electronic prior authorization requests used to satisfy this measure. Use of both ''electronic prescribing'' and ''real-time prescription benefit'' ONC health IT certification criteria ensures that MIPS eligible clinicians use standards-based capabilities within their health IT systems to successfully complete the measure. Beginning January 1, 2028, the specified standards within the certification criteria in 45 CFR 170.315(b)(3) and 45 CFR 170.315(b)(4) will be the same versions of the NCPDP SCRIPT Standard and NCPDP RTPB Standard, respectively, required for Medicare Part D sponsors and to be required for other impacted payers in the 2026 CMS Interoperability Standards and Prior Authorization for Drugs proposed rule (91 FR 19925 through 19927). For purposes of the new Electronic Prior Authorization for Prescription Drugs measure, ''requested electronically'' means initiating and submitting an electronic prior authorization request from within CEHRT using health IT certified under 45 CFR 170.315(b)(3) and 45 CFR 170.315(b)(4). Using health IT certified to the ''real-time prescription benefit'' ONC health IT certification criterion in 45 CFR 170.315(b)(4) allows a MIPS eligible clinician to ascertain the patient-specific out-of-pocket cost of a prescription drug, the cost of suitable alternatives, compare prescription costs at different pharmacies, and learn whether prior authorization for a specific prescription drug is required.

The 2026 CMS Interoperability Standards and Prior Authorization for Drugs proposed rule also proposed that impacted payers support the NCPDP

[403] For more information, *see: https://www.caqh.org/hubfs/Issue%20Briefs/CAQH_Insights_NCPDP_SCRIPT_Issue_Brief.pdf.*

F&B standard (91 FR 19925 and 19926). We are not including this standard as part of required CEHRT for this measure at this juncture. However, we believe that the NCPDP F&B standard complements the NCPDP SCRIPT and RTPB standards certification criteria for Health IT Modules in 45 CFR 170.315(b)(3) and 45 CFR 170.315(b)(4), respectively, and we encourage MIPS eligible clinicians to use the F&B standard functions within their EHRs as part of an electronic prior authorization workflow as well.

We noted in the CY 2027 PFS proposed rule that adoption of the new Electronic Prior Authorization for Prescription Drugs measure is not contingent upon the finalization of the proposals in the 2026 CMS Interoperability Standards and Prior Authorization for Drugs proposed rule (91 FR 44176). We also noted that the new Electronic Prior Authorization for Prescription Drugs measure includes an exclusion for cases in which no applicable payer supports the specified electronic prior authorization standard (91 FR 44176).

Electronic prior authorization requests for prescription drugs covered under a pharmacy benefit, which would leverage the NCPDP SCRIPT Standard and NCPDP RTPB Standard, are often for those prescription drugs dispensed at a retail pharmacy. We recognize that other prescription drugs may be covered under a medical benefit and are usually administered or dispensed by a medical provider in a health care setting. Those drugs covered under a medical benefit generally use FHIR-based electronic prior authorization processes, such as those supported by the Da Vinci CRD, DTR, and PAS implementation guides finalized under ONC health IT certification criteria, and therefore, are not in scope for the new Electronic Prior Authorization for Prescription Drugs measure. A MIPS eligible clinician that only needs prior authorization for prescription drugs covered under a medical benefit and not a pharmacy benefit would be eligible to claim an exclusion for not ordering an applicable prescription drug during the performance period.

For purposes of the new Electronic Prior Authorization for Prescription Drugs measure, ''one prescription drug ordered by the MIPS eligible clinician'' includes a new prescription and, where applicable, a prescription renewal or refill request that generates a prior authorization requirement at the time of prescribing. A prescription drug ''for which prior authorization is required'' is one for which the applicable payer rules indicate a prior authorization requirement at the point of prescribing for the patient and plan. In the CY 2027 PFS proposed rule, we indicated that we believe the NCPDP F&B Standard would help inform MIPS eligible clinicians when a prior authorization is required or not, even if not a mandate of the Electronic Prior Authorization for Prescription Drugs measure. We recognized that coverage for certain prescription drugs may fall under either the pharmacy or medical benefit and would continue to consider future policies to reduce workflow fragmentation across prior authorization approaches (91 FR 44176). In the CY 2027 PFS proposed rule, we requested public comment with a Request for Information (RFI) on the potential to expand the scope of the Electronic Prior Authorization measure to include prescription drugs covered under a medical benefit (91 FR 44182).

In the CY 2027 PFS proposed rule, we proposed that the Electronic Prior Authorization for Prescription Drugs measure would require an attestation of ''Yes'' or ''No'' response from a MIPS eligible clinician (*91 FR 44175 and 44176*). Beginning with the CY 2028 performance period/2030 MIPS payment year, a MIPS eligible clinician would be required to submit a ''Yes'' response for the measure or claim an applicable exclusion in order to earn a score for the MIPS Promoting Interoperability performance category. If a MIPS eligible clinician submits a ''No'' response for the measure, fails to submit any attestation, or does not claim an applicable exclusion for the Electronic Prior Authorization for Prescription Drugs measure, the MIPS eligible clinician would receive a score of zero for the MIPS Promoting Interoperability performance category (weighted at 25 percent of the MIPS final score), and would not be considered a meaningful EHR user for purposes of the MIPS Promoting Interoperability performance category for an applicable performance period.

In the CY 2027 PFS proposed rule, we proposed that the measure would initially require an attestation of a ''Yes'' or ''No'' response to allow MIPS eligible clinicians to gain familiarity with electronic prior authorization for prescription drugs and measure reporting (91 FR 44175 and 44176). We anticipate a future conversion of the Electronic Prior Authorization for Prescription Drugs measure to numerator/denominator reporting once standardized data capture and reporting have further progressed. We noted that we would monitor the measure's feasibility and consider updates, including volume-based thresholds or rate-based scoring, to ensure the measure reflects meaningful use at scale (91 FR 44176).

We requested public comment on the proposal.

We received public comment on the proposal. The following is a summary of the comments we received and our responses.

Comment: Many commenters supported the proposal to add the new Electronic Prior Authorization for Prescription Drugs measure as a required measure in the MIPS Promoting Interoperability performance category beginning with the CY 2028 performance period/2030 MIPS payment year. Several commenters highlighted the potential for standardized electronic prior authorization for prescription drugs to reduce administrative burden and delays and to improve patients' timely access to needed medications. A few commenters noted that electronic prior authorization for prescription drugs could improve care coordination, efficiency, and patient experience. A commenter noted that the new measure would align with the adoption of NCPDP SCRIPT standards supporting electronic prior authorization.

Response: We appreciate the support from commenters regarding the proposal to establish the new Electronic Prior Authorization for Prescription Drugs measure. We agree with commenters that use of standards-based electronic prior authorization for prescription drugs covered under a pharmacy benefit has the potential to reduce administrative burden and delays, support more timely patient access to needed medications, and improve care coordination and workflow efficiency. We believe the proposed new measure would help advance adoption of interoperable electronic prior authorization capabilities among MIPS eligible clinicians and other entities involved in the prescription-drug prior authorization process.

Comment: Many commenters did not support the proposal to establish the new Electronic Prior Authorization for Prescription Drugs measure as a required measure beginning with the CY 2028 performance period/2030 MIPS payment year. Several commenters expressed concern that the Electronic Prior Authorization for Prescription Drugs measure could become mandatory before standardized electronic prior authorization capabilities and workflows are sufficiently mature and have demonstrated meaningful value for MIPS eligible clinicians and patients. The commenters indicated that premature implementation of the

Electronic Prior Authorization for Prescription Drugs measure could result in additional administrative and financial burden. A few commenters questioned the need for a mandatory measure, noting that MIPS eligible clinicians already have incentives to adopt electronic prior authorization due to its potential to streamline prior authorization workflows and reduce associated administrative burden.

Response: We appreciate the feedback regarding the readiness of electronic prior authorization capabilities and workflows for prescription drugs, as well as the potential burden associated with implementing a new required measure. While we recognize the potential burden associated with the new required measure, we believe that the benefits of the measure outweigh the potential burdens and that finalizing, as proposed, to adopt the Electronic Prior Authorization for Prescription Drugs measure will advance use of standards-based electronic prior authorization for prescription drugs covered under a pharmacy benefit, which has the potential to reduce reliance on manual and portal-based processes and support more timely and transparent prior authorization workflows. Also, we believe that MIPS eligible clinicians and health IT vendors will have sufficient time to build an infrastructure, test, and prepare for the implementation of the Electronic Prior Authorization for Prescription Drugs measure requirements during the entirety of CY 2027 and the permissibility of continuing preparation into CY 2028. We intend for the adoption of the Electronic Prior Authorization for Prescription Drugs measure as a required measure beginning with the CY 2028 performance period/2030 MIPS payment year to strike an appropriate balance between providing stakeholders time to prepare for implementation and advancing broader adoption of electronic prior authorization for prescription drugs in a timely manner. The proposed start date allows a meaningful period for continued development, testing, and workflow integration while also supporting the objectives of the MIPS Promoting Interoperability performance category to advance interoperable, standards-based electronic exchange.

MIPS eligible clinicians and health IT developers will have a foundation for implementation through the NCPDP SCRIPT and Real-Time Prescription Benefit (RTPB) standards. CMS previously finalized requirements for Medicare Part D sponsors, prescribers, and dispensers to use specified NCPDP SCRIPT standards when electronically transmitting prescriptions, including for electronic prior authorization transactions, as well as requirements for Part D sponsors to implement a real-time benefit tool using the RTPB standard (42 CFR 423.160).

In addition, the measure includes an exclusion for MIPS eligible clinicians for whom no applicable payer supports the specified electronic prior authorization standard. The measure is structured as an attestation measure and merely requires a MIPS eligible clinician to electronically request prior authorization for one applicable prescription drug during the performance period to satisfy the measure. While MIPS eligible clinicians may already have business and clinical incentives to use electronic prior authorization for prescription drugs, we do not believe those incentives alone have been sufficient to drive widespread, consistent adoption of standards-based electronic prior authorization workflows and we believe that a measure under the MIPS Promoting Interoperability performance category will encourage further uptake.

Comment: Many commenters recommended delaying or phasing implementation of the Electronic Prior Authorization for Prescription Drugs measure. Other commenters requested the Electronic Prior Authorization for Prescription Drugs measure be optional and eligible for bonus points for the CY 2028 performance period/2030 MIPS payment year to encourage early adoption and implementation experience and then transition the Electronic Prior Authorization for Prescription Drugs measure to be required beginning with CY 2029 performance period/2031 MIPS payment period or other future performance period. A few commenters noted that allowing for an optional reporting period prior to requiring the measure would be consistent with phased approaches used to introduce other Promoting Interoperability measures in previous years. Several commenters specifically requested delaying mandatory reporting until the CY 2029 performance period/2031 MIPS payment period at the earliest. Commenters generally noted that a delayed or phased approach would provide additional time for payers, health IT developers, and MIPS eligible clinicians to implement and test electronic prior authorization capabilities, integrate them into clinical workflows, and gain implementation experience before mandatory measure reporting begins. A few commenters recommended that CMS consider the timing of payer implementation requirements when determining when to require the Electronic Prior Authorization for Prescription Drugs measure, expressing concern that payers and health IT developers may not have sufficient time to implement and test the necessary capabilities. A commenter recommended that this new measure remains voluntary during the transition year if CMS finalizes policies to increase the performance threshold or require MVP participation in the same performance year.

Response: We intend for the adoption of the Electronic Prior Authorization for Prescription Drugs measure as a required measure beginning with the CY 2028 performance period/2030 MIPS payment year to strike an appropriate balance between providing stakeholders time to prepare for implementation and advancing broader adoption of electronic prior authorization for prescription drugs in a timely manner. The proposed start date allows a meaningful period for continued development, testing, and workflow integration while also supporting the objectives of the MIPS Promoting Interoperability performance category to advance interoperable, standards-based electronic exchange.

While we have previously used phased approaches (for example, establishing an initial optional reporting period prior to requiring a measure) when introducing new measures or policies, we do not believe an initial optional reporting period is necessary for the Electronic Prior Authorization for Prescription Drugs measure and we note that an optional approach could lead to uneven adoption and slow progress toward more standardized use of electronic prior authorization processes for prescription drugs. Establishing the Electronic Prior Authorization for Prescription Drugs measure as required beginning with the CY 2028 performance period/2030 MIPS payment year will promote more consistent implementation across stakeholders and encourage movement away from manual prior authorization processes. We believe adoption of the Electronic Prior Authorization for Prescription Drugs measure can incentivize adoption of practices that reduce inefficiency and potential delays in patient access to medications.

We do not believe it is necessary to delay implementation of the new Electronic Prior Authorization for Prescription Drugs measure beyond the CY 2028 performance period/2030 MIPS payment year to align with payer compliance dates proposed in the 2026 CMS Interoperability Standards and Prior Authorization for Drugs proposed

rule (91 FR 19890). We note the proposed October 1, 2027, compliance date for impacted payers to support electronic prior authorization for prescription drugs precedes the implementation of the new measure beginning with the CY 2028 performance period/2030 MIPS payment year. However, adoption of this measure is not contingent on finalization of the proposals in the 2026 CMS Interoperability Standards and Prior Authorization for Drugs proposed rule. The new Electronic Prior Authorization for Prescription Drugs measure promotes the use of existing electronic prior authorization workflows for prescription drugs, which are already supported through established standards and are not dependent on the FHIR-based Prior Authorization API requirements for medical items and services. CMS also has previously existing requirements for Part D sponsors, prescribers, and dispensers to use specified NCPDP SCRIPT standards for electronic prescription drug prior authorization (42 CFR 423.160). These requirements build upon previously established electronic prior authorization standards and provide a standards-based foundation for implementation of this measure.

Additionally, this measure is intended to align with the implementation of the Electronic Prior Authorization measure relating to medical services and items as it becomes a required measure beginning with the CY 2028 performance period/2030 MIPS payment year. The simultaneous and in tandem implementation of the new Electronic Prior Authorization for Prescription Drugs measure and the Electronic Prior Authorization measure as required measures will encourage expansive adoption of electronic prior authorization.

We note that the MIPS performance threshold has been finalized with no increases until CY 2028 performance period/2030 MIPS payment year (90 FR 49918). Additionally, we refer readers to section IV.A.3.c. of this final rule for discussion of the proposed policy regarding the sunset of traditional MIPS, which has been finalized with a modification to delay implementation. Regardless, potential changes to the MIPS performance threshold, MVP participation policies and other policies, are separate policy topics that do not, in our view, justify making the Electronic Prior Authorization for Prescription Drugs measure optional.

Comment: Many commenters expressed concerns about ecosystem readiness to support the Electronic Prior Authorization for Prescription Drugs measure. Several commenters noted that standardized electronic prior authorization capabilities and workflows for prescription drugs are not yet widely available or sufficiently mature, with functionality varying across payers, health IT developers, and clinical practice settings. Several commenters noted that MIPS eligible clinicians' ability to successfully use electronic prior authorization for prescription drugs depends on the readiness and functionality of payers, health IT developers, pharmacy benefit managers, pharmacies, and other entities outside of their control. Several commenters also stressed that availability of electronic prior authorization functionality alone does not automatically demonstrate readiness and highlighted the need for functionality to be fully operational, integrated into clinical workflows, and tested end-to-end across participating entities. Several commenters recommended that CMS assess and monitor payer, health IT developer, and MIPS eligible clinician readiness to inform implementation of the measure. Commenters also noted that inconsistent adoption across the ecosystem could require MIPS eligible clinicians to maintain multiple workflows. A few commenters additionally raised concerns about the affordability of available technology, implementation costs, and differences in readiness across practice settings (such as small, independent, rural, and safety-net practices). A commenter recommended that CMS accompany the measure with enforceable expectations for health insurance plans and pharmacy benefit managers such as response timeframes and patient protections.

Response: We believe the previously established Medicare Part D requirements for use of specified NCPDP SCRIPT and RTPB standards for electronic prescribing and prescription-related transactions that support electronic prior authorization (42 CFR 423.160) provide a reasonable foundation for implementation beginning with the CY 2028 performance period. The measure's limited attestation requirement further supports implementation by requiring only one qualifying electronic prior authorization request during the performance period. Additionally, this measure, as proposed, includes exclusions that provide flexibility for MIPS eligible clinicians who may face challenges meeting the measure's requirements, including accommodation for where an applicable payer does not support the specified electronic prior authorization standard.

By requiring the Electronic Prior Authorization for Prescription Drugs measure, we intend to promote coordinated readiness across stakeholders to ensure that workflows become operational. Establishing the Electronic Prior Authorization for Prescription Drugs measure will encourage continued progress toward broader implementation and workflow integration across the ecosystem. Over time, increased use of standardized electronic prior authorization has the potential to reduce reliance on fragmented and duplicative workflows and better support interoperability goals. We will continue to work to align with ONC and other agencies regarding requirements for health IT developers, health insurance plans, and pharmacy benefit managers. We intend to assess implementation experience, and broader industry progress as the Electronic Prior Authorization for Prescription Drugs measure is implemented, and we will consider whether future refinements are warranted through rulemaking.

Additionally, we acknowledge the concerns from commenters regarding the affordability of available technology, implementation costs, and the spectrum of readiness across practice settings such as small, independent, rural, and safety-net practices. We intend to monitor the availability of technology, implementation challenges, and readiness across various practice settings, including small, independent, rural, and safety-net practices.

Comment: Several commenters emphasized the importance of aligning CEHRT requirements for the Electronic Prior Authorization for Prescription Drugs measure with broader CMS and HHS interoperability and prior authorization policies, including aligning clinician and payer requirements around common underlying standards to support consistent implementation across clinicians, payers, and health IT developers. A few commenters recommended for CMS to maintain consistency across programs, including the MIPS Promoting Interoperability performance category and Medicare Promoting Interoperability Program, to minimize differences in measure requirements, specifications, and implementation timelines, and prevent clinicians from being subject to different electronic prior authorization requirements across programs. Some commenters specifically requested for the proposal to align with ONC-certified health IT and standards-based

functionality. A commenter requested that CMS finalize the underlying standards requirements in related rulemaking before adopting the Electronic Prior Authorization for Prescription Drugs measure. A commenter recommended preserving established NCPDP standards for pharmacy-benefit transactions while promoting interoperability with emerging FHIR-based standards, emphasizing the importance of a coordinated approach that avoids disrupting established workflows as standards and program requirements evolve.

Response: We agree with the comment regarding the alignment with ONC-certified health IT and applicable standards-based functionality as it is important to support successful implementation and to minimize avoidable differences in technical and operational expectations across the industry. We recognize the importance of promoting consistency across CMS programs, where appropriate, to reduce burden. The NCPDP SCRIPT and Real-Time Prescription Benefit standards supporting the health IT certification criteria specified for the new Electronic Prior Authorization for Prescription Drugs measure align with standards required for Medicare Part D sponsors (42 CFR 423.160) and proposed for adoption by other impacted payers under the 2026 CMS Interoperability Standards and Prior Authorization for Drugs proposed rule (91 FR 19925 through 19927), supporting consistent standards-based electronic prior authorization capabilities across MIPS eligible clinicians, health IT developers, and payers.

However, we note that differences across programs may sometimes reflect distinct statutory authorities, program structures, or policy objectives. We agree that established standards, such as NCPDP standards, play an important role in current workflows and at the same time recognize the growing importance of newer approaches such as FHIR-based standards. We intend to continue seeking alignment across CMS programs and with broader federal interoperability efforts, to the extent feasible, as implementation proceeds.

Comment: Several commenters recommended expanding or strengthening the proposed exclusions and other protections for MIPS eligible clinicians who are unable to successfully report the Electronic Prior Authorization for Prescription Drugs measure due to circumstances outside their control. A few commenters recommended that such protections account for circumstances in which required electronic prior authorization capabilities are unavailable, nonfunctional, or not operationally implemented or integrated due to payer or health IT developer readiness limitations. A few commenters also raised concerns about the burden and practical challenges associated with determining and documenting whether a MIPS eligible clinician qualifies for an exclusion and recommended simplifying this process, such as through standardized reasons for not being able to meet the measure successfully or CMS-provided information on payer support for applicable electronic prior authorization standards.

Response: We note that the policies already available under the MIPS Promoting Interoperability performance category, including existing exclusion policies where applicable, and the significant hardship exception for the MIPS Promoting Interoperability performance category, provide important safeguards for MIPS eligible clinicians who are unable to meet requirements due to circumstances beyond their control. These policies are intended to provide flexibility in cases where a MIPS eligible clinician cannot reasonably comply with the MIPS Promoting Interoperability performance category requirements. We do not believe it would be practical to base exclusions on a CMS-maintained list of payer support for applicable electronic prior authorization standards because payer readiness may vary over time and across products, markets, and vendors. We believe that the current MIPS exclusion framework provides a more consistent approach. We intend to assess implementation experience, payer and health IT readiness, technological advancements, and the availability of ONC-certified health IT as this measure is operationalized, including issues related to the availability and functionality of electronic prior authorization capabilities.

Comment: Commenters provided mixed feedback on the proposed attestation based measure design for the Electronic Prior Authorization for Prescription Drugs measure. Several commenters supported the proposed attestation-based format for the initial measure design, noting that a percentage or frequency-based measure could potentially penalize MIPS eligible clinicians for payer limitations outside their control, particularly when their patient populations are covered by payers that do not yet fully support electronic prior authorization. Several commenters recommended that CMS transition to a numerator/denominator, performance-based approach as electronic prior authorization adoption and measure reporting capabilities mature. These commenters stated that a performance-based approach could better measure routine, integrated use of electronic prior authorization across applicable prescribing workflows. A commenter encouraged CMS to adopt numerator/denominator reporting as soon as feasible.

Response: We appreciate commenters' feedback on the proposed Electronic Prior Authorization for Prescription Drugs measure design. Beginning with an initial attestation based approach is appropriate because it allows MIPS eligible clinicians to gain familiarity with electronic prior authorization for prescription drugs and measure reporting while standardized data capture and reporting capabilities continue to develop. We also recognize that MIPS eligible clinicians may encounter variation in payer support for electronic prior authorization. The Electronic Prior Authorization for Prescription Drugs measure includes an exclusion for MIPS eligible clinicians who only prescribe drugs requiring prior authorization from payers that do not support the specified electronic prior authorization standard during the applicable performance period.

As implementation of the Electronic Prior Authorization for Prescription Drugs measure matures and more consistent data are available to support reliable performance measurement, we will continue to assess whether updating to a numerator/denominator-based approach is feasible and appropriate in future rulemaking.

Comment: Several commenters requested additional clarification regarding the technical requirements for the Electronic Prior Authorization for Prescription Drugs measure. For example, commenters requested clarification regarding the technical capabilities and transactions that would satisfy the Electronic Prior Authorization for Prescription Drugs measure, including whether conforming electronic prior authorization functionality delivered through a connected application would qualify and the minimum criteria for a qualifying electronic prior authorization transaction. Another commenter recommended clarifying the respective roles of NCPDP SCRIPT and Real-Time Prescription Benefit (RTPB) standards in facilitating electronic prior authorization and specifying which certified health IT capabilities are necessary to satisfy the measure. A commenter requested clarification

distinguishing electronic prior authorization for prescription drugs covered under the pharmacy benefit from those covered under the medical benefit. Another commenter recommended that CMS develop standardized calculation guidance and testing tools to promote consistent measure implementation and reporting across health IT vendors. A commenter requested that CMS publish the complete specification for the measure.

Response: We appreciate the feedback from commenters requesting clarification regarding the technical requirements for the Electronic Prior Authorization for Prescription Drugs measure. To meet the measure, a MIPS eligible clinician must initiate and submit an electronic prior authorization request from within CEHRT using health IT certified to the ''electronic prescribing'' and ''real-time prescription benefit'' criteria at 45 CFR 170.315(b)(3) and 45 CFR 170.315(b)(4). With regard to the request for clarification about electronic prior authorization functionality delivered through a connected application, we note that MIPS eligible clinicians adopt and use certified health IT from different health IT developers to meet the CEHRT definition, and may use applications connected to their primary EHR system as long as those applications are certified to the relevant ONC certification criteria required for the measure at 45 CFR 170.315(b)(3) and (b)(4).

The Real-Time Prescription Benefit (RTPB) functionality described in the certification criterion at 45 CFR 170.315(b)(4) may help a MIPS eligible clinician determine whether prior authorization is required for a particular prescription drug, but RTPB functionality alone does not satisfy the measure. The measure action requires the electronic submission of a prior authorization request using the applicable NCPDP SCRIPT transaction. Specifically, as we stated in the CY 2027 PFS proposed rule (91 FR 44176), for purposes of the new Electronic Prior Authorization for Prescription Drugs measure, ''requested electronically'' means initiating and submitting an electronic prior authorization request from within CEHRT using health IT certified under 45 CFR 170.315(b)(3) and 45 CFR 170.315(b)(4). Thus, we require the use of health IT certified to the ONC health IT certification criteria at 45 CFR 170.315(b)(3)—''Electronic prescribing'' and at 45 CFR 170.315(b)(4)—''Real-time prescription benefit'' to support any electronic prior authorization requests used to satisfy this measure.

Furthermore, we note that for every qualifying request, health IT certified to the RTPB functionality at 45 CFR 170.315(b)(4) must be used to check for a coverage requirement and then use health IT certified to the ONC health IT certification criteria at 45 CFR 170.315(b)(3)—''Electronic prescribing'' must be used to submit the request. We recognize that such actions may not be conducted in every circumstance in which a MIPS eligible clinician may seek prior authorization and note that the measure provides such flexibility as a result of requiring that for at least one prescription drug ordered by the MIPS eligible clinician during the performance period for which prior authorization is required, the prior authorization is requested electronically using CEHRT.

Regarding the commenter requesting clarification on distinguishing electronic prior authorization for prescription drugs covered under the pharmacy benefit from those covered under the medical benefit, we clarify that the electronic prior authorization processes outlined in this section of the final rule applies to prescription drugs covered under a pharmacy benefit and does not apply to prescription drugs covered under a medical benefit, which generally use different electronic prior authorization workflows.

We recognize the importance of clear implementation guidance regarding the technical capabilities and transactions that satisfy the measure. We will provide educational and guidance resources, as appropriate and feasible, to clarify implementation details. The measure specifications for the new Electronic Prior Authorization for Prescription drugs measure will be available on the QPP website at *https://qpp.cms.gov/reporting-requirements/measures-activities/explore*.

Comment: A commenter recommended that when implementing the new Electronic Prior Authorization for Prescription Drugs measure, CMS should require continued monitoring of denials, appeals, and treatment abandonment to measure whether patients are able to get needed care and medications in a timely manner.

Response: The Electronic Prior Authorization for Prescription Drugs measure in the MIPS Promoting Interoperability performance category is intended to assess whether MIPS eligible clinicians are using electronic prior authorization functionality for prescription drugs, rather than to measure payer decision-making, appeal outcomes, or patient medication adherence or abandonment. Data on denials, appeals, and treatment abandonment may not be consistently available to clinicians or captured in certified health IT in a standardized and reliable manner for purposes of MIPS reporting. In addition, these outcomes may be influenced by factors outside the clinician's control. Thus, we do not believe it is appropriate to require monitoring of denials, appeals, and treatment abandonment as a part of the Electronic Prior Authorization for Prescription Drugs measure at this time.

After consideration of public comment, we are finalizing, as proposed, the proposal to adopt the Electronic Prior Authorization for Prescription Drugs measure beginning with the CY 2028 performance period/2030 MIPS payment year.

We refer readers to Table C–G 2, Table C–G 5, Table C–G 6, and Table C–G 8 in sections IV.A.4.d.(4)(g)(i), IV.A.4.d.(4)(g)(ii)(D), and IV.A.4.d.(4)(g)(iv) of this final rule for information regarding the reporting requirements and scoring methodology of the MIPS Promoting Interoperability performance category.

(f) Modifying the Electronic Prior Authorization Measure

(i) Background

In the 2024 CMS Interoperability and Prior Authorization final rule (89 FR 8909 through 8927), we adopted the Electronic Prior Authorization measure under the Health Information Exchange objective in the MIPS Promoting Interoperability performance category. We finalized that MIPS eligible clinicians will be required to attest to the Electronic Prior Authorization measure beginning with the CY 2027 performance period/2029 MIPS payment year (89 FR 8910); and subsequently, once the measure will become effective as a required measure in the MIPS Promoting Interoperability performance category, MIPS eligible clinicians would be required to satisfactorily report on the measure (and meet the other reporting requirements) in order to earn a score for the MIPS Promoting Interoperability performance category. For purposes of the Electronic Prior Authorization measure, a prior authorization request would need to be made using a Prior Authorization API using data from CEHRT to submit a ''Yes'' response for the measure, unless a MIPS eligible clinician claims an applicable exclusion. We finalized the following measure description for the Electronic Prior Authorization measure (89 FR 8916):

For at least one medical item or service (excluding drugs) ordered by the MIPS eligible clinician during the

performance period, the prior authorization is requested electronically from a Prior Authorization API using data from CEHRT.

Exclusions: Any MIPS eligible clinician who:

- Does not order any medical items or services (excluding drugs) requiring prior authorization during the applicable performance period; or
- Only orders medical items or services (excluding drugs) requiring prior authorization from a payer that does not offer an API that meets CMS's Prior Authorization API requirements during the applicable performance period.

In addition to becoming a required measure beginning with the CY 2027 performance period/2029 MIPS payment year, we finalized that the Electronic Prior Authorization measure will not be scored (that is, not assigned points for successful completion) for the CY 2027 performance period/2029 MIPS payment year (89 FR 8910 through 8915). For the MIPS Promoting Interoperability performance category, satisfactory performance on the Electronic Prior Authorization measure can be demonstrated only by submitting a ''Yes'' response to affirmatively attest to the measure or by claiming an applicable exclusion. MIPS eligible clinicians who submit a ''No'' response, fail to submit any attestation response, or do not claim an applicable exclusion for the Electronic Prior Authorization measure will receive a score of zero for the MIPS Promoting Interoperability performance category (weighted at 25 percent of the MIPS final score), and will not be considered a meaningful EHR user for purposes of the MIPS Promoting Interoperability performance category for the applicable performance period (89 FR 8910 through 8915).

Also, the 2024 CMS Interoperability and Prior Authorization final rule finalized that Medicare Advantage plans, state Medicaid Fee-for-service (FFS) programs, state Children's Health Insurance Program (CHIP) FFS programs, Medicaid managed care plans, CHIP managed care entities, and Qualified Health Plans (QHP) issuers on the Federally-Facilitated Exchange (collectively referred to as ''impacted payers'') must implement and maintain a Prior Authorization API beginning in CY 2027. The compliance date is January 1, 2027, for MA organizations and state Medicaid and CHIP FFS programs; by the first rating period beginning on or after January 1, 2027, for Medicaid managed care plans and CHIP managed care entities; and for plan years beginning on or after January 1, 2027, for individual market QHP issuers on the FFEs (89 FR 8759 through 8760). In the 2024 CMS Interoperability and Prior Authorization final rule, we recommended, rather than required, specific FHIR Implementation Guides (IGs) to support the APIs (89 FR 8937).

In the Health Data, Technology, and Interoperability: Electronic Prescribing, Real-Time Prescription Benefit and Electronic Prior Authorization final rule (HTI–4 final rule), which was published as part of the FY 2026 IPPS/LTCH PPS final rule (90 FR 37164 through 37182), ONC finalized the following three ONC health IT certification criteria for electronic prior authorization:

- ''Provider prior authorization API—coverage requirements discovery'' in 45 CFR 170.315(g)(31).
- ''Provider prior authorization API—documentation templates and rules'' in 45 CFR 170.315(g)(32).
- ''Provider prior authorization API—prior authorization support'' in 45 CFR 170.315(g)(33).

These certification criteria are based on three IGs developed by the HL7 Da Vinci project which ONC adopted in the HTI–4 final rule [404] at 45 CFR 170.215(j)(1), (2), and (3)—

- HL7® FHIR® Da Vinci—Coverage Requirements Discovery (CRD) IG;
- HL7 FHIR Da Vinci—Documentation Templates and Rules (DTR) IG; and
- HL7 FHIR Da Vinci—Prior Authorization Support (PAS) IG.

Together, these ONC health IT certification criteria can enable electronic prior authorization for healthcare providers. We refer readers to the HTI–4 final rule (90 FR 37162 through 37175) for more information regarding ONC's finalized certification criteria at 45 CFR 170.315(g)(31) through (33) and section XI.B.4.b. of the HTI–4 final rule (90 FR 36541 through 36542) for a summary of all ONC finalized policies.

In the 2026 CMS Interoperability Standards and Prior Authorization for Drugs proposed rule, we proposed to require impacted payers to implement and maintain Prior Authorization APIs that conform to the CRD, DTR, and PAS IGs adopted by ONC on behalf of the Secretary at 45 CFR 170.215(j)(1), (2), and (3). We proposed compliance dates for impacted payers to conform to the proposed standards and IGs beginning October 1, 2027 (however, impacted payers must still implement Prior Authorization APIs beginning in CY 2027). Finally, in section II.J.6. of the 2026 CMS Interoperability Standards and Prior Authorization for Drugs proposed rule (91 FR 20002 and 20003), ONC proposed to adopt updated versions of the CRD, DTR, and PAS IGs. If finalized, such proposed updated versions will enable payers and health IT developers to implement Prior Authorization APIs and Health IT Modules conforming to the finalized ONC health IT certification criteria at 45 CFR 170.315(g)(31), (32), and (33) to utilize the latest versions of these specifications.

The 2026 CMS Interoperability Standards and Prior Authorization for Drugs proposed rule includes proposals for impacted payers to implement and maintain Prior Authorization APIs using the CRD, DTR, and PAS IGs. Those proposals, along with the proposals ONC finalized in the HTI–4 final rule to adopt the CRD, DTR, and PAS IGs and establish electronic prior authorization certification criteria for health IT developers, collectively support the Electronic Prior Authorization measure for MIPS eligible clinicians and advance interoperability by applying consistent standards across HHS programs. We refer readers to the 2026 CMS Interoperability Standards and Prior Authorization for Drugs proposed rule and the HTI–4 final rule (90 FR 37169 through 37171) for more information regarding the three ONC health IT certification criteria to support electronic prior authorization at 45 CFR 170.315(g)(31), (32), and (33).

(ii) Modifying the Electronic Prior Authorization Measure for the CY 2027 Performance Period/2029 MIPS Payment Year

In the CY 2027 PFS proposed rule, we proposed amendments to the Electronic Prior Authorization measure for the CY 2027 performance period/2029 MIPS payment year by modifying the measure description (91 FR 44176 through 44178). Specifically, we proposed that the new measure description would be: For at least one medical item or service (excluding drugs) ordered by the MIPS eligible clinician during the performance period, the prior authorization is requested electronically through a Prior Authorization API using CEHRT.

For the proposed modification to the measure description, we proposed amending the phrase from ''using data from CEHRT'' to ''using CEHRT'' to clarify that MIPS eligible clinicians must use certified Health IT Modules where necessary to support the electronic prior authorization processes specified in this measure (91 FR 44176 through 44178). When we adopted the

[404] In the 2026 CMS Interoperability Standards and Prior Authorization for Drugs proposed rule, ONC has proposed updated versions of such Implementation Guides (91 FR 19910 and 19911).

Electronic Prior Authorization measure in the 2024 CMS Interoperability and Prior Authorization final rule, we did not identify specific ONC health IT certification criteria required to complete the actions specified in the measure (89 FR 8910 through 8915). We stated that gathering structured data from CEHRT would be achievable without additional certification criteria (89 FR 8925) that had not been proposed or finalized at the time of the 2024 CMS Interoperability and Prior Authorization final rule. The proposed update to the measure description to require that a prior authorization be requested electronically ''using CEHRT'' is consistent with the availability of certified Health IT Modules that must be used to complete the action specified in the Electronic Prior Authorization measure. At this juncture, we did not propose to include the exclusion criteria that were finalized when the Electronic Prior Authorization measure was adopted (89 FR 8916). In the CY 2027 PFS proposed rule (91 FR 44178), we proposed to amend the Electronic Prior Authorization measure by modifying the measure description for the CY 2027 performance period/2029 MIPS payment year aligned with the same proposal for the Medicare Promoting Interoperability Program as proposed in the FY 2027 IPPS/LTCH PPS proposed rule (91 FR 19626).

We requested public comment on this proposal.

We received public comment on the proposal. The following is a summary of the comments we received and our responses.

Comment: Several commenters supported the modifications to the Electronic Prior Authorization measure for the CY 2027 performance period/ 2029 MIPS payment year. A commenter expressed the belief that the broader adoption of interoperable, standards based electronic prior authorization has the potential to reduce reliance on manual processes that disrupt clinical workflows and unnecessarily delay patient care. A few commenters supported CMS's efforts to clarify and update the measure, including the proposed change from requiring electronic prior authorization ''using data from CEHRT'' to ''using CEHRT.'' A few commenters indicated that the modified measure language would more clearly establish the role of certified health IT in successfully meeting the Electronic Prior Authorization measure and support alignment with standards-based electronic prior authorization capabilities.

Response: We appreciate the support from commenters. We agree with commenters that the use of CEHRT and the alignment with ONC health IT certification criteria will help establish a consistent technical foundation for the measure, support broader adoption of standards-based electronic prior authorization, and improve interoperability across MIPS eligible clinicians, EHRs, health IT vendors, and payers.

Comment: A few commenters raised concerns regarding changing the measure language from ''using data from CEHRT'' to ''using CEHRT.'' Commenters stated that electronic prior authorization workflows may rely on multiple systems, including EHRs, revenue cycle systems, payer portals, clearinghouses, and other connected applications. Commenters expressed concern that a narrow ''using CEHRT'' requirement could constrain practical software implementation options and increase burden. Commenters also noted that payer and health IT readiness to support standards-based electronic prior authorization remains variable, which could further limit the ability of MIPS eligible clinicians to satisfy the measure using CEHRT.

A few commenters recommended retaining the current ''using data from CEHRT'' language or clarifying that MIPS eligible clinicians may use conforming electronic prior authorization technology to meet the measure, whether embedded within CEHRT or provided through other systems or applications integrated into clinician workflows, such as revenue cycle systems, payer portals, and clearinghouses.

Response: We acknowledge the concerns from commenters regarding the proposed change in the measure description from specifying ''using data from CEHRT'' to ''using CEHRT.'' We recognize that electronic prior authorization workflows may involve multiple systems, entities, and technology solutions. Our intent is not to prohibit the use of standards-based intermediaries or other interoperable tools that support the electronic prior authorization workflow. Rather, the measure is intended to ensure that MIPS eligible clinicians conduct the measure action using standards-based health IT functionality certified to ONC's electronic prior authorization certification criteria. We note that different types of health IT products may obtain certification under the ONC Health IT Certification program and that nothing prohibits eligible clinicians from using certified Health IT Modules from different health IT developers in assembling technology meeting the CEHRT definition to support participation in the Promoting Interoperability performance category. Moreover, our proposal does not prohibit intermediaries from supporting electronic prior authorization exchange in other ways separate from the capabilities reflected in the electronic prior authorization certification criteria. As discussed in sections IV.A.4.d.(4)(f)(v) and IV.B.1.d. of this final rule, we are finalizing, as proposed, the proposal to make the Electronic Prior Authorization measure an optional measure and eligible for 10 bonus points for the CY 2027 performance period/2029 MIPS payment year, during which MIPS eligible clinicians may use one or more Health IT Modules certified to the applicable electronic prior authorization certification criteria, as necessary to fulfill the measure action. This final policy provides additional flexibility during initial implementation and assists in addressing concerns from commenters regarding implementation lead time, interface testing, and payer readiness.

Comment: Several commenters requested clarification or modifications to the technical specifications for the Electronic Prior Authorization measure. A few commenters recommended that CMS more clearly define what constitutes a qualifying electronic prior authorization transaction. A commenter expressed concern that the proposed measure language could be interpreted inconsistently across implementers because it does not clearly distinguish among initiation of an electronic workflow, successful submission of a standards-based electronic prior authorization transaction, portal-based processes, and requested clarification regarding the acceptable source(s) for a request that can initiate the workflow for a qualifying electronic prior authorization transaction.

A few commenters specifically recommended that a successfully completed transaction count regardless of whether the payer determines that prior authorization is required and, for the CY 2027 performance period/2029 MIPS payment year, that a successfully submitted request count even if a payer response is not received. A commenter also requested that CMS clarify whether conforming electronic prior authorization functionality delivered through an application connected to CEHRT, rather than embedded within CEHRT itself, may satisfy the measure.

Response: We appreciate the feedback from commenters, specifically the request for clarification regarding what constitutes a successful electronic prior authorization action for purposes of the

measure. For a prior authorization request for a medical item or service to qualify for the measure, the need for prior authorization must be established. Therefore, if a MIPS eligible clinician uses CEHRT to query a payer's Prior Authorization API and the payer responds that prior authorization is not required, the transaction would not satisfy the measure.

According to the Da Vinci IGs, the eligible clinician that queries a payer's Prior Authorization API will receive a response to the prior authorization request such as: *covered = not-covered* (that is, no coverage or possibility of coverage); *pa-needed = no-auth* (that is, service is covered and does not require prior authorization); *pa-needed = satisfied* (that is, prior authorization required, conditions evaluated, and authorization can be bypassed); *conditional* (that is, the payer cannot yet determine coverage, prior authorization, or documentation requirements); and *pa-needed = auth-needed* (that is, a prior authorization request is required, so the workflow can proceed through DTR and PAS until it is ultimately complete, having been approved or denied). To attest ''Yes'' for the Electronic Prior Authorization measure for the CY 2027 performance period/2029 MIPS payment year, the electronic prior authorization request must result in a satisfied, approved, or denied request; submission of a request without receipt of a payer response would not be sufficient. For the CY 2027 performance period/2029 MIPS payment year, a MIPS eligible clinician may use one or any subset of the Health IT Modules certified to the electronic prior authorization certification criteria at 45 CFR 170.315(g)(31), (32), and (33), as necessary to complete a qualifying transaction. This approach accommodates variation in electronic prior authorization workflows based on the medical item or service and the payer's documentation requirements. A MIPS eligible clinician needs to only successfully complete one qualifying electronic prior authorization request for at least one medical item or service during the performance period to attest ''Yes'' for the measure. We will provide educational and guidance resources, as appropriate and feasible, to clarify qualifying workflows and implementation details.

With respect to the request for clarification about electronic prior authorization functionality delivered through an application connected to CEHRT, we recognize that electronic prior authorization workflows often involve multiple systems and entities, including EHRs, revenue cycle systems, payer systems, clearinghouses, health information exchanges, standards-based intermediaries, and other interoperable technology solutions. MIPS eligible clinicians may use health IT from more than one health IT developer, including applications connected to a primary EHR system, to meet CEHRT requirements to support electronic prior authorization exchange as long as the health IT applications are certified to at least one of the relevant ONC certification criteria required for the measure at 45 CFR 170.315(g)(31), (32), and (33) for the CY 2027 performance period/2029 MIPS payment year.

After consideration of public comment, we are finalizing, as proposed, the proposal to modify the Electronic Prior Authorization measure for the CY 2027 performance period/2029 MIPS payment year by updating the measure description to amend the phrase from ''using data from CEHRT'' to ''using CEHRT'' to require that MIPS eligible clinicians must use certified Health IT Modules where necessary to support the electronic prior authorization processes specified for this measure. We note that the finalized, as proposed, policy that amends the Electronic Prior Authorization measure by modifying the measure description for the CY 2027 performance period/2029 MIPS payment year aligns with the same finalized, as proposed, policy for the Medicare Promoting Interoperability Program as finalized in the FY 2027 IPPS/LTCH PPS final rule (91 FR 50043 through 50047)

(iii) Modifying the Electronic Prior Authorization Measure Beginning With the CY 2028 Performance Period/2030 MIPS Payment Year

In the CY 2027 PFS proposed rule, we proposed amendments to the Electronic Prior Authorization measure description beginning with the CY 2028 performance period/2030 MIPS payment year to include a complete set of actions necessary to support robust prior authorization and require use of Health IT modules certified to the ONC health IT certification criteria at 45 CFR 170.315(g)(31),[405] (32),[406] and (33) [407] as part of the measure requirements (91 FR 44178). We proposed updating the measure in order to take a step-wise approach to the certified health IT capabilities necessary to complete the measure and ensure that MIPS eligible clinicians continue to progress towards adoption of capabilities necessary to fully support electronic prior authorization.

Specifically, in the CY 2027 PFS proposed rule (91 FR 44178) we proposed modifying the measure description as follows beginning with the CY 2028 performance period/2030 MIPS payment year: For at least one medical item or service (excluding drugs) ordered by the MIPS eligible clinician during the performance period, the MIPS eligible clinician uses CEHRT to electronically request and receive coverage requirements, request and populate prior authorization documentation using templates and rules, submit the prior authorization request, and receive the payer response through a provider Prior Authorization API (91 FR 44178).

We proposed modifying the measure description in the CY 2027 PFS proposed rule (91 FR 44178) to explicitly delineate the requirement to use technology certified to each of the relevant ONC health IT certification criteria for the Electronic Prior Authorization measure beginning with the CY 2028 performance period/2030 MIPS payment year. We proposed modifying the measure description to specify the following actions required for meeting the requirement of the measure: ''electronically request and receive coverage requirements,'' ''request and populate prior authorization documentation using templates and rules,'' ''submit the prior authorization request,'' and ''receive the payer response'' (does not require the approval of the prior authorization request by the payer, but does require that the MIPS eligible clinician receive a prior authorization decision or determination response from the payer) to reflect the specific capabilities supported by Health IT Modules certified to the ONC health IT certification criteria at 45 CFR 170.315(g)(31), (32), and (33) (91 FR 44178). We noted that we would interpret this requirement to mean that each of these specific actions should occur within the same prior authorization request (91 FR 44178).

We requested public comment on this proposal.

We received public comment on the proposal. The following is a summary of the comments we received and our responses.

Comment: Several commenters expressed support for advancing the Electronic Prior Authorization measure toward a more complete, standards-

[406] *https://www.ecfr.gov/current/title-45/subtitle-A/subchapter-D/part-170/subpart-C/section-170.315#p-170.315(g)(32).*

[407] *https://www.ecfr.gov/current/title-45/subtitle-A/subchapter-D/part-170/subpart-C/section-170.315#p-170.315(g)(33).*

based electronic prior authorization workflow beginning with the CY 2028 performance period/2030 MIPS payment year, including use of FHIR-enabled Health IT Modules certified to ONC's electronic prior authorization certification criteria. A few commenters suggested that alignment with standardized, certified electronic prior authorization capabilities would advance interoperability and electronic prior authorization adoption, support care coordination, and reduce administrative burden.

Response: We thank commenters for their support. We agree that the proposed modifications will advance a more complete, standards-based electronic prior authorization workflow by requiring certified health IT functionality that enables a complete set of actions necessary to support robust electronic prior authorization. We believe this approach will support broader adoption and improve interoperability.

Comment: Several commenters raised concerns with the modification to the Electronic Prior Authorization measure beginning with the CY 2028 performance period/2030 MIPS payment year to require completion of the specified electronic prior authorization workflow for at least one medical item or service, excluding drugs. A commenter expressed concerns that the measure holds clinicians accountable for the responsiveness of a payer to a prior authorization request, which is outside of the clinician's control. Several commenters noted that the proposed workflow includes electronic prior authorization functionality supported by the ONC certification criteria for determining coverage requirements, assembling required documentation, submitting the prior authorization request, and receiving a payer response. A few commenters stated that although MIPS eligible clinicians may need to have the capabilities supporting the complete electronic prior authorization workflow available, not every prior authorization request requires use of every capability. Commenters noted that, depending on the circumstances of a particular request, one or more steps may not be necessary to resolve the authorization. For example, an initial coverage requirements exchange may determine that prior authorization is not required or that additional documentation is unnecessary.

Several commenters, therefore, recommended that CMS not require every component of the specified workflow for a given request to satisfy the measure but instead allow MIPS eligible clinicians to use the certified electronic prior authorization capabilities necessary to successfully complete the particular request. Several commenters cautioned that requiring transactions that are not necessary to resolve a particular prior authorization request could add administrative burden to a process that electronic prior authorization is intended to streamline.

Response: We recognize that individual prior authorization requests may not require every electronic prior authorization capability in all circumstances and that payers may not respond electronically to every prior authorization request made by clinicians. We note that to satisfy the Electronic Prior Authorization measure, a MIPS eligible clinician would attest ''Yes'' to completing the specified actions for at least one qualifying prior authorization request during the performance period. Successfully meeting the Electronic Prior Authorization measure does not require completion of the specified workflow for every prior authorization request. This approach appropriately advances adoption of the capabilities necessary to support robust, standards-based electronic prior authorization while limiting the reporting requirement to at least one qualifying request.

Comment: Several commenters requested clarification regarding the proposed requirement, beginning with the CY 2028 performance period/2030 MIPS payment year, for MIPS eligible clinicians to electronically request and receive coverage requirements, request and populate prior authorization documentation using templates and rules, submit the prior authorization request, and receive the payer response within the same qualifying prior authorization request. Commenters indicated that the actions necessary to complete a given prior authorization request may vary depending on the circumstances of the request and the payer's coverage and documentation requirements.

Several commenters therefore recommended that CMS allow MIPS eligible clinicians to complete only the electronic prior authorization actions necessary to resolve a given prior authorization request, rather than requiring each of the specified actions within the same request. A commenter specifically recommended that requesting and populating prior authorization documentation using templates and rules be required only when the payer requires additional documentation, noting that this action may not be necessary when the payer can complete the authorization without additional documentation.

Response: We recognize that electronic prior authorization workflows may vary depending on the medical item or service and the payer's coverage and documentation requirements. However, the modifications to the Electronic Prior Authorization measure beginning with the CY 2028 performance period/2030 MIPS payment year are intended to advance the measure from the flexibility provided for the CY 2027 performance period/2029 MIPS payment year toward a more complete electronic prior authorization workflow.

To satisfy the Electronic Prior Authorization measure beginning with the CY 2028 performance period/2030 MIPS payment year, a MIPS eligible clinician must use CEHRT to electronically request and receive coverage requirements; request and populate prior authorization documentation using templates and rules; submit the prior authorization request; and receive the payer response through a provider Prior Authorization API, with each of these actions occurring within the same qualifying prior authorization request. We note that the Electronic Prior Authorization measure requires a MIPS eligible clinician to attest ''Yes'' based on at least one qualifying prior authorization request during the performance period; it does not require completion of the specified workflow for every prior authorization request. We recognize that only a subset of prior authorization requests may require the use of all capabilities and that clinicians will continue to conduct prior authorization requests that do not require the complete set of capabilities, consistent with the documentation needs associated with a given prior authorization request.

Accordingly, we disagree with recommendations from commenters that would require only those actions that may be necessary for a particular request, including the recommendation to require the documentation templates and rules action only when additional documentation is otherwise needed. Requiring the specified actions within at least one qualifying request will advance adoption of the capabilities necessary to support a complete, standards-based electronic prior authorization workflow. As noted previously, our intent is to pursue a stepwise expansion of electronic prior authorization capabilities in 2028. The revised measure would enable meeting this goal by ensuring eligible clinicians demonstrate the adoption of these

capabilities for at least one prior authorization.

Comment: Several commenters expressed concerns regarding whether MIPS eligible clinicians, payers, and health IT vendors would be sufficiently ready to support the proposed modifications to the Electronic Prior Authorization measure that begin with the CY 2028 performance period/2030 MIPS payment year. These commenters highlighted the variability in payer, EHR, and health IT vendor readiness as a particular concern given that MIPS eligible clinicians depend on them to support electronic prior authorization transactions. Commenters stated that successful implementation of standardized electronic prior authorization capabilities would require coordination, integration, and testing across MIPS eligible clinicians, health IT developers, payers, and other intermediaries.

A commenter stated that, based on discussions with electronic prior authorization stakeholders, only functionality for coverage requirements determination is expected to be available in the CY 2027 performance period/2029 MIPS payment year, with end-to-end electronic prior authorization not expected to become available until at least the CY 2028 performance period/2030 MIPS payment year. The commenter cautioned that availability of the technology does not necessarily equate to operational readiness, noting that EHR developers, payers, and intermediaries would need to test end-to-end functionality throughout CY 2028 performance period/2030 MIPS payment year and that fully operational end-to-end electronic prior authorization may therefore not be realized until the CY 2029 performance period/2031 MIPS payment year at the earliest. Another commenter similarly noted that current implementation efforts are concentrated on coverage requirements discovery and that integrated use of the capabilities needed to support the complete electronic prior authorization workflow remains uncommon. Several commenters recommended that CMS monitor implementation and readiness of electronic prior authorization and adjust the measure requirements or implementation timeline, as needed, based on demonstrated readiness.

Response: We appreciate the feedback from commenters. In regard to commenters' concerns about ecosystem readiness to support the proposed CY 2028 performance period/2030 MIPS payment year requirement for MIPS eligible clinicians to use functionality represented by all three specified ONC electronic prior authorization certification criteria for the Electronic Prior Authorization measure. We recognize that successful implementation will require coordination among MIPS eligible clinicians, health IT developers, payers, and other partners, as well as time for development, certification, testing, integration, and workflow redesign. As discussed in sections IV.A.4.d.(4)(f)(v) and IV.B.1.d. of this final rule, we are finalizing, as proposed, the proposal to make the Electronic Prior Authorization measure an optional measure and eligible for bonus points for the CY 2027 performance period/2029 MIPS payment year. As discussed in section IV.A.4.d.(4)(f)(v) of this final rule, we are also finalizing, as proposed, the proposal to modify the Electronic Prior Authorization measure by requiring a MIPS eligible clinician to use CEHRT to electronically request and receive coverage requirements, request and populate prior authorization documentation using templates and rules, submit the prior authorization request, and receive the payer response through a provider prior authorization API beginning with the CY 2028 performance period/2030 MIPS payment year. We believe that such step-wise approach will allow participants additional time to gain implementation experience and advance operational readiness. We intend to assess implementation experience and coordinate with ONC and across CMS as standards, certified health IT capabilities, and payer-facing requirements continue to mature.

We further note that under the revised measure starting in the CY 2028 performance period/2030 MIPS payment year, we would continue to require the completion of only one prior authorization request consistent with the use of capabilities identified in the revised measure language. Eligible clinicians and health IT developers that need a longer period during CY 2028 to adopt and deploy technology within clinical workflows could continue testing and rollout activities during the CY 2028 performance period/2030 MIPS payment year and successfully complete an action satisfying the measure at the end of the performance period. Additionally, this measure, as proposed, includes exclusions that provide flexibility for MIPS eligible clinicians who may face challenges meeting the measure's requirements, including accommodation for where an applicable payer does not support the specified electronic prior authorization standard.

After consideration of public comment, we are finalizing, as proposed, the proposal to modify the Electronic Prior Authorization measure by requiring a MIPS eligible clinician to use CEHRT to electronically request and receive coverage requirements, request and populate prior authorization documentation using templates and rules, submit the prior authorization request, and receive the payer response through a provider prior authorization API beginning with the CY 2028 performance period/2030 MIPS payment year.

(iv) ONC Health IT Certification Criteria To Support the Electronic Prior Authorization Measure

In the CY 2027 PFS proposed rule, we proposed to require that an electronic prior authorization must be requested using CEHRT to satisfy the Electronic Prior Authorization measure (91 FR 44178 through 44180). We are requiring MIPS eligible clinicians to use Health IT Modules certified to the ONC health IT certification criteria in 45 CFR 170.315(g)(31), (32), and/or (33) as finalized in the HTI–4 final rule. Specifically, for the CY 2027 performance period/2029 MIPS payment year, MIPS eligible clinicians would be required to use CEHRT for electronic prior authorization requests that includes the utilization of one, or more than one, Health IT Modules certified to the ONC health IT certification criteria in 45 CFR 170.315(g)(31), (32), or (33) as necessary to meet the requirements of the Electronic Prior Authorization measure. Beginning with the CY 2028 performance period/2030 MIPS payment year, MIPS eligible clinicians would be required to use CEHRT for electronic prior authorization requests that includes the utilization of Health IT Modules certified to all three of the ONC health IT certification criteria in 45 CFR 170.315(g)(31), (32), and (33) to meet the requirements of the Electronic Prior Authorization measure. Using certified health IT to support these electronic prior authorization transactions ensures that MIPS eligible clinicians have standards-based capabilities within their health IT systems to interact with Prior Authorization APIs impacted payers are required to implement and maintain.

In the CY 2027 PFS proposed rule, we discussed how the three ONC health IT certification criteria at 45 CFR 170.315(g)(31), (32), and (33) are based on the HL7 Da Vinci CRD, DTR, and PAS IGs, and address different parts of the electronic prior authorization workflow (91 FR 44178). The ''provider

prior authorization API—coverage requirements discovery'' in 45 CFR 170.315(g)(31) enables a healthcare provider to request information from payers about coverage requirements. Where further information is needed to support a prior authorization request, the ''provider prior authorization API—documentation templates and rules'' criterion in 45 CFR 170.315(g)(32) provides a mechanism for providers to assemble the documentation needed to support a prior authorization request according to a payer's requirements. Lastly, the ''provider prior authorization API—prior authorization support'' in 45 CFR 170.315(g)(33) enables submission of prior authorization requests from health IT systems as well as to check the status of a previously submitted request. By finalizing each component of the workflow as a separate ONC health IT certification criterion, ONC sought to support a more dynamic health IT marketplace in which a health IT developer could develop Health IT Modules demonstrating conformance to all three IGs or focus on a specific element or elements (90 FR 37167 through 37169).

In the CY 2027 PFS proposed rule, we proposed to modify the Electronic Prior Authorization measure such that a MIPS eligible clinician could submit a ''Yes'' response, in which they are affirmatively attesting to the measure, if a ''prior authorization is requested electronically through a Prior Authorization API using CEHRT'' for the CY 2027 performance period/2029 MIPS payment year (91 FR 44178 through 44180). Different prior authorization scenarios that allow a MIPS eligible clinician to successfully attest to the measure for the CY 2027 performance period/2029 MIPS payment year may require the functionality of one, or more than one, Health IT Modules certified to the criteria in 45 CFR 170.315(g)(31), (32), and (33). For instance, a MIPS eligible clinician could successfully report on the measure for the CY 2027 performance period/2029 MIPS payment year using CEHRT that includes a Health IT Module that is only certified to the ''provider prior authorization API—coverage requirements discovery'' criterion in 45 CFR 170.315(g)(31), but not to the ONC health IT certification criteria at 45 CFR 170.315(g)(32) or (33).

Consider an example, from the CY 2027 proposed rule, in which a patient is a Medicare Advantage (MA) enrollee who has stable coronary artery disease and new exertional dyspnea (feeling shortness of breath during physical exertion) (91 FR 44179). The patient's cardiologist wants to order an outpatient transthoracic echocardiogram (TTE) to assess left ventricular function and valvular disease. When the cardiologist places an order for a TTE in the EHR, a Health IT Module certified to the ''provider prior authorization API—coverage requirements discovery'' criterion (45 CFR 170.315(g)(31)) automatically sends a real-time query to the patient's MA plan endpoint to determine whether prior authorization is required for the requested service (the TTE) and, if so, what documentation is needed. In this example, the MA plan returns a CRD response (via CDS Hooks ''card'') indicating that prior authorization is necessary and has been approved under the beneficiary's plan benefits and network status, including information such as the prior authorization number and assumed billing codes.

In this first example, the prior authorization request is satisfied using only the capabilities represented with the ''provider prior authorization API—coverage requirements discovery'' (45 CFR 170.315(g)(31)). The MIPS eligible clinician submitted a query for prior authorization, the payer responded that prior authorization was required, the prior authorization was approved without the need for further documentation, and the MIPS eligible clinician received a response indicating this approval from the payer through the payer's Prior Authorization API. In this case, the receipt of an approval indicates that the MIPS eligible clinician effectively submitted a request for prior authorization, consistent with the requirements of the Electronic Prior Authorization measure. Conversely, if the MIPS eligible clinician receives a response that no prior authorization is required, that query would not fulfill the requirements of the measure. Also, we considered whether the allowance of using CEHRT to conduct a check to determine if an item or service requires prior authorization should be able to satisfy the measure when the MIPS eligible clinician successfully submits a prior authorization coverage requirements determination query, regardless of whether the payer's response indicates that prior authorization is required. We requested comment on whether such additional flexibility would benefit MIPS eligible clinicians.

In the CY 2027 PFS proposed rule, we noted that based on feedback we have received from implementers about their likely approach to phasing in electronic prior authorization capabilities, we expect that the use of health IT certified to the ''provider prior authorization API—coverage requirements discovery'' (45 CFR 170.315(g)(31)), as described in the example above, may be a common approach for the CY 2027 performance period/2029 MIPS payment year (91 FR 44179). However, we noted that under the approach to use certified Health IT Modules for the Electronic Prior Authorization measure for the CY 2027 performance period/2029 MIPS payment year as described in the CY 2027 PFS proposed rule, there could be additional scenarios that would qualify for the measure in which a MIPS eligible clinician uses only the Health IT Modules certified to the criteria in 45 CFR 170.315(g)(32) or (g)(33) as part of the workflow for submitting a prior authorization request (91 FR 44179).

For the following second example, the case illustrates a prior authorization workflow that would meet the requirements of the Electronic Prior Authorization measure for the CY 2027 performance period/2029 MIPS payment year and also meet the more stringent requirements for the measure beginning with the CY 2028 performance period/2030 MIPS payment year, as described in the CY 2027 PFS proposed rule, when all three certified Health IT Modules in 45 CFR 170.315(g)(31), (32) and (33) would be required (91 FR 44179). The initial prior authorization query from a MIPS eligible clinician to a payer could result in a response indicating the need for additional information before a determination as to whether prior authorization is approved or denied can be provided, based on the coverage requirements identified. Additional certified Health IT Modules supporting additional elements of the electronic prior authorization workflow would then need to be used to submit the prior authorization request after collecting the necessary documentation and receive the decision.

The CY 2027 PFS proposed rule considered another example, in which the patient is an MA enrollee who has been diagnosed with metastatic colorectal cancer (91 FR 44179 through 44180). The patient's oncologist has ordered a PET–CT scan and immunotherapy infusion. The oncologist places the order for a PET–CT scan and immunotherapy infusion in the EHR, which is certified to the ''provider prior authorization API—coverage requirements discovery'' criterion (45 CFR 170.315(g)(31)) and automatically queries the patient's MA plan's FHIR API. The EHR receives a response via CDS Hooks card indicating that prior authorization is required for both services and describes coverage criteria and documentation needs.

Because the EHR is also certified to 45 CFR 170.315(g)(32), the certified health IT enables the oncologist to complete prior authorization following the DTR IG. An embedded Substitutable Medical Applications and Reusable Technologies (SMART) on FHIR app fetches the payer's specific documentation template and rules for oncology prior authorizations. For the PET–CT, the payer's documentation rules ask for the cancer staging information and previous imaging results; the immunotherapy, the payer's documentation rules require the patient's biomarker (for example, PD–L1 expression) status, prior treatment history, and recent lab results. Much of this information can be auto-populated because the embedded DTR app uses Clinical Quality Language (CQL) logic and FHIR queries to pull the patient's latest CT scan report and lab results from her medical record, and it confirms her cancer diagnosis and stage from the problem list. The oncologist answers a few additional questions (such as confirming the patient has no contraindications and that a required biomarker test was positive). By the end of this step, the EHR has compiled all necessary supporting documentation for the prior authorization, ensuring the request will be complete.

Next, the oncologist's office submits the prior authorization request electronically using the capabilities under the ''provider prior authorization API-prior authorization support'' criterion (45 CFR 170.315(g)(33)) to bundle the request and documentation and send it to the MA plan's prior authorization endpoint. This bundle is transmitted via a FHIR RESTful interaction to the payer, as defined by the PAS IG. The EHR's certified Health IT Module ensures the request conforms to the required FHIR structure and sends it securely. Because all required information was provided up front and matched the plan's coverage criteria, the MA plan's system could potentially automatically adjudicate and approve the requests in near real-time. If that happened, the oncologist could now schedule the patient's therapy without delay, confident that the services are covered.

Both examples result in a prior authorization request that would meet the modification to Electronic Prior Authorization measure for the CY 2027 performance period/2029 MIPS payment year because in each case, the MIPS eligible clinician requests prior authorization electronically using CEHRT. However, each example utilized different combinations of Health IT Modules certified to electronic prior authorization certification criteria in 45 CFR 170.315(g)(31), (32), and (33). In the first example, the MIPS eligible clinician used a single Health IT Module certified to the ''provider prior authorization API—coverage requirements discovery'' criterion (45 CFR 170.315(g)(31)) to complete actions necessary to successfully attest ''Yes'' to the Electronic Prior Authorization measure. In the second example, the MIPS eligible clinician used Health IT Modules certified to all three of the electronic prior authorization certification criteria to complete all actions for the MIPS eligible clinician to successfully attest ''Yes'' to the Electronic Prior Authorization measure for the CY 2027 performance period/2029 MIPS payment year.

Consistent with the hypothetical examples, we note that a MIPS eligible clinician will be able to successfully attest ''Yes'' to the Electronic Prior Authorization measure for the CY 2027 performance period/2029 MIPS payment year using only those certified Health IT Modules necessary to meet the requirements of the measure. MIPS eligible clinicians will not be required to adopt additional Health IT Modules certified to the applicable certification criteria if they are not needed for the purposes of successfully reporting the Electronic Prior Authorization measure. We expect that the ability to utilize different combinations of certified Health IT Modules to meet the Electronic Prior Authorization measure for the CY 2027 performance period/2029 MIPS payment year will afford MIPS eligible clinicians and health IT developers flexibility in how they deploy, adopt, and use different aspects of certified health IT functionality for electronic prior authorization.

In the CY 2027 PFS proposed rule we proposed to modify the Electronic Prior Authorization measure language beginning with the CY 2028 performance period/2030 MIPS payment year to state that a MIPS eligible clinician must use CEHRT to ''electronically request and receive coverage requirements, request and populate prior authorization documentation using templates and rules, submit the prior authorization request, and receive the payer response through a provider prior authorization API'' (91 FR 44180). In order for a MIPS eligible clinician to attest ''Yes'' to the Electronic Prior Authorization measure, health IT Modules certified to all three criteria at 45 CFR 170.315(g)(31), (32), and (33) would be required, consistent with the actions associated with the proposed modifications to the measure, which require capabilities corresponding to each of the three ONC Health IT certification criteria . Only the second example described above, in which a prior authorization request is submitted after obtaining additional documentation necessary for the request and utilizing health IT certified to the complete set of ONC health IT certification criteria for electronic prior authorization, would meet the requirements of the measure for the CY 2028 performance period/2030 MIPS payment year.

We requested public comment on this proposal.

We received public comment on the proposal. The following is a summary of the comments we received and our responses.

Comment: Several commenters expressed support for the proposal to update the Electronic Prior Authorization measure to require use of specific FHIR-enabled Health IT Modules certified to ONC health IT certification criteria at 45 CFR 170.315(g)(31), (32), and/or (33) to support electronic prior authorization transactions for medical items and services, excluding drugs. The commenters supported alignment of the measure with the specified ONC health IT certification criteria, which are based on the HL7 Da Vinci Coverage Requirements Discovery (CRD), Documentation Templates and Rules (DTR), and Prior Authorization Support (PAS) implementation guides and support different aspects of an electronic prior authorization workflow. Commenters stated that use of standardized, certified functionality could support interoperable electronic prior authorization workflows and reduce administrative burden.

A commenter specifically supported requiring the complete electronic prior authorization workflow supported by CRD, DTR, and PAS. A few commenters also supported the proposed implementation flexibility provided under the proposed CY 2027 performance period/2029 MIPS payment year measure specifications, under which MIPS eligible clinicians could use one or more certified Health IT Modules as necessary to support the applicable electronic prior authorization workflow.

Response: We appreciate the support from commenters. We agree with commenters that aligning the Electronic Prior Authorization measure with ONC's electronic prior authorization certification criteria will promote use of standardized, interoperable functionality that supports electronic prior authorization workflows. Also, we

agree with commenters that allowing MIPS eligible clinicians, for the CY 2027 performance period/CY 2029 MIPS payment year, to use one or more certified Health IT Modules as necessary to complete a qualifying electronic prior authorization request provides appropriate implementation flexibility as these capabilities continue to mature and become integrated into clinical workflows.

Comment: Several commenters raised concerns or requested clarification regarding the proposed requirement for MIPS eligible clinicians to use CEHRT that includes Health IT Modules certified to the ONC electronic prior authorization certification criteria at 45 CFR 170.315(g)(31), (32), and (33). Commenters discussed the role of the three certification criteria as the technical foundation for the Electronic Prior Authorization measure, noting that the criteria correspond to the CRD, DTR, and PAS implementation guides and support different components of the electronic prior authorization workflow.

Several commenters requested clarification regarding how the certified functionality would be used or interpreted for purposes of satisfying the measure, including whether the measure may be satisfied using CRD, DTR, PAS, or a combination of these capabilities. A few commenters specifically recommended that a CRD response, indicating prior authorization is not required, should qualify as a successful transaction rather than requiring subsequent DTR or PAS functionality; the commenters noted that electronically determining prior authorization is not required provides useful information and can avoid unnecessary documentation, payer portal checks, phone calls, and other administrative processes. A commenter requested clarification regarding whether conforming electronic prior authorization functionality delivered through an application connected to CEHRT, rather than embedded within CEHRT itself, may satisfy the measure. Another commenter requested clarification regarding what constitutes a ''decision or determination response,'' including whether payer responses requiring further interaction outside the electronic workflow, such as a peer-to-peer review or referral to a delegated benefit manager, may satisfy the measure.

Response: The ONC health IT certification criteria at 45 CFR 170.315(g)(31), (32), and (33) support different components of an electronic prior authorization workflow, including coverage requirements discovery, documentation templates and rules, and prior authorization support. For the CY 2027 performance period/2029 MIPS payment year, a MIPS eligible clinician could use one or more certified Health IT Modules, as necessary to complete a qualifying prior authorization request. Beginning with the CY 2028 performance period/2030 MIPS payment year, clinicians would be required to use health IT that is certified to all three certification criteria to complete the actions specified in the measure within the same qualifying prior authorization request.

We disagree with commenters that a coverage requirement response indicating that prior authorization is not required should independently satisfy the Electronic Prior Authorization measure. A medical item or service that the payer determines does not require prior authorization is not within the scope of the measure because no prior authorization request is required or submitted. Although electronically determining whether prior authorization is required is an important component of the electronic prior authorization workflow, such a response would not satisfy the Electronic Prior Authorization measure for the CY 2028 performance period/2030 MIPS payment year due to the documentation and prior authorization submission actions specified in the measure would not occur.

With respect to how the certified functionality may be implemented, the intent is not to prohibit the use of applications, intermediaries, or other interoperable tools that are integrated with CEHRT and support the electronic prior authorization workflow. Rather, the Electronic Prior Authorization measure is intended to ensure that MIPS eligible clinicians have access to, and use, standards-based health IT functionality certified to ONC's electronic prior authorization health IT certification criteria to complete the required measure actions. Such approach supports a consistent technical foundation for electronic prior authorization within clinician workflows, while allowing Health IT Modules certified to the relevant criteria to be deployed in configurations that meet the operational needs of a MIPS eligible clinician.

Also, we clarify that receipt of a payer response does not require approval of the prior authorization request. A qualifying request may result in an approval or denial, provided that the MIPS eligible clinician completes the applicable measure requirements and receives the payer's decision or determination response through the provider Prior Authorization API. Where the payer's response indicates that additional documentation or other electronic action is needed before a decision can be made, the MIPS eligible clinician would need to complete the applicable workflow actions for the request to satisfy the measure. We will provide educational and guidance resources, as appropriate and feasible, to support consistent implementation and reporting.

Comment: Several commenters raised concerns about ecosystem readiness to support the proposed use of FHIR-enabled Health IT Modules certified to the ONC health IT certification criteria for the Electronic Prior Authorization measure. Specific concerns included ongoing interoperability challenges, limited payer readiness to support FHIR-based prior authorization, and EHR developers that are still building, testing, and refining connectivity to payer Prior Authorization APIs at scale. A commenter requested further guidance on how clinicians and EHR developers would identify and connect to payer API endpoints and raised concerns that some payers may continue to rely on existing portal-based processes rather than transition to API-enabled exchange.

A few commenters specifically raised concerns about the maturity of the CRD, DTR, and PAS capabilities needed to support the proposed certified health IT requirements. A commenter, based on their assessment of the current state of implementation, reported that implementation efforts remain largely concentrated on CRD and that integrated use of CRD, DTR, and PAS across payers, EHR developers, and provider workflows remains uncommon. The commenter questioned whether widespread, integrated use of all three capabilities would be achievable across medical groups by the CY 2028 performance period/2030 MIPS payment year and cited recent industry implementation activity focused primarily on CRD rather than full deployment of all three capabilities. A few commenters emphasized that successful implementation depends on factors including payer conformance, EHR developer readiness, workflow integration, testing, and operational support.

Several commenters recommended that CMS account for ecosystem readiness in implementing the certified health IT requirements. A commenter recommended using the CY 2027 performance period/2029 MIPS payment year as a transition period to evaluate real-world readiness and provide educational resources and technical assistance to support

implementation, while another encouraged CMS and ONC to coordinate implementation timelines and requirements for EHR developers to support feasibility for clinicians. Some commenters also recommended that CMS allow additional time for implementation of the certified health IT requirements and align implementation timelines with the availability and readiness of the required functionality.

Response: We appreciate commenters' concerns regarding the readiness of the health IT ecosystem to support standards-based electronic prior authorization. We recognize that successful implementation of the Electronic Prior Authorization measure depends on coordination among MIPS eligible clinicians, health IT developers, payers, intermediaries, and other partners, as well as on technical development, testing, workflow integration, training, and operational support.

The proposed phased approach appropriately balances these considerations with the goal of advancing interoperable electronic prior authorization. For the CY 2027 performance period/2029 MIPS payment year, we are finalizing our proposal to make the Electronic Prior Authorization measure optional and eligible for bonus points, allowing MIPS eligible clinicians and their health IT developers additional flexibility to implement, test, and gain experience with certified electronic prior authorization capabilities before the measure would be required beginning with the CY 2028 performance period/2030 MIPS payment year. For the CY 2027 performance period/2029 MIPS payment year, MIPS eligible clinicians could use one or more certified Health IT Modules, as necessary to complete a qualifying electronic prior authorization request.

We acknowledge commenters' concerns regarding the maturity of integrated CRD, DTR, and PAS capabilities and agree that ongoing coordination among CMS, ONC, payers, health IT developers, and clinicians will be important. We intend to assess implementation experience and consider recommendations from commenters as we develop educational and guidance resources, as appropriate and feasible. The measure is intended to advance the availability and use of standards-based, certified electronic prior authorization functionality through CEHRT, while supporting a transition away from fragmented and manual prior authorization processes.

Comment: Several commenters highlighted the importance of alignment between CMS Promoting Interoperability requirements and related ONC health IT certification policies. Commenters recommended continued CMS and ONC coordination to ensure consistent or parallel implementation timelines, certification criteria, and requirements for EHR vendors so that certified health IT supports MIPS eligible clinicians and ACOs in meeting electronic prior authorization reporting requirements. A commenter expressed appreciation for CMS's efforts to align Promoting Interoperability requirements with ONC health IT certification criteria.

Response: We appreciate the support from commenters regarding the continued alignment between CMS Promoting Interoperability requirements and ONC health IT certification policies. We agree with commenters that aligning the Electronic Prior Authorization measure with the ONC health IT certification criteria at 45 CFR 170.315(g)(31), (32), and (33) supports a consistent technical foundation for standards-based electronic prior authorization and we will continue to coordinate with ONC and across other CMS programs, as appropriate, to promote consistency in implementation.

Comment: A commenter recommended applying a consistent approach to electronic prior authorization requirements under the Promoting Interoperability Program.

Response: We believe that, although use of technology certified to all three criteria may not be required to satisfy the Electronic Prior Authorization measure in the CY 2027 performance period/2029 MIPS payment year, it is important for eligible clinicians to rapidly gain experience with use of technology certified to all three ONC health IT certification criteria at 45 CFR 170.315(g)(31), (32), and (33) in advance of the implementation of the revised measure in 2028 requiring technology supporting the all of the components of an electronic prior authorization workflow. We will continue to work across CMS programs to help ensure that over time and as appropriate, there are consistent electronic prior authorization measure requirements.

After consideration of public comment, we are finalizing, as proposed, the proposal to require MIPS eligible clinicians to use CEHRT that includes Health IT Modules certified to the ONC Health IT certification criteria at 45 CFR 170.315(g)(31), (32), and/or (33), as applicable, to satisfy the Electronic Prior Authorization measure. Specifically in the CY 2027 performance period/2029 MIPS payment year, MIPS eligible clinicians would be required to use CEHRT for electronic prior authorization requests that includes the utilization of one, or more than one, Health IT Modules certified to the ONC health IT certification criteria necessary for the measure as finalized the CY 2027 performance period/2029 MIPS payment year. Beginning with the CY 2028 performance period/2030 MIPS payment year, MIPS eligible clinicians would be required to use CEHRT for electronic prior authorization requests that includes Health IT Modules certified to all three ONC Health IT certification criteria at 45 CFR 170.315(g)(31), (32), and (33) consistent with the revised measure finalized for the CY 2028 performance period/2030 MIPS payment year.

(v) Modifying the Electronic Prior Authorization Measure to an Optional Measure for the CY 2027 Performance Period/2029 MIPS Payment Year

In the CY 2027 PFS proposed rule (91 FR 44180 and 44181), we proposed to amend the previously finalized requirement that required MIPS eligible clinicians to report the Electronic Prior Authorization measure in order to be considered a meaningful EHR user for the CY 2027 performance period/2029 MIPS payment year (89 FR 8916 through 8919). Subsequent to the Electronic Prior Authorization measure being established, we proposed in the 2026 CMS Interoperability Standards and Prior Authorization for Drugs proposed rule to require that impacted payers implement and maintain Prior Authorization APIs that use HL7 FHIR and conform to the HL7 FHIR Da Vinci CRD, DTR, and PAS implementation guides, as adopted by ONC, with compliance generally beginning October 1, 2027 (91 FR 19910 through 19911). In the CY 2027 PFS proposed rule (91 FR 44180), it was noted that we expect additional implementation complexity for MIPS eligible clinicians, who are downstream from impacted payers and health IT developers who would be required to implement such API standards version requirements in CY 2027 if the CMS Interoperability Standards and Prior Authorization for Drugs proposed rule is finalized as proposed (91 FR 19910 through 19911). As a result, we believe that MIPS eligible clinicians may need additional time and flexibility before requiring the Electronic Prior Authorization measure to account for such changes to the underlying transaction standards occurring in CY 2027. First, we recognize that MIPS eligible clinicians and health IT developers would need

additional time for procurement, integration, and testing to operationalize standards-based electronic prior authorization capabilities that support the Electronic Prior Authorization measure (91 FR 44180). Second, interested parties have indicated that achieving widespread implementation and routine use of these capabilities in CY 2027 may be challenging, particularly for small, rural, and otherwise under-resourced MIPS eligible clinicians (91 FR 44180). Third, there may be additional implementation complexity for MIPS eligible clinicians because the CMS Interoperability Standards and Prior Authorization for Drugs proposed rule includes proposals to update the versions of underlying transaction standards within the relevant ONC health IT certification criteria (91 FR 44180). For such reasons, a year of optional reporting would both incentivize adoption of Health IT Modules certified to ONC criteria for electronic prior authorization through bonus points and offer flexibility to those MIPS eligible clinicians that could benefit from additional time to test, implement, and deploy the CEHRT functionality that is required to support the Electronic Prior Authorization measure. In the CY 2027 PFS proposed rule (91 FR 44180), we note that we do not believe that finalization of this proposal is contingent on finalization of proposals in the CMS Interoperability Standards and Prior Authorization for Drugs proposed rule because health care providers, payers, and health IT developers have already begun to adopt and test standards-based electronic prior authorization capabilities, and we expect standards adoption, conformance testing, and validation for the relevant Health IT Modules to continue.[408]

Therefore, in the CY 2027 PFS proposed rule (91 FR 44180 and 44181), we proposed to modify the Electronic Prior Authorization measure, with the proposed measure updates, to be an optional measure. The measure would be eligible for 10 bonus points for MIPS eligible clinicians who submit a ''Yes'' response for the measure indicating that they have requested a prior authorization electronically using CEHRT from a payer's Prior Authorization API for at least one medical item or service (excluding drugs) ordered within the CY 2027 performance period. To account for the Electronic Prior Authorization measure being an optional measure for the CY 2027 performance period/2029 MIPS payment year with an allocation of 10 bonus points, we proposed to modify the scoring methodology for optional measures under the MIPS Promoting Interoperability performance category as described in the CY 2027 PFS proposed rule (91 FR 44205 and 44206). Under the proposal to modify the Electronic Prior Authorization measure from a required measure to an optional measure, a MIPS eligible clinician who submits a ''No'' response would not have an affected score for the MIPS Promoting Interoperability performance category, and their response would not impact the MIPS eligible clinician being considered a meaningful EHR user for the CY 2027 performance period/2029 MIPS payment year.

Such modification would change the policy adopted for the Electronic Prior Authorization measure as finalized in the 2024 CMS Interoperability and Prior Authorization final rule (89 FR 8911). As described in the CY 2027 PFS proposed rule, the optional reporting of the Electronic Prior Authorization measure for the CY 2027 performance period/2029 MIPS payment year may be particularly beneficial for MIPS eligible clinicians in small, rural, or otherwise under-resourced clinical practice settings navigating new measure requirements while minimizing and balancing operational and reporting burden and demand (91 FR 44181). Under the proposal to amend the Electronic Prior Authorization measure by modifying the measure from a required measure to an optional measure, exclusions would not be available for the Electronic Prior Authorization measure for the CY 2027 performance period/2029 MIPS payment year because there would be no negative consequences for MIPS eligible clinicians who do not report on the optional measure (91 FR 41881). Given the allocated timeframe for MIPS eligible clinicians to become familiar with the Electronic Prior Authorization measure since the CY 2024 performance period as provided in the 2024 CMS Interoperability and Prior Authorization final rule, we believe that proposing to amend the Electronic Prior Authorization measure by modifying it from being a required measure to being as an optional bonus measure solely for the CY 2027 performance period/2029 MIPS payment year will provide MIPS eligible clinicians sufficient time to adopt and begin utilizing the certified health IT necessary to successfully report the Electronic Prior Authorization measure.

In the CY 2027 PFS proposed rule (91 FR 44181), we noted that the proposal to amend the Electronic Prior Authorization measure by modifying the measure requirement from being a required measure to an optional measure for the CY 2027 performance period/2029 MIPS payment year aligned with the same proposal for the Medicare Promoting Interoperability Program as proposed in the FY 2027 IPPS/LTCH PPS proposed rule (91 FR 19625).

We requested public comment on this proposal.

We received public comment on the proposal. The following is a summary of the comments we received and our responses.

Comment: Many commenters supported the proposal to modify the Electronic Prior Authorization measure to be optional for the CY 2027 performance period/2029 MIPS payment year. Many commenters expressed appreciation that making the Electronic Prior Authorization measure optional for the CY 2027 performance period/2029 MIPS payment year would allow additional time and flexibility to ensure payer, health IT developer, and physician readiness, including testing and operationalizing electronic prior authorization workflows. A few commenters specifically supported making the measure eligible for bonus points during the CY 2027 performance period, noting that the incentive could encourage early adoption of electronic prior authorization. A commenter stated that the bonus opportunity would further strengthen incentives for clinicians to use electronic prior authorization tools associated with the 2024 CMS Interoperability and Prior Authorization final rule.

A few commenters supported the phased implementation approach, noting its alignment with previously implemented Promoting Interoperability measures and the Electronic Prior Authorization measure proposed for the Medicare Promoting Interoperability Program in the FY 2027 IPPS/LTCH PPS proposed rule. A few commenters also stated that optional reporting would provide time for practices to prepare for implementation of the modified measure requirements, particularly small, rural, and other under-resourced practices. A few commenters noted that the optional reporting approach could reduce reporting burden while providing practices additional time to implement evolving interoperability requirements.

Response: We appreciate the support from commenters regarding the proposal to make the Electronic Prior Authorization measure optional and

[408] For example, CMS has announced early adopters advancing electronic prior authorization solutions; *see https://www.cms.gov/newsroom/press-releases/cms-announces-early-adopters-advance-solutions-electronic-prior-authorization-accelerating-momentum.*

eligible for bonus points for the CY 2027 performance period/2029 MIPS payment year. We agree with commenters that the phased approach would provide MIPS eligible clinicians, payers, and health IT developers additional flexibility and incentive implementation, testing, and operationalization of electronic prior authorization capabilities and workflows before the modified measure requirements would apply beginning with the CY 2028 performance period/2030 MIPS payment year.

Also, we agree with commenters that the optional reporting period may be particularly beneficial for small, rural, and other under-resourced practices by providing additional time to prepare for evolving interoperability requirements while encouraging early adoption of standards-based electronic prior authorization.

Comment: Several commenters expressed concerns about ecosystem readiness during the CY 2027 performance period to support the Electronic Prior Authorization measure. A few commenters noted that MIPS eligible clinicians depend on factors outside their control, including payer API readiness, availability of certified health IT, vendor implementation timelines, and integration of electronic prior authorization functionality into provider workflows. A few commenters also raised concerns about alignment between provider-side and payer standards and the resulting challenges for workflow integration across the industry.

Commenters noted that these dependencies may require additional implementation time and supported flexibility during the CY 2027 performance period to allow clinicians, payers, and health IT developers to gain experience and advance operational readiness. A few commenters specifically emphasized the need for additional flexibility for small, rural, and under-resourced practices as electronic prior authorization capabilities continue to mature.

Response: We recognize that successful implementation of electronic prior authorization depends on alignment among MIPS eligible clinicians, health IT developers, and payers. We intend for the implementation of the Electronic Prior Authorization measure to encourage continued progress toward broader implementation and workflow integration across the ecosystem. With regard to concerns about readiness, we note that one year of reporting the Electronic Prior Authorization measure as an optional bonus measure provides sufficient time for MIPS eligible clinicians, including small, rural, and under-resource practices, to successfully deploy and test EHR upgrades by working with vendors, and to address any current challenges to electronic prior authorization implementation. The optional bonus year will also provide MIPS eligible clinicians with the opportunity to gain experience with and become familiar with the Electronic Prior Authorization measure without facing a penalty.

Comment: A few commenters recommended extending the optional reporting period beyond the CY 2027 performance period/2029 MIPS payment year or delaying mandatory reporting until CY 2029 performance period/2031 MIPS payment year or later, to allow adequate time for configuration, testing, training, and maturation of electronic prior authorization workflows across MIPS eligible clinicians, payers, EHR developers, and clearinghouses, and to allow practices and providers to become familiar with the Electronic Prior Authorization measure. Several commenters recommended that CMS assess payer, health IT developer, and MIPS eligible clinician readiness to inform implementation of the measure.

A few commenters also recommended aligning the implementation timeline for the Electronic Prior Authorization measure for medical items and services with the proposed Electronic Prior Authorization for Prescription Drugs measure, noting that aligned timelines could allow EHR implementation activities for the two measures to occur concurrently.

Response: We appreciate feedback from commenters regarding the implementation timeline. We believe that making the measure an optional measure and eligible for 10 bonus points for the CY 2027 performance period/2029 MIPS payment year provides appropriate implementation flexibility before the measure becomes required beginning with the CY 2028 performance period/2030 MIPS payment year. We intend to assess implementation experience, payer and health IT readiness, technological advancements, and the availability of ONC-certified health IT as the measure is implemented. Also, we recognize the benefits of aligning implementation activities with the proposed Electronic Prior Authorization for Prescription Drugs measure, which is reflected in our final policies because the Electronic Prior Authorization for Prescription Drugs measure would also be required beginning in the CY 2028 performance period/2030 MIPS payment year.

After consideration of public comment, we are finalizing, as proposed, the proposal to modify the Electronic Prior Authorization measure to be an optional measure and eligible for 10 bonus points for the CY 2027 performance period/2029 MIPS payment year.

We refer readers to Tables C–G 2, C–G 4, C–G 6, and C–G 8 in sections IV.A.4.d.(4)(g)(i), IV.A.4.d.(4)(g)(ii)(D), and IV.A.4.d.(4)(g)(iv) of this final rule for information regarding the reporting requirements and scoring methodology of the MIPS Promoting Interoperability performance category for the CY 2027 performance period/2029 MIPS payment year. We note that the finalized, as proposed, policy to amend the Electronic Prior Authorization measure by modifying the measure from being a required measure to an optional measure and eligible for 10 bonus points for the CY 2027 performance period/2029 MIPS payment year aligns with the same finalized, as proposed, policy for the Medicare Promoting Interoperability Program as finalized in the FY 2027 IPPS/LTCH PPS final rule (91 FR 50052).

(vi) Requiring the Electronic Prior Authorization Measure Beginning With the CY 2028 Performance Period/2030 MIPS Payment Year

When the Electronic Prior Authorization measure was adopted in the 2024 CMS Interoperability and Prior Authorization final rule (89 FR 8909 through 8927), we finalized that for a MIPS eligible clinician to satisfactorily meet the requirements of the measure, they would be required to affirmatively attest or claim an applicable exclusion for the Electronic Prior Authorization measure beginning with the CY 2027 performance period/2029 MIPS payment year (89 FR 8910). If a MIPS eligible clinician submits a ''No'' response, fails to submit any attestation, or does not claim an applicable exclusion for the Electronic Prior Authorization measure, the MIPS eligible clinician would receive a score of zero for the MIPS Promoting Interoperability performance category (weighted at 25 percent of the MIPS final score) and would not be considered a meaningful EHR user for purposes of the MIPS Promoting Interoperability performance category for the applicable performance period (89 FR 8911).

In the CY 2027 PFS proposed rule, we proposed to amend the Electronic Prior Authorization measure by modifying the measure to require MIPS eligible clinicians to report the Electronic Prior Authorization measure beginning with

the CY 2028 performance period/2030 MIPS payment year (91 FR 44181 and 44182). Specifically, beginning with the CY 2028 performance period/2030 MIPS payment year, we proposed that a MIPS eligible clinician must use CEHRT to electronically request and receive coverage requirements, request and populate prior authorization documentation using templates and rules, submit the prior authorization request, and receive the payer response through a Prior Authorization API for at least one medical item or service (excluding drugs) ordered within the applicable performance period. A MIPS eligible clinician would submit a ''Yes'' response, or alternatively claim an applicable exclusion, to satisfy the requirements of the Electronic Prior Authorization measure. In each case, the Electronic Prior Authorization measure would not affect the total score for the MIPS Promoting Interoperability performance category. If a MIPS eligible clinician submits a ''No'' response, fails to submit any attestation, or does not claim an applicable exclusion for the Electronic Prior Authorization measure, the MIPS eligible clinician would receive a score of zero for the MIPS Promoting Interoperability performance category (weighted at 25 percent of the MIPS final score) and would not be considered a meaningful EHR user for purposes of the MIPS Promoting Interoperability performance category for the applicable performance period (89 FR 8911). As noted in the CY 2027 PFS proposed rule (91 FR 44181), the proposal reflects the measure reporting requirements that were first adopted for the Electronic Prior Authorization measure as described in the 2024 CMS Interoperability and Prior Authorization final rule (89 FR 8911), but modifies the measure to being a required measure for the MIPS Promoting Interoperability performance category beginning with the CY 2028 performance period/2030 MIPS payment year instead of beginning with the CY 2027 performance period/2029 MIPS payment year as originally finalized.

As described in the CY 2027 PFS proposed rule (91 FR 44181 and 44182), the measure exclusions originally adopted in the 2024 CMS Interoperability and Prior Authorization final rule (89 FR 8923 and 8924 would be available to MIPS eligible clinicians for the CY 2028 performance period/2030 MIPS payment year and subsequent years. The available exclusions would be for any MIPS eligible clinician who: (1) Does not order any medical items or services (excluding drugs) requiring prior authorization during the applicable performance period; or (2) Only orders medical items or services (excluding drugs) requiring prior authorization from a payer that does not offer an API that meets CMS's Prior Authorization API requirements during the applicable performance period. A MIPS eligible clinician would also be able to claim the first exclusion if none of its prior authorization requests required the functionality described in the certification criteria at 45 CFR 170.315(g)(31), (32) and (33) for electronic prior authorization, which correspond to the elements of the revised measure language for the CY 2028 performance period/2030 MIPS payment year. For instance, if no prior authorization request submitted by a MIPS eligible clinician during the performance period required gathering and submitting additional documentation to support the request, which is supported by health IT certified to the criteria in 45 CFR 170.315(g)(32) and 45 CFR 170.315(g)(33), then no prior authorization request that MIPS eligible clinician performed would fulfill the measure and the MIPS eligible clinician will be able to claim an exclusion. More broadly, if the MIPS eligible clinician is unable to use CEHRT to effectively exchange information and submit a prior authorization request with any payer from which they are seeking an authorization, we believe that would be sufficient for a MIPS eligible clinician to claim that the payer does not have a functioning Prior Authorization API for the purpose of the reporting and exclusion eligibility.

In the CY 2027 PFS proposed rule, we noted that CMS's specified payer Prior Authorization API requirements include conformance to the three IGs underlying the ONC health IT certification criteria at 45 CFR 170.315(g)(31), (32), and (33) (91 FR 44182). Therefore, a MIPS eligible clinician could claim the second exclusion if all their requests are with payers that do not support all three FHIR IGs.

We requested public comment on this proposal.

We received public comment on the proposal. The following is a summary of the comments we received and our responses.

Comment: Several commenters supported the proposal to require the Electronic Prior Authorization measure beginning with the CY 2028 performance period/2030 MIPS payment year, with some commenters specifically supporting the phased approach of allowing optional reporting for the CY 2027 performance period/2029 MIPS payment year before transitioning to mandatory reporting for the CY 2028 performance period/2030 MIPS payment year. Commenters noted that making the measure required could help drive adoption of standardized electronic prior authorization capabilities, complement impacted payers' implementation and maintenance of Prior Authorization APIs under the 2024 CMS Interoperability and Prior Authorization final rule (CMS–0057–F), reduce administrative burden and delays, and streamline the prior authorization experience for patients, MIPS eligible clinicians, and payers.

Response: We appreciate the support from commenters. We agree with commenters that making the Electronic Prior Authorization measure optional for the CY 2027 performance period/2029 MIPS payment year before requiring it beginning with the CY 2028 performance period/2030 MIPS payment year provides an appropriate phased approach to advance adoption of standards-based electronic prior authorization. We believe requiring the measure beginning with the CY 2028 performance period/2030 MIPS payment year will support MIPS eligible clinicians' use of the Prior Authorization APIs that applicable payers must implement and maintain, promote broader adoption and interoperability, and help reduce administrative burden. We discuss comments regarding the scoring implications of the measure in section IV.A.4.d.(4)(g)(ii) of this final rule.

Comment: Many commenters either opposed making the Electronic Prior Authorization measure mandatory beginning with the CY 2028 performance period/2030 MIPS payment year or recommended delaying mandatory reporting until the CY 2029 performance period/2031 MIPS payment year or later. Commenters stated that the proposed timeline would not provide sufficient lead time for payers, EHR developers and other health IT vendors, MIPS eligible clinicians, and other stakeholders to implement, test, integrate, and operationalize reliable end-to-end electronic prior authorization capabilities. A few commenters expressed concern that changing measure specifications for the Electronic Prior Authorization measure while making it a mandatory measure and adding a new Electronic Prior Authorization for Prescription Drugs measure in the CY 2028 performance period/2030 MIPS payment year may add operational and technical burden for clinicians, specifically as a result of

having to update developer workflows. Commenters emphasized the importance of sufficient lead time to establish ecosystem readiness, particularly given variation in payer and vendor readiness and the ongoing development and uneven availability of standards-based, FHIR-based electronic prior authorization functionality.

Several commenters recommended extending optional reporting of the Electronic Prior Authorization measure beyond the CY 2027 performance period/2029 MIPS payment year. Several commenters requested that CMS use the period of optional reporting to evaluate real-world implementation and ecosystem readiness before transitioning to mandatory reporting. A commenter specifically recommended that CMS assess the number of impacted payers operating a conformant prior authorization API as a measure of ecosystem readiness. Several commenters expressed concern that MIPS eligible clinicians could be held accountable for technology, interoperability, payer, or vendor limitations outside their control. A few commenters noted that implementation challenges may be particularly significant for small, rural, and other resource constrained practices.

Response: We recognize that successful implementation depends on coordination across the healthcare ecosystem, including the availability and deployment of certified health IT and payer support for electronic prior authorization transactions. However, we believe that making the Electronic Prior Authorization measure optional and eligible for bonus points for the CY 2027 performance period/2029 MIPS payment year provides an appropriate transition to required reporting beginning with the CY 2028 performance period/2030 MIPS payment year. The optional reporting year provides MIPS eligible clinicians, including small, rural, and other resource-constrained practices, an opportunity to gain experience with the measure, work with health IT developers to deploy and test necessary capabilities, and address implementation challenges without a negative effect on their Promoting Interoperability performance category score. Additionally, we believe the modifications to the Electronic Prior Authorization measure and the implementation of the Electronic Prior Authorization for Prescription Drugs measure are appropriate and necessary to advance more consistent electronic prior authorization processes across care settings. We expect these concurrent measure additions will promote greater standardization and interoperability over time, which would ultimately reduce manual processes, duplicative work, and administrative burden on clinicians.

We intend to assess implementation experience, payer and health IT readiness, technological advancements, and the availability of ONC-certified health IT as the measure is implemented. Requiring the measure beginning with the CY 2028 performance period/2030 MIPS payment year will support MIPS eligible clinicians' use of the Prior Authorization APIs that applicable payers must implement and maintain and advance broader adoption of standards-based electronic prior authorization.

Comment: Several commenters recommended that implementation of the mandatory Electronic Prior Authorization measure beginning with the CY 2028 performance period/2030 MIPS payment year be aligned across applicable CMS programs and coordinated with related payer requirements. Commenters specifically requested consistency in measure requirements and implementation timelines across clinician and hospital programs and for clinician requirements to be appropriately sequenced with payer Prior Authorization API obligations.

Response: We appreciate feedback from commenters regarding alignment of Electronic Prior Authorization requirements across CMS programs and related payer requirements. We agree that the alignment of applicable requirements among MIPS eligible clinicians, eligible hospitals and CAHs, health IT developers, and payers is important to support consistent, standards-based electronic prior authorization workflows. We recognize that the proposed policy in the CY 2027 PFS proposed rule and the finalized, as proposed, policy in this final rule that requires MIPS eligible clinicians to use CEHRT for electronic prior authorization requests that includes the utilization of Health IT Modules certified to all three of the ONC health IT certification criteria in 45 CFR 170.315(g)(31), (32), and (33) to meet the requirements of the Electronic Prior Authorization measure starting with the CY 2028 performance period/2030 MIPS payment year differs from the finalized, as proposed, policy in the FY 2027 IPPS/LTCH PPS final rule pertaining to the Electronic Prior Authorization measure requirements applicable to eligible hospitals and CAHs. In the FY 2027 IPPS/LTCH PPS final rule (91 FR 50047), we stated that we are strongly considering returning to rulemaking in the FY 2028 IPPS.LTCH PPS proposal rule in order to align the Electronic Prior Authorization measure requirements to match the proposed requirements for MIPS eligible clinicians in the CY 2027 PFS proposed rule, which proposed to require the use of functionality found in each of the three ONC health IT certification criteria at 45 CFR 170.315(g)(31), (32), and (33) for CY 2028. Also, we note that the requirements for the Electronic Prior Authorization measure beginning with the CY 2028 performance period/2030 MIPS payment year align with related CMS and ONC policies; particularly, the Electronic Prior Authorization measure requires the same electronic prior authorization standards established by related CMS and ONC policies, including the ONC health IT certification criteria and payer Prior Authorization API requirements. We will continue to coordinate across CMS programs and with ONC to promote consistency in requirements and implementation timelines as electronic prior authorization capabilities mature.

After consideration of public comment, we are finalizing, as proposed, the proposal to require MIPS eligible clinicians to report the Electronic Prior Authorization measure beginning with the CY 2028 performance period/2030 MIPS payment year.

We refer readers to Table C–G 2, Table C–G 5, Table C–G 6, and Table C–G 8 in sections IV.A.4.d.(4)(g)(i), IV.A.4.d.(4)(g)(ii)(D), and IV.A.4.d.(4)(g)(iv) of this final rule for information regarding the reporting requirements and scoring methodology of the MIPS Promoting Interoperability performance category beginning with the CY 2028 performance period/2030 MIPS payment year. We note that the finalized, as proposed, policy to amend the Electronic Prior Authorization measure by modifying the measure to be a required measure beginning with CY 2028 performance period/2030 MIPS payment year aligns with the same finalized, as proposed, policy for the Medicare Promoting Interoperability Program as finalized in the FY 2027 IPPS/LTCH PPS final rule (91 FR 50054). As noted in the FY 2027 IPPS/LTCH PPS final rule, we are strongly considering proposals in the FY 2028 IPPS/LTCH PPS final rule to align the Electronic Prior Authorization measure with the revisions we are finalizing for the MIPS Promoting Interoperability performance category (91 FR 50044 through 50047).

(vii) Request for Information on Future Potential Performance-Based Measure of Electronic Prior Authorization

In the CY 2027 PFS proposed rule, we solicited comments on potential future updates we could make to the Electronic Prior Authorization measures, including the Electronic Prior Authorization measure and the Electronic Prior Authorization for Prescription Drugs measure, to incentivize MIPS eligible clinicians to use CEHRT for electronic prior authorization for a more substantial set of the electronic prior authorization requests that they submit over the course of a performance period and corresponding MIPS payment year (91 FR 44182). Specifically, we sought feedback on barriers and challenges that MIPS eligible clinicians in small, rural, or otherwise under-resourced practice settings might face when reporting performance-based electronic prior authorization measures; what alternative approaches should be considered to support use of electronic prior authorization; and how we can further strengthen the Electronic Prior Authorization measures in a manner that incentivizes progress while avoiding undue administrative complexity and implementation challenges for MIPS eligible clinicians (91 FR 44182).

We received many comments on this RFI, and thank commenters for their feedback. Although we will not be addressing the comments received in response to the RFI in this final rule, we value the input received and will take into consideration the feedback as we assess changes to the Electronic Prior Authorization measure included in the MIPS Promoting Interoperability performance category.

(g) Modifying Requirements and Scoring Policies for the MIPS Promoting Interoperability Performance Category

(i) Modifying Objectives and Measures

In the CY 2027 PFS proposed rule, we proposed updates to requirements and scoring policies for different performance periods (91 FR 44182 through 44198). For reference, Table C–G 2 in the CY 2027 PFS proposed rule (91 FR 44184 through 44190) and in section IV.A.4.d.(4)(g)(i) of this final rule sets forth the objectives and measures for the MIPS Promoting Interoperability performance category that are required for the CY 2026 performance period/2028 MIPS payment year, CY 2027 performance period/2029 MIPS payment year, the CY 2028 performance period/2030 MIPS payment year, and subsequent years. In the CY 2027 PFS proposed rule (91 FR 44184 through 44190) and in this final rule, Table C–G 2 reflects modifications to previously established objectives and measures, including:

- For the CY 2026 performance period/2028 MIPS payment year: Removal of the ONC Direct Review and ONC–ACB Surveillance attestations.
- For the CY 2027 performance period/2029 MIPS payment year: Removal of the Security Risk Analysis measure; and modification to the existing Electronic Prior Authorization measure that makes the measure optional and eligible for 10 bonus points.
- For the CY 2028 performance period/2030 MIPS payment year: Modification to the existing Electronic Prior Authorization measure that makes the measure required and unscored; and addition of the new Electronic Prior Authorization for Prescription Drugs measure to the Health Information Exchange objective.

BILLING CODE 4169–69–P

TABLE C-G 2: OBJECTIVES AND MEASURES FOR THE MIPS PROMOTING INTEROPERABILITY PERFORMANCE CATEGORY FOR THE CY 2026 PERFORMANCE PERIOD/2028 MIPS PAYMENT YEAR, CY 2027 PERFORMANCE PERIOD/2029 MIPS PAYMENT YEAR, THE CY 2028 PERFORMANCE PERIOD/2030 MIPS PAYMENT YEAR, AND SUBSEQUENT YEARS

Objective	Measure	Numerator	Denominator	Exclusion
Electronic Prescribing: Generate and transmit permissible prescriptions electronically	e-Prescribing – At least one permissible prescription written by the MIPS eligible clinician is transmitted electronically using CEHRT.	Number of prescriptions in the denominator generated and transmitted electronically using CEHRT.	Number of prescriptions written for drugs requiring a prescription to be dispensed other than controlled substances during the performance period; or number of prescriptions written for drugs requiring a prescription to be dispensed during the performance period.	Any MIPS eligible clinician who writes fewer than 100 permissible prescriptions during the performance period.
Electronic Prescribing	Query of PDMP – For at least one Schedule II opioid or Schedule III or IV drug electronically prescribed using CEHRT during the performance period, the MIPS eligible clinician uses data from CEHRT to conduct a query of a PDMP for prescription drug history.	N/A (measure is Yes/No and requires an affirmative attestation to meet requirement)	N/A (measure is Yes/No and requires an affirmative attestation to meet requirement)	Any MIPS eligible clinician who: 1. Is unable to electronically prescribe Schedule II opioids and Schedule III and IV drugs in accordance with applicable law during the performance period; OR 2. Does not electronically prescribe any Schedule II opioids or Schedule III or IV drugs during the performance period.
Health Information Exchange: The MIPS eligible clinician provides a summary of care record when transitioning care or referring their patient to another setting of care, receives or retrieves a summary of care record upon the receipt of a transition of care or referral or upon the first patient encounter with a new patient, and reconciles summary of care information from other healthcare providers into their EHR using the functions of CEHRT	Support Electronic Referral Loops by Sending Health Information – For at least one transition of care or referral, the MIPS eligible clinician that transitions care of a patient or refers their patient to another setting of care or healthcare provider: 1. Creates a summary of care using CEHRT; AND 2. Electronically exchanges the summary of care record.	Number of transitions of care and referrals in the denominator where the summary of care record was created using CEHRT and exchanged electronically.	Number of transitions of care and referrals during the performance period for which the MIPS eligible clinician was the transferring or referring clinician.	Any MIPS eligible clinician who transfers a patient to another setting or refers a patient fewer than 100 times during the performance period.
Health Information	Support Electronic	Number of	Number of electronic	Any MIPS eligible clinician

Objective	Measure	Numerator	Denominator	Exclusion
Exchange (HIE)	Referral Loops by Receiving and Reconciling Health Information – For at least one electronic summary of care record received for patient encounters during the performance period for which a MIPS eligible clinician was the receiving party of a transition of care or referral, or for patient encounters during the performance period in which the MIPS eligible clinician has never before encountered the patient, the MIPS eligible clinician conducts clinical information reconciliation for medication, mediation allergy, and current problem list.	electronic summary of care records in the denominator for which clinical information reconciliation is completed using CEHRT for the following three clinical information sets: 1. Medication – Review of the patient's medication, including the name, dosage, frequency, and route of each medication; 2. Medication allergy – Review of the patient's known medication allergies; and 3. Current Problem List – Review of the patient's current and active diagnoses.	summary of care records received using CEHRT for patient encounters during the performance period for which a MIPS eligible clinician was the receiving party of a transition of care or referral, and for patient encounters during the performance period in which the MIPS eligible clinician has never before encountered the patient.	who receives transitions of care or referrals or has patient encounters in which the MIPS eligible clinician has never before encountered the patient fewer than 100 times during the performance period.
Health Information Exchange (HIE)	Health Information Exchange Bi-Directional Exchange – Statement 1: I participate in an HIE to enable secure, bi-directional exchange to occur for every patient encounter, transition of care or referral and record stored or maintained in the EHR during the performance period in accordance with applicable law and policy. Statement 2: The HIE that I participate in is capable of exchanging information across a broad network of unaffiliated exchange partners including those using disparate EHRs and not engaging in exclusionary behavior	N/A (measure is Yes/No and requires an affirmative attestation to meet requirement)	N/A (measure is Yes/No and requires an affirmative attestation to meet requirement)	N/A

Objective	Measure	Numerator	Denominator	Exclusion
	when determining exchange partners. Statement 3: I use the functions of CEHRT to support bi-directional exchange with an HIE.			
Health Information Exchange	Enabling Exchange Under TEFCA – MIPS eligible clinicians attest to the following. Statement 1: I participate as a signatory to a Framework Agreement (as that term is defined by the Common Agreement for Nationwide Health Information Interoperability as published in the **Federal Register** and on ONC website) in good standing (that is, not suspended) and enabling secure, bi-directional exchange of information to occur, in production, for every patient encounter, transition of care or referral, and record stored or maintained in the EHR during the performance period, in accordance with applicable law and policy. Statement 2: I use the functions of CEHRT to support bi-directional exchange of patient information, in production, under this Framework Agreement.	N/A (measure is Yes/No and requires an affirmative attestation to meet requirement)	N/A (measure is Yes/No and requires an affirmative attestation to meet requirement)	N/A
Health Information Exchange	Electronic Prior Authorization for Prescription Drugs (CY 2028 and subsequent performance periods) – For at least one prescription written by the MIPS eligible clinician during the	N/A (measure is Yes/No and requires an affirmative attestation to meet requirement)	N/A (measure is Yes/No and requires an affirmative attestation to meet requirement)	Any MIPS eligible clinician who: 1. Does not write a prescription that requires prior authorization during the applicable performance period; or 2. only writes prescriptions requiring prior authorization where the payer does not support the specified electronic prior

Objective	Measure	Numerator	Denominator	Exclusion
	performance period for which prior authorization is required, the prior authorization is requested electronically using CEHRT.*			authorization standard during the applicable performance period; or 3 writes fewer than 100 permissible prescriptions during the performance period.*
Health Information Exchange	Electronic Prior Authorization (CY 2027 performance period *only*) – For at least one medical item or service (excluding drugs) ordered by the MIPS eligible clinician during the performance period, the prior authorization is requested electronically through a Prior Authorization API using CEHRT.**	N/A (measure is Yes/No and requires an affirmative attestation to meet requirement)	N/A (measure is Yes/No and requires an affirmative attestation to meet requirement)	None**
Health Information Exchange	Electronic Prior Authorization (CY 2028 and subsequent performance periods) – For at least one medical item or service (excluding drugs) ordered by the MIPS eligible clinician during the performance period, the MIPS eligible clinician uses CEHRT to electronically discover applicable coverage requirements, complete required documentation, submit the prior authorization request, and receive the payer response through a Prior Authorization API.*	N/A (measure is Yes/No and requires an affirmative attestation to meet requirement)	N/A (measure is Yes/No and requires an affirmative attestation to meet requirement)	Any MIPS eligible clinician who: 1. Does not order any medical items or services (excluding drugs) requiring prior authorization during the applicable performance period; OR 2. Only orders medical items or services (excluding drugs) requiring prior authorization from a payer that does not offer an API that meets CMS's specified Prior Authorization API requirements.*
Provider to Patient Exchange: The MIPS eligible clinician provides patients (or patient-authorized representative) with timely electronic access to their health information.	Provide Patients Electronic Access to Their Health Information – For at least one unique patient seen by the MIPS eligible clinician: 1. The patient (or the patient-authorized	Number of patients (or patient authorized representatives) in the denominator who are provided timely access to health information to view online, download, and	Number of unique patients seen by the MIPS eligible clinician during the performance period.	N/A

Objective	Measure	Numerator	Denominator	Exclusion
	representative) is provided timely access to view online, download, and transmit his or her health information; AND 2. The MIPS eligible clinician ensures the patient's health information is available for the patient (or patient-authorized representative) to access using any application of their choice that is configured to meet the technical specifications of the Application Programming Interface (API) in the MIPS eligible clinician's CEHRT.	transmit to a third-party and to access using an application of their choice that is configured to meet the technical specifications of the API in the MIPS eligible clinician's CEHRT.		
Public Health and Clinical Data Exchange: The MIPS eligible clinician is in active engagement with a public health agency or clinical data registry to submit electronic public health data in a meaningful way using CEHRT, except where prohibited, and in accordance with applicable law and practice.	Immunization Registry Reporting – The MIPS eligible clinician is in active engagement with a public health agency to submit immunization data and receive immunization forecasts and histories from the public health immunization registry/immunization information system (IIS).	N/A (measure is Yes/No and requires an affirmative attestation to meet requirement)	N/A (measure is Yes/No and requires an affirmative attestation to meet requirement)	The MIPS eligible clinician: 1. Does not administer any immunizations to any of the populations for which data is collected by its jurisdiction's immunization registry or immunization information system during the performance period; OR 2. Operates in a jurisdiction for which no immunization registry or immunization information system is capable of accepting the specific standards required to meet the definition of CEHRT at the start of the performance period; OR 3. Operates in a jurisdiction where no immunization registry or immunization information system has declared readiness to receive immunization data as of 6 months prior to the start of the performance period.
Public Health and Clinical Data Exchange	Electronic Case Reporting – The MIPS eligible clinician is in active engagement with a PHA to electronically submit	N/A (measure is Yes/No and requires an affirmative attestation to meet requirement)	N/A (measure is Yes/No and requires an affirmative attestation to meet requirement)	The MIPS eligible clinician: 1. Does not treat or diagnose any reportable diseases for which data is collected by their jurisdiction's reportable disease system

Objective	Measure	Numerator	Denominator	Exclusion
	case reporting of reportable conditions.			during the performance period; OR 2. Operates in a jurisdiction for which no PHA is capable of receiving electronic case reporting data in the specific standards required to meet the definition of CEHRT at the start of the performance period; OR 3. Operates in a jurisdiction where no PHA has declared readiness to receive electronic case reporting data as of 6 months prior to the start of the performance period.
Public Health and Clinical Data Exchange	Public Health Registry Reporting (Optional) – The MIPS eligible clinician is in active engagement with a PHA to submit data to public health registries.	N/A (measure is Yes/No and requires an affirmative attestation to meet requirement)	N/A (measure is Yes/No and requires an affirmative attestation to meet requirement)	None
Public Health and Clinical Data Exchange	Clinical Data Registry Reporting (Optional) – The MIPS eligible clinician is in active engagement to submit data to a clinical data registry.	N/A (measure is Yes/No and requires an affirmative attestation to meet requirement)	N/A (measure is Yes/No and requires an affirmative attestation to meet requirement)	None
Public Health and Clinical Data Exchange	Syndromic Surveillance Reporting (Optional) – The MIPS eligible clinician is in active engagement with a PHA to submit syndromic surveillance data from an urgent care setting.	N/A (measure is Yes/No and requires an affirmative attestation to meet requirement)	N/A (measure is Yes/No and requires an affirmative attestation to meet requirement)	None
Public Health and Clinical Data Exchange	Public Health Reporting Using TEFCA (Optional)* – The MIPS eligible clinician: 1. Is participating as a signatory to a Framework Agreement (as that term is defined by the Common Agreement for Nationwide Health Information Interoperability as published in the **Federal Register** and on ONC's website); 2.	N/A (measure is Yes/No and requires an affirmative attestation to meet requirement)	N/A (measure is Yes/No and requires an affirmative attestation to meet requirement)	None

Objective	Measure	Numerator	Denominator	Exclusion
	Is not suspended from participating in TEFCA exchange; 3. Submits health information using TEFCA to a PHA consistent with one or more of the measures under the Public Health and Clinical Data Exchange objective; 4. Is in active engagement Option 2 (validated data production) with a PHA to transfer health information for one or more of the measures under the Public Health and Clinical Data Exchange objective; AND 5. Uses the functions of CEHRT to exchange with the PHA.			
Protect Patient Health Information: Protect electronic protected health information (ePHI) created or maintained by CEHRT through the implementation of appropriate technical, administrative, and physical safeguards. Protect Patient Health Information	High Priority Practices SAFER Guide – Beginning with the CY 2024 performance period/2026 MIPS payment year, submit an affirmative attestation regarding the MIPS eligible clinician's completion of the annual self-assessment under the High Priority Practices SAFER Guide measure using the 2025 High Priority Practices SAFER Guide during the year in which the performance period occurs.	N/A (measure is Yes/No and requires an affirmative attestation to meet requirement)	N/A (measure is Yes/No and requires an affirmative attestation to meet requirement)	None

* Reflects modifications proposed in the CY 2027 PFS proposed rule and finalized, as proposed, in this final rule that apply to the CY 2028 performance period/2030 MIPS payment year and subsequent years.

** Reflects modifications proposed in the CY 2027 PFS proposed rule (91 FR 44184 through 44190) and finalized, as proposed, in this final rule that apply to the CY 2027 performance period/2029 MIPS payment year.

BILLING CODE 4169–69–C

(ii) Modifying Scoring Methodology

For reference, Tables C–G 3, C–G 4, and C–G 5 in the CY 2027 PFS proposed rule (91 FR 44192 through 44194) and this final rule set forth the scoring methodology for the MIPS Promoting Interoperability performance category for CY 2026 performance period/2028 MIPS payment year, the CY 2027 performance period/2029 MIPS payment year, and the CY 2028 performance period/2030 MIPS payment year and subsequent years. In the CY 2027 PFS proposed rule, we discussed the removal of certain attestations and measures, addition of certain measures, and modifications/updates to certain measures for the MIPS Promoting Interoperability

performance category (91 FR 44171 and 44182).

In the CY 2027 PFS proposed rule, we referred readers to the discussion regarding the modifications to the scoring methodology that account for the Electronic Prior Authorization measure being changed to an optional measure with an allocation of 10 bonus points for the CY 2027 performance period/2029 MIPS payment year (91 FR 44191 and 44192). Also, we noted that there are no implications to the scoring methodology for the proposed modifications to the definition of CEHRT (91 FR 44191).

In the CY 2027 PFS proposed rule, we discussed the scoring implications for the proposed modifications to the following attestations and measures within the MIPS Promoting Interoperability performance category (91 FR 44191 and 44192):

- Removal of the ONC Direct Review and ONC–ACB Surveillance attestations;
- Removal of the Security Risk Analysis measure;
- Addition of the new Electronic Prior Authorization for Prescription Drugs measure; and
- Modifications to the Electronic Prior Authorization measure.

(A) Modifying Scoring for the ONC Direct Review and ONC–ACB Surveillance Attestations

As discussed in the CY 2027 PFS proposed rule, we proposed to remove the required ONC Direct Review attestation and the optional ONC–ACB Surveillance attestation beginning with the CY 2026 performance period/CY 2028 MIPS payment year (91 FR 44171 and 44172). Subsequently, in the CY 2027 PFS proposed rule, we proposed to remove the scoring policies related to the required ONC Direct Review attestation and the optional ONC–ACB Surveillance attestation beginning with the CY 2026 performance period/CY 2028 MIPS payment year (91 FR 44191).

Prior to the proposal to remove the required ONC Direct Review attestation and optional ONC–ACB Surveillance attestation, to earn a score for the MIPS Promoting Interoperability performance category for inclusion in the MIPS final score, a MIPS eligible clinician must be a meaningful EHR user for MIPS and submit a ''Yes'' response attesting to engaging in activities supporting providers with performance of CEHRT, including acknowledging the requirement to cooperate in good faith with ONC Direct Review. For the optional ONC–ACB Surveillance attestation, a MIPS eligible clinicians could attest ''Yes,'' ''No,'' or not submit an attestation (81 FR 77019 through 77027).

In accordance with the proposal to remove the required ONC Direct Review attestation and the optional ONC–ACB Surveillance attestation, the ONC Direct Review attestation would no longer be required to earn a score for the MIPS Promoting Interoperability performance category and the optional ONC–ACB Surveillance attestation would no longer be available beginning with the CY 2026 performance period/CY 2028 MIPS payment year (91 FR 44191). Since we did not provide measure points for the required ONC Direct Review attestation and optional ONC–ACB Surveillance attestation, the removal of the attestation requirements and scoring policies beginning with the CY 2026 performance period/2028 MIPS payment year would not necessitate a redistribution of measure points within the MIPS Promoting Interoperability performance category.

In the CY 2027 PFS proposed rule, we referred readers to Table C–G 3 for more information regarding the scoring methodology for the MIPS Promoting Interoperability performance category for the CY 2026 performance period/ 2028 MIPS payment year (91 FR 44190 through 44192).

We requested public comment on this proposal.

We did not receive public comment on the proposal, and therefore, we are finalizing, as proposed, the proposal to remove scoring policies related to the required ONC Direct Review attestation and the optional ONC–ACB Surveillance attestation beginning with the CY 2026 performance period/CY 2028 MIPS payment year. We refer readers to Table C–G 3 in section IV.A.4.d.(4)(g)(ii)(D) of this final rule for more information regarding the scoring methodology for the MIPS Promoting Interoperability performance category for the CY 2026 performance period/ 2028 MIPS payment year, which does not include the ONC Direct Review attestation or optional ONC–ACB Surveillance attestation

(B) Modifying Scoring for the Security Risk Analysis Measure

As discussed in the CY 2027 PFS proposed rule, we proposed to remove the Security Risk Analysis measure beginning with the CY 2027 performance period/2029 MIPS payment year (91 FR 44173 and 44174). Subsequently, in the CY 2027 PFS proposed rule, we proposed to remove scoring policies related to the Security Risk Analysis Measure beginning with the CY 2027 performance period/CY 2029 MIPS payment year (91 FR 44191). We noted that the Security Risk Analysis measure is a required measure within the Protect Patient Health Information objective; however, the measure is not scored or does not contribute to the MIPS Promoting Interoperability performance category score as long as a MIPS eligible clinician affirmatively attests to meeting the requirements of the measure. While an attestation of a ''Yes'' response from a MIPS eligible clinician does not garner points within the Protect Patient Health Information objective or contribute to a MIPS eligible clinician's MIPS Promoting Interoperability performance category score, an attestation of a ''No'' response from a MIPS eligible clinician demonstrates that the MIPS eligible clinician did not complete the actions included in the measure as required by § 414.1375(b)(2)(ii)(A) and did not satisfy the definition of a meaningful EHR user at § 414.1305. Therefore, if the MIPS eligible clinician submits a ''No'' response for the Security Risk Analysis measure, the MIPS eligible clinician would earn a score of zero for the MIPS Promoting Interoperability performance category in accordance with § 414.1375(b)(2) (91 FR 44191).

In the CY 2027 PFS proposed rule, we noted that in accordance with the proposal to remove the Security Risk Analysis measure, such measure would no longer be required to earn a score for the MIPS Promoting Interoperability performance category beginning with the CY 2027 performance period/CY 2029 MIPS payment year (91 FR 44191). Since we did not provide measure points for the Security Risk Analysis measure, the removal of the measure requirement and scoring policies beginning with the CY 2027 performance period/2029 MIPS payment year would not necessitate a redistribution of measure points within the MIPS Promoting Interoperability performance category. In the CY 2027 PFS proposed rule, we referred readers to Table C–G 4 for more information regarding the scoring methodology for the MIPS Promoting Interoperability performance category for the CY 2027 performance period/2029 MIPS payment year, which would no longer include the Security Risk Analysis measure (91 FR 44191 and 44193).

We requested public comment on this proposal.

We did not receive public comment on the proposal, and therefore, we are finalizing, as proposed, the proposal to remove the scoring policy for the Security Risk Analysis measure beginning with the CY 2027 performance period/2029 MIPS payment year. We refer readers to

section IV.A.4.d.(4)(d) of this final rule for the discussion regarding the finalization of the proposal, as proposed, to remove the Security Risk Analysis measure. Also, we refer readers to Table C–G 4 in section IV.A.4.d.(4)(g)(ii)(D) this final rule for more information regarding the scoring methodology for the MIPS Promoting Interoperability performance category for the CY 2027 performance period/2029 MIPS payment year, which does not include the Security Risk Analysis measure.

(C) Modifying Scoring for the New Electronic Prior Authorization for Prescription Drugs Measure

As discussed in the CY 2027 PFS proposed rule, we proposed to adopt and implement the new attestation-based Electronic Prior Authorization for Prescription Drugs measure beginning with the CY 2028 performance period/2030 MIPS payment year (91 FR 44175 and 44176). Subsequently, in the CY 2027 PFS proposed rule, we proposed to establish the scoring methodology for the Electronic Prior Authorization for Prescription Drugs measure, in which the measure would be included as a requirement under the Health Information Exchange objective and would not be scored or contribute to the MIPS Promoting Interoperability performance category beginning with the CY 2028 performance period/2030 MIPS payment year as long as a MIPS eligible clinician submits a ''Yes'' response attesting to meeting the requirements of the measure or claims an applicable exclusion (91 FR 44191). As a result, the measure would not affect the total score for the MIPS Promoting Interoperability performance category. If a MIPS eligible clinician submits a ''No'' response for the attestation-based measure, fails to submit an attestation for the measure, or fails to claim an applicable exclusion, then the MIPS eligible clinician would receive a score of zero for the MIPS Promoting Interoperability performance category (currently weighted at 25 percent of the MIPS final score), and would not be considered a meaningful EHR user for MIPS for the applicable performance period (91 FR 44191).

We requested public comment on this proposal.

We received public comment on the proposal. The following is a summary of the comments we received and our response.

Comment: Many commenters did not support the proposed scoring methodology for the Electronic Prior Authorization for Prescription Drugs measure and expressed concerns regarding the scoring methodology for the Electronic Prior Authorization for Prescription Drugs measure, specifically, the provision that would consequently cause a MIPS eligible clinician to receive a score of zero for the entire Promoting Interoperability performance category if a MIPS eligible clinician attests ''No'' for the measure, fails to report the measure, or does not claim an applicable exclusion. The commenters described such consequence as disproportionate, particularly when successful reporting for the measure may depend on readiness factors that are outside the control of MIPS eligible clinicians. A few commenters supported the proposal to not assign points for the proposed Electronic Prior Authorization for Prescription Drugs measure, while a few commenters recommended changing the proposed scoring approach, including assigning points to the measure once it becomes required, in which the failure to meet the measure requirements would result in the loss of measure points rather than receiving a score of zero for the entire Promoting Interoperability performance category. A few commenters recommended that CMS make the Electronic Prior Authorization for Prescription Drugs measure optional and eligible for bonus points during the initial implementation of the measure to encourage early adoption.

Response: We appreciate the feedback from commenters regarding the proposed scoring methodology for the Electronic Prior Authorization for Prescription Drugs measure beginning with the CY 2028 performance period/2030 MIPS payment year. We recognize that successful use of standards-based electronic prior authorization depends on coordination among MIPS eligible clinicians, payers, health IT developers, intermediaries, and other entities, and that some implementation challenges may be outside the control of individual MIPS eligible clinicians. However, we believe that requiring an attestation of a ''Yes'' response for meeting the measure requirements or allowing for an applicable exclusion to be claimed, which would result in the measure not being scored or contributing to the MIPS Promoting Interoperability performance category score beginning with the CY 2028 performance period/2030 MIPS payment year, is an appropriate scoring approach to encourage adoption of electronic prior authorization for prescription drugs, which provides valuable information in assessing meaningful use of CEHRT under the MIPS Promoting Interoperability performance category. Additionally, as we aim to provide consistency and reduce complexity in scoring, such approach aligns with the scoring methodology for other required measures in the MIPS Promoting Interoperability performance category in which a MIPS eligible clinician who does not affirmatively attest (submission of a ''Yes'' response) to meeting the requirements of a required measure or claim an applicable exclusion receives a score of zero for the MIPS Promoting Interoperability performance category.

We intend to assess implementation experience, payer and health IT readiness, technological advancements, and the availability of ONC-certified health IT as the measure is implemented.

After consideration of public comment, we are finalizing, as proposed, the proposal to establish the scoring methodology for the Electronic Prior Authorization for Prescription Drugs measure, in which the measure would be included as a requirement under the Health Information Exchange objective. Beginning with the CY 2028 performance period/2030 MIPS payment year, a MIPS eligible clinician will be required to affirmatively attest (submission of a ''Yes'' response) to meeting the requirements the Electronic Prior Authorization for Prescription Drugs measure or claim an applicable exclusion. For MIPS eligible clinicians affirmatively attesting to meeting the Electronic Prior Authorization measure requirements or claiming an applicable exclusion, the measure will not affect the total score for the MIPS Promoting Interoperability performance category. If a MIPS eligible clinician submits a ''No'' response for the attestation-based measure, fails to submit an attestation for the measure, or fails to claim an applicable exclusion, then the MIPS eligible clinician will receive a score of zero for the MIPS Promoting Interoperability performance category and will not be considered a meaningful EHR user for MIPS for the applicable performance period. We refer readers to Table C–G 5 in section IV.A.4.d.(4)(g)(ii)(D) of this final rule for more information regarding the scoring methodology for the MIPS Promoting Interoperability performance category for the CY 2028 performance period/2030 MIPS payment year and subsequent years.
